The ototoxicity of the antiseptic combination chlorhexidine gluconate with cetrimide (savlon) is reviewed by Galle HG and colleagues on guinea pigs and observed the vestibular dysfunction in 15 clinical cases 12 dogs and 3 cats, in 8 animal ruptured tympanic membrane developed vestibular ototoxicity after applied this antiseptic combination(21). Further evidence, for the ototoxicity of chlorhexidine is demonstrated by Igarashi Y, Suzuki J, 0.05% or 2% chlorhexidine gluconate solutions were topically infused into the middle ear cavities of 12 test cats and observed the histologic change by both scanning and transmission electron microscope. Then 9 animals were decapitated 7 days after the third application, while the other three animals were sacrificed at 4 weeks. In the 2% chlorhexidine group, they found that hair cells in the organ of Corti had degenerated and had lost their hair bundles. In the animals sacrificed at 4 weeks, the injuries present seemed to have progressed. Even at a clinical concentration of 0.05%, chlorhexidine caused intracellular degeneration but with little surface damage(22). Aursnes J (1981) used two different solvents of chlorhexidine with different duration of exposure in guinea pigs and sacrificed at 2, 3, 4 or 10 weeks after exposure. The damage was extent to surface preparations of the organ of Corti in the Cochlea and the mucosal lining of the tympanic cavity was seen in almost all exposed ears with related to the concentration, the duration and to the time lapse after exposure(23). In addition, he did another study (1981) in guinea pigs with two different concentrations of chlorhexidine in two different solvents and the duration of exposure was varied. The result showed Vestibular neuroepithelial damage in most of the animals(24). Igarashi Y and Oka Y, found the chlorhexidine gluconate has an morphological ototoxic effect on the labyrinthine vestibule and observed in both the crista ampullaris and the macula with characteristic pronounced edema or amorphous dilatation of the nerve chalices with few small deformed mitochondria and even when used in dilute clinical concentration after intratympanic applications of 2% and 0.05% chlorhexidine gluconate in the cats (25). Morizono and colleagues supported this issue as well(26).

On other study Morizono T et al, demonstrated the ototoxicity of topically applied ethanol in guinea pigs quantitatively on cochlear microphones and the effect of ethanol with round window application on the endocochlear potential. Simultaneous recording of endocochlear Potential from the 1st and 3rd turn of the cochlea showed a more marked decline in the 1st turn. 70% ethanol caused an irreversible decline in endocochlear potential, while 35% ethanol caused a reversible(27).

Prospective controlled animal trial on all the antiseptics used in the ear surgery was conducted by Perez et al in (2000) to assess the function of the vestibular and cochlear parts of the 25 adult fat sand rat's inner ear after topical application of a different agent: chlorhexidine, povidone-iodine, and alcohol and based on the recording of vestibular evoked potentials (VsEPs) and auditory brainstem response (ABR). Administration of saline (control) affected neither VsEPs nor ABR. However, with gentamicin (ototoxic control) no responses in both VsEPs and ABR as expected. Povidone-iodine 10% did not affect VsEP recordings and had only a small effect on ABR after application. In contrast, chlorhexidine 0.5% had a clear toxic effect on the vestibular and cochlear function and all waves disappeared in all sand rats. In addition, 70% ethyl alcohol caused the waves to disappear not in all(28).

**Ototoxicity in humans studies:-**

Sade (1969) was first to question that a dead ear occasionally could result in a myringoplasty following the use of preparation solution during surgery (29). After that Ballantyne, recorded two patients with sudden sensorineural loss immediately after operation, whereas third patient developed a high-tone loss when seen 3 weeks postoperatively (30).

Again, why a simple procedure such as myringoplasty should result in a sensorineural hearing loss, by this question Bicknell's at 1971 start his study. He tried to find the possible etiology. In addition, performed a large study on series of 97 patients who had undergone myringoplasty. 0.05% chlorhexidine in 70% alcohol was used for perioperative antiseptic sterilization. Following that he recorded 14 patients developed severe SNHL in their operated ear within the first 6 months of the operation and 13 patients having a profound sensorineural hearing loss. An awareness amongst otologist was created following his article. Moreover, until date it serves as a landmark article on this subject (31).

**Conclusion:-**

Chlorhexidine has documented ototoxic effect and considered not safe in ear surgery especially with perforated tympanic membrane as concluded by Philip lai and colleagues in their literature review (32). In addition, alcohol also have clear ototoxic effects as discussed in various literature. Whereas diluted low concentration povidone-iodine is safe and to date is the standard topical antiseptic solution to be used for ear surgeries. A barrier method should also be considered during ear surgery if there is a concern. We recommend long-term multicenter clinical trials should be performed to evaluate the safe use of antiseptics during surgery.

### Abstract

This paper investigated the impact of stock dividend/bonus issue on return of corresponding company. Event study approach has been used to explore the abnormal return. For this purpose, 81 days event window has been created with 40 days of a pre and post window on the event occurred respectively. 27 service sector companies have been selected and calculated AR (Abnormal Return), AAR (Average Abnormal Return) and CAAR (Cumulative Average Abnormal Return). Finally, t-test technique applied to check the significance of the findings. This study concluded that bonus issues have a positive effect on the stock returns but the results are insignificant.

### Introduction:-

Bonus shares are the shares given by the company to its existing shareholders, according to the proportion of ownership they currently have in the company. An important point here is that, although the number of shares issued by the company increases but the value of the company remains the same. This is because the issued capital is subtracted from the retained earnings and added to the share capital of the company.

An issue of bonus shares is called bonus issue or stock dividend. When a company announces a bonus issue, it is also accompanied by the announcement of a "book closure date". It is the date when the company would temporarily close its books for the transfer of stock. This date is typically a couple of days before the bonus shares are actually issued and any person buying a share after the book closure date would not be entitled to receive any bonus shares.

In Pakistan the listed companies have been issuing stock as well as normal dividend. The topic of our research is to evaluate the effect of a stock dividend or a bonus issue on the returns of the individual stock. This effect of stock dividend is evaluated by event window analysis, the event window of our study is 80 days, 40 days before the event day and 40 days after the event day. The bonus issues included in the study range from 2008 to 2013, as announced in the KSE website and the sector included in the study is only the services sector.

### Modigliani–Miller theorem:-

It is a theorem on capital structure, arguably the most popular theorem for forming the capital structure of a company. The theorem states that, under the classical random walk approach of process and under some certain assumptions, i.e. in the absenteeism of taxes, bankruptcy costs, agency costs, and asymmetric information, i.e., in an efficient market, the value of a firm is unaffected by how that firm is financed. So it makes no difference what the

**Corresponding Author:-Kamran Ahmad.**  
Address:-Bahria University, Islamabad.

firm's capital structure is of what its dividend policy is. Therefore, the Modigliani–Miller theorem is also often called the **capital structure irrelevance principle**.

Miller and Modigliani in 1961 theoretically verified that bonus issues and other type of dividends do not alter the company's share capital. The implication of bonus issues is that as the bonus shares are issued to the same shareholders, the value of the shares remains the same but the number of shares has increased, so the price of the shares falls. Hence, the value of the shares held by the investors remains the same.

Essentially, firms that pay more dividends offer less stock price appreciation that would benefit stock owners who could choose to profit from selling the stock. However, the total return from both dividends and capital gains to stockholders should be the same. If dividends are too small, a stockholder can simply choose to sell some portion of his stock. Therefore, if there are no tax advantages or disadvantages involved with these two options, stockholders would ultimately be indifferent between returns from dividends or returns from capital gains.

Since the publication of the papers by Modigliani and Miller, numerous studies have shown that it does not make any difference to the wealth of shareholders whether a company has a high dividend yield or if a company uses its earnings to reinvest in the company and achieves higher growth. However, the importance of a firm's dividend decision is still contested, with a number of theories arguing for dividend relevance.

#### **Semi-Strong Form Efficiency:-**

It is a class of EMH (Efficient Market Hypothesis) stating that all public information is calculated into a stock's current share price. Meaning, that neither fundamental nor technical analysis can be used to achieve superior gains i.e. beat the market.

This hypothesis characterizes that only the information that is secret i.e. not publically available can give the investors abnormal returns. Apart from that every other information is adjusted in the stock's price.

The theory says that the investors are not concerned with a company's dividend policy since they can sell a portion of their portfolio of equities if they want cash. The dividend irrelevance theory essentially indicates that an issuance of dividends should have little to no impact on stock price.

#### **SEC rules bonuses:-**

A listed company may issue bonus shares is subject to the following conditions, namely: – draft amendments to the Company (issued capital) Rules “, 1996

The Company's Board of Directors resolved to issue bonus shares shall be communicated to the Commission and the Stock Exchange, the day of the decision, communicated to the public;

The Company shall retain at least 25% of the enhanced paid-up capital as free reserves;

The certificate shall be obtained by the Company's auditors certify: –

After the issue of bonus shares reserved free reserves of not less than 25%, increasing the company's paid-up capital;

(B) all contingent liabilities are computed, the lowest 25% of remaining reserves and the certificate will be sent to the respective stock exchanges of information and the decision of the day for the public dissemination Commission has charged.

Purposes of this section, the term “free reserves” Explanation. \_\_ include any amounts already allocated all intangible assets or fictitious assets adjusted income or other surplus

Free, it is not retained in order to satisfy any impairment in the value of assets, specific liability at the balance sheet date, the contingency of existence or promise, but does not include

1. reserves as a result of the revaluation of fixed assets;
2. Goodwill reserves;

Of the impaired range of ordinary depreciation or Otherwise, the conditions of admissibility of Income Tax Ordinance, “2001 (2001 forty-ninth);

Development allowance reserve created under the Income Tax Ordinance, “2001 (2001) forty-ninth requirements;

Provides tax-deferred or the extent of the Company’s current liabilities;

1. Capital redemption reserve;
2. Unrealized capital gains.

#### **Need of study:-**

We want to analyze the bonus issues and the effect the announcements of bonus issues have on the return of the shares. We studied various articles and highlighted this issue, as we observed there is not much study conducted in Pakistan when it comes to bonus issues. Hence, the need exists to further elaborate the effect and to identify any new findings about the issue at hand.

#### **Problem Statement:-**

Companies often issue bonus in shape of stock but there is on study which is entirely focus on the impact of stock dividend on stock return.

#### **Research Questions:-**

- What is the return of stocks before the bonus issue announcement?
- Is there any abnormal return of the stock after the announcement?
- What is the overall effect of the announcement on the stock?

#### **Research objective:-**

To examine the effect of bonus issues on stock return

#### **Significance of the study:-**

The beneficiaries of the study would be the researchers, the firms and the investors. As our study would give them a detailed account of the effect of bonus issues on the stock returns, so if the return is higher after the announcement then the investors would invest more after the announcement, the firms would use it to generate more investment and the researchers would have a new topic to discuss, scrutinize and analyze.

#### **Literature Review:-**

##### **2013 Omer Subaih The Effect, of Stock Split Declarations on Stock Prices: an Empirical Inquiry for the Toronto Stock Exchange (TSX)**

This paper investigates the effect of stock split announcements on stock Prices in the Toronto Stock Exchange (TSX). Used event study to determine event window and estimation window, then calculated returns in estimation window and event window using CAPM model. Compared the two to determine abnormal returns and finally t-test was applied to check the significance. Cumulative abnormal return exists on short-term period surrounding the stock split announcement. On the other hand, there is no evidence support that the cumulative abnormal return would continue to exist when the size of the event window is expanded. Abnormal returns on short run, but no significant evidence to support that the market participants can generate abnormal returns in long run.

##### **2010 Hideki Hanaeda, Toshio Serita The Effects of Stock Splits on Stock Prices, Liquidity and Stock Ownership: Evidence from Japan.**

The purpose of the study is to investigate the effects of stock splits on stock prices, liquidity and stock ownership in Japan. A window of 80 days was taken, -10 and +70 days. The stock market reaction to the announcement of stock splits was estimated by using market-adjusted prediction errors ( $PE_{it}$ ).  $PE_{it}$  is the difference between daily rate of return on the common stock of splitting firms and daily rate of return on the Tokyo Stock Price Index. After taking their average, t-test is applied. The price, returns and ownership increase as a result of stock splits, but liquidity decreases in Japan, stock splits have a positive effect on returns, price and ownership, but a negative effect on liquidity. **2008 Dr. Satyajit Dhar, Market Reaction, around the Stock Splits and Bonus Issues: Some Indian Evidence.**

This paper examines the announcement effects of stock splits and bonus issues on the Indian Stock market during the period April 2000 to March 2007. An event window was constructed, -40 and +40 days, returns were calculated using CAPM, average abnormal returns were calculated by subtracting actual and expected returns and finally t-test was applied to check the significance. It was found that 77% of sample companies have positive mean return in respect of stock split whereas that for bonus issues is 57%. Stock splits may give an investor more return than that from bonus issues considering entire event window. But on announcement date of bonus, 83% of sample companies experienced positive return compared to 69% of sample companies having positive return on stock split announcement date. Thus on the announcement date, reaction of market participants to bonus issues found to be more positive than that to stock splits.

#### **Karachi Stock Exchange closes at all-time high:-**

#### **2010 Mikko Reinikainen, Effects of stock splits, on stock returns: An event study, of Finnish companies.**

The main idea of this study is to test the legitimacy of the signaling effect of stocks splits in Finnish stock markets. If the signaling effect prevails, then abnormal returns would be detected around the split announcement days. It means that the investors take stock splits as favorable positive information. The study uses event study methodology to investigate the effect of stock splits on shareholder wealth. The study found no abnormal returns before or after the event date. So the study conducted is unable to state whether the signaling effect holds or not. These results differ from that of the previous empirical studies.

#### **2012 Yague, Gomez-Sala and Pove-da-Fuentes Stock split size, signaling and earnings management: Evidence from the Spanish market.**

The study was done in order to examine the use of stock split announcements as signals of a firm's earnings performance. Event study was done, abnormal returns were calculated and then finally t-tests were applied to check the level of significance. Positive abnormal returns were calculated as a result of stock split. Result found a statistically significant relationship between abnormal returns around the split announcement and the surprise component of the split factor, especially in splits in which the factor is higher than expected given the pre-split share price level and the size of the firm.

#### **2005 Leledakis, Pa-paioannou, Trav-los, Tsangarakism stock splits on the athens stock exchange.**

This study analyzes the price effects of stock splits undertaken by firms whose stock is traded on the Athens Stock Exchange (ASE). It also tests empirically some of the hypotheses that have been advanced, by prior literature, to explain the abnormal price reaction to stock splits. To check the price effect, again an event window was determined, and abnormal returns calculated. Liquidity decreases as we move on from the event day, but prices and returns show a positive change. No price reaction on announcement day, but earnings improve in the years prior to the split but there is no evidence of future earnings improvement. Study confirmed that liquidity does not increase as the result of stock splits.

#### **2002 Christen Wolff the market reaction to stock splits evidence from germany.**

This paper investigates the market reaction to stock splits, using a set of German firms. A sample of stocks whose split date was announced were selected, and returns before and after the announcements were calculated, then abnormal returns were calculated. At the announcement date itself, the abnormal return is very low and insignificant, but the following day shows an abnormal return of 0.47%. This abnormal return is significant according to all test statistics, even at the 1% level. Using trade-to-trade returns, the abnormal return on day + 1 is even higher, yielding 0.56%. The cumulative abnormal return over the extended event window [-30; +30] differs by almost 4%, depending on the method used. As compared to US, the market reaction in Germany around announcement date is relatively lower, but still it shows a positive effect on the returns of the stock.

**2006 Mayank Joshipura Price and liquidity effects of stock split: An Empirical evidence from Indian stock market.** This paper studies the price and liquidity effect associated with stock split surrounding its announcement and effective day by using standard event study methodology which, measures significance of abnormal return and change in liquidity associated with an event. Event study methodology was used, with -51 and +51 day window to work on, then abnormal returns were calculated, and finally t-test was applied to check the significance. Excess return on announcement day, abnormal return on the effective day, effect not long term. Though there is a significant positive abnormal return of 1.08% and 1.66% found on announcement and effective day respectively it did not sustain and got reversed in less than a week's time, and there was a clear evidence of significant

improvement in traded volume (turnover) associated with stock split both surrounding announcement and effective day.

**2002 Patrick Dennis Deon Strickland The effect of stock splits on liquidity and excess returns: Evidence from shareholder ownership composition.**

This paper studies the impact of firm ownership composition on both the abnormal returns at the announcement of a stock split and liquidity changes following a stock split. A sample of firms giving stock split announcements was selected. For each firm in the sample, quarterly ownership composition data for two years before and after each split were collected. Monthly and quarterly return, volume, outstanding shares and price data for two years before and after each split were collected. 1392 observations were in the four-year sample. The estimated coefficient on the percentage change in turnover is positive and significant. The estimated coefficient for institutional ownership is negative and significant at the one percent level. This suggests that the different levels of institutional ownership lead to large economic differences in the wealth effect of a stock split. The largest post-split increase in institutional ownership occurs for firms that had low institutional ownership prior to the split. Changes in liquidity are negatively related to the level of institutional ownership prior to the split. The abnormal return following a split is negatively related to the level of institutional ownership prior to the split.

**2012 May Hu An examination of stock split and special dividends announcements in relation to market timing, opportunities, business cycle and monthly pattern.**

The principal aim of this research is to examine the macro determinant that can explain why firms issue stock split and special dividend, and to know are the aggregate patterns and abnormal returns of stock split and special dividend announcement are related to the monthly patterns of January effect & Halloween effect. Comparison of announcement date with pre and post announcement dates on daily weekly, 10 days, 15 days, 1 month 2 month and 6 month. Market reaction to stock split is normally stronger in January but firms do not have a tendency to issue stock split in January rather they want to issue in Halloween period. The powers of business cycle variables are stronger in abnormal returns than the investor variables and monthly effect. The abnormal returns of stock split announcements are higher in bull market. Co.'s prefer to pay special dividend in bear market, both short term and long term abnormal returns are higher when market is downward.

**2010 John Mwendwa Stock split and their effect on share prices, a study of the firms listed on the Nairobi stock exchange.**

To determine the reasons Kenyan firms undertake stock split within the Kenyan market. To determine if stock split have any effect on share price. 10 co.'s which did stock split from 2004-2009 were taken and their prices were analyzed on monthly basis of before and after split. Interviews were and conduct with questionnaire and were analyzed by using SPSS. Stock split is being done in order to bring down the stock prices. Another finding is that co.'s did so to give off a positive outlook that co. is going well. There were not any fix changes in prices of the share before and after split. In Kenya co.'s do stock split in order to bring prices to optimal level. Stock split did not have a direct effect on share prices.

**2003 Isil sevilyyalmiz An analysis of stock splits in the Istanbul stock exchange.**

this study investigates the stock split decisions of the Turkish companies. Firstly the study investigates the liquidity effect of the stock splits on Turkish stocks; secondly it determines the optimal trading range of different sized firms and firms with different investors. Lastly, the study analyzes by testing whether or not Turkish firms whose share prices rise above their optimal trading ranges are more likely to split their stocks as compared to firms whose share prices are at or below the optimal trading ranges. Companies are selected from 1992 to 2002 which split their stocks; this is composed of 740 split events by 263 firms. The study was unable to define the relationship between share price and stock split, as no of shareholders are not publically available and the proxy used for it didn't define the result.

**2005 Annad. S. Desai Changes in trading activity following stock splits and their effect on volatility and the adverse information component of the bid-ask.**

Examine the volatility of stock after splitting and the effect of adverse information component of the bid-ask spread. Extract the adverse information component from the total bid-ask spread, then relate changes in this component to changes in the number of trades after split, the spread and the adverse information component of the spread increases after the stock split. We also find a negative correlation between the change in the adverse information component and the change in the number of trades. Results shows that the increase in volatility cannot be attributed

solely to microstructure biases arising from the bid-ask bounce and price discreteness and after correcting these biases, we find a significant increase in the volatility after the split.

#### **2011 Kanwal Iqbal Khan Effect of Dividends on Stock Prices**

The effect of stock dividend on stock prices of chemical and pharmaceutical industry. The objective of this study is to see the effect of cash dividend and stock dividend on stock market prices. A sample of twenty five companies is taken from the period of 2001 to 2010. They used Panel data approach to measure the relation between stock dividend and stock prices. Fixed and random effect models are applied on the panel data. Cash Dividend, Retention ratio and return on equity has positive significant relation with stock market prices while stock dividend and earning per share has negative insignificant relation with stock market prices. Dividend Irrelevance theories are not applicable in case of chemical and pharmaceutical companies of Pakistan.

#### **1994 Mark. S Granblatt The Valuation effects of stock splits and stock dividends.**

To check the Reaction of companies and its return on announcement of stock splits and stock dividends Sample of companies who is announcing stock split and stock dividend. Take out the data of return post and pre-split announcement. On Average, companies react positively to stock dividend and stock split announcement. Found Positive excess return on and around the ex-dates of stock dividends and splits. They concluded Positive relationship between stock split and the stock price. Post announcement abnormal returns, particularly the ex-dates of splits and stock dividends.

#### **Karachi Stock Exchange DHIYAN (FORECAST) for Mon, 26th, Nov, 2012:-**

#### **2009 Neinsu Shih, The Impact of Employee stock bonus on equity market value.**

The objective was to relation between equity market value and the expense of employee stock bonus that is disclosed but not recognized under Taiwan's law. Sample data was drawn from listed companies in Taiwan Stock Exchange from 1997 – 2005. Divide it into sector wise and then compare it which sector issues more employee stock bonus. The two-stage estimation of Heckman is used in this study. In the first stage, the determinants of employee stock bonus equation are estimated using the probity analysis. In the second stage, the inverse Mill's ratio obtained from the first stage is included in the second stage regression models to test the hypotheses of this study. The market value of employee stock bonus has a negative effect on the firm's share price. Results indicate the negative side of employee stock bonus is its dilution of the existing shareholders' equity rights. Employee stock bonus plan has a motivational effect for employees. Empirical results show that the fair value of employee stock bonus reduces a firm's equity market price.

#### **2009 CAHIT ADAOGLU AND MEZIANE LASFER, The Market Valuation, of Bonus Distributions in an Inflationary Environment.**

The objective was to check the market valuation of an unusual form of stock dividends, referred to as bonus distributions, which are carried out by transferring the accumulated equity reserves, mainly the inflation revaluation equity reserves, to paid-in capital leaving the total equity unchanged. They used event study methodology and sample consists of 371 announcements over the period of 1995 -2006. They find average abnormal returns on the announcement day 0, and 0.94on day +1. They found that the pre-event CAAR are positive, but post event period are negative. Hence, market reacts positively to the bonus announcements in Istanbul.

#### **2001 Balasingham Balachandran\* & Sally Tanner, BONUS SHARE ISSUES AND ANNOUNCEMENT EFFECT: AUSTRALIAN INDICATION**

The objective of the study was to check share price reaction to announcement of bonus share issues of Australian companies. Took data from different resources like Bloomberg, IRESS... 139 Observations. Daily share price data for a period from 250 days before to 20 days after the announcement dates and market value for each company making a bonus issue one month prior to the bonus issue announcements Pre-announcement effect was found only for industrial non-financial companies and financial companies that announced bonus issues simultaneously with other market sensitive information such as interim or final results. The magnitude of price reactions to bonus issue announcements is statistically related to the size of the bonus issues and the pre-announcement effect the price reaction to bonus issues announcements. Bonus issue announcements led to statistically significant positive price reaction around announcement dates for uncontaminated and contaminated events.

**Research Methodology:-****Methodology:-****Research Design:-**

There are basically 3 major types of research designs:

**Exploratory study:-**

It is a study undertaken to explore some certain problem or issue of a variable about which no or very little is known.

**Descriptive study:-**

It is a study under taken to ascertain or describe the characteristics of a certain variable under consideration.

**Hypothesis testing:-**

It is a type of research which explains the nature of relationships between the considered variables or checks the independence of two or more factors.

Hence, as we have tried to investigate the relationship of stock dividend and stock splits with their stock returns, the research conducted by us is a hypothesis testing study.

Furthermore, the sub-type of the research was an event window study. In which we tried to determine the abnormal returns for the firms before and after an event date by comparing the actual and expected returns.

**Methodology Literature:-**

All of the articles we studied used the same research methodology of an event study, though their sample size differed. All of them chose an event date and determined the abnormal return by calculating the returns for a given window before and after the event date and then calculating the excess returns by CAPM and finally subtracting the expected return by the actual return.

**Data:-**

The sample of our research is the all the bonus issues of the companies belonging to service sector in KSE, a total of 27 companies and 61 issues from 2008 to 2012. The data about these companies and their issues was collected from various sources, like opendoorsforall.com, zhvsec.com, breccorder.com and Pakistan-stock.blogs.com.

**Statistics:-**

Market return and stock returns were the two variables considered by us. Here market return is the independent variable and stock return is the dependent variable. Abnormal return was calculated by subtracting the expected return and the stock return.

**Stock and market return:-**

Stock and market return was calculated by the simple formula for calculating the return of a stock, i.e,  
 $\text{Returns} = (\text{Current return}/\text{previous return}) \log$

**Expected Return:-**

Expected returns give the return that the investors are expecting for a given day or a period is calculated by:

**Abnormal Returns:-**

Abnormal returns are the returns that give the return of the stock in excess to what was expected by it, it could be in positive or negative, if positive it is favorable to the investors if negative then it is not good for the investor's perspective:

$\text{AR} = \text{Actual return} - \text{Expected Returns}$

$\text{Average AR} = \text{AR}/n$

**Average abnormal Returns:-**

is calculated by dividing the sum to returns of the security for the window dates by the number of bonus issues considered

### Cumulative average abnormal Return:-

Cumulative average abnormal return is calculated by adding the average abnormal returns of the event window dates

### Results:-

As we explained in the above discussion that we took event window of 40 days before and after the event date. This strategy is called event study.

The objective of our study was to determine whether stock dividend, i.e. bonus issues have any effect on the stock's returns. Meaning, that does an announcement of stock dividend by a company lead to abnormal returns.

The results of our study on Average Abnormal Returns (AAR) of bonus issues are given in the annexure 1. The results show that on the event date there exists an average abnormal return of 0.49% which is significant at 2.2%, meaning that the investors would be able to get 0.49% then what they expected to get. Table 1 shows the impact of stock dividend announcements on share price performance. It shows that around 37 companies out of a total of 61 were able to get a positive return during the event window, meaning that 61% of the companies show a positive return to the stock dividend announcements during the event window. The table also signifies that a total of 23 companies out of 61, i.e. 39% of the companies, got a negative response to their dividend announcements during the event window.

Now looking at the effect of stock dividends on the announcement date or the event date, we see that a total of 38 out of 61 companies have a positive mean return on the announcement date, that is almost 64% (63.4%) companies having a mean positive return which is better than the number of companies showing positive return during the event window. While the number of companies showing negative return on the announcement date fall to 22 from 23, i.e. fall from 39% to 36.6%, meaning that more companies show a positive reaction to stock dividend announcement on the event date then the number of companies having a positive return on event window.

### Impact of stock Dividend announcement on share price performance:-

**Table.1:-**

Particulars	Bonus Issues	
	No. of Companies	Percentage
Companies having positive mean return during event window	37	61%
Companies having negative mean return during event window	23	39%
Companies having positive mean return on announcement date	38	63.4%
Companies having negative mean return on announcement date	22	36.6%
Total	60	100%

The table 2 tracks the course of the mean CAAR along the days in the event window. The table shows that the CAAR in the post event days is more than the pre event days. Furthermore, the CAAR on the event date is the maximum as compared to other ranges meaning that the return of the selected stocks increase as they lead up to the event date and then don't show any drastic changes after the event has occurred. The CAAR for the entire window, i.e.  $t_{-40}$  to  $t_{+40}$  is 1.8%.

CAAR across the Event Windows

**Table 2:-**

Days	Bonus Issues	
	Mean CAAR	Variance
$t_{-40}$ to $t_{-21}$	0.005167	0.00005772
$t_{-20}$ to $t_{-1}$	0.02754	0.00011762
$t$ to $t_1$	0.053238	0.00000002
$t_1$ to $t_1$	0.051532	0.00000583
$t_{+2}$ to $t_{+20}$	0.033454	0.00036727
$t_{+20}$ to $t_{+40}$	0.050648	0.00000553
$t_{-40}$ to $t_{+40}$	0.018276	0.00035753

These results show a positive abnormal return for the companies and the bonus issues, meaning that the market is inefficient, and the results are significant for the event date. But when the overall significance is considered then we see that majority of the results and returns are insignificant. Table 3 gives the significance of all the results. From the table it can be seen that although the positive abnormal returns of the stocks are significant on the event day, but an overwhelming majority of them are insignificant. Almost 82% of the results are insignificant. This shows that the market is efficient and the relevant information about the stock was already incorporated in the price of the stock before the announcement was made.

**Table 3:-**

Particular	Bonus issue	
	Significance @ 10%	Percentage
$t_{-40}$ to $t_{-21}$ significance AAR	4	4.9%
$t_{-20}$ to $t_{-1}$ significance AAR	4	4.9%
$t$ significance AAR	1	1.23%
$t_1$ - $t_{20}$ significance AAR	5	6.17%
$t_{21}$ - $t_{40}$ significance AAR	1	1.23%
issues having no significant	66	81.48%
Total	81	100%

### Discussion:-

Our results are in accordance with almost all of the previous studies that we have analyzed. We studied an article named “Market Reaction, around the Stock Splits and Bonus Issues: Some Indian Evidence” written by Dr. SatyajitDhar during 2008. As the name suggests they, like us, also wanted to check the effect of stock split and bonus issues on the market. They came up with the same result, that bonus issues have a positive effect on the returns.

Another article, “Dividend Announcements and Stock Returns: A study on Karachi stock exchange”written by Shahid Mahmood, Muhammad FayyazSeikh and Abdul QayyumGhaffari during 2011 investigated the same issue, the effect of dividend announcements and stock returns. The results of this study are also consistent with our research and back our findings in a Pakistani market.

The article entitled, “Bonus issue announcements and its impact on share prices of Colombo Stock Exchange (CSE) in Sri Lanka” by Ramesh S and Nimalathan B written during 2007 investigated the same issue but in a Sri Lankan market. This study is one of the very few that shows a negative relation between stock dividends i.e. bonus issues and the stock returns. This difference could have been because of many reasons, Sri Lanka is a small market and in the days when this research was conducted, terrorism also prevailed in the country. So these factors may have affected the stock market and the shares trade volume in the country, hence leading to inconsistent results.

Another article was “A study on effect of bonus declaration, on share price volatility and liquidity and its impact on market wealth creation, in Bangalore NSE” written by Prof. Suresha B, Dr.Gajendra Naidu during 2012. They also tried to investigate the effect of bonus declaration on share price and wealth creation. They concluded that bonus issues are favorable to market price and market wealth. These results are consistent with our findings, they support and back out findings in Pakistani market context.

Another article “An examination of stock split and special dividends announcements in relation to market timing, opportunities, business cycle and monthly pattern” which was written by May Hu during 2012 also tries to examine the effect of stock splits and stock dividends on the market. He concluded that the bonus issues and stock dividends have a positive effect on the market and are favorable to the investors and stockholders. These findings are again consistent with our own results.

Another article “Effect of Dividends on Stock Prices” written by Kanwal Iqbal Khan during 2011 also tries to investigate the effect of dividends on the stock prices. They used panel data approach to investigate the effect of both the cash and stock dividends on the stock prices, and their result was that it has a significant positive effect on the stock prices. These results are in accordance to our findings, hence they support our results.

Another article studied by us entitled “The Impact of Employee stock bonus on equity market value” written by Neinsu Shih during 2009 investigates the effect of employee stock bonus on equity market. The research concludes that market value of employee stock bonus has a negative effect on the firm’s share price. This is not following our findings, but that is due to that fact that here only the effect on employee stock bonus is concerned and it has a negative impact on equity value of the firm because it dilutes the existing shareholders’ equity rights.

Another article entitled “BONUS SHARE ISSUES AND ANNOUNCEMENT EFFECT: AUSTRALIAN INDICATION” written by Balasingham Balachandran\* & Sally Tanner during 2001 examines the price reaction to announcement of bonus share issues of Australian companies. They also concluded the market reaction around bonus issues to be statistically significant. Similar to our findings, hence this research also backs our findings.

Furthermore, our findings are also backed by a number of other studies that we analyzed, such as The Effect of Stock Split Declarations on Stock Prices: an Empirical Inquiry for the Toronto Stock Exchange (2013), The Effects of Stock Splits on Stock Prices, Liquidity and Stock Ownership: Evidence from Japan (2010), Effects of stock splits, on stock returns: An event study, of Finnish companies (2010), Stock split size, signaling and earnings management: Evidence from the Spanish market (2012), Stock splits on the Athens stock exchange (2005), the market reaction to stock splits, evidence from Germany (2002), The effect of stock splits on liquidity and excess returns: Evidence from shareholder ownership composition (2002) and still some studies have supported our findings.

### **Conclusion:-**

In this paper we have tried to investigate the effect of stock dividend or bonus issues on the returns of the stock, whether or not they exceed the investor expectations or not, i.e. do they provide any abnormal returns or not. For this reason we selected 61 issues from 27 different companies from the service sector of Pakistan, and set an event window of 81 days, i.e. -40 and +40 days around the event date, which was the announcement date. As a result of a thorough and rigorous analysis we conclude that bonus issues have a positive effect on the stock returns but the results are insignificant.

### **Major Findings:-**

There was yet a lot of speculation about whether or not stock dividend is relevant or irrelevant when it comes to the value of the firm, and Modigliani and Miller theorem proposed that there won’t be any abnormal returns, that all the relevant information is already adjusted in the price of the stock, and our results are support this theory. Our research has shown that, firstly although on the event date there exists an average abnormal return of 0.49% which is significant at 2.2%, meaning that the investors would be able to get 0.49% then what they expected to get on the event day. An overwhelming majority of companies shown a positive return on the announcement date, specifically 64% of the companies analyzed have shown a positive mean return on the announcement date. Secondly, majority of the companies have also shown a positive mean return during the event window, i.e. the days before and after the announcement date and the CAAR has continued to grow while leading up to the announcement date, but when the overall significance is considered then this result is shown to be insignificant. Which shows that although 61% of the companies have shown a positive reaction to the stock dividend announcements, this result is insignificant because the significance of more than 81% of companies is more than 10% (our considered level of significance).

### **Policy Implications:-**

On the basis of our findings it can be suggested that the investors should not believe bonus issues to result in additional returns to them, because our research shows them to be insignificant. Showing that no abnormal returns can be generated, that the market is an efficient semi strong market in which the public information is already

incorporated into the price before the event has occurred. So the firms should not use it to increase their share price or generate investor interest.

#### **Research limitations:-**

The bonus issues are not very popularly used in Pakistan, so the sample was not as big as we would have liked it to be. Furthermore, the effect of macroeconomic variables, political and social situation of the country were not included in our study.

#### **Future Directions:-**

Considering the research limitations and other research opportunities there are some certain directions for future research. Firstly, although we included all the bonus issues we found in the period we selected, but the time span can be expanded to increase the sample size by including more bonus issues and also by include other macroeconomic factors and their effect on the stock prices in the research. Furthermore, the effect of stock splits should also be analyzed by the future researchers because both stock splits and stock dividends go hand in hand and there has not been much research conducted in Pakistan in this regard. These considerations would help the future researchers increase the conclusiveness of their findings and increase the significance of their study.

### Introduction:-

Kissing nevus (also known as "congenital melanosis bulbi" or "nevus fuscoceruleus ophthalmomaxillaris") is a congenital nevus that affects parts of the upper and lower eyelid and owing to its name, because when the eyelids during closure approach and touch (kiss) each other [1]. The entire eye as conjunctiva, sclera, cornea, retina and optic disc could be involved in this disease. The malignant transformation was described in many cases especially in oral, uveal and leptomeningeal melanosis[2][3]. Unilateral presentation is classically seen in most cases. It is very frequent in Japanese descent and rarely in others descents [4]. This is the first report in northern region of Saudi Arabia.

### Case report:-

A 3 months old boy presented to the ophthalmology clinic in King Khalid Hospital, Hail, Saudi Arabia with a black discoloration of the left eyelids since birth, his family and medical histories were unremarkable. An Ophthalmic examination, the patient is fixing and following the objects normally, pupils equal, round and reactive to light and accommodation, Intraocular pressure is 14 mmHg on both eyes. On inspection, the left eye showed dark pigmentation covering the lateral third of left upper and lower lids, along with dark scleral pigmentation [Figure 1].

**Corresponding Author:- Rakan M Algorinees.**

Address:- College of Medicine, University of Hail, Kingdom of Saudi Arabia (KSA).

**Figure. 1:-**The iris is normal in both eyes. Dilated fundus examination showed dark choroid in left eye. The cycloplegic refraction is not significant bilaterally. The patient is given follow up every 6 months for possible complication.

### Result and discussion:-

Congenital nevus occurs in about 1% of all newborns [11]. It is more common in asian population comparing to other ethnic groups. The nevus of Ota occurs due to migration of melanocytes during the fusion of upper and lower eyelids before splitting of both eye lids, then after the separation of upper and lower eye lids the touch (kiss) each other during eye closure giving us “kissing” or split nevus [12].

Mostly it is a benign unilateral melanocytosis, also 80% of the patients were females [5] and 48% of patients developed a nevus of Ota at or after birth compared to 11% between 1 and 10 years of age and 36% at puberty [6]. In our patient who is 3 months old, came with unilateral black discoloration of upper and lower eyelids, the sclera discoloration and dark choroid on fundoscopic examination furthermore the vision and ocular function was intact. In Caucasian decent there is an association between ota nevus and uveal melanoma well documented. It is valued of 1 in 400 patients with ota nevus they will developed uveal melanoma later in their life, comparison to one of 13,000 in the general population [7]. It is thought that in fair skin patients the prevalence of melanomas is higher due to lacking of the protective effect of darker pigmentation [8]. Even though the glaucoma is frequently associated with ota nevus in Black descent but we should consider it [9][10]. For that they need at least 6 months follow up to predict any of this well known complications.

### Conclusion:-

To our knowledge it is the first report in Northern Region of Saudi Arabia, which highlight the attention of this rare disease in our area. We recommend lifelong follow up (every 6 months) of diagnosed cases of ota nevus to catch any melanoma changes or development of glaucoma.

#### Abstract

Cardiac abnormalities associated with HIV infection increase the risk of mortality and morbidity among patients. Literature on the prevalence of these abnormalities in HIV-infected children is negligible, particularly from India. This study was conducted to evaluate and describe the cardiac anomalies associated with HIV infection in pediatric population. This cross-sectional study was done at Pediatric HIV Clinic, Medical College, Thrissur, Kerala, for a period of one year. All 64 participants of the study underwent thorough clinical evaluation and echocardiography. Data collected was analyzed using appropriate statistical methods. The mean age of the participants was  $9.62 \pm 3.19$  years. On physical examination, the symptoms noted were pallor (26.6%), lymph node enlargement (51.6%), opportunistic infections (79.7%), and clubbing (9.4%). Pulmonary artery hypertension (9.4%) and valvular regurgitations (26.6%) were the major echocardiographic findings among the participants. No significant association was noted between history of anti-retroviral therapy (ART) and pulmonary artery hypertension (PAH;  $\chi^2=2.676$ ,  $p=0.102$ ). Cardiac anomalies were not prevalent or were not of poor prognosis in the pediatric population in this study. Most of the cardiac anomalies seem to be subclinical in children with HIV infection. Main cardiac abnormalities noted were mild pulmonary hypertension and mild valvular regurgitations. None of the patients had cardiomyopathy. No association could be found between cardiac abnormalities and ART status.

#### Introduction:-

The estimated number of people infected by HIV, worldwide, is around 34 million, out of which 3.4 million are children below the age of 15 years (WHO, 2014). Cardiac abnormalities in these children increase the risk of mortality, even when these symptoms are in subclinical stage. Early detection is the key for successful treatment of the condition (Lipshultz *et al.*, 2000). LV diastolic dysfunction, dilated cardiomyopathy, LV hypertrophy, LV systolic dysfunction, pulmonary hypertension, and pericardial effusion are the most frequently described cardiac problems in HIV-infected adult patients (Barbaro *et al.*, 2001; Khunnawat *et al.*, 2008). Earlier studies reported a high incidence of cardiac abnormalities in children infected with HIV (Lubega *et al.*, 2005). There are very few studies dealing with cardiac anomalies in HIV-infected pediatric population from India. This study was proposed to determine the prevalence of cardiac abnormalities in HIV-infected children and to describe the different cardiac symptoms using echocardiography, ECG, and x-ray. The study also aimed at finding the association of cardiac anomalies with anti-retroviral therapy (ART) status.

## Methodology:-

This is a cross sectional descriptive study conducted at Pediatric HIV clinic, Medical College, Thrissur, Kerala, from July 2011 to June 2012. Demographic, clinical, and echocardiographic data were collected from 64 children infected by HIV who attended the clinic. The study population consisted of children less than or equal to 15 years, for whom at least one parent has given an informed consent. All patients were subjected to clinical examination and details were recorded in the prescribed proforma. Name, age, gender, and the clinical stages as per WHO classification were entered for each participant. Documents from ART center were verified for drug compliance, ART regimen, and recent CD4 count. CD4 count estimation was done for all patients by flow cytometry using a BD FACS count system.

After clinical examination all patients were subjected to the following investigations- X-ray chest, ECG and ECHO. A 12-lead scalar electrocardiogram was taken to evaluate abnormalities in rate, rhythm, chamber enlargement, conduction abnormalities and ST-T changes. X-ray chest posteroanterior view was taken to note cardiac size, enlargement of specific cardiac chambers, pulmonary edema or venous congestion, pulmonary arterial hypertension, and lung parenchymal abnormality. Review of the X-rays was done by the radiologist who was blinded to patient's identity. All patients were evaluated using M-mode transthoracic ECHO cardiography and colour-flow Doppler examination using GE VIVID 3 machines with 5 MHz probe. Parasternal long axis view and apical 4 chamber view were conducted by the cardiologist. Left atrial dimensions, left ventricular end systolic and diastolic dimensions, ejection fraction, TR gradient, presence of pulmonary artery hypertension (PAH), presence of any mass, clot or effusion, structural valvular lesions, and approximate RV pressure obtained from TR jet gradient were studied using echocardiography. LV function were classified as, normal if ejection fraction (EF) is  $>55\%$ , mild impairment if EF  $40-55\%$ , moderate impairment if EF  $30-40\%$  or severe impairment if EF is  $<30\%$ . RV pressure was calculated from TR jet gradient if there is significant TR. PAH was classified as mild if calculated RV pressure is  $35-50$  mm of Hg, moderate if RV pressure is  $50-75$ , and severe if RV pressure is more than  $75$ . Data analysis was conducted using appropriate statistical package and methods.

## Results:-

There were 64 participants in the study with a male to female ratio of 1:1.1. The mean age group (mean  $\pm$  SD) of patients in the study was  $9.62 \pm 3.19$  years. About 50% of the patients belonged to the age group of 11-15 years. Mean weight grade (mean  $\pm$  SD) of the participants was  $22.38 \pm 7.5$  kg. About 21.9% of children had grade 1 and grade 2 protein-energy malnutrition (PEM), 11 had grade 3, and 4 had grade 4 PEM. About 26.6% ( $n=17$ ) had first degree stunting, while 10 participants (15.6%) each had 2<sup>nd</sup> and 3<sup>rd</sup> degree stunting. More than 60% of the patients ( $n=39$ ) had stage 2, 20.3% had stage 1, with relatively few in advanced disease stages, including 12.5% in stage 3 and 6.3% in stage 4 disease. Out of the 64 patients, 52% ( $n=33$ ) were on ART, of which 65% were on zidovudine, lamivudine, nevirapine (ZLN) therapy. Four children (13%) in the study were in zidovudine, lamivudine, efavirenz (ZLE) therapy, while 16% ( $n=5$ ) were on stavudine, lamivudine nevirapine combination therapy.

Among the different cardiac symptoms, 4 children had class 1 dyspnea on exertion. The different clinical features at presentation are given in **Table 1**. On clinical examination, the symptoms noted were pallor (26.6%), lymph node enlargement (51.6%), opportunistic infections (79.7%), and clubbing (9.4%). On x-ray examination, the symptoms observed were RA enlargement (15.6%), apex LV (85.9%), apex RV (14.1), and dilated hilar vessels (15.6%). No LA enlargement was present in any of the participants. The symptoms observed on x-ray examination and echocardiography are given in **Table 2**. PAH (9.4%) and valvular regurgitations (26.6%) were the major echocardiographic findings among the participants. ECG examination did not reveal significant changes in any of the features like ECG rate or rhythm, enlargement of chambers, ST or T wave, and conduction. Six patients (9.4%) had mild pulmonary hypertension. No significant association was noted between history of ART and pulmonary artery hypertension (PAH;  $\chi^2=2.676$ ,  $p=0.102$ ). Retroviral therapy did not have any significant association with echocardiographic mitral regurgitation (ECHO MR;  $\chi^2=0.288$ ,  $p=0.592$ ). Echocardiographic pulmonary regurgitation was also not significantly associated with ART in the patients (ECHO PR;  $\chi^2=1.939$ ,  $p=0.164$ ).

**Table 1:-** Clinical features at presentation in patients (PEM = Protein energy malnutrition; IAP = Indian Academy of Pediatrics, ZLN = zidovudine, lamivudine, nevirapine; ZLE = zidovudine, lamivudine, efavirenz; D4 T+3Tc +NVP = stavudine, lamivudine nevirapine)

**Discussion:-**

The aim of the study was to analyze and describe the major cardiac abnormalities in a population of HIV-infected children. The various cardiac manifestations were determined by x-ray, ECG, and echocardiography. Out of the 64 children with HIV infection, 43.75% had grade 1 or 2 PEM. Analysis of symptoms that could result from cardiac anomalies showed that four participants had tachypnea and dyspnea on exertion. Out of these, one had underlying respiratory problem, while three had anemia. But there were no other symptoms suggestive of cardiac failure. Other studies have reported dyspnea, cough and tachycardia as prevalent clinical signs in pediatric patients with HIV infection (Cheloet *et al.*, 2015).

Radiological review of all the patients for significant symptoms revealed 10 cases suggestive of right atrial enlargement by criteria, and 9 cases of right ventricular type of apex. None of the participants had features of pulmonary venous congestion, pulmonary edema, or pulmonary hypertension. Moreover, there were no symptoms of cardiomegaly in any of the cases in the study. ECG abnormalities were also nil in all the cases, with evidence of chamber enlargement or ST-T changes totally lacking.

Pulmonary hypertension is one of the most frequently described abnormalities in HIV-infected patients (Barbaro *et al.*, 2001; Khunnawat *et al.*, 2008). Radiological review did not reveal any cases of pulmonary hypertension, but echocardiography detected 9.4% (6 participants) as having this symptom. Our report is comforted by the fact that pulmonary hypertension was present only in 7% of the children in a more recent study conducted by Cheloet *et al.* (2015). And this is higher than 3.6% reported in Zimbabwe by Miller *et al.* (2013). This symptom is of significance as outcome of patients with right-ventricular dysfunction is related to the degree of pulmonary hypertension, varying from a mild symptomless condition to severe cardiac impairment with cor pulmonale and death (Pellicelliet *al.*, 1998). And, pulmonary hypertension found on screening echocardiography or right-heart catheterisation warrants an aggressive investigation for treatable pulmonary infections. Of the total of 6 children with pulmonary hypertension one with 2yrs had previous history of 5mm ostium secundum atrial septal defect (ASD) at 6 months of age. Present ECHO or clinical review did not show any evidence of ASD. None others had underlying cardiac problem or chronic pulmonary problem to account for the pulmonary hypertension.

More than half of the patients (51.6%) were not on ART in this study. Majority of those on ART (31.25%) were on ART protocol containing ZLN (zidovudine, lamivudine, and nevirapine). Despite a good proportion being on this protocol, no significant association could be traced between ART and the presence of a cardiac abnormality. But, this study was cross sectional and not comparative, making it difficult to evaluate the influence of different treatment modules on cardiac anomalies. Echocardiographic studies did not reveal any case of LV dysfunction, and this does support the fact that ART containing Zidovudine has low risk for heart as mentioned in other studies (Miller *et al.*, 1993; Coodley *et al.*, 1994).

Earlier studies had reported high prevalence of LV systolic dysfunction and LV dilatation. Our study did not have any cases of these two symptoms. Study by Miller *et al.*, (1993) reported 10.9% of LV dilatation and 5% of LV systolic dysfunction. While in a Nigerian study, the prevalence of these symptoms were even higher – 33% and 33.7% of systolic dysfunction and dilated cardiomyopathy, respectively (Okoromah *et al.*, (2012). The large difference in findings could stem from the variation in the mean age of the participants in the study. In the Cohort chosen by Miller *et al.* (1993), the mean age of the participants was 15 years as against 9.2 years in our study. The Zimbabwe study also had late diagnosis and most of them were on late stages of infection at the time of diagnosis. In the Nigerian cohort, on the other hand, 83% of the children were in AIDS stage at the time of diagnosis. Thus, it is possible that prevalence of LV dysfunction increases with advanced stages of disease at the time diagnosis. Similarly in an Indian perspective, 64.2 % cases had left ventricular systolic dysfunction in a cross sectional observational study on 100 HIV infected children between 1 and 18 years of age (Singhet *et al.*, 2015). Larger sample size and advanced stage of the disease are the probable cause of the higher incidence of the symptom. Studies do show that early diagnosis and initiation of ART in HIV-infected children will reduce the incidence of anomalies of LV systolic dysfunction (Lubega *et al.*, 2005; Cheloet *et al.*, 2015).

High prevalence of LV dysfunction is reported in HIV-infected children who are malnourished. In Ugandan population of infected children, 50% were malnourished with growth retardation. This cohort showed a high prevalence of LV dysfunction (17%; Lubega *et al.*, 2005). Other studies too reported malnutrition as a worsening factor for LV abnormalities (Miller *et al.*, 1993). Malnutrition is also described as a worsening factor irrespective of ART in some of the studies. The nutritional status of the participants in the study was adequate. The incidence of

valvular regurgitations observed in the present study was high (26.6%) compared to that noted in general population, but all the cases were of trivial to mild type. This particular symptom needs follow up for a better understanding of its prevalence. Cardiomyopathy was not seen in any of the participants, although this is considered to be a prevalent cardiac abnormality in HIV-infected patients.

There was no statistically significant association between echocardiographic abnormalities and the clinical variables. One of the reasons for the difference might be earlier diagnosis of infection. Most of the participants in the study were in stage II (60.9%), when compared to the advanced stages of disease in participants of other studies (Lubega *et al.*, 2005; Singhet *et al.*, 2015). This study shows that most of the cardiac involvement is subclinical in HIV-infected children. Early diagnosis and treatment are thus the tools for reducing progression of the disease. This can prevent morbidity and mortality among the patients to a large extent.

### Conclusions:-

Cardiac anomalies were not prevalent or were not of poor prognosis in the pediatric population in this study. Most of the abnormalities seem to be subclinical in children with HIV infection. Valvular regurgitations and pulmonary hypertension were the echocardiographic findings from the study. Early diagnosis and treatment may help in reducing the incidence of cardiac abnormalities.

Hepatocellular carcinoma,  
Radiofrequency ablation

### Abstract

**Background & Aims:** Tumor recurrence after curative radiofrequency ablation (RFA) of hepatocellular carcinoma (HCC) is common. The burden of frequent post-ablation investigations especially triphasic computerized tomography (TCT) is high. We investigated whether post ablation measurement of aspartate aminotransferase to platelet ratio index (APRI) and neutrophil to lymphocyte ratio (NLR) as simple and cheap biomarkers can precisely predict HCC recurrence and which of them is more valuable.

**Methods:** In this retrospective study, the demographic, clinical, laboratory and imaging data of 42 HCC patients treated with RFA were statistically analyzed. Patients were classified into two groups; those with HCC recurrence (group I) and those without (group II). In order to test the value of baseline NLR versus that of APRI in predicting tumor recurrence and compare both to alfa fetoprotein (AFP), we used receiver operating curve (ROC) statistics.

**Results:** Mean values of AST, Platelets count, APRI, NLR and AFP showed significant correlation with HCC recurrence. Using logistic regression analysis, NLR was the only independent risk factor predicting HCC recurrence. NLR had the highest sensitivity and specificity for prediction of HCC recurrence (90.9 % and 85%) followed by that of AFP (86.4 % and 75%), and lastly by that of APRI (72.7% and 70%).

**Conclusion:** NLR is a promising, simple and cheap surrogate marker for prediction of HCC recurrence after radiofrequency ablation, and is far more significant than APRI.

### Introduction:-

Hepatocellular carcinoma (HCC) is the fifth most common cancer worldwide (1). HCC is a primary malignancy of the liver and occurs predominantly in patients with underlying chronic liver disease and cirrhosis (2). The incidence of HCC is highest in Asia and Africa, where the endemic high prevalence of hepatitis B (HBV) and hepatitis C (HCV) strongly predisposes to the development of chronic liver disease and subsequent development of HCC (3). Radiofrequency ablation (RFA) became a main modality of loco-regional therapy for HCC, because of its

effectiveness and safety for small HCC (<5.0 cm), with a 3-year survival rate of 62–77%, a low treatment complication rate of 8–9%, and a low treatment mortality rate of 0–0.5% (4-6).

A number of factors, such as number and size of tumor nodules, increased levels of serum tumor markers, hepatitis C virus (HCV), HBV infections, diabetes mellitus and hyperglycemia, were reported to be related to HCC recurrence after RFA (7,8).

Despite the established role of alfa fetoprotein (AFP) in HCC diagnosis, it is of low significant value in prediction of HCC recurrence (9,10).

Aspartate aminotransferase (AST)-to-platelet ratio index (APRI) is a simple and feasible test validated in assessing the stage of fibrosis and in predicting prognosis for patients with chronic hepatitis (11,12). APRI shows reliable discriminative ability for predicting not only overall survival of HCC patients, but also tumor recurrence (13). APRI was also found to be a prognostic biomarker in small HCC patients after RFA therapy and surgical resection (14,15).

Some studies demonstrated that background liver inflammation and fibrosis play important roles both in the process of hepatocarcinogenesis and in recurrence after resection surgery (16,17). Moreover, there are increasing evidences that the presence of systemic inflammation correlates with poorer cancer-specific survival in certain cancers (18-20). Various markers of systemic inflammatory response, including cytokines, C-reactive protein (CRP), and absolute blood neutrophil or lymphocyte count as well as their ratio such as neutrophil-to-lymphocyte ratio (NLR) have been investigated for their prognostic roles in certain cancer populations (21,22). Patients with elevated NLR have a relative lymphocytopenia and neutrophilic leucocytosis which denote that the balance is tipped in favor of protumor inflammatory response and is associated with poor oncologic outcome (23). Significant elevation of NLR increases the risk of HCC recurrence and recipient death in patients undergoing transplantation for HCC (24). Several studies indicate that serum AFP level, AST level, AST-to-alanine aminotransferase (ALT) ratio, APRI and NLR have been associated with HCC recurrence and poor survival (11,12,25-27).

We conducted this study to compare the value of NLR and APRI for prediction of post RFA recurrence of HCC.

### **Patients and Methods:-**

This retrospective study had been carried out in Internal Medicine Department, Gastroenterology Unit, Faculty of Medicine, Zagazig University, from Aug. 2014 to Aug. 2016. All procedures performed were in accordance with the ethical standards of the institutional research committee and with the Helsinki Declaration and its later amendments.

**Inclusion criteria :** Patients with single focal lesion  $\leq 5$  cm or up to three lesions each  $\leq 3$  cm of HCC who received curative RFA.

**Exclusion criteria** included portal vein thrombosis, extra hepatic metastasis, class C liver cirrhosis (according to Child-Turcotte-Pugh score) (28,29). Also, we excluded patients with hematological disorders, active infection, heart failure, renal impairment (serum creatinine  $> 1.5$  mg/dl), pregnancy or history of drug abuse or ongoing chemotherapy intake and those who lost follow up.

Out of 50 HCC patients who underwent curative RFA, 42 patients who met our inclusion and exclusion criteria were selected and enrolled in the study. The studied 42 patients were divided into two groups; group I (recurrence group) including 22 patients with post-ablation recurrence of HCC, and group II (recurrence free group) including 20 patients without recurrence. Diagnosis of recurrence was made by radiologic evidence using triphasic CT (TCT).

All studied patients underwent baseline (one month after curative RFA) clinical examination, imaging studies including chest x ray, pelviabdominal ultrasonography and TCT, as well as laboratory investigations including complete blood count (CBC), liver function tests, kidney function tests, coagulation profile and serum AFP level, in addition to calculation of APRI and NLR. All participants were subjected to follow up reevaluation of AFP, APRI and NLR every 3 months for 2 years. And TCT every 6-12 months.

### **Statistical Analysis:-**

The quantitative variables were expressed as means  $\pm$  standard deviation (SD) and the categorical variables as count numbers and proportions. Statistical analysis was performed with SPSS package version 19 (SPSS Inc., Chicago, IL) using the suitable test e.g. ANOVA, chi square, Pearson's correlation and logistic regression analysis. The result was

considered significant if the  $P \leq 0.05$ . In order to test the predictive accuracy (sensitivity and specificity) of various markers in predicting tumor recurrence, we used receiver operating curve (ROC) statistics.

### Results:-

Table (1) showed comparison between group I and group II regarding demographic, clinical and laboratory parameters. There were significant differences between the two groups regarding the investigated tumor markers; APRI, NLR and AFP. HCC recurrence showed a significant positive correlation with each of AST, APRI, NLR and AFP, and a significant negative correlation with platelets count (table 2).

Using logistic regression analysis model, high NLR was the independent risk factor ( $p= 0.002$ ) for prediction of HCC recurrence (table 3). In order to test the predicting accuracy (sensitivity and specificity) of NLR in predicting tumor recurrence as compared to APRI and AFP, we used ROC curve statistics (table 4). NLR had the highest sensitivity and specificity (90.9 % and 85%) followed by AFP (86.4 % and 75%), and lastly by APRI (72.7% and 70%) (table 4, fig.1, fig. 2, fig. 3).

### Discussion:-

The burden of HCC has been increasing in Egypt with a doubling in the incidence rate in the past 10 years (30). Several studies investigated predictors for prognosis and survival for patients of HCC after RFA but only few studies investigated the predictors of tumor recurrence after radiofrequency (31,32).

This study was conducted for evaluation of the postoperative NLR and APRI as predictors of post RFA recurrence of HCC. Both markers were compared together and to AFP. The mean values of the investigated markers (APRI, NLR and AFP) were significantly higher in the recurrence group than in the recurrence free group ( $2.12 \pm 0.74$  versus  $1.49 \pm 1.12$ ,  $P=0.036$ ;  $2.37 \pm 0.82$  versus  $1.13 \pm 0.67$ ,  $P<0.001$  and  $6107 \pm 6655$  versus  $1300 \pm 4168$ ,  $P=0.008$ , respectively).

In the current study, five parameters (AST, PLT, APRI, NLR and AFP) showed significant correlation with HCC recurrence ( $P$  values were: 0.027, 0.032, 0.018,  $<0.001$  and 0.004, respectively).

In this study, APRI showed a significant positive correlation to HCC recurrence ( $r = 0.325$ ,  $P = 0.018$ ). Similarly, APRI was validated in several previous studies as a simple, noninvasive way to assess the degree of liver fibrosis in patients with chronic hepatitis B or C and also had a reliable discriminative ability for predicting overall survival and HCC recurrence (14,33,34).

In our study, NLR showed a highly significant positive correlation to HCC recurrence ( $r = 0.648$ ,  $P < 0.001$ ). By using logistic regression analysis model, the only independent risk factor for prediction of tumor recurrence among the above five parameters was NLR ( $P=0.002$ ).

It is widely accepted that inflammatory process plays a significant role in several stages of tumor development and progression. The tumor increases the inflammatory process, which in turn predisposes to tumor progression, via inhibition of apoptosis and promotion of angiogenesis (21,22). Wu and colleagues reported that hepatic inflammatory activity was associated with early HCC recurrence (16).

NLR, a biomarker of tumor inflammation and host immunity, was associated with increased mortality in cancer (35). In agreement with the results of our study Chen et al. (36), Dan et al. (37) and Tajiriet al. (38) reported that high postoperative NLR is associated with high recurrence rate of HCC after RFA.

The association between the high level of NLR and the increased numbers of HCC recurrence in our study and in previous studies may be attributed to the fact that host's immune response to tumors depends on lymphocytes, whereas patients with a large NLR have relative lymphocytopenia, which results in the attenuation of lymphocyte-mediated antitumor immune responses in these patients (36). Another explanation is that the patients with a large NLR usually have an enhanced neutrophil response, which could promote the production of pro-angiogenic factors,

including vascular endothelial growth factor, interleukin-8, and matrix metalloproteinase. These pro-angiogenic factors may promote tumor growth and recurrence (39).

The comparison between sensitivity and specificity of APRI, NLR and AFP in predicting tumor recurrence, in our study, using ROC curve statistics revealed that NLR attained the highest level of sensitivity and specificity (90.9 % and 85%) with Cut-off value (1.55) compared to AFP (86.4 % and 75%) and APRI (72.7% and 70%).

In contrary to our results, in their study on 98 post RFA HCC patients, *Chung et al.* (40) reported that APRI was significantly higher in the recurrence group than in the recurrence free group ( $2.3 \pm 1.8$  vs.  $1.3 \pm 1.4$ ,  $P=0.018$ ), while there was no significant difference between the two studied groups regarding NLR. The difference between our results and that of *Chung et al.* may be attributed to the different etiologic background of HCC as in our current study the main etiology of HCC was chronic HCV infection (77.3%) while in study of *Chung et al.*, the main etiology was chronic HBV infection (55.6%).

### Conclusion:-

From the aforementioned findings, we can speculate that NLR is more valuable than APRI in predicting HCC recurrence after RFA. NLR is a promising surrogate marker in predicting post RFA HCC recurrence. Further studies are needed to validate the clinical relevance of NLR in follow up of HCC patients.

#### Abstract

WDG formulation containing neem oil and metallic nanoparticles were prepared and evaluated for their efficacy against different pests nematode, fungus and cotton leaf worm. Various metallic nano particle like Ag and Cu alone and in combinations were tested for their efficacy against different pest. The process parameters and composition were optimized to get more improved formulation in terms of performance & other quality parameters such as Suspending ability, Dispersibility & Particle size, which affects performance of formulation during its application. The prepared formulation was tested against different pests like fungus, nematodes and further for antifeedant activity. S3 (mixture of Cu + Ag) provides highest 42% antifeedancy, 73% mortality in nematodes, and no fungal growth even after 48hrs. The present formulation S3 shows antifungal, nematocidal and antifeedant properties all in one activities in single formulation. The present S3 WDG formulations are safe and promising alternates to minimize the risk of dustiness, contamination.

#### Introduction:-

Pests have characteristics of damaging or harming agriculture through feeding on crops. Pests of different types either insects, fungus, nematodes infests variety of crops. These pests damage different parts of plant and are thus responsible for large loss in yield and also affect quality of crops. In order to protect crops from damage, pest management is a necessary tool. Different methods of pest control have been proposed by the investigators. For any pest control to be effective two important criteria are, improvement in quality of crop and crop protection.

To improve quality of crop, it is necessary to protect them from pests. Various synthetic pesticide formulations are used in agriculture against pests. But extensive use of these chemical pesticides has created environmental effects that are harmful to humans. These formulations are used for certain specific type of pest so user has to apply one or more different type of pesticide depending upon target pest. Because of such repetitive use of pesticide for different pests in crop protection, the problem associated with their use has become a major problem in recent years since there is issue of pesticide residue in most of the food commodities along with the soil. Pesticide residue accumulates in food, water and is toxic to human and environment (Lee et al; 2001). Harmful effects of synthetic pesticides are not limited to their toxicity alone, infact repetitive usage of pesticide has resulted in resistant pest, resistant pest are difficult to manage and required novel insecticide (Mecedo et al; 1997), which are bio botanical insecticide.

**Corresponding Author:- Smriti Kala.**

**Address:-** Institute of Pesticide Formulation Technology, Gurgaon.

Bio Botanical based pesticidal formulation can resolve above problem associated with synthetic pesticide since they are safe, biodegradable and non persistent in the nature.

Accordingly there is need for pesticide composition containing no chemical pesticide and possess wide range of activity in terms of pest control, which must be used against different pests. Neem oil commercially available is economical may be a safe alternative that can be used in place of synthetic pesticide. Neem itself has insecticidal, antifeedant (Shrivastava D.K. 2014) and also to some extent antifungal and nematocidal properties. The efficiency is not adequate, however neem oil has very superior antifeedant properties (Munetaka Ishida 1992). Whereas metallic nanoparticles

Having size range below 100nm are versatile agents with variety of properties (fungicidal, nematocidal) (Sahar M. Ouda 2014) because of high surface area the best part is that metallic nanoparticles used as antifungal and nematocidal agent are required in very low concentrations. i.e they are equally effective when used in small amount.

Keeping above facts in consideration, We have made efforts to develop a bio-botanical based WDG pesticide formulation with multifunctional activities like fungicidal, nematocidal, antifeedant and which will also decrease the load of pesticide in the environment by decreasing the number of sprays, replacing synthetic pesticide by bio-pesticide and at the same time to improve crop health along with enhancements of crop yield.

Water-dispersible granules (WG) are pesticide formulations that are almost free from dust and easy to handle in packing when compared to liquid formulation. They are used in a manner similar to the known water-dispersible powders (WP) (H.J. Niessen 1983). The WDG formulations are safe and promising alternative to WP formulations which have problem of dustiness, contamination and dilution.

WG formulations of pesticides are produced by different processes like Pan Granulation, Fluid-bed Spray Granulation and Extrusion (Knowles, 2008). The WDG were prepared by Extrusion process are easy to prepare also the process is industrial feasible. The formulations developed have been evaluated at laboratory scale.

## **Materials & Method:-**

### **Materials:-**

Neem oil, Silver Nitrate, Sodium borohydride and Lactose Monohydrate was obtained from Qualigens, Silica was obtained from Madhu silica pvt ltd, China Clay was obtained from IAC Minerals (Chennai, India), Wetting agent Sodium Naphthalene Sulphonate and Dispersing agent Lignin Sulphonate, Polycarboxylate were supplied by Albright & Wilson Ltd. (Mumbai, India),

### **Method:-**

#### **Preparation of Metallic Nanoparticles:-**

Metallic nano particles of silver and copper were prepared in laboratory by chemical reduction method using salts (Silver Nitrate and Copper sulphate pentahydrate) and reducing agent Sodium borohydride (Kandarp Mavani, 2013). PVP was used as capping agent for both salts. For copper nanoparticles Ascorbic acid was used as an antioxidant (LIU Qing-ming 2012). Prepared nanoparticles were characterized by Malvern Zetasizer.

#### **Preparation of WDG containing Metallic Nanoparticles and neem oil:-**

WDG was prepared by Extrusion method (D. Ian Wilson 2007) using laboratory mini screw extruder (Model-Caleva Mini Screw) fitted with screen of 1mm perforations. Neem oil and metallic nanoparticles were absorbed on silica; wetting and dispersing agents were added and mixed in mixer to get homogenous powder. Finally china clay was used as filler. Suitable amount of water was added to mixture and mixed properly with spatula. The final mixture was extruded in extruder to get granules. The extruded granules were dried in the oven. The composition of emulsion and WDG is given in Table 1

**Table 1:-** Composition of WDG.

Ingredients	% w/w
Neem oil	20
Metallic Nanoparticels (S1, S2 & S3)	5
Silica	30
Wetting Agent	5-10
Dispersing Agent	8-10
Lactose ( Dilutend)	20
China Clay (Dilutend)	q.s.
Total	100

Accordingly three samples were prepared **S1, S2 and S3**. Composition is same for all three samples only difference is **S1** contains Silver Nanoparticles, **S2** (Copper Nanoparticles) and **S3** (Copper nanoparticle + Silver Nanoparticles).

**Suspensibility Analysis:-**

Suspensibility (suspension stability) is the percent part of active ingredient suspended in a column of water after a given time period. Suspensibility of the WG formulations has significant role in the application of spray suspension. If the suspensibility is upto the mark, spray tank mixing requirement is less and homogeneity is maintained in the suspension. It ensures uniform distribution of active ingredient on the target area. The suspensibility of the samples was analyzed by method no. MT168 of CIPAC Handbook (CIPAC, 2007).

**Dispersibility Analysis:-**

Dispersibility is the percentage of active ingredient dispersed in water after stirring the suspension. The spray tank mixing requirement is minimum if the WG formulation has good dispersibility. The dispersibility is a major quality parameter of WG formulations. The dispersibility of the samples was analyzed by method no. MT174 of CIPAC Handbook (CIPAC, 2007).

**Particle Size Analysis:-**

The particle sizes of the samples were analyzed by particle size analyzer (Model- Malvern Master Sizer MS20) using distilled water as dispersant. The Suspensibility, Dispersibility & particle size shown in Table 3

**Bioefficacy Experiments:-**

The formulation developed was tested for antifungal, Nematicidal and Antifeedant activity. The formulation show remarkable activity against different types of pests.

**Antifungal Activity:-**

Antifungal activity was carried out according to food poisoning method (Siressha.O 2013) on fungus *Sclerotinia sclerotiorum* (SS). *Sclerotinia sclerotiorum* is a plant pathogenic fungus and can cause a disease called white mold. It infests wide range of vegetables. Potato dextrose Agar (PDA) was used as media. The dose was added into media. Fungus was allowed to grow on media in BOD at 25°C. The fungus growth was observed after 48h, 72h & 96h. After each time interval, fungus growth was recorded as radius of fungus growth, which is further compared with blank and control. The results are given in table 4

**Nematicidal Activity Test:-**

In vitro Nematicidal activity test was carried out on sample S1, S2 and S3. The root knot nematode *Meloidogyne graminicola* was tested on different sample concentrations. 500ul of nematode suspension containing 10 -15 nematodes count was treated with 500 ul of sample concentration. Mortality was observed after 24h, 48h and 96h. (Table 5 shows Nematodes count perml and No. of dead Nematodes at different time interval). % mortality is shown graphically in Graph 1.

**Antifeedancy Test:-**

Antifeedancy test was carried according leaf Disc no choice method (Jaipal Singh Choudhary 2014). The third instar larvae of *Spodoptera litura* was tested insect. It was allowed to feed on castor leaf. Third instar larvae of insects was starved for 24hrs. Castor leaf was properly washed with water and cut into uniform shape of equal diameter. 2% solution of WDG dispersed in distilled water was used. The different concentrations were sprayed on the leaves and

allow it to dry for 20s. Prestarved larvae were allowed to feed on treated leaf for 24h and 48h. Unconsumed area of leaf disc was recorded with leaf area meter. Larval mortality and pupal deformities was also recorded. The results are given in table 6

## Results and Discussion:-

### Suspensibility, Dispersibility and Particle size:-

The quality parameters Suspensibility, Dispersibility and Particle Size of three samples showed no remarkable difference when compared with each other. Sample S1 has highest suspensibility of 85% and Sample S3 has lowest Suspensibility 79%. Dispersibility of S1 is highest 88% and S3 has lowest 82%. The particle size corresponds to suspensibility. Higher the suspensibility lower is the particle size.

**Table 3:-** Suspensibility, Dispersibility and Particle Size of Samples

Sample Name	Suspensibility(%)	Dispersibility(%)	Particle size(microns)
S1	85	88	12
S2	82	86	10
S3	79	82	15

### Antifungal Activity:-

In sample S1 & S2 after 48hours growth has started, whereas no growth was observed in S3 till 96h. The blank at 48h has fungus growth of radius 4.1Cm which further reached to 8cm after 96h. Whereas in sample S1 after 96h has 4.2cm radius of fungus extended, 4.0cm in S2 and no growth in S3 compared to blank (8cm). S1 & S2 were showing almost same effect with negligible change. S3 can be considered best sample it showed no growth till 48h and even after 96h it has no fungus growth. *It can be because Sample S3 has mixture of nanoparticles suspension (Cu+Ag) which together suppressing fungal growth. Copper and silver nanoparticle both have their own antifungal properties as shown in S1&S2. when copper and silver Nanoparticle used in combination they show potential to suppress fungal growth.*

**Table 4:-** Antifungal activity in different samples

Time (hrs)	Blank	Sample(S1)	Sample(S2)	Sample(S3)
48	4.1	Growth started	Growth started	No Growth
72	6.3	3.4	3.2	Growth Started
96	8.0	4.2	4.0	0

### Nematicidal Activity:-

Nematicidal Activity of S3 was highest in 24h, 48h & 96h, Sample S1 has more mortality% as compared to S2 in 24h, 48h & 96h, whereas in blank the mortality % was only 10% in 96h and there was no mortality at 24h and 48h. The mortality in one nematode may be because of infirmity, so death of one single Nematode is considered negligible out of 10. Same trend is observed here also as was in case of antifungal activity here is also S3 has maximum mortality of 73% after 96h, the effect may be again attributed to mixture of nanoparticles used in combination in formulation which together enhancing the property.

**Graph 1:-** Showing % Mortality in Nematodes at different Time Intervals)**Antifeedancy Test:-**

Antifeedancy of S1 in 24h and 48h were 20% and 35% respectively and in S2 20% and 39% respectively and in S3 33% and 42% respectively, whereas in blank only 10% and 16% mortality was observed in 24h and 48h respectively. There is no significant difference in antifeedancy% in all three samples. All samples following almost same trend. Antifeedancy varies in  $39 \pm 5$  in 48h and in 24h S3 shows highest antifeedancy as compared to S1 and S2 with a difference of  $(33-20 = 13\%)$

**Table 6:-** Antifeedancy % of Samples

Sample	% Antifeedancy(24h)	% Antifeedancy (48h)
S1	20	35
S2	20	39
S3	33	42
Blank	10	16

**Conclusion:-**

All three samples have negligible changes in quality parameters suspensibility, Dispersibility and particle size. Suspensibility corresponds to particle size in all samples. As far as efficacy part is concerned all three samples have shown remarkable effect in antifungal activity and Nematicidal activity in comparison of blank. The antifeedancy of samples as compared to blank was not much significant. However when three samples compared to each other S3 was best among other two samples. It shows significant antifungal activity and has no fungal growth even after 48h and only 2.0 cm growth after 96h. S3 also show upto 73% mortality in nematodes population after 96h which was highest among all samples, also S3 provides heighest 42% antifeedancy after 48 hrs. Since S3 contains mxture of two nanopartcles (Cu+Ag) the two together attributes good performance in all activity. The prepared formulation shows antifungal, nematicidal and antifeedant properties so it can be said that there are multiple activities in single formulation.

Retroperitoneal descending colon injury,  
filling defect post rectal contrast

### Abstract

Penetrating trauma to the abdomen is an emergent and life-threatening event which needs immediate surgical attention. Moreover, retroperitoneal penetrating trauma is more challenging when managed based on clinical evaluation alone. We report a case of descending colon perforation due to a pellet gunshot wound. The patient had no clinical manifestations of colonic perforation, e.g. peritonitis. The diagnosis was based solely on the finding of a filling defect on delayed rectal contrast. No similar finding has been described in trauma setting.

Copy Right, IJAR, 2016., All rights reserved.

### Introduction:-

Penetrating trauma to the back or flank is associated with a lower likelihood of significant injury. However, these injuries can pose a problem because of the difficulty in evaluating the retroperitoneal organs with physical examination and focused assessment with sonography for trauma (FAST). Laparotomy in abdominal gunshot wound can be negative or non-therapeutic procedure in 15% to 25% of cases.<sup>1</sup>

Gunshot wounds most commonly injure the small bowel (50%), colon (40%), liver (30%), and abdominal vasculature (25%).<sup>2</sup>

To the best of our knowledge, we report the first case of a filling defect in post rectal contrast study after penetrating injury of posterior descending colon.

### Case report:-

A 19-years old man brought to the emergency department as a victim of pellet gunshot wound to the left flank from two meter distance, eight hours prior to the presentation. He was initially seen in a local hospital where he had a plain abdominal x-ray and referred to our hospital. He had no medical problem and was nonsmoker.

On examination: his vital signs were normal. Abdominal examination was unremarkable apart from a one cm entry wound in the left flank along the posterior axillary line with minimal tenderness at entry side (Figure 1). Bowel sounds were normal. Rest of physical examination was normal.

Laboratory investigation revealed WBCs of 23 k/ul and hemoglobin of 12.3 mg/dl. Abdominal X-ray showed a foreign body in the left flank area with free air around the left kidney (Figure 2). Abdominal computed tomography (CT) scan with IV and rectal contrast showed the foreign body in the left psoas muscle with a large amount of free air around the left kidney (Figure 3). There was no pneumoperitoneum. Delayed abdominal X-ray revealed a filling

defect in the descending colon (Figure 4). These findings were suggestive of colon perforation although clinically the patient had no signs of peritonitis.

The patient underwent exploratory laparotomy which revealed two perforations in posterior descending colon two cm apart with no gross spillage. Primary repair was done (Figure 5). Foreign body was removed from left psoas muscle (Figure 6). No other injuries were identified.

Hospital course was uneventful and the patient was discharged on 4<sup>th</sup> post-operative day.

Figure 4:-

Figure 5:-Figure 6:-

### Discussion:-

Next to the small bowel, the colon is the second most common organ to be injured in penetrating abdominal trauma. Colon perforation is a life-threatening condition that needs early recognition and intervention.<sup>1</sup> Moreover, penetrating trauma to the back and flanks is associated with increased risk of injuring the retroperitoneal structures including the ascending and descending colon.<sup>2,3</sup>

Given the higher kinetic energy associated with gunshot wounds, the incidence of injury and therefore laparotomy are significantly higher than with stab wounds. Clinical evaluation is the mainstay to establish the diagnosis of colon injuries despite the availability of advanced imaging. Signs of hemodynamic instability and peritoneal irritation including rebound tenderness and non-voluntary guarding are highly suggestive of intra-abdominal injury.<sup>4,5</sup> These signs, however, may not be present in retroperitoneal injuries due to the propensity of the retroperitoneal structures to exert tamponade effect and confine the bleeding even in severe injuries.<sup>6,7</sup>

In addition to clinical examination, diagnostic tools such plain abdominal x-ray, peritoneal lavage, ultrasound, CT scan and laparoscopy have been advocated for determining the need for laparotomy. Plain abdominal radiograph may show air under the diaphragm or retroperitoneal air collection depending on the site of perforation. Other findings in CT scan are inflammatory changes, extraluminal fluid collection, and thickening of bowel wall around the perforation site.<sup>4</sup>

In a stable patient, CT scan is reliable for excluding significant injuries and plan the management.<sup>8,9</sup> Recently, the necessity of rectal contrast has been questioned. As demonstrated by our case, delayed abdominal films after rectal contrast revealed a filling defect at site of gunshot injury which raised suspicion of colon perforation despite the absence of clinical signs. Ultimately, the surgeon must exercise good clinical judgment in determining the most appropriate course of action.

Hemodynamic instability after penetrating injury should almost always prompt immediate laparotomy. Selective non-operative management is a good approach in hemodynamically stable patients with penetrating injuries. Indeed, this approach is well established in stab wounds. It goes without saying that selective non-operative management of gunshot injuries mandates the presence of experienced trauma surgeons.<sup>10,11</sup>

The presence of retroperitoneal air should raise suspicion of a perforated retroperitoneal viscus in both blunt and penetrating abdominal trauma.<sup>12</sup> It is still difficult to find a study in current medical literature in which single imaging method is compared directly with laparotomy. However, delayed abdominal films post rectal contrast can be considered in hemodynamically stable patients in cases where diagnosis is still controversial.

**Conclusion:-**

As demonstrated by our case, the amount of air not explainable by a penetrating track may predict injury to the descending colon. The presence of filling defect due to bowel wall edema and hematoma in post rectal contrast study with delayed imaging helps in locating and establishing the diagnosis.

We recommend routine plain abdominal X-ray four to six hours post CT scan with rectal contrast in case of no leak in CT scan. In addition, prospective studies are needed in future to establish the importance of post rectal contrast imaging studies in trauma setting.

Cascode Current Mirror, IAFCCM,  
Negative feedback gain, two stage  
current mirror.

#### Abstract

Current mirror is the basic key element in VLSI design. To obtain high performance analog circuit application, the output impedance and accuracy are the most important parameter to determine the performance of the current mirror. A new current mirror is proposed in this paper to provide high accuracy and very high output impedance. To increase the output impedance and matching accuracy significantly a novel feedback gain is used. The new proposed current mirror also has output swing similar as the traditional two stage cascode current mirror.

*Copy Right, IJAR, 2016,. All rights reserved.*

#### Introduction:-

Due to the better performance the current mode approach [1] - [5] is gaining interest more and more. The decreasing power supply voltage of digital micro electronics makes it suitable for mixed mode application is the reason for using current mode circuit. The current mirror is used for biasing or loading elements in analog circuit design. The most important parameter used to determine the performance of current mirror are accuracy and output impedance. It can be used to find many researches that focus on these two points. To increase the output impedance the cascode current mirror [6] and the RGC current mirror [9] is used. IAFCCM [8] was proposed to increase the accuracy. To achieve higher output impedance, multi stage cascode mirror has been used, although its suffer from low output voltage swing. The output impedance of the two stage cascode current mirror is lower than the output impedance of RGC current mirror and the accuracy of the RGC current mirror is not good enough for high precision application.

The accuracy of IAFCCM is better than RGC current mirror and the output impedance of IAFCCM is equivalent to the RGC current mirror. A new high output impedance current mirror is proposed in the paper to improve the accuracy and the output impedance of the new current mirror, it is based on the RGC circuit. To increase the output impedance and matching accuracy significantly a novel feedback gain stage is used. The new current mirror is similar to the traditional two stage cascode current mirror, so the proposed current mirror is better than that of RGC and IAFCCM.

**Description of previous circuits and the new current mirror:-****Previous current mirror circuits:-****Fig. 1:- Traditional current mirror [1]****Fig 2:- Cascode current mirror [1]****Fig 3:- IAFCCM [1]**

The traditional current mirror is shown in fig.1. As the traditional current mirror's output impedance is not infinite, it will influence the output current  $I_{out}$  by the variation of the output node voltage  $V_{ds}$ . It is a drawback in the analog circuits. In fig.2 the cascode current mirror is shown. It has the matching accuracy [7] problem and it was proposed to improve the output impedance. In fig.3 the IAFCCM is shown. It was proposed to increase the output impedance,

output voltage swing and matching accuracy. IAFCCM improves lots of output voltage swing, but the output impedance is not high enough. Meanwhile the output node voltage influences the output current  $I_{out}$ .

**The proposed new current mirror circuit:-**

**Fig 4:-** The proposed current mirror [1]

The proposed new current mirror improves the new key parameters of the current mirror, the matching accuracy and output impedance. The fig.4 shows the schematic diagram of the proposed new current mirror. Here are some MOS transistors such as M0, M2, M10 are used as a two stage cascode current mirror and some MOS transistors such as M1, M6, M9, M7 and M8 are used to improve the matching accuracy of the cascode current mirror. M3, M4 and M14 are the three novel negative feedback gain stages that can increase the output impedance of the current mirror significantly.

**Fig 5:-** The feedback circuit [1]

The feedback circuit of the current mirror is shown in fig.5 and the voltage gain of each gain stage is shown as A. The output impedance are out of the new proposed current mirror can be estimated by following.

$$V_1 = i \frac{1}{g_{d2}} \quad [1]$$

$$i = g_{m10} * (-|A|^3 - 1) * V_1 + g_{d10} * (V_0 - V_1)$$

[2]

$$\Rightarrow i * \left( 1 + \frac{g_{m10}}{g_{d2}} |A|^3 + \frac{g_{m10}}{g_{d2}} + \frac{g_{d10}}{g_{d2}} \right) = g_{d10} * V_0$$

$$\Rightarrow \frac{V_0}{i} = \left( 1 + \frac{g_{m10}}{g_{d2}} |A|^3 + \frac{g_{m10}}{g_{d2}} + \frac{g_{d10}}{g_{d2}} \right) \div g_{d10}$$

$$= \frac{gm_{10}}{gd_{10}} |A|^3 \frac{1}{gd_2} \quad [3]$$

$$R_0 = \frac{gm_{10}}{gd_{10}} \frac{1}{gd_2} |A|^3 \quad [4]$$

As shown in equation (4) where  $A \cong \frac{gm_i}{gd_i}$  ( $i=3, 4$  and  $14$  respectively), the proposed new current mirror has much larger  $R_{out}$  than that of the IAFCCM which has output impedance  $R_{out} = gm_{53} gm_{5k} \frac{1}{gd_{52}} \frac{1}{gd_{53}} \left[ \frac{1}{gd_{5k}} // \frac{1}{gd_{5c}} \right]$

Fig 6:- The I-V curve of the simulation result [1]

In fig.5 the voltage  $V_1$  is independent of  $V_0$ . When  $V_0$  and  $V_1$  are increased then the  $V_{ds14}$  is decreased due to the three gain stages. The negative feedback signal is created by connecting  $V_{ds14}$  to the gate of  $M_{10}$ . Therefore decrease in  $V_{ds14}$  decrease the  $V_1$ . Thus the negative feedback loop locks  $V_1$  so that a stable  $I_{out}$  is obtained. Now the proposed new current mirror has high output impedance.

For a good current mirror another factor is the matching accuracy [10] between  $I_{in}$  and  $I_{out}$ . The MOS transistors  $M_6$ ,  $M_7$ ,  $M_8$  and  $M_9$  are used to match the current  $I_{m1}$  and  $I_{m2}$  in the new proposed circuit and further make  $V_{Gs3} = V_{Gs1}$ . From  $V_{Gs1} = V_{Gs0} = V_{Ds0}$  and  $V_{Gs3} = V_{Ds2}$ , we can find  $V_{Ds2} = V_{Ds0}$  which results  $I_{in} = I_{out}$ . The proposed new current mirror has better matching accuracy than the IAFCCM and it is proved by the HSPICE simulation results.

### Simulation Results:-

The HSPICE simulation results are based upon  $0.35\mu\text{m}$  1P4M CMOS process which has a supply voltage of  $3.3\text{V}$  where,  $L = 1\mu\text{m}$  for all transistors except  $M_8$ ,  $M_9$  transistors for which  $L = 3\mu\text{m}$ .  $W = 20\mu\text{m}$  for  $M_0$ ,  $M_1$ ,  $M_2$ ,  $M_3$ ,  $M_6$ ,  $M_7$ ,  $M_{10}$  and

$W = 40\mu\text{m}$  for  $M_8$ ,  $M_9$  to ensure  $I_{out} = 100\mu\text{A}$

$W = 5\mu\text{m}$  for  $M_4$ ,  $M_{14}$

$W = 10\mu\text{m}$  for  $M_5$ ,  $M_{11}$

$W = 1\mu\text{m}$  for  $M_{12}$ ,  $M_{13}$

The I-V curve simulation result of the proposed new current mirror and IAFCCM is shown in fig.6. The I-V plot of the input current  $I_{in}$  is the lowest line. The top line is the I-V plot of IAFCCM, it shows that the output impedance is not that much high to avoid the influence of  $V_{ds}$  i.e. under the variation of the output voltage  $V_0$  the  $I_{out}$  will be changed. The I-V plot of the proposed circuit is the middle line and it indicates that the output impedance of the proposed circuit is higher than IAFCCM. In fig.6 the comparison results of the accuracy is shown. The proposed circuit has a matching accuracy better than IAFCCM when the input current  $I_{in} = 100\mu\text{A}$ .

**Table 1:-** The proposed CM performance comparison with IAFCCM [1]

Issue	The proposed circuit	IAFCCM
Mirroring error $I_{in}=5\mu A$	0.016%	0.036%
Mirroring error $I_{in}=10\mu A$	0.012%	0.03%
Mirroring error $I_{in}=100\mu A$	0.001%	0.019%
Mirroring error $I_{in}=200\mu A$	0.005%	0.015%
Mirroring error $I_{in}=300\mu A$	0.012%	0.014%
Mirroring error $I_{in}=400\mu A$	0.026%	0.013%
Rout	$\propto \frac{1}{gd} \left( \frac{gm}{gd} \right)^4$	$\propto \frac{1}{gd} \left( \frac{gm}{gd} \right)^2$

Table 1 shows the comparison result between the proposed circuit and IAFCCM under various input circuit. Input current changes from  $5\mu A$  to  $400\mu A$ . When the input current is lower than  $400\mu A$  due to the MOS transistor sizes of the proposed circuit are smaller than IAFCCM. But the output impedance  $R_{out}$  of the proposed new circuit is larger than that of the IAFCCM.

### Conclusion:-

A high output impedance and high accuracy current mirror is proposed and analyzed in this paper. According to the simulation results the accuracy and the output impedance of the proposed circuit is better than IAFCCM. The proposed current mirror is much suitable for using in high linearly, high output impedance current output stages and the operational amplifiers design.

### Abstract

Tuberculosis caused by Mycobacterium strains intracellular bacilli is a pernicious infection posing global menace to public health. It kills about 2 million people per year worldwide and has been declared as "Global emergency" by WHO. Nano particulate drug delivery systems are suitable for targeting chronic intracellular infections such as tuberculosis. Given the options for oral as well as parenteral therapy the very nature of the disease and its complex treatment urges one to emphasize on the oral route for controlled drug delivery. Treatment of drug susceptible TB continues for a period of 6 – 9 months, while Multi Drug Resistance TB requires rigorous treatment with second line anti-TB drugs that has many unacceptable systemic side effects. These arduous treatment regimens and lack of knowledge regarding the importance of completing the treatment course can cause non-adherence of patient to the medications that remains the most important reason for treatment failure. Targeted drug delivery in the form of nanoparticles holds significance in combating TB bacilli by prolonged and intracellular drug release. Pending are the discovery of more potent anti-tuberculosis drugs, nanotechnology based intermittent chemotherapy provides a novel and sound platform for an onslaught against tuberculosis. The current review discusses the traditional anti-TB drugs and the advantages of targeted delivery of nanoparticles over conventional treatment in terms of efficacy, reduced frequency of dosing, decreased duration of treatment regimens and reduced systemic toxicity.

### Introduction:-

"Tuberculosis, commonly known as TB, is a contagious and an often severe airborne disease caused by a bacterial infection. TB typically affects the lungs, but it also may affect any other organ of the body."<sup>[1]</sup> In spite of tremendous efforts to surmount the TB epidemic across the world, it remains to be one of the most horrendous threats for the global health communities. As per Global TB control report of 2012, Mycobacterium, causing infection is the culprit for 1.3 million people's death and 8.6 million new active infections. It has been estimated that 64% of TB incidents were reported to National TB Programs in 2013.<sup>[2]</sup> According to reports of WHO, TB is one of the three major

**Corresponding Author:-Madiha Nooreen.**

causes of deaths among females of age group 15 - 44 years and approximately 320000 women died due to TB in 2010. <sup>[3]</sup> Of 34,000 MDR patients enrolled on treatment in 2010, only 48% successfully completed treatment and 15% died. Among 795 XDR cases, mortality rate was approximately 50%. Only about 50% of detected cases in cohort study conducted in 2012 were successfully treated. <sup>[4]</sup>

Although the treatment of TB has been around for approximately 50 years but it remains to be the leading bacterial infection caused by Mycobacterium, which can produce either a silent, latent or active disease. A person's lifetime risk of active TB is 10% once infected by Mycobacterium bacilli, it becomes 4-16 times for patients with underlying immunosuppression (e.g.- Renal failure, cancer etc.) and it dreadfully becomes 100 times for HIV infected patients <sup>[5,6]</sup>

Treatment of drug susceptible, uncomplicated Tb typically requires minimum of 6 months. One of the major problems with such arduous and demanding regimen is poor medication compliance that can eventually lead to MDR-TB. Exhaustive undertakings have helped to resolve stumbling blocks of medication compliance, toxicity and frequency of dosing by targeting the site of infection via carrier based drug delivery system that can be important therapeutic approach for better health outcomes. In the era of nanotechnology, its most promising application is targeted drug delivery and nanoparticles forms kernel of nanomedicine. Owing to its nanoscale size and large surface to volume ratio, nanoparticles readily interact with biomolecules at cellular level, thus it can be potential diagnostic and therapeutic tool. Nanoparticles have been scrutinized for drug solubility, stabilization and targeted delivery. In uncomplicated TB, targeting lymph nodes has proved to be a propitious strategy. Nevertheless, so far diminutive evidence is available for determining its influence in drug-resistant TB. Even though developing new anti-TB drugs is of prime importance in an onslaught against intracellular bacilli, formulating anti-TB drugs in nanoparticle based drug delivery system appears to be a viable and effective alternative which not only reduces the duration of regimen, dosing frequency, systemic toxicity and drug interactions but also delivers the drug efficaciously and acts as silver lining in overcoming the blockades of the conventional orally administered drug regimens. Thus, eventually helps to improve patient compliance and completion rates, which has significant impact in preventing MDR-TB.

### Background:-

Nanoparticles as carriers of therapeutic agents in molecular targeted therapy and better diagnostic imaging are emerging as neoteric and promising platform in nanomedicine as novel therapeutics. <sup>[7]</sup> The primary intent of nanoparticles is to control and manipulate bio macromolecular constructs and supramolecular assemblies that plays a vital role to in improving the quality of human health. The advent of Nano therapeutics/ diagnostics will allow a profound understanding of both the diseases that have been a threat for human lives since ancient times and treatment to improve the human quality of life. Nanoparticles for the purpose of drug delivery can be defined as solid, submicron, colloidal particles that are of size 10-1000nm. <sup>[8]</sup> Because the diameter of smallest vessels in the human body is approx. 4micromts, the colloidal particles of >200nm are not pursued in nanomedicine. Based on their designing they are of two types:

- a) **Nanospheres:** (Matrix systems) monolithic nanoparticles in which drug is physically and uniformly dispersed throughout the polymeric matrix.
- b) **Nanocapsules:** (Vesicular systems) Nanoparticles in which the drug is concentrated in the core (hydrophilic/ hydrophobic) surrounded by a shell like wall or "capsule". <sup>[9]</sup>

### Polymeric nanoparticles:

Since the polymeric nanoparticles are more stable and have ease of surface modification, they are more heavily used in Nano therapeutics. <sup>[10]</sup> Nanoparticles have been made by a wide range of biocompatible and biodegradable Nano particulate substances for the sake of delivery of therapeutic compounds to their site of action. They can be made from both natural (e.g., gelatin, albumin) and synthetic (e.g., polylactides, polyalkylcyanoacylates). <sup>[11]</sup> The era 1960's and early 1970's has witnessed the birth of polymer microparticles by the use of acrylamide polymerization technique and since then different preformed polymers have been developed by using variety of polymerization methods. The most commonly used polymers now-a-days are listed below:

**Table 1: CARRIERS USED IN DRUG DELIVERY:**<sup>[12]</sup>

<b>NATURAL CARRIERS</b>	<b>SYNTHETIC CARRIERS</b>
<b>Proteins and polypeptides</b>	<b>Aliphatic polyesters and Hydroxy acids</b>
a. Albumin b. Fibrinogen/ fibrin c. Collagen d. Gelatin e. Casein	a. Polylactic acid b. Polyglycolic acid c. Poly (lactide-co-glycolide) d. Polyhydroxy butyric acid e. Polycaprolactone
<b>Polysaccharides</b>	<b>Polyanhydrides</b>
a. Alginic acid b. Starch c. Dextran/ Dextrin d. Hyaluronic acid e. Chitin f. Chitosan	Poly ortho esters
	Poly alkyl cyanoacrylate
	Polyamino acids
	Polyacrylamides
	Poly alkyl carbonates

**Drug release from nanoparticles:-**

Nanoparticles are surrounded by polymers through which the drug is released by either controlled diffusion or erosion from the core across the polymeric matrix. Although the rate of drug release is dependent upon the ability of the drug to dissolve and diffuse in the polymeric matrix but it is also affected by the ionic interactions between the drug and the auxiliary ingredients added, that results in the formation of a complex which is less water soluble that could cause slow drug release.<sup>[13]</sup>

**Drawbacks of conventional atd therapy:-**

Conventional ATD therapy is very effective; however, it does have its own downsides. Majority of TB cases reported are of pulmonary TB (more than 80%) that demands administration of high doses since only small fraction of the total dose given via oral route reaches the macrophages in the lungs. And this small fraction is cleared from the lungs within a short span of time thus requiring the administration of multiple ATDs regularly, a regimen to which not all the patients show good compliance. On top of that, the continuous increase in MDR TB incidences has to be addressed properly since the commonly used second line ATD are not only more costly and toxic but also has longer duration of regimens that contributes to patient non-compliance which is the cardinal reason for the development of MDR-TB.<sup>[14]</sup>

Figure1: Site of action of first line ATDs:<sup>[15]</sup>

Table2: First line agents of tuberculosis:<sup>[16,17]</sup>

DRUGS	MECHANISM OF ACTION	ACTS AGAINST
Isoniazid	Inhibiting the cell wall synthesis	Rapidly multiplying bacteria
Pyrazinamide	Inhibiting and depleting the membrane energy	Bacteria which can survive under acidic pH and has lower metabolic activity
Ethambutol	Inhibiting the cell wall synthesis	Rapidly multiplying bacteria and used against INH resistant strains
Rifampicin	Inhibiting the nucleic acid synthesis	Bacteria with spurts of metabolism, dormant stage followed by short and active span growth and metabolism

#### 4. Advantages of nanoparticle drug delivery over conventional atd therapy:

However, nanoparticle based drug delivery can be tailored to achieve sustained, controlled and targeted drug delivery, improve bioavailability, increased solubilization of drug.

It has been established by various studies that nanoparticle based drug delivery system has many advantages over the conventional therapy. Some of them are enumerated below:

1. The particle size and surface properties can be altered easily in order to target the drug by both mechanisms i.e., active and passive delivery
2. Controlled release and particle degradation can be readily manipulated by using appropriate matrix polymer
3. It can be administered by various routes such as oral, pulmonary, subcutaneous etc.

4. Improved bioavailability by enhancing water solubility
5. Increases the elimination half life of the drug
6. Targets the drug to specific locations in the body by binding the drug with specific ligands or by magnetic guidance.

This leads to reduction of dose and systemic toxicity, thus enabling the safe delivery of therapeutic agents to the target organ. <sup>[18]</sup>

**Table 3:** Properties of Anti TB drugs that can be improved with the use of proper drug delivery system: <sup>[12]</sup>

Anti- Tuberculosis Drugs	Properties
Rifampicin	Food interactions Drug-drug interactions
Ethambutol	Low shelf life
Streptomycin	Poor intestinal absorption
Metronidazole	Unpalatability
Danazol	Poor solubility in intestinal fluid
Azathioprine	Short duration of stay
Clotrimoxazole	Sub therapeutic levels in plasma

### Nanoparticles characteristics to be considered when used for drug delivery:

#### 1. Particle size:

With the particle size, one can determine the biological fate and the accuracy of target delivery of the system. It also influences other vital properties such as rate of drug release, stability, dose to be incorporated etc.

The size of the nanoparticles can be determined by two primary methods;

- a) Photon correlation spectroscopy
- b) Dynamic light scattering

Transmission electron spectroscopy (TES) and scanning electron spectroscopy (SEM) are then used to verify the results obtained. <sup>[18]</sup>

#### 2. Surface properties:

Once nanoparticles (surface non-modified/conventional) are in the blood stream, they are rapidly cleared and opsonized by the MPS (mononuclear phagocyte system). <sup>[19]</sup> Therefore, there is demanding need of coating the non-modified nanoparticles with polymer/ surfactants or formulating with the biodegradable polymers with hydrophilic properties.

Example: Polyethylene glycol (PEG), polyethylene oxide, polyoxamer, poloxamine and polysorbate 80 (Tween 80). <sup>[20]</sup>

It is important to determine the surface charge properties of the nanoparticles. The most common method is by using zeta potential. <sup>[21]</sup> The surface charge is greatly influenced by the medium of dispersion and composition of the particles. <sup>[22]</sup>

#### 3. Drug entrapment:

Drug loading/ entrapment primarily depends upon drug solubility with both the matrix and the excipients. <sup>[23]</sup> The macromolecules or proteins loaded within the nanoparticles has more loading efficacy when loaded at or near their isoelectric point (IP). <sup>[24]</sup> Studies have shown that in smaller molecules, the ionic interaction between the drug and the matrix can increase the drug loading. <sup>[13]</sup>

#### 4. Drug release:

In polymer coated nanoparticles, diffusion of the drug across the membrane is the rate limiting step. Ionic interactions influence the rate of drug release. Example; A poorly water soluble compound can be formed due to the

interaction between the drug and the excipient which will slow the rate of drug release. The rate of drug release can be increased by decreasing the interactions between drug and the matrix by adding the excipients like ethylene oxide-propylene oxide block copolymer (PEO-PPO) to chitosan.<sup>[25]</sup>

## 5. Target delivery:

This can be two types:

- ✓ Active delivery
- ✓ Passive delivery

**Active delivery** involves the release of encapsulated drug in the nanoparticle which is bonded to the carrier only when it comes in contact with the specific ligand or the tissue. Whereas in **passive delivery**, the drug encapsulated in the nanoparticles are passively released after it has reached the targeted organ.<sup>[26]</sup>

### Different delivery systems of ATDs:

1. Orally administered NP
  - ✓ Non-surface Functionalized
  - ✓ Surface Functionalized
- a. Inhalational NP
- b. Injectables NP
  - Intravenous
  - Subcutaneous
  - Intramuscular

#### a. Orally administered nanoparticles:

##### 1. Non-surface functionalized nanoparticles:

Panday et al. designed two therapeutic regimens and sub categorized each regimen into free drug or PLG based drugs.

The three first line Anti-TB drugs INH, RIF and PZA were encapsulated in PLG based NP (prepared by solvent evaporation and double emulsion technique). This experiment concluded promising results after only one therapeutic dose of ATD-loaded PLG nanoparticles was administered. The MIC of ethambutol, rifampicin, isoniazid / pyrazinamide was found in the blood even after 3,6 and 8 days respectively which is a remarkable discovery since free drug concentrations were undetectable only after 12 h of oral administration. The first line drugs of TB i.e., Isoniazid, Rifampicin and Pyrazinamide when encapsulated with PLG nanoparticles and administered via oral route in mice have shown propitious results. The drugs were detected in the blood circulation even after 4 days (for RIM) and 9 days (for INZ and PYZ) and duration of drug stay in tissues was about 9-10 days, while, for free drugs duration of drug stay was up to 24 hours. ATD-loaded nanoparticles have efficacy equal to 46 conventional doses when administered IV or IM in mice and guinea pigs respectively. When the ATD nanoparticles were given (5 oral doses every 10<sup>th</sup> day), it resulted in complete sterilization of infection. The study has not shown any hepatotoxicity. With 10 X and 150 X therapeutic doses, the time of drug stay for free drugs in the tissues was 24 h, while, it was 9-10 days for PLG encapsulated drugs. However, 150 X therapeutic dose of free drugs was found to be lethal.<sup>[27]</sup>

In another study, o-stearyl amylopectin was tagged to liposomal encapsulated INH and RIF and administered intravenously in Mtb infected mice. The tagging with o-stearyl amylopectin facilitates targeting the bronchial tissue. The bacterial load was cleared within 6 weeks when it was given once a week by using a quarter of their total therapeutic dose. This study also has shown no sign of hepatotoxicity.<sup>[28]</sup>

##### 2. Surface Functionalized Nanoparticles:

The bioadhesive properties of the PLG - NP greatly influence bioavailability of the encapsulated drug. The bioadhesive drug delivery system helps to improve/ enhance the bioavailability of the administered drug by increasing its residence time in the GIT, which in turn increases its contact time with gastric mucosal epithelium. Bioadhesion of drug carriers to the mucosal surface in the GIT is limited by the turnover time of the mucosal layer, which is approximately few hours for almost all of the mucosal surfaces. Polymeric carriers conjugated with specific

cytoadhesive ligands that can undergo reversible and non-covalent binding with the gastric epithelial surface by receptor mediated interactions.<sup>[29]</sup>

**Figure 2:-** Surface functionalized encapsulated nanoparticles for the specific surface markers on the alveolar macrophages<sup>[30]</sup>

The role of Lectins as mucoadhesives has been exploited because of their biorecognition interactions with the glycosylated structures and their ability of resistant to proteolytic degradation. Lectins mediate:<sup>[31]</sup>

- ✓ Mucoadhesion
- ✓ Cytoadhesion
- ✓ Cytoinvasion of drugs

Lectins are structurally diverse group of proteins, which can be found in varied organisms such as viruses, plants and humans. Wheat germ agglutinin (WGA) has been preferably used in the drug delivery because of it is one of the least immunogenic lectins and also its receptor can be found on both gastric and alveolar epithelia. WGA functionalized poly (lactide-co-glycolide) nanoparticles based formulations of ATD of size 350- 400 nm showed dramatic improvement in the sustained released property. INZ and RIF was present in the plasma for 13 days and PYZ for 7 days and were detectable in tissues for up to 15 days well above their MIC. Three doses given for 15 days were as efficient as 45 doses of free drugs administered orally and Mycobacterium cfu was almost cleared following administration of 5 doses every 10th day. This study has reported that WGA functionalized PLG NP loaded with ATD results in enhanced bioavailability, decreased dosing frequency and duration of regimen which ultimately affects patient compliance because of cost effectiveness for a full course (1\$ vs 17\$ mg/kg) in guinea pigs.<sup>[29]</sup>

**b. INHALATIONAL NANOPARTICLES (Pulmonary route):-**Pulmonary route is the novel approach in delivering the ATDs directly and thus provides a more efficient platform in combating pulmonary TB.

**Potential advantages of pulmonary route:**<sup>[32,33]</sup>

- Administration of drug directly to the bronchial tissue.
- Less dose is required.
- Reduced dosing frequency
- Since the rest of the body is not exposed to the action of drug administered, the incidences of systemic side effects decreases.
- Onset of action is fast.
- Bioavailability is relatively high.
- Better mucosal adherence.
- Bypasses first pass metabolism.

**Disadvantages of Pulmonary route:**<sup>[32,33]</sup>

- Administration of drug requires specific device
- Supervision is required
- Administration of drug involves technique.

Because alveolar macrophages are known to be the pivotal abode of Mycobacterium tuberculosis, there have been renewed interests in targeting these cells. Phagocytic cells have relatively selective ability for cellular uptake of NP

which makes them easier targets for nanoparticle encapsulated ATDs. INH, RIF and PYZ were formulated in PLG based co-encapsulated nanoparticles and were administered to experimentally infected guinea pigs animal models via aerosol route. The mass median aerodynamic diameter was about 1.88 micrometers which is favorable for deep bronchial delivery. A single nebulization was enough to maintain therapeutic concentrations in plasma for approx. 6-9 days and in lungs for 9-11 days. There was drastic improvement in other properties as, such as, plasma elimination half-life, mean residence time and absolute bioavailability compared with the unconjugated or unbound drug. Further, 5 nebulized doses given on every 10<sup>th</sup> day resulted in undetected cfu which is equiefficient to 46 conventional oral doses.<sup>[34]</sup> This study has broadened the horizon for co-administering multiple ATD that has helped to substantially improve the therapeutic response.

- ✦ **Sung JC et al.**, formulated RIF for aerosol delivery in a dry powder 'porous nanoparticle-aggregate particle'(PNAP) form by solvent evaporation process and spray dried in PNAP, which has shelf stability, effective dispersibility and extended release in lungs and systemic drug delivery. The spray dried RIF administered to guinea pigs by intrathecal insufflation revealed that pulmonary drug levels was maintained for 8 hours and systemic drug levels were obtained within 6-8 hours.<sup>[35]</sup>
- ✦ In another study, RIF poly (lactic-co-glycolic acid) PLGA nanoparticles (RIF/PLGA nanoparticles) were formulated in mannitol microspheres. It was then administered in rats using four-fluid nozzle spray dryer in one step. In vivo studies have concluded that RIF's uptake for RIF/PLGA/MAN microspheres was higher, approx. 4% at 1 hr. of administration that has further increased to 9.3% at 4 hour; in contrast to uptake of RIF from RIF/PLGA microspheres which was relatively smaller.<sup>[36]</sup>
- ✦ Lectin receptors are quiet extensively distributed in the respiratory tract so the chemotherapeutic potential of lectin functionalized PLG-NP was assessed as well. Nebulization of Lectin functionalized PLG-NP to guinea pigs, resulted in maintenance of therapeutic drug concentrations in plasma for 6-10 days and in organs for 15 days. Various experimental studies has shown that 46 conventional doses can be reduced to 5 nebulized doses of PLG – NP, that can be further reduced to only 3 lectin based PLGNP<sup>[37]</sup>

### C. Injectable nanoparticles:

Different routes by which ATD – NP can be injected includes:

1. Intravenous
2. Subcutaneous
3. Intramuscular

Compared to conventionally administered ATD of 35 oral doses, when the infected mice were given only a single injection of drug loaded PLG-NP via subcutaneous route, it showed not only remarkable sustained drug levels in the plasma for about 32 days and in the organs (lungs/spleen) for about 36 days but also better efficacy by completing eliminating the Mycobacterial bacilli from the organs. At the site of injection, the nanoparticles form drug depot from which the drug is slowly released into the blood circulation.<sup>[38]</sup> Poly (butyl cyanoacrylate) nanoparticles loaded with INH and streptomycin showed elevated accumulation levels in the cultivated human blood monocytes. Thus, resulted in enhanced activity against intracellular M. tuberculosis bacilli. Similar results were shown by the encapsulated ciprofloxacin and RMP in the infected macrophages. However, previous in vitro studies has concluded that increased intracellular drug accumulation levels rarely, simultaneously increases the activity of the drugs against intracellular bacteria compared to the extracellular bacterial population.<sup>[39]</sup>

**Table 4:-** Techniques involved in preparation of PLGbased nanoparticles<sup>[12]</sup>

TECHNIQUES INVOLVED	MERITS/DEMERITS
Emulsion / evaporation	Poor entrapment of hydrophilic drugs
Double Emulsion / evaporation	Good entrapment of both hydrophilic and hydrophobic drugs
Salting out	Long purification method
Emulsification diffusion	Rapid technique
Solvent displacement / non precipitation	Hydrophilic drugs has poor entrapment
Emulsification-diffusion-evaporation	Size and shape of the nanoparticles are better controlled

### TOXICITY EVALUATION OF PLG NANOPARTICLES BASED ATDs:

The toxicity studies include single dose toxicity (or acute toxicity that determines median lethal dose LD<sub>50</sub> I.e., the single dose produces 50% mortality of animals within 14 days), and multiple dose toxicity which further includes sub-acute toxicity for 28 days and chronic toxicity for 90 days.

**Panday et al.**, reported detailed toxicological and chemotherapeutic evaluation of INH, RIF, PYZ and EMB loaded PLG- NP. The single dose administration of PLG based nanoparticles not only didn't show any sign of adverse effects but also when they were administered several times higher than the recommended therapeutic dose, showed similar results. On the other hand, conventional free drugs were lethal when given at equivalent higher doses. The acute and chronic toxicity studies conducted based on survival, gross pathology, histopathology, blood biochemistry and hematology observed no evidence of toxicity for the PLG-NP based ATDs.<sup>[40]</sup> The remarkably positive safety profile put forth by the above study provides a solid foundation for the researchers to scrutinize it further for oral administration and in higher animal models like guinea pigs.

### Mdr tuberculosis and nanoparticle technology:

The above studies are done in relation to the drug susceptible TB, however they are significantly relevant in paving the way for surmounting not only the drug susceptible TB but also the horrendous MDR-TB. The outstanding results of nanoparticles based ATD of improved bioavailability, sustained and targeted (intracellular) drug delivery and improved pharmacokinetic profiles has provided renewed approach against *Mycobacterium bacilli* as it directly affects the treatment duration, frequency of administration and pill burden. Since the researchers around the world have failed to categorize or put forth any anti-tuberculosis drug as the first line agent against MDR-TB, the most immediate and reliable approach is to treat the drug susceptible TB efficiently. However, the patient compliance and proper infection control are the two cardinal factors that effects the treatment of drug susceptible TB which can be improved by reducing the duration of regimen, frequency, pill burden, increased bioavailability, sustained therapeutic concentrations in the targeted tissues. Nanoparticles, being a cost effective alternative for lengthy and arduous regimens has potential to play significant role especially in the underdeveloped and developing countries and for the people below the poverty line who are more prone for the infection owing to their poor hygienic environments. According to WHO reports, these countries carry the burden with rates of 20 times higher than that of developed countries. The load of developing MDR TB can also be attributed to the lack of required diagnostic tools, proper health care and health care professionals. Above all, it is the financial condition of patients that is prime culprit that limits even the necessary education and transportation. These situations are ideal for the MDR TB to thrive and for the nanoparticles to unleash its possibilities. As there are no front line agents for MDR TB or XDR TB, nanotechnology can be applied to many second line agents as well. For MDR TB, the resistance profiles can vary. Recent studies have provided evidence that high dosage levels of first line ATDs, like high doses of INH can overcome the MDR TB. One of the hurdles that prevents its clinical practice is that it is irrational to believe that the regimen for which the patient developed DR TB will be successful and will have compliance for the increased regimen of the same. This is where the nanoparticle fits into the baffling puzzle against the DR TB, since, nanoparticle drug delivery of INH reduces the regimen while simultaneously increasing the therapeutic dosage levels. In ideal conditions it is unacceptable to increase the dose of the drugs for combating the infection, however, in resource constrained settings it is the only viable option that could be lifesaving not just for the patient but also for the community as a whole by reducing the epidemic.

### Barriers to overcome:

Despite being a feasible alternative, there are a number of barriers that has prevented the nanoparticles based ATDs to enter into the human trials.

**Table 5:-Barriers to overcome:**

|--|

Effective pulmonary administration of drugs (insufflation and nebulization). In the large scale production of ATD based NP using synthetic polymers, removing the residual organic solvents is a limitation. It can be addressed by using temperature controlled vacuum drying, which will increase the production cost. Using a natural polymer like

alginate can be an affordable alternative. As in animal models certain pivotal issues have not been solved to mimic the human diseases and drug therapies, the technology has not entered the clinical trials. To maintain the batch-batch consistency of nanoparticles loaded drug, efficient quality control measures are required. PLG should be stored at low temperatures; hence the rigorous stability studies are required to evaluate the shelf life of the formulations. It becomes an obstacle in rural areas of developing countries with poor storage conditions. The sustained delivery of different formulations in animal models is not the representative of dosing schedule in human subjects, which can be commented upon once the clinical trials in human subjects have been done.<sup>[13]</sup>

### **Future prospects:**

The emergence of the MDR TB and XDR TB has posed an urgent threat globally that needs to be addressed effectively. As the researchers around the world has failed to propose first line drugs in MDR TB, it is the call of the hour to explore alternative and feasible strategies. Although the continuous efforts to discover new anti-TB drugs and to evaluate their efficacy and safety should be the priority, however, eradicating TB requires the new drug delivery systems as well. Animal studies of nanoparticle technology has given a new ray of hope to fight this trending global health threat. Due to the obstacles mentioned above, nanoparticle based ATDs have not entered the human trials. Studies should be directed towards overcoming these barriers and evaluating the performance of this novel delivery system in human trials.

### **Conclusion:**

The limitations with the conventional oral chemotherapy such as difficulty in targeting the MDR TB and latent bacteria, toxicity of second line agents and uncertainty of bacterial resistance development has pushed the researchers to explore alternative therapeutic strategies. This is where Nanotechnology fits in the 'puzzle' of combating TB epidemic.

Nanoparticle technology has proved to be most effective to enhance the therapeutic efficacy of first line ATDs among several carriers based controlled drug delivery systems. It can be administered by oral, pulmonary, intravenous, subcutaneous and intramuscular routes. It provides sustained targeted drug delivery which has the potential to reduce the frequency of drug administration and duration of treatment. Additionally, it increases the drug bioavailability and the therapeutic efficacy can be maintained even at sub-therapeutic dose levels. These favorable features eventually facilitate to improve the completion rates as it reduces the cost burden on the patients and on health infrastructure, making the DOT therapies more affordable. With respect to MDR TB Nanoparticle based chemotherapeutic drugs having advantages of improving patient adherence, reducing pill burden, and shortening duration of regimen has the potential to increase the completion rates, thus preventing an individual to progress towards MDR TB. Thus, the tremendous potential of nanoparticle technology in eradicating TB should not be understated. The performance of these neoteric modalities in human subjects is yet to be assessed and analyzed to evaluate their effectiveness in eliminating and controlling TB.

#### Abstract

The study aims at isolation, identification and preservation of rhizobia isolated from wild legumes and further to test their ability to fix nitrogen with their homologous crop legumes.

A field survey was carried out in Gezira State and Shendi area for the purpose of collecting samples of wild legumes for isolation and identification of their associated rhizobia. *Rhizobium* strains were isolated using YEMA media and presumptive test were carried out. Seedlings of some leguminous plants representing the main cross-inoculation groups were inoculated with isolates from the wild legumes.

The result showed that all collected wild legumes were found to bear nodules on their roots. Some isolates were found to be fast-growing and acid producing rhizobia while others were found to be slow-growing and alkaline. The cross inoculation classification of the isolates showed that isolates from *Phaseolus trilobus* plants can be grouped with *Rhizobium leguminosarum* bv. *Viciae* and *Rhizobium* spp. Isolates from *Sesbania sesban* and *Indigofera articulata* can be grouped with *Rhizobium leguminosarum* bv. *Viciae*, *Rhizobium leguminosarum* bv. *Phaseoli* and *Rhizobium* spp.

None of the isolates can be grouped with *Rhizobium leguminosarum* bv. *Trifoleae*, *Bradyrhizobium lupinus* or *Bradyrhizobium japonicum*. It was also noticed that all isolates formed nodules on roots of *Vigna unguiculata* and they are belonging to the miscellaneous cowpea group.

All of the RAPD primers gave amplification products and they were all reproducible. The most relative isolates were SH1 and ENRRI23 with 73% similarity; while the most distant were ENRRI21 and TAL380 with similarity percentage of 26%.

#### Introduction:-

Wild legumes (herb or tree) are widely distributed in arid regions and actively contributed to soil fertility in these environments. These legumes in arid regions are subject to severe environmental conditions. They have a great variation in nodulation and nitrogen fixation in respect to site and locality. N<sub>2</sub> fixing activity and tolerance to drastic conditions may be higher in wild legumes than in crop legumes. Oref.

A great deal of *Rhizobium* research has been traditionally devoted to cultivated species, for which the rhizobial microsymbionts have been thoroughly characterized and described (Thies et al., 2001). In contrast, little attention has been dedicated to the root-nodule symbionts of truly wild legumes intended as those whose ecology is for the most part independent of human action or carry-over. Although there have been some surveys of 'wild' rhizobia, there has been little systematic comparison of the symbionts of wild and cultivated legumes, nor between populations in cultivated and uncultivated soils (Mutch, et al., 2004).

The rhizobia from wild legumes are expected to be adapted to environmental conditions like their symbiont plants. Accordingly, these rhizobia can serve as adaptive inoculant rhizobia if they prove to be highly effective in nitrogen fixation with their homologous crop legumes).

The diversity of rhizobia in a particular soil may be influenced by the method of its isolation. Several arrays of techniques are used for detecting and describing rhizobial diversity. These are host range, comparative growth in culture, intrinsic antibiotic resistance, tolerance in pH, and salt. These are among the most common methods that are considered as phenotypic characters and are used primarily to study rhizobial diversity (Maatallaah et al., 2002). The size, shape, color and).

Modern molecular tools which are more preferred to phenotypic methods can also be used to evaluate the specificity of the strains (Thies et al., 2001). Some of these molecular tools employed for rhizobial diversity identification includes: plasmid profiling (Broughton et al., 1987), restriction fragment length polymorphism (RFLP) (Odee et al., 2002), polymerase chain reaction based techniques (PCR) (Richardson et al., 1998).

### Materials and Methods:-

The study was conducted in the Faculty of Science and Technology, Shendi University, Sudan. Five *Rhizobium* strains were used throughout this study. Four strains were obtained from The Biofertilization Department, Environmental, Natural Resources and Desertification Research, Institute Khartoum, Sudan. The 5<sup>th</sup> strain (Shendi S1) was isolated from *Sesabania* plant grown in Shendi. The source and classification of *Rhizobium* and *Bradyrhizobium* strains is shown in table (1).

### Morphological Characteristics:-

The morphological characteristics of the isolates were determined according to Lupwayi and Haque (1994). A loopful of rhizobial isolates from 48 hrs old broth culture was inoculated by streak plating onto YEM Agar and incubated at  $28 \pm 2^\circ\text{C}$  for 3-5 days. After 5 days, colony diameter and morphology, colony texture were recorded.

**Gram Staining** The gram staining technique and motility test were done according to Benson (1994). **Biochemical and Physiological characteristics** The biochemical and Physiological tests were carried out in growth medium at  $28^\circ\text{C}$  for 48 hours incubation. All the tests were carried out with three replicates.

**Acid-base production** To determine the ability of the rhizobial isolates to produce acid or alkaline in the medium, YEMA containing bromothymol blue (0.025 w/v) was used. After the incubation of 72 h at  $28 \pm 10^\circ\text{C}$ , the pH changes was scored on the basis of color change of the medium (Chen and Lee, 2001).

**Oxidase test** A few drops of freshly prepared oxidase reagent was added on a piece of filtered paper in a clean Petri plate. Using a glass rod, a colony of the isolate was smeared on the filter paper and the paper was observed for any change in the colors of the reagent (Benson, 1994).

**Catalase test** A thick growth of the test culture was immersed in 3ml of 3%  $\text{H}_2\text{O}_2$  solution with the help of a sterile glass rod. Active bubbling within a few seconds showed a positive catalase activity (Benson, 1994).

### Growth rate reaction:-

A measurement was done by using spectrophotometer to measure growth rate of bacteria for six days.

### Phosphorus Solubilization:-

A single colony of rhizobial strains was streaked on pikovskaia medium containing tricalcium phosphate (Pikovskaia et al., 1948) and incubated at  $28 \pm 1^\circ$  for 3-5 days. The plates were observed for clear P-zone formation around colonies.

**Inoculation test:-**

A pot experiment was carried out at the Faculty of Science and Technology, Shendi University to study the nodulation of crop legumes (Beans, Kidney peas, Lupin and Bake) by the strains isolated from wild legumes.

Six samples of each crop were replicated four times. Five out of the six samples were injected each with one specific inoculant (strains isolated from wild legumes), while the sixth sample being control. complete Randomized

Six seeds were sown per plastic bag. After the seedling had reached 10-15 cm in length they were thinned to 3 seedlings per bag. The bags were watered daily in order to maintain the moisture at approximately 75% of the field capacity.

Inoculation was done aseptically 10 days after sowing.

Five ml of the broth media were injected by a sterile disposable syringe.

At harvest, nodules number, nodules dry weight, Dry shoot and roots were measured.

**Molecular Characterization of Rhizobium:-****Genomic DNA Extraction:-**

DNA extraction from isolates was done according to the boiling centrifugation method reported by Miller (1972). A single colony was grown over night at 28°C in YEM broth. Bacterial cell were precipitated by a centrifugation at 13000 rpm for 10 minute in a micro-centrifuge (Sanyo). The supernatant was discarded and the pellets were resuspended in 500ml deionized water. The suspension was boiled for 10 minutes in a water bath and then immediately cooled on ice. Extracted DNA was then stored refrigerated until used.

**Agarose gel electrophoresis of the extracted DNA:-**

The extracted DNA was electrophoresed in 1.5% agarose gel [0.75g agarose dissolved in 50 ml of 1x TBE buffer (0.089 mol/L Tris-borate, and 0.002mM EDTA, pH 8.00). Then 2 µl of ethidium bromide (10 mg/ml) were added. Prior to casting the gel, the comb was adjusted and the gel was poured (making sure that there were no bubbles). While the gel was solidifying, DNA mixtures were prepared for electrophoresis as follows: 1 µl of each DNA sample was transferred to a clean Eppendorf tube and 3µl of loading dye (bromo phenol blue dye) was added to the DNA sample. The content was mixed several times using a micropipette. The comb was removed with gentle back and forth motion and the gel was then immersed in 1x TBE buffer. The buffer was added until it reached a level approximately 3-5 mm above the gel surface. The sample mixtures were loaded into the wells using plastic-tipped micropipettes. 1Kb ladder (Invitrogen) was used as a molecular weight marker. The apparatus (Habaib, U.K, 9H 310083) was closed and the power was turned on, the voltage was adjusted to 75V (400mA) and the running was continued without cooling for 20 minutes after which the gel was visualized under trans illumination cabinet (Model TM-10E, Uvitec. Product) and image was captured and photographed. Extracted DNA was then stored refrigerated until used as a template for PCR amplification.

**Polymerase chain reaction (PCR):-**

For genetic diversity studies four RAPD primers were used to amplify the genomic DNA. The primers were purchased from Gene link, Inc. and Operon Tech., NY 10532. These were 10 oligonucleotide OPC9 primer (CTCACCGTCC), OPY14 (GGTCGATCTG), opl 18 (ACCACCACC) and opr 10(CCAATCCA).

PCR amplification reactions were carried out in a total volume of 20 µl. Each PCR mixtures contained (Final concentration): 5X FIRE Pol PCR Master Mix (Ready to load), 5 X reaction buffer (0.4 M Tris-HCL, 0.1 M (NH<sub>4</sub>) SO<sub>4</sub>, 0.1% w/v Tween 20), 12.5 Mm dNTPs, 50 ng of the primer under test, 1 U Taq polymerase and 20 ng template DNA.

The amplification program used consisted of one cycle at 94°C for 5min, followed by 35 cycles of initial denaturation at 94°C for 1min, annealing at 32°C for 3min, extension at 72°C for 2 min and a final extension step at 72°C for 10 min.

**Results and Discussion:-**

Table 2 showed the growth rate of the rhizobial isolates tasted. Three of the 5 rhizobia under test performed fast growing rate in (3 – 5) days to form separate colonies these were *Crotalaria senegalesis*, *Desmodium dichotomm*

and *Clitorea ternata*. It was understood that the fast growing nodule bacteria belongs to the genus *Rhizobium* were the slow growing ones belong to the *Bradyrhizobium*. *Sesbania sesban* belongs to *Isorhizobium* although it is a slow growing bacteria.

Progress in bacteria growth rate was observed during the second day – fourth day, while deterioration observed at fifth and sixth days. It was reported that the fast growing rhizobia belongs to *Rhizobium* and the slow growing ones were *Bradyrhizobium* (Hiatt 1990).

Acid base production reaction (Bromothymol) *Crotalaria senegalensis*, *Desmodium dichotomum* and *Clitoria ternata* changed the growth medium to acidic one were as the other two changed the medium to alkaline one (table 2). It was reported by many research workers the acid producing root nodule bacteria were classified as *Rhizobium* and the alkali producing ones were *Bradyrhizobium*.

The acid producing *Rhizobium* changed the color of the growing medium when Bromothymole blue added to the broth culture to yellow color producing acids. The alkaline producing *Bradyrhizobium* changed the color of the medium from blue to dark blue (Jordan, 1984)

Table (3) showed the some biochemical tests of the collected strain from wild legumes.

All the strains were found to be gram negative, catalase positive and solubilize phosphorus except strain SHS<sub>1</sub>, which was isolated from *Sesbania sesban* which did not solubilize phosphorus.

#### Inoculation test:-

As shown in Table (4) cross inoculation of legumes by the strains isolated from wild legumes it was clear that *Vicia faba* formed nodules by most of the strains, *Phaseolus vulgaris* only formed nodules by strain SHS<sub>1</sub> and non of the strains formed nodules in *Trifolium sp*. A previous study of *Rhizobium* isolates indicated that one isolate had the ability to nodulate both alfalfa and common bean (Eardly et al., 1985).

The presence of isolates from wild legumes cross-inoculating *Phaseolus vulgaris* is an important finding since it is known that this crop is poorly nodulated and rarely forms effective symbiosis with rhizobia (Herridge and Bergersen, 1988). Isolates from the wild legumes might serve as a solution for this problem and might prove to be effective in nitrogen fixation with *Phaseolus vulgaris*. This necessitates extensive research on the compatibility of isolates from wild legumes with leguminous crops and their ability to form effective symbiosis with their homologous crop.

The result of the experiment showed that some of the isolates belong to more than one cross-inoculation group. This finding reflects the weakness of the cross-inoculation classification of rhizobia which has been criticized by many researchers (Segovia et al; 1993). This entails that other systems of classification should be studied and adopted for the identification and classification of rhizobia.

#### Molecular Characterization of Rhizobium:-

The 9 isolates were amplified using 4 different Operon RAPD primers. The primers were: OPC9, OPL18, OPR10 and OPY14.

- All of the RAPD primers gave amplification products and they were all reproducible.
- A total of 141 fragments were detected for the 9 isolates representing 25 different loci with 100% polymorphism.
- 55.6% of the 9 isolates (ENRRI21, ENRRI22, USDA209, ENRRI2 and ENRRI8) didn't produce any amplification product with primer OPC9.
- Isolate 2 gave no product with primer OPL18.
- The Similarity indices were calculated using Jaccard's coefficient.
- The most relative isolates were SHS<sub>1</sub> and ENRRI23 with 73% similarity; while the most distant were ENRRI21 and TAL380 with similarity percentage of 26%.
- According to the similarity indices, the nine samples were grouped into three clusters each containing three isolates. Cluster 1 includes ENRRI23, SHS<sub>1</sub> AND ENRRI3; Cluster 2 contained ENRRI22, ENRRI2 and TAL380 while Cluster 3 includes ENRRI21, USDA209 and ENRRI8.

The results of PCR experiment are recorded in table 6 and depicted in figure number 8 as well. In figure 8 the uppermost cluster comprises the SH1, ENRRI3 and ENRRI23 isolates which are most genetically compatible. As the similarity reaches around 0.71 which gives rise to a far extent of genetic compatibility.

The RAPD technique was used to detect the compatibility between 9 isolates of rhizobia used in this study, which analysis clear the most relative isolates were SH1 and ENRRI23, this similarity could be attributed to compatible genetic characteristics. While the most distant were TAL380 and ENRRI21 which may be underlying to fewer shared genetic characteristics.

Carambola, jam making, preservation, shelf-life, nutritive value

#### Abstract

Making of jams is the common methods of preserving fruit, the main factor being high concentration of sugar that helps in preservation. Carambola is a sub-tropical fruit found in Indonesia, Malaysia, etc. In India the fruit is available in the months of September through October and January through February. The main health benefits of carambola are anti-inflammatory, analgesic, hypoglycemic, antimicrobial, hepatoprotective and anti-ulcer activity. Product development was carried out using carambola fruit. The jam was developed as a complete natural product with no added preservatives. Organoleptic properties of the product were assessed by sensory evaluation and the jam was found to be acceptable. Shelf-life study of the jam was carried out by microbial analysis and it was found that there was a decrease in the no. of microbial contaminants. Nutritive value of the product was also analyzed; the results obtained were Protein 0.88%, Fat 0.19%, Carbohydrates 44.89%, Energy 185 kcal, Dietary fiber 1.68%, Magnesium 156 mg and Vitamin C 5 mg per 100 gms.

#### Introduction:-

Food is something that is consumed not only for its varied taste but also for its nutritional importance. Food usually provides the humans with ample nutrients such as proteins, carbohydrates, fats, vitamins, minerals & energy. The sources of food are plants and animals, plant sources being the fruits & vegetables. As most of the fruits are seasonal and perishable in nature, its processing is a must. To ensure the supply of wholesome, safe, nutritious and acceptable food to the consumers, there should be processing of fruits into various products that could be preserved for a long time and which adds value to the product. Processing of fruits not only serves as a purpose of its preservation but also several other purposes such as diversification of the economy, reduction of imports and meeting export demands, stimulate agricultural production by obtaining marketable products, generate employment, reduce fruit & vegetable losses, develop new value added products which are also available during off-seasons (Bakshi & Joshi; 2013).

*Avverhoa Carambola* or commonly called as star fruit is a native fruit to Tropical Asia, Indonesia, Malaysia and other exotic regions such as Australia, Brazil, Cambodia etc. India's Carambola season is throughout the year; but it flourishes during two times i.e. September through October & January through February. It prefers warm climate and can be grown in India on the hills up to 1,200 m. In spite of its high availability, it is an underutilized fruit in the

Indian market. The fruit have a high water content and is a rich source of dietary fiber, Vitamin C, antioxidant phyto-nutrients such as polyphenols and flavonoids, B-complex vitamins such as folates, riboflavin, and pyridoxine. It also carry small amount of minerals and electrolytes like potassium, phosphorus, and zinc and iron (Ferrera, 2009).

Carambola has a potent antioxidant and antimicrobial activity. It boosts the immune system to fight against toxic free radicals and other common infections. The insoluble dietary fiber helps in digestion and also in lowering blood cholesterol. According to the studies carried out by Dasgupta et.al in 2013 on *Avverhoa carambola*, the plant is proved to possess medicinal properties such as anti-inflammatory, analgesic, hypoglycemic, antimicrobial, hepatoprotective and anti-ulcer activity and therefore the plant & its fruit can be used as a potent medicine.

Carambola fruits have a very high nutritive value but a sour taste which makes it unpopular. The availability of the fruit throughout the year makes it a good choice to be used for development of new products with an appealing taste. Attempts have been made to develop commercial products from carambola such as essence, juice and wine (Nagy et.al, 1990; Napahde et.al, 2010). The present study aims to develop jam using carambola and to study its quality, stability and nutritional properties.

## **Materials and Methods:-**

### **Product development:-**

*Avverhoa carambola* was purchased from the local market. Experimental trial jams were prepared using the fruit pulp, different concentrations of granulated sugar and commercial pectin. Plate test was performed to determine the setting point of jam as described by Khanna and Gupta, 1993.

### **Sensory evaluation:-**

The trial samples were subjected to sensory evaluation by 10 semi-trained panelists to determine the acceptability of the samples. The jam was evaluated on a 5 point hedonic scale where 1 is the lowest point and 5 is the highest point for that particular characteristic. The characteristics on which the jam was evaluated were appearance, color, taste, texture, mouth-feel, aftertaste and overall acceptability (Lawless and Haymenn, 1999).

### **Nutritional analysis:-**

Nutritional analysis of the jam was carried out at Anazeal Analyticals & Research Pvt. Ltd. Labs. The overall content of proteins, fats, carbohydrates, energy, dietary fiber, calcium, phosphorus, potassium, magnesium, Vitamin C provided per 100 gm of jam sample was determined (Pathak and Chakraborty, 2006).

### **Shelf life and Stability studies:-**

A microbial challenge study was carried out by growth inhibition method on jam samples to evaluate the stability and safety of a product with respect to food borne pathogens and spoilage-causing microorganisms. The samples were challenged by inoculating them with common spoilage organisms and food-borne pathogens i.e. *Escherichia coli*, *Staphylococcus aureus*, *Bacillus cereus* and *Saccharomyces cerevisiae* individually and incubated at 28°C for 20 days (US FDA, 2009)

At different time intervals aliquots were obtained from these samples, adequately diluted and plated on selective media and incubated for growth of the contaminants. Nutrient agar, MacConkey's agar, Baird parker's agar and Sabourad's agar were used for enumeration of *Bacillus cereus*, *Escherichia coli*, *Staphylococcus aureus* and *Saccharomyces cerevisiae*, respectively.

Viable counts were determined at zero time, after 5 days, 10 days, 15 days and 20 days of storage of the samples at room temperature. Uninoculated controls were also maintained and total bacterial and mould counts were determined on Nutrient agar and Sabouraud's agar.

## **Results and Discussions:-**

### **Product Development:-**

The quality of jam is determined by the proportions of sugar and pectin added to the fruit pulp. Ideally jams contain 50-65% of sugars which gives the product a bright colour and natural stability. To optimize the sugar and pectin content in the final product, trial jams were developed using different variations as tabulated below (Table 1).

**Table 1:-** Optimization of sugar and pectin content

<b>Trials</b>	<b>Sugar Concentration %</b>	<b>Pectin Concentration %</b>
Trial 1	60	0
Trial 2	40	5
Trial 3	60	3
Trial 4	60	2
Trial 5	60	1

The production parameters, mainly the degree to which the pulp is homogenized and the time and temperature used for processing also affect drastically the quality of the jam produced, and this is well reflected in the sensory assessment of jams.

The product that was standardized was a pectin-free product as designed in trial 2. It constituted of pulp-125 gms and sugar- 75 gms and was processed for 25 minutes. At lesser concentrations the characteristic gel consistency is lost whereas higher sugar content cause crystallization in the jam. Jams with less sugar content were also susceptible to spoilage due to microbial fermentation and may need chemical preservatives (Sidappa and Lal; 1998).

The work carried out by Patil et al in 2010 has shown that the pectin content of mature fruits of carambola is very high (5 %). The jam formed using only pulp and sugar had a bright colour and smooth consistency which had set well as demonstrated by plate test. There was no need to add commercial pectin as the fruit itself was pectin-rich.

#### **Sensory Evaluation:-**

The sensory evaluation for the variations of the product showed that the jam with no pectin added was given the highest scores for all the parameters by the panelist. This was due to carambola having inherent pectin and therefore no commercial pectin was needed for a product with good consistency. Fig 1 gives the comparison of the mean scores obtained of the parameter studied for sensory evaluation for jams prepared with and without added commercial pectin.

Siddiqui et al in 2015 has used sapodilla for jam preparation. The source of pectin for this was the fruit peel. Sensory evaluation was carried out for the prepared jam and the consistency of the jam was approved. Commercial pectin was not required as the fruit peel was shown to possess gelling properties because of high pectin content. Fruit jams prepared without adding commercial pectin were found to be of acceptable quality if the fruit is rich in pectin.

**Fig.1:-** Comparison of acceptability for jam with and without added commercial pectin

**Nutritional analysis:-**

Table 2 gives the nutritive value of the jam as determined for 100 gm. According to these results, it can be stated that the product contains certain minerals, Vitamin C and is an abundant source of energy.

**Table 2:-** Nutritive value/100 gm

Nutrient	Nutrient value/100gm
Protein	0.88 %
Fat	0.19%
Carbohydrates	44.89%
Energy	185 kcal
Dietary fiber	1.68%
Calcium	0
Phosphorus – as P	0.08%
as P <sub>2</sub> O <sub>5</sub>	0.18%
Potassium	0.37%
Magnesium	156 mg
Vitamin C	5 mg

The pulp and seeds of quince fruit was used to prepare jam by Silva et al in 2004 and the antioxidant activity of the product as well as the raw pulp and seeds were studied. Their results showed that the product showed a very good activity which can be correlated to its Vitamin C content. A slight reduction in the activity was reported for the processed jams as compared to the raw pulp and seed.

**Shelf life and Stability testing:-**

Shelf-life study was carried out to check the keeping quality of the carambola jam. The primary reasons for the deterioration of the product are the micro-organisms, leading to change in the physical attributes and organoleptic properties of the product. The product standardized is a 100% natural jam with no added preservatives, with the ingredients only being carambola and sugar. Therefore, the only preserving factor in the jam is sugar. Caramola jam is an acid food, rich in carbohydrates, and is therefore vulnerable to the growth of microbial agents such as yeasts and molds. Therefore, shelf-life study of the standardized product was carried out by growth inhibition test for 20 days at an interval of 5 days with storage at room temperature. Before inoculating the challenge organisms, baseline level of microorganisms present in the product were determined as control. .

Control sample, without any inoculation of the challenge organisms showed product to be safe and of good quality microbiologically. The results obtained for challenged samples are mentioned in Table 3

**Table 3:-** Results of shelf life study.

No. of days	Inoculated Jam				Uninoculated Jam (Control)	
	<i>B.cereus</i> (cfu/gm)	<i>S.aureus</i> (cfu/gm)	<i>E.coli</i> (cfu/gm)	<i>S.cerevisiae</i> (cfu/gm)	Yeast (cfu/gm)	Bacteria (cfu/gm)
0	2* 10 <sup>3</sup>	2.5* 10 <sup>3</sup>	3* 10 <sup>3</sup>	1* 10 <sup>3</sup>	20	12
5	257	35	60	40	20	7
10	213	16	13	20	15	5
15	191	0	0	3	2	0
20	163	0	0	0	0	0

According to results obtained for the 20-day shelf life study, there is a decrease in the number of bacteria, yeasts and molds contaminants in the jam. The common spoilage causing micro-organisms which were used for shelf-life study were *Bacillus cereus* and *Saccharomyces cerevisiae*. The bottles in which micro-organisms were inoculated also showed a decreased gradation in the microbial population. This indicates that the sugar concentration in the jam i.e. 60% was enough for the inhibition of spoilage causing micro-organisms. At this concentration the microbial contaminants are not able to survive in the product and hence the product would not be spoiled quickly.

The studies carried out by Viberg et al in 1997 on blackcurrant jam prepared without chemical additives had shown that the jam can remain stable for a period of 13 months at low temperature. The sugar content of the jam was 23 %. Microbial analyses carried out at regular should no growth of bacteria, yeasts and molds, sporeformers and pathogens. The nutritional value and the minerals and vitamin content were found to be within the acceptable value. The colour, viscosity and appearance of the jam were stable.

### Conclusion:-

An acceptable product i.e. jam with the use of Carambola, an uncommon and underutilised fruit was formulated. This jam was developed as a 100% natural product with no added preservatives. The product was found to be acceptable based on the sensory evaluation using Hedonic-scale. It is also nutritious and beneficial for health serving as a good source of anti-oxidants, minerals and dietary fiber. It was found to have a stable product with a defined shelf-life. The sugar concentration added was enough to prevent the food contaminants like *B.cereus* and *S.cerevisiae* from growing and causing the deterioration of the product. Thus, a nutritious Carambola jam which was sensorily accepted with a good keeping quality was developed. Additionally, different products of carambola can be formulated like carambola juice, confectionary (candy) or marmalade.

#### Abstract

**Background:** Obesity is a common health problem and rapidly increasing among Saudi Arabians. There is no studies that aim at identifying the prevalence and the main risk factors of obesity in Arar city.

**Objective:** to determine the prevalence of obesity and overweight among Northern Saudis of both gender, aged 15 years or older and to study some of obesity related risk factors in that population.

**Methods:** A cross-sectional study was carried out during the period from 1, January 2016 to 29, April 2016. A total of 592 subjects attending 3 randomly selected primary healthcare centers in Arar city. Each participant was interviewed separately, and confidentiality was assured. Data were collected by means of personal interview with the sampled women using a predesigned questionnaire covering the needed data.

**Results:** The majority of participant in the study was a females 75% , and only 25 % were male. The overall prevalence of obesity was 35.3% and the overall prevalence of overweight was 27.2%. Obesity was found in 32.2% of females and 44.6% of males while 26.1% of females and 30.4% of males were overweight. (P value = 0.002). 13.8% of obese have history of childhood obesity, 56.8% had family history of obesity in 1st degree relatives and 25.7% of overweight and obese prefer the takeaway meals. Regarding the previous trials of treatment of obesity, diet regulation was tried in more than half (57.3%) of patients while medical treatment was followed in only fifth (20.8%) and 15.1% tried surgical treatment of obesity. More than half (59.2%) of overweight and obese don't perform any muscular exercise, 13.0% performing daily muscular exercise, 27.8% performing muscular exercise 1-3 times/week.

**Conclusion and recommendations:** The results of this study indicate an increased rate of obesity and overweight in the Arar population. Male sex, middle age, history of childhood obesity, family history of obesity in 1st degree relatives and takeaway meals are risk factors for both overweight and obesity. Therefore, a community-based multiple strategies are required to combat with increasing rate of obesity and its subsequent complications such as diabetes, coronary artery disease, hypertension and osteoarthritis.

## ..... Introduction:-

Obesity is actually an epidemic problem in the world; it has become truly a global problem affecting countries rich and poor. An estimated 500 million adults worldwide are obese and 1.5 billion are overweight or obese [1].

Much of the information about obesity among adults rest in the use of body mass index (BMI) to define obesity, which will be defined as a BMI  $30 \text{ kg/m}^2$  or greater unless otherwise stated [2]. The World Health Organization (WHO) categorizes adults with a BMI of 25 to 30 as overweight, whereas obesity is classified according to stages or grades - Grade 1: BMI 30.0-34.9, Grade 2: BMI 35.0-39.9 and Grade 3: BMI  $\geq 40.0$  [3].

Obesity is a consequence of many risk factors, as increased energy consumption and reduced physical exercise [4].

Obesity is a major risk factor for illness and death. It is associated with diabetes, hypertension, hyperlipidemia, obstructive sleep apnea, and osteoarthritis [5].

Previous studies in KSA indicate an increasing trend in the prevalence of obesity. Data from the late 1980s through mid-1990s show a prevalence of obesity averaging about 20%, ranging from as low as 13.1% among men to as high as 26.6% among women. However, all prevalence estimates from 1995 and beyond are above 35% [6,7,8].(11–13).

Obesity and overweight are increasing in KSA with an overall obesity prevalence of 35.5%. The prevalence of overweight was 36.9%. Overweight is significantly more prevalent in males (42.4%) compared to 31.8% of females. Females are significantly more obese with a prevalence of 44% than males 26.4%.Reduction in overweight and obesity are of considerable importance to public health [9].

In the (2013) survey all over the KSA, Of the 10,735 participants evaluated, 28.7% were obese (body mass index  $\geq 30 \text{ kg/m}^2$ ). Prevalence of obesity was higher among women (33.5% vs 24.1%). Among men, obesity was associated with marital status, diet, physical activity, diagnoses of diabetes and hypercholesterolemia, and hypertension. Among women, obesity was associated with marital status, education, history of chronic conditions, and hypertension [10].

Hence, the increased cost of obesity and its sequelae will put a strain on the resources of governments and individuals [11].

The influence of genetics on obesity is well established. Adoption studies and twin studies suggest that about 80% of the obesity risk is genetic. We designed a tool to predict outcomes of treatments in patients with sporadic or familial obesity [12].

Studies have linked a familial predisposition of obesity, CVD (hypertension, dyslipidaemia and thromboembolic events), and type 2 diabetes mellitus to BMI as well as other adiposity measures in children, suggesting degrees of familial aggregation of metabolic derangements. A pattern of predispositions arising from mothers, parents or grandparents as being most influential have been found, but further comprehensive studies are needed in order to specify the exact implications of familial predisposition [13]. Overweight children have an increased risk of being overweight as adults [14].

In Iranian, population-based cross-sectional study conducted to determine the prevalence rate of obesity, overweight, central obesity and their associated factors in the north of Iran. In the population aged 20-70 years, the

overall prevalence rates of obesity and overweight were 18.8% and 34.8% respectively. The overall prevalence rate of central obesity was 28.3%. The rate of obesity in women was higher than men. In both genders, particularly in the women, the rate of obesity was raised by increasing age. Marriage, history of parental obesity and parity  $>$  or  $=5$  were associated with increased risk of obesity. With respect to these findings, low level of activity and education, parity, family history of obesity, marriage at earlier age and ageing are responsible for both obesity and central obesity in the north of Iran [15].

### **Rationale:-**

obesity is a common health problem and rapidly increasing among Saudi Arabians. Moreover obesity is considered to be a burden on the health system. There is no studies that aim at identifying the prevalence and the main risk factors of obesity in Arar city. Since we are medical health workers, we saw the necessity of conducting a study that could give a vivid idea of prevalence and the main risk factors of obesity in Arar city, Northern Saudi Arabia.

### **Objective:-**

Obesity and overweight are well known risk factors for coronary artery disease (CAD), and are expected to be increasing in the Kingdom of Saudi Arabia (KSA) particularly among females. Therefore, we designed this study with the objective to determine the prevalence of obesity and overweight among Northern Saudis of both gender, aged 15 years or older and to study some of obesity related risk factors in that population.

### **Participants and methods:-**

**Study sitting:-** The present study was conducted in Arar which is the regional headquarter of the Northern Border Province of Saudi Arabia.

**Study type:-** A community-based cross-sectional study was carried out during the period from 1, January 2016 to 29, April 2016.

**Sampling:-** A total of 592 subjects aged 15 years and above (75.0% women) attending 3 randomly selected primary healthcare centers in Arar city. They were selected using a systemic random sampling procedure. Each participant was interviewed separately, and confidentiality was assured. Health centers provide healthy and sick citizens with healthcare services in an acceptable atmosphere of both privacy and confidentiality.

**Data collection methods:-** Data were collected by means of personal interview with the sampled women using a predesigned questionnaire covering the following items:

- (1) Socio-demographic characteristics , including age, educational and marital status.
- (2) Data related to obesity as physical activity, obesity of 1<sup>st</sup> degree relative, Family income/month , History of childhood obesity, Takeaway meals , consumption of milk, dairy products and egg, performing muscular exercise, history of consumption of fatty meals, consumption of fruits and vegetables, history of associated chronic diseased and history of trials of treatment of obesity among overweight and obese was obtained.

The exclusion criteria were, significant liver or kidneys disease and mal-absorption syndrome. Anthropometric examination included height and weight measurements with the use of a calibrated balance beam scale and a wall-mounted stadiometer and calculation of body mass index (BMI). Normal weight was defined as  $BMI < 25 \text{ kg/m}^2$ , overweight as  $25 \leq BMI < 30 \text{ kg/m}^2$  and obesity as  $BMI \geq 30 \text{ kg/m}^2$  [16].

### **Ethical considerations:-**

This study was reviewed and approved by the Research Ethics Committee of Faculty of Medicine, Northern Border University. Participants were informed that participation is completely voluntary, and written consent was obtained from each participant before being subjected to the questionnaire and after discussing the objective with the participants. No names were recorded on the questionnaires. Adequate training of data collectors took place to ensure protection of confidentiality, and all questionnaires were kept safe.

### **Statistical analysis:-**

Collected data were coded and analyzed using statistical package for the social sciences (SPSS, version 15). The chi square test was used as a test of significance, and differences were considered significant at P value 0.05 or less.

### **Results:-**

**Table 1: Sex, age group and family income/month of the studied population, Arar, KSA, 2016 (n= 592)**

Sex	No.	%
Female	444	75.0
Male	148	25.0
<b>Age group</b>		
15 – 25	229	38.7
26 – 35	211	35.6
36 – 50	122	20.6
> 50	30	5.1
<b>Family income/month (*SR)</b>		
< 5000	86	14.5
5000 - 10,000	305	51.5
> 10,000	201	34.0

\* Saudi Real

**Table (1)** shows the socio-demographic characters of studied male and female . The majority of participant in the study was a female 75% , and only 25 % were male .

38.7 % aged between 15 – 25 , while 35.6 % between 26 – 35 , and 20.6% were between 36 – 50 , and only 5.1 % were > 50 years old .The family income per month of the studied participant was between 5000 – 10,000 in nearly more than the half ( 51.5 % ) of the participant , and less than 5000 in 14.5 % while more than 10,000 was 34% of participant .

**Table 2:-** Obesity and its associated risk factors in the studied population, Arar, KSA, 2016 (n= 592)

Obesity	No.	%
Underweight	29	4.9
Normal	193	32.6
Overweight	161	27.2
Obese	209	35.3
<b>History of childhood obesity</b>		
Don't know	316	53.4
No	220	37.2
Yes	56	9.5
<b>Takeaway meals</b>		
Sometimes	313	52.9
No	116	19.6
Yes	163	27.5
<b>Family history of obesity in 1<sup>st</sup> degree relative</b>		
No	213	36.0
Don't know	57	9.6
Yes	322	54.4
<b>Associated chronic diseases</b>		
No	555	93.7
DM	23	3.9
DM and hypertension	8	1.3
Hypertension	6	1.01

**Table (2)** shows obesity and its associated risk factors beside presence or absence of chronic disease, according to BMI the table revealed that the majority of studied participant was classified as obese 35.3% while 32% of the participant was normal .

27.2% of participant was classified as overweight and only 4.9% of the studied participant was underweight . As regard History of childhood obesity , nearly more than the half of the participant 53.4% does not know whether they were obese in childhood or not , and more than one-third (37.2%) of them denied childhood obesity and about a 10<sup>th</sup> (9.5%) were obese in childhood. Takeaway meals habit was found as sometimes in more than the half (52.9%) of

participant , while (27.5%) of participant was regular on takeaway meals , and only (19,6%) don't mention takeaway meals . The highest percentage of studied participant (54.4%) reported that they have family history of obesity in 1<sup>st</sup> degree relative, and (9.6%) of participant don't know whether they have family history of obesity in 1<sup>st</sup> degree relative or not, and more than one-third (36.0%) don't have family history of obesity in 1<sup>st</sup> degree relative. As regards presence or absence of chronic disease, the highest percentage of participant (93.7%) mention no association with chronic disease, (3,9%) have only diabetes mellitus, while (1.3%) have both diabetes mellitus and hypertension and only (1.01%) have hypertension .

**Table 3: Trials of treatment of obesity among overweight and obese (Total =370)**

<b>Treatment of obesity by Diet regulation</b>	<b>No.</b>	<b>%</b>
No	158	42.7
Yes	212	57.3
<b>Medical treatment by drugs</b>		
No	293	79.2
Yes	77	20.8
<b>Surgical treatment of obesity</b>		
No	314	84.9
Yes	56	15.1
<b>Performing muscular exercise</b>		
Daily	48	13.0
1-3 times / week	103	27.8
No	219	59.2

Table (3) illustrates the trials of treatment of obesity among overweight and obese (n=370). Diet regulation was tried in more than half (57.3%) of patients while medical treatment was followed in only fifth (20.8%) and 15.1% tried surgical treatment of obesity. 13.0% of overweight and obese performing daily muscular exercise, 27.8% performing muscular exercise 1-3 times / week but unfortunately more than half (59.2%) don't perform any muscular exercise.

**Table 4:- Relationship between sex and age group and body weight among the studied population**

Variable	Obesity				Total (n=592)	P value
	Underweight (n=29)	Normal (n=193)	Overweight (n=161)	Obese (n=209)		
	No. (%)	No. (%)	No. (%)	No. (%)	No. (%)	
Sex						
Female	26(5.9)	159(35.8)	116(26.1)	143(32.2)	444(100.0)	0.002
Male	3(2.0)	34(23.0)	45(30.4)	66(44.6)	148(100.0)	
Age group						
15 – 25	16(7.1)	77(34.2)	43(19.1)	89(39.6)	225(100.0)	0.000
26 – 35	4(1.9)	57(26.5)	63(29.3)	91(42.3)	215(100.0)	
36 – 50	6(4.9)	48(39.3)	47(38.5)	21(17.2)	122(100.0)	
> 50	3(10.0)	11(36.7)	8(26.7)	8(26.7)	30(100.0)	

Table (4) demonstrates the relationship between sex and age group and body weight among the studied population. From the table it is clear that, 26.1% of females and 30.4% of males are overweight , on the other hand, 32.2% of females and 44.6% of males are obese. With statistically significant difference between males and females (P value = 0.002). As regards age, 39.2% of overweight were from the age group 26-35 years old and 29.2% from 36-50 years and least proportion (26.7%) aged 15-25 years. As regards obesity, the highest proportion (43.5%) were from the age group 26-35 years followed by 42.6% from the age group 15-25 years and least proportion (3.8%) aged more than 50 years

**Table 5: History of childhood obesity, obesity in 1st degree relatives and takeaway meals and body weight among the studied population**

History of childhood obesity	Body weight			Total (n=592)	P value
	Underweight (n=29)	Normal (n=193)	Overweight and obese (n=370)		
	No. (%)	No. (%)	No. (%)	No. (%)	
Don't know	28(96.6)	159(82.4)	129(34.9)	316(53.4)	0.000
No	1(3.4)	29(15.0)	190(51.4)	220(37.2)	
Yes	0(0.0)	5(2.6)	51(13.8)	56(9.5)	
Obesity in 1 <sup>st</sup> degree relatives					
Don't know	3(10.3)	22(11.4)	32(8.6)	57(9.6)	0.349
No	8(27.6)	77(39.9)	128(34.6)	213(36.0)	
Yes	18(62.1)	94(48.7)	210(56.8)	322(54.4)	
Takeaway meals					
Sometimes	10(34.5)	118(61.1)	185(50.0)	313(52.9)	0.000
No	1(3.4)	25(13.0)	90(24.3)	116(19.6)	
Yes	18(62.1)	50(25.9)	95(25.7)	163(27.5)	

Table (5) illustrates the relationship between history of childhood obesity, obesity in 1st degree relatives and takeaway meals and body weight among the studied population. 13.8% of obese have history of childhood obesity, 56.8% had family history of obesity in 1<sup>st</sup> degree relatives and 25.7% of overweight and obese prefer the takeaway meals .

### Discussion:-

The present study was conducted in Arar city. Arar is the regional headquarters of the northern border province of Saudi Arabia. It has a watering station and a power station. It engages in a wide range of agricultural activities including the production of dates and the managing of livestock (camels, goats and sheep). Arar is the crossing point for many of the Iraqi pilgrims entering the Kingdom to perform Hajj.

Our study indicated high rates of overweight obesity in male and female population of Arar. Our findings showed that most Northern Saudis are physically inactive and don't perform regular muscular exercise.

In the current study, the overall prevalence of obesity was 35.3% and the overall prevalence of overweight was 27.2% .

The overall prevalence of overweight is less than findings of 2005 [9] study which reported prevalence of overweight 36.9%. The overall prevalence of obesity is in accordance with findings of 2005 [9] study (35.6%). while our figure was more than findings of 2013 study which found 28.7% of participants were obese (body mass index  $\geq 30$  kg/m<sup>2</sup>) [10]. These finding is in accordance also with Kavadar, et al, (2015) who found Mean ( $\pm$  SD) of BMI in non diabetic population were  $28.2 \pm 3.16$  kg/m<sup>2</sup>. [12].

On the other hand, in the current study, 32.2% of females and 44.6% of males were obese while 26.1% of females and 30.4% of males were overweight. Our findings are also not in accordance with findings of 2005 study that females are significantly more obese with a prevalence of 44% than males 26.4% [9] and those estimated for 2010 study who reported 23% for males and 36% for females respectively [13].

This overall increase in obesity prevalence in Arar city is bad news for the Arar's, Saudis' health. Over the last decade, the Saudi Ministry Of Health has implemented several public health programs to reduce obesity. Most of these programs have focused on awareness and behavioral changes [14].

In the current study, 56.8% of overweight and obese had family history of obesity in 1st degree relatives which is supported by findings of Thirlby and Randall (2002) who reported that, about 85% of patients who are candidates for bariatric surgery have elements in their history to suggest a genetic risk for morbid obesity. About 15% have extremely strong genetic Obesity Risk Index [17].

Familial predisposition to obesity and related cardiovascular disease (CVD) complications constitute the presence of obesity and/or obesity-related complications in primarily blood-related family members [18].

In the current study, 13.8% of overweight and obese had history of childhood obesity, which is supported by findings of Indian study which reported that, Overweight children have an increased risk of being overweight as adults [19].

### **Conclusion and Recommendations:-**

The results of this study indicate an increased rate of obesity and overweight in the north population of KSA. With respect to these findings, Sex, age, history of childhood obesity, family history of obesity in 1<sup>st</sup> degree relatives are responsible for both overweight and obesity in the north of KSA. Therefore, a community-based multiple strategies are required to combat with increasing rate of obesity and its subsequent complications such as diabetes, coronary artery disease, hypertension and osteoarthritis.

### **Acknowledgment:-**

The success and final outcome of this research paper required assistance from many people and I am extremely fortunate to have got this all along the completion of this work. My thanks go to Mohammed Faried Mourad, Sara A Alsaddique, Nawaf Abdullah Almohaisen and Faiz Faisal Alanazi (Intern, Faculty of Medicine, Alfaisal University, Riyadh, KSA) Ali GhannamAlmuhawwis, Othman Mashfi Alshammari, (6<sup>th</sup> year medical students, Northern Border University) and WalaaMohamed Bakr Ali for their cooperation in different steps of the research.

### Abstract

Aim: To determine the extent of internet addiction among students of health faculties in Jazan University and its effects on their academic performance and social relationships. Method: This study reports the results of surveyinvolved 400 students (198 males 202 females) from 4 health faculties in Jazan University to measure the prevalence of internet addiction among the students and its effects on the academic performance and social relationships. It is a cross sectional study in which a standardized self-administered questionnaire was used to classify the internet addiction into 4 levels according to the score of each student. Also some questions were asked about the academic performance and social relationships of the students. Results: Its found that males are more addicted to the internet than females although females stay home more than males and also we found that about 59% of the students have mild addiction to the internet but this could be considered normal because nowadays the access to the internet is much easier and available and makes life easier and things to be done faster and also mild addiction doesn't have negative effects as moderate and severe addiction.

### Introduction: -

The internet nowadays is an essential media for communications, academic research, exchanging information and entertainment. With the advancement of Internet technology, the number of internet users is greatly increasing and it is considered a must in people's social life and education, but some users are considered heavy users for using the internet for a long time every day, which leads to a general weakness in all aspects of their life, academic performance or career and social relationships. Internet addiction leads to inattention to time passage, sometimes accompanied by skipping meal and insomnia. Internet addiction is a common problem, especially among young people and teenagers leading to weakness in the academic performance, achievements and social isolation. Sometimes internet addiction shows some signs, for example when the connection is down some signs of anger, nervousness or depression appears. We chose this topic to be our research title and we chose the students of health faculties in Jazan University for being in an important stage of education and which will determine the future of the student and also the future of health services in Jazan. We noticed that the students have time management problems especially before exams. Some of them said that they always can't finish reading the subject before exam takes place because they have not enough time. We think that they have time but they have bad time

management. We asked about something the students are interested in, some of them answered they spend a long time daily on social websites and others answered that they are interested more in online gaming. So it is all about being connected to the internet for hours and wasting their time.

#### **Aim:-**

To determine the extent of internet addiction among students of health faculties in Jazan University and its effects on their academic performance and social relationships.

#### **Objectives:-**

- 1- To determine the prevalence of internet addiction among the students of health faculties in Jazan University.
- 2- To compare between males and females in the prevalence of internet addiction.
- 3- To compare the academic performance of the students according to the pattern of internet using.
- 4- To determine the effects of internet addiction on social relationships.

#### **Literature Review:-**

##### **Defining Internet Addiction:-**

The American Psychiatric Association defined the Internet addiction disorder as the problematic use of the Internet, including the various aspects of its technology, such as electronic mail (e-mail) and the World Wide Web (American Psychiatric Association, 2000).

##### **The Effects of Internet Addiction:-**

A study by Robinson and Kestnbaum considers that as more time is spent online, it directly affects the person's other activities and in turn, his/her social life (Robinson, Kestnbaum, 1999).

Scott Hazelhurst, Yestin Johnson and Ian Sanders conducted an investigation of the academic performance and the internet use of 2153 undergraduate students. Data from university proxy logs allowed them to examine usage patterns and they compared the data to the students' academic performance. Their results showed a small but significant (both statistically and educationally) association between heavy internet using and poor academic results (lower marks, higher failure rates) (Scott Hazelhurst, Yestin Johnson and Ian Sanders).

Kubey, R. W., Lavin, M. J. and Barrows, J. R. conducted a study in 2001 on 572 students. The results of this study show that heavier recreational Internet use was shown to be correlated highly with impaired academic performance. Loneliness, staying up late, tiredness, and missing class were also intercorrelated with self-reports of Internet-caused impairment. Self-reported Internet dependency and impaired academic performance were both associated with greater use of all Internet applications, but particularly with much greater use of synchronous communication applications such as chat rooms and MUDs, as opposed to asynchronous applications such as email and Usenet newsgroups (Kubey, R. W., Lavin, M. J. and Barrows, J. R. 2001).

In a study conducted by Sadiq M. Sait, Khalid M. Al-Tawil, Syed Sanaullah and Mohammed Faheemuddin, the highest percentage among all employment types of internet users was for students and it was 32.4% (Sadiq M. Sait, Khalid M. Al-Tawil, Syed Sanaullah and Mohammed Faheemuddin, 2006).

Anderson (1998) collected data from a mixture of colleges in the US and Europe, yielding 1,302 respondents (with an almost equal gender split). On average, his participants used the Internet 100 min a day, and roughly 6% of the participants were considered as high-users (above 400 min a day).

Scherer (1997) studied 531 students at the University of Texas at Austin. Of these, 381 students used the Internet at least once per week and were further investigated. Based on the criteria paralleling chemical dependencies, 49 students (13%) were classified as Internet dependent (71% male, 29% female).

##### **The positive Impact of the Internet:-**

There also have been numerous studies that report a positive impact of the Internet on society (Robinson et. al., 2002; Cole, 2000; Cole, 2003). The results from these survey-based studies suggest that the Internet is mostly used to complement existing social activity and doesn't directly replace it. A study of international scholarly networks by Koku et al. shows that though the Internet helps in maintaining contact with different people, most of these are

almost always those who users also meet in real life; hence this only serves to further strengthen social interaction (Koku, Nazer& Wellman, 2001).

In another study by Nie and Erbring, most of the people who were surveyed, reported no change in their social lives, though excessive Internet users (logging more than 40 hours online per week) reported a decline in socializing, interaction, and other activities (Nie, Erbring, 2000).

#### Methods:-

The study design used is cross sectional and t we used the stratified random sampling method to determine the sample size for each faculty as the following table:

Count		Faculty				Total
respondent's gender		Faculty of Medicine	Faculty of Applied Medical Sciences	Faculty of Dentistry	Faculty of Pharmacy	
	male	31	113	27	27	198
	female	30	118	27	27	202
Total		61	231	54	54	400

Bar Chart representing the sample distribution:

The data was collected from each faculty using a self-administered questionnaire containing an internet addiction test developed by Dr.Kimberly Young. It is a reliable and valid measure of addictive use of internet consists of 20 items that measure mild, moderate and severe level of internet addiction. To answer each question of the questionnaire the following scale was used:

Answer	Score
Never	0
Rarely	1
Occasionally	2
Frequently	3
Often	4
Always	5

After totaling up the scores for each item the level of internet addiction was determined as follows:

Score	Level of Internet Addiction
Less than 20 points	No internet addiction
From 20 to 49 points	Mild internet addiction
From 50 to 79 points	Moderate internet addiction
From 80 to 100 points	Severe internet addiction

To assess the academic performance of the students we asked them to write down their GPA and also some questions about the performance and productivity were used. To assess the status of social relationships of the students we asked some questions about visiting relatives and meeting friends. After that we entered the data in the SPSS software for the data analysis, making tables and graphs.

### Results: -

After determining the level of internet addiction we found that the 58.8% of the students was considered having mild addiction to the internet.

A table showing the level of internet addiction of the students:

Level of internet addiction		Frequency	Percent
	No internet addiction	83	20.8
	Mild internet addiction	235	58.8
	Moderate internet addiction	76	19.0
	Severe internet addiction	6	1.5
	Total	400	100.0

Then we compared between males and females in each level of internet addiction and we found that males are more addicted to the internet.

A table of comparison between males and females in each level of internet addiction:

		level of internet addiction of respondent				Total
		No internet addiction	Mild internet addiction	Moderate internet addiction	Severe internet addiction	
respondent's gender	male	18	137	40	3	198
	female	65	98	36	3	202
Total		83	235	76	6	400

After that we compared between the mean of the GPAs according to gender and according to level of internet addiction. According to gender we found that the females' mean GPA is slightly more than that of males.

According to Gender:					
Gender	Mean	N	Std. Deviation	Minimum	Maximum
male	3.322711	166	.6109202	1.3000	4.7000
female	3.444765	170	.7602890	.8500	5.0000
Total	3.384464	336	.6922205	.8500	5.0000

According to the level of internet addiction:

INT-AD	Mean	N	Std. Deviation	Minimum	Maximum
No	3.390147	68	.7481729	2.0000	4.8700
Mild	3.432513	195	.6263232	1.3000	5.0000
Moderate	3.228088	68	.8106129	.8500	4.7000
Severe	3.560000	5	.3938908	3.2200	3.9900
Total	3.384464	336	.6922205	.8500	5.0000

Asking about the GPA Showed no significance may be because of high missing data and also the students were not equally distributed among the levels of addiction. However, we asked some questions about the grades and productivity of the students and the following are some examples:

		How often do respondent's grades suffer negatively because of the amount of time he/she spends online?						Total
		Never	Rarely	Occasionally	Frequently	Often	Always	
No internet addiction		66	11	4	0	2	0	83
Mild internet addiction		92	54	63	15	7	4	235
Moderate internet addiction		9	12	23	5	15	12	76
Severe internet addiction		0	2	0	0	0	4	6
Total		167	79	90	20	24	20	400

Level		How often does respondent's academic performance or productivity suffer negatively because of the amount of time he/she spends online?						Total
		Never	Rarely	Occasionally	Frequently	Often	Always	
No internet addiction		69	9	3	0	2	0	83
Mild internet addiction		105	63	43	14	8	2	235
Moderate internet addiction		5	21	23	4	13	10	76
Severe internet addiction		0	0	0	0	2	4	6
Total		179	93	69	18	25	16	400

In the previous two tables we can see that 4 of 6 students (66.7%) who are considered having severe internet addiction said that their grades, academic performance and productivity are always affected negatively because of the heavy use of the internet and the remaining 2 students answered (often).

Social Relationships:

		How often does respondent choose to spend more time online over visiting his/her relatives?						Total
		Never	Rarely	Occasionally	Frequently	Often	Always	
No internet addiction		73	8	2	0	0	0	83
Mild internet addiction		86	82	47	11	5	4	235
Moderate internet addiction		5	18	21	12	7	13	76
Severe internet addiction		0	0	1	0	1	4	6
Total		164	108	71	23	13	21	400

In the previous table we can see that 4 from 6 students (66.7%) who are considered having severe internet addiction said that they always choose to stay home using the internet over visiting their relatives and also we can see that those who are considered having no internet addiction didn't choose the answers (frequently, often and always).

		How often does respondent choose to spend more time online over going out with others?						Total
		Never	Rarely	Occasionally	Frequently	Often	Always	
f	No internet addiction	69	8	6	0	0	0	83
	Mild internet addiction	73	51	82	18	5	6	235
	Moderate internet addiction	9	14	19	13	11	10	76
	Severe internet addiction	0	0	0	2	1	3	6
Total		151	73	107	33	17	19	400

In the previous table we can see that 3 of 6 students (50%) who are considered having severe internet addiction said that they always choose to spend more time using the internet over going out with others while no one from those who are considered having no internet addiction choose this answer although they are 83 students.

### Discussion:-

The previous results reveal that 83 students (20.8%) are considered having no internet addiction and at this level we noticed excellent social relationships. 235 students (58.8%) are considered having mild internet addiction but could be considered as average users because they do not experience problems because of the internet. 76 students (19%) are considered having moderate internet addiction and experience occasional or frequent problems because of the internet and about 13% of them experience some sort of social isolation. Only 6 students (1.5%) are considered having severe internet addiction and experience significant problems because of the heavy use of the internet in which 4 students (66.7%) are socially isolated because of the internet and have problems in their academic performance and productivity more than the other levels.

In the comparison between males and females in each level we found that males are addicted to the internet more than females although males in Saudi Arabia can do much more activities than females do. These results resemble the results of Scherer study mentioned before. When we compared the mean of the GPAs between males and females we found that the mean of the GPAs of the females is slightly higher but we couldn't confirm the effect of the internet addiction on the academic performance using only the GPA because of missing data or may be some students were not telling the truth although we did not ask them about names or any other personal information. However, we can confirm that students with severe addiction are more affected in their grades using the questions mentioned before and matching the results with Kubey, R. W., Lavin, M. J. and Barrows, J. R. study mentioned before.

### Conclusion and Recommendations:

In general, internet addiction is an extremely broad topic with little guidance and definitions. Signs of internet addiction mentioned in the literature were clear and can be noticed easily and we can confirm internet addiction using these signs but confirming the effects of internet addiction is a little bit harder especially its effects on the academic performance. Controlled use of the internet can help both the academic performance and social relationships. However, the use of samples and data collection methods that minimize sampling bias is recommended. Also researchers should work to develop a standardized definition for internet addiction. Using more specific methods to measure the effects of internet addiction on the academic performance is recommended.

##### Key words:-

*Streptococcus pneumoniae*,  
 nasopharyngeal carriage, Hajj and  
 Umrah, ethnic groups, Saudi Arabia.

#### Abstract

**Background:** Hajj and Umrah poses many health challenges and lead to a higher risk of acquiring and disseminating infectious diseases, as a result of mass gatherings and shared accommodation and air pollution. Nasal colonization by *Streptococcus pneumoniae* is a major contributing factor for pneumococcal disease that still one of the major causes of morbidity and mortality worldwide. The aim of this study was to the detection and evaluate of *S. pneumoniae* in the nasopharyngeal carriage and the antibiotic susceptibility patterns of *S. pneumoniae* isolates in different ethnic groups, during Umrah and Hajj Season.

**Methods:** A total of 3184 nasal swab were collected from 979/613 Umrah visitors/Pilgrims, swab from each one upon arrival and swab before leaving Saudi Arabia, during the period from March to November 2009 G. Samples were cultured for the presence of *S. pneumoniae* by stander laboratory procedures in the Microbiology research laboratory, Faculty of Medicine, Umm Al-Qura University.

**Results:** The carriage rate of *S. pneumoniae* was 0% before performing Umrah and 6.41% after performing Umrah and 80% from isolates after Umrah were sensitive to Cefotaxime, Ceftriaxone, Rifampicin and Meropenem antibiotics. The carriage rate of *S. pneumoniae* was 0.7% before performing Hajj and 1% after performing Hajj and 75% from isolates before Hajj and 66.7% after Hajj were sensitive to the previous antibiotics.

**Conclusion & Recommendations:** This study revealed that ethnic groups carries *S. pneumoniae* were more after performing Hajj and Umrah than before Hajj and Umrah. Thus, we recommend to repeat this study after few years to evaluate the carriage rate of *S. pneumoniae* in Umrah visitors and Pilgrims and adding controls from Saudi nationals to any upcoming study in order to compare the carriage rate of *S. pneumoniae* in Umrah visitors, Pilgrims and Saudi nationals, for designing control strategies for these infectious diseases during Umrah and Hajj seasons.

## Introduction:-

Hajj is the greatest ritual gathering of Muslims from around the world. It takes place in holy Makah. The congregation of so many people from different parts of the world in unavoidably overcrowded conditions within a confined area for a defined period of time presents many public health challenges and health risks are greatly increased with potential for both local and international consequences. One of the main health problems correlated with crowding is respiratory tract and meningitis infections due to its ease of transmission by air droplets<sup>1,2</sup>. These infections can be transmitted from infected people and more significantly from asymptomatic carriers due to absence of symptoms<sup>3,4</sup>. The human nasopharynx and nares are densely colonized by a broad variety of microorganisms including commensal bacteria as well as potentially pathogenic bacteria (PPB) such as *Streptococcus pneumoniae*. Studies have shown that colonization with PPB is a major contributing factor for respiratory and extra-respiratory infections including pneumonia and meningitis in PPB carriers as well as their closed contacts<sup>5-8</sup>. The reported rates of PPB colonization acquisition and carriage vary extensively between different studies and geographical sites<sup>9-13</sup>. These differences have been related to genetic background variables and socio-economic conditions including housing, access to health care, poor hygiene, and overcrowded living conditions<sup>14,15</sup>. *S. pneumoniae* (the pneumococcus) is a Gram-positive aerobic commensal bacterium which forms part of the normal flora in the nasophary<sup>16</sup>. The pneumococcus can evade the immune system through a combination of surface expressed and secreted virulence factors to cause mucosal diseases such as otitis media, sinusitis and pneumonia, as well as systemic diseases such as bacteremia and meningitis<sup>17,18</sup>. These diseases, collectively termed pneumococcal disease, can be classified as invasive or non-invasive disease. Otitis media, sinusitis and non-bacteremic pneumococcal pneumonia are examples of non-invasive disease which are confined to the mucosal surface, whereas bacteremic pneumonia, bacteremia and meningitis are examples of invasive disease. Bacteremic pneumococcal pneumonia, defined as having pneumonia and a positive blood culture<sup>19</sup>. Invasive pneumococcal disease is thought to progress from colonization to bacteremia, with or without pneumonia, only a minority of cases developing meningitis. Pneumonia accounts for 19% of all under 5 year old deaths worldwide, which makes it the most deadly infectious illness for this age group<sup>20</sup>. The pneumococcus is the leading cause of pneumonia in children and it has been reported to cause over 50% of severe pneumonia cases in Africa<sup>21,22</sup>. Pneumococcal disease is most prevalent in the young and the elderly. Pneumococcal pneumonia is treatable using antibiotic therapy. However, where treatment is delayed or unavailable mortality is high<sup>23,24</sup>. Previously, the developing world had focused on treating pneumococcal disease rather than preventing it, but with the current increase in antibiotic resistance, it is widely accepted that prevention is the key to minimizing the disease burden<sup>25</sup>. Vaccination offers the most efficient and cost-effective method of preventing this disease. However, there are more than 90 pneumococcal serotypes which make development of a vaccine to provide universal protection a big challenge. There are two formulations of pneumococcal vaccines that have been licensed thus far: polysaccharide vaccines (Pups) and protein conjugate vaccines (PCVs). The 23-valent pneumococcal polysaccharide vaccine, which contains purified capsular polysaccharide antigens from 23 serotypes, offers some protection against invasive pneumococcal disease in adults but is not effective in either children less than 2 years of age or immune compromised adults<sup>26,27</sup>. PCVs, which contain purified capsular polysaccharides conjugated to a carrier protein, offer protection against both pneumonia and invasive disease in children and immune compromised adults<sup>28,29</sup>. The availability of a vaccine against some *S. pneumoniae* serotypes has risen the concern of increasing colonization rate by other strains that are not part of the vaccines currently available, which may explain the continuous appearance of clinical cases in some areas. This information is important particularly in the crowding seasons due to gathering of millions of people in a confined area, which means an increasing chance of colonization and infection with those serotypes not included in the currently available vaccines. An example of this importance is what happened in the pilgrimages of 2000 and 2001 which were associated with an increased number of *Neisseria meningitidis* sero group W135 infections in pilgrims and their close contacts<sup>30</sup>. Many infections with this previously uncommon strain were subsequently reported from several countries in Europe, Africa and the Middle East with a high mortality rate resulting in the requirement of vaccination with quadrivalent polysaccharide vaccine (PS) before entering Saudi Arabia<sup>31,32</sup>. Although PS vaccination prevents the disease, it cannot prevent the carriage. The aim of the present study was to evaluate the potentially pathogenic bacteria in Umrah visitors, pilgrims and carriers during Umrah and Hajj seasons in order to determine: the Colonization of potentially pathogenic bacteria in different ethnic groups, to find out any significant correlation between carriage rate and ethnic group and the risk of transmission of highly virulent PPB circulating to other countries during the season by their returning Umrah visitors and Pilgrims.

## Material and Methods:-

### Study design:-

This study was performed on 979 Umrah visitors from different nationalities including; 129 Turkish, 127 Indonesian, 102 Pakistani, 99 Syrian, 98 Nigerian, 79 Egyptian, 77 Iranian, 71 Indian, 56 British, 56 Iraqi, 39 Malaysian, 27 Libyan, 14 Swedish, 4 American and 1 Jordanian, during the period from March to end of August 2009 G and also in 613 Pilgrims from different nationalities including; 161 Indian, 102 Nigerian, 95 Indonesian, 90 Libyan, 68 Syrian, 46 British, 35 Turkish, 11 Australian, 3 Swedish and 2 Iranian during the period from October to end of November 2009 G in the Microbiology research Laboratory, Faculty of Medicine, Umm al-Qura university.

### Samples collection:-

Around 3184 nasopharyngeal swabs were collected from 979/613 Umrah visitors/Pilgrims, swab from each Umrah visitor/Pilgrim at arrival to Saudi Arabia and swab before leaving the country. The swabs were collected at arrival of the Umrah visitors/Pilgrims to King Abdul-Aziz International Airport (KAAIA), and data forms including; nationality, age, sex, smoking, coughing, sore throat, antibiotic usage, date of collection, contacts numbers for the group's leaders, were recorded for each visitors/Pilgrims. While, the remaining swabs were then collected before departure from KAAIA from the same visitors/Pilgrims. All Samples were collected on Amies transport swabs media and transported to the Microbiology research laboratory without any delay.

### Laboratory procedures:-

All samples were cultured for the presence of *S. pneumoniae* in the Microbiology research laboratory, under complete aseptic conditions and incubated at 37°C and 5% CO<sub>2</sub>. *S. pneumoniae* was isolated from blood agar and chocolate agar plates after an overnight incubation and identified according to standard laboratory procedures, by colony morphology, alpha-hemolysis, Gram stain, optochin sensitivity disc and bile solubility test. The susceptibility tests were performed according to the Clinical and Laboratory Standards Institute (CLSI)<sup>33</sup>.

## Results and Discussion:-

### Overall prevalence of *S.pneumoniae* isolated from Umrah visitors during the Umrah season:-

Out of 1958 nasopharyngeal swabs were collected from 979 Umrah Visitors selected in this study, 129 were of Turkish nationality. The carriage rate of the potentially pathogenic bacteria among the 129 Turkish Umrah Visitors were 0 (0%) positive for *S.pneumoniae* before performing Umrah and 1 (0.8%) were positive after performing Umrah and this difference was not statistically significant (p-value = 1.0). 126 were of Indonesian nationality. The carriage rate of the potentially pathogenic bacteria among the 126 Indonesian Umrah Visitors were, 0 (0%) positive for *S.pneumoniae* before performing Umrah and 1 (0.8%) were positive after performing Umrah and this difference was not statistically significant (p-value = 1.0). 102 were of Pakistani nationality. The carriage rate of the potentially pathogenic bacteria among the 102 Pakistani Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Pakistani Umrah Visitors before or after performing Umrah. 99 were of Syrian nationality. The carriage rate of the potentially pathogenic bacteria among the 99 Syrian Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Syrian Umrah Visitors before or after performing Umrah. 98 were of Nigerian nationality. The carriage rate of the potentially pathogenic bacteria among the 98 Nigerian Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Nigerian Umrah Visitors before or after performing Umrah. 79 were of Egyptian nationality. The carriage rate of the potentially pathogenic bacteria among the 79 Egyptian Umrah Visitors were 0 (0%) positive for *S.pneumoniae* before performing Umrah and 1 (1.3%) were positive after performing Umrah and this difference was not statistically significant (p-value = 1.0). 77 were of Iranian nationality. The carriage rate of the potentially pathogenic bacteria among the 77 Iranian Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Iranian Umrah Visitors before or after performing Umrah. 71 were of Indian nationality. The carriage rate of the potentially pathogenic bacteria among the 71 Indian Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Indian Umrah Visitors before or after performing Umrah. 56 were of British nationality. The carriage rate of the potentially pathogenic bacteria among the 56 British Umrah Visitors were 0 (0%) were positive for *S.pneumoniae* before performing Umrah and 2 (3.5%) were positive after performing Umrah and this difference was not statistically significant (p-value = 0.5). 56 were of Iraqi nationality. The carriage rate of the potentially pathogenic bacteria among the 56 Iraqi Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Iraqi Umrah Visitors before or after performing Umrah. 39 were of Malaysian nationality. The carriage rate of the potentially pathogenic bacteria among the 39 Malaysian Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Malaysian Umrah Visitors before or after performing Umrah. 27 were of Libyan nationality. The carriage rate of the potentially pathogenic bacteria among the 27 Libyan Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Libyan Umrah

Visitors before or after performing Umrah. 14 were of Swedish nationality. The carriage rate of the potentially pathogenic bacteria among the 14 Swedish Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from Swedish Umrah Visitors before or after performing Umrah. 4 were of American nationality. The carriage rate of the potentially pathogenic bacteria among the 4 American Umrah Visitors were 0 (0%) no *S.pneumoniae* was isolated from American Umrah Visitors before or after performing Umrah. 1 was of Jordanian nationality. No potentially pathogenic bacteria were isolated from the Jordanian Umrah Visitor before or after performing Umrah. Table 1. Summarize the prevalence of the potentially pathogenic bacteria isolated from Umrah visitors during the Umrah season. (Table 1) .

In this study 5 *Streptococcus pneumoniae* isolates were isolated. These isolates were distributed as the following according to different nationalities: 1 isolate was isolated from Turkish Umrah visitors, 0 before Umrah and 1 after Umrah, 1 isolate were isolated from Indonesian Umrah visitors, 0 before Umrah and 1 after Umrah, 1 isolate was isolated from Egyptian Umrah visitors, 0 before Umrah and 1 after Umrah, and 2 isolates were isolated from British Umrah visitors, 0 before Umrah and 2 after Umrah.

Out of the 979 Umrah visitors tested in this study for the presence of the potentially pathogenic bacteria, *Streptococcus pneumoniae* was isolated from 0 (0%) Umrah visitors before performing Umrah and 5 (6.41%) Umrah visitors after performing Umrah. The difference in the prevalence of positive *Streptococcus pneumoniae* from the Umrah visitors before and after performing Umrah was statistically not quite significant (p-value = 0.06).

**Overall prevalence of *Streptococcus pneumoniae* isolated from Pilgrims during the Hajj season:-**

In this study 1226 samples (2samples from each pilgrim, one at arrival to Saudi Arabia and one before leaving the country) were collected from 613 pilgrims from different nationalities including; 161 Indian, 102 Nigerian, 95 Indonesian, 90 Libyan, 68 Syrian, 46 British, 35 Turkish, 11 Australian, 3 Swedish and 2 Iranian. The carriage rate of the potentially pathogenic bacteria among the 161 Indian pilgrims were 1 (0.6%) positive for *Streptococcus pneumoniae* before performing Hajj and 3 (1.9%) were positive after performing Hajj and this difference was not statistically significant (p-value = 0.6). The carriage rate of the potentially pathogenic bacteria among the 102 Nigerian pilgrims were 1 (1%) positive for *Streptococcus pneumoniae* before performing Hajj and 1 (1%) were positive after performing Hajj and this difference was not statistically significant (p-value = 1.0). The carriage rate of the potentially pathogenic bacteria among the 95 Indonesian pilgrims were 1 (1.1%) were positive for *Streptococcus pneumoniae* before performing Hajj and 0 (0%) were positive after performing Hajj and this difference was not statistically significant (p-value = 1.0). The carriage rate of the potentially pathogenic bacteria among the 90 Libyan pilgrims were 1 (1.1%) were positive for *Streptococcus pneumoniae* before performing Hajj and 1 (1.1%) were positive after performing Hajj and this difference was not statistically significant (p-value = 1.0). The carriage rate of the potentially pathogenic bacteria among the 68 Syrian pilgrims were no *Streptococcus pneumoniae* was isolated from Syrian pilgrims before or after performing Hajj. The carriage rate of the potentially pathogenic bacteria among the 46 British pilgrims were no *Streptococcus pneumoniae* was isolated from British pilgrims before or after performing Hajj. The carriage rate of the potentially pathogenic bacteria among the 35 Turkish pilgrims were no *Streptococcus pneumoniae* was isolated from Turkish pilgrims before or after performing Hajj. The carriage rate of the potentially pathogenic bacteria among the 11 Australian pilgrims were 0 (0%) were positive for *Streptococcus pneumoniae* before performing Hajj and 1 (9.1%) were positive after performing Hajj and this difference was not statistically significant (p-value = 1.0). The carriage rate of the potentially pathogenic bacteria among the 3 Swedish pilgrims were no *Streptococcus pneumoniae* was isolated from Swedish pilgrims before or after performing Hajj. The carriage rate of the potentially pathogenic bacteria among the 2 Iranian pilgrims were no *Streptococcus pneumoniae* was isolated from Iranian pilgrims before or after performing Hajj. Out of the 613 pilgrims tested in this study for the presence of the potentially pathogenic bacteria *Streptococcus pneumoniae* was isolated from 4 (0.7%) pilgrims before performing Hajj and 6 (1%) pilgrims after performing Hajj. The difference in the prevalence of positive *Streptococcus pneumoniae* from the pilgrims before and after performing Hajj was not statistically significant (p-value = 0.8). (Table2).

**Table 2:- Overall prevalence of *Streptococcus pneumoniae* isolated from different nationalities of the Pilgrims during the Hajj season**

Nationality	Number of Pilgrims tested	Before Hajj		After Hajj		P-value of difference between positive pilgrims before performing Hajj and positive pilgrims after performing Hajj
		+ Pilgrims	- Pilgrims	+ Pilgrims	- Pilgrims

<b>Total</b>	<b>613</b>	<b>4 (0.7%)</b>	<b>609 (99.3%)</b>	<b>6 (1%)</b>	<b>607 (99%)</b>	<b>0.8 not significant.</b>

**Antibiotics susceptibility testing of *S.pneumoniae* isolated from Umrah Visitors during the Umrah season:-**

The following antibiotics were used for antimicrobial susceptibility testing: benzylpenicillin, cefoxitin, clindamycin, erythromycin, fosfomycin, gentamycin, clindamycin, lefloxacin, linezolid, moxifloxacin, mupirocin, oxacillin, rifampicin, teicoplanin, tetracycline, tigecyclin, tobramycin, trimetho-prim/sulfamethoxazole, vancomycin,

ceftriaxone, meropenem, ciprofloxacin, levofloxacin, azithromycin, augmentin and ceftazidime. For the 5 *Streptococcus pneumoniae* isolates isolated from Umrah Visitors in this study, (80%) isolates after Umrah were sensitive to Cefotaxime, Ceftriaxone, Rifampicin and Meropenem antibiotics. While, in the other side, (80%) isolates after Umrah were resistant to Erythromycin and Trimethoprim-sulfamethoxazole antibiotics. (Table3).

**Table 3:-** Antimicrobial Susceptibility of *S.pneumoniae* isolated from Umrah visitors during the Umrah season

ANTIBIOTICS	Before Umrah Total (0)				After Umrah Total (5)			
	Susceptible	%	Non-susceptible	%	Susceptible	%	Non-susceptible	%
Azithromycin	0	0.00	0	0.00	3	60.00	2	40.00
Cefotaxime	0	0.00	0	0.00	4	80.00	1	20.00
Ceftriaxone	0	0.00	0	0.00	4	80.00	1	20.00
Ciprofloxacin	0	0.00	0	0.00	3	60.00	2	40.00

**Conclusion and Recommendations:-**

The carriage rate of *S.pneumoniae* among the Umrah visitors was more after Umrah than before Umrah and the carriage rate of *S.pneumoniae* among the pilgrims was more after Hajj than before Hajj. The Indonesian and Libyan pilgrims were the most ethnic groups carries *S.pneumoniae* before performing Hajj, while the Australian pilgrims were the most ethnic group carries *S.pneumoniae* after performing Hajj. The most effective antibiotics against

*S.pneumoniae* isolated from Umrah visitors and pilgrims were Cefotaxime, Ceftriaxone, Rifampicin and Meropenem. Thus we recommend to repeat this study after few years to evaluate the carriage rate of *S. pneumoniae* in Umrah visitors and Pilgrims and if there is any changes in the rate either increasing or decreasing. Adding controls from Saudi nationals to any upcoming study to compare the carriage rate of *S. pneumoniae* in Umrah visitors, Pilgrims and Saudi nationals.

### Acknowledgments:-

We would like to thank the center of Excellence for Hajj and Umrah Research at Umm Al-Qura University, Makkah, Saudi Arabia for funding up this research. Many thanks to all staff in department of Microbiology, Faculty of Medicine, Umm Al-Qura University. We also thank Students of the 3rd year in the Faculty of Medicine and 2nd, 3rd years in the Faculty of Medical Science, Umm Al-Qura University for their efforts regarding samples collection.

Ultraviolet index, clear sky global solar radiation, temperature, erythema, somatic, genetic, teratogenic and transgenerational.

#### Abstract

**Background:** The interest in solar ultraviolet (UV) radiation from the scientific community and the general population has risen significantly in recent years because of the link between increased UV levels at the Earth's surface and depletion of ozone in the stratosphere. However, Ultraviolet (UV) radiation is a well-known physical hazard responsible for photoaging, photoallergic, and phototoxic reactions as well as carcinogenesis. On the other side, ionizing radiation is known as one of the detrimental factors in the work environment that can cause serious, irreversible and irreparable damages in professional radiation workers, but the effects of low doses on human health has not been completely known.

**The Aim:** The study clarifies the late and low level effects of ionizing radiation on health and recognizes the adverse effects of excessive solar radiation on skin, eyes and the immune system. It also outlines new approaches on how to improve the effectiveness of the UVI as a public awareness tool toward encouraging sun protection behavior aiming to reach a simplified estimation method and accurate predictive results for daily clear sky global solar radiation (H) and daily maximum ultraviolet index (UVI<sub>max</sub>).

**Methods:** A simplified estimated model and accurate prediction results of UVI<sub>max</sub> are reached in this work. The linear multiple-regression model is used to forecast the UVI<sub>max</sub> for state of Sharm El-Sheikh. The precision of the developed forecasting model of daily UVI<sub>max</sub> is based on maximum temperature and accurate prediction results of daily H. The linear multiple- regression empirical model for estimating daily global solar radiation is based on three -predictor variables and one response variable.

**Results:** The predictor variables of the daily global radiation (H) developed model are different from predictors of other existing models. The developed model is considered as a simplified statistical approach because it depends on two constant predictors and one changeable predictor. It shows that the predicted global solar radiation

Address:-Assistant Prof. of Applied Statistic in Radiation Safety Department, Nuclear and Radiological Regulatory Authority, Cairo, Egypt.

overlaps the measured global solar radiation in all months of the year. The UVI refers to the daily maximum effective irradiance and serves as an indicator of the impact of UV-radiation on erythema (sunburn). It was developed as a tool to conceptualize the amount of harmful radiation and to encourage the general public to use sun protection, and it is recommended to be integrated with broader public health approaches. By comparing to late and low level effects of ionizing radiation, there are four types of delayed radiation effects: somatic, genetic, teratogenic, and transgenerational. The current radioprotection guidelines state that all exposures to radiation should be avoided if possible and that exposure should be kept as low as is reasonably achievable.

### ..... Introduction:-

Ultraviolet (UV) radiation is a well-known physical hazard responsible for photoaging, photoallergic, and phototoxic reactions as well as carcinogenesis, including life-threatening melanomas (Zuba et al., 2016). Solar radiation is an important natural factor because it forms the Earth's climate and has a significant influence on the environment. The ultraviolet part of the solar spectrum (UV) plays an important role in many processes in the biosphere. It has several beneficial effects but it may also be very harmful if UV exceeds "safe" limits. If the amount of UV radiation is sufficiently high the self-protection ability of some biological species is exhausted and the subject may be severely damaged. This also concerns the human organism, in particular the skin and the eyes (Allinson et al., 2012). Overexposure to both natural and artificial UV radiation is a public health concern. 30% of cancers diagnosed worldwide are skin cancers. Approximately three million non-melanoma skin cancers and 132 000 new cases of melanomas are diagnosed globally each year. Sunburns, especially in childhood, are a very important risk factor for melanomas. Several studies demonstrated a positive association between sunbed use and an increased incidence of malignant melanoma (Zuba et al., 2016). The International Agency for Research on Cancer has noted that there is sufficient evidence from studies in animals and in man to establish ultraviolet radiation as a human carcinogen. Skin cancer has been the most commonly studied cancer site with respect to UV radiation. The nature and timing of sun exposure appear to be important determinants of both the degree of risk and the type of skin cancer. Cutaneous malignant melanoma and basal cell cancer are much more strongly related to measures of intermittent ultraviolet exposure (particularly those of childhood or adolescence) than to measures of cumulative exposure. In contrast, squamous cell cancer is more strongly related to constant or cumulative sun exposure. Lip cancer is causally related to lifetime sun exposure. It has been estimated that solar ultraviolet radiation accounts for approximately 93 percent of skin cancers and about half of lip cancers (Gallagher et al., 2010).

The diurnal and annual variability of solar UV radiation reaching the ground is governed by astronomical and geographical parameters as well as by the atmospheric conditions. As a consequence, solar UV radiation is a highly variable environmental parameter that differs widely in time and space. The need to reach the public with simple-to-understand information about UV and its possible detrimental effects led scientists to define a parameter that can be used as an indicator of the UV exposures. This parameter is called the UV Index (UVI) (Allinson et al., 2012). It was introduced in 1995 by the World Health Organization (WHO), the United Nations Environment Programme (UNEP), the World Meteorological Organization (WMO), and the International Commission for Non-Ionizing Radiation Protection (ICNIRP, 1995). UVI is a unit of measure of UV levels relevant to the effects on human skin. The UVI is now widely used in many operational weather reports and forecasts. In Europe, for example, there are more than a dozen forecasting centers that release estimated UVI values for countries or regional areas. Different methods are used to predict the UVI and all kinds of information systems and presentations are seen. Operational UVI forecasting has already been implemented in many countries. The forecast methods vary from simple statistical methods used for local areas to more complicated methods with global coverage and with forecast times from a few hours to several days, either for clear sky or all sky conditions (Allinson et al., 2012). Many researchers have a try to achieve to the best empirical models for estimating the daily global solar radiation by using different equations based on one independent variable such as: mean relative sunshine duration ( $S/S_0$ ). These equations represented in linear, exponential, power, logarithmic, quadratic, cubic, linear exponential and linear logarithmic (Marwal et al., 2012; Medugu and Yakubu, 2011; Muzathik et al., 2011; Khalil and Fathy, 2008; Corredor, 2013). Other researchers used multiple regression equations with different predictor variables (weather parameters) for estimating the daily global radiation such as: clearness index, mean relative sunshine duration ( $S/S_0$ ), mean daily maximum

temperature ( $T_{\max}$ ), mean daily relative humidity (Rh), mean daily rainfall (R), mean daily temperature ( $\bar{T}$ ), ratio of maximum and minimum daily temperature and other weather parameters (Falayi et al., 2008; Augustine and Nnabuchi, 2009; Ituen et al., 2012; Habbib, 2011). These researchers depend in their studies on different changeable predictors. However, using multiple regression models for estimating the daily global radiation give more accurate results than other equations that depends on one variable under condition of presence the mean relative sunshine duration parameter. So, to avoid damage from high UV exposures, both acute and chronic, people should limit their exposure to solar radiation by using protective measures (Allinson et al., 2012). In 2002, the concept of the UVI was expanded as a public awareness tool to help the public conceptualize the amount of harmful UV radiation and to alert people to the need for sun protection measures (WHO, 2002). After 10 years of use, a systematic review of the effectiveness of the UVI revealed that the UVI has raised public awareness of UV exposure to some extent, but that it has not significantly improved sun protection practices (Italia and Rehfuess, 2012).

Ionizing radiation, particularly X-ray and those emitted by radioactive substances, play a vital role in medicine, both in diagnosing and treating diseases (Calabrese et al., 2014). On the other side, ionizing radiation is known as one of the detrimental factors in the work environment that can cause serious, irreversible and irreparable damages in professional radiation workers, but the effects of low doses on human health has not been completely known (Klucinski et al., 2014). Considering and following up the health of persons who are occupationally exposed to long-term, low levels of ionizing radiation is of great importance. Basic studies on the biological response to radiation at low doses are considered a research priority in order to better understand the occupational risks associated with working in radiation departments with the possible development of long-term health effects (Heydarheydari et al., 2016). However, radiation may damage various cellular components including DNA, directly (molecule ionization) or indirectly (reactive oxygen species production). Irradiated cells protect themselves by many innate defense mechanisms such as removal of oxidative stress and damaged cells, and DNA repair. Remained damages of cells may cause tissue/organ dysfunction and malignant diseases. For radiation protection, the biological effects of radiation are conventionally categorized into two broad classes: stochastic and deterministic effects (or recently termed tissue reactions) (Seong et al., 2016). *Stochastic effects* have probability of occurrence depending on the irradiated doses without threshold. These effects can occur by chance and consist primarily of cancer and genetic effects such as inherited mutations. It often shows up years after exposure. In addition, because they can occur in individuals under background radiation levels without exposure, it can never be determined that an occurrence of these effects was due to a specific exposure (Mettler, 2012). *Deterministic effects* (or non-stochastic effects) are malfunctions of organs by irradiation at more than threshold. These effects do not exist below their threshold doses, for example, skin burns, cataracts, cardiovascular disease, intestinal damage, and hemopoietic system and central nervous system failure (Kadhim et al., 2013). Recent ICRP report referred to deterministic effects as tissue reactions because it was recognized that these effects are not decided at the moment of irradiation and can be modified through various biological responses (ICRP, 2012). This simplistic classification is not absolute. Deterministic effects can occur as a result from the loss of normally functioning large number of critical cells caused by stochastic killing of irradiated individual cells (Seong et al., 2016).

Over the last several years, there was a trend to investigate the biological effects of the radiation using hematological, biochemical, and cytogenetic parameters (Ossetrova et al., 2010). These investigations have demonstrated that stochastic effects may appear after the exposure to low level radiation (Elgazzar and Kazem, 2015). Deterministic effects are well-known and often need higher radiation doses than received by medical professionals (MPs) (Yang et al., 1995). Therefore the concern and unawareness of MPs are related to the stochastic effects of long-term exposure to low-dose radiation. The risk of stochastic effects, such as cancer, increase by dose without threshold (Muirhead et al., 2009; Venneri et al., 2009). Long-term exposure to low doses of ionizing radiation can affect proliferating cells (Fliedner et al., 2012) and tissues. The effect of radiation on hematopoietic and immune system (Hrycek et al., 2002; UNSCEAR, 2012) suggest that, long-term effects can disturb immunity of MPs by suppressing or stimulating the immune system and may induce various hematological diseases (Roguin et al., 2012; Venneri et al., 2009). However, the biological effects of chronic low-dose radiation on human health are complex and have not been well established. It seems that, hematological parameters survey could not be a reliable test as the biological indicator of long term exposure to very low dose of radiation exposure in medical professionals which their physical dosimetry values are lower than dose limits (Shafiee et al., 2016). Additionally, all the workers occupationally exposed showed an increase in DNA fragmentation after the workday. The amount of radiation in all three services is different, in Nuclear Medicine and Radiotherapy the workers showed a greater monthly dose of exposure and greater DNA damage than the Radiology workers. Most of the DNA damage detected by the comet assay is repaired; however a part of it may result in stable chromosomal rearrangements that may

represent a long-term health risk. It is important to sensitize exposed workers on their responsibility of working with radiation and the improvement of the hospital safety practices (Martínez et al., 2010). Fortunately, Low-level radiation exposure is generally considered to be less than the dose that produces immediate or short-term observable biological effects. In humans, low-LET gamma or X-radiation doses of less than 0.5 Gy do not produce prodromal symptoms or the hematopoietic subsyndrome; however, recent studies suggest that low-level radiation exposure does increase the probability that delayed effects will occur (Hall et al., 2012; Joiner and van der Kogel, 2009). There are four types of delayed radiation effects: (1) somatic, (2) genetic, (3) teratogenic, and (4) transgenerational. Irradiation enhances the naturally occurring frequency of the specific effect, and in some cases produces the observable endpoint by a process different than that of a natural process. Certain biological responses have such low thresholds that they are statistically indistinguishable, in many cases, from normal incidence (Joiner and van der Kogel, 2009; Miller et al., in press).

#### The Aim:-

The study clarifies the late and low level effects of ionizing radiation on health and recognizes the adverse effects of excessive solar radiation on skin, eyes and the immune system. It also outlines new approaches on how to improve the effectiveness of the UVI as a public awareness tool toward encouraging sun protection behavior aiming to reach a simplified estimation method and accurate predictive results for daily  $H$  and  $UVI_{max}$ .

#### Materials and Methods:-

In the current study,  $UVI_{max}$  is modeled for forecasting its daily value. The statistical prediction model is based on two independent variables (predictor variables) for constructing the linear multiple regression equation. The first predictor is daily clear sky global solar radiation on a horizontal surface ( $H$ ) and the second predictor is daily maximum temperature ( $T_{max}$ ). These model predictors are considered more accurate effective for  $UVI_{max}$  forecasting results than other weather parameters. Additionally, model is developed with multiple regression equation than other researchers to predict the daily global solar radiation future time ( $H$ ). The developed multiple regression models based on three predictors. These independent variables are: monthly average day length ( $S_0$ ), monthly average cosine solar zenith angle at mid-time between sunrise and solar noon ( $\cos(\theta_{ZMT})$ ) and monthly average daily temperature ( $\bar{T}$ ). Two predictors are calculated ( $S_0$  &  $\cos(\theta_{ZMT})$ ) and one predictor is measured ( $\bar{T}$ ). This model is considered a simplified statistical approach because it depends on two monthly constant predictors ( $S_0$  &  $\cos(\theta_{ZMT})$ ) and one daily changeable predictor ( $\bar{T}$ ).

The material data of monthly averaged clear sky global radiation on a horizontal surface ( $kWh/m^2/day$ ) and monthly average air mean and maximum temperature at 10m above the earth surface ( $\bar{T}$  &  $\bar{T}_{max}$ ) (degrees Celsius) is obtained from NASA meteorology (NASA., 2016). The data covered a period of 22 years (1983 – 2005) for Sharm El-Shiekh in Egypt at Latitude  $27.912^\circ$  and longitude  $34.33^\circ$ . UVI data is obtained from Weather2Travel climate guides [weather2travel]. The suggested modified empirical model of clear sky global solar radiation has been estimated on the basis of measurements of monthly averaged clear sky global radiation on a horizontal surface and monthly average air mean temperature for Sharm El-Shiekh. Also, the empirical model based on calculation of monthly mean daily extraterrestrial radiation, maximum possible sunshine duration and monthly average cosine solar zenith angle at mid-time between sunrise and solar noon.

#### Developed empirical model to estimate the daily global radiation ( $H$ ):-

The devolved model for estimating the daily global radiation based on three independent variables (predictor variable) and one dependent variable (response variable). The response variable is the variable to be predictable

$\bar{H}/\bar{H}_0$  and the three-predictor variables are  $S_0$ ,  $\cos(\theta_{ZMT})$  and  $\bar{T}$ .

The following modification empirical model is used to estimate the daily global radiation

$$\frac{\bar{H}}{\bar{H}_0} = 0.6857 - 0.010306(S_0) + 0.42213(\cos(\theta_{ZMT})) - 0.002947(\bar{T}) \quad (1)$$

$$\bar{H}_{calculated} = (0.6857 - 0.010306(S_0) + 0.42213(\cos(\theta_{ZMT})) - 0.002947(\bar{T})) \bar{H}_0$$

where,  $\frac{\bar{H}}{\bar{H}_0}$  is clearness index,  $\bar{H}$  is monthly mean daily clear sky global solar radiation on a horizontal surface,

$\bar{H}_0$  is monthly mean daily extraterrestrial radiation  $\text{KW/m}^2$ ,  $S_0$  is monthly average day length,  $\cos(\theta_{\text{ZMT}})$  is monthly average cosine solar zenith angle at mid-time between sunrise and solar noon and  $\bar{T}$  is monthly average daily temperature. The values of the monthly average daily extraterrestrial radiation ( $\bar{H}_0$ ) can be calculated from equation 2 (Duffie and Beckman, 2013).

$$\bar{H}_0 = \frac{24}{\pi} I_{\text{SC}} E_0 \left[ \cos \phi \cos \delta \sin w_s + \frac{\pi w_s}{180} \sin \phi \sin \delta \right] \quad (2)$$

$$E_0 = 1 + 0.033 \cos \left[ \frac{360 d_n}{365} \right]$$

where,  $I_{\text{SC}}$  is the solar constant ( $=1.367 \text{ KWm}^{-2}$ ),  $\phi$  is the latitude of the site,  $\delta$  is the solar declination,  $w_s$  is the mean sunrise hour angle for the given month, and  $d_n$  is the number of days of the year starting from the first of January (the Julian day number). The solar declination ( $\delta$ ) and the mean sunrise hour angle ( $w_s$ ) can be calculated by the following equations:

$$\delta = 23.45 \sin \left[ 360 \frac{(d_n + 284)}{365} \right]$$

$$w_s = \cos^{-1} (-\tan \phi \tan \delta)$$

The maximum possible sunshine duration ( $S_0$ ) (or monthly average day length) which is related to  $w_s$ , can be computed by using the following equation:

$$S_0 = \frac{2}{15} w_s \quad (3)$$

Monthly average cosine solar zenith angle at mid-time between sunrise and solar noon is calculated according the following formula (NASA., 2016):

$$\cos(\theta_{\text{ZMT}}) = f + g[(g - f) / 2g]^{1/2} \quad (4)$$

where,

$$f = \sin(\phi) \sin(\delta), \quad g = \cos(\phi) \cos(\delta)$$

Monthly average daily mean temperature ( $\bar{T}$ ) is calculated as follows:

$$\bar{T} = \frac{(T_{\text{maximum}} + T_{\text{minimum}})}{2} \quad (5)$$

#### Empirical model to estimate the daily maximum ultraviolet index (UVI<sub>max</sub>):-

The statistical estimation model of daily ultraviolet index is based on two independent variables for constructing the linear multiple regression equation. The first predictor is the monthly mean daily clear sky global solar radiation on a horizontal surface ( $\bar{H}$ ) and the second predictor is monthly average maximum temperature ( $\bar{T}_{\text{max}}$ ).

$$UVI_{\text{max}} = -4.5146 + 1.4178(\bar{H}_{\text{calculated}}) + 0.12697(\bar{T}_{\text{max}}) \quad (6)$$

$H$  and  $T_{\text{max}}$  are considered more accurate effective for  $UVI_{\text{max}}$  forecasting results than other weather parameters.

#### Statistical Evaluation:-

There are numerous works in literature which deal with the assessment and comparison of monthly mean daily solar radiation estimation models. The most popular statistical parameters are the mean bias error (MBE) and the root mean square error (RMSE) (Muzathik et al., 2011). In this study, to evaluate the accuracy of the estimated data,

from the models described above, the following statistical tests are used, MBE, RMSE, mean absolute percentage error (MAPE) (Sivamadhavi and Selvaraj, 2012; Corredor, 2013) and coefficient of correlation (R). The evaluation accuracy is based on the low error value and the high correlation coefficient value.

$$MBE = \frac{\sum_{i=1}^n (\bar{H}_{i,caculated} - \bar{H}_{i,measured})}{n}, \quad RMSE = \sqrt{\frac{\sum_{i=1}^n (\bar{H}_{i,caculated} - \bar{H}_{i,measured})^2}{n}}$$

$$MAPE = \frac{1}{n} \sum_{i=1}^n \left| \frac{\bar{H}_{i,measured} - \bar{H}_{i,caculated}}{\bar{H}_{i,measured}} \right| * 100$$

$$R = \frac{\sum_{i=1}^n (\bar{H}_{i,caculated} - \bar{H}_{i,caculated})(\bar{H}_{i,measured} - \bar{H}_{i,measured})}{\sqrt{\left( \sum_{i=1}^n (\bar{H}_{i,caculated} - \bar{H}_{i,caculated})^2 \right) \left( \sum_{i=1}^n (\bar{H}_{i,measured} - \bar{H}_{i,measured})^2 \right)}}$$

### Results:-

#### Devolved empirical equation for prediction of daily global solar radiation (H):-

The various meteorological data are related to global solar radiation (H). Empirical model is developed to estimate the daily global radiation. Multiple linear regression analysis of four parameters is employed to estimate the daily global solar radiation ( $\bar{H}/\bar{H}_0$ ,  $S_0$ ,  $\cos(\theta_{ZMT})$  and  $\bar{T}$ ).

The following modification empirical model is devised for global solar radiation estimation.

$$\frac{\bar{H}}{\bar{H}_0} = 0.6857 - 0.010306(S_0) + 0.42213(\cos(\theta_{ZMT})) - 0.002947(\bar{T})$$

$$\bar{H}_{calculated} = (0.6857 - 0.010306(S_0) + 0.42213(\cos(\theta_{ZMT})) - 0.002947(\bar{T})) \bar{H}_0$$

The calculated values for  $\bar{H}_0$ ,  $\bar{H}/\bar{H}_0$ ,  $S_0$ ,  $\cos(\theta_{ZMT})$ ,  $\bar{T}$  and  $\bar{H}_{calculated}$  for Sharm El-Sheikh are presented in Table 1.

A number of linear multiple regression equations (7-10) were developed by other researchers to predict the relationship between global solar radiations with one or more combinations of weather parameters. Some researchers used different weather parameters such as: clearness index, The mean relative sunshine duration ( $S/S_0$ ), mean daily maximum temperature ( $T_{max}$ ), mean daily relative humidity ( $Rh$ ), mean daily rainfall ( $R$ ), mean daily

temperature ( $\bar{T}$ ), ratio of maximum and minimum daily temperature and other weather parameters. The suggested modified multiple regression model (eqn. 1) is developed using weather parameters different than that other weather parameters previously used. The suggested developed model and some researchers-developed models are tested for our and their applicability to predict the global solar radiation for State of Sharm El-Sheikh. The suggested developed model is considered a simplified statistical approach because it depends on constant predictors ( $\bar{H}_0$ ,  $S_0$  and  $\cos(\theta_{ZMT})$ ) and one inconstant predictor ( $\bar{T}$ ). The constant predictors are determinate according to its corresponding month (from Table 1). All constant predictors are calculated and the changeable predictor is measured. Table 2 shows some statistical indicators (R, MBE, RMSE and MAPE) for comparing the suggested developed model with some linear multiple regression models.

**Table 2:** Equations with regression and statistical indicators of accuracy

Equations	source	R	MBE	RMSE	MAPE
$\frac{\bar{H}}{\bar{H}_0} = 0.94736 + 0.06068(S/S_0) - 0.0407(T_{mini}/T_{maxi}) - 0.4528(Rh/100) - 0.00299(\bar{T}) \quad (7)$	(Falayi, 2008; Habbib, 2011)	0.998	-0.0005	0.0586	0.729
$\frac{\bar{H}}{\bar{H}_0} = 0.9697 + 0.0519(S/S_0) - 0.00342(T_{maxi}) - 0.495(Rh/100) \quad (8)$	(Ituen, 2012)	0.999	-0.0021	0.0600	0.732
$\frac{\bar{H}}{\bar{H}_0} = 0.956 - 0.5672(T_{mini}/T_{maxi}) + 0.0054(T_{maxi}) \quad (9)$	(Okunda-miya, 2011)	0.999	-0.0032	0.0652	0.787
$\frac{\bar{H}}{\bar{H}_0} = 1.582 + 0.05963(S/S_0) - 0.5407(T_{average}/T_{maxi}) - 0.125(\ln(Rh))(10)$	(Adhika-ri, 2013)	0.999	-0.0011	0.0687	0.832
$\frac{\bar{H}}{\bar{H}_0} = 0.6857 - 0.010306(S_0) + 0.42213(\cos(\theta_{ZMT})) - 0.002947(\bar{T})$		<b>0.9998</b>	<b>-0.000098</b>	<b>0.0323</b>	<b>0.422</b>

The results obtained show a remarkable agreement between the measured and the predicted values using different linear multiple regression models. The empirical developed model under study (eqn. 1) gives the best accuracy and more reliable results than other researchers' models (eqns. 7-10). The accuracy tests indicate that the error rate is reduced nearly by 40-50% in favor of our developed model. Therefore, the suggested developed model is preferred to use for prediction of global solar radiation on horizontal surface for Sharm El-Sheikh. Figure 1 shows comparison between the measured and predicted global solar radiation using the suggested empirical developed model. It is clear from the figure that there is an excellent correlation exists between the measured and predicted global solar radiation. However, the predicted global solar radiation overlaps the measured global solar radiation in all months of the year.

To predict the daily global solar radiation in Sharm El-Sheikh, substitute  $S_0$  and  $\cos(\theta_{ZMT})$  values in the developed empirical equation according to the corresponding month for this predictable day.  $\bar{T}$  is calculated from daily changing maximum and minimum temperature. For example, to predict daily global solar radiation of few days for some months, substitute the values of  $S_0$ ,  $\cos(\theta_{ZMT})$ ,  $\bar{H}_0$  (from Table 1) and  $\bar{T}$  (from eqn. 5) in equation 1. The results are presented in Table 3.

Table 3 shows that in the month range June-August (Fig.1) the global solar radiation value decrease with the increase in average temperature value. The given month range belongs to the maximum value in Fig. 1. The choice of the month range June-August (summer) is considered in this work because the effect of UVI is maximum. Moreover, the estimated high global solar radiation of the summer months is required for detailed study to get the maximum benefits of solar energy for electric power production.

#### Empirical equation for forecasting daily ultraviolet index (UVI):-

In this section, the strong relationship between  $H$ ,  $T_{max}$  (as independent variable) and UVI (as dependent variable) is illustrated by using the linear multiple regression equation which relating to these three variables. Two linear multiple regression equations are compared for attempt to deduce the best of them. The first equation (eqn. 6) is based on  $\bar{H}_{calculated}$  and  $\bar{T}_{max}$ . The second equation (eqn. 11) is based on  $\bar{H}_{measured}$  &  $\bar{T}_{max}$ .

$$UVI_{max predicted} = -4.5146 + 1.4178(\bar{H}_{calculated}) + 0.12697(\bar{T}_{max})$$

$$UVI_{max predicted} = -4.5156 + 1.4123(\bar{H}_{measured}) + 0.12823(\bar{T}_{max}) \quad (11)$$

The results of estimated  $UVI_{max}$  according to equations 6 and 11 are shown in Table 4.

**Table 4:-**Meteorological data and ultraviolet index for Sharm El-Sheikh

MONTH	( $UVI_{max}$ ) measured	$\bar{H}_{calculated}$ (KW/m <sup>2</sup> /day)	$T_{max}$	estimated ( $UVI_{max}$ ) from $\bar{H}_{calculated}$	$\bar{H}_{measured}$ (KW/m <sup>2</sup> /day)	estimated ( $UVI_{max}$ ) from $\bar{H}_{measured}$

SEPT	<b>10</b>	6.9475	35.2	9.805	6.98	<b>9.856</b>
OCT	<b>8</b>	5.7358	31.2	7.580	5.69	<b>7.521</b>
NOV	<b>5</b>	4.6757	26.3	5.454	4.72	<b>5.523</b>
DEC	<b>4</b>	4.2236	21.9	4.254	4.22	<b>4.253</b>

The accuracy indicators, R, MSE, RMSE and MAPE, are used for measuring the powerful of empirical forecasting models and for illustrating the best estimator model, which gives the best prediction performance results. Table 5 displays the results of the accuracy indicators values.

**Table 5:-**Statistical indicators of accuracy

Accuracy Indicators	R	MSE	RMSE	MAPE
UVI <sub>max</sub> predicted from $\bar{H}_{calculated}$	0.9919	0.131	0.362	0.042342
UVI <sub>max</sub> predicted from $\bar{H}_{measured}$	0.9918	0.140	0.374	0.044359

According to the accuracy indicators, there are slightly differences between the results of the two models. The results show that, equation 6 gives the best prediction performance results comparing with equation 11. Therefore, using equation 6 is recommended. The value of  $H$  is calculated according to equation 1 and the value of  $T_{max}$  is determinate according to its daily changeable value. Figure 2 shows comparison between the measured and estimated UVI<sub>max</sub> using the empirical model. It is clear from that figure that there is a very good correlation exists between the measured and estimated UVI.

For example, to estimate the value of UVI<sub>max</sub> of the same days in Table 3, substitute the values of  $H_{calculated}$  and  $T_{max}$  (from Table 3) in equation 6. The results of UVI<sub>max</sub> values are presented in Table 6.

**Table 6:-**Some estimated values of daily UVI<sub>max</sub>

Date	$H_{calculated}$	$T_{max}$	Estimated UVI <sub>max</sub>
16-6-2015	8.457026	35	<b>11.92</b>
19-6-2015	8.323262	40	<b>12.36</b>
28-6-2015	8.423585	36	<b>12.00</b>
03-7-2015	8.350196	34	<b>11.64</b>
26-7-2015	8.234825	40	<b>12.24</b>
29-7-2015	8.201861	41	<b>12.32</b>
06-8-2015	7.733736	40	<b>11.53</b>
09-8-2015	7.655973	43	<b>11.80</b>
13-8-2015	7.671525	43	<b>11.82</b>

Table 6 shows that the value of UVI<sub>max</sub> increases with the increase in the value of maximum temperature, so that the increase is linked to the high values of  $H$  for each day in that month. As well, UVI<sub>max</sub> is extremely high in Jun, July and August. Therefore, estimate of UVI<sub>max</sub> and its health protection are recommended in those months of the year.

**The daily UV dose (DUVD) is calculated as an integral of UV index over the daylight time:-**

$$DUVD = \int_{T_0}^{T_{N+1}} UVI(t) dt$$

$T_0$  is the sunrise time and  $T_{N+1}$  is the sunset time.

**The calculations are performed again using the trapezoid rule that results in the following formula:-**

$$DUVD = \frac{1}{2} \sum_{j=0}^N (UVI_j + UVI_{j+1}) \cdot (T_{j+1} - T_j)$$

The daily UV dose is in UV Index hours (UVI h) if the units of  $T_j$  are hours. To convert UVI h units to  $\text{kJ/m}^2$ , units that are commonly used to express DUVD, the result from the last equation have to be multiplied by the factor:  $0.09 = 25 \times 3.6 / 1000$  (Kiedron et al., 2007).

### Discussion:-

The increase in the amount of solar ultraviolet (UV) light that reaches the earth is considered to be responsible for the worldwide increase in skin cancer and considered as the main etiological factor (Rivas et al., 2015). It has been reported that excessive levels of UVA and UVB light have multiple effects, which can be harmful to humans. There is a steady increase in the incidence of skin cancer in Africa, most probably due to the high levels of UV light and the latitude to which individuals are exposed throughout the year, as well as the accumulative effect of this type of radiation on the skin (Rivas et al., 2015). At the time of developing the UVI, the less energetic UVA (315-400 nm), which is 1,000-fold less efficiently absorbed by DNA than UVB, was believed to play little or no role in skin carcinogenesis as only UVB (280-315 nm) had been shown to damage DNA directly. On the basis of data, in 2009, the International Agency for Research on Cancer (IARC) classified UVA, both from sunlight and tanning devices, as carcinogenic to humans (IARC, 2012). Though less directly damaging to DNA than UVB, UVA is much more abundant in natural light. There is now convincing in vitro and in vivo evidence that UVA is able to cause damage to a variety of biomolecules via photosensitizer mediated processes, leading to oxidative damage to lipids and protein, and can create a number of molecules, including pyrimidine dimers and base oxidation products associated with DNA strand breaks (Ridley et al., 2009). The genotoxic effects of solar UV radiation may therefore derive from both UVB and UVA with the efficiency of DNA repair pathways such as base excision repair and nucleotide excision repair playing an important modulating role in determining the spectrum of mutations produced (Ridley et al., 2009; Ikehata and Ono, 2011). Additionally, The facts that UVA is more penetrating than UVB, reaching keratinocytic stem cells and melanocytes of the basal layer, and also substantially contributes to local immunosuppression (Halliday et al., 2011) provide a further layer of complexity in understanding the contribution of UVA to skin carcinogenesis (Allinson et al., 2012).

The UVI refers to the daily maximum effective irradiance and serves as an indicator of the impact of UV-radiation on erythema (sunburn), an acute skin effect that is closely related to the potential for chronic sun-induced skin damage like skin cancer and photoaging (Allinson et al., 2012). The current UVI formula is weighted around the clinical finding of erythema, which is primarily UVB associated. Moreover, the use of erythema as a surrogate for cancer risk is supported by consistent positive associations between sunburn and both melanoma and non-melanoma skin cancer (Dennis et al., 2008). Epidemiologic studies, however, are not able to quantify skin cancer risk at low levels of sun exposure (UVI 1-3) and cannot distinguish between the specific impact of UVA and UVB radiation. Outdoors, humans are virtually always exposed to UVA and UVB simultaneously, whose intensities vary broadly in parallel. The UVA-UVB ratio depends on the solar zenith angle and thus on the latitude, altitude, time of day, and season, but these variations are too small to capture as input parameters in epidemiologic studies. Thus, although the contribution of UVA to carcinogenesis has likely been underestimated in the past, minor modifications of the action spectrum to take this into account are not expected to have a significant impact on the UVI. The UVI was developed as a tool to conceptualize the amount of harmful radiation and to encourage the general public to use sun protection, and it is recommended to be integrated with broader public health approaches (Table 7) (WHO, 2002).

**Table 7:-UV Index and the corresponding exposure level as categorized by the World Health Organization (WHO)**

UV Index	0-2	3-5	6-7	8-10	$\geq 11$
Exposure level	Low	Moderate	High	Very high	Extreme

Studies examining the impact of the UVI on knowledge, attitudes, sun protection behavior and sun exposure generally showed no effect (**Italia and Rehfuess, 2012**). This suggests that the UVI can raise risk awareness to some extent, but given low levels of understanding in the general population, its potential as a tool to change behavior is limited. Nevertheless, the UVI can indicate usefully when sun protection is required, and several studies have shown population demand for UVI information (**Wester and Paulsson, 2000; Börner et al., 2010; Bulliard and Reeder, 2001**). As awareness about skin cancer prevention and vitamin D increases, so will the interest of the general population in the UVI. For this reason, promotion of the UVI is encouraged. The possible improvements in the utility of the UVI as a public awareness tool are discussed and agreed. It was confirmed that sun protection messages promoted at a UVI of 3 and above are of high public health relevance toward reducing skin cancer incidence and do not conflict with other health messages, especially regarding vitamin D and outdoor physical activities. There is currently insufficient evidence about the quantitative relationship of sun exposure, vitamin D, and human health to include vitamin D considerations in sun protection recommendations. The UVI continues to be a useful tool to estimate risk from solar exposure. However, the impact of the UVI on sun protection behavior is currently very limited, and primary research is needed to improve the effectiveness of the UVI as a public awareness tool. Additionally, well conducted studies are needed on the most effective strategies for using the UVI as part of sun protection efforts. On the other hand, the final goal of changing sun protection behavior in the population might be reached by developing health promotion campaigns that account for personal determinants, such as attitudes, self-efficacy, and self-affirmation (**Allinson et al., 2012**).

Fortunately, the UV Dose (UVD) is directly related to some health effect on humans. A 50% increase in erythral UVD would therefore increase the rate at which the skin reddens by 50% (**Wiegant et al., 2016**). However, **Hatfield et al., (2009)** found statistical relations between exceedance of threshold UVI values and cancer incidence rates by investigating the relation between UV exposure and non-melanoma skin cancer using a statistical model. On the other hand, Vitamin D production in the skin is directly related to UV irradiance weighted by the vitamin D action spectrum. Vitamin D may have beneficial effects regarding cancer incidence and survival rates (**Lim et al., 2006; Garland et al., 2006**). **Kelly et al., (2016)** study the vitamin D thresholds. They studied plasma vitamin D (25OHD) in blood samples in relation to a cumulative weighted vitamin D UVD. The vitamin D production is directly related to the UVD (unlike cancer to UVI, which is statistically related). The UVI threshold of 7 is relevant for skin cancer. Ozone concentrations (in the stratosphere) do not directly relate to any health effects, whereas the UVI and UVD do. Studying the health effects in these regions is the main interest, as this is the primary reason for translating ozone to surface UV irradiance. Interpretation of the results regarding skin cancer incidence and vitamin D can still be expanded, although this is largely dependent on how scientists in the field of medicine quantify the effect of UV irradiance on humans (**Wiegant et al., 2016**). However, **Juzeniene et al., (2014)**, found a direct relation between cancer incidence rates and UVD using sigmoidal curves.

Professional radiation workers are occupationally exposed to long-term low levels of ionizing radiation. Occupational health hazards from radiation exposure, in a large occupational segment of the population, are of special concern. The effective annual dose ranged from 0.05 to 6.84 mSv; radiation workers had a median exposure of  $0.68 \pm 1.58$  mSv/year. These doses, although below maximal permissible limits set by the International Commission of Radiation Protection (ICRP), can have clear biological effects (**Heydarheydari et al., 2016**). Fortunately, the late effects of ionizing radiation can be divided into three major groups: **Somatic damage** ranges from fibrosis and necrosis of individual organs to cataracts and cancer (**O'Sullivan et al., 2003; Stroian et al., 2008**). It can result from somatic mutations and accumulated damage, and include impaired circulation, necrosis, fibrosis of skin and muscle tissue, loss of hair, loss of taste, impaired bone growth, susceptibility to disease, immunodeficiency, aplastic anemia, cataracts, and increased incidence of cancer (**Joiner and van der Kogel, 2009**). Radiation-induced fibrosis (RIF) is one of the most predominant long-term adverse effects of ionizing radiation (**O'Sullivan et al., 2003; Stroian et al., 2008**). Typically, fibrotic response occurs due to the progressive onset of extra cellular matrix (ECM) deposition from stromal tissue such as lung, liver, kidney, and intestine. Chronic deposition leads to loss of elasticity and muscular dysfunction or atrophy in extreme cases. The severity of fibrosis depends on radiation dose, quality of radiation, and dose rate. Fibrosis may be accompanied by epilation, loss of vascularity, and even necrosis of the tissue (**O'Sullivan et al., 2003**). The lens tissue of the eye is particularly radiosensitive and radiation exposure can increase its opacity. Radiation cataractogenesis is the most common delayed radiation injury and is thought to result from damage to the anterior equatorial cells of the lens's epithelial tissue (**O'Sullivan et al., 2003; Stroian et al., 2008**). Most somatic effects require high threshold doses of radiation; cancer is the main health concern after exposure to low-level radiation. The three most common radiation-induced malignancies are leukemia, breast cancer, and thyroid cancer. The latency periods for the detection of cancer after

radiation exposure range from 2 years for leukemia to 30 to 40 years for some solid tumors. On the other hand, the acute effects of radiation exposure on skin are well known and result in severe skin burns (Miller et al., in press). However, low levels of chronic radiation to skin have been observed as well. The accompanying erythema, which resembled a burn, was painless; but, chronic radiation dermatitis following repeated exposure is usually extremely painful. Five progressive categories of radiation damage are observed in skin: (1) erythema, (2) transepithelial injury (moist desquamation), (3) ulceration, (4) necrosis, and (5) skin cancer. Radiation-induced erythema occurs in two stages: (1) mild initial erythema, usually appearing within minutes or hours on the first day after irradiation (occurring earlier with higher doses), and (2) the main erythema, appearing at 2 to 3 weeks and persisting for longer periods. In some cases, a third erythema may occur at 6 weeks. Radiation-induced erythema is a threshold phenomenon. Early erythema arises from the release of mediators and from increased capillary dilation and permeability. It is equivalent to a first-degree burn or mild sunburn, subsiding within 2 or 3 days. Although indomethacin and other prostaglandin-synthesis inhibitors have been used topically to prevent or reduce erythema caused by sunburn or ultraviolet light, they have not been widely used to treat radiation induced erythema. The second onset of erythema is attributed to impaired circulation in the arterioles, producing inflammation and edemas and accompanied by dry desquamation of the epidermal corneocytes. Upper cells are sloughed or abraded off, exposing cells that are not completely keratinized. Cell death and moist desquamation ensue. Both dry and wet desquamation occur about 1 to 4 weeks after irradiation. Regeneration of the stratum corneum requires 2 months to 4 years, and this regenerated tissue will be more sensitive to other skin-damaging agents. The new skin may be thinner than the original, with greater sensitivity to touch and pain. Reduction or loss of the dermal ridges making up the fingerprint has occurred from large or chronic exposures (Miller et al., in press). Fortunately, skin cancers are common in those using radiation equipment, although the incidence has decreased due to increased safety standards (Hall et al., 2012; Miller, 2007). In general, radiation skin cancers are readily diagnosed and treated at any early stage of development and maintain a high rate of curability (Miller et al., in press).

**Genetic or hereditary** effects are the second category of low-level or late effects of radiation. It is estimated that 5 to 65 additional genetic disorders will occur in the next generation for every million individuals receiving 0.01 Gy of gamma or low-LET radiation (Hall et al., 2012; Joiner and van der Kogel, 2009; Miller, 2007). These disorders will be mainly autosomal dominant and gender linked. If each succeeding generation were to receive an additional 0.01 Gy of radiation, equilibrium would be reached in the gene pool, and an average increase of 60 to 1,100 genetic disorders per million individuals would be observed in the population. This would result in a 1.5% increase in the overall incidence of genetic disorders. The normal incidence of genetic disorders in the population is 1 in 10 (Miller et al., in press). However, genetically induced malformations, cancers, and numerous other health effects in the children of populations who were exposed to low doses of ionizing radiation have been unequivocally demonstrated in scientific investigations (Schmitz-Feuerhake et al., 2016). The third category of late radiation damage is **teratogenic** effects. The primary teratogenic somatic effects seen in humans exposed in utero are microencephaly, intellectual disability, and growth retardation. These effects have been observed with an increased incidence in the atomic bomb survivors exposed in utero to doses of less than 0.10 Gy, although a neutron component may have enhanced the radiation effectiveness. In general, thresholds exist for the induction of birth defects by radiation, and effects below 0.10 Gy are negligible. The normal incidence of birth defects is 1 in 10 live births. One concern for low-level exposure to ionizing radiation in utero is the increased incidence of cancer in childhood. An estimated 25 additional cancer deaths are predicted for every million children receiving 1 cGy of radiation in utero. Preconceptional parental exposures leading to transgenerational effects have recently become a concern. The human data are inconclusive and controversial, so no risk estimates have been established. Further studies in epidemiology and with animal models will provide guidance (Miller et al., in press).

### Conclusion and Recommendation:-

Empirical model is developed to estimate the daily clear sky global radiation (H). Multiple linear regression models of four variables are employed to estimate H. According to statistical evaluation, the predicted clear sky global solar radiation overlaps the measured clear sky global solar radiation in all months of the year. The developed model is considered a simplified statistical approach because it depends on two monthly constant predictors ( $S_0$  &  $\cos(\theta_{ZMT})$ ) and one daily changeable predictor ( $\bar{T}$ ). The estimated high global solar radiation of the summer months is required for detailed study to get the maximum benefits of solar energy for electric power production and for estimating  $UVI_{max}$ . Consequently, the estimated H and  $T_{max}$  are used to construct accurate simplified estimation model of daily  $UVI_{max}$ . The results show that, the value of  $UVI_{max}$  increases with the increase in the value of maximum temperature, so that the increase be linked to the high values of H for each day in that month. Additionally, the study

recognized adverse effects of excessive solar radiation on the skin, the eyes and the immune system and outlines new approaches on how to improve the effectiveness of the UVI as a public awareness tool toward encouraging sun protection behavior. The study also clarifies the late and low level effects of ionizing radiation on health.

Although radiation biology cannot currently provide direct evidence of low dose effects in human health, a comprehensive understanding of radiobiological mechanism would facilitate epidemiological studies and improve the precision of a dose-response relationship at low dose levels. The integration of biological and epidemiological studies along with social science research will allow firmer conclusions about low dose effects on human health on the basis of social trust. Insights from health behavior theory and health communication science and recent developments in information technologies may offer opportunities to improve the effectiveness of UVI communication efforts. One important approach to increase the effectiveness of public health campaigns relies on strategic design of the intervention, including a specific definition of the target group and theory- and evidence-based development of the campaign message.

#### Abstract

Tannin Acyl Hydrolase (E.C 3.1.1.20) commonly referred as Tannase is one of the important hydrolytic microbial enzymes. It hydrolyses hydrolysable tannin and produces glucose and gallic acid. It is an industrially important enzyme and has several applications in various industries such as food, pharmaceutical, leather, animal feed and cosmetics. Realizing the importance of enzyme tannase, the present study aims to investigate the total phenolic content and hydrolysable tannin content from different agro-residues and utilize the efficient agro-residue as a substrate for potent tannase producing microorganism for the production of tannase. The amount of total phenols, were analyzed using a spectrophotometric technique, using Folin-ciocalteu reagent. Gallic acid was used as standard compound and the total phenols were expressed as mg/g gallic acid equivalents. The hydrolysable tannin content was analyzed by Mondal's method. The maximum phenolic content and hydrolysable tannin content was found in *Punica granatum* peel (pomegranate peel) and *Prunus dulcis* leaves (almond leaves) respectively. Thus out of the thirty one agro-residues; three agro-residues were selected for final screening having higher concentration of hydrolysable tannin content viz. *Prunus dulcis* leaves (almond leaves), *Annona reticulata* leaves (Custard apple leaves); *Azadirachta indica* leaves (Neem leaves). The selected agro residues were used for production of microbial tannase. Accordingly the actinomycetal isolate, *Streptomyces* sp.SKA1 and the leaves of *Azadirachta indica* were selected as potent combination for tannase production.

#### Introduction:-

Phenolics compounds are broadly distributed in the plant kingdom and they are the most abundant secondary metabolites in plant. These plant phenolic are involved in defense against ultraviolet radiation or aggression by pathogens, parasites and predators. They are abundant in all plant organs therefore they are integral part of human diet. They are important constituents of plant food (Fruits, vegetables, cereals, olive, legumes, etc.) and beverages (Tea, coffee, beer, wine etc.) and they are also responsible for bitterness and astringency of fruit and fruit juices. (Jin, D. and Russell, J. M 2010)

Plant phenolics include phenolic acids, flavonoids, tannins, the stilbenes and lignans. Tannins constitute a large group of complex organic, non-nitrogenous phenolic compounds of high molecular weight. Tannins are natural polyphenolic compounds that are widely distributed in several parts of vascular plants. They are the second most abundant group of phenolics in nature and are considered as secondary metabolic compounds of plants because they play no direct role in plant metabolisms (Pepi M, Lampariello L R, Altieri R *et al.* 2009). These secondary metabolites are present in solution form in the cell sap and also in distinct vacuoles. Chemically tannins contain the mixture of complex organic substrate in which polyphenol are present, generally with O-dihydroxy or O-trihydroxy group on a phenyl ring. (Fig. I) Tannins are soluble in water and alcohol; they form colloidal solution with water and are non crystalline. They have the capacity to combine with tissue proteins and precipitate them. Tannins are characterized by their ability to form strong complexes with different minerals and macromolecules, such as proteins, cellulose, and starch among others (Bele, A.A., Jadhav, V. M., Kadam, V. J. 2010). Tannins have several interesting biological activities. Active principles of medicinal plants are often polyphenolic compounds, and, in recent years, there has been a great scientific interest for this group of compounds due to their antioxidant, antiviral, and anticancer properties (Bors, W. Michel, C. 1999, Carretero-Accame M E. 2000). High concentrations of tannins in beverage such as ice tea, beer, wine, fruit juices, and coffee-flavored beverages can result in the formation of precipitates due to their interaction with other molecules present in these beverages. These undesirable effects of tannins can be reduced or eliminated by a chemical or enzymatic treatment. (Belmares, R., Contreras-Esquivel, J. C., Rodríguez-Herrera, R. Coronel, A. R., Aguilar, C. N. 2004). Tannins are toxic to fungi, bacteria, and viruses. However, many microorganisms have developed the mechanisms to overcome the effects of tannins. These mechanisms include tannin modification, degradation, dissociation of tannin-substrate complexes, tannin inactivation by high-affinity binders, membrane modification, and metal ion sequestration (Belur, P. D., Gopal, M., Nirmala, K. R., Basavaraj, N. 2010) Tannins are subdivided into two groups: 1) Hydrolysable tannins and 2) Condensed tannins.

#### Basic Structure of Tannin

Hydrolysable tannins undergo hydrolysis and produce gallic acid. According to acid produced, they are known as gallitannins or ellagitannins. Examples of hydrolysable tannins are gallotannin in nutgall, rhubarb, amla, clove and chestnut; ellagitannin from oak, myrobalans and pomegranate bark. Condensed tannins are oligomers or polymers of flavan-3-ol linked through an interflavan carbon bond.

Interest in tannins has considerably increased in recent year because of their broad spectrum of chemical and diverse biological properties. One of the important properties of tannin is that it is used as substrate for the production of enzyme tannase. Though these polyphenolic compounds are widely distributed, the health effects of dietary Polyphenols have come to the attention of nutritionists in recent year (Jin, D. and Russell, J. M. 2010) however using the enzyme tannase the nutritional quality of dietary products can be improved. Tannins are known for their

antimicrobial property and are resistant against microbes to protect plant bodies. They are toxic and release bacteriostatic compounds making non-reversible action with proteins (Bhat et al., 1998)

Tannase catalyzes the hydrolysis of bonds present in the molecule of hydrolysable tannins and gallic acid esters (Lekha and Lonsane, 1997). The systematic name of tannase is Tannin acyl hydrolase (3.1.1.20). It is an extracellular, inducible enzyme that catalyses the hydrolysis of ester and depside linkages in hydrolysable tannins yielding glucose and gallic acid as products. It can be obtained from fungi, bacteria, some yeasts, higher plants and animal sources (Belur and Mugeraya 2010). It has wide application in preparation of instant tea, acron wine, coffee flavored soft drinks, clarification of beer and fruit juices, detanification of food and increasing the nutritive property of feed and also in bioremediation of effluent from leather industries. Tannase has wide application in cosmetics, chemicals and brewing industries; in preparation of gallic acid (Brahmbhatt D. et al., 2014). Recently bacteria showing tannase activity is considered as a biomarker for colon cancer (Lekha and Lonsane, 1997; Das Mohapatra et al., 2012). Due to Production costs and insufficient knowledge of the enzyme the use of tannase on a large scale is severely limited. (C.N. Aguilar and G. Gutie 2001)

Tannase is known to produce by bacteria, yeast and fungi, no reports available with actinomycetes. Filamentous fungi of the *Aspergillus*, *Penicillium* genus and bacteria of the *Bacillus* and *Lactobacillus* genus have been investigated for tannase production (Banerjee et al. 2001; Mondal et al. 2001). Techniques for production of tannase have been extensively studied and commercial production of tannase is achieved using synthetic tannic acid. The industrial process makes use of chemical tannic acid for tannase production but this process involving synthetic substrates has adverse environmental consequences. Conventionally gallic acid is also produced chemically by acid hydrolysis of synthetic tannic acid and suffer from disadvantages like high cost to yield ratio and low purity. (Swaran Nandini et al. 2014).

Therefore it is very necessary to design a process for the production of tannase which is more economical and environmental friendly. This has led to generating interest in searching natural source for tannic acid that can be effectively utilized by microbes. This effort may reduce the dependency on synthetic tannic acid.

Realizing the importance of enzyme tannase, the aim of the present study was to estimate the total phenolic content and hydrolysable tannin content in the methanolic extract of various agro-residues, to select the efficient agro-residue for production of microbial tannase.

## **Materials and Methods:-**

### **Plant material:-**

Different agro-residues like fruits, leaves, fruit peels, seeds were collected from local area and botanical garden in January 2014 and shade dried.

### **Extraction:-**

Dried ground agro-residues were extracted with 99% methanol. The extract was concentrated by evaporation to yield gummy concentrate of greenish color.

### **Chemicals:-**

Gallic acid, Methanol, Folin-Ciocalteu (FC) reagent, Bovine Serum Albumin, Sodium acetate, Ferric chloride, Acetic acid, SDS, Triethanolamine was obtained from Hi media chemicals. All the chemicals used were of analytical grade.

### **Microorganisms for the production of Tannase:-**

The potent tannase producing fungal cultures SKF7, SKF11, Actinomycetal cultures SKA1, SKA2, and bacterial cultures SKB2, SKB3 were used for tannase production.

### **Screening of agro-residues:-**

The methanolic extracts of thirty one agro-residues were screened for the total phenolic content by the Folin Denis Method and hydrolysable tannin content by the Mondal's method.

### **Estimation of total Phenolic content:-**

A standard graph was prepared using different concentration of gallic acid ranging from 10 µg/ml-100 µg/ml was prepared. A volume of 1.5 ml FC reagent was added in each tube. After five minutes, 4 ml of 20% sodium carbonate

solution was added and the volume was made up to 10 ml with distilled water. The mixture was kept for 30 mins and absorbance was read at 738nm. (Premakumari K.B. *et.al.* 2010). Tannic acid was used as standard compound and the total phenols were expressed as mg/g gallic acid equivalents

#### Sample Preparation and estimation:-

Methanolic extract of all agro-residues in 100 ml volumetric flask were made up to 50 ml with distilled water. (As shown in figure 3). Further 0.1 ml of methanolic extract, 1.5 ml of FC reagent, and 4ml of 20% sodium carbonate solution were mixed and made up to 10 ml with distilled water. After 30 mins, absorbance was read at 738nm. Premakumari K.B. *et.al.*, 2010 detected antioxidant activity and estimated total phenolic content of *Muntingia calabura* by employing this method.

#### Estimation of hydrolysable Tannin content by Mondal's method:-

##### Tannase Assay:-

Standard graph of tannic acid was prepared by making the various concentration of tannic acid ranging from 1 mg/ml to 10 mg/ml in 0.2M acetate buffer (pH 5). Then 0.5 ml of tannic acid from each tube, mixed with 2ml of Bovine Serum Albumin (1mg/ml) which precipitates the tannic acid. A control reaction was also carried out with heat denatured enzyme. The tubes were then centrifuged (5,000 x g, 10 min) and the precipitate was dissolved in 2 ml of SDS-triethanolamine (1% w/v triethanolamine) solution (As shown in Figure 4) and the absorbance was measured at 530 nm after addition of 1 ml of FeCl<sub>3</sub> (0.13 M) (Mondal *et.al.*, 2001)

#### Sample Preparation and estimation:-

Methanolic extract of all agro-residues taken in 100 ml volumetric flask were made up to 50 ml with 0.2 M acetate buffer (pH 5). From this solution 0.5 ml was taken out in a test tube and mixed with 2ml of Bovine Serum Albumin (1mg/ml). A control reaction was also carried out with heat denatured enzyme. The tubes were then centrifuged (5,000 x g, 10 min) and the precipitate was dissolved in 2 ml of SDS-triethanolamine (1% w/v triethanolamine) solution and the absorbance was measured at 530 nm after addition of 1 ml of FeCl<sub>3</sub> (0.13 M)

### Results and Discussion:-

#### Phytochemical Screening:-

The observation revealed that methanolic extract of various agro-residues showed the presence of total phenols by Folin-Ciocalteu method. Mariela Gonzalez, Bernardo Guzman *et.al* 2003 reported that, due to its reproducibility, the Folin-Ciocalteu method is recommended for *Propolis* with high phenolic compound concentrations.

#### Estimation of total phenolic content:-

The amount of total phenols was determined with Folin-Ciocalteu reagent. Gallic acid was used as standard compound. The absorbance for various dilutions of gallic acid with Folin-Ciocalteu reagent and sodium carbonate were noted and are shown in table I. The total phenolic content (gallic acid equivalent) in methanolic extract was found to high in *Punica granatum* peel (pomegranate peel) which was shade dried (7.04 mg/ml). Sharma G.N. *et.al.*, 2011 reported the total phenol content of methanolic extract of *Aegle marmelos* as 65.20 mg/g

#### Screening of agro- residues for microbial tannase production:-

Out of thirty one agro-residues finally three agro-residues *Prunus Dulcis* leaves (Almond leaves) *Azadirachta indica* leaves (Neem leaves) and *Annona reticulate* leaves (Custard apple leaves) showed high hydrolysable tannin content, among these three agro-residues combination of *Azadirachta indica* leaves as a substrate and actinomycetal isolate SKA1, show promising tannase activity (As shown in figure 1). Paranthaman R. (2008) reported that Rice straw and Sugarcane can be used as substrate for the production of tannase. Kulkarni, A. patil, P. and Kinige, P. (2012) reported tannase production from *Aspergillus oryzae* NCIM 1032 using mixture of Jamun (*Syzgium cumini*) and Babul (*Acacia nilotica*) stem barks under solid state fermentation.

**Table 1:- Concentration of total phenolic content and hydrolysable tannic acid of different Agro-residues**

Sr.no.	Botanical Name of Agro-residues	Common name of Agro - residues	Conc. of total phenol mg/ml	Conc. Of hydrolysable tannin mg/ml
1	<i>Terminalia belirica</i>	Behda	4.75	2.52

Figure 5:- Potent tannase producer fungal (SKF7), bacterial (SKB2) and actinomycetal (SKA1) isolates

### Conclusion:-

The total phenolic content of thirty one agro-residues was estimated using Folin-Ciocalteu reagent. The results of Phytochemical screening reveals that the maximum phenolic content was found in methanolic extract of pomegranate peel, whereas the maximum hydrolysable tannic acid concentration was found in methanolic extract of almond leaves. When different combinations of all the types of Isolates with three efficient agro-residues were carried out it was found that combination of actinomycetal culture *Streptomyces* sp. SKA1 and *Azadirachta indica* leaves (Neem leaves) as a substrate was found to be best combination for tannase production. Further study of process optimization will be carried out using this high tannin containing substrate.

#### Key words:-

hypertriglyceridemia, milky blood.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Hypertriglyceridemia (HTG) is defined as an increase in fasting serum triglyceride (TG) levels greater than 150 mg/dl<sup>1</sup>. Causes of HTG vary from hereditary to acquired causes, such as diet or medications. Presentation of patients with HTG ranges from being asymptomatic and being diagnosed incidentally, to having minor presentations, such as skin manifestations, and to life-threatening conditions, such as pancreatitis. High TG levels result in turbidity and cloudiness of the blood, and this subsequently interferes with laboratory results<sup>2</sup>.

We present a case of a 42-year-old woman who presented to the emergency department (ED) in an acute confusional state. She had milky white blood secondary to HTG. To the best of our knowledge, this is the first case with a similar clinical picture and initial presentation secondary to a pituitary macroadenoma to be described.

#### Case Presentation:-

A 42-year-old woman, not known to have any medical illnesses prior to presentation, was brought to the ED with an altered level of consciousness, which was noticed by her family. The patient's symptoms were confusion, abdominal pain, nausea, and vomiting. The patient was noticed to have had six to seven meals per day, and she also consumed large amount of powdered milk of approximately 5 to 6 L per day.

A physical examination showed that she had an average body mass index and was confused with a Glasgow Coma Scale score of 14/15. Vitals signs showed a temperature of 36.7°C, heart rate of 114 bpm, blood pressure of 135/87 mmHg, respiratory rate of 30, and O<sub>2</sub> saturation of 99%. The rest of the physical examination was unremarkable. A blood sample was collected from the patient to undergo laboratory testing. The blood was milky white (Figure 1). Findings from the initial laboratory investigations that were performed at the ED are shown in Tables 1 and 2.

The patient was then admitted to the intensive care unit and started on anti-lipemic medication, insulin, and heparin. She underwent plasmapheresis three times over 3 consecutive days (Figures 3). She then improved clinically and biochemically (Tables 1 and 2).

**Corresponding Author:-Adnan AlAwami.**

Address:-Department of Emergency Medicine, King Fahad Hospital of the University, Imam Abdulrahman Alfaisal university, Alkhobar, Saudi Arabia.

During the patient's stay at the intensive care unit, she underwent magnetic resonance imaging (MRI) of the head because of the impaired level of consciousness. MRI showed a pituitary macroadenoma (Figures 3 and 4), which could explain the polyphagia experienced by the patient. Then patient was referred for surgical follow up and evaluation after discharge.

### Case Discussion:-

We report a case of severe HTG that was induced by excessive milk powder ingestion (polyphagia), which could be explained by the presence of a pituitary macroadenoma. To the best of our knowledge, this is the first reported case of severe HTG that was secondary to such a cause.

There have been few previously reported cases similar to our case, in which the patient presented with milky white blood. Most of the previously reported cases were from India, Nepal, and the USA. Sandhya reported a patient aged 43 years old, with type 2 diabetes mellitus on irregular treatment, who presented with abdominal pain. The patient had a random blood sugar level of 640 mg/dl. The patient's TG level was 17,300 mg/dl. The patient was treated accordingly as a case of diabetic ketoacidosis and severe HTG<sup>3</sup>. Another patient with milky white blood was reported from Nepal in 2010. A 66-year-old man, who had hypertension, and was an alcoholic and a smoker, complained of joint pain. The patient had a history of eating a large amount of fried pork and drinking a large amount of alcohol. The patient's TG level was 1621 mg/dL<sup>4</sup>. An asymptomatic case was reported in the USA, in which the patient had no complaints and was incidentally found to have white opaque blood upon a regular checkup<sup>5</sup>.

HTG is defined as an increase in fasting serum TG levels greater than 150 mg/dl. Recent Endocrine Society guidelines classified HTG into the following four categories: mild (150–199 mg/dL; 1.7–2.2 mmol/L), moderate (200–999 mg/dL; 2.3–11.2 mmol/L), severe (1000–1999 mg/dL; 11.2–22.4 mmol/L), and very severe (>2000 mg/dL; >22.4 mmol/L).<sup>1</sup> In our case, the patient was categorized as having severe HTG. Her HTG level at the ER was 3760 mg/dl. The underlying pathogenesis of HTG is due to increased production and/or intake, reduced catabolism, or a combination of both. HTG can be either primary or secondary. Primary HTG is mainly due to genetically-based familial hyperlipidemias.<sup>6</sup> Familial combined hyperlipidemia is the most common heritable dyslipidemia with a prevalence of 1–2% in the general population. It is an autosomal condition, associated with insulin resistance, obesity, and premature cardiovascular disease.<sup>6,7</sup> There are other less common heritable dyslipidemias, such as familial HTG, chylomicronemia syndrome, and type III hyperlipidemia or dysbetalipoproteinemia.<sup>7</sup> Secondary causes of HTG include a high carbohydrate and fat diet, drugs, such as bile acid sequestrants,<sup>8</sup> retinoids,<sup>9</sup> and antihypertensive drugs (thiazide, furosemide, and beta-blocker agents), especially in patients with underlying genetic hyperlipidemia.<sup>10</sup> Conditions with insulin resistance, such as diabetes mellitus type 2, metabolic syndrome, polycystic ovarian syndrome, acromegaly, and pregnancy, increase the production of TG, leading to HTG<sup>10,11</sup>. Acute hepatitis and nephrotic syndrome can also cause HTG.<sup>12,13</sup>

In our case, the patient did not have any previous medical illnesses, obesity, or the use of any drugs. She was consuming a high amount of carbohydrate and fat, which is thought to be secondary to the pituitary adenoma that was later diagnosed. Patients with HTG are usually asymptomatic, but they may present with some characteristic features, including eruptive xanthomas and fatty changes in the liver. The most feared clinical feature of HTG is the risk of developing life-threatening acute pancreatitis. Studies have shown that TG levels >500 mg/dL increase the risk of developing acute pancreatitis.<sup>14</sup> High serum TG levels can interfere with laboratory results. Chylomicrons and very-low-density lipoprotein are suspended particles that scatter light, which results in cloudiness or turbidity of the blood.<sup>2</sup> This may result in the delay or underestimation of electrolyte concentrations in the blood. This situation can

be minimized by ultra-centrifuging the sample by reducing the lipid or by using polymers to precipitate the lipids in the sample.<sup>15</sup>

Management of HTG should consist of non-pharmacological and pharmacological treatment, which is known as conventional management. Non-pharmacological therapy basically targets the life style of the patient. This therapy includes modification of the diet by restriction of carbohydrates and a fat-rich diet, or introducing a diet rich in omega-3 fatty acids,<sup>16</sup> exercise, and weight loss. Physicians recommend that in severe HTG (>1000 mg/dL), dietary fat intake should be less than 10% of total caloric intake. If TG levels are 400–1000 mg/dL, then dietary fat should be 20% of total of caloric intake<sup>17</sup>.

Pharmacological therapy should be considered according to clinical practice guidelines when TG levels are greater than 200mg/dl.<sup>17,18</sup> This therapy includes anti-lipidemic agents, insulin, and heparin. Anti-lipidemic agents include fibrates, statins, and niacin. Fibrates, such as gemfibrozil, are the first-line agent for controlling TG levels.<sup>18</sup> Fibrates can reduce up to 30–50% of TG in the serum by several mechanisms, including increased catabolism of TG by increasing oxidation and by decreasing production of very-low-density lipoprotein by the liver.<sup>19,20</sup> Statins are HMG-CoA reductase inhibitors (rate-limiting enzyme of cholesterol synthesis). Statins mainly lower cholesterol levels, and can lower TG levels by 25–30% with high doses.<sup>21</sup> Therefore, statins cannot be used alone. Statins can be used with fibrates, but with caution, by close monitoring of creatinine kinase because they may increase the chance of rhabdomyolysis.<sup>21,22</sup> Niacin can be used as well, but its effects in lowering TG levels are only 10–30%. Insulin and low-dose heparin can be used to lower TG levels, but both increase lipoprotein lipase, which degrades TG to glycerol and free fatty acids.<sup>23</sup>

Plasmapheresis is a therapeutic procedure where the plasma is separated from the blood and filtered, and then returned. Plasmapheresis should be indicated in case of failure of conventional treatment to lower TG levels. A previous study suggested that TG levels greater than 2000mg/dl should be an indication for plasmapheresis to avoid systemic complications, such as acute pancreatitis.<sup>24, 25</sup> A single session of plasmapheresis can reduce TG levels up to 70%, producing a clear, clinical, and laboratory improvement<sup>24, 25</sup>. Plasmapheresis is a relatively safe procedure with few complications, such as urticarial, paresthesia, rigors, headaches, hypotension, and muscle cramps.<sup>26</sup>

## Conclusion:-

To the best of our knowledge, this is the first case of Sever HTG secondary to excessive milk ingestion and polyphagia which was caused by macroadenoma of the pituitary gland. Physician must be aware of such etiology for further management considerations in addition to the usual medical therapy.

#### Abstract

A powered wheel chair is a mobility-aided device for persons with moderate or severe physical disabilities. In order to take care of people with different disabilities, various kinds of interfaces have been developed for powered wheelchair control; such as joystick control, head control, chin control and sip-puff control. Many people with disabilities do not have the ability to control powered wheel chair using the above mentioned interfaces. In this project work, we propose and implement an eye controlled wheelchair system in which the control of the wheelchair is done as per the movement of eye. For this purpose, we use the optical-type eye tracking system to control powered wheel chair. User's eye movement are translated to screen position using the optical type eye tracking system. When user looks at appropriate direction, then computer input system will detect the direction, based on the coordinate position of pupil i.e., when user moves his eyes balls up (move forward), left (move left), right (move right), down (move backward) and in all other cases wheel chair will stop. The image captured by a camera after being processed it is fed to the microprocessor. The microprocessor will take a USB output from the laptop and convert the data into signals that will be sent to the wheelchair wheels for movement. Also, the object detection sensors will be connected to our microprocessor to provide necessary feedback for proper operation of the wheelchair system. In the case of the wheelchair, the front two wheels will be used for steering left and right and rear wheels provide the forward movement. All four wheels will be connected to our microprocessor that will send signals to control the wheels and thus the overall movement.

#### Introduction:-

The Wheelchair is dependent system used by elderly and physical disable persons. Here introducing the design implementation models of totally independent Eye control electric wheelchair. As per requirement of the disabilities, different kind of automatic systems are available in market such as voice control or joystick control system. Sometime for totally paralysis person may be have very difficult to use that type of systems. Here the Eye control system provides the independence to make their life easy and more convenient. And also they save the huge amount

of energy or external man power. Camera captured the image in real time and analysis the image as input to set the commands for interface the motor driver IC. The motor driver circuit is used to perform the different operation such as left, right, forward and stop.

Several application and algorithms are used to find out accurate pupil location detection and tracking of that. One of them is Haar cascade like features detection algorithm used to detects single or multiple face and detection of both eye. To detect the exact Eye pupil and locate its center point is the ultimate goal of this system. For automatically finding out Eye pupil and tracking eye pupil, many computer vision library of Image processing techniques like object detection, Motion detection, Image color conversion, Edge detection, Pattern matching etc. are used.

This is efficient as well as cost effective system. Here real time video image capturing based on Face, Eye and Eye Pupil detection with minimum delay of time is used. The system includes multistage that mainly track the Eye pupil center. An Eye tracking technique is used, which capture the image and detects the presence of human face. After detecting the face, it detects area of the eye location on the face detected image, and performs several operation of basic image processing like colour image to grey conversion, filtering, threshold, pattern matching, noise reduction and circle detection on it.

### **Literature Survey:-**

In paper [1], The main aim of this paper is to develop an efficient interface to track the iris movement and to use this information to control the direction of robotic vehicle. This paper gives information about morphological operations to detect eyeball movement and how we can use it to move a robot in direction of the line of sight of the user. Through a web camera, the photographs of either the left or the right eye is continuously captured. Send this information to the robotic vehicle through a wireless link. The robotic vehicle receives the digital data and performs some operation on it. According to the digital data the robotic vehicle controls its direction.

In Paper [2], deals control and navigation of the wheelchair for elderly and disabled based on kinematic model iris motion and image processing. A navigation system, based on iris movement and image processing, was real-time implemented in MATLAB. This navigation system identifies the user's eye movement in three directions: forward, left and right. Stop of the wheelchair is done by eye closing. Using a LabView platform, a graphic user interface has been designed and implemented, allowing user to control wheelchair movements. The whole set of information in the image processing includes eye detection, direction finding and validating it by averaging 10 frames.

In Paper [3], An Eye Controlled System which enables the movement of the patient's wheelchair depending on the movements of eyeball. The person sitting on the automated Wheel Chair with a camera mounted on it, is able to move in a direction just by looking in that direction by making eye movements. The captured camera signals are then send to PC and controlled MATLAB, which will then be send to the Arduino circuit which in turn will control motors and allow the wheelchair to move in a particular direction. It is easier and simple to handle, and User friendly. It has Poor gaze direction accuracy and costly.

This is a paper [4], implements a Smart Phone controlled Robot that uses ATMEGA328 Microcontroller. In this paper, a robot is designed that can be controlled using an application running on an android phone. It sends control command via Bluetooth which has certain features like controlling the speed of the motor, sensing and sharing the information with phone about the direction and distance of the robot from the nearest obstacle. The data received by the Blue-tooth module from Android smart phone is fed as input to the controller. Thereby, the controller acts accordingly on the DC motors to move in the entire robot in all the four directions using the Android phone. The robot is small in size so can be used for spying and it can be used in the borders for disposing hidden land mines.

The paper [5], implements a non-periodic signal digitalization using ATMega microcontroller. Sampling and quantization are accomplished but ATMega328 micro processor. A microprocessor ATMega328P, which was released by company of Atmel, was used to meet this requirement. ATMega328P is an eight bite processor with eight analogue input pins, fourteen digital input/output pins of it six pins have also PWM analogue output pins. Internal memory of microprocessor is 32KB Flash, 2KB SRAM an 1KBEEPROM. Clock frequency is 16MHz.

This paper [6], Develops a Bluetooth Electronic Scale for Water Intake using Arduino. The hardware part of the system mainly includes Arduino board UNO and development environments. Arduino is an open-source development of I/O interface control panel. There is a similar java, C language development environment, so that

users can use the Arduino language and other software to make interactive works. Many switches or sensors, LED, stepper motors, etc. There are many amazing interactive work can be developed through the Arduino. Arduino UNO R3 is the latest of a 2012 easy-to-open source controller, compared with the Arduino UNO and has not major changes in hardware. The biggest difference is that the USB-connected in series circuit, instead of a piece of ATmega16U2 microcontroller, costs will has increased, the software portion as before, there is not big changes.

This paper [7], aims in implementing a mobile robot system, which is capable of performing various tasks for the physically disabled. To avoid collision with unexpected obstacles, the mobile robot uses ultrasonic range finders for detection and mapping. This paper describes some features of a mobile nursing robot system, which is produced as an aid for bedridden who acquire constant assistance for the most elementary needs. The obstacle is detected with the ultrasonic rays being reflected is being sensed by the sensors. The amount of reflected sound energy depends strongly on the surface structure of the obstacle. It is accurate and make the disabled person independent but Ultrasonic is expensive.

In this paper [8], proposes a novel approach to obstacle detection and collision avoidance using ultrasonic sensors in indoor environment. For an intelligent quad-copter, detecting obstacles to avoid collisions is very important. If a robot can be made to avoid colliding with objects in the environment, then other higher-level capabilities can safely be incorporated into the system. A custom designed 'cap' with sensors fitted in, interfaced with the copter through Arduino Development Board has been used to make the quad-copter intelligent through feedback and correction. In this cap, four slots are created for fitting the ultrasonic sensors. As four sensors are used here, best results were obtained by placing them at an angular separation of  $90^\circ$ . These ultrasonic sensors are controlled using an Arduino development board. The sensors are placed one on each of the four faces of cap. A custom made shield has been used to create a common power supply for all the sensors. Arduino, along with the shield is glued inside the cap so that the wires or the modules don't dangle ensuring that the connections are not disturbed.

In thi paper [9] , presents both simple and complex obstacle detection using an ultrasonic sensor ring with overlapped beam pattern. It is assumed that a set of ultrasonic sensors of the same type are arranged along a circle of non-zero radius at regular spacings with their beams overlapped. To assess the positional uncertainty of an overlapped ultrasonic sensor ring in obstacle detection, the obstacle distances of three adjacent ultrasonic sensors are compared. First, the positional uncertainty for single obstacle detection can be determined based on the combination of ultrasonic sensors detecting an obstacle. Second, the positional uncertainty for multiple obstacle detection can be determined based on the inequality relationship among three adjacent obstacle distances. Third, the positional uncertainty for omnidirectional obstacle detection can be determined by overlapping all the uncertainty arcs obtained for every three consecutive ultrasonic sensors.

In paper [10] , Eye Ball Tracking System is a device which is intended to assist patients that cannot perform any voluntary tasks related to daily life. Patients who only can control their eyes can still communicate with the real-world using the assistive devices like one proposed in this paper. This device provides a human computer interface in order to take decisions based on their eye movement. A real time data stream is captured via webcam that transfers data serially to MATLAB. Then a sequential image processing scheme segments the iris of the eye and calculates the centroid, thereby generating control signal with the help of a reference axis. The control signals are then used to manipulate the position of a motorized platform via USB microcontroller interface. The data processing is done in a simplest way and low cost.

In this paper [11], it presents an effective albeit simple technique to perform mouse cursor movement by first detecting the user's eyes, and then calculating the position on screen at which the user is looking. The idea of our paper is to use a series of steps for image processing, and then use a certain algorithm to convert screen coordinates to world coordinates. Once pupil detection is done, we get the coordinates of the pupil in the image. Our algorithm uses a concept of distance of these coordinates from the midpoint of the screen to calculate the actual coordinates of the position on screen the user is looking at. These are then passed to a function in MATLAB to move the cursor. The captured image is converted to a grayscale image. The grayscale image then undergoes K-Means clustering after which it is converted to a binary image. This binary image undergoes further transformation, at the end of which we get a rectangular region containing the eyes of the user. Once these coordinates are calculated, a formula is applied factoring in the distance of the face from the screen, and the average radius of an eye. The output of this is the actual coordinates to which the cursor is moved.

The paper [12] is to, implements an Eye Movement Based Electronic Wheel Chair For Physically Challenged Persons. The main objective of segmentation is to remove non useful information, namely the pupil segment and the part outside the iris (sclera, eyelids, skin). Daugman proposes an integrodifferential operator to find both the pupil and the iris contour. The algorithm will perform the iris recognition in two phases. The algorithm used in the first phase, uses the knowledge that a pupil is a very dark blob of certain minimum size in the picture, and The second algorithm takes the information of the pupil canter and tries to find direction in which the eye looks. The input image given to the MATLAB for processing will produce an output image with the coordinates of iris and pupil. The input image given to the MATLAB for processing will produce an output image with the coordinates of iris and pupil.

In this paper[13], mainly aims in describing the method of using Radio Frequency transmission as wheelchair user interface. Human-machine interface can be considered as an essential element in robotic wheelchair control mode. The purpose of this paper is to examine the functionality and efficiency of the manual control mode with the implementation of low cost RF Transmitter and Receiver modules for wireless transmission. A User's Controller Panel as well as a model of robotic wheelchair has been designed and developed to provide the testing of robotic wheelchair locomotion control via wireless data transfer. By using C programming algorithm, PIC16F877 has been used as the Microcontroller unit for robotic wheelchair while PIC16F88 as the Microcontroller unit for User's controller panel. The results prove that low cost RF modules have the feasibility to be used for simple-one way wireless data transfer with the capability of transmitting several basic instructions to the robotic wheelchair.

In Paper[14], implements a Mobile Robot Control over a Radio Frequency Communications Link. the operation of the robot was to be quite simple; it was to be able to move forward and backward and turn left or right. Keeping these commands separate simplified distance calculations, and with the use of optical encoders attached to the wheels, this data was easily gathered. The direction beading was measured with the use of a digital compass that output the direction in a binary number. The user controls robot movement in one of two ways. The first possibility is a real-time instruction that tells the robot to execute a particular command until another is given. Essentially, the operation is similar to that of a remote controlled car. The other possibility is a list of commands to be executed in a particular order. The data contained in this list includes the direction in which the robot is to go, the length at which the robot is to execute the command, and the speed at which the command is to be executed.

In Paper [15], implements RF Module Based – Speed Check and Seatbelt Detection System. This system will have to part 1)Transmitter and 2) Receiver System. Transmitter part will be on the Road Side at Speed Sign Board. The role of the transmitter is to transmit the maximum allowable speed limit of that road to receiver. Receiver part will be on the vehicle embedded with the system. Role of the receiver would be to compare received Speed Limit Data (received from transmitter) with current speed of the vehicle. It will generate a signal in case of over-speeding and after 10 seconds the engine will stop.

### Proposed system:-

A powered wheel chair is a mobility-aided device for persons with moderate or severe physical disabilities or chronic diseases as well as the elderly. In this project work, we propose and implement an eye controlled wheelchair system in which the control of the wheelchair is done as per the movement of eye. For this purpose, we use the optical-type eye tracking system to control powered wheel chair. User's eye movement are translated to screen position using the optical type eye tracking system.

**Fig:- Overall Block Diagram**

We capture the image using the camera, and after perfect capturing of image, it is send to the MATLAB software in the PC where segmentation of image is done and processing of finding the pupil and its direction is found out. Image

Capturing is to capture a sequence of iris images from the subject using a specially designed camera. The image is then changed from RGB to gray level for further processing. The final output of the MATLAB is then transmitted through the RF Modem Transmitter as Analog Data.

### Conclusion:-

Our project, Autonomous Eye consist of a wheelchair, the motion of which is controlled by the eye movements of the user. The aim of implementing an autonomous eye is to help physically disabled persons to make their life independent. A sequence of images of the eye will be captured and it is processed in MATLAB to obtain the direction of movement of the wheelchair. There the system used the ultrasonic sensor for obstacle detection. Low cost RF transmitter and receiver are capable of handling some basic wireless communication such as sending basic instruction to MCU of the robotic wheelchair.

#### Abstract

Medicinal plants are the main component in traditional medicine system and most rural people of Bangladesh still depend on folk medicine practitioners (Kavirajes) for their primary health care needs and medicinal plants used by folk medicine practitioners actually differ from region to region. The present study was designed to record the use of medicinal plants in different health ailments by the folk medicine practitioners of Sujanagar upazila(subdistrict) of Pabna district of Bangladesh. A structured survey questionnaire was prepared to obtain all the information, informed consent was obtained from the interviewer and the interview was taken in local language (Bangla) so that kavirajes could easily understand and provide necessary information. In our present study, we recorded total 63 plant species from 45 different families used by folk medicine practitioners of Sujanagar upazila in different illness. Liliaceae and Solanaceae appears the most prominent family in this study each having 3 plant species followed by Fabaceae and Acanthaceae having 2 species. Folk medicine practitioners use different parts of the plants including whole plant, leaves, fruits, barks, and rhizome. In this study, we found that leaves along with other parts of the plant had highest percentage of use (36.507%, 23 species) and only leaf holds the second position in its usage percentage (17.46%, 11 species). This study revealed that kavirajes of Sujanagar upazila preferred oral route (60.32%) of administration for their different medicinal formulations. There were also some formulations for topical application (11.11%) and found some plant based formulations were also for both oral and topical application (28.57%). This study represents many medicinal plants used by folk medicine practitioners of study area could be important source to isolate new bioactive compounds and novel drugs through extensive research in future.

#### Introduction:-

Human being experienced to diseases and ailments frequently during their whole life span and the nature blessed them to provide remedy to utilize plants and such type plants which are extensively used to treat health ailments are called medicinal plants. Medicinal plants are the best natural resources of traditional medicine system (Tumapa et al., 2014). Still in this modern world, 80% of people in developing countries extremely relies on traditional system

Address:- Department of Pharmacy, University of Asia Pacific, 74/A, Green Road, Dhaka-1215, Bangladesh.

of medicine as medicinal plants are easily accessible and cheap (Dey et al., 2014). Today plant based traditional knowledge is a recognized tool in search for new source of drug (Sahu et al., 2014). Ethnomedicinal survey which deals with ethnobotany and traditional knowledge of uses of plants is the most effective method identifying new medicinal plant and bioactive compounds, thus further study on these plants can easily lead to discovery of new therapeutic entity.

Bangladesh has a rich history of practicing traditional medicine among which unani, ayurvedic and folk medicine are quite popular in this country. Folk medicine practitioners commonly known as Kavirajes are primary health care provider to significant rural areas of the country (Salahuddin et al., 2015, Rahmatullah et al., 2010). Such traditional knowledge of uses of plants in different health ailments can be useful for planning of effective use of natural resources and conservation of biodiversity and cultural knowledge. Therefore, the main objective of this study was to document the use of plants in traditional health care practice at Sujanagar upazila (Subdistrict) in Pabna district of Bangladesh.

## Methods:-

### Study area:-

This study was conducted at Sujanagar upazila (subdistrict) of Pabna district. Pabna is a district having an area of 2372.5 square kilometers falls within Rajshahi division of Bangladesh. The district is roughly located between 88°55' -89°42' E and 23°48' - 24°22' N and Sujanagar sub-district (Upazila) with an area of 334.4 square kilometers is a part of Pabna district and is located between about 89°23' - 89°38' E and 23°48' - 24°00' N. The main occupation is agriculture and the major crops are paddy, jute, wheat, sugarcane, oil seeds, onion, garlic, betel leaf and pulses. The climate of Pabna is moderate and yearly temperature falls within a minimum of 9.6°C to a maximum of 33.9°C; the average rainfall is 1872 mm (District Statistics: Pabna District, 2011).

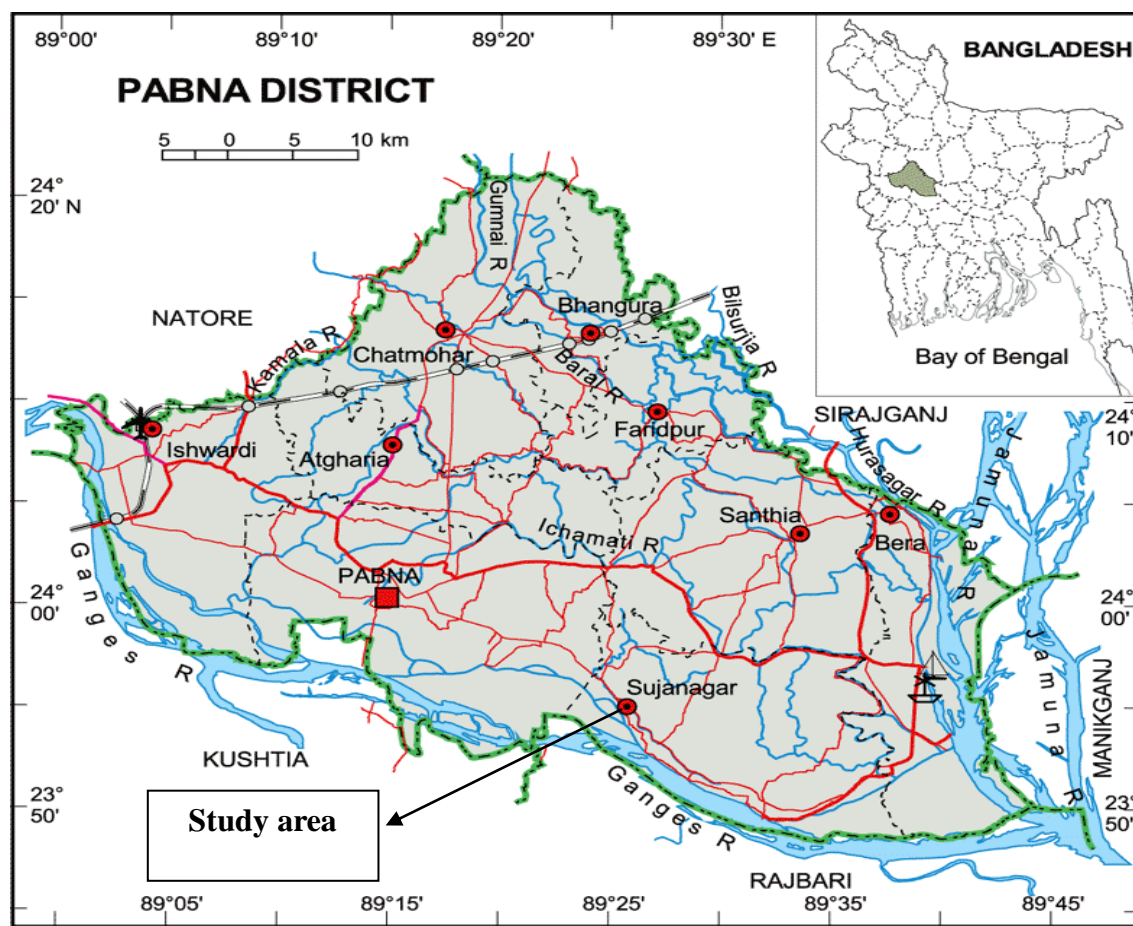

Figure 1:- Location map of Pabna district showing the study area.

**Data Collection:-**

A questionnaire was prepared to collect the required data on various aspects of the study. The questions were arranged systematically and presented clearly to be easily understood by the respondents. Data on age, sex, level of education, human diseases treated, local names of plants used, parts used, methods of remedy preparations, routes of administration, noticeable adverse effects of remedies, use of antidotes for adverse effects, indigenous knowledge transfer and other uses of the ethnomedicinal plant species were gathered during the interviews. The survey was conducted in Bangla language, which was spoken both by the folk medicine practitioners (Kavirajes) as well as the surveyor and is the national language of Bangladesh. Prior to the study, informed consents were obtained from the Kavirajes that the information may be disseminated both nationally and internationally and all the information obtained was cross checked. Total 15 kavirajes were participated in this study and data were collected from 17<sup>th</sup> August, 2016 to 24<sup>th</sup> August, 2016.

**Data analysis:-**

Responses of the completed questionnaires were numerically coded and analyzed. Microsoft Office Excel 2007 program was used to process all collected information. Descriptive statistics such as frequency and percentage distribution were used to analyze data. In addition, graphs and tables were used to interpret the findings.

**Results:-****Distribution of plants into families:-**

In this study, total 63 plant species including herb, shrub, and tree distributed into 45 different families were recorded that is used by folk medicine practitioners (Kavirajes) of Sujanagar upazila (subdistrict) of Pabna district of Bangladesh. Liliaceae and Solanaceae appears the most prominent family in this study, each having 3 plant species followed by Fabaceae and Acanthaceae having 2 species.

Plant species and families recorded in this study are illustrated in following table along with their usage parts and dispensing procedure to people.

**Table 1:- Scientific name, local name, family, parts used and indications.**

Scientific Name	Local name	Family	Part used	Consumption/dis pensing procedure	Route	Use
<i>Abroma augusta</i>	Ulotkombol	Sterculiaceae	Stem	Crushed stems are taken with sugar	Oral	Debility, Infertility in women due to problems in uterus
<i>Achyranthes paniculata</i>	Apang	Amaranthaceae	Root, Bark, Leaf	Paste of root bark and juice of roots are used, paste of leaves are applied to the affected area	Oral, Topical	Abortion, Eczema, Wound
<i>Aegle marmelos</i>	Bel	Rutaceace	Leaf, Fruit	Juice of young leaves, decoction of immature fruits and ripe fruits are taken.	Oral	Fever, Abscess, Indigestion, Dysentery
<i>Allium cepa</i>	Piaj	Liliaceae	Bulb	Juice of bulb/scales is used	Oral, Topical	Cough, Headache
<i>Allium sativum</i>	Roshun	Liliaceae	Bulb	Juice obtained from crushed bulb is taken orally.	Oral	Pain in the chest area- usually external muscle pain, Piles, Rheumatism
<i>Aloe barbadensis Mill</i>	Ghritokumari	Asphodelaceae	Leaf	Juice of leaves is applied to the affected area and leaf mucilage	Topical	Sexually transmitted diseases in men, Skin disorders,

				is used		Piles, Menstrual disease, Sexual problems
<i>Ananus comosus</i>	Anarosh	Bromeliaceae	Fruit, Leaf	Juice of unripe fruit, ripe fruit and leaves is used	Oral	Abortion, Cough, Diuretic, Fever, Helminthiasis.
<i>Andrographis paniculata</i> Nees.	Kalomegh	Acanthaceae	Leaf, Stem, Root	Root paste is taken with sugar for liver disorders. Leaf paste mixed with sugar is taken for helminthiasis. Stem is taken with sugar to reduce acidity.	Oral	Liver disorders, Helminthiasis, Gastric acidity
<i>Aristolochia indica</i> L.	Ishwarmul	Aristolochiaceae	Root	Crushed roots are used	Topical	Snake bite
<i>Artocarpus heterophyllus</i> Lamk.	Kathal	Moraceae	Bark, Leaf, Root	Juice made from young leaves, young roots and juice made from bark is also taken	Oral	Asthma, Itches, Diarrhea, Excessive menstrual discharge
<i>Asparagus racemosus</i>	Satamuli	Liliaceae	Whole plant, roots	An amulet containing whole plant is tied around the waist, Root paste mixed with sugar is taken for constipation	Oral, Topical	Constipation, Impotency in men.
<i>Averrhoa carambola</i>	Kamranga	Oxalidaceae	Fruits	Fruits are eaten	Oral	Jaundice, Fever, Piles
<i>Azadirachta indica</i>	Neem	Meliaceae	Leaf, Bark	Paste of the leaves is applied to the affected area and powder of bark is taken.	Oral, Topical	Rheumatic fever, Itches, Ring worm, Helminthiasis, Chicken pox.
<i>Blumea membranacea</i> DC.	Ukra, Uhra	Asteraceae	Leaf, stem	Juice from stem and leaves are applied to the scalp	Topical	Fever with mucus
<i>Cajanus cajan</i> (L).Huth	Aral	Fabaceae	Leaf	Young leaf juice is taken.	Oral	Jaundice, Diabetes
<i>Calotropis gigantea</i>	Akondo	Apocynaceae	Root, Leaf, Bark	Leaves are taken during pneumonia. Leaves are warmed in oil and applied to painful areas	Oral, Topical	Ulcer, Tooth pain, Chronic dysentery, Cold, Asthma, Pain
<i>Carica papaya</i> L.	Pepe	Caricaceae	Fruit, Latex	Fruit juice, Ripe fruits are taken and latex is used	Oral, Topical	Constipation, Itches, Indigestion, Liver disease, Diarrhea
<i>Cassia sophera</i> L.	Kolkashundia	Fabaceae	Whole plants	Paste of whole plant is applied to affected area	Topical	Eczema.
<i>Centella asiatica</i>	Chaka thankuni	Apiaceae	Leaf, Stem	Juice obtained from crushed leaves and stems is	Oral	Stomach disorders

				used.		
<i>Cissus quadrangularis L.</i>	Harjora	Vitaceae	Leaf, Stem	Paste of leaf and stem is applied to fractures	Topical	Bone fracture
<i>Coccinia grandis (L.) Voigt</i>	Telakucha	Cucurbitaceae	Leaf	Vegetables made from young leaves are eaten	Oral	Diabetes, Fever
<i>Curcuma longa L.</i>	Holud	Zingiberaceae	Rhizome	Raw rhizome is taken orally, paste of rhizome is applied to the affected area	Oral, topical	Wet dream, Scabies, Eczema
<i>Cuscuta reflexa</i>	Aloklata	Convolvulaceae	Leaf	Juice of the leaves is taken	Oral	Dysentery
<i>Cynodon dactylon</i>	Durva Ghash	Poaceae	Whole plant	Juice of the plant is taken with milk and applied to wound	Oral, Topical	Wounds, Acne.
<i>Datura metel L.</i>	Kalodhutura	Solanaceae	Leaf, Juice from stalk of fruits	Macerated leaves are taken with juice from stalk of fruits	Oral	Antidote to poisoning
<i>Eclipta prostrata</i>	Kalokeshi	Asteraceae	Leaf, Fruit, Flower	Paste made from leaves is used in affected area. Juice made from whole plants are used	Oral	Jaundice, Asthma, Gallbladder stone, Wounds, Itches, Skin diseases, Constipation.
<i>Ficus racemosa L.</i>	Dumur, Joggodumur	Moraceae	Fruits	Paste of fruit is taken with milk	Oral	Diabetes
<i>Garcinia cowa Raxb.</i>	Kaufol	Clusiaceae	Fruits	Fruits are eaten	Oral	Cold, Coughs
<i>Heliotropium indicum</i>	Hatishur	Boraginaceae	Root	Paste of root is mixed with sugar or honey	Oral	Wet dreams, STDs, Swelling of knees, Joint pain
<i>Hibiscus rosasinensis</i>	Joba	Malvaceae	Flower, Leaf	Paste of flower is applied on fresh cut and extract of flower is taken	Oral, Topical	Wound, Irregular menstruation.
<i>Ipomoea mauritiana Jacq.</i>	Bhuikumra	Convolvulaceae	Root	Root paste is applied to hair & penis	Topical	Blackening of hair in men and women, Erectile dysfunction
<i>Justicia adhatoda L.</i>	Basok	Acanthaceae	Leaf	Tablets made from paste are taken	Oral	Whooping cough
<i>Kalanchoe pinnata (Lam.) Pers.</i>	Patharkuchi	Crassulaceae	Leaf	Leaves are chewed with salt to dissolve gall bladder stones, Leaf paste is applied topically.	Oral, Topical	Remove gallbladder stones, Stomach pain, Headache
<i>Lawsonia inermis L.</i>	Mehedi	Lythraceae	Leaf	Juice from leaves is taken and paste from leaves are applied to the affected area	Oral, Topical	Cuts and wounds, Cracked skin, Diabetes, Burning sensations during urination.
<i>Leucas aspera</i>	Dondo kolosh	Lamiaceae	Stem	Crushed stems is	Oral	Diarrhea, Blood

				taken usually with parts of other medicinal Plants (Azadirachta indica, Coccinia cordifolia)		purifier, Loss of appetite, Indigestion, Skin disease
<i>Mangifera indica</i>	Aam	Anacardiaceae	Young leaves, Buds	Sap of young leaves is applied to the eyes, a syrup made from the buds along with Musa sapientum and ghee is taken orally	Oral, Topical	Conjunctivitis, Passing of sperm with urine.
<i>Mentha viridis</i>	Pudina	Lebiatae	Whole plant	Juice of the plants is taken	Oral	Metabolic disorder, Gastritis
<i>Mimosa pudica</i> L.	Lojjaboti	Mimosaceae	Leaf, Root, Fruit	Leaf juice are used externally and root and fruit juices are taken with honey	Oral, Topical	Piles, Boils, Dysentery, Bone injuries as painkiller, Tumor for early burst
<i>Moringa oleifera</i> Lam.	Sogina	Moringaceae	Leaf, Stem, Root	Juice obtained from crushed leaves and stems is taken.	Oral	Jaundice, Chickenpox, Paralysis, Fever
<i>Mormordica charantea</i> L.	Korola	Cucurbitaceae	Leaf, Fruit	Juice made from leaves is used. Curry made from unripe fruit are eaten	Oral	Chickenpox, Rheumatism, Diabetes
<i>Nigella sativa</i>	Kalojira	Ranunculaceae	Seed	Paste of seeds or seeds are taken along with water or honey and oil obtained from seeds are applied externally.	Oral, Topical	Rheumatic fever, Hypertension, Skin disease
<i>Nyctanthes arbortristis</i> L.	Sheuli	Verbenaceae	Leaf	Boiled and macerated leaves are taken	Oral	Fever due to metabolic imbalances in the body.
<i>Ocimum sanctum</i>	Tulsi	Lamiaceae	Leaf, Root	Juice of leaves are taken with honey	Oral	Rheumatic pain, Coughs, Constipation, Snake bite
<i>Ocimum tenuiflorum</i> L.	Kalo tulsi	Lamiaceae	Leaf	Juice of leaves is mixed with sugar and eaten	Oral	Coughs, Dysentery, Diuretics, Diabetes
<i>Paedaria foetida</i>	Gondho vadule	Rubiaceae	Leaf	Leaf juice is taken	Oral	Dysentery, Metabolic disorder, Cold, Arthritis
<i>Phyllanthus emblica</i> L.	Amlaki	Euphorbiaceae	Fruit	Ripe fruits and dried fruits are taken	Oral	Fatigue, Thirst, Burning sensation during urination, Biliary problem,

						Diabetes
<i>Plumbago zeylanica</i> L.	Kalpanath	Plumbaginaceae	Leaf	Paste of leaves is taken in empty stomach	Oral	Infertility in women
<i>Psidium guajava</i> L.	Piyara	Myrtaceae	Leaf, Fruit, Bark	Fruits and juice from leaves and stem barks are taken and decoction of leaves is taken.	Oral	Diarrhea, Debility, Bloody dysentery, Toothache, Worm
<i>Punica granatum</i>	Dalim	Lythraceae	Fruit, Leaf	Fruit and leaf juice is taken	Oral	Anemia, Erectile dysfunction, Osteoarthritis, Dysentery
<i>Rauwolfia canescens</i> L.	Boro chanda	Apocynaceae	Root	Paste of roots is applied to the affected areas and crushed roots taken.	Topical, Oral	Snake bite
<i>Rauwolfia serpentina</i> (L.) Benth. ex Kurz	Chotochanda	Apocynaceae	Root	Paste of roots is applied to the affected areas and crushed roots taken.	Topical, oral	Snake bite
<i>Solanum surattense</i> Burm. f.	Choroibaegun	Solanaceae	Fruits	Macerated fruits are taken	Oral	Tumor in humans, Swelling of throat in cattle.
<i>Syzygium cumini</i>	Jam	Myrtaceae	Bark, seed	Paste made from the bark is used externally, dry seed dust mixed with normal water taken	Oral, Topical	Dysentery, Wound, Diabetes
<i>Syzygium malaccense</i>	Jamrul	Myrtaceae	Roots	Macerated roots are taken	Oral	Helminthiasis.
<i>Terminalia arjuna</i>	Arjun	Combretaceae	Bark	Bark boiled in water is taken and paste of bark is applied	Oral, Topical	Chest pain due to heart disorders, Burning sensations during urination, Bone fracture.
<i>Terminalia bellirica</i> (Gaertn.)	Bohera	Combretaceae	Fruit, Seed	Fruits are eaten, oil extracted from the seeds and used	Oral, Topical	Loss of appetite, Headache, Rheumatic fever
<i>Terminalia chebula</i> Retz.	Haritaki	Combretaceae	Fruit	Ripe fruits and unripe fruits are used	Oral	Constipation, Indigestion, Rheumatism and Urinary disease.
<i>Tinospora cordifolia</i>	Pipolti	Menispermaceae	Stem	Plant juice and stem juice are taken	Oral	Swelling, Gastric trouble and ulcers
<i>Vitex negundo</i>	Nishinda	Lamiaceae	Root, Leaf	Tablets made from leaves are taken	Oral	To increase memory, Bloating, Rheumatism, Edema, Helminthiasis, Throat infections, Piles, Loss of

<i>Vitis pentagona</i>	Sonatola	Vitaceae	Flower, Leaf	Paste of flower is taken and leaf paste is taken with salt	Oral	appetite, Fever Rheumatic fever
<i>Withania somnifera</i> (L.) <i>Dunal</i>	Ashwagandha	Solanaceae	Fruits	Mixture of fruit, leaf and stem is taken	Oral	Sex stimulant
<i>Zingiber officinale</i> Roscoe	Ada	Zingiberaceae	Rhizome	Juice from rhizome is applied to the scalp daily.	Topical	Depression, Cough & cold
<i>Ziziphus jujuba</i> Mill	Boroi	Rhamnaceae	Leaf, fruits	Leaves and fruits are taken	Oral	Hypertension

A report described the wide therapeutic use of different plant families throughout the world and many of these plants from different families are also used in the study area (Joy et al., 1998).

#### Used plant parts:-

The various plant parts were used included whole plants, leaves, roots, barks, stems, seeds, fruits, and rhizome. The Kavirajes used different modes of preparation for using a particular plant or plant parts. Leaves along with other parts are most commonly used in different methods had highest percentage of use (36.507%, 23 species) and only leaf holds the second position in its usage percentage (17.46%, 11 species). The following table summarizes percent of curative plant parts used in different health ailments by kavirajes.

**Table 2:- Number of the medicinal plants with their curative parts and percentage.**

Serial No.	Curative plant parts	No. of species	Percentage (%)
1.	Leaf only	11	17.46
2.	Fruit	07	11.11
3.	Seed	01	1.59
4.	Root	06	9.52
5.	Whole plant	04	6.35
6.	Leaf with other parts	23	36.51
7.	Flower	00	0
8.	Bark	01	1.59
9.	Wood	00	0
10.	Rhizome	02	3.17
11.	Stem	03	4.76
12.	Bulb	02	3.17
13.	Bark & Seed	01	1.59
14.	Fruit & Seed	01	1.59
15.	Fruit & Latex	01	1.59

#### Percent of plant use in different Ailments:-

In this study, we recorded 63 different plant species from different plant family which are used by folk medicine practitioners in their regular practice. We calculated the percent of different plant used in different health ailments and summarized in the following table. (Table: 3).

**Table 3: Board categories of the ailments and percentage of plants used in each category**

Serial No.	Board categories of ailments	No of species	Percentage (%) of plant used
1.	Gastrointestinal disorders	33	52.38
2.	Cold and Flu related ailments	18	28.57
3.	Pain, Inflammation and Burning sensation	22	34.92
4.	Sexual problems	15	23.81
5.	Skin diseases	12	19.05
6.	Respiratory tract disorders	4	6.35

7.	Cardiovascular diseases	6	9.52
8.	Nerve disorders	4	6.35
9.	Oral and larynx health diseases	4	6.35
10.	Hepatic problems	8	12.70
11.	Antiseptic purposes	10	15.87
12.	Wound and Blood disorders	11	17.46
13.	Bone related ailments	15	23.81
14.	Renal diseases	3	4.76
15.	Miscellaneous	15	23.80

In this study, we revealed that most plant species were used in the treatment of different gastrointestinal tract disorders (33 species, 52.38%) followed by pain, inflammation and burning sensation (22 species, 34.92%), cold and flu related ailments (18 species, 28.57%). We also found that a single plant species or its different parts is being used in the treatment of many diseases. As a medicinal plant contains lots of chemical species, so a single medicinal plant or its different parts may have many therapeutic potential and that's why the total percentage of plants used in different diseases is more than 100 percent. Usages of plants to treat some diseases by kavirajes in our study area were also interesting.

#### Percent of administration routes of plant species:-

Folk medicine practitioners preferred oral routes of administration. In our study we found that, 60.32% (38 species) of their medicinal formulations were for oral route. Some of their formulations were for topical application (11.11%, 7 species). We also found some plant species formulations were for both oral and topical application (18 species, 28.57%).

Figure 2:- Percent of routes of administration of different medicinal plant formulations.

#### Discussion:-

Plants have played a significant role in maintaining human health and in the treatment of different diseases. In our study, we recorded many medicinal plants used by the folk medicinal practitioners many of which have widely established medicinal value reported in many scientific journals and interestingly we found similar pattern of usage of medicinal plants in our study area.

Kavirajes of Sujanagar upazila of Pabna district frequently use *Justicia adhatoda* L.(Basok) in the treatment of cough and *Calotropis gigantea* (Akonda), *Eclipta prostrata* (Kalokeshi) in the treatment of asthma. It is reported in a review that the whole plant of *Justicia adhatoda* L is an ingredient of different cough formulation used in combination with Ginger (*Zingiber officinale*) and Tulsi (*Ocimum sanctum*) where it exerts its action as an expectorant and antispasmodic. The fluid extract and tincture were used in European medicine practitioners as an antispasmodic, expectorant and febrifuge (Dhankhar et al., 2011). Another study also reported broad spectrum antimicrobial activity of methanolic leaf extract of *Justicia adhatoda* L (Pa and Mathew, 2012).

Many review articles published authentic information regarding the medicinal properties of different parts of *Calotropis gigantean*. Various phytoconstituents like Calotropin, Calotoxin, Choline, D-arabinose, D-glucosamine,  $\beta$ -Sitosterol are isolated from different parts of this plant which may be responsible for its different pharmacological activity. It is reported that different parts of this plant have antimicrobial, anti-cancer, anti-pyretic/analgesic and anti-asthmatic potential (Quazi et al, 2013, Sharma et al, 2012, Parvin et al, 2014). Folk medicine practitioners of Sujanagar upazila of Pabna district use various plant species in the treatment of gastrointestinal disorder. In our study, we found indigestion is treated with *Leucas aspera* (Dondokolosh), *Terminalia chebula* Retz. (Horitoki), *Aegle marmelos* (Bel), *Carica papaya* L. (Pepe). Such activities of these plants are recorded in many ethnomedicinal system and folk medicine practitioners of Tripura of India also uses *Aegle marmelos* in the treatment of indigestion, dysentery, constipation (Das et al., 2012). We also found the use of *Carica papaya* L both in the treatment of indigestion and constipation by the folk medicine practitioners.

There are many literatures published about the main phytoconstituents curcumin isolated from *Curcuma longa* L which mainly responsible for its different medicinal property like anti-inflammatory and anticancer activity (Zari and Zari, 2015, Araujo and Leon, 2001). In this study we found that kavirajes frequently use this plant mainly in the treatment of eczema and scabies.

Rural people suffering from STD frequently visit to folk medicine practitioners for their treatment and in our study we found that kavirajes of our study area use *Ipomoea mauritiana* Jacq. (Bhuikumra), *Aloe barbadensis* Miller (Ghritokumari), *Heliotropium indicum* (Hatisur) in the treatment of STD. Researchers found antimicrobial activity of different crude extracts of these plant that may be responsible for this therapeutic potential and they becomes a promising source of new antimicrobial agents (Devi et al., 2012, Osungunna and Adedeji, 2011). *Abroma augusta* have many therapeutic potential like root and root barks are used as uterine tonic, used in the treatment of amenorrhea, dysmenorrhea, extracts of different parts of plant are reported to have anti diabetic, anti-inflammatory, wound healing, hypolipidemic, antifungal, antibacterial and insecticidal activity (Gupta et al., 2011). In our study, we found the use of this plant in the treatment of infertility. Kavirajes also use *Asparagus racemosus* (satamuli) in the treatment of impotency of men.

Kavirajes provide wide range to treatment option as primary health care practitioners and rural people frequently visit to them for their many health ailments. In our study we found the use of many medicinal plants dispensed to different health disorder and formulated in different way by the kavirajes. Medicinal properties of these plants are well established and we found the use of same medicinal plants in different health disorders. Plants contain wide range of phytoconstituents and such phytoconstituents are mainly responsible for their various medicinal properties.

### Conclusion:-

Knowledge about the medicinal properties of plants is usually transferred from generation to generation through informal educational system. Folk medicine practitioners are still playing a vital role in providing necessary remedy in this modern world and use of such plants in different health ailments are well established today. In our current study we recorded many plant species from different family which are also used by folk medicine practitioners of other parts of this country or even in other countries as well. Such documentation is very much necessary for preserving the knowledge and treatment pattern of different health ailments by folk medicine practitioners and such ethnomedicinal knowledge may lead to discovery of new drug compounds.

#### Abstract

**Introduction:** Attention deficit hyperactivity disorder (ADHD) is a wide spread, highly heritable, disruptive, childhood-onset condition, the etiology and pathogenesis of which is poorly understood. ADHD in children have been associated with several cytogenetic aberrations. The most remarkable of these include; sex chromosome aneuploidies, fragile X syndrome, velocardiofacial syndrome, certain balanced translocations, and others. Some researchers have suggested that cytogenetic analysis should be considered in children with ADHD. However, most evidence to date suggests that these abnormalities are found with increased frequency in ADHD children with positive family history or abnormal clinical signs. **Objective:** The main goal of this study is to assess the potential diagnostic value of conventional cytogenetic analysis (karyotyping) in ADHD children with positive family history and / or abnormal clinical signs. **Method:** Blood samples were obtained from 19 ADHD children (13 boys) with positive family history and / or abnormal clinical signs, and analyzed for the presence of cytogenetic abnormalities using high resolution chromosomal banding. **Results:** three cases had chromosomal abnormalities. Two of them had numerical sex chromosome abnormalities; one had Klinefelter syndrome (47, XXY), while the other had triple X syndrome (47, XXX). The third case had balanced translocation as follow; [46,XY,t(4;21)(p16;q22.1)]. By comparing these findings with their respective prevalence among live births, there was highly significant statistical difference, which indicates high diagnostic value of karyotyping with these selection criteria. **Conclusions:** In the presence of abnormal clinical signs or positive family history, the cytogenetic assessments are indicated for children with ADHD as a component of investigations of this disorder.

#### Introduction:-

With 5% prevalence, ADHD is among the most common psychiatric disorders in pediatrics. Moreover its symptoms usually continue throughout adulthood.<sup>1</sup>

Address:- Clinical Pathology Department, Faculty of Medicine, Ain Shams University, Cairo, Egypt.

ADHD is described as a disorder of improper levels of attention and / or hyperactivity, which gives rise to hindrance in scholastic, family, and social circumstances. Regarding the clinical presentation, The Diagnostic and Statistical manual of Mental disorders, 5th edition (DSM-V) assigns three ADHD subtypes as: mainly inattentive, mainly hyperactive-impulsive and combined subtypes.<sup>2</sup>

ADHD is a heterogeneous disorder, regarding the clinical presentation, etiology, and pathophysiology. To date, no single factor has been identified as the cause of ADHD, also the etiology of ADHD is not completely clarified. There are developing confirmations for the contribution of hereditary and environmental factors in ADHD etiology.<sup>3</sup> Most of the ADHD environmental risk factors have negative impact on fetal and infantile wellbeing such as maternal smoking, maternal anemia, breech delivery, prematurity, low birth weight, hypoxic-ischemic encephalopathy, cocaine and alcohol exposure, meningitis, encephalitis, and head trauma.<sup>4</sup>

While ADHD is linked to genetic factors in about 80% of cases, molecular genetic studies suggest that the genetic architecture of ADHD is complex. Many studies show strong evidence for participation of several genes in the etiology of the ADHD, such as; The Dopamine D4 receptor (DRD4), The Dopamine 5 receptor (DRD5), and The Dopamine Transporter Gene (DAT, SLC6A3).<sup>5</sup>

Despite presence of significant number of syndromes associated with ADHD (include Prader-Willi, Klinefelter, Williams, velocardiofacial, Turner, fragile X, and others), these disorders are infrequently presented among ADHD-clinic patients. The prevalence of cytogenetic abnormalities was assessed in ADHD children with normal intelligence, and no significant difference from that expected in the general population had been found.<sup>4,6</sup>

So with lacking of positive family history or abnormal clinical signs, this expensive and time consuming test is not a routine for the children with ADHD.<sup>6</sup> However, no screening for the diagnostic value of cytogenetic analysis in a population of ADHD children with positive family history or abnormal clinical findings had been performed. The current exploratory study aims to assess the potential diagnostic value of conventional cytogenetic analysis (karyotyping) in ADHD children with positive family history and / or abnormal clinical signs.

## **Patients and methods:-**

### **Study design:-**

A cross-sectional study was conducted at the psychiatric department, El- Hussein Hospital, Al-Azhar University-Cairo, Egypt, over a period of 5 months from May to September 2016. Informed parental consent was obtained prior to enrollment in the study.

### **Study population:-**

A sample of 19 ADHD subjects aged between 5-18 years were consecutively enrolled. Each of them must fulfill at least one of the following criteria; 1) positive family history of a major neuropsychiatric disorder (ADHD, autism, mental retardation,...etc), or 2) abnormal clinical finding e.g. epilepsy, short stature, mental retardation, dysmorphic features,...etc. ADHD was diagnosed and categorized according to the DSM-V criteria for diagnosis and grading of ADHD.<sup>2</sup>

Cases that have typical phenotypic features of any specific syndrome or multiple congenital anomalies will be excluded from the study.

### **Methods:-**

All candidates were subjected to:

#### **History**

comprehensive history-taking including; Personal history (age, sex, residence, and school attendance), Perinatal history (complete obstetric and medical history of the mother stressing on prenatal, natal, and postnatal history, including intrauterine exposure to the teratogenic drugs), developmental history (including four major developmental milestones; fine motor, gross motor, social, and language), detailed family history of neurobehavioral disturbance (e.g. learning disability, language delay, autism, schizophrenia, or ADHD), and Medical history for major medical insults e.g. (CMV, meningitis ...etc).

**Clinical examination:-**

A detailed clinical examination was performed including; general examination, chest examination, cardiac examination, abdominal examination, and neurological examination.

**Intelligence quotient (IQ) assessment:-**

All the study cases were subjected to IQ assessment using the Arabic version of Stanford-Binet Intelligence Test (SBITA), the fifth edition.<sup>7</sup> Total IQ quotient was classified into: mentally retarded ( $\leq 67$ ), borderline intelligence (68-78), below average (79-88), average (89-110), above average (111-120), excellent (121-131) and genius ( $\geq 132$ ).<sup>7</sup>

**Conventional Cytogenetic analysis (Karyotyping):-****Sample collection and set up:-**

5 ml of venous blood were collected in heparinised vacutainers from every referred patient for a lymphocyte cell culture. Few drops of the sample were cultured in RPMI 1640 (Biochrom AG, Germany) medium supplemented with fetal calf serum, penicillin/streptomycin, Amphotericin B, and Phytohaemagglutinin (as a mitogenic agent), then incubated at 37°C for 72 h. The metaphases were arrested by adding a colchicine derivative (colcemid) (Euroclone) 2 hours prior to the harvest.<sup>8</sup>

**Harvesting:-**

At harvest, the culture solution is centrifuged at 800-1000 rpm for 8 minutes. Most of the supernatant of the tubes was discarded leaving only 0.5 ml for resuspension of the cells. This was done by gentle tapping of the tube at the bottom, 10 ml of hypotonic potassium chloride solution (0.56% KCl) was added slowly, incubated at 37 °C for 20 minutes, then centrifuged for 8 minutes at 800-1000 rpm, and the supernatant of the tubes was discarded.<sup>8</sup>

After that, 10 ml of freshly prepared fixative solution of a 3:1 mixture of methyl alcohol and glacial acetic acid is added, mixed gently by a clean glass Pasteur pipette and centrifuged for 8 minutes at 800-1000 rpm. The supernatant of the tubes was discarded, and the previous step was repeated twice with 10 ml then 5 ml of fixative solution respectively, until the supernatant becomes clear. Then, the culture tubes were left frozen.<sup>8</sup>

Chromosome staining and banding techniques were performed as described by Benn and Perle.<sup>9</sup> In every case, 20 cells were counted and at least 5 cells were analyzed, using two separate blood tubes from each patient. If there was any indication for mosaicism, in addition to the mentioned procedure, 200 metaphases were scanned again from that two separate blood tubes.<sup>10</sup>

All karyotypes had been performed using applied software and imaging system and were interpreted according to the International System for Human Cytogenetic Nomenclature (ISCN).<sup>11</sup>

**Statistical analysis:-**

Data were analyzed using IBM SPSS Advanced Statistics version 20.0 (IBM Corp., Armonk, NY, USA). Numerical data were expressed as mean, standard deviation, and range. Qualitative data were expressed as frequency and percentage. Chi-square test was used to examine the relation between the qualitative variables. The odd ratio (OR) is describing the strength of association or non-independence between two binary data values. Confidence interval (CI) is used to find the margins of accuracy given by a survey's sample size and results, for a chosen confidence level. The Z-value is a test statistic for Z-tests that measures the difference between an observed statistic and its hypothesized population parameter in units of the standard deviation. p-value < 0.05 was considered statistically significant.

**Results:-**

After reviewing 185 children with ADHD, consecutive enrollment of 19 cases in the study was done according to the inclusion criteria as follow; 10 cases had positive family history of major neuropsychiatric disorder [positive family history of; ADHD (6 cases), autism (3 cases), and mental retardation (1 case)], 8 cases had abnormal clinical findings [tall stature (1 case), short stature (1 case), cryptorchidism (1 case), mental retardation (2 cases), obesity (1 case), large head (1 case), and epilepsy (1 case)], and 1 case had both positive family history (autistic mother) and positive clinical findings (proband was mentally retarded). The age of the study population varied between 5 to 18 years of age (Mean  $\pm$ SD = 9.63  $\pm$ 4.09 years), and the IQ among them (Mean  $\pm$  SD = 76.63 $\pm$  12.16649). Other criteria of the study population are shown in table 1.

**Table (1):-** Criteria of the study population.

Criteria of the study population		n	%	X <sup>2</sup>	P-value

Out of 19 patients that were karyotyped using conventional G-banding technique, three had chromosomal abnormalities. Two of them had sex chromosome aneuploidies SCA; one had Klinefelter syndrome (47, XXY) (fig. 1), while the other had triple X syndrome (47, XXX) (fig. 2). The third patient had structural autosomal abnormality in the form of balanced translocation between chromosome 4 and chromosome 21, with breaks in 4p16 and 21q22.1 [46,XY,t(4;21)(p16;q22.1)] (fig. 3).

Comparing our prevalence of major chromosomal abnormalities 3/19 (15.79%) to the expected prevalence of such abnormalities among live births 1/140 (0.714%)<sup>12</sup>, there is significant statistical difference (p=0.0059).

Also, our prevalence of sex chromosome aneuploidies 2/19 (10.53%) to the expected prevalence of these abnormalities among live births 1/426 (0.234 %) <sup>13</sup>, there is significant statistical difference (p=0.0017).

Furthermore, our prevalence of balanced translocations 1/19 (5.26%) to the expected prevalence of these abnormalities among live births 1/500 (0.2 %) <sup>14</sup>, there is significant statistical difference (p=0.0206).

**Table (2):-** Comparison between prevalence of chromosomal aberrations among the study population, and general population.

Karyotype results			Odd ratio	95% CI	z score	p-value
<b>Major chromosomal abnormalities</b>	<b>Study cases (+ve/total)</b>	3/19	0.0384	0.0038 to 0.3911	2.753	<b>0.0059</b>

	<b>General population (+ve/total)</b>	1/500				

The subject with a chromosomal abnormality (47,XXY) was enrolled in the study due to unilateral left sided cryptorchidism, otherwise he was clinically indistinguishable from the other cases. He had below average intelligence (IQ = 85). He was delivered by caesarian section at 37 weeks of gestation , weighing 2,700 kg. Development during infancy passed with unremarkable events. He had combined subtype of ADHD. At the time of enrollment in this study, he was 7 years old and attended regular schools.

While the subject with a chromosomal abnormality (47,XXX) was enrolled in the study due to tall stature (height > 2SD), otherwise she was clinically indistinguishable from the remaining probands. She had below average intelligence (IQ = 88). She was delivered by normal vaginal delivery at 35 weeks of gestation, weighing 2,400 kg. Development during infancy passed within ordinary limits except for language delay, where her first plain word spoken after 20 months. Pubertal onset and sexual development occurs normally (Menarche at the age of 12.5

years). She had mainly inattentive subtype of ADHD. At the time of enrollment in this study, she was 15 years old and attended regular schools.

The only subject with autosomal structural balanced chromosomal aberration [46,XY,t(4;21)(p16;q22.1)] was enrolled in the study with positive family history of autistic mentally subnormal mother and the proband himself was mentally retarded (IQ = 65), without dysmorphic features. He was delivered by normal vaginal delivery at 37 weeks of gestation, weighing 2,800 kg. Development during infancy was globally delayed, where his first plain word spoken after 30 months, walking at 21 months. He had combined subtype of ADHD. At the time of enrollment in the study, he was 9 years old and attended special schools. The proband's parents accepted the option of being tested. The proband's mother has the same translocation.

### Discussion:-

Among 19 children with ADHD selected according to the inclusion criteria and enrolled in this study, 6 cases were females while 13 cases were males. Our study showed significant statistical difference between male to female ratio ( $p = 0.023$ ), which was also observed in several studies.<sup>15,16</sup> However, other studies lacked such difference.<sup>17,18</sup> The combined type was the commonest ADHD subtype among our cases 17/19 ( $p < 0.001$ ), where comparable results were described in several other studies.<sup>16,19,20</sup>

Also, we found statistically significant difference between the proportion of the ADHD children with history of premature delivery compared with term children ( $p < 0.001$ ). Analogous studies found that preterm children have higher risk for ADHD.<sup>21,22</sup>

Our results revealed statistically insignificant higher proportions of ADHD among low birth weight children ( $p = 0.330$ ), which make a matter of controversy with Valdimarsdottir et al. who reported statistically significant increased risk for ADHD associated with low birth weight.<sup>23</sup>

Significant statistical difference between ADHD children with positive past history of perinatal insult in comparison to those lacking such history had been reported in our study ( $p = 0.023$ ). Despite presence of several perinatal insults that associated with an increased risk for multiple neurologic sequelae, these perinatal risk factors have not been investigated sufficiently in relation to ADHD.<sup>24,25</sup>

In this study, conventional cytogenetic assessment identified three children with chromosomal aberrations; two cases with sex chromosome aberrations [one had Klinefelter syndrome (47, XXY), while the other had triple X syndrome (47, XXX)] and single case with balanced translocation between chromosome 4 and chromosome 21 [46,XY,t(4;21)(p16;q22.1)].

Our results were in agreement with the vast majority of studies that concerned with sex chromosomes aneuploidies SCA: (e.g. XXY, XXX, XYY, and XXYY). These studies stated that children and adolescents with SCA are at increased risk for ADHD symptoms.<sup>6,26</sup>

In agreement with our findings, Pacenza et al. stated that cryptorchidism is the commonest prepubertal presentation of Klinefelter syndrome.<sup>27</sup> Also, our findings were well matched with many studies that concerned with triple X syndrome; where their conclusions told that one of the early remarkable presentations among those patients is a tall stature, furthermore pubertal onset and sexual development are usually normal among them.<sup>28</sup>

Many cytogenetic literatures and studies stated that, about 6% of balanced translocation carriers have a wide range of behavioral disorders, and intellectual disability. A gene disrupted or deregulated at the breakpoint of the translocation is likely the cause of these symptoms. This is similar to our findings in our proband with balanced translocation.<sup>14</sup>

The break point of our proband [46,XY,t(4;21)(p16;q22.1)], which at 4p16 was described in other literatures and researches as one of the top three risk loci for Parkinson's disease.<sup>29</sup> Despite that no previous direct link between the 4p16 locus and the ADHD but, both Parkinson disease and ADHD originate from dopaminergic system disturbance<sup>5</sup>, which makes this locus one of the supposed gene loci for ADHD for further evaluation.

Despite absence of data about previous studies that screened for the diagnostic value of cytogenetic analysis in ADHD children with positive family history or abnormal clinical findings, Bastain et al. study assessed the prevalence of cytogenetic abnormalities in an unselected population of 100 children with ADHD and IQ >80. Only one subject had a clear cytogenetic abnormality (a girl with trisomy 47, XXX), and this did not differ significantly from that expected in the general population (1/426) ( $p = 0.21$ ). The conclusion of Bastain et al. study showed that in the absence of clinical signs or positive family history, these relatively expensive laboratory assessments are not clinically indicated.<sup>6</sup>

Regarding our prevalence of balanced translocations 1/19 (5.26%) to the expected prevalence of these abnormalities among live births 1/500 (0.2 %), there is statistically significant difference (odd ratio=0.0361, 95% CI=0.0022 to 0.6000,  $p = 0.0206$ ). Also, comparison between our prevalence (2/19) and the expected prevalence of sex chromosome abnormalities in general population (1/426) revealed highly significant difference (odd ratio=0.0200, 95% CI=0.0017 to 0.2315,  $p = 0.0017$ ).

As a whole, our prevalence of major chromosome abnormalities (3/19) in comparison to their expected prevalence in general population (1/140) was highly significant (odd ratio=0.0384, 95% CI=0.0038 to 0.3911,  $p = 0.0059$ ). These findings indicate high diagnostic value of karyotyping with this selection criteria.

In conclusion, This study indicates higher diagnostic value of karyotyping among ADHD children with positive family history and/ or abnormal clinical finding. Therefore, meticulous history taking, and examination by expert pediatrician are mandatory to select ADHD cases indicated for cytogenetic analysis.

#### Conflict of interest:-

The authors declare no conflict of interest.

#### Limitations:-

The low rates of the genetic abnormalities we studied is the primary limitation that can be applied to this study.

- We excluded ADHD children with typical phenotypic features of any specific syndrome or multiple congenital anomalies from the study, which decreased the likelihood of detecting chromosomal abnormalities.
- Sample size is low (only 19 cases). But we had reviewed 185 out clinic ADHD children to get these cases in respect of inclusion and exclusion criteria. In addition, we had limited resources regarding this expensive investigation.

Roles of Leaders  
Organizational Change Sustainable  
Business Development Principle

#### Abstract

This article aims at studying the roles of leaders for sustainable development of organization, which include sustainable business development, quality development, merit development, cultural change development, and strategic development. The current paper finds that in order to create sustainable growth of business, profit and benefit of organization must be achieved ethically and legally. Sustainable business development depends on its response to the need of all stakeholders. Quality development is one of the most important factors which can guarantee a sustainable growth of an organization. Leaders should be adherent to merit and ethics, and be a good example of their followers. As change is constant and nothing is going without change, leaders must be able to manage cultural change appropriately with priority on services responded to the needs of customers, consumers, or public. Success of an organization is based on the good understanding of organizational environment and culture, marketing strategy, assessment of market trends, and analysis of competitors as well as social responsibility and social reward.

#### Introduction:-

Leaders play a key role in the success of an organization. Good leaders are those who are knowledgeable, visionary, strategic, courageous, generous, and adherent to good ethics and virtue. William, James and Keith (1994) described that leaders are authority figures and role models in their companies. By setting a personal example of high ethical behavior, they can influence the others around them. Repeated studies over the years have arrived at the same conclusion that the behavior and ethical attitudes of an employees' boss are seen as the most important factors determining whether the employee will behave ethically or unethically on the job. Peter (2000) described that leaders have power and wield it to affect change in others. Leadership is an instrument of goal achievement in helping group members achieve their goals and meet their needs. This view includes leadership that transforms followers through vision setting, role modeling, and individualized attention. Nakai and Schultz (2003) identified the characteristics of a good leader that may consist of the following: (a) a good leader is visionary, (b) a good leader is courageous, (c) a good leader leads, follows, or gets out of the way, (d) a good leader is results-oriented, (e) a good leader has perspective, (f) a good leader is strategic, and (g) a good leader respects his or her people.

According to Buddhism, a good leader should consist of the following characteristics: (a) Endurance to physical and mental suffering, (b) Tolerance when being criticized, (c) Knowledge updater, (d) Being aware of things, (e) Having great endeavor and strong determination, (f) Being able to analyze situations, (g) Being able to put the right man on the right job, (h) Having kindness, compassion and fairness, (i) Be a problem shooter, (j) Be a friendship builder, and (k) Be a good communicator (Chakka. Ang., Chatuka. Ang., Pati. Dhi., & Dham. Khut; cited in Payutto, 2003).

Leaders must have a strong motivation and take full responsibility for both negative and positive outcome. They give credit for the success to followers and blame themselves when things go poorly. In this regard, Collins (2001) mentioned that level 5 leaders who have a strong motivation and dedicate themselves for the organization's success are necessary for organizational change in the age of competition. "Level 5" refers to a five-level hierarchy of executive capabilities, with level 5 at the top. Level 5 leaders embody a paradoxical mix of personal humility and professional will. They are ambitious, to be sure, but ambitious first and foremost for the company, not themselves. Level 5 leaders set up their successors for even greater success in the next generation; they look out the window to attribute success to factors other than themselves. When things go poorly, however, they look in the mirror and blame themselves, taking full responsibility. The comparison CEOs often did just the opposite - they looked in the mirror to take credit for success, but out the window to assign blame for disappointing results.

Leaders must have a leadership that is the power relationship existing between leaders and followers. Peter (2000) asserted that corporations want individuals who have "leadership abilities" because they believe these individuals provide special assets to their organizations. Fleishman (1991) views leadership as the focus of group processes; the leader is at the center of group change and activity and embodies the will of the group. Bass (1990) conceptualizes leadership from a personality perspective, which suggests that leadership is a combination of special traits or characteristics that individuals possess and that enables them to induce others to accomplish tasks.

Since leaders are the most important persons in organizations; success and failure of organizations mainly depend on the roles of leaders. This article focuses on the roles of leaders in various aspects such as the roles of leaders for sustainable business development, quality development, merit development, cultural change development, and strategic development.

#### **Purposes of research:-**

To study the roles of leaders for sustainable development of organization.

#### **Results:-**

##### **Sustainable Business Development:-**

The main purpose of business is to gain profit. However, in order to create sustainable growth of business, profit and benefit of organization must be achieved ethically and legally. Creating sustainability of business becomes the important goal of all businesses, starting from community business corporations to public business corporations. As business cannot be operated over the community objection, the interests of all stakeholders need to be given consideration by the company's managers. If their concerns are disregarded, stakeholders may damage the company's reputation or halt the company's operations. Yodthong, et al. (2012) mentioned that the sustainability of community business comes from the roles of leaders. Leaders must govern the business corporations with fairness and justice. Leaders must have good leadership characteristics, sacrifice and dedicate time and energy for organization, understand the ways of life, and be able to analyze the weakness and strength of the community. Moreover, they must be able to build collaboration with other people and create loyalty, unity and harmony of people in the community by applying good ethical principle in running business. Cheoravanon (2012) described that the sustainable growth of business depends on its response to the living organism. Business is alive, and must be operated to respond to the need of all stakeholders i.e. employees, business partners, and stockholders. Business should consider virtue and ethics as the most important factor leading to the sustainable development of the community and the country at large. According to Chutikorntaweasin, et al. (2016) described that the old businesses have to adapt themselves to develop, to grow, and to survive by generating the most wealth and profit, which is not an important thing to indicate the overall success; and Kaplan and Norton (1992; cited in Chutikorntaweasin, et al., 2016) mentioned that when the time of technology comes, it is very necessary for businesses to create value in the future through the investment about stakeholders. Channuwong (2014) found that in the current world of high competition, finding and retaining human talent has become a competitive battleground. Attracting, developing, and retaining individual with talent, skills, knowledge, and experiences sufficient to drive global business and solve social problems become the key strategies for creating sustainable growth of business.

Sustainable business comes from a well balance of benefits among each stakeholder. When the fit is good, it leads to create employee satisfaction and customer satisfaction and loyalty over the long run. Moreover, leaders must be able to help employees solve their physical and mental sufferings as these problems may lead to low productivity, inability to compete in the global markets, employees' morale deterioration, employees' strike, and job absenteeism. Leaders must figure out how to attract employees; how to train less educated and poorly skilled employees; and how to keep experienced employees when they have fewer opportunities for advancement. In addition, a well balance between physical and mental health of employees is a key strategy for sustainable business. This is because when employees are happy and satisfied with their jobs, they will help increase productivity to organization.

Brown (2005) described that business organization gaining advantage over competitors should not evaluate its performance by profit alone, but the evaluation should also cover a good relationship with customers, customer satisfaction and loyalty, new innovation, internal operation process, employees' knowledge and skill, and the ability of its human resources to work for sustainable profit. The concept of Balance Score Card (BSC) should be implemented to evaluate the efficiency, quality, innovation, and responsiveness to customer. In this regard, Samuel (2006) suggested that in order to create sustainable business, organization should be responsible for society in the following four aspects: (a) Economic responsibility, which includes production activity, service that responds to the need of consumers, job employment, fair payment of salary, and maintenance of staff security; (b) Life quality, which means that an organization should place great emphasis on life quality of society, for examples, producing high quality of products, fair treatment of employees and customers, and environmental protection; (c) Social capital, which means that an organization should consider the cost and human resources that organization uses to solve problems in society such as in education, merit activity, and art; and (d) Problem solving, which means that an organization should pay attention to social responsibility and improve its ability to solve social problem such as social participation in planning for community development over the long run, investigating the sources and origins of social problems and seeking for resolutions to those problems.

### **Quality Development:-**

In recent decades, there has been an intense debate regarding the role of leader in managerial work. Leaders must focus on quality development. Development with high quality is one of the most important factors which can guarantee a sustainable growth of organization. In the world of high competition, quality becomes a symbol of good reputation and credibility of organization. Channuwong (2010) found that the sustainability of organization is the result of high quality development. The important factor leading to the quality in development is the role of leaders.

Leaders must have dreams and be able to make the dreams come true. Moreover, leaders must have clear vision and strategy. They must be able to manage their resources effectively and take into account of product quality, service quality and work quality closely. Warren Bennis, Guru in leadership (cited in Brown, 2005), has set up the standard of social leaders in the future, which can be described as follows: Modern leaders are those who have their own stand points and tangible vision; persuade others to participate in the activities with practical, interesting and clear vision; and encourage the others to works on the assigned jobs with high quality standard. Achinsamajarn (2008) defined leaders with quality development as those who are able to increase moral of their followers, empower their groups, know how to improve creative ideas, pull out the talents of all group members to support their jobs, and practice in the principle of good governance. Good governance is the universal principle placing great emphasis on accountability, participation, law and legitimacy, transparency, morality, responsibility, effectiveness and efficiency which plays a key role for sustainable success and development of an organization.

In order to clarify the meanings of good governance, William, James, and Keith (1994) defined good governance as the development principles of the country, society, organization, institution and business with great emphasis on honesty, transparency, accountability, fairness, quality and efficiency as well as having general ethical and moral standard in order to increase the strength and sustainable growth of an organization. These definitions are relevant to the idea of Channuwong, (2010) which defined good governance as the principles of managing business effectively and ethically. It must be in accordance with philosophy of sufficiency economy in which organizational structure and code of ethics must be integrated in business operation. Good governance also includes a good relationship between board of directors, development team and stockholders with responsibility to all stakeholders.

### **Merit Development:-**

Merit is a symbol of human value. Those who are adherent to merit have more value than those who do not. Leaders must really know what is right and wrong, and what is appropriate and inappropriate. Leaders who practice in good

merit and ethics can be able to maintain their good reputation and become a good example of their subordinates. In Buddhism, merit is considered as righteousness. Everyone should sacrifice his wealth, organ and life in order to protect and maintain the righteousness. In this regard, there were Buddhist proverbs which stated that “Let a man sacrifice his wealth for the sake of his organ, let him sacrifice his organ for the sake of his life, but with respect to merit or righteousness, let him sacrifice his wealth, organ, life and all” (Khuddakanikaya, Jataka 28/147 cited in Thammasapa and Bunluetham Instituion, 1989).

Limsakdakul (2010) described that the sustainability of organizations depends on the characteristics of leaders; leaders must adhere to merit and ethics, be honest and apply ethics in development in the same way as His Majesty the King Bhumibol Adulyadej of Thailand expressed his first royal statement that “I will rule the land by virtue for the benefits and happiness of the Siamese people.” This statement should be considered as the model for administrators in private sector, public sector, and people at large. This virtue principle should be practiced and implemented by all Thai people. Channuwong (2014) described that there are six senses in human life i.e. eye, ear, nose, tongue, body and mind, which are needed to be developed by administrators. To be a good leader, he or she needs to use his or her own sense to screen, analyze, synthesize, distinguish each situation, and be able to apply his or her own wisdom in development appropriately. Leaders must be able to analyze which action is moral or immoral, ethical or unethical, and perform only the moral and ethical activities. Doing merits is a way leading to eternal happiness and peace.

Leaders should understand the principle of the four noble truths, which is the process of using wisdom to solve problem according to its causes and factors. In this principle, the wisdom of a person should be implemented to solve his or her problems. The principle of the four noble truths consists of the following: (a) the fact that there is suffering; (b) the fact that there is the cause of suffering, or origin of suffering; (c) the fact that there is the cessation of suffering, or extinction of suffering; and (d) the fact that there is the path leading to the cessation of suffering. The aforementioned principle can be implemented as development strategy for the success of organization with great emphasis on considering the cause and result of each problem (Anguttaranikaya Catukanipata cited in Payutto, 2003). Phradhammapidhok (2005) mentioned that in order to create a peaceful society, a leader must be a good example of followers, and must adhere to the following merit principles: (a) loving kindness, and friendliness, a leader should be gentle, kind and generous; (b) compassion, a leader should consider followers’ suffering as his or her own, and try to help them liberate from all kinds of physical and mental suffering; (c) sympathetic joy, a leader should be free from jealousy, and be delighted when followers are successful, or receive popularity or promotion; and (d) equanimity, poise and fairness, a leader should be free from bias and prejudice, be calm and be adhered to the justness and fairness. Buddhadasa Bikkhu (1957) described that the merit principles leading to success in all activities consist of the following four components: (a) will and aspiration; (b) effort and exertion; (c) thoughtfulness and active thought; and (d) consideration and reasoning.

#### **Cultural Change Development:-**

Leaders should understand the work culture of followers and be able to change it to increase more effectiveness in terms of product quality and service quality. Culture is the way we do things around here; it is the collection of overt and covert rules, values, and principles that guide organizational behavior and that have been strongly influenced by history, custom, and practice (Burke, 2001). Corporate culture is a blend of ideas, customs, traditional practices, a company’s values, and shared meanings that help define normal behavior for everyone who works in the company. There are five types of corporate culture which can be presented as follows: a caring climate, a law-and-code climate, a rule climate, and instrumental climate, and an independence climate (William, James and Keith, 1994). A caring climate concerns the good of all the people in the company as a whole. A law-and-code-climate expects people to comply with the law and professional standards over other considerations. A rule climate emphasizes on the rules and regulations of the company. An instrumental climate expects people to do anything to further the company’s interests, regardless of the consequences. An independence climate gives people freedom to be guided by their own personal ethics.

In the age of globalization, accelerating social and technological change requires leaders who do not merely manage change, but use it to gain competitive advantage. When things change, the structure and strategy of organization must be changed to conform to external changes. However, changing things that people in the organization get used to it for long is not an easy way, managers may confront with many resistances from inside and outside. Managers must be able to explain about change that it will lead to betterment and prosperity of organization. If managers do not have sufficient reasons to explain about change, change will be a tough and difficult task to do. Managers should

have enough leadership, clear vision and objective to motivate their people that only change can bring success, growth and prosperity to their organization; without change organization cannot survive and prosper. Philip and Robert (2000) asserted that the organizational change means servicing better and faster the needs of the customer, consumer, or public. Individuals can be trained to move toward a culture of continuous change, but the organization's way of doing things must also continuously reaffirm this norm of human behavior.

Sirisunhiran, et al. (2012) described that to better manage organizational energies, a strong culture offers a consistent set of implicit understandings that help in dealing with ambiguities of business politics and relationships. It is not only plant and equipment that can rust and deteriorate. Within human systems, values and norms, policies and practices, leadership and technologies can also lag or become obsolete. They may call for planned renewal when the people and their productivity are being undermined by outdated or archaic approaches or processes.

Corporate culture is dynamic, and leaders should not underestimate the adaptive changes necessary for survival. They should understand that the new organizational culture should enable people to spend their lives on something worthwhile that will outlast them, live a life of consequence without stress and undue cultural restraints, preserve for tomorrow what we can use up today, value the work as much as we did the work ethic and accept difference and appreciate similarities. The way people believe, think and behave in organization affects the productivity of organization. People in organization will explicitly represent the mission and strategies of the organization. As success of an organization mainly depends on corporate culture, thus, changing corporate culture should come together with changing organizational strategies (Michael, Courtland and John, 1999).

In the past, organizations had a close relationship with customers through face to face and personal touch. But, in the present, things change very quickly, the organizations use new technologies to communicate and disseminate the information to customers quickly and efficiently without personal touch. A decision making to do a business among each other is mainly based on a good reputation of each side. An online communication through internet and website plays an important role in business transaction of all organizations. The leaders of the organization and employees must learn how to use these new advance technologies to gain the advantages over competitors. The organizations may spend much money for training employees in technical skill and communicative skill.

Work culture must be changed to respond to current situations that customers hope for high quality products and rush service. The paradox of change is that it is inevitable and constant. It seems to have only two choices in the matter of change. We can direct the change or we can let change direct us. When change directs us, we are resistant, mad, not open to new ideas; we block our own growth, but probably out of innocence. We honestly do not know how to use change effectively. But, when we direct change, we will be able to be well prepared, and make a good plan to make change gradually. So, let change yourself at your discretion for your own prosperity and growth before the unavoidable situation forces you to change (Michael, Courtland and John, 1999). Organizations of the future will be excellent to the extent that maximize their human energy assets, and minimize their human energy losses. They must be able to capitalize on ad hoc, unstructured relationships among people, to cope effectively with uncertainty and accelerating change, and to cooperate in multicultural environments (Hessenbein, Goldsmith and Beckhard, 2001). New technologies are one of the most important factors for the success of each organization. The organization that neglects using these new technologies cannot compete in the global market (Pringpuangkaew, 1999).

#### **Strategic Development:-**

Strategic development is a positioning of the organization in its competitive environment and then formulating and implementing strategy. Managers must develop and maintain a keen understanding of the environment, in which their organization operates, from general economic conditions to the specific actions of competitors. If managers ignore or misjudge an important component of the organizational environment, any number of problems can result. Managing an organization's strategies includes analyzing environment, setting goals and objectives, and formulating and implementing strategies. When these multiple strategic processes are effectively integrated and managed, an organization is well positioned for long-term survival and prosperous operations.

In order to survive and to prosper, organizations need to manage their strategies, structure, and behavior carefully. Channuwong (2014) described that success of an organization is based on the good understanding of organizational environment and culture, marketing strategy, assessment of market trends, and analysis of competitors as well as social responsibility and social reward.

Leaders should understand the current environments surrounding their business situations. They should be able to think outside the box, predict the future outcomes precisely, and be able to develop appropriate strategies that are responsive to the situational changes. Strategy is about choice, which affects outcomes. In situation of the world today, the leaders must find the ways of success that fit their organizations. Although there is no one best strategy for using in all organizations, but finding the fit one is the leaders' duty and responsibility. Phillip and Robert (2000) stated that there must be a fit between people and their organizational culture if synergy is to occur, effective global leaders will direct more effort toward promoting that match.

Since change is constant and unavoidable, coping with change appropriately becomes the most important role of modern leaders. Leaders can cope with change effectively by means of farsightedness, strategic planning and development. One strategy is to carefully recruit and select knowledgeable and skillful personnel who are comfortable to work in the company, and then acculturate them to a strong culture. Another strategy is to adapt the organization to its people, especially in terms of a particular place or time.

Effective leaders must be able to anticipate resistance, diagnose it, and then manage it, or incorporate it into the system. The global managers should be sources of innovation, and skillful in managing change. Their revision might include a goal of learning to be knowledgeable and comfortable as possible wherever they are located. Within an organization, the initial concern would be to examine the change possibilities in ten categories:

1. Structure: the system of authority, communication, roles, and work flow.
2. Vision: clear direction, leading to go through for the same purposes.
3. Strategy: a plan of action designed to reach a particular goal.
4. Leadership: ability to motivate and lead people in organization
5. Technology: problem solving mechanisms, tools, and computers.
6. Tasks: activities accomplished, such as manufacturing, research, and service.
7. Processes: techniques, simulations, methods, such as development information systems.
8. Environment: internal or external atmosphere.
9. People: personnel or human resources involved; put the right man on the right job.
10. Culture: the way we do, act, and perform to offer better service and quality (William, James and Susan, 2001).

By practicing skill in planned change, leaders not only facilitate people's preparation and acceptance of change, but also reduce stress and energy waste. Maximum two-way communications about the proposed change can create the necessary readiness for its eventual implementation and defuse the negative impact of sudden changes. While proposing innovations, leaders can endeavor to reduce the uncomfortable threat of those involved. Thus, negative reactions like apathy or sabotage, protest or revolt can be minimized. Helping people become open to change and realize its benefits will facilitate change to become a much easier, more graceful process. And finally, change doesn't have to be painful (Louis and David, 1993).

### **Discussions and Conclusions:-**

Leaders need to understand and analyze the impact of culture on organizations. Furthermore, they should lead in influencing cultural change within their institutions. When a group of people formulates an organization, its culture reflects that of the larger community, and impacts behavior both within and without enterprise (William, James and Susan, 2001). The human and material energy exchanged through the organization is affected by culture, which may foster or undermine productivity and profits. Organizational culture may motivate or obstruct high performance (Burke, 2001).

The sustainability of organizations depends on the characteristics of leaders; leaders must adhere to the virtue and ethics, be honest and apply ethics in development. Leaders must have good leadership characteristics, sacrifice and dedicate time for organization; they should understand the ways of life, and be able to analyze the weakness and strength of community.

Quality development is one of the most important factors which can guarantee the sustainable growth of an organization. Quality becomes a symbol of good reputation and credibility of an organization. Customers are satisfied with the high quality products and services. Thus, quality is one of the most influencing indicators of customer satisfaction and loyalty. Merit is a symbol of human value. Leaders should be adherent to merit, virtue and ethics. In Buddhism, merit is considered as righteousness, which everyone should sacrifice his or her wealth, organ

and even life for the sake of maintaining the righteousness. Leaders should focus on the principle of the four noble truths which places great emphasis on investigating the causes and factors of situations, and using reasoning wisdom to solve each problem according to its causes and factors. Leaders should be able to analyze the current situations, think outside the box and be able to predict the future outcomes. Additionally, they need to develop appropriate strategies that are responsive to the situational changes.

Today's managers operate in a global environment that has changed more rapidly and extensively than any other period in human history. In order to survive and prosper, leaders so not only need new skills for coping with change, but must learn to build an environment that is open to dynamic change within their systems, as well as within the life-styles of their colleagues and themselves. Although the outlooks on change and the roles of leaders are culturally conditioned, leaders should realize that the new work culture worldwide requires them not only to be open to change, but also to build it into work environments and social systems. Thus, we must stay relevant in meeting human needs by creating new markets, processes, products, and services as well as maintaining employee satisfaction and loyalty (Bass, 1985).

Change is constant; nothing is going without change. Therefore, learning how to cope with change effectively is what the Buddha taught. The benefit of change is that we have an opportunity to make situations better, rather than to adhere to the old tradition which may be obsolete and out of date any time in this competitive age. Therefore, the global managers should be a source of innovation, and be skillful in managing change.

Leaders need to understand the general systems theory, which explains that all living organisms or systems interact with, and are affected by other forces in their host environments. The key to survival is the ability to adapt to be responsive to the changing conditions in the environment. For modern business corporation, systematic thinking provides a powerful tool to help managers appreciate the relationships between their companies and the rest of the world (William, James and Keith, 1994).

In the Buddhist concept, nothing can last forever; everything happens, exists at one moment and comes to an end. Change is constant and is expected to happen anytime and anywhere. It is the same as corporate culture and strategies that need to be changed from time to time. When the world and situations change quickly, organizational cultures and strategies need to be changed in order to cope with changing situations for the success, survival and prosperity of organizations in the age of competition. In this regard, leaders play a key role in changing organizational cultures and strategies for sustainable development of organization.

#### Abstract

To assess the level of awareness of medical students in clinical years regarding Zika Virus, and to compare the level of awareness among male and female student.

This is a cross sectional survey of medical students in the clinical years in KSAU-HS, Riyadh, College of Medicine. Assessment was done by a self-administered questionnaire, and data entry analysis was done by using SPSS version 20.

Of the 152 participants out of 293 students, 114 were male (75%) and 38 were female (25%). 29 out of 152 reported that they had never heard of the virus before (19.1%). 36 (29.3%) of participants chose an infected Aedes species mosquito's bite, 40 (32.5%) chose that maternofetal transmission occurs during pregnancy, and only 9 (7.3%) chose that it can be transmitted through sexual contact. When asked about previous Zika disease outbreaks, 76 (61.8%) students said that they have heard of the 2015 Brazil outbreak, 6 (4.9%) students said that they had heard about the 2013 French Polynesia outbreak, and not a single student said that they had heard about the 2007 Yap outbreak. In conclusion, a low level of knowledge regarding Zika virus was found amongst medical students especially when compared to their knowledge of MERS-COV.

#### Introduction:-

Zika virus is a single stranded RNA virus of the Flaviviridae family and the genus Flavivirus. It was first identified in 1947 in rhesus macaque monkeys in the Zika forest of Uganda. [1] Since then, reports of human cases were infrequent until an outbreak in 2007 in the island of Yap occurred where 49 confirmed serologically over a 4 month period and, over three years, an estimated 73% of the island's population were infected. [1] Two other outbreaks occurred afterwards, first in 2013 in French Polynesia with 294 confirmed cases over 10 weeks and more recently in May 2015 in Brazil where the Brazilian Ministry of Health estimates that the number Zika infections since the outbreak began is 0.5 – 1.5 million as of the 22<sup>nd</sup> of January 2016. [1-2]

The vector by which Zika virus is transmitted is the Aedes mosquito. Other confirmed modes of transmission include maternofetal, perinatal, and sexual transmission. [1, 3] The symptoms of Zika infections include fever, skin

rashes, conjunctivitis, muscle and joint pain, malaise, and headache which usually last 2 – 7 days and are mainly mild, as such; no specific treatment is required. Presently, there is no vaccine for the Zika virus. Microcephaly and Guillain-Barré syndrome are potential complications of Zika virus infection. [3]

Based on what has been mentioned and since medical students are future physicians who are supposed to play an effective role in spreading awareness regarding Zika Virus in the community and seeing how rapidly the most recent outbreak has spread and the huge number of people infected, the study is aimed to assess the awareness and background knowledge of medical students at King Saud Bin Abdulaziz University for Health Sciences' (KSAU-HS) Riyadh College of Medicine and specifically targeting those in the clinical years regarding Zika Virus.

#### Methods:-

This is a cross sectional survey of all male and female medical students (approx. 293) in the clinical years (Fifth and sixth year medical students) at the College of Medicine (COM) of King Saud bin Abdulaziz University for Health Science (KSAU-HS) Riyadh, Saudi Arabia. Awareness of medical students regarding Zika Virus was assessed by a self-administered questionnaire and data entry analysis was done by using SPSS version 20.

#### Results:-

Out of 293 students in the clinical years, 152 participated in our study. Of the 152 participants, 114 were male (75%) and 38 were female (25%), while 84 were fifth year medical students (55.3%) and 68 were sixth year medical students (44.7%) (Table 1). 29 out of 152 reported that they had never heard of the virus before (19.1%).

Of the 123 students who have heard of the virus, when presented with multiple possible modes of transmission and spread of the virus (more than 1 answer can be chosen), 36 (29.3%) chose an infected Aedes species mosquito's bite (daytime biter), 40 (32.5%) chose that maternofetal transmission occurs during pregnancy, and only 9 (7.3%) chose that it can be transmitted through sexual contact as seen on table 2 which also includes the frequencies of the incorrect choices. When presented with multiple possible symptoms and signs of Zika infection (more than 1 answer can be chosen), 49 (39.8%) chose coughing, 16 (13.0%) chose joint pain, 22 (17.9%) chose conjunctivitis, and 37 (30.0%) chose sore throat as seen on table 3 which also includes the incorrect symptoms presented to the students and the number of times each symptom was chosen.

When presented with eleven knowledge assessing questions which include multiple choices in each question where only 1 choice is correct per question, the most correctly answered question was "Which of the following is a known complication of Zika virus" where 58 (47.2%) students answered Microcephaly which is the correct answer. The second most correctly answered question was "Is there a vaccination for Zika virus disease" where 52 (42.3%) students answered "No" which is the correct answer. The third most correctly answered question was "How is Zika disease infection treated" where 45 (36.6%) students answered "Supportive" which is the correct answer. All knowledge assessing questions and the percentage of correct answers for each question can be seen on Table 4.

When asked about previous Zika disease outbreaks, 76 (61.8%) students said that they have heard of the 2015 Brazil outbreak, 6 (4.9%) students said that they had heard about the 2013 French Polynesia outbreak, and not a single student said that they had heard about the 2007 Yap outbreak (Table 5).

The students were graded for each question and for the entire questionnaire according to their correct answers; however, no statistically significant difference was found between the students' grades when compared by age, gender, and medical year (Table 6).

**Table 1:-** Demographics.

		N	%
Age (Years)	22	41	27.0%
	23	63	41.4%

**Discussion:-**

Even though Zika virus has been identified in Africa since 1947, its most recent outbreak in Brazil affecting the lives of many has brought it to the center of attention. In that light, serious measures need to be taken in order to spread awareness regarding this virus in case of a local outbreak, especially since more cases are reported in areas outside Brazil including Germany, France and United States of America. Since medical students play a major role in public education and are future health care providers, this study was done in order to assess the knowledge level of Zika virus amongst medical students in their clinical years in terms of basic science, symptoms, diagnosis, treatment and preventive measures.

This study included 152 male and female medical students 75% and 25% respectively in their fifth or sixth medical years. 19.1% of our population never heard of Zika virus. When comparing this result to a study conducted by Al-Mohrej, measuring level of awareness of MERS-COV which showed only 3% never heard of MERS-COV, we find significant difference. [4] In addition, when asked about modes of transmission, 32.5% of our population didn't know how the disease is spread. This result was compared to Al-Mohrej sample which showed only 2.9% didn't know how the disease is transmitted compared to 32.5% in our study. Out of the remaining students, 32.5% answered correctly with maternal-fetal transmission, which can be explained by the prevalence of microcephaly as one of the major and known complications of Zika. Also, while 29% were able to answer Aedes mosquito (daytime biter) correctly, 22% included Anopheles mosquito (nighttime biter) as another source of infection. Which indicates that although students recognized mosquitos as a major mode of transmission, they weren't able to identify which type of mosquitos are associated with the disease. Surprisingly, only 7.3% knew that sexual contact is a source of transmission.

The results also demonstrated around 48% of our students were familiar with Zika virus symptoms. However, when presented with multiple choices of symptoms (more than 1 answer can be chosen) there was marked inconsistency in answers. For example, although 39.8% identified fever as a major symptom, only 17.2% chose conjunctivitis which is a correct and 17.2% chose sore throat which is incorrect. Another example of inconsistency only 13% chose joint pain even though it's correct, and 13% chose diarrhea which is not a symptom of Zika. Likewise, 12.2% chose rash which is correct, and 11.4% chose vomiting which is incorrect. This can be explained by the non-specificity and vagueness of Zika virus symptoms. In comparison, in Al-Mohrej study 97.7% of their population knew the typical symptoms of MERS-COV. [4]

The questionnaire also included questions on basic sciences and general knowledge of Zika virus in which our students performed less than expected. While the students could fairly recognize Zika virus complications,

treatment and availability of vaccine with 36%-47% able to answer correctly, when presented with basic questions such as genera, genome and when the virus was discovered less than 10% of the students were able to answer. This could be attributed to the fact that the study population is composed of students in their clinical years.

Each student was graded for each question and for the entire questionnaire and then the students' grades were compared according to age, gender, and medical year, but no statistically significant difference was found in their grades. This could be explained by the general lack of knowledge about and exposure to the Zika virus in our population when compared to their knowledge about MERS-COV as seen in Al-Mohrej's study which has found a significant difference between males and females when asked about the possibility of people infected with MERS-COV to be asymptomatic. [4]

We compared our results to Al-Mohrej's study that tested medical students' knowledge of MERS-COV and found significant differences. Both studies showed low level of knowledge in terms of basic science and general knowledge questions, which can be explained by college's and students' heavy emphasis and focus on clinical aspect of the disease and lack of interest on basic sciences during the clinical years of medical college. Still from a clinical aspect, diagnosis and treatment, students showed better knowledge of MERS-COV. These differences can be attributed to the recent outbreak in Saudi Arabia, especially in Riyadh at King Abdul-Aziz Medical City where most of medical students spent their rotation. During the outbreak, students were informed about the risk of exposure in case of direct contact with patients infected with MERS-COV. Also, the ministry of health has made multiple efforts to educate the public regarding this disease, such efforts included public campaigns at malls and schools, infection control workshops and posts on multiple media outputs.

Our study has some limitations. First, we weren't able to compare our results to other studies that test Zika knowledge, since we couldn't find any while searching literature. Secondly, since the study only included students in their clinical years at KSAU-HS it might not be a representative of medical students in Saudi Arabia. The study can be expanded by comparing results from medical student from different universities. Also, our results can be compared to a control group from general population.

### **Conclusion:-**

The results of this study demonstrated a low level of knowledge regarding Zika virus amongst medical students especially when compared to their knowledge of MERS-COV. Which might indicate the need for an intervention in order to spread Zika virus awareness.

#### Abstract

**Background:** Rupture of aneurysms often present as subarachnoid haemorrhage (SAH). It is one of the most severe form of stroke especially in female population. Estrogen has a potential influence on the vascular pathophysiology. Several reports have come up with the hypothesis of establishing the role of estrogen on SAH. Hence, revisiting the hypothesis of the possible relationship of estrogen with SAH is utmost necessary to find a rationale therapeutics based on understanding of pathophysiology.

**Conclusion:** Estrogen deficiency has significant impact on SAH. A practical approach based on pathophysiology is vital in preventing this dreaded complication in peri-menopausal women harbouring unruptured aneurysms.

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

Rupture of intracranial aneurysms often results in subarachnoid haemorrhage which is a dangerous variety of stroke. 50% of cases often succumb and another 20% are often left with debilitating disability. Of the 30% cases who survive, 10% lose life due to delay in treatment.<sup>1,3,5</sup> SAH has higher incidence in females compared to males and so is the mortality rate associated with it. There is also higher incidence of multiple aneurysms in female population compared to male population. Several meta-analysis and systematic reviews have postulated that in younger ages the incidence is higher in male population and after 50 years the incidence steadily increases in female population<sup>2,6</sup>. And also, cerebral aneurysms are found to occur more commonly in women who achieve early menopause substantiating the role of estrogen as a protective factor against growth of aneurysms<sup>9</sup>. Here is a need for an insight into this hypothesis and its possible therapeutic implications.

#### Aneurysms:-

Abnormal dilatations in the vessel wall are termed as aneurysms. Morphologically there are 2 major types of aneurysms: saccular and fusiform. Saccular aneurysms are more common in cerebral vasculature. They are thin walled spherical expansion from the branching regions of the major cerebral arteries. Fusiform aneurysms are more elongated dilatations of the vessels and are often secondary to certain etiologies like atherosclerosis, dissections etc. SAH is more often associated with saccular aneurysms than fusiform aneurysms and been discussed in this context<sup>11,15,17</sup>.

Address:-Assistant Professor, S. S. Institute of Medical Sciences and Research Centre, Davangere, Karnataka, India.

The layers of cerebral vasculature wall are from within outside: tunica intima, tunica media and tunica adventitia. Internal elastic lamina separates intima from media and is composed of elastin. Tunica media is mainly composed of smooth muscle cells and collagen fibrils. Tunica adventitia mainly consists of vasa-vasorum, fibroblasts, elastin and collagen fibres. Collagen fibres are mainly produced by fibroblasts. Fibroblasts are also responsible for repair and maintenance of connective tissue. It is the defect or loss of segments of tunica media that incites aneurysms. The production and degradation of collagen fibres is dependent on stretch of the wall of the vessels. The hemodynamic factors like shear stress and blood pressure play a vital role in the growth of aneurysms<sup>11,12</sup>.

The 3 important determinants of aneurysms are : hypertension, increased vessel fragility and hemodynamic shearing stress. And interestingly estrogen can affect all these factors and thereby increase the risk of cerebral aneurysm formation. Low dose estrogen reduces blood pressure and so is the hormone replacement therapy. It also has conducive effect on lipid profiles which directly contributes to reduced risk for atherogenesis and plaque formation which weaken the vessel walls. The tunica media is composed of collagen type 1 and 3 which is the main structural matrix of major arteries including internal carotid arteries<sup>14</sup>. During post-menopause, connective tissues of the internal carotid arteries undergo degeneration contributing to aneurysm formation. Low dose estrogen and hormone replacement therapy promote strengthening of the connective tissue by promoting the formation of collagen 1 and 3 by fibroblasts and thereby preventing aneurysm formation and growth. Hence estrogen plays an important role in vascular and aneurysmal integrity through the control of collagen production and maturation in the vessel wall<sup>17,18</sup>.

### **Estrogens:-**

Endogenous estrogens include: estrone(E1), estradiol (E2) and estriol (E3). Majority of estrogens are formed in the liver or in peripheral tissues from androstenedione. Major circulating form is estradiol(E2) which is formed mainly in ovaries. The source and plasma levels vary with age. In post-menopausal women, estrone(E1), testosterone and circulating androstenedione are the major precursors of estrogen production in peripheral tissues. E2 metabolism also depends on genetic background, ethnicity, menopausal status and the phase of menstrual cycle. This variation in metabolism has immense effect on vascular integrity<sup>11,18,19</sup>. Estrogen receptors have very high affinity and specificity to circulating estrogens. There are sex and age related differences in the expression of these estrogen receptors. However, estrogen itself regulates these receptors depending on the phase of menstrual cycle and age of the patient. Hence, estrogen treatment has profound effect on regulation of estrogen receptors thereby decreasing the major fluctuations. Estrogen receptors(ER) have protective effect on vasculature by production of Nitric Oxide( NO). Regulation of expression of these ER by mainly E2 plays a vital role in preventing aneurysmal growth and rupture.<sup>19,20</sup>

### **GPER:-**

A G-protein coupled estrogen receptor (GPER) is widely distributed in brain and cerebral vasculature. E2 has strong affinity to this receptor which is totally unrelated to traditional estrogen receptors. This GPER carries out non – genomic effects of estrogen which have regulatory role on collagen morphology of vessel wall.<sup>19,21</sup>

### **Contributing Factors:-**

In a study on Japanese women, earlier age of menarche and nulliparity were associated with increased risk of Sub arachnoid haemorrhage. Therefore sex specific hormonal factor may play a role in the pathogenesis of aneurysm formation and rupture<sup>27,29</sup>.

The collagen that is present in the bone and skin is similar to that found in the walls of proximal segments of cerebral arteries. In post-menopausal women, there is wasting of this collagen due to estrogen deficiency. This could possibly explain for the degeneration of this collagen in the proximal segments of cerebral arteries leading to aneurysm formation.<sup>23,28</sup>

Factors leading to relative deficiency of estrogen often increased the risk of aneurysm formation and SAH. But, estrogen deficiency alone is not sufficient to corroborate the hypothesis because men also show some deficiency of estrogen. So, it is not the absolute levels but dramatic changes in the estrogen levels is that which contributes to the pathogenesis. Hence men are at reduced risk because they do not experience that steep change in the levels of estrogen as it occurs at menopause. Hence periodicity in the levels of estrogen is the contributory factor.<sup>27,29</sup>

Harada et al found based on their observations that internal carotid artery( ICA) was more commonly involved in aneurysm formation as well as rupture in women whereas anterior cerebral artery (ACA) and middle cerebral artery (MCA) are more commonly affected by aneurysm formation in men. In men it is the hemodynamic factors that contribute to evolution of aneurysms whereas in females it is the intrinsic deficiency in the wall of vessel which is more contributory. Hence estrogen is a potential target for preventing the evolution of aneurysms in peri-menopausal women.<sup>32</sup>

#### **Role of hormone replacement therapy (HRT):-**

Regulation of inflammatory cascades and vascular wall integrity are the main areas where estrogen has its conducive effects. Dysregulation of this mechanism promotes growth and rupture of aneurysms. Hence , hormone replacement therapy(HRT) with E2 could be a therapeutic strategy. However, various randomized control trials have shown negative effects of HRT and the reasons could be: age related changes in ER numbers, changes in distributions of ER, down streaming of ER signaling pathways and age related changes in the collagen components in vessel walls. Estrogen cannot reverse the pre-existing vascular pathology although it can give relief from menopausal symptoms<sup>31,32</sup>. In various randomized control studies, HRT might not have been administered early enough so has to have conducive effect and contributing to negative effects. Hence, the time of HRT administration is vital in preventing aneurysm growth and rupture. The HRT should begin soon after the depletion of endogenous E2 to have positive effect in preventing aneurysm growth and rupture<sup>33,35</sup>.

And coming to the mode of administration, oral HRT increases the risk of venous thrombo-embolism whereas transdermal HRT has little impact on thrombosis. And also the risks of coronary heart diseases are reduced in women who start HRT within 10 years of menopause. Other effects of HRT are : increased risk of breast cancer and meningiomas in women<sup>35,36</sup>.

#### **Selective estrogen receptors modulators (SERM):-**

Specific estrogen agonists targeted on modulating cerebral vascular ER activity without having any other detrimental effects on other systemic circulation have been recently developed providing a boost to HRT. A superior effect of these selective estrogen receptor modulators (SERM) with favorable tissue specificity have been documented on preventing the growth and rupture of aneurysms compared to E2.<sup>39,40</sup>

#### **Phytoestrogens:-**

Isoflavones such as Genistein which are chiefly found in soya-bean derived products mediate estrogenic effects through ER and also GPER thereby promoting genomic and non-genomic actions on cerebral vasculature. Genistein has also conducive effects on extra-cellular matrix (ECM). ECM has vital role in regulating vascular wall integrity and remodeling and hence these provide an alternate strategy to HRT.<sup>36,41</sup>

#### **Future trends:-**

The current strategies of management of unruptured intracranial aneurysms is controversial. Medical management is largely limited to: smoking cessation, control of blood pressure, radiological surveillance, neurosurgical and endovascular interventions. There is no documented pharmacological treatment available to decrease the risk of aneurysm growth and rupture. Pathophysiology based therapies like HRT, SERMS and Phytoestrogens may play a vital role in preventing rupture of intracranial aneurysms in post-menopausal women thereby reducing the morbidity and mortality due to SAH in this segment of population.<sup>2,9,42</sup>

New generation HRT, SERMS and Phytoestrogens may have beneficial role in prevention of rupture of aneurysms if initiated at right timing of peri-menopausal women diagnosed with having small un-ruptured aneurysms. Although conducive effects of these agents are much less in older women due to pre-existing cerebrovascular diseases and cardiovascular pathologies, future investigations are needed to devise novel strategies. Appropriate route of administration, dosage, periodicity of administration and timing of administration provide a pragmatic approach for increasing the benefits of these therapies and subsequent preventing the growth and rupture of aneurysms causing SAH.<sup>49,50</sup>

#### **Conclusion:-**

Estrogen deficiency has a significant impact on the pathophysiology of aneurysmal rupture and SAH. An understanding of this subtle relationship between estrogen and SAH might have significant implication on women's health.

#### Abstract

risk of developing metabolic disturbances. This risk may be further exacerbated by the use of antipsychotic agents. Research is still ongoing to determine the metabolic impact of antipsychotics on glucose regulation. In this case report we review some of the possible mechanisms of action of antipsychotic medication on glucose regulation.

**Case presentation:-** We present the case of a 50-year-old man diagnosed with paranoid schizophrenia who developed type 2 diabetes mellitus whilst on treatment with second generation antipsychotics (SGA). His diabetes was controlled by a combination of antidiabetic drugs that were associated with his psychotropic treatment. Due to deterioration in his mental state, the patient was admitted on two occasions to a psychiatric unit during which his prescribed medication (olanzapine and risperidone) was discontinued and changed to aripiprazole. On both occasions, the patient suffered hypoglycaemic episodes and his antidiabetic treatment had to be adjusted accordingly. The patient did not require any antidiabetic treatment whilst on aripiprazole during the follow up period.

**Conclusion:-** Clinicians face regular dilemmas in trying to find the right balance between achieving control over a patient's mental illness and reducing any adverse effects associated with the prescribed medication. In patients receiving concomitant antidiabetic therapy, caution should be exercised when changing from one SGA to another. Whilst more longitudinal data are required, a trial of alternative SGAs, including aripiprazole in those developing type 2 diabetes and impaired glucose tolerance may be a worthwhile therapeutic option.

**Introduction:-** People with schizophrenia are at increased

#### Introduction:-

Second generation antipsychotics (SGAS) have been adopted as first line treatment for people with schizophrenia [1]. This has been based on a superior safety profile with regards to adverse events such as extrapyramidal symptoms in comparison to first generation (or 'conventional') antipsychotics [2]. However, many studies have

provided convincing evidence for a high risk of metabolic abnormalities associated with the use of some of these agents [3]. These are of major concern owing to the additive effect on morbidity and mortality in a population with already increased prevalence of obesity, type 2 diabetes mellitus and cardiovascular disease [4].

The prevalence of diabetes mellitus among people with schizophrenia is approximately two to four times higher than in the general population, and schizophrenia appears to be an independent risk factor for diabetes mellitus [5]. The development of metabolic abnormalities within an individual patient can depend on the contribution of drug effects (for example, weight gain) as well as individual host factors, such as race, family history, disease or lifestyle. The part played by antipsychotic medication in the development of diabetes mellitus is an ongoing focus of research. Apart from increased adiposity, there are still unanswered questions about the mechanism of action involved in altering insulin sensitivity or secretion by these agents [5, 6].

We present a patient with paranoid schizophrenia who developed type 2 diabetes whilst on treatment with SGAS. He suffered hypoglycaemic episodes on two separate occasions when the treatment was changed to aripiprazole with no change to his antidiabetic treatment.

### **Case presentation:-**

The patient, a 50-year-old Asian man diagnosed with paranoid schizophrenia when in his late twenties, had been treated with a variety of first generation antipsychotics for several years. Whilst an inpatient at age 42 years, he had been prescribed SGAS. He was medically fit, apart from suffering from hypertension controlled with perindopril 4 mg/day. He was discharged once clinically stable on olanzapine 20 mg/day. His records revealed that at age 48 years, whilst on 20 mg olanzapine, his random glucose levels were 17.6 and his glycosylated haemoglobin was 10.9%. He was started on oral hypoglycaemic agents by his general practitioner, a combination of gliclazide MR 30 mg/day and metformin 500 mg twice daily, which was later increased to 1 g twice daily because of poor response.

His diabetes mellitus was under control, but as his mental state continued to deteriorate, olanzapine was increased to 25 mg/day and subsequently changed to aripiprazole reaching a dose of 20 mg/day. After 2 months, the patient experienced gradual weight loss associated with episodes of hypoglycaemia. Gliclazide was consequently discontinued and he remained on metformin 1 g twice daily.

The patient was re-admitted to hospital 7 months later owing to poor compliance with medication and exacerbation of his psychiatric symptoms. Whilst in the community, his general practitioner restarted his diabetic medication (gliclazide 30 mg/day and metformin 500 mg twice daily) and combined it with a lipid-regulating drug (simvastatin 20 mg/day) and antihypertensive treatment (amlodipine 10 mg/day and perindopril 4 mg/day). On admission, his fasting glucose levels were between 3.7 and 6 mmol/l and he was overweight with a body mass index (BMI) of 27. Risperidone was added to the medication regime reaching a dose of 6 mg/day. His fasting glucose levels were between 4.2 mmol/l and 6 mmol/l. After 3 months, despite controlling his psychiatric symptoms, risperidone use resulted in intolerable side effects in the form of urinary incontinence, therefore it was discontinued and aripiprazole restarted reaching a dose of 15 mg daily. Six weeks later, the patient presented with symptomatic episodes of hypoglycaemia with fasting glucose levels between 2.1 and 3 mmol/l with no changes in body composition or other metabolic parameters. In consultation with his diabetologist, the oral hypoglycaemic medication was discontinued. The patient remained physically well with fasting glucose levels within normal range (3.5 to 6 mmol/l) during the 6 months that he remained in the unit.

### **Discussion:-**

The majority of studies indicate that SGA drugs which induce more weight gain (for example, clozapine and olanzapine) are associated with increased risk of diabetes mellitus and interpretations in the literature in relation to specific differences among these drugs have been controversial [7]. The increased prevalence of abnormalities in glucose regulation (for example, insulin resistance) and under-diagnosis of type 2 diabetes in patients with schizophrenia, prior to the commencement of antipsychotic medication, is a confounding factor [4, 6]. In addition, the issue is complicated by the nature (mostly retrospective) and heterogeneity of the data with studies funded primarily by pharmaceutical companies [6, 7].

Differing weight gain risk across the SGA agents seems to run alongside the variation in relative risk for metabolic disturbances [7]. One of the proposed mechanisms appears to be related to a greater H1 histamine receptor affinity

associated with complex interplay among many other receptors (alpha1, H1, muscarinic, 5 hydroxytryptamine type 2A-2C and so on). Increased adiposity is linked to decrease in insulin sensitivity and changes in plasma glucose and lipid levels [6, 8]. Emerging evidence in animal studies suggests that direct drug effects on beta-cell function and insulin action could be involved as factors independent from changes in body composition in up to a quarter of treatment-related new onset diabetes [7, 9]. Rapid induction of hyperglycaemia sometimes accompanied by ketoacidosis has been reported in patients on clozapine and olanzapine without weight gain [9]. It seems likely that the hepatic insulin resistance develops with acute dosing, whereas weight gain and hyperlipidemia occur following repeated dosing. An alternative mechanism is inhibition of glucose transport into peripheral tissues, with suppression of cholinergic-stimulated insulin secretion by direct action on the pancreas, which involves antagonism of muscarinic M3 on beta-cells [6, 9]. In addition, it is likely that the central nervous system plays an important role through the hypothalamus and its action over sympathetic and parasympathetic pathways on glucose regulation [6, 8].

Data on the metabolic impact of aripiprazole suggest that it has little or no detrimental effect relative to other SGAs. However, two cases of diabetic ketoacidosis were reported in people with schizophrenia after starting aripiprazole [10, 11, 12] and further reports claim that it may even have a favourable impact on metabolic parameters [12]. The debate is still ongoing as a result of fewer long-term data owing to the limited time this medication has been on the market.

Our patient, who has diabetes treated with oral hypoglycaemic agents, experienced changes in body composition such as gradual weight loss and reversal of metabolic parameters towards normal levels associated with hypoglycaemia when the antipsychotic medication he was on was switched to aripiprazole for the first time. When his antipsychotic medication was changed to aripiprazole once again ten months later, following the discontinuation of risperidone owing to side effects, a second episode of hypoglycaemia occurred. On both occasions this led to review of his antidiabetic treatment. The hypoglycaemic episode could be explained by the discontinuation of olanzapine and/or risperidone as described in the literature [13] or the combination of oral hypoglycaemic medication with aripiprazole. However, it is relevant to note that the patient did not require any antidiabetic treatment whilst on aripiprazole during the follow up period.

### **Conclusion:-**

Clinicians face regular dilemmas in trying to find the right balance between achieving control over the patient's mental illness and reducing the adverse effects associated with the prescribed medication. Whilst research in the area is ongoing, psychiatrists should perform regular general health monitoring (including screening for diabetes mellitus) in all patients with schizophrenia. In patients receiving concomitant antidiabetic therapy, caution should be exercised when changing from one SGA to another. Whilst more longitudinal data is required, a trial of alternative SGAs, including aripiprazole in those developing type 2 diabetes and impaired glucose tolerance may be a worthwhile therapeutic option.

Further research is required to determine the potential of aripiprazole to prevent complications or reverse metabolic abnormalities in those patients with pronounced disturbances at baseline. If present, these properties could enhance treatment options in patients receiving concomitant antidiabetic therapy and in those patients with treatment resistance on combination therapy with drugs known to have a poor safety profile [14].

### **Consent:-**

Written informed consent was obtained from the patient for publication of this case report and any accompanying images. A copy of the written consent is available for review by the Editor-in-Chief of this journal.

#### Abstract

**Background:** The long-term prognosis after Hematopoietic stem cell transplantation (HSCT) has greatly improved. However, HSCT survivors are at risk of developing long term complications. Cardiac complications are potentially life-threatening and there is a need to elucidate the incidence, severity and underlying mechanisms of these complications. We assessed the systolic cardiac function by echocardiography in patients who underwent autologous and allogeneic hematopoietic stem cell transplantation for lymphoproliferative disorders and evaluated the association between the conditioning regimens used and the decline in ejection fraction.

**Materials and methods:** 100 patients were enrolled in this retrospective study, 72 patients underwent autologous and 21 patients underwent allogeneic stem cell transplantation. 39 patients had multiple myeloma, 30 patients had NHL, 21 patients had acute lymphoblastic lymphoma, 10 patients had HD. LVEF was assessed by echocardiography and compared to a healthy control group as well as 50 positive control of patients who received chemotherapy without undergoing transplant.

**Results:** The mean ejection fraction of cases after transplant is significantly reduced compared to the negative control group. The ejection fraction decline was highly pronounced in older age groups, male patients and more in patients with larger surface area, with the use of TBI-based regimens followed by patients who received high-dose cyclophosphamide in the conditioning regimens.

**Conclusion:** LVEF was reduced in patients with lymphoproliferative disorders after autologous and allogeneic hematopoietic stem cell transplantation and was correlated with the use of TBI-based conditioning regimens and high-dose cyclophosphamide.

#### Introduction:-

Allogeneic or autologous HSCT offers a possibility of cure or long-term remission in hematological malignancies. However, gastrointestinal, pulmonary, infectious and immunological complications are major problems and limiting factors for HSCT<sup>1</sup>.

**Corresponding Author:- Haitham Mohammed Abdelbary.**

Address:- Clinical Hematology and Bone Marrow Transplantation Unit, Division of Internal Medicine, Ain Shams University, Cairo, Egypt.

Finally, in the last few years reduced-intensity conditioning regimens have been applied to patients undergoing allogeneic HSCT to reduce drug toxicity while maintaining the potential for achieving disease remission exploiting the graft-versus-leukemia effect<sup>2</sup>.

The long-term prognosis after haematopoietic stem cell transplantation (HSCT) has greatly improved. However, HSCT survivors are at risk of developing long term complications, and mortality rates remain four- to ninefold higher than in the general population<sup>3</sup>.

Cardiac complications have been documented in several series, with reported incidence varying among investigators from 0 to 43%, and mortality up to 9% in earlier studies<sup>1</sup>.

Cardiovascular complications can be grouped into three main categories: vascular abnormalities, cardiac structural problems and myocardial dysfunction and heart failure.

Evaluation of cardiac toxicity in patients includes consideration of biomarkers such as cardiac troponins and B-type natriuretic peptides, together with noninvasive imaging in the form of 2D-, 3D-, or strain echocardiography, multiple gated radionuclide angiography, quantitative gated blood-pool SPECT, or cardiac magnetic resonance imaging<sup>3</sup>.

**The purpose of this study is to** evaluate systolic dysfunction in patients with lymphoproliferative disorders after hematopoietic stem cell transplantation.

## **Patients and Methods:-**

### **Study Design:-**

#### **Patients and Control:-**

The study was conducted in the bone marrow transplantation unit (department of clinical hematology at Ain Shams university hospital) during a period from June 2015 to August 2016.

#### **Participants were grouped into:-**

Group (1): included 100 patients with lymphoproliferative disorders who underwent BMT in our unit, 79 patients underwent autologous transplant and 21 underwent allogeneic transplant, 30 patients with NHL, 10 patients with HD, 39 patients with multiple myeloma and 21 patients with acute lymphoblastic leukemia.

Group (2) (healthy control group): included participants without known cardiovascular disease, hypertension or DM. They were matched 1:1 based on age, sex, blood pressure and surface area with the cases.

Group (3) (positive control): 50 patients with lymphoproliferative disorders who received chemotherapy without undergoing BMT. They included 25 males and 25 females, 46% had MM, 42% had NHL and 12% had HD.

Informed consents were obtained from all participants. The study was conducted in accordance with the stipulations of the local ethical and scientific committees of Ain Shams University and the procedures respected the ethical standards in Helsinki declaration of 1964.

### **Methods:-**

All patients were subjected to full history and physical examination including the presence of B-symptoms like weight loss, fever, drenching sweats and pruritis, anemic manifestations or bleeding or the presence of bone fractures and the presence of lymphadenopathies or hepatosplenomegaly.

#### **To confirm the diagnosis of NHL and HD:-**

- Excision lymph node biopsy for fresh frozen and formaline-fixed samples for histopathological assessment.
- Immunohistochemistry for B-cell markers like CD20,CD19,CD79a,CD10 and T-cell markers like CD3,CD4,CD8,CD7,CD5,CD2 , markers of immature lymphoblast like TdT, immunoglobulin Kappa and Lambda light chain restriction and for CD15 and CD30 for characterization of Reed-Sternberg cells.
- Chest X-ray, contrast-enhanced CT scans of the neck, chest and pelviabdomen.
- Baseline, interim and end of therapy PET was carried out whenever available for staging and response assessment.

- Bone marrow aspiration and trephine biopsy.
- Cytogenetic analysis using conventional cytogenetics and FISH for certain specific chromosomal abnormalities.
- Staging is carried out according to Ann-Arbor staging system Examination.
- Cerebrospinal fluid and triple intrathecal chemotherapy prophylaxis was given to certain patients like: (1): patients with DLBCL with bone marrow, testicular, paranasal and epidural involvement. (2): lymphoblastic lymphoma. (3): primary CNS lymphoma.
- Upper GI endoscopy in those with suspected GI involvement eg. Mantle cell lymphoma.

#### **To confirm the diagnosis of multiple myeloma:-**

- Complete blood counts and serum chemistries especially for serum calcium, serum creatinine to detect CRAB features.
- Detection of monoclonal M-protein in the serum and urine by serum protein electrophoresis.
- Characterization of heavy and light chains in the serum and urine sample by immunofixation.
- Bone marrow aspiration and biopsy to evaluate the percentage of plasma cells.
- Conventional chromosomal analysis and FISH for high-risk myeloma like t(4;14), (14;16) and 17p.
- Skeletal survey for evaluation of lytic bone lesions using X-ray of spine, skull, pelvis, humerus and femur.
- MRI to evaluate symptomatic bony sites even if skeletal survey is negative or in case of spinal cord compression.
- Serum free light chains and Kappa/Lambda ratio for the detection of stringent CR whenever possible.

#### **To confirm the diagnosis of acute lymphoblastic leukemia:-**

- Complete blood count and differential for the detection of peripheral blasts.
- Bone marrow aspiration and trephine biopsy for the detection of the percentage of blast cells.
- Immunophenotyping for lymphoid and myeloid markers.
- Conventional cytogenetics and FISH for Philadelphia chromosome.
- CT scans for the neck, chest and pelviabdomen.
- CSF examination and triple intrathecal chemotherapy for prophylaxis and/or therapy in case of CNS involvement.

#### **Patients who underwent autologous transplant were subjected to:-**

- Complete blood count using (LH Beckman coulter).
- Serum chemistries including liver and renal function tests (AU 680 chemistry autoanalyzer).
- Viral markers for hepatitis B, hepatitis C and HIV using Rosh diagnostics and performed by copus instruments.
- Polymerase chain reaction (PCR) for CMV using kits supplied by Qiagen and performed by rotor gene instrument for automated real time PCR.
- Serology for herpes simplex (HSV), Toxoplasma and Epstein Bar virus (EBV).
- Pulmonary function tests.
- Renal scan.
- Electrocardiogram and echocardiography.
- Mobilization was done using different regimens ranging from G-CSF alone to G-CSF and cyclophosphamide or other chemotherapeutic regimen depending on the specific disease.
- Conditioning regimens: for patients with MM high dose melphalan 200mg/m<sup>2</sup> on day -2, for patients with NHL and HD they received a conditioning regimens consisted of cyclophosphamide 60mg/kg/d -3 and -2, etoposide 15mg/kg/d -3 and -2, carboplatin 400mg/m<sup>2</sup> -3 and -2.

#### **In addition, patients undergoing allogeneic transplant are subjected to:-**

- Donors received (after informed consent) 4 days of treatment with SC G-CSF (10ug/kg/d) before stem cells were collected.
- Mononuclear cells were isolated using a Cobe Spectra separator (Lakewood, Co, USA).
- The number of CD34 cells transfused was calculated using flowcytometric analysis.
- GVHD prophylaxis consisted of cyclosporine and methotrexate.
- Engraftment was defined as absolute neutrophilic count of more than 500 for three consecutive days.
- Chimerism analysis by variable number of tandem repeats (VNTR) was done at +28 and +56 after transplant.

- Conditioning regimen consisted of TBI 2.5GY days -7 to -4 /Cyclophosphamide 60mg/kg days -3 and -2, TBI 2.5 GY days -7 to -4 /etoposide 60mg/kg d-3, Fludarabine 30mg/m<sup>2</sup> days -6 to -2 /oral Busulfan 1mg/kg/6hours days -6 to -3.

All patients in both autologous and allogeneic transplant were treated using the same anti-infectious and transfusion policy of our transplant center.

#### Transthoracic echocardiography:-

- All patients were evaluated during transplant in case of occurrence of any minor or major cardiac events according to the international guidelines recommended by ACC and AHA.
- Transthoracic echocardiograph was done before transplant and 6 months after transplant.
- Transthoracic echocardiography was carried out using 2-4 MHz phased array transducer attached to a vivid S5 echocardiography machine by a cardiologist who was blinded to clinical details of each subject. Inter-observer variability was reduced by taking the mean of three reading during each echocardiography.
- The following parameters were examined: left ventricular end-diastolic diameter (LVEDD) and left ventricular end-systolic diameter (LVESD), intraventricular end-diastolic diameter (IVSDD), posterior wall end-diastolic diameter (PWEDD), right ventricular end-diastolic diameter (RVEDD), left atrium diameter (LA) and aorta diameter (Ao). The systolic function was determined by left ventricular ejection fraction (LVEF) using M-mode and modified Simpson's formula. Left ventricular diastolic function was evaluated with pulsed Doppler and tissue Doppler imaging (TDI). The following parameters of the diastolic function of left ventricle were determined: early filling velocity E wave (E) and A wave (A) of mitral inflow, Doppler-derived mitral deceleration time of early filling (DT), isovolumetric relaxation time (IVRT) and early diastolic velocity of mitral annulus wave (E0).

#### Statistical analysis:-

- All analyses of the present study were done using SPSS version 17 software.
- Statistical presentation and analysis of the present study was conducted, using the mean, standard deviation, student t-test, chi square.
- Data were expressed as mean value  $\pm$  SD for continuous variables, and as percentages for categoric variables. In this study, statistical significance was established as follows:  $p > 0.05$  insignificant,  $p \leq 0.05$  significant,  $p \leq 0.01$  highly significant.
- Comparisons between continuous variables were performed using the paired t-test or unpaired t-test. For comparisons of categorical variables, frequency tables and chi-square tests were used.

#### Results:-

100 patients were enrolled into the study (39 patients with MM, 30 patients with NHL, 10 patients with HD and 21 patients with ALL) (table 1). There were 50 males and 50 females, 55 patients aged <45 years, 21 aged 45-55 years and 24 aged >55 years (table 5). Healthy control group included participants without known cardiovascular disease, hypertension or DM. They were matched 1:1 based on age, sex, blood pressure and surface area with the cases. Positive control included 50 patients with lymphoproliferative disorders who received chemotherapy without undergoing BMT. They included 25 males and 25 females, 46% had MM, 42% had NHL and 12% had HD. 72 patients underwent autologous and 21 patient underwent allogeneic stem cell transplantation (figure 1).

**Table 1:-** Percentages of patients with lymphoproliferative disorders in our study:

Lymphoproliferative disorder		
	N	%
MM	39	39.00
NHL	30	30.00
HD	10	10.00
ALL	21	21.00
Total	100	100.00

**Figure 1:-** Percentages of autologous and allogeneic stem cell transplant patients in our study group.

The mean ejection fraction of cases after transplant is significantly reduced compared to the negative control group with highly statistically significant difference (P-value <0.001) (table 2). There is a highly statistically significant difference between ejection fraction in the initial echocardiography before therapy in all patients and the follow up echocardiography after either chemotherapy only in group III or transplanted patients in group I (P-value<0.001).

Also, these results show that group I (transplant group) had higher initial ejection fractions compared to group III with highly statistically significant difference by using unpaired t-test (P-value <0.001) (table 3).

**Table 2:-** The mean ejection fraction of group I patients that underwent transplant and that of healthy group II (negative control) included in the study:

ECHO	GROUPS		T-test	
	Group I (cases) after transplant	Group II (Negative control)	T	P-value
Range	49-70	59-75	-5.322	<0.001*
Mean $\pm$ SD	59.590 $\pm$ 6.299	66.760 $\pm$ 4.728		

**Table 3:-** Correlation between the ejection fraction in the initial echocardiography before therapy in all patients and its decline in the follow up echo after either chemotherapy only in group (3) or transplant in group (1):

Echo		Group I (cases)	Group III (Positive control)	T-test	
				T	P-value
Initial echo	Range	55-75	52-73	5.261	<0.001*
	Mean $\pm$ SD	67.290 $\pm$ 4.123	62.880 $\pm$ 6.033		
Follow up echo	Range	49-70	45-62	5.883	<0.001*
	Mean $\pm$ SD	59.590 $\pm$ 6.299	53.820 $\pm$ 4.084		
Paired difference	Mean $\pm$ SD	7.700 $\pm$ 5.519	9.060 $\pm$ 5.464		
Paired samples test	T	13.953	11.725		
	P-value	<0.001*	<0.001*		

Conditioning regimens used during transplant included high dose melphalan in 39 patients with multiple myeloma, Cyclophosphamide/Carboplatin/Etoposide in 36 patients with NHL and HD, Fludarabine/Busulfan and TBI-based regimens in patients with ALL (table 4).

**Table 4:-** Percentages of conditioning regimens used in our study:

Conditioning regimen		
	N	%
High dose melphalan	39	39.00
Cyclophosphamide/Carboplatin/Etoposide	36	36.00
Fludarabine/Busulfan	14	14.00
TBI-based	11	11.00
Total	100	100.00

Chemotherapy regimens used prior to transplant included hyperCVAD/Holezer protocols for patients with ALL, VAD/CVAMP for MM, ABVD/GDP for HD and CHOP/DHAP for NHL (figure 2).

**Figure 2:-** Type of chemotherapy used prior to transplant

The ejection fraction decline was highly pronounced in older age groups compared to younger group with highly statistically significant difference (P-value 0.001) (table 5). The ejection fraction decline was seen more in male cases compared to females (P-value 0.009) (table 5). Also, the decline of ejection fraction was more in patients with surface area >1.8 than those with surface area <1.8 (P-value 0.040) (table 5). There is no statistically significant difference between the type of transplant and the decline in ejection fraction (table 5).

**Table 5:-** Relation of the different age groups, sex, surface area and type of transplant of the cases and the decline in their ejection fraction:

	EF decline						Chi-Square

**Discussion:-**

The current standard for cardiac monitoring during cancer therapy is mainly based on LVEF assessment, but it can underestimate early potentially progressive cardiotoxicity, and preserved cardiac function is generally required for enrollment in clinical trials of high dose chemotherapy. This is commonly defined as LVEF>50% and no other significant cardiac disease.

Many studies reported a significant association between pretransplant LVEF and cardiotoxicity. However, measurement of LVEF before high dose chemotherapy is not the only determinant factor as 2/3 major cardiac events reported in patients with normal LVEF<sup>2</sup>.

In the current study, we found that the mean ejection fraction of cases after transplant is significantly reduced compared to the negative control group with highly statistically significant difference (P-value <0.001). Also, there is a highly statistically significant difference between ejection fraction in the initial echocardiography before therapy in all patients and the follow up echocardiography after either chemotherapy only in group III or transplanted patients in group I (P-value<0.001).

A wide variety of conditioning regimens have been used prior to stem cell transplantation. Including, TBI-based regimens and high-dose cyclophosphamide, and cardiac toxicity has been associated mostly with the use of these regimens with a wide spectrum of incidence, manifestation and severity.

HD cyclophosphamide-associated cardiac toxicity is thought to depend upon toxic endothelial damage followed by extravasation of toxic metabolites with resultant myocyte damage and interstitial hemorrhage and edema. HD cyclophosphamide-associated cardiotoxicity occurs during or soon after (within 3 weeks) administration. It is manifested clinically as acute or subacute onset of congestive heart failure (CHF) with pulmonary congestion, weight gain and oliguria. Pericardial effusion, in some cases with cardiac tamponade. Although HD cyclophosphamide-associated cardiac toxicity is potentially reversible, in patients who develop severe, progressive CHF, this complication may lead to death within few weeks<sup>2</sup>.

In our study, we found that ejection fraction decline is higher in patients with a body surface area >1.8 than those with a body surface area <1.8 reflecting a higher dosage of chemotherapeutic agents used in those patients.

In fact, optimal chemotherapy dosing in obese patients is one of the most controversial aspects of HD chemotherapy since obese patients have altered pharmacokinetics for many medications including chemotherapeutic agents when compared with the non-obese.

Indeed, association of obesity with cardiac toxicity can be spotted throughout the literature. As a practical approach, reduction of HD cyclophosphamide dosage in patients whose actual BW exceeds by >20% of the IBW is a safety measure that doesn't affect the efficacy of chemotherapy and minimizes the risk of toxicity<sup>2</sup>.

In the current study, the ejection fraction decline was highly pronounced in older age groups compared to younger group with highly statistically significant difference (P-value 0.001). The ejection fraction decline was seen more in male cases compared to females (P-value 0.009).

The comparison between autologous and allogeneic recipients is especially important. More pronounced cardiotoxic effects could be expected in allogeneic recipients as a result of a different spectrum of conditioning regimens, infectious complications and also an effect of GVHD.

In our study, no difference was found between the incidence of EF decline and the type of transplant. However, the number of allo HSCT in this study is much fewer than the auto patients.

Hernstein et al found that despite the speculation of higher incidence of cardiotoxic complications in patients undergoing allo-HSCT, a higher incidence heart failure was found in autologous recipients in their study. However, the number of autologous patients in their study was small<sup>4</sup>.

There is a statistical significance between the decline in ejection fraction and the conditioning regimen used for the transplant with patients in the TBI-based regimens are more affected followed by patients who received high dose cyclophosphamide.

Comparing TBI-based regimens to non-TBI regimens there is highly statistically significant difference between the decline in ejection fraction and the use of TBI (P-value 0.012).

The epidemiology of RICVD is complicated by the continual improvements in radiation dosimetry and shielding that tend to reduce cardiovascular exposure and the latent effects of radiation, which takes years or decades to manifest.

Several large studies have been published over the last few years that analyzed the outcome of RT administered between one and four decades ago.

Radiation-induced pericarditis is the earliest form of RICVD to occur following mediastinal irradiation. It may occur in either of two forms, early and acute or delayed and chronic, which should be regarded from a histopathological standpoint as two distinct disease entities<sup>5</sup>.

The risk of radiation-induced cardiomyopathy increases after 5 years, but it can evolve decades after initial RT<sup>6</sup>. Pathologically, RICM is characterized by inflammation followed by the development of a diffuse, patchy interstitial fibrosis of the myocardium and effacement of perimyocyte and endothelium<sup>7</sup>.

More recently, researchers at the Netherlands Cancer Institute found a stepwise decrease in 30-year cumulative incidence of valvular heart disease (VHD) corresponding to diminishing doses of RT, from 12.4% at doses greater than 40 Gy to 3.0% at doses less than 30 Gy<sup>8</sup>.

A large case control study of breast cancer survivors in Denmark and Sweden undertaken in 2013 found that the risk of a major CHD event begins to increase within the first 5 years post-treatment and continues to significantly exceed that of the general population through at least 20 years of follow-up. These patients experienced increased risk of angina pectoris, MI, and sudden cardiac death despite having been treated with a modest mean heart dose of 3.6 Gy RT between 1958 and 2001<sup>9</sup>.

Another large study of women in Denmark and Sweden ( $n=35000$ ) comparing incidences of MI in breast cancer survivors observed an incidence ratio of 1.22 in patients undergoing left-sided vs right-sided RT<sup>10</sup>.

In the current study 36.4% of lymphoma patients that underwent autologous transplant with cyclophosphamide-based regimens developed a decline in their LVEF. Previous reports showed that CY cardiotoxicity is correlated with the dose of CY is being higher in patients received 200 >120 >100 mg/kg<sup>11</sup>.

In a previous report, higher age, administration of cyclophosphamide and higher glucose concentrations represented independent risk factors for the worsening of left ventricular diastolic function<sup>12</sup>.

Several methods were investigated to reduce anthracycline cardiotoxicity, most cardioprotective strategies are not in common clinical practice. Other approaches to mitigate the cardiotoxic impact of anthracyclines employ potentially cardioprotective medications, such as ACE inhibitors and beta blockers. Although promising data have been published recently, convincing evidence from large randomized and prospective trials is still needed<sup>3</sup>.

There are some limitations of our current analysis. First, this was a retrospective study from a single institution. Second, early CY-induced cardiotoxicity appears to be characterized by LV diastolic rather than systolic dysfunction.

### Conclusion:-

LVEF was reduced in patients with lymphoproliferative disorders after autologous and allogeneic hematopoietic stem cell transplantation and was correlated with the use of TBI-based conditioning regimens and high-dose cyclophosphamide.

### Abstract

**Introduction:** Hypertensive is defined as an abnormal elevation in diastolic pressure and/or systolic pressure; mean arterial pressure is also elevated in hypertension, but it is not usually measured in people. In past years, the diastolic value was emphasized in assessing hypertension. However, elevations in systolic pressure ("systolic hypertension") are also associated with increased incidence of coronary and cerebrovascular disease (e.g., stroke). Therefore, we now recognize that both systolic and diastolic pressure values are important to note. High blood pressure, termed "hypertension" is a condition that afflicts almost 1 billion people worldwide and is a leading cause of morbidity and mortality. About 26% of Saudis are hypertensive. For males, the prevalence of hypertension is 28.6%, while for females; the prevalence is significantly lower at 23.9%. The urban population show significantly higher prevalence of hypertension of 27.9%, compared to rural population's prevalence of 22.4%. One-third of them are not even aware they are hypertensive.

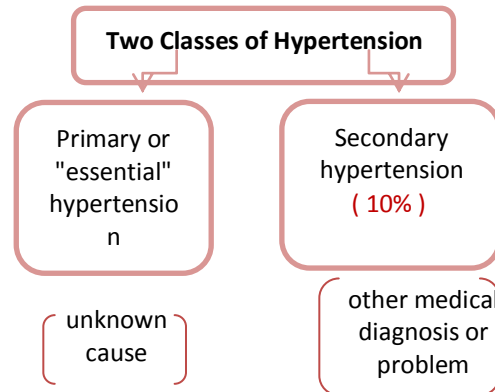

The Prevalence of hypertension in Saudi Arabia is 26%

The following represents different stages of hypertension:

Classification	Systolic (mmHg)	Diastolic (mmHg)
Normal	<120	<80
Prehypertension	120-139	80-89
Stage 1	140-159	90-99
Stage 2	>160	>100

**Objectives:** The study aims to decrease HTN among working personnel in Al-medina. Also to determine the prevalence of HTN among working personnel, faculty of education at Taibah University and Identify associated risk factors that may contribute in the disease.

**Research question:** What is the prevalence of hypertension among working personnel, faculty of education at Taibah University?

**Methodology:** Our research is considered a type of observational study which is cross sectional (survey, prevalence) study. We started our research by doing survey on working personnel, faculty of education (30 subjects/men) who are between 25 – 55 . The data collected included the main risk factors of hypertension (age, exercise, smoking, stress, and family history) by self- administrated questionnaires. We aimed to get completeness and avoid complexity. We have made sure that all of collected data are highly confidential and for the purpose of scientific research only. The statistical analysis was conducted by SPSS program.

The Prevalence of hypertension among working personnel is 33.3%

#### Age & hypertension

		AGE		
		>45	45-30	<30
		Count	Count	Count
Blood Pressure	Normal	7	2	10
	Hypertension	5	1	4

The risk of hypertension may increase with age

**Exercise & hypertension**

Exercise may decreases the risk of hypertension

**Weight & hypertension**

		Weight		
		Normal weight	Overweight	Obese
		Count	Count	Count
Blood Pressure	Normal	8	7	3
	Hypertension	2	2	6

Obesity may increases the risk of hypertension

**Family history & hypertension**

Hypertension tends to run in families.

**Smoking & hypertension**

		Smoking	
		yes	no
		Count	Count
Blood Pressure	Normal	9	11
	Hypertension	7	3

smoking may increases the risk of hypertension.

**Results:** The prevalence of HTN among working personnel, faculty of education at Taibah University is 33.3 %. According to the study exercise may decrease the risk of hypertension. The main risk factors are age, obesity, family history and cigarette smoking.

**Conclusion:** The research conducted indicates a higher prevalence in working employees at the University of Taibah. than in the general population. The prevalence is % higher than in the general population. A factor that may contribute to the higher prevalence is the small sample size of our research. Also, another factor may be the type of job that is performed by the employees of the university, the stress level of this form of job may have increased the prevalence and also the sedentary level of this type of job may have increased the prevalence as well. It is a concern that may need to be addressed to decrease the likelihood of heart disease in this population.

#### Abstract

India is described as a union of states and the bulk of responsibility for social and economic development lies with the state governments. It is accepted that it is the duty of the state governments to ensure that every citizen can enjoy the primary necessities of life proportionate with need. Therefore state government expenditure is an important instrument for the protection and promotion of socio-economic welfare of the people. An important issue which has gained prominence in the recent years is the impact of economic reforms on the expenditure pattern of state governments. The core of this study is to analyze the pattern of public expenditure in Tamil Nadu during pre and post reform period in order to understand the impact of economic reforms on that.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Public expenditure is the sum of all types of expenses incurred by the government of a country and its authorized agencies during the period of one financial or accounting year. Only in the beginning of the 20<sup>th</sup> century it was realised that public expenditure was far more important in its implications and bearing on public welfare than public revenue. The main reason for the early neglect of the subject of public expenditure seems to be that the amount of public expenditure was very small as the field of governmental activity was restricted. In recent times, public expenditure has increased enormously. The main reason is that the functions of the state have increased manifold. Unlike the past when the state was considered as a 'police state', now the state is regarded as a welfare state which is concerned with promoting the welfare of its citizens.

In India, public expenditure has increasing year by year due to the expansion of state activities. In the sphere of development most of the functions and responsibilities pertain to State Governments. For a due discharge of this wide array of functions, State Governments have perforce to spend more and ever more. Therefore state governments face an explosive cycle of current expenditure growth and are in the throes of a debt trap in recent years.

Mathur K.P.L analysed fiscal reforms and public expenditure management in state governments of India and found that the reduction in total expenditure to GDP ratio from 16.37 per cent in 1985-90 to 15.44 per cent in 1995-2000 is only because of a reduction in capital expenditure to GDP from 3.21 per cent to 2.11 per cent. The increases in interest payment and pensions have been at the cost of capital expenditure of the state governments. While analyzing the state finances during the period 1985-86 to 2001-02, Narasimhulu stated that the problems of the Central

Address:- Associate Professor of Economics, Rani Anna Govt. College (W), Tirunelveli-8.

government are reflected at the level of States since the framework of fiscal federalism within which India functions makes Centre-State resource flows an important component of State budgets.

The core of this study is to analyze the pattern of revenue and capital expenditure in Tamil Nadu during the pre and post reform period to understand the impact of economic reforms on that. Therefore, this study is related with the following special problems. Have the expenditure on revenue account been affected during the post reform period? Whether economic reform compresses capital expenditure of Tamil Nadu? Is there any growth in the volume of expenditure after removing the adverse effect of rise in population and price level? How far revenue and capital expenditure are responsive to the growth of the economy during pre and post reform period?

#### Objectives:-

1. To compare the growth pattern of revenue expenditure in Tamil Nadu during the pre and post reform period.
2. To estimate the growth pattern of capital expenditure in Tamil Nadu during the pre and post reform period.

#### Hypotheses:-

1. There is no significant difference between pre and post reform period in the growth pattern of revenue expenditure.
2. Economic reforms do not have the impact of curtailment on capital expenditure in Tamil Nadu.

#### Nature and Sources of Data:-

Secondary data form the basis of this study. The data on expenditure for the years from 1971-72 to 2013-14 were collected from RBI Bulletins and RBI Website. The data on Net State Domestic Product was collected from Economic Surveys and Hand Book of Statistics on Indian Economy.

#### Methodology:-

Expenditure devoted per head of population was calculated to eliminate the influence of population change. Compound Annual Growth Rate was used to estimate the growth rate of expenditure in Tamil Nadu during the pre and post reform period. The functional form used to estimate the compound growth rate is  $Y = ab^t$ . To assess the growth of public expenditure in real terms, the influence of price changes should be eliminated and for this national income deflator at 1980-81 prices has been made use of. To trace the income elasticity of state expenditures in revenue and capital account, regression coefficient was calculated by employing the following formula:  $\log Y = a + b \log X$

#### Results and Discussion:-

Public expenditure in India is generally divided for accounting purposes into two broad categories, namely, expenditures on revenue account and capital account. Revenue Expenditures are those that are routine, recurring and periodical with no enduring value beyond the financial year in which they are incurred. Capital expenditures are those that are spent on assets from which income is generated. These are normally enduring in nature.

Note: AE - Absolute Expenditure, PE- Per capita Expenditure, TE- Total Expenditure( Revenue and Capital Expenditure), NSDP – Net State Domestic Product

From 1971-72 to 1990-91, there was a striking increase in total expenditure on revenue account in money terms. It rose from Rs.357.36 crores in 1971-72 to Rs.5641.29 crores in 1990-91, thus registered growth by nearly 16 per cent within a period of 20 years. In per capita term, the expenditure increased by 14 per cent from Rs.86.74 in 1971-72 to Rs.1023.57 in 1990-91. At constant price, the compound annual growth rate for total and per capita expenditure was 6.04 and 4.51 per cent respectively.

In 1971-72, revenue expenditure as a proportion of total expenditure claimed 90.97 per cent of total expenditure. In 1990-91, it increased to 96.21 percent. The share of revenue expenditure in net state domestic product had also increased from 13.25 per cent to 20.38 per cent prior to economic reforms.

During the post-reform period, the total expenditure increased far less rapidly by comparison. The total expenditure which amounted to Rs.8679.52 crores in 1991-92, went up to Rs.109824.67 crores in 2013-14, that is, a growth by 12.52 per cent in a period of 23 years. In 1991-92, per capita expenditure was Rs.1553.83 and it increased to Rs. 14824.02 in 2013-14. Hence, per capita expenditure increased by 11 per cent during the post-reform period.

In 1991-92, the proportion of revenue expenditure to total expenditure was at the level of 96.88 per cent. The share was more than 90 per cent till 2002-03. After that, it formed 85 to 89 per cent of total expenditure. Likewise the share of revenue expenditure has declined from 26.64 per cent to 14.23 per cent after reforms in Tamil Nadu.

It could be ascertained that the growth rate of total and per capita revenue expenditure was less during the post-reform period when compared with pre-reform period. A considerable fall in the proportion of revenue expenditure to total expenditure was noticed in the post reform period. Besides there was a significant decline in the proportion of total expenditure to state domestic product during the post reform period. Moreover prior to economic reforms, one per cent increase in per capita income led to 1.15 per cent increase in per capita expenditure, but after reforms, one per cent increase in per capita income has ruled to only 0.91 per cent increase in per capita expenditure. Hence, our first hypothesis, there is no significant difference between pre and post reform period in the growth pattern of revenue expenditure in Tamil Nadu is disproved.

It is contradictory to the findings of the study made by Seema Joshi(2006) which shows that fiscal adjustments in India during the reform period have been brought about by reducing public investment (i.e, capital expenditure) rather than by revenue expenditure. Anil Kumar Jain (2010) also found that, in India, government expenditure has tilted in favour of revenue expenditure and capital expenditure had to bear the brunt. In the words of Ashok K.Lahiri, “one of the most striking features of Indian public finances at the sub national level has been the crowding out of capital and other essential expenditures including developmental and maintenance expenditures – by increasing revenue expenditure mainly owing to higher interest payment and wages”.

The total capital outlay increased from Rs.35.46 crores in 1971-72 to Rs.222.49 crores in 1990-91 and registered 11.85 percent growth. In per capita terms, it was Rs.8.61 in 1971-72. But it enlarged to Rs.40.37 in 1990-91 after a chequered growth in between 1971-72 and 1990-91. The compound annual growth rate was 10.08 percent. At constant price, the growth rate registered by total outlay was 3.25 percent. But per capita expenditure fell down from Rs.18.53 to 17.79 which accounted for 1.61 percent change. Capital outlay as a proportion of total expenditure in 1971-72 claimed 9.03 percent. But in 1990-91, it declined to 3.79 percent. The share was the maximum of 10.86 per cent in 1975-76. The percentage share of capital expenditure to net state domestic product also decelerated. In 1971-72, the share was 1.32 per cent and in 1990-91, it dipped to 0.80 per cent. "Since 1970s Tamil Nadu has opted for large current expenditure at the expense of capital outlays"(M.S.Guham 1979). The present study supported this.

Source: AE at Current Price- RBI Bulletins and RBI Website; PE, AE & PE at Constant Price, % to TE, % to NSDP and Regression Co-efficient - Computed.

During the post reform period, the total capital outlay shot up tremendously from Rs.279.09 crores to Rs.17173.07 crores which accounted 20.92 percent growth rate. Per capita expenditure also surged voluminously from Rs.49.96 to Rs.2318.00 and registered 19.36 percent growth rate during the same period. At constant price also, growth rate of total and per capita capital outlay was high during the post reform period.

Regarding the percentage share of capital outlay to total expenditure, it moved up largely. In 1991-92, it was only 3.12 percent. But in 2013-14, it jumped to 13.52 percent. The percentage share of capital expenditure to net state domestic product also accelerated. In 1991-92, the share was only 0.86 per cent. But in 2013-14, it has augmented to 2.23 per cent. It is inferred from the analysis that growth rate of capital outlay during post reform period is very much higher than pre reform period. Besides, the share of capital outlay in total expenditure is increased in post reform period against pre reform period. The regression co-efficient representing the income elasticity of capital

expenditure implies that the increase in per capita income by one per cent has led to an increase in the per capita capital outlay by 1.39 per cent in the post reform period, but it was 0.89 in the pre reform period.

C.Rangarajan stated that “Over the last several years the proportion of capital expenditures to the total has shown a sharp decline. For the Central Government this proportion has declined from 24 per cent in 1992-93 to 15 per cent in 2000-2001” “Capital expenditure was expanded at a lower rate and hence capital expenditure as percentage of NSDP dipped to 3.33 in 1997-98 from 5.01 in 1990-91 in Gujarat. This indicates that the reduction in fiscal deficit was achieved by compressing capital expenditure”(Atul Sarma). Various studies show that economic reforms have the impact of compressing capital expenditure in India and the states.( Seeta Prabhu 1994, Mahendra Dev 2000, Mathur 2001, Manoj Dolli 2012).

The result of the study undertaken by Jegadish Gandhi deviated from this opinion. It revealed that Tamil Nadu did not opt for reductions in their capital outlays. The Gross Fiscal Deficit of Tamil Nadu has increased for Rs.8,548 crores in 2008-09 to Rs.16,880 crores in 2011-12. The capital outlay increased by 57.3 per cent for Rs.9,104 crores to Rs.15,880 crores in the same period. The present study endorses the same view and disregards the general opinion that economic reforms compress the capital expenditure in order to reduce fiscal deficit. So, it is inferred that, as far as, the state Tamil Nadu is concerned, economic reform does not have adverse impact on the capital outlay. Hence the second hypothesis “Economic reforms do not have the impact of curtailment on capital expenditure in Tamil Nadu” is proved.

### **Conclusion:-**

The present study exhibits that in Tamil Nadu total public expenditure is reduced because of the reduction of revenue expenditure. And there is no adverse impact on the capital expenditure. The study suggested that reduction of fiscal deficit should not be done at the cost of bringing down the public expenditure. States may take efforts to collect more revenue from non-tax sources for reducing fiscal deficit. The government should increase the expenditures well enough to counter balance the impact of price rise and increase in population.

##### Key words:-

Cadmium toxicity, *Labeo rohita*, Impact on RBC, Heavy metals.

#### Abstract

Concentration of aquatic environment with heavy metals has become a matter of great concern because of their toxicity, persistence and bioaccumulation. Cadmium is widely distributed in aquatic environments and is an extremely toxic metal commonly found in industrial settings as a key component in the production of batteries, pigments, coatings and electroplating. Fish play an integral role in the aquatic ecosystem food web and any effects that change the population structure of fish may also alter community and food web dynamics. The consumption of fish is recommended because it is a good source of omega-3 fatty acids, which have been associated with health benefits due to its cardio-protective effects. However, the content of heavy metals such as Cadmium discovered in some makes it difficult to establish clearly the role of fish consumption on a healthy diet. The present study is planned to determine the abnormal morphology of RBC in fish *Labeo rohita* at different concentration of Cadmium.

#### Introduction:-

A Wide range of adverse effects on aquatic organisms have been observed due to heavy metals entering aquatic ecosystem through effluents discharged from industries, mining, fossil fuel combustion, sewage treatment plants and drainage from urban and agricultural areas. Heavy metals are important pollutants because of their environmental persistence and undegradable nature. Cadmium is a well known heavy metal which is extremely toxic. Among heavy metals, Cadmium has been listed in "Blacklist" of European community<sup>4</sup>. It is a non corrosive and highly toxic metal. It is a nonessential element with no known biological function. It is used in batteries, plastics, metal alloys, dye and metal plating industries. Effluents from such activities are sources of Cadmium in aquatic environment. A higher concentration of Cadmium in the aquatic environment is lethal to many organisms<sup>3, 9</sup>. Cadmium has been considered as an important xenobiotic, persistent and nonbiodegradable chemical pollutant in the aquatic environment<sup>5</sup>. The adverse causative factors and the sources of contamination of the essential and non-essential heavy metals, such as zinc, copper, cadmium, in aquatic environment are numerous due to increased urbanization, expansion of industrial activity, untreated industrial wasteful effluents, exploration of natural resources, municipal wastes, and the increased use of automobiles<sup>2, 6, 7, 8</sup>.

Cadmium is naturally occurring as well a product of industry and agriculture. Cadmium from fertilizers, manure parent soil and air gets deposited into oceans and seas and is taken up easily by certain seafood. Effluent from electroplating industries manufacturing vinyl plastics, metallurgical operations and mining are the major sources of Cadmium into aquatic environments. Fishes occupy the upper trophic level in aquatic ecosystem and there are

greater chances of transferring Cadmium to higher organism particularly to human. Cadmium is a recognized carcinogen in mammals. Cadmium has become the focus of global research due to its toxicity to terrestrial and aquatic organisms. The significance of the present study lies in the fact of conservation and protection of aquatic biota which is useful as a food factor for man in long run which needs protection on priority basis.

### Methodology:-

#### Processing of the fresh water fingerlings major carp *Labeo rohita* for study:-

Live and healthy fresh water fingerlings major carp *Labeo rohita* of both sexes were collected from the local fish farms. The fingerlings were transported in polythene bag containing O<sub>2</sub> saturated water and brought to the aquarium of the size of 4' x 2' x 2' nearly 125 to 160 fingerlings of *Labeo rohita* and were kept as stock. Aquarium containing normal fresh water, commercial fish food was given twice a day. Dissolved Oxygen level and pH of water was maintained in the laboratory. Experiments were commenced after acclimatizing the fishes to the lab condition for a period ranging from 15 to 20 days. Different concentrations of Cadmium were made by dissolving appropriate amount of analytical grade Cadmium chloride in the fresh water. Live and healthy fresh water fingerlings exposed to different concentration of Cadmium chloride. After exposing to different concentration for different duration 2-3 fingerlings were remove and sacrifice for blood smear study. The thin blood smears were prepared for observing the cellular alterations in the blood cells. The smears were stained with Leishmann's stain and the observations were noted in a tabular form.

#### Preparation of Cadmium Chloride Samples and Processing of Fingerlings:-

Different concentration of Cadmium was made by dissolving appropriate amount of analytical grade Cadmium chloride in the fresh water. These sets of different concentration of Cadmium chloride (5, 10, 15 ppm) were prepared for treatment. The fish were divided into different group of 3 individuals each in separate polythene boxes. Commercially available fish food was provided twice a day and water medium with Cadmium chloride was changed every alternate day.

#### Preparation of Blood Smear:-

Live and healthy fresh water fish subjected to different concentration of Cadmium chloride (5, 10, 15 ppm). The blood smear was prepared for observation. After an interval of 15 days fish were removed from each container and the blood was drawn from the dorsal aorta or from pressing of gills. A drop of blood was taken on a glass slide and a thin smear was made. It was allowed to dry at room temperature. The slide was then stained with Leishmann's stain for 10 minutes. Then it was washed with distilled water and allowed to dry at room temperature and studied under light microscope. After an interval of 15 days 3 fish were taken from each of the container and made inactive by general hypothermia.

#### Result of Hematological Studies on Fish *Labeo rohita*:-

**Table:-** Effect of Varying Concentrations of Cadmium Chloride on the Normal Blood Cells of *Labeo rohita*

Cadmium chloride Concentration	Effect on RBC after Exposure for		
	15 days	30 days	45 days
5 ppm	The cell membrane damaged.	The cell membrane damaged and vacuolation observed.	The nucleus damaged and vacuolation observed.
10 ppm	The nucleus enlarged and cell membrane damaged.	The nucleus damaged and the cell membrane wrinkled.	The nucleus damaged and the cell membrane wrinkled.
15 ppm	The cell membrane wrinkled.	The cell membrane destroyed.	The cell membrane destroyed and the nucleus enlarged and damaged.

**Normal Blood Smear of Fish *Labeo rohita***

**Fish *Labeo rohita* exhibiting damage to the cell membrane of RBCs**

**Fish *Labeo rohita* exhibiting both cell membrane of RBCs damaged with vacillation.**

**Fish *Labeo rohita* exhibiting total destruction of the cell membrane of RBCs.**

**Fish *Labeo rohita* exhibiting destruction or damage of cell membrane of RBCs with enlargement of nucleus****Discussion:-**

During the study of Cadmium Chloride on RBCs 5 ppm concentration exposed to fish on 15<sup>th</sup> day the cell membrane damaged but in longer duration it was observed on 30<sup>th</sup> day the cell membrane damaged and vacuolation observed. While on 45<sup>th</sup> day nucleus damaged and vacuolation observed. 10 ppm of Cadmium Chloride concentration leads to damage cell membrane and enlarge nucleus even in short term exposure of 15 days. While on 30<sup>th</sup> and 45<sup>th</sup> day exposure, there was damaged cell membrane, vacuolation and damaged nucleus, accomplished by wrinkled cells. 15 ppm concentration leads to wrinkled cell membrane on 15<sup>th</sup> day and on 30<sup>th</sup> day cell membrane was destroyed, while on 45<sup>th</sup> day cell membrane was damaged or destroyed and nucleus enlarged or damaged<sup>1</sup>.

**Conclusion:-**

These types of condition like wrinkled cell membrane, damaged nucleus or enlarged nucleus, vacuolation lead either to death of cell in long run or are responsible for anemic condition of animals. Anemic conditions and less iron content have been reported by several workers in fish, bird and mammal following exposure to pollutants. It is also reported that RBCs count was declined by higher concentration of endosulfan subjected to fish. Researchers have postulated that the reduction of RBCs count might be due to inhibition of RBCs production and destruction of RBCs by pollutant. Heavy metals effect on reticulo-endothelial system and haematopoiesis.

### Abstract

Vapour pressure deficit (VPD) is considered as an important environmental factor that affect transpiration rate (TR) in plants. In this study, transpiration rate were observed in Pepper (*Capsicum capsularis*) in 3 different soil conditions (organic, sand and mineral) subjected to low (0.10-1.5) and high VPD (2.50-3.90). The highest transpiration rate noted in mineral soil (2.08) but organic one showed more exponential results under high VPD (3.29), comparing lower leaf area to other soil conditions. The lowest TR indicated in sands (0.17) with lower VPD level and large leaf area. The results showed that sand has the lowest transpiration rate and organic soil has the highest transpiration rate. Adding more substrate will be better to compare the transpiration

Copy Right, IJAR, 2016., All rights reserved.

### Introduction:-

Plants lose a copious amount of water by transpiration. Plants take up and transpire a great deal of water by their rooting system. The speed and amount of water moving from the root to shoot in turn determine the concentration of solutes arriving at the shoot (Markhart and Smith 1990).

VPD is a good indicator of plant stress, brought about by either excessive transpiration of water (high VPD values) or the inability to transpire adequately (low VPD values). VPD alone does not provide a perfect model of crop water stress. However, if the measurements of VPD calculation are taken in a manner that provides an accurate representation of the current crop conditions, it could be used to influence key environmental control management decisions. Saturated vapour pressure are increasing exponentially with increasing temperature to impact on plant growth (Sinclair *et al.*, 2007). Temperature and vapor pressure deficit (VPD) effects on plant growth are almost always confounded in experiments because VPD is increasing with the decreasing temperature. Increasing VPD rate raise up the atmospheric demand, and consequently higher plant transpiration (Sinclair *et al.*, 2007). A large number of researchers showed that higher leaf to air, VPD decreased stomatal conductance (Bunce 2006, Lopez-Berenger *et al.*, 2006). Stomatal closure limits the transpiration rate and sometimes a decrease at high VPD (Oren *et al.*, 2001). Therefore, stomatal closure restricts the corresponding decrease in plant water potential and prevents excessive water loss.

Different types of soil play a distinguishing role in the plant's ability to extract water. It is noted that water holding capacity depends on soil texture and the effects of soil organic matter are strongest in more sandy soils (Hudson

1994; Minasny *et al.* 1999; Rawls *et al.* 2003). Texture, structure and porosity influences the movement and retention of water in the soil, which subsequently affects the plants transpiration (Moyano *et al.* 2013).

The original intent of this experiment was to study the effect of transpiration rate, as manipulated by several vapor pressure deficit levels in combination with different soil conditions. Pepper (C3) showed substantial differences in their rate and sensitivity to the VPD and limitations in transpiration rate at high VPD. Most of the studies have been conducted in a specific growth phase of the crop, while there is little information on transpiration rate over the plants ontogeny but these studies has been conducted for checking the soil effects on plant transpiration rate.

#### Objectives:-

To measure the effect of transpiration rate on Pepper (C3) plants in response to changes the atmospheric vapour pressure deficit.

#### Hypothesis:-

The hypotheses are

Soil has the effects on transpiration rate

#### Materials and Methods:-

The experiment was carried out during the summer season under greenhouse conditions (22-35 °C; light: dark = 16:8 hours).

#### Plant material:-

Pepper (*Capsicum capsularis*) seeds were used to getting seedlings. This was needed at least 6-8 hours of sunlight per day. Support each pepper plant with a stake, to help bear the weight of the broad leaf and fruits.

#### Plants growing strategy:-

The whole experiment was split into three sub divisions

1. Pepper plants were raised in three (organic, mineral and sand) different conditions in controlled environments.
2. Transpiration rates were measured in the climate chamber and biomass harvested.

**Table 1:-** Species and their photosynthetic metabolism, life form, substrate and corresponding family of Pepper plant

Species	Photosynthetic metabolism	Life form	Substrate	Family
<i>Capsicum capsularis</i>	C3	Perennial Dicotyledonous	Organic soil Sand Mineral soil	Piperaceae

#### Soil properties:-

Pepper was raised in three different (organic, mineral and sand) conditions in controlled environment. Each soil has different properties (Table 1)

**Table 1:-** Guinea grass in different substrates

Species	Soil type	Soils description
<i>Capsicum capsularis</i>	Organic soil	Its contain more than 20% organic carbon Fine textured soil High water retention capacity
	Sand	less nutrient and Low water holding capacity large particles (2.0 mm -0.05 mm)
	Mineral soil	Derived from minerals or rocks and containing little humus or organic matter Less than 20% of carbon contend

**Seedling were raising in three different soil conditions:-**

Three seeds of pepper were placed in three (mineral, sand and organic) different soil conditions in each and every pot. One week after germination, the pots were thinned to single germinated seedling. (Figure 1).

**Fig 1:-** Pepper (C3) plants are growing in three different soil conditions (organic, mineral and sand respectively).

**Technical set-up for climate chamber:-**

The plant transpiration rate was measured in a climate chamber (80×80×100cm) with PVC transparent side and top elements. LED light was installed 15cm away from the top of the climate chamber for providing photosynthetic photon flux (PPF) at  $600\mu\text{mol m}^{-2}\text{s}^{-1}$  at the bottom and  $1200\mu\text{mol m}^{-2}\text{s}^{-1}$  near the top. Uninterrupted air flow through the VPD chamber excluded the possibility of carbon dioxide deficit in the chamber. The temperature and the relative humidity were recorded every minute for calculating the accurate atmospheric VPD by using Tinytag data loggers (Type-TV4505, Gemini Data Loggers., UK). Four individual balances (KERN KB 2400-2N d=0.01g, with a maximum load of 2400g) arranged symmetrically in order to maintain equal light conditions which are connected to a PC for every minute weight information with GrassLog software version 0.1. Four box fans are installed on the top of the chamber for mixing the inside air by continuously adjustable intensity.

A desiccant dehumidifier (Consort DC-10, Seibu Giken, Sweden) was used to generate dry air at a flow rate of max.  $190\text{ m}^3/\text{h}$ . The air flow at  $60\text{ m}^3/\text{h}$  was simultaneously used to counterbalance temperature losses of the wet air produced by ultrasonic nebulizers (Fogstar 100, Seliger GmbH, Germany). Both air streams were saturated before entering the chamber from a side entrance. The speed of each air stream was adjustable with throttle flaps placed inside PVC tubes before mixing.

The actual atmospheric VPD was measured by calculating the recorded every 60 seconds relative humidity and temperature. Different humidity levels were reached by adjusting throttle flaps of wet and dry airstreams while targeting four VPD levels between 0.40 and 3.80.

### Plant transpiration rate measuring in the climate chamber

**Figure 2:-** Transpiration rate measuring in climate chamber

Figure 2. Showing the transpiration rate measurement in climate chamber. The pot was covered with aluminum foil to reduce evaporation. VPD was maintained approximately 0.5 kPa and increased stepwise to almost 4.0 kPa. After the equilibrium condition in the chamber, the entire unit of plants and pot were weighed on a balance. Plant transpiration rates were recorded based on the mass loss. Four humidity levels in the chamber were established by adjusting the humid and dry air. Transpiration rate were started to measure from low VPD to higher VPD. Transpiration rates were recorded over 20 minutes for each VPD levels with an interval of 5 minutes for adjusting VPD until the starting of the higher VPD levels. The measurements for each replicate consisted of four VPD levels for around 2 hours in total.

#### Determination of transpiration rate and dry biomass:-

After measuring the transpiration rates, plants were clipped at the stem base and separated into shoot and root. The total leaf area was measured in green house by using LI-3100 area meter. Every pot was immersed in water to remove sand, soil and inert materials. Roots were further washed, cleaned and sealed separately in leveled paper bags. Whole plant tissues were dried in an oven at 70°C for 48 hours to get the constant weight.

#### Statistical Calculation:-

##### Transpiration rate calculation:-

Plant transpiration rates (TR) were calculated per unit of leaf area ( $\text{mmol H}_2\text{O m}^{-2}\text{s}^{-1}$ ), based on their pot weight changing in every minute's interval.

$$\text{TR} = \{(W_0 - W_1) / 18\} / \text{Time} \times \text{Leaf Area}$$

W<sub>0</sub> = the initial weight

W<sub>1</sub> = weight after 60 seconds

VPD were calculated by using recorded temperature and relative humidity. The data were analyzed by plotting TR against VPD using Software package SAS.

##### Root-Shoot ratio calculation:-

Root dry weight (g) was divided by Shoot dry weight (g) in each and every replication.

$$\text{Root - Shoot ratio} = \frac{\text{Root dry weight (g)}}{\text{Shoot dry weight (g)}}$$

**Normalizing transpiration rate to VPD:-**

VPD in the chamber were manipulated by manually through adjusting the relative humidity while keeping the temperature constant. Therefore, the exact VPD couldn't be fixed at exactly 0.5, 1.90, 2.90, 3.70 KPa. All the TR values were plotted against their respective VPD to produce regression line compare with TR and VPD.

**Results:-****Root-Shoot ratio:-****Table 3:-** Root-Shoot ratio (root dry weight (g) / shoot dry weight (g)) in three soil conditions respectively).

Soil condition	Root/Shoot
Organic	0.3053
Mineral	<b>0.4365</b>
Sand	0.2798

Table 03 showed that root-shoot ratio was higher in mineral soil and lower in sand. In organic condition the ratio is in between two of them. Root-shoot ration is higher in mineral and transpiration rate also higher but less exponential then organic condition with their increasing VPD.

**Transpiration rate measurement in different soil condition:-**

Transpiration rate were measured in different soil condition in the climate chamber and three exponential lines were indicated different transpiration rate in the figure 03, 04 and 05.

Figure 03 showed that, transpiration rate were gradually increasing with their increasing VPD Exponential line of transpiration rate showed organic condition that, it's increasing with the increasing VPD. Figure 04 indicated that, transpiration rate in mineral soil were increasing but the line were less exponential compare to the organic condition. In figure 05 showed that, transpiration rate were vibrating the same way with their increasing VPD.

**Table 4:-** Analysis of variance

Analysis of variance	VPD	TR
Organic	2.558	0.4502
Mineral	2.557	0.9860

Table 04 showed that, transpiration rate of each and every substrate is not significant with their respective VPD. The organic one indicated more transpiration compare to the other soil condition.

## Discussion:-

### Biomass measurement in relation to transpiration rate:-

The rate of water supply to the plant shoot is dependent on both the conductance of water in the soil and in the roots (Hogg and Hurdle, 1997; Meiner and Grantz, 1990). In that case, the organic soil has the huge possibility for water, root conductance and transpired more water than the mineral soil followed by sand. The fine textured soil has the more ability to preserve and continuous water supply around the root zones compare to the sandy soil.

### Root-Shoot ratio:-

The rate of transpiration tends to increase with higher root-shoot ratio (Devlin, 1975). He also mentioned that it is expected that a plant with a higher root: shoot value will tend to transpire faster than another plant with a lower root to shoot. In this experiment it's observed that, the root-shoot ratio was higher in mineral soil. Higher leaf area against root volume compare to the others could be the reason (Table 03).

### Soil properties in terms of transpiration rate:-

Soil texture highly influences water infiltration, pH, permeability and water holding capacity. Soil texture refers to the composition of the soil in terms of the proportion of small, medium and large particles (clay, silt and sand respectively) in a specific soil mass. Brady (1990) mentioned that sandy soils have low porosity and the movement of air and water is rapid. Soil porosity refers to the space between soil particles, which consists of various amounts of water and air. A fine soil has smaller but more numerous pores than a coarse soil. A coarse soil has bigger particles than a fine soil, but it has less porosity or overall pore space.

Smettem and Collis-George (1985) reported that a single continuous pore of 0.3 mm diameter can conduct more water than the rest of a 100 mm diameter sample. Water can be held tighter in small pores than in large ones, so fine soils can hold more water than coarse soils.

In that case, available water was higher in organic and mineral soil and transpires more water than the sandy soils (appendix 03). Naiman *et al.*, (1994) also mentioned that higher levels of organic matter result in a greater number of cation exchange sites which tend to decrease the pH. He also added sandy soils with a low CEC are generally unsuited for septic systems since they have the little adsorptive ability and there is potential for groundwater. The main effect of soil pH is on the availability of plants nutrients which have the specific preference range of soil pH. So pH could be varied and it might have the effects on nutrients absorption, even extra nutrients was supplied in sand and mineral growth medium for equal plant growth but the effects still unclear.

In this study, transpiration difference was isolated by comparing similar size individual pot weight in each plant. Results showed that organic substrate transpire much of water by generating the shoot biomass. (Fig: 03).

Measurement of 55 days old Pepper (C4) plant showed large leaf area in mineral soil condition but the effect of less transpiration rate. Plants may sense different soil condition and hence send inhibitory signals to the shoots which harden the plants against the consequences of a degrading environment, especially if the plants water supply is at risk. Transpiration rate can be interpreted as anticipated rates to the soil becoming too dry. Since different substrates condition varying degree of the inhibitory signals may affect and different stomatal conductance, cell expansion, cell division and the rate of leaf appearance.

### Acknowledgment:-

I am very grateful to all members of the Institute of Plant Production and Agro-ecology in the Tropics and SubTropics, University of Hohenheim, Stuttgart, Germany.

### Conclusion:-

In the present study, it shows different rate of foliar transpiration over its ontogeny under lowers to higher VPD levels. Although little or no change in leaf appearance was shown in this study, differences were observed in overall plant leaf area under low and high VPD. But the results showed that leaf area expansion is a key difference to high VPD. Under high VPD, higher TR was associated with lower leaf area expansion rates as shown in the results for Pepper (C3) plant. Including by more substrates and growth stages should be the preference for further research. Checking the rewetting data could be the possible way to know plant recovering and soil texture.

Including by more substrates and growth stages would be the preference for further research. Checking the rewetting data could be the possible way to know plant recovering. Tying a small around among the all exposed leaves would be the way in order to obtain the exact amount transpired from the water source into the atmosphere. This will be able to provide more details on the exact time and amount of water was transpired.

#### Abstract

The aim of the study was to determine the impact of boxing experience on shoulder internal rotators concentric and eccentric strength of amateur male boxers. Forty amateur boxing athletes participated voluntarily in the study. Measurements of internal rotators concentric and eccentric strength of both shoulders were done under static conditions on a Kin-ComTM (Chattecx, Chattanooga, TN) dynamometer at angular velocities of 60, 120 and 180°/sec. One way analysis of data revealed the following significant differences: At 60°/sec: Between boxing experience and shoulder internal rotators concentric and eccentric strength both in dominant arm ( $p < 0.001$  &  $p < 0.03$  respectively) and in non-dominant arm ( $p < 0.03$  &  $p < 0.04$ ). At 120°/sec: Between boxing experience and shoulder internal rotators concentric and eccentric strength of the dominant arm ( $p < 0.001$  and  $p < 0.005$ ). At 180°/sec: Between boxing experience and shoulder internal concentric and eccentric contraction in dominant arm ( $p < 0.016$  and  $p < 0.019$ ). Post hoc corrections with bonferroni method revealed: At 60°/sec: Boxers who had experience more than 10 y had greater shoulder internal rotators concentric and eccentric strength in dominant hand, in relation to athletes with experience 5 y ( $p < 0.002$  and  $p < 0.04$ ). Boxers who had experience more than 10 y had greater shoulder internal rotators concentric and eccentric strength in non-dominant arm, in relation to the athletes with experience 5 y ( $p < 0.002$  and  $p < 0.005$ ). At 120°/sec: Boxers who had experience more than 10 y had greater shoulder internal rotators concentric and eccentric strength in dominant hand, in relation with the athletes with experience 5 y ( $p < 0.001$  and  $p < 0.05$ ). At 180°/sec: Boxers who had experience more than 10 y had greater shoulder internal rotators concentric and eccentric strength in dominant hand, in relation with the athletes with experience 5 y ( $p < 0.017$ ). It is concluded that the boxing experience has positive effects on shoulder internal rotators concentric and eccentric strength of amateur male boxers.

## Introduction:-

Boxing is one between combat sports that demands both physical and mental characteristics. As with other sports the participation in the boxing requires agility optimal coordination, endurance, speed, strength and stamina (Koutedakis and Jamurtas, 2004; Chaabène, et al, 2014). The number of rounds is the main difference that characterized the amateur boxing to the professional one. However participation in both, the scope of the boxers is to earn points and to win the round by delivering clear punches to opponent's target areas, using different tactics and strategies. The three types of the boxing punches are, a) the straight, b) the hook and c) the uppercut.

It is known that supraspinatus, infraspinatus, teres minor and subscapularis are the muscles group that comprise the rotator cuff of the shoulder joint.

These muscles are grouped together because they have rotational functions of the humerus and because their tendon interwoven into the capsule to form the musculotendinous cuff around the joint. They act together to hold the head of the humerus bone against the glenoid fossa and thus to stabilize the shoulder joint against downward dislocation of the mentioned bone. These muscles are activated with the help of deltoid muscle during abduction and flexion of the shoulder joint. The power line of these muscles contributes to the dynamic stability of the joint. The infraspinatus, teres minor and subscapularis when acting generate a force that moves the humerus downwards (Stergioulas and Aggelidis, 2001). Thus, this force reduces the shearing stress between the head and glenoid, which is higher at 45 degrees abduction.

The infraspinatus and teres minor except for the stabilizing role contribute to the movement of abduction external rotation causing the humerus, which does not allow the impact on major humeral tuberosity at the acromion process. The deltoid contraction causes displacement of humerus upwards and the contraction the muscles infraspinatus, teres minor and subscapularis creates a force couple. In the power pair, the traction forces cause pure rotation movement, in this case the head of the humerus rotating around a fixed axis of rotation, (Stergioulas and Aggelidis, 2001; Stergioulas, 2005). Thus, the humeral head is stabilized in the glenoid fossa and the supraspinatus with the deltoid can lift the upper extremity during the abduction (Stergioulas, 1991).

As by the above analysis one can be understood, the shoulder internal rotators are involved in the initial segments of the straight and hook punches, while with the uppercut the external ones. External and internal shoulder rotators muscles maintain glenohumeral joint, stabilize the rotator cuff and promote the integrity throughout the range of movements, that included in the hook, uppercut and straight punches (Pędzich et al., 2012).

The isokinetic dynamometer is an accepted modality used to assess functional parameters of antagonist/agonist muscles involved in different physical activities (Ellenbecker & Davies, 2000; Koutedakis et al., 1998). However, we found no published data on shoulder rotator muscle dynamometer characteristics in relation to amateur boxing. So, in the current literature there is a lack of knowledge regarding the impact of boxing experience in power of concentric/eccentric internal rotations muscle of the shoulder in the amateur boxing sportsmen in different speeds.

Therefore, to bridge this literature the purpose of the present study was to confirm if the boxing experience has any impact on shoulder internal rotation concentric and eccentric strength of amateur boxer athletes at the angular velocities of 60, 120 and 180°/sec.

## Materials and Method:-

### Samples:-

Volunteers for this investigation (n = 40) were uninjured members of amateur Greek boxing clubs, recruited from a larger study sample. To be eligible for participation in the investigation, the amateur boxers were required to have competed the 5 consecutive years before the study primarily as a boxer in organized amateur boxing matches in any category, to be uninjured and unrestricted in boxing activities at the time of testing. All participants were informed on the purpose of the study and signed the agreement forms before tests. That study was approved by the Ethic Committee of the University Peloponnese Review Board in January 2015.

**Measurements:-**

The Kin-Com<sup>TM</sup> (Chattecx, Chattanooga, TN) dynamometer was used for the determination of the peak torque of the internal/external rotators of both shoulders, during concentric and eccentric contractions at the angular velocities of 60, 120 and 180°/sec.

After the general warm-up exercises, male amateur boxers informed on the Kin-com apparatus system. The sitting position in 45 degrees of shoulder abduction in scapular plane, gives more anatomical advantages without any rate difference with upright in 90 degrees of shoulder abduction and frontal plane, (Hellwig, & Perrin., 1991), while it seems to be the most reliable power evaluation positions for internal and external rotation (Eduard et al., 2011). The device tilted to up 45 degrees (to allow 45 degrees of abduction of the shoulder) and adjusted to the lowest available rate. The joint rotation axis aligned with the axis of the arm by changing the height of the seat. The best alignment determined by visual inspection, the frontal and scapular position and seat height adjusted for each subject. The lower ends of each testing subject, supported in a chair throughout the test procedure.

The trunk and hips stabilized during the warm-up and testing repetitions. The stabilization of the trunk became with a belt that is positioned horizontally across the chest and is secured to the back of the chair and the stabilization of the hip provided with a belt positioned about 45 degrees across the pelvis and is secured to the chair. The movable seat stabilized at the position where finds the best test position.

The elbow placed in 90 degrees of flexion. The elbow/shoulder supported by the use of belt. The length of the lever arm was inserted into the computer. The peak torque of the internal/external rotators of the shoulders, during concentric contractions were measured at the angular velocities of 60, 120 and 180°/sec for all subjects.

Before the maximum effort measurements, warm up contractions were executed, consisted of three sub maximal repetitions and two maximal ones, both concentric and eccentric contractions in accordance with the test protocol (continuous or intermittent). After this procedure two minutes break in the warm-up and test followed.

The evaluation processes consisted of three repetitions of maximal voluntary eccentric and concentric contraction at internal and external rotation at the angular velocities of 60°/sec and 180°/sec. Each maximal concentric contraction was measured first, followed by an eccentric contraction. There was a two-minute rest between tests of two muscle groups. Any subject tested first in rotation at the angular velocities of 60°/sec and 180°/sec (Wilhite et al., 1992). A 2-minute rest was between the two angular velocities. During the maximum contraction test, the subjects were not allowed to use the other upper extremity of stabilization. The range of motion during the tests of the internal rotation was from 90° to 0° and from 0° to 90° for the external rotation.

The intermittent contraction protocol allowed 5 sec break in concentric and eccentric contraction. Verbal encouragement is not used during the warm-up period or during the test. All measurements were conducted in the Skordis rehabilitation center (<http://www.skordis.gr>)

**Statistics:-**

The data were statistically analyzed by statistical package for social sciences program (*version* 21.0). Analysis of variance (ANOVA) and post hoc Bonferroni method was used to compare the experience years with of the peak torque of the internal rotators of the dominant hand, during concentric/eccentric contraction. The level of significance was set at  $p = 0.05$  probability level.

**Results:-**

The age of the subjects was  $25.48 \pm 3.49$  y, the height  $1.77 \pm 6.01$  cm and body weight  $78.80 \pm 8.76$  kg. Nine athletes had 0-5 y experience, 17 athletes had 6-10 y experience and 14 of athletes had up to 10 y experience.

In the table 1 are presented the statistics of the internal concentric and eccentric contraction of the shoulder muscles according to boxing experience (One way ANOVA).

**At angular velocity of 60°/sec:-**

There was a significant difference between boxing experience and shoulder internal rotators concentric strength in dominant arm ( $F_{2,37} = 7.55$ ,  $p < 0.002$ ). Further correction by Bonferroni method showed that boxers who had

experience more than 10 y ( $57.36 \pm 4.62$  N), had greater shoulder internal rotators concentric strength in dominant arm, in relation to athletes with experience 5 y ( $50.33 \pm 2.45$  N,  $p < 0.002$ ).

There was a significant difference between boxing experience and shoulder internal rotators concentric strength in non-dominant arm ( $F_{2,37} = 3.72$ ,  $p < 0.034$ ).

Further correction by Bonferroni method showed that boxers who had experience more than 10 y ( $51.85 \pm 3.79$  N), had greater shoulder internal rotators concentric strength in non-dominant arm, in relation to athletes with experience 5 y ( $48.66 \pm 4.36$ ).

There was a significant difference between boxing experience and shoulder internal rotators eccentric strength in dominant arm ( $F_{2,37} = 4.034$ ,  $p < 0.026$ ). Further correction by Bonferroni method showed that boxers who had experience more than 10 y ( $69.21 \pm 8.70$  N) had greater shoulder internal rotators eccentric strength in dominant arm, in relation to athletes with experience 5 y ( $59.67 \pm 10.19$  N,  $p < 0.05$ ).

There was a significant difference between boxing experience and shoulder internal rotators eccentric strength in non-dominant arm ( $F_{2,37} = 3.39$ ,  $p < 0.044$ ). Further correction by Bonferroni method showed that boxers who had experience more than 10 y ( $62.29 \pm 4.53$  N), had greater shoulder internal rotators eccentric strength in non-dominant arm, in relation to athletes with experience 5 y ( $56.22 \pm 8.08$  N,  $p < 0.05$ ).

*At angular velocity of 120°/sec:*(i) There was a significant difference between boxing experience and shoulder internal rotators concentric strength in dominant arm ( $F_{2,37} = 12.73$ ,  $p < 0.001$ ). Further correction by Bonferroni method showed that boxers who had experience more than 10 y ( $51.50 \pm 5.85$  N), had greater shoulder internal rotators concentric strength in dominant arm, in relation to athletes with experience 5 y ( $43.56 \pm 1.94$  N,  $p < 0.002$ ).

There was a significant difference between boxing experience and shoulder internal rotators eccentric strength in dominant arm ( $F_{2,37} = 4.00$ ,  $p < 0.05$ ). Further correction by Bonferroni method showed that boxers who had experience more than 10 y ( $63.93 \pm 9.09$  N), had greater shoulder internal rotators concentric strength in dominant arm, in relation to athletes with experience 5 y ( $54.00 \pm 9.34$  N,  $p < 0.05$ ).

*At angular velocity of 180°/sec:* (i) There was a significant difference between boxing experience and shoulder internal rotators concentric strength in dominant arm ( $F_{2,37} = 4.66$ ,  $p < 0.016$ ). Further correction by Bonferroni method showed that boxers who had experience more than 10 y ( $45.57 \pm 5.58$  N), had greater shoulder internal rotators concentric strength in dominant arm, in relation to athletes with experience 5 y ( $39.00 \pm 4.35$  N,  $p < 0.017$ ).

There was a significant difference between boxing experience and shoulder internal rotators eccentric strength in dominant arm ( $F_{2,37} = 6.77$ ,  $p < 0.019$ ). Further correction by Bonferroni method showed that boxers who had experience more than 10 y ( $60.50 \pm 6.69$  N), had greater shoulder internal rotators eccentric strength in dominant arm, in relation to athletes with experience 5 y ( $50.00 \pm 6.77$  N,  $p < 0.035$ ).

**Table 1:** - Comparison between mean values of IRcon and IRecc at 60,120, 180°/sec of boxers and years of experience (Analysis of variance).

### Discussion:-

We conducted the present investigation to confirm if the boxing experience has any impact on shoulder internal concentric/eccentric strength of amateur boxing athletes.

Although in several sports in which the athletes using the hand above the horizontal plane have been conducted many studies, the present investigation is the first, that determined the effects of training experience of shoulder internal concentric/eccentric strength in amateur boxers.

We hypothesized initially that concentric and eccentric internal rotators strength at angular velocity of 60°/sec could be increased bilateral and symmetrical over the years of training and competitive boxing. Our results confirmed this hypothesis, since we found differences between boxers who had experience 0 to 5 y and those with up to 10 y, in concentric and eccentric internal rotation strength in both shoulders (dominant and non-dominant arm).

It seems that the internal rotators act concentrically during the acceleration phase of the boxing punches such as the hook, straight and uppercut. This loads, which occurs in training activities and fighting increases the biomechanical adaptations of muscle tendon units of internal rotators. These adaptations of the subscapularis and inner deltoid, improved because of neuromuscular adaptations of the number and the type motor units that are recruited and activated, the frequency of each pulse of the motor unit, the size of the muscle fibers, the sarcomere length and the speed of contraction. More, the effect of neuromuscular training in the boxing punches and the participation in non-

dominant hand during these synergies, increase the internal rotators power simultaneously (Andrade et al., 2010; Bompa and Buzzichelli, 2015).

Other researchers confirmed that sport specific training with regular, repeated throwing motions causes an increase in the shoulder internal rotator muscle torques in the dominant arm, thus contributed to glenohumeral stability (Ellenbecker, 1991; Ellenbecker, 1992; Elliot, Marsh, and Blanksby, 1986; Roetert, Ellenbecker, Chu and Bugg, 1997).

Beneka et al. (2002), in a classical study determined the effect of shoulder muscle training using exercises over a period of six weeks: one group followed multi-joint dynamic resistance training for the rotator cuff muscles and another one group of young healthy people trained following an isokinetic exercises program. The results showed statistically significant improvement in the internal and external rotator muscles strength after six weeks of training.

Alderink and Kuckl (1986), determined the isokinetic shoulder strength in twenty four high schools and college baseball pitchers ranging in age between fourteen to twenty one. No significant difference was found between torque output in the dominant and non-dominant internal rotators.

Codine et al. (1997), investigated shoulder internal rotation using an isokinetic device in baseball players, runners, tennis players and non-athletes, at angular velocities of 60°/s and 180°/s. The results showed that the tennis players had greater torques produced by internal rotator muscles.

Mikesky et al. (1995), assessed bilateral isokinetic concentric muscular strength of the shoulder's internal rotator muscles in a twenty five collegiate baseball pitchers. They found no significant differences in concentric strength were observed between dominant and non-dominant arms of shoulder internal rotation.

Ivey et al., (1985), determined the shoulder strength in an isokinetic device in 18 males and 13 females athletes with an age range of 21 to 50. No statistical differences were observed between the dominant and non-dominant hand. However, the mean torque values of the dominant side were higher.

Saccol et al. (2007), evaluated concentric isokinetic strength of shoulder rotators in 26 males and 14 females elite junior tennis players at 60 and 180°/s. They showed in their study that the internal rotation strength on the dominant shoulder was greater in comparison to non-dominant hand.

Andrade et al. (2010), conducted a study to establish the isokinetic profile of shoulder rotator muscles strength in female handball players. They found that the internal rotation concentric strength in the dominant hand was greater than in the non-dominant hand. The authors suggested concentric strength exercises for internal rotators to improve their adaptations.

Brown et al. (1988), investigated the shoulder rotation in an isokinetic apparatus in professional baseball players. They found that shoulder internal rotator muscles of the dominant arm produced greater torque in comparison with the muscles of the non-dominant arm.

McMaster et al (1991), in their study determined the peak torques produced by the shoulder internal rotator muscles in elite water polo players. They found that there were significantly greater in the dominant arm than in the non-dominant arm muscles.

Ellenbecker and Bleacher (1999), investigated the internal rotation strength in 38 females aged between 25 45 years using the Cybex norm dynamometer. After analysis of their results, they found that the internal rotation shoulder strength was greater in dominant hand in comparison to non-dominant hand. The measurement of concentric and eccentric shoulder internal rotation, was done with the subjects in a seated position in 45° of shoulder abduction in the scapular plane.

The second hypothesis of our study was that would be significant differences between years of experience and concentric/eccentric internal rotators strength at angular velocity of 120°/sec in dominant in dominant hand. Our results confirmed that boxers that had experience up to 10 years had better concentric and eccentric internal rotation strength in dominant shoulder, than the boxers who had boxing experience until 5 years. These adaptations at the

same angular velocities, are mentioned in other sports in which the hand is used up to horizontal plane, lead to substantial gains in muscular strength (Ellenbecker and Roetert, 2002).

The third hypothesis of our study was that would be significant differences between years of experience and concentric and eccentric internal rotators strength at angular velocity of 180°/sec only in dominant hand. Our results confirmed that boxers that had experience up to 10 years had better concentric and eccentric internal rotation strength in dominant shoulder, than the boxers that had boxing experience until 5 y.

The next hypothesis was that would be significant differences between years of experience and concentric/eccentric internal rotators strength at 180°/sec in dominant hand. The analysis showed that boxers who had experience up to 10 years had better concentric/eccentric internal rotation strength in dominant shoulder, than the boxers who had boxing experience until 5 years. These adaptations are mentioned in other sports such as collegiate tennis (Chandler et al., 1992), elite junior and players (Koziris et al., 1991), in collegiate swimmers (McMaster, Long and Caiozzo, 1991), water polo players (McMaster, Long and Caiozzo, 1991), as well as wheelchair athletes (Burnham, et al., 1993).

#### **Reliability of isokinetic assessment of shoulder internal rotator strength:-**

For the assessment of concentric/eccentric shoulder internal rotation strength, we used for the present study, the seated position of 45° of shoulder abduction in the scapular plane. This position seemed the most reliable for IR strength assessment, since its reliability has been studied in most methodologically high-quality studies (Codine et al., 2005; Davies, 1992; Dauty et al., 2003; Meeteren, Roebroek and Stam, 2002; Plotnikoff and MacIntyre, 2002). The mentioned position has many advantages because is more comfortable, physiological and safe. More, it elicits optimal torque; and it showed good to excellent reliability for concentric/eccentric shoulder internal rotation strength (Davies, 1992; Edouard et al., 2011).

#### **Conclusions:-**

The present study showed that the training experience can increase the concentric power of shoulder internal rotation in the measurement angular velocities of 60, 120 and 180°/sec. These results confirm that the boxing experience plays an important role on the increase of internal shoulder rotators strength not only in the dominant hand, but in the non-dominant hand as well. However, it is unclear if bilateral symmetry in strength is adequate for long-term effective and injury-free sports performance in this group of boxing amateur athletes.

Further studies are necessary to elucidate the action of the shoulder internal rotators during a boxing punches, i.e., whether they act as primary propulsions or shoulder stabilizers. In addition, other factors such as shoulder flexors and extensors strength, punching and timing may be important determinants of glenohumeral stabilization and merit future study. More, future studies that incorporate a prospective design will be necessary to determine whether a point exists at which inadequate muscle strength is a risk factor for injury or negatively affects punching effectiveness without rotator cuff injuries.

#### **Acknowledgements:-**

The authors want to thank the study subjects for their willingness to participate. This study was conducted with the support of the University of Peloponnese.

#### **Conflict of Interest:-**

The authors reports no conflict of interest in the reporting of the present data.

#### Abstract

**Background and Objective:** Cytokeratin 20 (CK20) is a widely expressed epithelial protein used as immunohistochemical marker for routine diagnosis. The aim of the current study was to detect the immunohistochemical expression of Ck20 tumor marker in colorectal tumors among Sudanese patients.

**Methods:** Retrospective analytical case control study was conducted at Khartoum state. One hundred and fifty previously diagnosed colorectal tumor blocks were enrolled including 100 malignant tumors and 50 benign colorectal tumors. The paraffin sections were tested by immunohistochemical method for CK20 expression.

**Results:** Females were significantly at greater risk of getting colorectal malignant tumors than males (p. value 0.003). Malignant tumors were significantly more common in the rectal site than the colon site (p 0.000). Significant positive immunohistochemical expression of Ck20 was noticed in colorectal malignant tissues (58%) when compared to benign tumors (22%) (p 0.000).

**Conclusion:** The study concluded that colorectal cancer was more distributed in females and the rectal was the most affected site. Immunohistochemical expression of Ck20 in malignant tissues was twice that of benign colorectal tumors confirming the importance of CK20 staining colorectal carcinogenesis regardless of cancer grade.

#### Introduction: -

Colorectal cancer is a major cause of morbidity and mortality throughout the world. It accounts for over 9% of all cancer incidence<sup>(1)</sup>. It is the third most common cancer worldwide and the fourth most common cause of death<sup>(2)</sup>. Cytokeratin 20 (CK20) is a polypeptide with molecular weight of 48.5 kDa encoded by a gene located on chromosome 17q21.2<sup>(3, 4)</sup>. The immunohistochemical expression of CK20 marker was considered suitable for the localization and therapy checks. The levels of Ck20 reflect the success of surgery, radiotherapy and chemotherapy on the patients<sup>(5)</sup>. Immunohistochemical studies with highly specific antibodies showed that CK20 expression in normal tissues is limited to epithelial cells of the gastrointestinal (GI) tract, the urothelium and Merkel cells, and that

**Corresponding Author:- Ahmed Hasan Ahmed Guzailan.**

this profile is maintained in malignant tumors of these cells. Both the specificity of CK20 antibodies and the restricted CK20 expression make CK20 a valuable diagnostic marker. Accordingly, CK20 IHC is a useful diagnostic tool for the classification of tumors, especially in the case of distant metastasis where the tissue of origin is unknown, as well as for the detection of disseminated tumor cells<sup>(6)</sup>. The objectives of this study were to detect the immunohistochemical expression of Ck20 tumor marker in colorectal tumors among Sudanese patients and to correlate immunohistochemical expression of Ck20 tumor marker with cancer grades and demographical data of patients.

## **Materials and Methods: -**

### **Study subjects: -**

A retrospective analytical case control study aimed to detect the immunohistochemical expression of Ck20 tumor in colorectal tumors among Sudanese patients. The study was conducted at Khartoum state in IbnSina and Soba Teaching Hospitals during the period April 2014 – December 2015. One hundred and fifty blocks of colorectal tumors were enrolled in the study including one hundred blocks previously diagnosed as colorectal cancer and fifty benign colorectal tumor blocks.

### **Immunohistochemical staining: -**

Sections of 5µm in thickness were obtained from each formalin-fixed paraffin embedded tissue block using rotary microtome. Sections were immune stained using monoclonal antibodies by new indirect techniques. Briefly, sections placed on coated slides were dewaxed in hot plate oven and cleared in two changes of xylene for two minutes. Sections were then hydrated through a series of ethanol concentrations (100%, 90%, 70%, 50%) and a final wash in water for two minutes for each. Slides were retrieved by water bath heat retrieval technique and treated with hydrogen peroxide for fifteen minutes. After that, sections were washed in phosphate buffer saline (PBS, pH 7.4) for five minutes and treated with protein blocker solution for fifteen minutes. Sections were treated with anti- Ck20 primary antibodies for thirty minutes, and then rinsed in PBS before being treated with secondary polymer conjugate for thirty minutes and rinsed in PBS. Slides were treated with DAB for seven minutes then washed in PBS for five minutes. For the staining step, sections were counter stained in Mayer's hematoxylin for one minute washed and blued in running tap water before they were dehydrated through ascending concentrations of ethanol (50%, 70%, 90% & 100%). Sections were finally cleared in xylene and mounted in DPX<sup>(7)</sup>.

### **Statistical analysis: -**

The data were analyzed using SPSS computer program, frequency, means and chi-square values were calculated.

### **Ethical consideration: -**

Before the study, was conducted the proposal of the study were ethically approved by ethical committee of the Sudan University of Science and Technology and Ministry of Health research committee. An official written permission to conduct the study was obtained by the investigator from responsible authorities.

## **Results: -**

A total of 150 paraffin blocks previously diagnosis as colorectal tumors were collected in the study. According to the histopathological diagnosis, 100 tumors were classified as malignant cases and 50 as benign controls.

According to gender, 44% were males and 56% were females among patients with malignant tumors, while the majority of benign tumors were among males (70%). Females were found to be at significant greater risk of getting malignant tumors (p. value= 0.003, OR= 2.9, CI= 1.25-3.5) as malignant tumors constituted 79% of all tumors among females. According to age group, patients with malignant tumors were slightly older at presentation (41% were less than 50 years old and 59% were more than 50 years), while the opposite was among patients with benign tumors in which 58% were less than 50 years and 42% were more than 50 years, with significant relation between the elder age group and malignant histopathological diagnosis (p 0.049). Concerning the site of the tumor, colon site was less presented among malignant tumors (41%) when compared to rectal site tumors (59%), while the majority of benign tumors were at the colon site (72%), with significant relation between the rectal site of tumor and malignant histopathological diagnosis (p 0.000) (Table 1).

Positive immunohistochemical expression of Ck20 was represented in 58% of malignant tissues. While only 22% of benign tissues were positive for this marker with significant relation between immunohistochemical expression of Ck20 and histopathological diagnosis (Table 2) (Fig. 1).

The immunohistochemical expression of Ck20 was mostly positive in moderately differentiated and well differentiated tumors (65% and 54% respectively), with no significant relation between the immunohistochemical expression of Ck20 and cancer grade (p 0.123) (Table 2).

### Discussion: -

Colorectal adenocarcinoma is a heterogeneous disease that involves multiple tumorigenic pathways. The disease is one of the most commonly diagnosed cancers, and a leading cause of cancer deaths, around the world<sup>(8)</sup>.

According to the literature, colorectal cancer has higher prevalence among elder individuals<sup>(9)</sup>. In the current study, patients with malignant tumors were slightly older at presentation (59% were more than 50 years) with a mean age of  $52 \pm 15$  years while the opposite was observed among patients with benign tumors (58% were less than 50 years) with a mean age of  $50 \pm 15$  years. Marginal significant relation between the elder age group and malignant histopathological diagnosis ( $p = 0.049$ ) was noticed in the study.

In contrast to most of the reported data<sup>(9, 10)</sup>, females were found at greater risk of developing malignant tumors constituting 79% (56/71) of all tumors, while the majority of benign tumors were among males (70%). Colorectal cancer is broadly considered to be an environmental disease with a wide range of cultural, social, and lifestyle factors<sup>(11)</sup>. Thus, the higher presentation of females might be due to some differences in the predisposing factors among Sudanese or might be due to sampling error that lowered the presentation of females among benign tumors. However, and according to data in hand, being a female increases the risk of getting malignant colorectal tumors by three times among Sudanese.

Concerning the site of the tumor, colon site was less presented among malignant tumors (41%) when compared to rectal site tumors (59%), while the majority of benign tumors were at the colon site (72%), with significant relation between the rectal site and malignant histopathological diagnosis. Interestingly, when gender was included in the analysis, malignant tumors were equally distributed between the two sites among females while 70% of males had tumors at the rectal site supporting other reports of sexual differences in the site of the disease. Male: female ratio of rectal was reported to be higher in most high incidence populations in contrast to low incidence populations where the sex ratio between these two sites is comparable. Therefore, it's reasonable to correlate such changes with adopting modernized life style among Sudanese population. The results of this study also supports that the differences under the influence of environmental factors are site-specific<sup>(12)</sup>.

Cytokeratin 20 (CK20) is a low molecular weight member of the Cytokeratin family of proteins that is expressed in primary colorectal tumors and their metastatic cells. It was considered a relevant marker for colorectal diagnosis, since its expression is restricted to gastric and intestinal epithelium, urothelial, and Merkel cells, as well as cancers originating from these tissues<sup>(13)</sup>. Thus, CK20 levels can provide clinically valuable information on the postoperative prognosis of patients with colorectal cancer<sup>(14)</sup>. The accumulative effects of such gene may play an important role during carcinogenesis<sup>(15)</sup>. Moreover, Cytokeratin-based tumor marker assays were considered as a simple and cheap tool for efficient management before conventional methods<sup>(16)</sup>. In concordance with other studies, CK20 expression in the current study presented a good indicator for malignancy even though it was expressed in both malignant and benign tumors (22% and 58% respectively). Thus, our data agrees with several other studies in considering cytokeratin 20 (CK20) a well-established marker for colon cancer. The detected expression in the current study was lower than most of the reported data<sup>(9, 14)</sup>. For instance reported higher expression values of CK20 in colorectal cancer (80%)<sup>(9)</sup>. Moreover, other studies showed higher frequencies of CK20 in colorectal adenocarcinomas reaching 81% and 84%<sup>(17, 18)</sup>. It's also important to highlight the significance of the reported negative immunohistochemical expression of CK20 in this study (42%) which was associated with higher microsatellite instability in previous studies and thus bad prognosis<sup>(19)</sup>.

In general, the analyzed subset of samples showed differential expression of CK20 throughout the different histological grades representing 53.6% of well differentiated tumors, 64.7% of moderately differentiated samples and 37.5% of poorly differentiated tumors. However, immunohistochemical expression of CK20 among malignant tumors was not significantly correlated with cancer histological grade ( $p > 0.05$ ). Several studies reported no relevance between cancer grade and CK20 expression<sup>(5, 20)</sup>. Accordingly, CK20 can be considered an indicator to primary colorectal cancer tumors or malignancy in general but that elevated expression can be disingenuous afterwards in the tumor.

### Conclusion: -

The study concludes that colorectal cancer was more distributed in female and the rectal was the most affected site. CK20 expression was higher in the colorectal malignant tumors in general regardless of the histological grade of tumors. Our results sustain the data published in literature concerning the importance of immunohistochemical expression of CK20.

#### Abstract

**Objective:** To study the causes associated with preterm labour and the perinatal outcome in preterm labour.

**Methods:** This prospective observational study was conducted in the department of obstetrics and gynaecology NDMC Medical College and Hindu Rao Hospital over a period of 6 months (Jan to June 2016). All patients presented with preterm labour, preterm premature rupture of membrane and with conditions where labour was iatrogenically induced prematurely were included in the study. All the patients were divided into four groups depending upon the gestational age – less than 28 weeks, 28 to 31 weeks, 32 to 34 weeks and more than 34 weeks. Risk factors and the perinatal outcome were analyzed.

**Results:** Out of 4382 patients delivered 946 were preterm delivery (21.5%). 54 out of 946 preterm deliveries had come with intrauterine death. The commonest risk factor of preterm delivery was preterm premature rupture of membrane followed by infection, anemia, preeclampsia and abruption. 73.2% of patients went into spontaneous preterm labour and 26.8% had caesarean section. Maximum perinatal complications and death were seen in group with gestational age less than 28 weeks.

**Conclusions:** The most common associated cause for preterm birth was preterm premature rupture of membrane. Perinatal outcome improves with gestational age. All preterm deliveries should be conducted in tertiary care hospital where better neonatal care is available.

#### Introduction:-

WHO defines preterm birth as the delivery of an infant between 20 and less than 37 weeks of gestation. Preterm delivery is responsible for 70% of mortality and 75% of morbidity in the neonatal period [1]. Approximately 12.9 million babies worldwide are born too early every year, representing an incidence of preterm birth of 9.6% [2]. About 85% of all preterm births occur in Africa and Asia [3]. Preterm birth can be due to spontaneous preterm labour with intact membrane, preterm premature rupture of membranes and delivery for maternal and fetal indications. Spontaneous preterm labour and PPRM contributes to 70% of cases [4]. About 70% of cases are seen at late gestational age (34-36 weeks) [5]. The precise etiology is still unknown. Many factors like prior preterm

deliveries, low social-economic status, extremes of maternal age, (<17, >35 years of age) and present obstetric complications like over distension of uterus, pre-eclampsia and antepartum haemorrhage are thought to be mainly responsible for onset of preterm labour [6].

#### **Aims and objective:-**

1. To find out the incidence, etiological risk factors responsible for preterm labour.
2. To evaluate the perinatal outcome in preterm births.

#### **Material and Methods:-**

This prospective observational clinical study was carried out in 946 cases, between 20 weeks to less than 37 weeks of gestation, who presented with preterm labour, preterm premature rupture of membrane and with conditions where labour was iatrogenically induced prematurely were included in the study. The patients who presented with following signs and symptoms were included in the study:-

1. Painful uterine contractions four in 20 min with progressive cervical changes.
2. Cervical effacement of more than 80% and dilatation more than 1 cm.

The duration of study was 6 months. All the cases were admitted in the labour room and the progress of labour was monitored. Obstetric management was done as per the findings in the individual case. Paediatricians were available at the time of delivery. All subjects and their babies were followed throughout their hospital stay. Associated maternal risk factors and perinatal outcomes were analyzed. Babies were transferred to premature baby care unit for neonatal care and neonatal outcome was analyzed.

#### **Results:-**

Total number of delivery in 6 months study period were 4382. Out of 4382 deliveries, 946 were preterm birth (21.5%). It was observed that 40% women were from poor social-economic status. 44.5% of cases had pregnancy duration of 34 to 37 weeks. 70% cases had some associated risk factor responsible for preterm labour. PPROM, hypertension and anemia were the common risk factors associated with preterm labour (Table 1). 73.2% delivered vaginally and 26.8% cases were delivered by caesarean section. Perinatal mortality was 17.8% (Table 2). Early neonatal death was seen in 7.1% of cases. 4.4% of preterm deliveries came with intrauterine death. Antepartum haemorrhage, hypertension and fetal congenital malformation were common causes of still births (Table 3) whereas respiratory distress syndrome, birth asphyxia and septicaemia were common causes of early neonatal deaths (Table 4). Neonatal outcome was directly proportional to gestational age (Table 5) and birth weight of the baby. Neonatal mortality was highest in the babies born with birth weight less than 750 grams.

**Discussion:-**

This clinical prospective study was carried out in a tertiary care teaching hospital for duration of 6 months. In the present study, the incidence of preterm birth was 21.5% which was higher than reported by Bangal et al [7] and Devi et al [8] where incidence were 13.2% and 12.18% respectively. The higher incidence could be due to many preterm high risk pregnancies referred to our hospital and associated risk factors necessitating a preterm birth for maternal and fetal indication. In the present study, 40% women were from poor socio-economic status whereas in a study reported from Bangal et al [7] 95% of cases were from poor socio-economic class. The reason for high poor socio-economic class was that their study was carried out in a rural tertiary care teaching hospital catering patients from surrounding villages.

In the present study, it was found that 70% of preterm deliveries had associated risk factors. Molly et al [9](1970) found that 67% of premature births had some obvious risk factors associated with preterm labour and Bangal et al [7](2012) found the associated risk factor in 57% of cases. In the present study the common risk factors were preterm premature rupture of membrane followed by hypertension, anemia and antepartum haemorrhage.

In the present study, 44.5% of preterm births were between 34 to < 37 weeks of gestation. Similar reports were reported by Bangal et al [7]. In their study 50% cases had pregnancy duration of 32 to 34 weeks. The reason for the selective rise in the "late preterm" group possibly was due to an increase in medical reasons necessitating a preterm delivery, changes in obstetric practice or both [10].

The perinatal mortality among premature babies is very high in developing countries due to low birth weight and prematurity. In the present study it was observed that perinatal mortality was directly related to birth weight and

gestational age of the baby. Similar outcome was observed by Devi et al (1974) [8], Singh et al (1980) [11] and Bangal et al (2012) [7].

In the present study, the perinatal mortality was 17.8% as compared to 42.4% seen in a study conducted by Bangal et al [7]. The reason for low perinatal mortality in our hospital was due to availability of better neonatal care unit. The main risk factor associated with fresh still birth in the present study are acute placental insufficiency as a result of antepartum haemorrhage and severe hypertension. Fetal congenital malformation, severe anemia and hepatitis were responsible for antepartum fetal death. The most common cause for early neonatal death was respiratory distress syndrome seen in 38.3% of cases followed by birth asphyxia and septicemia. Similar results were observed by Bangal et al (2012) [7] in their study.

Preventive measures like regular antenatal check-ups, screening of high risk cases, diagnosis and treatment of lower genital tract infections [12][13] by performing prophylactic encirclage in cases of cervical incompetence [14], use of short term tocolysis and glucocorticoids for improving lung maturity [15,16], improving maternal nutrition leads to reducing the incidence of preterm labour and thereby reducing perinatal mortality. Neonatal septicemia can be reduced by improving the aseptic conditions in the labour room and in the neonatal care unit and by use of broad spectrum antibiotics in preterm labour. Birth asphyxia can be reduced by improvement in neonatal care facilities.

### Conclusion:-

Preterm onset of labour has a multifactorial etiology. Early detection and correction of risk factors like control of blood pressure in preeclampsia, correction of anemia, treatment of cervicovaginal infections and asymptomatic bacteriuria, avoidance of coitus in late pregnancy and cervical encirclage in proven cases of cervical incompetence can reduce the incidence of preterm labour. Maternal betamethasone for enhancing the fetal pulmonary maturity and reducing the incidence of respiratory distress syndrome in new born babies should be administered. All preterm deliveries should be conducted in tertiary care hospital where better perinatal care is available.

### Declaration of interest statement:-

The authors report no declarations of interest.

### Abstract

The rapid development of the Internet needs to meet development and improvement of techniques to increase the performance of browsing and decrease the overload on the network traffic. To overcome this situation, Web caching techniques have been used. Web cache reduces the high traffic over the Internet so that users can access the web content faster.

The ALFUR replacement algorithm is developed by taking advantage of LFU, LRU and SIZE cache replacement algorithms. This algorithm separates the operation of the algorithm into three main agents, that we use it because to have the benefit of agents. This paper introduces the new proposed technique and compares between traditional LFU and ALFUR.

### Introduction:-

Nowadays, the rapid development of computer networks and internet services, the interactive web pages especially the social media have been accompanied by a mass and an extension in the speed of browsing and access to information at high speed. This speed is the causative agent that is dealing with the cache memory on browser side, proxy or origin server side. In order to be in a high speed browsing, should be dealing mainly with the cache memory of web caching concepts, since these pages must be carried into cache memory. While the main issues lie in the cache memory on any side have some limitations of size, it might be possible to the main memory to be fully occupied depending on the data or object that is stored in it. So, looking at this scenario in a serious way at this important junction, the proposed web caching policy of this study tends to tackle this issues immediately as it is continuously happening.

The sample of data is generated using webtraff generator, to compare between LFU and ALFUR the researcher generated 5 sample of data with cache size 1Mb, 6Mb, 500Mb, 800Mb and 1Gb.

There are different points at which we can set up a cache such as browser at client site, proxy server and close to original server. When a user requests web page, firstly it is checked in cache, if the requested web page is available then is sent back to the user. If the web page is not found in the cache, then the request is redirected to the web server and the response is sent to the client. Because of the limited size of the cache memory, it becomes so hard to save all objects in this memory [1].

The new proposed algorithm to improve LFU web cache replacement is named ALFUR - the proposed algorithm - combines between main web caching replacement strategies: LFU, Least Redundancy Used (LRU) and SIZE respectively; to take advantage of their features.

ALFUR is designed to solve the problem of the traditional web caching replacement strategies; to decrease the overhead of network traffic and to increase the speed of browsing. This paper is implemented using artificial intelligent that is play main role to improve algorithms.

#### **LFU replacement strategy:-**

LFU replacement strategy is one of web cache replacement strategy. That used to remove object from cache memory to free space for new objects. The cache memory play main role with increase the speed of browsing throw internet. Mainly LFU depends on frequency number, Frequency number is increased once when web object is requested. The object with least frequency is removed from the cache [1].

#### **Disadvantage of LFU:-**

Since LFU is a frequency-based strategy, it considers the frequency of access. This is valuable in static environments where the status of objects does not change very much over a specific time period (day, week).

#### **The disadvantages are as follows [1]:-**

Complexity. LFU-based strategies involve a more complex cache administration. LFU cannot be implemented, for example without a priority queue.

Cache pollution. Frequency counts are static for dynamic changes in the Workload. Therefore, aging was introduced. But aging is nothing but a recency- based technique. It is questionable if sophisticated aging techniques are better than simple recency-based techniques in dynamically changing environments. Furthermore, they add complexity to the replacement process.

Similar values. Many objects can have the equivalent frequency count. In this case, a tie breaker factor is required.

#### **Category of cache page Replacement policy:-**

Cache page replacement policies can be divided into four categories as follows:

##### **Recency-based:-**

In this category, time is the main issue, i.e. time to access the last references of object. An example of this category is LRU (Least Recently Used) that has been applied in a number of proxy caching servers.

##### **Size-based:-**

In this category, object size is the basic parameter. LFU-Size based algorithm is considered an example of this category.

##### **Frequency-based:-**

In this category, the frequency of the object is functioned, that number of times an object is accessed is worked on. An algorithm of this category is LFU.

##### **Function-based:-**

This category involves multiple parameters which are related to performance metric that was used to determine a cost based function algorithms. Most suggestive algorithm of this category is Greedy-Dual Size. [3], [4], [7].

##### **Agent:-**

There is no commonly recognized definition of the word agent. Russel and Norvig (1995) define an agent as an entity that can be viewed as perceiving its environment through sensors and acting upon its environment through effectors.

(Coen, 1995) views software agents as programs that engage in dialogs and negotiate and coordinate the transfer of information.

Wooldridge and Jennings (1995) state that an agent is a hardware and/or software-based computer system displaying the properties of autonomy, social adeptness, reactivity, and proactivity. Others (Brustolini, 1991; Franklin and Graeser, 1996; Maes, 1995; Hayes-Roth et al, 1995; Gilbert et al, 1995) offer variants on this theme.

There is an agreement with Autonomy; the ability to act without the involvement of humans or other systems, is a significant feature of an agent. Furthermore, different attributes take on different importance based on the domain of the agent. [5]

#### **Intelligent agent:-**

Wooldridge and Jennings (1995) define an intelligent agent as one that is capable of flexible autonomous action to meet its design objectives.

#### **Flexible means:-**

##### **Reactivity:-**

Intelligent agents identify and respond in a timely fashion to changes that arise in their environment in order to fulfill their design objectives. The agent's aims and/or rules that form the root for a process that is currently executing may be affected by a changed environment and a different set of actions might be needed to be accomplished.

##### **Pro-activeness:-**

In a changed environment, intelligent agents have to recognize opportunities and take the initiative if they are to produce meaningful results. The challenge to the agent designer is to integrate effectively goal-directed and reactive behavior.

##### **Social ability:-**

Intelligent agents are proficient of cooperating with other agents (and possibly humans), through negotiation and/or collaboration, to satisfy their design objectives [5], [6].

#### **Proposed system:-**

This technique was developed based on LFU policy with some significant improvements that let the web object near to end user to reduce the network traffic and increase the availability of web object in cache.

ALFUR technique used additional factors to select the victim- object to be deleted- and remove it from cache to free space for another object. All calculations to select the object to remove is done using multi-agent system.

Although ALFUR technique can be implemented in cache memory at end user side, proxy server side or original server side; it has been implemented at proxy cache memory side; because proxy server caching is widely operated by computer network administrators to reduce user delays and to alleviate Internet overcrowding.

#### **ALFUR technique common properties:-**

1. Distributed Manner: The knowledge required to solve some problems does not reside in a single resource or agent, so that cooperation of many individual agents is needed to solve the problems.
2. Speed: Each agent has its own local processor and memory.
3. Efficiency: Not all knowledge is needed for all tasks, the agent uses the only part of the knowledge required to solve the problem.
4. Reliability: Multi-agent system is more reliable because there would be multiple agents in the setup which provide particular functionality or service. If an agent resource providing some functionality dies, another agent may take over.

#### **ALFUR Technique:-**

##### **ALFUR properties rotate around three issues:-**

First, it provides the characteristics of intelligent agent which have been discussed here before, beside this Agents in ALFUR Technique can act independently that states Autonomous. Each agent is independent with local tasks, it has the capabilities of problem-solving and decision-making and acts as a centralized management system.

##### **Second, ALFUR considers four mechanisms in dealing with multi agents system:-**

Cooperation: It is the process of sharing responsibilities in satisfying shared goals and generating dependent roles in joint activities.

**Coordination:** It is the process of management of agents' activities so that they coordinate their deeds with each other in order to share resources, meet their own interests.

**Independence:** every agent in ALFUR technique is able to work concurrently and relatively independently, it has its own goal to increase hit ratio and byte hit ratio, but it is also capable of coordinating with other agents in order to achieve a common goal.

**Agents Communication:** Agents communicate among themselves by message passing, an agent can be permanently ready to receive messages from other agents and, at the same time, carry out its own computational tasks.

Third, ALFUR technique contains some artificial intelligence techniques such as:

**Learning:** learning provides an excellent method for optimizing agent's action. Reinforcement learning (RL) is a generic name given to a family of techniques in which an agent tries to learn a task by directly interacting with the environment. In multi-agent reinforcement learning, many agents are simultaneously learning by interacting with the environment and with each other.

There are two popular learning algorithms for single-agent systems: value iteration and Q-learning, and they can be extended to multi-agent systems.

#### **ALFUR Description:-**

ALFUR is a new multi agent technique that consists of four big agents: Reader agent, Analyzer agent, Removal agent and Performance agent, which are disused as following:

**Reader Agent:** The reader agent reads the object date from "access log file" which is created by the proxy server.

**Analyzer Agent:** The main task of the analyzer agent is the calculations of frequency, size and request time for objects, in order to prepare object's information and then send it to the removal agent.

**Removal Agent:** Its main task is to remove objects to create free space in cache for other object, depending on the analyzer agent results.

**Performance evaluator Agent:** calculates the number of hit ratio and number of byte hit ratio that are used to measure the performance of ALFUR.

#### **Model Architecture:-**

The model architecture consists of three modules as shown in figure1:

1. The Monitoring Module: contains the monitoring agent and analyzer agent. It is a reactive agent that monitors the proxy cache. This agent works by using a fast response behavior. It provides information that allows the analyzer agent to take a decision.
2. The Removal Module: contains the parent cache removal agent that cleans up the cache according to web object frequencies, sizes, and times.

**Figure1:-** Model Architecture

#### **Algorithm Methodology:-**

Proposed ALFUR new technique reads the objects in cache memory using a reader agent, then it analyzes the cache object using an analyzer agent that calculates average of frequencies, object's frequency, size and time, and then removes the object using a removal agent based on the following conditions:

If object's frequency is greater than the average of frequencies, then don't remove the object, otherwise remove the object.

If object's frequency equals to the average of frequencies, then compare the object's size with the average, if it's greater, it must be removed.

If object's frequency equals the average frequencies and the average equals to the object's size, then calculate the average of the web objects' time stamp, if it is less than the web object time stamp, don't remove the object, otherwise remove the object.

Finally, the performance agent calculates the number of hit ratio and number of byte hit ratio to measure the performance of this new technique.

#### **ALFUR algorithms:-**

- Read web object
- Calculate web object frequency, size ,request time
- Calculate Average of web object frequency, size and request time
- IF object Freq>Average objects Freq THEN
- ((Don't remove object
- else
- Remove object)
- Else IF object Freq=Average objects and object size>average objects size THEN
- (Remove object
- else
- Don't remove object)
- Else IF object Freq=Average object and object size=average object size and object request time>average request time THEN
- (Don't remove object
- Else
- remove object))
- end

#### **Performance Metrics:-**

To accomplish the objective, cache replacement policy depends on several key metrics. Based on these performance metrics, we can compare the performance of different algorithms. These performance metrics play a very important role in web cache performance calculation. Such replacement policy aims to optimize performance metrics. To evaluate the performance of the cache, performance metrics are being used. The most commonly used are hit rate, byte hit rate saved bandwidth, and delay saving ratio.

#### **Hit rate:-**

The percentage of all object requests which are found in the cache instead of transferring from the requested server.

#### **Byte hit:-**

The percentage of all data that is transferred straight from the cache rather than from the requested server.

This paper measures the performance of proposed ALFUR model using Hit and Byte hit ratio for the new cache file after implement the model.

The hit ratio calculates the summation of requested objects found in new cache file divided by the number of all objects in original cache.

$$HitRatio = \frac{\sum_{i=1}^n \partial i}{n}$$

The byte hit ratio calculates the summation of requested objects size found in new cache file divided by total objects in original cache.

$$\text{ByteHitRatio} = \frac{\sum_{i=1}^n b_i \partial_i}{\sum_{i=1}^n b_i}$$

When n: total Number of requests

$\partial_i$ : 1 if the request i is in the cache

$\partial_i$ : 0 otherwise

$b_i$ : size in bytes

### Result:-

The following figures show the comparison of ALFUR with traditional LFU removable algorithms in terms of Hit ratio. For different cache size shows above the figures.

Hit ratio Comparison figure 2 Tested with cache size 1MB

Figure 2:- HR (ALFUR vs. LFU cache size 1Mb)

Hit ratio Comparison figure 3 Tested with cache size 6MB

Figure 3:- HR (ALFUR vs. LFU cache size 6Mb)

#### **ALFUR Best Result In Hit Ratio and Byte Hit Ratio:-**

The figure 12 shows the best result of ALFUR in term of Hit Ratio and Byte Hit Ratio for generated data using webtraff simulator, when cache size equals 6MB.

**Figure 12:-** Best HR and BHR for ALFUR

#### **ALFUR Worst Result In Hit Ratio and Byte Hit Ratio:-**

The figure13 shows the best result of ALFUR in term of Hit Ratio and Byte Hit Ratio for generated data using webtraff simulator, when cache size equals 800MB

Figure 13:- Worst HR and BHR for ALFUR

### Result Discussion:-

The webtraff simulation results illustrated that the cache size plays a main role in improving the performance of the web cache. There is a difference when the cache size increases and decreases. the new ALFUR algorithm has better performance over traditional LFU replacement algorithms in terms of Hit Rate and Byte Hit Rate.

### Result Discussion in terms of Hit Ratio (ALFUR vs. LFU):-

This section consists of performance result discussion for data generated using webtraff in terms of Hit Ratio between ALFUR and LFU.

- Figure 2, cache size is equal to 1Mb the ALFUR and LFU are same result with hit ratio 83.33%. This rate of hit ratio is forth range for all samples.
- Figure 3, cache size is equal to 6Mb the ALFUR is in the better rate than LFU in this size with hit ratio 85.83% and LFU hit ratio is equal to 40.94%.ALFUR is better than LFU in this size with +44.89% rate of hit ratio. This rate of hit ratio is the third range for all samples.
- Figure 4, cache size is equal to 500Mb the ALFUR is in the better rate than LFU in this size with hit ratio 84.13% and LFU hit ratio is equal 38.88%.ALFUR is better than LFU in this size with +45.25% rate of hit ratio. This rate of hit ratio is the second range for all samples.
- Figure 5, cache size is equal to 800Mb the LFU is in the better rate than ALFUR in this size with hit ratio 47.29% and ALFUR hit ratio is equal to 34.745%.ALFUR is worse than LFU in this size with -12.54% rate of hit ratio. This rate of hit ratio is the fifth range for all samples.
- Figure 6, cache size is equal to 1 GB the ALFUR is in the better rate than LFU in this size with hit ratio 74.87% and LFU hit ratio is equal to 10.83%.ALFUR is better than LFU in this size with +64.04% rate of hit ratio. This rate of hit ratio is the first range for all samples.

### Result Discussion in terms of Byte Hit Ratio (ALFUR vs. LFU):-

This section consists of performance result discussion for data generated using webtraff in term of Byte Hit Ratio between ALFUR and LFU.

- Figure 7, cache size is equal to 1Mb, the ALFUR and LFU are same result with byte hit ratio 48.32%. This rate of byte hit ratio is forth range for all samples.
- Figure 8, cache size is equal to 6Mb the ALFUR is in the better rate than LFU in this size with byte hit ratio 60.31% and LFU byte hit ratio is equal to 42.33%.ALFUR is better than LFU in this size with +17.98% rate of byte hit ratio. This rate of byte hit ratio is the third range for all samples.
- Figure 9, cache size is equal to 500Mb the ALFUR is in the better rate than LFU in this size with byte hit ratio 53.92% and LFU byte hit ratio is equal to 35.45%.ALFUR is better than LFU in this size with +18.47% rate of byte hit ratio. This rate of byte hit ratio is the second range for all samples.
- Figure 10, cache size is equal to 800Mb the LFU is in the better rate than ALFUR in this size with byte hit ratio 47.00% and ALFUR byte hit ratio is equal to 16.02%. ALFUR is worse than LFU in this size with -30.98% rate of byte hit ratio. This rate of byte hit ratio is the fifth range for all samples.

- Figure 11, cache size is equal to 1Gb the ALFUR is in the better rate than LFU in this size with byte hit ratio 40.30% and LFU byte hit ratio is equal to 18.73%.ALFUR is better than LFU in this size with +21.57% rate of byte hit ratio. This rate of byte hit ratio is the first range for all samples.

### Conclusion:-

This paper introduces a new LFU web cache replacement using intelligent agent, this algorithm used more than one factors for removing object from cache memory. ALFUR compares between averages number of frequency with object request and removes the least frequency, if more than object have same frequency, it compares average object size with object size, and remove object with the biggest size, if more than object have same average object size, then finally it compares between time stamps of object and average of time stamp and remove the object with old request time. The comparison condition illustrated ALFUR algorithm. ALFUR is best performance when comparing Hit, Byte Hit, and Miss Ratio, The average ALFUR hit rate is equal to 72.58%, and from above result the ALFUR is better than average LFU which is equal to 44.25%. This means that ALFUR algorithm has better performance than LFU in terms of Hit Ratio with +28.33% rate. The average ALFUR byte hit rate is equal to 43.77%, from above result the ALFUR is better performance than average LFU which is equal to 38.37%. This mean that ALFUR algorithm has better performance than LFU in the terms of Byte Hit Ratio with +5.41% rate.

### Abstract

To find out the Special Pythagorean Triangles, where their perimeters are Triangular numbers and Pentagonal numbers both is the main objective of this paper. A few interesting results are observed.

#### Key words:-

Pythagorean Triangles, Triangular Numbers, Pentagonal numbers.

Copy Right, IJAR, 2016,. All rights reserved.

### Introduction:-

Figure Numbers, first studied by Pythagoras, played very important role in Pythagorean science of numbers. Pythagorean Theorem, which gave the world, a powerful method of proof, *reductio ad absurdum*, also called **Proof by Contradiction**, continues to ignite the minds of those who love to play with numbers. Rana and Darbari [1] obtained special Pythagorean Triangles, with their legs to be consecutive, in terms of Triangular Numbers while Darbari [2] explored their perimeters as triangular numbers. Gopalan and Janaki [3] and Darbari [4] have studied special Pythagorean Triangles in terms of Pentagonal Numbers. Extending the problem further, existence of special Pythagorean triangles with their perimeters as Triangular Numbers and Pentagonal numbers both is explored in this paper.

### Method of Analysis:-

The primitive solutions of the Pythagorean Equation,

$$X^2 + Y^2 = Z^2 \quad (2.1)$$

is given by [5]

$$X = m^2 - n^2, Y = 2mn, Z = m^2 + n^2 \quad (2.2)$$

for some integers  $m, n$  of opposite parity such that  $m > n > 0$  and  $(m, n) = 1$ .

#### Perimeter is a Triangular number:-

Definition 2.1.1: A natural number  $p$  is called a Triangular number if it can be written in the form

$$\frac{\gamma(\gamma+1)}{2}, \gamma \in \mathbb{N}$$

Definition 2.1.2: A natural number  $p$  is called a Pentagonal number if it can be written in the form

$$\frac{\beta(3\beta-1)}{2}, \beta \in \mathbb{N}$$

**Corresponding Author:- Dr. Mita Darbari.**

Address:- Head, Department of Mathematics St. Aloysius' College, Jabalpur, India.

If the perimeter of the Pythagorean Triangle (X, Y, Z) is Triangular and Pentagonal number  $p$ , then

$$X + Y + Z = \frac{\gamma(\gamma+1)}{2} = \frac{\beta(3\beta-1)}{2} = p \quad (2.3)$$

By virtue of equation (2.2), equation (2.3) becomes

$$2m^2 + 2mn = \frac{\gamma(\gamma+1)}{2} = \frac{\beta(3\beta-1)}{2} = p, \gamma \text{ \& } \beta \in N \quad (2.4)$$

Using *Mathematica* for  $0 < \gamma < 10^{20}$ ,  $0 < \beta < 10^{20}$ , there are just 18 numbers which are both Triangular and Pentagonal numbers. They are as follows:

**Table 2.1:-** Numbers which are both Triangular and Pentagonal

### Observations and Conclusion:-

We observe that

1.  $X + Y + Z = 0 \pmod{2}$ .
2.  $Y + Z - X = 0 \pmod{2}$ .
3.  $(X + Y + Z) (X + Y - Z) = 0 \pmod{8}$ .
4.  $(Y + Z - X)^2 = 2(Y + Z)(Z - X)$ .
5.  $(X + 2Y + Z)^2 = (Z - X)^2 + 4(X + Y)(Y + Z)$ .

In conclusion, other special Pythagorean Triangle can be found which satisfy the conditions other than discussed in the above problem.

#### Abstract

The paper describes the synthesis and X-ray study of a complex structure of ferrite  $\text{BiLiFe}_2\text{O}_5$ . Ferrite with mixed complex oxide  $\text{BiLiFe}_2\text{O}_5$  was synthesized by high temperature solid state reaction. The structure of the ferrites, type of syngony, parameters of the unit cells, radiographic and pycnometric densities were determined by X-ray phase analysis for a first time:  $a=5,277$ ,  $c=13,86\text{\AA}$ ,  $V_{\text{un.cell}} = 1054,6 \text{\AA}^3$ ,  $Z=12$ ,  $\rho_{\text{rad}} = 7,7022$ ,  $\rho_{\text{pcn}} = 7,7031 \text{ g/cm}^3$ . A comparative analysis of the relationship between crystal lattice parameters with parameters of the crystal lattice of initial oxides and complex ferrites has been performed.

#### Introduction:-

Semiconductor materials, which functionality is stipulated by electron charge are generally used in modern electronics. Increasing requirements to electronic devices expose the problem of search and implementation of alternative materials, working on non-classical principles. The basis of future electronic can become spintronics devices that use both electron charge and its spin [1].

Spintronics became known after opening the effect of discovery of "giant" magnetoresistance (GMR), which is stipulated by different scattering on ferromagnetic impurities of two groups of electrons' spins with "up" and "down". This selection requires the significant difference between the average lengths of free path of the electrons with "up" and "down" directions of the spins. This occurs in ferromagnetic materials characterizing by differences in the density of the free states of electrons caused by exchange splitting of 3d zone. This principle lays in the basis of magnetoresistive devices implementing the effects of the giant and tunnel magnetoresistance [2].

Literature data analysis shows that orthoferrites  $\text{BiFeO}_3$  or so-called multiferroics are the most studied of ferrites that simultaneously have the electric polarization and magnetic ordering. The orthoferrites are prospective for implementation as the working environment in the data storage and processing devices. At the present time, the search of new materials with ferroelectric properties and specific electronic and magnetic structures is performed using the most famous multiferroic for. Substituted perovskites based on the bismuth ferrites often combine ferroelectric and weak ferromagnetic properties with the dominant antiferromagnetic ordering [2, 3].

This study is to investigate the conditions for obtaining and X-ray features of new classes of complex mixed bismuth ferrites, in which  $\text{Bi}^{+3}$  is partially substituted by the ions of rare-earth elements and sodium.

#### Experimental part:-

New polycrystalline complex of bismuth ferrites were synthesized by ceramic processing technology. Bismuth oxide (III) (mark “chemically pure”), lithium carbonate (mark “highly-pure”) and iron oxide (III) (mark “chemically pure”) were used as the initial components. Solid-phase synthesis was carried using the thermal data of the initial components taking into account Tamman conditions for ceramic reactions [4,5]. Stoichiometrically calculated mixtures of initial components preliminary annealed in a muffle furnace at 400°C for one hour, were thoroughly stirred and the calculated mixture of the starting components are thoroughly mixed and grinded in an agate mortar, placed in an alundum crucibles, and annealed in a silite furnace. Annealing was performed by two stages: first stage at 600°C for 48 h and second stage at 800°C for 20 h [6].

Formation of new phases was controlled by X-ray scattering analysis performed using the radiologic diffractometer X-ray MiniFlex 600 (Rigaku). The conditions of analysis included: CuK $\alpha$  – radiation, Ni – filter, U=40 kV, I=10 mA, rotation rate – 1000 impulses/s, and time constant  $\tau$ =5 s,  $2\theta$  = 10° – 90°. Diffraction peaks were evaluated using hundredpoint scale. Radiographs of the synthesized polycrystalline powders were indexed by the homology method (homologue is distorted structure type of perovskite) [7]. Pycnometric density of manganites was determined by the method described in [8]. Toluene served as indifferent liquid. The density of each ferrite was measured 4 – 5 times and the data were averaged. Table below shows the results of indexing of radiographs of ferrites. In a [Table 1] shows the results of X-ray indexing ferrites.

### Results:-

On the basis of X-ray diffraction of the synthesized compounds indexing  $\text{BiLiFe}_2\text{O}_5$  found that ferrite crystallized in the tetragonal structure with the following unit cell parameters:  $a=5,277$ ,  $c=13,86\text{\AA}$ ,  $V_{\text{un.cell}} = 1054,6 \text{\AA}^3$ ,  $Z=12$ ,  $\rho_{\text{rad}} = 7,7022$ ,  $\rho_{\text{cm}^3}$ ,  $\rho_{\text{picn}} = 7,7031 \text{ g/cm}^3$ .

The correctness of the results of the ferrite indexing confirmed the good agreement of the experimental and calculated values of the reciprocals of the squares of the distances between planes ( $10^4/d^2$ ), consistency of values of X-ray and pycnometric densities.

### Conclusions:-

$\text{BiLiFe}_2\text{O}_5$  crystallizes in the tetragonal system, analysis of the relationship between the parameters of the crystal lattice parameters of the original  $\delta\text{-Bi}_2\text{O}_3$  shows equality and parameter and increase the value of the parameter to twice the sum of the values of the even squares Miller index ( $h^2 + k^2 + l^2$ ) shows a body nature of the crystal lattice.

Development, Economic Development.

### Abstract

Women education guarantees better advancement of human progress, as well as to instruct after that era as well. Education is point of interest of women empowerment since it encourages them to react to the difficulties, to stand up to their standard appearance and upset their living. Women education in India has additionally been a noteworthy distraction of both the administration and common society as taught women can assume an essential part in the improvement of the nation. Education is point of reference of women empowerment since it empowers them to reacts to the difficulties, to go up against their conventional part and change their life. With the goal that we can't disregard the significance of education and development in reference to women empowerment India is ready to getting to be superpower, a created nation by 2020. The development of women's education in country regions is moderate. This clearly implies still extensive womenfolk of our nation are uneducated, the powerless, in reverse and misused. Education of women in the perspective of training and development is the most effective apparatus of progress of position in the public eye. This paper looks at the issue of women's access to education in India. Drawing on existing writing and different insights concerning women's education, the paper gives a diagram of the condition of education as for women and highlights a portion of the issues and obstructions to women's education. In view of an investigation of rising issues, a few proposals and recommendations are offered as far as grassroots level intercessions, key activities and empowering strategy system, towards enhancing women's access to education.

### Introduction:-

Women education in India assumes an essential part in the general advancement of the nation. It not just aides in the improvement of half of the human resources, however in enhancing the personal satisfaction at home and outside. Educated women not just have a tendency to advance education of their young lady kids; additionally can give better direction to every one of their youngsters. In addition educated ladies can likewise help in the diminishment of newborn child death rate and development of the populace.

**Corresponding Author:- Shail Mishra.**

Address:- Assistant Professor of Education, G.S. College, Jabalpur.

In spite of the fact that in the Vedic period, women had permission to education in India, they had bit by bit lost this privilege. In the British time frame, there was increment of enthusiasm for women's education in India. Amid this period, different socio religious operations drove by prominent people like Raja Ram Mohan Roy, Iswar Chandra Vidyasagar underlined on women's education and connection with external world in India. However women's education got a quick augmentation after the nation got autonomy in 1947 and the government has taken different measures and activities to give education to all Indian ladies. Subsequently women's proficiency rate has become over the three decades and the development of female proficiency has in certainty been higher than that of men education rate for little a long time. While in 1971 just 22% of Indian women were proficient, before the end of 2001 54.16% female were proficient.

#### **Significance of women education in India:-**

Sexual orientation disparity in education is extraordinary. In India young women were less inclined to get to school, to stay in school or to accomplish in education. Be that as it may, now the situation is changing and families understand the significance of education. Women education in India assumes an essential part in the general development of the nation. It not just makes a difference in the advancement of half of the human capital, however in enhancing the standard of living. Taught women not just have a tendency to advance training of their young women children; however additionally can give better direction to every one of their youngsters and their future. Also taught women can likewise help in the lessening of neediness and unemployment by supporting their families' completely.

#### **Women empowerment in India:-**

Women empowerment alludes to expanding the otherworldly, political, social, instructive, sexual orientation or monetary quality of people and groups of women. Women empowerment in India is intensely reliant on a wide range of factors that incorporate topographical area (urban/rustic) instructive status societal position (standing and class) and age. Approaches on Women empowerment exist at the national, state and nearby (Panchayat) levels in numerous divisions, including wellbeing, training, monetary open doors, sexual orientation based viciousness and political interest. However there are huge hole between strategy headways and genuine practice at the group level.

Women empowerment is basically the procedure of upliftment of financial, social and political status of ladies, the generally underprivileged ones, in the general public. It is the way toward guarding them against all types of brutality. Women empowerment includes the working up of a general public, a political situation, wherein women can inhale without the dread of abuse, misuse, worry, segregation and the general sentiment oppression which runs with being a lady in a customarily male ruled structure.

Women constitute just about half of the total populace yet India has indicated unbalanced sex proportion whereby female's populace has been relatively lower than guys. To the extent their societal position is concerned, they are not regarded as equivalent to men in every one of the spots. In the Western social orders, the ladies have measure up to right and status with men in all kinds of different backgrounds. However, gender disabilities and discriminations are found in India even today. The dumbfounding circumstance has with the end goal that she was in some cases worried as Goddess and at different times only as slave.

#### **Status of women Empowerment:-**

The status of Women Empowerment can't be pictured with single measurement rather multidimensional appraisal regarding different segments of women' life and their status would bring a reasonable origination. In this way, this paper tries to give a fundamental thought regarding the condition and status of women in wording of empowerment, education, and economic development.

#### **Hindrances of women Empowerment:-**

The main Problems that were faced by women in past days and still today up to some extent:

1. Gender discrimination
2. Lack of Education
3. Female Infanticide
4. Financial Constraints
5. Family Responsibility
6. Low Mobility
7. Low ability to bear Risk

8. Low need for achievement
9. Absence of ambition for the achievement
10. Social status
11. Dowry Marriage in same caste and child marriage (still existing)
12. Atrocities on Women (Raped, Kicked, Killed, Subdued, humiliated almost daily.)

#### **Objectives of the study:-**

- To study the status and scenario of women education and women empowerment in India.
- To study the significance of women education and Women Empowerment in India.
- To analyze the Factors influencing the Economic Empowerment of Women.
- To identify the Hindrances in the Path of Women Empowerment with particular reference to education.

#### **Review of Literature:-**

**H. Subrahmanyam (2011)**<sup>1</sup> looks at women education in India at present and Past. Author highlighted that there has a decent advance in general enrolment of young women understudies in schools. The term engage intends to give legitimate power or power to act. It is the way toward securing a few exercises of women.

**M. BhavaniSankaraRao (2011)**<sup>2</sup> highlighted that soundness of women individuals from SHG have surely taken a swing to better. It unmistakably demonstrates that health of women individuals talk about among themselves about wellbeing related issues of different individuals and their youngsters and make them mindful of different Government arrangements uniquely implied for them.

**Doepke M. Tertilt M. (2011)**<sup>3</sup> *Does Female Empowerment Promote Economic Development?* This study is an observational investigation recommending that cash in the hands of moms advantages youngsters. This study built up a progression of non-helpful family dealing models to comprehend what sort of grindings can offer ascent to the watched observational relationship.

**Duflo E. (2011)**<sup>4</sup> *Women's Empowerment and Economic Development*, National Bureau of Economic Research Cambridge The study contends that the bury connections of the Empowerment and Development are presumably too powerless to be in any way self-managing and that consistent approach duty to similarly for its own particular purpose might be expected to achieve equity amongst men and ladies.

**Sethuraman K. (2008)**<sup>5</sup> *The Role of Women's Empowerment and Domestic Violence in tyke Growth and under sustenance in a Tribal and Rural Community in South India*; This examination paper investigates the relationship between Women's Empowerment and Domestic Violence, maternal nutritious status and the dietary status and development more than six months in kids matured 6 to 24 months in a provincial and tribal group.

**Venkata Ravi and Venkatraman (2005)**<sup>6</sup> concentrated on the impacts of SHG on women cooperation and practicing control over basic leadership both in family matters and in gathering exercises.

#### **Research Methodology:-**

This paper is fundamentally descriptive and analytical in nature. In this paper an endeavor has been taken to examine the women empowerment and development in India. The data and information utilized as a part of it is absolutely from auxiliary sources as indicated by the need of this study.

#### **Findings of the Study:-**

- Globalization, Liberalization and other Socio - Economic strengths have given some relief to a vast extent of the populace. Be that as it may, there are still a significant number regions where women empowerment in India is to a great extent lacking.
- There should be an ocean – change in the attitude of the general population in the nation. Not only the women themselves, but rather the men need to wake up to wake up to a world that is moving towards balance and value. It is better this is grasped sooner than later for our own great.
- There are a few Government projects and NGOs in the Country, there is still a wide crevice that exists between those under assurance and those not.

- Neediness and ignorance add to these intricacies, The Empowerment of Women starts with an assurance of their wellbeing and security.
- Empowerment of Women must be accomplished if their monetary and societal position is made strides. This could be conceivable just by receiving distinct social and monetary arrangements with a perspective of aggregate improvement of women and to make them understand that they can possibly be solid people.
- Keeping in mind the end goal to make a feasible world, we should start to Empower Women.

#### **Suggestions of the Study:-**

- The most importantly need ought to be given to the women's education, which is the grassroots issue. Consequently, training for women must be given careful consideration.
- Mindfulness programs should be sorted out for making mindfulness among women particularly having a place with weaker segments about their rights.
- Women ought to be permitted to work and ought to be sufficiently given security and support to work. They ought to be given legitimate wages and work at standard with men so that their status can be hoisted in the general public.
- Strict execution of Programs and Acts ought to be there to control the mal-hones common in the general public.

#### **Conclusion:-**

"At the point when women push ahead the family moves, the town moves and the country moves". It is basic as their idea and their esteem frameworks lead the advancement of a decent family, great society and at last a decent country. The most ideal method for empowering is maybe through drafting women in the standard of advancement. Women empowerment will be genuine and successful just when they are enriched pay and property with the goal that they may remain on their feet and develop their personality in the general public. The Empowerment of Women has gotten to be a standout amongst the most essential worries of 21st century at national level as well as at the global level. Government activities alone would not be adequate to accomplish this objective. Society must step up with regards to make an atmosphere in which there is no sexual orientation segregation and women have full chances of self-basic leadership and taking an interest in social, political and monetary existence of the nation with a feeling of equity.

#### Abstract

##### Abstract:

**Background:** Over the last twenty years, Saudi Arabia has witnessed major socioeconomic development leading to significant changes in its standard of living and lifestyle. This transformation of the society resulted in changes in dietary habits, compounded by a lack of exercise among elderly have contributed to the emergence of diseases, including hypertension and IHD and other important cardiovascular diseases. **Objectives:** To estimate the prevalence of cardiovascular system diseases, its types and its determinants among the elderly population of Arar city, Kingdom of Saudi Arabia. **Participants and methods:** A cross sectional study included 276 participant aged 60 years and above, attending 5 randomly selected primary healthcare centers in Arar city. Data was collected through personal interviews with the sampled elderly and filling the questionnaire which guided us to the data of socio-demographic characteristics, smoking status and diabetes millets. BMI was calculated. The questionnaire included questions regarding the cardiovascular system diseases, its types and its determinants, after ensuring the diagnosis and by reviewing the accompanied health reports and prescriptions and asking the caregivers about the case. **Results:** The overall prevalence of cardiovascular diseases was 73.2%, hypertension was found in about half (44.9%) of them, ischemic heart diseases in 18.9%; Myocardial infarction was found in 10.9%, Ischemia in 8.0% and Arrhythmias in 6.5% of the studied elderly population. There is insignificant relationship between the occurrence of hypertension and sex, age group, DM and obesity ( $P>0.05$ ). But there is significant relation between the occurrence of hypertension and smoking in studied elderly population ( $P<0.05$ ). There is significant relation between the occurrence of ischemic heart diseases and sex, age group, smoking and DM in studied elderly population ( $P<0.05$ ). But there is insignificant relationship between the occurrence of ischemic heart

## Introduction:

Aging is a natural biological process which is associated with deterioration of health status of elderly people. The ageing is inevitable and it is a concern of every one. Ageing is known as a process of deterioration in the functional capacity of a person that results from structural changes, with advancement of age [1].

The world will have more elderly people than children because economies are globalizing and the technologies are evolving rapidly [2].

Elderly life is full of problems- physical, social and economic. Older people are helpless and a disability is more likely to occur in the old age [3]. From 1990 through 2010, there was a decline in age-specific mortality in KSA. During the same time, life expectancy increased from 72.5 to 75.0 for men and from 76.3 to 79.9 for women. During the same time, healthy life expectancy increased from 61.8 to 63.9 for men and from 63.5 to 66.6 for women [4].

Over the last twenty years, Saudi Arabia has witnessed major socioeconomic development leading to significant changes in its standard of living and lifestyle. The transformation of the society has also resulted in changes in dietary habits and related social practices. This has been compounded by a lack of exercise among large segments of the society. These factors and others have contributed to the emergence of life style-related diseases, including hypertension and diabetes mellitus.[5].

Cardiovascular disease (CVD) is a class of diseases that involve the heart or blood vessels which are the leading cause of death globally. In the Cardiovascular Health Study which the prevalence of cardiovascular diseases in older Americans, the prevalence rates of definite myocardial infarction and angina were 11% and 15%, respectively, among men aged 65–69 years, 18% and 17% among men aged 80–84 years, 4% and 8% among women aged 65–69 years, and 3% and 13% among women aged 80–84 years [6].

In southwest Saudi Arabia, Al-Modeer study found that, the most prevalent cardiovascular disease is hypertension (59.1%) followed by ischemic heart diseases (16.7%) and arrhythmias occurred among 8.1% of study population; 8.9 in females % and 7.0% in males. Most of the cardiovascular morbidities have the same percent in both genders. Some diseases show significant ( $P < 0.005$ ) high prevalence among males such as hypertension, its prevalence among males was 63.7% compared to 55.5% in females [7].

In Fayum, Egypt, hypertension was the second prevalent disease (37.4) with more prevalence among males (19.3%) than Females (18.2%). CHD was 5.9% 3.6% in males and 2.2% in females [8].

In a national study in KSA conducted by Al-Nozha et al., the overall prevalence of Coronary Artery Diseases obtained from this study is 5.5% in KSA. The prevalence in males and females were 6.6% and 4.4% ( $P<0.0001$ ). Urban Saudis have a higher prevalence of 6.2% compared to rural Saudis of 4% ( $P<0.0001$ ). The following variables are found to be statistically significant risk factors in KSA: age, male gender, body mass index (BMI), hypertension, current smoking, fasting blood glucose, fasting cholesterol and triglycerides [9].

In a study conducted in Dubai, the most common prevalent disease was hypertension (67.5%) [10].

In Udaipur, Rajasthan Vishnoi et al., found hypertension among elderly was 25% it was 38.7 in females and 15.3 in males [11].

Assessment of the cardiovascular morbidity profile will help in the application of interventions, to keep and improve vision and the quality of life of the elderly. Yet, up to our knowledge, there is little or no baseline information on the prevalence of cardiovascular diseases in the elderly population in our region.

## Objectives:

To estimate the prevalence of previously diagnosed cardiovascular system diseases, its types and its possible determinants among the elderly population of Arar city, Kingdom of Saudi Arabia.

## Participants and methods:

### Study design and setting :

The present cross sectional study was conducted in Arar city, which is the regional headquarter of the Northern Border Province of Saudi Arabia.

**Study period and target population:** During the period from 1 June to 30 September 2016, on elderly people of age 60 years and more.

**Sampling:**

The sample size was calculated using the sample size equation:  $n = z^2 p(1-p)/e^2$ , considering target population more than 1000, and study power 95%. Data was collected from 276 elderly participant aged 60 years and above, attending 5 randomly selected primary healthcare centers in Arar city. They were selected using a systemic random sampling procedure. Each participant was interviewed separately, and confidentiality was assured. Health centers provide healthy and sick citizens with healthcare services in an acceptable atmosphere of both privacy and confidentiality.

**Data collection:**

Data were collected by means of personal interview with the sampled elderly using a predesigned questionnaire covering the following items:

- (1) Socio-demographic characteristics including age, sex, educational and marital status.
- (2) Smoking status and certain types of diseases that may be prevalent among elderlies suggested to affect cardiovascular system diseases such as diabetes mellitus and thyroid gland diseases.
- (3) Questions regarding the previously diagnosed cardiovascular system diseases, its types and its determinants, after ensuring the diagnosis and by reviewing the accompanied health reports and prescriptions and asking the caregivers about the case.
- (4) Anthropometric examination included height and weight measurements with the use of a calibrated balance beam scale and a wall-mounted stadiometer and calculation of body mass index (BMI). Normal weight was defined as  $BMI < 25 \text{ kg/m}^2$ , overweight as  $25 \leq BMI < 30 \text{ kg/m}^2$  and obesity as  $BMI \geq 30 \text{ kg/m}^2$  [16].

**Ethical considerations**

Data collector gave a brief introduction to the participants by explaining the aims and benefits of the study. Informed written consent was obtained from all participants. Anonymity and confidentiality of data were maintained throughout the study. There was no conflict of interest.

**Statistical analysis**

We utilized the statistical package for social sciences, version 16 (SPSS Inc., Chicago, Illinois, USA) to analyze the study data. The results were displayed as counts and percentages. The X<sup>2</sup> test was used as a test of significance, and differences were considered significant at P value less than 0.05.

**Results:**

Table (1) illustrates the socio-demographic characteristics and BMI status of the studied elderly population. The table showed that mean age ( $\pm$  SD) was 70 ( $\pm 9.25$ ) years, male to female ratio was 47.8 to 52.2, married were 88.4 while 9.4 were widow, illiteracy constitutes 52.9% and 20.3% completed primary education, 13% preparatory and 13.8% completed the secondary education. Regarding working status, most of the participants (38.4%) haven't work while 33.3% were retired, 15.2% house wives and 10.9% were Shepherd. D.M was found in 37.0% and 44.9% were hypertensive. About half (45.7%) were obese, 26.8% underweight and only 24.6% had normal weight.

Table (2) illustrates the percentage distribution of cardiovascular diseases among the studied elderly population. The overall prevalence of cardiovascular diseases was 73.2%, hypertension was found in about half (44.9%) of them, ischemic heart diseases in 18.9%; Myocardial infarction was found in 10.9%, Ischemia in 8.0% and Arrhythmias in 6.5% of the studied elderly population.

Table (3) illustrates the relationship between hypertension and socio-demographic characters, obesity and D.M in the studied elderly population. There is insignificant relationship between the occurrence of hypertension and sex, age group, DM and obesity ( $P > 0.05$ ). But there is significant relation between the occurrence of hypertension and smoking in studied elderly population ( $P < 0.05$ ).

Table (4) illustrates the relationship between ischemic heart diseases and socio-demographic characters, obesity and D.M in the studied elderly population. There is significant relation between the occurrence of ischemic heart diseases and sex, age group, smoking and DM in studied elderly population ( $P < 0.05$ ). But there is insignificant relationship between the occurrence of ischemic heart diseases and obesity ( $P > 0.05$ ).

## Discussion:

Saudi Arabia like most countries in the world is facing the challenge of an ageing population. The recent increases in the proportion of elderly has raised attention to issues concerning the morbidity profile of this potentially vulnerable age group. The Physical functioning and psychological wellbeing of elderly are influenced by their morbidities. (12)

This study is a cross-sectional study was carried out in Arar city, the capital of the Northern Province of KSA, during the period from 1 June to 30 September 2016, on 138 elderly people of age 60 years and more.

In this study hypertension was the most common among these morbidities (44.9%) and is also found to be more prevalent among females (55.6%) than males (44.4%), however the gender difference was insignificant ( $P>0.05$ ) .

In Al-Modeer study hypertension was the most common among these morbidities (59.1%) and is also found to be more prevalent among males than females this isn't in agreement with findings of our study [7]. In Dubai study, the most common prevalent disease among studied elderly was hypertension (67.5%) [10] which is more than our figure. In Fayoum, Egypt, hypertension was the second prevalent disease (37.4) with more prevalence among males than females [8]. Other studies found hypertension was (73.6% and 67.9% among males) [13,14]. In Udaipur, hypertension among elderly was 25%, it was more prevalent in females than males (38.7 Vs. 15.3) [11] which is consistent with our result, but the figure is less than our figure.

The gender differences may result from biological differences, but they may be due to other comorbidity as obesity. A systematic review of the overall worldwide prevalence of hypertension, showed no gender difference [15] This study further supports this finding.

Results of the current study showed that Ischemic Heart Diseases was found in 18.9% of studied elderly population, it was more encountered among males compared to females ( $P < 0.05$ ). Results of the Fayoum, Egypt study showed that 5.9% of elderly had coronary heart disease (CHD) which was more encountered among males compared to females [8] this was greeted with our result but the figure is far less than us. Al-Modeer study found IHD in 16.7% of elderly (18% in males and 15% in females) with insignificant difference between males and females ( $P > 0.05$ ) [8]. In Dubai study, Ischemic Heart Diseases was found in 15% of studied elderly population, with more prevalence among males than females (17.9% Vs. 13.7%) [10]. All are consistent with our findings. Results from the National Community Based Survey in the Saudi Arabia revealed that the prevalence of IHD was 9.3% and male gender was a risk factor [16].

In the current study arrhythmias occurred among 6.5% of study population, this finding is in accordance with Al-Modeer et al. findings, arrhythmias occurred among 8.1% of study population; 8.9 in females % and 7.0% in males [8].

In the current study, there is significant relation between the occurrence of ischemic heart diseases and age group, smoking and DM in studied elderly population ( $P < 0.05$ ). But there is insignificant relationship between the occurrence of ischemic heart diseases and obesity ( $P > 0.05$ ). National Community Based Survey in the Saudi Arabia revealed that the prevalence of IHD among elderly aged 60-70 years was lower [16].

In a national study in KSA conducted by Al-Nozha et al., the following variables were found to be statistically significant risk factors of ischemic heart diseases: age, male gender, obesity, hypertension, current smoking and Diabetes [9].

### **Conclusion and recommendations:**

The study revealed that elderly were suffering from many cardiovascular diseases. Such common comorbidities as DM, obesity, and Smoking need decision makers to plan and implement more effective preventive, curative and rehabilitative services to improve the health status and the quality of life of those vulnerable group.

#### Key words:-

Railway accidents, pedestrians in rail deaths, pattern of railway deaths, comparison of patterns, Amputation, Fractures.

### Abstract

**Background:** The purpose of all accident investigations is to establish the cause of the incident. This information will be sought for a number of reasons which may overlap. The victims or their families may want to see what can be done to prevent recurrence. The patterns of injuries in railway track deaths may vary according to the position of the person or the different situations when struck. In forensic literature only few systematic studies of the respective injury pattern are available. In many instances the forensic pathologists are asked to reconstruct the event after medicolegal autopsy. Hence an attempt is made to study the pattern of injury in pedestrians involved in railway track incidences with relative position of victim and train so that this study may help the forensic pathologist to reconstruct the events and rule out foul play.

**Materials and methods:** A cross sectional study of all railway track deaths brought for medicolegal autopsy at Thiruvananthapuram Medical College, Kerala, from 1<sup>st</sup> March 2010 to 28<sup>th</sup> February 2011 were analyzed. A total of 104 cases of railway track deaths were studied excluding cases with advanced decomposition. Data regarding nature of incidents were collected from the Kerala Police Form 102 (KPF 102), investigating officers and relatives. Clinical case records were studied in treated cases. A meticulous external and internal examination was made and the details regarding nature, dimensions and location of injury was entered in a proforma. The data were entered in MS Excel and statistical analysis was done.

**Results:** Among 104 cases of railway accidents in the study period 17 (16.3%) cases were those with history of hit by train while they were walking along the side of or through the track (GROUP I) and 34 (32.7%) cases were those with history of crossing the track (GROUP II). All the cases showed external injuries. In all cases of Group I, there was lacerated wound on the head, and in 82.4% external injury was present on the face also. Among these, 6 cases (35.3%) showed crushed lacerated wounds on the head and face. In 14 cases (82.4%) there was skull fracture. Facial bone was fractured in 52.9% of cases and showed intracranial haemorrhages associated with skull fracture. Injury to brain was seen in 17.6% of cases. Two (11.8%) cases showed fatal neck injury, one was a case with decapitation injury and the other showed fracture of the cervical spine with contusion of the cord. Nine cases (52.9%) showed injury to chest and 8 among them

**Corresponding Author:-Dr. Sreelekshmi. J.**

Address:-Junior resident medical officer, Department of forensic medicine and toxicology Govt.T.D Medical College, Alappuzha.

(47%) showed injury to abdomen also.. Thoracic spine was fractured in 23.5% of cases. Transection had occurred in 2 cases (11.8%) .

The most prominent injury in group II was lacerated wound (91%). Head and face were injured in 31 cases (91%). In this, 9 cases (26.5%) showed fracture fragmentation of skull bone with extrusion of the brain. Skull fracture was seen in 18 cases (52.9%). Out of which, Intra cranial haemorrhage was present in 8 cases (23.5%) and another 2.9% showed isolated intra cranial haemorrhage. Brain showed injury in 9 cases (26.5%).Decapitation was seen in 6 cases (17.6%). In 7 cases (20.5%) soft tissue injury with cervical spine fracture was seen. One case (2.9%) showed only soft tissue injury on the neck region. Chest and abdomen were injured in 38.2% cases and 32.4% showed chest injury alone. Abdominal injury alone was present in one case, that too was a transection injury. In 20 cases (58.8%) ribs were fractured. Sternum and thoracic spine were fractured in 4 (11.8%) and 8 (23.5%) cases respectively. The chest viscera were injured in 10cases (29.4%) .Lumbar spine was fractured in 2.9 % of cases.

**Conclusion:** Head injuries were common in cases with history of crossing the track. Cases with history of walking along the side of or through the train showed characteristics pattern of lacerated wound with fracture on the back of head. Transection injuries were common in cases with history of walking along the track and while crossing the track. In cases with history of crossing the track, most of the injuries were distributed on the upper part of the body. In the case where hit occurring in the upright position, lacerated wounds can be caused on the upper part of the body due to hitting against the projecting parts of train like buffer head, hand rail, or platform in front of loco engine.

## Introduction:-

### Background:-

Large number of people use some form of mass transportation systems such as trains, buses or aero planes, and accidents involving these are disastrous. Being a huge system of transportation, railway is an agent causing accidents during operations and any type of trauma may be seen in this. It traverses the length and breadth of the country covering 6909 stations over a total route length of more than 63273 km (39350 miles) through both urban and rural areas<sup>1</sup>. Railway deaths are usually because of a person trying to cross the track/collision between trains, automobile accident in unmanned crossings, passengers who hang out of doors & are hit by trees/poles or during outbreak of fire.<sup>2</sup>In the absence of case history it is difficult to distinguish between, accident/Suicidal death or criminal violence.<sup>3</sup> Railway wheel mark, dirt & grease contamination, pattern of injuries over the body deserve careful observation to rule out criminal violence.<sup>4</sup>The patterns of injuries in railway track deaths may vary according to the position of the person or the different situations when struck. The victims or their families may want to know why they were injured or killed; the regulatory authorities may wish to fix the responsibility and the safety authorities will want to see what can be done to prevent recurrence<sup>5</sup>. This study may help the forensic pathologist to a considerable extent in their proceedings in suspicious cases of railway incidences.

### Aims & Objectives:-

1. To find out the pattern of injuries among pedestrians involved in accidents while walking along the side, through or crossing the railway tracks.
2. To compare the pattern of injuries in pedestrians involved in accidents while walking along the side or through tracks with those during crossing the railway tracks.

### Materials And Methods:-

A cross sectional study of all railway track deaths brought for medicolegal autopsy at Thiruvananthapuram Medical College, Kerala, from 1<sup>st</sup> March 2010 to 28<sup>th</sup> February 2011 were analyzed. A total of 104 cases of railway track

deaths were studied excluding cases with advanced decomposition. Data regarding nature of incidents were collected from the Kerala Police Form 102 (KPF 102), investigating officers and relatives. Clinical case records were studied in treated cases. A meticulous external and internal examinations was made and the details regarding nature, dimensions and location of injury was entered in a proforma. From the history given by the informant, the victims were classified in to two groups. Group I was persons walking along the side or through the track and group II was persons crossing the railway track. The data were entered in MS Excel and statistical analysis was done.

### **Results:-**

#### **GROUP I- WALKING ALONG THE SIDE OF OR THROUGH THE TRACK**

In the study population (104 cases) 16.3% of victims were those with history of hit by train while they were walking along the side of or through the track. All the cases showed external injuries. These cases showed high rate of incidence of abrasion and lacerated wounds (TABLE 1). In all the cases there was lacerated wound on the head, and in 82.4% external injury was present on the face also. Among these, 6 cases (35.3%) showed crushed lacerated wounds on the head and face. In 14 cases (82.4%) there was skull fracture. Facial bone was fractured in 52.9% of cases and showed intracranial haemorrhages associated with skull fracture. Injury to brain was seen in 17.6% of cases. In this group only 2 (11.8%) cases showed fatal neck injury, one was a case with decapitation injury and the other showed fracture of the cervical spine with contusion of the cord. Nine cases (52.9%) showed injury to chest and 8 among them (47%) showed injury to abdomen also. Rib fractures were present in 52.9%. Associated lung injury was seen in 29.4% of cases. Thoracic spine was fractured in 23.5% of cases. Among the abdominal organs liver was the frequently affected organ. Laceration of liver was seen in 17.6% of cases. Transection had occurred in 2 cases (11.8%) at the level of abdomen with evisceration of viscera in one case. Traumatic amputation of the upper limb occurred in one case and in the lower limb the frequency was 17.6% (FIGURE 1).

#### **GROUP II- WHILE CROSSING THE RAIL TRACK**

Of the 104 cases studied 32.7% occurred while crossing the rail track. All the cases showed external injuries. Among the external injuries the most prominent group was lacerated wound (91%)(TABLE1). Head and face were injured in 31 cases (91%). In this, 9 cases (26.5%) showed fracture fragmentation of skull bone with extrusion of the brain. Skull fracture was seen in 18 cases (52.9%). Out of which, Intra cranial haemorrhage was present in 8 cases (23.5%) and another 2.9% showed isolated intra cranial haemorrhage. Brain showed injury in 9 cases (26.5%).Decapitation was seen in 6 cases (17.6%). In 7 cases (20.5%) soft tissue injury with cervical spine fracture was seen. One case (2.9%) showed only soft tissue injury on the neck region. Among the 34 cases analyzed, chest and abdomen were injured in 38.2% cases and 32.4% showed chest injury alone. Abdominal injury was present in one case, that too was a transection injury. In 20 cases (58.8%) ribs were fractured. Sternum and thoracic spine were fractured in 4 (11.8%) and 8 (23.5%) cases respectively. The chest viscera were injured in 10cases (29.4%) . The chest structure most commonly involved was rib (58.8%) and among the thoracic viscera, the organ which showed a high frequency of injury was lung (32.4%). Among the abdominal organs liver (20.5%), intestine and mesentery (14.7%), spleen (11.8%) and kidneys (8.8%) were the organs frequently injured. Liver showed the highest frequency. Lumbar spine was fractured in 2.9 % of cases. In 2 cases (5.8%) there was transection through the abdomen, with one showing extrusion of abdominal viscera. In one case there was transection through the pelvic region with missing of pelvic viscera. Excluding this case another 6 cases (17.6%) also showed pelvic bone fracture. Frequency of traumatic amputation of the limbs was higher in this group. 23.5% of cases showed amputations in the upper limbs and 5.8 % in lower limbs. In the upper limbs multiple sites were involved in 11.7 % cases and in lower limb only one case showed amputation at multiple sites. In four cases the same limb showed fracture at multiple sites and amputation

Excluding the sites of amputation, incidence of fracture was also high in this group. In 8 cases (23.5%) upper limb showed fracture at single site and in 7 cases (20.5%) at multiple sites (FIGURE 2). In lower limbs, fracture of a single bone was seen in 23.5% of cases and more than one bone is fractured in 5.8% of cases. In one case amputation of lower limb was seen on one side and fracture of limb bones on the opposite side. If the person was hit by train at the moment of entering into the track, it will cause injury to the preceding parts of the body. In 21 (61.76%) cases the injuries were concentrated on the upper parts of the body especially on the head, shoulder and upper limbs. In this group 6 cases (17.6%) showed decapitation injury.

## Discussion:-

An attempt was made to compare and correlate the pattern of injury derived by the study in accordance with the nature of incidence and the history provided by the informant.

### Cases with history of walking along the side of or through the track.

Seventeen cases (16.3%) comprise this group. Abrasions were mostly distributed in the upper limbs (88.2%) and lower limbs (70.5%). This was in agreement in study done by Ammamulla<sup>6</sup> and Pathak et al<sup>7</sup>. Lacerated wounds were seen in all cases in the head region followed by lower limbs in 64.7% of cases. The chest region was free of lacerated wounds. Contusions were also frequent on the head (35.2%). Decapitation was present only in a single case (5.8%). The type of injury which dominated was lacerated wound involving the head region. Transection injury was present in 2 cases (11.8%); one at the level of abdomen and the other at the pelvic region (5.8%) each. Traumatic amputations and fracture of limbs showed high rates of incidence. Incidence of fracture was very high when compared to the incidence of amputation.

### Cases with history of crossing the rail track:

The study populations came under this group was 32.7%. This was the largest group. All the victims gave a history of trespassing on to the Railway track. Using the railway track as a short cut to cross to the other side, to reach the other platform, to reach the railway station or to reach home is a common practice which is endangering the safety of humans and railway track. This is in agreement with the study done by Ramesh wasnik<sup>8</sup>. Laceration of head (91%) was the most frequent external injury seen among this group. In all the cases there was fracture of the skull bones as observed in other studies<sup>9,10</sup>. In 26.4% of cases there were contusions and lacerated wounds with fracture fragmentation of the skull bones and in these cases the brain was found extruded. Membrane haemorrhage was present in 26.5% of cases.

Fracture of the skull bone was seen in 14 cases (82.3%). Facial bones were fractured in 52.9% of the cases. Intracranial haemorrhages were present in 5 cases (29.4%); subarachnoid haemorrhage was present in (29.4%) of cases and subdural haemorrhage in 11.8% of cases. Brain injury was present in 17.6% of cases. In 58.8% of cases there was rib fracture which was the most commonly affected structure on the chest. There were associated injuries to other chest structures and chest viscera in 29.4 % of cases. Sternum alone was fractured in 11.8% of cases.

Transection of trunk was present in 8.8% of cases; 5.9% of cases at the level of abdomen and 2.9% cases through the pelvic region due to run over. This is in agreement with V.V pillay<sup>11</sup>. Limb fracture was common in this group which showed upper limb fracture in 48.5% cases and the lower limbs fracture in 41% cases. Amputations were also frequently seen (23.5% in upper limb and 5.8% in lower limbs at single site and 11.7% in upper limbs and 2.9% in lower limbs at multiple sites ).

## COMPARISON OF INJURY PATTERNS AMONG THE ABOVE GROUPS

The cases in these groups involved pedestrians who were hit in an upright position. Hence the injuries in these two groups should show a similar pattern. When the injury pattern of two groups were compared pedestrians with history of crossing the track showed more extensive injuries than the ones who were walking along the side or through the track (TABLE 2). In Group I, head was involved in 82.3%, upper limbs in 41% & lower limbs in 47%. In Group II, the head was involved in 91% and the upper and lower limbs showed a frequency of 47% and 32.4%. A significant difference was observed in the distribution of injuries to neck, chest and lower limbs. In Group II victims, neck was involved in 38.2% cases while in the other group it was only 5.8%. The basic reason could be the increased chance of upper part of the body which is proceeding while climbing up to the rail track to cross it. In this group the lower limbs were less involved (32.4%). There is more chance of being thrown out of the track when the train hit the upper part of the body. The study by Dr. Kishorkumar in 2005 also showed similar values<sup>12</sup>.

In the case where hit occurring in the upright position, lacerated wounds can be caused on the upper part of the body due to hitting against the projecting parts of train like buffer head, hand rail, or platform in front of loco engine. If the victim was walking through the side of the track, the hand rail may hit against the shoulder or back of head causing characteristic lacerated wounds on these parts. This is in agreement with Sahoo et al<sup>13</sup>.

The frequency of traumatic amputation of upper limbs and lower limbs in Group I was 5.8% and 17.6% respectively, while in the other group the rates were 23.5% and 5.8% respectively. This also showed a reduced involvement of the lower parts of body while crossing the track. In Group I and II, the person might have been hit in the upright

position. The chance of falling in the track and run over by the train is more. In cases where hit can occur in the upright position, lacerated wound can be caused on the upper part of the body due to hitting against the projecting parts of train like buffer head, hand rail, or platform in front of loco engine as discussed by Umadathan<sup>14</sup>.

If the train hit the person while at the middle of the track, he may get pushed down and the degree of mutilation will be high. Injuries to head and limbs followed the similar pattern as the one which is observed in cases with history of walking along the side of or through the track. While crossing the track, train is hitting usually on the side of the body and in the other case it is hitting on the back or in the front aspect. In both the cases the victim is in the upright position.

**Table 1:-** Distribution of external injuries among the pedestrians walking along the side or through the track (Group I, n=17) & crossing the track (Group II, n=34).

Injury	Groups	Head (n)	Neck (n)	Upper limbs (n)	Chest (n)	Abdomen (n)	Pelvic region (n)	Lower limbs (n)
Abrasion	Group I	8 (47.1)	1 (5.8)	12 (70.6)	11 (64.7)	10 (58.8)	4 (23.5)	15 (88.2)
	Group II	14 (41.2)	4 (11.8)	24 (70.6)	13 (38.2)	9 (26.4)	1 (2.9)	26 (76.4)
Contusion	Group I	6 (35.3)	0 (0.0)	1 (5.8)	0 (0.0)	1 (5.8)	0 (0.0)	3 (17.6)
	Group II	11 (32.4)	1 (2.9)	2 (5.8)	2 (5.8)	2 (5.8)	0 (0.0)	1 (2.9)
Abraded contusion	Group I	0 (0.0)	1 (5.8)	1 (5.8)	1 (5.8)	0 (0.0)	0 (0.0)	0 (0.0)
	Group II	2 (5.8)	1 (2.9)	5 (14.7)	2 (5.8)	2 (5.8)	1 (2.9)	1 (2.9)
Lacerated wound	Group I	17 (100.0)	1 (5.8)	9 (52.9)	0 (0.0)	4 (23.5)	4 (23.5)	11 (64.7)

**Table 2:-** Distribution of pedestrians with injury according to body part affected and in different railway injury groups (Groups I and II)

Group (N=51)	Head n(%)	Neck n(%)	Chest n(%)	Abdomen n(%)	Upper limb n(%)	Lower limb n(%)
Group I (n=17)	14 (82.3)	2 (11.8)	9 (52.9)	8 (47.0)	7 (41.0)	8 (47.0)
Group II (n=34)	31 (91.0)	13 (38.2)	24 (70.5)	14 (41.0)	18 (52.9)	11 (32.4)

**Figure 1:-** Level of amputations among pedestrians with railway injuries

*\*pedestrians walking along the side or through the track (Group I) & crossing the track (Group II).*

**Figure 2: - Level of fractures in pedestrians with railway injuries****Conclusion:-**

High frequency of head injury was seen in cases with history of crossing the track (91%). Cases with history of walking along the side of or through the train showed characteristics pattern of lacerated wound with fracture on the back of head. Transection injuries were common in cases with history of walking along the track and while crossing the track. In cases with history of crossing the track, injury to lower limbs were less. Most of the injuries were distributed on the upper part of the body. In the case where hit occurring in the upright position, lacerated wounds can be caused on the upper part of the body due to hitting against the projecting parts of train like buffer head, hand rail, or platform in front of loco engine. To conclude, the causation of majority of instances of railway track deaths are due to adult male trespassers who take short cut routes by walking along the railway tracks to reach their destinations and crossing the track carelessly.

**Acknowledgements:-**

We extend our sincere gratitude to Dr. P. Rema (Professor & Head of The Department of Forensic Medicine, Trivandrum) and all other teachers & faculties of Trivandrum medical college for the guidance, valuable and inspiring sense of communications and interactions in this study.

#### Abstract

Teratomas are tumors consisting of tissues derived from all three germ cell layers: endoderm, mesoderm, and ectoderm, in different proportions. There are often solid and cystic components to the mass. If the neoplastic tissue is uniformly mature, the tumor is termed Mature teratoma. The presence of any immature tissue with an embryonal appearance warrants a designation of immature teratoma. Cervical teratomas are rare, found once in every 20,000 births. They can block the baby's esophagus and affect the baby's ability to swallow amniotic fluid. This can lead to an increase in the fluid level around the baby (polyhydramnios). Increased fluid can lead to preterm labor. Cervical teratomas have increased blood flow which can result in fetal heart failure (hydrops). The cervical teratoma is a rare entity. Its prognosis mostly depends on the risk of neonatal respiratory distress, its extension and potential malignancy. Surgical management must be as complete as possible to avoid recurrences and malignant transformation. We present a case of a cervicofacial teratoma in an infant with total excision and cure.

#### Introduction:-

A twenty five days old male child weighing 2.54 kgs, admitted with cystic swelling at the left side of neck as well as face. CBC shows neutrophilic leucocytosis, CRP level raised -29.19mg/dl. AFP levels is more than 400 IU/ml. Provisional diagnosis was made either Lymphangioma or Dermoid cyst. Although the patient remained asymptomatic except slight dyspnea. In my case the patient belongs to low socioeconomic category from a remote area so antenatal ultrasound was not done thereby detected at birth only. On local examination, there was a solitary left neck mass which was irregular, of size about 10 x 7cm<sup>2</sup>, soft cystic to firm consistency, nontender, local temperature not raised, visible veins present, overlying skin is smooth and more firm on lower part of the swelling. MRI showed a 11x8x4 cm<sup>3</sup> mass, with solid and cystic components with contralateral airway displacement. CT scan revealed tumoral calcifications. The infant underwent surgical excision and the specimen was sent for histopathological examination. The infant was discharged without any particular complaints. Gross examination shows a greyish white cystic structure measuring 10x7x3cm<sup>2</sup>, outer surface is partly nodular with hard consistency. Microscopy shows predominantly solid with areas of cystic changes. Multiple sections studied from tumor showed mature as well as immature elements derived from all 3 germ layers. Mature elements comprised of

Address:- Consultant Histopathologist, G.R.M.I., Rajasthan Hospital, Ahmedabad, Gujarat.

glands, mature cartilage, and neural tissue and foci of calcification. Immature elements included neuroepithelial elements, neuroectodermal rosettes, and immature cartilage. Final diagnosis was immature cervical teratoma with no evidence of malignancy.

### Discussion:-

Cervical teratomas are rare neoplasms found once in every 20,000 births. Teratomas are the most common congenital tumor<sup>1-3,11</sup>. The most common location of teratomas is sacrococcygeal followed by intracranial. 5% of fetal teratomas are located in the cervical region<sup>7,12</sup>. Fetal teratomas consist of ectodermal, endodermal and mesodermal germ-cell tissue including neuroepithelial tissue. Mature and immature teratomas are distinguished by the degree of differentiation of the tissue. The differential diagnosis of fetal cervical teratoma includes cystic hygroma, lymphangioma, hemangioma, cervical meningocele, thyroglossal duct cyst, esophageal diverticula, dermoid cyst, brachial cleft cyst, epignathus and congenital goiter<sup>13</sup>. Usually a teratoma is often a non-threatening mass; however, the malignant transformation of fetal cervical teratomas has been reported. Ultrasound diagnosis is done in early pregnancy which help in planning the surgery thereby preventing complications. The sonographic findings of cervical teratomas typically include solid and cystic structures within a heterogeneous mass. In up to 50% of cases calcifications might be seen within the mass while cartilage or bone tissue is less common<sup>14</sup>. The extent of vascularization can be assessed by Doppler flow imaging. Magnetic resonance imaging has also been described as providing essential information about the localization and diagnosis of giant fetal neck masses. MRI showed a 11x8x4 cm mass, with solid and cystic components with contralateral airway displacement. The tumor was capsulated and not infiltrating the surrounding tissues. It was completely excised. At birth, patient was stable with slight dyspnoea. The alpha fetoprotein (AFP) level was elevated at 400 IU/ml. Immature cells produce a protein called alpha-fetoprotein (AFP) which can be monitored with a blood test. AFP levels in the blood are used as a screening tool to check for tumor regrowth, in addition to regular check-ups and imaging. CBC shows neutrophilic leucocytosis, CRP level raised -29.19mg/dl. Pathological examination revealed an immature teratoma, which consisted of a mixture of tissue such as embryonic cartilage, immature mesenchymal substrate, endodermal glands, respiratory epithelial and immature neuroepithelial tissue with necrosis. A teratoma with immature cells presents a small risk of recurrence.

### Conclusion:-

Cervical teratomas are rare entity mostly presenting at birth. antenatal diagnosis can be done with the help of ultrasound, MRI, CT scan and AFP levels. Although they are benign but in some cases malignant transformation can occur. Airway obstruction and esophageal compression can occur. Complete surgical excision is done to cure the patient.

Nasal Cavity, Angioleiomyoma.

#### Abstract

**ABSTRACT:** Angioleiomyoma is a benign tumor arising from the vascular smooth muscle (tunica media) and presents commonly between third and fifth decades of life. Although there are sporadic reports about this tumor in the literature, none describes all the information in detail. It is an extremely rare benign tumor. Since the first case reported by Maesaka et al in 1966, only 30 cases of angioleiomyoma of the nasal cavity have been published in English literature. Angioleiomyoma presents as a painful mass in approximately 60% of the cases. Pre-operative diagnosis is difficult, but with a high index of suspicion and awareness, it is possible. The use of ultrasound and magnetic resonance imaging should be considered. It causes minimal morbidity and excision is usually curative. Histological examination using smooth muscle Actin stain portrays the smooth muscle bundles clearly. We report here a case of angioleiomyoma of nasal cavity in a 33 years old female presented with a mass in Rt. Nasal cavity, manifested mainly with nasal obstruction.

#### Introduction:-

**OBJECTIVE:** To describe rare benign nasal lesion like Angioleiomyoma that present as a nasal mass and can be cured by simple surgical excision. Angioleiomyoma is uncommon benign tumor of the nasal cavity and are relatively rare. Reporting and assisting the systematization of more accurate diagnostic methods in clinical and complementary investigation of vascular leiomyoma in the nasal cavity. It is extremely rare tumor of nasal cavity that represents less than 1% of all vascular leiomyomas. It is more prevalent in women between the fourth and sixth decades, reaching primarily the inferior nasal turbinates.

It is composed of smooth muscle cells with a variable amount of fibrous stroma in the vascular wall or by remnants of embryonic tissue, commonly found in the uterus (95%), skin (3%) and gastrointestinal tract (1.5%)<sup>1,2</sup>

Less than 1% of all vascular leiomyomas occur in the nasal cavity<sup>3,4</sup> Hachisuga et al describe only 48 cases (8%) of angioleiomyoma in the head & neck in a study with 562 cases. Only 5 of the 48 cases were located in the nasal cavity, accounting for 1% of all angioleiomyomas.<sup>5</sup>

Leiomyoma has many variants. They are classified in three groups: leiomyoma, angioleiomyoma and epithelioid leiomyoma.<sup>6</sup> Angioleiomyoma or vascular leiomyoma accounts for approximately 4% of benign soft tissue tumors.

**Corresponding Author:- Mustafa Jamal Al Khanani.**

Address:-Department of Head and Neck surgery, King Saud Medical City, Riyadh, KSA.

Most angioleiomyomas occur in the extremities, especially the lower extremity, and other sites include the head & the trunk.<sup>7</sup> The tumors are usually located in the subcutis and less often in the deep dermis.

Maesaka et al reported the first case of angioleiomyoma in the nasal cavity in 1966.<sup>8</sup> Only 30 cases have been documented in English literature. Forty nine additional cases have been reported in the Japanese literature.<sup>9</sup>

The origin of angioleiomyoma of the nasal cavity is uncertain, partly due to the scarcity of smooth muscle in the nasal cavity. Three hypotheses have been proposed for the origin of smooth muscle tumors in the nasal cavity: from aberrant undifferentiated mesenchymal cells; from elements of smooth muscle in the walls of blood vessels and of pilorector muscles; or from both previous hypotheses, simultaneously.<sup>2, 10-13</sup> Some articles indicate that sexual hormones and Epstein- Barr virus infection can affect the genesis of nasal angioleiomyoma.<sup>3,14</sup>

The literature shows a prevalence of angioleiomyomas of the nasal cavity in female patients (in a 2:1 ratio between females and males) between the fourth and sixth decades of life, and affecting mainly the inferior nasal conchae.<sup>9,11</sup> These angioleiomyomas develop in the mucosa of the nasal cavity as single solid small cutaneous masses. They can be painful or not and can expand.<sup>4, 14</sup> They usually manifest as epistaxis and with nasal obstruction.<sup>11</sup>

Computed tomography (CT) and magnetic resonance do not conclude the diagnosis. Cytologic examination does not provide a conclusive diagnosis. Surgical excision with histologic examination is the only way to make a definite diagnosis.<sup>4</sup> In addition to that, conventional light microscopy studies for the identification of angioleiomyoma after staining with hematoxylin- eosin can be performed using special staining, such as Masson trichrome stain, or immunohistochemical markers such as smooth muscle actin, desmin, myoglobin, S-100 protein, and vimentin. The absence of atypias is the most important histologic indication of benignity. The treatment of choice is total excision of the lesion.<sup>2,10, 12-15</sup> Recurrence is extremely rare after total excision.

### Case report:-

A 33 years old female admitted in the ENT Department of KingSaud Medical City with complaints of nasal obstruction and episodes of small volume epistaxis. The patient's medical and family histories were unremarkable. Physical examination and nasal endoscopy, showed the presence of a reddish mass which occupied the whole rt. nasal cavity and preventing the progression of the nasofibroscope. CT scan showed a lobulated enhancing soft

Fig:1 CT scan showing mass involving Rt. nasal cavity

tissue mass in Rt. nasal cavity extending upward to involve the posterior ethmoid sinus (Fig 1). No intracranial extension of the lesion seen and no bony defect seen in the skull base. The patient underwent surgical excision of the mass. Grossly, the excised specimen measured 3x3x1 cm and was soft. On microscopic examination the tumor (Fig: 2 A, B, C) demonstrated a proliferation of thick walled blood vessels admixed with a monomorphic spindle cell population without necrosis, vessels & admixed spindle cells ( intermediate magnification) pleomorphism or increase in mitosis. This spindle cell proliferation stained positive for Vimentin and h- Caldesmon and smooth muscle actin (SMA) immunostain. Postoperatively, the surgical wound healed well with normal scarring.

### Discussion:-

Angioleiomyoma is a rare, benign, smooth muscle tumor arising from the tunica media of veins and is seldom diagnosed before surgery. Angioleiomyoma can be found throughout the body but occurs most frequently in the lower extremities.<sup>5, 16-20</sup> It commonly arises in the dermis or subcutaneous tissue.<sup>17</sup> A majority of these tumors are quite small, generally less than 2 cm in diameter.<sup>16-19</sup> Nasal cavity angioleiomyomas are extremely rare. The paucity of smooth muscle in the nasal cavity might explain why the tumors were rare. It is rarely included in the differential histopathologic diagnosis.<sup>4</sup> Other tumors of the nasal cavity are: nasal angiofibroma, inverted papilloma, malignant lymphoma, fibromyoma, leiomyoblastoma, hemangiopericytoma, angiosarcoma, angiomyolipoma, and vascular leiomyosarcoma.<sup>12</sup> The most affected nasal sites are the nasal septum, the inferior turbinate and the vestibule. The other sites are superior and middle turbinate. The most common symptoms are nasal obstruction associated frequently with epistaxis. The other symptoms are headache and facial pain.

Radiologically, the images are not specific,<sup>11</sup> but CT and MRI could provide the information about the extent of the lesion. It usually presents, macroscopically, as a solitary, well circumscribed or lobulated mass ranging from 5 to 20mm. Microscopically, angioleiomyoma is separated into three subtypes: solid, venous and cavernous. It is characteristically composed of smooth muscle cells which are mature and well differentiated and numerous walled vessels. Mitotic figures are usually absent or very rare.

Most angioleiomyoma was diagnosed by microscopy with conventional Hematoxylin and Eosin staining. Differential diagnosis arise rarely with other spindle cell tumors such as angiofibroma, fibroma angiomyolipoma and angiosarcoma. Immunohistochemical examination can be helpful in these cases.

The etiology of sinonasal angioleiomyoma remains uncertain. Nasal cavity contains smooth muscle tissue in the walls of blood vessels and in the hair erecting muscles of the anterior vestibule.<sup>11</sup> The advanced theories of this neoplasm are that the tumor cells derive from the wall of vessels, from the hair erecting muscles or from some aberrant undifferentiated mesenchyma. Some authors documented case of a nasal leiomyoma and angioleiomyoma which express progesterone receptor.<sup>2, 22</sup> They suggest that the growth of this tumor may be hormone dependent.

The treatment of choice is local surgical excision.<sup>2</sup> No recurrences were reported in follow up studies of nasal cavity angioleiomyoma.

### Conclusion:-

Angioleiomyoma of the nasal cavity is a rare benign tumor that is difficult to diagnose clinically and requires a detailed and invasive investigations. The complementary tests should guide the diagnostic reasoning; however, we concluded that it is essential to perform postoperative histopathological study to make a definite diagnosis of angioleiomyoma of the nasal cavity.

##### Key words:-

sex workers – behaviour – HIV/AIDS – prevention.

#### Abstract

**Background:** Various strategies and policies have been implemented in order to prevent the transmission of HIV infections. However, the prevention programs are associated with a number of issues and challenges in each country as well. Most of new HIV infections occur through sexual contacts and most of them are commercial sex workers who are a challenging and hard-to-reach population. Therefore, ideas in HIV/AIDS prevention programs, particularly for sex worker groups, should be well-arranged continuously.

**Methods:** Electronic journals and reports were accessed by using Cochrane, BioMed, DOAJ, Proquest, PubMed, Bioline, Taylor & Francis, Google, and Google Scholar. The search strategy was limited to English and published year from the last ten years with the keywords of HIV/AIDS, cognitive-attitude-practice, sex workers, and prevention. The literature review generated 28 articles, with 19 studies meeting the inclusion criteria.

**Results:** Generally, financial need is the reason for initiating and maintaining sex work. Most of sex workers knew and were aware of HIV/AIDS, but their needs did not allow any fear and health consciousness, also they did not see any other options outside sex work. Unfortunately, many sex workers reported the inconsistency of condom use.

**Conclusion:** Social, psychological, and environmental-structural factors, such as supports from the establishment owner (employers), manager trainings, peer influences, accessibility of condoms, promotion of condom use, knowledge about condom use, and supports from community health care providers are very necessary to be increased.

*Copy Right, IJAR, 2016,. All rights reserved.*

#### Background:-

Based on the report from The Joint United Nations Program on HIV and AIDS (UNAIDS), the total number of new HIV cases is gradually declining by more than 50% in 26 countries between 2001 and 2012, and between 25% and 49% in an additional 17 countries (UNAIDS, 2013), with the annual AIDS-related deaths have decreased in 2016 by 43%. These numbers have shown an important progress of the HIV/AIDS prevention as the HIV/AIDS pandemic has become the most challenging health and social problems worldwide since first time discovered in 1983 (The U.S. Department of Health & Human Services, 2006). Various strategies and policies have been implemented in order to

prevent the transmission of HIV infections. Comprehensive and continuous approaches are needed as HIV/AIDS contributed to 1.6 million of death in the world in 2012(UNAIDS, 2013) and 2.1 million new HIV infections reported by UNAIDS in 2015.

Over 75% of new HIV infections occur through sexual contacts (WHO, 2013) and most of them are commercial sex workers who are a challenging and hard-to-reach population(OHTN, 2012). Sex workers and their clients are at the highest risk for HIV/AIDS(Giri, Hiremath, & Kasbe, 2012) as they have high risk sex or sex with high risk partners, illicit drug use, unstable living and working environments, young age, tattooing or body piercing, and a history of sexual abuse which are the most potential HIV transmission(OHTN, 2012). Each country has been implementing various methods to increase the sex workers knowledge and motivation in HIV/AIDS preventions. However, based on the fact that the prevalence of HIV/AIDS among sex workers estimates higher than the general population (Chipamaunga, Muula, & Mataya, 2010), more effective programs should be identified and implemented. Decisions about further programs should be based on best available information (Pattanaphesaj & Teerawattananon, 2010). Therefore, this paper will try to analyze and discuss knowledge, behavior, perception, attitude, and practice of female sex workers towards HIV/AIDS in several countries, in order to find out some new ideas about HIV/AIDS prevention programs particularly for sex worker groups.

### **Methods:-**

Electronic journals and reports were accessed by using Cochrane, BioMed, DOAJ, Proquest, PubMed, Bioline, Taylor & Francis, Google, and Google Scholar. The search strategy was limited to English and published year from the last ten years with the keywords of HIV/AIDS, cognitive-attitude-practice, sex workers, and prevention. The literature review generated 28 articles, with 19 studies meeting the inclusion criteria. The aim of this process is to gather information about knowledge, behavior, perception, attitude, and practice of female sex workers towards HIV/AIDS in several countries, particularly in Asia. Purposefully, new programs which are more effective and efficient to prevent HIV transmission among sex workers could be developed based on the literature review and research that will be done in the nearest future.

### **Findings and Discussions:-**

#### **1. Become a sex worker:-**

The most effective method to prevent HIV transmission among sex workers is by stop the sex work. However, a research reported that sex work could give them more money and pleasure, also because they did not regard life outside sex work as a viable option (Chipamaunga et al., 2010). Generally, studies found that financial need is the reason for initiating and maintaining sex work, because in some countries most of sex workers were from poor socio-economic status and broken family (Giri et al., 2012). Other factors such as lack of education, poverty, domestic violence, marital breakup, family responsibility, lack of support by family members, harassment, and abuse in society and in workplace are the main reasons for women coming to this profession as well(Charles et al., 2013).

#### **2. Knowledge of HIV/AIDS:-**

In many discussions about knowledge, attitude, and practice model, knowledge has been known as a prerequisite for the intentional performance of health-related behavior(Chipamaunga et al., 2010). Individual perception of susceptibility to HIV/AIDS and benefits of condom use are important factors in determining condom use and cognitive information through health education is an effective promotion (Ye et al., 2012). Most of sex workers knew and were aware of HIV/AIDS and the common source of information about HIV/AIDS was from television (Giri et al., 2012) and doctors (Lau, Tsui, Siah, & Zhang, 2010). However, studies found that knowledge is not always directly associated with behavior change (Pattanaphesaj & Teerawattananon, 2010).

A study in Durban shows that 100% female sex workers knew of HIV/AIDS and aware that HIV/AIDS is a major health concern in South Africa, but their work did not allow a situation of fear, too much health consciousness, and HIV awareness has only little impact on choice of either client or personal partners (Varga, 2010). Denial is the most common response of sex workers towards HIV transmission. They believed that they could not easily get HIV in the future because they use condoms with “most” clients (Varga, 2010). Other sex workers used fatality (prioritize life concern and justify lack of any active effort to protect themselves from HIV infection), economic rationalization, partner categorization through selective condom use (love or

unknown clients), purposeful ignorance of HIV status, and abnegation of responsibility (too weak to control clients who are disagree using condoms) as their coping mechanism towards HIV transmission risk (Varga, 2010).

### 3. Sexual Risk Behavior:-

From several researches, condoms use, street outreach programs, programs for the prevention of mother-to-child HIV transmission, circumcision, and needle and syringe programs were the only interventions with strong evidence of reducing HIV infection (Pattanaphesaj & Teerawattananon, 2010). Voluntary HIV counselling and testing, peer education, and male and female condom use have been proved to be effective and cost-effective for female sex workers (Pattanaphesaj & Teerawattananon, 2010). From those interventions, condoms are believed as the most effective prevention for HIV transmission because consistent condom use results in 80% reduction in the spread of the disease (Giri et al., 2012).

Because there is no cure or vaccine, HIV prevention depends on the ability to modify risky behaviors, consistent, and appropriate condom use (Morisky, Stein, Chiao, Ksobiech, & Malow, 2006). Unfortunately, many sex workers reported the inconsistency of condom use. Various factors such as situational factors (including female condom availability) the type of client, desire for sexual pleasure, and financial considerations could affect the decision whether condoms were used or not (Chipamaunga et al., 2010). In China, the primary reason for not using condoms during sexual contact was the clients' refusal to use condoms (Lau et al., 2010). Moreover, one study found that 61% of Haitian women felt that the decision on condom use was exclusively the male's right (Couture, Soto, Akom, Joseph, & Zunzunegui, 2010). Most of them are generally poor and with dependent family members and there have little power to negotiate use of condom. Other interesting fact is that about 10% of the total respondents in a study in China thought that condoms could be used repeatedly and no expiration date (Lau et al., 2010).

Varga(2010) found that 67.3% of sex worker respondents in a study in Durban would forego condoms for extra payment, while the average of condom utilization among female sex workers in Thailand was only 51% (Buckingham, Moraros, Bird, Meister, & Webb, 2007). In Thailand, factors contributed to the use of condoms are ethnicity of patron (western have willingness to utilize condoms than foreign Asian or native Thai patrons) and bargaining capacity with potential patrons (Buckingham et al., 2007). Similar report from Ye et al. (2012) stated that sex workers capability to negotiate safe commercial sex takes a part to persuade clients into using condoms consistently during sexual intercourse. Interestingly, although sex workers are able to be convinced to use condoms with clients, it was more difficult for sex workers in Shanghai to initiate condom usage with non-paying partners (Cai et al., 2010). It based on their boyfriend/husband/partner's perception that their partners were not having unprotected sex with anyone else.

### 4. Prevention Programs:-

Due to the inconsistency condom use by sex workers, it is very important to identify factors that could motivate and influence the sex workers' decision on condom use. Approximately 13% of respondents in a study in China reported that it was difficult to get condoms when needed particularly for younger, 59,3% said that pharmacy shops were the most convenient place to buy a condom and 7,9% stated that they did not know how to use a condom (Lau et al., 2010). Condom availability may not be a major factor affecting condom use, as a research in China with 504 respondents investigated that social, psychological, and environmental-structural factors are very important in determining consistency condom use among female sex workers and their clients (Ye et al., 2012). Therefore, supports from the establishment owner (employers), accessibility of condoms, supports from community health care providers are very necessary(Morisky et al., 2006; Ye et al., 2012). Besides that, the peer influences, promotion of condom use and knowledge about condom use must be an important component of future prevention programs(Lau et al., 2010; Morisky et al., 2006).

In the Philippines, one of the most useful program in order to prevent HIV prevention is the manager training intervention. The training series consist of regular meeting, monitoring, providing educational materials on HIV/AIDS, and making condom available (Morisky et al., 2006). Besides that, the training also encourages the manager to provide positive reinforcement of their employees' healthy sexual practices.

### Conclusion and Recommendations:-

For some groups of population, become a sex worker is "the only option". Social-economic status and family background are the most reason for this decision. Therefore, they did not see other way for live although based on the studies from some countries, almost all female sex workers knew and were aware the risk of HIV transmission.

Unfortunately, sex workers decisions to use HIV prevention methods are often difficult when it depends on their customer as well. Various programs to increase the motivation of female sex workers to prevent HIV transmission, including the problem of the inconsistency of condoms use should be developed. Interventions should also include social, psychological, and environmental-structural factors, such as supports from the establishment owner (employers), manager trainings, peer influences, accessibility of condoms, promotion of condom use, knowledge about condom use, and supports from community health care providers.

#### Abstract

**Aim:** to identify the effect of hepatitis C virus treatment by pegylated interferon and ribavirin on the level of angiogenic factor (Angiopoietin -2 and its receptor Tie-2) and detection of their levels as a predictor of response to treatment.

**Methods:** one hundred and sixteen patients with chronic hepatitis C, who were candidate for interferon and ribavirin combination therapy according to the Egyptian Ministry of Health Program, enrolled in this study where the levels of Angiopoietin -2 and its receptor Tie-2 were determined before and after the combination therapy.

**Results:** There was a significant decline of serum Ang-2 after the end of treatment, week 48 ( $330.8 \pm 73.0$ ) compared to the baseline values ( $544.7 \pm 64.1$ ) in all patients ( $P < 0.01$ ), while There was a significant increase of serum sTie-2 after the end of treatment, week 48 ( $31.2 \pm 1.04$ ) compared to the baseline values ( $17.7 \pm 2.1$ ) in all patients ( $P < 0.01$ ). However there was no difference between responders ( $212.5 \pm 87.1$ ) and non-responders ( $228.3 \pm 22.9$ ) at week 48 regarding serum Ang-2, and also there was no difference between responders ( $13.4 \pm 2.4$ ) and non-responders ( $14.22 \pm 2.39$ ) at week 48 regarding serum Tie-2 ( $P < 0.01$ ).

**Conclusion:** Angiopoietin -2 and its receptor Tie-2 may not be a useful predictors for treatment responses to pegylated interferon and ribavirin.

#### Introduction:-

About 3% of the world's population is infected with HCV, mostly found in the developing countries, while the prevalence ranging from 0.1–5% in different European countries<sup>(1)</sup>. Egypt has the largest epidemic of hepatitis C virus (HCV) in the world; the released Egyptian Demographic Health Survey [EDHS] tested a representative sample of the entire country for HCV antibody where over 11,000 individuals were tested, the sample included both urban and rural populations and included all 27 governorates of Egypt, The overall prevalence positive for antibody to HCV was 14.7%<sup>(2)</sup>. Unfortunately, most of the patients with HCV infection will progress to chronic liver diseases

(CLDs), liver cirrhosis and a respectable significant ratio will have hepatocellular carcinoma (HCC)<sup>(3-4)</sup>. Several mechanisms were identified in the pathogenesis of CLDs, the formation of new blood vessels is a key mechanism, where neovascularization and establishment of an abnormal angioarchitecture are related to its pathological progression<sup>(5)</sup>; moreover, the pathophysiology of portal hypertension is linked to an increased hepatic and splanchnic neovascularization<sup>(6)</sup>, nevertheless, angiogenesis is a pivotal factor in the pathophysiology of HCC<sup>(7)</sup>. As suggested by Yoshiji et al., 2003<sup>(8)</sup>, the close relationship between the progression of CLDs and angiogenesis brings about two potential clinical goals, first the detection of selected pro-angiogenic molecules that may serve as a non-invasive way to monitor both disease progression, as well as therapeutic response; second, anti-angiogenic therapy may be an effective tool for blocking or slowing down fibrogenic progression of CLDs. Although the recent advances in treatment of HCV, interferon and ribavirin combination therapy still the essential therapy in Egypt due to various reasons. The high prevalence of HCV in Egypt, progression of the disease to chronicity and liver cirrhosis which may be complicated by hepatocellular carcinoma, and the role of angiogenesis factors in the pathogenesis, motivated us to study the effect of Interferon/Ribavirin therapy on angiogenesis marker (Angiopoietin-2 and its receptor TIE-2) in chronic hepatitis C patients, and if we can use its pre-treatment level as a predictor of response to therapy or not?

### **Aim of the work:-**

The aim of this work was to identify the effect of hepatitis C virus treatment by pegylated interferon and ribavirin on the level of angiogenic factor (Angiopoietin -2 and its receptor Tie-2) and detection of their levels as a predictor of response to treatment if any.

### **Subjects and Methods:-**

A prospective study was conducted among one hundred and sixteen (116) patients at the center for treatment of viral hepatitis in Ismailia fever Hospital, Egypt, in the period from November, 2011 to December, 2013. All the patients have chronic liver disease due to HCV infection, and were candidate for interferon and ribavirin combination therapy according to the Egyptian Ministry of Health Program. Besides, the known exclusion criteria for the drugs contraindications and hypersensitivity, patients with co-infection with hepatitis B virus or other causes for CLDs, were excluded based on the laboratory data and liver biopsy. Pre-enrollment data included complete medical history, thorough clinical examination, abdominal ultrasound (CT if needed), ECG, fundus examination, and laboratory investigations including liver function tests, CBC, coagulation profile, Blood Chemistry, thyroid function, Viral markers, Auto-antibodies and liver biopsy. Finally, Serum Angiopoietin-2 (Ang-2) and Serum solubleTie-2 were determined by ELISA (Quantikine, R&D Systems, UK) before and after combination therapy. Then the patients were divided into 2 equal groups; 58 each according to type of peg-interferon given to each group. According to the national committee of viral hepatitis treatment, the patients received either Peg-interferon alfa 2a (pegferon 180µg) as a fixed dosage (manufactured by Memphis farm - Egypt) (Zeuzem et al., 2003)<sup>(9)</sup>, or Peg-interferon alfa 2b (pegintron 100, 120 and 150 µg) by a dose of 1.5µg/kg body weight (manufactured by Schering Corp., a subsidiary of Merck & Co., Inc.), plus a Dose of ribavirin (600 -1200 mg), as a weight adjusted dosage, given orally each day in two divided doses with food<sup>(10)</sup> (manufactured by Sigma Pharm industries –Egypt /S.A.E. and Schering CO. /U.S.A.). All patients included in this study were submitted to follow up records at 12th weeks included: CBC with reticulocyte count- Liver enzymes (ALT/AST) - Bilirubin total and direct - Serum creatinine - HCV RNA PCR [for early viral response (EVR)]. Finally follow up records at 48th week included: Serum Angiopoietin-2 and serum-CBC with reticulocyte count- ALT and AST- Bilirubin total and direct - Serum creatinine - HCV RNA PCR [end of treatment response (ETR)].

### **Data analysis:-**

Gathered data was processed using Statistical Package of Social Sciences version 10 (SPSS version 10 Inc., Chicago, IL, USA). Quantitative data was expressed as median or means  $\pm$  standard deviation (SD) as appropriate. Qualitative data was expressed as frequency (numbers) and percentages. The results for all categorical variables were given in the form of rates (%). Student t test was used to test significance of difference for quantitative variables that follow normal distribution. Chi Squares and Fishers Exact tests were used to test significance of difference for qualitative variables. The independent data of the study was conducted and analyzed. Definitive statistics was used for the analysis of the socio-demographic and other variables. Firstly, the relation between the dependent and independent variables was studied using the Chi-square test and the t-test. Second, the significant variables were subjected to multivariate logistic regression analysis.

## Results:-

In this study, (116) hepatitis C patients were involved, where all of them received interferon and ribavirin therapy at the center of viral hepatitis treatment at Ismailia fever hospital, Their age ranged between 23 and 57 years (mean =  $42.5 \pm 8.2$ ), the majority (51.7%) were at age group from 40 to 50 year, and regarding their gender, 80 patients were males (69%) and 36 patients were females (31%). **Table (1)** shows the distribution of the patients according to response to treatment at week 12 {Early Virological Response (EVR)}, and week 48 {End of Treatment Response (ETR)}. Of the 116 patients included in the study, 99 patients (85.3%) had EVR where they completed the course to week 48 and 90 of them (90.9%) had ETR while 9 patients relapsed; so Sustained Virological Response (SVR) was obtained in 81 out of the 116 patients (69.8%). **Table (2)** shows the effect of combination therapy IFN/RBV on the serum level of Ang-2. There is a significant decline of serum Ang-2 after the end of treatment, week 48 ( $330.8 \pm 73.0$ ) compared to the baseline values ( $544.7 \pm 64.1$ ) in all patients whether had end of treatment response (ETR) or those who had no ETR ( $P < 0.01$ ). **Table (3)** shows the effect of combination therapy IFN/RBV on serum sTie-2 ( $n=99$ ). There is a significant increase of serum sTie-2 after the end of treatment, week 48 ( $31.2 \pm 1.04$ ) compared to the baseline values ( $17.7 \pm 2.1$ ) in all patients whether had end of treatment response (ETR) or those who had no ETR ( $P < 0.01$ ). **Table (4)** shows a comparison between the mean pre-post changes ( $\Delta$ ) in Angiopoietin-2 & Tie-2 between responders & non-responders at week 48. There is no difference between responders ( $212.5 \pm 87.1$ ) and non-responders ( $228.3 \pm 22.9$ ) at week 48 regarding serum Ang-2 and also there is no difference between responders ( $13.4 \pm 2.4$ ) and non-responders ( $14.22 \pm 2.39$ ) at week 48 regarding serum Tie-2 ( $P < 0.01$ ). **Table (5)** shows the Correlation between Biopsy findings and baseline Angiopoietin-2 & Tie-2. There was a significant correlation between baseline sTie-2 and grade of inflammation (0.242) ( $P < 0.01$ ). There was no correlation between baseline level of Ang-2 or sTie-2 and stage of fibrosis, Spearman's Rank Correlation Coefficient (-0.020) and (-0.056) respectively ( $P < 0.01$ ). There was no correlation between baseline level of Ang-2 and grade of Inflammation, Spearman's Rank Correlation Coefficient (-0.061) and (-0.242) respectively ( $P < 0.01$ ). **Table (6)** shows the correlation between Lab. & clinical findings and baseline Angiopoietin-2 & its receptor TIE-2. There was a positive correlation between age and serum level of Tie-2 by 0.199 ( $p < 0.05$ ) that means that with increasing age there was an elevation of the serum level of Tie-2. Also, there was a negative correlation between white blood cell count and serum Ang-2 by 0.233 ( $p < 0.05$ ).

## Discussion:-

Our prospective study was performed on the data collected from 116 patients with chronic HCV infection who were candidate for combination therapy in the center for treatment of viral hepatitis in Ismailia Fever Hospital, Egypt. The primary objectives of this study were to identify the effect of pegylated interferon and ribavirin therapy on the level of angiopoietin-2 and its receptor Tie-2 and to correlate the level of angiogenic factor angiopoietin-2 and its receptor Tie-2 with end of treatment response in chronic hepatitis C patients under combination therapy interferon/ribavirin. We have to admit that Information on the pathophysiological role of the Ang/Tie-2 system in chronic inflammatory liver disease is rather scarce. Most of our knowledge gained by oncology studies, such as in hepatocellular carcinoma, in which the fundamental pathophysiological role played by angiogenesis has been well established<sup>(11)</sup>, but generally speaking Ang-2 promotes a rapid increase in capillary diameter, remodeling of the basal lamina and vessel growth by facilitating sprouting<sup>(12)</sup>, while the soluble form of the Tie-2 receptor functions as a natural inhibitor of Ang-2, and is therefore antiangiogenic<sup>(13)</sup>. The mean age of our patients was  $42.5 \pm 8.2$  years with a range of 23 – 57 years, where the frequency of male patients was higher than female patients (69% versus 31%, respectively); This comes in agreement with Several previous researches, which indicated a greater proportion of males are infected versus females<sup>(14-16)</sup>. In our study, there was a baseline elevated level of serum Angiopoietin-2 (Ang-2) in all patients ( $544.7 \pm 64.1$  in patients who achieved EVR, and  $553.9 \pm 24.9$  in those who didn't achieve EVR at 12 weeks of therapy). Similarly, Salcedo et al. (2005)<sup>(17)</sup> found that the serum level of Ang-2 is a significantly higher in chronic hepatitis C (CHC) group compared to a control group, which indicated that Ang-2 may be more relevant to the pathophysiology of the disease; also in another study<sup>(18)</sup> it was reported that the mean levels of sAng-2 were significantly elevated in HCV, HBV and HCC patients when compared to that in the healthy control subjects. Regarding the response to the combination therapy with interferon and ribavirin in our study, there was a marked reduction in the serum marker Ang-2 before and after therapy at week 48 ( $545.1 \pm 66.8$  and  $332.6 \pm 75.7$ ) respectively; more interestingly, the same reduction was observed also between patients who achieved ETR and those who didn't achieve it ( $540.7 \pm 26.1$  and  $312.3 \pm 33.8$ ) respectively. Similarly, Salcedo et al. (2005)<sup>(17)</sup> founded that antiviral combination therapy markedly decreased Ang-2 levels in CHC patients. Also, Wada et al. (2007)<sup>(19)</sup> reported that interferon alpha treatment decreased the level of Ang-2 in hepatocellular carcinoma patients although it was combined with 5-fluorouracil and concluded that this combination has anti-proliferative and anti-

angiogenic effects, which we can say also for our combination therapy regardless the virological response; this can be powered by the fact that also, IFN-alpha has been successfully used in patients with pulmonary hemangiomatosis, <sup>(20)</sup> angioblastomas <sup>(21)</sup> and hemangioendotheliomas <sup>(22)</sup> which was via its anti-proliferative and anti-angiogenic effects by decreasing Ang-2 level. On the other hand, in our study, we found that combined therapy by IFN/RBV raised the level of serum sTie-2 from baseline levels to end of treatment levels ( $17.7 \pm 2.1$  and  $31.2 \pm 1.04$ ) respectively; this finding is similar to that mentioned by Salcedo et al. <sup>(17)</sup> where he found a low level of the Ang-2 inhibitor sTie-2 receptor in 36 CHC patients were comparable to the 15 healthy controls which was markedly increased after combination therapy by IFN/RBV. However, in our study, serum Ang-2 and sTie-2 didn't express statistically significant change between responders and non-responders at 48 weeks, while Salcedo et al. <sup>(17)</sup> demonstrated a close relationship between variations in serum levels of angiogenesis markers and response to therapy in CHC patients; this may be due to the smaller number of their patients or differences in samples. As regards the relation between the angiogenic factors and viremia, we found that high level of viremia was associated with increased serum levels of Ang-2 and is inversely related to level of sTie-2 Vice versa; while in a study conducted by Helaly and Abou Shamaa <sup>(23)</sup> who studied the Influence of hepatitis C virus infection on circulating levels of VEGF (another angiogenic factor similar in action to Ang-2) in patients with hepatitis C and hepatocellular carcinoma (HCC), they found a weak correlation between the level of viremia and VEGF. In contrast to Salcedo et al. <sup>(17)</sup> who mentioned that determination of Ang-2 and sTie-2 in parallel to the viral load and fibrosis markers may provide complementary information to assess response to treatment and disease progression. Our results showed no statistically significant correlation between the grade of inflammation and stage of fibrosis and serum levels of Ang-2 and sTie-2; this also comes in agreement with the results of Salcedo et al. <sup>(17)</sup> However, Hernandez et al. <sup>(24)</sup> found that Ang-2 serum concentrations raised progressively with the stage of fibrosis. Although it was interesting to discover the effect of combination therapy by IFN/RBV on liver biopsy findings through its effect on Ang-2 and sTie-2, but for many ethical causes and of invasiveness of liver biopsy, we did not repeat the biopsy post-treatment. Finally, in our study, a significant correlation of Ang2 levels with prothrombin time was found and negative correlation for the albumin level; this comes in agreement with Kasztelan-Szczerbinska et al. <sup>(25)</sup> who mentioned that Ang-2 levels is related to synthetic liver function parameters, being positive for INR and negative for the albumin level, which suggested that Ang2 may be a relevant biomarker of liver function impairment and indicated the potential for its use in clinical practice. Moreover, in our study, we found a positive correlation of plasma Ang-2 concentrations with the liver enzyme ALT but no correlation with AST, which was Similar also to Kasztelan-Szczerbinska et al <sup>(25)</sup>, who described a positive correlation of plasma Ang-2 concentrations with liver enzymes.

### Conclusion:-

Although Ang-2 and sTie-2 can't be used as a predictors of response to therapy, antiviral combination therapy markedly decreased serum Ang-2 levels and increased sTie-2 levels so it may be beneficial as a protective factor to reduce angiogenesis and consequently reducing hepatitis C related liver cirrhosis and HCC.

### Ethical considerations:-

This study was approved by the University's Research Ethical Committee and an informed consent was taken from all the participants prior to recruitment into the study.

### Conflicts of interest:-

We have not any conflict of interest to declare.

#### Abstract

**Introduction:** Intraoral soft tissue esthetics has become a significant aspect of dentistry and clinicians are faced with achieving acceptable gingival esthetics as well as addressing biologic and functional problems.

**Aim of study:** was to evaluate the effect of diode laser irradiation on gingival depigmentation.

**Materials and methods:** 3 watts continuous mode diode laser was used to remove gingival hyperpigmentation of dogs. Specimens were divided according to the follow up periods of (1, 2, 4 and 8 weeks) where the experimental specimens were contralateral to the control ones. Specimens were evaluated pre- and post-treatment histologically using H&E, histochemically using Masson Fontana and ultrastructurally by transmission electron microscope.

**Results:** histological, histochemical and ultrastructural evaluation revealed a statistically significant decrease in melanin content in the follow up periods compared to the baseline. Meanwhile, the recurrence of melanin was observed more in groups of 4 and 8 weeks after laser irradiation yet did not reach the baseline.

#### Introduction:-

A smile expresses a feeling of joy, success, sensuality, affection and can reflect self-confidence and kindness. The harmony of a smile is not only determined by the shape, position and color of the teeth, but also by the gingival tissues. Gingival health and appearance became of a great concern since they are essential components of an attractive smile. Melanin pigmentation of the gingiva occurs in all ethnicities. Therefore, an increasing number of persons are found seeking treatment for this condition (Lagdive et al., 2009).

Melanin, a brown pigment, is the most common natural pigment contributing to endogenous pigmentation of gingiva and is produced by melanocytes in the basal and suprabasal cell layer of the gingival epithelium. The gingiva is the most frequently pigmented tissue of the oral cavity (Rosa et al., 2007).

Address:-Assistant lecturer of Oral Biology, Faculty of Dentistry, MSA University, Egypt.

Gingival hyperpigmentation is increased pigmentation beyond the normally expected degree of the oral mucosa. Several physiologic and pathologic factors can cause hyperpigmentation (Dummett and Gupta, 1964). However, the most common cause is physiologic or ethnic hyperpigmentation which is genetically determined and is clinically manifested as variable amounts of diffuse or multifocal melanin pigmentation in different ethnic groups (Hegde et al., 2013).

Numerous intrinsic and extrinsic factors, including body distribution, ethnicity/gender differences, variable hormone-responsiveness, genetic defects, hair cycle- dependent changes, age, UV-R, climate/season, toxin, pollutants, chemical exposure and infestations, are responsible for a whole range of responses in melanosome structure and distribution (Costin and Hearing, 2007).

Depigmentation is the treatment of removal of melanin hyperpigmentation. Various methods have been used for this procedure including gingivectomy, electrosurgery, cryosurgery, chemically using phenol and alcohol and abrasion with diamond bur (Atsawasuwan et al., 2000).

Laser has been used in dentistry since the beginning of the 1980s. Recent research has centered on using diode laser for oral surgery of the tongue and gingiva and to remove infected epithelium in chronic periodontitis. Diode laser has offered some advantages over the others, such as easy gingival reshaping, reduced need of local anesthesia and dry operative field due to excellent hemostasis associated with significant decrease in pain and inflammatory postoperative score. Minimal scarring and satisfactory clinical outcome on the long term have also been achieved. Moreover, there is evidence in the recent literature of successful depigmentation using diode laser (Hedge et al., 2013).

### **Aim of the study:-**

The aim of the present study was to evaluate the effect of diode laser irradiation on gingival depigmentation, histologically, histochemically and ultrastructurally.

### **Materials and methods:-**

Twenty-eight adult male dogs were evenly divided into 4 main groups; groups (I, II, III and IV) correspondent to post-operative follow-up periods of (1, 2, 4 and 8 weeks) respectively. Specimens of each group were divided into 2 groups; control (A) and experimental (B), where specimens of group B (right side) were selected from contralateral area to group A (left side).

The melanin pigmented gingiva at the region of the canines was ablated by diode laser irradiation with a flexible, fiber-optic delivery system (320 microns diameter) in a contact technique, air cooling handpiece with 3 W continuous mode under standard protective measures. The procedure was performed on pigmented areas until blister formation occurred. Laser ablation started from the mucogingival junction towards the free gingival margin including the inter-dental papilla. The laser beam was guided in brush stroke movements until the entire pigmented spot had disappeared without causing any bleeding which was beneficial for clear visualization (Agarwal et al., 2014). This procedure was repeated until the desired depth of tissue removal was achieved. Remnants of the ablated tissue were removed using sterile gauze damped with saline so as to allow clear visibility of the field. Gingival specimens were examined by light microscope using Hematoxyline and Eosin stain and Masson Fontana special stain and by electron microscope.

### **Results:-**

Histologically, before laser irradiation, the gingiva of dogs showed extensive physiologic pigmentation of a brown color. The specimens showed that most of the melanin is located in the basal and suprabasal layers. After 1, 2, 4 and 8 weeks of the laser irradiation, the specimens were free of the the brown coloration. Complete re-epithelialization was seen after 1 week (subgroup IB) of the application. Some cytoplasmic vacuoles were seen in the granular layer after 2 weeks (subgroup IIB) of the irradiation. Also the granular cells were of faintly stained and less dense cytoplasm. A remarkable thickening in the keratin layer of subgroup IIIB (4 weeks after irradiation) was observed. Normal epithelial cells were seen after 8 weeks (subgroup IVB) of laser irradiation. Lamina propria was normal with some inflammatory cell infiltration (Fig. 1).

Using Masson Fontana, the specimens before laser irradiation showed positive reaction throughout the entire epithelial layers. After 1 and 2 weeks (subgroups IB and IIB), there was a remarkable decrease in the melanin concentration. But at 4 and 8 weeks (subgroups IIIB and IVB), there was a little increase in the melanin concentration compared to subgroups IB and IIB but yet didn't reach the baseline (Fig. 2).

Our histological and histochemical results were confirmed with the histomorphometry where subgroups IB and IIB were highly statistically significant with our histological results as the melanin concentration in the basal layer was significantly decreased while subgroups IIIB and IVB statistically significant where melanin concentration in basal layer was decreased but yet more than subgroups IB and IIB (Fig. 3).

Electron microscopic examination of the gingiva of the control subgroup showed the basal cells of their two types; the serrated basal cells which are a single layer of cuboidal or high cuboidal cells with protoplasmic processes projecting from their basal surface towards the connective tissue. They contain some melanin granules in their cytoplasm around the nucleus. The other population of the basal cells which are the non-serrated could also be seen. They give rise to a population of cells amplified for cell division. Considerable amount of melanosomes of variable sizes and electron density were seen inside their cytoplasm (Fig. 4a). Melanocytes with many melanin granules were scattered between lower prickly layer. Some melanocytes had a large rounded nucleus and others with elongated or ellipsoid nucleus containing a nucleolus. The nuclear membrane was smooth with regular outline which may however exhibit a single small cleft. The cytoplasm was relatively clear or electron lucent surrounding the nucleus. Numerous electron dense melanin granules (melanosomes) of different size and shape correspondent to their maturative stage were seen throughout the cytoplasm (Fig. 4b). Relatively less melanin granules were seen between upper prickly cell layer. The granular cell layer consisted of flatter, wider and larger cells than those of the prickly layer. Their nuclei showed signs of degeneration and pyknosis. A cytoplasmic vacuole surrounded the nucleus and some melanosomes were detected in it (Fig. 4c). The keratin layer presented some melanosomes and pyknotic nuclei. Gingival specimens of subgroup IB showed that almost all basal cells were devoid of melanin granules meanwhile few of them presented some. The nuclear outline tended to be more irregular (Fig. 4d). Most of the prickly cells were devoid of melanin granules and normal desmosomal attachments were seen between them (Fig. 4e). The specimens of subgroup IIB showed the basal cells with variable sized electron dense melanin granules (Fig. 4f). Cells of the prickly layer were almost devoid of melanin granules similar to those of subgroup IB. However, some of them presented cytoplasmic vacuoles (Fig. 4g). Subgroup IIIB showed prominent melanin granules in some of their prickly cells (Fig. 4h). A remarkable thickening of the keratin layer was noticed in this subgroup (Fig. 4i). Abundant melanin granules were seen between adjacent keratinocytes of subgroup IVB (Fig. 4j).

### Discussion:-

Laser was used in the current study because its use is currently the most common technique in gingival depigmentation. Laser depigmentation is a superior treatment modality for a number of conditions when compared to traditional techniques in terms of precision cutting, hemostasis and lowering the risk of other complications commonly seen such as pain, edema and infection (Romeo et al., 2014).

Gingival depigmentation performed in this study was carried out by a 970 nm wave length diode laser and a 3 W irradiation power settings as it has near optimal absorption for melanin and hemoglobin (Lagdive et al., 2010). In the present study there was minimal side effects such as the very slight coagulation on the treated surface as laser has been recognized as one of the most effective, comfortable and reliable techniques for the gingival depigmentation (Shenawy et al., 2015).

In the present study, dogs have been chosen for the gingival depigmentation procedures rather than any other experimental animal due to the marked presence of melanin pigments in their gingiva. Dummett et al., 1964 declared the presence of melanin pigments in the stratum spinosum and the basal layers of the dog's attached gingiva through a heavy patchy distribution.

It is known that the nature of the pigmentation and the depth or the degree of its penetration into the tissue are decisive factors in the outcome of the laser treatment (Sharon et al., 2000). In the current study, the utilized laser wavelength was 970nm. Such wavelength is known to induce relatively deep tissue penetration (Atsawasuwan et al., 2000).

In the present study, the light microscopic examination of subgroup IB (1 week after laser irradiation) revealed the completion of re-epithelialization and normal maturation of the epithelium manifested by the presence of all layers

till the stratum corneum. It also showed the absence of the brown colored melanin pigmentation in the basal cell layer compared to the control subgroup (IA). The results of subgroup IIB (2 weeks after laser irradiation), showed that the basal and prickle cells presented almost normal histological features. The granular cells were of faintly stained cytoplasm. Also some cells showed a relatively large vacuolar spaces. A remarkable thickening in the keratin layer of subgroup IIIB (4 weeks after irradiation) was observed. Normal epithelial cells were seen in subgroup IVB.

These findings were supported by Yousuf et al., 2000 who evaluated the possibility of the removal of canine gingival melanin pigmentation in dogs with the semiconductor diode laser using a 3 W in a continuous mode. They also checked for the brown pigmentation after 3 weeks of the laser irradiation and they did not find any repigmentation when examined by H&E stain.

However, in our study using Masson Fontana stain reflected that there was rare amount of melanin in basal and suprabasal layers of the epithelium of the dog gingiva after 1 week (subgroup IB) of the diode laser application. Also after 2 weeks (subgroup IIB) of laser application, Masson Fontana stain revealed very small spots of melanin. And according to the statistical analysis of the histomorphometric results, these two groups showed a highly statistically significant decrease in melanin concentration in the basal and suprabasal layers of the gingival epithelium in comparison to the baseline treatment of each subgroup.

Masson Fontana results of subgroups IIIB and IVB (4 and 8 weeks postoperative respectively) revealed a slight to moderate appearance of melanin throughout the whole thickness of the epithelium. The statistical analysis of the histomorphometry revealed a statistically significant decrease in amount of melanin in relation to the baseline of each subgroup.

In the present study, the ultrastructural changes observed in the epithelial cells after laser irradiation were consistent with the histological and histochemical examinations.

Despite the different technique of erbium:YAG laser that was utilized by Attwa et al., 2015 in treatment of melasma of skin (acquired hyperpigmentation involving cheeks, nose, upper lip and forehead) in humans. Skin of the face was treated with 2 consecutive passes. This treatment was repeated monthly for a total of 6 months. Evaluation was done at baseline, before each session and at 1, 3 and 6 months after final treatment. Similarly, their electron microscopic results seemed similar to those of the current study. Their results showed that there was a decrease in the aggregation of melanin granules within keratinocytes and melanocytes of the epidermis.

In accordance to the results of this study, it may be concluded that the application of diode laser appears to be a safe and effective alternative method for gingival depigmentation procedure. However, the esthetic outcome may not last for long time. Therefore, further studies are recommended with different laser treatment parameters for a better understanding of the potential benefits of laser depigmentation.

Fig. 1: Photomicrograph of the gingiva of the control subgroups showing: (a) the brown pigmentation in basal layer. (b) 1 week after irradiation no brown pigments. (c) 2 weeks after irradiation showing some vacuoles in granular layer. (d) 4 weeks after irradiation showing remarkable thickening of keratin layer. (e) 8 weeks after irradiation showing normal epithelial cells (H&E org. mag. X 200).

Fig. 2: Photomicrograph of the gingiva of the control subgroups showing: (a) melanin pigmentation in full thickness of epithelium (b) 1 week after irradiation scarce amount of melanin. (c) 2 weeks after irradiation showing few amount of melanin. (d) 4 weeks after irradiation showing scattered areas of melanin (e) 8 weeks after irradiation showing scattered areas of melanin (Masson Fontana org. mag. X 200).

Fig.3: Bar chart showing melanin mean area percent expression in gingiva between all the subgroups.

Fig. 4: An electron photomicrograph of the gingiva of the control subgroups showing: (a) the serrated type of basal cells with melanin pigmentation (b) showing the the melanocytes with variable sized melanosomes in control group. (c) granular cell with pyknotic nucleus and some melanosomes (d) basal cells of group IB devoid of melanosomes (e) prickle cells with desmosomal attachments in group IB (f) basal cells showing some melanosomes in group IIB. (g) prickle cells of group IIB with cytoplasmic vacuoles. (h)prickle cells of group IIIB with scanty amount of melanosomes and cytoplasmic vacuoles. (i) thickening of keratin layer in group IIIB. (j) basal cells of group IVB with few melanosomes.

### Conclusions:-

- Using diode laser of 970nm wave length and 3 watts power caused significant decrease in gingival pigmentation in all follow-up periods.
- Gingival pigmentation began to reappear on the 8th week after laser irradiation yet did not reach the baseline.

#### Abstract

Isolation of bacteria for antibacterial activity was conducted on sponge-associated marine bacteria, *Haliclona* sp.2 and *Axinellid* sp. from Ngege Island, Sibolga. Seventeen isolates were obtained from the two sponges. Based on antibacterial test, 11 isolates (64%) were potential as antibacterial, whereas 6 isolates (35%) were not indicated as antibacterial. Isolate H2, A1, and A2 with broad spectra of antibacterial activity were further separated for extraction of secondary metabolites. Based on screening results of isolates, ethyl acetate extract of isolate H2, A1, A2 and n-hexane extract of isolate A2 displayed antibacterial activity against *Staphylococcus aureus* and *Escherichia coli*, whereas methanol extract A2 was only able to inhibit the growth of *Escherichia coli*. For bioactive compound test, EH2, EA1 and EA2 were positive for alkaloid, whereas HA2 and MA2 were positive for alkaloid and saponin. Based on purification of secondary metabolite using Thin Layer Chromatography (TLC), there were 22 fractions with solvents of different polarities. Screening of antibacterial activity for isolate extract fractions showed that MA2 of fraction 2 had a strong inhibitive effect against *E. coli* and *S. Aureus* about 10,15 mm and 9,95 mm consecutively. The antagonistic activity of EH2 of fraction 3 against *S. aureus* and *E. coli* were about 7,05 mm and 7,45 mm consecutively, whereas EA1 of fraction 3 was about 6,55 mm against *P. Aeruginosa*. The results of phytochemical secondary metabolite of isolate extract fractions showed that MA2 of fraction 2 and MA2 of fraction 3 were positive for saponin, while EH2 fraction 3 and EA1 fraction 3 were positive for alkaloid. Bacteria associated with sponges *Haliclona* sp.2 and *Axinellid* sp. had activity as antibacterial against bacteria *S. aureus*, *E. coli* and *P. aeruginosa*.

antibacterial. In order to overcome this issue, it is important to explore antibacterial originated from bioactive compounds of plants, animals and microorganisms.

Sponge is one of corral reef components that has a potential bioactive but not has been explored. Exploration of sponges as bioactive source has been reported in various researches. However, the use of secondary metabolites produced by bacteria associated with sponges as antibacterial source is more beneficial as compared to isolation from its host. The excessive exploration of sponges to produce new bioactive could cause overfishing that could damage marine ecology. In addition to the growth of sponges that is relatively slow will inhibit the biomass availability as source of secondary metabolites. Therefore, the use of bacteria associated with sponges will be efficient because the bacteria could be cultured in laboratory and could be multiplied in relatively fast (Abubakar et al., 2011).

Capability of sponges in producing bioactive compounds due to its symbiosis with bacteria. The relationship sponges with bacteria will produce secondary metabolite as a form of defense against natural enemies such as predators, pathogenic microorganisms, competitor and fouling organisms (Taylor et al., 2007). This relationship includes a generous supply of nutrients through metabolism translocation such as nitrification, nitrogen fixation, photosynthesis, and an enhancement of chemical defenses. Due to the roles, symbiotic bacteria with sponges is estimated has a great potential on the production of bioactive compounds isolated from sponges (Kennedy et al., 2008).

Some researchers of marine explore a new bioactive compounds from sponge-symbiotic bacteria. Peptide was isolated from both sponge *Hyatella* sp. and an associated *Vibrio* sp. that has antibacterial activity (Taylor et al., 2007). New metabolites from sponge-symbiotic bacteria contribute to has antibacterial and antiplasmodial activity. Extract of n-hexane and ethyl acetate from 4 (four) potential species of bacteria isolated from sponges have antibacterial activity (Dash et al., 2009; Inbaneson et al., 2012). One of antibacterial compounds was isolated from bacteria *Pseudovibrio* spp. associated with sponges *Axinella dissimilis* (Halloran et al., 2011).

Bacteria associated with sponges include representative of the Proteobacteria, Bacteroidetes, Firmicutes, and Actinobacteria (Taylor et al., 2007). Selvin et al., (2009) reported that potential microbe which produce active compounds are Cyanobacteria, Fungi and Actinomycetes. The active compound resulted by sponge *Dendrilla nigra* associated with Actinomycetes *Nocardioopsis dassonvillei* MAD08 was as antimicrobial compound against gram-negative bacteria (*Staphylococcus aureus* MTCC 2940, *Staphylococcus aureus* MTCC 96, *Micrococcus luteus* MTCC 106, *Rhodococcus rhodochrous* MTCC 265) and gram-positive bacteria (*Vibrio cholerae* PC6, *Pseudomonas aeruginosa* MTCC 2453 and *Escherichia coli* MTCC 2939). Some bacteria isolates associated with sponges *Jaspis* sp. are antibacterial because of inhibiting the growth of *Staphylococcus aureus*, *Vibrio harveyi*, *Escherichia coli*, *Pseudomonas aeruginosa* and EPEC K-11 (Abubakar et al., 2011). Correlation between production of antibacterial compound by bacterial symbionts with sponges has been investigated by Narsinha and Anil (2000), that antibacterial compound produced by bacterial symbionts such as *proteobacterium* MBIC 3368, *Idiomarina* sp and *Pseudomonas* sp. were very affected by protein recombinant of *Suberites domuncula* as host. This research confirmed that there is a collaboration in biosynthesis of secondary metabolite between symbiont microbe and sponges.

Based on various results research, an investigation for sponge-associated bacteria as antibacterial which easy to be cultured, was needed to be conducted. The isolation results will be tested for antibacterial activity against *Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Escherichia coli*.

## Materials and Methods:-

### 2.1 Sample collection

The marine sponges were collected off from Ngge Island, Sibolga by SCUBA diving at 2-10 m. Temperature, salinity, and pH were determined at the moment of sample collection. Sponges samples were collected as needed then put into plastic bag filled marine water and oxygen then put into cool box. Sponges were identified at Laboratory of Marine Biology of Fishery Faculty of Riau University.

### 2.2 Extraction of Secondary Metabolite from Potential Bacterial Isolate

Suspension was made with turbidity justified with Standard of McFarland  $10^8$  CFU/ml, then spreaded with cotton swab on the surface of NA media. Some suspensions were made on petri disk and incubated for 5-6 days at 25°C. Bacterial cultures which obtained were cut into small pieces then put into erlemeyer 500 ml then it was added  $\pm 150$  ml solvent n-hexane, macerated for 3 x 24 hours. It was filtered with Whatman 42, thus resulted macerate and residual. Residual was reextracted with ethyl acetate and filtered. With the same way, residual was extracted with methanol. Each macerate was centrifuged with 3000 rpm for 15 minutes, thus result supernatant. Then the

supernatant was separated with each their solvent by using rotary evaporator at 45°C. It was obtained extract n-hexana, ethyl acetate and methanol secondary of potential bacterial isolate(Nofiani *et al.*, 2009). The series levels of extraction was shown in appendix 4a.

### 2.3 Screening Bacterial Extract for Antibacterial Activity

Bacterial suspension of *Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Escherichia coli* were as tested bacteria. For extract activity test, suspension of test bacterial culture was prepared by inoculation each them into nutrient broth media and incubated for 24 hours at 25°C. Activity test conducted by inoculated 200µl suspension of bacterial test that was rejuveniled into agar media and spread out with hockey stick thus test bacterial suspension mix on media surface. Then it was kept for a few moment to let the bacterial test fuse with the media. Then it was put into oxoid disk that was dropped with 10 µl of extract –n- hexana secondary metabolite potential bacteria into agar media that was inoculated with *Staphylococcus Aureus*, *Pseudomonas aeruginosa* and *Escherichia coli*. Then incubated for 24 hours at 25oC and investiged inhibition zone formed with vernier caliper. The same treatment was applied against extract ethyl acetate and methanol of secondary metabolites of potential bacteria.

### 2.4 Identification of Chemical Compound in Potential Isolate Extract n-Hexana, Ethyl acetate and Methanol.

Preliminary test of secondary metabolite was carried out on each potential isolate extract. 5 ml aquadest and chloroform were added into the extract then mixed strongly and let it for a few minute until two layers formed. Water layer was used for metabolite secondary assay of flavonoid, fenolik, and saponin whereas Chloroform layer was used for terpenoid and steroid (Harbone, 2006).

### 2.5 Identification and Isolation Secondary Metabolite Potential Isolate Extract by Preparative Thin Layer Chromatography.

Chamber was saturated with raising solvent by covered chamber with filter paper, then raising solvent was put into chamber until all filter paper throughly wet by the solvent. Extract solvent contained secondary metabolite of potential isolate spotted on preparative TLC with 20 x 20 cm until the plate saturated by extract solvent (1.5 cm from under line), plate was let until dry for ±15 minutes. Previous plate was marked upper and down limit. Then plate put into chamber that was saturated and eluted until the solvent reached upper limit line. Node formed was checked under UV light and pattern formed of node was drawn with pencil. Then the pattern was scraped with spatula and each node was separated into vial furthermore was washed and separated from its silica. Compounds that were separated from the silica, the solvents was volatiled and antimicrobe test was conducted.

### 2.6 Screening of Antibacteria Activity Fraction of n-hexana, Etil Acetate and Methanol of Potential Bacteria Isolate.

Bacterial suspensions of *Staphylococcus aureus*, *Pseudomonas aeruginosa* and *Escherichia coli* were as bacterial test. For screening, the suspensions were inoculated nutrient broth media and was incubated for 24 hours at 25°C. Identification of antibacterial activity was used disc diffusion assay (Bauer *et al.*, 1996). 200 µl suspensions that already rejuveniled were inoculated into nutrient agar media and spreaded out with hockey stick, thus bacterial suspension test was mixed throughly on surface media.

Then it was waited for a few minute until the bacterial suspension fused with media. Then it placed on the empty oxoid disk that already spotted with 10µl fraction n- hexana secondary metabolite of potential bacteria into media NA that was inoculated with bacteria *S. aureus*, *P. aeruginosa* and *E. coli*. The culture was incubated for 24 hours at 25° C and inhibition zone formed was observed with vernier caliper. The same treatment was applied on fraction ethyl acetate and methanol of secondary metabolite of potential bacteria. Furthermore, result of screening antibacterial activity was tested for phytochemical identification of potential isolate extract fraction.

## Results and Discussions:-

### 3.1 Sponges Characteristic

Sponges were taken from Ngge Island, Sibolga from 2- 10 m with purposive sampling method by scuba diving. Determination of pH with pH – meter shown that pH of marine water of sponge sampling was 7.5; salinity 30‰ and temperature 29°C. Collecting sponges was located based on GPS that were N. 01. 39. 001. E. 098. 47. 661. N. 01. 34. 379. E. 098. 45. 251. N. 01. 34. 361. E. 098. 45. 252. N. 01. 35. 419. E. 098. 41. 831. Measurement of sampling location condition was to create suitable environment for symbion bacterial test thus symbiont bacteria was able survive to live. Sponges sample were taken as needed then put into plastic bag that filled with marine water and oxygen and then put into cool box. The sponges from Ngge Sibolga were *Haliclona* sp.2 and *Axinellid* sp.

(Figure 4.1). In addition, *Haliclona* sp.2 has oscula on each branch and blue colour, whereas *Axinellid* sp. has a shape like fan, yellowness, and oscula on whole surface (Gosliner *et al.*, 1996)

Figure 4.1. Sponges (a) *Haliclona* sp.2 and (b) *Axinellid* sp.

### 3.2 Isolation and Purification of Symbiont Bacteria

Based on isolation results, there were 17 isolates from mesophyl of the two sponges that consisted of 8 isolates of *Haliclona* sp.2 and 9 isolates of *Axinellid* sp. (Appendix 2b). Bacteria in mesophyl was bacteria that has a similarity secondary metabolite with the sponges. Thiel *et al.* (2007) had discovered bacteria in large amount on sponges mesophyl *Chondrilla nucula*. The bacteria was isolated based on morphology, size and shape of colony. Seventeen isolates were isolated based on color and colony shape (Table 1). It showed possibility many differences of activity for each isolate that used for further test. Isolation and purification of symbiont bacteria could be shown as follows:

Table 1. Characterization morphology of bacterial isolate that was isolated based on colour and shape on sponges *Haliclona* sp.2 and *Axinellid* sp.

Species	Isolate Code	Colony form	Color	Elevation	The edge of the colony
<i>Haliclona</i> sp.2	H1	Round	Yellow	Flat	Entire
	H2	Round	Beige	Flat	Entire
	H3	Bobbin	Beige	Raised panel	Round
	H4	Round	Yellow	flat	Wave
	H5	Round	Beige	Flat	Entire
	H6	Bobbin	Yellowish beige	Arise	Entire
	H7	Round	Beige	Flat	Irregular
	H8	Irregular	Beige	Flat	Curly
<i>Axinellid</i> sp.	A1	Round	Beige	Flat	Wave
	A2	Bobbin	Yellow	Arised panel	Entire
	A3	Irregular	Beige	Panel	Curly
	A4	Round	Beige	Flat	Entire
	A5	Round	slightly yellow	Flat	Entire
	A6	Round	Beige	curve	Entire
	A7	Root like	Beige	Flat	Curly
	A8	Irregular	Beige	Flat	Jagged
	A9	Irregular	Beige	Flat	Blade

Various microorganisms associated with sponges. For instance, unicellular algae, Cyanobacteria, dinoflagellates and Archaea. Among these microorganisms, bacteria are the most dominant that constituted up to 40% of the biomass or 60% of the tissue volume of certain sponge species (Lee *et al.*, 2006). According to Vasanthabharathi *et al.*, (2012), bacterial density that associated with sponges *H. cribriformis*, *S. carnosa*, *C. diffusa* and *S. officinalis* Var. *ceylonensis* was in the range was  $13 \times 10^3$  -  $1.6 \times 10^7$  CFU/g,  $6.77 \times 10^3$  -  $1.5 \times 10^7$  CFU/g,  $7.68 \times 10^3$  -  $1.1 \times 10^7$  CFU/g and  $2.69 \times 10^3$  -  $1.4 \times 10^7$  CFU/g. In Taylor *et al.* (2007) described that associations between sponges and microorganisms can be maintained by two ways that is filter feeding which microbes can be recruited from the surrounding water to the sponges (horizontal transmission) or by reproductive stages (vertical transmission). In vertical transmission, oocyte from the adult mesohyl of sponge can phagocytosis to the microbial cells so bacterial symbiont could be found on embryo/ sponges larva.

Differentiation of diversity and number of bacterial isolates of each kind of sponges might be due to isolation technic and growth media that used for isolation bacteria associated with sponges. Nutrient contents of culture media would affect bacterial growth. According to Haloran *et al.* (2011), there were 73 from the marine sponges

*Axinella dissimilis*, *Polymastia boletiformis* and *Haliclona simulans* and identified as being *Pseudovibrio* spp. by 16S rRNA genesequencing and phylogenetic analysis. Radjasa *et al.* (2008) reported, there were 32 bacterial isolates from sponges *Haliclona* sp. in North Java Sea. Murniasih and Rasyid (2010) also reported that there were 75 bacterial isolates from sponges *Theonella* sp., *Aaptos* sp., *Melophlus sarasssinorum*, *Callyspongia* sp., *Ircinia* sp., *Stylissa flabeliformes*, *Lisoclinum* sp., and *Clarithria* sp. by direct plating. Abdullah (2006) also had obtained 7 bacterial isolates associated with sponges *Axinella* sp. by using marine broth agar media.

Symbiont bacteria produce a wide array of secondary metabolites as antibacterial (Lee *et al.*, 2001). Although the mechanism of association between sponges and bacteria is not known well, the association could produce secondary metabolite. Secondary metabolite production by sponges has similarity with microorganisms associated with sponges itself, include bacteria (Radjasa *et al.*, 2007). In addition, bacteria associated with organisms have probability an interaction with the host organisms (Lee *et al.*, 2001). The biochemical interaction makes a possibility that symbiont bacteria produces the same bioactive compound with its host. In Taylor *et al.* (2007), was explained that bacteria symbiosis with sponges are able to photosynthesis, oxidize methane, nitrification, nitrogen fixation, sulphat reduction and dehalogenase.

### 3.3 Extraction of Secondary Metabolite from Potential Bacteria

Extraction of secondary metabolite was carried out by maceration (Appendix 4b). In Nofiani *et al.* (2009) was described that maceration can produce intracellular antimicrobe compound thus bacterial cell need to be broken to obtain antibacterial compounds. Different polarity of solvents in maceration were n-hexane (nonpolar), ethyl acetate (semipolar) and methanol (polar). According to Dash *et al.* (2009) polarity differences on solvent used in order to isolate secondary metabolite and identification of following stage.

Extraction of secondary metabolites with different polarity of solvent was conducted serially. The isolates for this stage were determined based on the ability to inhibit some bacteria tests, that were H2, A1 and A2. Then, results of secondary metabolite extraction were extract of n-hexane, ethyl acetate and methanol of potential bacteria isolates. Taylor *et al.* (2007) described that, secondary metabolites produced by symbiont bacteria is potential as precursor of biosynthesis of sponges metabolite.

### 3.4 Screening Activity of Extract Antibacteria of Isolate Potential Bacteria

Results of screening for antibacteria activity of potential bacteria isolate extract were each isolates of extract ethyl acetate (EH2, EA1 and EA2) and extract n-hexane A2 showed antagonistic capability against bacteria test *S. aureus* and *E. coli*.

Figure 3. Sampling of antibacterial activity (a) extract ethyl acetate of isolate H2 (EH2) against *S. Aureus* and (b) Extract n-hexane, ethyl acetate and methanol of isolate A2 (HA2, EA2 and MA2) against *E. coli*.

Based on screening results of antibacteria activity, H2 and A1 were able to inhibit growth of *P. Aeruginosa*, while screening results of secondary metabolite extract showed that both isolates did not perform antibacterial activity against *P. aeruginosa* (Table 4.3). Extract hexane and ethyl acetate of isolate A2 (HA2) resulted inhibition zone against *S. aureus* and *E. coli* (Table 4.3) but not for *P. Aeruginosa*. For antagonist test of isolate showed that isolate A2 was capable of inhibiting growth of both bacteria *S. aureus* and *E. coli* (Table 4.3). According to Tinambunan *et al.* (2012) extract of bacteria associated with sponges with concentration 10% showed largest zone inhibition of antibacterial activity against *S. aureus* and *E. coli*. Extract ethyl acetate of isolate A2 (EA2) had broad spectrum activity because it was capable of inhibiting gram positive and gram negative bacteria and according to David and Stout (1971) it was included as active compound with strong inhibition capacity (diameter of inhibition zone against *S. aureus* and *E. coli* were 20,05 mm and 23,00 mm consecutively).

Extracts of three isolates (H2, A1 and A2) showed negative results against bacteria test *P. aeruginosa*. While extract MA2 only capable of inhibiting growth of bacteria test *E. coli* (Table 4.3). This might due to MA2 was suggested contain secondary metabolite that was facilitated to disturb permeability cell membrane of gram negative bacteria thus cell bacteria lysis. In Nofiani et al. (2009) explained that there are some suggestions that caused bacterial isolates did not show antibacterial activity namely (1) isolat has gene code formation secondary metabolite compound but it is not expressed at normal condition and will be expressed when it is induced previously; (2) symbiont bacteria produces antimicrobe compound intracellularly but it does not have antibacteria activity against bacteria test. Radjasa *et al.* (2007) stated that the production of secondary metabolite from the sponges has similar with microorganisms associated with sponges. It indicate that the production of secondary metabolite from simbiotic bacteria is affected by host sponge. Thus when simbiotic bacteria is isolated from host sponge, it will affect secondary metabolite as antibacteri.

### 3.5 Test Chemical Compound of Extract n-Hexana, Ethyl Acetate and Methanol of Potential Isolate

Identification of secondary metabolite content is an important initial step in searching new bioactive compound from natural material and as precursor for synthesis new medicine or as a medicine prototype with certain activity (Harborne, 2006). Capability of antagonistic activity against bacteria test is due to presence of secondary metabolite produced by isolate of symbiont bacteria. Test component of extract chemical compounds, n-hexana, ethylacetate and methanol of isolate potential bacteria was conducted as initial test to investigate the characteristic of secondary metabolite. Alkaloid was positive for each extract ethylacetate isolate (H2, A1 and A2) by used dragendorff reagent and resulted red sediment (Appendix 5b). Furthermore, extract n-hexana and methanol of isolate A2 were positive contained alkaloid and sapoin (Table 4.4). Alkaloid and sapoin indicated antagonist ability against bacteria test (Tabel 4.3) whereas identification other secondary metabolite such as steroid, terpenoid, fenolic and flavonoid showed negative result.

### 3.6 Identification of Secondary Metabolites in Potential Bacteria Isolates by using Thin Layer Chromatography (TLC) Preparative

Identification secondary metabolite compounds of symbiont bacteria was conducted with TLC (Penesyan et al., 2011). Based on preparative TLC results were found 22 fractions observed under UV from five extracts (EH2, EA1, EA2, HA2 and MA2) with different polarity. Movement phase was used to eluted the samples and varied based on polarity gradient (Yuhernita, 2011). Movement phase drained through static phase and carried components of extract potential bacteria isolate. Different component will move with different rate. Based on preparative chromatography results, separation of compounds in extracts of bacteria isolates into pure substances were obtained 6 fractions in HA2 (nonpolar) while EH2, EA1, EA2 and MA2 (semipolar and polar) obtained 4 fractions for each. (Figure 4).

Figure 4. Results of *Thin Layer Chromatography (TLC) preparative* for secondary metabolite of extract potential bacteria isolate. (a) HA2; (b) EH2; (c) EA1; (d) EA2; (e) MA2.

### 3.7 Screening Antibacteria Activity on Extract Fraction of Potential Bacterial Isolate

Secondary metabolite fraction of extract potential bacterial isolate showed antagonist ability against bacteria test. Based on screening results of antibacterial activity, the largest antagonist ability of secondary metabolite extract

fraction was MA2F2 against *E. coli* and *S. aureus* bacteria with diameter 10,15 mm and 9,95 mm consecutively (Fig.5). MA2 was obtained from sponges *Axinellid sp.* that contained saponin.

Figure.5. Examples of antibacteria activity of extract methanol of Isolates A2 fraction 2 (MA2F2) against bacteria (a) *E.coli* and (b) *S. Aureus*

Antibacteria activity was also found on EH2F3 against bacteria *S. aureus* and *E. coli*. Isolate H2 was obtained from sponges *Haliclona sp.2* with secondary metabolite alkaloid. Antagonist ability was indicated with the formation clear zone against bacteria *S. aureus* and *E. coli* with diameter 7,05 mm and 7,45 mm consecutively. Research about antibacteria activity of sponges genus *Haliclona* was also conducted previously. Radjasa et al. (2007) stated that symbiont bacteria of sponges *Haliclona sp.* showed antibacteria activity against some bacteria test, one of them was *S. aureus* with diameter > 9 mm.

Screening results of antibacteria activity of extract fraction of Isolate EA1F3 showed clear zone with diameter 6.55mm against *P.aeruginosa*. This result was different from antibacteria activity screening of isolate extract, where extract isolate EA1 did not have antibacteria activity against *P. Aeruginosa*. Extract fraction screening result of isolate MA2 was also showed differences from extract screening of bacterial isolate. For initial screening, isolate MA2 was only showed antagonistic ability against bacteria *E. coli* whereas extract fraction screening of bacterial isolate MA2F2 and MA2F3 showed antagonistic ability against *E. coli* and *S. Aureus*.

A research conducted by Nofiani et al. (2009) stated that extract methanol of bacteria associated with sponges showed antibacteria activity but based on minimum inhibition concentration value, antimicrobe activity still categorized as weak. Both extract fractions of n-hexana and ethyl acetate of isolate A2 did not show presence of antibacterial activity. This might due to the presence of other secondary metabolites that associated in each other and this indication has not detected thus capable of producing antibacterial activity against bacteria test. Other factors was the amount of secondary metabolite fraction obtained was small thus it was not capable of inhibiting the bacteria test growth.

### 3.8 Chemical Compound Assay of Extract Fraction n-Hexana, Ethyl Acetate and Methanol of Potential Bacterial Isolate

Based on screening results of antibacterial activity extract fraction of EH2F3, EA1F3, MA2F2, and MA2F3 have antagonist ability against bacteria test. Furthermore, test of chemical compound for secondary metabolite was conducted. It showed that MA2F2 and MA2F3 were positive contained saponin while EH2F3 and EA1F3 was positive contained alkaloid. Saponin for MA2F2 and MA2F3 and alkaloid for EH2F3 and EA1F3, have the same result with previous test of secondary metabolite compound. Secondary metabolite such as alkaloid and saponin are potential as antibacterial. According to Zheng (2005), secondary metabolite alkaloid of bacteria associated with sponges *Himeniacidon parve* also showed antibacterial activity against *S. aureus*. Antibacteria activity produced by symbiont bacteria of sponges *Haliclona sp.2* and *Axinellid sp* are enable competition occur in the sea ecosystem. According to Dash et al (2009), symbiont bacteria which produces antibacterial compound is enable to form colony on the sponges surface. Saponin, tanin and flavonoid are secondary metabolites that have antibacterial activity. Saponin is bioactive compound to increase membran permeability thus cell hemolysis occur, when saponin interacts with bacterial cell, the bacterial cell will be broken or lysis. This could be made as opportunity to develop secondary metabolite for further research (Ganiswarna, 1995).

### Conclusions:-

Based on research results, the conclusion of this research were as this following:

1. Extracts of EH2, EA1, EA2, HA2 and MA2 have antibacterial activity on bacteria *S. Aureus*, *E. Coli* and *P. Aeruginosa*.
2. Extract of EH2 was very potential against *S. aureus* and *E. Coli* compared with extracts EH2, EA1, HA2 and MA2.

3. It was found 4 (four) extract fractions of secondary metabolites (EH2F3, EA1F3, MA2F2 and MA2F3) which have an activity against *S. aureus*, *E. coli* and *P. Aeruginosa*.
4. Based on phytochemical screening of secondary metabolite fractions (EH2F3, EA1F3, MA2F2 and MA2F3) that has antibacterial activity were alkaloid and saponin.

### Abstract

A begomovirus was isolated from tomato plants showing typical leaf curl and stunting symptoms in tomato fields near the Delhi, India. Viral genomic components were enriched by rolling-circle amplification; PCR amplified and were cloned and sequenced. The genome organization of this virus was found to be similar to those of Old World monopartite begomovirus, with DNA-A and a betasatellite component. The alphasatellite or DNA-B component was not detected. The complete nucleotide sequence of DNA-A shared highest similarity with Tomato leaf curl New Delhi (ToLCNDV) virus while betasatellite DNA showed similarity with betasatellite DNA reported from infected leaves of Tomato, Sunflower and Potato. The data present here strongly support the association of a monopartite ToLCNDV and betasatellite DNA with the leaf curl disease of tomato.

### Introduction:-

Tomato leaf curl disease (ToLCuD), caused by Tomato leaf curl virus (ToLCV) is one of the most devastating causal agents for the loss of tomato (*Solanum lycopersicum*) crop which has spread substantially and covers new areas in tropical and subtropical continents every year. This virus belongs to the genus Begomovirus, a whitefly (*Bemisia tabaci*) transmitted virus which comes under family Geminiviridae. Begomoviruses infect dicotyledonous plants and have either a bipartite genome with two single-stranded (ss) DNA components designated as DNA A and DNA B, each one about 2.7 kb in size, or a monopartite genome with one ssDNA component analogous to DNA-A (Bridson et al., 2012; Kumar et al., 2011). Begomovirus genes required for virus replication and encapsidation by coat protein are encoded by DNA-A component and those for virus movement (both intra and intercellular) by DNA-B. In monopartite begomoviruses, genes for replication, encapsidation and movement are present in a single component (DNA-A) (Murthi et al., 2007).

In Indian subcontinent, ToLCV is a major problem in tomato-growing regions and several reports on new strains have been documented from New Delhi, Lucknow, Bangalore, Varanasi, Mirzapur, Vadodara, and Western Uttar Pradesh (Chakraborty et al., 2003). In recent years, another component designated as betasatellite (single stranded DNA) has been found to be associated with Old World monopartite begomoviruses. This small, circular DNA has

Address:- School of Life Sciences, Jawaharlal Nehru University, New Mahrauli Road, New Delhi-110067, India.

size approximately half (~1.3 kb) to that of DNA-A, and is capable of inducing symptom in plants. It is dependent on DNA-A for replication, encapsidation and transmission (Briddon et al., 2001; Briddon et al., 2008). In addition to betasatellites, monopartite viruses are sometimes found to be associated with another type of satellite designated as alphasatellite, which encodes one replication initiation protein. The role of these alphasatellites in pathogenesis is not yet clear (Briddon et al., 2008).

Indian ToLCV isolates are mostly monopartite (DNA-A) in nature with few isolates possessing bipartite (DNA-A and DNA-B) genome organization such as tomato leaf curl New Delhi virus (ToLCNDV) and tomato leaf curl Palampur virus (ToLCPaV) (Briddon et al., 2008). Here we report the presence of monopartite ToLCNDV and betasatellite DNA associated with the leaf curl disease of Tomato from New Delhi region.

## Materials and Methods:-

### Virus source and DNA isolation:-

During the month of May-June, 2012, leaves were collected from tomato plants showing typical leaf curl, vein thickening and stunting symptoms in the fields near Delhi (Latitude: 28.61 and Longitude: 77.20), India. Total DNA was isolated (Dellaporta et al., 1983) and viral genomic components were enriched via rolling-circle amplification, and PCR amplified using specific primers for full-length (DNA-A) and betasatellite DNA (Briddon et al. 2001; Kumar et al. 2011).

### Cloning and sequencing:-

PCR amplified product was run on agarose gel and visualized in UV illumination. DNA fragments representing CP gene and betasatellite DNA were excised from the gel and purified using HiPura gel extraction kit (Hi Media Pvt.Ltd. India) following manufacturer's instruction. The DNA fragments were cloned into pDrive vector (QIAGEN, Germany). The recombinant plasmid was then transformed into *Escherichia coli* DH5 $\alpha$  cells and positive clones containing desired DNA fragments were sequenced using automated sequencer.

### Sequence analysis:-

Nucleotide sequences of full-length genome of ToLCuV and betasatellite DNA under study were aligned with those of other begomovirus sequences from Gen Bank using CLUSTAL W (Tamura et al., 2013) alignment program. Following multiple sequence alignments, phylogenetic analysis was done using MEGA software version 6.0 (Tamura et al., 2013). Default parameters used were character- based algorithm (Maximum Parsimony), and distance-based algorithms (Minimum Evolution and Neighbour-Joining). A consensus dendrogram was generated using bootstrap value of 1000 replicates for these algorithms. The expasy proteomic server tool was used to translate set of protein encoding genes.

## Results and Discussion:-

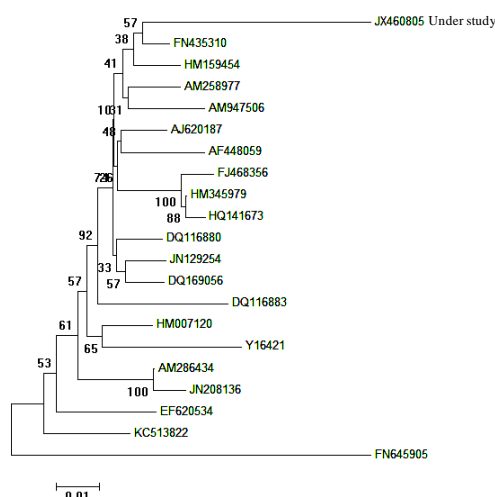

### Phylogenetic analysis:-

The sequences obtained were combined using several sequences available in the GenBank. The complete nucleotide sequence data of DNA-A of the begomovirus consisted of 2,730 nucleotide (Acc. no. JX460805), which shared highest (90%-94%) nucleotide identity with DNA-A component of several isolates of ToLCNDV (FN435310, HM159454, U15015, JN129254, HM159454), followed by <90% similarity with Squash leaf curl china virus [Pum:IARI], Bhendi yellow vein Haryana virus, Squash leaf curl China virus [Pum: Lucknow] (JN587811, FJ561298, DQ026296). The genome organization of this virus was found to be similar to those of Old World monopartite begomovirus, with DNA A and a betasatellite component. However, an attempt to amplify alphasatellite or DNA B component was unsuccessful.

The betasatellite DNA consisted of 1359 nt and was assigned accession number JX679002. The betasatellite DNA shared maximum identity (90-97%) with betasatellite DNA of Tomato leaf curl virus (AY438557), Sunflower leaf curl virus (JX678964), Potato apical leaf curl disease (EF043234), Papaya leaf curl virus (DQ118862, JX050199) etc. However it shared less sequence similarity (<70%) with betasatellite DNA from Cotton leaf curl Multan virus or Cotton leaf curl Burewala virus. The sequence of betasatellite DNA shows the typical arrangement of betasatellites, (1) a single open reading frame (ORFs) in the complementary sense (known as  $\beta$ C1; coordinates 557–201); (2) a region of sequence rich in adenine (coordinates 706–986); and (3) a sequence motif highly conserved between all betasatellite DNA satellites, known as the satellite conserved region (SCR; coordinates 1260–14). The ORF  $\beta$ C1 is predicted to encode a 119-amino-acid protein.

The phylogenetic analysis of complete sequence of ToLCNDV under study showed its clustering with ToLCNDV has been reported from Pakistan. The betasatellite DNA clustered with betasatellite reported mostly from non-Solanaceae family. This kind of incidence may occur due to high inoculum pressure or high adaptation capability of the host. This report of monopartite ToLCNDV associated with betasatellite DNA may give some insight into the types of Tomato leaf curl virus infecting tomato crops in north India. There were earlier reports of bipartite ToLCV associated with leaf curl disease of tomato in North India, and monopartite ToLCV in South India (Chowda et al., 2005), but due to more and more sample analysis across the country this opinion is no longer valid, as both types are found from infected tomato plants in all parts of the country (Tiwari et al., 2013). However, monopartite Tomato leaf curl Gujarat virus (ToLCGuV) is now a dominant monopartite begomovirus with betasatellite associated with tomato leaf curl disease in India (Jyothsna et al., 2013).

The search on the available literature and sequences present in NCBI suggests only bipartite ToLCNDV without betasatellite DNA is associated with leaf curl disease of tomato. The report of a monopartite ToLCNDV naturally infecting tomato will add to the variability of ToLCV. Additionally, the data present here strongly supports the association of a monopartite ToLCNDV and non-solanaceous betasatellite with leaf curl disease of tomato in North India.

**Fig. 1:-** Phylogenetic analysis of DNA-A molecules of this study with other DNA-A molecules of different ToLCV. The optimal tree with the sum of branch length = 0.44812555 is shown. The tree was generated using the Neighbor-Joining method in MEGA 6.0 (software). The percentage of replicate trees in which the associated taxa clustered together in the bootstrap test (500 replicates) is shown next to the branches. The evolutionary distances were computed using the Maximum Composite Likelihood method and are in the units of the number of base substitutions per site.

**Fig. 2:-** Dendrogram showing a relationship of betasatellite (this study) with other betasatellite associated with begomoviruses. The optimal tree with the sum of branch length= 0.86863634 is shown. The percentage of replicate trees in which the associated taxa clustered together in the bootstrap test (500 replicates) is shown next to the

branches. The evolutionary distances were computed using the Maximum Composite Likelihood method, and the evolutionary history was inferred using Neighbor-Joining method in MEGA 6.0 software.

#### Abstract

This paper, proposes a new Secure Cloud Data as an enhancement for the framework model in data security and cloud storage model by integrating the dual system encryption technology with selective proof technique. While the introduced scheme supporting any standard access structures is built in the composite structure bilinear group, it is verified adaptively CCA secure in the standard technique without threatening the expressiveness of access policy. In this paper, we attempt in addition to make an enhancement for the model to obtain more efficiency in the re-encryption key generation and re-encryption phases. Proxy Re-Encryption (PRE) is an effective cryptographic essential model that permits a data owner to nominee the access rights of the encrypted data which are stored on a cloud storage system to remaining entities without leaking the information of the data to the honest-but-curious cloud server. It implements the effectiveness for data sharing as the data owner even working with limited resource devices (e.g. mobile devices) can offload most of the computational activity to the cloud. Since its establishment many variants of PRE have been recommended and proposed. SecRBAC Based Proxy Re-Encryption (SecRBAC - ABPRE), which is observed as a regular approach for PRE, engages the PRE technology in the attribute-based encryption cryptographic framework as like that the proxy is granted to make change an encryption down an access policy to another encryption under a new access policy. CP-ABPRE is suitable to numerous real time network appliances, like sharing secure data in the network or cloud applications.

#### Introduction:-

Cloud computing [1], which has received considerable attention from research communities in academia as well as industry, is a distributed computation model over a large pool of shared-virtualized computing resources, such as storage, processing power, applications and services. Cloud users are provisioned and release resources as they want in cloud computing environment. This kind of new computation model represents a new vision of providing computing services as public utilities like water and electricity. Cloud computing brings a number of benefits for cloud users. For example, (1) Users can reduce capital expenditure on hardware, software and services because they pay only for what they use; (2) Users can enjoy low management overhead and immediate access to a wide range of applications; and (3) Users can access their data wherever they have a network, rather than having to stay nearby their computers. However, there is a vast variety of barriers before cloud computing can be widely deployed.

A recent survey by Oracle referred the data source from international data corporation enterprise panel, showing that security represents 87% of cloud users' fears<sup>1</sup>. One of the major security concerns of cloud users is the integrity of their outsourced files since they no longer physically possess their data and thus lose the control over their data. Moreover, the cloud server is not fully trusted and it is not mandatory for the cloud server to report data loss incidents. Indeed, to ascertain cloud computing reliability, the cloud security alliance (CSA) published an analysis of cloud vulnerability incidents. The investigation [2] revealed that the incident of data Loss & Leakage accounted for 25% of all incidents, ranked second only to "Insecure Interfaces & APIs". Take Amazon's cloud crash disaster as an example<sup>2</sup>. In 2011, Amazon's huge EC2 cloud services crash permanently destroyed some data of cloud users. The data loss was apparently small relative to the total data stored, but anyone who runs a website can immediately understand how terrifying a prospect any data loss is. Sometimes it is insufficient to detect data corruption when accessing the data because it might be too late to recover the corrupted data. As a result, it is necessary for cloud users to frequently check if their outsourced data are stored properly [4].

These same ranges of possibilities imply surrender of control over physical security, sharing resources with cotenants and lacking the knowledge of where cloud resources are hosted [2]. In a nutshell, user assets become vulnerable to various security issues and challenges that are exacerbated by the lack of monitoring capabilities and decreased visibility into the security status of assets being hosted by the Cloud Service Providers (CSPs) [3, 4]. Nevertheless, users have over the years gained appreciable understanding of the need to monitor assets and the threats associated with the benefits of cloud computing, and to some extents, methods have been devised by CSPs to effectively provide users with monitoring capabilities so as to increase the adoption of cloud services. For instance, CSPs offer dashboards for tracking service availability, timely discovery of service outages and performance metrics [5]. These attempts by CSPs although sufficient for performance and functional requirements, cannot be said to be sufficiently convincing for end-users to rely on, particularly whose proclivity is the monitoring of security related metrics.

Data de duplication enables data storage systems to find and remove duplication within data without compromising its availability. The goal of data de duplication is to store more data in less space by storing and maintaining files (blocks in fine-grained de duplication manner) into a single copy, where the redundant copies of data are replaced by a reference to this copy [11]. It means that data de duplication storage system could reduce the storage size of  $u$  clients, who share the same data copy  $m$ , from  $O(u - jmj)$  to  $O(u + jmj)$  if some implementation-dependent constants are hidden [6]. Also, clients do not need to upload their data to the cloud storage server when there has been one copy stored, which will not only greatly reduce the communication cost of clients and cloud server, but also save the network bandwidth [7].

Since the data from different clients is encrypted with different secret keys, it is difficult to conduct cipher text data de duplication among clients. A secure cross-client de duplication scheme should enable a storage server to detect data de duplication over the data encrypted by different clients, and efficiently prevent the practical attacks [10], [13], [14] from poor de duplication. Douceur et al. [21] proposed the first solution for secure and efficient data de duplication, and they call it convergent encryption. This idea promoted many significant applications, where various schemes [15], [16] are implemented or designed based on convergent encryption. Recently, Bellare et al. [17] defined a new primitive, Message- Locked Encryption (MLE), which brought rigor to security de duplication, and captured various security aspects of MLE. Also, they constructed several schemes and provided some detailed analysis over them [18].

To strengthen the notions of security by considering plaintext distributions depending on the public parameter, two approaches (fully random scheme and deterministic scheme) that are secure even for lock-dependent message in realistic. It answered the question: Can message-locked encryption be secure for lock dependent message [19]. The tag randomization design makes the fully random scheme, R-MLE2 for short, satisfy the standard secure notion of data confidentiality. Also, the overhead in the length of the cipher text is only additive and independent of the message length [20].

#### **Contribution and plan of this paper:-**

The work in this paper seeks to unravel the issue of tool based cloud security monitoring by discerning the approaches and tools for enabling users attain security visibility in the cloud. It augments existing literatures in the area of cloud security by using a systematic approach that reflects on real-life requirements to help cloud users address one of the most pressing concerns associated with gaining visibility. We present a real-world case study to

evaluate the ability of the tools and approaches to meet the security requirements based on published properties and functionality. We believe that this paper contributes to existing work by forming the first step to creating a framework for identifying cloud security monitoring requirements and implementing solutions to meet such requirements.

The paper is structured as follows: section two discusses related works and section three covers problem definition and the parameters behind it. Section four presents the motivations of this project. Section five presents the proposed system and tools that can be employed for cloud monitoring and section six presents the implementation of the proposed system. Section seven draws conclusions and outlines future work.

### **Literature survey:-**

There are several existing works in the area of cloud monitoring. Alhamazani et al [6] reviewed commercial cloud monitoring tools by considering applications within the various cloud layers. Aceto et al [7] analyzed the properties that are key to monitoring cloud systems and adopted a methodology that analyses state of the art cloud monitoring techniques. Similarly, Fatema et al [8] identified essential features that are desired for operational monitoring in the cloud, reviewed and analyzed a broad range of monitoring tools that are being used to observe cloud functional resources.

Krizanic et al [33] performed a review and categorization of monitoring tools according to Operating Systems (OS), notification and other services being supported by the cloud, while Rimal et al [34] presented taxonomy of cloud services based on comparative study of different CSPs and their systems. Although, our work does not include a systematic literature review of the tools, it is a significant contribution and differs from other literatures by using a case study to reflect on how the tools can fulfill real-life monitoring requirements. It also focuses on cloud security monitoring in addition to a selection criteria of suitable tools.

Bellare et al. [27] formalized this primitive as message locked encryption, and explored its application in space efficient secure outsourced storage. An MLE scheme  $MLE = (P; K; E; D; T)$  is composed of five polynomial time algorithms. In MLE, the parameter generation algorithm  $P$  is used to generate the public parameter. The key generation algorithm  $K$  is used to generate the message-derived key. On inputting a key and a message the encryption algorithm  $E$  outputs the cipher text. The decryption algorithm  $D$  reverses the process, whose output is used to compute the cipher text/plaintext, and the tag generation algorithm  $T$  is used to generate the tag of the cipher text. In the scheme, tag generation maps the cipher text to a tag and identical plaintext result in one equal tag.

To enhance the security of de duplication and protect the data confidentiality, Bellare et al. [25] showed how to protect the data confidentiality by transforming the predictable message into an unpredictable message. In their system, a third party called key server is introduced to generate the file tag for duplication check. Li et al. [26] addressed the key management issue in block-level de duplication by distributing these keys across multiple servers after encrypting the files. Li et al. [29] considered the hybrid cloud architecture consisting of a public cloud and a private cloud and efficiently solved the problem of de duplication with differential privileges. Yuan et al. [30] proposed a de duplication system in the cloud storage to reduce the storage size of the tags for integrity check. Recently, Bellare and Keelveedhi [31] proposed a new primitive iMLE, which adopted interaction as a new ingredient to provide privacy for messages that are both correlated and dependent on the public system parameters.

Abadi et al. [28] provided stronger security guarantee for secure de duplication. The first approach was to avoid using tags that are derived deterministically from the message. They designed a fully randomized scheme that supported equality test over cipher text. More precisely, there were three components in the fully randomized scheme, namely a payload, a tag and a proof of consistency. The second approach was a deterministic scheme. It was made secure subject to the condition where the distributions were efficiently more sampler using at most  $q$  queries to the random oracle. Thus, the security of the second approach was guaranteed by limiting the computational power of the adversarial message distributions.

### **Problem Statement:-**

#### **Problem Definition:-**

In cloud data storage, the client stores the data in cloud via cloud service provider. Once data moves to cloud he has no control over it i.e. no security for outsourced data stored in cloud, even if Cloud Service Provider (CSP) provides

some standard security mechanism to protect the data from attackers but still there is a possibility threats from attackers to cloud data storage, since it is under the control of third party provider, such as data leakage, data corruption and data loss. We note that the client can verify the integrity of data stored in cloud without having a local copy of data and any knowledge of the entire data. In case clients do not have the time to verify the security of data stored in cloud, they can assign this task to trusted Third Party Auditor (TPA). The TPA verifies the integrity of data on behalf of clients using their public key.

**System Architecture:-**

The network representation architecture for cloud data storage, which consists four parts: those are Client, Cloud Service Provider (CSP), Third Party Auditors (TPAs) and SUBTPAS. Clients are those who have data to be stored, and accessing the data with help of Cloud Service Provider (CSP). They are typically desktop computers, laptops, mobile phones, tablet computers, *etc.* Cloud Service Provider (CSP):- Cloud Service Providers (CSPs) are those who have major resources and expertise in building, managing distributed cloud storage servers and provide applications, infrastructure, hardware, enabling technology to customers via internet as a service. Third Party Auditor (TPA):- Third Party Auditor (TPA) who has expertise and capabilities that users may not have and he verify the security of cloud data storage on behalf of users. SUBTPAS: the SUBTPAs verifies the integrity of data concurrently under the control of TPA

**Security Threats:-**

The cloud data storage mainly facing data corruption challenge: Data Corruption: cloud service provider or malicious cloud user or other unauthorized users are self interested to alter the user data or deleting.

There are two types of attackers are disturbing the data storage in cloud: 1) Internal Attackers: malicious cloud user, malicious third party user (either cloud provider or customer organizations) are self interested to altering the user's personal data or deleting the user data stored in cloud. Moreover they decide to hide the data loss by server hacks or Byzantine Failure to maintain its reputation. 2) External Attackers: we assume that an external attacker can compromise all storage servers, so that he can intentionally modify or delete the user's data as long as they are internally consistent.

**Goals:-**

In order to address the data integrity stored in cloud computing, we propose an Efficient Distribution Verification Protocol for ensuring data storage integrity to achieve the following goals: Integrity: the data stored safely in cloud and maintain all the time in cloud without any alteration. Low-Overhead: the proposed scheme verifies the security of data stored in cloud with less overhead.

**Motivation:-**

Unfortunately, despite being free from secret key distribution, PEKS schemes suffer from an inherent security problem regarding the keyword privacy, namely (inside) off-line Keyword Guessing Attack (KGA). Specifically, given a trapdoor, the adversarial server can choose a guessing keyword from the keyword space and then use the keyword to generate a PEKS cipher text. The server then can test whether the guessing keyword is the one underlying the trapdoor. This guessing-then-testing procedure can be repeated until the correct keyword is found. As the keyword always could leak some sensitive information of the user data, it is therefore of practical importance to overcome this security threat for secured and searchable encrypted data outsourcing.

**Proposed system:-**

We first provide the basic RDPC scheme only for static data integrity checking. Furthermore, we show the advanced RDPC scheme supporting fully dynamic block operations based on ORT. A. Basic RDPC Scheme We use the homomorphism hash function defined in [20] to construct our basic RDPC scheme.

**Figure 1:-** Proposed system architecture

#### System model:-

System Components and its Security consists of six algorithms namely Setup, Extract, Tag Gen, Challenge, Proof Gen and Proof Check are involved in a CP-ABPRE system.

**Setup (1k)** is a probabilistic algorithm run by the KGC. It takes a security parameter  $k$  as input and outputs the system parameters  $PARAM$  and the master secret key  $MSK$ .

**Extract (PARAM; MSK; ID)** is a probabilistic algorithm run by the KGC. It takes the system parameters  $PARAM$ , the master secret key  $MSK$  and a user's identity  $ID$  as input, outputs the secret key  $SKID$  that corresponds to the identity  $ID$ .

**Tag Gen (PARAM; F; SKID)** is a probabilistic algorithm run by the data owner with identity  $ID$ . It takes the system parameters  $PARAM$ , the secret key of the user  $SKID$  and a file  $F$  to store as input, outputs the tags  $\tau = (\tau_1; SKID; n)$  of each file block  $m_i$ , which will be stored on the cloud together with the file  $F$ .

**Challenge (PARAM; FN; ID)** is a randomized algorithm run by the TPA. It takes the system parameters  $PARAM$ , the data owner's identity  $ID$ , and a unique file name  $FN$  as input, outputs a challenge  $CHAL$  for the file named  $FN$  on behalf of the user  $ID$ .

**Proof Gen (PARAM; ID; CHAL; F)** is a probabilistic algorithm run by the cloud server. It takes the system parameters  $PARAM$ , the challenge  $CHAL$ , the data owner's identity  $ID$ , the tag(a), the file  $F$  and its name  $FN$  as input, outputs a data possession proof  $P$  of the challenged blocks.

**Proof Check (PARAM; ID; CHAL; P; FN)** is a deterministic algorithm run by the TPA. It takes the system parameters  $CHAL$ , the challenge  $CHAL$ , the data owner's identity  $ID$ , the file name  $FN$  and an alleged data possession proof  $P$  as input, outputs 1 or 0 to indicate if the file  $F$  keeps intact.

#### Pseudo code of proposed Method:-

##### Step 1:-

Start Procedure

If User is registered then go to Step1

Else go for User registration

##### Step 2:-

User is going for user logs in

If User go for LDAP Authentication

If spoofed IP detected then, Block user until admin authentication.

If user is authorized by cloud admin go to step 2

Else block user permanently by cloud admin

Else forward user and go to Step 3

Else User forward to user logs in go to step2

**Step 3:-**

Compress the user data

IF User data is sensitive then *go to* step 4

Else go for cloud storage and *go to* step 5

**Step 4:-**

Apply two way encryption algorithms

**Step 5:-**

Stored user data in cloud storage

**Step 6:-**

End procedure

We consider three security properties namely completeness, security against a malicious server (soundness), and privacy against the TPA (perfect data privacy) in identity-based remote data integrity checking protocols. Following the security notions due to Shacham and Waters [7], an identity-based RDIC scheme is called secure against a server if there exist no polynomial-time algorithm that can cheat the TPA with non-negligible probability and there exists a polynomial-time extractor that can recover the file by running the challenges response protocols multiple times. Completeness states that when interacting with a valid cloud server, the algorithm of Proof Check will accept the proof. Soundness says that a cheating identifier who can convince the TPA it is storing the data file is actually storing that file. We now formalize the security model of soundness for identity-based remote data integrity checking below, where an adversary who plays the role of the un trusted server and a challenger who represents a data owner are involved.

**Implementation:-**

The proposed system is divided into three major modules and described as below.

1. Key distribution
2. Verification process
3. Validating integrity

**Key Distribution:-**

In key distribution, the TPA generates the random key and distributes it to his CP-ABPRE as follows: The TPA first generates the Random key by using SOBOL Random Function. After that TPA chooses CP-ABPRE and distributes  $n$  pieces to them. The procedure of key distribution is given in algorithm 1.

**Algorithm 1: Key Distribution:-**

1. Generates a random key  $K$  using SOBOL Sequence  
 $K = f * I * k$
2. Then, the TPA partition the  $K$  into  $n$  pieces using  $(m, n)$  secret sharing scheme
3. TPA select the Number of SUBTPA<sub>s</sub>:  $n$ , and threshold value  $m$ ;
4. **for**  $I=1$  to  $n$  **do**
5. TPA sends  $K_I$  to the all SUBTPA<sub>I</sub> s
6. **end for**
7. end

**Verification Process:-**

In verification process, all SUBTPAs verify the Integrity of data and give results to the TPA; if  $m$  SUBTPAs responses meet the threshold value then TPA says that Integrity of data is valid. At a high level, the protocol operates like this: A TPA assigns a local timestamp to every SUBTPA of its operations. Then, every SUBTPA maintains a timestamp vector  $T$  in its trusted memory. At SUBTPA<sub>I</sub>, entry  $T[j]$  is equal to the timestamp of the most recently executed operation by SUBTPA<sub>I</sub> in some view of SUBTPA<sub>I</sub>. To verify the Integrity of data, each SUBTPA creates a challenge and sends to the CSP as follows: first SUBTPA generates set of Random indices  $c$  of set  $[1, n]$  using SOBOL Random Permutation (SRP) with random key  $j(c) K_j = \pi(4)$  Where local and key(a) is a SOBOL Random Permutation (SRP), which is indexed under key:  $\{0,1\}^{\log_2(l)} \times \text{key} - \{0,1\}^{\log_2(l)}$ . Next, each SUBTPA

also chooses a fresh random key  $RJ$ , where  $RJ = (a)^{2*f*l}$ . Then, creates a challenge  $CHAL = \{j, RJ\}$  is pairs of random indices and random values.

The CSP computes a response to the corresponding SUBTPA challenges and send responses back to SUBTPAs. When the SUBTPA receives the response message, first he checks the timestamp, it make sure that  $V-T$  (using vector comparison) and that  $V[I] = T[I]$ . If not, the TPA aborts the operation and halts; this means that server has violated the consistency of the service. Otherwise, the SUBTPA COMMITS the operation and check if stored metadata and response (integrity proof) is correct or not? If it is correct, then stores TRUE in its table and sends true message to TPA, otherwise store FALSE and send a false signal to the TPA for corrupted file blocks. The detailed procedure of verification processes is given in algorithm 2.

#### Algorithm 2: Verification Process

1. Procedure: Verification Process
2. Timestamp  $T$
3. Each SUBTPA<sub>i</sub> computes
4. Compute  $j(c) = \pi$
5. the Generate the SOBOL random key  $RJ$
6. Send  $(CHAL=(j, RJ))$  as a challenge to the CSP;
7. the server computes the Proof  $PR_i$  send back to the SUBTPAs;
8.  $PR_i = \text{Receive}(V)$ ;
9. **If**  $(V * V[I] = T[I])$
10. return COMMIT **then**
11. **if**  $PR_i$  equals to Stored Metadata **then**
12. **return** TRUE;
13. Send Signal,  $(\text{PACKET}_i, \text{TRUE}_i)$  to the TPA
14. **else**
15. **return** FALSE;
16. Send Signal,  $(\text{PACKET}_i, \text{FALSE}_i)$  to the TPA;
17. **end if**
18. **else**
19. ABORT and halt the process
20. **end if**
21. **end**

#### Validating Integrity:-

To validate the Integrity of the data, the TPA will receive the report from any subset  $m$  out of  $n$  SUBTPAs and validates the Integrity. If the  $m$  SUBTPAs give the TRUE signal to TPA, then the TPA decides that data is not corrupted otherwise he decides that data has been corrupted. In the final step, the TPA will give an Audit result to the Client. In algorithm 3, we given the process of validating the Integrity, in which, we generalize the Integrity of the verification protocol in a distributed manner. Therefore, we can use distribution verification on scheme.

#### Algorithm 3: -Validating Integrity

1. Procedure: validation(i)
2. TPA receives the response from the  $m$  SUBTPAs
3. **for**  $I=1$  to  $m$  **do**
4. **If**  $(\text{response} == \text{TRUE})$
5. Integrity of data is valid
6. **else if**  $(\text{response} == \text{FALSE})$
7. Integrity is not valid
8. **end if**
9. **end for**
10. **end**

### Experiment Results:-

To evaluate the efficiency of our scheme in experiments, we implement the scheme utilizing the GNU Multiple Precision Arithmetic (GMP) library and Pairing Based Cryptography (PBC) library. The following experiments are based on coding language C on a Linux system (more precise, 2.6.35- 22-generic version) with an Intel(R) Core(TM) 2 Duo CPU of 3.33 GHZ and 2.00 GB RAM. For the elliptic curve, we choose an MNT curve with a base field of size 159 bits,  $\text{jpg}=160$  and  $\text{jpg}=80$ .

We mainly analyze the computation cost of PEKS generation, trapdoor generation and testing in the schemes of our scheme. The computation cost of our scheme is only slightly higher than that of the BCOP scheme in terms of PEKS generation and trapdoor generation. It is because that the computation involved in the underlying CP-ABPRE scheme is quite small. Since our solution does not introduce any additional operation in the testing phase, the corresponding computation cost remains the same as the underlying PEKS system. As for the scheme which achieves a certain level of security against off-line KGA, the computation cost is more than that of the PEKS scheme and our scheme in terms of all the operations. Particularly, it takes about 2 seconds to generate a PEKS cipher text for the scheme when the keyword number is 50, while that of the scheme of Keyword Time of Testing (s) BCOP XJWW Our Scheme.

Computation Cost of Testing in our scheme is around 0.9 second and 1 second, respectively. For the trapdoor generation, the computation is slightly higher than that of our scheme as the exponentiation in  $G_1$  is usually more expensive than the exponentiation in  $Z_N$ . To be more precise, the time of trapdoor generation for 50 keywords is about 0.12 seconds while that of our scheme is 0.08 seconds. Regarding the testing operation, the computation cost is almost twice that of our scheme. Specifically, the computation cost of testing is around 1.6 second for the scheme and 0.8 seconds for our scheme. This is because the testing requires an additional pairing computation.

### Conclusion:-

This paper provides a general architecture based on CP-ABPRE and hardly any guiding principle that can be espoused by cloud retailer in categorize to store and progression the data steadily. A refuge architecture that provides security as a service model and this model provides to its multiple tenants and consumers of its tenants. The security as a service model while proffering a baseline safety measures to the provider to save from harm its own cloud infrastructure also make available of flexibility to tenants and have supplementary precautions functionalities that costume their security necessities.

The future of this work would be to test the tool on real prospective cloud consumers to check if it can effectively help with cloud provider selection.

### Abstract

Marine algae are a source of compound endowed with ingenious structure and potential biological activities. In this study, extracts of red marine algae *Gelidium sesquipedale* and brown marine algae *Laminaria ochroleuca*, harvested from the coast of El Jadida-Morocco were investigated for their anti-inflammatory activity against phospholipase A<sub>2</sub> and Elastase and for their cytotoxic activity using the test of brine shrimp lethality for larvae and then both algae were tested on KB cell lines (human buccal epidermal carcinoma), K562 cell lines (Human chronic myelocytic leukemia) and HeLa cell lines (human epitheloid cervix carcinoma). For anti-inflammatory activity, both algae showed anti-elastase activity higher than 80%, however, only *Gelidium sesquipedale* showed a total inhibition of phospholipase A<sub>2</sub> activity. *Gelidium sesquipedale* showed an anticancer activity against all cells lines used, however, *Laminaria ochroleuca* showed significant cytotoxic activity of 100% inhibition against *Artemia salina* and an antitumor activity against KB cells lines.

### Introduction:-

The inflammatory and cancer diseases are among the most common diseases all over the world. The prevalence, severity, and complexity of these diseases are rapidly rising and considerably adding to the burden of healthcare costs. Although, the synthetic and combinatorial chemistry have given rise to notable successes in the development of novel anti-inflammatory and anti-cancer drugs (Vo et al., 2012). Meanwhile, the perceived value of natural products in the treatment of these diseases has yet to be fully explored. Thus, the extensive studies of alternative anti-inflammatory and anti-allergic drugs from natural products are essential. Notably, marine algae have been utilized in food products as well as in pharmaceutical products due to their biological activities and health benefit effects. Algae are an important source of various bioactive compounds such as antioxidants, antimicrobials and antivirals (Pulzet al., 2004). These compounds are also important for protecting the algal cells against stressful conditions. To enable rapid adaptation to new environmental conditions, algae produce a great variety of secondary metabolites that cannot be found in other organisms (Rodriguez-Meizoso et al., 2010). The biomass of macroalgae, represented mainly by a few species of Rhodophyta and Phaeophyta, is traditionally used to produce phycocolloids such as agar-agar, alginates and carrageenan.

Recently, marine algae have attracted a special interest as great sources of anti-inflammatory and anti-cancer properties (Lee et al., 2013). Inflammation has molecular links to carcinogenesis (Vendramini-Costa et al., 2012; Poehlmann et al., 2012). Therefore, pro-oxidant natural products are commonly chosen when developing anti-cancer drugs (Martin-Cordero et al., 2012; Farooqi et al., 2012; Yen et al., 2012).

In this study, we evaluated the anti-inflammatory and anti-cancer activities of two marine algae *Gelidium sesquipedale* and *Laminaria ochroleuca* collected from the coast of El Jadida-Morocco.

## **Material and Methods:-**

### **Algal materials:-**

Seaweeds *Gelidium sesquipedale* and *Laminaria ochroleuca* were collected at low tide and during the spring tide by hand-picking in the period of March to April from Sidi Bouzid-El Jadida coast (33°- 33°16'09''N, 8°30'-8°45'W). The algae were cleaned, washed in distilled water, then dried at room temperature and crushed until a fine powder was obtained.

### **Preparation of extracts:-**

The powder of dried algae was extracted in methanol, hexane, dichloromethane, dichloromethane /methanol and water as described by Caccamese and Azolina (1979). The resulting extracts were concentrated to dryness in a rotary evaporator under reduced pressure (at 45°C) until a crude extract was obtained and was conserved at 4°C.

### **Anti-inflammatory activity:-**

#### **PLA<sub>2</sub> inhibition assay:-**

Bioassay was based on a colorimetric bioassay (De Araujo et al., 1987). Each extract (10 µg dissolved in DMSO (10 µL)) was incubated in 96 well plates for 1h at 25°C, with *Apis mellifera* venom PLA<sub>2</sub> (Sigma, 2 µL of a 1 mg/mL DMSO stock solution). Substrate solution (198 µL) containing L- $\alpha$ -phosphatidylcholine (L- $\alpha$ -lecithin, 3.5 mM), red phenol (0.055 mM), NaCl (100 mM), CaCl<sub>2</sub> (10 mM) and Triton (7 mM) at pH 7.6 were added. Mannitol was used as a positive control. Colorimetric measurements were made as duplicates at time 0 and after 5 min thereafter read at 550 nm.

#### **Elastase Inhibition assay:-**

This activity is measured by the calorimetric method (La Barre et al., 1996). Bioassay was monitored by measuring the inhibition of the amidolysis of N-succinyl-alanylalanyl-prolyl-leucyl p-nitroanilide (Sigma) by the elastase (EC 3.4.21.36 Type II-A) from porcine pancreas (Sigma) at 410 nm. The reaction was carried out in 0.2M Tris-HCl buffer (pH 8.0) containing 200 µL elastase (0.2 mg/mL), 100 µg of each extract prepared in 10 µL of DMSO was added to the reaction mixture, and the elastase inhibition was assessed at 25 °C. The reaction mixture was preincubated for 10 min before addition of 2 µL the substrate (7.2 µg/100 µL of DMSO). The change in absorbance was measured at 410 nm in a 96-well reader.

### **Cytotoxic activity test:-**

#### **Brine shrimp lethality bioassay:-**

Brine shrimp lethality test for larvae nauplii was used to determine the toxicity of methanol/dichloromethane extract of seaweeds (McLanghlin et al., 1993). The eggs of brine shrimp (*Artemia salina* Leach) were collected and hatched in an Erlenmeyer at 30 °C with constant oxygen supply. Two days were allowed to hatch and mature the nauplii. Stock solution of the extract sample was prepared by dissolving 25, 50, 75, 100, 250 and 500 µg of extract in 4 µL of pure dimethyl sulfoxide (DMSO). 10 living nauplii were taken to each of the vial containing different concentrations of test sample with pipette Pasteur. Then, specific volumes of sample were transferred from the stock solution to the vials to get final sample concentration. In the control vials, same volumes of DMSO (as in the sample vials) were taken. After 24 hours, the vials were observed and the number of nauplii survived in each vial was counted. As controls, *A. salina* nauplii were submitted to seawater and that containing 1% DMSO (100% survival).

The number of survivors was counted and the percentage of death was calculated. Larvae were considered dead when they did not exhibit any internal or external movement during several seconds of observation. The 50% lethal concentrations (LC<sub>50</sub>) of the extracts were determined, values of LC<sub>50</sub> that were greater than 100 µg/mL were considered to represent an inactive extract (Moshi et al., 2009), the test was repeated five times.

**In vitro antitumor activity assay:-**

KB cells (human buccal epidermal carcinoma), Cell strains K562 (Human chronic myelocyticleukemia) and HeLa cell lines (human epitheloid cervix carcinoma) were used using the method of Arisawa et al. (1997) with minor modifications. The cell suspension  $3.10^3 \text{ ml}^{-1}$  was placed in 96-well tissue culture microplates. Sample were dissolved in 0.2% DMSO and added to the cell suspension at  $10 \mu\text{g} \cdot \text{ml}^{-1}$ . The cells lines were counted by using neutral red as dye and absorbance were measured at 540 nm in a microplate reader.

**Statistical Analysis:-**

The results were analyzed by one-way ANOVA using the SPSS 17 statistical software to compare the mean values of each treatment. The results are expressed as means  $\pm$  SD. Probability levels of less than 0.01 were considered highly significant. All tests were performed in triplicate.

**Results and Discussion:-*****Gelidium sesquipedale*:-****Anti-inflammatory activity:-**

The search for anti-inflammatory activity of *Gelidium sesquipedale* was evaluated through the inhibition of phospholipase  $A_2$  and the inhibition of elastase. Extracts of the algae were tested for their anti-inflammatory capacity in quantity of extracts of 100, 250 and 500  $\mu\text{g}$ . Only the dichloromethane / methanol extract is represented, the other extracts prepared in methanol, hexane, dichloromethane and water showed no positive activity (Fig 1).

The results of the inhibition of phospholipase  $A_2$  and elastase by different quantity of *Gelidium sesquipedale* extracts show that the inhibition is proportional to the amount of extract tested. They show that 100% of inhibition of phospholipase  $A_2$  and 98% of the elastase was obtained with 500  $\mu\text{g}$  of extract.

In literature, studies on phospholipase  $A_2$  activity and elastase in seaweed are infrequent. The most significant works are those of Mayer et al. (1993) which showed an anti-phospholipase  $A_2$  activity in 10 species of algae.

Many researches reports that marine algae possess anti-inflammatory activity. Chen et al. (2013) showed that an aqueous extract of *Gracilariatenuistipitata* suppressed virus-induced inflammation; also, Lim et al. (2006) indicated that the anti-inflammatory effects of a methanol extract of *Neorhodomelaaculeata* in neurological diseases included inhibiting cellular reactive oxygen species (ROS) generation,  $\text{H}_2\text{O}_2$ -induced lipid peroxidation, and inducible nitric oxide synthase.

**Figure 1:-** Percent inhibition of  $\text{PLA}_2$  and elastase according to the quantity of DC / MeOH extract of the algae *Gelidium sesquipedale*.

**Cytotoxic activity:-**

Since the isolation of the Halomon by Fuller et al. (1992), special attention was paid to the cytotoxic activity of the algae. Several species were tested for cytotoxicity on cancer cells, hepatocytes or tumors. In our study, the cytotoxic activity was investigated in the dichloromethane / methanol extract of *Gelidium sesquipedale* (Table 1).

The extract of *Gelidium sesquipedale* showed significant cytotoxic activity of 100% inhibition for a quantity of 100 µg against *Artemia salina*. *Gelidium sesquipedale* extract was also tested against KB cells, against cervical carcinoma Human cell lines (HeLa) and against chronic myelogenous leukemia cell lines of (K562).

The extract showed a high antitumor activity against KB with 100% of cytotoxicity, also, anticancer activity against HeLa and K562 cell lines. IC<sub>50</sub> values of the MTT test is 36.01 µg / ml for HeLa and 17.41 µg / ml for K562.

**Table1:-** Cytotoxic activity of dichloromethane/methanol extract of *Gelidium sesquipedale*.

<i>A. salina</i>	KB	HeLa	K562
100 % of death	100 % of death	IC <sub>50</sub> : 36,01 µg/ml	IC <sub>50</sub> : 17,41 µg/ml

Metidji et al. (2015) showed that methanolic extracts of *Gelidium sesquipedale* showed prominent result in brine shrimp cytotoxicity assay. The LD<sub>50</sub> value was 2.22 µg/ml. In addition, they found that the degree of lethality was found to be directly proportional to the concentration of the extract.

Many of the secondary metabolites produced by the marine red algae are well known for their cytotoxic property. As noted by Harada et al. (1997), the extract from a red alga, *Amphiroa zonata* exhibited strong cytotoxicity to human leukemic cell line. El-Baroty et al. (2007) demonstrated the cytotoxic activities of powdered *Asparaguses taxiformis* and its water extract on *Daphna magna*.

Many studies of cytotoxic activity of other red algae are already reported. Zubia et al. (2009) reported that *Asparagopsis armata* had a strong cytotoxic activity against cancer cell lines. Similarly, Manilal et al. (2009) reported the cytotoxicity of active fraction of *Laurencia brandeni* showed value of 93 µg/ml for the LC<sub>50</sub> from brine shrimp lethality.

Zandi et al. (2010a,b) showed that aqueous extracts of *Gracilariacorticata* and *Sargassum oligocystum* inhibited the proliferation of human leukemic cell lines. Yeh et al. (2012a,b) reported that both ethanol and methanol extracts of *Gracilariatenuistipitata* had anti-proliferative effects on Ca9-22 oral cancer cells and were involved in cellular apoptosis, DNA damage, and oxidative stress. Similarly, caspase-dependent apoptosis induced by a methanol extract of *Plocamium telfairiae* has been demonstrated using HT-29 colon cancer cells (Kim et al. 2007).

***Laminaria ochroleuca*:-****Anti-inflammatory activity:-**

The dichloromethane / methanol extract of *Laminaria ochroleuca* was tested for its ability to inhibit phospholipase A<sub>2</sub> and elastase in 100, 250 and 500 µg. Extracts prepared in methanol, hexane, dichloromethane and water showed no activity.

The results represented in figure 2 showed that the extract of *Laminaria ochroleuca* showed a low anti-PLA<sub>2</sub> activity with a percent inhibition less than 60%, by cons, this extract has a high ability to inhibit elastase with percentage inhibition greater than 80% at 100 µg of extract.

**Figure 2:-** Percent Inhibition of elastase and PLA<sub>2</sub> depending on the quantity of DC / MeOH extract of *Laminaria ochroleuca*.

The work of Etahiri (2002) is in agreement with our results, it showed that the extract of *Laminaria ochroleuca* has a weak anti-PLA<sub>2</sub> activity.

In literature, Kim et al. (2007) indicated that a murine asthma model showed that an ethanol extract of *Ecklonia cava* reduced allergic airway reactions and inflammation and inhibited LPS-induced inflammation in human endothelial cells (Kim et al. 2010). An ethanol extract of *Ishigeokamurae* also showed anti-inflammatory effects (Kim et al. 2009).

Additionally, anti-inflammatory effects have been demonstrated for the *Myagropsismyagroides*-derived carotenoid fucoxanthin (Heo et al. 2010), for *Eiseniabicyclis*, *Ecklonia cava*- and *Eckloniakurume*-derived polyphenol phlorotannins (Kim et al. 2011), and for *Sargassumsiliquastrum*-derived sargachromanol G (Yoon et al. 2012). Phloroglucinol, a monomer of phlorotannins that is abundant in brown algae, reportedly had an anti-oxidative stress effect and inhibited the production of inflammatory mediators in LPS-stimulated cells (Kim et al. 2010).

#### **Cytotoxic activity:-**

Marine macroalgae belonging to the group of Pheophyceae possess anti-tumor activity against several culture cell lines (Tang et al., 2002).

Several cytotoxic compounds such as fucoidans, laminarians and terpenoids, reported to be abundant in brown algae, have anti-cancer, anti-tumor and antiproliferative activities (Gerwick et Bernat, 1993 ; Carte, 1996 ; Smit, 2004 ; Manilal et al., 2009 ; Synytsya et al., 2010 ; Vinayak et al., 2010 ; Ayyad et al., 2011).

The dichloromethane / methanol extract of *Laminaria ochroleuca* showed significant cytotoxic activity of 100% inhibition for 100 µg against *Artemia salina*. The extract of *Laminaria ochroleuca* was also tested against KB, HeLa and against K562. The extract showed an antitumor activity against KB cells lines with 100% of activity.

Studies of brown algae have shown that glycoproteins from *Laminaria japonica* (Go et al., 2010) and fucoidans from *Sargassumhornery*, *Ecklonia cava*, and *Costariacostata* (Ermakova et al., 2011) had anti-cancer effects on human colon cancer cells. Heterofucans from *Sargassumfilipendula* exhibited anti-proliferative effects on cervical, prostate, and liver cancer cells (Costa et al., 2011). A carotenoid fucoxanthin could inhibit the growth of LNCap prostate cancer cells by arresting these cells in the G1 phase via the GDD45A and SAPK/JNK pathways (satomi et al., 2012).

## Conclusion:-

The results of the present work showed that dichloromethane/methanol extract of both algae *Gelidium sesquipedale* and *Laminaria ochroleuca* offer potential for use as anti-inflammatory and anticancer candidate. These findings of this work are useful for further research to identify, isolate and characterize the specific compound which is responsible for these activities.

##### Key words:-

hip roof, house roof, pyramidal roof, roofing.

#### Abstract

Pyramidal roof is a hip type of roof. It has no vertical sides or gables. The purpose of the project is to provide the roofing design with a small modification of installing draining water pipes from roof to the ground surface and ventilation facility. Pyramidal roof withstands and gives strength against hurricanes. Due to their aerodynamic shape, a pyramidal roof is less likely to be damaged by high winds than most other roof styles. With its even sides and overhanging eaves, the pyramidal roof gives the home a striking and distinctive appearance. This roof style looks good from all angles. The roofing design contains with a small modification of installation of draining water pipes from roof to ground surface and ventilation facility.

#### Introduction:-

Pyramidal roof is a hip type of roof. It has no vertical sides or gables. This is a type of roof where all sides slope downwards to the walls, with a fairly gentle slope. Pyramidal roof is a shape of square hip roof. They almost have same pitch or slope, which makes them symmetrical about the centerlines. They often have a consistent level gutter that can be fitted all around.

#### Objective:

The various objectives to provide pyramidal roof are as follows:

1. To resist the wind. Due to equal pitch on both sides, it has good aerodynamics which gives ability to withstand strong winds.
2. To use pyramidal roof in coastal regions where tough winds & storm are common occurrence.
3. To provide natural insulation.
4. To maintain low interior temperature of room, this saves cost of air conditioner.
5. To provide efficient drainage.

As we know that, in India there are many regions which face wind storms and hurricanes. The problem to be found out is that during the weather of high winds or hurricanes, the houses in those areas are destroyed. Also during the rains the water makes the houses weak due to leakage and moisture. The houses become weak in the coastal regions. The pyramidal roof house gives resistance to the high winds or storms or hurricanes. It is also provided with the drainage and ventilation facility on the roof which helps draining the rain water immediately and gives light through ventilation windows in daytime.

**Corresponding Author:- Krishan Thakkar.**

Address:- Civil engineering department, neotech institute of technology, vadodara.

**Framing of roof:**

The process of framing a pyramid roof may get complicated sometimes, or easy to do it. The framing of roof depends on the size of roof and structure. Time taken for the framing of roof also depends on the size of roof.

The basic steps of the framing of roof are as follows:-

- i. A circular saw, a measuring tape, a 2-by-6 lumber, nails and a hammer will be needed.
- ii. The pitch of the pyramid roof should be decided as the pitch determines the final length of the hip rafters.
- iii. Section the rafters as per the decided pitch.
- iv. At initial install the two pairs of rafters in opposite direction that leans at each other. They should be diagonally joined by nailing them together.
- v. Again install the next pair of rafters. Do this till the frame of roof is obtained.
- vi.

**Fig.1:- ROOF FRAME**

**Rooflight in pyramidal roof:-**

The pyramidal roof light has no internal hip framework. It ensures that the maximum natural light will be given to room beneath. It also has greatly improved thermal efficiency resistance. The roof light can be used in double glazed or triple glazed. The thermal resistivity in both the roof light are more. They are provided with toughened safety glass.

**Fig.2:- ROOF LIGHT**

**Drainage in pyramidal roof:**

The drainage facility in roof plays one of the important role. According to drainage in roof, it decided the draining of rain water from roof. It can be done by providing the gutters at the end of roof at each side of roof with equal slope at all sides. At the end of gutters draining pipes should be connected which allows rain water to reach the ground level.

**Fig.3:- DRAINING GUTTER**

**Implementation:**

Earlier, prior to 1930's pyramidal roofing was a popular constructing structure for American houses which still in use are considered as American bungalows, log cabins and modern Victoria style homes.

As we know a pyramid roof is one of the type of hip roof which lacks gables or vertical sides, having constructed on top of a square or rectangular base the pyramidal roof is suitable for small structures of house. A pyramid roof having all the sides sloping downwards towards the wall may have three or more rectangular faces depending on the structure size and design preference of the individual.

Considering the conservative construction of the pyramid roof displays the efficiency of the structure in places with high winds which makes them less prone to wind damages, hence constant roof maintenance and repair is minimized.

Besides this, following are the reasons why pyramid roofs are implemented:

- A. Resistant to wind
  - B. Natural insulation
  - C. Efficient drainage capabilities
- a) Resistant to wind: - This is considered to be the most admirable feature for an individual looking to build a pyramid roof. Due to the shape with equal pitch on both sides, the structure allows to have a good aerodynamic feature, which gives the ability to withstand strong winds compared to roofs with normal gable, with this quality the pyramidal roof is therefore ideally suitable for coastal regions where winds and storms are considered as common occurrence.
- b) Natural insulation: - Insulation is considered to be the important aspect in all components of a building, which eventually determines the energy bills, considering especially in very hot and very cold seasons. These excellent insulating capability of pyramidal roof comes from the fact that they have eaves on all sides. With proper implement of pyramid roof, builders can allow sufficient roof for insulation materials. This design allows the interior temperature to remain low which on a long term helps in saving the cost of continuous air conditioning.
- c) Efficient drainage capabilities: - Drainage is considered to be the most bothersome problem which most of the usually roof faces. With poor drainage capabilities the collected rain water fails to direct it away, eventually causes major problems not only to the roof but also to other structures of the roof. Constructing pyramid roof allows an efficient drainage capabilities because of the equal slopes of the structure, which always drains away almost immediately. Therefore, problems like mold growth or leaking of the roofs is not experienced.

Therefore, the structure designed gives the best possible solution for the above described capabilities of the pyramid roof. The pyramidal roof typed structure can be implemented in coastal area where there is high wind storms and hurricanes. In the coastal regions, during hot seasons it gives cooling effect in the house. Due to sloping sides warm winds are resisted and it is converted into cooling effect which also saves electricity bills. In cold seasons, the electricity consumption is at minimum.

**Conclusion:-**

As we know that pyramidal roof is a high wind resistant roof, it can be applied to various places. Pyramidal roofs are generally used for the small structures like garages, cottages, etc. and it has been also used for bungalows. Pyramidal roof gives qualities such as traditional design, solidness and more comfort. It is mostly used for the advance architecture.

In the project, the design gives the strength to withstand the high winds, hurricanes, or storm like places. It also gives the facility of rain water drainage and roof lighting windows. Roof lighting windows allows beneath rooms the natural light in daytime.

### Abstract

Potato is one of the most important food crops grown in more than 100 countries in the world. Over one billion people consume potato worldwide and it is the staple diet of half a billion people in developing countries. Present study entitled “**Socio-Economic Status of Farmer's of the Basis of Family Profile and Materials Possessed involved in Potato Cultivation activities**” The pre-coded interview schedule was constructed in order to elicit information needed to obtain the objectives of the study. Multistage purposive random sampling technique was followed to select the state, district, blocks and finally respondents. District Kannauj is purposively selected as this is one of the largest potato producer districts while two blocks namely Kannauj and Jalabad were randomly selected. Two villages from each selected block i.e. Basirapur and Mahmoadpur paith from **Kannauj** and, Badlepurwa and Kheda from **Jalalabad**, selected randomly. Forty farmers from each selected village, Total sample size 160 respondents were randomly selected for final data collection. Majority of head of respondent's family were farmer and earning Rs. less than 10,000 per month. Prevalence of nuclear family was seen in rural areas as majority of respondents were belonging to nuclear family, having up to five members, living in mixed type of houses, belonging to small farmer category and holding upto two animals. Rural areas were also witnessing technological advancement as majority respondents were having improved chulha and mobile phones while considerable per cent were having gas connection, television and other asstes.

### Introduction:-

Potato (*Solanum tuberosum* Linn.) ranks fourth among the major food crops of the world. It is the staple food of almost half of the world's population. The global area under potato during 2009 was about 18.28 million ha, with a total production of 343.91 million t. India ranks 3rd in area (1.86 million ha) 2nd in production (42.34 million t) in the world. The production and productivity of the crop have been improved by a number of technological interventions viz., improved varieties, quality and quantity of fertilizers. Irrigation schedule, seed size, seed rate,

planting distance and pest management. In Jammu division, it occupies highest area cover after rice, wheat and maize and has 16 per cent share in area and 18 per cent share in production under vegetables.

### Research Methodology:-

The study was conducted in Kannauj district of Uttar Pradesh during the year 2015. The pre-coded interview schedule was constructed in order to elicit information needed to obtain the objectives of the study. Multistage purposive random sampling technique was followed to select the state, district, blocks and finally respondents. District Kannauj is purposively selected as this is one of the largest potato producer districts while two blocks namely Kannauj and Jalabad were randomly selected. Two villages from each selected block i.e. Basirapur and Mahmoadpur paith from **Kannauj** and, Badlepurwa and Kheda from **Jalalabad**, selected randomly. Forty farmers from each selected village, Total sample size 160 respondents were randomly selected for final data collection.

### Result and Discussion:-

**Table 1.1:-** Distributions of Respondents on the Basis of Occupation of head of family

S.No	Occupation of head of family	Frequency	Percentage
1	Labour	62.00	38.75
2	Farming	64.00	40.00
3	Business	25.00	15.62
4	Service	09.00	05.63
	<b>Total</b>	<b>160.00</b>	<b>100.00</b>

Majority (40.00%) of heads of respondent's family were farmers while little less i.e. 38.75 per cent were labours. About sixteen per cent heads of respondents family were doing business while only 5.63 per cent heads of family were service man.

**Table 1.2:-** Distributions of Respondents on the Basis of Monthly Income

S.No	Monthly Income (Rs)	Frequency	Percentage
1	Less than 10000	64.00	40.00
2	10001-15000	63.00	39.37
3	15001-20000	25.00	15.63
4	Above 20000	08.00	05.00
	<b>Total</b>	<b>160.00</b>	<b>100.00</b>

Table 1.2 inferred that forty per cent and 39.37 per cent respondents were having monthly family income less than Rs. 10,000 and Rs. 10001-15,000 respectively, whereas 15.63 per cent respondents were earning Rs. 15, 0001-20,000 month. Only five per cent respondents were having income above Rs. 20,000 per month. **Fig. 01** revealed that maximum respondents from all income groups were identified as above 55 years age group. It shows that as age increases the income level of the respondents also increases.

**Fig. 01:-** Monthly Income of the Respondents According to Age

**Table 1.3:-** Distributions of Respondents on the Basis of Type of Family

S.No	Type of Family	Frequency	Percentage
1	Nuclear	97.00	60.63
2	Joint	55.00	34.37
3	Extended	08.00	05.00
	<b>Total</b>	<b>160.00</b>	<b>100.00</b>

Table 1.3 depicts that more than sixty per cent respondents were from nuclear family followed by 34.37 per cent respondents belonging to joint family. Very few i.e. only five per cent respondents were from extended family.

**Table 1.4:-** Distributions of Respondents on the Basis of Size of Family

S.No	Size of family	Frequency	Percentage
1	Up to 5 members	95.00	59.37
2	6-7 members	50.00	31.25
3	Above 7 members	15.00	09.37
	<b>Total</b>	<b>160.00</b>	<b>100.00</b>

It is evident from the figures presented in Table 1.4 that majority (59.37%) of respondents under study were having upto 5 members in their family followed by 31.25 per cent having 6-7 members. Little less than ten per cent respondents were having above 7 members in their family.

**Table 1.5:-** Distributions of Respondents on the Basis of Type of house

S.No	Type of house	Frequency	Percentage
1	Kachcha Type	43.00	26.87
2	Mixed Type	73.00	45.63
3	Pacca Type	44.00	27.50
	<b>Total</b>	<b>160.00</b>	<b>100.00</b>

It is clear from Table 1.5 that more than forty five per cent respondents were living in mixed type of houses i.e. Kachcha and Pacca mixed while approximately 26.87 per cent and 27.50 per cent respondents were having Kachcha type and Pacca type house respectively.

**Table 1.6:-** Distributions of Respondents on the Basis of Type of land holding

S.No	Type of land holding	Frequency	Percentage
1	Landless	70.00	43.75
2	Marginal Farmer(Less than 1ha)	73.00	45.62
3	Small Farmer (1-2ha)	12.00	07.50
4	Medium Farmer(2-4ha)	02.00	01.25
5	Large Farmer(4ha and above)	03.00	01.87
	<b>Total</b>	<b>160.00</b>	<b>100.00</b>

Land holding has direct bearing upon economic condition of family. Enquiry regarding land holding revealed that more than forty three per cent respondents were falling in landless and 45.62 per cent were in marginal farmer category respectively. While about eight per cent respondents were from small farmers group. Two respondents identified from medium farmer category, whereas about two per cent respondents were from large farmer category. **Fig. 02** explicit that majority of small farmers were belonging to the age group 45- 55 years and large farmer were belonging to above 55 years.

**Fig. 02:-** Land Holding of the Respondents According to Age**Table 1.7:-** Distributions of Respondents on the Basis of Livestock

S.No	Livestock	Frequency	Percentage
1	Low (up to 2 animal)	80.00	50.00
2	Medium (3 to 4 animal)	61.00	38.12
3	High (above 4 animal)	19.00	11.87
	<b>Total</b>	<b>160.00</b>	<b>100.00</b>

The data presented in Table 1.7 reveals that fifty per cent respondents were having up to 2 animals and falling in low category followed by 38.12 per cent respondents having 2-4 animals and belonged to medium category. About twelve per cent respondents had more than 4 animals and thus belonging to high category in holding the livestock. It is very clear from **Fig. 03** that majority respondents were holding up to two animals and living in kachcha house while medium (2 to 4 animals) and high (above 4 animals) livestock holding respondents were living in pacca house.

**Fig. 03:-** Distribution of Livestock on the Basis of Type of House Existing

**Table 1.8:-** Distributions of Respondents on the Basis of Materials Possessed  
N=160

S.No.	Materials possessed	Frequency	Percentage
1	Improved Smokeless Chulha	134.00	83.75
2	Gas connection	66.00	41.25
3	Mixer Grinder	12.00	07.50
4	Refrigerator	08.00	05.00
5	Solar Cooker	-	-
6	Sewing machine	24.00	15.00
7	Television	46.00	28.75
8	Tape recorder/cd player	30.00	18.75
9	Mobile phone	106.00	66.25
10	Fan	60.00	37.50
11	Wooden Furniture	14.00	08.75
12	Others	40.00	25.00

Table 1.8 dealing with material possessed by selected respondents revealed that majority (83.75%) of respondents having improved smokeless chulha followed by 66.25 per cent respondents were having mobile phone. About forty one per cent respondents were having gas connection in their homes while little less i.e. 37.50 per cent respondents were having fans. More than twenty five per cent respondents were having television, whereas about nineteen per cent respondents were having tape recorder/CD player. Fifteen per cent respondents were having sawing machine in their homes while about nine per cent respondents were having wooden furniture. Minimum, only five per cent respondent were having refrigerator, whereas 7.50 per cent respondents were also possessing mixer and grinder. About one quarter respondents were having other materials like cycles, solar panel and washing machine etc.

### Conclusion:-

It can be concluded from the Tables that majority (40.00%) of heads of respondent's family were farmers, whereas,

forty per cent and 39.37 per cent respondents were having monthly family income less than Rs. 10,000 and Rs. 10001-15,000 respectively. More than sixty per cent respondents were from nuclear family and majority (59.37%) of respondents under study were having up to 5 members in their family. More than forty five per cent respondents were living in mixed type of houses and belonging to landless category. Fifty per cent respondents were having up to 2 animals and identified in low category. Majority (83.75%) respondents having improved smokeless chulha followed by 66.25 per cent respondents were having mobile phones. About forty one per cent respondents were having gas connection in their homes while little less i.e. 37.50 per cent respondents were having fans.

### Abstract

Energy consumption that will affect our future is highly related to green areas in urban and the environment. Green areas have the qualities to reduce the energy consumption of cities as well as buildings. Therefore, green areas now are taking over much more missions than ever before.

In this paper, a different calculation method as “effecting green area” has been introduced depending on coefficients of different qualified green area groups according to their performances. This method is not determined new green area standard value, just put on reducing the green areas sizes as temporarily by purposing more efficiency on urban benefits.

### Introduction:- The Importance of Green Area Planning

Energy consumption is the main subject that will affect the future of our World. International Energy Agency (IEA) declares that buildings are responsible for at least % 40 of the primary energy consumption and % 24 of the global carbon dioxide emission of the world (Mira, 2013).

In cities, building masses constitute the main part of the areas that we are settled. It is obviously true that each one of these building masses is an energy consumption source. That is the reason why as the masses increase, the energy consumption increases.

However, due to needs of civilisation, each day the need for these building masses is getting inevitable. Consequently, the subject of decreasing the energy consumption of building masses is getting more and more important.

As the result, the concept of decreasing the energy consumption by increasing the relation of building masses with nature is maturing.

This new concept is an economic and sustainable approach in harmony with nature.

This way of thinking diverts the architects and city planners to pay much more attention to the importance of sustainable architecture and urbanism and especially to the effect of plants on city life. “Green architecture,” “roof gardens,” “green terraces,” “vertical vegetation, etc. are designing approaches which are all included in the concept of “sustainability”. They are designings implying that the plants placed on buildings show that inside or around the cities the tendency to green is relatively increasing. Today, the effects of green terraces and green roofs decreasing the energy consumption regarding heat losses for buildings and indirectly for the cities are plainly noticed. For example, the importance of green on the building, reducing the value of the heat conduction coefficient of the

building envelope that is very effective on the construction of the energy efficient buildings is very often agreed upon (Voss, 213). In the same way, the positive effect of the green covered areas both on cities and surroundings in reaching the various objectives in lessening energy consumption can not be ignored. Various scientific works prove that these above mentioned positive effects are correct. The mentioned objectives are reducing noise, controlling of the wind and solar radiation and removing the environmental and visual pollution. Also, various positive effects of areas with green structures on the psyche- social subjects are very well known and accepted (Lyle, 1985).

All these developments show that the amount of green spaces in the city, open areas and providing the necessary standard of green area per capita are getting more and more important. That is why we may conclude that more detailed investigations must be made on this subject.

### **Performance of Green Area Standards in Planning:-**

The distribution of the green areas in and around the cities depend on one single standard value as the quantity of green area per person; at during preparation phase of the development plans. Not taking into consideration the functions and the qualifications at all, the area sizes are added up on each other on the m<sup>2</sup> basis and then the total is divided by the population of the city and as the result, the green area per person is obtained. The obtained amount of green area per person is checked by how much it is in compliance with the green area standards to be followed in urbanism discipline (Karagüler, 1983). In this respect, these are three critical issues that may be considered as problems that need attention:

1. Green area standards applications in our World differs from 2m<sup>2</sup>/person to 80m<sup>2</sup>/person. This huge variation in value causes and unprevented chaos. Consequently, the acceptable standard value of needed green area becomes flue and a standard value that can be accepted as satisfactory can not be obtained (Yıldızci, 1982).
2. The distribution of green spaces in and surroundings of the cities follow a special hierarchy. A city may be rich in mountainous, rough, historical and /or archaeological conditions. In this case, the distribution mentioned above, can not often be provided especially in the cities developing from the past till today.
3. Green areas with various functions have various factorial values like “ The amount of green surfaces”, “usability” etc. The problem is that these different values of green areas have not been evaluated regarding benefits to the city and have not been reflected in planning.

The sufficiency of green areas in the development plan, regarding all the benefits of them to the cities, especially energy control can be clarified by solutions of these three issues.

The required standard of the first subject can be determined by taking the city groups in the World showing common standards into consideration. That determination can only be done by the decisions and certain assumptions of city planners by examining the economic, geographical and social specialities of the planning area (Karagüler, 2004). However, the solution requires a detailed evaluation.

As the second issue, even if the total green area is numerically suitable to the determined standard; the distribution in the city and around may not be planned as hierarchical. This problem can be solved again by city planners; taking city planning discipline as the main concept and regarding the developing tendency of the planned area by giving priority to green area hierarchy and can only be solved by a conscious planning.

The third important point is; even if a proper planning has been done for the first and second points; the planned green facilities may not be evaluated and calculated considering green area performance. In other words, even if a standard is provided and a green hierarchy system is built up at the planned area; the planned green areas may not be evaluated regarding the usefulness of the green area effectiveness to the city. The solution to this subject will be explained in this article, by proposing an effective green area evaluating method.

### **Effective Green Area Method:-**

The approach mentioned above will be explained by proposing the “ Effective Green Area Method.” This method depends on reducement of green area bignesses to effective green area bignesses. The “Effective Green Area” concept will be explained at below. Following the explanation, the phases of the method will be put forward for consideration.

**Effective Green Area Concept:-**

When the subject is considered in regards to the effectiveness of the green areas, have quite a lot in number and various benefits. The characteristics of these areas change by the effects of various factors. As very well known, because of their qualifications, the green areas on the plan may be as big as other green areas; but may not perform the same green area performances. The distinction of active and passive green areas is not satisfactory necessarily to reveal these different performances. Some active green areas are closed to public like building gardens. In the same way, some passive green areas are closed public because of their different statuses like Consulate gardens or military green areas although they have intensity green tissues. Usability of green area is so important as well. So, the subject is the benefit of cities from the green areas; the main reason of this matter may be explained by two factors. These factors must be the quantity of planted surfaces in the green areas (Schipperijn *et al.* 2010a) and the public ownership. Therefore, the effect of some subfactors determined by the mentioned two main factors should be reflected in city planning to show out the effectiveness of the green area species. The samples of green areas with different quantity of green tissues are illustrated in figure 1 and 2. In this respect, we may determine ratios considering the effects of the factors mentioned above. These ratios are multiplied by the sum of green areas, and new area bignesses are obtained. They should be considered as effective green area values. In this respect, the control of the standard of green area per person should be made by using effective green areas.

Consequently, this article defends that; in city planning, the calculation of effective green areas should be done according to the main factors determining the benefits of green areas in cities. Then it is emphasised that green areas should be evaluated by considering their suitability degree to the mentioned main factors and then calculated regarding the effective green area values. In other words, the article claims that at first the bignesses of areas having green area status on the plan must be reduced to different values considering green performance and then their appropriateness to the standard should be controlled (Figure 1 and Figure 2).

**Figure 1:-** Poor Vegetated Green Areas Examples From Istanbul.

**Figure 2:-** Dense Vegetated Green Areas Examples From Barigui.

**The Stages of Effective Green Area Method:-**

The method contains the following steps in succession:

1. Determination of green area types
2. Determination of positive factor numbers
3. Determination of green efficiency coefficients
4. Determination of green area sizes

Figure 3 shows the “Flowing Scheme of the Effective Green Area Method” prepared in compliance with the steps mentioned above.

**Figure 3:-** Flowing Scheme of the Effective Green Area Method.

#### **Determination of Green Area Types and Positive Factor Numbers:-**

Green areas have various functions in respect with usage aims of their times. The aims depend on upon the visiting reasons of the time (Schipperijn *et al.* 2010b). For that reasons, the green areas in and around the city can be grouped in functions in compliance with today's objectives as follows:

1. Green areas for resting purposes
2. Green areas for gardening use
3. Green areas for sports and play facilities
4. Green areas for entertaining purposes
5. Green areas for agricultural purposes
6. Green areas with spatial status

During the determination of six main groups, the existing groupings are taken into consideration with literature and discipline subjects and also, new groups are added to the present day's conditions (Çetiner, 1979), (Öztürk, 2004), (Germann and Seeland, 2002).

The green area types forming the above-mentioned main groups are shown in Table 1.

**Table 1:-** Factor Numbers for Green Spaces.

Function	Green Areas	Place in the Plan		Factors									Positive Factor Number

GREEN AREAS IN SPECIAL SITUATION	Military Green Areas	+	+	+	+	-	+	+	-	+	+	+	7
	Consulates Gardens	+	-	-	+	-	+	+	-	+	-	+	6

The main factors that will determine the suitability degrees of the green area types can be presented in relation to the environmental and urban benefits of the green areas.

Today, the environmental and urban benefits of the green areas may be listed briefly as follows:

1. Protection of ecological balance
2. Control of the solar radiation and wind
3. Prevention of environmental pollution (air, visual, noise, etc.)
4. Control of natural disasters (flood, erosion, earthquake, etc.)
5. Fulfillment of open air social activities
6. Providing of psychological satisfaction (improvement of mental health, rest, touristic actions, getting in close touch with nature, focusing on human scale) (Schipperijn *et al.* 2010b), (Karagüler, 1993)

These benefits such as protection of ecological balance, control of the wind and solar radiation, prevention of environmental pollution and control of natural causes can only be provided at green areas with intense green tissue. Environmental and urban benefits directed towards psychological satisfaction such as resting, getting close to nature, focusing on human scale and improvement of mental health; can be provided if the use of the green is open for public use and concentrated green tissue. Taking these evaluations into consideration, the factors affecting the values such as the concentration of green tissue on green areas and being open to public use only be determined by the main effective factors provide the urban and environmental benefits of green areas. Green tissue concentration on green areas varies according to factors mentioned below:

1. The amount of construction
2. The ratio of hard ground
3. Density of users
4. Diversity of plants
5. Difference of plant sizes
6. Preservation of natural surrounding impression

The use of green areas open to public change in respect to three main factors mentioned below:

1. Being in possession of public
2. Usability
3. Being active

On this green space if the amount of construction and ratio of the hard ground is plenty the areas covered with green tissue will be accordingly small. On the other hand, as the user density gets higher, it will become harder and harder to keep the ratio of green tissue high. The increase in the diversity of plants and difference of plant sizes depend on the highness of the concentration of green tissue. Therefore, these factors may be accepted as the main factors of protection of ecological balance, improvement of urban climate, contribution to urban landscape and prevention of noise in the achievement of urban and environmental benefits of green spaces. While arranging the green areas using natural and especially materials and objects made of plants increase the density of green. At the same time, it plays a very efficient role in providing all the benefits of psychological satisfaction because it was not disturbing the impression of natural atmosphere and characteristic. On the other hand, urban citizens can only use this green area type if the ownership belongs to the public. The usage of private and judicial owned green areas is very limited because they do not belong to the public. Areas like pedestrian refuges, military green areas and small woods belonging to the foreign country representatives have special statuses and special place in the planning area. For those reasons, these green areas are closed to direct public use, and this plainly shows the importance of the “usability” factor.

Considering the analyses mentioned above the nine main factors that are listed below can be determined in providing urban and environmental benefits for green area types:

1. Expropriation obligation
2. Usability
3. Lack of “solid ground rate.”
4. Possibility of low-density construction
5. Low user density
6. Active usage
7. Plurality of diversity of plants

8. Variety of plant heights
9. Protection of natural environment impression

“ Positive Factor Numbers” are determined by evaluating the appropriateness of these factors to each green area type. In this case, green areas can be categorised gradually in respect to positive factor numbers as shown in Table 1.

#### Determination of Green Efficiency Coefficient for Green Areas:-

In planning, it has been considered necessary that green area types in and around the city should be classified into two main groups as shown in Table 1 (Ratcliffe, 1974). Considering the determined factors and positive factor numbers as mentioned in the second section; green area types in and around the cities show common green area characteristics forming different groups of green area types. For this reason, the green area types are grouped considering the common features ( see Table 2 and 3). In another study, starting from the biggest to the fewest, a green area grouping with different percentages is prepared as good, moderate, poor and barren (Wang *et al.* 2014). In this mentioned study green area categorisation is made using the filtering percentages of green tissues and depending on the water filtering capacity. At the result, the importance of covered with plants is emphasized. In this article, priority is given to spaces covered with plants while classifying the groups. However, also, other factors determining the benefits of the green areas to the cities explained in chapters 3,2 and 1. are taken into consideration. In each one of the green areas groups with common characteristics formed by this method, the positive factor numbers of the green area types will be equal or very close to equal.

**Table 2:-** Efficiency Percentage of Green Areas in the City.

QUALITY		GREEN AREAS IN THE CITY	WITHIN STANDART	CODE NO	POSITIVE FACTOR NUMBER	I. DEGREE GREEN AREAS	II. DEGREE GREEN AREAS	III. DEGREE GREEN AREAS	IV. DEGREE GREEN AREAS	GREEN EFFICIENCY %
A	Public Spaces With Plenty of Green Area	Neighborhood Parks	+	A <sub>1</sub>	9	X				100
		District Parks	+	A <sub>2</sub>	9	X

Common characteristic groups of “green areas in city”:

1. Public Spaces with plenty of green areas
2. Spaces with plenty of green areas but without public usage
3. Public spaces with partial green areas
4. Sports, entertainment and rest areas with little green areas

Common characteristic groups of “green areas around the city”:

1. Public spaces with plenty of green areas
2. Green areas lacking an adequate level of usability or green tissue
3. Green areas lacking usability and landscape contribution
4. Recreational open spaces with little green area lacking landscape contribution

The breakdown of green areas that the groups of characteristics contain are shown in Tables 2 and 3 with the positive factor numbers. If a grading is prepared from green area-specific groups with high factor numbers to green area-specific groups with low factor numbers:

1. Group A is green areas in city with positive factor numbers 9 and eight as 1st degree
2. Group B is green areas in city with positive factor numbers 7 and six as 2nd degree
3. Group C is green areas in city with positive factor numbers 5 and four as 3rd degree
4. Group D is green areas in city with positive factor numbers 3 and two as 4th degree

**In the same way:-**

1. Group E is green areas surrounding the city with positive factor numbers 9 and eight as 1st degree
2. Group F is green areas surrounding the city with positive factor numbers 7 and six as 2nd degree
3. Group G is green areas surrounding the city with positive factor numbers 5 and four as 3rd degree
4. Group H is green areas surrounding the city with positive factor numbers 3 and two as 4th degree
5. These determinations above are accepted grading for green areas in and around the city.

Assuming that the accepted performances of the highest degree green areas will be the highest considering the green areas; a “Green Efficiency Coefficient” should be defined reflecting the performances of the characteristic groups of all green areas with certain hierarchy and percentage ratios. In short, “Green Efficiency Coefficient” can be explained as the expected performance degree from green areas and determined by the percentage ratio. This coefficient is revealed as parallel to the green area gradation determined according to the numbers of positive factor describe in the second section. “Green Efficiency Coefficients,” are shown in Tables 2 and three separately for green area groups in and around the city.

It can be clearly seen that the green areas, both in and around the city, four different green area hierarchy is valid. In this case, green efficiency coefficient for the first-degree green areas (highest factor number being 8 and 9) may be accepted as % 100. Then the average unit ratio per each factor number can be calculated as 11,76 ( $100 / 8,5$ ). When this value is multiplied by the average positive factor numbers of the 2nd, third and 4th-degree green areas; the green efficiency coefficients can be obtained. To show it more clearly:

1. The green efficiency coefficient is approximately % 29 ( $11,76 \times 2,5$ ) for fourth-degree green areas with positive factor number 2 and 3.
2. The green efficiency coefficient is approximately % 52 ( $11,76 \times 4,5$ ) for third-degree green areas with positive factor number 4 and 5.
3. The green efficiency coefficient is approximately % 76 ( $11,76 \times 6,5$ ) for second-degree green areas with positive factor number 6 and 7.

These values can be considered as % 25, % 50, and % 75 for easy calculation in practice.

As the result, with respect to the above determinations, the green efficiency coefficients in and around the cities, starting from the highest to the lowest can be categorized as follows: (see Table 2 and 3).

1. % 100 for first-degree green areas
2. % 75 for second-degree green areas
3. % 50 for third-degree green areas
4. % 25 for fourth-degree green areas

Figures 4 and 5 indicate the distributions of green area types, classified in and around the city; showing the effective values of “Green Efficiency Coefficient” with respect to the green area characteristics.

**Figure 4:-** Green Areas Efficiency Percentage Distribution Graph in the City based on Factor Numbers.

**Figure 5:-** Green Areas Efficiency Percentage Distribution Graph around the City based on Factor Numbers.

#### Determination of Effective Green Area Sizes:-

As explained above, the sums of green area sizes of 1st, 2nd, third and 4th degrees are the sums of A+ B+ C+ D in the cities and E + F + G + H around the cities. Their actual openings in and around the city can be seen in Tables 2 and 3.

#### In the city:-

1. Public Areas with Plenty of Green:  $A = A_1 + A_2 + A_3 + A_4 + A_5 + A_6$  ( Green Efficiency Coefficient : % 100 )
2. Areas with Plenty of Green but Without Public Usage:  $B = B_1 + B_2 + B_3 + B_4 + B_5$  ( G.E.C : % 75 )
3. Public Areas with Partial Green:  $C = C_1 + C_2 + C_3 + C_4 + C_5 + C_6$  ( G.E.C : % 50 )
4. Recreational Open Areas with Little Green:  $D = D_1 + D_2 + D_3 + D_4 + D_5 + D_6 + D_7$  ( G.E.C : % 25 )

#### Around the city:-

1. Green Areas with Plenty of Green and High Usage:  $E = E_1 + E_2 + E_3 + E_4 + E_5 + E_6 + E_7 + E_8$  ( Green Efficiency Coefficient: % 100)
2. Public Green Areas Lacking an AduquateLevel of Usability or Green Tissue:  $F = F_1 + F_2 + F_3 + F_4 + F_5 + F_6 + F_7 + F_8 + F_9 + F_{10} + F_{11} + F_{12}$  ( G.E.C : % 75 )
3. Green Areas Lacking Usability and Lanscape Contribution:  $G = G_1 + G_2 + G_3 + G_4 + G_5 + G_6 + G_7$  ( G.E.C : % 50 )
4. Recreational Open Areas with Little Green and Lacking Landscape Contribution :  $H = H_1 + H_2 + H_3 + H_4 + H_5 + H_6 + H_7 + H_8 + H_9$  ( G.E.C : % 25 )

If all of these green area sizes should be transformed into effective green area sizes, each one of the green area size in green area group must be multiplied by the above-mentioned “Green Efficient Coefficient.”

In this case, the sizes of effective green areas in and around the city are formulated as follows:

Total effective green area sizes in city =  $A + 0,75 B + 0,50 C + 0,25 D$

Total effective green area sizes around the city =  $E + 0,75 F + 0,50 G + 0,25 H$

### **Formulation of Green Area Standart by Effective Green Area Method:-**

Green area standard is explained as the green area size per capita in the planned area. The value that this standard will get shows differences depending on the cities and countries according to the planning conditions and applications. The definition of this standard value and the problems in reaching the mentioned standard value are detailly explained in Chapter 2.

In this article, the standard value determined as the green area size per capita in planning is not noticed. Highlighted topic is the way to calculate it by the effective green area view in fact. For this aim, a new calculation system has been brought as “Effective Green Area Method”. The “green area size capita” used as “green area standard” can be formulated below as “effective green area size per capita” as explained above considering effective green area sizes.

Effective Green Area Standard (E.G.A.S) = Green Area Size x Green Efficiency Coefficient / Population

Therefore, the formulas of the effective green area standard per person are obtained by dividing the effective green area sizes in and around the city to the population of the planning area, as explained above. Those formulas are below:

$$\text{E.G.A.S}_{\text{in city}} (\text{m}^2 / \text{person}) = (A + 0,75 B + 0,50 C + 0,25 D) / \text{population} \quad (1)$$

$$\text{E.G.A.S}_{\text{around the city}} (\text{m}^2 / \text{person}) = (E + 0,75 F + 0,50 G + 0,25 H) / \text{population} \quad (2)$$

In reality, generally in urban conception, a green area standard value per person is not used for around the city. The green area types around the city as mentioned in Table 3, are generally found in the green belt surrounding the city. The reason for this is because the green belt around the city is the belt which protects the city. Therefore the green tissue belong this belt is also under protection.

Still, nowadays, considering some mega-cities such as Tokyo, Sydney, and Beijing, there is no success so much for the protection of green belts from activities and construction (Ratcliffe, 1974). Whereas, these areas are green areas where citizens can use for long periods. That is why their efficiency in city life is vital. For this reason, considering their positive effect on the city, their necessity can not be denied. So, if a standard value should be used in the concept of the green areas around the city; the green area sizes that will be used in the standard calculation, must be calculated by the effective green area method, just like the green areas in the city.

Determined formulas (1) and (2) are very flexible in adding or extracting, various green area types to planning as can be understood by the formation of the effective green area method as well. The important main idea is into which group the mentioned green area type should be included.

### **Evaluation and Discussion:-**

Concerning the planning discipline, areas with a green character belonging to private possession are not included in determined green area standard per person. The reason is that considering both the construction regulations and the urban planning discipline; the green areas in the city are accepted as public owned places assigned for general services (Gül, 2001).

On the contrary in this article, private green areas especially in the city such as houses and establishment gardens (Erkun, 1999) with expropriation obligation factor negative; are included into green areas when calculating the efficient green area standard. Because these mentioned areas own positive values for different characteristics other than the “expropriation obligation” factor. For that reason, even though they can not completely be used by the public, that kind of green areas; have the green area performance of their green efficiency coefficient ratio determined by this method.

Also, the areas of private status like the military green areas and green areas of foreign representatives; although closed for public use; are %100 include to the determined green area standard conventionally used. The efficient green area calculation explained in this article eliminates the contradiction by including such areas into the total green area by the green efficiency coefficient rate.

In this article, green areas have been grouped according to the green efficiency coefficients that explained above for their benefits to urban. However, in this regard that kind of mistake should not be done like “low green efficiency coefficient” means poor green quality. Because, no matter what type, every kind of green area is essential for urban with its function. That is why all kinds of green areas are not given up in planning. Green efficiency coefficient explained in this paper, reveals the importance of two main factors as the amount of green tissue and opening to public use regarding their benefits to city climate and energy-saving. Therefore, Efficiency Green Area Standard (E.G.A.S) must be used in a sense of efficiency of green control together with green area standard conventionally used.

Consequently, in this article, a more efficient method is proposed to reach the green area standard accepted legally and by discipline in planning. A brand new green area standard value is not determined.

As very well known, all of the green area types do not need to take place in every planning area. Certain green area types can only take place in in the planning area concerning characteristics such as population etc. The emphasis in this article is, determining the weights of green area types regarding opening to public use and green tissue amount shall be included in the standard.

As long as the planned urban settlement area gets large, some of the green areas around the city or almost all just as in the metropolitan areas may stay in the city. Such a case will cause no difference in the calculation; the mentioned green area type will be included in urban green area formula with its green efficiency coefficient.

Therefore the two different effective green area standard formulas suggested in this article can be simplified in practice and transformed into one formula. In this case, the sizes of effective green areas in the standard formula can be calculated as;  $(A+E) + \%75 (B+F) + \%50 (C+G) + \%25 (D+H)$  and divided by the area population. So, one single standard control can be made as effective green area per person.

Besides, in time, considering the improvements in life conditions such as new green area types and placing green on buildings, green roofs (Werthmann, 2007), etc. innovations can continuously be added. This method is in a structure that enables to determine the green efficiency coefficients of the new types by the determined factors.

This approach, on one side, by including all types of green areas into calculation; enables to increase the standard value of green areas in and around the city above the standard values applied up today. On the other hand, it will be much more useful concerning the performance of the planned green areas.

## Conclusions:-

1. The green area standard that should be obeyed in urban settlement planning depending on the size of the settlement must be divided into two sections being inside the city and around the city if needed.
2. Green areas can be evaluated in six general categories being resting, garden use, entertainment, games and sports, agriculture and private status.
3. Green areas have five main urban benefits being control of ecological balance, prevention of environmental pollution, control of natural disasters, fulfilment of social activities and psychological satisfaction.
4. The more green tissue and being open to public use characteristics; the more suitable are the green areas to urban end environmental benefits.
5. The nine main factors that are effective on the urban and environmental benefits of green areas are determined. These factors are; the obligation of expropriation, low user density, usability, lack of solid ground ratio, be active usage, a variation on heights of plants, low construction density, a plurality of diversity of plants and protection of natural environment impression.
6. Green area groups are evaluated according to the number of positive factors. Consequently being both insides of the city and around the city, four green area groups with varying positive factor numbers are determined.

7. When calculating the green area standards regarding m<sup>2</sup> per person, the sizes of green areas both in and around the city should be calculating considering the “green efficiency coefficients” that determine the green area performances.
8. The green efficiency coefficients of green area types are determined depending on the bigness of the positive factor numbers explained in this article. If the positive factor number increases, the green efficiency coefficient also increases.
9. Green area sizes in plans can be transformed into “effective green area sizes” if multiplied by green efficiency coefficients. In city planning divided the total of effective green area sizes pay the population of the plan we find the size of effective green area per person. Of course, it is a must to control if this value in compliance with the green area standard value conventionally used of the plan.
10. “Effective Green Area Standard” formulas have been developed as (1) and (2) for in and around the city. These formulas are improved by reducing the green areas coded with A, B,C,D,E,F,G and H shown in Table (1) and (2), into effective green area sizes by their green efficiency coefficients.
11. As explained in the “evaluation and discussion” section, if there is no need for distinction of in and around the city, this mentioned “Efficient Green Area Standard” formulas can be reduced to one single formula as follow:
12.  $E.G.A.S = [(A+E) + \%75 (B+F) + \%50 (C+G) + \%25 (D+H)] / \text{population of plan}$
13. Effective green size formula can be generalized as shown below:
14.  $E.G.A = \text{Green Area Size} \times \text{Green Efficiency Coefficient}$

### Abstract

**Background:** The microenvironment of epithelial ovarian cancer (EOC) continued to be an important point of research to discover new therapeutic targets for such malignancy. It was discovered that any cells that were in the microenvironment of the EOC may be associated with cancer prognosis like tumor-infiltrating lymphocytes (TILs) and T-regulatory cells (Tregs).

The PD-1/PD-L1 pathway was a T-cell checkpoint pathway that sent inhibitory signals to T cells that can inhibit immunity. PDL1, a PD-1 ligand, is detected in lymphocytes, dendritic cells, macrophages and tumor cells. Tregs (mature T lymphocytes) that start in the thymus after stimulation of naïve T cells and responsible for the reduction of autoimmune diseases, but its over production will inhibit endogenous protection against infection and tumors. Forkhead/winged-helix transcription factor box P3 (Foxp3) is an intracellular molecule for Tregs growth and maturation and was found to be the most specific Tregs marker. It was found that Foxp3 is not only found in Treg cells that originated in the thymus but also in malignant cells and its difference in expression can affect the outcome of cancer patients.

**Aim of our study:** was to assess PD-L1 and FOXP3 expression in epithelial ovarian carcinoma a trial to detect their prognostic value and their impact on survival in patients with such type of cancer.

**Methods:** The expressions of PD-L1 and FOXP3 in both tumor cells and stromawere evaluated in sections of 50 paraffin blocks that were retrieved from 50 patients with EOC using immunohistochemistry. We assessed the relation between their expressions, clinicopathological parameters, survival and prognosis of those patients

**Results:** Expression of PDL-1 in tumor cellswas positively correlated with; grade, stage of the tumor, LN metastasis ( $p=0.001$ ) and histopathological type (0.011), type of surgery and residual disease after surgery ( $P=0.010$ ). Expression of PDL-1 in TILswas positively correlated with grade ( $p = 0.033$ ) and stage of the tumor ( $p = 0.029$ ). Expression of FOXP3in tumor cellswas positively correlated with; age of the patients ( $p=0.017$ ), grade ( $p = 0.010$ ), stage of the tumor ( $p<0.001$ ) and distant metastases ( $p=0.002$ ). Whereas the expression of

FOXP3 in TILs was correlated with histological type ( $P=0.038$ ). Combined low PDL1 & FOXP3 expressions in tumor cells were significantly associated with higher progression free survival (PFS) ( $p<0.045$ ).

There were highly significant statistical relations were found between expression of each marker in tumor cells and Pdl1 in TILs and both Pdl1 & FOXP3 in TILs ( $p<0.001$ ).

There were highly significant statistical relations between expression of both markers in TILs and each one of the following ( Pdl1 in tumor cells ( $P<0.001$ ), FOXP3 expression in tumor cells ( $p=0.007$ ) and both markers in tumor cells ( $P<0.001$ )).

**Conclusion:** PD-L1 and FOXP3 are considered poor prognostic markers in EOC patients with bad impact on progression free survival.

## Introduction:-

Epithelial ovarian cancer (EOC) is the 4<sup>th</sup> most common cancer in women. The serous and mucinous carcinoma are the commonest EOC subtypes (1). It was found that EOC microenvironment has an important role in its initiation, progression and prognosis (2). So it continued to be an important point of research to discover new therapeutic targets for such malignancy. The cells that were in the microenvironment of the EOC may be associated with a good or poor prognosis like tumor-infiltrating lymphocytes (TILs) and T-regulatory cells (Tregs) (3, 4).

The PD-1/PD-L1 pathway was a T-cell checkpoint pathway that sent inhibitory signals to T cells that can inhibit immunity (5). PD-L1, a PD-1 ligand named also B7 homolog 1 (B7-H1) or CD274, is detected in T lymphocytes, B lymphocytes, dendritic cells, macrophages and various tumor cells (6). PD-L1 expression and relation to both pathological, clinical parameters and prognosis were studied in many cancers, but the exact mechanism of how PD-L1 and its effect on tumor microenvironments can have a role in cancer immunity is not adequately understood (7). PD-L1 expression in EOC was not done in details and has many conflicting results (8).

Tregs are mature T lymphocytes that start in the thymus after stimulation of naïve T cells and responsible for the reduction of autoimmune diseases but their over production will inhibit endogenous protection against infection and tumors (9). Forkhead/winged-helix transcription factor box P3 (Foxp3) is an intracellular molecule specified for Tregs growth and maturation and was found to be the most specific Tregs marker (10). It was found that Foxp3 is not only found in Treg cells of thymus origin but also in cancer cells with different expression pattern which can affect the outcome of cancer patients (11). However, the role of Foxp3 in the prognosis of cancers is still a point of research, so FoxP3+ Tregs are investigated as a prognostic factor and they can be used as a novel therapeutic target.

**Aim of our study:** was to assess immunohistochemical expression of PD-L1 and FOXP3 in both tumor cells and stroma of epithelial ovarian carcinoma in a trial to detect their prognostic value and relation to survival of patients with such type of cancer.

## Patients and Methods

In our retrospective study fifty archived formalin fixed paraffin embedded blocks of EOC collected from Pathology Department, Faculty of Medicine, Zagazig University in the period from August 2011 to July 2015. We used the tumor-node-metastasis (TNM) and International Federation of Gynecology and Obstetrics (FIGO) classifications for staging of EOC and the WHO grading system for their pathologic grading (12,13). We identified age, grade, stage, lymph node, distant metastasis of the cases, type of surgery which was done for those patients, response to chemotherapy according to RECIST criteria of the patients and the patients outcome from the patients' records at Clinical Oncology and Nuclear Medicine and Medical Oncology Departments, Faculty of Medicine, Zagazig University by retrospective examination of the patient's files at the involved departments and the slide files of the pathology department. Our patients had follow-up records for 4 years. Progression was defined by radiological diagnosis according to the RECIST criteria or as doubling of the nadir serum CA-125 (14). The chemotherapy regimen was 6 cycles of paclitaxel (175 mg/ m<sup>2</sup>) with carboplatin (AUC 6), administered every 3 weeks. Histopathological examination and evaluation of PD-L1 and FOXP3 expression in both tumor cells and stroma by using immunohistochemistry were done in the pathology department, Faculty of Medicine, Zagazig University. We

assessed the relation between their expressions, clinicopathological parameters, response to chemotherapy, survival and prognosis of those patients. Patients with nonepithelial ovarian cancer, patients treated before operation, and patients who were not treated surgically were excluded from this study. Local Research Ethics Committee approval of the study was obtained.

#### **Immunohistochemical staining:**

Immunohistochemical staining was carried out using streptavidin–biotin immunoperoxidase technique (15). The slides were incubated with rabbit monoclonal anti- PD-L1 antibody [28-8] ab205921 was used at a dilution of 1:200 and Mouse monoclonal anti-FOXP3 antibody (ab22510) diluted 1/50 at 4°C overnight (Abcam, Cambridge, MA, USA). Normal human tonsil is used as a positive control for both PD-L1 and FOXP3 but the negative controls by replacing the primary antibodies by the non-immune serum.

#### **Evaluation of immunohistochemical expressions of PD-L1:**

##### **1. PD-L1 expression in tumor cells;**

The expression of PD-L1 was evaluated according to the intensity of the staining and scored as follows: 0, negative; 1, weak expression; 2, moderate expression and 3, strong expression. Cases with scores 0 and 1 were defined as the low-expression group, and cases with scores 2 and 3 were the high-expression group (16).

##### **2. PD-L1 expression in tumor infiltrating lymphocytes (TILs)**

Five tumor areas in a 400x magnification (high power fields (HPF) were assessed in areas with higher intratumoral TILs density. The non-tumor areas (e.g. stroma, necrosis) will be separated from areas of pure tumor. PD-L1 positive TILs that were in direct contact with tumor cells were called intratumoral TILs or PD-L1 positive TILs within the stroma were called stromal TILs. The total number of TILs was added to obtain TILs/5 HPF (17). The cut off (no vs any expression) was used for statistical analysis; no expression in TILs was considered low expression and any expression in TILs considered high expression.

#### **Evaluation of immunohistochemical expressions of FOXP3:**

##### **1. FOXP3 expression in tumor cells;**

The expression intensity was classified into four grades as follows: no staining was scored as zero; weak staining was scored as one; moderate staining was scored as two; strong staining was scored as three. Scores for the positive cells were as follows: (score 0) means less than or equal 5% positive cells; (score one) means 6-24% positive cells; (score two) means 25-49% positive cells; and (score three) means 50-74% positive cells; and (score four) means more than or equal 75% positive cells. The scores of percentage and intensity reflect the sums of scores, with total scores of 0 indicated as (-); 1-2 as (+); 3-5 as (++); and 6-7 as (+++) (18). We use total score 5 as a cut off value above which is considered high expression and below which is low expression.

##### **2. FOXP3 expression in tumor infiltrating lymphocytes (TILs).**

TILs in tumor stroma were counted in ten high-power field (HPF, at 400 magnification). TILs count of more than five per HPF was defined as high TILs, and TILs counts of less than 5 per HPF was defined as low TILs (19).

#### **Statistical analysis:-**

The statistics were done by usage of SPSS 22.0 for windows (SPSS Inc., Chicago, IL, USA) and MedCalc (MedCalc Software bvba 13, Belgium Ostend,). All the Continuous variables were made as the mean (95%CI). Percent of categorical variables were compared using Chi-square test or by Fisher's exact test. Trends of changes in distribution of the relative frequencies between ordinal data were compared by using Chi-square test. Overall Survival rate (OS) was assessed from the time of cancer diagnosis to death or to the most recent follow-up data. Progression Free Survival rate (PFS) was assessed from time of starting cancer treatment to time of progression or till the most recent follow-up data when patients were known to be progression free. Assessments of OS and PFS rates were made according to our markers. These time-to-event rates were assessed using Kaplan-Meier plots and compared by using two-sided log-rank test. We included patients with suboptimal surgery with residual cancer in response evaluation but the others were excluded. All tests were two sided. A p-value less than 0.05 were considered significant.

**Results:-****Patient Characteristics**

The clinical characteristics of the 50 ovarian carcinoma (OC) patients that were included in our study are summarized in (Table1) with age ranged from (25-75) years (Mean: 55.08±10.80 years), 30(60%) cases were serous carcinoma, 15(30%) were mucinous carcinoma and 5 (10%) were carcinoma of other types. The most prevalent stage is stage III which is present in 27 patients (54%) whereas stage II and IV are present in 7(14%) patients and 14 (28%) patients respectively. Only two patients had stage Ic. Forty three patients (86%) had high grade OC. Lymph node and distant metastasis are present in 33(66%) patients and 14 (28%) patients respectively. The suboptimal surgery with residual disease more than 1cm, was present in 22 (44%) patients but optimal surgery was done for 28 (56%) patients. The median of follow up duration was 25.50. While its range was 10-48 months.

**PDL-1 immunoexpression and their correlation with clinicopathological features of OC patients: (Fig 5)****1.PDL-1 expression in tumor cells**

High cytoplasmic expression of PD-L1 in tumor cells was detected in 31 out of 50(62 %) cases of our patients, and it was significantly positively correlated with; histopathological type ( $p = 0.011$ ), grade, stage of the tumor and lymph node metastases ( $p=0.001$ ), type of surgery and absence of residual disease after surgery ( $P=0.010$ ). No significant correlation was found between PD-L1 in tumor cells expression and distant metastases or age of the patients (**Tables 2, 4**).

**2.PDL-1 expression in tumor infiltrating lymphocytes (TILs)**

High cytoplasmic expression of PDL-1 in TILs was detected in 20 out of 50(40 %) cases of our patients and it was significantly positively correlated with grade ( $p = 0.033$ ) and stage of the tumor ( $p = 0.029$ ). No significant correlation was found between PD-L1 expression, histopathological type of the tumor, lymph node metastases, distant metastases or age of the patients, type of surgery and residual disease after surgery (**Tables 2,4**).

## 2.FOXP3 expression in tumor infiltrating lymphocytes (TILs)

High nuclear expression of FOXP3 in TILs was detected in 20 out of 50(40 %) cases of our patients and it was significantly positively correlated with histopathological type of the tumor ( $p = 0.038$ ). No significant correlation was found between FOXP3 expression, grade and stage of the tumor, lymph node metastases, distant metastases or age of the patients , type of surgery and residual disease after surgery . There were highly significant statistical relations were found between PD-L1 expression in both tumor cells and TILs ( $p<0.001$ ) There were highly significant statistical relations between expression of PD-L1 expression in TILs and FOXP3 expression in tumor cells ( $p=0.001$ )(Tables 2 ,4).

### Correlation between the clinopathological parameters on immunohistochemical staining for PD-L1 and FOXP3 in tumor cells and TILs in epithelial ovarian carcinoma women

The combination between the two markers in tumor cells were significant with age (P=0.006), grade and stage (P<0.001), histological type (P=0.019), LN metastasis (P=0.007), distant metastasis (P=0.013), type of surgery and residual disease after operation (P=0.020) .

The combination between the markers in TILs were significant with stage (P=0.020) only.

No significant correlation was found between combinations of the markers in TILs with the age, grade and stage, histological type, LN metastasis, distant metastasis, type of surgery or residual disease after operation .

There were highly significant statistical relations were found between expression of both markers in tumor cells and PD-L1 in TILs and both PD-L1 & FOXP3 in TILs (p<0.001).

There were highly significant statistical relations between expression of both markers in TILs and PD-L1 in tumor cells (P<0.001), FOXP3 expression in tumor cells (p=0.007) and both markers in tumor cells (P<0.001) (**Tables 3, 5**).

### The response and the outcome and their correlation with the markers (Tables 1, 4& 5, Figs 1, 2, 3& 4)

Patients with residual disease (22patients) were included in evaluation of response otherwise other patients were excluded. Fifteen (68.2%) patients had response to treatment; 11 (50%) patients had CR whereas 4 (18.2%) patients had PR .Only 7 (31.8%) patients had no response (SD&NR) .Overall 35 patients (70%) had progression and 23 (46%) patients died. Table 1There were high response rate and less progression and less mortality in patients with low PD-L1 expression in tumor cells or TILs but with no significant correlation between them with each marker or their combination with FOXP3 . There were high 4 y- DFS and 4y-OS in patients with low PD-L1 expression in tumor cells or TILs but with no significant correlation with each marker . Combined low PDL1& FOXP3 expressions in tumor cells were significantly associated with higher progression free survival (PFS) (p<0.045). There were high response rate and less progression in patients with low FOXP3 expression in tumor cells or TILs but the mortality was less in patients with low FOXP3 in tumor cells only ,with no significant correlation between them with each marker or their combination with PD-L1 . The mortality was higher in patients with low FOXP3 in TILs only but without any significance .There were high 4 y- DFS in patients with low FOXP3 expression in tumor cells or TILs but with no significant correlation with each marker . However there were low 4y-OS in patients with low FOXP3 expression in tumor cells or TILs but with no significant correlation with each marker . Combined low PD-L1& FOXP3 expressions in tumor cells were significantly associated with higher progression free survival (PFS) (p<0.045). so:-

- There are no significant correlations between PD-L1 or FOXP3 expression or their combination in tumor cells or in TILs with response to treatment , progression, or mortality(P>0.05)
- There are no significant correlations between PD-L1 expression in tumor cells or TILs with progression free survival (PFS)& overall survival (OS) rates (p >0.05).
- There are no significant correlations between FOXP3 expression in tumor cells or in TILs with overall survival (OS) or progression free survival (PFS) (P>0.05)
- Combined low PD-L1& FOXP3 expressions in tumor cells were significantly associated with higher progression free survival (PFS) (p<0.045).

### **Discussion:-**

The microenvironment of epithelial ovarian cancer (EOC) is heterogeneous and various immune cell populations have been associated positively or negatively with clinical prognosis, including tumor-infiltrating lymphocytes (TILs) (3). In ovarian cancer; TILs express the immune receptor programmed cell death 1 (PD-1) , but cancer cells express its ligand PD-L1 (20,16).

We found that high expression of PD-L1 in tumor cells was significantly positively correlated with histopathological type, high grade, advanced stage of the tumor and high lymph node metastases, type of surgery with presence of residual disease after surgery. High expression of PD-L1 in TILs was significantly positively correlated with grade, stage of the tumor. In addition, there were, in our result, Fifteen of 22 with residual disease (68.2%) patients had response to treatment; 11 (50%) patients had CR whereas 4 (18.2%) patients had PR Only 7 (31.8%) patients had no response (SD&PD). Overall 35 patients (70%) had progression and 23 (46%) patients died. We found high response rate, less progression and less mortality in patients with low PD-L1 expression in tumor cells or TILs but with no significant correlation between them with each marker or their combination with FOXP3. There were high 4 y- DFS and 4y-OS in patients with low PD-L1 expression in tumor cells or TILs but with no significant correlation with each marker. Combined low PD-L1& FOXP3 expressions in tumor cells were significantly associated with higher progression free survival (PFS) ( $p<0.045$ ).

**Hamanishi et al., 2007(16)** found similar results to ours that over expression of PD-L1 has been associated with poor clinicopathological parameters and poor overall survival in EOC, which meant that there will be a benefit from PD-1/ PD-L1 inhibition in EOC patients. **Hamanishi et al., 2015 (21)** gave another proof of the therapeutic benefits of the PD-1/ PD-L1 pathway in EOC. **Wu et al., 2015 (22)** mentioned that tumor expression of PD-L1 was positively correlated with cancer progression and poor prognosis of malignancies of many organs, but full accurate data are not available and are conflicting. This problem might be due to usage of different antibodies clones which had different specificity with variable scoring methods (8).

Similar results proved by **Taube, et al., 2014 (23)** that PD-L1 was expressed in the cancer microenvironment, mainly in TILs and had the strongest association with response to nivolumab. These results clarified measuring, not only PD-L1 positivity in tumor cell, but also PD-L1 positivity in TILs for immune checkpoint therapy response prediction. **Sabatier et al., 2015 (24)** proved in his mRNA study results that were different from our results in that high/unregulated PD-L1 expression was associated with better survival, However, **Baptista et al , 2016 (25)**, found that high PD-L1 protein expression was associated with shorter survival which was like our results. PD-L1 expression in malignant cells is a recent prognostic marker that could prove the antitumor immunity interruption. Previous studies proved that PD-L1 overexpression was an important prognostic factor in malignancies of many organs (26). PD-L1 overexpression and relations to patient prognosis differ according to cancer type (27).

So, our data revealed that PD-L1 overexpression by EOC cells is a significant prognostic factor and such expression allow better evaluation of host-tumor immunity that allow better treatment of ovarian cancer. Recently, many researches proved that cancers with PD-L1-positive TILs had a high response rates to cancer immunotherapies, proving the role of PD-L1 as a predictive marker of response to anti-PD-1 antibody therapy (28).

Usage of immunotherapy in treatment of cancer is rapidly evolving from therapies that non-specifically stimulate the immune system to more specific and targeted activation of specific components of the immune system with decreased toxicity and increased efficacy of immunotherapy. Therapies that inhibit the interaction between programmed death ligand 1 (PD-L1) and programmed death 1 (PD-1), are generating much excitement, even in malignancies that are not traditionally considered to be immunogenic (29). Anti-PD therapy has become the backbone of cancer immunotherapy and a major modality of cancer treatment. It is important to learn from this successful therapy for better understanding of the immune system and its role in cancer and to improve future therapies (30).

We found that high expression of FOXP3 in tumor cells was significantly positively correlated with poor clinicopathological parameters like younger age of the patients, high grade, distant metastases and advanced stage of the tumor. High expression of FOXP3 in TILs was significantly positively correlated with histopathological type of the tumor only. There were high response rate and less progression in patients with low FOXP3 expression in tumor cells or TILs but the mortality was less in patients with low FOXP3 in tumor cells only, with no significant correlation between them with each marker or their combination with PD-L1. The mortality was higher in patients with low FOXP3 in TILs only but without any significance. There were high 4 y- DFS in patients with low FOXP3 expression in tumor cells or TILs but with no significant correlation with each marker. However there were low 4y-OS in patients with low FOXP3 expression in tumor cells or TILs but with no significant correlation with each marker. Combined low PD-L1& FOXP3 expressions in tumor cells were significantly associated with higher progression free survival (PFS) ( $p<0.045$ ).

Our results were in agreed with previous studies in ovarian carcinoma (31). **Curiel et al., 2004, (5)** who proved that FOXP3 over expression in cancer cells is associated with poor prognosis and decreased survival which could be due to their suppressive effects on anticancer immune responses. Recently, Foxp3 was found to be not only specifically expressed in Treg cells which were normally arose in the thymus, but also in the malignant cells and its expression is positively correlated to cancer progression and prognosis (32). This relation has been reported in a many metastatic or non-metastatic cancers (11).

There are several studies proved an inverse correlation between FOXP3 expression in Tregs and survival in certain kinds of tumors (33), in contrast to us as we found no significant correlations between FOXP3 expression in tumor cells or TILs and worsened survival rates of the patients like many other studies which indicated that there were no significant correlation between FOXP3+ Tregs and survival (34,35,36)

So, conflicting data had been reported about the prognostic role of FOXP3+ Tregs infiltration in cancers which may play a negative, positive or non-significant role in cancer patient prognosis and survival(11). The association of FOXP3 positivity and poor prognosis could be explained by that FOXP3+ Tregs cells in ovarian carcinomas express intracellular FOXP3, inhibit host immunity and stimulate cancer growth (18). Also, **Hinz et al 2007(37)** added another explanation for that as inhibition of an effector T-cell response allow cancer immune escape. **Merlo et al, 2009 (38)** found that FOXP3 over expression was associated with decreased overall and metastasis free survival rates but not with local recurrence; so, FOXP3 expression was related to the cancer metastatic ability rather than to a specific immune response suppression.

These data therefore provide direct evidence that human FOXP3 positive Treg cells have an important immunopathological role in human cancer by suppressing endogenous T cell immunity (39). FOXP3 was found to be a novel therapeutic target so vaccines that eradicate FOXP3-expressing cells increase host immunity against cancer (40), the specific mechanism underlying the role of Foxp3 in cancer pathogenesis is uncertain. Foxp3 expressing Tregs can increase the occurrence of metastasis in cancers. **Ma et al 2013(41)**, found that Foxp3 was markedly expressed in the gastric carcinoma cells and activate the apoptosis pathways so induce gastric cancer cells apoptosis and inhibit the cancer progression so predicted a better prognosis (41,19). Above findings suggest that Foxp3 role in the cancer cells are still conflicting as it may had a tumor suppressor effect to inhibit cancer progression or stimulate cancer growth by inhibiting immunity but the specific mechanism is still uncertain.

In our study, absence of significance between each one of PDL1 in tumor cells and TILs and FOXP3 in tumor cells and TILs with the response, progression and survival may be due to small number of our patients which is a limitation of our study which may limit our statistical power.

## Conclusions:-

EOC is one of the most life-threatening malignancies and immunotherapy may be a promising supplementary treatment for it in the near future. The role of microenvironment cells in EOC remains controversial and may not be informative for survival prediction after resection of the primary tumor. We found that combination of PDL-1 and FOXP-3 expressions in EOC were correlated with poor prognosis but further studies on large number of cases were recommended to prove our results and clarify the possible use of them as therapeutic targets in cancer.

#### Abstract

**Aim:** The aim of the present study was to compare the S ig A levels and dental caries in obese and non obese children.

**Materials and Methods:** Eighty normal healthy children in the age group of eight to twelve were selected and divided into two groups, Obese(Group I, n=40) and Nonobese(Group II, n=40). Each group was further divided into two sub groups as carious (n=20), and non carious (n=20) based on deft/DMFT score. From all the children 2 ml of unstimulated saliva collected and S IgA levels were estimated by using ELISA method.

**Results:** The difference between S Ig A levels and dental caries in obese and non obese was not statistically significant where as intragroup(carious and non carious) S IgA levels were significantly higher in carious free sub group than carious sub group in both groups.

**Conclusion:** Higher levels of S ig A in caries-free mouth can be attributed for protection against dental caries. From the present study, it was concluded that obesity has no effect on S Ig A levels.

#### Introduction:-

Dental caries is an infectious microbial disease with a multifactorial origin that continues to be the most common chronic disease in humans affecting nearly the entire population.<sup>1</sup> Human saliva not only lubricates the oral tissues, making oral functions such as speaking, eating, and swallowing possible, but also protects teeth and oral mucosal surfaces in different ways. Recent studies have revealed a large number of functions, mediated by both the inorganic and organic components of saliva, that should be considered in assessments of the effects of human saliva on dental caries. Some genetically regulated salivary components like immunoglobulins may influence both the colonization and the clearance of microorganisms from the oral cavity.<sup>2</sup> Out of all five classes (IgA, IgD, IgE, IgG, IgM) of immunoglobulins secretory IgA is the main immunoglobulin in salivary secretions. Salivary secretory immunoglobulin A (S IgA) has an immunological control over dental caries and presumably prevents the adherence of cariogenic microorganisms to hard surfaces and may also inhibit the activity of glucosyltransferases.

Childhood obesity is also one of the most serious public health challenges of the 21<sup>st</sup> century. The problem is global and is steadily affecting many low and middle income countries, particularly in urban settings, and prevalence has increased at an alarming rate. Worldwide, the numbers of overweight children under the age of five is estimated to be over 42 million, and close to 35 million of these are living in developing countries.<sup>4</sup> Diet plays an important role in the increased prevalence of obesity due to the higher consumption of foods rich in fat and carbohydrates. Overweight or obese children and adolescents reported higher consumption of sugary drinks and foods such as “fast food” compared with those who reported normal weight. Besides being directly associated with obesity, eating habits, especially regarding the intake of sucrose, have a well established causal relationship with tooth decay.<sup>5</sup> Recent studies have revealed that there are significant relations which occur between salivary immunoglobulin A (SIgA) levels and dental caries<sup>6,7,8</sup> body mass index (B.M.I) and dental caries in children.<sup>9,10,11</sup> The purpose of the present study is to compare the salivary IgA levels and dental caries in obese and non obese children.

## **Methodology:-**

### *Sample selection:*

The present study was conducted in the Department of Pedodontics and Preventive Dentistry, Mamata Dental College and Hospital, Khammam in association with Department of Microbiology and Immunology, Mamata General Hospital, Khammam. The study was approved by Ethical Review Board.

A total of 80 school going children aged between 8-12 years were selected randomly for the present study based on the following inclusion and exclusion criteria after obtaining informed consent from the parents.

### *Inclusion criteria:*

- Children with normal growth and development
- Children with good oral hygiene.
- Children without any systemic disorders.

### *Exclusion criteria:*

- Children with upper respiratory tract infection
- Medically compromised children and children with systemic disorders.
- Children having history of antibiotics intake in past 7 days.
- Children have oral exposure to food before two hours of sample collection.

### *Anthropometric measurements:*

Anthropometric measurements were taken prior to the dental examination. The height without shoes was measured with a height measuring charts. The weight was assessed using a digital weighing machine. The BMI was calculated as the weight divided by the square of the height (kg/m<sup>2</sup>). The calculated BMI was considered as obese according to the Centers for Disease Control and Prevention's (CDC) BMI-for-age growth charts.

## **Dental examination:**

A caries assessment was performed with a mouth mirror and a probe under clinical conditions by single examiner. All the children were selected during routine dental camps conducted by the department of pediatric and preventive dentistry, Mamata Dental College & Hospital, Khammam.

Each group was again divided into two sub groups of each 20 as Carious and Non carious groups based on the WHO criteria 1997.

## **Saliva Collection<sup>12</sup>:**

Salivary samples were collected between 10 AM to 12 PM in order to prevent any differences in the concentration of saliva due to circadian rhythm. Patients were informed not to eat or drink one hour before saliva collection to minimize possible food debris and stimulation of saliva. The child was seated in a well-ventilated and well-lit room. The head was kept at 45 degrees flexion with one hand holding a disposable vial for 2 minutes in a calm atmosphere to simulate unstimulated conditions. The saliva was allowed to drip into the sterile vial held to the lower lip for collection of 2 ml of unstimulated saliva. If the saliva sample was insufficient within 2 minutes, the collection was continued until 3 ml of saliva per subject was obtained.

## **Determination of S Ig A level:**

Saliva collected from children were centrifuged and supernatant was added to prepared salivary diluents. Diluted antibody enzyme conjugate was added to standard, control, unknown samples and incubated for 90 minutes at room temperature. 50µl of sample from each tube was added to appropriate wells and covered plate with adhesive plate sealer. Washed wells 6 times with wash buffer and added TMB solution. 50µl of stop solution was added to all wells

and waited until all wells turned from blue(fig 3) to yellow (fig 4). Then read in a plate reader at 450 nm for S IgA levels.

Fig 1. S Ig A Elisa kit

Fig 2 - Collected saliva samples

Fig 3 Before adding stop solution

Fig 4 After adding stop solution

### Results:-

The results obtained were subjected to statistical analysis. The mean values, standard deviation (SD) for both the groups were analyzed using the “Statistical Package for the Social Sciences” (SPSS) software, version 16.0. A  $p$  value of  $<0.05$  was considered as statistically “significant” and a  $p$  value  $<0.001$  was considered as statistically “highly significant”.

Intra group comparison shows mean S Ig A levels for obese carious children is  $157.05 \mu\text{g/ml}$  and  $182.8 \mu\text{g/ml}$  for non carious children (Graph 1& Table 1). Intra group comparison of mean S Ig A levels for Non obese group is  $158.55 \mu\text{g/ml}$  in carious and  $183.8 \mu\text{g/ml}$  for non carious children (Graph 2& Table 2). S IgA levels were significantly higher in carious free sub group than carious sub group in both obese and non obese groups (Graph 3 & Table 3). Inter group comparison of mean S IgA levels for Obese children is  $169.92 \mu\text{g/ml}$  and  $171.17 \mu\text{g/ml}$  in Non obese children (Graph 4&Table 4). There is difference between S Ig A levels and dental caries in Obese and Non obese group but the difference is not statistically significant ( $p:0.9963$ )

### Discussion:-

Dental caries is a multifactorial disease and one of the major contributing factors is saliva. Secretory immunoglobulin A (S IgA) is the prominent immunoglobulin in whole saliva and is considered to be the main specific defence mechanism in the oral cavity. S IgA helps in prevention of dental caries by inhibition of bacterial adherence, reduction of hydrophobicity, agglutination of bacteria and inactivation of bacterial enzymes and toxins. Several studies on the role of S IgA in prevention of dental caries showed contradictory results.<sup>13</sup>

Overweight and obesity among children are a major public health concern, especially in developing countries. There are many reasons for the obesity like fast food contributes to a high-energy consumption, and a sedentary life style reduces energy expenditure. Indeed, many of the foods, including soft drinks and refined-wheat breads, are low in micronutrients.<sup>14</sup>

Increased SIgA levels are seen in Wiskott-Aldrich syndrome, Cirrhosis of the liver, IgA myeloma, Autoimmune disorders, Rheumatoid arthritis, Lupus erythematosus etc. Whereas decreased SIgA levels are seen in Hereditary ataxia, Telangiectasia, Malabsorption syndromes, Lymphoid aplasia, Chronic lymphoblastic leukemia etc. Because of changes in salivary IgA levels in different diseases, present study excluded the children having health problems.<sup>15</sup>

Saliva was collected by the method suggested by Colin Dawes<sup>16</sup> as it was easy to obtain the child's cooperation. All the samples were collected between 10-11am. This time was two hours after any oral or visual exposure to food stuffs. This was done to prevent the effect of circadian rhythms on salivary concentrations. Edgar M<sup>17</sup> found that the IgA & protein concentration decreased with increased salivary flow from the parotid and submandibular salivary glands. Stimulated saliva could have decreased the concentration of the IgA, hence unstimulated whole saliva was collected for the study.

After collection of saliva, it is important to keep samples at or below -20°C within 4 hours of collection from children to avoid bacterial growth in the specimen. In the present study salivary samples were stored at -70°C in cryo refrigerator to prevent bacterial growth in collected salivary samples.

According to Fontana et al<sup>18</sup> establishment of disease depends on the relative incapacity of the host to provide effective specific and nonspecific protective barriers and on the ability of the microorganism to adhere and to overcome these barriers. Pathogenic microorganisms must overcome the host nonspecific defence barriers (e.g., cleansing mechanisms such as coughing, swallowing, and fluid flow) and must also escape recognition by soluble immune or non immune host molecules in host secretions. Secretory IgA antibodies may bind to surface antigens of microorganisms in saliva, causing them to agglutinate, thereby facilitating their rapid elimination and prevent from dental caries. Salivary IgA antibodies can mediate *S. mutans* colonization. If glycosyltransferase (GTF) enzyme is bound to *S. mutans* fimbriae, enzyme neutralization by IgA antibody may inhibit *S. mutans* enzyme activities and, therefore, cariogenicity by reducing both the colonization by *S. mutans* and the virulence of the organism.

Fontana et al<sup>18</sup> suggests that caries free subjects may be protected immunologically from dental caries by salivary IgA antibody against *S. mutans* antigens. In the present study also salivary IgA levels were more children with less dental caries to give protection against dental caries. The results of present study were not in agreement with Thaweboon<sup>6</sup>, Chawda GJ<sup>7</sup>, Ranadheer E<sup>8</sup> found higher salivary IgA levels in children with more dental caries which are contradictory to the present study.

The contradictory results seen in the literature may be due to difference in sampling methods, different criteria for patient selection, and different laboratory tests used between the studies. Moreover, the concentration of salivary immunoglobulin may change depending upon the salivary flow rate, hormonal factors, emotional states, and physical activity.<sup>6</sup>

A few studies conducted to find out the relation between body mass index (B.M.I) and dental caries in children and concluded that there was no relation between BMI and dental caries Tripathi<sup>11</sup>, Toumi et al<sup>19</sup>, Pinto<sup>20</sup>. On contradictory to these studies Larsson B<sup>9</sup>, Nava FV<sup>10</sup>, investigated the association between dental caries and BMI and concluded as there was an association between BMI and dental caries.

### Conclusion:-

Dental caries is a complex and dynamic process where a multitude of actors influence and initiate the progression of disease. Till to date studies on comparative evaluation of salivary Ig-A levels and dental caries in Obese and Non obese children are very less. The present study shows that there is a significant difference in IgA levels among carious and non carious children in both obese and non-obese conditions, but there is no significant difference between obese and non-obese conditions. From this present study it can be concluded that obesity does not make any difference in production of salivary immunoglobulins especially S IgA. Further studies are needed to confirm the role of S IgA on caries activity.

#### Abstract

Studies show that many parastatals and government departments worldwide Botswana included are over-supporting and value the acquisition of entrepreneurial skills as a key driver for business performance through various intervention programs. The support is reflected in the effort and amount of scarce resources that are committed to pre-tertiary, tertiary and post-tertiary levels of training to impart entrepreneurial skills. Entrepreneurial skills of creativity and innovation (unique business idea), among others is perceived by private and public resources supporters of business promoters as a basic requirement for viability. This effort directed towards reducing the risk of business failure, has so far not yielded anticipated level of results. Many business projects fail within the first few years of establishment despite of the resources support provided to the promoters. This article seeks to explore the reasons attributable to the failure of such well-planned and initially well-executed business ventures. Twenty business investments covering different industry sectors at varying investment levels in Gaborone were purposefully sampled, observed and interviewed, in addition to archival literal studies. The studies and entrepreneurial interviews, when qualitatively analyzed reveals that successful performance of a business venture continuously requires surmountable business management skills with varying levels of unique combinations of entrepreneurial skills along the business investment life cycle. These findings are presented in a practical E-M business model that is a suggested remedy to the failures.

#### Introduction:-

Entrepreneurship has been viewed by many researchers and authors as the messianic key driver for business success and consequently national economic growth (Shemi and Procter, 2013, Hurley 1999). Studies show that Entrepreneurship is thought of as a risky rigorous process of conceptualizing, organizing, creating a new economic entity centered on a novel product or service with unique differences from other market offerings (Deakins and Freel, 2012, Hisrich and Peters, 1998, Dollinger, 1995, Theresa et al 2012). This understanding has made most national economies and institutions to craft various supportive intervention programs towards this course. For example, in Botswana, some of the national programs that have been designed to heavily support entrepreneurship are taught programs in pre-tertiary, tertiary and post-tertiary knowledge stages, intended to impart an entrepreneurial

**Corresponding Author:-Dr. Anyona N. Andrew.**

Address:-Formerly Senior Lecturer, Botswana Accountancy College P.O. Box 1672 – 40200 Kisii, Kenya.

mind in learners. This is intended to support the economic diversification, which is a major policy for the government of Botswana (NDP9 2003-2009, NDP 10 2010-2006). For example, all tertiary institutions in Botswana offer entrepreneurial studies or related disciplines as part of the curriculum. This course is supported by an understanding that this entrepreneurial mindset will then either at individual level or at corporate level influence the way a business venture operates (Pinchot, 1985 and Thornberry 2001) because corporate entrepreneurship is demonstrated through the behaviour and practices of individuals working within the business (Geisler, 1993, Kuratko et al. 2005, Zampetakis and Moustakis 2007). Every year, 66,500 students from 1,600 universities around the world gather to demonstrate their entrepreneurial capabilities through the Enactus programme (Kristia van Heerden, 2014).

There is no doubt whatsoever that entrepreneurial qualities of innovativeness, risk taking, networking, integration, opportunism, non-system-bound orientation, change orientation, flexibility informality and results orientation (Theresa et al, 2012) are critical elements which should drive a business towards realizing its set objectives. Parastatals and government departments in Botswana provide resources to support businesses based on a well-crafted business proposal whose underlying characteristics are based on a viable entrepreneurial idea. Institutions like; Botswana Development Corporation (BDC) established in 1970, Botswana Export Development and Investment Authority (BEDIA) established in 1997, Local Enterprise Authority (LEA) established in 2004, Citizen Empowerment Development Authority (CEDA) established in 2001, International financial services Centre (IFSC) established in 2003, The Ministry of Youth, Sports and Culture Youth Fund, just to list a few, carry out evaluation of business investment proposals on the basis of a viable entrepreneurial idea. Most of these institutions provide direct interventions in the form of capital financing to support the government's policy on employment creation, economic diversification and growth. The need for economic diversification is because Botswana is over-dependent on the mining sector, with exportation of cosmetic diamonds that contribute 35% of Gross Domestic Product (Central Statics Office 2005) in addition to beef exports to the European Economic Community. However, this diversification policy is not being realized as most of these supported ventures fail a short period after establishment (BICA 2013, Sserwanga and Rooks 2013, Sekwati 2010) or do not achieve the set objectives. For example, since it was established in 2007, LEA has assisted 14,400 clients of whom only 1500 are active businesses, (President Khama, 2011) and CEDA notes that the impairment charge on its portfolio continues to increase at an increasing rate (CEDA 2011/12 financial report). Questions as to why these interventions are not yielding fruit are abound in many minds. This is not a problem experienced in Botswana alone. Studies carried out by Dan & Bradstreet Inc. in the United States of America indicate that this is a continuous problem as more than 140 businesses closed doors during the month of June 2013. The Euler Hermes economic research studies echo along the same scenario by emphasizing on a likely ongoing global economic fragility and vulnerability in many investment sectors (Economic Outlook June-July 2014).

This paper aims to address and consequently establish the inherent causes of failure in businesses after establishment despite the much drummed up and available support that is extended to individual and organizational business promoters by government, parastatals and non-government institutions in the world including Botswana. The paper proposes a remedy for the failure in the form of an E-M business Model.

## **Review of related Literature:-**

### **Business Failures and the Business Environment:-**

The twenty first century era is characterized by increasing need for resources investment in various businesses as a means of providing self-employment for socioeconomic independence or as an alternative to a shrinking job market as demonstrated by most world economies (Anyona 2013), Botswana included. Resources are inevitably scarce and when investors spot a viable opportunity, a good return for investment is anticipated from the investment. However, this has not always turned out to be the case in many parts of the world including Botswana and consequently created suffering and misery to the investors and stakeholders. For example, Air America, an American radio network, specializing in progressive talk programming, with four million unique listeners every week went off the air in January 2010 after operating only for six years. This investment failed in an economy 'perceived' to be relatively strong as shown in Figure 1.

Though the large number of business failures in Figure 1 occurred in 2008 and 2009 can be attributed to broader unfavourable economic conditions, Dun and Bradstreet Corporation in their world business failure report (2011) put the number of failed investments at 83,384 (cited by Anyona, 2013). This scenario is not unique to USA. Studies carried out by Sserwanga and Rooks (2013), observed that 30% of all businesses established in Uganda during

2003-2004 actually failed to meet objectives and consequently closed down. Botswana continues to experience failures across investment levels a situation detestable particularly at a time that economic diversification is being embraced.

**Figure 1:-Documented Business failures in the USA (2000 – August 2011)**

**Source:** Adapted from [www.wikipedia.org](http://www.wikipedia.org) (accessed 27.08.2011:0930hrs)

This article explores the much documented and over-emphasized entrepreneurial skills (Shemi and Procter 2013) that are perceived as a prerequisite for successful investments. This school of thought has now been negated by many investments made by well-grounded entrepreneurs that have failed to realize the set objectives. Amit, Glosten and Muller (1993) have categorically expressed fears on the alarming failure rate of new ventures demonstrated by low returns on seed financing. This scenario is equally of concern in Botswana as many Botswana government and institutional investments in such programs have not met the set objectives as alluded earlier.

However, the author of this article views management as a continuous activity of organizing and coordinating the activities of an investment in accordance with prior determined policies and in achievement of defined objectives (Anyona, 2013). This latter school of thought is particularly critical during the 21st century and beyond due to the continuously dynamic and increasing hypercompetitive investment environment emanating from a/an;

- Highly informed workforce;
- Fairly educated consumers;
- Broadened access to information for businesses;
- Increase in virtual organizations;
- Increase in nontraditional staffing;
- Declining motor and brick outlets;
- Upsurge in the utilization of market space;
- Demand for flexible (multi-skilled/cross-trained) workforce by employers;
- Increase in outsourcing of activities by businesses;
- An upsurge of computer links among businesses, suppliers and customers;
- Increase in new learning technologies resulting in increased staff training and development;
- Continued globalization an important feature creating more competition among businesses
- Businesses continuously attracting more females both at employers and employee levels; and
- Increasing emphasis on a triple bottom line (financial, social and environmental performance) for businesses.

The interrelationships of the foregoing characteristics, presents market place and space conditions that are highly complex and cannot be successfully manipulated by an emphasis on traditional entrepreneurial skills.

#### **Entrepreneurial Theories/Concepts:-**

The study of entrepreneurship is relatively young (Hurley 1999) and did not attract any scholarly studies until late 1980s, even then with minimal theoretical foundations (Bygrave and Hofer 1991). Definition of entrepreneurship is as varied as there are researchers. Entrepreneurship has been defined as; innovation (Schumper, 1958), initiating, maintaining, and developing a profit oriented business (Cole, 1965), making significant decisions about changes that affect resources of an organization (Sawyer, 1958), risk-bearing (Mill, 1848), ultimate formal authority within an organization (Weber, 1917) or making changes in strategy for an existing firm that alter the state or pattern of resources deployment (Ginsberg, 1988).

However within a short time, studies on the method of predicting the individual who can become an entrepreneur or which conditions lead to entrepreneurship have been done. Hurley (1999) proposes two streams of theory that lead to entrepreneurship; psychological and sociological. The psychological theory reflects on the psychological influences, personal characteristics and effects of past exposure on the person while sociological theory has a thrust on the influence of environment. For example, high economic and social growth in some societies tends to boost emergence of entrepreneurship especially when a new venture is being established (Aldrich, 1990). Other relevant societal aspects include; political, cultural, financial, location and geographical issues.

Examining the many definitions and concepts, the key words in approaching defining entrepreneurship and consequently identifying entrepreneurial individuals are; risk-taking, creativity and innovation (Amit, Glosten and Muller, 1993). It is risk-taking because it is impossible to predict the future events within an environment with certainty. Creativity emanates from a perceived opportunity within the operating environment which is pursued using an innovative (unique) product (organization) or service. The numerous definitions, precise as they may be lack cognitive ability of an organization (business) being 'alive'; born, grow, mature and decline (Rwigema and Venter 2007). This philosophy is supported by Hannan and Freeman (1977) who draw similarity of organizations to the process of population ecology in which there is birth, survival and death.

#### **Management thinking (theories/concepts):-**

Knowledge from extant literature on management is abounding. Studies by Taylor's scientific management (1911) postulated the Classical School of Management that emphasized organizational structure, Weber (1864-1920) introduced the system of bureaucracy in organizations, distinguishing kinds of organizations based on the source of authority; Fayol (1916) who advocated the administrative management school who defined management as to forecast, plan, organize, command, coordinate and control; Elton Mayo and Hawthorne (1927-1932), viewed management from the Human Relations School that stressed the understanding of the human part of the organization in order to improve its performance; The systems theory (Lwidi 1951 and Boulding 1956) viewed organizations as a systems of levels and that they have a symbiotic relations with its environment; the contingency theory of Woodward (1958), Burns and Stalker (1961) postulated the mechanistic and organic systems based on the premise that there isn't one single approach to successfully managing an organization except to consider entire variables within its environment.

#### **Contemporary theories:-**

Peters and Waterman (1983) formulated the Contemporary Theories that emphasize excellence in organizations as being dependent on value systems. Theory X and Y (McGregor 1960) argue that human beings do not like work naturally and require to be compelled by rewards in order to be more productive. These two theories developed simultaneously gave rise to democratic view of managing organizations. Ouchi's Theory Z (1981) emphasizes organizational performance as being dependent on participation and the commitment of all the employees. It is noteworthy that the later contemporary theories are philosophically biased towards leadership in organizations and form the basis of the practice of management as we know it today. Though management has many definitions, it can be broadly viewed as an activity of organizing and coordinating the activities of a business in accordance with prior determined policies and in achievement of defined objectives (Anyona 2013 and Olum 2004). This definition is in tandem with the extant studies and the philosophy underlying the management theories that exist.

Definition of management notwithstanding, one would imagine that the most recognized management theories of Quantitative Approach, The Systems approach and The Contingency Approach, would have developed a view of the 'living' nature of organizations, the manner they are understood today (Rwigema and Venter 2007). The more recent Chaos Theory (Peters 1987, Weick 1936) explain the concept using biological systems with emphasis on increasing volatility resulting from increasing complexity and so letting organizations thrive by themselves. It is also silent on the 'living' nature of an organization.

#### **The Research methodology/Approaches:-**

The aim was to find out an explanation for the perceived and observed different business performance levels in situ overtime. Just like majority of management studies, this research was based on case study approach within the interpretive paradigm. This approach was found convenient because entrepreneurship is holistic in nature. A number of both internal and external interrelated factors will inform the behaviour or decisions made by the business management. These factors include; leader-management style, business structure, business policy and regulations, employee skills and motivation, political climate, general state of the economy, technology, sociocultural aspects, just to list a few. Consequently, entrepreneurship can only render itself to studies based on non-algorithmic analysis since it is essentially a conscious action (Penrose 1989) that deals with sudden changes and discontinuities within the environment. Regression analysis is inherently reductionist and consequently generates smoothly changing analytic functions which cannot be applied to entrepreneurial actions.

A purposeful method of sampling (Huberman and Miles 2002) was employed to select a representative of twenty (20) businesses within Gaborone that dealt in products and services. These businesses also operated at different levels in the market segments in terms of volume in daily transactions and had operated for at least more than three (3) years. The industry sectors that were involved in the study are; Departmentalized stores, supermarkets, wholesaler/distributor, motor vehicle showrooms, food stores, apparel and textiles, training providers, motor vehicle repairers, motor vehicle replacement parts dealers and tuck shops.

The businesses were then subjected to a six month long periodical critical physical observations of their in-store situation. The visits to the outlets and observations were made during the first week of the month (day 1-4) and the third week (day 15-18). The observations whenever possible during the same visit were combined with unstructured in-depth face-to-face interviews of the respondents for further explanations on the observable in-store state or the resultant features. The explanations provided referred to the volume or number of transactions. This informant interview (Ghauri and Gronhaug 2005; Healey and Rawlinson 1994; and Robson 2002) allowed the business owner/manager to guide the conduct of the interview. The narratives behind the observable changes or attributes of the business were then recorded.

#### **Data collection, Analysis and Discussion:-**

Data in this study was recorded information in the form of a number of sentences/statements. The data was then analyzed using qualitative categorization approach. Though the underlying principle was to establish the reasons for poor or failed businesses, there weren't predetermined categories into which to group the statements/sentences. The categories that were used in the study are those that emerged (Saunders, Lewis and Thornhill, 2007) during the course of the face-to-face interviews. Four distinct categories emerged; no change with reducing transactions (NCRT), no change same transactions (NCST), no change increasing transactions (NCIT), change with increasing transactions (CIT).

The entire study involved 240 visits and observations, whose category statements were tabulated as shown in Table 1.

**Table 1:-Distribution of Category statements**

<b>Category</b>	<b>No change Reducing Transactions (NCRT)</b>	<b>No Change Same Transactions (NCST)</b>	<b>No Change Increasing Transactions (NCIT)</b>	<b>Change with Increasing Transactions (CIT)</b>
<b>Businesses/Entrepreneurs</b>	8	8	1	3
<b>Percentage(%)</b>	40	40	5	15

**CIT:-**

The fifteen percent (15%) of outlets in which there was a continuous upsurge of transactions took place across all sectors disregarding the levels of transactions and target market. The entrepreneurs/business managers explained this by their ability to focus on monitoring the environment and responding with activities to increase the traffic flow into the store. "We fix our eyes on the break-even graph", the entrepreneurs of these businesses claimed. An unfavourable shift of the profits would immediately be met with staff meeting to craft an appropriate activity to improve the shopping experience of the customers. Some of the activities sounded and looked very simple. A swift or change in the position of the same merchandise within the floor space was all that was required to increase customer traffic and transactions. More elaborate changes also included; introduction of new departments, new products or services to meet customer needs. This observation is supported by Deakins and Freel (2012), Theresa et. al.(2012), and Schumper (1958) who view entrepreneurship as a continuous process of creating and innovating products or services. These businesses exhibited a life cycle phase of either growth or sustained growth within strategic life cycles. This phenomenon was characteristic of departmental stores, super markets and apparel and textile sectors.

**NCIT:-**

Five percent (5%) of the businesses observed increased traffic flow and transactions. The business did not implement any changes within the six months. They have kept their products/services and business formats same during the periods when they did not have resources to effect any changes except for minor store repairs. These businesses claimed to be experiencing increased traffic flow since they have stuck to what they claimed to be knowledgeable. "Customers know us for who we are and what we do" the entrepreneurs/business managers claimed. This was particularly observed in motor vehicle repair services. The outcome could demonstrate a business or product/service that is experiencing a growth phase (Rwigema and Venter 2007, Hannan and Freeman 1977), despite having selected participating businesses aged more than three years. This was evident mainly in the motor vehicle replacement parts dealers.

**NCRT:-**

Forty percent (40%) of the businesses experienced reduced traffic flow and transactions. The businesses have maintained the same or similar merchandise and business formats since establishment. The entrepreneurs attributed the observable business situation to inflation affecting their customers. "People have no money to spend", the managers claimed. The only response management has made is to focus on controlling expenditure by reducing the payroll. This situation is characteristic of a product or service at the decline phase of a Product/Business Life Cycle (Rwigema and Venter 2007, Hannan and Freeman 1977) that is often associated with chaos within the labour force. This phenomenon was observed within wholesaling/distribution, retailing, tuck-shops and motor vehicle repair services.

**NCST:-**

Forty percent (40%) of businesses claimed a no effect on volume of traffic and transactions. The face-to-face interviews did not reveal any ambition to change the merchandise or the business format. The business has maintained offering the same or similar products and services since inception. The most likely position in the life stage of these businesses is maturity phase (Rwigema and Venter 2007, Hannan and Freeman 1977) in which the entrepreneur could be focusing more on managing the business activities (Anyona, 2013 and Olum, 2004) with a lot of complacency for survival.

**Conclusions:-**

Business life cycle is a model whose premise is that requirements in terms of internal strengths to exploit external opportunities while reducing threats to the business will vary depending on the stage of development in which the business finds itself (Figure 1). Five growth phases are observable within business organizations; birth or start-up (A), growth (B), maturity (C), decline (D) and revival or bust (E).

**Figure 1:-Business Life Cycle.**

For example the threats at the start-up phase are different from threats at the maturity phase. Businesses inevitably move from one phase to another in an attempt to create a 'fit' with its environment for survival. This 'fit' is attained by efficiency and effectiveness in meeting or exceeding the needs of customers. The implication of a business life cycle (BLC) therefore, is that different objectives, strategies, managerial processes (planning, organizing, directing and controlling), technology, culture, and decision-making should be crafted to ensure a businesses is aligned with the environment. Continuous change in the managerial processes using management skills must be in tandem with the volatile hypercompetitive and complex external environment. The managerial processes alone cannot adequately address changing customer needs but both the managerial skills and entrepreneurial skills are required in order to meet or exceed the dynamic customer needs. The extent of entrepreneurial skills and managerial skills required at each different BLC phase will vary from one type of business or product/service to another. Apparel and textile fashion houses have an extremely short BLC (Kotler and Armstrong 2008) in contrast to motor vehicle repair services. This article seeks to point out the need to blend the skills but not necessarily to provide absolute arithmetical values. The differential skills requirement at different phases can be explained in Table 2.

**Table 2:-Entrepreneurial and Managerial Skills at different BLC Phases (E-M Model)**

BLC Phase	Entrepreneurial Skills	Managerial Skills
Birth (A)	Sporting and exploiting the opportunity by creating an innovative product or service requires a very high level of practical entrepreneurial skills.	Minimal managerial skills in planning to support the new innovation will be demanded.
Growth (B)	Entrepreneurial skills start reducing to monitoring the performance of the innovation and the activities within the task environment. Internal and external stakeholder's interests are important.	More sophisticated and formalized managerial skills are demanded to achieve the growth objective. Organizing and directing authority is delegated to lower levels of management.
Maturity (C)	At the start of maturity phase, entrepreneurial skills are at a minimum. The skills start increasing in demand into the 2 <sup>nd</sup> quarter of the phase, so that during the 4 <sup>th</sup> quarter, an innovation should be evident to restart the life cycle.	This phase requires the highest demand of managerial skills. Processes for fast decision-making are hampered by inherent bureaucracy and a higher need for superior coordination and control becomes a priority.
Decline (D)	Maximum entrepreneurial skills are required to create another innovation to avoid the business proceeding into death or bust. The highest level of entrepreneurial skills will ensure the business is revamped into sustained growth.	Though the business will be starting all over again, the managerial skills demanded will be a lot higher than the initial creation of a unique product. The business will be having resources but require planning and organizing to reload resources onto the plans.
Revival, Bust (E)	The business demands a similar level of entrepreneurial skills like in the growth phase. If the business is void of such skills, it will bust and close doors.	The innovation must be managed just like in the initial growth phase. However, the skills required exist in the business and requires refocusing.

The implication of the BLC explained in Figure 2 is that an operating business set-up consists of a series of BLCs. The number and shape of BLCs and the period occupied by the various phases is determined by the type of product or service, the industry of establishment and the nature of the complexity created by environmental factors. A graph of business success plotted against period (years) is shown in Figure 3.

**Figure 3:- BLC Graph**

In practice, the dynamic interplay of environmental factors creating a highly complex business environment leaves both entrepreneurs and business managers gasping for knowledge, and becoming casualties of indecisiveness.

The different school of thought in this article, demonstrated by the E-M model, while supporting the former school of thought with a bowl of salt, views ‘blending’ the entrepreneurial and business skills along the business life cycle, in a ‘unique’ combination as the messianic dose for success in investments, not only in Botswana but entire economic world. While emphasis has been on the entrepreneurial skills when developing an investment idea, success of a business demands application of management skills at differing levels along the life of the investment.

#### **Challenges of The e-m model:-**

The BLC concept is applicable to businesses and also to products (PLC) or services (SLC). The critical dimension to the simple E-M Model is the capability of the entrepreneur or business manager to practically determine the current phase of the business, product or service, in order to generate appropriate response. The expected appropriate response is the optimum levels of blended entrepreneurial and management skills. The optimum quantifiable skills levels provide a scope for future studies.

A befitting quote from Charles Darwin (1863) on the appropriate balance between theory and observation: “Let theory guide your observation, but till your reputation is well established, be sparing in publishing theory. It makes persons doubt your observations”.

#### **Delimitation:-**

This article is not based on observation research conducted outside Botswana.

#### **Definition of terms:-**

Entrepreneur in this article is interchangeably used with investor or business manager. The same applies to business and investment.

Non-timber forest products, Medicinal values, Sirsi taluk, Karnataka.

#### Abstract

Minor forest products or Non-timber forest products (NTFPs) have an important role in forest social life from different aspect. The knowledge related to forest and forest products have developed among forest communities for generations. Non-timber forest products (NTFPs) are any product or service other than timber that is produced in forests. NTFPs are used and managed in complex socioeconomic and ecological environments. In traditional forest communities, many NTFPs may be used for subsistence while others are the main or only source of income. Some NTFPs have significant cultural value, as totems, incense, and other ritual items.

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

Non-timber forest products (NTFPs) are wild plants and fungi that people gather and use for food, medicine, crafts, spiritual, aesthetic, and utilitarian purposes. The NTFPs includes plants that can be found in a variety of habitats across the forested landscape. Therefore, in this sense, we will find plants that make their home in old fields and wetlands as well as the woods. The many species commonly used today were first introduced to the area by settlers because of their medicinal or edible properties.

A NTFPs is literally any and every natural resource from the forest except timber. This is illustrated in the definition of Wickens (1991) that NTFPs are 'all the biological material (other than industrial roundwood and derived sawn timber, wood chips, wood-based panels and pulp) that may be extracted from natural ecosystems, managed plantations, etc. and beautified within the household, be marketed, or have social, cultural or religious significance'.

They cover a wide range of products including bamboo, thatching materials, fruits, seeds, nuts, tubers and medicinal plants. In India there are about 15,000 plant species out of which nearly 300 species (20%) yield NTFPs. However, only about 126 species (0.8%) have been commercially developed (Murthy *et al.*, 2005). Non-timber forest products (NTFPs) contribute significantly to a rural household's livelihood in the African semi-arid tropics. On average, income from NTFPs accounted for 39% of total household income and had a strong equalizing effect on it. However, the economic relevance of NTFPs differs between households: Poorer households are relatively more dependent on NTFPs in order to full fill basic needs than wealthier households. This is mainly due to a significant greater land holding. Moreover, the study revealed that net income from NTFPs reflects traditional sources of livelihoods of different ethnic groups (Heubach *et al.*, 2011).

#### Materials and Methods:-

The present study is the outcome of exhaustive field survey undertaken during year of 2014.

**Corresponding Author:- Pramod V. Pattar.**

Address:- Department of Botany, Davangere University, Shivagangothri, Davangere. Karnataka, India. 577 002.

**Study area.**

Sirsi taluk is located in Western Ghats of Uttar Kannada district, Karnataka state, India. It lies in 14°70' N latitude and 74°80' E longitude. Mean annual rainfall ranges from 2,000 mm to 6000mm. About 95% of the rainfall is received during the month of June to September, when the southwest monsoon is at its climax. Temperature range from 22°C to 36°C with relative humidity of dry month and monsoon month were less than 35% and 75% respectively. (Fig.1)

**Collection of plant material:-**

Some of the important non-timber forest products were collected from the forest of Sirsi taluk, Uttar Kannada District, Central Western Ghats of Karnataka.

**Identification of Plants:-**

Diagnostic features of all the specimens were studied and relevant field notes were made on fresh plant materials. Photographs were also taken for each species. Specimens were identified with the help some of the tribal community. Authentications of species were done with the help of Panduranga Hegde, Prakruthi Institution.

**Fig. 1:-** Location map of Sirsi Taluk, Uttar Kannada District.

**Results and Discussion:-**

***Acacia concinna* Willd:-**

**Family:-** Fabaceae

**Parts used:-** Leaves, Fruits

**Harvesting:-** April to May

**Collection and Processing:-**

The fruit pods, leaves were collected and dried in direct sun light these dried were ground into a powder. Made a pack it should be free from moisture.

**Medicinal uses:-**

*Acacia concinna* Willd. has been used traditionally for hair care since long time in India. Fruits are used for washing hair, for promoting hair growth, expectorant, emetic and pungitive. Aqueous extract of this fruit has been used as detergent and natural shampoo preparations. It had antimicrobial activity and also it contains secondary metabolites

such as alkaloids, flavonoids, phytosterols, saponin, tannins, phenolic compounds, gums (Todkar *et al.*, 2010). Leaves were used as anti-dandruff, pods were used for some skin diseases. It acts as anti-dermatophytic (Natarajan and Natarajan 2009).

***Ailanthus triphysa* (Dennst.) Alston:-**

**Family:-** Simaroubaceae

**Parts used:-** Gum or Resin.

**Processing:-** In mature plant, cut or hole made on the stem portion up to 2-3 inches in depth. Polythene cover or plastic bowls attached below the cut portion to collect the gum or resin. It is in the form of semi liquid state then it solidifies in 15-20 days at room temperature.

**Medicinal uses:-**

Traditionally used as dhupa or resin to release mental stress. Its pleasant smell gives relaxation to the mind and also used in bronchitis problems, treatment of cough, cold, fever. Bark is used as antibacterial and in chronic rheumatism treatment.

**Other uses:-**

Resin of the plant is mixed with coconut oil and used in candle making in rural areas.

***Artocarpus gomezianus* Wall:-**

**Family:-** Moraceae

**Harvesting:-** April and May varies from region to region.

**Parts used:-** Fruits, Bark.

**Processing:-** The fruits are made into thin half-moon shaped slices and they dried under the direct sunlight for 8-10 days. The seeds are separated and discarded simultaneously. The dried slices treated with common salt. The processed product is known as 'Huli Seppe.' The processed slices are powdered along with 2-3% of cooking salt or without salt. The processed product earn up to 70-80 per kg.

**Medicinal uses:-**

*A. gomezianus* Wall. The powder is used in treatment of dysentery, dry cough in local areas. The fruits are edible it contains high nutritive value.

**Other uses:-**

It is used in preparations of sambar, fish curry, papad in Sirsi taluk. It is used replace of tamarind and most important ingredient for the preparation of dishes in Western Ghats (Sarala and Krishnamurthy 2014).

***Calamus rotanga* Linn:-**

**Family:-** Arecaceae

**Parts used:-** Bark

**Processing:-** Mature plant stems are pulled out and the dead leaf sheaths removed using a sharp knife. Then the soft upper most part is dipped or immersed in the lake or river 15-20 days. After fibers became very elastic in nature, brittleness is completely removed.

**Uses:-**

It is one of the most useful forest products next to timber plants. It plays an important role in the rural economy, employing many people in rural areas. Fiber is used to make mat, bucket, flower basket, protecting sheath for small houses.

***Canarium strictum* Roxb:-**

**Family:-** Burseraceae

**Harvesting:-** Rainy season

**Parts used:-** Resin

**Medicinal uses:-**

*C. strictum* Roxb. species producing resin, is a rich source for making fragrance smoke (Sambrani or Blackdammer) and it is given for the treatment of bronchial diseases and orally given resin powder used to cure rheumatism and it is one of the major drug in Siddha medicine. Black dammer resin is also used as an alternate for burgundy pitch in making medical plasters. Extreme usage of resin in industry as well as in traditional medicine (Muthuswamy and Senthamarai, 2014).

***Cinnamomum tamala* (Buch-Ham) T. Nees:-****Family:-** Lauraceae**Parts used:-** Leaves.**Medicinal uses:-**

Leaves are used as astringent, stimulant, carminative and also used in treatment of rheumatism, colic, diarrhea, nausea and vomiting. The essential oil of leaves used as diuretic, anti-flatulent and cardiac disorders. It is also used in pharmaceutical preparations because of its hypoglycemic and carminative properties (Sharma and Nautiyal 2011). The antimicrobial potentials of essential oil and oleoresins were reduced the growth of food born fungi and bacteria ( Kapoor *et al.*, 2008 ). It is also used as anti-gonorrhoeic and antidote for scorpion sting (Shah and Panchal, 2010).

**Other uses:-**

It is commonly called “Bay Leaf” it is used as spices. It is one of the major exporting spice. It also used as food preservatives.

***Cinnamomum zeylanica* J. Presl:-****Family:-** Lauraceae**Parts used:-** Bark.**Medicinal uses:-**

*Cinnamon* is used in flatulence control and indigestion, bark used in mouth washes. *C. zeylanica* J. Presl. Used in the treatment of dyspeptic conditions such as mild spastic condition of the gastrointestinal tract, loss of appetite, abdominal pain and diarrhoea. Ayurveda and folklore system of medicine in India from the era of Charakasamhita. It is used for the treatment of inflammation of the eye, leukorrhoea, vaginitis and toothache problems (Manosi *et al.*, 2013). It acts as antioxidant, anti-parasitic, antimicrobial, it lowers the blood glucose level and blood pressure (Ranasinghe *et al.*, 2013).

***Entada rheedii* Spreng:-****Family:-** Fabaceae**Parts used:-** Seed.**Medicinal uses:-**

The plant is used as a topical ointment against jaundice, toothache, ulcers and to treat muscular-skeletal problems.

**Other uses:-**

The seeds are sought after as pieces of jewelry and as good-luck charms.

***Garcinia cambogia* (L.) Roxb.****Family:** Clusiaceae**Harvesting:** June to July.**Parts used:** Fruit and seed.

**Processing:** The ripe fruit is halved or sectioned and spread in thin layers, dried in the fire smoke for three to seven days to moisture level of about 15 to 20 percent. Commercially available rind is loaded with considerable amounts of common salt, which is added during drying. Seed is completely dried and crushed and then boiled the crushed seeds in water and skimming off the fat from the top. This fat is commonly called *G. cambogia* ghee. It is stored in plastic bottles.

**Medicinal uses:-**

The fruits having sour taste are help to promote digestion. The fruit juice possesses anti-scorbutic, anthelmintic, antibacterial and cardio tonic properties. Also used in the treatment of piles, dysentery, tumors, pains and heart complaints. The decoction of the fruit rind is given in rheumatism and bowel complaints. Rind of the fruit also reduces blood cholesterol level. It is also possess antioxidant, anti-helmintic, anti-cancer and antimicrobial activity (Tharachand *et al.*, 2013).

**Other uses:-**

The fruit rind and extracts of *Garcinia* species are used in many traditional recipes. The dried rind is also used for polishing gold and silver. The yellow resin obtained from the fruit is used as varnish. Fat of *G. cambogia* used replace of ghee for making some sweet dishes, like halwa, barffi, banana sweets.

***Garcinia indica* (Thouars) Choisy:-****Family:-** Clusiaceae**Harvesting:-** April-May.**Parts used:-** Fruit and seed.

**Processing:-** The ripe fruit is halved, fleshy portion containing the seed is removed and spread the skin of the fruit in thin layers, dried in the sun light for three to seven days to moisture level of about 15 to 20 percent. Commercially available rind is loaded with considerable amounts of common salt, which is added during drying. Kokam butter: Seed is completely dried and crushed and then boiled the crushed seeds in water and skimming off the fat from the top. This fat is in the form of flakes. Kokum syrup: Kokum rind by adding cane sugar at the rate of 1:2. The mixture is kept in sun light then syrup is obtained it is filtered with the help of cleaned muslin cloth. Then it is stored in bottles.

**Medicinal uses:-**

The fruit has an agreeable flavour - and a sweetish acid taste. Kokum has been traditionally used as an acidulant. The fruit of *G. indica* is anti-helminthic and cardio tonic and useful for treatment of piles, dysentery, tumors, pains and heart complaints. Kokum butter is considered nutritive, demulcent, astringent and emollient. It is suitable for ointments, suppositories and other pharmaceutical purposes (Braganza *et al.*, 2012). It is used for local application to ulcerations and fissures of lips, hands etc. The cake left after extraction of oil is used as manure. Kokum butter is used as a specific remedy for diarrhea and dysentery (Kureel *et al.*, 2009).

**Other uses:-**

The traditional fish curry, Sambar Kokum rind is a usual ingredient. The dried rind, strained in water, is boiled into a soup called solkadi. Spiced and sweetened with jaggery it is a must for marriage feasts and functions in Sirsi taluk. Red syrup, extracted from the rind of the ripe fruit with the help of sugar is stored in the households of this region for making cool drinks in summer.

***Mangifera indica* L:-**

**Family:-** Anacardiaceae

**Parts used:-** Fruit, leaves, bark.

**Processing:-** This particular pickle makes use of very tender, small, unripe mangoes. This pickle is known to last for long. You can use the tiniest mangoes too. Take a jar, any kind will do, for instance a 'Bharani' (traditional ceramic jar) would be perfect. Boil and cool some water. When the water is warm, add the rock salt so that it dissolves. Filter the brine. Wash the small, tender mangoes. The tip of the stalk, or the knob should be included and not discarded. Pour the saline solution in the jar. Drop the mangoes in the brine. The salt water level should be an inch or two inches above the level of the tiny mangoes. Close the jar. The lid should not have even a trace of rust, so it is best to avoid using a metal lid and store for two weeks. This lasts for a year to up to three years.

**Medicine uses:-**

The leaves make a plaster to remove warts and also act as a styptic. Seeds are used to treat stubborn colds and coughs, obstinate diarrhoea and bleeding piles. The bark is astringent, homeostatic and anti-rheumatic. Mango kernel decoction and powder (not tannin-free) are used as vermifuges and as astringents in diarrhoea, hemorrhages and bleeding hemorrhoids. The fat is administered in cases of stomatitis. Extracts of unripe fruits and of bark, stems and leaves have shown antibiotic activity (Bharati R.P, 2013). Dried flowers are of medicinal value and used for curing dysentery and catarrh of bladder. It is a cure for wasp sting, rubbed between hands and left to dry.

**Other uses:-**

Unripe ripe and processed (at various stages of maturity, in the form of pickles or chutneys, dried slices, canned slices in syrup, juice and puree or paste). The fruit is surrounded by golden, juicy flesh. The green fruit is also used to flavour fish and meat dishes in the same way as tamarind and other sour fruits. The kernels are important as a famine food, but the astringency has to be removed by boiling, roasting and soaking them for a long time. Young leaves are cooked as a vegetable.

***Mammea suriga* (Buch-Ham. ex Roxb.) Kosterm:-**

**Family:-** Clusiaceae

**Harvesting:-** March-July.

**Parts used:-** Flower and root

**Medicinal uses:-**

Flower buds mild stimulant, carminative, astringent and used in dyspepsia. It is used in many skin diseases like ringworm, intertrigo, eczema, dandruff (Bhat *et al.*, 2014). Its root paste is used in the treatment of partial headache. The extract of the plant root contain antibacterial and antifungal activity (Mahesh *et al.*, 2015).

**Other uses:-**

Flowers used in Hindu worship and for decorating hair. Manly flower is used to prepare scents.

***Murraya koenigii* L:-****Family:-** Rutaceae**Parts used:-** Leaf.**Medicinal uses:-**

*Murraya koenigii* leaves is boiled with coconut oil reduced to blanked residue which is then used as natural hair tonic and hair growth promoter. It can be used as anti-helmentics, it also acts as febrifuge, blood purifier, antifungal, depressant, anti-inflammatory, body aches, for kidney pain and vomiting *Murraya koenigii* is used as a stimulant and anti-dysentric. It is also effective against diabetes Mellitus. Leaves are applied externally to bruises and eruption. The leaves and roots are bitter in taste analgesic, cure inflammation and itching. It is also useful in leucoderma and blood disorders and also cures diseases like piles. It can be also used to stop vomiting by infusion of the toasted leaves. If someone is bitten by poisonous animals, local application of the leave paste is effective. In an ancient systems of medicine including Ayurveda, Siddha and Unani, *Murraya koenigii*, a medicinally important herb (Jain *et al.*,2012).

**Other uses:-**

Fresh leaves, dried leaf powder, and essential oil are widely used for flavouring soups, curries, fish and meat dishes, eggs dishes, traditional curry powder blends, seasoning and ready to use other food preparations. The essential oil is also utilized by soap and cosmetic aromatherapy industry (Kumar *et al.*,2013).

***Myristica malabarica* Lam:-****Family:-** Myristicaceae**Parts used:-** Fruit.**Medicinal uses:-**

Seeds are used in external application for indolaent ulcer, crude fat from seeds analgesic and used in rheumatism, gangrene. It acts as antioxidant. Mainly it is used as spices.

***Myristica dactioides* Gaertn:-****Family:-** Myristicaceae**Parts used:-** Fruit.**Medicinal uses:-**

The yellowish mace is used as an adulterant for true mace (*Myristica fragrans* Houtt). Seeds are used in external application for indolaent ulcer, crude fat from seeds analgesic and used in rheumatism, gangrene. It acts as antioxidant. Mainly it is used as spices.

**Parts used:-** Fruit and leaves.

**Uses:** Its fruit is sweet in taste and used as nutritive food. Leaves were dried and used to make preparation of mat, bucket, cap.

***Phyllanthus emblica* Linn:-****Family:-** Phyllanthaceae**Parts used:-** Fruit.**Medicinal uses:-**

The fruits are sour, astringent, bitter, acrid, sweet, cooling, anodyne, ophthalmic, carminative, digestive, stomachic, laxative, alterant, aphrodisiac, rejuvenative, diuretic, antipyretic and tonic. They are useful in vitiated conditions of tridosha, diabetes, cough, asthma, bronchitis. It acts as anticancer, antitussive, antioxidant (Khan, 2009). Plant reveals its analgesic, antiatherogenic, neuroprotective, chemo modulatory properties (Dasaroja and Gottumukkala, 2014). It also act as immune-modulatory, anti-inflammatory (Singh *et al.*,2011).

***Sapindus emarginatus* Vahl:-****Family:-** Sapindaceae**Parts used:-** Fruit.**Medicinal uses:-**

The members of genus *Sapindus* are well known or their medicinal values. For thousands of years it has been used for various purposes. The fruits of *Sapindus emarginatus* are commonly used for hair problems and also in preparation of shampoos. Traditionally it used as anti-inflammatory and antipyretic. The plant has antimicrobial, antiulcer, fungicidal, anti-inflammatory activity (Pelegrini *et al.*, 2008).

***Strychnous nux-vomica* L:-****Family:-** Loganiaceae**Parts used:-** Fruit and seed.**Medicinal uses:-**

The properties of *nux-vomica* are substantially those of the alkaloid Strychnine. The motor or sensory ganglia of the spinal cord; during the convulsion there is great rise in blood pressure; in some types of chronic lead poisoning it is of great value. In cases of surgical shock and cardiac failure large. It has hepatoprotective, anti-snake venom, immuno-modulatory effect (Kumar *et al.*, 2012). It has antioxidant and anti-diabetic property (Chitra *et al.*, 2010).

***Terminalia belerica* Roxb:-****Family:-** Combretaceae**Parts used:** Fruit.**Medicinal uses:-**

The fruit rind (pericarp) is astringent, laxative, anthelmintic, pungent, germicidal and antipyretic. It is applied in a diverse range of conditions including cough, tuberculosis, eye diseases, anti-HIV-1, dyspepsia, diarrhoea, dysentery, inflammation of the small intestine, biliousness, flatulence, liver disease, leprosy, cleanse the blood and promote hair growth in the Ayurvedic drug. *Terminalia belerica*. Roxb is growing widely throughout the Indian subcontinent, Sri Lanka and SE Asia. In the Traditional system of medicine like Ayurveda, Siddha and Unani, medicinal uses have been described as it works in disease of every system. It is used as antioxidant, antimicrobial, antidiarrheal, anticancer, antidiabetic, antihypertensive and hepatoprotective agent (Motamarri., 2012).

***Terminalia chebula* Retz:-****Family:-** Combretaceae**Parts used:-** Fruit.**Medicinal uses:-**

Traditionally used as used this plant in the treatment of asthma, sore throat, vomiting, hiccough, diarrhea, dysentery, bleeding piles, ulcers, gout, heart and bladder diseases. The plant has been demonstrated to possess multiple pharmacological and medicinal activities, such as antioxidant, antimicrobial, anti-diabetic, hepatoprotective, anti-inflammatory, anti-mutagenic, anti-proliferative, radio-protective, cardio-protective, antiarthritic, anticaries, gastrointestinal motility and wound healing activity (Surya Prakash *et al.*, 2012).. Bio-active compounds isolated from *T. chebula* has prospective use in alleviating ageing, cancer and various disorders (Sawant *et al.*, 2013).

***Zingiber cassumunar* Roxb:-****Family:-** Zingiberaceae**Medicinal uses:-**

The decoction is prescribed for asthma, and as a topical for rheumatism. Pulverized rhizome also used for diarrhea. The fluid squeezed from the swollen ends of club-shaped stems is used for shampoo. Rhizome is used like the common ginger, as a remedy for coughs, asthma, parasitism, and variety of skin diseases. Compressed rhizomes used for bruises and cuts and to treat headaches, toothaches, ringworm, joint sprains.

**Other uses:-**

Powdered rhizomes used as perfume.

**Table. 1:-** The production of Minor forest product in Sirsi taluk

Graph. 1:- Graph showing total NTFP in tons

### Conclusion:-

Minor forest products or Non-timber forest products (NTFPs) have an important role in forest social life from different aspect. Till date, the state Forest Department succeeded to enlist several forest resources from the uses by native villagers. The knowledge related to forest and forest products have developed among forest communities for generations. Therefore, for the configuration of states own sustainable forest governance policy, more academic research on such indigenous forest based social life is extremely essential. Non-timber forest products (NTFPs) are any product or service other than timber that is produced in forests. They include fruits and nuts, vegetables, medicinal plants, gums, resins, essences and a range of barks and fibres such as bamboo, rattans, and a host of other palms and grasses. NTFPs are used and managed in complex socioeconomic and ecological environments. In traditional forest communities, many NTFPs may be used for subsistence while others are the main or only source of income. Some NTFPs have significant cultural value, as totems, incense, and other ritual items. Others have important medicinal value and contribute to the community's health and wellbeing. The role of forests in nutrition and health, land tenure change, the increasing move by small communities to monetary based economies and the cultural importance of NTFPs.

### Acknowledgment:-

Authors acknowledge the Co-ordinator, Department of Botany, Davangere University, Davangere for the facilities extended.

#### Introduction:-

The Induction of general anesthesia allowed Surgeons to operate with careful deliberation on patients made totally unaware and pain free.

With this arose the problem of inducing quick and reversible unconsciousness with minimal side effects. This was initially tried with inhalation agents and later intravenous agents.

The ideal intravenous induction agent would provide hypnosis, amnesia, analgesia, muscle relaxation without undesirable cardiac and respiratory depression and pleasantly induce anesthesia in one arm brain circulation time and completely wears off in a few minutes.

Thiopentone has been the routine induction agent of anesthesia since 1930's because of its rapid and predictable action. The main drawbacks are cardiovascular and respiratory depression, increased incidence of Laryngospasm, bronchospasm, allergic reactions. Thiopentone has survived the test of time as an intravenous anesthesia drug.

The research for a better inducing agent which has good control of hemodynamic changes during intubation, The different agent like Etomidate have been tried with varied success.

The Etomidate was introduced into clinical practice in 1972. Its properties include hemodynamic stability, minimal respiratory depression, cerebral protection and rapid recovery after either a single dose or a continuous infusion. In practice these patients are compromised by trauma, serious illness, shock or cardiovascular co- morbidity. The fast onset of anesthesia and high therapeutic index for cardiovascular side effects are helpful during a rapid sequence induction.

Our study allows evaluation of Etomidate in comparison with Thiopentone sodium as an induction agent. This study aims an attempt to compare hemodynamic changes and other untoward effects of both the drugs.

#### Aims and objectives:-

Among patients who come to a tertiary care hospital with select chronic disease (cardiovascular disease).

- To study hemodynamic changes after ETOMIDATE and THIOPENTONE usage.

- To study any complication arising as result of side effect of the etomidate and thiopentone if any

### **Methodology:-**

#### **Source and method of collection of data:-**

An observational study of etomidate with thiopentone as an induction agent in cardiac surgery patients. After permission and clearance from the ethical committee, this study was conducted in Dhiraj general hospital in Department of Anesthesiology. We did this study on 60 patients of Grade-I, II and III of American Society Of Anesthesiologist's (ASA) classification who were admitted for elective cardiac surgeries. The study was prospective in nature. All the patients participating in the study were explained clearly about the purpose and nature of the study in the language they can understand. They were included in the study only after obtaining a written informed consent. A cross sectional analysis was made at the time of presentation. We collected the data for 1.5 years and analyze the data statistically.

#### **Inclusion criteria:-**

Patients between the age group of 45 to 65 years of both sex belonging to American society of anesthesiology grade II to III undergoing elective cardiac surgery under general anesthesia.

#### **Adult patients posted for CABG:-**

##### **Patients were randomly divided into 2 groups of 30 each**

- a. Group E(30 patients) to be induced with inj.etomidate 0.3mg/kg IV
- b. Group T(30 patients) to be induced with inj. thiopentone 5mg/kg IV

#### **Exclusion criteria:-**

1. Patient refusal
2. History of allergic reaction to the drug under study.
3. Patients with renal and hepatic disease.
4. Patients with history of epilepsy
5. Carotid insufficiency.
6. Adrenal insufficiency.
7. ASA GRADE IV
8. Presence of hypotension
9. History of arrhythmia

#### **Reoperative preparation:-**

Tab. Alprazolam 0.5 mg were given on the night prior to surgery. Patients were asked to restrict fluids and solids by mouth at least eight hours before operation. The patients were reassured, the procedure of anesthesia explained and a written informed consent was obtained from them.

Patient were taken inside the operation theater. Oxygen was given by face mask. Intravenous line was secured with 16G or 18G cannula and the patients were given I.V.Fluids (NS) according to the requirement. Multipara monitors were attached and base line pulse rate, respiratory rate, non-invasive blood pressure, SPO<sub>2</sub> and ECG were recorded. Under local anaesthesia a right radial artery is cannulated for invasive pressure monitoring and central venous line in right internal jugular vein for CVP monitoring was inserted.

Patient were premedicated with inj.glycopyrrolate 0.2 mg, inj. ondansetron 4mg. Intravenous inj.fentanyl 5mcg/kg was given over one minute before induction. Patients were randomized into two groups group E and group T, for patients receiving etomidate and thiopentone respectively. After preoxygenation with 100% oxygen for 3-5 mins, Induction of anaesthesia was done either with etomidate 0.3 mg/kg or thiopentone 5 mg /kg. Loss of eye lash reflexes and lack of response to verbal commands was considered to be as end point of induction. Followed by this inj succinylcholine in doses of 1.5-2mg/kg was given (depolarizing muscle relaxant) to facilitate tracheal intubation, patient was intubated after 1min of interval.

After confirming the proper position of endotracheal tube, it was connected to anaesthesia circuit. Patient was ventilated with 50% oxygen and 50% air along with inhalation agent and maintained with intravenous inj vecuronium. 0.1 mg/kg

**Observation and Results:-**

Sixty patients of grade-II and III of American Society Of Anesthesiologists (ASA) classification were taken for study in elective cardiac surgeries. They were allocated randomly in two equal groups. (Group E - inj. Etomidate 0.3mg/kg and Group T- inj.Thiopentone 5 mg/kg )

**Demographic data:-****Table 1:-** Demographic Characteristics

Variable	Group E	Group T	p-value
Age (years)	45.70 ± 9.15	47.60 ± 9.27	0.427
Weight (kg)	59.50 ± 8.56	60.70 ± 9.27	0.604
Sex (M/F)	17(56.7%) / 13(43.3%)	18(60%) / 12(40%)	0.793

The distribution of patients with respect to sex were comparable in both groups.( p=0.793)

Fairly stable distribution of age confirms the hypothesis that the two groups were not different in the age. The mean Age in Group E was 45.70 ± 9.15years while in Group T it was 47.60±9.268 years which was statistically non significant(p>0.05.)

Fairly stable distribution of weight confirms the hypothesis that the two groups were not different in the weight. The mean weight in Group E was  $59.50 \pm 8.561$  years while in Group T it was  $60.70 \pm 9.267$  years which was statistically non significant ( $p > 0.05$ .)

:Mean systolic blood pressure at different intervals in both the groups

SBP	Group-E	Group-T	p-value
Pre Induction	$134.8 \pm 19.782$	$136.67 \pm 20.044$	0.718
Induction	$134.93 \pm 19.713$	$135.6 \pm 19.871$	0.897
0 min	$131.73 \pm 19.446$	$125.33 \pm 17.223$	0.182
1 min	$130.87 \pm 19.339$	$118.07 \pm 15.892$	0.007
3 min	$129.6 \pm 19.521$	$112.4 \pm 14.087$	<0.001
5 min	$128.87 \pm 19.622$	$106.6 \pm 10.994$	<0.001
7 min	$128.2 \pm 19.243$	$105.8 \pm 11.146$	<0.001
10 min	$127.4 \pm 19.206$	$103.33 \pm 10.175$	<0.001

**Table 8:-** Mean diastolic blood pressure at different time intervals in both the groups

DBP	Group-E	Group-T	p-value
Pre Induction	$85.53 \pm 11.927$	$90.33 \pm 14.143$	0.161
Induction	$84.93 \pm 11.408$	$88 \pm 15.447$	0.385
0 min	$82.8 \pm 11.418$	$80.13 \pm 13.224$	0.407
1 min	$81.67 \pm 11.722$	$75.13 \pm 11.881$	0.036
3 min	$80.33 \pm 11.46$	$71.27 \pm 12.233$	0.004
5 min	$79.27 \pm 11.246$	$69 \pm 13.023$	0.002
7 min	$78.4 \pm 11.294$	$67.13 \pm 11.916$	<0.001
10 min	$78 \pm 11.179$	$64.87 \pm 11.163$	<0.001

SBP and DBP were recorded at preinduction, induction, intubation, 1, 2, 3, 5, 7 & 10 min from the start of the injection of the drug. Both systolic blood pressure and diastolic blood pressure changes were very minimal in group-E. There was a fall in systolic blood pressure and diastolic blood pressure in Group-T at 3, 5, 7 minute and 10 minutes. The difference in both SBP & DBP between group E and group T at 3, 5, 7 & 10 min was statistically highly significant ( $P < 0.001$ ).

## Discussion:-

### Systolic blood pressure:-

In etomidate group pre induction SBP was  $134.8 \pm 19.782$ . In post induction SBP  $134.93 \pm 19.713$ . Again SBP after intubation 0 min, 1 min, 3 min, 5 min, 10 min were  $131.73 \pm 19.446$ ,  $130.87 \pm 19.339$ ,  $129.6 \pm 19.521$ ,  $128.87 \pm 19.622$ ,  $127.4 \pm 19.206$  respectively. There was no significant change in SBP in post induction and after intubation compared to pre induction value and also no significant change after intubation compared to pre induction and post induction value.

In thiopentone group pre induction SBP was  $136.67 \pm 20.044$ . In post induction SBP  $135.6 \pm 19.871$ . Again SBP after intubation 0 min, 1 min, 3 min, 5 min, 10 min were  $125.33 \pm 17.223$ ,  $118.07 \pm 15.892$ ,  $112.4 \pm 14.087$ ,  $106.6 \pm 10.994$ ,  $103.33 \pm 10.175$  respectively. There was no significant change in SBP in post induction and after intubation compared to pre induction value and also no significant change after intubation compared to pre induction and post induction value.

### Diastolic blood pressure:-

In etomidate group, pre induction DBP was  $85.53 \pm 11.927$ . In post induction, DBP was  $84.93 \pm 11.408$ . After intubation 0 min, 1 min, 3 min, 5 min, 10 min DBP were  $82.8 \pm 11.418$ ,  $81.32 \pm 4.78$ ,  $81.3 \pm 4.7$ ,  $79.9 \pm 4.9$  and  $78.93 \pm 5.0$  respectively. There was no significant change in DBP in post induction and after intubation compared to pre induction and after intubation compared to post induction.

In thiopentone group, pre induction DBP was  $90.33 \pm 14.143$ . In post induction, DBP was  $88 \pm 15.447$ . After intubation 0 min, 1 min, 3 min, 5 min, 10 min DBP were  $80.13 \pm 13.224$ ,  $75.13 \pm 11.881$ ,  $71.27 \pm 12.233$ ,  $69 \pm 13.023$  and  $64.87 \pm 11.163$  respectively. There was significant change in DBP in post induction and after intubation compared to pre induction and after intubation compared to post induction.

## Summary:-

The present study was conducted on 60 patients' age group between 45-65 years belonging to ASA grade II AND III. These patients were scheduled for elective cardiac surgeries.

Sixty patients were randomly selected, and divided into two groups with thirty patients in each group. Group E patients were induced with Inj. Etomidate 0.3mg/kg and Group T patients were induced with Inj. Thiopentone 5mg/kg. as an induction agent.

The following parameters were compared between the group E and group T, pain on injection, myoclonus, induction time and hemodynamic parameters.

Incidence of pain on injection is about 50% of the patients induced with Etomidate and absent in Thiopentone group. Myoclonus occurred in about 43% patients in etomidate group compared to 13% patients in thiopentone group.

Induction time was faster with Inj. Etomidate, which induced anesthesia at an average about  $25 \pm 3.2$  seconds. Thiopental induced anesthesia at an average about  $31 \pm 4.5$  seconds.

Hemodynamic changes with respect to the heart rate and blood pressure changes after premedication were minimal in both groups. At the time of induction there was minimal fall in blood pressure in Etomidate group but blood pressure significantly decreased in Thiopentone group.

After the intubation there were minimal changes in Etomidate group. heart rate and blood pressure were significantly raised in Thiopentone group.

To summarize both the groups shared complications like Pain on injection was present after inducing with Etomidate and it was absent in Thiopentone Myoclonus. It was more significant in Etomidate group than Thiopentone group. The induction time was faster and smoother in Etomidate group, when compared with Thiopentone group. Etomidate has reduced cardiovascular response to laryngoscopy and tracheal intubation in comparison with Thiopentone in elective cardiac surgeries.

### Conclusion:-

By the present study it can be concluded the induction time is lesser with Inj. Etomidate than Inj. Thiopentone. Etomidate is an effective and rapid acting induction anesthetic agent with good cardiovascular stability.

Finally, we conclude that Inj. Etomidate can be safe, hemodynamically stable and effective alternative to Inj. Thiopentone for the induction of general anesthesia in elective cardiac surgeries.

#### Abstract

The innovatory modifications in the field of journal bearing are at quite slow speed. In the field of tribology tools requires high stiffness to improve accuracy. Thus it is necessary for the designer to study the parametric influence of journal bearing quantitative as well as qualitative. This article provides a brief review for journal bearing from available literature in recent years. Since there have been lot of developments in design, the parametric optimization has been performed by many researchers. Numbers of researchers have been working on different aspects of performance of the journal bearing, ranging from temperature rise, geometry of grooves, damping, eccentricity ratio and clearance etc. Based on the state of art in bearing identification, valuable discussions are made with future directions.

#### Introduction:-

Now a days, hydrodynamic journal bearing are in high demand for their excellent properties such as long-term performance, negligible friction and almost zero wear particularly in Diesel engine, centrifugal compressors, pumps, motors, etc. Now a day, hydrodynamic journal bearing are in high demand for their excellent properties such as long-term performance, negligible friction and almost zero wear particularly in Diesel engine, centrifugal compressors, pumps, motors, etc. This type of bearing works on hydrodynamic principle, which involves with the rotation of shaft, creates an oil wedge that supports the shaft and relocates it within the bearing clearances. The shaft spinning within a journal bearing is actually separated from the journal bearing's metal facing by an extremely thin film of continuously supplied oil that prohibits metal to metal contact. In other words the hydrodynamic journal bearing works on hydrodynamic lubrication theory, which is concerned with separation of two surfaces in relative motion.

**Figure 1:-** Journal bearing geometry

Journal bearings shown in figure 1 have many designs to compensate for varying load requirements, machine speeds, cost, or dynamic properties. A stable bearing design holds the rotor at a fixed attitude angle during transient periods such as machine start-ups/shutdowns or load changes. The performance of a hydrodynamic journal bearing is governed by a number of bearing parameters, such as radial clearance length, diameter, viscosity, groove geometry, location, etc. There are few assumption regarding hydrodynamic journal bearing are as the flow is laminar and isothermal with a constant vertical load  $W$  is applied on the journal. Geometry and co-ordinate system of the journal bearing is shown in fig 1. The journal rotates with angular velocity  $\omega$  and remains in equilibrium position under the action of external load,  $W$ . The journal centre  $O$  is eccentric to bearing centre  $O'$ . The film thickness  $h(\theta)$  varies from its maximum value  $h_{max}$  at bearing angle  $\theta = 0$  to its minimum value,  $h_{min}$  at  $\theta = \pi$ .

In this article, we present a review of hydrodynamic journal bearing from literature available in recent years. Since there have been lot of developments in design, the parametric optimization has been performed by many researchers. Numbers of researchers have been working on different aspects of performance of the journal bearing, ranging from temperature rise, geometry of grooves, damping, eccentricity ratio and clearance etc. Based on the state of art in bearing identification, valuable discussion is made and future directions are suggested.

### Literature Review:-

First a remarkable work on Thermo-hydrodynamic study of journal bearing was done by Hughes and Osterle [1] and describes a relation between viscosity as a function of temperature and pressure of the lubricant inside the journal bearing for adiabatic conditions with examples Basri and Gethin [2] have investigated the thermal aspects of various noncircular journal bearing using adiabatic model. Cupillard et al. [3] have presented an analysis of lubricated conformal contact to study the effect of surface texture on bearing friction and load carrying capacity using computational fluid dynamics. The authors have reported that the coefficient of friction can be reduced if a texture of suitable geometry is introduced. Gertzos et al. [4] have investigated journal bearing performance with a Non-Newtonian fluid i.e. Bingham fluid considering the thermal effect. Huiping Liu et al.[5] studied hydrodynamic journal bearings with elastic insert and found that the elastic deformation of the bearing had a significant influence on the rotor–bearing system, particularly for the polymeric-based materials. Jaw-Ren Lin et al. [6] numerically calculated oil film pressure by using Fourth Runge-Kutta method and this pressure is utilized to evaluate the load carrying capacity and the friction parameter. A comparison of the results between the Darcy model and Brinkman model is made to show the viscous shear effects provide an increase in the load capacity, as well as a decrease in the friction parameter. Nabhan et al.[7] solved Navier-Stokes equation with the aid of Simpson rule and calculated the pressures, drags and load carrying capacities by taking binary fluid mixture with different viscosity ratio. Hassan E.

Rasheed [8] theoretically presented the effects of circumferential, axial and combined surface waviness on the performance of the hydrodynamic journal bearings by using Reynolds equation for Newtonian isoviscous lubricant. It was observed that when waviness number is approximately below nine, then circumferential waviness increases the load carrying capacity and decreases the friction variable. But the axial waviness is to always have an opposite effect on the load carrying capacity and friction variable. S.k.guha [9] analyzed the effect of isotropic roughness on the steady-state characteristics of hydrodynamic journal bearings terms of load capacity, attitude angle, end leakage flow rate, misalignment moment and friction coefficient are estimated for different values of roughness parameter, eccentricity ratio and degree of misalignment at unit slenderness ratio. Finite difference method is also used to measure steady-state oil film pressures by using Reynolds equation. Myung-Rae Cho et al.[10] presented the effects of circumferential groove on the minimum oil film thickness in engine bearings and used mobility method for journal locus analysis. It was observed that the circumferential 360° groove only decreases the magnitude while 180° half groove affects the shape and position of the minimum oil film thickness. NabarunBiswas and PrasunChakraborti[11] used physical properties of SAE-50 lubricant for analysis purpose in journal bearing. They involve with six time steps 10, 30, 50, 70, 90, and 110 sec for unsteady analysis and found out that after 110 sec the flow becomes steady. It was also observed that maximum pressure is observed at minimum oil film thickness with increasing value of roughness.

Sep et al.[12] analysed new design of the journal bearing with two-component surface layer and experimentally proved its usefulness in the case, where oil is contaminated by hard particles. In this new design the helical grooves are made on the bearing journal surface that should enable to eliminating contaminants from the frictional contact zone and concluded that if soft material is placed in the immediate vicinity of the grooves it will restrict the hard particles driving into the bearing surface which also decreases sensitivity. Byoung-Hoo Rho et al. [13] investigated acoustical properties of hydrodynamic journal bearing. The universal Reynolds equation is solved at each step of time using the finite difference method and the nonlinear transient motion of the journal centre is obtained by numerical integration of its acceleration using fourth order Runge-Kutta method. Byoung-Hoo Rho et al [14] investigated the effects of design parameters on the noise of rotor-bearing system supported by oil lubricated journal bearing. The Reynolds equation for finite width bearing under unsteady condition is applied for calculating pressure. It was observed that the radial clearance, mass eccentricity of the rotor and the width of the bearing considerably affect the A-weighted sound pressure level of the bearing. Wu et al.[15] studied wall slip problem by parametric quadratic programming method and generalized Reynolds equation with wall slip for two-dimensional flow is applied. It is observed that if limiting shear stress at bearing surface should be more than that at the journal surface, the wall slip avoided. Nikolakopoulo et al.[16] developed an analytical modal which shows the relationship among the friction force, wear depth and misalignment angles The Reynolds equation is used to calculate the friction force in equilibrium condition and found that friction function dependent on wear and misalignment of the bearing. Singh et al [17] theoretically performed steady-state thermodynamic analysis of an axial groove bearing by using Reynolds equation, energy equation and heat conduction equation with appropriate boundary conditions in the journal bearing. It was found that the fluid film temperature increases due to frictional heat resulting viscosity and load carrying capacity decreases. It was also observed that groove angle of 360° and groove length (Half of the bearing length) promoted to decrease the maximum temperature and increase the load carrying capacity. Ron A.J. Van Ostayen [18] presented a mathematical optimization procedure to find the optimal film height distribution for a hydrodynamic bearing. Firstly this methodology is applied for a bearing with constant load and sliding speed. Then subsequently applied for a bearing with periodic load and sliding speed. Slider bearings with different shapes, loads and speeds are analyzed by new heuristic load optimization procedure along with Reynolds equation and found more efficient than general purpose optimization routine. Andras Z. Szeri [19] modified the structure of lubricant film by using double layer of lubricant into clearance space of bearing surfaces in place of single layer of lubricant. Basic Reynolds equation was used for composite films under the restrictive assumptions by applying boundary conditions. The low-viscosity lubricant reduced viscous dissipation, while the high-viscosity lubricants maintained the desirable thickness to separate out the bearing surfaces. It was also found that composite-film bearings have considerably lower frictional losses in comparison to other traditional bearings. Lui et al.[20] designed and fabricated a test rig to investigate the stability nature of the JRHB. It was found that the rolling bearing plays a protective role under IHP condition. K. M. Panday et al [21] analysis thin film lubricated journal bearing with different L/D ratios such as 0.25, 0.5, 1, 1.5, and 2. It was observed that maximum pressure present at minimum oil film thickness. Also reported that shear stress is reduces on bearing and journal surface with increase in L/D ratio whereas turbulent viscosity of lubricant rises with increase in L/D ratio. NacerTala-Ighil et al [22] developed a numerical model based on finite difference method by using Reynolds equation to study the cylindrical textures shape effect on the performance of hydrodynamic journal bearing. Based on geometric arrangement of textures on the bearing surface, a comparison of

considered twenty five cases is conducted. It was found that the minimum oil film thickness increased approximately by 1.8% and friction torque is decreased approximately by 1.0%. Meybodi et al [23] developed a general methodology, to design the proper bearing in order to eliminate the deviation of final product in extrusion process. Three smooth curved dies with non-symmetric T-shaped sections at different off-centricities have been taken and for each die proper bearing has designed. It was found that the deviation of final product is eliminated to a great extent. McAllister and Rohde [24] optimized the load-carrying capacity of one-dimensional journal bearings for a given minimum film thickness by using a long bearing approximation, which is inaccurate in most practical design ranges. Hashimoto [25] presented an optimum study for high speed short journal bearings using successive quadratic programming. For Eccentricity  $> 0.8$  and  $L/D > 0.3$ , the short bearing approximation predicts highly unreliable results. Peeyush vats et al [26] presented thermal analysis of journal bearing by using FEM analysis. Parameters like heat generated, temperature distribution and heat dissipation are studied. From results it is reported that difference between heat dissipated and heat generated in oil film was very large, which causes increase in temperature of the bearing and damaged the bearing pads.

Currently, due to advancement in computer technology, many researchers trying to use commercial computational fluid dynamics (CFD) programs in their investigations. The CFD code is differ from other relevant codes because full Navier–Stokes equations is used with provides a solution to complex flow problem, whereas finite difference codes are based on the Reynolds equation. Moreover, the CFD packages are applicable in very complex geometries. Authors used different computational codes to study the parametric influence of hydrodynamic journal bearing are listed below with their outcomes.

Ref.	Technique used	Bearing type	Parameter	Analysis /Results
[27 ]	CFD	journal bearing with smooth and textured surface	Surface texture on eccentricity ratio and frictional force	Light loading condition increased minimum film thickness and reduced frictional force and for high loading conditions increasing pressure zone decreases the frictional force.
[28]	CFD	Central circumferential groove of hydrodynamic journal bearing	Bearing carrying capacity, cavitations zone and vapour fraction.	Groove depth affect the load zone, bearing carrying capacity, cavitations zone and vapour fraction.
[29]	CFD	Hydrodynamic journal bearing	$L/D$ and eccentricity ratios, pressure	FSI approach is used to find out pressure, stress and deformation of hydrodynamic journal bearing
[30]	CFD	Journal bearing with bingham fluid.	Eccentricity ratio, yield stress	Fluent software compared with experimental and theoretical results of Newtonian as well as Bingham lubricants and found good agreement. It is also concluded that the effect of yield stress is small for low eccentricity ratio on the journal bearing
[31]	CSD and CFD	Full 360° journal bearing.	Deformation and stress distribution	The paper presented, these techniques is effectively used for To finite element method (FEM) was used to calculate stress distribution .finding the surface deformation of bearing under static load.effect of resulting forces is also discussed. The simulation of elasto-hydrodynamic lubrication have validated with standard lubrication result
[32]	CFD-FSI	Journal bearing	Deformation, eccentricity ratios and speeds	Investigate interaction between elastic behavior of bearing and fluid by developing models for different eccentricity ratios and speeds. this technique developed accurate performance of the bearing
[33]	CFD and	Thermo-	Pressure,	Finite volume and finite element method is used

	FSI.	hydrodynamic and thermo-elastohydrodynamic analysis of full journal bearing	temperature and velocity distribution in the fluid film, and bearing surface deformation	to determine the characteristics under static load condition. Distortion due to pressure is important factor for determining the behavior of bearing.
[34]	COMSOL models	Hydrodynamic bearing	Pressure distribution, eccentricity ratio	Pressure distribution is found out on infinite (short as well as long) bearing under steady state condition. It was predicted that increasing pressure is proportional to eccentricity ratio and pressure increases along the direction of eccentricity
[35]	ANSYS. MATLAB software	Bush type journal bearing	Temperature	It is showed that around 12% variations observe between two methods. But Ansys gave more exact solution than numerical method.
[36]	CFD	Journal bearing	Pressure, temperature viscosity, L/D ratio, rotational speed, Eccentricity ratio, pressure distribution	Software results validated with numerical results got from Raimondi and Boyd chart method. It is predicted that increasing temperature raises pressure but decreases of attitude angle
[37]	CFD (Gambit and using fluent 6.3.26 )	Plain journal bearing	Pressure distribution, temperature and viscosity	It is observed that increasing frictional force increases the temperature and reduces viscosity as well as maximum pressure of lubricant
[38]	CFD	Circular journal bearing	Pressure and temperature distribution	When the viscosity is put constant , temperature as well as pressure increases
[39]	CFD and FSI	Infinitely long journal bearing	Pressure and temperature variation	It is found that maximum pressure occurred nearer to the region of minimum film thickness
[40]	CFD	Journal bearing	Pressure distribution, friction force, friction coefficient	It is observed that dimple is useful for lubrication performances and reduces friction force but there is loss of load capacity.

### Common observations:-

From the available literature it is clear that researchers have listed almost all aspects regarding performance characteristics of journal bearing, however there is a need to develop new mathematical models based on behaviour of rotor-bearing systems. Similarly more experimental work also needed to study the influencing parameters on performance of hydrodynamic journal bearings. CFD code set new level of precision in the research of journal bearing with accuracy. New experiments can be used available data more effectively, especially with the inherent practical constraints for measurements and development of new identification techniques. The load carrying capacity, fluid film thickness and eccentricity ratio of journal bearing are discussed briefly but the effect of time duration is also hidden in the available literature which may influence performance characteristics of journal bearing.

#### Abstract

A study was conducted on physico-chemical parameters of water from the estuary region in Coringa Wildlife Sanctuary. Physico-chemical parameters play an important role in the structuring the fish species and other aquatic organisms in mangrove swamp, estuaries and coastal areas. The baseline study was carried out for two successive years that is from January 2015 to December 2016 respectively. Monthly water samples were collected and 10 water parameters were analyzed. Data on temperature and pH were obtained from the field using mercury-in-glass thermometer and portable pH pen. Dissolved Oxygen, Salinity, Alkalinity, Hardness, Calcium and Magnesium were analyzed by using the standard protocols. Temperature varied between 33.8-26; pH, 8.5-7.15; salinity 24-0; dissolved oxygen 7.8-4; Ammonia 1.2 - 0.05; alkalinity, 340-80; Nitrite 1 – 0.01; Hardness 3500-110; Calcium 250-80; Magnesium 450-180. The water parameters favored the growth of the aquatic organisms. However, due to the ever increasing discharge of the effluents from the industries, municipality drainages and the aqua culture ponds contribute to the pollution of the estuarine ecosystems. This study is baseline data towards future ecological study, conservation and management of the resources in the East Godavari estuarine ecosystem.

#### Introduction:-

Water quality is defined in terms of the chemical, physical and biological contents of water. The water quality of rivers and lakes changes with the seasons and geographic areas, even when there is no pollution present. Water quality guidelines provide basic scientific information about water quality parameters and ecologically relevant toxicological threshold values to protect specific water uses. Important physical and chemical parameters that majorly influencing the aquatic environment are temperature, pH, salinity, dissolved oxygen, Ammonia, Nitrite, Alkalinity Hardness, Calcium and Magnesium. These parameters are the limiting factors for the survival of aquatic organisms (flora and fauna) of the particular water bodies. Poor water qualities may be caused by low water flow, municipal effluents and industrial discharges (Chitmanat and Traichaiyaporn, 2010). Water temperature is probably the most important environmental variable. Temperature is also a limiting factor in the aquatic environment Odum

(1971) and Boyd (1979). The salt concentration directly affects the salinity which impacts circulation with estuaries and coastal regions can derive from or be strongly influenced by the density variation associated with salinity. Mangrove vegetation is considered to be highly productive tropical ecosystems (Clough, 1992). The mangrove forests are the important source of carbon and nutrients to the adjacent lagoonal and coastal systems (Odum and Heald, 1972, 1975; Twilley, 1988; Wattayakorn et al., 1990; Robertson et al. 1992).

The Godavari Mangroves are located in Godavari Estuary of East Godavari District, Andhra Pradesh. Total area under Godavari mangroves is 33,263.32 ha. and is the second largest mangrove patch along the east coast of India. This area also supports a wide range of other flora and fauna that include 35 species of mangrove and associated species, 277 benthic organisms, 609 Fin Fish species, 269 bird species, 26 species of Reptiles and 18 species of terrestrial mammals. Coringa Wildlife Sanctuary comprises of 34 creeks, canals including the Coringa and Godavari rivers.

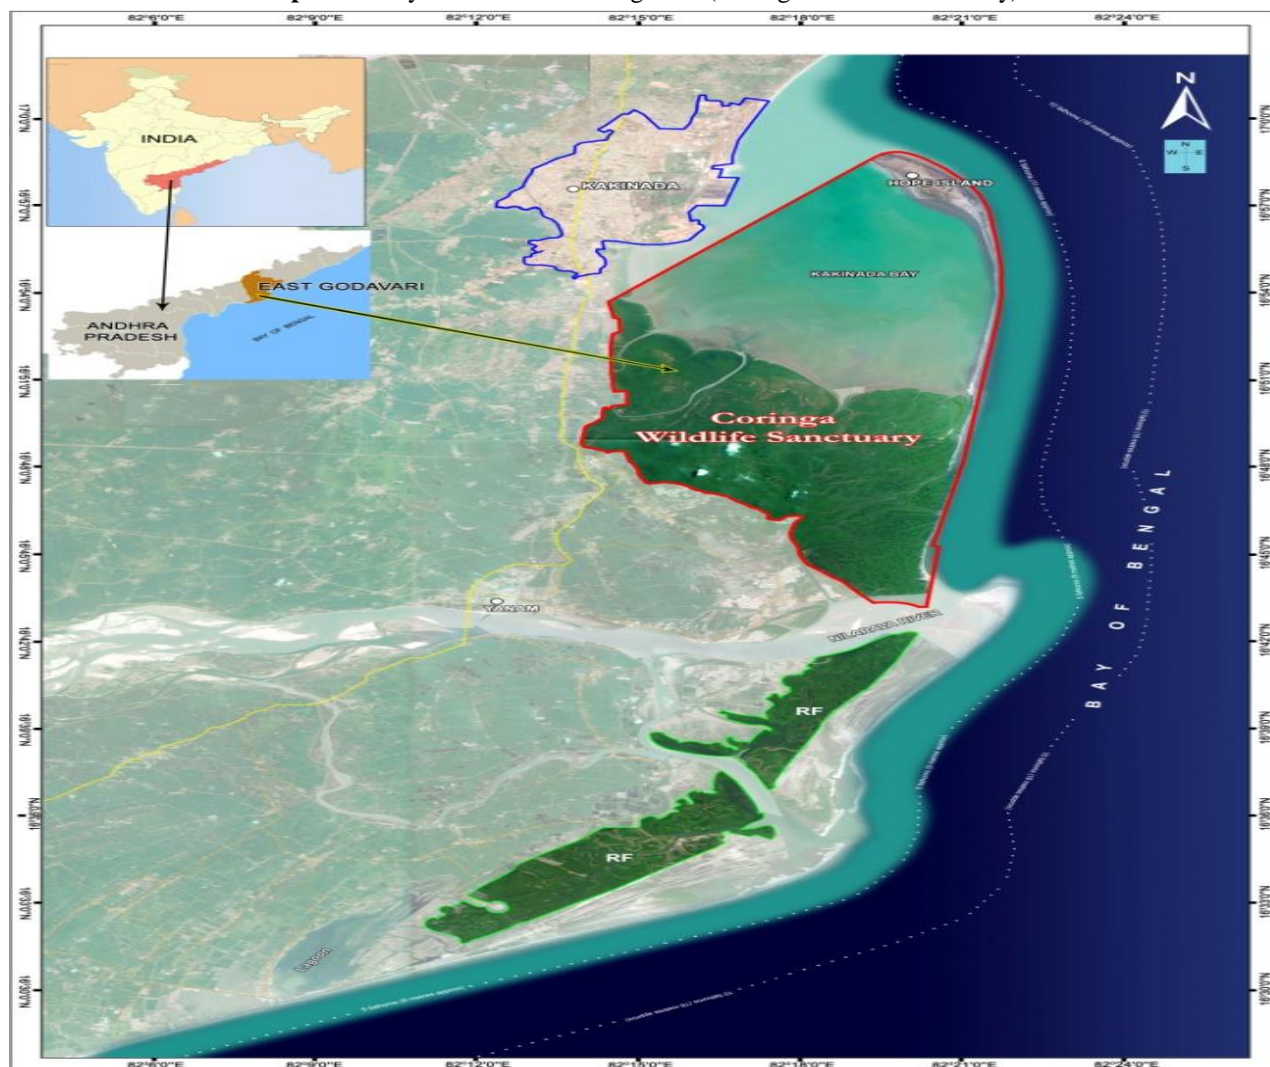

Due to rapid development of Kakinada port and erection of large scale industries changed urbanization of the Kakinada town, the mangrove fringed Coringa became a victim due to drastic urbanization and intensive commercial aquaculture practices. These factors have been identified as possible attributes towards a steady increase in eutrophication of waters in this area (Murthy, 1997). Although Coringa mangroves declared as Wildlife Sanctuary since 1972, this rich but fragile ecosystem has undergone serious alterations largely induced by human activities. Most of the mangrove areas are being converted for aquaculture culture areas. It is therefore necessary to understand the possible role of mangroves in ecosystem functioning. Selvam et al. (1992) studied the diurnal variation in physical – chemical properties and primary production in the interconnected marine, mangrove and freshwater biotopes of Kakinada coast, Andhra Pradesh. Bhaskara Rao et al. (1992) studied the mangrove environment and its sediment characters in Godavari estuary, east coast of India. Tripathy et al. (2001) studied the Water quality assessment of Gautami Godavari mangrove estuarine ecosystem of Andhra Pradesh, India.

#### **Materials And Methods:-**

##### **Study Area:-**

‘Coringa Wildlife Sanctuary’ is located between 16°44’ to 16° 53’ N and 082° 14’ to 082° 22’ E and at the confluence of the river Godavari with the Bay of Bengal in the East Godavari District of Andhra Pradesh. The sanctuary is a part of the Godavari Estuary and has extensive mangrove cover. The total area is 235.7 sq.km. The average temperature of the region is 17°C to 40°C. Average Rainfall is greater than 1,000 mm. The Northern part of sanctuary is covered by the back waters of the Kakinada Bay and covers an area of about 100 sq. km.

**Map -1:-** Study area Godavari mangroves (Coringa Wildlife Sanctuary)

Due to seasonal distribution of rainfall, East Godavari estuary ecosystem experiences seasonal flooding which introduces a lot of detritus and pollutants from the land. The estuary region presently serves as a major drainage channel receiving domestic wastes as well as industrial effluents from the industrial area of Kakinada.

#### Activity in the field:-

Water samples were collected to study the physico-chemical parameters of the estuary region of the Coringa Wildlife Sanctuary, these samples were collected from both surface and bottom of the creek. Usually water samples were collected between 6 AM to 10 AM, samples were collected from two different points between January 2015 to December 2015 and January 2016 to December 2016.

Water parameters like pH and salinity were analyzed at the sampling station by using portable pH pen and digital salinometer. The water was collected by dipping cans 50-60 cm beneath the water surfaces. Fixation of the DO samples were done immediately after the sample collection in the DO bottles with the Wrinklers A and Wrinklers B reagent. The sample bottles were filled fully with water from each sample station, labelled and stored on ice for transport to the laboratory for water quality analysis. Samples collected in the 500ml plastic bottles and DO bottles were analyzed for general parameters viz., pH, Dissolved Oxygen, Salinity, Alkalinity, Hardness, Calcium and Magnesium using the standard protocols and calibrated methods.

## Results and Discussions:-

The results were primarily influenced by seasonal variations and inflow of the Godavari and Coringa river influencing the water quality parameters. The results were tabularize in (Table -1).

In the present study atmospheric temperature ranges from 26<sup>0</sup> C to 33.8<sup>0</sup>C. Minimum recorded in the month of December and February 2015 and maximum in the month of May 2015 and 2016. The temperature is important factor which considerably fluctuated during study period. Lower temperature in the above months due to cloudy sky and rainfall brought down the temperature to the minimum.

The Hydrogen ion concentration or pH is one of the important proxy of water quality conditions, since pH of water is easily changed by chemical pollution. It is one of the vital environmental characteristics decides the survival, metabolism, physiology and growth of aquatic organisms. The pH is influenced by acidity of the bottom sediment and biological activities. High pH may result from high rate of photosynthesis by dense phytoplankton blooms. pH higher than 7 but lower than 8.5 according to (Abowei 2010) is ideal for biological productivity, but pH at <4 is detrimental to aquatic life. pH may be affected by total alkalinity and acidity, run off from surrounding rocks and water discharges. Ramanathan et al. (2005) recommended optimum range of pH 6.8-8.7 for maximum growth and production of shrimp and carp. The Hydrogen ion concentration has been recorded to be maximum of 8.5 to 7.15 minimum during the two years of study. Hence, the pH is at the permissible limit for the favorable growth of the aquatic fauna in this region.

Salinity is a dynamic indicator of the nature of the exchange system. It determines distribution of organisms in aquatic environments. The salinity of the water within the estuary tells us how much fresh water has mixed with sea water. Oxygen solubility decreases slightly as salinity increases, but oxygen solubility decreases more as temperature goes up regardless of salinity. Alkalinity of a water body is a measure of its capacity to neutralize acids to a designated pH ( APHA, 1980 and Edokpayi, 2005.) In the present study the lower salinity was recorded during the month of October 2016(0 ppm), The zero level of the salinity was because of the inflow of the Godavari River during the monsoon season. and higher salinity was recorded in the month of March 2016 (24ppm), the result was corroborated with the (Muduli Bipra Prasanna et al., 2010) When river water mixes with seawater, a large number of physical and chemical processes take place, which may influence of water quality.

Dissolved oxygen (DO) affects the solubility of and availability of nutrients. Dissolved Oxygen is essential for the survival of fish and other aquatic life and is an important indicator of pollution and/or eutrophication in rivers. The solubility of oxygen in river waters depends mainly on the water temperature and salinity. Its low levels can result in damages to oxidation state of substances from the oxidized to the reduced form thereby increasing the levels of toxic metabolites. In the present study Dissolved oxygen ranges in between 4 to 7.8 ppm. The highest (7.8 ppm) D.O recorded in the month of July 2016 and lowest (4ppm) D.O recorded in the month of April 2016 and September 2105.

Ammonia acts as indicator of the pollution from excessive usage of ammonia especially from fertilizers. Ammonia is the initial product of the decomposition of nitrogenous organic wastes and respiration. Ammonia concentration in waters must not exceed the recommended limit because it is very dangerous and can harm an aquatic life in the river water. High concentrations of ammonia causes an increase in pH and ammonia concentration in the blood of the fish which can damage the gills, the red blood cells, affect osmoregulation, reduce the oxygen-carrying capacity of blood and increase the oxygen demand of tissues (Lawson, 1995). Present study confirms the maximum level of 1.2 ppm and the lowest 0.05 ppm and the mean for the two successive years was 0.47782.

Alkalinity is a measure of the capacity of unfiltered water to neutralize acid. In almost all natural waters alkalinity is produced by the dissolved carbon dioxide species, bicarbonate and carbonate.

Alkalinity is the water's ability to resist changes in pH and is a measure of the total concentration of bases including carbonates, bicarbonates, hydroxides, phosphates and borates, dissolved calcium, magnesium, and other compounds in the water. According to Moyle (1946) the range of total alkalinity as 0.0 - 20.0 ppm for low production, 20.0 - 40.0 ppm- low to medium, 40.0 - 90.0 ppm- medium to high production and above 90.0 ppm productive of the aquatic organisms especially fish fauna. Hence, the present study determines the good alkalinity levels in the study for the good environment for the growth of fishes.

Nitrite is an intermediate product of the aerobic nitrification bacterial process, produced by the autotrophic *Nitrosomonas* bacteria combining oxygen and ammonia. The ideal and normal measurement of nitrite is zero in any aquatic system. Stone and Thomforde (2004) suggested that the desirable range 0-1 mg L<sup>-1</sup> NO<sub>2</sub> and acceptable range less than 4 mg L<sup>-1</sup> NO<sub>2</sub>. The results shows that the Nitrite rate from 1 ppm. and 0.01 ppm and most of the months was recorded to be nil thus the study area has permissible limit for the survival of the aquatic organisms.

Hardness is the measure of alkaline earth elements such as calcium and magnesium in an aquatic body along with other ions such as aluminium, iron, manganese, strontium, zinc, and hydrogen ions. Hardness was recorded maximum 3500ppm during September 2015 and minimum 110 ppm during October 2016 from the study area.

Calcium salts and Calcium ions are the most commonly occurring salts in Nature. They can come from natural or manmade. The concentration of calcium in water samples detected in between the range of 250-80 ppm with mean level of 155.24 ppm. It can be attributed to Hydro-chemical processes and also by anthropogenic sources like domestic wastes. Mean value of Magnesium was found to be 352.205 ppm and showed between the range of 450-180ppm, which may be attributed to basaltic inflows due to natural process in the study area, sea water influx, Aqua culture waste water and industrial waste waters.

\*ppm = parts per million

It is perceived that the chemical run off from aquaculture may also contribute to the pollution of the estuarine ecosystems. The discharge of these effluents into the environment poses a threat to the coastal ecosystem and it is natural resources (Chua et al. 1989) and cause eutrophication of receiving water such as lakes and rivers (Cripps and Berghem, 2000). A study by Rangarao et al. (2003) indicates that pollutants are not flushed out completely due to the existing water circulation pattern and tend to accumulate in the southern part of the bay where mangroves are located. A small percentage (9%) of the fishermen of the Godavari mangroves attributes aquaculture effluents as the main cause of declining harvests (Dahdouh- Guebas et al. 2006). Untreated waste water loaded with uneaten feed

and fish faeces may contribute to nutrient pollution to the creeks which are near to the fish ponds. Industrialization, municipality drainage discharges, discharge of untreated water from the aqua culture ponds which were adjacent to the creeks and canals of the Coringa Wildlife Sanctuary contribute the estuary ecosystem. And when quantities of nitrogen wastes such as ammonia and nitrite are greater than creek waters can assimilate, water quality can deteriorate to a level that is toxic to aquatic organisms.

### Recommendations:-

Proper disposal of industrial wastes, agricultural runoff, and the municipal waters while outlet in to the marine waters. Industrial sectors, governmental authorities and aqua cultural farmers have to take responsibility to ensure that chemical use in view of environmental quality and human health as well.

### Acknowledgements:-

We are grateful to the Government of India, United Nations Development Programme, Global Environment Facility and Government of Andhra Pradesh (GoI-UNDP-GEF-GoAP), EGREE Foundation and State Institute of Fisheries Technology, Kakinada for their support. We wish to acknowledge Dr. K. Thulsi Rao, State Project Coordinator, (GoI-UNDP-GEF-GoAP), EGREE Foundation. We are very much thankful to Mrs. Nirmala Grace, Research Scholar, for her help during the analysis. We also like to acknowledge Mr. D. Mahesh Babu and P. Ganesh, Field Assistants for their help during the field data collection.

#### Key words:-

Pesticides, Epigenetics, Cancer risk.

### Abstract

Potential for carcinogenicity of pesticides is identified on the basis of its potential for causing genotoxicity. But, there are some pesticides that do not cause mutation at very early stage of exposure but result in silencing certain genes which make the cells addicted to oncogenic products to become neoplastic. This review throws light on the epigenetic changes brought about by pesticides, which effect the expression of genes without change in their DNA sequence. If certain epigenetics based tests are included in the panel of screening pesticides before they are introduced into the market, then not only will it help in deciding norms for regulating exposure to these chemicals but will also solidify our knowledge for that pesticide.

### Introduction:-

Pesticides are group of chemicals designed to eliminate pests, including insects, molds and unwanted plants, in order to protect crops. Based on their targets the pesticides are categorized as fungicides, insecticides, herbicides etc.

Pesticides are neurotoxins, nephrotoxins, genotoxins, hemotoxins and endocrine disrupters for the target organisms. Thus regulation of their exposure and usage is important for protecting the non-target organisms. One of the most undesirable effects of the pesticides on the non-target organisms is development of cancer. The pesticides are tested for genotoxicity and carcinogenicity before authorization for marketing (Bull, Fletcher, Boobis and Battershill, 2006). But, there are several epidemiological studies that indicate association of chronic exposure to certain pesticides with increased risk of cancer (See Table I). This suggests that possibly long term exposure to pesticides eventually brings about neoplastic changes to the cells via mechanisms other than genotoxicity (Tsai and Baylin, 2011; Baccarelli and Bollati, 2009; Mostafalou & Abdollahi, 2013).

Pesticides can result in carcinogenesis via multiple mechanisms like oxidative stress, several receptor mediated pathways and aberrant epigenetic changes (Alavanja, Ross and Bonner, 2013). Epigenetic modifications of tumor suppressor genes and oncogenes are considered important molecular drivers for tumorigenesis and are crucial for cancer diagnostics. Study of epigenetic signatures for exposure to environmental chemicals is a developing field (Hou, Zhang, Wang, & Baccarelli, 2012).

**Table I:-** Some epidemiological studies to study role of pesticide exposure on different cancer types prevalent in the population

S. N O.	TYPE OF CANCER	TYPE OF PESTICIDE EXPOSURE	POPULATION STUDIED	AGE OF SUBJECTS	TYPE OF DATA COLLECTION	TIME SPAN OF STUDY	REMARKS / CONCLUSIONS	References
1	Brain tumor	Occupational pesticide exposure	Rio-de-Janerio	Men (age >18)	Death certificates from health centers	1998-2005	Agricultural workers showed higher mortality risk due to brain cancer than non-farm workers	(Miranda-Filho, Monteiro, & Meyer, 2012)
2	Prostate cancer	OP: Malathione . Fonofos, Turbufos ; OC: Aldrein	Iowa and North Carolina	Men (age not defined)	Interviews based on questionnaire	1993-2007	Association of increased risk of total prostate cancer with increased use of Fonofos and Aldrein in those with family history.	(Koutros et al., 2013)
3	Multiple sites	Occupational pesticide exposure	Andalusia (Spain)	Men and women (average age 37)	Hospital records	1998-2005	Prevalence higher in areas with higher exposure. Males show higher cases of lung, prostate, and testicular cancers. Females show higher cases of ovary and breast cancer.	(Parrón, Requena, Hernández, & Alarcón, 2013)
4	Childhood leukemia ALL, AML	Occupational pesticide exposure	Europe (13 nationwide studies)	Children (mostly of age 15) and parents	Data from study done by CLIC	Variable	Increased risk of AML with maternal exposure to pesticides during pregnancy. Slight increase in the ALL with paternal exposure to	(Bailey et al., 2014)

							pesticides	
5	Non-Hodgkin's Lymphoma	Many lifestyle associated factors, diet, occupational exposure to pesticides	Mumbai (India)	Men (average age 46)	Data from TATA memorial hospital followed by interview	1997-1999	3X increase in lymphoma on exposure to pesticides.	(Balasubramani am, Saoba, Sarade, & Pinjare, 2013)
6	Hodgkin's Lymphoma	Multiple pesticides	6 provinces of Canada	Men (age >19)	Data from CCSPH followed by interview	1991-1994	Association of Hodgkins Lymphoma with fungicides and insecticides specially acetylcholine esterase inhibitors	(Navaranjan et al., 2013)
7	Childhood leukemia ALL, AML	Occupational pesticide exposure	India	Children (age<18) and parents	Patients from (PBD SHUS) followed by questionnaire	2008-2012	Increase in the risk leukemia in children whose mothers are working in agricultural field during pregnancy	(Kumar, Vashist, & Rathee, 2014)
8	Stomach Pancreatic Leukemia	Organochloric pesticides DDT	Sardinia (Italy)	Men and Women (age not defined)	.....	1984-1986	Mortality from stomach cancer increased up to 2X in high exposure. But no exposure-response trend was observed.	(Cocco et al., 1997)
9	Colorectal Cancer	50 Occupational pesticide exposure	Iowa and North Carolina	Not defined	Exposure details by questionnaire	1993-1997	Chlorpyrifos and Aldicarb exposure associated with colorectal cancer	(Lee et al., 2010)
10	Bladder Cancer	Occupational pesticide exposure	France	men (age 35-74)	Data from Pesticide Exposure Index for 89 units in France	1984-1986	A significant link with PEI in vineyards was found	(Viel & Challier, 1995)

12	Stomach, Kidney etc	Occupational pesticide exposure	Central Italy	Men (age 35-80)	Data from Municipal registration	Data from 1953-1985	Increased risk of stomach and kidney cancer among men with >10 years of pesticide exposure	(Forastiere et al., 1993)
13	Thyroid Cancer	Fungicide Mancozeb	Norway	Men and Women (age 30-75) and children (age<10)	data from different census reports	1974-1989	Mild association between Mancozeb and Neural tube defects and no association was found between mancozeb exposure and thyroid cancer	(Nordby, Andersen, Irgens, & Kristensen, 2005)

Even before the genetic mutations show up, there are a set of modifications in the genome without changing the sequence of DNA, events that can change the fate of a cell. These are called epigenetic modifications. These modifications in a normal cell maintain a stable state of suitable gene expression and are responsible for cell differentiation and genomic imprinting. Their aberrations lead to aberrant gene expression and ultimately render the cell addicted to oncogenic product. There are piling reports that have proved association of epigenetic aberrations with development of chronic disorders, especially if the aberration occurs in the early stage of life (Sharma, Kelly and Jones, 2010). (See Box I)

Genetic changes are rare and take time to show up, epigenetic changes get perturbed easily in response to change in the micro-environment of its cell. There are certain attributes that makes epigenetics an attractive field medical advances (See Box II).

Epigenetics can help understand the molecular mechanisms altered by non-genotoxic Carcinogens. These can prove to be the key to solve issues associated with rising cases of cancers associated with occupational exposure of pesticides and also give some insight into mechanisms involved in environment influenced disease pathogenesis. Pesticide exposure during early stages of life results in epigenetic modifications in the cell. This may form the basis for developing diseases later in life (Shuk-Mei Ho, et. al., 2012). Malansky in 1981 suspected epigenetic mode for tumorigenicity in hepatocytes by organochloric pesticides which had no observable genotoxicity (Maslansky & Williams, 1981). Over the decades immense reporting has been done to unveil different mechanisms involved in influence of ecotoxicants on our epigenome.

**BOX I: EPIGENETICS - BASIC INTRODUCTION**

The Branch of Biology that studies interaction between genotypes and phenotypes of a cell that decides the final outcome of a locus, without altering a DNA sequence of a cell (Goldberg, Allis and Bernstein, 2007). It reflects the transcription status of the cell based on its past cellular events. Epigenetic changes are heritable (Bonasio, Tu and Reinberg, 2010). Epigenetic pattern are decided by DNA methylation at CpG islands in genic or non genic regions of the genome, post translational histone modifications like methylation, acetylation, ubiquitylation, phosphorylation and micro RNA.

**DNA Methylation:** Major proportion of 5-methyl cytosines are located at CpG islands in the genome. These changes are brought about by DNA methyltransferases (DNMTs).

**Covalent modifications of Histone Tails:** Histones are basic octamer proteins that help in packaging of DNA. Histones constitute of 2 H3, 2 H4 and dimers of H2A and H2B. The covalent modifications of histone tails are dynamically and strictly regulated by different enzymes. Histone acetyltransferases (HATs) and histone methyltransferases (HMTs) add acetyl and methyl groups, respectively, whereas histone deacetylase (HDACs) and histone demethylases (HDMs) remove acetyl and methyl groups, respectively. Histone acetylation at lysine is strictly associated with transcription activation of genes. But histone methylation has different impact on the transcription status of the gene based on the position of methyl group. Histone modifications have been shown to be important in altering chromatin structure and therefore DNA accessibility. Histones modifications along with DNA methylation can regulate gene expression, chromatin remodeling, cell survival and cell death.

**MiRNA:** These are single-stranded RNAs of about 21–23 nucleotides in length that are transcribed from DNA but not translated into proteins (non-coding RNAs). Their functional role is gene expression regulation mediated by a control of messenger RNA (mRNA) stability or translation. ncRNA can be small or long. Small ncRNA interact with RNA, DNA or RNA-DNA triplet or recruit modifiers. Long ncRNA form complex structures that have domains to interact with modifier or RNA Polymerase II and target base pair sequence (Bonasio et al., 2010).

Simple epigenetic assays can be introduced in the panel of tests that are performed for approval of pesticides and as biomarkers for post marketing assessment for toxicity of pesticides. This can make understanding the efficacy of pesticides clearer and can complement the assays for carcinogenicity. .

This review discusses about different epigenetic alterations that are brought about by some of the known pesticides. Studies on aberrant epigenetic alterations caused by pesticide exposure would not only help us to identify the chemicals that are potential carcinogens, but also open new arenas to assess health of non-target population exposed to pesticides at chronic or acute levels, thereby define better safety biomarkers (Thomson, et. al., 2013) because Epigenetic aberrations pave path for cancer development or development of chronic diseases later in life (Feinberg and Tycko, 2004).

**Epigenetic link between pesticides and chronic diseases:-**

The pesticides are approved based on antimicrobial testing, movement of pesticides in soil, water, plant and environment and residues in the food-feed, animal commodities and extensive carcinogenicity testing before regulatory approval. But pesticide exposure has repeatedly been associated with various cancers. The usual tests that are used to validate carcinogenicity are based on genotoxicity that include mutagenicity. Several ecotoxicants that were traditionally known to be non-mutagenic are now considered as epimutagens owing to their detrimental effects on the epigenome of the people coming in contact with these (Hou, Zhang, Wang and Baccarelli, 2012). Some of these chemicals are summarized in Table II.

Mammalian germ cells and pre-implantation embryos undergo critical process of imprinting, regulated epigenetically, that lays grounds for differential reprogramming (Sasaki and Matsui, 2008). Presence of xenobiotics or their derivatives during these critical periods can induce persistent and heritable epigenetic changes. Anway et al. showed gestational exposure of endocrine disruptor **Vinclozolin**, a common dicarboximide fungicide, induced

**BOX II: EPIGENETICS - CLINICAL APPLICATIONS**

Epigenome off lately has caught attention of the medical field also. Apart from its implications in environmental issues, it has now started being considered as important as the genome of the individual for diagnosis of cancer. There are number of genes whose expression is involved in normal cell cycle, apoptosis, cell adhesion, angiogenesis or some way or the other associated with suppression of tumor. But as cancer develops the expression of these genes is suppressed by genetic or epigenetic mechanisms. Genetic alterations like mutations show up later in the cancer development if the cause is not congenital. Silencing by hypermethylation of genes like RASSF1A, p16, APC, MLH1, SEPT9, CDH1 have been implicated in many cancers and can be detected early in tumor development (Li, Jin, & Wang, 2014)(Y.-J. Zhang et al., 2007)(Brock et al., 2008).

Genetic mutations are not always conclusive about malignancy of the tumor, the signature of cancer. Certain disorders that exploit the same pathways for its development as cancer may also show similar genetic mutations, like the case of Chronic Obstructive Pulmonary Disorder (COPD) and lung cancer. Rather epigenetic alterations are more conclusive about cancer development eg. CDKN21 hypermethylation (Brothers et al., 2013).

Frequency of hypermethylation of SFRP and Basonuclein 1 has been found to be associated with survival of renal cell carcinoma patients. These modifications are better markers than tumor dimension (Ricketts, Hill, & Linehan, 2014).

Inclusion of such panels of non-invasive, highly sensitive and specific genome-wide epigenetic biomarkers for different types of cancers can drastically improvise the efficiency of cancer diagnosis.

Versatility and recognition of epigenetics can be appreciated by the fact that FDA has approved some anti cancer drugs like Azacitidine, Decitabine that exploit epigenetic mechanisms to suppress cancer development.

**Table II:-** Epigenetic pathways exploited by different pollutants

<b>POLLUTANTS</b>	<b>CARCINOGEN</b>	<b>MUTAGEN</b>	<b>EPIGENETIC MECHANISM OF ACTION</b>	<b>REFERENCES</b>
<b>Metals</b>				
Cadmium	Yes	Mild	Inhibit DNMT by interfering in enzyme-DNA interaction	(Takiguchi, Achanzar, Qu, Li, & Waalkes, 2003)
Arsenic	Yes	Yes in high concentration	Inhibit DNMT by limiting availability of SAM for DNMT	(Srivastava, D'Souza, Sen, & States, 2008)
Nickel	Yes	Inhibit excision repair	<i>In vitro</i> studies reflect reduced histone acetylation	(Ke, Davidson, Chen, Kluz, & Costa, 2006)
Chromium	Yes	Only by hexavalent salts	<i>In vitro</i> studies reflect altered histone modifications	(Schnekenburger, Talaska, & Puga, 2007)
Methyl Mercury	Yes	Moderate	Epigenetic suppression of BDNF	(Onishchenko, Karpova, Sabri, Castrén, & Ceccatelli, 2008)
<b>TCE, DCA, TCA</b>	Rodent carcinogen	Only in very high doses	Decreased methylation of 2 proto-oncogenes	(Moore and Harrington Brock, 2000)
<b>Air Pollution</b>	PAH is carcinogenic	PAH is mutagenic	Reduced global DNA methylation levels	(Ehrlich, 2002) (Alexandra Ya. Khesina, 2004)
<b>Benzene</b>	Yes	Benzene oxide is mutagenic	Changes in the DNA methylation pattern	(Bollati et al., 2007) (R P Chilcott, 2007)
<b>RDX</b>	Yes	Yes	Modify miRNA expression	(Zhang & Pan, 2009) (Bhuvan B. et al 2003)
<b>Endocrine-disrupting Chemicals</b>				
Diethylstilbe	Yes	No	Inhibit methylation by	(H.R. Glatt, 1979)

strol (DES)			inhibiting COMT gene transcription	
Bisphenol A (BPA)	Yes	No	Modify DNA methylation pattern	(Dolinoy, Huang, & Jirtle, 2007)

From data obtained from Epigenetics and environmental chemicals (Baccarelli & Bollati, 2011) and other sources

multiple abnormalities in the mice offsprings for at least 3 generations (Nilsson, Anway, Stanfield and Skinner, 2008). Presence of ecotoxins in the microenvironment during early stages of life can greatly perturb epigenome thereby the whole cellular function especially thereby making the organism susceptible to develop disorders during later stages of life (Jirtle and Skinner, 2007).

**Arsenic**, a semi-metal frequently used as pesticide, easily found to contaminate water sources and has been linked to cancer of the bladder, lungs, skin, kidney, nasal passages, liver, and prostate. Arsenic is used in wood preservatives, paints, dyes, metals, drugs, soaps and semi-conductors. Though its genotoxic effects are known it's also known to affect the epigenome. Hypomethylation of *LINE* repeat has also being associated with low level Arsenic exposure in Mexican children (Alegría-Torres et al., 2016). Arsenic is also associated with hypermethylation mediated silencing of p16 and p53 genes in a dose dependent manner in the people of West Bengal, one of the most Arsenic contaminated regions in the world, and is strongly correlated to arsenic induced skin lesions in people (Chanda et al., 2006). High Pesticide Exposure Events has been correlated with elevated DNA methylation of GSTP1 promoter among pesticide applicators older than 59 years of age (Rusiecki et al., 2016). GSTP1 promoter hypermethylation is associated with prostate cancer (Gonzalvo et al., 2003). Inorganic arsenic is biologically detoxified by methylation catalyzed by S-adenosine methionine methyltransferase (reviewed by Ajees and Rosen, 2015). Excess arsenic in the body lowers activity of DNMTs by cofactor restriction, required to maintain the proper methylation status of the cell. Hyper and hypomethylation due to arsenic exposure are reported at both, gene specific and genome specific levels and the mechanism of its action is not yet clearly elucidated (reviewed by Reichard and Puga, 2010).

Arsenic has been shown to alter miRNAs expression, involved in a carbon metabolism, in human lymphoblastoid cells (Marsit, Eddy and Kelsey, 2006).

For its adverse effects on human health all arsenic derivative pesticides except Monosodium methanearsonate (MSMA) have been banned under EPA 2009. The residual Arsenic content present in soil and water still pose severe health risks.

Persistent Organic Pollutants (POPs) are chemical substances that persist in the environment, bioaccumulate through the food web and pose a risk of causing adverse effects to human health and the environment. POPs are global concern because POPs can be transported across international boundaries far from their sources. Their effects on wildlife species, even in areas where these are not produce have raised alarm on their implications in humans. Human exposure in the arctic regions is among the highest in world. Their main route to enter is via food and its endocrine disrupting role linked them to reproductive impairment in humans. They are also reported to cause immune system disruption. 12 of these POPs have been targeted by UNEP for global elimination based on the extensive reports of their persistence, though association of these chemicals with chronic diseases in humans is incomplete.

Most POPs are either insecticide related products or are produced in industries. Rusiecki et al reported association of high serum concentration of a panel of POPs including DDT, Chlordane Mirex, PCB, hexachlorobenzene and Toxaphene with decrease in the global methylation status in the *Alu* repeat regions of Greenlandic Inuit population (Rusiecki et al., 2008). The association between global hypomethylation with genomic instability might explain the increasing rate of cancer in this area. Similar results were obtained by a different group of investigators for a population (South Korea) with much lower biological concentration of POPs as compared to Greenlandic Inuit (Kim et al., 2010).

Another study done by Shutoh et. al. reported DNA hypomethylation at 6 specific gene promoter sites and at global level on vivo exposure to DDT in a dose dependent manner (Shutoh et al., 2009). DDT can induce production of reactive oxygen species (Pérez-Maldonado et al., 2005). Low levels of 5mC induced by Hypoxia is responsible for solid tumor formation in presence of ROS (Shahrzad, Bertrand, Minhas, & Coomber, 2007). Another recent report

suggests tumor hypoxia mediated reduction in the activity of Ten Eleven Translocase (TET) enzyme results in hypermethylation of promoter regions as TET mediates oxidative demethylation of 5mC (Thienpont et al., 2016).

**DDT** is now banned for agricultural purposes but is used for vector control in some countries. Due to lack of mutagenicity it is considered only a probable carcinogen to humans by EPA 1987. Similarly **Chlordane** is now banned but its non-mutagenicity do not compliment its link to prostate and breast cancers development and affects the nervous system. An occupational study reported association between chlordane exposure and non-Hodgkins's lymphoma. EPA has classified chlordane as a Group B2, probable human carcinogen. **Mirex** is banned as pesticide in US but is used in other products. It is a non mutagen but is a carcinogenic risk to humans. **PCBs** have widespread utilities apart from pesticides and are known to be associated with liver cancer in spite of being a non-mutagen. According to EPA, PCBs are probable human carcinogens (B1). **Toxaphene** (EPA Group B2) has limited mutagenicity but is highly toxic to liver, kidney, spleen, adrenal and thyroid glands, CNS, and the immune system. Chronic oral exposure to **hexachlorobenzene** (EPA Group B2), now banned in US is associated with a liver disease with associated skin lesions. Epidemiologic studies of people exposed to hexachlorobenzene have not shown an increased cancer incidence. However, animal studies have reported cancer of the liver.

**Dieldrin**, another dreaded POP insecticide, is associated with non-mutagenic carcinogenesis in mouse but lack of human evidence makes it most probable human carcinogen (Stevenson et al., 1999) and is linked to Parkinson's disease, breast cancer and immune, reproductive and nervous system damage. Its persistence, like other POP has made it one of the red listed chemicals for EPA. Aberrant histone modifications were observed under the influence of this POP by Song et. al. they observed short term and long term in-vitro effect on mammalian cell. Long term, small dose treatment was more environmentally relevant and was observed to result in hyperacetylation of H3 and H4 after 6-24 hrs of treatment on the dopaminergic neuronal cells. In-vivo treatment of the same resulted in hyperacetylation of H4 in striatum of mice brain, the part associated with Parkinson's. They linked this finding to accumulation of a HAT. The epigenetic impact on the dopaminergic neuronal cells may give some clue to understand relation between Parkinson's and dieldrin exposure (Song, Kanthasamy, Anantharam, Sun, & Kanthasamy, 2010).

Apart from these 7 of the 12 United Nations Environment Programme (UNEP) targeted POPs for global elimination (May 2001), there are other organic pollutants also that are not so much a threat in terms of persistence. **Fonofos** is a commonly used pesticide in most of the countries and is non carcinogenic. **Parathion** is a commonly used insecticide for many crops. No epidemiological information is available on reproductive, developmental, or carcinogenic effects of parathion in human population. Limited data on animals are available; increased adrenal cortical tumors were observed in rats orally exposed to parathion. EPA has classified parathion as a Group C, possible human carcinogen. Both, Parathione (Velázquez, Xamena and Creus, 2009) and Fonofos are non-mutagenic. But Zhang et al reported alteration in the methylation status of 712 genes in response to treatment of these organophosphate pesticides (X. Zhang et al., 2013). This may account for sparse reports that are available on the chronic impacts of these pesticides (Bonner et al., 2010).

**Triazophos** and **Dichlorovos** are organophosphate pesticides that are used for agricultural purposes in most of the countries in the world. No information is available on the reproductive, developmental, or carcinogenic effects of dichlorovos on humans. A study by the National Toxicology Program (NTP) reported an increased incidence of tumors of the pancreas, mammary glands, and forestomach in animals. EPA has classified dichlorovos as a Group B2, probable human carcinogen though mutagenicity of dichlorovos is disputed (Ashwood-Smith, Trevino and Ring, 1972; Carere, Ortali, Cardamone and Morpurgo, 1978). There is no active registration for Triazophos under EPA but Triazophos is non mutagenic (Velázquez et al., 2009). It is non carcinogenic in animals but carcinogenicity is controversial in human. Ross et al analyzed tumorigenic triazophos and dichlorovos, and non tumorigenic **myclobutanil**, a fungicide, and observed that though all the three pesticides result in the negative fold change of 19 different miRNAs, the alteration observed for the two tumorigenic pesticides was times more than the non tumorigenic pesticide. These alterations can be potential markers for effect of tumorigenic conazoles in mouse at 90 day of exposure, when there was no tumor or neoplasticity observed. Secondly, the genes whose mRNAs are targeted by these miRNAs are probably important for tumorigenesis. They also concluded that there probably a threshold of downregulation of miRNAs is required to be attained for causing tumorigenesis, which is not attained by the non-tumorigenic myclobutanil (Ross et al., 2010). The epigenetic aberrations reported for these OP pesticides, might give clue to the chronic neurotoxicity associated impacts of organophosphorus pesticides (Rastogi, Tripathi and Ravishanker, 2010).

There are many pesticides that are not Persistent Organic Pollutants, but are associated with occurrence of chronic disorders. **Paraquat**, a herbicide, is associated with respiratory disorder on high exposure (Dalvie et al., 1999). It shows mild direct mutagenicity and is categorized as a Group E pesticide (showing no evidence of carcinogenicity). Song et al reported impact of Paraquat on epigenome of mammalian cells. They observed that Hyperacetylation is responsible for paraquat induced neurotoxicity using N27 Dopaminergic Neuronal cells with decrease in the total HDAC activity after Paraquat exposure (Song, Kanthasamy, Jin, Anantharam and Kanthasamy, 2011). Such hyperacetylation might lead to aberrant activation of genes.

**Propiconazole** is a fungicide and anti microbial pesticide. No mutagenicity is associated with this pesticide and EPA has classified propiconazole as Group C for carcinogenicity (possible human carcinogen). **Fipronil**, a insecticide, is associated with no evident chronic impact and U.S. EPA classified fipronil as Group C - possible human carcinogen. In a vivo study on zebrafish showed alteration in miRNA levels after treatments with propiconazole and fipronil. Alteration of different miRNAs expression was observed in response to individual and combinatorial treatments. It suggests that efficacies of exposure to these pesticides in isolation or in combination, may be varied or summative (Xingxing Wang, Zhou, Ding, Zhu and Guo, 2010).

### BOX III: EPIGENETICCS vs. GENETICS

It is now established that cancer progression in due to interplay between epigenetic and genetic mechanisms. Now studies have shifted from studying silencing classical Tumor Suppression Genes to studying candidate TSGs based on the hyper or hypomethylation of promoter regions of cells with characteristic neoplastic phenotype. Following are certain aspects that make packing of DNA as important as the sequence of the genome.

- ✓ Genetic changes involve premutagenic damage like strand breakage, mutagenic damage and chromosomal aberrations. Epigenetic changes involve changes in the DNA methylation pattern histone acetylation pattern and altered miRNA expression.
- ✓ Epigenetic alterations can be detected at the early stages of cancer. The genetic alterations characterize the tumor formation or metastatic stage of cancer. Thus effect of any alteration in the microenvironment can be understood more quickly with the help of epigenetic alterations it causes.
- ✓ Familial genetic mutation may not show up in a population till it is homozygous. It gets diluted by mating with non-mutants. Whereas epigenetic silencing can occur in multiple individuals and appear to be more persistent. It raises the probability of developing a disorder later in life.
- ✓ Genetic mutations are more stable and irreversible than the epigenetic alterations. Thus the latter opens good prospects for treatment of chronic disorders before occurrence of severe mutations restrict the treatment.
- ✓ For a given tumor growth there are seldom multiple mutations because only one hit is sufficient to disrupt the complete pathway. Whereas for gene silencing there are many such disruptions that can be associated with a single tumor suppressing pathway. These aberrations recruit other modifiers also. Their notoriety makes them detectable over a wide range.

These all evidences of impact of pesticides on our epigenome suggest there are many other mechanisms that may give rise to environment induced cancer. There are several mechanisms at play that lead to altered cell physiology, epigenomic aberrations being one of them. So if we restrict the use of pesticide with proper regulations, we can curtail the threat (Alavanja et al., 2013). The carcinogenicity status assigned to these pesticides by EPA, IARC and NTP and usage status in India have been summarized in table III.

**Table III:-** Brief overview of some common pesticides.

PESTICIDES	TYPE	IARC / EPA / NTP	USAGE IN INDIA	MECHANIS M STUDIED IN THE REVIEW	REFERENCES
Dichloro Diphenyl Trichloroethane (DDT)	Organochloric Insecticide	IARC 2B NTP - RAHC	largest producer and sole exporter with restricted use	DNA Methylation	(cibrc.nic.in/ibr2012.doc)
Mirex	Organochloric Insecticide	IARC - 2B NTP - RAHC	banned for manufacture, import and use	DNA Methylation	(Bhuvaneshwari, Rajendran, & Nadu, 2012)
L-chlordane	Organochloric Insecticide	IARC - 2B	banned for manufacture, import and use	DNA Methylation	(cibrc.nic.in/ibr2012.doc) (IARC, 1991)
Polychlorinated biphenyls (PCBs)	Organochloric Insecticide	IARC - 2A NTP - RAHC	Present in dietary intake	DNA Methylation	(IARC, 1991)
Monosodium methanearsonate (MSMA) – OAP	Herbicide	Only Arsenical pesticides permitted by US EPA 2009	High concentrations of arsenic have been measured in drinking-water include large areas in West Bengal. Used mainly for cotton crops.	DNA Methylation	IARC Monograph (post 2004 on Arsenic And Arsenic Compounds)
Disodium methanearsonate (DSMA)	Herbicide	IARC - 3 Prohibited under US EPA 2009		DNA Methylation	
calcium acid methanearsonate (CAMA)	Herbicide	Prohibited under US EPA 2009		DNA Methylation	
cacodylic acid	Herbicide	Prohibited under US EPA 2009		DNA Methylation	
Fonofos	OP insecticide	Not Classified by IARC Category E in US EPA	Common agricultural usage	DNA Methylation	EPA Red Facts (Fonofos 1999)
Terbufos	OP nematocide and insecticide	Not classified by IARC 15 percent or more terbufos are classified as RUPs	Used to control corn rootworms.	DNA Methylation	US EPA
Parathion	OP insecticide and	IARC - 3 Category C by US EPA	Methyl parathion under	DNA Methylation	(cibrc.nic.in/ibr2012.doc)(IARC, 1991)

	acaricide.		restricted use. Ethyl parathion banned for manufacture, import and use		
Dieldrin	OC insecticide	IARC - 3 No current use in US	banned for manufacture, import and use	Histone modification	(cibrc.nic.in/ibr2012.doc)(IARC, 1991)
Paraquat	Herbicide	Not classified by IARC Category E by US EPA 1997 Though restricted or banned in many countries	Paraquat Dimethyl Sulphate banned for manufacture, import and use. Paraquat dichloride is avidly used and registered	Histone modification	(cibrc.nic.in/ibr2012.doc) (PANAP Feb 2011)
Triadimefon	Fungicide	Not Classified by IARC Category C by US EPA	Registered under CIBRC and used in many states	miRNA based regulation	(www.cdms.net/ldat/) State of pesticide regulations in India (CSE)
Propiconazole	Fungicide	Not Classified by IARC Propiconazole is a General Use Pesticide.	Registered under CIBRC and used in many states for many crops	miRNA based regulation	State of pesticide regulations in India (CSE) (http://www.toxipedia.org/)
Myclobutanil	Fungicides	Not Classified by IARC Myclobutanil is a General Use Pesticide.	Registered under CIBRC and used in many states for Apple	miRNA based regulation	State of pesticide regulations in India (CSE) (http://www.toxipedia.org/ )
Fipronil	Insecticides	Not Classified by IARC Category C by US EPA	Registered under CIBRC and used in many states for sugarcane and cotton (no MRL)	miRNA based regulation	State of pesticide regulations in India (CSE) (NPIC)

Triazophos	OP insecticide	Not registered with the EPA for use as pesticide in the US Banned in the EU for use	Registered under CIBRC and used in many states for paddy and cotton	miRNA based regulation	State of pesticide regulations in India (CSE) ( <a href="http://hazmap.nlm.nih.gov/">http://hazmap.nlm.nih.gov/</a> )
Dichlorovos	OP insecticide	Not Classified by IARC Category B2 by US EPA (probable human carcinogen)	Broad application	miRNA based regulation	( <a href="http://www.epa.gov/">http://www.epa.gov/</a> )

### Conclusion:-

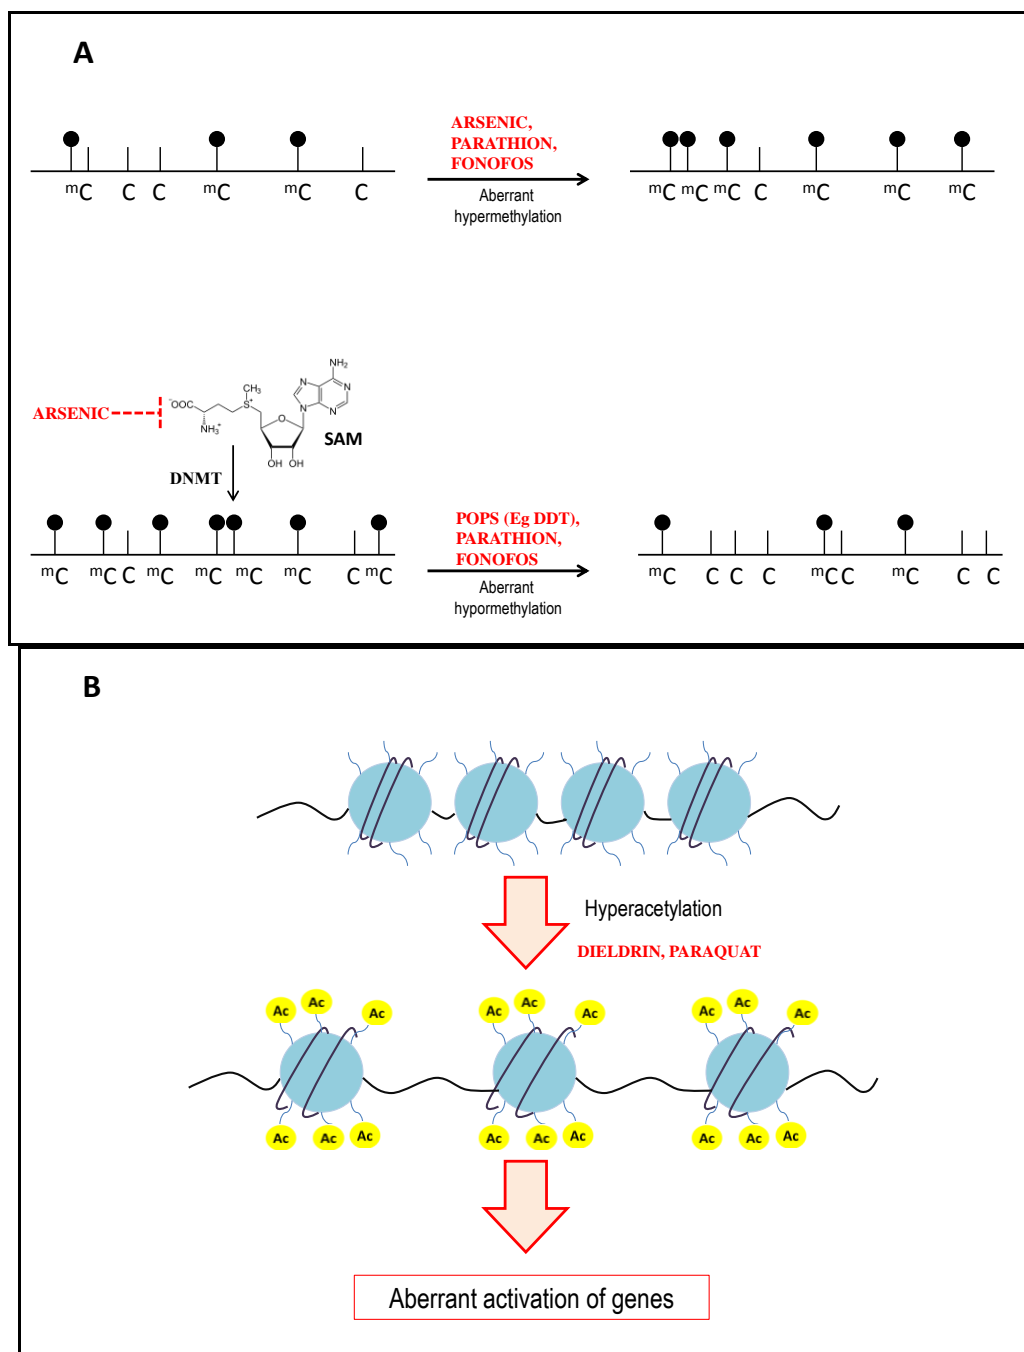

To minimize the risk of cancer due to pesticide usage, strategically refined regulatory parameters need to be laid down. These parameters should be based on the research aimed to correctly identify the chemicals that are potential carcinogens. This would help in successful reduction of harmful exposure to workers and general public thereby curbing the risk of developing cancer.

Genotoxicity testing includes identification of genetic alterations such as mutation in genes involved in tumorigenesis or the chromosomal aberrations in number or structure. But such tests are not complete for identification of non-genotoxic carcinogens (Thomson, Moggs, Wolf and Meehan, 2013). For now it is well known that not only our genome, but our epigenome also regulates the cellular functions. Early appearance and higher plasticity of epigenetic changes as compared to genetic changes (Box III) make them attractive subject to determine the disease endpoints for different pesticides.

To assess this scenario of increasing cases of cancer in pesticide exposed population we need to look beyond just the genotoxic effects of pesticides. Heritability of epigenetic changes makes them crucial biomarkers for studying the long term and short term effect of the pesticide exposure on the gene expression. Thus integrating epigenetic and transcriptomic studies can give insight into effects at early stages of exposure and predict the long term effect of the chronic exposure of the pesticides more accurately (Thomson et al., 2013).

Eventually pesticide exposure specific signature databases can be generated based on epigenomic and transcriptomic research data. The pinnacle authorities for pesticide approval like EPA, CIRBC etc can bring about suitable amendments in their guidelines for approval and registration. But prior to this sufficient scientific research is required to understand the role of epigenetic endpoints in the toxicity. Though epigenetic safety is a developing field of research but it holds the promise to deeper understanding of xenobiotic exposures and their role in disease progression in the long term and understanding the environment associated pathology of different diseases.

**Fig I:-** Role of pesticides in aberrant activation of genes via DNA methylation and histone acetylation.

Pesticides are reported to alter the DNA methylation (A) and histone acetylation (B) status of the cells. Both these mechanisms contribute to abnormal activation of certain genes and genomic instability, making the cells vulnerable to become neoplastic.

#### Abstract

**Objectives:** To assess the prevalence of Chronic Rhinosinusitis in Saudi Arabia, identify the most affected age group and Gender, assess the most common risk factors for Rhinosinusitis and determine recurrent of Rhinosinsitis after treatment and after surgery and to compare them.

**Methods:** A cross-sectional study which was conducted electronically through a random sampling includes 434 person from Saudi Arabia during 2016. The used questionnaire includes 20 questions and was formulated to include demographic aspects, clinical features, risk, medical and surgical history. The questionnaire items were designed and written to suit the tradition and the Islamic culture.

**Results:** about half had infected with chronic sinusitis. 61.6% were females. 55.6% were between (21- 30) years old. 31.9% of infected respondents still having the inflammation without complications for more than three months. 97.6% of infected respondents are treated using medical drugs. 96.9% of the infected ones have the inflammation many times after having drugs as a way of treatment, while 3.1% of them have the inflammation many times after having surgical treatment but it is very important to clarify that the first case's percentage is much higher than the second; because most of the infected people use the medical drugs as a way of treatment not the surgical treatment. The most of our infected respondents weren't smokers. 61.6% of infected respondents suffer from sensitivity. 82.9% of infected respondents hadn't nasal polyps.

**Conclusion:** High prevalence of Chronic Rhinosinusitis in Saudi Arabia. The prevalence of chronic rhinosinusitis among females was higher than that among males, the most affected age group were between (21- 30) years old. Generally The presence of risk factors which may cause Chronic Rhinosinusitis was moderate

CRSSNP	CRS without nasal polyps

### Introduction:-

Chronic rhinosinusitis (CRS) is one of the most common chronic diseases which is defined as inflammation of the nose and paranasal sinuses that persists for 12 weeks or longer with two or more of the following symptoms: nasal congestion or blockade, anterior or posterior nasal discharge, facial pain or pressure, reduction or loss of smell, and complementary endoscopic signs and CT changes. Disturbing the quality of life of the affected people and causing a high financial burden on society. The ostiomeatal complex plays a fundamental role in the pathogenesis of rhinosinusitis (Fokkens, 2012).<sup>(1-2)</sup> In Saudi Arabia, chronic rhinosinusitis is prevalent in the eastern province and affects people from all age groups. In the past few years, there has been an increase in the chronic rhinosinusitis incidences in Saudi Arabia (El-Banna&Jiman-Fatani, (2013)).<sup>(3)</sup>

Chronic rhinosinusitis has several subtypes, such as where it can exist with or without nasal polyps. There is also fungal sinusitis, dental sinusitis, pediatric CRS, biofilms as well as MRSA among others. There is a large incidence of allergies in people suffering from chronic rhinosinusitis, particularly those for dust mites, molds, cockroaches and animal dander. Poorly controlled allergies can cause the deterioration of chronic rhinosinusitis symptoms. According to Dutre, Al Dousary, Zhang and Bachert (2013).<sup>(4)</sup> Exposure to airborne irritants such as formaldehyde or tobacco smoke increases the risk of chronic rhinosinusitis. People with particular problems in their immune systems have increased risk of getting chronic rhinosinusitis. One of the most common problems with regard to chronic sinusitis is hypogammaglobinemia or antibody deficiency.

People with subtle issues with their immune defenses mainly affecting the lungs, noses and sinuses also face a greater risk of acquiring chronic rhinosinusitis. Repeated infections by viruses increase the risk of getting chronic rhinosinusitis like common cold. However, it is unclear whether or not the infections are responsible for the rhinosinusitis. A deviated septum also increases the risk of getting chronic sinusitis (Hamid, Joseph & Al-Qahtani, 2015).<sup>(5)</sup> A deviated septum may be present since birth or develop in later years of life because of a nasal injury. A deviated septum results in nasal blockage causing the blockage of one or both nostrils. People with chronic rhinosinusitis usually need lifelong treatment to keep the symptoms in check. Several treatment options are available for people with chronic rhinosinusitis. Yet there are many challenges to the management of CRS especially in the case of the more severe and refractory forms of the disease. As a consequence a wide range of medical and surgical therapies have been used to treat CRS.<sup>(6-7)</sup> researches evaluating the comparative efficiency of various treatments for chronic rhinosinusitis (CRS) is scanty.

This study aimed to assess the prevalence of Chronic Rhinosinusitis in Saudi Arabia, identify the most affected age group and Gender, and assess the most common risk factors for Rhinosinusitis. Determine Recurrent of Rhinosinusitis After Treatment and After Surgery and to Compare them.

### Objectives:-

1. To assess Prevalence of Chronic Rhinosinusitis in Saudi Arabia.
2. To identify the most affected age group and Gender.
3. Determine Recurrent of Rhinosinusitis After Treatment and After Surgery and to Compare them
4. To assess the most common risk factors.

### Methodology:-

This is a cross-sectional study which was conducted through a random sampling. The population was people lives in Saudi Arabia during 2016. All recruited subjects of this study were from Saudi Arabia. Subjects who are not were excluded from the study analysis.

A pre-designed structured English and Arabic languages questionnaire was used in this cross-sectional survey. The used questionnaire includes 20 questions and was formulated to include demographic aspects, clinical features, risk, medical and surgical history. The questionnaire items were designed and written to suit the tradition and the Islamic culture. The questionnaires were electronically on a large scale to get the effective sampling. The questionnaires with missing data more than 50% were excluded from the study analysis. The final study sample size 434 person.

Approval was taken from the ethics committee at faculty of medicine, Taibah University. Ethical consideration was considered to avoid physical or emotional harm in the study questionnaire. The confidentiality and privacy of the collected data were ensured through the use of anonymous questionnaire and during data entry and analysis. People were provided with information on the study aims and methods.

### Population & Sample of the Study:-

The study population includes all residents in the Kingdom of Saudi Arabia till the research year (2016), a random sample of (438) participants was selected, they answered the questionnaire electronically, (216) persons of them were infected with chronic sinusitis, they are nearly half of the selected sample, while (222) aren't infected with sinusitis, table (1) shows the participants properties according to their personal information:

**Table 1:-** The participant's personal data.

		All participants		Infected with sinusitis		Uninfected with sinusitis	
		#	%	#	%	#	%
Gender	Female	250	57.1	133	61.6	117	52.7
	Male	188	42.9	83	38.4	105	47.3
Age	(11-20)	72	16.4	27	12.5	45	20.3
	(21-30 )	271	61.9	120	55.6	151	68.0
	(31-40 )	54	12.3	39	18.1	15	6.8
	(41-50)	30	6.8	21	9.7	9	4.1
	(51-60)	10	2.3	9	4.2	1	.5
	More than 60	1	.2	27	12.5	1	.5
Nationality	Saudi	400	91.3	200	92.6	200	90.1
	Other	38	8.7	16	7.4	22	9.9
Total		438	100.0	216	100.0	222	100.0

From the previous table we notice that 61.6% of the infected people were females, while 38.4% of the infected ones were males.

We also can notice that 55.6% of the ages of those who suffer chronic sinusitis were between (21- 30) years old, while 18.1% of them were between (31- 40) years old, 12.5% of them were between (11- 20) years old, 9.7% of them were between (42- 50) years old, and 4.2% of them were between (51- 60) years old.

The next diagram concludes the previous results.

**Figure 1:-** The participants personal data.

The infected persons' answers descriptive show:-

Through the image Is it possible to determine the exact site of inflammation:-

	Frequency	Percent	Valid Percent
A	55	25.5	26.6
B	84	38.9	40.6
C	68	31.5	32.9
Missing	9	4.2	
Total	216	100.0	

It is clear from the previous table that 40.6% of them suffer from Ethmoid Sinuses (location B), while 32.9% of them suffer from maxillary sinuses (location C), and 26.6% of them suffer from front nasal sinuses (location A).

And according to the side of disease, 87.1% answered that it is in both their face sides, while 6.7% of them told that it is in their left side of their faces, and 6.2% of them suffer from the right side of their faces.

#### How do you diagnose?

And according to the way they have their disease diagnosis, 57% of the infected ones were diagnosed by the doctor, while 33% of them diagnosed themselves, 8% of them were diagnosed by a friend who is suffering from the same symptoms, and 2% of them were diagnosed by a pharmacist.

#### What is the period of inflammation with or without acute exacerbations?

	Frequency	Percent	Valid Percent
Less than 3 months	143	66.2	68.1
More than 3 months	67	31.0	31.9
Missing	6	2.8	
Total	216	100.0	

It is clear from the previous table that 68.1% of the infected ones still have the inflammation for less than three months without having any complications, and 31.9% of them still having the inflammation without complications for more than three months.

#### How many times have you suffered from sinusitis on one year?

	Frequency	Percent	Valid Percent
less than 4 times in year	107	49.5	51.0
more than 4 times in year	103	47.7	49.0
Missing	6	2.8	
Total	216	100.0	

It is clear from the previous table that 51% of the sinusitis infected ones suffer the inflammation less than four times a year, while 49.1% of them suffer from the inflammation for more than four times a year.

#### What is the method of treatment?

	Frequency	Percent	Valid Percent
medication	200	92.6	97.6
surgical treatment	5	2.3	2.4
Missing	11	5.1	
Total	216	100.0	

It is clear from the previous table that 97.6% of the infected ones are treated using medical drugs, while only 2.4% are treated through surgical operations.

#### Have you had any sinus or nasal surgery after sinusitis:

	Frequency	Percent	Valid Percent
No	199	92.1	93.9
Yes	13	6.0	6.1
Missing	4	1.9	
Total	216	100.0	

The previous table shows that 93.9% of the sinusitis infected ones had no surgical operations for sinusitis or for their noses after the infection, while 6.1% of them had surgical operations after the infection.

#### Sinusitis return after which treatment:-

	Frequency	Percent	Valid Percent
medication	190	88.0	96.9
surgical treatment	6	2.8	3.1
Missing	20	9.3	
Total	216	100.0	

It is noticed from the previous table that 96.9% of the infected ones have the inflammation many times after having drugs as a way of treatment, while 3.1% of them have the inflammation many times after having surgical treatment but it is very important to clarify that the first case's percentage is much higher than the second; because most of the infected people use the medical drugs as a way of treatment not the surgical treatment, the researcher think that result to that the sinusitis is a chronic disease and it is not easy to be completely cared.

#### How many times sinusitis return after treatment?

	Frequency	Percent	Valid Percent
Once	48	22.2	24.5
Twice	35	16.2	17.9
three times	24	11.1	12.2
more	89	41.2	45.4
Missing	20	9.3	
Total	216	100.0	

From the previous table we can conclude to that 45.4% of the infected ones have the inflammation for more than three times after having the surgical treatment, while 24.5% have the inflammation just once after the surgical treatment, 17.9% have the inflammation twice after the surgery, and 12.2% of them have the inflammation repeated three times after the surgical treatment.

The question	Yes		No		Missing	
	#	%	#	%	#	%
Have you ever smoked?	43	19.9	169	78.2	4	1.9
Do you suffer sensitivity?	133	61.6	79	36.6	4	1.9
Have you ever been tested for allergies?	49	22.7	157	72.7	10	4.6
Have you ever been on antihistamines?	113	52.3	95	44.0	8	3.7
In the past year do you use nasal steroid sprays or oral steroids?	146	67.6	61	28.2	9	4.2
In the past year do you suffer from nasal polyps?	30	13.9	179	82.9	7	3.2

#### From the previous table we can conclude to that:-

- Most of the infected ones are nonsmokers, as their percentage was 78.2% of the participants.
- 61.6% of the sinusitis infected ones suffer from sensitivity, 36.6% of them don't suffer it.
- 72.7% of sinusitis infected ones have never been tested for allergies, while 22.7% had.
- 52.3% of sinusitis infected ones have used treatment for general sensitivity, while 44% of them haven't.
- 28.2% of sinusitis infected ones didn't use nasal steroid sprays or oral steroids, while 67.6% of them did.
- 82.9% of sinusitis infected ones didn't suffer from nasal polyps, while 13.9% suffered from it.

#### The most important symptoms of sinuses inflammations and it's degrees can be seen in the next table:-

Symptoms	Absent		Mild		Moderate		Severe	
	#	%	#	%	#	%	#	%
Sneezing	43	19.9	76	35.2	40	18.5	37	17.1
Cough	38	17.6	70	32.4	42	19.4	40	18.5
Nasal congestion	50	23.1	68	31.5	50	23.1	23	10.6

Runny Nose	44	20.4	66	30.6	49	22.7	31	14.4
Nasal Obstruction	95	44.0	46	21.3	25	11.6	7	3.2
Loss of Smell or Taste	78	36.1	58	26.9	30	13.9	13	6.0
Thick Nasal Discharge	59	27.3	63	29.2	45	20.8	15	6.9
Post-Nasal Discharge	71	32.9	56	25.9	32	14.8	18	8.3
Ear Fullness or pain	56	25.9	60	27.8	40	18.5	31	14.4
Facial Pain/Pressure	63	29.2	69	31.9	27	12.5	28	13.0
Difficulty Falling Asleep or Wake Up At Night	42	19.4	67	31.0	47	21.8	32	14.8
Fatigue	84	38.9	57	26.4	26	12.0	16	7.4

**From the previous table we can conclude to:-**

- 17.1% of sinusitis infected ones suffer from severe Sneezing, while 35.2% of them suffer mildly from Sneezing.
- 18.5% of sinusitis infected ones suffer from severe Cough, while 32.4% of them suffer mildly from it.
- 10.6% of sinusitis infected ones suffer from severely Nasal congestion, while 31.5% of them suffer mildly from it.
- 14.4% of sinusitis infected ones suffer from severely Runny Nose, while 30.6% of them suffer mildly from it.
- 3.2% of sinusitis infected ones suffer from severely Nasal Obstruction, while 44% of them never suffer from it.
- 6% of sinusitis infected ones suffer from severely Loss of Smell or Taste, while 36.1% of them never suffer from it.
- 6.9% of sinusitis infected ones suffer from severely Post-Nasal Discharge, while 29.2% of them suffer mildly from it.
- 8.3% of sinusitis infected ones suffer from severely Post-Nasal Discharge, while 32.9% of them never suffer from it.
- 14.4% of sinusitis infected ones suffer from severely Ear Fullness or pain, while 27.8% of them suffer mildly from it.
- 13% of sinusitis infected ones suffer from severely Facial Pain/Pressure, while 31.9% of them suffer mildly from it.
- 14.8% of sinusitis infected ones suffer from severely Difficulty Falling Asleep or Wake Up At Night, while 31% of them suffer mildly from it.
- 7.4% of sinusitis infected ones suffer from severely Fatigue, while 38.9% of them never suffer from that.

**Discussion:-**

Chronic rhinosinusitis (CRS), one of the most common chronic diseases, CRS is associated with a substantially impaired quality of life.<sup>(8)</sup> reduced workplace productivity and serious medical treatment costs.<sup>(9,10)</sup>

Identified several risk factors for CRS, including influenza vaccination, septal deviation and allergic rhinitis. Moreover, there were significantly increased prevalence of chronic rhinosinusitis in plant and machinery operators and assemblers, craft and related trade workers and the unemployed.<sup>(11)</sup>

Therefore this study aimed to assess the prevalence of Chronic Rhinosinusitis in Saudi Arabia, identify the most affected age group and Gender, and assess the most common risk factors for Rhinosinusitis.

In the present study about half of the respondents had infected with chronic sinusitis. This considered a very high prevalence. This rate is higher than in many previous studies in different countries, it was 12% in the USA.<sup>(12)</sup> 10.9% in Europe.<sup>(13)</sup> this difference in results may be because CRS is difficult to study as the disease is difficult to define and diagnose. Without neglect the role of weather at this difference, there is some evidence that CRS is more prevalent in the warm than in the colder places.<sup>(14)</sup>

Regarding to demographic data the majority of infected respondents 61.6% were females. confirming earlier data from the US National Health Interview Survey (NHIS),<sup>(13)</sup> and Canada.<sup>(14)</sup> but this finding unlike results of study in china which reported that The prevalence chronic rhinosinusitis among males was higher than that among females in the general population.<sup>(15)</sup> More than half 55.6% of infected respondents were between (21- 30) years old. this finding conform with Kim et al. whose found that A relatively higher prevalence was seen in those aged 15–34.<sup>(16)</sup>

This could be due to this age group are the most vulnerable to risk factors of chronic rhinosinusitis.

The majority of our respondents suffer from Sinuses Safavid, regarding side of disease the most had it in both their face sides. But just about half of the respondents diagnosed their infection by the doctor, this may be one of the reasons of the behind the answer of large number of participants that they were infected with the disease, because not all of them diagnosed their infection by the doctor.

Chronic rhinosinusitis (CRS) is one of the most common chronic diseases which is defined as inflammation of the nose and paranasal sinuses that persists for 12 weeks or longer with two or more of the following symptoms: nasal congestion or blockade, anterior or posterior nasal discharge, facial pain or pressure, reduction or loss of smell, and complementary endoscopic signs and CT changes.<sup>(1-2)</sup> But in our study just 31.9% of infected respondents still having the inflammation without complications for more than three months.

97.6% of infected respondents are treated using medical drugs, while 6.1% of them had surgical operations after the infection. Due to recurrent symptoms, many patients presenting with CRS require repeated medical treatment and even surgical interventions. So in our study 96.9% of the infected respondents have the inflammation many times after having drugs as a way of treatment, and 3.1% of them have the inflammation many times after having surgical treatment.

Previous studies found that smoking and allergies are potent risk factors for CRS.<sup>(14)</sup> Lieu and Feinstein found a significant association between current smoking and rhinosinusitis in women but not men.<sup>(10)</sup> Lotvall J, et al. found revealed a 20 % increased risk of rhinosinusitis in current smokers.<sup>(17)</sup> The most of our infected respondents weren't smokers, but this does not negate the possibility of exposure to secondhand smoke.

In Shi et al., cross-sectional investigation, they reported that having asthma or a nasal allergy significantly increased the risk of CRS.<sup>(15)</sup> which was consistent with some studies discovering positive associations between sinus disease or CRS and asthma.<sup>(18,19)</sup> This conform our finding 61.6% of infected respondents suffer from sensitivity.

CRS is classified into two types based on the presence or absence of nasal polyps: CRS with nasal polyps (CRS<sub>NP</sub>) and CRS without nasal polyps (CRS<sub>NP</sub>).<sup>(20,21)</sup> In this study 82.9% of infected respondents hadn't nasal polyps, while 13.9% suffered from it.

The Canadian Clinical Practice Guidelines for Acute and Chronic Rhinosinusitis recommend the presence of at least two major symptoms (nasal congestion, facial pain or pressure, nasal obstruction, anterior or posterior nasal discharge, and loss of sense of smell).<sup>(22)</sup> our study showed that for symptoms among the majority of infected respondents were absent or mild.

#### **Acknowledgment:-**

The first one we would like to thanks Allah the cherisher and sustainer of the world for his blessing. We would like to thanks Dr. TalalAljeraisi who supervised my work for his major effort in reaching and guidance . And we would like to thanks: Dr. Abdullah HasanAlhojaili, Dr. Alhassan Ali Alghamdi, and Dr. Khalid Ahmed Amara; to assist us in collecting study data

#### **Conclusion:-**

the present study showed high prevalence of Chronic Rhinosinusitis in Saudi Arabia. The prevalence of chronic rhinosinusitis among females was higher than that among males, the most affected age group were between (21- 30) years old. Generally The presence of risk factors which may cause Chronic Rhinosinusitis was moderate.

#### **Recommendation:-**

1. Further studies on the same topic to include the largest number of participants These studies include a medical examination in order to confirm the diagnosis of participants.
2. Community awareness of how to avoid infection of Chronic Rhinosinusitis.
3. The government should do practical procedures to decrease infection risk factors like such as smoking prevention in crowded public places.
4. Be sure to follow safety procedures in the professional business that may increase the chances of disease infection.

### Abstract

The main objective of this paper is to compare sovereign Sukuk performance to classic sovereign bonds issued by the Malaysian government. This comparison focuses on the excess returns variations in reaction to factors as defined by Fama and French (1993). Firstly, sukuks are more sensitive to each of the different factors of the model. Secondly, concerning size effect, small issuances outperform big ones; the opposite is available for bonds. Thirdly, a positive value effect relative to the factor HML is evidenced for Sukuk. However, we highlighted similarities regarding the reaction of both instruments to interest rates and market risk variations.

### Introduction:-

Sukuks are considered as financial innovations representing a model of ethical finance (see Guéranger (2009)). Among the wide range of Islamic financial products we will be interested in sukuks which represent Islamic certificates of investment. The latter have experienced explosive growth. Global sukuk issuances in 2008 were about 24.264 billion\$ and increased almost twelve times to reach 290.6 billion\$ in 2015. This enabled it to grab significant share of the market for fixed income instruments. This broad expansion is dominated mainly by sovereign and semi-sovereign issuances. Indeed, sovereign sukuk and government related entity issuances account for 70% versus 30% of corporate ones of total global issuances.

Miller, Challoner and Atta (2007), pointed out that the sukuk are Shariah<sup>1</sup> compliant instruments that are very similar to conventional bonds. Despite the respected condition on the assets which must have no relation with illicit activities with the respect of Islam law. Sukuk are similar to traditional bonds in the commitment established between the subscriber and the issuer. Furthermore, the authors added that in practice the two financial instruments generate the same income value for their investors. The only difference is that, for sukuk, the investor receives returns on the underlying asset instead of the interest for conventional bonds.

Wilson (2008) also confirms that the sukuk have no remarkable divergences from conventional bonds, especially from a financial point of view. Certainly, investors feel more protected from risk when holding familiar instrument compared to another new one. In addition, for the sukuk rating, Wilson added that ordinary rating agencies use the

<sup>1</sup> Sharia is Islam law.

same assessment methods as for traditional funding instruments<sup>2</sup>. In the same way, when considering G7 countries Kim and In (2007) have reached the same conclusions. This confirms the evidence on the similarity between Islamic and conventional instruments. Moreover, the shape of co-movement between Islamic assets and conventional bonds showed clearly that they behave in the same way even in terms of frequency and time.

Recently, Ahmad, and Radzi (2011) added that this similarity is clearer for "asset based sukuk<sup>3</sup>". This result was confirmed by Naifar and Mseddi (2013). Although, the two instruments generate predictable returns; they differ in terms of sensitivity to economic and market conditions. They used a sample of issuances spread over a period of 20 years to identify the impact of GDP, the exchange rate, market liquidity on sukuk and bonds from the Malaysian market. The results showed that sukuk are sensitive to economic factors like GDP, Forex and international liquidity (reserves minus gold), while conventional bonds are only sensitive to Forex evolution. These results stipulate that the sukuk take into account the economic circumstances. Moreover, these authors noted that this impact is of minor importance compared to the bonds' one. In the same framework, Godlewski, Turk-Ariss, Weill (2010), pointed out that the sukuk are rather "asset-based" than asset-Backed<sup>4</sup> "instruments, with underlying assets whose nature and area of activity are in accordance with Islamic law. The same research has shown that despite the similarity of sukuk with conventional shares, the sukuk are linked to a specific assets, services or projects during a specific time period unlike ordinary stocks representing a property right that concerns the whole company for an indefinite period.

A comparison of the investors' required returns for the two financial instruments with the same ratings and generating the same profits (coupons for conventional bonds) was performed by Ariff and Safari (2012). In other words, the latter used bonds and sukuk with the same duration, same issuer (sovereign, quasi-sovereign, corporate) rated AAA. Using the classical method for bond valuation the authors showed that required interest rates on the sukuk are different from those on conventional bonds. In addition, they recommended using two different methods for their assessments. Elsewhere,

They found that there was no relationship between the performance of Islamic sukuk and conventional bonds.

For the Malaysian market, Ramasamy et al (2011) compared sukuk to government bonds and corporate ones in terms of sensitivity, as measured by convexity and duration. The results show that sukuk are less risky compared to corporate bonds. In terms of profitability, the sukuk are more profitable. These results have allowed the authors to consider the sukuk as the best investment appropriate for risk adverse investors especially as the debt market is generally preferred by this kind of investors.

Moreover, Godlewski et al. (2010), Alam et al (2013), attributed negative market reaction to Sukuk's issuances against a positive one to conventional bonds to the investor's faculty to distinguish between the two financial instruments despite their structural similarity. Usmani (2007) showed that market participants perceive these instruments differently and their reactions to the issuance of these instruments are specific to one another. This research indicates a lack of a market significant reaction to issuance of conventional bonds against the evidence of a negative one to the Sukuk announcement. In other words Sukuk emissions have a negative effect on the market reflected by the negative value of the Sukuk's average cumulative abnormal returns.

Godlewski et al. (2010) explained this significant difference in market reaction between the issuance of sukuk and that of conventional bonds by adverse selection. According to the authors, only borrowers who predict low returns from their projects are motivated by the issuance of Sukuk because issuers must choose between a mandatory coupon payment without taking into account the conventional return and the principle based on sharing profits and losses. So if an entrepreneur predicts a low profit, he prefers financing based on profit and loss sharing to minimize its possible losses. And if he forecasts large profits, it becomes more interesting to be financed by conventional bonds. So Sukuk issuance presents a negative signal for investors about the company, since bad entrepreneur will

---

<sup>2</sup> Several Islamic rating agencies were dedicated to awarding Sukuk ratings, such as "the Islamic Development Bank (IDB)" which has gained a lot of experience in this area, these institution still use the same criteria used by other conventional credit rating institutions.

<sup>3</sup>According to Patel (2013) for the asset-based Sukuk, the principal repayment is guaranteed by the issuer through the buy-back commitment and therefore the coupons are protected.

<sup>4</sup> For asset-backed sukuk, the principal is not guaranteed by the issuer and the coupons are therefore unprotected (the investor has no guaranteed income).

choose this instrument which is badly perceived by investors. In the same context, Kuran (2004) advanced the same argument when he explained the reason that makes several Islamic banks no longer funding by financial instruments based on participatory bases (Moucharaka<sup>5</sup>, Moudharaba<sup>6</sup>). Because, in many countries where Islamic banks coexist with conventional ones when dealing with an adverse selection problem they use the following strategy: proposing conventional bond issuance when the anticipated profits of a project exceed a certain threshold, otherwise they offer sukuk issuance. This last choice is justified by the principle of sharing the losses with the subscribers.

Again, when defending the innovative vision of the Sukuk, Vishwanath and Azmi (2009) consider that the innovative principals of the Sukuk implies a higher exposure to certain financial market risks, especially credit and counterparty ones. Indeed, Sukuk issuers are largely found in emerging markets where counterparties have less sophisticated risk management mechanisms. On the other hand, Fathurahaman and Fitriati (2013) were interested in the Indonesian market. They compared Yield to Maturity (YTM) of both instruments for 10 Sukuk groups and bonds randomly built. The results showed that the YTM of the Sukuks were higher than those of the conventional bonds.

On the other hand, Cakir and Raei (2007) showed that Sukuks present a different financial instrument compared to traditional bonds. They tested the issuance advantage of sovereign Sukuk in terms of risk and thus confirmed that they are alternative financial instruments to conventional bonds. Within a value-at-risk (VaR) framework and for portfolios of equal values, they found that the maximum loss decreases when adding Sukuks to portfolio of Eurobonds. This is explained not only by the fact that these instruments offer a diversification advantage for investors but also because of the different price behaviour of the two instruments. Hassan (2012) carried out the same methodology as Cakir and Raei (2007) they noticed a gain in the portfolios following diversification. However, within a Value at Risk (VaR) framework, the first study concluded that the Sukuk's built portfolio is more risky than the bonds' one. This contradicted the results obtained by Cakir and Raei (2007).

Blake, Elton, Gruber (1993) were interested on bonds and more specifically on bond funds. They agree that compared to stock returns, the latter are generally influenced by fewer factors.

Within market risk valuation framework, researches by Fama and French (1992a), Fama and French (1993) shows that market excess return relative to a risk-free asset is one of the explanatory variables influencing returns' variation of the considered asset. Indeed, an increase in this premium leads investors to require additional returns.

In the same vein we propose to verify the validity of the following assumptions:

**H1: The Sukuk returns vary in the same direction as the market risk premium.**

**H2: Bond returns vary in the same direction as the market risk premium.**

In addition, other risk premiums have been used in the financial literature such as size, value, interest rate variations (TERM). The latter is the difference between the return of long-term government bonds and short-term rates. Fama and French used the "mimicking portfolio" (SMB: small minus big) as a size factor proxy. They made a set of allocations of their sample to calculate this variable which expresses the size premium. Indeed, Bernoth, Hagen, Schuknecht (2012) used the issuance size of sovereign bonds for the European bond market. This variable presents an indirect measure of liquidity. They concluded that the larger the bond size, the higher is required return.

So the next hypotheses could be formulated as follows:

**H3: Sukuks returns vary in the same direction with the size factor (SMB).**

**H4: Bonds returns vary in the same direction with the size factor (SMB).**

Another management style indicator used by Fama and French is the HML (High minus Low) which is the difference between the average of companies with a high book to market ratio and that of companies with the low ratio. Fama and French (1992a) found that firms with low market prospects have a high ratio and a high return, hence a low price of the stock. Conversely, firms with strong prospects have a low ratio and a low return. Hence, the positive relationship with the asset's return.

**H5: The return of the Sukuks varies in the same direction as the value factor (HML).**

<sup>5</sup> Moucharaka (contribution): A participatory contract stipulating the modality of each contribution and the repartition of profits and losses between different participants.

<sup>6</sup> Moudharaba: a partnership engaging two partners one provides capital and the other managing skills.

**H6: Returns on bonds vary in the same direction as the value factor (HML).**

Fama and French (1993) argued that one of the common risk factors associated with bonds is relative to unexpected interest rate variation. Indeed the latter is inversely related to conventional bonds performance. According to Syamni and Husaini (2010) coupon rates are fixed but the present value of receivable cash-flows fluctuates negatively to interest rate variation.

As a result, investors and fund managers will constrain to sell long-term bonds at a reduced price in order to generate cash for redemptions.

Similarly, Bhattacharyay (2013) underlined a negative relationship between bond returns and interest rate variations. This is due to the reluctance of investors to invest in long-term bonds when interest rates fluctuate.

**H7: Bond returns are negatively related to the factor (TERM) representing the interest rate variation.**

Concerning the relationship between Sukuk and interest rate changes, Syamni and Husaini (2010), Said and Grassa (2013) have shown that there is no significant relation between Islamic bonds' returns and interest rate variations as Islamic law prohibits interest. The same result was made by Guyot (2008) through a comparison between the Islamic indices and the conventional ones. The author has found that Treasury Bill rate has less significant impact (even null) on the Islamic indices compared to the conventional ones as the Islamic indices are subject to a "specific filter" linked to the prohibition of the 'Riba<sup>7</sup>'.

Although Islamic law prohibits interest in its undertakings, Elkarim (2012), Xian et al (2015) found that Sukuk returns present a significant and negative reaction to interest rate variations. Indeed, they pointed out a negative relationship between sukuk's revenue and the interest rate. The impact of interest rate variation on sukuk can only be indirect. As a consequence, the authors argued that this variable is a common economic indicator that affects affecting all financial instruments included the sukuk. Thus the following hypothesis:

**H8: Sukuk returns are negatively related to the interest rate (TERM) factor.****Data and Methodology:-**

The recent development of the Sukuk market in Malaysia over the last few years has allowed it to become the world preferred destination for attracting local and foreign investors interested in these innovative financial instruments. Consequently, in 2013 Malaysia accounts for 69% of the world's issuances owing to the development of the necessary skills that have made this country a favourable ground for Islamic financial industries and services. The present paper fits in this framework. We propose to deal with sovereign issues since they are perceived as a benchmark in terms of stability for sovereign bonds. The relative returns variation is considered as an indicator of investor confidence in the government's solvency. Moreover we selected the sukuk and bonds of maturity 10 and 11 years. We chose to deal with daily frequencies spread over the period from 04 September 2013 to 30 April 2015 relative to 17 sukuks issuances and 10 bonds ones.

**Table 1:-** Descriptive statistics of returns for the two financial instruments:

Instrument	ISIN	Mean	Min	Max	ST deviation

All bonds mentioned above are domestic issues and provide fixed rate income.

Based on the ratings assigned by the Fitch rating agency, all of the broadcasts in our sample have the same notation as "A".

Price database of domestic Sukuk / domestic bonds were downloaded from Reuters. We used the following calculations to determine the daily performance of the two types of instruments:

Daily returns of the asset  $i$  at time  $t$  ( $R_{i,t}$ ) were calculated using the formula: RETURN.TIME.ECCEANCE (liquidation, maturity, issue, rate, nominal value, base) available on the Excel software where:

**Liquidation** is the liquidation date of the bond.

**Maturity** represents the maturity date of the bond. It is the expiry date.

**Issue** is the issue date of the bond, expressed as a serial number.

**Nominal value** represents the price per unit of nominal value of 100 currency units.

**Base** is the type of the day counting base to use: Base Day Count.

As we have already mentioned, our research is interested in the comparison of the two instruments (Sukuk and Conventional bonds) in terms of return and risk.

In the majority of financial models that are concerned with asset performance measurement, one of the data used is the risk-free rate ( $R_f$ ). Academics and practitioners arbitrarily use either short-term or long-term government bonds as a proxy for risk-free securities.

However, and according to Bruner et al (1998) the majority of practitioners prefer long-term bonds: 70% of companies and financial advisors use T-bonds with a maturity of 10 years or more, while almost 10% use T-bills.

In the present research we will use the US T-bonds as the risk-free rate ( $R_f$ ). We have represented below a descriptive table of the T-bonds:

**Table 2:-** Descriptive statistics of the T-bonds:

ISIN	Maturity benchmark	Amount	Coupon type	Coupon (%)	Rating (Agency)
US912796GH66	1	25 000 390 800	Fixed	N/A	AAA (Fitch)
US912828K668	2	26 095 183 100	Fixed	0,5	AAA (Fitch) Aaa (Moody's)

US912828K585	5	35 128 097 400	Fixed	1,375	AAA (Fitch) Aaa (Moody's)
US912828WZ90	7	29 106 083 700	Fixed	1,75	AAA (Fitch) Aaa (Moody's)
US912828XB14	10	24 543 188 500	Fixed	2,125	AAA (Fitch)

Hereafter, we will focus on the variables that will be used in our econometric model inspired from Fama and French (1993).

Fama and French (1993) model uses as explained variable the profitability in excess relative to the risk-free investment:  $(R_i - R_f)$ .

On the other hand, the explanatory variables were: market profitability in excess relative to risk-free investment  $(R_m - R_f)$ , Small minus Big (SMB), High minus Low (HML) and a maturity premium (TERM). Based on the literature, the model will be expressed as follows:

$$(R_i - R_f) = f((R_m - R_f), SML, HML, TERM) \quad (1)$$

#### Excess profitability of the bond/sukuk $(R_i - R_f)$ :

Litterman and Scheinkman (1991) when identifying bond performance determinants, they found that, there are "other natural candidates" to play the role of the dependent variable. And the best choice is the excess return of the security relative to the risk-free rate calculated as the difference between the return of the instrument (bonds/Sukuks) and the risk-free rate for a given date.

**Excess return of the market  $(R_m - R_f)$ :** is the difference between the average daily returns of bonds/Sukuk market and the risk-free rate.

The risk-free rate used is the US T-bonds corresponding to the daily term to maturity for each security.

The estimated bond market risk  $(R_m - R_f)$  varies between 0.757% and 3.787% for the whole sample. The intra-individual variance (within) is equal to 0.08, while the inter-individual variance (between) is equal to 0.64 on a total variance of 0.65, and 98% of the total variance. Hence the importance of the individual dimension relative to the temporal dimension of this variable.

**Table 3:-** Descriptive statistics of the variable  $(R_m - R_f)$  for Sukuks and bonds:

Variable bonds		Mean	St deviations	Min	Max	observations
$(R_m - R_f)$	Overall	2,205928	0,8079963	0,75755	3,78745	N=4320
	Between		0,8007581	1,244663	3,493616	n=10
	Within		0,2750132	1,482721	3,354426	T=432
Variable sukkuk		Mean	St deviations	Min	Max	observations
$(R_m - R_f)$	Overall	2,238364	0,6258143	0,8675882	3,697559	N=7344
	Between		0,5586861	1,507482	3,405912	n=17
	Within		0,3127843	1,291665	3,275123	T=432

#### Small minus Big (SMB) & High minus Low (HML) variables:-

These two variables represent the contribution of Fama and French (1992a). They showed that profitability of financial assets is not explained only by the market factor but other factors arising from behavioural finance are candidates.

SMB and HML are, by the way, two portfolios constructed as follows: firstly the bond and sukkuk samples were subdivided into two subsamples (S and B) according to their sizes (S for smallest capitalisations and B For the big capitalisation ones).

A second ranking was made on the basis of the average daily return. There results three groups: L (Low), M (Medium) and H (High) representing respectively 40%, 20% and 40% of the total sample.

There were six portfolios at the junction of the two previous rankings: SL (Small-Low), SM (Small-Medium), SH (Small-High), BL (Big-High). For example, the SL portfolio contains the smallest Sukuk (bonds) and the lowest average returns.

The explanatory variable reflecting the size premium factor (SMB) corresponds to the difference between the average profitability of the three small-cap portfolios (SL, SM, SH) and the average profitability of the three large-capitalization portfolios.

$$SMB = \frac{1}{3}[R_{SL} + R_{SM} + R_{SH}] - \frac{1}{3}[R_{BL} + R_{BM} + R_{BH}] \quad (2)$$

The third explanatory variable reflecting the premium factor (HML) corresponds to the difference between the average profitability of the two portfolios of high average returns (SH, BH) and the average profitability of the two portfolios of low average returns (SL, BL):

$$HML = \frac{1}{2}[R_{BH} + R_{RH}] - \frac{1}{2}[R_{BL} + R_{SL}] \quad (3)$$

**Table 4:-** Descriptive statistics for the SMB portfolio.

Variable		Mean	St deviations	Min	Max	observations
Bonds	Overall	0.2734078	0.0729897	0.11325	0.4461667	N=4320
	Between		0	0.2734078	0.2734078	n=10
	Within		0.0729897	0.11325	0.4461667	T=432
Sukuk	Overall	-0.1810376	0.0415897	-0.2756667	0.51025	N=7344
	Between		0	-0.1810376	-0.1810376	n=17
	Within		0.0415897	-0.2756667	-0.063	T=432

The size premium for bonds varies between 0.11325 and 0.4461667 for the whole sample. Its average value is of the order of 0.2734078. The intra-individual variance (within) is equal to 0.01, whereas the inter-individual variance (between) almost null. As the SMB variable, we note that the total variance of SMB is explained, entirely, by the intra-individual one (within). This proves the importance of the temporal dimension of this variable compared to the individual one.

For the Sukuk population the size premium (SMB) varies between -0.2756667 and 0.51025 for the whole sample. Its mean value is of the order of -0.1810376. The intra-individual variance (within) is equal to 0.002, whereas the inter-individual variance (between) is null. As for bonds, we notice that the total variance is entirely explained by the intra-individual variance (within).

**Table 5:-** Descriptive table of the HML variable for Sukuk Variable

Variable		Mean	St deviations	Min	Max	observations
Bonds	Overall	0,4450804	0,1209728	0,228375	0,731375	N=4320
	Between		5,85E-17	0,4450804	0,4450804	n=10
	Within		0,1209728	0,228375	0,731375	T=432
Sukuk	Overall	0,3505561	0,0527164	0,21825	0,51025	N=7344
	Between		0	0,3505561	0,3505561	n=17
	Within		0,0527164	0,21825	0,51025	T=432

The value premium HML for the Sukuk population has a minimum value of 0.21825 and a maximum of 0.51025 for the whole sample. Its mean value is about 0.3505561. The intra-individual variance (within) is equal to 0.03, while the inter-individual variance (between) is null. We note that the total variance of HML is explained by the intra-variance (Within). This proves the importance of the temporal dimension of the HML variable. This result is available for bonds.

#### Term:-

The unexpected variance of the interest rate presents one of the risk factors for bonds. Our proxy for this factor is the TERM variable which is the difference between the daily performance of Sukuk / bonds and the U.S. Treasury-Bill yield of 3 months. The descriptive analysis of this variable on Stata 11 gave the following tables:

**Table 6:-** Descriptive statistics for the variable TERM:

Variable		Mean	St deviations	Min	Max	observations
Bonds	Overall	3.674705	0.299041	2.8805	4.2635	N=4320
	Between		0.2839073	3.147558	3.933998	n=10
	Within		0.129868	3.289207	4.073147	T=432
Sukuk	Overall	3.937537	0.2305956	3.2555	4.597	N=7344
	Between		0.2012848	3.488421	4.246591	n=17
	Within		0.1226249	3.437638	4.292081	T=432

It's important to note that we applied the Spearman test to ensure that there is no correlation between the different variables.

#### Fama and French (1993) Model:-

In what follows we propose to estimate the Fama and French model (1993). This framework represents a multiple linear regression of the variable to be explained (the excess return) and the explanatory ones such: the market excess return, size premium, the value premium, the interest rate variation proxy.

$$(R_{i,t} - R_{f,t}) = \beta_0 + (R_{m,t} - R_{f,t})\beta_i + SML_t\beta_{s,i} + HML_t\beta_{h,i} + TERM_t\beta_{d,i} + \varepsilon_{i,t} \quad (4)$$

$R_{i,t}$  is the return of the asset i for time t;

$R_{f,t}$  is the risk-free at time t;

$\beta_0$  is a constant;

$R_{m,t}$  is the market return at time t;

$\varepsilon_{i,t}$  is white noise;

SMB: is the risk premium generated by the size factor;

HMB: is the risk premium relative to the value risk factor;

TERM: is the premium relative to the term structure of interest rates.

#### Estimation results and interpretation:-

Considering the model presented above and with the respect of the brief literature review, we could expect the same behaviour of sukuk and bonds toward every explicative variable. However, estimation results presented here after couldn't confirm all of the research hypotheses.

Estimation results are reported in table 7.

In fact and according to table 7, the coefficient  $\beta_i$  relative to excess market returns is positive and close to 1 for both instruments. In other words, a 1% change in market excess returns results in a variation of 0.886% (0.866%) of the return of the Sukuk (bonds).

Therefore, Bonds and sukuk are very sensitive to market return variations.

**Table 7:-** Estimation results.

$(R_{i,t} - R_{f,t}) = \beta_0 + (R_{m,t} - R_{f,t})\beta_i + SML_t\beta_{s,i} + HML_t\beta_{h,i} + TERM_t\beta_{d,i} + \varepsilon_{i,t}$  where  $R_{i,t}$  is the return of the asset i at time t;  $R_{f,t}$  is the risk-free at time;  $\beta_0$  is a constant;  $R_{m,t}$  is the market return at time t;  $\varepsilon_{i,t}$  is white noise; SMB: is the risk premium generated by the size factor; HMB: is the risk premium relative to the value risk factor; TERM: is the premium relative to the term structure of interest rates. And i=Sukuk/Bonds.

Coefficient	Sukuk	Bonds
$\beta_0$	-2.089876 (0.00)	-1.798089 (0.00)
$\beta_i$	0.8866522 (0.00)	0.8661735 (0.00)
$\beta_{s,i}$	0.7242783 (0.00)	-0.106433 (0.00)
$\beta_{h,i}$	0.2082551 (0.00)	-0.151512 (0.00)
$\beta_{d,i}$	-0.610277 (0.00)	-0.595921 (0.00)

Taken together and in absolute value, all model parameters are higher for sukuk than for bonds. This shows the excess of sensitivity of the first instrument to different risk factors.

The excess market return  $(R_{m,t} - R_{f,t})$  is considered as a risk premium representing additional return required by the market for the extra risk taking compared to a risk-free investment.

When a market risk premium increases, investors require additional returns that will allow them to hedge market risk. Hence, the confirmation of hypotheses 1 and 2.

As far as, the slight sensitivity of the Sukuk's excess return to the market risk premium ( $\beta_{Sukuk} > \beta_{Bonds}$ ) reflects the risky nature of this instrument compared to bonds. Indeed, being prohibited by the precepts of "Sharia", any negotiation of the debt is prohibited in the commitments of the Sukuk. This makes sukuk issuers prone to default.

For the SMB variable, the two financial instruments differ widely from one another. Indeed, for Sukuk a 1% change of the SMB variable leads to a variation of 0.72% in Sukuk performance. However, for bonds, the latter is about -0.11%. This difference is also detected when returns are regressed separately on the size indicator variable (SMB). Consequently, we can say that Sukuk returns are more sensitive to liquidity factor as measured by size.

Also positive  $\beta_{s,sukuks}$  coefficient show that sukuk returns vary in the same direction of size factor. In other words, the smaller the size of sukuk is, the higher the perceived return becomes. Small issuance of sukuk sends a positive signal on the presence of counterparts in the Malaysian market.

**Hypotheses 3** supposing a sukuk's return variation of the same meaning with the SMB, is verified.

Surprisingly, the coefficient  $\beta_{s,Bonds}$  is of opposite sign for bonds indicating a negative reaction of excess returns to size factor increase (SMB). This factor is always related to momentum phenomena stipulating that small capitalisation stocks (bond) over perform big ones (see Kent Hirshleifer and Subrahmanyam (1998)). However, when the opposite sign is observed this theory is thwarted. Thus and in the bases on the study of Burmeister, Roll and Ross (2003) we can say that big capitalisations outperform small ones especially in the case of an economic recession. Small issuances are more sensitive to market conditions.

This result clearly rejects hypothesis 4.

As in Fama and French (1993) we consider the book to market (Book value/market value) and the HML factor in the same way as "YTM" as indicators of financial distress. We noticed that Sukuks with downward trending prices have a high "YTM" and positive HML coefficients.

Concerning bonds, the positive impact of the HML portfolio and the explained variable is not supported. Indeed, a 1% increase in HML results in a decrease in excess bond return of 0.1515%. This leads to reject hypothesis 6 of the positive relation between these two variables. This result confirms those of Fama and French (1992b) pointing out that investors are actively hedging against the value risk represented by HML portfolio. We also notice that the latter contributes poorly to bonds' price variation (only 0.1515% of the performance in excess).

Contrariwise, table 7 reports a positive impact of HML portfolio on the excess return of sukuk. In fact, a 1% increase of this factor leads to 0.208% increase of the sukuk excess return. Firstly, the impact in absolute value of HML on returns is twice as high for sukuk as for bonds. Then, this variable contributes more in explaining relative returns. Secondly, the negative value of  $\beta_{h,Sukuk}$  shows that there is some profits opportunity to realise when buying undervaluated sukuk (high B/M) and selling the over valued ones (low B/M).

Thus, we can confirm the positive impact of the HML factor on excess returns for sukuk introduced by the 5<sup>th</sup> hypothesis.

The last variable in our model is TERM proposed by Fama and French (1993) as an extension of Fama and French (1992a). It reflects the market interest rate variation namely the difference between Sukuk (bonds) returns and the 3 months Treasury rate.

The Sukuk-specific model shows a significant effect at the 1% threshold of the Sukuk performance variable. This result urges us to confirm hypothesis 8 which assumes that the Sukuk are negatively influenced by interest rate variations (see Syamni et al (2010) and Said and Grassa (2013)). As in Elkarim (2012) and Xian et al (2015), we can say that Interest rate variation affects indirectly the performance of sukuk as it represents a common economic indicator for financial assets.

In addition, TERM factor highly and negatively contributes to relative sukuk returns variation at about -0.61% for 1% variation. Bonds excess returns have the same meaning with respect to the TERM variation: an increase in the interest rate of about 1% results in a returns' decrease of 0.5959%.

These results could be interpreted in two ways: firstly, sukuk and bonds returns are very sensitive to business condition variations as specified by Fama and French (1993). Secondly, and according to Bhattacharyay (2013) investors are reluctant to invest in long term sukuks/bonds when interest rates increase as they predict a decrease of their purchasing power of long term fixed-rate bonds/Sukuk. Hence, the decline in demand for both instruments. This leads to a decrease in their returns.

Taken together, the last two results, are consistent with the literature review cited above, this leads us to confirm hypotheses 7 and 8.

### Conclusion:-

This paper sheds the light on differences between Sukuks and conventional bonds. Focusing on sovereign ones we have showed that investors perceive differently these two financial instruments.

Firstly, Sukuks are slightly more risky than bonds since relative underlined asset value isn't guaranteed at maturity. On the other side, interest on bonds and principal pay back are fixed beforehand.

Secondly, with respect to SMB factor, sukuks and bonds returns present variations of opposite sign. The first reacts positively leading to better performance of small issuances. And the latter reacts negatively to the size factor increase; hence big bond issuances outperform small ones.

Concerning value premium (HML factor), its contribution in absolute value to sukuk performance is twice that of bonds. However, a negative impact for bonds testifies that investors are actively hedging against the value risk. An effect of a contrary sign is valid for the sukuk showing that there is some profits opportunity to realise when buying undervaluated sukuks (high B/M) and selling the overvaluated ones (low B/M).

Nevertheless, toward interest rate variation, both instruments show negative reactions despite that by construction sukuk returns should be disconnected from. Then we can say that as well as bonds, sukuks are sensitive to changes in market conditions and business environment.

Indeed, the Sukuks show a performance higher than bonds throughout the analysis period. Based on a test of the averages of returns averages and risk premium, we confirmed the difference between the two financial instruments<sup>8</sup>.

Dexmedetomidine, Esmolol,  
hemodynamics, endotracheal intubation,  
laryngoscopy.

#### Abstract

**Background:** Laryngoscopy and intubation causes catecholamine release leading to sympathetic overdrive, resulting in hypertension and tachycardia. Different agents have been tried to overcome these responses over the years.

**Aims:** To compare an alpha-2 agonist, Dexmedetomidine, with Esmolol, a beta blocker and to observe which of two is more proficient in suppressing this hemodynamic response.

**Settings & Design:** Randomized, observational and a prospective study.

**Subjects & Methods:** Sixty patients scheduled for general anesthesia were divided into two groups, D (Dexmedetomidine 1 mcg/kg) and E (Esmolol 2 mg/kg), received either drug as an intravenous premedication over 10 minutes before laryngoscopy and endotracheal intubation. Systolic, diastolic, mean arterial pressures and heart rate were measured at various time points. Percentage change of parameters at those time points from the baseline were compared between groups.

**Statistical Analysis Used:** Demographics and hemodynamic parameters were compared for groups by one way (ANOVA) ANALYSIS OF VARIANCE. Paired *t*-test was used for comparison between groups, while for comparison within groups, unpaired *t*-test was used. Probability was said to be significant if *p* value was less than 0.05. Data was represented in mean and SD.

**Results:** Percentage change of hemodynamic parameters from base line were less in Dexmedetomidine group than in Esmolol group. Statistically significant differences were observed between the two groups at time points within 1 minutes after laryngoscopy and endotracheal intubation.

**Conclusions:** Dexmedetomidine was more effective than Esmolol in attenuating the hemodynamic responses to laryngoscopy and tracheal intubation.

## Introduction:-

Laryngoscopy and endotracheal intubation are one of the two most important integral parts of anaesthetic management and critical care since their description by Rowbotham and Magill in 1921. Laryngoscopy and endotracheal intubation provides control of airway during general anaesthesia. Laryngeal and tracheal stimulation causes circulatory response, was known since 1940 (Reid and Brace).<sup>[1]</sup> The mechanism behind hypertension and tachycardia, is an increased sympathetic action due to increased catecholamine release<sup>[2]</sup> and mechanical stimulus causing reflex responses in cardio-respiratory systems.<sup>[3]</sup> The increase in heart rate (HR) and blood pressure is usually variable, transient and unpredictable which may not be much significance in healthy individuals but can be detrimental in those with hypertension, cardiac dysfunction, coronary vessel disease or cerebro-vascular disease. Laryngoscopic and tracheal intubation responses in such individuals can precipitate coronary insufficiency, arrhythmias, pulmonary edema, left ventricular failure and cerebral hemorrhage.<sup>[4]</sup>

Various non pharmacological and pharmacological methods are in vogue to control this hemodynamic response. Opioids, local Anaesthetics, vasodilating agents and adrenergic blocking agents have been used to attenuate the pressor response.<sup>[5-13]</sup> Alpha2 agonists, recently have gained significance in suppressing the laryngosympathetic responses.<sup>[14]</sup> Dexmedetomidine is an  $\alpha$ -2 adrenergic receptor agonist, with particularly more prominent effects on cardiovascular system. **Srivishnu Vardhan Yallapragada<sup>(15)</sup> et al**, in 2016, concluded that, Dexmedetomidine (0.5 mcg/kg) is superior to esmolol (0.5 mg/kg) in attenuating the hemodynamic response to laryngoscopy and tracheal intubation. Among the  $\beta$  adrenergic receptor antagonist drugs, Esmolol is one of the most effective modality in minimizing the cardiac responses to laryngeal stimuli because of its ultrashort action (9 mins) and it can be administered intravenously. While it is an inhibitor of receptors of myocardium, receptors on smooth muscles of bronchial and vessel walls are also inhibited at higher doses<sup>[16]</sup> **SV Reddy<sup>(17)</sup> et al** in 2014, concluded that Dexmedetomidine 1.0  $\mu$ g/kg provided a more consistent, and effective diminution of haemodynamic response as compared to Esmolol 2.0 mg/kg. Thus, we sought to compare the effects of both these drugs in countering the exaggerated sympathetic responses secondary to laryngoscopy and endotracheal intubation.

## Materials and Methodology:-

60 patients belonging to ASA I & II, of either gender, in age group 18 – 65 yrs posted for elective non- cardiac surgery were included in the study. Exclusion criteria- Patients with cardiovascular system pathologies, drug allergies, H/o bronchial asthma, on beta blocker treatment.

Preanaesthetic preparation- Patients were fasted preoperatively since 10 pm, night before surgery.

On the day of surgery, on the operation table, baseline parameters including Heart Rate (HR), SPO2, Diastolic blood pressure (DBP), Systolic blood pressure (SBP) and Mean arterial pressure (MAP) were recorded using standard ECG, NIBP & SPO2 monitors. IV cannula was secured and all the patients were pre-loaded with Ringer lactate 10 ml/kg. All patients were premedicated using Inj glycopyrolate 0.004 mg/kg, Inj midazolam 0.02 mg/kg and Inj ondansetron 0.08 mg/kg, intravenously on arriving in operation theatre. They were randomly allocated into two groups by chit method. The study groups received either 2 mg/kg of Esmolol iv or 1  $\mu$ g/kg of Dexmedetomidine iv, all made in a 10 ml disposable syringe diluted upto 10 cc with normal saline. The drug were administered as a 10 minutes iv infusion. After injecting the study drug, All study parameters were recorded again after 10 minutes.

## Anaesthesia Technique:-

Patients were pre-oxygenated with 100% oxygen for three minutes. Induction was done with Inj. Thiopentone sodium 6 mg/kg iv and endotracheal intubation was facilitated with Inj succinylcholine 2 mg/kg iv. All parameters were recorded after induction. Laryngoscopy and endotracheal intubation were performed by single investigator by the use of a rigid laryngoscope with standard Macintosh blade & with appropriate sized, disposable, high volume, low pressure, cuffed tracheal tube. Laryngoscopy and intubation was done gently and in a single attempt. All study parameters were recorded for 1, 3, 5, 7, 10, minutes of intubation. Anaesthesia was maintained with O2 (50%) 4 ltr /min, N2O (50%) 4 ltr /min, Isoflurane and inj. Atracurium. All surgical stimuli, analgesics supplements were avoided during the study. IV fluid were calculated and managed. Patients were reversed at the end of surgery, by intravenous inj Neostigmine 0.05 mg/kg and inj. Glycopyrolate 0.01 mg/kg iv.

**Statistical analysis:-**

The data was analyzed using Student's T Test for intergroup comparison and all statistical methods were carried out using the chi-square test. The results were considered statistically significant when the [probability] p value  $<0.05$ .

**Results:-**

All 60 patients who were included were able to complete the study. The demographic data were comparable in terms of age, gender ratio & ASA status for all the patients and there were no statistically significant differences in between the groups ( $P > 0.05$ ). Baseline values of Heart Rate, Systolic Blood Pressure, Diastolic Blood Pressure and Mean Arterial Pressure were comparable in both Group D and Group E. Rise in mean Heart Rate after laryngoscopy and endotracheal intubation was observed in both the groups, although mean rise was minimal 2.39% in Group D (2 beats) as compared to Group E, 8.40% (7 beats), which was highly significant ( $P < 0.05$ ). Mean Heart rate between the two groups was found to be significant throughout the study period immediately after laryngoscopy and intubation. ( $P < 0.05$ ). Furthermore, only in the Group D, there was no statistically significant increase in Heart Rate at any time interval.

Mean rise in systolic blood pressure [SBP] was minimal [1.65%] in the D Group, as compared to the E Group [4.29%], which was statistically significant ( $P < 0.05$ ). Mean Systolic blood pressure between the two groups was found to be significant throughout the study period immediately after laryngoscopy and intubation ( $P < 0.05$ ).

The DBP levels in both, Group D and Group E were comparable at all times after intubation. In both the groups, there was no significant rise in DBP following intubation ( $P > 0.05$ ).

Mean blood pressure decreased after induction, but was not statistically significant in between Group D & Group E. The MAP was raised by, 5.20% (4.8mmHg) in Group D & 5.89% (5.3mmHg) in Group E at the time of intubation. Mean blood pressure was significant at 5, 7 & 10 minutes after intubation in between both groups. ( $P < 0.05$ ).

## Discussion:-

Laryngoscopy and endotracheal intubation violates the patient's protective airway reflexes and this noxious airway stimuli leads to cardio-vascular responses initiated by proprioceptors responding to the supraglottic and the tracheal tissue irritation.<sup>(18)</sup> These proprioceptors consist of mechanoreceptors which are located in close proximity to the airway mucosa, with the small-diameter myelinated fibers, slowly-adapting stretch receptors with large-diameter myelinated fibers, and nonmyelinated nerve fibers'spolymodal endings.<sup>(19)</sup> These impulses to brainstem are transmitted to the glossopharyngeal and vagal afferent nerves, which in turn, causes the widespread autonomic activation through the sympathetic and parasympathetic nervous systems. Deeper planes of anaesthesia using the inhalational agents; topical lignocaine sprays, calcium channel blockers, vasodilators such as sodium-nitroprusside; nitroglycerine and narcotics etc are used as prophylaxis<sup>[20]</sup> but hypotension, bradycardia, sedation and respiratory depression, are some of their prominent side-effects.

Esmolol, among the  $\beta$ -adrenergic blocking agents, appears to be an appropriate pharmacological agent for minimizing haemodynamic responses to laryngoscopy and endotracheal intubation, as it is more cardio-selective, with a rapid onset and ultra short elimination half-life. Several studies, describing the effects of Esmolol, on both Heart Rate and Blood Pressure during laryngoscopy and endotracheal intubation when compared to control, have been done in the past. **Miller et al**<sup>[21]</sup> reported that Esmolol when given as a single bolus dose of 100 mg, was effective in minimizing the haemodynamic response to laryngoscopy and endotracheal intubation. **Liu et al**<sup>[22]</sup> used

infusion of esmolol and found that rise was 50% lower in patients treated with esmolol when compared to the control group.

Similarly, in our study, we found that, there was a rise in mean heart rate after laryngoscopy and endotracheal intubation in both study groups. Mean rise was less [2.39%] in Group D as compared to Group E [8.40%] which was statistically highly significant ( $P < 0.05$ ). Mean Heart rate between the two groups was found to be significant throughout the study period immediately after laryngoscopy and intubation ( $P < 0.05$ ).

Dexmedetomidine, directly acts on  $\alpha_2$ -adrenoceptor agonists and clinically have significant effects on the requirement of anaesthetic agents and on haemodynamic responses or the sympatho-adrenal responses which occurs during laryngoscopy and anaesthesia induction by Anaesthesia and surgery. **Scheinin et al**<sup>[23]</sup> suggested that Dexmedetomidine when given in a dose of 0.6 mcg/kg, reduces, but not totally abolishes, the pressor responses to laryngoscopy and endotracheal intubation in young & healthy individuals. **Keniya et al**<sup>[24]</sup> concluded from their study that Dexmedetomidine 1.0 mcg/kg when used as pre-medication, minimized, but not totally obtunded the cardio-vascular responses to endotracheal intubation after anaesthesia induction.

In our study, we found that there was increase in mean SBP after laryngoscopy and intubation in both the groups, but the mean increase was minimal 1.65% in Group D when compared with Group E, 4.29%, which was statistically significant ( $P < 0.05$ ).

The Diastolic Blood Pressure levels in both, Group D and Group E were comparable at all times after intubation. In both the groups, there was no significant rise in DBP following intubation ( $P > 0.05$ ).

In our study, we infused Dexmedetomidine at a dose of 1mcg/kg and Esmolol at 2mg/kg, both over a period of 10 min, before induction, when compared to study mentioned above, we found that the mean arterial pressure decreased, but was statistically not significant in between Group D and Group E. The MAP raised by, 5.20% (4.8 mm Hg) in Group D and 5.89% (5.36 mm Hg) in Group E during intubation. MAP was found to be significant at 5, 7 & 10 mins after intubation in between both the groups ( $P < 0.05$ ).

In our study, we did not observe either bradycardia or hypotension in any of the patients in both the study groups.

### Conclusion:-

In constraints of our study, we conclude that, Dexmedetomidine 1 mcg/kg IV as 10 min infusion, more effectively diminishes the pressor stress responses to laryngoscopy and endotracheal intubation compared to Esmolol 2 mg/kg IV without any deleterious effects.

Zingiberaceae

### Abstract

The present paper includes *Alpinia calcarata* Roscoe as a new record in the Zingiberaceae flora of Manipur. The plant is described along with the field photographs.

Copy Right, IJAR, 2016,. All rights reserved.

### Introduction:-

Zingiberaceae is considered as one of the most important and valuable group of monocots. It is a well-known plant family for its medicinal and economic significance<sup>5</sup>. They are mostly distributed in tropical and sub-tropical region of the globe with maximum distribution in South East Asia.<sup>4,6</sup>

Manipur is situated in the north-east India and is centrally located on the eastern arm of the Himalayas- Purvanchal consisting of a valley embosomed in the mountainous region. The specimen was observed during the field survey in the valley districts in 2016. Detailed studies were undertaken with the various floras and herbaria and is subsequently identified as *Alpinia calcarata* Roscoe. The collection forms a new distributional record in the Zingiberaceae flora of Manipur.

### Taxonomic treatment:-

*Alpinia calcarata* Roscoe- Trans. Linn. Soc. London 8: 347. 1807 (IK)

Pseudostem to 1.3m; leaves sessile; ligule 0.8-1.2 cm, glabrous, apex obtuse bilobed; leaf blade linear, lanceolate, 25-33 x 2.5-3.7 cm, glabrous, green, base attenuate; leaf margins with short bristles; panicle 11.2 cm, rachis velvety; proximal branches 3 flowered; bracteoles membranous, apex obtuse, 1.4 cm long; pedicel 3 mm, pubescent; calyx apex 3-toothed, pubescent, 1.2cm, split on 1 side, white in colour; corolla white, glabrous, obtuse, lobes oblong, 2 shorter, 1.8 cm x 0.5 cm, 1 larger, 2 cm x 0.9 cm; lateral staminodes red, subulate, 3 mm, adnate to the base of labellum; labellum white with cherry red streaks, obovate, apex emarginated, 3.3 cm x 2.4 cm; stamen 2.2 cm; anther dorsifixed, bilobed, 0.7 cm, filament slender slight pinkish at the base, 3.3cm; stigma capitate; presence of 2 oil glands, yellow, 0.2 cm; capsule globose, pubescent; ovary trilobular.

### Abstract

In this prospective, randomized, double-blinded study 60 adult patients underwent cardiac surgery with CPB were randomly assigned to receive either succinylated gelatin or Ringer's acetate as priming and perioperative maintenance. We found that the dose of the study solution was significantly less in gelofusine group. The pH level, the BE values, coagulation parameters and hematological parameters showed significant changes in the gelatin group. We concluded that: Succinylated gelatin is more effective plasma expander than Ringer's acetate but with worse outcome regarding the acid base balance and coagulation parameters.

### Introduction:-

Within the human body, fluid homeostasis is a result of complex interactions between different compartments and barriers and the prerequisite of hemodynamic stability. <sup>(1)</sup> Severe intravascular hypovolemia results in a decreased cardiac output, tissue hypoperfusion and organ dysfunction. <sup>(2, 3)</sup> Therefore, perioperative fluid management should avoid these complications via replacing blood and fluid losses as adequately as possible. However, debates regarding the adequate type, amount and composition of fluids are ongoing. <sup>(2, 4, 5)</sup> Colloids are often added to solutions used for volume replacement to keep a colloidal osmotic pressure in the intravascular compartment, <sup>(6)</sup> they are now recommended as an alternative to crystalloids in several resuscitation guidelines <sup>(7)</sup>, but still controversially discussed. <sup>(8)</sup> Colloids can be classified into natural (e.g. albumin) and synthetic colloids (e.g. dextran, hydroxyethyl starch (HES) or succinylated gelatin) <sup>(6)</sup>. Colloids have a smaller volume of distribution than crystalloids; therefore, fewer amounts of fluid are needed to restore intravascular volume, <sup>(9)</sup> they also have been shown to improve oxygen transport, tissue oxygenation, and cardiac output. <sup>(10)</sup> Colloids have been used after cardiac surgery due to their ability to maintain intravascular volume and regional tissue perfusion more efficiently than crystalloids, <sup>(11-12)</sup> however all intravenous fluids produce dilutional coagulopathy and colloids interact with the coagulation System <sup>(13)</sup>. Gelatins can impair coagulation <sup>(14)</sup> and affect platelet aggregation. <sup>(15)</sup> On the other hand, Ringer's solution does not disturb coagulation <sup>(16)</sup> and can be used for fluid therapy in patients with coagulation disorders. No differences in mortality among critically ill patients had been demonstrated after the use of different colloids or crystalloids. <sup>(17)</sup> Cardiopulmonary bypass (CPB) causes a strong activation of the haemostatic system with increasing the risk of postoperative bleeding. <sup>(18)</sup> Previously, Wilkes and colleagues <sup>(19)</sup> showed that the use of HES solutions (HES 450/0.7 and HES 200/0.5) after CPB predisposed patients to increased blood loss. Results of many studies support an evidence-based recommendation for the avoidance or cautious use of HES solutions in patients undergoing surgery with CPB. <sup>(20)</sup> Studies showed that, chloride containing solutions produce hyperchloremia proportional to

their chloride content which persists for at least 6 hours.<sup>(21)</sup> The use of newer preparations of balanced colloids results in less impairment of acid base status and is considered to be a promising strategy to avoid metabolic acidosis associated with colloids suspended in 0.9% saline.<sup>(22)</sup> Hyperchloremia is evident to suppress renin activity in humans.<sup>(21)</sup>

### Patient & Methods:-

After the approval of the institutional review board and the Ethics Committee of Al Fayoum University, written informed consent from 60 patients scheduled for cardiac surgery were obtained.

#### Inclusion criteria:-

Male and female adult patients age from 20 to 55 years old underwent elective cardiac surgery with cardiopulmonary bypass with an expected time of CPB between 30 minutes and 3.5 hours. **Exclusion criteria;** included a history of cardiac surgery, severe congestive heart failure (ejection fraction  $\leq 25\%$ ), hemoglobin concentration  $\leq 10$  g/dL before study, a known allergy to gelatins, renal insufficiency (serum creatinine of  $\geq 2.5$  mg/dL), significant hepatic disease (liver function tests  $\geq 3^{\text{red}}$  upper limit of normal), or a history of coagulation disorders.

This study included two groups: **Group A:** 30 adult patients - age from 20 to 55 years old - who received Ringer's acetate solution. **Group B:** 30 adult patients- age from 20 to 55 years old – who received modified gelatin solution. Preoperative cardiac medications were continued until the morning of surgery, except for angiotensin-converting enzyme inhibitors and angiotensin II antagonists were discontinued at morning of surgery. Acetylsalicylic acid was discontinued 5 days before surgery.

#### Anesthesia:-

All patients were pre-medicated with IV. midazolam (0.1 mg/kg), Anesthesia was induced with propofol (1.0-1.5 mg/kg), fentanyl (3-10  $\mu\text{g/kg}$ ), and pancuronium bromide (0.1 mg/kg), Then Patients were intubated with an oral endotracheal tube and ventilated with a minute volume of 80-100 ml/kg/min. to achieve a target alveolar partial carbon dioxide pressure between 35 and 40 mmHg. Arterial cannula and central venous line were inserted. Heart rate, ECG, invasive arterial blood pressure, central venous pressure and nasopharyngeal temperature were continuously measured. A bladder catheter was inserted to monitor urine output during and after the operation. Anesthesia was maintained with isoflurane 0.5-1.5 MAC till cardiopulmonary bypass, then maintained with propofol (50-100  $\mu\text{g/kg/min}$ ), incremental doses- if needed-of fentanyl & pancuronium during CPB.

#### Anticoagulation and Cardiopulmonary Bypass:-

Anticoagulation was established, while the aortic purse-string sutures are placed before cannulation, with an initial bolus 300-400 IU/kg BW of heparin sodium to get activated clotting time (ACT) higher than 480 sec. Additional heparin - if needed – was administrated to maintain ACT higher than 480 sec during the whole procedure. The cardiopulmonary bypass circuit was prepared as following:

- For group A: 1,500mL of Ringer's acetate + 0.5 g/kg mannitol.
- For group B: 1000mL of gelofusine solution +500 ml Ringer's acetate + 0.5 g/kg mannitol.

After anticoagulation with heparin (300 IU/kg), cardiopulmonary bypass was performed using a non-pulsatile blood flow at 2.5 L/min/m<sup>2</sup>, a non-heparin-coated circuit, and a membrane oxygenator (Quadrox, Maquet, Hirrlingen, Germany; Dideco Compactflow, Mirandola, Italy; or Hilite 7000, Medos, Stollberg, Germany). Mild-to-moderate hypothermia was induced (28°-32°C) and norepinephrine was given to maintain a mean arterial pressure  $\geq 60$  mmHg. St Thomas crystalloid cardioplegic solution (Hamburg) was used for myocardial preservation. Randomization was performed using envelop method. The anesthetist, who collected the data, was blinded with the study solutions. Fluid infusion was adjusted individually for each patient to achieve hemodynamic stability, which is defined as a systolic blood pressure  $>90$  mmHg and avoidance of decrease of systolic blood pressure  $>20\%$  from baseline, a heart rate  $<100$  beats/min and avoidance of an increase in heart rate of 30% from baseline, normal central venous pressure 5-12 mmHg and urine output  $>0.5\text{mL/kg/h}$ , using a maximum study solution dose of 50 ml/kg. If additional volume was needed Ringer acetate solution was given. The use of sodium bicarbonate was only allowed if arterial pH was  $<7.2$ . Regarding concomitant medication, the use of synthetic colloids other than the study solution was forbidden until end of surgery. Transfusion triggers for the transfusion of allogeneic red blood cells were hemoglobin concentrations of  $\leq 7.0$  g/dL (during cardiopulmonary bypass), 7.5 to 8.0 g/dL after weaning from cardiopulmonary bypass, and 8.0 to 8.5 g/dL after the end of surgery. Before weaning from CPB all patients were

rewarmed to 37°C (nasopharyngeal temperature) & heparin was neutralized with 1:1 protamine sulphate to regain normal ACT.

#### Measured parameters:-

The primary variable for assessing therapeutic equivalence was the volume of the study solution in milliliters needed for hemodynamic stabilization until 1 hour after the end of surgery (i.e., the cumulative volume of the study solution in milliliters administered up to this time point). Therapeutic equivalence regarding the primary variable was defined as the treatment difference  $\leq 500\text{mL}$  in the amount of the study solution. Consecutive variables analyzed were arterial pH & base excess at the end of surgery. Arterial pH was measured at each time point from the induction of anesthesia to 1 hour after arrival in the intensive care unit (ICU) (including: room air, after induction, on bypass, before weaning from bypass, after bypass is off, before end of surgery, and after arrival to the ICU samples). In addition, base excess values were measured at the same time points as arterial pH. All blood gas analysis samples were measured at 37°C. Secondary parameters were hemodynamic parameters, fluid balance, and concomitant vasoactive medications. Safety parameters were coagulation variables (platelet count, prothrombin time, prothrombin concentration, and INR), hematology parameters (hemoglobin and hematocrit) clinical chemistry parameters (creatinine, urea, AST and ALT), serum electrolytes (Na & K), and adverse events, safety parameters were measured preoperative as a baseline & one hour after end of surgery.

#### Statistical Analysis:-

Data was collected and coded to facilitate data manipulation and double entered into Microsoft Access and data analysis was performed using SPSS software version 18 under windows 7. Simple descriptive analysis in the form of numbers and percentages for qualitative data, and arithmetic means as central tendency measurement, standard deviations as measure of dispersion for quantitative parametric data, and inferential statistic test: **For quantitative parametric data:** In-dependent **student t-Test** used to compare measures of two independent groups of quantitative data. **Paired t-test** used in comparing two dependent quantitative data. **For quantitative non parametric data:** Non Paired variables; Mann-Whitney test used in comparing two independent groups. Paired variables; Wilcoxon test used in comparing two groups of dependant data. **For qualitative data:** **Chi square** test to compare two of more than two qualitative groups. The level  $P \leq 0.05$  was considered the cut-off value for significance. The sample size was calculated according to Epi Info 2000. Using a special formula based on the lowest reported values of different study outcomes; at a confidence interval of 95%, alpha error 0.05, beta error 0.1 and 90% power of study.

#### Results:-

The demographic data, type of surgery and the operative details showed no significant difference between the two groups (table 1), (table 2) and table (3).

**Table 1:-** Comparisons of age, and weight in different study groups:

Variables	Group A (n=30)		Group B (n=30)		p-value	Sig.
	Mean	SD	Mean	SD		
Age (years)	41.6	9.7	43.3	9.4	0.5	NS
Weight (kg)	76.1	8.6	74.7	9.4	0.5	NS

NS = no statistically significant difference. Group A = Ringer's acetate, Group B = succinylated gelatin

**Table 2:-** Comparisons of gender and type of operation in different study groups:

Variables	Group A (n=30)		Group B (n=30)		p-value	Sig.
	No.	%	No.	%		
Sex						
Male	20	66.7%	15	50%	0.3	NS
Female	10	33.3%	15	50%		
Type of operation						
Valvular	20	66.7%	16	53.3%	0.4	NS
CABAG	10	33.3%	14	46.7%		

**Table 3:-** Comparisons of operation data in different study groups:

Variables	Group A (n=30)		Group B (n=30)		p-value	Sig.
	Mean	SD	Mean	SD		
EF%	68.3	5.3	67.4	5.6	0.6	NS
Duration of surgery (hrs)	5	0.41	5.1	0.47	0.9	NS
Cardiopulmonary bypass time (min)	110.2	22.8	107.4	17.8	0.6	NS
Cross clamp time (min)	74.4	11.7	73.5	13.5	0.8	NS

The dose of the study solution was highly significant between the two groups (in group A -Ringer's acetate-:  $3700 \pm 427.5$  ml in group B -gelofusine group-:  $2365.3 \pm 100.8$  with p value  $<0.001$ ). It is noted that there was no need for additional solution in group B (gelofusine group), on the other hand in group A (Ringer's acetate) almost all cases needed additional solution ( $453.3 \pm 366.9$  ml.). Also the total amount of solution needed was highly significant between the two groups (in group A:  $4153.3 \pm 330.3$ , in group B  $2365.3 \pm 100.8$  with p value  $<0.001$ ) as shown in table (4)

**Table 4:-** Comparisons of volume of study solutions in different study groups:

Variables	Group A (n=30)		Group B (n=30)		p-value	Sig.
	Mean	SD	Mean	SD		
Dose of study solution	3700	427.5	2365.3	100.8	$<0.001$	HS
Additional solution used	453.3	366.9	0	0	$<0.001$	HS
Total amount	4153.3	330.3	2365.3	100.8	$<0.001$	HS

HS = highly significant difference.

Regarding the PH levels, there was no significant difference between the two groups at T1 (Room air; baseline) and T2 (After induction). On the other hand from T3 to the end point of the current study there was an obvious reduction in the PH level of group B (4% succinylated gelatin), which was statistically highly significant in comparison of group A (Ringer's acetate). Figure (1) shows the time line course of the PH in different groups.

The BE also found no significant difference between the two groups at T1 and T2. On the other hand from T3 to the end point of the study, the BE values showed a highly significant difference between the two groups. In group B (4% succinylated gelatin) the BE values decreased and became at the negative side in contrast to the group A (Ringer's acetate). Figure (2) illustrates the time line course of the BE throughout the study in both groups.

**Figure 1:-** time line course of PH in different groups

T1= Room air, T2 (After induction) T3 (on bypass) T4 (before weaning) T5 (after bypass) T6 (end of surgery) T7 (at ICU)

Figure 2:- time line course of BE

Apart from the CVP, the secondary variables showed no significance between the two groups as shown in tables (5) & (6)

Table 5:- Comparisons of secondary variables at end of surgery in different study groups:

Variables	Group A (n=30)		Group B (n=30)		p-value	Sig.
	Median	IQR	Median	IQR		
Hear rate	90	5(85-90)	90	10(80-90)	0.06	NS
CVP	6	1(5-6)	7	3(6-9)	<b>0.001</b>	<b>HS</b>

Table 6:- Comparisons of secondary variables at end of surgery in different study groups:

Variables	Group A (n=30)		Group B (n=30)		p-value	Sig.
	Mean	SD	Mean	SD		
Systolic blood pressure	120.2	7.7	119.3	7.8	0.7	NS
UOP	2.5	0.76	2.4	0.84	0.8	NS
Vasoactive drugs	0.47	0.7	0.37	0.6	0.6	NS

All safety variables including; platelet count, prothrombin time, prothrombin concentration, INR, hemoglobin, hematocrit, kidney function, liver function and serum electrolytes, showed no significant difference between the two groups when compared preoperatively, however, when comparing the safety parameters within the same group, we showed that; in group A (Ringer's acetate) (table 7) platelet count has significantly decreased after operation ( $226.9 \pm 25.8$  to  $171.4 \pm 18.4$  p-value <0.001), the prothrombin time prolonged and concentration decreased, the INR showed a significant increase after operation (with  $1.1 \pm 0.06$  preoperative vs.  $1.2 \pm 0.04$  postoperative p-value 0.02). Also, the hematological parameters; hemoglobin and hematocrit decreased significantly. Apart from the (AST), no statistical significances were recorded regarding the clinical chemistry parameters and postoperative serum potassium level significantly increased.

Table 7:- Comparisons of safety variables before and after operation among group A:

Variables	Before operation		After operation		p-value	Sig.
	Mean	SD	Mean	SD		
Coagulation profile						
Platelet count	226.9	25.8	171.4	18.4	<0.001	HS

K level	3.9	0.26	3.9	0.25	0.9	NS

To find out the differences between the two groups, we compared the postoperative values of both groups (table 9). It was found that, no significant differences between the two groups regarding the clinical chemistry parameters or serum electrolytes. However, there were; significant decrease in postoperative platelet count, significant prolongation in prothrombin time, significant decrease in postoperative prothrombin concentration and significant increase in INR in group B(gelofusine group) when compared to group A (Ringer's acetate). Also, there was a significant decrease in hemoglobin concentration and hematocrit in succinylated gelatin group when compared to Ringer's acetate.

### Discussion:-

One of the major findings in our study was the primary variable for assessing the therapeutic equivalence defined as the volume of the study solution in milliliters (including the priming); the current study denoted that gelofusine is superior to Ringer's acetate in maintaining hemodynamic stabilization with much less volume. This is met with several studies which denoted that colloids are more effective regarding their plasma expanding property than crystalloids.<sup>(9, 21)</sup> Regarding 4% succinylated gelatin (the colloid of use in this study), and being a colloid of low average molecular weight, there was a believe that it escapes the capillary pores faster than that of medium and high molecular weight can do, hence, less plasma expanding effect<sup>(23)</sup>, however several studies have described gelatins and starches as equal plasma expanders both in: animal models<sup>(24-26)</sup> and human.<sup>(20, 27)</sup> Moreover, in their study, Dileep et al.<sup>(21)</sup> have described an equal duration of plasma expansion of both 4% succinylated gelatin (gelofusine) and 6% hydroxyethyl starch (Voluven) attributing this to the fact that hydroxyethyl starch is eliminated by the cleavage action of the serum amylase, which increased four times after infusion of hydroxyethyl starch as reported by Wilkes et al.<sup>(28)</sup>

The PaCO<sub>2</sub> levels in this study were maintained by ventilation therefore, base excess (BE) and PH changes reflected any change in the non-respiratory (i.e. metabolic) state. Regarding the pH levels, there was a significant difference between the two groups from T3 to the end point of the current study. Ten cases of group B (4% succinylated gelatin) reached a PH level less than 7.35 to a maximum fall to 7.31 (i.e. metabolic acidosis). This can be attributed to the fact that gelofusine is a saline – based gelatin, it contains: 145 mmol/l sodium ion concentration, 120mmol/l chloride concentration and Succinylated Gelatin 40.0 g/l.

The PH can be calculated by using the Henderson-Hasselbalch equation  $pH = pK + \log \left( \frac{[HCO_3^-]}{(PaCO_2 \times 0.03)} \right)$ , But it does not quantify the abnormalities. Another approach was therefore introduced to eliminate the limitation above which is the Stewart approach.<sup>(29)</sup> According to Stewart, the variables that contribute to the body pH are: the strong ion difference (SID,  $\Sigma$  [strong cations] -  $\Sigma$  [strong anions]), the albumin concentration, and the PCO<sub>2</sub>.<sup>(10)</sup> From this approach we can clear that the SID is the main variable to determine the metabolic influences on the body pH, so if normal saline solution or a saline based solution is infused, an increase in chloride concentration (one of the main anions) will result, leading to a decrease in the SID and hence acidosis (the so called hyperchloremic metabolic acidosis).<sup>(10)</sup> This is met with Dileep et al.<sup>(21)</sup>, who in their Randomized, three-way crossover study, cleared an incidence of hyperchloremia in patients receiving NaCl containing solutions ( including: normal saline, Gelofusine and Voluven) with a direct relationship between the degree of hyperchloremia and the concentration of NaCl in the solutions used. Also in their study Base et al.<sup>(10)</sup> reported a significant hyperchloremia in patients infused with saline-based colloid versus non in who received a colloid in a balanced electrolyte solution. On the other hand Awad et al reported a significant hyperchloremia after 6% hydroxyethyl starch (Voluven) but not 4% succinylated gelatin (Gelofusine).<sup>(27)</sup> Hyperchloremic metabolic acidosis has been considered a benign and self limiting condition over the last few years<sup>(30)</sup> with unclear clinical impact, however recent published data suggest that there is some.<sup>(10)</sup> Noritomi et.al,<sup>(31)</sup> reported a complex metabolic acidosis in patients with severe sepsis or septic shock on ICU admission mainly due to hyperchloremia. Wilkes et al<sup>(32)</sup> in their study reported improved organ perfusion in patients who received balanced solution compared to those who received saline-based one. Also Ondiveeran and Fox-Robichaud<sup>(33)</sup> suggested that solution composition may have an impact on the immune response.

We can attribute the significant difference in the BE to the difference in the electrolyte component of each solution as mentioned above. In their study Boldt et al.<sup>(34)</sup> reported a significant decrease in BE after the use of unbalanced colloid HES in contrast to balanced HES, also Base et al.<sup>(10)</sup> reported the same finding.

The difference in CVP between both groups can be explained by the longer duration of plasma expansion of Gelofusine than Ringer's acetate. On the other hand, the urine output (UOP) and despite the different compartmental distribution of both solutions showed no significant difference between the two groups. This is met with Dileep et al.<sup>(21)</sup> who reported equal volume of UOP in healthy volunteers after loading with 1 liter of different solutions using 0.9% saline, 4% succinylated gelatin (Gelofusine) and 6% hydroxy-ethyl starch (Voluven), they attributed this to the fact that the colloids shifted fluid from the extravascular into the intravascular space.

When comparing the safety parameters within the same group, the current study showed that; in group A (Ringer's acetate) platelet count has significantly decreased after operation ( $226.9 \pm 25.8$  to  $171.4 \pm 18.4$  p-value <0.001). This finding comes in line with Olmos et al.<sup>(35)</sup> and **Tülün Öztürk** et al.<sup>(36)</sup> when assessing the effectiveness of priming the extracorporeal circulation system with albumin - mannitol combined with Ultrafiltration, Olmos et al, used a control group in which the extracorporeal circulation was primed with Ringer's lactate 1500mL, they reported a decrease in platelet count in their control group. Also **Tülün Öztürk** et al in their study about the effect of acute normovolemic hemodilution (ANH) using colloids on the coagulation parameters, they used a control group in which the extracorporeal circulation was primed with Ringer's lactate and mannitol without ANH, they reported a statistically significant decrease in the platelet count within the control group when comparing the baseline reading to that one hour after discontinuation of CPB. Moreover the literatures reported that, thrombocytopenia commonly occurs during cardiac surgery using an extracorporeal circulation due to hemodilution, sequestration and destruction by the non-endothelial surfaces.<sup>(37)</sup>

Regarding the prothrombin time and concentration within group A (Ringer's acetate) there were a significant difference when comparing the preoperative and postoperative values, the prothrombin time prolonged and concentration decreased. This comes in line with **Tülün Öztürk** et al.<sup>(36)</sup> who reported a significant prolongation of prothrombin time in their control group. Also, in the current study, the INR showed a significant increase after operation (with  $1.1 \pm 0.06$  preoperative vs.  $1.2 \pm 0.04$  postoperative p-value 0.02). In their study Olmos et al.<sup>(35)</sup> reported an increase in the INR in the control group but without intra-group analysis.

The hematological parameters within group A (Ringer's acetate) showed that hemoglobin decreased significantly (preoperative  $12.7 \pm 0.94$ , postoperative  $10.7 \pm 0.61$  p-value <0.001) and hematocrit, also decreased significantly (preoperative  $37.9 \pm 2.9$ , postoperative  $32.3 \pm 1.8$  p-value <0.001). In their study Olmos et al.<sup>(35)</sup> reported – within their control group – a decrease in hemoglobin and hematocrit but without intra-group analysis. Also, **Tülün Öztürk** et al.<sup>(36)</sup> reported a significant decrease in hemoglobin within their control group, when comparing the preoperative values to that one hour after discontinuation of CPB.

The significant increase in postoperative serum potassium level among patients of group A can be attributed to the potassium content of the solution used.

The safety variables within group B (gelofusine group) showed the same changes occurred as in group A (Ringer's acetate) except that there was no significance regarding the potassium level postoperatively, and when comparing the postoperative values of both groups, we found that, there were; significant decrease in postoperative platelet count, significant prolongation in prothrombin time, significant decrease in postoperative prothrombin concentration and significant increase in INR in group B (gelofusine group) when compared to group A (Ringer's acetate). Also, there was a significant decrease in hemoglobin concentration and hematocrit in succinylated gelatin group. This is met with Schramko et al.<sup>(38)</sup> and Nielsen VG<sup>(39)</sup> who reported that both gelatin and HES solutions decreased Hb, Hct, and PC more than Ringer's acetate. Also in their study about the effect of intravenous fluids (including; albumin, gelofusine, Haemaccel and saline) on platelet function and hemostasis in elective hip surgery, Evans et al.<sup>(40)</sup> reported that there was a significant decrease of Hb, Hct and platelet count when comparing pre and post and pre and last time points in all fluid groups with less fall in saline group. Despite disturbances of coagulation parameters, these disturbances did not cause detectable clinical changes; this is met with Schramko et al.<sup>(38)</sup> No adverse events were recorded in our study.

## Conclusion:-

In conclusion, the succinylated gelatin is more effective plasma expander and gets more hemodynamic stability than Ringer's acetate. However it has worse outcome regarding the acid base balance and coagulation parameters (Despite no detectable clinical changes). The safety regarding kidney and liver functions and serum electrolytes was comparable between the two groups.

We recommend further studies about balanced Succinylated gelatin (e.g. ISOPLEX 4% W/V SOLUTION FOR INFUSION) produced by Beacon Pharmaceuticals U.K. containing Na 145mmol, K 4mmol, chloride 105mmol, magnesium 0.9mmol and lactate 25mmol, with osmolarity of 284mosm/l and MW 30,000 Daltons.

#### Abstract

Plasma gun is a very effective source to fire plasma structures and has a wide range of applications in optimization of plasma parameters of the plasma structure fired from plasma gun is an important field of research. The effect of background plasma upon plasma structure fired from a plasma gun is reported in this communication. It is observed that in the presence of background plasma both electron density and electron temperature of plasma structure is modified.

#### Introduction:-

Plasma guns have a wide range of applications in plasma physics and controlled fusion research. They provide high density plasmas for ion extraction [1]. They supply the target plasma in mirror experiments [2] and also help in the initiation of toroidal discharges [3]. They are widely used to accelerate pellets for fuelling fusion devices [4]. A variety of plasma guns have been developed and are in use since last half a century [5-14]. Optimization of plasma parameters in the structure fired from a plasma gun is an interesting field of research even today. Effect of another plasma source to fuel plasma structure fired from a plasma gun in worth discussing.

#### Experimental:-

The plasma gun used in this experiment consists of washer shaped electrodes which are made up of metal/alloys. Copper washer is used as anode and brass washer is used as cathode. In between the electrodes floating brass washers are stacked. The gas feed network injects desired gaseous substance into gun body to make it operational. Argon gas is used in this experiment. The gun is energized by a pulse forming network, which produces square wave pulse of 140  $\mu$ s. The schematic diagram of plasma gun and allied circuit is shown in figure 1. An electromagnetic valve is used to inject gas into the gun from backside (cathode side). A low voltage capacitor bank was fired through a thyatron to generate a magnetic field in the vicinity of the mild steel piece and the resultant magnetization of the mild steel piece lifts the piston to allow the opening of the orifice and entry of the gas into the plasma gun.

**Figure 1:-** Schematic diagram of plasma gun and allied circuit.

A background plasma set up is created [15] in the CPS device [16]. The effect of background plasma upon plasma parameters of the plasma structure fired from plasma gun is studied by means of different diagnostic tools. Langmuir probe is simple to fabricate, and is a very effective diagnostic tool to measure plasma parameters [17-18]. The biasing scheme of Langmuir probe is shown in figure 2. A piece of ceramic tube holds the tungsten probe/probes connected with copper wire/wires. Teflon pipe and tapes are used as insulation and holding material. These materials (tungsten, ceramic, teflon etc.) are able to withstand high temperature and are vacuum compatible. Ceramic is also resistant to sputtering and is an insulator.

**Figure 2:-** Langmuir probe biasing scheme

### Results and Discussion:-

Electron density of plasma is measured using Langmuir probe. If  $I_{sat}$  is the electron current flowing through the circuit when probe is maintained at plasma potential and lower than floating potential then,

$$I = I_{sat} \exp(-eV_p/kT) \quad (1)$$

Where  $T$ ,  $V_p$ ,  $k$  are the electron temperature, probe potential and Boltzmann Constant respectively.

$$V_p = V_a - V_s$$

$I_{sat}$  in terms of electron density is given by,

$$I_{sat} = A_p e n_e v = A_p e n_e (kT/2m)^{1/2}$$

Where  $A_p$ ,  $e$ ,  $n_e$ ,  $v$ , and  $m$  are the area of the probe, charge associated with an electron density, mean thermal velocity and mass of the electron respectively. Electron temperature is measured from the slope of  $I \sim V$  curve.

The electron density is

$$n_e = (I_{sat}/A_p)(2\pi m_e/e^3)^{1/2} (e/kT_e)^{1/2} \quad (2)$$

Where,  $A_p = \pi r^2 + 2\pi r l$  = Area of the probe,  $r$  and  $l$  are the radius and exposed length of the probe.

The electron density of plasma fired from the plasma gun is found to be  $9.7 \times 10^{16} \text{ m}^{-3}$  at discharging potential 1.4 kV and ambient pressure 0.2 mb. The electron temperature is  $\sim 1 \text{ eV}$ . The probe is placed at 10 cm and 12.5 cm respectively from the plasma gun. When the background plasma system is turned on and plasma is fired from the gun across the background plasma, the peak electron density becomes  $7.9 \times 10^{17} \text{ m}^{-3}$  at a distance 10 cm from plasma gun, where the background plasma exists. The electron density of back ground plasma is  $10^{13} \text{ m}^{-3}$  for discharging potential 0.5 kV [15]. The background plasma extends from 8 cm from plasma gun to 12 cm, as the parallel plate used in back ground plasma is around 4 cm wide. On the other hand at a distance 12.5 cm from plasma gun where the periphery of background plasma region exists, the electron density of plasma is found to be  $1.9 \times 10^{17} \text{ m}^{-3}$ . The electron density profiles of plasma in the absence and presence of background plasma is shown in figures 4 and 5 respectively.

**Figure 3:-** Electron density profile of argon plasma at a distance 10 cm from plasma gun

**Figure 4:-** Electron density profile of argon plasma at a distance 12.5 cm from plasma gun

Image of plasma structure gives a lot of information [19]. The image of background plasma is shown in figure 5 and the image of plasma fired from plasma gun in the presence of background plasma is shown in figure 6. The plasma structure inside background plasma region becomes more intense, which is evident from the images. The density of plasma structure increases, being fueled by background plasma, ten times as shown in figure 3. So, external plasma near gun mouth will enhance the plasma density and this will be very helpful for the experimenters using plasma guns in fusion devices. Parallel plate type as well as filament plasma can be used as external plasma source for a plasma gun, for its optimization.

**Figure 5:-** Image of background plasma

**Figure 6:-** Image of plasma from plasma gun in the presence of background plasma.

### **Conclusion:-**

Background plasma enhances plasma density of the structure fired from plasma gun. The electron density of plasma structure increases ten times, when fueled by background plasma of density thousand times less than that of plasma produced from plasma gun. The electron temperature is modified in the presence of back ground plasma. External plasma source will enhances the parameters of the plasma structure from plasma gun for fusion devices.

#### Abstract

**Background:** Ovarian carcinomas are frequently diagnosed at advanced-stage due to lack of distinct symptoms and reliable procedure for early detection. The applying of immunohistochemistry has become an important tool improving the prognosis of patients with ovarian carcinomas. **Aim:** To assess the expression of Glut-1 in epithelial ovarian tumors and study its correlation with PCNA to detect their usefulness in the diagnosis and prognosis of such tumors. **Methods:** Glut-1 immunoexpression was analyzed and correlated with PCNA in 45 epithelial ovarian tumors (7 benign, 10 borderline and 28 malignant tumors). **Results:** Glut-1 was expressed in 80% and 92.85% of the studied borderline and invasive carcinomas respectively, but not expressed in any benign tumors. These differences in Glut-1 expression among the benign, borderline and malignant cases, were statistically significant ( $p = 0.000$ ). Analysis of Glut-1 immunoexpression with the clinicopathological criteria of ovarian carcinomas revealed that Glut-1 expression is more significantly expressed in high grade carcinoma and in tumors with an advanced FIGO stage ( $p = 0.043$  and  $p = 0.005$  respectively). Glut-1 was more significantly expressed in lymph node metastases positive group and in those with intraperitoneal implants ( $p = 0.011$  and  $0.016$  respectively). There was a strong positive significant correlation between Glut-1 and PCNA among the studied 45 ovarian tumors (Spearman correlation ( $r$ ) = 0.603,  $p$  value = 0.000). **Conclusion:** Glut-1 can increase the diagnostic accuracy of ovarian tumors by help in differentiating between benign, borderline and malignant tumors. Glut-1 correlated with poor prognostic factors and can be used with PCNA as prognostic markers for epithelial ovarian tumors.

#### Introduction:-

In Egypt, tumors of the reproductive organs account for 4% of the overall malignancies in females and ovarian malignancies constituted about 1.4% of them [1]. Ovarian carcinomas are frequently diagnosed at advanced-stage due to lack of distinct symptoms and lack of reliable procedure for early detection [2]. Epithelial ovarian tumors

**Corresponding Author:-Samah S. Elbasateeny.**

Address:-Pathology Department, Faculty of medicine, Zagazig University, Egypt.

constitute the majority of ovarian tumors [3] WHO classified ovarian surface epithelial tumors histologically into: serous, mucinous, transitional cell, endometrioid, clear cell, mixed, squamous, and undifferentiated subtypes [4].

Many clinicopathological variables are considered to be of great importance in determining the prognosis of patients with ovarian carcinoma, including tumor staging, histological typing, presence of ascites positive for malignancy, residual tumor mass, and the chemoresponsiveness of the tumor cells [5]. Beside these well-known clinical prognostic factors, the applying and usage of molecular techniques is more accurately related to the intrinsic behavior of the tumors and the pathway of carcinogenesis and may be supportive in improving the prognosis of patients with ovarian carcinomas [6].

There have been significant advances in understanding ovarian carcinoma based on immunohistochemistry and molecular analysis [7]. Immunohistochemistry has become an important tool not only in the diagnosis of ovarian tumors, but also represent markers of prognostic significance[8].Most of the identified tumor markers in ovarian epithelial tumors have not shown satisfactory sensitivity and specificity. Therefore, new candidate markers are needed that can be used to improve the diagnostic accuracy of the screening strategies [9].

The cells of the tumors show a considerable increase in the metabolism of glucose in contrast to the normal tissue. This great increase in the demand of glucose by tumor cells signifying a need for a corresponding enhancement glucose transport through the cellular membrane [10]. The active passage of glucose through the membrane of the cell is controlled via a group of proteins named glucose transporters, they are 14 types (from Glut 1 to Glu-14). They show variable differences in the affinity for glucose, tissue allocation and physiological control [11].

The glucose transporter-1 (Glut-1), is normally expressed and detected by immunohistochemical staining in the membranes of red blood cells (RBCs), endothelium of the capillary of the brain and the perineurium of the peripheral nerves [12]. The Glut-1 is up regulated in situations with decreased oxygen concentrations and hypoxia [13]. Moreover, Glut-1 is accompanied by a rise in the expression of many proteins that have the ability to help the survival of cellular tumor in the adverse microenvironment and enhance the metabolism of glucose [14]. Tumors that overexpress Glut-1 tend to show better and complete response to chemotherapy. So, Glut-1 may be regarded as an independent factor of prognosis that can predict the response of the patient to treatment with chemotherapy, it addition to its early diagnostic role [15]. There has been a great attention to find a link between the expression of Glut-1 in epithelial neoplasms, and the association of Glut-1 expression with the carcinogenesis and patient prognosis in ovarian tumors [16]. However, many researches have detected an association between the expression of Glut-1 and neoplastic progression, development, and the bad outcome of many neoplasms [17, 18].

Detection of proliferating cells by immunohistochemistry is a method to determine the proliferative potential of a tumor[19].Proliferating Cell Nuclear Antigen (PCNA) is a protein cofactor of DNA polymerase that is expressed in the cell cycle during the replication of the DNA and often regarded as an index of cell proliferation.Ki67 is thought to be a more expressive marker of proliferation than PCNA, and as result of that PCNA was less routinely utilized [20]. Interestingly, many researches that have studied the expression of both proliferative markers (Ki67 and PCNA) in the same patient group reported a concordant score with the use of both markers [6, 21, and 22]. This signifies that the usefulness of cellular proliferative markers and the prognosis of cases is more dependent on the selected group of cases rather than the proliferative marker used [20].

The aim of the present work was to assess the immunohistochemical expression of Glut-1in epithelial ovarian tumors and studyits correlation with tumor proliferative marker PCNA and other clinicopathological factors of ovarian carcinomas to detect the usefulness of Glut-1 expression in the diagnosis and prognosis of ovarian epithelial tumors.

## **Material And Methods:-**

### **Patients and clinical data:-**

The present study was performed at the Departments of Pathology, Obstetrics and Gynecology, and Surgery, Zagazig University Hospital, Egypt in the period from May 2015 to November 2016. The study included 7 patients with benign tumors, 10 patients with borderline tumors and 28 patients with malignant tumors. Complete surgical staging that includes total abdominal hysterectomy, bilateral salpingo-oophorectomy, omentectomy, peritoneal washing with cytology and appendectomy for mucinous neoplasms was performed. Conservative surgery that includes either (ophorectomy, unilateral salpingo-oophorectomy or cystectomy) was performed for young aged

patients with apparently benign neoplasm by radiological and clinical data and patients with stage I (with no peritoneal implants) borderline neoplasm who wish to preserve their fertility. For patients with advanced stage disease, cytoreductive surgery was performed.

We collected the clinical and pathological information from the medical records of the patients. All the patients did not receive chemotherapy or radiation prior to the surgical interference. Tumors were staged according to the FIGO (The International Federation of Gynecology and Obstetrics staging system) [23]. Histological typing and grading have followed the World Health Organization classification (WHO) criteria [4]. The ethical committee of Zagazig University approved this study and all patients wrote a consent of agreement prior to their inclusion in this study. All tissue samples were formalin-fixed and paraffin-embedded, the blocks were cut at 4-5 microns and stained with ordinary H&E stain to diagnosis and grade the tumors.

#### **Immunohistochemical staining:-**

The sections (4–5  $\mu$ m) cut from the corresponding tissue sample blocks were deparaffinized with xylene, placed in graded alcohols for rehydration, and deposited in 0.5% hydrogen peroxide in methanol for 10 min to stop endogenous peroxidase activity. Antigen retrieval was achieved by keeping in 0.01 M citrate buffer (pH 6.0) for 5 minutes in a pressure cooker. The primary antibodies were added to the sections at room temperature for 60 min. Then strept avidin-biotin-peroxidase complex technique was applied for Glut-1 (Rabbit Polyclonal Antibody, Dilution 1:200, catalog no. PA1-1063 Thermo Fisher Scientific/Lab Vision Corporation, Rockford, USA.) and PCNA (Mouse monoclonal antibody, clone PC10, Dilution 1:50, catalog no. MA5-11358, Thermo Fisher Scientific/Lab Vision Corporation, Rockford, USA.) by utilizing diaminobenzidine (DAB) as the chromogen. RBCs were used as internal positive control for Glut-1 and breast carcinoma were used as positive control for PCNA. Negative controls for both markers were performed by excluding the primary antibody.

#### **Evaluation of immunohistochemical staining:-**

Glut-1 expression was considered positive only if membrane staining is present. The expression was semi-quantitatively evaluated by analyzing the intensity and the percentage of stained cells. The intensity was scored as 0 (negative), 1+ (weak), 2+ (moderate), and 3+ (strong). A combined score depending on the intensity of staining and the proportion of stained cells was applied as the final score as follow: Low expression was defined as an intensity of 1, 2, or 3 and < 10% stained cells or an intensity of 1 and < 50% stained cells; and high expression was defined as an intensity of 2 or 3 and > 10% stained cells or an intensity of 1, 2, or 3 and > 50% stained cells [24]. Finally for statistical evaluations we have 3 groups, negative, low expression and high expression groups.

PCNA was considered positive if there was any brown nuclear staining present. To assess proliferation, the PCNA labelling index (PCNA LI), was calculated following the previously described method by Ino et al. [6]. The PCNA LI was defined as the number of tumor cells with nuclear PCNA immunostaining divided by the total number of tumor cells, and expressed as a percentage. A total of 1000 nuclei in the selected area were counted under a light microscope at high magnification (X 400 fields) and the mean percentages were recorded as the PCNA LI. For statistical evaluation, tumors with a PCNA LI  $\geq$  50, were considered as high proliferative index group, while cases with a PCNA LI of < 50 were defined as low proliferative index group.

#### **Statistics:-**

The results from the continuous variables analysis were expressed as a means  $\pm$  standard deviation (SD). Categorical data analysis was performed using the  $\chi^2$  or Fisher's exact test, spearman correlation was done to detect and measure the correlation between Glut-1 and PCNA. The statistical analyses were done using SPSS software (version 19.0; SPSS, Chicago, IL) and  $P \leq 0.05$  was regarded as indicator of a statistically significant difference.

#### **Results:-**

##### **Clinicopathological results:-**

The mean age of the studied 45 ovarian tumor patients at initial surgery was  $53.16 \pm 12.01$  years (range 23- 72 years). Among these 45 patients, 7 (15.55%) cases were benign cystadenomas, 10 (22.22%) cases were borderline, and 28 (62.22%) cases were malignant (invasive) carcinoma. Serous type was the predominant histological type (62.22%, 28/45) among all the studied benign, borderline and malignant tumors (Fig. 1). Grading of the studied 28 ovarian carcinomas according to WHO grading system revealed that G1 was the most frequent grade of the studied ovarian carcinoma (53.57%, 15/28), while staging of ovarian carcinomas according to FIGO staging system revealed that the majority of carcinomas (60.7%, 17/28) were diagnosed at advanced stage (Stage III-IV). Lymph node metastases, intraperitoneal implants and ascites were detected in 35.71% (10/28), 57.14% (16/28) and 75%

(21/28) respectively of the studied ovarian carcinomas. All ovarian carcinoma patients' clinicopathological variables are outlined in Table 1.

#### Immunohistochemical expression of Glut-1:-

Glut-1 membranous immunoreactivity was detected in 80% (8/10) and 92.85% (26/28) of the studied borderline and invasive carcinomas respectively and showed progressively more increase in staining intensity in invasive tumors as compared to borderline tumor. Glut-1 immunoreactivity was absent in all the studied benign ovarian tumors (Fig. 2, a, c. Fig. 3, a, c). These differences in Glut-1 expression among the studied benign, borderline and malignant cases, were statistically highly significant ( $p=0.000$ ) (Table 2). Analysis of Glut-1 immunoreactivity with the clinicopathological criteria of the studied 28 ovarian carcinomas revealed that Glut-1 expression is more intensely expressed in high grades carcinoma (G3) and in tumors with advanced FIGO stage (Stage III-IV) with a significant relationship ( $p=0.043$  and  $p=0.005$  respectively). Glut-1 also tend to be expressed with more intensity in lymph node metastases positive group and those with intraperitoneal implants with statistically significant relationship from the negative groups ( $p=0.011$  and  $0.016$  respectively). However, no correlation was found between Glut-1 immunoreactivity and age of the patient, histological types of the tumor or the presence or absence of ascites. ( $p>0.05$ ) (Table 3).

#### PCNA immunoreactivity and the result of correlation analysis between the expression of Glut-1 and the expression of PCNA (PCNA LI) among the studied 45 ovarian epithelial tumors:

PCNA positive immunoreactivity was detected as brown nuclear staining (Fig. 2, b, d. Fig. 3, b, d). Calculation of PCNA labelling index revealed that 37.77% (17/45) of cases had PCNA LI  $\geq 50$ . Based on the correlation analysis between the results of the expression of Glut-1 and the tumor proliferative marker PCNA LI, a significant strong positive correlation was found between the expressions of the two markers among the studied 45 epithelial ovarian tumors (Spearman correlation ( $r$ ) = 0.603,  $p$  value= 0.000) (Table 4).

(d) The previous high grade adenocarcinoma showing strong nuclear PCNA immunoreactivity (PCNA LI> 50). (X 400).

### Discussion:-

Glut-1 is a prototype of the Glut family and is widely distributed in normal tissues including RBCs [25]. Studies on ovarian cancer have suggested that Glut-1 is overexpressed and correlated with tumor aggressiveness and poor prognosis [15, 26]. PCNA is a validated specific cellular proliferative marker. In the cell cycle, it is expressed in the cellular nuclei during the phase of DNA synthesis. It is suitable for estimation of different tumors and benign lesions with proliferative potential [27]

In the present study, we examined the immuoexpression of Glut-1 in 45 ovarian epithelial tumors, including 7 benign cystadenomas, 10 borderline tumors and 28 ovarian carcinomas. We correlated the Glut-1 expression with the expression of tumor proliferative marker PCNA and with other clinicopathological factors of the ovarian carcinoma to detect the usefulness of Glut-1 expression in diagnosis and prognosis of ovarian epithelial tumors.

Our analysis revealed that serous type was the predominant histological type (62.2%, 28/45) among all the studied benign, borderline and malignant ovarian neoplasms. This is closely similar to the study of Choetal. [28], they reported 59.32% (35/59) serous type among their studied ovarian neoplasms.

Grading of the studied 28 ovarian carcinomas, revealed that 53.57% (15/28) of carcinoma were G1. This is in agreement with previous related studies [29, 30], while staging revealed that 60.7% (17/28) of ovarian carcinomas were at stage III - IV. These results revealed that most of ovarian carcinomas are diagnosed at an advanced stage, this is in concordance with many previous related studies [31, 32].

In the present study, analysis of Glut-1 expression among the studied 45 ovarian tumors, revealed that Glut-1 staining was absent in all benign ovarian tumors, and showed progressively more staining in invasive tumors as compared to borderline tumors. These differences in Glut-1 expression among the studied benign, borderline and malignant tumors, were statistically highly significant ( $p=0.000$ ). These findings are in concordance with many previous related studies [15, 16, 26, 28, and 33].

Also, Ma et al [34] reported nearby results on endometrium, where there was a progressive increase in the expression of Glut-1 among normal, hyperplastic and endometrial carcinomas (3.3%, 25.0% and 70.0% respectively). However, in contrast to our finding, Iida et al. [35], reported Glut-1 expression in 68% of benign tumors, 95% of borderline and in all cases of ovarian carcinomas (100%). These differences in the finding may be due to differences in the cohort number (Iida: 102 ovarian tumors, ours: 45), different staining technique, the use of different primary antibody types and the use of different methods of evaluation of marker immunoreactivity.

Based on our finding that Glut-1 immunoreactivity showed a gradual increase in the staining intensity from borderline to frankly malignant ovarian tumors and absence in benign tumors, we could infer that Glut-1 plays an important role in pathogenesis of ovarian carcinomas by supporting their increased need for glucose metabolism. So, Glut-1 increases the diagnostic accuracy of ovarian tumors by help in differentiating between benign, borderline and malignant tumors. This differentiation is of great significance in planning therapeutic strategy.

In the present study, analysis of Glut-1 immunoexpression with clinicopathological criteria of the studied 28 ovarian carcinomas revealed that Glut-1 expression is more intensely expressed in high grade carcinomas with a significant relationship ( $p=0.043$ ). This observation was in concordance with many previous related studies [15, 28, 33, and 36], they reported that poorly differentiated tumors tend to significantly overexpress Glut-1 compared to well and moderately differentiated tumors. Moreover, Centuria et al [15] concluded that tumors with overexpression of Glut-1, had more possibility to get benefit from chemotherapy, so Glut-1 may play a role not only in diagnosis but also it is an independent prognostic factor which determine the response to therapy.

However, in contrast to our finding, Kim et al. [37] did not find any statistical relationship between the grade of ovarian carcinoma and the expression of Glut-1. This difference may be due to the different immunohistochemical clones, different technique used, different cohort number and difference in the selection criteria. This indicates further study on a larger cohort.

Our finding that high grade tumors tend to overexpress Glut-1 than low grade tumors may be due to increase demand for glucose uptake in poorly differentiated tumors. So we could infer that Glut-1 plays a role in tumor differentiation, as well as supplying energy to rapidly proliferating tumor cells. Furthermore, analysis of Glut-1 expression among the studied ovarian carcinomas, detected that Glut-1 tend to be expressed more intensely in tumors with advanced FIGO stage (Stage III-IV) with a statistically significant relationship ( $p=0.005$ ). This is consistent with many previous related studies [24, 28, 33, 36, and 37].

Glut-1 also tends to be expressed with more intensity in lymph node metastases and intraperitoneal implants positive groups with statistically significant relationship from the negative groups ( $p=0.011$  and  $0.016$  respectively). This is consistent with the finding of Cai et al [16], and also consistent with Zhao et al [36] who found that Glut-1 staining was positively correlated with the cancer invasion and lymph node metastasis. The correlation of Glut-1 expression with the grade and stage of studied ovarian carcinomas and with lymph node metastasis and intraperitoneal implants can spotlight on its advantage as prognostic marker in targeted therapy

In the present study, a significant strong positive correlation was detected between the expressions of Glut-1 and the expressions of tumor proliferative marker PCNA among the studied 45 ovarian epithelial tumors (Spearman correlation ( $r$ ) = 0.603,  $p$  value = 0.000). This finding is nearly similar to the finding obtained by Mamede et al. [38] who found a significant positive correlation between the expressions of Glut-1 and the expressions of PCNA

(Spearman correlation ( $r$ ) = 0.58,  $P < 0.01$ ) among the studied pulmonary malignant lesions (41 primary lung cancers and 5 pulmonary metastatic lesions). This finding is also consistent with the finding of Zhao et al. [36] who reported that the score of PCNA was significantly higher in malignant ovarian tumors with strong Glut-1 staining, but this relationship was not significant with moderate and low Glut-1 staining. This difference may be due to the usage of different immunohistochemical clones and technique and different method of interpretation of markers immunoreactivity.

Our finding that there was a strong positive correlation between Glut-1 and tumor proliferative marker PCNA among our studied cases, indicates that tumors with high proliferative activity, need a comparable increase in glucose uptake to have sufficient energy for rapid cellular division.

This supports that both markers play important role in the progression of epithelial ovarian carcinoma and further support their value as a predictive marker of poor prognosis in targeted therapy.

**In conclusion,** Glut-1 increasing the diagnostic accuracy of ovarian tumors by help in differentiating between benign, borderline and malignant tumors. This differentiation is of great significance in planning therapeutic strategy. The correlation of Glut-1 expression with poor prognostic factors such as high grade, advanced stage, lymph node metastasis and intraperitoneal implants can spotlight on its advantage as prognostic marker in targeted therapy together with PCNA which showed high strong correlations with Glut-1 among the studied epithelial ovarian tumors.

### Abstract

The performance of medical students is influenced by both personality characteristics and positive psychological capital. The aim of the current study was to examine the relationship between Big Five Personality traits and PsyCap among final year medical students and secondly, to determine whether Big Five personality traits hold predictive value for PsyCap of final year medical students. Participants for this study were 200 (90 males and 110 females) final year MBBS students pursuing their course in a Government Medical College of Jaipur City. PCQ-24 (Luthans, Avolio and Avey, 2007) and Big Five Inventory (John & Srivastava, 1999) were used to measure PsyCap and personality traits respectively. Results of bivariate associations showed that overall measure of psychological capital (PsyCap) was significantly related to all of the personality traits, except for conscientiousness. By means of multiple regression analysis, the findings revealed that Extraversion and Agreeableness were significant predictors of PsyCap. Implications of these findings are discussed.

### Introduction:-

The study of medicine is a long and laborious process of five and a half years. The personality and psychological capital strength of medical students is an important determinant of their successful accomplishment of the course. The prevalence of anxiety, depression and burnout increases during their graduation program. Numerous studies have examined potential risk factors that pose a threat to students' mental health. These potential risk factors are workload, competition, sleep deprivation, lack of social support and the suffering and dying of patients which contribute to medical students' stress and their deteriorating mental health. One of the important steps would be identifying positive human resources such as hope, resilience, self-efficacy, optimism, hardiness, sense of coherence and personality factors such as agreeableness, conscientiousness, openness etc. in medical students to promote good health. The ability to solve problem, critical thinking, strong communication skills and integrity are some of the important factors in medical training followed by residency and professionalism. As a positive psychological resource, PsyCap tends to improve academic performance as well as contributes to personality development in medical students. Big five factors i.e. Extraversion, Openness to experience, Conscientiousness, Neuroticism and Agreeableness, success, adjustment, physical as well as psychological health are important in ensuring their suitability for medical schools since they are future doctors. Therefore, there is an important need to

Address:- Research Scholar, Department of Psychology, Manipal University Jaipur, Rajasthan, India.

assess the personality and psychological capital strength of Indian medical students as there is a dearth of research done on this aspect. Medical students have to balance the pressure of academics and clinical experience.

Hence, the objective of this study is to assess the big five factors and PsyCap in Final Year MBBS students and further explore the relationship between Big Five Personality factors and components of PsyCap.

Psychological Capital (PsyCap) is defined as study and application of positively oriented human resource strength and psychological capacities (Luthans & Youssef, 2004). In terms of positive organizational behaviour, PsyCap acts as interventional model for employees and organization. PsyCap consists of four state-like psychological resource capacities of self-efficacy, hope, optimism and resilience which are measurable and open to development. Self – efficacy is defined as individual's positive belief about one's ability when confronted with difficult tasks. Hope refers to positive motivational state strengthening individual's perseverance in the path of desired goal and success. Resilience is identified as bouncing back in the time of adversity or positive state that goes beyond failure to attain success. Optimism refers to positive aspect regarding self - attribution towards goal achievement (Luthans, Avolio, Avey & Norman, 2007).

The Big Five personality traits are five broad domains or dimensions of personality that are used to describe human personality, the five-factor model. Openness to experience refers to Appreciation for art, emotion, adventure, unusual ideas, curiosity, and variety of experience. Conscientiousness refers to tendency to be organized and dependable, show self-discipline, act dutifully, aim for achievement, and prefer planned rather than spontaneous behaviour. Extraversion refers to Energy, positive emotions, assertiveness, sociability and the tendency to seek stimulation from others. Neuroticism refers to the tendency to experience unpleasant emotions easily, such as anger, anxiety, depression, and vulnerability.

Researchers have shown that performance of both Malaysian medical students and doctors is influenced by certain personality traits such as agreeableness, openness and conscientiousness. There was a positive significant association of agreeableness, openness and conscientiousness with respect to academic achievement in a cross – sectional study of medical students studying in seven universities. Furthermore, significant gender differences were reported in which females scored high in openness, agreeableness and conscientiousness as compared to males (Mustaffa et al., 2012).

Personality traits such as conscientiousness denote learning habits that are considered to be favourable to academic achievements, namely hardworking, responsible, and self-discipline (Chamorro Premuzic & Furnham, 2003a; Chamorro Premuzic & Furnham, 2003b; Gray & Watson, 2002; Laidra et al., 2007; Lieven et al., 2002; Nofle & Robins, 2007). A study by Mirsaleh et al. (2010) showed that there was a positive correlation between openness and conscientiousness in medical students and negative correlation between neuroticism and satisfaction with clinical training. Klasner and Pistole (2003) discovered the influence of personality and social support in adjustment process in medical students. The big five factors except neuroticism significantly associated with mental health, coping and academic stress.

In terms of academic achievement in medical school, Ferguson et al. (2000) and Lievens et al. (2002) found that conscientiousness is a significant predictor of academic success. Studies on success in medical studies and personality have reported that high scores in conscientiousness and low scores in neuroticism are associated with success (Barrick & Mount, 1991; Salgado, 1997). Tanoff (1999) through his research concluded that neuroticism is a primary factor, in determining job satisfaction. Further, Connolly and Viswesvaran (2000) asserted that neuroticism was negatively associated with job performance among employees.

Openness to experience has been found to significantly correlate with academic achievement in medical students. Further, poor personality traits and negative coping styles appear to play a role in the physical and psychological health of medical students (Wang & Miao, 2009).

Multon, Brown and Lent (1991) concluded their meta-analysis and found academic self-efficacy is more predictive than general self-efficacy in educational context. Besides, researchers also conducted academic resilience scales in educational studies (Martin & Marsh, 2006). Therefore, this study re-combined the four components of PsyCap for educational application with academic self-efficacy, optimism, hope, and academic resilience.

A study by Khan et al. (2011) among undergraduate students of different universities of Kuala Lumpur concluded that positive psychological capital and big five personality traits were found to be significantly related to coping mechanisms except neuroticism. High extraversion, openness & conscientiousness individuals engaged in more problem-focused coping. Therefore, personality factors and positive psychological capital has emerged as important constructs for detecting coping mechanisms.

In Indian context, there is a dearth of research on PsyCap in medical students, henceforth, in the light of above concerns, the present study aims to examine big five personality factors and PsyCap in Final Year MBBS students and further investigate the relationship between PsyCap (i.e. Hope, Resilience, Optimism and Efficacy) and big five personality traits (i.e. Extraversion, Openness to experience, Conscientiousness, Neuroticism and Agreeableness) in medical students.

## Methods:-

### Sample:-

This study comprised of 200 (90 males and 110 females) final year MBBS students studying in SMS medical college in Jaipur, Rajasthan in the age range of (20-25 years) and their mean age is 23.19 years.

## Materials:-

### Proforma:-

Information about the demographic details such as age, gender, year of study, etc. were obtained from each student who participated in the survey

**Psychological Capital Questionnaire** (Luthans, Youssef & Avolio, 2007) - PCQ was developed by Luthans, Avey and Avolio in 2007. It measures PsyCap and comprises four subscales, namely, hope, optimism, resilience and self – efficacy. The PCQ is a self - report 24 item questionnaire. Each subscale is comprised of six items and assessed on a six-point Likert scale with the response options: 1 – strongly disagree, 2 – disagree, 3 – somewhat disagree, 4 – somewhat agree, 5 – agree, 6 – strongly agree. The resulting score represents an individual's level of PsyCap.

**Big Five Inventory** (John & Srivastava, 1999) – BFI was developed by John and Srivastava in 1999. It measures big five personality traits namely extraversion, conscientiousness, Neuroticism, Openness and Agreeableness. The BFI is a self - report questionnaire and has 44 items measured on a 5- point Likert scale ranging from 1 (Strongly disagree) to 5 (strongly agree). Alpha reliabilities were reported as follows: .87 for Extraversion, .79 for agreeableness, .81 for Conscientiousness, .82 for Neuroticism and .79 for Openness to Experience.

### Procedure:-

Participants were recruited from MBBS section of Government medical college. PsyCap questionnaire and Big Five Personality Inventory were administered among 200 respondents in their medical college. Demographic information was collected through questionnaires. Instructions were given to the respondents before administration of the scale. For data analysis, SPSS version 21 was used for descriptive analysis (mean, standard deviation) of the data. Pearson Product Moment Correlation was used to investigate the relationship of PsyCap to Big Five Personality factors, furthermore, hierarchical multiple regression analysis was used to identify significant predictors of PsyCap and its components.

## Results:-

Table 1 lists the means and standard deviations of the study variables, as well as the partial correlations between these variables. These bivariate associations show that the overall measure of psychological capital (PsyCap) was significantly related to all of the personality traits, except for conscientiousness. The means regarding PsyCap and its components i.e. hope, resilience, efficacy and optimism of final year medical students were 4.47, 4.61, 4.25, 4.68 and 4.32 respectively. These means indicate higher levels of self – efficacy and hope and average level of overall PsyCap, Resilience and optimism. Table 1 also indicates that among the five personality factors (i.e. Openness to experience, Conscientiousness, Extraversion, Agreeableness and Neuroticism), Overall PsyCap has significant positive association with Agreeableness (.358,  $p < .01$ ) and Extraversion (-.214,  $p < .05$ ). Furthermore, the components of PsyCap were also significantly associated with big five factors of personality. Hope was significantly associated with Agreeableness (.202,  $p < .01$ ) and negatively associated with Neuroticism (-.431,  $p < .05$ ). Efficacy had significant positive relationship with Extraversion (.244,  $p > .01$ ), Agreeableness (.260,  $p < .05$ ) and Neuroticism

(-.432,  $p < .05$ ). Similarly, Resilience had significant positive correlation with Agreeableness (.307,  $p < .05$ ) and Extraversion (.228,  $p < .01$ ). Optimism was significantly associated with Agreeableness (.439,  $p < .05$ ), Conscientiousness (.201,  $p < .01$ ) and openness to experience (.326,  $p < .05$ ).

By means of hierarchical linear regression analysis, significant linear relationships were identified between big five personality factors and overall PsyCap. Table 2 clearly indicates that Extraversion ( $\beta = .382$ ,  $t = 3.858$ ,  $p = .000$ ) and Agreeableness ( $\beta = .449$ ,  $t = 6.390$ ,  $p = .000$ ) were significant predictors of PsyCap,  $F(5, 194) = 13.745$  ( $p < .000$ ).

### Discussion:-

The main objective of this study was to explore the relationship between PsyCap and Big Five Factors of Personality among Final year MBBS students. On the basis of relationship between PsyCap and Personality factors, it was observed that the facets of PsyCap namely Hope, Efficacy, Optimism and Resilience are significantly associated with Agreeableness, Neuroticism, Extraversion, Conscientiousness and Openness to Experiences. This demonstrates that medical students high on traits such as Agreeableness and Extraversion tends to have stronger PsyCap levels. People who are high in this trait tend to exhibit positive experiences in social situations and are helpful, cooperative, caring and being affectionate. In comparison to other non – medical streams like engineering, law, mass media and architecture, the personality domains vary from person to person.

With respect to components of PsyCap, this study shows that the medical students have higher levels of Hope and Efficacy which indicates that they are persistent in goal attainment in academics as well as clinical practise. Similar findings were reported in meta-analytic study by Multon(1991) on PsyCap as a predictor of Academic performance in different educational contexts. With respect to the five personality factors, Agreeableness is having significant positive relationship with overall PsyCap and components of PsyCap, i.e. Hope, Efficacy and Optimism

respectively. Agreeableness trait has an interpersonal dimension which means that medical students are empathetic and like to help others (Costa & McCrae, 1992).

Results also showed that Neuroticism has scored lowest in medical students and is having significant relationship with overall PsychCap as well as four facets of PsychCap. In a comparative study by Mustaffa et al. (2012), similar results were observed in which personality traits were examined based on year of the study of MBBS students and Fifth year students scored lowest on neuroticism as compared to first, second, third and fourth year students. In this regard, low scores on Neuroticism implies that fifth year students were more emotionally stable and less impulsive.

In addition, it can be a very good development since medical doctors need to not only deal with patients but also their families and the general public. It is very important for the doctors to always be very careful, patient, and able to control their emotions especially when faced with critical and crisis situations. They also need to be calm and have strong coping abilities.

The limitation of this study is that the data are based on subjective evaluations of final year medical students and due to uneven sample ratio of gender i.e. Male(70%) and Female(30%), gender differences were not investigated with respect to personality traits and PsychCap.

This study indicates the need to investigate predictors with respect to PsychCap and Personality traits in medical students using Regression Analysis and identify positive psychological resources in different groups of Non – Medical streams in view of promoting stress management, mental health promoting programs among students.

### Conclusion:-

The results of this study revealed significant associations of Agreeableness and Extraversion with overall PsychCap in final year medical students. It is concluded by analysing various literatures that, few studies have investigated the relationship between both big five personality factors and PsychCap for training and interventional aspect that would be helpful in medical training and clinical experience as doctors. Especially in medicine sector, the examination of positive psychological capacities with Big Five Personality dimension will lead to better understanding of medical profession and the basic personality profile will help them choose their specialisation and foster their professional life.

#### Abstract

*In vitro* antibacterial screening of bacterial strains isolated from marine invertebrates, collected from the Moroccan Atlantic coast, against human pathogenic bacteria was conducted in this study. However fourteen marine microorganisms were tested against three Gram-positive bacteria (*Staphylococcus aureus*, *Bacillus sp.* and *Enterococcus faecalis*) and three Gram negative bacteria (*Escherichia coli*, *Pseudomonas fluorescens* and *Pseudomonas sp.*) using the agar disk-diffusion and the agar cylinders methods. The identification of the isolates shows that are belong to the genera *Enterobacter*, *Morganella*, *Aeromonas*, *Pantoea*, *Kluyvera*, *Raoultella*, *Stenotrophomonas*, *Pseudomonas*, *Sphingomonas* and *Staphylococcus* which indicates a diversification in the marine microflora. The evaluation of antibacterial activity of these isolates on human pathogenic bacteria shows that all strains are active against at least one pathogen studied for the two used methods. For the agar cylinders method, six isolates are showing a significant antibacterial activity with inhibition zone diameters greater or equal to 15 mm (*Aeromonas sobria*, *Enterobacter cloacae*, *Stenotrophomonas maltophilia*, *Staphylococcus capitis*, *Pantoea sp3* and *Raoultella ornithinolytica*). For the agar disk-diffusion method, among 28 extracts of the marine isolates, five extracts which are active against two pathogenic bacteria (*Pseudomonas sp* and *Enterococcus faecalis*) with inhibition zone diameters greater or equal to 15 mm (two ethanol extract of *Enterobacter cloacae*, ethanol extract of *Raoultella ornithinolytica*, ethanol extract of *Morganella morganii* and ethanol extract of *Aeromonas sobria*). By comparing the two used methods we can conclude that the agar cylinders method gave better results compared to the agar disk-diffusion method.

## Introduction:-

Among benthic animals, soft-bodied, sessile animals have concentrated most of the interest in pharmaceutical studies. The toxic chemicals are crucial for invertebrates lacking morphological defence structures such as shells or spines (De Rosa, 2002; Blunt et al., 2008). Indeed, sponges are the most prolific marine producers of novel compounds in terms of new metabolites reported annually (Taylor et al., 2007; Menna, 2009). Furthermore, more sponge-derived compounds are in clinical and preclinical trials (e.g., as anticancer or anti-inflammatory agents) than compounds from any other marine taxa (Taylor et al., 2007; Menna, 2009). A wide variety of novel secondary bioactive metabolites have been isolated from various species of marine sponges world-wide, including powerful antiviral, antimalarial, antitumour and anti-inflammatory, as well as antimicrobial (antibiotic) compounds (Faulkner, 2002). Marine-based microorganisms are also a potential source of new medicines. However, the successes to date are based upon a very limited investigation of these microorganisms in few areas of the world oceans (Pushparaj et al., 1998), suggesting a high potential for continued discovery of new drugs from these microbes (Board, 2002). Accumulated evidence also suggests that microorganisms living in the body of sponges could well be the true source of at least some of these metabolites found in Mediterranean sponges (Thiel et Imhoff, 2003) and in other species from other oceans (Anand et al., 2006; Taylor et al., 2007). Marine sponges often contain diverse and abundant microbial communities, including bacteria, microalgae, and fungi. In some cases, these microbial associates comprise as much as 40% of the sponge volume and can contribute significantly to host metabolism via e.g. photosynthesis or nitrogen fixation (Taylor et al., 2007). Many antimicrobial, antifouling substances have been found among these kinds of bacteria due to the specialized role they play in their respective hosts (Burgess et al., 1999; Holmstrom et al., 2002). It is suggested that the primary role of these antibiotic substances could be related to ecological competition (Zheng et al., 2005). In the present work, we have studied antibacterial activity of isolated marine bacteria associated with same invertebrates belonging to the Moroccan Atlantic coast.

## Material and Methods:-

### Biological materials:-

The marine sponges (*Haliclona viscosa*, *Cliona viridis*, *Ircinia spinulosa* and *Paraleucilla magna*) and the sea cucumber were collected from the littoral Atlantic of El-Jadida (Morocco) at a depth ranging from 3 to 10 m. After sampling, the samples were cleaned, photographed, washed with sea water and immediately transported to the laboratory. The sponges *Haliclona viscosa*, *Cliona viridis* and *Ircinia spinulosa* were identified by Dr. Maria-Jesús Uriz, Research Professor at the Centro de Estudios Avanzados (El Amraoui et al., 2010), while the sponge *Paraleucilla magna* was identified by Dr. Paco Cardenas, Researcher at Evolutionary Biology Centre, Uppsala University, Department of Systematic Biology, Norbyvägen 18D 752 36 UPPSALA, SWEDEN and Dr. Michelle Klatau from Universidade Federal do Rio de Janeiro, Brazil.

### Isolation and identification of microorganisms:-

1 cm<sup>3</sup> of each marine organism was sampled using a sterile scalpel, ground in a sterile mortar in the presence of sterile physiological water, and inoculated on the culture media. After inoculation, the dishes are incubated in an oven at 35 ± 2 °C for 24 hours. Several subcultures were conducted to obtain pure culture.

The identification of marine microorganisms was carried out at the Maghreb laboratory, Rabat (Morocco) to the following protocol: the Gram-positive or Gram-negative bacterial differentiation was carried out by the Gram staining. The Gram-positive bacteria are tested for catalase whereas Gram-negative bacteria undergo the oxidase test, and there-after, according to the results of biochemical tests, a type of gallery is used. Galleries "ID32 STAPH" are used for Gram (+), catalase (+), galleries "ID32 STREP" for Gram (+), catalase (-). Whereas galleries "ID32 GN" for Gram (-), oxidase (+) and galleries "ID32 E" are used for the Gram (-), oxidase (-). Galleries and results are analyzed using an identification device "ATB Expression 2000 SYSTEMS bioMérieux VITEK" linked to the computer.

### Antibacterial activity of isolated microorganisms:-

Antibacterial activity of marine microorganisms was estimated by the agar cylinders and the agar disk diffusion methods against three Gram-positive bacteria (*Staphylococcus aureus* ATCC25923, *Bacillus sp.* CIP104717 and *Enterococcus faecalis* ATCC19433) and three Gram-negative bacteria (*Escherichia coli* CIP54127, *Pseudomonas fluorescens* CAN 228-1 and *Pseudomonas sp.*) using Mueller-Hinton agar medium [bioMérieux® SA]. These

reference strains were obtained from the Collection of Pasteur Institute (CIP), and from the American Type Culture Collection (ATCC). The test pathogens inoculated were prepared by suspending in 10 mL of sterile water the colonies from 18 h culture on Luria Bertani medium. The cell density was determined by a haemocytometer and adjusted to  $10^6$  UFC/mL.

#### **Agar disk diffusion method:-**

The isolated bacteria were cultured in nutrient broth for 7 days then each culture was extracted with ethyl acetate ( $3 \times 100$  ml). The ethyl acetate extracts were combined, dried on anhydrous sodium sulphate ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated at reduced pressure to give an ethyl acetate extract (extract C). The aqueous phases were lyophilised and twice dissolved in absolute ethanol, then filtered and concentrated at reduced pressure to give an ethanol extract (extract B). The extracts (B and C) were tested for their antibacterial activity using agar disk diffusion methods.

6 mm diameter cellulose discs were saturated with 300  $\mu\text{g}$  of extract (B or C) of isolated bacteria then applied on the test media which were previously inoculated with each pathogen strain. Plates were first kept at  $4^\circ\text{C}$  for at least 2 h to allow the diffusion of chemicals, and then incubated at  $37^\circ\text{C}$ . Inhibition zones were measured after 24 h of incubation. Standard disks of the antibiotic tetracycline (30  $\mu\text{g}$ ) and penicillin (10  $\mu\text{g}$ ) served as the positive antibacterial controls. All tests were performed in triplicate.

#### **Agar cylinders method:-**

Isolates were grown on marine agar plates for four days at  $37^\circ\text{C}$ , and then a calibrated cylinder (6 mm in diameter) was cut out and placed on the surface of the test medium (Muller Hinton) previously inoculated with each test strain. Plates were kept first at  $4^\circ\text{C}$  for at least 2 h to allow the diffusion of active metabolites, and then incubated at  $37^\circ\text{C}$ . Inhibition zones were measured after 24 h of incubation.

#### **Results and Discussion:-**

Six microorganisms were identified from the sponge *Ircinia spinulosa* (Sarcotragus), four microorganisms from the sponge *Paraleucilla magna*, one microorganism from the sponge *Cliona viridis*, one microorganism from the sponge *Haliclona viscosa* and two microorganisms from the sea cucumber. The results of identification of microorganisms are summarized in table 1. Identified isolates belong to the genera Enterobacter, Morganella, Aeromonas, Pantoea, Kluyvera, Raoultella, Stenotrophomonas, Pseudomonas, Sphingomonas and Staphylococcus. This shows a diversification in the marine microflora. Isolates species and their antibacterial activity against six pathogen bacteria were reported in tables 2 and 3.

For the agar cylinders method (Table 2), the results show that all strains (14 isolates) have antibacterial activity against at least one out of six test pathogens studied.

Four microorganisms of the genus Enterobacter are of the same species (*Enterobacter cloacae*). Three of them, Cv, Is<sub>4</sub> and Pm<sub>4</sub>, were isolated from marine sponges (*Cliona viridis*, *Ircinia spinulosa*, *Paraleucilla magna*) while Sc<sub>1</sub> was isolated from Sea cucumber. The four isolates show significant antibacterial activity but only Sc<sub>1</sub> and Pm<sub>4</sub> haven't antibacterial activity against *Pseudomonas fluorescens*. Two microorganisms of the genus Aeromonas are of the same species (*Aeromonas sobria*). One of them, Sc<sub>2</sub>, was isolated from Sea cucumber while Is<sub>1</sub> was isolated from marine sponge *Ircinia spinulosa*. The two isolates show significant antibacterial activity but only Sc<sub>2</sub> haven't antibacterial activity against *Pseudomonas fluorescens*. This strain has a very high potential resistance against the antibacterial action of the majority of microorganisms.

ND: not determined; —: no activity; +: inhibition diameter <8 mm.

Among the marine microorganisms, six isolates which are showing a significant antibacterial activity with inhibition zone diameters greater or equal to 15 mm:

- Four isolates were active against *Pseudomonas sp*, *Aeromonas sobria*, *Enterobacter cloacae*, *Stenotrophomonas maltophilia* and *Staphylococcus capitis*;
- one isolate (*Enterobacter cloacae*) was active against *Pseudomonas fluorescens*;
- three isolates (*Aeromonas sobria*, *Pantoea sp3*, and *Enterobacter cloacae*) were active against *Bacillus sp.* ;
- three isolates (*Raoultella ornithinolytica*, *Staphylococcus capitis* and *Enterobacter cloacae*) were active against *Staphylococcus aureus*.

For the agar disk-diffusion method (Table 3), the results show that all isolate have antibacterial activity against at least one out of six test pathogens studied.

All B extracts (14 extracts) of studied marine microorganisms have displayed some activity against at least one out of six test pathogens studied.

Except two C extracts of isolates (*Kluyvera cryocrescens* and *Sphingomonas paucimobilis*) were not active against any pathogens studied.

Among 28 extracts of the marine microorganisms, five extracts which are showing a significant antibacterial activity with inhibition zone diameters greater or equal to 15 mm:

- four extracts were active against *Pseudomonas sp.*, two B extract of *Enterobacter cloacae* (Is<sub>4</sub> and Cv), B extract of *Raoultella ornithinolytica* (Is<sub>5</sub>) and B extract of *Morganella morganii* (Hv);
- four extracts (B extracts of *Aeromonas sobria* (Is<sub>1</sub>), *Enterobacter cloacae* (Is<sub>4</sub> and Cv) and *Raoultella ornithinolytica* (Is<sub>5</sub>)) were active against *Enterococcus faecalis*.

By comparing the two methods used to determine the antibacterial activity of the studied microorganisms against the six test pathogens studied, we can conclude that the agar cylinders method gave better results compared to the agar disk-diffusion method.

It is evident then that marine macro- and microorganisms, living in an environment where competition and predation are the maximum without physical defence structure, defends themselves by producing chemicals to survive. It is found that the sea surface or cavum of marine organisms such as seaweeds and invertebrates are more nutritious than inanimate material and seawater, and a large number of bacteria could live on it (Sponga et al., 1999). These bacteria species are not generally real symbiotic to the host, but they can instead be regarded as associated bacteria (Ponce et al., 1999), and are forced to develop resistance to antibiotics secreted by its host. In fact, they can produce antibiotics and antifungal to inhibit or limit the development and growth of other competitive microorganisms. Several products have been isolated from marine microorganisms with antimicrobial (Romanenko et al., 2007; Charyulu et al., 2009), antifungal (Barsby et al., 2002), antibacterial (Li et al., 2006; Asha Devi et al., 2011), antiviral (Yasuhara-Bell et al., 2010) and cytotoxic (Maskey et al., 2002; Shaaban et al., 2011) activities.

It is evident then that the antibacterial spectra of the active marine bacteria are different (Zheng et al., 2005). This difference comes from the variation of the ecological conditions of the environment of the microorganisms (El-Wahidi et al., 2011). However, some isolates of the same species show a difference in their antibacterial activity. Moreover, molecular studies of these species could provide the answer.

### Conclusion:-

Preliminary results show that marine microorganisms associated to different marine invertebrates have an antibacterial potential. They can also constitute a potential source of new compounds to be used in the field of health. *Aeromonas sobria* (Is<sub>1</sub>), *Enterobacter cloacae* (Is<sub>4</sub> and Cv), *Stenotrophomonas maltophilia* (Is<sub>6</sub>), *Staphylococcus capitis* (Pm<sub>3</sub>), *Pantoea sp3* (Is<sub>2</sub>) and *Raoultella ornithinolytica* (Is<sub>5</sub>) bacteria that exhibit a significant antibacterial activity should be investigated for isolation and identification of natural antibacterials.

### Abstract

The aim of the present study was to apply Bio informatics tools to the proteins expressed in alteration with Bisphenol A. The structure-based computational methods are needed to help, identify and characterize protein-protein complexes and their function. Differentially expressed Proteins were Tryptic digested and were analyzed by MALDI-TOF to identify peptide masses afterward used for MS/MS. For individual proteins, the most successful technique is homology modeling. Based on their mass to charge ratio, the expressed proteins sequences were collected from Mascot search data. The sequences were analysed with the help of Phyre-2 server, RasMol version 2.6 software, BLAST, QMEAN servers, SWISS-PROT, QMEAN servers, STRING and Rampage validation tool.

### Introduction:-

Bioinformatics is the discipline of science in which biology, computer science, and information technology merge to form a single command. A web server for the analysis and comparison of 2D gels using bioinformatics tools has been developed, [1]. Functional analysis and elucidation of large-scale proteomics and gene expression data require effective use of bioinformatics tools and collective information resources coupled with expert-guided examination [2]. Bisphenol-A (BPA), one of many environmental endocrine disrupters, is widely used in polycarbonate plastics, food cans and dental sealants. It is generally believed that consumer exposure to BPA occurs primarily via food in contact with BPA-containing materials, such as polycarbonate baby bottles, table ware and food containers as well as food and beverage cans lined with epoxy resins. Differences in the estrogenic activity of bisphenol A and reference estrogens may be due to differences in recruiting by the liganded receptor of co-regulatory proteins. BPA is thought to bind to plasma proteins in rodents, monkeys and humans [3]. Because pharmacokinetics are altered by protein binding, the potential uptake of BPA into other tissues, including estrogen-target tissues, may be affected. In proteomics ground, combinations of analytical techniques are used to analyse the protein samples. The initial step in all proteomic studies involves the separation of a mixture of proteins. This can be conceded out using 2-D gel electrophoresis technique in which proteins are separated based on their individual molecular weight and charges. Two dimensional gel electrophoresis can retrieve information regarding thousands of different proteins from a crude protein sample. The spots obtained in 2-D gel electrophoresis are separated and subjected to mass spectrometric analysis using MALDI-TOF. MALDI-TOFMS/MS data converted into MGF (Mascot Generic Format). This data can be analysed by using MASCOT server. Mascot is widely used by research facilities around the world. Mascot uses a probabilistic scoring algorithm for protein identification that was adapted from the MOWSE algorithm.

Mascot is a software search engine that uses mass spectrometry data to identify proteins from peptide sequence databases [4]. This sequence is aligned by using alignment tools, sequence alignment is to identify the functional and structural relationship between the sequences [5]. The first step in comparative modelling is to distinguish all protein structures related to the target sequence, some of which will be used as templates. This step is greatly facilitated by databases of protein sequences and structures and software for scanning those databases. The target sequence can be searched against sequence databases, such as Protein Identification Resource (PIR), GENBANK, SWISS-PROT, or EMBO nucleotide sequences database, and/or structure databases such as the Brookhaven Protein Databank and SCOP. The most popular programs, including FASTA and BLAST to compare the target sequence with each sequence in a database Program MODELLER which implements all the stages in comparative modelling [6], can also automatically search for proteins with known three-dimensional structure that are related to a given sequence. QMEAN is a composite scoring function which is able to derive both entire structure and residue of protein error estimates on the basis of one single model [7,8].

### **Experimental:-**

#### **Tissue collection:-**

The hippocampal regions of the brain were dissected and then stored at -80°C until use. The tissue was homogenized on ice with a cold Tris/EDTA buffer and centrifuged at 10,000 g for 20 min at 4°C. Supernatant was collected and processed for protein analysis. [9] About 0.5g of each liver was homogenized in 4.5 ml of phosphate buffered saline. The crude tissue was centrifuged at 8000 g for 30 min and the supernatant was collected and stored at 4°C [10]

#### **2D gel electrophoresis:-**

The samples were loaded on to the IEF strips 3-10pH Linear, 18cm and kept for Iso-Electric Focusing. After IEF run, the strip was equilibrated in Equilibration Buffer and the second dimension was carried out on a 10% SDS-PAGE. The gels were Silver stained to observe the protein spots and were scanned using Epson Expression 11000XL Scanner

#### **MS Analysis:-**

Mass spectrometry is an important emerging method (Model voyager De-STR, applied Biosystems, Foster, CA, USA) for the characterization of proteins from isolated 2-D gel spots as this method is very sensitive. Spot was treated with acetonitrile for dehydration and trypsin for protein digestion.  $\alpha$ -cyano-4-hydroxycinnamic acid in acetonitrile was used as matrix.

#### **MASCOT Search:-**

After MALDI-TOF MS/MS analysis expressed protein data is converted into MGF (MascotGeneric Format). These data can be analysed by using MASCOT server(<http://www.matrixscience.com>). Mascot has three main search modes: Peptide MassFingerprint, Sequence Query, and MS/MS Ion Search. MS/MS Ion Search is used to analyse data from tandem mass spectrometry experiments. The report was generated depending on specific options used for protein analysis. For each protein match, Mascot calculates an overall Protein Score. This number reflects the combined scores of all observed mass spectra that can be matched to amino acid sequences within that protein. A higher score indicates a more confident match. The number of protein matches at each scoring position is indicated by the height of the red bars, the non-significant area is shaded in green. Complete results are automatically sent to the registered E-mail.

#### **Sequence alignment:-**

The target sequence was searched with BLAST search against Protein Data Bank, which one has a high level of sequence identity with target protein selected as a template protein. Templates were determined by super imposition of the two structures and multiple sequence alignment was performed with CLUSTAL W (1.1) program to identify the set of conserved residues alignment.

#### **Homology modeling:-**

The sequences were analysed with the help of Phyre-2 (protein Homology/analogy Recognition Engine V 2.0) server for obtaining pdb file. The final 3-D structure obtained with the help of RasMol version 2.6 software programme.

**Ramachandran plot analysis:-**

Ramachandran plot displays the phi and psi backbone conformational angles for each residue in a protein. The phi angle is the angle of right-handed rotation around N-C $\alpha$  bond and the psi angle is the angle of right-handed rotation around C $\alpha$ -C bond. Phi and psi angles are also used in the classification of some secondary structure elements such as alpha helix and beta turns. In a Ramachandran plot, the core or allowed regions indicate preferred areas for psi/phi angle pairs for all residues in a protein. If the determination of protein structure is reliable, most pairs will be in the favoured regions of the plot, some pairs will be in the allowed region, and only a few will appear in 'disallowed' regions

**QMEAN analysis for the quality resolution structure:-**

The QMEAN scoring function estimates the global quality of the models on the basis of a linear combination of six structural descriptions, four of them are statistical potentials of mean force. The local geometry is analysed by a torsion angle potential over three consecutive amino acids. The distance –dependent interaction potentials based on C $\beta$  atoms and all atoms, respectively are used to assess long-range interactions. A solvation potential describes the burial status of the residues. The analysis of these Z-scores of the individual terms can help identifying the geometrical features responsible for an observed large negative QMEAN Z-score. Models of low quality are expected to have strongly negative Z-scores for QMEAN but also for most of the contributing terms. Large negative values correspond to red regions in the colour gradient. Good structures are expected to have all sliders in the light red to blue region. The quality of resolution structure of differentially expressed proteins under control, bisphenol and bisphenol with probiotic treated samples represented in the following figures

**Analysis of physico-chemical parameters of a sequence:-**

ProtParam is one among the protein analysis tool available on the ExPasy server. (<http://www.expasy.org/tools/protparam.html>). It is used for calculating various physiochemical parameters of a provided protein. The protein can be either is specified as a UniProtKB/Swiss-Prot accession number or ID or as sequences of amino acids.

**String analysis of differentially expressed proteins:-**

The database STRING is a precomputed global resource for the exploration and analysis of these associations. Since the three types of evidence differ conceptually, and the number of predicted interactions is very large, it is essential to be able to assess and compare the significance of individual predictions. Protein–protein interactions are not limited to direct physical binding. Proteins may also interact indirectly by sharing a substrate in a metabolic pathway, by regulating each other transcriptionally, or by participating in larger multi-protein assemblies. For information on genomes, genes, and encoded proteins, STRING relies on the annotated proteomes maintained by SWISS-PROT.

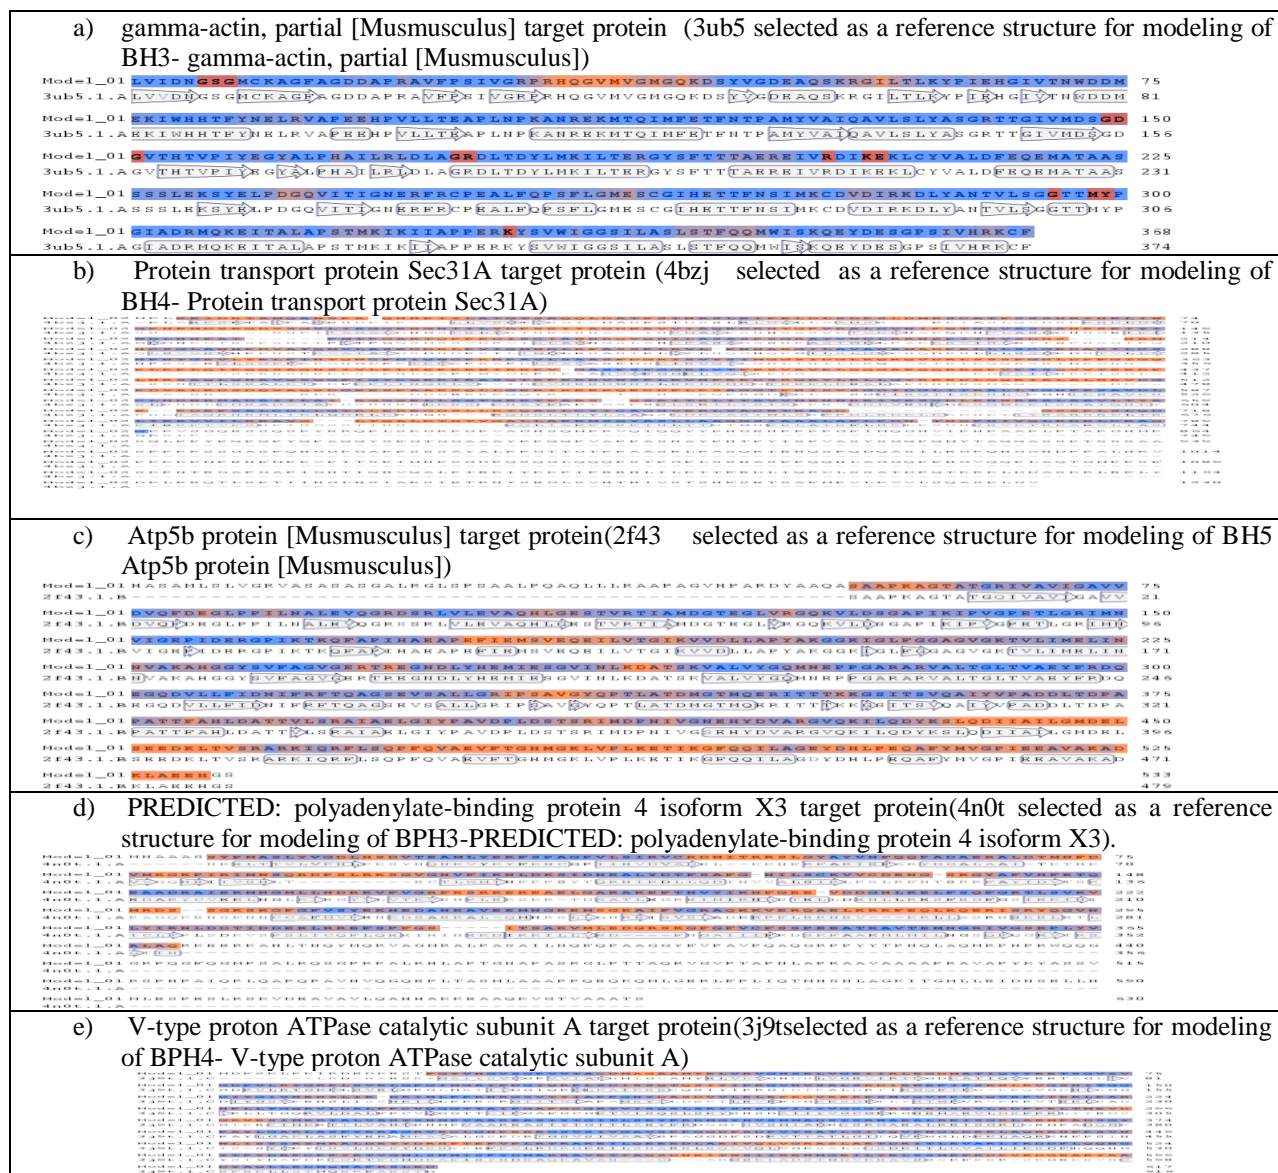

**Results:-**

**Table 1:-** List of differentially expressed proteins of hypothalamus tissue of *Rattus norvegicus* in response to BPA and BPA with probiotic treatment.

Spot no	Protein name	Molecular weight	Calculated pI	Number of amino acids
BH3	gamma-actin, partial [Musmusculus]	41018.9	5.56	268
BH4	Protein transport protein Sec31A	133569.2	6.30	1230
BH5	Atp5b protein [Musmusculus]	56666.8	5.24	533
BPH3	PREDICTED: polyadenylate-binding protein 4 isoform X3	69331.3	9.58	630
BPH4	V-type proton ATPase catalytic subunit A	68326.0	5.41	617

**Table 2:-** List of differentially expressed proteins in liver tissue of *Rattus norvegicus* in response to BPA and BPA with probiotic treatment

Spot no	Protein name	Molecular weight	Calculated pI	Number of Amino acids
BL1384	INSL3_MOUSE, Insulin-like 3	13585.8	9.25	122
BL1500	ATP synthase subunit beta, mitochondrial precursor [Musmusculus]	56300.4	5.19	529
BL1549	Laminin subunit alpha-5 precursor	404053.6	6.28	3718
BPL119	Nucleolar protein 14	98769.4	7.34	860
BPL128	Nuclear protein MDM1	75673.7	9.33	673

**Fig 1:-** Sequence alignment of differentially expressed proteins In hypothalamus induced by Bisphenol, Bisphenol and probiotic treated proteins.

**Fig 12:-** Prot param and string analysis of expressed proteins in Liver tissue response to BPA and BPA+probiotic treatment

In the present study, we have identified the structures and complete protein information regarding 3D structures, atomic configurations, no. of amino acid residues in Ramachandran plot analysis of BPA stressed liver proteins and BPA and probiotic treated Hypothalamus tissue proteins. We were interested in BPA induced proteins in liver as they were over expressed and this over expression in normal cellular metabolism may lead to the diseases.

This protein is a member of the insulin like hormone or protein super family and was first recognized by cloning projects using testicular tissue, hence its original name of Leydig insulin-like peptide [12,13 ] and also expressed in

ovarian theca and luteal cells in females. Although recognized for some time, its function was unknown until 1999 when two groups investigating mice mutants for INSL3 found bilateral cryptorchidism and developmental abnormalities of the gubernaculum [14,15] in males. It is the Newest hormone or protein demonstrated to be involved in abnormalities like:

#### **Testicular descent or cryptorchidism and Gubernacular swelling:-**

INSL3/Leydig insulin-like peptide acts as a ligand and activates the LGR8 receptor (G-protein coupled receptor) present on testes cells, important in testis descent. This LGR8 receptor activation leads to Signalling process and INSL3 peptide continuous signalling or mutation leads to a condition called cryptorchidism in which testicle that doesn't move into its proper position in the bag of skin hanging below the penis (scrotum). In humans, circulating INSL3 increases through puberty, to reach a maximum in early adulthood, and subsequently appears to decline to significantly lower plasma levels in aging men [16, 17]. Recently, it has been suggested [18] that androgens and phthalates at high concentration may modulate Insl3 gene expression in cultured Leydig cells. Caudal enlargement of the gubernaculum during relative transabdominal movement of the testis is known as the "gubernacular swelling reaction" or "gubernacular outgrowth" and is caused by cell division and an increase in glycosaminoglycans and hyaluronic acid (19). The hydrophilic nature of hyaluronic acid makes the end of the gubernaculum bulky and gelatinous. In females over expression of INSL3 induces ovary descent.

#### **Mitochondrial ATP synthase, H<sup>+</sup> transporting F1 complex beta subunit protein:-**

Mitochondrial ATP5B expression in the liver has been shown to be controlled at the post-transcriptional level (and controlling process was found to be induced by miR-127-5p). MiR-127-5p 3'UTR of  $\beta$ -F1-ATPase which shows much expression in fetal liver targets mRNA ( $\beta$ -mRNA) and miR-127-5p inhibits  $\beta$ -F1-ATPase mRNA translation in humans [20]. MiR-127-5p has an important role in regulating the activity of mitochondrial bioenergetics in oncogenesis[21]. ATP5B was found to be up regulated in breast cancer in tissues in a significant manner. Control of translational efficiency of beta-F1-ATPase mRNA depends on the regulation of a protein that binds the 3' untranslated region of the mRNA. miR-127-5p inhibits  $\beta$ -F1-ATPase mRNA translation in humans.

#### **Counter effect on ATP synthase:-**

The agonist of ATP synthase MAb3D5AB1 recognises catalytic  $\beta$ -subunit of ATP synthase and inhibits the activity of F1 domain. Mab3d5ab1 shows angiostatin-like properties and can be useful in the chemotherapy... This protein can even play an important role as a target protein in the treatment of cancers. Using ATP synthase inhibitor aurovertin B, in breast cancer cells MCF-7, the effect of ATP5B protein in tumor progression was found to be reduced. [22].

#### **Laminin subunit alpha-5 precursor protein:-**

This protein contains five, N-terminus, extracellular immunoglobulin domains, a single transmembrane domain, and a short, C-terminal cytoplasmic tail and may play a role in epithelial cell cancer and in vaso-occlusion of red blood cells in sickle cell disease. More recent data indicate a direct participation of the vascular endothelium, of multiple and complex cellular interactions, and of a global inflammation-mediated cell activation, in the initiation and propagation of the vaso-occlusive process with two consecutive steps. The first step involves adhesion of the stress reticulocytes[23] and activated polymorphonuclear neutrophils, (iii) signalling pathways in the red blood cell (the signalling pathways in the red blood cell, makes the cell susceptible to be modulated by stress, hypoxia, and by the inflammatory response and to influence the activation status of adhesion receptors and of ion transporters implicated in SS-RBC dehydration and finally of a syndrome of complex endothelial dysfunction involving abnormalities of the metabolism of nitric oxide (NO) was brought into light to the endothelium of post-capillary venules, slowing down the blood flow and thereby inducing and propagating sickling of mature SS-RBCs that are maintained for a longer time in a hypoxic environment and activates polymorphonuclear neutrophils second step involves the entrapment of irreversible sickle cells and to the complete occlusion of the micro-vessels[24-31]

#### **Conclusion:-**

In our study, we concluded that BPA stressed proteins in liver tissue are involved in certain metabolic disorders like cryptorchidism, Gubernacular swelling, oncogenesis, epithelial cell cancers and Vaso-occlusive process where BPA and probiotic treatment in liver shown production of Nuclear protein MDM1 protein which is a microtubule-binding protein that negatively regulates centriole duplication which binds and stabilizes microtubules in controlling cell duplication process in testis. This negative regulation seems to be to control the cryptorchidism caused by over expressed proteins by BPA in liver.

#### Abstract

Participating in school sports is an important means to increase physical activity among adolescents. While participation in schools can play an important role in increasing physical activity levels, school sports participation alone may not be sufficient to meet the current physical activity recommendations for adolescents. Therefore sports participation should not be seen as a replacement for physical education in schools but rather as a supplement to the solid foundation provided by physical education.

#### Introduction:-

Acne vulgaris is an important health problem among adolescents and young adult. It defined as a polymorphic eruption due to chronic inflammation of the pilosebaceous apparatus characterized by comedones, papules, pustules, cysts and scars that confined to the face, shoulders, upper chest and back.<sup>(1)</sup> The Prevalence of Acne vulgaris varies between 50%<sup>(2, 3)</sup> to 80%<sup>(4, 5)</sup> among different populations in different studies.

Acne vulgaris is also associated with greater physical, psychological and social distresses and the quality of life can be severely affected in sufferers<sup>(6, 7)</sup>. A cross-sectional study conducted in UK among 111 acne patients referred to a dermatologist reported levels of social, psychological and emotional problems were as great as those reported by patients with chronic disabling asthma, epilepsy, diabetes, back pain or arthritis.<sup>(7)</sup>

Despite its high prevalence and the associated negative effects, many people have a lot of wrong beliefs and misunderstandings about their condition.<sup>(2, 8, 9)</sup> Adding to that, a study conducted in Aseer, Saudi Arabia found that there are no major differences in the beliefs, perception and psychological impact of acne patients from a developing society compared to more developed societies.<sup>(10)</sup>

Although Acne represents a common health problem among all age group, however, few studies have been conducted about this important problem among general population in Saudi Arabia.

The objective of the study was to determine awareness and knowledge of acne among adults in Saudi Arabia.

#### Methods:

This is a cross-sectional design included 200 participants. A questionnaire design in

Arabic language was distributed among Saudi population through social media (as twitter and what's up). The Subjects were asked about the knowledge and perception about the causes of acne and psychosocial impact of acne on the individual.

Demographic data, such as age, gender, educational level, and the economic level was included in the questionnaire. Surveys were administered from September to October 2016. Data entry and descriptive analysis were done using SPSS program.

### Results:-

In our study we take 80.5% female, 19.5% male with average age group (13-18) (4.5%), 60 % (19-25), 19% (26-30), 16.5% ( more than 31) with different educational level 5% illiterate, 1.5% intermediate school, 11% high school, 77% university education with different financial status, 54% average economic situation, 35% excellent economic situation, 11% good economic situation and whether they have acne or not it was 52.5% doesn't have acne, 47.5% with acne.

- ❖ According to type of skin it was 42.5% have combined skin, 27% oily skin, 17.5% normal skin, 13% dry skin and according to what they prefer to use 51% prefer cream, 31.5% using lotion, 17.5% using gel.
- ❖ 85% say that there is a relation between stress and acne, 15% say it is not.
- ❖ 87% say they think there is a relation between acne and hormonal or genetic factors, 13% say there is no relation.
- ❖ According to obesity 44.5% think there is a relation between obesity and acne, 55.5% thinks there is not, 50.5% say there is a relation between poor hygiene and acne, 49.5% say there is no relation.
- ❖ 67.5% say that having acne is affecting their social life, 32.5% say it is not.
- ❖ 73% find that having acne is not affecting their performance at work, 27% it is.
- ❖ 81.5% find there is a relation between their food and acne but 18.5% find it is not.
- ❖ 51% think there is a relation between sun and acne, 49% think it is not
- ❖ 84% think that there is relation between acne and some of the cosmetic products, 16% think it is not.
- ❖ 84% say that acne affect their appearance 15.5% say it is not
- ❖ 84.5% think that acne is infectious disease, 15.5% think it is not
- ❖ 80% say that acne is not affecting their health, 20% they say it is.
- ❖ 67.5% say that they think acne is not affect only the face, 32.5% say it is
- ❖ 75.5% they think that using their medication more frequents will not increase their chance of healing, 24.5% think it is.

### Discussion:-

Acne is a common problem among teenagers. Because of puberty and hormonal changes that is happening. Teens will find ways to counteract this problem since teenage years is the time when an adolescent builds up his self-esteem and acne is a major hindrance to this.

The aim of this research is to clear out the misconceptions about the causes of acne and inform the readers about it. In this research also are the recommendations for preventing and treating acne.

The relationship between acne and aging has several facets it is well known that acne typically starts at certain age around puberty and tend to either resolve or diminished in early to mid twenties. But here in our study we find that average age group 4.5% (13-18) 60.0% (19-25) 19% (26-30) 16.5% ( more than 31) and as it well known that acne more common in women here in our study confirmed by 80.5% female 19.5% male that it is more related to hormones . As there is connection between acne and type of skin usually in our study we find 42.5% have mixed skin 27.0% oily skin 17.5% normal skin 13.0% dry skin according to what they prefer to use 51.0% prefer cream 31.5% lotion 17.5% gel, while it is hard to say that stress is a known cause of acne but it can aggravate acne as we find 85.0% say that there is a relation between stress and acne 15.0% say it is not. A high glycemic diet which can lead to obesity seems to trigger both acne and insulin as we find 44.5% think there is relation between obesity, while 81.4% find there is relation between their food and acne. A lot of people have heard that acne is caused by dirty skin actually we find 50.5% say there is a relation between hygiene and acne in fact washing skin too frequently and too aggressively can make an acne breakout much worse . Acne resulting from sun exposure can be linked to simple sun

sensitivity or may be sign for more serious conditions but here in our study we find 51% think there is a relation between sun and acne 49% think it is not.

Many makeup artist will say that makeup should be used to enhance your best traits not hide your perceived flaws that's easy when you have clear skin but for those who haven't found makeup is the best acne treatment unfortunately makeup can cause acne ,blackheads, whiteheads and inflammations. Here we find 84% think that there is relation between acne and some of the cosmetic products. Finally 84.5% say that acne affect their appearance 15.5% say it is not.

### **Conclusion:-**

The study revealed that there is an actual defect in the general awareness about acne regarding its causes and it is revealed that 47.5% of population (answers) was suffered from acne, which means there is a need to institute society health education programs to enable the adolescents to learn and get the right knowledge and how to handle the acne issues. Education about acne prefers to start at young ages and at students' level which they can understand and recognize their needs, thus should be provided in intermediate and high schools.

As the main target in education about acne is the adolescents, a suitable family education program should be constructed too.

#### Abstract

**Background:** -Acute myeloid leukaemia (AML) is a malignant clonal disorder resulting from the neoplastic proliferation of a clone of myeloid cells. Flow cytometry is used for confirming diagnosis, identifying prognostic differences, staging of AML and detecting an aberrant immunophenotype that can be used for monitoring of complete remission (CR) achievement.

**Objectives:** - To evaluate the expression of aberrant CD9 and CD56 in newly diagnosed adult AML patients and their association with clinical and haematological parameters and with CR achievement.

**Methods:** -Thirty adult patients (>15 years) who were newly diagnosed de novo AML were selected from the Baghdad Teaching Hospital and Al-Imamein Kadhimein medical city from July 2015 to March 2016. All patients were grouped according to FAB classification and evaluated individually and the diagnosis was based on the morphology, cytochemistry or flow cytometry. Aberrant antigens CD9 and CD56 expressions were investigated by four-colours flow cytometry at the time of diagnosis. The patients were evaluated at day 28 from the start of chemotherapy to assess complete remission achievement. Verbal consent was taken from the patients.

**Results:** -The aberrant expression of CD56, CD9 were observed in 23.3% and 33.3% of AML patients respectively. CD56 was expressed more with monocytic differentiation and CD9 was expressed more with M2 cases. CD56 expression was significantly associated with high total WBC count, high peripheral blood and bone marrow blast cells and the extramedullary manifestations. There was significant association between CD56 and CD9 expression regardless of their intensity of the markers with non-responsiveness to induction therapy.

**Conclusion:** -Aberrant CD9 and CD56 antigens were associated with adverse clinical and hematological parameters at presentation as well as with low cure rate.

#### Introduction: -

Acute myeloid leukaemia (AML) is a hematopoietic stem cell disorder, characterized by a block in differentiation of haematopoiesis which results in the growth of a clonal population of neoplastic cells or blasts. This malignant alteration in hematopoietic stem cells leads to a loss of normal hematopoietic function. The peak incidence rate

occurs in the first year of life and then decreases steadily up to the age of 4 years and remains relatively constant in childhood and early adulthood; AML is thus a disease of adults. (1)

AML represents approximately 90% of all acute leukemias in adults but accounts for only 13% of leukaemia cases in children younger than 10 years.(2)

Recurring chromosomal aberrations and gene mutations are frequently found in AML and contribute greatly to the pathogenesis of the disease. (2) One of these is the t (8; 21) (q22; q22) translocation which produces RUNX1-RUNX1T1 fusion product that blocks hematopoietic differentiation and enhances self-renewal of hematopoietic stem cells.

The inv (16) (p13q22) or t (16; 16) (p13; q22) produces the leukaemogenic CBF $\beta$ -MYH11 fusion gene which blocks differentiation of hematopoietic stem cells by inhibiting the function of Runt-related transcription factor 1 (RUNX1). APL cells usually have t(15;17)(q22;q11-21) producing PML-RARA fusion products which also behave as a transcriptional repressor.

Accurate diagnosis and classification in AML are essential for treatment decisions and assessment of prognosis. Initial assessment requires a careful history, physical examination, complete blood count (CBC) with peripheral blood (PB) smear review, bone marrow (BM) examination, Flow cytometry (FC), cytogenetic and selected molecular genetic analysis. (3)

#### **Classification of AML: -**

Acute myeloid leukaemia can be classified in many ways: (4, 5)

1. By morphology and cytochemistry supplemented by immunophenotyping, as proposed by the FAB group.
2. The morphologic, immunologic, and cytogenetic (MIC) classification, which was the first to recognize the usefulness of cytogenetic for identifying subgroups of acute leukaemia.
3. The WHO Classification which takes into account morphologic and immunologic features plus well-studied, common non-random chromosomal abnormalities.
4. By immunophenotyping alone, as proposed by the European Group for the immunological classification of leukaemias (EGIL). Laboratory investigation of acute myeloid leukaemia:

#### **CBC and peripheral blood Smear: -**

The leukocyte count is elevated in more than one half of patients but is  $>100,000$  cells/mm<sup>3</sup> in  $<20\%$ . Blasts usually are identified on peripheral smear; Auer rods are considered pathognomonic of AML (which are reddish rod-like filaments of aggregated primary granules). A leukemic leukemia (no blasts in the peripheral smear) is rare. (6)

#### **BM Morphology: -**

A bone marrow aspirate is part of the routine diagnostic work-up of a patient with suspected AML. A marrow trephine biopsy is optional, but it should be performed in patients with a dry tap. For a diagnosis of AML, a marrow or blood blast count of 20% or more is required, except for AML with t (15; 17), t(8; 21), inv (16) or t (16; 16). Myeloblasts, monoblasts, and megakaryoblasts are included in the blast count. In AML with monocytic or myelomonocytic differentiation, monoblasts and promonocytes, but not abnormal monocytes, are counted as blast equivalents. Erythroblasts are not counted as blasts except in the rare instance of pure erythroid leukaemia. (7)

#### **Cytochemistry: -**

Cytochemistry encompasses the techniques used to identify diagnostically useful enzymes or other substances in the cytoplasm of haematopoietic cells

A: Myeloperoxidase: Myeloperoxidase is a lysosomal enzyme present in granulocytic and monocytic cells. The basis of the stain is breakdown of hydrogen peroxide by the enzyme MPO.

B: Sudan Black B (SBB) stain: which is a lipophilic dye that binds irreversibly to an undefined granule component in granulocytes, eosinophils and some monocytes. The intensity of a positive reaction with SBB in general parallels MPO activity; however, SBB is preferable as it is slightly more sensitive in the detection of myeloblasts. (8)

C: Specific esterases: Specific Esterases are a group of enzymes capable of hydrolyzing halogenated naphthol esters. The most commonly used substrate is naphthol AS-D chloroacetate. Chloroacetate esterase (CAE) is most frequently used for the identification of neutrophilic series; it is negative for monocytes, megakaryocytes, erythroblasts and lymphocytes. (8)

D: Nonspecific esterases: are a group of enzymes capable of hydrolyzing various aliphatic and aromatic short chain esters. The substrates used to detect NSEs activity include  $\alpha$ -naphthyl butyrate,  $\alpha$ -naphthyl acetate, naphthol AS-D acetate and naphthol AS acetate. They are most frequently used because they do not stain for granulocytes. Besides monocytes and histiocytes,  $\alpha$ -naphthyl acetate esterase is also positive in megakaryocytes and platelets. (9)

E: Periodic Acid-Schiff (PAS) Reaction: Periodic acid specifically oxidizes 1-2 glycol groups to produce stable aldehydes which give a red reaction product when exposed to Schiff's reagent (leucobasic fuchsin). A positive PAS stain in erythroblasts is a common finding in erythroleukemia where it has a coarsely granular pattern in cells of early stage and a finely granular pattern in cells of later stage. (9)

### Immunophenotyping:-

Leukaemic cells express characteristic nuclear, cytoplasmic and cell surface antigens, this is referred to as the immunophenotype of the cell. Characterization of the immunophenotype is referred to as immunophenotyping is achieved by means of labeled antibodies that recognize specific epitopes of cellular antigens by:

A: immunocytochemistry methods.

B: multiparameter immunophenotypic flow cytometry.

Flow cytometry is the measurement of numerous cell properties as the cells move in single flow in a fluid column and interrupt a beam of laser light. The method allows the quantitative and qualitative analysis of several properties of cell populations from body fluids. In an individual patient, the role of Flow cytometric (FC) immunophenotyping may be: confirming a diagnosis, identifying prognostic differences within a diagnostic category, staging a disease, and detecting an aberrant immunophenotype that can be used for monitoring minimal residual disease, i.e. expression of an antigen inappropriate to a lineage. (10)

Leukaemic myeloblasts express a variety of leucocyte differentiation antigens, which reflect commitment to the myeloid lineage as well as a level of maturation. In the EGIL classification, AMLs are defined immunologically by the expression of 2 or more of the following myeloid markers: MPO, CD13, CD33, CDw65, and CD117. (11) as shown in (Table 1).

**Table 1:-** Expression of cell-surface and cytoplasmic markers for the diagnosis of acute myeloid leukemia. (7)

Myeloid stage	CD markers
Precursor stage	CD34, CD38, CD117, CD133, HLA- DR
Granulocytic markers	CD13, CD15, CD16, CD33, CD65, cytoplasmic myeloperoxidase (cMPO).
Monocytic markers	Nonspecific esterase (NSE), CD11c, CD14, CD64, Lysozyme, CD4, CD11b, CD36, NG2 homologue.
Megakaryocytic markers	CD41 (glycoprotein IIb/IIIa), CD61 (glycoprotein IIIa), CD42 (glycoprotein 1b).
Erythroid marker	CD235a (glycophorin A)

### Aberrant immunophenotyping expression: -

In the majority of cases of AML, leukemia cells have immunophenotype that distinguish them from myeloid progenitor cells found in normal marrow. Comparison of antigen expression on AML cells with that in normal bone marrow reveals: (a) expression of non-myeloid antigens; (b) asynchronous expression of myeloid-associated antigens; (c) over expression of myeloid-associated antigens; and (d) absence of expression of myeloid-associated antigens. (12)

### CD9:-

A transmembrane-4 super family that are characterized as having four transmembrane domains with cytoplasmic N and C termini and the conserved cysteine motif, which act as "molecular facilitators" and linkers for

transmembrane proteins forming tetraspanin web. (13)

#### **CD56:-**

CD56 antigen, a 200–220-kDa cell surface glycoprotein, belongs to the immunoglobulin supergene family and has been identified as an isoform of the neural cell adhesion molecule (NCAM). This antigen mediates cell-to-cell interactions and is possibly involved in cell-mediated cytotoxicity. (14)

#### **Aims of the study:-**

1. To detect the frequency of aberrant CD56 and CD9 expression in de novo newly diagnosed cases of adult AML.
2. To evaluate the correlation of CD56 and CD9 expression with certain clinical and haematological parameters and their initial response to the induction therapy.

#### **Patients, Materials and Methods:-**

This prospective cross-sectional study was conducted on thirty adults newly diagnosed de novo AML patients from July 2015 to March 2016.

The patients were admitted to the Hematology Department of Baghdad Teaching Hospital of the Medical City and Al-Imamein Kadhimein medical city. Diagnosis was based on morphology and cytochemistry of the PB and/or BM samples by an expert haematopathologist in the Teaching Laboratories of the Medical City in Baghdad and Al-Imamein Kadhimein medical city. FC was done by four-color (Partec Cyflow®, Germany).

#### **Flow cytometric Immunophenotyping:-**

After AML cases have been documented in the Teaching Laboratories, the samples were transferred in cool box (6 hours being the maximum time since obtaining the sample) to be investigated for the aberrant expression of surface marker antigens CD56 and CD2 by using four-color (Partec Cyflow® Cube 6, Germany).

Gating of the cells of interest was done depending on FSC/SSC gate. Device software based on Windows™ FC software (CyView™), and the optics of the instrument employing 6 optical parameters: FSC and SSC work in combination with 4 fluorescence channels (FL1-FL4). (15)

#### **Assay Procedure:-**

##### **Includes 3 steps:-**

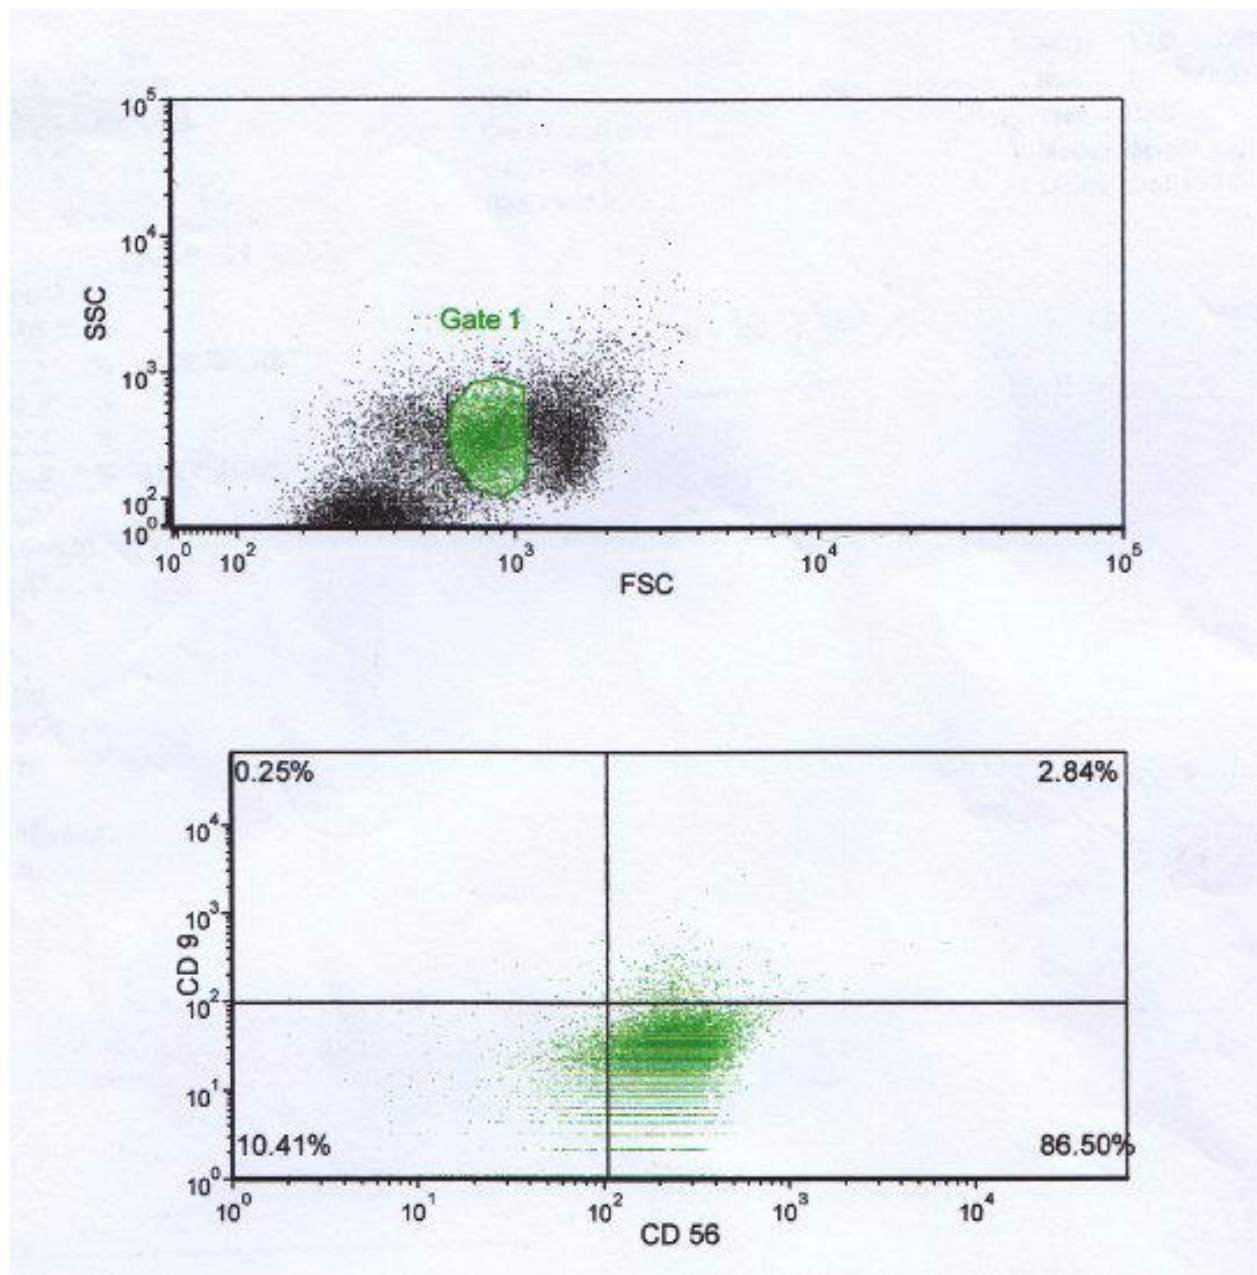

1. Antibody labeling: 100 µl of whole blood was mixed with 10 µl conjugated antibodies in a test tube, and after thoroughly mixing the mixture was incubated for 15 minutes in the dark at room temperature.
2. Leucocyte fixation: 100 µl of reagent A was mixed thoroughly with the mixture obtained in step 1 and was incubated for 10 minutes in the dark at room temperature.
3. Erythrocyte lysis: 2.5 ml of reagent B was added to mixture in step 2 and was shaken gently and incubated for 20 minutes in the dark.

Determination of the aberrant marker Identification of blast cells was performed using FSC versus SSC parameters. Basically, antigen expression is considered to be positive when the percentage of positive blast cells is equal or greater than 20%. Similarly, aberrant phenotypes are defined when at least 20% of the blast cells expressed that particular phenotype. (16) (Figure 1, 2, 3).

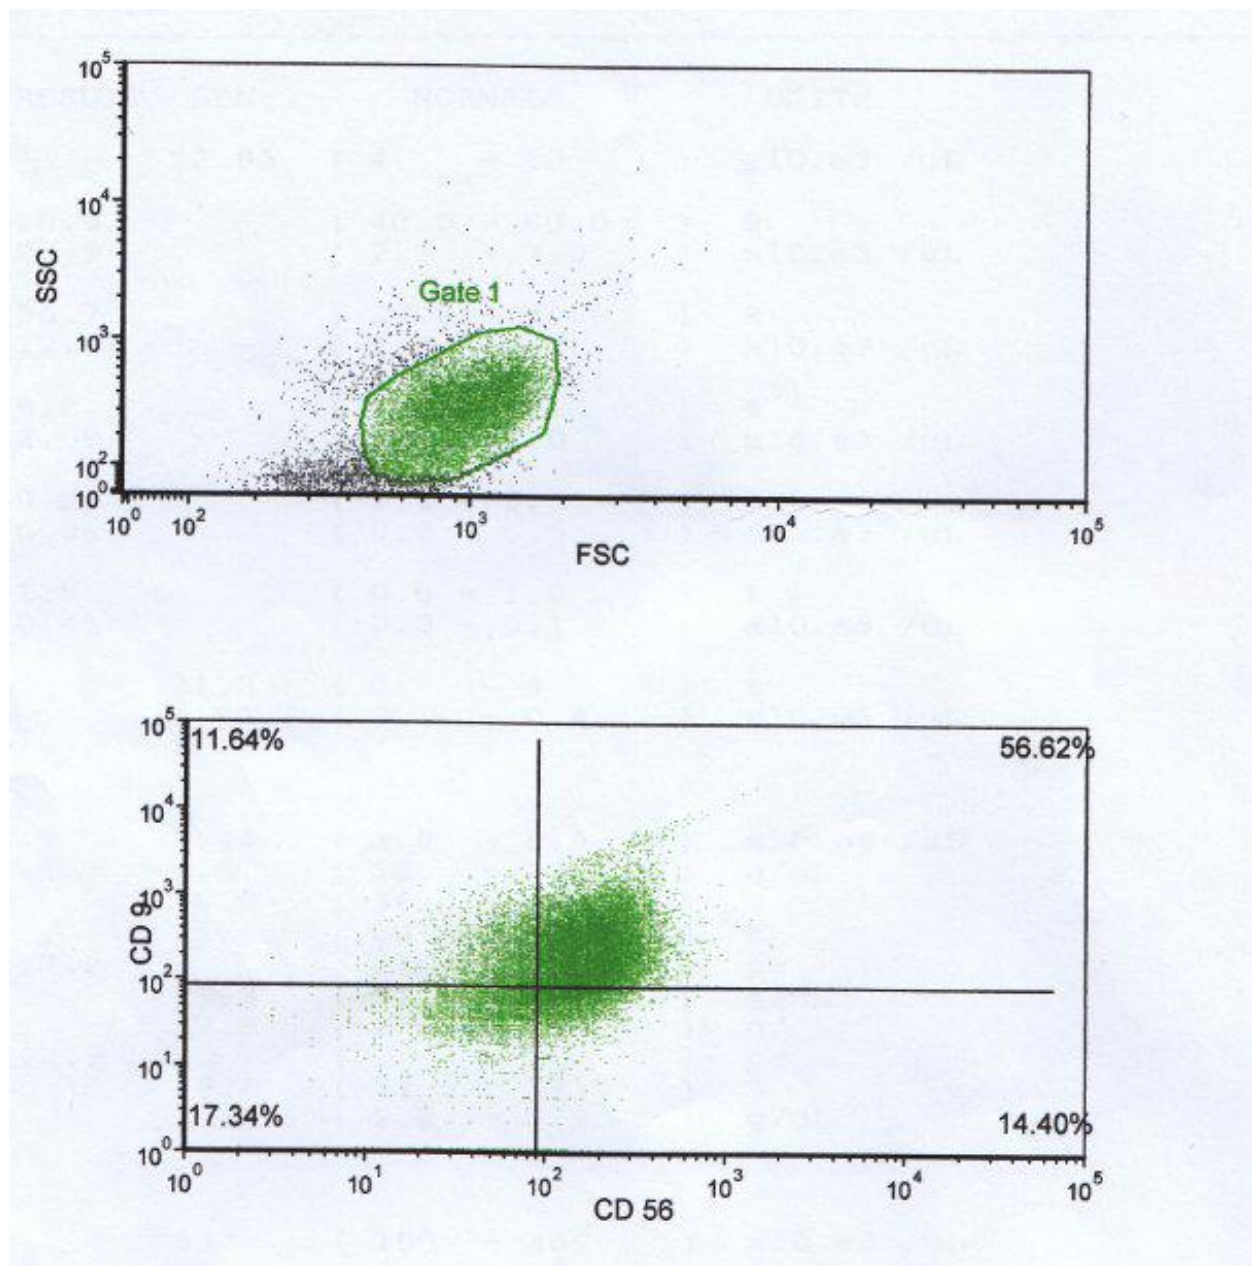

#### **Statistical Analysis:-**

Statistical Package for Social Science (SPSS) version 17 was used to present, describe and analyze data included in the present study. Numeric variables were represented as mean and standard deviation. Nominal variables were expressed as frequency (number) and percentage out of total. Pearson's chi-square and Fisher exact tests were used to evaluate nominal variable frequency difference between groups. Independent sample student t-test was used to compare the mean of numeric variables between groups. The level of ( $\leq 0.05$ ) was considered significant for interpretation of P values.

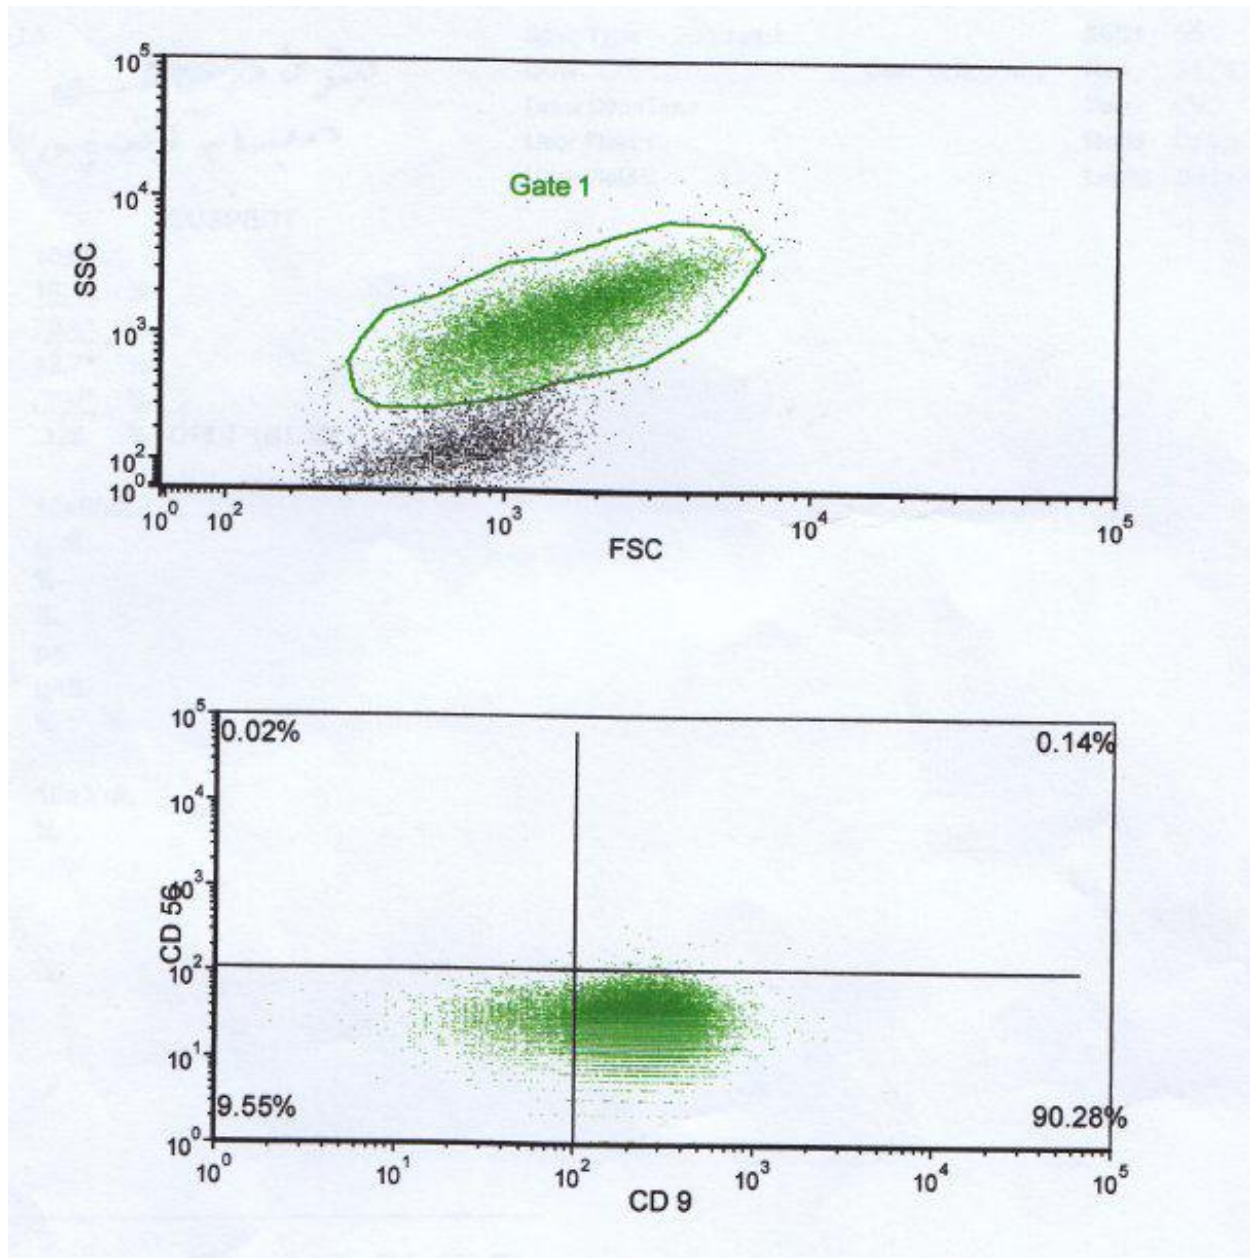

**Figure.1:-** Aberrant expression of CD56 by FC

**Figure 2:-** Aberrant co-expression of CD56 and CD9 by FC

**Figure 3:-** Aberrant expression of CD9 by FC

### Results:-

#### Age Groups:-

The mean age of AML patients included in this study was  $41.33 \pm 16.6$  SD, with a median of 38 years (range of 16-75 years). Half of the cases (50%) being in the age group 21-40 years (Figure 4).

**Figure 4:-** Distribution of the patients according to the age groups.

#### **Gender:-**

Acute myeloid leukaemia were observed more in males (17 males “56.7 %”) than in females (13 females “43.3 %”) with an M: F ratio of 1.3:1.

#### **Distribution of AML cases according to the FAB subtypes:-**

According to FAB subtypes, of the 30 cases studied, 4 were M1, 9 were M2, 7 were M3, 4 were M4, 4 were M5, one was M6 and one was M7. (Figure 5)

**Figure 5:-** Distribution of patients according to FAB subtypes

**Clinical Features:-**

**Figure 6:-** shows the common signs and symptoms of AML patients

**Figure 6:-** Patient's common signs and symptoms.

**Aberrant CD56 and CD9 Expression:-**

CD56 was expressed in 7/30 patients (23.3%), 3 of those were with moderate intensity, 2 were weak and 2 were strong. For CD9 expression, 10/30 patients (33.3%) had positive expressions with 6 of those were with weak intensity, 2 were moderate and 2 were strong. And 2/30 patients (6.7%) had CD56 and CD9 co expression (Figure 6).

**Figure 7:-** Percentage of aberrant expression of CD56 and CD9 in AML patients.

**Correlation between the aberrant CD56 and CD9 expressions with hematological parameters:-**

Table 2 shows that the total WBC count, PB and BM blast cells percentage of AML patients with aberrant CD56 expression were significantly higher than those without aberrant CD56 expression ( $p$  value  $< 0.05$ ), while there was nonsignificant correlation between Hb and platelet count with the aberrant CD56 expression.

**Table 2:-** Correlation between CD56 expression with hematological parameters.

Parameter	CD56 positive (n=7)		CD56 negative (n=23)		P-value
	Mean	SD	Mean	SD	
Total WBC ( $\times 10^9/L$ )	88.9	18.8	16.5	17.7	<0.001
Hb (g/dl)	7.3	1.8	8.8	2.8	0.199
Platelet count ( $\times 10^9/L$ )	82.3	43.1	53.7	35.7	0.088
PB blast cells %	68.2	54.6	30.6	10	<0.001
BM blast cells %	74.6	15.5	45.4	21	0.002

Table 3. showed that there was no significant correlation between the aberrant CD9 expression and any of the hematological parameters.

**Table 3:-** Correlation between CD9 expression with hematological parameters

Parameter	CD9 positive (n=10)		CD9 negative (n=20)		P-value
	Mean	SD	Mean	SD	
Total WBC ( $\times 10^9/L$ )	25.7	34.3	37.2	36.8	0.42
Hb (g/dl)	8.8	2.7	8.3	2.6	0.579
Platelet count ( $\times 10^9/L$ )	64.4	33.2	58.4	42	0.699
PB blast cells %	36.1	19.7	41	18.3	<0.5
BM blast cells %	46.4	24.2	55.2	22.9	0.336

#### The Distribution of aberrant CD56 and CD9 expression in relation to AML FAB Classification:-

CD56 was expressed in 57.1% of the cases of AML FAB subtypes with monocytic differentiation (M5 cases (2/4, 50%) and M4 (2/4, 50%)); it was also expressed in other FAB subtypes 1/4 for M1, 2/9 for M2. CD56 is not expressed on M3, M6 and M7 subtypes.

CD9 was expressed more in M2 subtype (4/9, 44.4%). It is also expressed in all other AML subtypes except M7 subtypes

#### Correlation between the aberrant CD56 and CD9 expression with the extramedullary manifestations:-

The extramedullary manifestations were present in 57.2% of CD56 positive patients with statistically significant correlation (p-value = 0.016).

There is no significant correlation between CD9 aberrant expression and the extramedullary manifestations (p-value = 1).

#### Correlation between the aberrant CD56 and CD9 expression with CR Achievement:-

Complete remission was achieved in 17/30 patients (56.7%) with standard chemotherapy. For patients with aberrant CD56 expression 6 out of 7 did not respond to induction treatment. It appeared that there was a significant correlation between this expression with the non-responsiveness to the induction therapy with p-value = 0.025 (Table 4).

**Table 4:-** Correlation between aberrant CD56 expression with CR achievement

CR achievement	CD56				Total	
	Positive		Negative			
	No.	%	No.	%	No.	%
Yes	1	14.3	16	69.6	17	56.7
No	6	85.7	7	30.4	13	43.3
Total	7	100	23	100	30	100
	P-value =0.025					

For patients with aberrant CD9 expression 9 out of 10 did not respond to induction treatment, and it appeared that there was significant correlation between this expression with the non-responsiveness to induction therapy with p-value <0.001 (Table 5).

**Table 5:-** Correlation between aberrant CD9 expression with CR achievement

CR achievement	CD9				Total	
	Positive		Negative			
	No.	%	No.	%	No.	%
Yes	1	10	16	80	17	56.7
No	9	90	4	20	13	43.3
Total	10	100	20	100	30	100.00
	P-value <0.001					

**Discussion:-**

This study was conducted on 30 newly diagnosed de Novo acute myeloidleukaemia patients. The mean age of all patients was  $41.33 \pm 16.6$  SD, medianof 38 years and ranged between 16-75 years. Those results were comparable toIraqi studies (17-18).

Pallor and fever are the two most frequent signs, while Lymphadenopathyand gingival enlargement are the least frequent. Easy fatigability was the most frequent symptom. Those results were comparable to that published by AlwanAF et al. (19) and Hu R et al. (20)Of the 30 cases studied, M2 was the most frequent AML subtype (30%)followed by M3 (23.3%). This result was comparable to studies done by PoulsRK et al. (21) in Erbil, Alwan AF et al. (19).

The current study revealed that CD56 was expressed in 7 cases out of 30(23.3%) newly diagnosed AML cases, this result was in agreement withRaspadori D et al. (22) E et al. and Dina J et al. (23)

For CD9, it was expressed in 10 cases out of 30 (33.3%) of AML cases. Thisresult is comparable to that obtained by El-Sissy AH et al. (24) who reported CD9expression in 29.4% of AML cases.

Regarding the haematological parameters; the total WBC count of AMLpatients with CD56 expression was significantly higher than those without thisexpression, those findings were comparable with the results obtained by OlteanuH et al. (25). Also the correlations were found betweenPeripheral blood (PB) and bone marrow (BM) blast cells percent of AMLpatients were significantly higher in patients with aberrant CD56 expression. The cause of the higher total WBC count, PB and BM blastcells percent in AML patients with CD56 expression may be explained by thatCD56 expression is associated with an abnormal over expression of the fulllengthp48 RUNX1 isoform in AML cells which block haematopoieticdifferentiation and enhances self-renewal of haematopoietic stem cells andthus we may predict that the CD56 is a poor prognostic marker.

For the distribution of aberrant expression among FAB subtypes, CD56 expression was expressed in half of the cases of AML FAB subtypes withmonocytic differentiation M5 cases (2/4 ; 50%) and M4 (2/4 ; 50%) and thoserresults in agreement with Graf M et al. (26). The increased aberrant CD56 expression in M4 and M5 which areconsidered as unfavorable AML FAB subtypes (14) confirms that CD56 isassociated with a poor prognosis.

About the CD9 expression, it was detected more on M2 subtype (4/9;44.4%). there was a significant correlation between CD56 expression and the extramedullary manifestations and this confirms also that CD56 is a poor prognostic marker as AML patients with increased extramedullary manifestations at presentation generally have a poor outcome. This result was in agreement with Chang H et al. (27)

On the other hand, CD9 expression was no significantly correlated with theextramedullary manifestations.

Regarding the initial response to the induction therapy, CD56 was highlyexpressed with the non-responsiveness to the induction therapy. This correlationmay be explained by observation of more frequent P-glycoprotein (PGP)expression in CD56 positive patients. 106). Those results were consistent with that of Raspadori D et al. (22)Regarding CD9 expression in this study was highly expressed with the non-responsiveness to the induction therapy.

**Conclusion:-**

1. CD56 and CD9 expressions in AML patients were detected in 23.3% and 33.3% respectively.
2. CD56 was expressed more in monocytic AML subtypes.
3. Aberrant CD56 expression was associated with a higher total WBC count, higher PB and BM blast cells, increased extramedullary manifestations at presentation, and a lower response rate to the induction therapy; thus CD56 can be considered as an unfavourable marker.
4. Aberrant CD9 expression was associated with lower response rate to the induction therapy; thus CD9 can be considered as an unfavorable marker.

**Recommendations:-**

1. Studying the correlation of the aberrant expression of CD56 with multidrug related P-glycoprotein (PGP).
2. Studying further aberrant antigens expression in AML as CD10, CD22, and CD4.
3. Further studies for CD9 expression in AML patients.
4. The study should be performed on larger sample size and for longer period of time.

CD 200, B-CLL, MCL, CD5 POSITIVE LYMPHOPROLIFRATIVE DIEASES.

### Abstract

Chronic B-cell lymphoproliferative disorders (B-CLPD) are a group of clonal diseases characterized by proliferations of mature B lymphocytes in the bone marrow (BM), peripheral blood, and lymphoid tissues.

Mature B-cell lymphoproliferative disorders is divided by CD5 expression into two groups:

1. CD5 (positive) diseases including B cell chronic lymphocytic leukemia (B-CLL) and mantle cell lymphoma (MCL).
2. CD5 (negative) diseases and including all the other forms of B-CLPD.

Chronic lymphocytic leukemia (B-CLL) and mantle cell lymphoma (MCL) have many features in common and their differential diagnosis may be arduous, particularly when a leukemic phase of lymphoma is the only presentation. Immunophenotypic panels are often useful, with CD23 being the most valid in B-CLL and in MCL suspected cases should be confirmed by immunohistochemically cyclin D1 detection but sometimes indefinite or some time negative repercussion may occur and other immunological markers and advanced cytogenetics or molecular techniques are bona fide but they add extra cost and not widely available. So we study the expression of CD 200 which is a membrane gp of the immunoglobulin superfamily in CD 5 positive mature B-cell lymphoproliferative disorders to help in differentiation.

#### Aim of the study: -

1. To detect the immunohistochemically expression of CD200 in CD5 +ve Mature B-cell lymphoproliferative disorders.
2. Evaluation of the value of CD200 in diagnosis and differentiating between B cell chronic lymphocytic leukemia (B-CLL) and mantle cell lymphoma (MCL).

#### Patients, materials and methods: -

This cross sectional study included 49 adult patients and newly diagnosed by morphology and flow cytometric immunophenotyping as B-CLL for score 4-5 and MCL with score <4 conducted from February 2015 to September 2016 from many centers, Baghdad teaching hospitals and private clinic.

From each patient, left over samples were used.

Bone marrow trephine biopsy sections were stained with hematoxylin and eosin for histopathological assessment. Further detection for the expression of cyclin D1 and CD200 were performed by immunohistochemistry technique.

**Results:** - The patients were 36 males and 13 females newly diagnosed as CD5 positive mature B-cell lymphoproliferative disorder, 39 patients were presented with B-chronic lymphocytic leukemia and 10 were mantle cell lymphoma diagnosed by morphological assessment and flow cytometric immunophenotyping as B-CLL with score 4-5 and MCL with score <4, MCL diagnosis proved by immunohistochemically expression of cyclin D1.

The result showed that CD200 was expressed in 37 (94.9%) out of 39 chronic lymphocytic leukemia patients while mantle cell lymphoma cases were all negative for CD200 expression.

Highly significant association between CD200 expression and B-CLL, p value was <0.001 and negative in 2 cases (5.1%) shown to have an advanced disease.

**Conclusions:** - CD200 is highly expressed in B-CLL and it has a discriminative role in mature CD5 positive B-cell lymphoproliferative disorders (B-CLL and MCL). The only CD 200 negative CLL cases might related to the advanced stage of disease.

## Introduction: -

Chronic mature B-cell lymphoproliferative disorders (B-CLPD) are a group of clonal diseases characterized by proliferation of mature looking B lymphocytes in the bone marrow, peripheral blood, and lymphoid tissues. B-CLPD diagnosis can be made by morphological, and immunophenotyping that help in differentiation between different types of mature B-cell lymph proliferative disorders (B-CLPD) and this supported by cytogenetic parameters, as is described in the World Health Organization classification (WHO). (1)

Immunohistochemically immunophenotypic analysis is particularly helpful in establishing the diagnosis because there is significant overlap in clinical and morphologic features between these diseases entities and as the B-CLL and mantle cell lymphoma have many features in common and they may give equivocal or negative result for the specific markers used for differentiation so a more advanced cytogenetic or molecular tests are required but they add extra cost and might not be available. (2)

Such difficult cases of B-CLPDs can be further sub classified according to the expression of CD5. Patients with CD5 negative B-CLPD usually present as the leukemic phase of lymphoma such as marginal zone lymphoma (MZL), lymphoplasmacytic lymphoma (LPL), follicular cell lymphoma (FCL), or hairy cell leukemia (HCL); While patients with CD5 positive B-CLPD can be either B-CLL or mantle cell lymphoma in which differentiations between them may be so difficult as they do not have the characteristic immunophenotypic score of CLL or mantle cell lymphoma (MCL) (i.e. CD5+B-CLPD). (3), (4), (5).

CD200 is a membrane gp MRC (OX-2). It is a member of the immunoglobulin superfamily which is encoded by a gene at chromosome 3q12; This transmembrane protein is expressed on different cell types, and it is expressed by endothelial cells and neurons and by B lymphocyte and a subset of T lymphocyte; It plays an important role in the regulation of anti-tumor immunity (5), and overexpression of CD200 has been reported in a number of malignancies, including CLL, because of its differential expression in B-CLL and mantle cell lymphoma (MCL), we evaluate this expression differences on these two disorders.

## Materials and Methods: -

This cross sectional study was conducted on 49 adult patients newly diagnosed mature CD5 positive BCLPD, 39 patients were presented with chronic lymphocytic leukemia diagnosis depend on the WHO classification of mature B-cell Neoplasms with score 4-5 and 10 were mantle cell lymphoma score < 4 (1). The diagnosis of which was

confirmed by the demonstration of cyclin D1 expression by immunohistochemistry, the cases were randomly selected for the age and sex.

**The samples for each patient were subjected to the following procedures: -**

1. Samples were leftover.
2. Bone marrow biopsy was fixed with formalin solution and stained by hematoxylin and eosin for histopathological examination.
3. Immunohistochemistry technique on bone marrow biopsy used to detect CD200 to assess its differential expression on B-CLL and MCL.

**Procedures: -**

**Processing of B.M biopsy and immunohistochemistry: -**

Sections slides were stained with hematoxylin and eosin and sections were fixed on positively charged slides for immunohistochemically tests for CD200 each section was with 4-micron thickness, procedure of immunohistochemistry used in this study was adopted by abcam®. All steps are performed at room temperature.

**Staining protocol: -**

1. Deparaffinize and rehydrate formalin fixed paraffin-embedded tissue section.
2. Add enough drops of hydrogen peroxide block to cover the section. Incubate for 10 minutes. Wash 2 times in buffer.
3. Apply protein block and incubate for 10 minutes at room temperature to block nonspecific background staining. Wash 1 time in buffer.
4. Apply primary antibody and incubate.
5. Wash 3 times in buffer solution.
6. pour complement and incubate for ten minutes at room temperature. Wash 2 times in buffer solution.
7. Pour HRP conjugate and incubate for 15 minutes at RT.
8. Rinse four times in buffer solution. Add 30µl (1 drop) DAB chromogen to 1.5 ml of DAB substrate, mix by swirling and apply to the tissue. Incubate for 10 minutes. Rinse 4 times in buffer.
9. Apply counter stain.
10. Dehydrate and coverslip.

**The slides were examined by light microscope and scanned on low and high powers (10x, 40x).**

**Assessment of immunohistochemically staining: -**

The scoring systems for CD200 were scored positive if 20% or more of the cells within an aggregate showed brown cellular membrane and/or cytoplasmic staining pattern. (6)

**Statistics: -**

A non-parametric two-way contingency table test (Fisher exact test) was employed, using Prism 7 for Mac OS X software, ver. 7.0a (Graph Pad Software, San Diego, California). The validity of CD200 in discrimination of B-CLL than MCL was calculated using sensitivity, specificity, positive and negative predictive values.

**Result: -**

Thirty-nine patients with B-CLL and ten with MCL were enrolled in this study, patients were randomly selected for the age and sex as shown in the table 1. The male to female ratio in B-CLL cases were 2.5:1 and in MCL were 4:1.

**Table 1: -age and sex distribution.**

		Study groups		P value
		CLL	MCL	
Age (years) Mean±SD (Minimum-Maximum)		60.08±11.15 (39-80)	57.7±4.3 (50-64)	0.784 <sup>NS</sup>
Sex	Male (%)	28 (71.8)	8 (80)	0.467 <sup>NS</sup>
	Female (%)	11 (28.2)	2 (20)	

Binet stages were available for B-CLL cases and were as shown in table 2

**Table 2:** - Binet staging system for B-CLL

Binet stage		
A	30	76.9%
B	7	17.9%
C	2	5.1%
Peripheral blood lymphocytes ( $10^9$ per liter)	22.1	15-35
Hb (g/100 ml)	13	10.5-13.6
Platelets ( $10^9$ per liter)	145	95-190

CD200 was expressed by 94.9 % of our CLL cases as shown in figure 1 compared with 0% of MCL cases as shown in figure 2. The cut-off value of CD200 percent expression on malignant clone cells in both groups was 20 %, it had 99.37 % sensitivity, 100% specificity, 100% positive predictive value, and 83.33% negative predictive value as shown in the table 3.

**Figure 1:** -Cytoplasmic positivity for CD200 in B-CLL.

**Figure 2:** -cytoplasmic negativity for CD200 in MCL

**Table 3:** -The CD 200 expression on the two studied groups.

	Study groups		P value	Sensitivity (CI)	Specificity (CI)	PPV	NPV	Kappa index
	CLL (4-5)	MCL (<4)						
CD200 positive (%)	37 (94.9)	0 (0%)	<0.001**	94.87 82.68 to 99.37	100 69.15 to 100.00	100	83.33 56.45 to 95.07	0.883
CD200 negative (%)	2 (5.10)	10 (100)						
Total	39	10						

**Discussion: -**

Chronic mature B-cell lymphoproliferative disorders (B-CLPD) are a group of malignant diseases marked by accumulation of mature looking B lymphocytes in the bone marrow, peripheral blood, and lymphoid tissues. B-CLL and MCL both are CD5+ve mature B lymphocyte neoplasms that show differences in the outcomes, modality of treatment and outcomes; B-CLL tends to follow an indolent course, having median survival ranging from 8 to 12 years depending on gene mutational status of immunoglobulin. While in MCL the disease shows a more clinical aggression and treatment-resistant over the time. with a median survival of 3 to 7 years. (7). Thus differentiation of these disorders has vital role prognostically and therapeutically (8). The conjunction of clinical features, morphology and immunological features can lead to an accurate diagnosis in the majority of the cases of B cell chronic lymphoproliferative disorders; but the diagnosis remains uncertain in a small percentage of cases. The characteristic immunophenotypic features of CLL are aberrant expression of CD5, together with CD23 expression and the negativity of CD79b and FMC7 (9).

This is in contrast to MCL, who also express CD5 and lack CD23 expression and strongly express FMC7. The most important helpful markers in their differentiation are CD23 and FMC7. MCL is CD23-ve and FMC7+ve, while CLL usually have the opposite. however aberrant phenotypes may occur as reported by previous studies... whose found that CD23 positivity in CLL ranged from 86.6 to 100% of cases while CD23 expression was found in about half of MCL cases and FMC7 positivity of 0–12% in CLL cases (10, 11) and 90–100% in MCL (10,12) so in these cases flow cytometric discrimination of CLL from MCL can be arduous.

In this study, we scrutinized the expression of CD200 on the clonal cells of patients with B-CLL and MCL. CD200 was expressed in 94.9% CLL cases compared with 0% in MCL cases. And the results showed that there were highly significant differences between these two disorders. CD200 expression in which P was < 0.001, the results also showed that CD200 expression was negative in only two cases of B-CLL who were known to have an advanced diseases shown in table 2 according to Binet staging (stage C). CD200 positivity showed a positive predictive value of 100%, a negative predictive value of 83.33 %, a sensitivity of 94.87 %, and a specificity of 100%.

The results of this study agree with previous studies which confirm the uniform expression CD200 on B-CLL cases and the only negative B-CLL were stage C so there may be a relation between the CD200 expression and the prognosis this need an expanded study. this agree with Alapat et al. (13) and Dahlia A. El-Sewefy et al. (14)

So the inclusion of CD200 in routine panels can be very helpful in distinguishing between these two disease, specially, in patients with inconclusive phenotypes.

**Conclusion: -**

CD200 is highly expressed in B-CLL and it has a discriminative role in mature CD5+ve B-CLPD (B-CLL and MCL). The only CD 200 negative CLL case might related to the advanced stage of disease, so more expanded study required to correlate the CD200 expression and the prognosis of the disease.

#### Abstract

Cracks and fractures in teeth are relatively common problems in general and specialist dental practices. The CTS presents both a challenge and an opportunity for the dentist. The possibility of CTS must always be considered when a patient complains of pain or discomfort on chewing or biting. In spite of CTS being a diagnostic challenge, having knowledge and awareness of CTS should enable the dental practitioner to detect the same, thereby preventing further crack propagation and complications associated with crack tooth.

*Copy Right, IJAR, 2016., All rights reserved.*

#### Introduction:-

Cracks and fractures in teeth are relatively common problems in general and specialist dental practices. Tooth fractures include trauma-related crown, crown-root, and root fractures and a broad group of cracked teeth. Bader et al. reported that approximately one in 20 people fracture a tooth each year. Since, these fractures had varying consequences ranging from no treatment being required to extraction of the tooth, it is likely that some of these fractures are crack.

#### Classification of crack tooth syndrome:-

The American Association of Endodontists (AAE)<sup>1</sup> has identified five types of cracks in teeth :

- Craze lines - visible fractures that only involve enamel
- Fractured cusps -originate in the crown of the tooth, extend into dentin, and the fracture terminates in the cervical region
- Cracked tooth -crack extending from the occlusal surface of the tooth apically without separation of the two segments
- Split tooth - extends through both marginal ridges usually in a mesiodistal direction, splitting the tooth completely into two separate segments
- Vertical root fracture - originate in the root, and are generally complete, although they may be incomplete

#### Definition:-

Cameron in 1964 coined the term cracked tooth syndrome<sup>2</sup> which is as “an incomplete fracture of a vital posterior tooth that involves the dentin and occasionally extends to the pulp.”

In recent times, the definition has been modified as follows: “A fracture plane of unknown depth and direction passing through tooth structure that, if not already involving, may progress to communicate with the pulp and or periodontal ligament”.<sup>3</sup>

**Incidence:-**

Crack tooth syndrome occurs primarily in adulthood. Cameron et al<sup>2</sup> reported that 80% of 102 cracked teeth occurred in patients over 40 years of age. Men and women are found to be equally affected.

Most commonly associated with heavily restored mandibular tooth. Mandibular second molars are most commonly affected followed by mandibular first molar and maxillary premolars. While the crack tends to have a mesiodistal orientation in most teeth, it may run buccolingually in mandibular molars. Wedging effect of the prominent mesiopalatal cusp of the maxillary first molar may be a predisposing factor.<sup>4</sup> The transverse ridge of maxillary molars may provide reinforcement and account for lower incidence of fracture in these teeth.<sup>4</sup>

Non-functional cusp may be more susceptible than functional cusp<sup>5</sup> as functional cusps are significantly larger in buccolingual dimension and covered with a thicker layer of enamel.<sup>6</sup> In molars, non functional cusps are found to have a steeper cuspal incline. Cuspal inclines are the guiding planes for lateral excursive movements for group functional occlusal relationships thus non functional cusps may be subjected to greater occlusal forces.

Higher incidence of Crack tooth syndrome in mandibular second molar may be associated with the proximity to the temporomandibular joint, based on the principle of the “LEVER EFFECT”- the mechanical force on an object is increased at closer distances to the fulcrum.<sup>7</sup>

**Etiology:-**

The etiology of crack tooth syndrome is multifactorial. Guersten et al<sup>8</sup> stated that ‘*excessive forces applied to a healthy tooth or physiologic forces applied to a weakened tooth can cause an incomplete fracture of enamel or dentine*’

**Lynch et al<sup>9</sup> subdivided the causes of cracks into four major categories:**

1. Restorative procedures
2. Occlusal
3. Developmental
4. Miscellaneous

Classification	Factors	Examples
1. Restorative procedures	Inadequate design features	<ul style="list-style-type: none"> <li>Over-preparation of cavities</li> <li>Insufficient cuspal protection in inlay/onlay design</li> <li>Deep cusp-fossa relationship</li> </ul>
	Stress concentration	<ul style="list-style-type: none"> <li>Pin placement</li> <li>Hydraulic pressure during seating of tightly fitting cast restorations</li> <li>Physical forces during placement of restoration, e.g., amalgam or soft gold inlays (historical)</li> <li>Non-incremental placement of composite restorations (tensile stress on cavity walls)</li> <li>Torque on abutments of long-span bridges</li> </ul>
2. Occlusal	Masticatory accident	Sudden and excessive biting force on a piece of bone
	Damaging horizontal forces	Eccentric contacts and interferences (especially mandibular second molars)
	Functional forces	Large untreated carious lesions Cyclic forces
	Parafunction	Bruxism
3. Developmental	Incomplete fusion of areas of	Occurrence of cracked tooth syndrome in

	calcification	unrestored teeth
4. Miscellaneous	Thermal cycling	Enamel cracks
	Foreign body	Lingual barbell
	Dental instruments	Cracking and crazing associated with high-speed handpieces

**Signs and symptoms:-**

Two classic patterns<sup>2</sup> of crack formation are present

- ☐ Crack – centrally located- Follow dentinal tubules → extend to pulp
- ☐ Crack – more peripherally directed → may result in cuspal fracture

A suspicion of infraction is raised when symptoms of toothache are not readily connected to evidence of caries, periodontal disease or recent trauma. Many patients with infected teeth may suffer symptoms for long periods of time before a correct diagnosis is made.

Most common symptoms<sup>10,11</sup> associated with symptomatic tooth infractions are-

- Pain on chewing
- Pain on exposure to cold food

Not all teeth with infractions are symptomatic. Symptoms develop when infraction involves the pulp, especially when infractions become populated with bacteria<sup>12,13</sup> and localization may also be possible when infraction reach the periodontal ligament, usually starting in the area of crestal ligament.<sup>14</sup>

These symptoms can be explained by Hydrodynamic theory of pain.<sup>15</sup> Sutton et al<sup>16</sup> suggested that the occasional sharp, momentary lancinating masticatory pain was due to bending and rubbing of dentin along fracture lines.

A unique pain response to chewing experienced by many patients is the pain that occurs when they release the pressure of biting, referred to as “rebound” or “relief” pain.<sup>11,12</sup> Pain that is stimulated by temperature changes, particularly with application of cold stimuli, also a common feature. Often, the pain felt anterior to the tooth responsible for the symptom. Pattern of pain referral noted by Brynjulfsen et al<sup>17</sup> was that pain from mandibular teeth was frequently distributed to maxillary teeth, the neck, ear, muscles of mastication and TMJ. *An important observation was that the longer the duration of pain, the more diffuse it became and often led to headaches*

**Diagnosis:-**

Diagnosis is often problematic and challenging. 20% patients referred to specialist endodontists with diagnostic uncertainties are eventually diagnosed with incomplete tooth fractures

**Dental History:-**

History of a course of extensive dental treatment involving repeated occlusal adjustments or replacement of restorations which fail to eliminate symptoms.

Patient gives a history of pain on biting on a particular tooth, often occurring with foods that have small, discrete, harder particles in them.<sup>18</sup> Patient gives a history of sensitivity to thermal changes, particularly cold.

According to Homewood<sup>18</sup>, fractures tend to occur in a direction parallel to the forces on the cuspal incline; thus with larger restorations, cracks tend to be more superficial and thereby produce fewer symptoms, while with smaller restorations cracks tend to be deeper and closer to the pulp.

If wedging forces are placed on both buccal and lingual cuspal inclines, the resultant crack may occur in the midline of the tooth and propagate towards the pulp, especially in unrestored teeth.

#### **Clinical Examination:-**

Patient may present with facets on the occlusal surfaces of teeth, localized periodontal defects. Use of rubber dam enhances the probability of visualizing these cracks by isolating the tooth, highlighting the crack with a contrasting background.

#### **Visual Examination:-**

Reveal many instances of infractions, especially when aided by the use of transillumination and a dye.

#### **Transillumination:-**

The use of transillumination is dependent on the part of the tooth to be examined. Tooth without restoration will allow the light beam to pass through, when it encounters a fracture line in dentin, the light beam will bend and not pass through the fracture line and opposite tooth structure will be dark.<sup>10</sup> Transillumination along with the use of magnification can help better in visualization of crack.<sup>17</sup>

#### **Methylene blue:-**

Gentian violet or methylene blue stains can be used to highlight fracture lines. Disadvantage of this technique is that it takes at least 2–5 days to be effective and requires placement of a provisional restoration. Placing a provisional restoration undermines the structural integrity of the tooth and further propagates the crack.

#### **Bite Tests:-**

Mimic the symptoms associated with incomplete fractures of posterior teeth.<sup>9</sup> Objects traditionally used for this purpose include: orange wood sticks, cotton wool rolls, rubber abrasive wheels such as a Burlew wheel or the head of a number 10 round bur in a handle of cellophane tape.

The technique for the use of wood sticks<sup>20</sup> has been described. It is advocated that the stick is rested on the suspected tooth and the patient is asked to bite, by the subsequent application of the stick to each individual cusp in turn, to localize the affected cusp.

- Pain which is perceived upon release of pressure is suggested to confirm the diagnosis of crack tooth syndrome.<sup>21</sup>
- Commercially available diagnostic tools to undertake “bite test” include products such as *Fract finder*, *Tooth Slooth II*. Ehrmann et al<sup>20</sup> have advocated the use of this method as one with a higher level of sensitivity than that associated with the use of wood sticks.

Cold stimulus application and electric pulp testing provides information about the status of the pulp and there is evidence that teeth with infraction respond at lower threshold levels to cold and electric pulp testing stimulation compared to non cracked teeth.

Percussion sensitivity is not frequently seen. If infraction is a cuspal infraction and does not directly involve the pulp, percussion may not be as likely to produce a symptomatic response as percussion of teeth with infraction in direct contact with the pulp.

#### **Periodontal probing:-**

- Helps to distinguish between a cracked tooth and a split tooth when the fracture line extends below the gingival, thereby causing a localized periodontal defect.
- For suspected cracks, careful probing must be performed to disclose the presence of an isolated periodontal pocket.
- *However, isolated deep probing often indicates the presence of split tooth, which predicts a poor prognosis.*

#### Radiographs:-

Radiographs are of limited use as fractures tend to propagate in a mesiodistal direction.<sup>9</sup> However, of value in detecting more rarely occurring fractures which may be running in a bucco-lingual direction.<sup>22</sup> Cracks can be detected radiographically in the rare instance in which bacteria in the infraction has stimulated clastic activity in the pulp, resulting in internal resorptive lesions.

#### Microscopic Detection:-

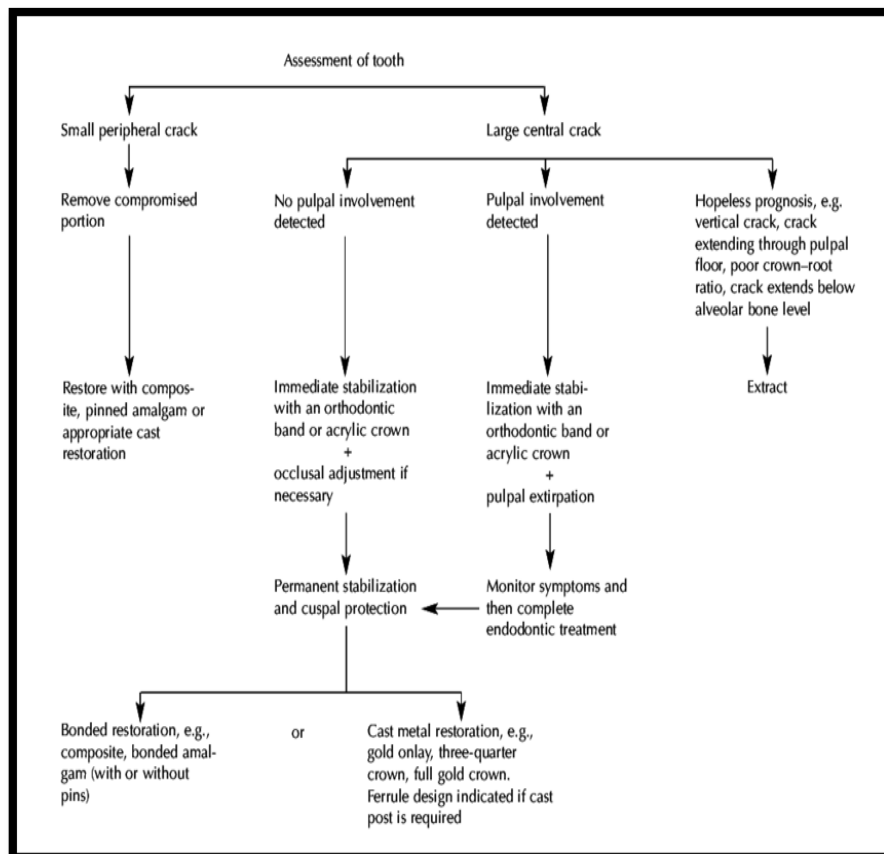

×16 provide an ideal magnification level for the evaluation of enamel cracks.<sup>23</sup> *Use of the clinical microscope makes possible the treatment of asymptomatic but structurally unsound posterior teeth.* It facilitates observation of microscopic crack lines that may show minimal color contrasts against a desiccated tooth surface.

#### Ultrasound:-

Owing to short wavelength in hard tissues and associated high resolution, ultrasound has the potential in clinical dentistry. *It has the ability to penetrate hard structures and detect hard tissue discontinuities, or pathoses, under existing radiopaque restoration.* It is also effective in detecting physical discontinuities. Therefore, ultrasound provide a significant benefit to patients by allowing early detection of dental pathology, especially cracks.<sup>24</sup>

#### Treatment:-

Treatment of CTS will depend on the position and extent of the crack. Management options vary according to clinical need, from replacement of the fractured cusp with a simple restoration to placement of an extracoronal restoration with adequate cuspal protection or root canal treatment.

**Conclusion:-**

The CTS presents both a challenge and an opportunity for the dentist. The possibility of CTS must always be considered when a patient complains of pain or discomfort on chewing or biting. In spite of CTS being a diagnostic challenge, having knowledge and awareness of CTS should enable the dental practitioner to detect the same, thereby preventing further crack propagation and complications associated with crack tooth.

Ehrlich ascites carcinoma –  
*Aurelia aurita*- hepatic and renal injury

#### Abstract

The ability of Jellyfish, *Aurelia aurita* (A.A) crude venom to modify the hepatic and renal dysfunction associated with Ehrlich ascites carcinoma (EAC) stress in experimental mice was assessed. Intraperitoneal injection of A.A. crude venom into EAC-bearing mice at different doses (50, 125, 250, 500, 750 mg/kg B.W), daily, for 7 days was compared with the standard drug, cisplatin, (2mg/kg). Loading the mice with EAC significantly reduced the red blood cells counts and subsequently reduced the hemoglobin (HB). Administration of A.A venom significantly restored red blood count and HB. EAC load had increased the activities of serum AST and ALT but decreased the concentration of albumin and total protein. A.A. crude venom as well as cisplatin improved the hepatic injury by declining the ALT activity and increasing albumin values but no significant changes in the total protein were observed. Moreover, levels of the renal biomarkers, creatinine and urea were highly elevated in EAC-bearing mice. Interestingly unlike cisplatin, levels of those renal biomarkers, creatinine and urea, were significantly decreased by A.A. crude venom administration. Furthermore, histopathological examinations revealed hepatic and renal tissues improvement in EAC-loaded mice after venom administration compared with control group. Taken together, results from this study suggest that A.A crude venom can potentially reduce the hepatic and renal damage induced by EAC load in experimental animals.

#### Introduction:-

Marine environment has always been considered as rich sources of both biological and chemical diversity. Marine organisms are the main sources of structurally diverse bioactive compounds. The great deal of interest has been expressed regarding marine derived bioactive peptides because of their numerous health related beneficial effects (Kim and Wijesekara, 2010).

**Cnidarians** venoms have roles in drug discovery as the toxic compounds isolated from cnidarian have been viewed to produce several serious implications to human health due to their neurotoxicity, cytotoxicity and tissue damage. Their toxins might offer a tool to study cell physiology (Morabito et al., 2015) and provide promising sources of pharmacological agents for therapy of human diseases.

Biological properties of venom from terrestrial animals have been extensively investigated, while scarce research has been undertaken jellyfish venom. Most of the proteinaceous venoms showing marked curative properties are from highly toxic species (snake, scorpion, etc) and their high toxicity hinders clinical trials. Hence, less toxic species like jellyfish represent a valuable source of pharmacological compounds that may lead compounds for new drugs.

*In vitro* toxic action of the venom from *A.Ahas* received some attention. Lethality and dermonecrosis were observed in mice, with various potencies depending on the origin of the specimen (**Radwan et al., 2001**). The venom is hemolytic to human, sheep, and bovine red blood cells (**Radwan et al., 2001, Segura et al., 2002 and Rastogi et al., 2012**). Protease and phospholipase A activities were recorded to change in response to such venom (**Nevalainen et al., 2004 and Lee et al., 2011**).

Previous studies concluded that SDS-PAGE electrophoresis revealed that the crude venom of *A.A* contains several bands between 200 and 6 kDa (**Rastogi et al., 2012**). The venom was purified by chromatography and the neurotoxic activity of some fractions was characterized. The protein fractions named Aa-1 and Aa-2 were identified and used for further studies. After intramuscular injections with 0.06 mg protein/kg in 0.1 ml/vol of fractions Aa-1 or Aa-2, adult crabs developed tetanic reactions followed by total paralysis and death within three minutes. The molecular weights of Aa-1 and Aa-2 were 66 and 45 kDa, respectively (**Segura et al., 2002 and Ponce et al., 2013**).

Cancer is a group of diseases involving abnormal cell growth with the potential to invade or spread to other parts of the body and associated with different organs disorder. Cisplatin has become one of the most used drugs in the treatment of solid tumors of epithelial origin. Although cisplatin has been a mainstay for testicular cancer therapy (**Einhorn, 1997**), it is also commonly used to treat ovarian, cervical, bladder, and non-small cell lung carcinoma as well as head and neck cancers (**Armstrong, 2006, Helm and States, 2009 and Konstantakou, 2009**). The two limiting factors for a successful application of cisplatin are acquired or intrinsic drug resistance of the tumor and severe side effects in normal tissues, mainly in the kidney, in the inner ear and in the peripheral nerves (**Pabla and Dong, 2008**).

In this regard, the present study aimed to evaluate the potency of *A.A* crude venom to improve the hematological, biochemical and histological injuries induced in the kidney and liver by EAC-loaded in the experimental mice and compare this effect, if there is any with this of cisplatin as one of anticancer drug.

## Material and Methods:-

### *A.A* sampling areas:-

*A.A* was collected during June, 2014 from the Red sea "Wadi el Gemal protected national park" from North head Hnkurab and North head Baghdadi areas.

### Venom preparation:-

*A.A* crude venom was prepared as described by **Torres and Heimer, (2001)** as follows; the oral arms and tentacles of organisms were clipped manually, combined and centrifuged at 1620 g for 10 min at (4°C). The pellet was resuspended in distilled water, lyophilized and stored at (-20°C). The nematocysts rupture was monitored optically in order to obtain their maximal discharge. The best technique for nematocysts discharge was obtained by applying an osmotic shock by resuspending freshly lyophilized samples in deionized water (1mg/10µl), this preparation was stirred for two minutes and centrifuged at 1932 g for 30 min at (4°C). The supernatant was then centrifuged at 11130 g for 20 min at (4°C), and filtered (0.45µm). The venom isolated and resuspended in this form, maintained full activity when stored at (-20°C) for 1 month.

### Experimental animals:-

One hundred twenty *Swiss albino* female mice were purchased from Faculty of Pharmacy Mansoura University. They were housed in plastic cages under standard condition of humidity, temperature, chow and water in the animal lab of Faculty of Science, Port Said University until became of suitable weight. EAC-bearing albino mice (tumor donor animals) were obtained from Tumor National institute, Cairo, Egypt. These mice were kept in the same conditions of normal mice.

1 ml Ehrlich tumor cells were drawn and diluted with saline (0.9% NaCl). Using haemocytometer, the tumor cells were counted and 0.2 ( $1 \times 10^7$ ) ml of freshly drawn diluted ascites fluid were intraperitoneally injected into the normal experimental mice.

### Experimental design:-

#### Animal grouping:-

After 72h of Ehrlich tumor cell injection, Female mice were grouped as follows

**1. Group1. Normal mice (Normal control)**

- a. Normal mice were I.P injected with 0.9% normal saline.

**2. Group2. EAC-bearing mice (Positive control)**

- a. Normal mice were I.P injected with 0.2 ml ( $1 \times 10^7$ ) tumor cells/mouse.

**3. Group3. EAC+ (50 mg/kg BW)**

**4. Group4. EAC+ (125 mg/kg BW)**

**5. Group5. EAC+ (250 mg/kg BW)**

**6. Group6. EAC+ (500 mg/kg BW)**

**7. Group7. EAC+ (750 mg/kg BW)**

A.A crude venom daily for 7 days

**8. Group8. EAC+cisplatin:** Tumor-bearing mice after 72 h of tumor cell injection were I.P injected with the standard drug at dose (2mg/kg) every day for 7 days as standard drug control (El-Nagar, 2011).

#### Collection of samples:-

The blood samples were collected from control group and treated groups after 7 days of daily treatment. Blood samples were collected in EDTA tubes for hematological analysis, another blood sample were left for clotting, centrifuged at 300 rpm for 15 minutes and immediately frozen at (-20°C) till the biochemical assay (ALT, AST, albumin, total protein, urea and creatinine) were carried out. Kidney and liver of the normal, EAC-bearing albino mice and treated animals were fixed in formalin (10%) for histopathological assay.

#### Hematological and Biochemical assays:-

Complete blood count (CBC) includes hemoglobin content, Red blood cells (RBC), white blood cells (WBC), and platelets (PT) counts. It was done by Abbott CELL-DYN1800 automated hematology analyzer, USA, using ready-made kits produced by Abbott laboratories, Abbott Park, IL, 60064, USA. Serum biochemical analysis was determined by colorimetric methods using ready-made kits produced by Linear Chemicals. S.L. Biochemical, BIOMED, SPINERACT diagnostic assays include Aspartate transaminase (AST), Alanine transaminase (ALT), Albumin, Total protein, Urea and Creatinine.

#### Statistical analysis:-

Data was statistically analyzed using MINITAB (Lenth, 1989). Tabulation and graphics of data were done using Microsoft Excel XP. All of the data of control and treated groups were expressed as mean values  $\pm$  standard error. One-way ANOVA and unpaired t-test were carried out to find if there was any significant difference among control and treated groups with A.A crude venom at different doses.

### Results:-

#### Haematological assay:-

The alteration of hematological parameters induced in EAC-bearing albino mice and the protective effect of A.A crude venom are given in **table (1)** comparing to cisplatin post treatment.

As shown in Table (1) EAC-bearing albino mice had a significant decline in Hb, Red blood cells but non-significant change of White blood cell, and platelet counts when compared with control group. Administration of different doses of A.A crude venom after injection with EAC had significantly increased Hb, Red blood cell. While non-significant changes were observed on the Hb levels in the groups administered with doses 125, 250, 500 and 750 mg/kg BW of A.A crude venom. Administration of the standard drug, cisplatin, at dose of 2mg/kg, showed non-significant changes in hemoglobin levels and significant elevation in the RBC count when compared with the EAC control group.

**Table 1:-** Effect of A.Acrude venom and(2mg/Kg BW) Cisplatin on hematological parameters of EAC-bearing *Swiss albino* female mice.

Parameter Groups	Haemoglobin (g/dL)	RBCs count ( $\times 10^6/\mu\text{L}$ )	WBCs count ( $\times 10^3/\mu\text{L}$ )	Platelets count ( $\times 10^3/\mu\text{L}$ )
Normal control	9.58 $\pm$ 0.258	5.212 $\pm$ 0.104	8.02 $\pm$ 0.229	194.4 $\pm$ 17.608
EAC control	7.26 $\pm$ 0.597 <sup>b**</sup>	2.8 $\pm$ 0.10 <sup>b***</sup>	6.5 $\pm$ 0.776	115.8 $\pm$ 1.907
EAC + Cisplatin (2mg/Kg BW)	6.98 $\pm$ 0.427	2.24 $\pm$ 0.051 <sup>a***</sup>	8.06 $\pm$ 0.112	97.2 $\pm$ 2.956 <sup>a***</sup>
EAC+50mg/kg A.A venom	9.18 $\pm$ 0.262 <sup>a*</sup>	5.08 $\pm$ 0.454 <sup>a***</sup>	7.86 $\pm$ 0.384	118 $\pm$ 4.898
EAC+125mg/kg A.A venom	8.5 $\pm$ 0.519	4.854 $\pm$ 0.613 <sup>a**</sup>	9.62 $\pm$ 0.220 <sup>a**</sup>	150.2 $\pm$ 3.942 <sup>a***</sup>
EAC+250mg/kg A.A venom	8.34 $\pm$ 0.627	5.03 $\pm$ 0.638 <sup>a**</sup>	10.04 $\pm$ 0.549 <sup>a**</sup>	170.4 $\pm$ 17.823 <sup>a**</sup>
EAC+500mg/kg A.A venom	9.08 $\pm$ 0.600	5.09 $\pm$ 0.286 <sup>a***</sup>	9.78 $\pm$ 0.950 <sup>a*</sup>	174.2 $\pm$ 20.582 <sup>a*</sup>
EAC+750mg/kg A.A venom	8.58 $\pm$ 0.888	4.97 $\pm$ 0.595 <sup>a**</sup>	8.52 $\pm$ 1.047	194.8 $\pm$ 10.767 <sup>a***</sup>
ANOVA(Pvalue)	—	0.000	0.005	0.000

Results expressed as Mean $\pm$  SE (n=5). ANOVA (P value) represents the difference between all groups. <sup>a</sup>represents significantly different comparing with EAC control group. <sup>b</sup> represents significantly different comparing with normal control group. \* (p<0.05), \*\* (p<0.01), \*\*\* (p<0.001).

## Biochemical Assay:-

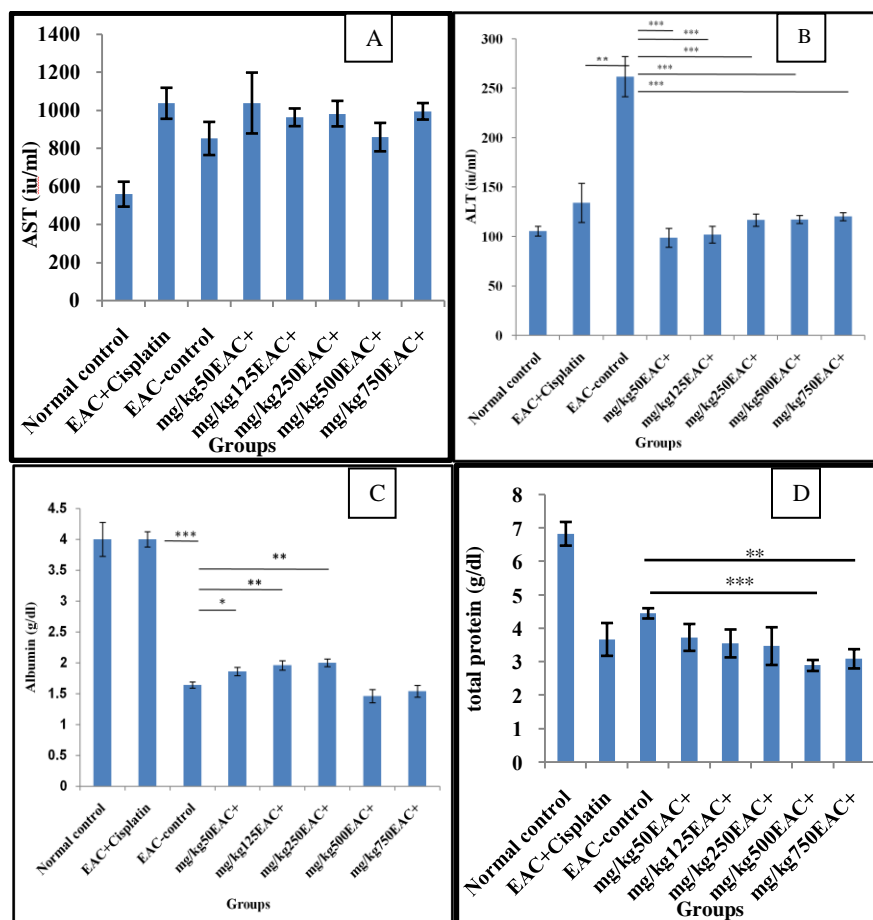

### a-Hepatic biomarkers:-

The changes in the serum liver biomarkers are shown represented in Figure 1(A, B, C, D).

EAC load in albino mice induced hepatotoxicity which is represented as significant increase in liver biomarkers; serum AST and ALT activities ( $P \leq 0.01$  &  $P \leq 0.05$ ) respectively. Both treatments with different doses of A.Acrude venom at all doses 50, 125, 250, 500 and 750 mg/kg BW and the standard drug, cisplatin, non-significantly changed AST activities while different doses of A.Acrude venom at all doses 50, 125, 250, 500 and 750 mg/kg BW and the standard drug, cisplatin, significantly declined ALT activities and ameliorate the hepatotoxicity induced by EAC as noticed in Fig 1-A and B

Moreover, Serum albumin, total protein were highly significant decreased ( $P \leq 0.001$ ) in EAC-bearing *albino* mice. I.P treatment of EACs-bearing mice with A.A crude venom induced significant increase ( $P \leq 0.05$ ) in albumin levels at dose 50, 125 and 250 mg/kg BW and non-significant changes at higher doses 500 and 750 mg/kg. Similarly, the standard drug, cisplatin, induced a very highly significant increase ( $P \leq 0.001$ ; Fig 1C)

I.P treatment of EACs-bearing mice with different doses of A.A crude venom induced non-significant changes in the serum total protein content at low doses 50, 125 and 250 mg/kg BW. Meanwhile, high doses 500 and 750 mg/kg BW of A.A crude venom caused very highly significant decrease ( $P \leq 0.001$  and  $P \leq 0.01$ ). Treating EAC-control mice with the standard drug, cisplatin, induced non-significant changes as shown in **fig1D**.

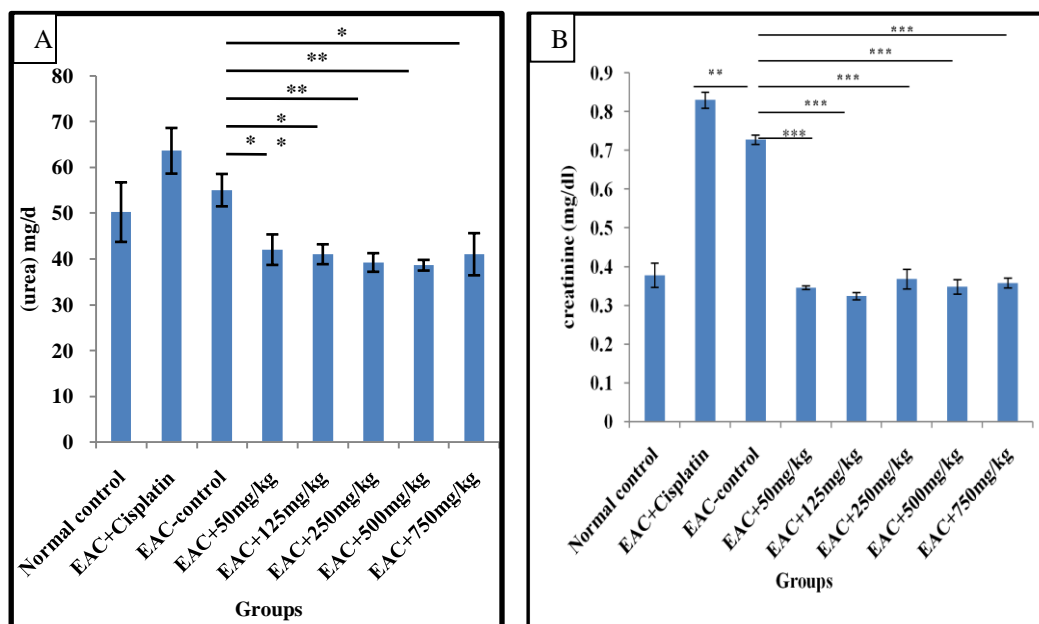

**Figure 1:-** Effect of A.A crude venom on the alteration of biochemical markers induced by EACs-bearing mice, (A) AST, (B) ALT, (C) albumin and (D) total protein levels. \* ( $p < 0.05$ ), \*\* ( $p < 0.01$ ), \*\*\* ( $p < 0.001$ ).

#### **b-Renal biomarkers:-**

EAC-bearing albino mice induced renal damage which is represented as disturbance in renal biomarkers (creatinine and urea). As shown in Fig 2, urea had non-significantly changed ( $P \leq 0.001$ ), while creatinine was significantly increased in EAC-bearing albino compared to those of the normal mice.

Treatment of EACs-bearing mice with different doses of A.A. crude venom caused a significant decline in serum urea and creatinine at all doses 50, 125, 250, 500 and 750 mg/kg BW respectively. On the other hand, EAC-control mice treatment with cisplatin did not induce any noticeable changes in urea concentration but caused a significant increase ( $P \leq 0.01$ ) in creatinine, as illustrated in **figure 2A,B**.

**Figure 2:-** Effect of A.A crude venom on the alteration of biochemical markers induced by EACs-bearing mice. urea (A), creatinine (B), \* ( $p < 0.05$ ), \*\* ( $p < 0.01$ ), \*\*\* ( $p < 0.001$ ).

#### Histopathological Assay:-

Liver and kidney from EAC-loaded mice, A.A crude venom-treated EAC-bearing mice and cisplatin treated EAC-bearing mice were represented in Fig 2 and 4. As shown loading mice by EAC deteriorate lobular architecture where hepatocytes showed enlarged nuclei, hydropic degeneration and sinusoidal infiltration of carcinoma cells mixed with lymphocytes. In addition, marked degenerative changes of renal tubules, stromal congestion and moderate inflammation with mild degeneration of glomeruli, an improvement in hepatic and renal tissues in EAC-loaded mice after A.A crude venom administration was observed at **figures 3 (A-H)**.

**Figure 3:-** Histopathology of liver in normal and EAC-bearing mice groups. **A-** Section of liver of normal control mice showing normal histological appearance of liver including central vein (CV), hepatic cells (HC). **B-** Section of liver of EAC-bearing mice illustrating hydropic degeneration (arrow head) and sinusoidal infiltration of carcinoma cells mixed with lymphocytes (arrows). **C-** Section of liver of **50** mg/kg BW A.A. venom-treated EAC-bearing mice showing shrunken deeply stained nuclei (arrow). **D-** Section of liver of **125** mg/kg BW A. A. venom-treated EAC-bearing mice showing shrunken deeply stained nuclei (arrow) **E-** Section of liver of **250** mg/kg BW A.A. venom-treated EAC-bearing mice showing restored normal lobular architecture, still to notice very few hepatocytes showed shrunken deeply stained nuclei (arrow). **F-** Section of liver of **500** mg/kg BW A.A. venom-treated EAC-bearing mice showing mild improvement with hydropic degenerative changes (arrow head). **G-** Section of liver of **750** mg/kg BW A.A. venom-treated EAC-bearing mice showing: marked improvement with mild degenerative changes (arrow). **H-** Section of liver of 2mg/kg BW **cisplatin**-treated EAC-bearing mice illustrating some hepatocytes hydropic degeneration and ballooning degeneration (arrow head). Slides captured with Power Field of 400x

**Figure 4:-** Histopathology of kidney in normal, EAC-bearing and treated EAC-bearing mice groups. **A-** section of the cortical tissue of the kidney of control normal mice showing glomeruli(G), proximal and distal convoluted tubules (DT) **B-** Section of mice kidney of EAC-control group showing moderate inflammation with mild degeneration of glomeruli, accompany the infiltration of many proliferating groups of neoplastic cells (arrow). **C-** Section of mice kidney of 50 mg/kg BW A.A. venom-treated EAC-bearing mice. **D-** Section of mice kidney of 125 mg/kg BW A.A. venom-treated EAC-bearing mice illustrating degenerative changes of tubules and inflammation with mild degeneration of glomeruli (arrow) Neoplastic cells are fewer than EAC control denoting minimal improvement (arrow head) **E-** Section of mice kidney of 250 mg/kg BW A.A. venom-treated EAC-bearing mice showing cortical tissue few of neoplastic proliferation with minimal glomerular capillary congestion (arrow head). **F-** Section of mice kidney of 500 mg/kg BW A.A. venom-treated EAC-bearing mice showing fewer neoplastic cells are than EAC control denoting minimal improvement (arrow head). **G-** Section of kidney of 750 mg/kg BW A.A. venom-treated EAC-bearing mice showing kidney totally free of neoplastic proliferation with minimal glomerular capillary congestion (arrow head) and mildly degenerated tubules (arrow). **H-** Section of kidney of 2 mg/kg BW cisplatin-treated EAC-bearing mice showing degeneration of tubes and congestion of corpuscles (arrowhead) and mildly degenerated tubules (arrow). Slides captured with high Power Field (HPF) of 400x.

### Discussion:-

Several marine organisms are of considerable interest as a new promising antitumor source. The present investigation showed the ability of A.A crude venom at different doses 50, 125, 250, 500 and 750 mg/kg BW to restore the hematological, biochemical, histopathological disorders developed in experimental mice bearing EAC cells.

The current study revealed that anemia is associated with loading the mice with EAC. It was reported that anemia encountered in tumor bearing mice is mainly due to reduction in RBC and/or hemoglobin percentage and this may occur either due to iron deficiency or due to hemolytic or myelopathic conditions (Fenninger and Mider, 1954 and Sinclair, *et al.*, 1990).

In the current study, hemoglobin content, RBCs count and platelets count showed significant decrease in EAC-bearing control mice. Interestingly, treatment with A.A crude venom with different doses induced appreciated increase in hemoglobin, RBC, WBCs and platelets counts after venom injection. The increase in RBCs, hemoglobin and platelets after treated with A.A crude venom are running in agreement with the data by **Zaki, (2005)** who proved the antitumor effect of sea cucumber, *Holothuria atra*, crude venom on biochemical and hematological parameters on rat, and suggested that this increase in the in RBCs, hemoglobin and platelets may be attributed to activation of the bone marrow by sea cucumber. Similarly, this explanation runs in agreement with **Jakowska et al., (1958)** who reported that the toxin of sea cucumber stimulates hemopoiesis in the bone marrow.

The increase in hemoglobin levels, RBCs, WBCs and platelets counts indicates that A.A crude venom may possess a protective action for the hematopoietic system. On the other hand, the significant increase in WBC's may result from the stress induced by venom injection as reported by **Bawaskar, (2012)** who studied the effect of scorpion sting.

The fact that haemoglobin and RBC content are increased in A.A crude venom-treated groups is consistent with the result by **Meenakshi, et al., (2013)** and this result by **Abd El-Aziz et al., (2014)** who studied the inhibitory effects of Rosemary (*Rosmarinus officinalis L.*) on EAC-bearing mice. Similar effect was observed by **Gupta et al., (2004)** for the extract of *Bauhinia racemosa* stem bark on EAC bearing mice. Moreover the increase in platelets count might be due to platelets activation according to **Konca et al., (2014)** who reported that during his study on the platelet function in children with scorpion envenomation.

In cancer chemotherapy, the major problems are myelo suppression and anemia (**Price and Greenfield, 1954**). In the present study, the treatment of EAC-bearing mice with the standard drug, cisplatin induced significant decrease in RBCs, hemoglobin and platelets levels comparing with EAC-control mice. Based on these results, A.A crude venom may have an advantage to restore the haematological parameters which distorted by cancer in EAC-bearing mice model.

Hepatic enzymes including ALT and AST showed a significant elevation in the EAC control group in comparison with normal control which indicates the hepatocellular damages caused by inoculation with EACs (**El-Dayemet al., 2013**). Moreover, our results revealed that the levels of hepatic enzymes (ALT, AST) were elevated in the EAC-bearing mice. Administration of A.A crude venom to EAC-bearing mice reduced the elevated ALT level indicating a recovery from EAC hepatotoxicity. Reduced level of this hepatic enzyme in serum is one of the indications of the antitumour potential (**Chakraborty et al., 2006** and **Sundaram et al., 2012**).

The current study demonstrated that the treated mice with different doses of A.A crude venom can elevate the plasma level of AST; this might be due to hepatocellular toxicity. Treatment with cisplatin as a standard drug elevated transaminases values indicating a hepatic toxicity too.

In support of this finding, elevation in the plasma levels of AST also agrees with the data by **Liang et al (2011)** who studied the effects of tentacle-only extract from the jellyfish *Cyanea capillata* and the results by **Bruschetta et al., (2014)** who studied the inflammation and oxidative stress by the crude venom extracted from the jellyfish *Pelagia noctiluca* in rats.

**Abu-Amra et al. (2015)** studied the role of bradykinin potentiating factor (BPF7) separated from jellyfish, *Cassiopea andromeda*. It was suggested that the marked increase in this hepatic enzyme by this factor may be due to an enhancement of protein biosynthesis, changes of cellular permeability and release of cyclic AMP. This suggestion was also recommended by **Enjalbert et al., (1980)**, **Etgen and Browning, (1983)**, **Abu-Amra and Abd El-Rehim, (1992)** and **Abu-Amra (2000)**.

On the other hand, the biochemical results of EAC-bearing mice revealed a decrease in the albumin and total protein levels; this may be attributed to increased mitotic division of tumor cells with high body fluid withdrawal and the capillary permeability, which permit the escape of plasma proteins into peritoneal cavity (**Garrison et al., 1987**).

Furthermore, hypoproteinemia and hypoalbuminemia may be due to excessive nephritis and/or massive ascites and also associated with liver disease. This is in parallel to increased AST activity which may be attributed to hepatic damage as a result of cancer cells invasion (**Badret et al., 2011**). Treatment of EAC-bearing

mice with A.A crude venom had significantly increased albumin level in a dose-dependent pattern in lower doses (50, 125 and 250 mg/kg BW) and return to decrease albumin level non-significantly in the higher doses (500 and 750 mg/kg BW), while treatment with cisplatin elevated albumin value to be restored to normal values.

This change of albumin levels recorded in the A.A crude venom-treated animals is in agreement with **Abd El-Aziz et al., (2014)**. The decrease in albumin level in Ehrlich group and its improvement by A.A crude venom may be due to A.A hepatoprotective activity in EAC-bearing-treated mice. In line with these findings, **Natesan et al., (2007)** and **Senthilkumaret al., (2008)** showed that the methanol extract of *Careya arborea* (has antitumor effect) have a hepatoprotective activity in EAC-bearing mice.

In the present study we found a decrease in total protein level after the administration of A.A crude venom. The same effect was observed in the cisplatin-treated EAC-bearing mice. This decrease in total protein level after the administration of A.A crude venom agrees with the study by **Zaki, et al., (2005)**. This decrease may be due to increased catabolism of plasma proteins, or to impaired synthesis of the protein.

It was demonstrated that, the presence of tumors in human body or experimental animals is known to affect many functions of vital organs (**DeWys, 1982**). At the current study, urea and creatinine levels, which are considered as makers of kidney function, were significantly elevated in serum of EAC-control mice indicating renal impairment. These alterations induced by toxic conditions, reflected metabolic cellular dysfunction of these tissues (**Robbins et al., 2001**). An elevation of urea may be attributed to an increase in nitrogen retention or excessive protein breakdown (**Geraciet al., 1990**).

Treatment with A.A crude venom gradually returned the increased levels of urea and creatinine to more or less the normal values, while the treatment of EAC-bearing mice with cisplatin maintained their higher values.

Histopathological assay offered more evidence for improving the EAC-induced cytotoxicity by A.A crude venom. Treatment with different doses of A.A crude venom especially high doses showed regular hepatocytes with abundant cytoplasm with mild hydropic degeneration and mild degenerative changes similar to control.

In addition, treating EAC-bearing mice with the A.A crude venom especially, at the highest doses shows kidney totally free of neoplastic proliferation with minimal glomerular capillary congestion and mildly degenerated tubules with interstitial inflammation. This result is similar to that reported by **Nagarjuna et al., (2013)** when they studied the anti-cancer activity of *Ruellia tuberosa* on EAC induced mammary tumor.

In conclusion, loading mice with EAC-bearing mic- induced haematological, hepatic and renal toxicity. I.P administration of A.A crude venom could restore the hepatic and renal biomarkers which were disturbed by EAC application, moreover, A.A crude venom had improved the histopathological disturbances by EAC load. This biological activities induced by A.A crude venom might be attributed to some bio-active compounds. Further researches are still required to separate and identify the biologically active protein of A.A crude venom individually, then determined the biological mechanism of the effective fraction/s.

Saudi Arabia

#### Abstract

**Background:** Mobile phones provide health care workers' (HCWs) with fast communication and quick access to medical information. Their frequent use in the hospital environment may pose a risk of spreading nosocomial infections. In this study, we aimed to determine the bacterial contamination of HCWs' mobile phones.

**Materials/Methods:** Samples were collected from mobiles of HCWs' at King Abdulaziz Medical City, Riyadh. A swab taken from the mobile phone and a questionnaire was answered by each subject. The swabs were sent to the lab for culture, carrying a serial number to indicate the questionnaire.

**Results:** Of the 400 mobile phone samples, 171 (43%) showed bacterial growth. Different variables were examined. The number of male HCWs sampled was 167, 90 of them (54%) showed positive growth, while only 81 (35%) of the 233 samples taken from female participants showed positive growth (p-value = <0.005). In addition, samples taken from phones that are frequently cleaned (226 samples) showed 10% less growth than mobile phones that are not frequently cleaned (p-value = 0.049). The most commonly isolated organism was Coagulase negative Staphylococci, which were isolated from 121 (30%) phones of the mobile phones sampled.

**Discussion:** More than one third of the HCWs' mobile phones were contaminated with bacteria. Our results showed that the degree of bacterial contamination in KAMC-Riyadh is less than studies done in other countries. The most common isolated organism in many of the reviewed studies was methicillin sensitive S.aureus, while in our study it was coagulase negative Staphylococci.

**Conclusion:** More than one third of the HCWs mobile phones were contaminated by bacteria. The results support the claim that HCWs' mobile phones may serve as vectors for transmission of nosocomial infections, and that cleaning mobile phones may reduce this risk.

**Introduction:-**

Mobile phones provide healthcare workers (HCWs) with faster communication and quick access to information, hence, they are usually kept near-at-hand.<sup>7</sup> Some hospitals are even using mobile phones instead of pagers.<sup>9, 10</sup> There are currently no guidelines on mobile phone cleaning and handling in the medical field. Whenever HCWs use their mobile phones, they may transmit organisms from their hands to their mobile phones. As a result, HCWs' mobile phones serve as reservoirs for these microorganisms that could be easily transmitted back to the HCWs' hands. In this way, mobile phones may facilitate the transmission of nosocomial infections.

Many studies have supported this claim: a study done in Turkey has shown that 94% of HCWs' mobile phones and hands in operating rooms and intensive care units demonstrated evidence of bacterial contamination with different types of bacterial organisms. 31.3% of the mobile phones sampled were contaminated with gram negative strains.<sup>11</sup> Another study done in India has shown that as much as 98.5% of HCWs' mobile phones were contaminated by bacteria.<sup>12</sup> Furthermore, a study that sampled 90 HCWs' mobile phones revealed that 70 (89.7%) mobile phones were contaminated by bacteria, 10 of them (11.5%) were contaminated with bacteria known to cause nosocomial infections.<sup>15</sup>

Our study was conducted in King Abdulaziz Medical City (KAMC)-Riyadh. KAMC-Riyadh is a 962 bed tertiary care center located in Riyadh City, Saudi Arabia, which is affiliated with King Saud Bin Abdul-Aziz University for Health Sciences.<sup>16</sup> In this study, we aimed to determine the degree of bacterial contamination of HCWs' mobile phones in KAMC-Riyadh and to identify the microorganisms colonizing these mobile phones. Also, we wanted to estimate the effect of various factors (e.g. gender, position, department of the owner and age of the mobile phone) on bacterial contamination of the mobile phones.

**Methods:-**

A total of 400 samples were collected from HCWs. Non-probability convenience sampling was used. Each morning the principal investigator would assign the data collectors to a different location inside the hospital. Ten samples were collected per day. Before taking samples, written consent was taken from each participant. After that, the participant's mobile phone was sampled using a sterile wet swab. All 400 swab-samples were collected by a single data collector to ensure consistency of the swabbing technique. The back and sides of the mobile phone were swabbed using a sterile wet swab. Simultaneously, the participant was asked to fill a questionnaire. The questionnaire was prepared based on literature review. The questionnaire assessed the following factors: position, department, gender, years of owning the mobile phone, frequency and method of cleaning the phone, frequency of usage of the mobile phone, use of headphones, and use of the phone while dealing with patients. Then, the swabs were taken to the lab conservatively, and assigned lab technicians cultured the samples on blood agar media for 48 hours. Positive cultures were further analyzed using Gram stain, Coagulase, and Catalase reactions.<sup>11,12,14,15</sup>

After obtaining culture results, data from the lab and questionnaire were entered into Microsoft Excel. After data entry was done, data was exported to SPSS version 21 for analysis. Variables were analyzed by Chi square test. P values < 0.05 were considered significant.

**Results:-**

The rate of bacterial contamination of HCWs' mobile phones was 43% (171 phones). Coagulase negative Staphylococci were isolated from 123 (30%) mobile phones, followed by Corynebacterium species, which was isolated from 53 (13%) mobile phones. Details of the number and type of bacteria obtained from mobile phones are depicted in Figure I.

Figure 1-Frequency of isolated organisms from mobile phones

Demographic variables and their effect on phone contamination were obtained from HCWs and are summarized in Table 1. Phone related factors and whether or not they affected the rate of contamination are shown in Table 2. Of the aforementioned variables, only two showed significant difference, which were gender of the owner and cleaning the mobile phone. The number of samples taken from male participants was 167, of which 90 samples (54%) showed positive growth. On the other hand, 81 (35%) of the 233 samples taken from female participants showed positive growth (p-value= <0.005). In addition, samples taken from phones that are cleaned daily (226 samples) showed 10% less growth than mobile phones that are not cleaned daily (p-value= 0.049). In addition to isolating various bacteria, one mobile phone of a female nurse isolated a fungus "Curvularia species."

Table 1:- Participant demographics.

		Positive		Negative		P-value
		N	%	N	%	
Position	Consultant	33	47%	37	53%	0.571

Do you use your cellphone while dealing with the patient?	Yes	62	52%	58	48%	0.139
	No	167	60%	113	40%	

**Discussion:-**

Of the phones sampled in this current study, 43% showed positive bacterial growth which is comparable to a study conducted in the eastern province of Saudi Arabia by Sadat-Ali et al.<sup>17</sup> Most studies show higher contamination rate than our study. Another study done by Ulger et al. reported that 94.5% of 200 health care workers' mobile phones were contaminated with various microorganisms, including nosocomial pathogens.<sup>11</sup> Another study done in India has shown that as much as 98.5% of HCWs' mobile phones were bacterially contaminated.<sup>12</sup> However, a study done in Queen Elizabeth hospital in Barbados, West Indies, had results similar to ours with 45% of mobile phones of 266 medical staff and students were culture positive.<sup>14</sup>

In our study, the most frequently isolated organism was coagulase negative Staphylococcus which was isolated from 30% (121 phones) of the samples. The most common organisms found by Sadat-Ali et al. were Staphylococcus aureus (33%), followed by Staphylococcus epidermidis (22.9%) and Escherichia coli (12.8%).<sup>17</sup> Whereas, a study done in Egypt by Badr et al. had similar results to our study with coagulase negative Staphylococcus being the most common isolated organism (33.3%).<sup>18</sup> Also, 90.5% of the phones sampled by Ulger et al. showed positive growth of coagulase negative Staphylococcus.<sup>11</sup>

The fact that we were able to isolate a fungus "Curvalaria species" indicates another area of thinking about the chance that mobile phones can transmit fungal infections to certain patients.

A limitation to our study is the lack of antibiotic sensitivity testing, which prevented us from accurately comparing our results to other studies. Also, we were not able to assess the risk of some of the isolated bacteria.

Even though the use of cellphones may facilitate patient care, it may pose a risk to patients in the form of transmitting nosocomial infections. Cleaning mobile phones reduces the bacterial contamination of mobile phones which may decrease this risk. We recommend that mobile phone cleaning guidelines are put forth and implemented. Furthermore, the use of mobile phones should be restricted in high-risk situations.

#### Abstract

The present study focused on the identification, isolation and quantification of a major bioactive compound colchicine from the suspension culture of *Gloriosa superba* L. The plant is an ornamental climbing herb with tuberous roots and having numerous medicinal properties. Suspension culture was established in MS medium with different hormonal combinations. Phytochemicals were analysed from callus which later compared to the methanol extract from root tubers of *Gloriosa superba*. The presence of high amount of colchicine in the methanol extract of root tuber and the callus was confirmed through the HPLC. Both the tuber extract and callus indicated the presence of colchicine but the callus has only less amount of colchicine. So production of colchicine was enhanced through elicitation in the suspension cultures. Suspension culture of *Gloriosa superba* was established and production of colchicine was enhanced using various biotic and abiotic elicitors. Colchicine in the suspension culture was identified, quantified and isolated using various chromatographic techniques. The result showed that maximum colchicine production was induced by the biotic elicitor namely chitosan and colchicine was separated and quantified through HPLC, column chromatography, HPTLC, and TLC. The present study thus confirmed that the suspension culture of *Gloriosa superba* possessed high amount of colchicine and which has to be used for further investigation and evaluation of medicinal properties.

#### Introduction:-

Medicinal plants have played an important role in the development of human culture. Majority of the modern medicines are produced indirectly from medicinal plants and some plants are directly used as medicines. Many commonly used food crops also showed medicinal properties along with their nutritional qualities. Medicinal plants are the major resource for new drugs or drug leads, so the study of these plants helps to understand the pharmacological and therapeutic output and thereby give way for their sustainable utilization. The cultivation and preservation of medicinal plants also helps to protect the biological diversity (Irchhaiya *et al.*, 2014).

The medicinal plant *Gloriosa superba* L. is one of the perennial climbing herb belongs to the family Liliaceae. This plant has numerous medicinal properties and is used for curing major ailments like ulcers, piles, cancer, asthma,

haemorrhoids, inflammation, malaria, leprosy and stomach aches. All parts of *Gloriosa superba* showed medicinal values. The leaf sap is used as a smoothening agent for skin eruptions. The V- shaped tuber is used for the treatment of cancer, haemorrhoids, chronic ulcers and also for inducing labour pains and also reported to have hepatoprotective (Nikhila *et al.*, 2016) as well as anti-inflammatory activities (Nikhila *et al.*, 2015). Root tuber with sesamum oil will reduce the pain in arthritis affected joints. Seeds are used for curing rheumatic pain and also act as muscle relaxant (Ravindra and Mahendra, 2009). The medicinal properties of the plant give evidence to the presence of major secondary metabolites. One of the major compound identified from *Gloriosa superba* is colchicine (Kavina *et al.*, 2011). The cell suspension culture is an important technique for the production of secondary metabolites from the medicinal plants. Thus the main objective of the present study was focused on the isolation and quantification of a major compound colchicine from the suspension culture of *Gloriosa superba* through various chromatographic techniques.

## Materials and Methods:-

### Establishment of Suspension Culture:-

The callus was established using various explants like internode, leaves etc. inoculated with M S medium at different hormonal combinations. Then the six week old callus was transferred into liquid MS media. The cell suspension culture was grown for 25 days in the shaker and this culture was used for the production of secondary metabolites. For the enhancement of secondary metabolite production various types of elicitors were used periodically. The major elicitors used were chitosan, pectin, salicylic acid and calcium chloride at various concentration and incubated for 24, 48 and 72 hours (Gopi and Vatsala, 2006). Major bioactive compounds were identified and quantified using chromatographic techniques.

### Chromatographic Techniques:-

For the identification, isolation and quantification of bioactive compounds various types of chromatographic techniques were used. In case of HPLC the retention time of sample was compared with that of the standard for the identification of colchicine. A C18 column with silica gel and acetonitrile: methanol: water (32:48:20) were used as the stationary phase and the mobile phase respectively.

Column chromatography is a method used to purify individual chemical compounds from mixtures of compounds. The Silica gel was used as the stationary phase and the mobile phase consisted of toluene: ethyl acetate: formic acid: methanol. The fractions obtained were subjected to High Pressure Thin Layer Chromatography. In HPTLC the silica gel used as stationary phase and toluene: ethyl acetate: formic acid: methanol was used as mobile phase. For TLC silica gel and the mixture hexane: chloroform used as stationary and mobile phase respectively (Asha *et al.*, 2013).

## Results and Discussion:-

### Suspension Culture:-

The HPLC profiling showed that the crude methanol extract possessed high amount of colchicine compared to the other standards. Since it is present in high amount, the colchicine is selected as a major compound for further study. For the establishment of suspension culture 96% of the callusing was observed in the hormone combination NAA+ BAP at the concentration of 0.15 + 0.25mg/l. But the callus produces only lesser amount of colchicine [(Fig 1(a) and Fig 1(b))]. So the suspension culture which is ideal for production of colchicine was established and elicitors were used for enhanced production. The six week old callus were used for the elicitation of major compound namely colchicine (Fig: 2).

Suspension culture with the elicitor salicylic acid induced the production of 4.09 mg/g alkaloid within 48 hours at the concentration of 0.25µM. The medium also have 1.86 mg/g alkaloid which exuded into the medium with in the 24 hours at the concentration of 5 µM (Table 1). With the presence of CaCl<sub>2</sub> maximum alkaloid production was observed at 0.5µM concentration within the 48 hours and 1.57mg alkaloid was exuded out into the medium at the concentration of 2.5µM within the 72 hours (Table 2). The Table 3 showed the effect of chitosan on alkaloid production. Maximum alkaloid production (5.96mg/g) was noticed at the concentration of 1mg of chitosan. The medium also have 3.46mg/g alkaloid at the concentration of 1mg of chitosan within the 48 hours. The Table 4 showed that 4.56mg/g of alkaloid was produced at the concentration of 1mg of pectin and the medium also have 2.86mg/g of alkaloid which was exuded out into the medium within the 48 hours. Pandurangan and Philomina, (2010) reported enhancement of colchicine by the addition of sulphate ions whereas in the present study addition of the chitosan enhanced the maximum production of colchicine in cell suspension culture of *Gloriosa superba*.

**HPTLC:** The estimation and quantification of isolated compound from suspension culture was analysed by HPTLC. The result showed that the chitosan induces maximum amount of colchicine production in the suspension culture (Fig: 3)

#### Column Chromatography:-

The column chromatography of suspension culture provide 82 fractions. These fractions are subjected to the alkaloid test. Out of 82 fractions only 12 to 19 fractions showed positive result for the alkaloid test. Isolated fractions with alkaloid were subjected to HPTLC and also subjected to TLC using standard (Fig: 4). The spot with alkaloid was scratched out from the preparative TLC was used for further analysis which clarifies it as colchicine. These results were comparable with the previous work done by Kavina *et al.*, (2011) where identification and quantification of colchicine from seed and tuber through various chromatographic techniques were reported.

#### Conclusion:-

It can be concluded that the suspension cultures of *Gloriosa superba* can suggested as an improved system for *in vitro* production the medicinally active compound colchicine. The present study will be helpful for the maximum utilization of the plant along with the identification and isolation of useful bioactive molecules.

##### Key words:-

Existing physical feature, Rural kitchen.

#### Abstract

Women spent their most of the time in the kitchen. Their work efficiency, cooking quality and the stress on women is more important in the kitchen. All these will be going to affect by physical condition of the kitchen. Compare to bedroom, kitchen rooms, need proper planning of lighting but unfortunately due importance not given to the kitchen. A study was conducted in village area to affect the physical condition of the rural kitchen on the house wives of rural area while carrying out kitchen activities. The study indicated that there is a need to create awareness and educate housewives about the necessity of good physical condition for carrying out cooking activities with ease and comfort and also to impress upon them the unnecessary strain that they under go due to poor physical condition of kitchen. Keeping this fact in view the present study was conceptualized to gain inside into the rural kitchen, its physical features and water facilities. Study was conducted in Kanpur Dehat through direct interview schedule. Rural kitchen were still not in good condition maximum were of kachcha type and constructed in open place.

#### Introduction:-

Housing is a basic human need and an important constituent for the quality life of the people and an index of the socio-economic progress of a country. It provides the base for increased access to health, education and sanitation, especially for the poor and the vulnerable groups. Housing in India has two major facets: urban and rural. Urban housing received more attention because of the pressure of growing population and the need to meet the requirements of slum and pavement dwellers as well as urban renewal. In the process, rural housing got neglected, though the greater part of population lives in villages. The nature and magnitude of rural housing problem is much more complex. In the rural areas, poor people usually live in *kachcha* sheds which can hardly be called houses in the true sense. It is surprising but true that when living standard of people has been rising day by day, there is not much improvement in the organization and qualities of kitchen especially in rural areas and lower income brackets of urban areas. Mud, brick wall and cow dung smeared floor were the most common being found in almost all the houses while only one had stone wall and two had their flooring of cement in Ludhiana (Kirthi, 1985).

Encyclopedia Britannica has defined kitchen “as a room or place in a house for cooking in which culinary and other activities are kept”. The kitchen is the most valuable and important place in a house because cooking is done here for the physical and mental fitness of the family members. A family’s physical and mental health depends upon the

food cooked in the kitchen and (Patani, 1979). In other words, kitchen is a very significant part of house. A home maker spends major part of her working hours in food related tasks and the kitchen is the main arena where these tasks are performed. A rural homemaker spends about 6 to 7 hours daily in the kitchen (Sandhu, 1972). It is important that kitchen of a house should meet at least minimal standards, so that the health and safety of a home maker, who spends most of her time in the kitchen can be safe guarded. Hence, careful planning and organization of kitchen are imperative to perform the activities efficiently and reduce the time and energy spent in cooking related activities. Keeping this fact in view the present study was conceptualized to gain inside into the rural kitchen, its physical features, use and storage features available so as to pave the way. Further, it was thought that a study of this nature would also build information on prevalent conditions in rural housing as we entered the new millennium.

### Materials and Methods:-

The study was conducted in Kanpur dehat of Uttar Pradesh during the year 2016. The pre-coded interview schedule was constructed in order to elicit information needed to obtain the objectives of the study. Multistage purposive random sampling technique was followed to select the state, district, blocks, villages and respondents. District Kanpur dehat was purposively selected as a field of study while four blocks namely Akbarpur, Maitha, Amraudha and Rajpur were selected randomly. Two villages from each selected block i.e. Bara and Patari village from **Akbarpur block**, Chhateni and Tikari villages from **Maitha block**, Chaprehta and Fatepur village from **Amraudha block** and from **Rajpur block** Kandhi and Dewanpur village were selected randomly. Twenty respondents from each selected village were randomly selected. Total 160 respondents were randomly selected for final data collection.

### Results and Discussion:-

The housing as a component of social sector of modern economy was most under developed and under invested. In other words, housing was one such social sector which often exhibited very low yield.

**Table 1:-** Distributions of Households on the Basis of location of Kitchen.

S.No	Location of Kitchen	Frequency	Percentage
1	Verandah	37	23.13
2	Open	90	56.25
3	Close Compact	33	20.62
4	Total	160	100.00

Results of the study in table 1 revealed that Area used for cooking food is mentioned as kitchen in the study. Data pertinent to physical features of rural kitchen presented in table 4.2.1 inferred that majority (56.25 %) households had open kitchen while about twenty four per cent kitchens were located in verandah, followed by 20.63 per cent kitchens were close compact kitchen, whereas data pertinent to location of cooking area as identified by **Awasthi et al. (2002)** revealed that while 50.83 % rural families carried out cooking in a separate/enclosed kitchen the remaining cooked in open verandah or backyard.

**Fig 1.2:-** Location of Kitchen According to the Age of Respondents

Clearly depicts that maximum respondents belonging to less than thirty year of age group were having close compact kitchen but in contrast to this majority of fifty and above age groups respondents were having open kitchen. Majority of respondents having kitchen in verandah were belonging to 30-40 years of age.

**Table 2:-** Distribution of Households on the Basis of Orientation of Kitchen

S.No	Orientation of Kitchen	Frequency	Percentage
1	East	50	31.25
2	West	45	28.13
3	North	25	15.62
4	South	40	25.00
	<b>Total</b>	<b>160</b>	<b>100.00</b>

As per the recommendations given by *R.S. Deshpande (1965)* kitchen should be oriented towards East or Northeast and about thirty one per cent households were having their kitchen towards East side followed by 28.13 per cent who's kitchen had West orientation. One quarter kitchens were oriented towards South, whereas minimum (15.62 %) kitchens were having North orientation.

**Table 3:-** Distribution of Households on the Basis of Style of the Kitchen.

S.No	Style of the Kitchen	Frequency	Percentage
1	Sitting	120	75.00
2	Standing	25	15.62
3	Sitting & standing both	15	9.38
	<b>Total</b>	<b>160</b>	<b>100.00</b>

Out of total 160 households, three fourth i.e. 75.00 per cent households under the study were having sitting style kitchen, while 15.62 per cent households were having standing kitchens. Only nine per cent households were found to have sitting and standing both styles as per the need.

**Table 4: Distribution of Households on the Basis of Type of Kitchen**

S.No	Type of Kitchen	Frequency	Percentage
1	Kachcha	40	25.00
2	Mixed	85	53.13
3	Pucca	35	21.87
	<b>Total</b>	<b>160</b>	<b>100.00</b>

More than fifty per cent households were having mixed type of kitchen followed by twenty five per cent who had kachcha type of kitchen. About twenty two per cent kitchens were pucca kitchens.

**Table 5:-** Distribution of Households on the Basis of Type of Floor

S.No	Type of Floor	Frequency	Percentage
1	Mud	81	50.63
2	Brick	37	23.12
3	Cement plastered	33	20.62
4	Tiled/Mosaic	9	5.63
	<b>Total</b>	<b>160</b>	<b>100.00</b>

More than fifty per cent floors out of total kitchen under the study were made of mud, followed by 23.12 per cent which were made of bricks. About twenty one per cent kitchen floors were cement plastered. Minimum i.e. only about six per cent kitchen floors were made of tiles or mosaic.

**Table 6:-** Distribution of Households on the Basis of Kitchen Enclosures

S.No	Kitchen Enclosures	Frequency	Percentage
1	With roof & dwarf wall	35	21.88
2	Roof with high wall	33	20.62
3	Without roof & dwarf wall	29	18.13
4	With roof & without dwarf wall	63	39.37
	<b>Total</b>	<b>160</b>	<b>100.00</b>

As per the table 6 majority (39.37 %) households having kitchen without roof and dwarf wall, whereas 21.88 per cent kitchens were enclosed with roof and dwarf wall. Further 20.62 per cent kitchens were having roof with high walls while, about eighteen per cent kitchens were enclosed by roof but not having dwarf wall.

**Table 7:-** Distribution of Households on the Basis of Construction Material of Roof

S.No	Construction Material of Roof	Frequency	Percentage
1	Thatch	13	8.13
2	Fired mud tiles	28	17.50
3	Tin shade	15	9.38
4	Brick	18	11.25
5	Cemented plastered	23	14.37
	<b>Total</b>	<b>160</b>	<b>100.00</b>

Roof was found in 97 kitchens and out of those maximum i.e. about eighteen per cent roofs were made of fired mud tiles, while 14.37 per cent households were having cement plastered roofs in their kitchen followed by 11.25 per cent households were having roofs of kitchen made of bricks. About ten per cent households were having tin shade on kitchen. Only 8.13 per cent were having thatched roof. Majority about thirty nine per cent kitchens were not having any roof.

**Table 8:-** Distribution of Households on the Basis of Construction Material of Wall.

S.No	Construction Material of Wall	Frequency	Percentage
1	Mud	43	26.88
2	Brick	29	18.13
3	Plastered	25	15.62
4	No construction of wall	63	39.37
	<b>Total</b>	<b>160</b>	<b>100.00</b>

Out of total 97 households having walls in their kitchen, 26.88 per cent households were having mud walls in their kitchens, while more than eighteen per cent households were having brick walls in the kitchen. About sixteen per cent households were having cement plastered walls in the kitchen. On the other hand 39.37 per cent households were not having any walls in their kitchens.

### Conclusions:-

The outcomes of the study reveals that 20.62% respondents carried out cooking in a separate or closed compact kitchen while 23.13% of them cooked in verandah and majority 56.25% respondents cooked food in open place of the house. 28.13 % kitchens had west oriented face. More interestingly, only 42.5 % rural kitchen had roof and out of those only 14.35% were cement plastered roof. Hence, it can be concluded that the kitchens in rural areas are in poor conditions compare to urban areas. Therefore, rural kitchens and its designing need immediate attention of planners, policy makers' architects and builders apart from households themselves.

#### Abstract

A wireless sensor network (WSN) consists of number of sensor nodes along with a sink node that keeps track of all information in the network. These sensor nodes get the power from small some batteries in them. The WSN is used for many applications mostly for the regions that are out reach of human beings e.g. hilly area, mountains, rivers and to get readings of these places to get the environmental changes, we have to connect all nodes, connection of these all nodes forms the graph of the network. There is needed to be synchronized and balanced battery life to increase the life of the network. This is the main motive of our project here we have proposed a protocol which will help us in enlarging the life of network and low battery loss in the network for that we will keep only the sensor nodes that are part of path at the time of transmission and those who are not in use will be kept in sleep mode. This will help us to enhance energy of the battery of and also enhances the energy of entire network.

#### Introduction:-

A Wireless Sensor Network (WSN) consists of large numbers of sensor nodes. These sensors are sensing the number of events in the world. All sensor nodes are keeping communication within the nodes by using wireless network only. They are getting power from battery and we know that battery have limited energy. Each sensor node consumes limited power and memory again due to constraints imposed by the available supply of energy. The major function of WSNs is to observe and record events in the environment and report them to the sink. In the process, the sink node also needs to broadcast messages to each node of the WSN, and sensor nodes may need to communicate with each other as well. Wireless sensor network are typically deployed in extreme conditions such as mountainous region, foreign planets such as Moon, Mars etc.

In order to enhance the network life duration, it is very important to minimize the consumption of energy by individual nodes. This would ensure that the connectivity needed to transmit data from a sensor node to sink can always be maintained. And average energy loss per transmission will be minimized.

Another requirement of WSNs for applications such as flood detection, fire detection etc. is that the delay to transmit data from sensor node to the sink should be as minimum as possible. These requirements need to be complete. Completion of requirements is not too easy. The transceiver is the major unit that consumes lots of energy

in each sensor node even when it is idle. Therefore, sensor nodes are usually put to sleep if they are not required to transmit data or sense environment i.e. minimization of energy consumption and it is really very difficult to integrate sleep scheduling scheme with routing protocols for WSNs. Thus we can achieve the objective of routing protocols. We assume that the transceiver, processor, and sensing units can be put to sleep (minimization of energy consumption) independently and when we say that the sensor node is put to sleep, we denote that the transceiver and the processor are put to sleep. The sleep scheduling of sense units can be complete separately to ensure sensing coverage. Here, we propose a fresh sleep scheduling scheme using a tree, and an energy aware routing protocol that is appropriately integrated with the above sleep scheduling scheme with a view to meet the objectives for routing protocols as given above.

### Project scope:-

The energy routing protocol in this project is intended for WSNs in which sensor nodes are static. Besides the applications running in the WSN require that the information's gathered by the sensor nodes have to be transmitted quickly to the sink. We are assuming that each node has a unique ID, and the communication between neighboring nodes is symmetric and bidirectional. It is as well unspecified that the clocks of the sensor nodes in the WSN are synchronized so that nodes can be woken up nearly at the same time i.e. synchronization and they can execute the protocol. The objectives of energy routing protocol with sleep scheduling are as follows.

1. Many sensor nodes should be asleep many of the time so that the energy consumption per node is reduced.
2. Consumption of energy by all the sensor nodes of systems remains balanced, i.e., at any time, consumption of energy of each node should be same.
3. Transmission time of data from a sensor node to the sink is as minimum as possible as i.e. energy consumption will be minimum.

### Project Architecture:-

**Fig 1:- Project architecture**

Energy routing protocol with sleep scheduling. The energy routing protocol is intended for WSNs in which sensor nodes are static. Besides the applications running in the WSN require that the information shared by the sensor nodes from the sensing field have to be transmitted urgently to the sink. Next, we have to consider that each node has a unique ID, and the communication between neighboring nodes is symmetric and bidirectional. It is as well unspecified that the clocks of the sensor nodes of all in the WSN are synchronized so that nodes can be woken up nearly at the same time, and they can execute the energy routing protocol.

Also with the special module that will inform the administrator about any attack that has appeared at any of the nodes in our wireless sensor network by sending the details of the attack in the form of a message notification to his mobile phone.

### Overview of energy routing protocol:-

System is divided in two parts 1. Sensor node & 2. Sink node. Sensor node is one of the nodes in the network except the one who receives data sensor node's work is to provide the data to be delivered to the sink node and the information about its neighbors along with their battery lives. Sink node find its the path of data delivery and also one who receives the data from the sensor nodes.

We plot a graph of network that we have to deal with the entire sensor node who is the information sender then. Sink node divides the sensor node in internal nodes and Leaf nodes basically internal nodes are those who have active participation in the data delivery and leaf nodes are those whom we don't need during current data delivery. And according to our protocol we keep the internal nodes awoken and let the leaves sleep till this data transmission is completed. Administrator is informed if any node is under attack .Thus we did the energy consumption by doing the sleeping the nodes whenever not required and wake up the sensors whenever required. Also we made the equal energy consumption of all sensors nodes and proper synchronization.

### Results of energy routing protocol:-

We have obtained few results by comparing our system with few of the previously existing systems. Following are the results by comparison with the GSP [4].

**Fig 2:-** Percentage of active nodes and dead nodes, packets delivered, and average remaining energy in unipath approach.

**Fig 3:-** Percentage of active nodes and dead nodes, packets delivered, and average remaining energy in our approach.

Here the two graphs look same but our protocol is different from the GSP [4]. Because our protocol takes very less time than it, reason behind that is table that consists of the energy value of each node and it is automatically updated after each transmission is complete. While in GSP [4] the table is created each time while we are going to transmit other node or the same node.

Following figure shows the comparison of our protocol with the traditional approaches that were used previously even before the GSP [4]. From the following graph it is easy to predict how energy efficient our protocol is, e.g. if we consider the total battery consumption in the network in 8 transmissions by taking integer value 60 / transmission then if the network is of 8 nodes the battery consumption will exceed integer value 3500, but using our proposed protocol the value is even less than integer value 2000. The result says it all.

Fig. 4:- Comparison of battery use in our protocol & previous protocol.

### Conclusion:-

We presented an energy aware routing protocol with sleep scheduling for WSNs. The core of the routing protocol is the efficient construction of the broadcast tree with two paths from each node towards the sink, and with higher remaining energy at each internal node of the tree. The tree is reconstructed at the beginning of each period so that none of these nodes dies before other nodes, which means that all nodes will die at around the same time. Consecutive packets are routed through alternative path to reduce traffic in individual paths. Leaf node sleep mechanism is highly energy efficient as more number of nodes is able to sleep, and this helps to prolong the network lifetime.

#### Abstract

This paper reports the results of numerical study undertaken to investigate the effect of different impeller types and rotational speed on velocity field in mixing tank. The hydrodynamic of the flow in standard mixing tank generated by two impellers, Chemineer S-4 impeller (radial flow), Pitched Blade impeller (axial flow) is studied. Using ANSYS FLUENT v15.4. is used to solve the continuity and momentum equations incorporating the RNG K- $\epsilon$  turbulence model with the standard wall function available in Fluent. The multiple frames of reference (MFR) model is used for impeller modeling. The results show that the mixing performance of Chemineer impeller is better than the Pitched blade impeller at the same level of rotation speed.

#### Introduction

Mixing tank is one of the techniques that used and play a significant role in industrial processes to homogenize the mixture of two or more fluids/solids by using rotating impeller. The better understanding of the fluids behavior in mixing vessel may improve the performance of impeller and the mixing process. The main aims of using mixing are to improve the mass and heat transfer and to generate a homogenized mixture to minimize the settling of the particles at the bottom of the tank. A summary of some recent published works in the literature is given below.

**Nienow, and Miles** (1977) investigated the effect of impeller type and mixing tank configuration on fluid-particles mass transfer. **Ducoste and Clark** (1997) study the effect of tank size and impeller type on the turbulence in mixing tank. **Wei, et. al.** (1997) studied the influence of the number and width of baffles in mechanically mixing vessel with and without aeration on the fluid hydrodynamics and mixing tank. **Ducoste and Clark** (1999) employed the Computational Fluid Dynamics (CFD) in the study. The model was a simple geometry consists of the submerged impellers in cubical mixing vessel. The k- $\epsilon$  model was used to simulate the turbulence and the flow pattern induced in the vessel. **Masoud Rahimi** (2005) used CFD simulation to study the impellers number and layout on mixing time. A large storage tank of 19000m<sup>3</sup> contain three types of crude oil with difference density. **Aoyi et. al.** (2008) investigated the hydrodynamics of fluid in mixing stirred vessel agitated by Rushton turbine with low clearance condition. The CFD technique and LDV measurements were performed in order to understand the flow pattern and mixing time. **Angelique Delafosse et. al.** (2008) investigated the hydrodynamics in mixing tank by CFD simulation. Two models were used to determine the dissipation rate and its distribution in mixing vessel. Three dimensional simulations using the commercial CFD code FLENT 6.2.16 based on the Unsteady Reynolds Averaged Navier-Stokes equations (URANS) model and Large Eddy simulation (LES) model was used.

In this paper, the flow field in stirred tank is studied using ANSYS Fluent (13) to identify the dead zones in the tank where the fluid is not mixing by presenting the velocity vectors at different planes in the tank. Two types of impellers (Pitched Blade and Chemineer S-4 Impellers) are used in this investigation to select the appropriate impeller for flocculation mixing process.

### The CFD Model and Simulation

The CFD modeling of mixing problem, consist of three steps which are pre-processing, equation solving and post-processing. In first part the problem geometry should be built and meshed. In the second step the partial differential equations describing the flow (Continuity and Navier-Stokes) are discretized on the mesh and solved simultaneously. The boundary and initial conditions should be introduced to the CFD. The turbulence model selected which is describing the effect of turbulence on the bulk flow properties of the fluid. Finally, the obtained results should be analyzed.

The CFD involves the numerical solution of conservation equations. In the present study, the simultaneous solution of continuity and Reynolds-averaged Navier –Stokes (RANS) equations together with the RNG of K- $\epsilon$  turbulent model were carried out using the finite control volume with cylindrical coordinates. The following equations were used in the model:

#### Continuity Equation:-

The net flow of mass across the boundary of a control volume is zero in steady state flow:

$$\nabla \cdot \vec{G} = 0 \quad (1)$$

Where:

$\vec{G} = \rho \vec{V}$ , is mass velocity.

Equation (1) can be written relative to cylindrical coordinates as follows:

$$\frac{\partial G_z}{\partial z} + \frac{1}{r} \frac{\partial}{\partial r} (r G_r) + \frac{1}{r} \frac{\partial G_\theta}{\partial \theta} = 0 \quad (2)$$

The subscripts z, r and  $\theta$  are representing to the axial, radial and tangential components respectively. The  $\bar{u}$ ,  $\bar{v}$  and  $\bar{w}$  are the components for the time mean velocity in z, r and  $\theta$  directions respectively, and  $u'$ ,  $v'$  and  $w'$  be the corresponding velocities of fluctuation. The continuity equation can be written as conservation of mass equation with the following form: (Joseph 1997), (Ronald 1984)

$$\frac{\partial}{\partial z} (\bar{u}) + \frac{1}{r} \frac{\partial}{\partial r} (r \bar{v}) + \frac{1}{r} \frac{\partial}{\partial \theta} (\bar{w}) = 0 \quad (3)$$

#### Momentum Equations:-

The general momentum equations in terms of shear stress  $\tau$  governing the fluid motion for three dimensions for cylindrical coordinate are [9]:

In Z-direction

$$\rho \left( \frac{\partial U}{\partial t} + U \frac{\partial U}{\partial z} + V \frac{\partial U}{\partial r} + \frac{W}{r} \frac{\partial U}{\partial \theta} \right) = - \frac{\partial p}{\partial z} + \left[ \frac{1}{r} \frac{\partial}{\partial r} (r \tau_{rz}) + \frac{1}{r} \frac{\partial}{\partial \theta} \tau_{\theta z} + \frac{\partial}{\partial z} \tau_{zz} \right] + \rho F_z \quad (4)$$

In R-direction

$$\rho \left( \frac{\partial V}{\partial t} + U \frac{\partial V}{\partial z} + V \frac{\partial V}{\partial r} + \frac{W}{r} \frac{\partial V}{\partial \theta} - \frac{W^2}{r} \right) = - \frac{\partial p}{\partial r} + \left[ \frac{1}{r} \frac{\partial}{\partial r} (r \tau_{rr}) + \frac{1}{r} \frac{\partial}{\partial \theta} \tau_{\theta r} + \frac{\partial}{\partial z} \tau_{zr} - \frac{\tau_{\theta\theta}}{r} \right] + \rho F_r \quad (5)$$

In- $\theta$ -direction

$$\rho \left( \frac{\partial W}{\partial t} + V \frac{\partial W}{\partial r} + \frac{W}{r} \frac{\partial W}{\partial \theta} + \frac{WV}{r} + U \frac{\partial W}{\partial z} \right) = - \frac{1}{r} \frac{\partial p}{\partial \theta} + \left[ \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \tau_{r\theta}) + \frac{1}{r} \frac{\partial}{\partial \theta} \tau_{\theta\theta} + \frac{\partial}{\partial z} \tau_{z\theta} + \frac{\tau_{\theta r} - \tau_{r\theta}}{r} \right] + \rho F_\theta \quad (6)$$

The previous equations of mass conservation and momentum can be combined to form of one general form (Versteeg 1995)

$$\frac{\partial \psi_z}{\partial z} + \frac{1}{r} \frac{\partial(r\psi_r)}{\partial r} + \frac{1}{r} \frac{\partial(r\psi_\theta)}{\partial \theta} = S_\Phi \quad (7)$$

For the continuity and momentum the  $\psi_z$ ,  $\psi_r$ , and  $\psi_\theta$  are the total diffusion fluxes defined by:

$$\psi_z = \rho U \phi - \Gamma_\phi \frac{\partial \phi}{\partial z} \quad (8)$$

$$\psi_r = \rho V \phi - \Gamma_\phi \frac{\partial \phi}{\partial r} \quad (9)$$

$$\psi_\theta = \rho W \phi - \Gamma_\phi \frac{\partial \phi}{r \partial \theta} \quad (10)$$

Where  $\Phi$  stands for any of the dependent variables and the corresponding values of  $\Gamma_\phi$  and  $S_\phi$  is indicated in table

(1). For axisymmetric swirling flow  $\left(\frac{\partial \phi}{\partial \theta} = 0\right)$ , equation (7) becomes:

$$\begin{aligned} \frac{\partial \psi_z}{\partial z} + \frac{1}{r} \frac{\partial(r\psi_r)}{\partial r} &= S \\ \rho \frac{\partial}{\partial z} \left( U \phi - \Gamma_\phi \frac{\partial \phi}{\partial z} \right) + \frac{1}{r} \frac{\partial}{\partial r} \left( r V \phi - r \Gamma_\phi \frac{\partial \phi}{\partial r} \right) &= S_\phi \end{aligned} \quad (11)$$

### The $k$ - $\epsilon$ Turbulence Model:-

Jones and Launder had proposed the following equations for both the turbulence kinetic energy ( $k$ ) and for energy dissipation ( $\epsilon$ ) [10], for turbulence kinetic energy ( $k$ )

$$\rho \bar{u} \frac{\partial k}{\partial z} + \rho \bar{v} \frac{\partial k}{\partial r} + \rho \bar{w} \frac{\partial k}{\partial \theta} = \frac{\partial}{\partial z} \left( \frac{\mu_t}{\sigma_{k,t}} \frac{\partial k}{\partial z} \right) + \frac{1}{r} \frac{\partial}{\partial r} \left( \frac{\mu_t}{\sigma_{k,t}} r \frac{\partial k}{\partial r} \right) + \frac{1}{r} \frac{\partial}{\partial \theta} \left( \frac{\mu_t}{\sigma_{k,t}} \frac{\partial k}{\partial \theta} \right) - \rho \epsilon + \mu_t G \quad (12)$$

For energy dissipation rate ( $\epsilon$ )

$$\rho \bar{u} \frac{\partial \epsilon}{\partial z} + \rho \bar{v} \frac{\partial \epsilon}{\partial r} + \rho \bar{w} \frac{\partial \epsilon}{\partial \theta} = \frac{\partial}{\partial z} \left( \frac{\mu_t}{\sigma_{\epsilon,t}} \frac{\partial \epsilon}{\partial z} \right) + \frac{1}{r} \frac{\partial}{\partial r} \left( \frac{\mu_t}{\sigma_{\epsilon,t}} r \frac{\partial \epsilon}{\partial r} \right) + \frac{1}{r} \frac{\partial}{\partial \theta} \left( \frac{\mu_t}{\sigma_{\epsilon,t}} \frac{\partial \epsilon}{\partial \theta} \right) + C_1 \frac{\epsilon}{k} \mu_t G - C_2 \frac{\epsilon^2}{k} \quad (13)$$

Where G refers to the generation term and is given by [37]:

$$G = 2 \left[ \left( \frac{\partial \bar{u}}{\partial z} \right)^2 + \left( \frac{\partial \bar{v}}{\partial r} \right)^2 + \left( \frac{\bar{v}}{r} \right)^2 \right] + \left[ \left( \frac{\partial \bar{u}}{\partial r} \right) + \left( \frac{\partial \bar{v}}{\partial z} \right) \right]^2 + \left( \frac{\partial \bar{w}}{\partial z} \right)^2 + \left( \frac{\partial \bar{w}}{\partial r} - \frac{\bar{w}}{r} \right)^2 \quad (14)$$

The turbulent kinetic energy (k) and the dissipation rate of the turbulent energy ( $\epsilon$ ) are chosen as the two properties in order to determine the turbulent viscosity  $\mu_t$

$$\mu_t = \frac{C_\mu \rho k^{\frac{1}{2}}}{l^{-1}} \quad (15)$$

Where:  $C_\mu$  is a constant. It is assumed that at a high Reynolds number, ( $\epsilon$ ) value to be Proportional to  $k^{\frac{3}{2}}/l$ , the above equation becomes:-

$$\mu_t = \frac{C_\mu \rho k^2}{\epsilon} \quad (16)$$

The quantities  $\sigma k, t$ ,  $C_1$ ,  $C_2$ ,  $\sigma \epsilon, t$  and  $C_\mu$  that appear in the k- $\epsilon$  model and  $\mu_t$  equations, are the universal k- $\epsilon$  model constants, whose values are reproduced in table (2).

**Table 2:-** shows the variable of k- $\epsilon$  model.

Equation	$\Phi$	$\Gamma \Phi$	$S\Phi$	$C_1$	1.44
Turbulent K.E.eq. (12)	K	$\mu_t/\sigma k, t$	$-\rho \epsilon + \mu_t G$	$C_2$	1.92
Dissipation rate eq.(13)	$\epsilon$	$\mu_t/\sigma \epsilon, t$	$\mu_t G C_1 \frac{\epsilon}{k} - C_2 \frac{\epsilon^2}{k}$	$C_\mu$	0.09
				$\sigma k, t$	1
				$\sigma \epsilon, t$	1.3

#### Mixing time:-

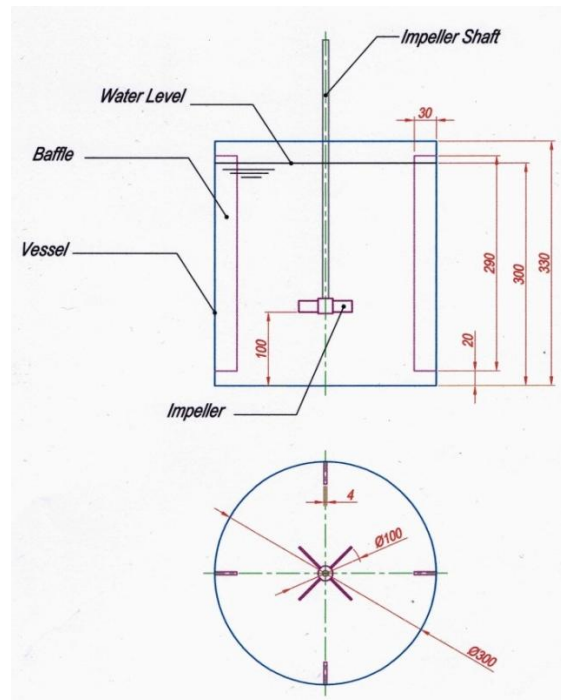

Mixing time can be calculated from experimental relation referring to the concentration of tracer material which reach 99% using calculated tracer concentration in all tank fluid. (Harnby, 2001)

$$t = \frac{4.605}{a/D_i^b / D_i^c} \quad (17)$$

Where a, b and c are constant depending on type pf impeller.

#### Model Stirred Tank Configuration:-

A schematic diagram of the tank and the impeller is shown in Fig. 1. The system consists of a flat bottomed cylindrical vessel, the diameter ( $D_t = 0.3$  m) of which equals the height of the liquid ( $H=D_t$ ). Four baffles having width,  $W=D_t/10$  are spaced equally around the vessel. The shaft of the impeller is concentric with the axis of the vessel. The Impeller diameter,  $D_i$ , equivalent to  $D_t/3$ . The distance between the tank bottom and the impeller position C is set to  $C= D_t/3$ . The rotational speed of the impeller, N, is ranging from 60 rpm to 135 rpm increasing step 15 rpm, leading to a tip speed,  $V_{tip}$ , ranging 0.314 m/s to 1.05 m/s. The working fluid is water with density,  $\rho$ , of 1000 kg/m<sup>3</sup> and viscosity,  $\mu$ , of  $1 \times 10^{-3}$  Pa.s. The mixing tank as showed Fig.1 was design in depends on the standard configuration as follow: [1], (Georgy 1991). The two types of impellers: Chemineer S-4 and pitched blade impeller as shown in Fig.2, the specification of the impellers are show in table (3).

**Fig. 1:-** mixing Tank in Present Study

**Table 3:-** Specification of Impeller.

Specification	Impeller type	
	Chemineer S-4	Pitched Blade
No. of blades	4	4
Blade width at tip (m)	0.016	0.02
Blade width at root (m)	0.016	0.02
Blade thickness	0.003	0.003
Hub cord angle (deg.)	90	45
Hub Diameter (m)	0.2	0.2
Hub height (m)	0.2	0.2

### The Numerical Solution Setup

In the present study, mixing in 21.2 liter of water agitated by three types of impellers. The impellers rotation speeds were ranging from 60 to 135 rpm. The mixing tank model was divided in to 58244 nodes as shown in Fig.3. The MFR method was applied for modeling the impeller rotation. Also the continuity and Navier-Stokes equations together with the RNG version of the K- $\epsilon$  were used to describe the equation of motion (13).

### Results and Discussions

The impellers rotation speed has a great effect on fluid motion in mixing processes. Consequently, the efficiency of settling process for the solid material is affected by the changing of impeller rotation speed. Also, the concentration of chemical additives would become more homogeneous when the optimum impeller rotation speed has been correctly selected.

Fig.4 and Fig.5 illustrated the velocity vectors, contour and graph for Z- $\theta$  and Z-R planes for Pitched Blade impeller rotated at 60 rpm. At the Z- $\theta$  plane 0 degree, the impeller pumping the fluid toward the bottom of the tank, and then moved with high velocity toward the upper zone near the baffle surface because the baffles help the circulated fluid to flow upward to the upper zone of the tank instead of circulation. This fluid motion produced a circular mixing zone (eddy) at which the fluid circulated around the specific point located at 0.11m from the center of tank with height of 0.54m from the base surface which is almost half the clearance between the impeller and the bottom of tank.

The average velocity of fluid is in varied with the radius of the tank. Thus, two poor mixing zones are generated at center of the bottom of the vessel also at the free surface of fluid. The same behavior of fluid is repeated in Sec.30°, and Sec60° but the average velocity of fluid decreases when the fluid motion toward the upper zone of the vessel due there are no baffles existed at those sections. At Sec. 90 degree it is easy to note that the fluid motion is identical with the fluid flow at Sec.0 degree.

In Z-R plane as shown in Fig. 5 at height 0.01m from the bottom of the tank the fluid flow generates a low velocity zone at the center of plane, this zone about 0.085m in diameter. At height 0.1m the fluid velocity is highly fluctuated due to the high influence of impeller pumping capacity as well as the effect of circulation fluid which decrease the velocity of pumped fluid which produces the eddy as explained earlier. The low velocity mixing zone is located between the impeller zone and the tank wall having an annulus shape of inner diameter about 0.038m and 0.24m in outer diameter. The fluid velocity is increased near the baffles with impeller rotation direction is clockwise, resulting in part of the fluid flow toward the upper zone of tank and the rest return to impeller zone with high velocity. The fluid flow changes from highly fluctuated to more moderate motion at height of 0.2m which reflects the effect of rotational motion of impeller. The effect of baffles is quite clear by producing poor mixing zones located between them. The velocity increases as height increased until reached 0.3m height at which the eddies length scale become small and circulated toward the shaft of impeller due to the effect of pumping from impeller.

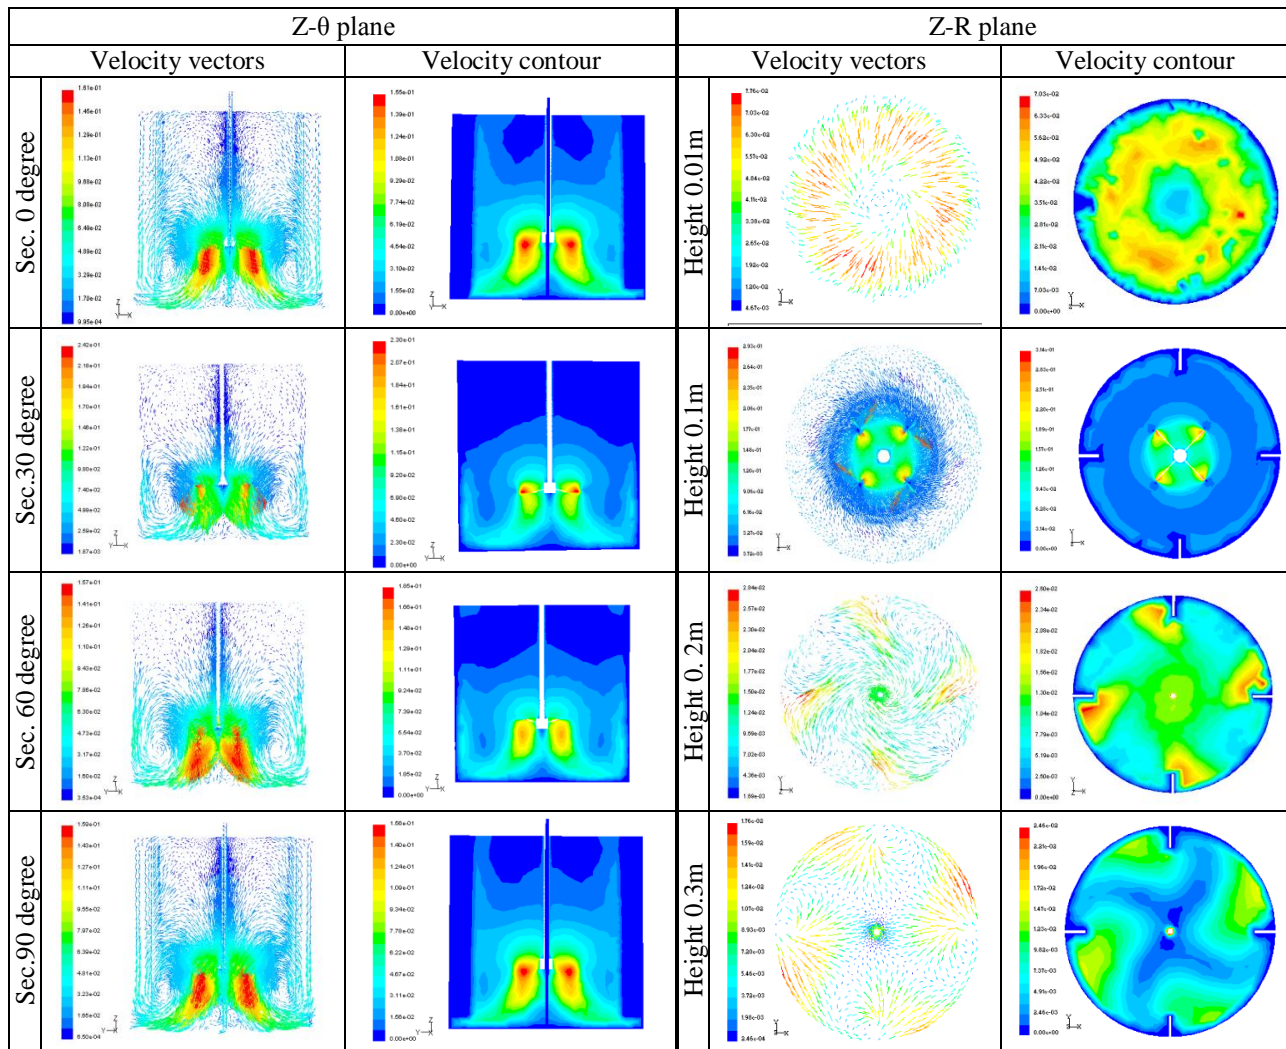

Fig. 4:- Velocity Vectors and Contour for Pitched Blade Impeller Rotation Speed at 60 Rpm.

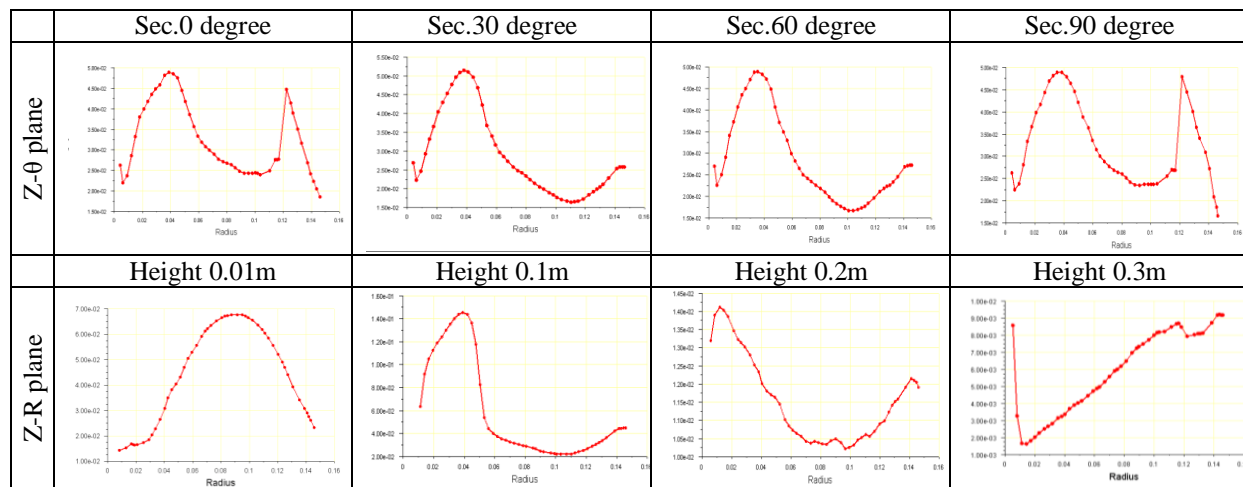

Fig. 5:- Velocity graph for Pitched Blade Impeller Rotation Speed at 60 Rpm in Z- $\theta$  and Z-R planes.

Fig.6 shows the velocity vectors and contours for Chemineer S-4 impeller rotates at 60 rpm. The velocity vectors for 0° plan show that the impeller blades pumped the fluid radially to ward tank wall that cause fluid to split into two

jets. The small jet is circulated downward to the bottom of tank and then returns to the impeller zone so produces an eddy in the zone below the impeller. The center of eddy is located at radius of 0.103 m from the tank center and 0.064m from the bottom of tank. A Poor or weak mixing region is existed at the center of tank below the impeller.

The second jet of the fluid will be circulated in upward direction, so generate an eddy which is located at same radial direction with lower one but with height of 0.134m from the bottom of tank. The flow pattern will be same at 30° and 60° plans except the reduction in the fluid flow velocity at the upper zone especially at 30° plan and velocity of fluid near the wall of tank increases in the upward direction. The fluid flow behavior in 90° plan is similar to that observed at 0° plan.

In Z- $\theta$  direction at height 0.01 m velocity vectors and contour shows the poor mixing zone in the center of tank. The velocity increases toward the wall of tank, then the velocity decreases near the tank wall, this fluctuation of velocity lead to form annular ring zone with high mixing. At height of 0.1m (impeller zone) the velocity linearly increases along the blade of impeller until it reaches to its maximum value at the tip of the blade. Then the velocity is sharply decreases because of fluid circulation as a result of the direction of pumping direction.

At height 0.2 m most of fluid is split into four symmetrical jets and the other flows upward direction reaching the free surface. These symmetrical jets are radially circulated in the mixing plan thus, eddies were generated as the flow become close to the wall of the baffles. The fluid flow far from the wall of baffles still circulate with high velocity in the radial direction toward the center of tank that lead to generate a high mixing zone. At the free surface of fluid the velocity decreases because most of the fluid circulates in the lower zone due to the influences of impeller pumping capacity. The high mixing zone reduces especially at the center of tank but swirling motion continues near the baffles wall.

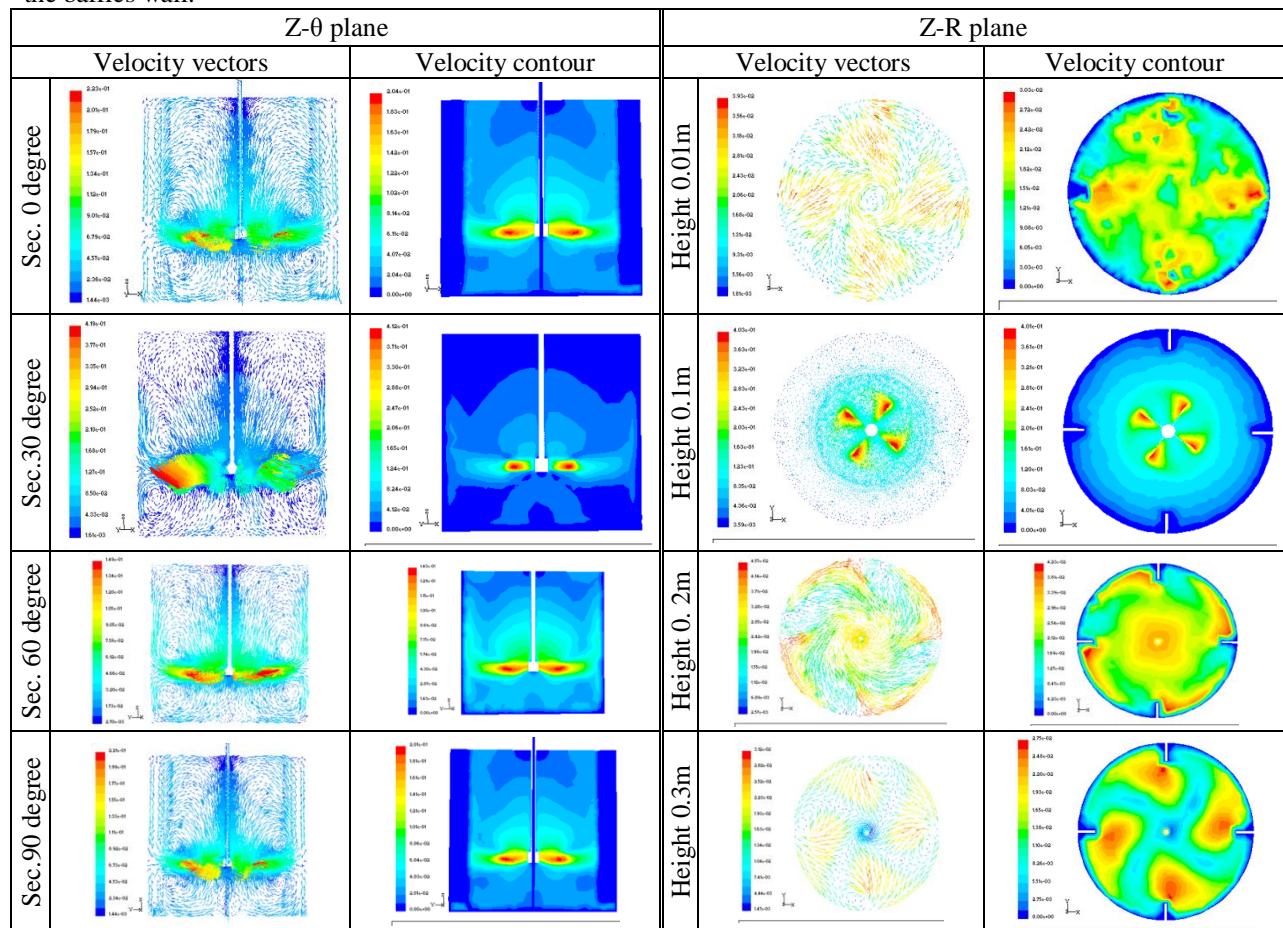

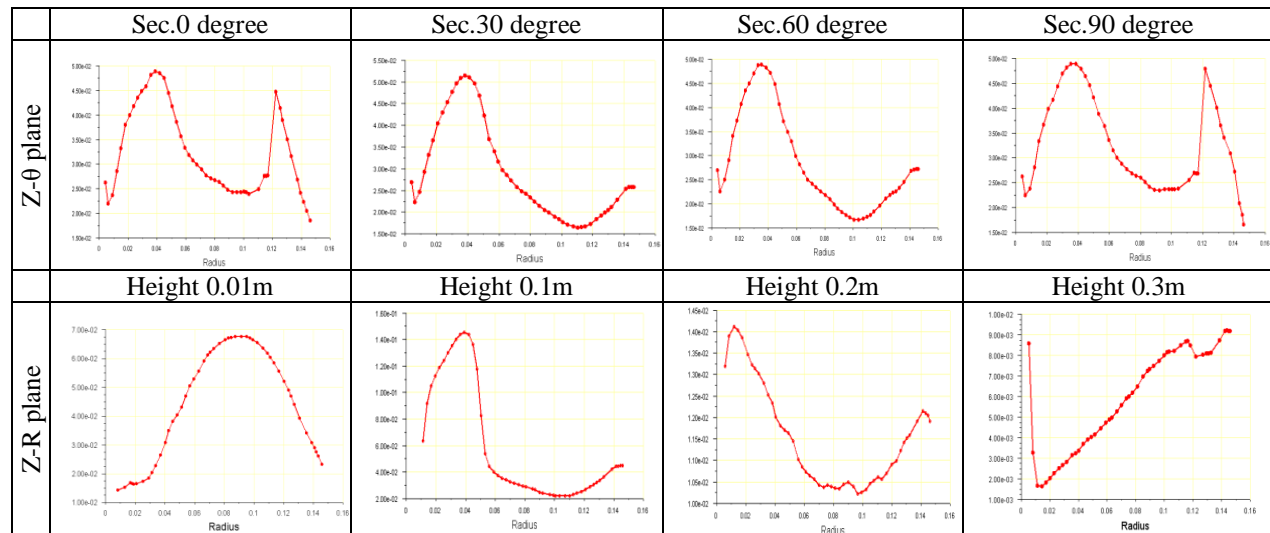

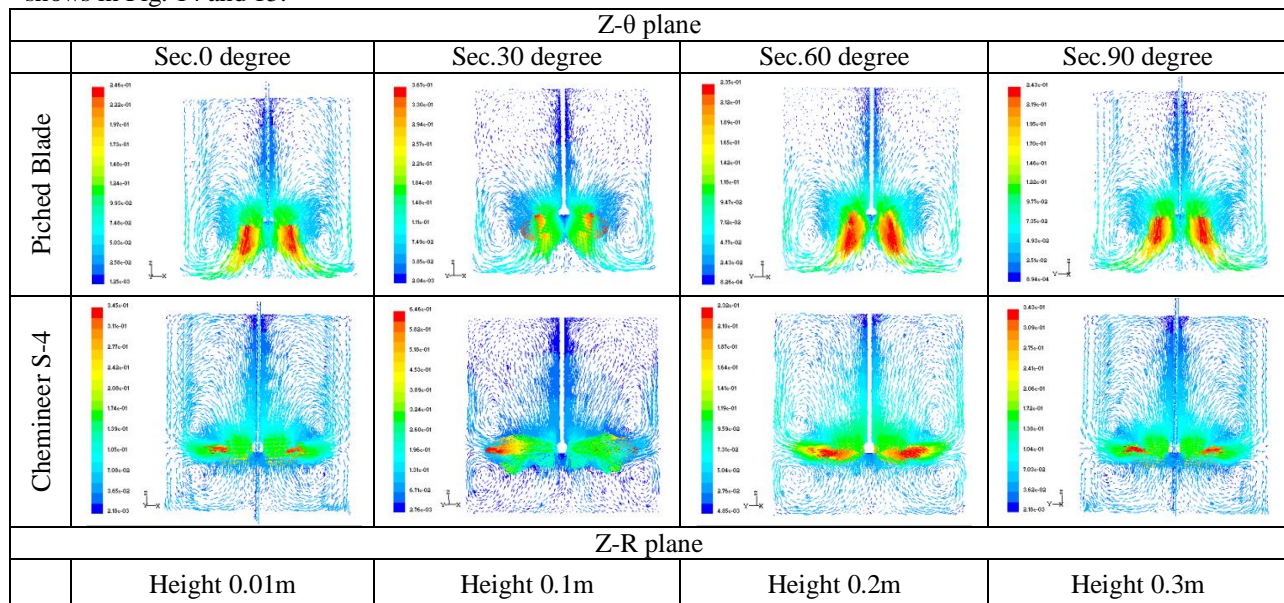

Fig. 6:- Velocity Vectors and Contour for Chemineer S-4 Impeller Rotation Speed at 60 Rpm

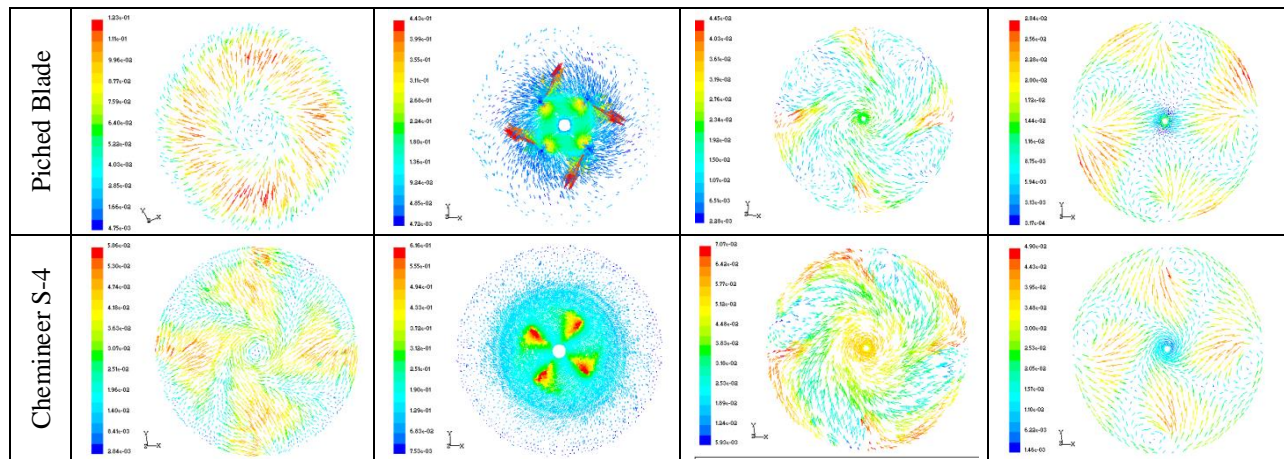

**Fig. 7:-** Velocity graph for Chemineer S-4 Impeller Rotation Speed at 60 Rpm in Z-θ and Z-R planes

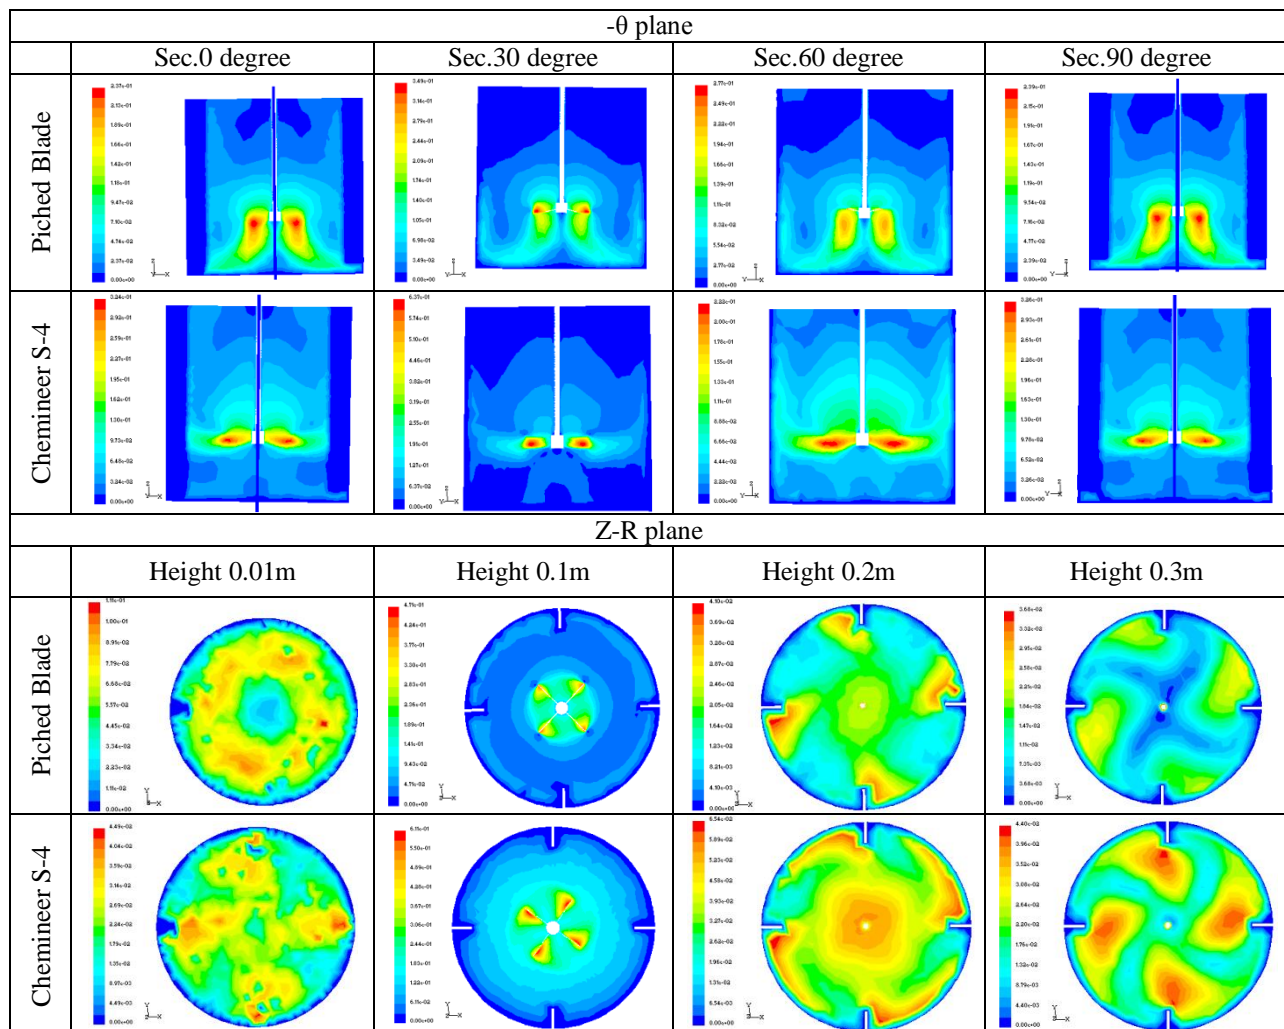

Fig.8 shows the difference between the flow patterns induced by Pitched blade and Chemineer impellers with both rotates at 90 rpm. The difference can be observed in both Z-θ and Z-R planes. The Pitched blade impeller influence the all tank while Chemineer impeller influence the mixing in 2/3 of the tank at same rotation speed. The velocity of fluid flow in mixing tank agitated by Chemineer impeller is higher than that induced by pitched blade impeller as showed in Fig.9 Thus the mixing time with Chemineer impeller is less than that with Pitched blade one.

Fig.10 illustrated the velocity of the fluid in the mixing tank in Z-R plane with height 0.1 m from the bottom of the tank. The Chemineer impeller produces a fluid flow with a high velocity as well as the high velocity fluctuated in comparison with the Pitched Blade impeller. In the height of 0.1 , 0.2 and the free surface of the fluid, it easy to note that the similarity with velocity fluctuated produced by both impellers but still Chemineer impeller produce fluid motion higher than that produces by Pitched Blade impeller as shows in Fig. 11,12 and 13. In the Z-θ plane the velocity of fluid generated by both impellers is similar in the fluctuation and closer in values for all sections as shows in Fig. 14 and 15.

**Fig. 8:-** Velocity Vectors for Pitched Blade and Chemineer S-4 Impellers Rotation Speed at 90 Rpm

**Fig. 9:-** Velocity Vectors and Contour for Pitched Blade Chemineer S-4 Impeller Rotation Speed at 90 Rpm

**Fig. 10:-** Velocity graphs for Pitched Blade and Chemineer S-4 Impeller Rotation Speed at 90 Rpm at Z-0 plane Height 0.01m

**Fig. 11:-** Velocity graphs for Pitched Blade and Chemineer S-4 Impeller Rotation Speed at 90 Rpm at Z-R plane Height 0.1 m

**Fig. 12:-** Velocity graphs for Pitched Blade and Chemineer S-4 Impeller Rotation Speed at 90 Rpm at Z-R plane Height 0.2 m

**Fig. 13:-** Velocity graphs for Pitched Blade and Chemineer S-4 Impeller Rotation Speed at 90 Rpm at Z-R plane Height 0.3 m

**Fig. 14:-** Velocity graphs for Pitched Blade and Chemineer S-4 Impeller Rotation Speed at 90 Rpm at Z-R plane Sec. 30 degree.

**Fig. 15:-** Velocity graphs for Pitched Blade and Chemineer S-4 Impeller Rotation Speed at 90 Rpm at Z-θ plane Sec. 60 degree.

The mixing time depend on both the fluid flow pattern and fluid velocity, hence the Chemineer impeller produce fluid flow with high velocity and shorter paths than that generates with Pitched Blade impeller thus the mixing equipped with Chemineer impeller is less in time than with Pitched Blade impeller as Shows in Fig. 16.

Fig 16:- Mixing Time for Pitched Blade and Chemineer S-4 Impellers.

ε <sub>e</sub>	Eddy viscosity	Pa.s
Γ	Arbitrary parameter	

## Conclusions

The FLUENT v.15.4 is used to analysis the Pitched Blade and Chemineer impeller used for mixing purpose in cylindrical mixing tank. The following conclusions and the results of the study:

1. The numerical analysis gives good results of velocity distribution and mixing rate with the tank. Such results can be used for describing the flow behavior and the difference between the two used impellers
2. Velocity vectors show that the poor mixing zone is generated with Pitched Blade impeller is less than that generated with Chemineer impeller.
3. The fluid flow velocity generated with Chemineer impeller is higher than that generated with Pitched Blade.
4. The fluid flow velocity is similar in the distribution behavior for Z- $\theta$  and Z-R planes but noted a difference in the magnitude for the two impellers.

Published: January 2017

#### Abstract

**Objectives:** The published data on prevalence of asthma among Saudi children and its risk factors is scarce. This study was carried out to determine the prevalence of Asthma and its relationship with risk factors among Saudi children in Makkah, Saudi Arabia.

**Methodology:** A retrospective study was done at Obstetrics and Gynecology Hospital (OGH) in Jarwal, Makkah, Saudi Arabia. Random selection of 150 cases (30 cases each year) admitted to OGH within the period 2002 – 2006. A questionnaire form was used to collect information from patient's medical records, including demographic data discharge diagnosis with other associated diseases. Data were entered and analyzed using SPSS package.

**Results:** Overall, 36 out of 150 cases (24%) are asthmatic. 61.1% of asthmatic children are males and 38.9% are females. Asthmatic cases recorded the least percentage in 2002 (16.6%) and the highest in 2006 (36.6%). 20% of cases recorded in 2003 and also in 2005. In 2004, 26.6% of cases recorded. Out of 36 children with asthma, 9 cases (25%) are with positive family history, 10 cases (27.8%) are with positive relation to change in weather, 16 cases (44.4%) are with positive relation to dust, 8 cases (22.2%) are with positive relation to exercise, 2 cases (5.6%) are with positive relation to passive smoking and 6 cases (16.7%) are with positive relation to pets.

**Conclusion:** The prevalence of asthma among Saudi children in Makkah is higher than those reported from the neighboring cities and other countries. Males are more susceptible to asthma than females. Dust was the most common risk factor triggering asthmatic children in Makkah. Passive smoking was the less common risk factor related to asthmatic children.

#### Introduction:

Asthma is the most common chronic disease in children [Asher I, Pearce N, 2014]. It is one of the most common chronic illnesses in Saudi Arabia and local reports suggest that the prevalence of asthma is increasing [Al-Ghamdi BR, Mahfouz AA, Abdelmoneim I et al 2008]. An estimated 300 million people worldwide suffer from asthma, with 250,000 annual deaths attributed to the disease WHO, 2007). Asthma is not just a public health problem for high income countries: it occurs in all countries regardless of level of development. Over 80% of asthma deaths occur in low and lower-middle income countries [WHO, 2006]. Asthma deaths will increase by almost 20% by 2020 if urgent action is not taken [WHO, 2006]. Despite the abundance of high-caliber medical services and the availability of international guidelines, recent studies have shown that the burden of asthma might be significantly higher than previously estimated [Rabe KF, Adachi M, Lai CK, Soriano JB et al 2004], [Abudahish A, Bella H. et al 2006]. Asthma is under-diagnosed and undertreated, creating a substantial burden to individuals and families and possibly restricting individuals' activities for a lifetime [WHO, 2006].

In Saudi Arabia, it is estimated that up to 11.5% of children are suffered from bronchial asthma [Al-Frayh AR et al.1992]. For reasons that remain unclear, the prevalence of bronchial asthma is increasing [El-Gamal FM et-

**Corresponding Author: Salman A. Al-Harthi**

Address: Umm Al-Qura University, College of Medicine, Makkah, Saudi Arabia.

al.1993]. In Taif city, western city in Saudi Arabia, the asthma prevalence rate among children was 13.1%, whereas smoking and a history of asthma in the family increased this rate [Fayez Hamam, Ahmed Eldalo, Ahmad Albarraq et al 2015]. Other researchers concluded that there was a significant increase in the prevalence of bronchial asthma in the Kingdom of Saudi Arabia every year (during the period 1986-1995) [A R Al Frayh; Z Shakoor; M O Gad El Rab; and S M Hasnain; 2001]. In United States, about 1 in 10 children (10%) had asthma in 2009 [Centers for Disease Control and Prevention, *Vital Signs*, May 2011]. In most parts of the world, asthma prevalence is continuing to increase or remaining stable [C. Anandan, U. Nurmatov, O. C. P. Van Schayck, A. Sheikh; 2009].

Asthma runs strongly in families and is about 50% due to genetic susceptibility and about 50% due to environmental factors [Palmer, L.J., Burton, P.R. et al. 2000]. Boys are consistently reported to have more prevalent wheeze and asthma than girls [Almqvist C, Worm M, Leynaert B; 2007].

Bronchial asthma in children is varying from region to region due to the variability of extrinsic allergens that play a major role in infection of susceptible children that lead to the disease [Al-Frayh AR et al.1992]. In a recent survey, 75 % of people said that cold air can trigger asthma symptoms [www.asthma.org.uk]. Change in weather, fluctuations in humidity and temperature, appear to influence emergency department visits for pediatric asthma [Nana Mireku, Yun Wang et al; 2009]. The exposure to air pollutants exacerbates the risk of asthma in children even at relatively low levels of exposure [Jong-Tae Lee, Ho Kim, Hoyin Song et al 2002]. Other investigators in Riyadh, Capital city in Saudi Arabia, revealed that dust of sand storm had no significant impact on acute asthma exacerbations in children [Abdullah A. Alangari, Muhammad Riaz; 2015]. Exercise-Induced Asthma is associated with impaired quality of life among children with asthma [Namiko Kojima, Yukihiro Ohya, Masaki Futamura et al 2009]. Bronchoconstriction of approximately 12-15% of the population associated with exercise can occur in nearly all individuals with asthma [Mahler DA; Section of Pulmonary and Critical Care Medicine, Dartmouth-Hitchcock Medical Center, 1993]. The exposure to environmental tobacco smoke in asthmatic children was higher than among healthy children, indicating that passive smoking may be a predisposing and/or aggravating factor for childhood asthma [S. Willers, E. Svenonius et al; 1991]. Prevalence rate for asthma in children with pets is twice that of children without pets [Bener A, al-Jawadi TQ, Ozkaragoz F, al-Frayh A, Gomes; 1993]. Pet-ownership was associated with increased respiratory symptoms [Bener A, al-Jawadi TQ, Ozkaragoz F, al-Frayh A, Gomes; 1993]. Children with pets had more frequent transient or intermittent asthma symptoms [M. Kerkhof, A. H. Wijga, B. Brunekreef et al; 2009].

In Saudi Arabia, few studies have been conducted so far to investigate the various aspects of this problem among children [El-Gamal FM et al 1993., Al-Frayh A et al.1992, Al-Frayh AR et al.1992].

This study was taken to assess the prevalence of asthmatic children in period from 2002 to 2006 and to figure out the most related risk factor to asthmatic children in Makkah.

## Methodology:

A retrospective review was done randomly for 150 patients less than 5 years of age admitted to Obstetrics and Gynecology Hospital (OGH) in Jarwal, Makkah, Saudi Arabia with complaints of fever, abdominal pain, vomiting, shortness of breath, cyanosis, anemia, skin infections and high blood sugar during the period from 2002 to 2006. We randomly picked out 30 patient's medical records for each year (2002 – 2006). The data were collected in 3 days from 22 – 24 / 4 / 2007. The study received approval from Institutional Review Board. Informed consent was obtained from the hospital. A questionnaire form was used to collect information from patient's medical records, including demographic data discharge diagnosis with other associated diseases. Patient's medical records were filtered according to inclusive and exclusive criteria. Inclusive criteria are Saudi and under 5 years old patients. Gender, family history, change in weather, dust, exercise, passive smoking and animal indoor were the main risk factors focused on it inside patient's medical record. Data were entered and analyzed using SPSS package (Release 10.01, 1999, Chicago, IL, USA). Descriptive statistics were performed as appropriate, including frequencies for variables, mean  $\pm$  standard deviation and cross tabulations. Statistical significance was set at  $p < 0.05$  throughout the analysis.

## Results:

First, 150 cases (30 each year) were randomly selected. Then of these 150 samples, 36 cases were asthmatic, and hence asthma prevalence rates among Saudi children less than 5 years of age was 24% (table 1.1).

The original distribution of Male: Female in Makkah is 1:1. The total number of Asthmatic cases in our sample is 36. During the period 2002 to 2006, we found that males are more faced to Asthma than females in which 22 out of 36 cases are males and 14 out of 36 are females. It means 61.1% males and 38.9% are females (Table 1.2). That reflects males are more likely to be affected by Asthma than females.

We noticed that the prevalence of asthma among Saudi children in Makkah increases by time (Table 1.3). We randomly picked out 30 patient's medical records for each year (2002 – 2006). At 2002, 5 cases out of 30 cases are asthmatic (16.6%). At 2003, 6 cases out of 30 cases are asthmatic (20%). At 2004, 8 cases out of 30 cases are asthmatic (26.6%). At 2005, 6 cases out of 30 cases are asthmatic (20%). At 2006, 11 cases out of 30 cases are asthmatic (36.6%). So totally, Prevalence of Asthma among Saudi Children increases every year in Makkah.

Within the period of 2002 – 2006, family history factor was positive in 9 cases (25% of cases). (Table 2.1 a). Change in weather factor was positive in 10 cases (27.8% of cases). (Table 2.1b). Dust factor was positive in 16 cases (44.4% of cases) (Table 2.1c). Exercise factor was positive in 8 cases (22.2% of cases) (Table 2.1d). Passive smoking factor was positive in 2 cases (5.6% of cases) (Table 2.1e). Indoor animal (Pets) factor was positive in 6 cases (16.7% of cases) (Table 2.1f).

### 1.1 Prevalence of asthma. 36 out of 150 cases (24%) are asthmatic children.

	Frequency	Percent
Asthma	36	24.0
Other	114	76.0
Total	150	100.0

### 1.2. Male: Female ratio. 61.1% of asthmatic children are males, 38.9% are females.

		Frequency	Percent
Valid	Male	22	61.1
	Female	14	38.9
	Total	36	100.0

### 1.3 Year prevalence. Asthmatic cases recorded the least percentage in 2002 (16.6%) and the highest in 2006 (36.6%). 20% of cases was recorded in 2003 and 2005. In 2004, 26.6% of cases was recorded.

Year		Count	Asthma	Total
	2002	Count	5	30
		% within Disease	16.6%	20%
	2003	Count	6	30
		% within Disease	20%	20%
	2004	Count	8	30
		% within Disease	26.6%	20%
	2005	Count	6	30
		% within Disease	20%	20%
Total	2006	Count	11	30
		% within Disease	36.6%	20%
		Count	36	150
		% within Disease	100.0%	100.0%

### 2.1a Family history. 9 cases (25%) are with positive family history.

		Disease

		% within cases	77.8%

**2.1e Passive smoking. 2 (5.6%) cases are with positive relation to passive smoking.**

			Disease
			asthma
Passive smoking	Yes	Count	2
		% within cases	5.6%
	No	Count	34
		% within cases	94.4%

**2.1f Pets. 6 (16.7%) cases are with positive relation to pets.**

			Disease
			asthma
Pets	Yes	Count	6
		% within cases	16.7%
	No	Count	30
		% within cases	83.3%

**Discussion:**

This retrospective study has clearly shown that there is overall increase in the prevalence of asthmatic children in Makkah. The prevalence of 24% is relatively high compared with AlFrayh's study and Fayeze Hamam's study [Al-Frayh AR et al.1992],[Fayeze Hamam, Ahmed Eldalo, Ahmad Albarraq et al 2015]. This 24% of asthmatic children in Makkah is also more than the prevalence of asthmatic children in United States. The study concurs with the study of A R AlFrayh [A R Al Frayh; Z Shakoor; M O Gad El Rab; and S M Hasnain; 2001] in which the prevalence of asthma among Saudi children is increasing every year. Also, the study concurs with Almqvist's study [Almqvist C, Worm M, Leynaert B; 2007] in which males are more susceptible to have asthma than females. Although 50% of asthmatic children have family history [Palmer, L.J., Burton, P.R. et al. 2000], our study revealed 25% which is less than that in Palmer's study. Despite weather change triggers asthmatic symptoms and influence pediatrics to visit emergency department [www.asthma.org.uk], [Nana Mireku, Yun Wang et al; 2009], our study revealed that only 27.8% of asthmatic children visit emergency department due to change in weather. According to Alangari's study, there is no significant relation between dust and asthma [Abdullah A. Alangari, Muhammad Riaz; 2015]. Otherwise, our study revealed that 44.4% of asthmatic children triggered by dust. Bronchoconstriction associated with exercise

of approximately 22.8% asthmatic children is relatively high compared with Mahler's study [Mahler DA; Section of Pulmonary and Critical Care Medicine, Dartmouth-Hitchcock Medical Center, 1993]. Asthma associated with passive smoking of approximately 5.6% asthmatic children is relatively low compared with S. Willers's study [S. Willers, E. Svenonius et al; 1991]. 10.7% of asthmatic children triggered by pets is relatively low compared with Bener A's study [Bener A, al-Jawadi TQ, Ozkaragoz F, al-Frayh A, Gomes; 1993].

There are a number of limitations that need to be considered, of which the data taken from only one hospital and the sample size was very small. To overcome these limitations, a larger study that excludes all the limitations should follow.

In conclusion, the prevalence of asthma among Saudi children in Makkah is higher than those reported from the neighboring cities and other countries. Males are more susceptible to asthma than females. Dust was the most common risk factor triggering asthmatic children in Makkah. Passive smoking was the less common risk factor related to asthmatic children. Further studies including large sample size and more than one hospital are required.

#### Abstract

**Purpose:** This work has been carried out to evaluate the arginase activity and lactoferrin (LF) level as biochemical markers in type 2 diabetic Egyptian.

**Subjects and Methods:** The present study consisted of 84 patients classified into three groups: Uncontrolled diabetic patients [G1], Control diabetic patients [G2], Normal healthy subjects [G3]. Lactoferrin concentration was measured using ELISA technique. Arginase and other biochemical parameters were measured by using Jenway 6105 uv/vis spectrophotometer. Finally, all the results were statistically analyzed and compared with normal subjects [G3].

**Results:** The mean sera value of both arginase and LF was found to be elevated in uncontrolled type 2 diabetic patient group [G1] and controlled type 2 diabetic patient group [G2] compared to normal healthy group [G3].

**Conclusion:** Both arginase and LF are considered as good biomarkers for diagnosis of type 2 diabetes and for detection of the best and most effective method for the treatment.

#### Introduction:-

Diabetes is defined as a chronic metabolic disorder characterized by a dysfunction in insulin secretion and/or insulin action, also known as hyperglycemia, and is divided into type 1 diabetes mellitus, type 2 diabetes mellitus (T2DM), and gestational diabetes mellitus (GDM) [1]. Diabetes is defined by the WHO that a plasma glucose >200 mg/dl, a fasting plasma glucose of >126 mg/dl [2].

Arginase is the fifth and final step in the urea cycle. It converts L- arginine into ornithine and urea (9). Although the function of the arginase enzyme in the liver is the catalysis of arginine hydrolysis to ornithine and urea, in extrahepatic tissues the function of the enzyme is essentially unknown. Normal blood serum contains only trace of arginase. However, in some pathological conditions, especially in various types of cancer, the elevated activity levels of arginase enzymes in the serum have been reported in many studies [3].

Lactoferrin is an iron-binding diferric glycoprotein present in most of the exocrine secretions. The major role of lactoferrin, which is found abundantly in colostrum, is antimicrobial action for the defense of mammary gland and

the neonates. Lactoferrin consists of two equal halves, designated as N-lobe and C-lobe, each of which contains one iron-binding site. While the N-lobe of lactoferrin is known for its enhanced antimicrobial effect, the C-lobe of lactoferrin mediates various therapeutic functions which are still being discovered. The potential of the C-lobe in the treatment of diabetes has been indicated [4].

### **Objective:-**

The aim of this project is to clarify the relation between LF and arginase by indicating the effect of LF in diabetic patients which is counter and handling to the effect of arginase. Also, to evaluate the arginase activity and lactoferrin protein concentration levels in diabetic patients and to detect whether these parameters can be used to improve the clinical assessment of diabetes mellitus and considered as biomarkers for monitoring, the progression and recurrence of diabetes mellitus. In addition, the work aims to assess the role of these parameters in monitoring diabetes mellitus therapy and detect the best and most effective method for the treatment.

### **Material and Methods:-**

#### **Patients:-**

The present study consisted of subjects of 84 patients. They were classified into three groups: Untreated Type 2 Diabetes group [G1]: consisting of 32 type 2 diabetic patients, the duration of disease ranged from (15 months-96 months). Treated type 2 diabetes group [G2]: consisting of 32 type 2 diabetic patients treated with tablets (Gliclazide), and duration of disease ranged from (24-120) years. Normal healthy subjects group [G3]: consisting of 20 normal healthy persons. All groups included in this study were matched in age, BMI and gender. They free from heart diseases, muscle disorders and liver diseases.

#### **Biochemical Measurements:-**

All biochemical parameters including serum creatinine, liver enzymes as (ALT) and (AST) and random blood glucose were determined by using Jenway 6105 uv/visspectrophotometer. The method used for the determination of arginase activity was based on the colorimetric determination of urea by condensation with diacetylmonoxime in an acid medium in the presence of ferric chloride (oxidant) and carbazide (accelerator) using Jenway 6105 uv/vis spectrophotometer.

Lactoferrin, LF, level was measured using ELISA technique. This assay employed a quantitative sandwich enzyme immunoassay technique, which measured LF in 5 hours. A monoclonal antibody specific for human LF had been pre-coated onto a microplate. Human LF in standards and samples was sandwiched by the immobilized antibody and biotinylated polyclonal antibody specific for human LF, which was recognized by a streptavidin-peroxidase conjugate. All unbound material was then washed and a peroxidase enzyme substrate was added. The color development was stopped and the intensity of the color was measured.

#### **Statistical Analysis:-**

The data were evaluated with One Way ANOVA used to declare the significant difference between groups at  $p < 0.05$ . Duncan multiple comparisons test at  $p < 0.05$  was used to declare the significant difference between each two groups. Both tests used to compare both serum arginase activity and serum lactoferrin concentration in different studied groups where significant values represented by ( $P < 0.05$ ) while non-significant values represented by ( $P > 0.05$ ).

### **Results:-**

The range of serum arginase activity in uncontrolled diabetic type 2 patients group (G1) was (86.30-141.80 U/L), with a mean  $\pm$  SD  $[114.49 \pm 14.82]$  U/L. The range of serum arginase activity in controlled diabetic type 2 patients group (G2) was (43.50-70.70 U/L), with a mean  $\pm$  SD  $[56.07 \pm 8.71]$  U/L. The range of serum arginase activity in normal healthy subjects (control group) (G3) was (10.90-33.50 U/L), with a mean  $\pm$  SD  $[21.77 \pm 6.51]$  U/L. The range of serum LF concentration in uncontrolled diabetic type 2 patients group (G1) was (40.20-67.50 ng/ml), with a mean  $\pm$  SD  $[52.35 \pm 6.75]$  ng/ml. The range of serum LF concentration in controlled diabetic type 2 patients group (G2) was (29.90-48.50 ng/ml), with a mean  $\pm$  SD  $[39.73 \pm 4.05]$  ng/ml. The range of serum LF concentration in normal healthy subjects (control group) (G3) was (9.70-19.10 ng/ml), with a mean  $\pm$  SD  $[14.01 \pm 3.00]$  ng/ml. Statistical analysis using ANOVA test revealed that significant elevation in the mean levels of both serum arginase activity and lactoferrin concentration in uncontrolled diabetic type 2 patients group (G1) compared to controlled diabetic type 2 patients group (G2) and normal healthy subjects (G3). Significant elevation in mean values of serum

arginase activity was found in controlled diabetic type 2 patients group (G2) compared to normal healthy subjects (control group) (G3) as shown in table (1).

In uncontrolled type 2 diabetic patient group (Group 1), there is correlation between arginase and urea at  $P (<0.01)$  and  $r = (0.909)$ . The correlation of LF and total cholesterol, triglycerides, HDL and LDL –cholesterol in both diabetic groups are shown in table(2) and table(3).

### Discussion:-

The present study may consider a link between the effect of serum arginase activity and serum lactoferrin concentration in one study for diabetes mellitus disease. We showed in this study that there is inverse relation between the effect of both arginase activity and lactoferrin concentration on Egyptian diabetic patients, where elevation of serum arginase activity in type 2 diabetes causing vascular dysfunction may as a result of decreasing insulin level and elevation of ROS at the same time serum lactoferrin concentration start to raise as immune response to counteract the inflammation that result from elevation of arginase and ROS.

This may be explained by hyperglycemia or insulin resistance in that appears to be involved in the widespread induction of arginase observed in diabetes as exposure of vascular cells to high concentrations of glucose triggers a rise in arginase activity. Consequently, Egyptian diabetic patients will have a weakened immune resulting from the hyperglycemia and decreasing insulin signaling which has anti-inflammatory effect, as a result the Egyptian diabetic patients will be exposed to inflammation and cell damage that cause increasing of oxidative stress as increasing ROS that cause vascular dysfunction and inducing the immune system yielding some signals, and some pathways that stimulate increasing serum arginase activity. Also, elevation of serum arginase level in control diabetic patient Egyptian begin to decrease somewhat due to controlling glucose levels by handling with tablets or exogenous insulin by syringe which modulate the immune system through adjusting the insulin level by its action as anti-inflammatory and restoring the elasticity of vascular cells.

**Table 1:-** Biochemical Data in Patient and Control Groups

Groups Biochemical Data	Uncontrolled Diabetic Type 2 Patients (G1)	Control Diabetic Type 2 Patients (G2)	Normal Subjects (G3)
Serum Arginase Activity (U/L)	<b>114.49 ±14.82<sup>c</sup></b>	<b>56.07 ±8.71<sup>b</sup></b>	<b>21.77±6.51<sup>a</sup></b>

Serum HDL Cholesterol Concentration (mg/dl)	<b>-0.962</b>	
Serum LDL Cholesterol Concentration(mg/dl)	<b>0.978</b>	

While most studies have focused on the coronary circulation and large conduit blood vessels, the role of arginase in mediating diabetic endothelial dysfunction in other vascular beds has not been fully investigated [5].

In this study, there is a correlation between arginase and urea at  $P (<0.01)$ . Diabetes was accompanied by increased food consumption, amino acid metabolism, and ratio of blood glucagon to insulin, all of which would tend to increase urea cycle and arginase activity [6]. Arginase, which is present in two isoforms catalyzes the final step of the urea cycle yielding L-ornithine and urea from L-arginine [7]. It was demonstrated that elevated levels of arginase and lower serum arginine levels are associated with increased urea production by RBCs from DM patients might have a negative impact on the functionality of vascular endothelial cells to impair NO synthesis by endothelial cells [8]. The deamination of amino acids reaction was catalyzed by many enzymes and excreted in the form of urea in diabetes. The increase in activity of liver arginase in diabetes may be a response to this high rate of protein catabolism [9].

Lactoferrin is stored in secondary granules of neutrophils and is released in response to activation of proinflammatory cytokines such as TNF- $\alpha$ , IL-6, and IL-8. The serum level of lactoferrin, which is very low in the physiological state, increases significantly with infection. By studying the results of serum LF concentration in Egyptian diabetic patients with type 2, it was shown that diabetic patients (uncontrolled and control patients) may be accompanied with complications like inflammation as a result of elevation of arginase level and ROS which lead to secretions of LF from neutrophils with higher levels as immune response and that may be explained by deficiency in secretion of insulin from pancreas or low efficiency of insulin effect on the target cells comparing to healthy subjects. As LF has anti-inflammatory effect and its secretion is one of the immune response processes, it was noted that, elevation of LF levels could decrease serum arginase activity by increasing the production of NO at the same time decreasing levels of ROS which cause vascular dysfunction in response to cytokines.

LF elevation may be due to inflammation accompanied to diabetes complication that result from elevation of serum arginase activity and ROS levels. Also, elevation of lipid profile may explain this elevation in lactoferrin concentration. Our results observed that there is correlation between lactoferrin, cholesterol, triglycerides (TG), HDL cholesterol and LDL cholesterol at ( $P < 0.01$ ) in non-control diabetic group (Group 1), control diabetic group (Group 2) and normal healthy subject (Group 3). Also, our study about the diabetic Egyptian patients showed that there was significant difference between each two groups of this experiment represented by  $P (<0.05)$ .

The anti-inflammatory effect of lactoferrin takes place by suppression of  $\text{TNF-}\alpha$  and  $\text{IL-1}\beta$ , which were activated in TNB-Induced colitis. The inhibitory effect of lactoferrin on proinflammatory cytokines suggested that lactoferrin released from secondary granules of activated neutrophils at an inflammatory site may provide an inhibitory feedback mechanism to prevent excessive neutrophil aggregation and activation [10].

Improving insulin action [by the administration of insulin or an insulin-sensitizer as rosiglitazone] could increase lactoferrin production and improve the neutrophil function. Insulin under strict euglycemia was able to prime neutrophil function in adult healthy humans and modulates neutrophil activity not only by gaining a better metabolic control but also through a direct effect of the hormone. Thus, improved insulin action might act as an immunoregulatory agent to turn immune cells to a primed state, which prepared the cell for a greater immune response and increased cytokine secretion. Increased insulin action or sensitivity would allow a more balanced neutrophil response, increasing the efficiency of the immune system [11].

The concentration of circulating lactoferrin was significantly decreased in individuals with an altered glucose tolerance and might contribute to dyslipidemia. In addition, the circulating lactoferrin concentration was linked to the plasma lipid profile where it was demonstrated the effect of lactoferrin as antiatherosclerosis by reducing the plasma and hepatic concentrations of cholesterol and triglycerides in mice and increased plasma concentrations of HDL cholesterol [12]. However, it was observed that concentration of lactoferrin was lower in diabetic patients as compared to control group [13]. On the other hand, it was explored that no difference in lactoferrin was found among the patients with non-insulin-dependent diabetes mellitus (NIDDM) group and healthy controls group [14].

Experimental studies in cells demonstrated that lactoferrin significantly inhibited/decreased intracellular reactive oxygen species (ROS) levels in a dose-dependent manner and protected from oxidative stress. As FFA produce an increase in oxidative stress, the putative decrease of FFA induced by lactoferrin could also contribute. In fact, different protective functions against inflammation have been attributed to lactoferrin, and the preservation of adipose tissue integrity and the associations with lactoferrin with CRP and antioxidant enzymes may be interpreted in this scenario. It was found that lactoferrin led to decreased TG concentration in adipose tissue explants [15].

Our experimental results for elevation of lactoferrin concentration in uncontrolled diabetic patient group (group 1) are in agreement with [16] using ELISA and [17] who found a significant increase in the concentration of lactoferrin in NIDDM in comparison to control group. It was found that significant increases in the concentration of lactoferrin in the diabetic subjects (30%) in comparison with (17%) of healthy subjects suggesting that disease-specific mechanisms might be responsible and these increased concentrations may reflect neutrophil priming caused by hyperglycemia.

Lactoferrin also directly interacted with modified LDL to prevent its interaction with scavenger receptors. A region rich in basic amino acid residues near the lactoferrin N terminus is responsible for the interaction with acetylated or oxidized LDL. This cationic part of lactoferrin strongly binds modified LDLs via electrostatic interaction with positively charged Arg residues at physiological pHs [12].

The mechanism of LF action might involve several processes, such as inhibition of adipogenesis, decrease of dietary triglyceride absorption, elevation of HDL cholesterol possessing anti-atherogenic properties, inhibition of accumulation of oxidized LDL cholesterol forms in macrophages and protection against formation of foam cells. LF also increased the susceptibility of cells to insulin action, including in conditions when the response to insulin was lowered (during inflammation). LF was a promising, completely nontoxic, natural remedy which might be applied in long-term prophylaxis and therapy of metabolic disturbances, such as insulin resistance/type II diabetes [18].

It was shown that circulating lactoferrin concentration was inversely associated with fasting triglyceride concentration ( $r = -0.24$ ;  $P = 0.001$ ), body mass index (BMI) ( $r = -0.20$ ;  $P = 0.007$ ), waist-to-hip ratio ( $r = -0.35$ ;  $P < 0.001$ ), and fasting glucose concentration ( $r = -0.18$ ;  $P = 0.01$ ), and directly correlated with HDL cholesterol concentration ( $r = 0.21$ ;  $P = 0.004$ ) [11] and [12].

The increase of lactoferrin was favorably associated with lipid levels and parameters of oxidative stress and inflammation. Lactoferrin had been described to inhibit selective uptake of HDL-cholesterol esters by 35–50% in human primary adipocytes and SW872 liposarcoma cells. By inhibiting HDL uptake, lactoferrin could lead to preservation of HDL-cholesterol levels after fat overload. This action seemed to be mediated by the interaction of

lactoferrin with low-density lipoprotein-related protein. Low-density lipoprotein-related protein contributes physiologically to HDL-cholesterol selective uptake in adipocytes. Lactoferrin would also inhibit the interaction of lipoprotein lipase with low-density lipoprotein-related protein[15].

So our results can conclude that elevation of serum LF concentration may play an important role in returning the immunity balance to the prime state by its action in recurrence of immunity of diabetic patients especially the vascular dysfunction which represents the main problem of Egyptian diabetic patients that result from elevation of serum arginase. Detection of both arginase activity and lactoferrin concentration may act as new parameters to evaluate the sequel of the diabetes especially concerning the major and minor vasculopathy in Egyptian diabetic patients. Also, in the future research in the pharmacology field, we can use these results for arginase activity and LF concentration as a target for controlling the diabetes complications.

#### Abstract

**Background:** There is increase in the prevalence of diabetes in Saudi Arabian population, due to significant changes in cultural factors, in addition to changes in dietary habits and socio-economic factors in addition to the high prevalence of physical inactivity.

**Objective:** The aim of this study is to measure the prevalence of Diabetes Mellitus, and to identify some of the associated risk factors in adult educated and employed males of Arar city, Northern Saudi Arabia.

**Participants and methods:** A cross-sectional study was carried out in Arar city, during the period from January to February 2016. A total of 325 educated and employed male Saudi nationals aged  $\geq 30$  years were included in the study. Data were collected by means of personal interview with the participants using a predesigned questionnaire covering the medical history of diabetes, age, family history of diabetes and physical activity. Anthropometric examination included height and weight measurements and calculation of body mass index (BMI). Blood sample is drawn under complete aseptic conditions to determine random blood glucose level. Person considered diabetic if random blood sugar was  $\geq 200$  mg/dl.

**Results:** The prevalence of Diabetes Mellitus among adult educated and employed males of Arar city was 14.8 %. There is high statistically significant difference between different age groups of the participants as regard diabetes (P value  $< 0.001$ ) but there is no statistically significant difference between obese and non obese (P value  $> 0.05$ ). There is also highly significant relation between the family history of diabetes and diabetes (P value  $< 0.001$ ). Diabetes was found in 17.8% and 9.8% of physically inactive and physically active participants respectively and there is statistically significant relation between diabetes and physical activity (P value  $< 0.05$ ).

Address:- Associate professor, Community Medicine Department, Faculty of Medicine, Sohag University, Sohag, Egypt and Faculty of Medicine, Northern border University, Arar, KSA.

**Conclusion and recommendations:** The prevalence of diabetes is relatively high among the male Arar city, Northern Saudi Arabia population and represents a major clinical and public health problem. Factors such as aging, family history of DM and physical activity are associated with diabetes. A national prevention programs to prevent diabetes and address the modifiable risk factors should be implemented.

## INTRODUCTION:

A major international study collating and analyzing worldwide data on diabetes found that the number of adults with this disease has doubled since 1980, reaching up to 347 million in 2008 [1].

Another significantly large study, which assessed obesity as a diabetes risk factor across five continents, showed more than 60% of men and 50% of women being overweight or obese, thereby contributing immensely to this global health problem [2].

A prominent example of a country with a sharp increase in its diabetes prevalence rate as a result of rapid economic and cultural change is the Kingdom of Saudi Arabia. Over the last four decades, the data in Saudi Arabia show an ever increasing prevalence of physical inactivity, unhealthy dietary habits and sedentary behavior in its population [3], which in turn resulted in Saudi Arabia being ranked as the third country in the world with the highest prevalence of diabetes [4].

The prevalence of diabetes in Saudi Arabia increased from 4.3% in 1987 to 23.7% in 2004 [5]. This increase has been attributed to significant changes in cultural factors, such as increase in affluence, which unmasks an increase in the genetic or ethnic propensity for diabetes, in addition to changes in dietary habits with the substitution of animal products and refined foods [6], along with the socio-economic factors. This is in addition to the high prevalence of physical inactivity among Saudi Arabian population that reached 96.1% [7] and ranged from 43.3% to 99.5% [8].

## Study objective:

The aim of this study is to measure prevalence of diabetes, and to identify some of the associated risk factors in adult educated and employed male population of Arar city, Northern Saudi Arabia.

## PARTICIPANTS AND METHODS:

A cross-sectional study was carried out in Arar city, the capital of the Northern Province of KSA, during the period from January to February 2016.

## Sampling

A total of 325 educated and employed male Saudi nationals aged  $\geq 30$  years were included in the study. Data were collected by means of personal interview with the participants using a predesigned questionnaire covering the following items:

- Medical history of diabetes, age, family history of diabetes and physical activity.
- **Anthropometric examination included height and weight measurements** with the use of a calibrated balance beam scale and a wall-mounted stadiometer and calculation of body mass index (BMI). Normal weight was defined as  $18 \leq \text{BMI} < 25 \text{ kg/m}^2$ , overweight as  $25 \leq \text{BMI} < 30 \text{ kg/m}^2$  and obesity as  $\text{BMI} \geq 30 \text{ kg/m}^2$  [9].
- Blood sample is drawn under complete aseptic conditions to determine random blood glucose level. Person considered diabetic if random blood sugar was  $\geq 200 \text{ mg/dl}$  [10].

Any participant suspected as diabetic was advised to visit a nearby primary health care center to complete investigations, start management and follow up.

## Ethical considerations

This study was reviewed and approved by the Research Ethics Committee of Faculty of Medicine, Northern Border University. Participants were informed that participation is completely voluntary, and written consent was obtained from each participant before being subjected to the questionnaire and after discussing the objective with the participants. No names were recorded on the questionnaires. Adequate training of data collectors took place to ensure protection of confidentiality, and all questionnaires were kept safe.

### Statistical analysis

Collected data were coded and analyzed using statistical package for the social sciences (SPSS, version 15) [11]. The w2-test was used as a test of significance, and differences were considered significant at P value 0.05 or less.

### Results:-

Table (1) shows the background characteristics of studied Participant. The majority of the Participants in the study were between 40 and 50 years of age, and only 2.8% were between 30 and 40 years of age. More than half of participants have no Family History of DM (52%). About 36 % of the participants are obese (BMI >30). About 37.8% recorded physical activity. Blood samples revealed that 14.8 % of the participants showed measured random blood glucose > 160 ml/dl and considered as diabetic.

Table (2) shows the relationship between DM and age group, family history of DM, presence of obesity and physical activity in studied adult males of Arar population. There is high statistically significant difference between different age group of the participants as regard D.M (P value < 0.001). The percentage of diabetes among obese and non obese was 18.6% and 12.6% respectively. But the difference was not significant between obese and non obese regarding D.M (P value >0.05). 25.6% of participants having positive family history of diabetes were diabetic and there is high statistically significant difference (P value <0.001). Diabetes was found in 17.8% and 9.8% of physically inactive and physically active participants respectively. There is statistically significant relation between physical activity of the participants and D.M (P value <0.05).

There is significant weak positive correlation between age and random blood glucose in the studied population (r = 0.286 and P value < 0.001). (Table 3).

## Discussion:

Determining the prevalence of diabetes mellitus is important to allow for rational planning and allocation of resources. Therefore, we designed this study to determine the prevalence of diabetes among adult male Saudi nationals.

This study is a cross-sectional study was carried out in Arar city, the capital of the Northern Province of KSA, during the period from January to February 2016.

A total of 325 male Saudi nationals aged  $\geq 30$  years with Mean age ( $\pm$ SD) was 38.0 ( $\pm 6.1$ ) were selected.

In the present study revealed that the prevalence of Diabetes among adult males of Saudi Arabia was 14.8 % . Our finding is less than that reported by **Khalid et al, (2011)**, the prevalence of diabetes among adult males in KSA was 34.1% [11]. and less than the reported prevalence in Gulf region (25.7%) and Oman (16.1%).[12,13 ]. Our figure is quite lower than the prevalence found in other Arab countries and other regions of KSA, this is mostly attributed to the relatively health awareness of our target group and the strict health measures and health education adopted by local health authorities in Arar city to prevent and control Diabetes Mellitus.

Our data demonstrate that 18.7% of individuals aged 50-60 years have diabetes. Studies from Saudi Arabia have shown different age-specific prevalence rates of diabetes. Our data demonstrate also an positive correlation between

age and random blood sugar level; the fact that diabetes prevalence increases with age is consistent with the findings in previous studies [11,14].

It is well documented that obesity is a strong risk factor for the development of DM as shown by several studies, however, In this study, the data showed that (36.3%) of Arar men population are obese and that (18.6%) of them are diabetics (P value = 0.094). This finding isn't in accordance with findings of Daousi et al., 2006 who reported higher prevalence of obesity in diabetics with 80% to 90% of people diagnosed with type 2 diabetes being obese [15]

Both obesity and diabetes are preventable. Previous studies have demonstrated that changes in lifestyle are effective in preventing both diabetes and obesity in high-risk adults with impaired glucose tolerance [16,17].

The current study reported that, diabetes was found in 17.8% and 9.8% of physically inactive and physically active participants respectively. There is statistically significant relation between physical activity of the participants and D.M (P value <0.05). Increasing physical activity, improving diet and then sustaining these lifestyle changes can reduce both body weight and risk of diabetes. Health professionals must continue to stress the importance of a balanced diet and physical activity for healthy weight loss [9].

Age, physical activity and family history of DM were major contributors significantly associated with DM. This significant relationship has been found consistently in different populations. In United Arab Emirates [18], the significant risk factors for DM were age, family history of DM and obesity and in Greece, age, obesity, family history of DM, hypertension, and elevated triglyceride levels were significantly associated with the presence of DM [19].

In the Saudi society, men and women must overcome many obstacles to make the best choices for optimal health. The provision of clinical preventive services to identify and control hypertension, elevated cholesterol levels, obesity and diabetes remain important medical priorities nationally. Development and implementation of national programs to promote a balanced diet, increased physical activity and weight control must be national priorities as well.

### **Conclusion and recommendations:-**

The prevalence of diabetes is relatively high among the male Arar city, Northern Saudi Arabia population and represents a major clinical and public health problem. Factors such as aging, family history of DM and physical activity are associated with diabetes A national prevention programs to prevent diabetes and address the modifiable risk factors should be implemented.

### **Acknowledgment:-**

The success and final outcome of this research paper required assistance from many people and I am extremely fortunate to have got this all along the completion of this work. My thanks go to Abdalla Mohamed Bakr Ali (1st year medical student, Sohag University, Egypt), Omar TabaanAlenezi, Abdullah Barghash k. Alanazi, Muaz Bilal Wali, Abdullah TbanAlanazi, (Medical students, Northern Border University) and Walaa Mohamed Bakr Ali for their cooperation in different steps of the research.

#### Abstract

**Background:** Despite knowing the seriousness of obesity and its impact on health, its prevalence still growing in Saudi Arabia, which puts a considerable financial burden on governments and individuals resources

**Objective:** to determine the prevalence of obesity among Saudi female in Riyadh city, Find out level of awareness among women regarding obesity and its problems.

**Methods:** A cross-sectional study among Saudi female in Riyadh. Self-administered pretested questionnaire was distributed in six major shopping malls in January, 2011. The administered questionnaire included the demographic data, anthropometric measurements, questions to assess the knowledge of participants about obesity.

**Results:** Total of 174 female participants included in study, mean age was 22 years. 59 % of participants have collage level education, 50% high school education .For marital status , 63% of participant were married . Regarding the participants weight, 33.3% were overweight (BMI 25-30) and 28% were obese (above 30). Most of participants reported High caloric intake (96%) and Lack of physical activity (92%) as the main risk factor for obesity. For health consequences and complication of obesity, Most of participants reported hypertension, stroke, heart disease, and DM as the main health consequence for obesity with percentage of 79%, 70%, 73%, 70% respectively. While 30%, 26 % and 10% reported cancer, sleep apnea and Gynecological problems as health problem related to obesity (respectively).

**Conclusion:** Obesity is a real public health problem among Saudi female that need control strategies through life style modification and medical intervention. Knowledge of the health consequences of obesity among Saudi female were high about cardiovascular risk but poor about cancer, Osteoarthritis, sleep apnea and Gynecological risk.

## Introduction:-

Obesity is a major health problem that associated with decreases in life expectancy and health-related quality of life (1). In 2014, WHO estimated that more than 1.9 billion of adults around the world were overweight and over 600 million were obese (2). Locally, Prevalence of overweight and obesity in Saudi female above age of 15 years is reported to be 28.8% and 33% 10.6%, respectively (3).

Obesity have strong relationship with many risk factor including hormones, low socioeconomic status, smoking , high media times and high intake of food though the strength of the relationship varies with the condition (4-5).

Furthermore, obesity associated with multiple co-morbidities including cardiovascular, endocrine, pulmonary, sleep apnea, arthritis, gastrointestinal, gall bladder disease, and certain types of cancer (6).

Despite knowing the seriousness of obesity and its impact on health, its prevalence still growing (7). This increase obesity rate put a considerable financial burden on governments and individuals resources (8). Knowing the prevalence rates and level of societies awareness is therefore a major step to the development of useful interventions methods to minimize this health problem.

The objective of this study was to determine the prevalence of obesity among Saudi female, Find out level of awareness among women regarding obesity and its problems.

## Methods:-

A cross-sectional study was conducted among Saudi female in Riyadh. Self-administered pretested questionnaire was distributed in six major shopping malls (Granada mall, Hayat mall, Panorama mall, Sahara mall, Alothaim mall and Riyadh gallery) in January, 2011. The coded questionnaires had unique identification numbers to keep the anonymity of participants. In each of the six malls, 29 questionnaires were distributed over visitor. The purpose of the study were explained to participants and written consent obtained from female, who agreed to participate in the study. The final questionnaire was developed after pilot testing among 30 Saudi female and necessary modifications were done. The Inclusion criteria for study were Saudi females, ages 18 and older, living in Riyadh city and not working in the medical field.

The administered questionnaire included the following sections:

- Demographic data: age, marital status, education level
- Anthropometric Measurements: Body weight was measured using a bathroom scale. Height was measured using a stadiometer then Body mass index was calculated for each subject as the ratio of body weight (in kg) and squared height (in metres). A participant was considered to be obese or not by using the BMI criteria Suggested by Beaton et al. BMI less than  $18.5 \text{ kg/m}^2$  was considered underweight, between 18.5 and  $25 \text{ kg/m}^2$  was considered normal,  $25\text{--}30 \text{ kg/m}^2$  was considered overweight, and  $30 \text{ kg/m}^2$  or above was considered obese.
- Knowledge of participants: was assessed by asking them about different aspects of obesity including risk factor, various medical conditions and cancers associated with obesity, management of obesity.

The ethics committees at a collage approved this study. Each participant received a thorough explanation of the purpose of the study and written consent obtained from each participant .the participants was told that the enrollment is voluntary.

The survey responses were entered into the SPSS software (version 17.0) and checked for any errors or missing information. Demographic characteristics were assessed using means for continuous variables and proportions for categorical variables. Knowledge about disease risk was assessed using proportions. Analysis of variance test used to assess differences in obesity awareness by demographic Variables (marital status, age).

## Results:-

Total of 174 female participants included in study, mean age was 22 years, the age ranged from 18 to 54 years. 59 % of participants have collage level education, 50% high school education and 16% postgraduate level education. For marital status, 63% of participants were married while 36.7% were singles. Regarding the participants weight, 4.5 % were underweight with body mass index below 18.5, 34 % were normal weight (BMI between 18.5-25) , 33.3%

were overweight (BMI 25-30) and 28% were obese (above 30). **Table 1** showed demographic data and BMI of participant.

**Table 1:** Demographic data and BMI.

<b>Age</b>	18 -25	79	45.4 %
	26 -40	56	32 %
	Above 40	39	22.4 %
<b>Education</b>	Illiterate	2	1.%
	Primary & Middle school &	3	1.7%
	high school	50	28.7%
	Collage	103	59.%
	Post graduate	16	9%
<b>BMI</b>	Under weight	8	4.5 %
	Normal weight	59	34 %
	overweight	58	33.3 %
	obese	49	28 %
<b>Marital status</b>	single	64	36.7 %
	Married	110	63 %

Regarding participants knowledge about the risk factors of obesity ,most of participants reported High caloric intake (96%) and Lack of physical activity (92%) as the main risk factor while 56.8% reported Insufficient sleep , 56.8% psychiatric illness 48.8% Genetic susceptibility 52.8% Drugs and 47.7 Age 40 as risk factors. For health consequences and complication of obesity, Most of participants reported hypertension, stroke, heart disease, and DM as the main health consequence for obesity with percentage of 79%, 70%, 73%, 70% respectively. While 30%, 26 % and 10% reported cancer, sleep apnea and Gynecological problems as health problem related to obesity (respectively). Regarding obesity preventative measures, 96% and 93 % of responder reported Healthy diet and regular exercise as main preventative measures (respectively). **Table 2** showed Percentage of Participants having Correct Knowledge about obesity Risk Factors and health consequences.

**Table 2:-** Percentage of Participants having Correct Knowledge about obesity Risk Factors, preventative measure and health consequences

<b>Risk factor</b>	Lack of physical activity	161	92%
	Insufficient sleep	99	56.8%
	psychiatric illness	85	48.8%
	Genetic susceptibility	92	52.8%
	Drugs such as steroids, OCP	83	47.7
	High caloric intake	168	96
	<b>Age</b>	70	40
<b>Health consequences</b>	Hypertension	138	79%
	Stroke	122	70 %
	Heart disease	128	73 %
	Cancer	52	30 %
	DM	121	70 %
	Osteoarthritis	45	26 %
	sleep apnea	78	45 %
<b>Preventative measure</b>	Gynecological problems	19	10%
	Healthy diet	168	96.5%
	Regular exercise	162	93%
	Meditation	87	50%
	Regular health check-ups	90	51.7%
	stress management	50	28.7%

Most of participants (57%) between age of 18 to 25 were non obese. In contrast, 74.3 of the participants above 40 years were obese ( $p < 0.001$ ). Among married female, 29% were non obese, 38% overweight and 36.3 were obese while single female 54.6 % non obese 31% overweight and 14% obese ( $p = 0.001$ ). **Tables 3 and 4 .**

**Table 3:-** Relationship between obesity and age of participant.

Age	Non obese	Overweight	Obese	Total
18 -25	45 (57%)	29 (36.7%)	5 (6%)	79 (100%)
26- 40	19 (34%)	22 (39.2%)	15 (26.7 %)	56 (100%)
Above 40	3 (7.6 %)	7 (18%)	29 (74.3)	39 (100%)
Total	67 (100%)	58 (100%)	49 (100%)	174

**Discussion:-**

This study aimed to determine the prevalence of obesity among Saudi female and to assess the level of awareness among Saudi women regarding obesity and its problems. This small scale study is unique in certain ways as the study was conducted at the capital city of Saudi Arabia , in the largest malls of city which is a destination of all society spectrums and made this study as representative of obesity prevalence and level of awareness.

Prevalence of obesity in our study reported to be 28%, this is almost consistent with previously reported among Saudi female (33%) (3). This shows that obesity is major public health problem among Saudi female, that need control strategies and not to be ignored.

BMI increases in direct proportion with age, in which participants above age of 40 have the greatest rate of obesity followed by age of 25 to 40. Similar conclusion reported previously (9). The reason behind this could be due to decline in physical activity with age in addition to menopause that associated with Weight gain and changes in fat distribution (10).

In current study, marital status was associated with higher BMI, several studies reported similar association between marriage and increased prevalence of obesity (11-12). The explanation for this finding could be because married couples tend to eat regularly with their children and they have better eating pattern and high caloric intake. Sobal J etal reported strong association between marital status and obesity only among men, but not among female (13).

In our study between 70 %to 79 % of subjects were aware that obesity increase risk of hypertension, cardiac disease, stroke and diabetes. Eden R Cardozo etal reported similar finding for awareness of cardiovascular disease and DM in obese subject (14). Ginger J. Winston reported slightly higher level of awareness (94%-96%) (15).in our study, we found lower level of awareness among participants about the association of cancer and Gynecological problems to obesity and this finding reported globally (14, 16).

The limitation of study included study design as the cross sectional study may give a different results if another time-frame has been chosen

In summary, Obesity is a real public health problem among Saudi female that need control strategies through life style modification and medical intervention. Our findings indicated that Saudi females were knowledgeable about association between obesity and increased risk of cardiovascular, diabetes .in contrast level of awareness about obesity and risk of cancer, Osteoarthritis, sleep apnea and Gynecological problems were poor.

 Honda, Analysis

#### Abstract

Customer satisfaction is important to business from the short term and long term point of view. In short importance we can include worn and repurchase, while in long-term brand image and market share. If a customer is satisfied he will praise product his/her friends, relatives, neighbors or colleagues and he/she may recommend the product to people he/she may intend to buy the same product, or may buy again in near future one satisfied customer may be the best means of advertisement. It can build a brand image in a particular area and gradually shall increase leading to a greater market share. Hence short - term benefits of satisfaction will pave way to long -term benefits empirical evidence regarding extend of negative versus positive word of mouth is some what equivocal. This study has undertaken to know the customer satisfaction regarding Honda bikes in Chinnamanur town, Theni District.

#### Introduction:-

Honda is the world's largest manufacturer of two Wheelers, Recognized the world over as the symbol of Honda two wheelers, the 'Wings' arrived in India as Honda Motorcycle and Scooter India Pvt. Ltd. (HMSI), a 100% subsidiary of Honda Motor Company Ltd., Japan, in 1999. Since its establishment in 1999 at Manesar, District Gurgaon, Haryana, Honda has lived up to its reputation of offering the highest quality at the most reasonable price. Despite being one of the youngest players in the Indian two-wheelers market, Honda has become the largest two wheeler manufacturer as well as the second largest two-wheelers company in India.

Honda is also the fastest growing company in country today. With a host of facilities under its wings, the first factory of HMSI is spread over 52 acres including a covered area of about 100,000 sq. meters in Manesar, District Gurgaon, Haryana with an annual capacity of 1.65 million units. To meet the ever increasing demands of the

**Address:-** M.Com., M.Phil., (MBA), PGDCA, Ph.D., SET., Assistant Professor of Commerce, Hajee Karutha Rowther Howdia College, Autonomous and A grade by NAAC, Uthamapalayam- 625 533. Theni District. Tamilnadu. India.

products, Honda has started operations of its second plant in Tapukara, District Alwar, Rajasthan. Expanding to full operations, Honda production capacity has jumped 30% year on year to 2.8 million per annum in FY 12- 13.

Honda's third plant at Narsapura Industrial Area near Bengaluru, Karnataka is equipped to manufacture 1.2 million units. Utilizing production technologies refined at Manesar & Tapukara plants as starting point, the 3rd plant is employed with state-of-the-art manufacturing, automation and environment friendly technologies to deliver quality products. On February 17 2016, Honda inaugurated the "World's largest only scooter plant" at Vithalapur Gujarat with annual capacity of 1.2 million units. The new plant will employ approximately 3000 people within first 2 years of commercial production.

The history of the Honda brand is nothing more than the history of our challenges and achievements in creating values, invariably ahead of our time. It is also the history of the dreams of each of our associates that have come true and have been shared by people around the world.

**Methodology:-**

Research is defined as a scientific and systematic search for pertinent information's on a specific topic. It also refers to a search for knowledge. Search comprises defining and redefining problems formulating hypothesis suggested solutions, collecting organizing and evaluating data, making deductions and reaching conclusions and testing the conclusion.

**Research design:-**

The descriptive research studies are those studies, which are concerned with describing the characteristics of a particular individual or a group (demographic characteristics). In the study the researcher has used the descriptive methods of research.

**Period of the Study:-**

The study was undertaken during November – December 2016.

**Data Collection:-**

The study depends on primary data and secondary data.

**Primary Data:-**

The primary data is collected through interaction with personnel at all level on HR perspective the researcher has constructed questionnaire.

**Secondary Data:-**

The secondary data were collection from the company profile policy, letter, relevant manual; notification in the office communication (IOC) verified assessment report, statement of account, p/c statement (audit reports) statutory records are offered for study. Relevant supportive/authentic document are offered for verification.

**Sampling Design:-**

Under the simple random sampling each member of the population has a known and equal chance of being selected in the study, the researcher used the simple random sampling methods for the research from the total population.

**Sample Size:-**

The size of the sample was finalized to 110 samples after considering the factors like the extent of error, degree of confidence etc.

**Objectives:-**

- To study the socio demographic factors of customers.
- To identify the factors that influence to purchase of Honda bikes
- To analyse the satisfactory level of customers about the Honda bikes in the study area.
- To offer suitable suggestions based on the findings of the study.

**Research Hypothesis:-**

- There is a significant association between age' and satisfaction of two- wheeler (Bajaj).
- There is a significant association between area of residency and attraction of media.

**Statistical Tools Used:-**

- Percentage analysis
- Chi - square test

**Data Analysis And Interpretation:-****Table 1:-** Disrblution Of Respondents on the basis of gender.

S.no	Gender	No. of Respondents	Percentage
1.	Male	95	86.36
2.	Female	15	13.64
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: Primary data

It is evidenced from table 1, 86.36% of respondents belong to the Male category and 13.64% of respondents belong to the female category. Therefore majority of the respondents belong to the male category.

**Table 2:-** Distribution Of Respondents on the basis of age.

S.no	Age	No. of Respondents	Percentage
1.	Below	5	4.54
2.	21-30	59	53.64
3.	31-40	22	20.00
4.	41-50	15	13.64
5	Above51	9	8.18
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: Primary data

From the above table it is identified that 53.64% of respondents belong to 21-30 years of age, 20% of respondents belong to 31-40 years of age, 13.64%, of respondents belong to above 41-50 years of age, 8.18% of respondents belong to above 51 years of age, 4.54% of respondents belong to below 20 years of age group. Hence majority of the respondents belong to 21-30 years of age group.

**Table 3:-** Distribution Of Respondents on the basis of educational qualification

S.no	Educational Qualification	No of Respondents	Percentage
1.	Uneducated	1	0.91
2.	SSLC	23	20.91
3.	HSC	12	10.91
4.	UG	45	40.91
5.	PG	29	26.36
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: primary data

It is noticed from table 3, 40.91 % of respondents belong to UG. degree, 26.36% of respondents belong to P.G. degree, 20.91% of respondent belong to SSLC, 10.91% of respondents belong to HSC, 0.91 % of respondents belong to uneducated. Therefore, majority of the respondents belong to UG degree only.

**Table 4:-** Distribution of respondents on the basis of occupation.

S.No	Occupation	No. of Respondents	Percentage
1.	Govt. employees	12	10.91
2.	Private employees	54	49.09
3.	Students	14	12.73
4.	House wife	5	4.54
5.	others	25	22.73
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: primary data

Table 4 reveals that 49.09% of respondents are private employees, 22.73% of respondents belong to other occupations, 12.73% of respondents are students, 10.91% of respondents are government employees and 4.54% of respondents are house wife. Therefore majority of the respondents belong to private employees.

**Table 5:-** Distribution Of Respondents On The Basis Of Annual Income.

S.no	Annual income	No of Respondents	Percentage
1.	Rs.50,000	40	36.36
2.	Below Rs 50,000	22	20.00
3.	Rs.1,00,000	24	21.82
4.	Above Rs.1,00,000	16	14.55
5.	Rs.1,50,000 to Rs.2,00,000	8	7.27
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: Primary data

Table 5 shows that 36.36% of respondents belong to the income of Rs. 50,000, 21.82% of respondents belong to the income of Rs. 1,00,000, 20% of respondents belong to the income of below 50,000, 14.55% of respondents belong to the income of above Rs. 1,00,000 and 7.27% of respondents belong to the income of Rs. 1,50,000 to Rs. 2,00,000. Therefore majority of the respondents belong to the Annual income of Rs. 50,000 only.

**Table 6:-** Distribution of respondents on the basis of marital status

S.no	Marital Status	No. of Respondents	Percentage
1.	Married	62	56.36
2.	Unmarried	48	43.64
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: primary data

It is clear from table 6, 56.36% of respondents belong to 'married and 43.64% of respondents belong to unmarried. Therefore majority the respondent belong to married.

**Table 7:-** Distribution of respondents on the basis of cost of bikes

S.no	Cost of two wheeler	No of Respondents	Percentage
1.	Low	13	11.82
2.	Moderate	65	59.09
3.	High	32	29.09
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: Primary data

Table 7 clearly shows that 59.09% of respondents feels the cost of two wheeler is moderate, 29.09% of respondents feels the cost of two wheeler is high and 11.82% of respondents feels the cost of two wheeler is low. Therefore majority of the respondents feels the price of bikes are moderate.

**Table 8:-** Distribution of respondents on the basis of usage of bikes

S.No	Usage of Two wheeler	No. of Respondents	Percentage
1.	0-2 years	46	41.82
2.	3-5 years	34	30.91
3.	6-8 years	12	10.91
4.	Above 9 years	18	16.36
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: Primary data

Table 8 shows that 41.82% of respondents using the bikes 0 to 1 years, 30.91% of respondents using the bikes 3 to 5 years, 16.36% of respondents using the bikes above 9 years and 10.91 % of respondents using the bikes 6 to 8 years. Hence majority of the respondents are using the bikes upto 2 years.

**Table 9:-** Distribution of respondents on the basis of selection of honda bikes

S.No	Selection of two wheeler criteria	No. of Respondents	Percentage
1.	Price	49	44.55
2.	Quality	20	18.18
3.	Comfort and Fuel efficiency	28	25.45
4.	Style and pick up	13	11.82
5.	Others	-	-
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: Primary data

Table 9 shows that 44.55% of respondent prefers for price, 25.45% of respondents prefer for comfort and fuel efficiency, 18.18% of respondents prefer for quality. 11.82% of respondents prefer for style and pickup, hence majority of respondents prefer the bike for its price factor.

**Table 10:-** Distribution of respondents on the basis of attraction of media.

S.No	Attraction of media	No of Respondents	Percentage
1.	Television Advertisement	35	31.82
2.	Magazine	15	13.64
3.	Friends and relatives	44	40.00
4.	Show rooms	12	10.91
5.	Others	4	3.63
	<b>Total</b>	<b>110</b>	<b>100</b>

Source: Primary data

Table 10 reveals that 40% of the respondents purchase decisions were influenced by their friends and relatives, 31.82% of respondents were influenced by television, 13.64% of respondents were influenced by magazine, 10.91% of respondents were influenced by show room displays, 3.63% of respondents were influenced by others factors. Hence, majority of the respondents were influenced by their friends and relatives for the purchase of Honda bikes.

#### Association between age and satisfaction of two wheeler (honda).

Age	Satisfaction of two wheeler			Statistical inference

= 4

4' at 5% level of significance.

**Inference:-**

There is no significant association between area of residency and attraction of media. Hence the null hypothesis has been accepted.

**Findings suggestions and Conclusions:-****Findings related to socio - demographic factors:-**

- Majority of Respondents are Males (86.36%)
- Majority of Respondents belong to the age group of 21 - 30 years (53.64%)
- Majority of Respondents studied up to their U.G. degree (40.91 %)
- Majority of Respondents using the Honda bikes are private employees (49.09%) Majority of Respondents receiving the income of Rs. 50,000 (36.36%)
- Majority of Respondents are married (56.36%).

**Findings Related To Hypothesis:-****Research Hypothesis:- 1**

There is a significant association between age and satisfaction of Honda Bikes

**Null Hypothesis:-**

There is no significant association between age and satisfaction of Honda Bikes.

**Statistical test used:-**

Chi-square test was used.

**Finding:-**

There is no significant association between age and satisfaction of two Wheeler. Hence null hypothesis is accepted.

**Research Hypothesis:- 2**

There is a significant association between area of residency and attraction of media.

**Null Hypothesis:-**

There is no significant association between the area of residency and attraction of media.

**Statistical test used:-**

Chi - square test was used.

**Finding:-**

There is no significant association between' area of residency and attraction of media.  
Hence null hypothesis is accepted.

**Suggestions:-**

- It is suggest that though Honda Two wheelers are having good quality, it should be improved furthermore.
- More styles and models should be introduced to attract the more customers.
- Lot more facilities may be provided.
- More safety measures may be provided to attract more amounts of customers.
- It is suggest that more advertisements may be given on television and magazine to influence the customer to purchase the Honda two wheelers more.
- It is suggest that to provide installment payment scheme. So that the product can attract the customers easily.
- It is suggest the company should concentrate more on cost of maintenance.
- It is suggest that the company should concentrate more on the mileage of Honda two wheelers, because some of the customers are dissatisfied about mileage.
- It is suggest that the company may open many show rooms in and around chinnamanur town so as to attract rural people surrounding that town.

**Conclusion:-**

The study reveals that almost all the customers are satisfied with the facilities and services provided by the Honda two wheelers in the study area. The company may make necessary research frequently about the product as well as satisfaction level of customers about Honda bikes, company may also get feedback from the customer's part to overcome the problems faced by them. . The company can change the product style and reduce the cost of the product may be attracted by more customers and get full satisfaction. The suggestions given in this study will improve the sale of the product and thus improve their efficiency and production.

Superoxide dismutase (SOD), Extraction,  
Tamarixaphylla.

#### Abstract

The present study was conducted to investigate the optimum conditions of superoxide dismutase (SOD) extract from *Tamarixaphylla* L. (tamarisk) parts included (Leaves, Flowers, Fruits, and Seeds). The results indicated that the highest superoxide dismutase specific activity concentrated in the crude extract of the leaves reaching 24.98 unit / mg protein, and followed by flowers 17.53 unit / mg protein, and fruits 8.99 unit / mg protein, while the seeds have lowest specific activity 5.66 unit / mg protein. using potassium phosphate buffer 0.1 M pH 7.8 containing 1mM EDTA- $\text{Na}_2$  and 2% PVP, and pyrogallol as substrate, Therefore, the leaves was used as source of SOD. The study was aimed to determine the optimum conditions of the enzyme extraction. The result indicated that the optimum concentration of EDTA- $\text{Na}_2$ , PVP, extraction ratio, pH, buffer concentration, and the extraction time were 2mM, 2%, 1:3, 0.1M and 20 min, respectively.

#### Introduction:-

Superoxide dismutase SOD (EC 1.15.1.1) is a metalloenzymes which is known to accelerate spontaneous dismutation of superoxide radicals to molecular oxygen and hydrogen peroxide [1]. SOD is widely distributed among aerobically living organisms and has been inferred to play active role in controlled superoxide levels in cellular compartments [2,3]. There are three types of SODs in plants, classified according to the metal at the catalytic centre: CuZnSOD, FeSOD and MnSOD [4]. Cu/ZnSOD are chiefly located in chloroplast, also in the cytosol. And also found in the watermelon cotyledons [5]. FeSODs located in the chloroplasts, but also located in the peroxisomes and mitochondria of *Dianthus caryophyllus* L. together with a Mn-isozyme [6]. Also found in Hybrid agave [7]. MnSOD in mitochondria [8]. MnSOD is essential to a biotic life [9,10]. Specific inhibitors used to detect isoenzymes of SOD include  $\text{H}_2\text{O}_2$  and (KCN). Cu/Zn SOD inhibited by both inhibitor, unlike MnSOD, while FeSOD inhibited only by  $\text{H}_2\text{O}_2$  [11,12,13].

All types of superoxide dismutase are abundant in different organisms, including tobacco, pea, *Pisum sativum*, *Ginkgo biloba*, *Nuphar luteum*, *Rauwolfia serpentina* Benth, *Methanobacterium bryantii* and *Escherichia coli* [14-21]. SOD extract from different plant species, *Bambusa oldhamii* [22], leaves and roots of *Deschampsia Antarctica* [23], and *Manihot esculenta* [24].

**Corresponding Author:-Eman Salman Raheif.**

Address:-College of Science University of AL-Qadisiyah.

**Material and Methods:-****Plant and Chemicals Materials:-**

*Tamarixaphylla* L. plant were harvested from the farmland surrounding the university of Qadisiyah province of Diwaniyah.

The source of chemicals were as follows: Potassium phosphate Pyrogallol, Bovine serum albumin, PVP, EDTA- $\text{Na}_2$ , HCl, (BDH(England)). Coomassie brilliant blue G-250 (Sigma( USA))., Tris-base, , (Fluka (Switzerland)). Tris-HCl(Oxoid(England)).

**SOD Extraction:-**

Superoxide dismutase extracted from *Tamarixaphylla* L. according to [25], with some modification. Fresh plants tissues (5g) was pulverized in a cold mortar and pestle with (15ml) of 0.1M potassium phosphate buffer pH (7.8) containing 1mM EDTA- $\text{Na}_2$  and 2% (w/v) insoluble PVP. The homogenate was strained through four layers of miracloth and centerfuged at 15,000 rpm for 20 min at 0°.

**SOD activity:-**

The activity of superoxide dismutase was determined using a Pyrogallol auto-oxidation . One unit of activity is defined as the amount of SOD required to inhibit the 50% of pyrogallol auto-oxidation [26].

**Protein determination:-**

The total protein concentration was measured by the Bradford method [27], by using bovine serum albumin as the standard.

**Optimum Conditions of SOD:-****Concentration of EDTA- $\text{Na}_2$ :-**

SOD from *Tamarixaphylla* L. leaves extract at different concentration of EDTA- $\text{Na}_2$  (0.1, 0.2, 0.4, 0.6, 0.8, 1 , 2) mM .

**Concentration of PVP:-**

SOD extract at different concentration of PVP (0.1, 0.2, 0.4, 0.6, 0.8, 1, 2, 3, 4, 5) % (w/v).

**Optimum ratio for SOD extract:-**

SOD extract from *Tamarixaphylla* L. extracted at different ratio (1:2, 1:3 , 1:4 , 1:5 , 1:6) (w:v)

**Concentration of buffer solution:-**

SOD extract at different concentration of potassium phosphate buffer range between (0.1-0.7) M pH 7.8 .

**Optimum pH:-**

SOD extract at different pH range between (4.0-9.0)

**Optimum extraction time:-**

SOD extract at different time (5 , 10 , 15 , 20 , 25 , 30 ) min.

**Results and Discussion:-****SOD activity in *Tamarixaphylla* L. parts:-**

High SOD specific activity concentrated in the crude extract of *Tamarixaphylla* L. leaves compare with the other parts of plant, reached 36.55 unit/ mg protein. Therefore, it has been used as a source of SOD in further studies.

Figure 1:- SOD activity in *T. aphylla* L. parts

#### The optimum conditions of SOD :

**Concentration of EDTA- $\text{Na}_2$ :** The enzyme was found to show maximum activity at concentration 1 mM. SOD extract from the leaves *Eleusinecoracana* L. by added 1mM EDTA- $\text{Na}_2$  [28]. The optimum concentration of EDTA- $\text{Na}_2$  added in the extraction of SOD from roots and leaves of *Medicago truncatula* was 0.1mM [29]. The used of EDTA in the extraction of the enzyme maintained the stability of enzyme being chelating agent prevent overlapping contaminated ions of the buffer during the work of enzyme [30]. So it added in concentration 1 mM in the current study to get rid of the harmful effects of metal ions and to maintain the stability of the enzyme.

Figure 2:- Effect of EDTA- $\text{Na}_2$  on the specific activity of SOD from *T. aphylla* L.

#### Concentration of PVP:-

The high SOD activity showed at concentration 2% (w/v) . The PVP added to extract SOD from *Fritillaria meleagris* was 200 mg [31]. While the PVP ratio to extract SOD from roots and leaves of *Kandelia cande* L was 4% [32]. PVP used in the extraction of enzymes from plants tissues to adsorption of phenolic compounds and reduced the impact on the stability of protein and their effectiveness [33].

**Figure3:-**Effect of PVPon the specific activity of SOD from *T. aphylla*L.

#### Extraction ratio:-

Maximum activity of the enzyme showed at 1:3 (W:V) . SOD extracted from the leaves of *Brassica napus* L. in 1:3 ratio [34]MnSOD extracted from the leaves of *Pisumsativum* L. in 1:5 ratio [8].

**Figure 4:-**Extraction ratio of SOD from *T. aphylla*L. leaves

#### Concentration of buffer solution:-

The enzyme show high activity at 0.1 M of potassium phosphate buffer. The ionic strength of 0.1 M of potassium phosphate buffer sufficient to decode the correlation between cellular enzyme and other materials , While the difference in extraction buffer concentrations used in the study included a decrease in the efficiency of extraction increased emphasis this is because the increase of the buffer solution concentration increases the liberation of protein and non-protein , thereby increasing protein concentration and decrease the specific activity. Optimum SOD specific activity of SOD extract from seeds of Chickpea by used potassium phosphate buffer 0.1 M [35].SOD specific activity extract from Spinachby used 50mMpotassium phosphate [36].

**Figure 5:-**Effect of concentration of buffer solution of SOD specific activity

#### pH buffer Solution:-

The highest SOD activity was determined at pH (8.0) by used potassium phosphate buffer 0.1M, therefore it considered the optimum pH. Optimum pH of SOD extract from the seeds of *Brassica napus* L. was 7.8[37]. The optimum activity of SOD extract from the leaves of *Triticumaestivum* L [38].

**Figure 6:-**Effect of pH of SOD from *T. aphylla* L.leaves

#### Extraction Time:-

The high SOD activity determined at 20 min. with specific activity reached 38.11 unit/ mg protein ,then followed by 15, 10, 25,5 and 30 , respectively. 20 min was enough for liberation of the enzyme , Therefore it is considered the optimum period of the extraction.

Figure 7:-Effect of extraction time on SOD specific activity

#### Abstract

Accumulation of plastics in the environment is creating a threat to the mankind. Some plastics are degradable which do not cause threat to the environment, and are being used for several purposes such as making of containers, use for packaging, water pipes etc. In this study, the isolation and characterization of plastic degrading bacteria from paper mill waste water was done. Identification of the isolated strains was performed on the basis of colony morphology, grams nature, and several biochemical tests. Plastic strips are subjected to biodegradation by isolated bacteria using mineral salt medium. The degradation was observed by changes in physical and optical characteristics. The maximum degradation was observed in *Pseudomonas sp.* showed after 21 days of incubation

Utilization of fly-ash, produced by thermal power plants in different fields to control environmental pollution has given due importance for the last many years. In this paper an attempt has been made to present the results of some experiments conducted to utilize fly-ash collected from Kolaghat thermal power plant, properly by extracting its suitable nutrients, by *Pseudomonas sp.* isolated from waste water, useful for plant growth. To conduct this experiment, a single bacterial isolate are isolated from waste water through King's media. After single colonies isolation and thrice time purification, isolate are stored in 40% glycerol solution at isolate are separated for studying their fly-ash and their seed germination as well as plant growth promoting ability on isolate showed good results of seed treatment whether on general soil or fly have been in tabulated form.

#### Introduction:-

Energy is an essential ingredient for all around development of any country. In India, almost 80% of total electrical power produced, is generated by coal-based thermal power plants. Since, Indian coal consists of high percent of ash, so, when it is burnt by thermal power plants, they produce huge amount of fly-ash causing environmental pollution. With ever-increasing per capita consumption of energy due to exponentially rising population, it is not possible to reduce power generated by coal-based power plants due to environmental pollution but stress may be given to control the same. Several attempts have been made to utilize effectively this huge amount of fly-ash without

dumping into the ash-pond or on the bare lands. For example: the production of in-organic polymer[1,2], production of nano-structure materials[3] and utilization in concrete and cement production is the most effective one for both economic and ecological point of view.

Plastics are the polymers which on heating become mobile and can be cast into moulds. Plastics are non-metallic compounds that can be molded into any desired shapes and sizes. Plastics are used for packaging, making diapers, fishing nets, agricultural films and also used for many more purposes. Plastics and their use has become a part in all sectors of economy. Present demand of plastics is increasing in the areas of agriculture, consumer goods, health and medicine [4]. Plastics can be categorized into some of the basics classes such as: natural plastics, semi synthetic plastics, synthetic plastics, thermoplastics, thermosetting plastics. Amongst these plastics comes the Low density polyethylene (LDPE), Medium density polyethylene (MDPE) and High density polyethylene (HDPE) products. The LDPE, MDPE, and HDPE forms can be classified into polyethylene terephthalate, polyvinyl chloride, polypropylene, polystyrene etc[5]. Various mediums or environment as a whole is used for biodegrading polymers. Due to various physical as well as biological forces depolymerisation can be observed. The physical forces such as temperature, moisture, pressure cause mechanical damage to the polymers[6]. A large number of microorganisms have found to produce enzymes which degrade plastics and many more metallic as well as non metallic compounds.

Today there is a growing interest in the development of biodegradable plastics that would enhance the degradability of other plastic products in landfills and composts under natural conditions [7]. Microbial degradation of plastics is caused by enzymatic activities leading to a chain cleavage of the polymer into oligomers and monomers after which they are further metabolized by the microbial cells. Aerobic metabolism results in carbon dioxide and water[8], whereas anaerobic metabolism results in carbon dioxide, water, and methane as the end products, respectively[9]. One of the major factors in determining the degradability is the melting temperature( $T_m$ ). Melting temperature( $T_m$ ) is inversely proportional to biodegradability [10]. A large number of parameters such as roughing of surface, formation of holes, cracks, defragmentation, change in color, formation of biofilms,  $CO_2$  evolution, oxygen consumption, molar mass, formation of clear zones and weight loss of the compound help in measuring the extent of biodegradability[11,12,13].

This research article evaluates the biodegradability of plastics by *Pseudomonas sp.* isolated by a pure culture shake-flask incubation method. The percent of biodegradation was evaluated by comparing the initial and final dry weights of plastic before and after incubation in their respective culture media. Our hypothesis and purpose of selecting *Pseudomonas sp.* for biodegradation was, this bacteria are predominant in nature and are often found to survive in nutrient deficient ecosystems with their versatile metabolism, hence they would be able to utilize polyethylene amended in the nutrient medium as carbon and energy source when basal nutrients in the medium are exhausted.

It was reported that some bacteria can solubilise many water insoluble minerals like tri-calcium phosphate [14,15,16], manganese dioxide, calcium silicate[17] etc. present in fly-ash[18,19]. Since, Indian fly-ash is full of plant-nutrients, like- Zn, Cu, Ni, Cr, V etc.[20,21], so in this paper, an attempt has been made to present the results of some experiments conducted to extract nutrients from the fly-ash using pseudomonas bacteria isolated from waste water so that fly-ash could be effectively utilized in cultivated land for plant-growth

## **Materials and Methods:-**

### **Sample collection:-**

Waste water samples were collected in sterile containers from garbage dump in paper industry, Balichak, Paschim-medinipur (Latitude-22° 25' 00" to 22° 57' 00" north, longitude- 87° 11' east, altitude 23 meters from mean sea level), West-Bengal, India.

### **Isolation of plastic degrading micro-organisms:-**

99ml of sterile distilled water was taken into a conical flask and One gram of soil sample was added to it and mixed well. Serial dilution of the sample was done. Pour plate method was adopted to isolate the microorganisms, and nutrient agar was used for the culture of bacteria. For each dilution, three replicates were made. For 2-7 days the plates were incubated at 30°C. Sub-culturing of the developed colonies was done to obtain pure colonies and then the colonies were stored at 40°C. The developed colonies were isolated and sub cultured repeatedly to get pure colonies and then preserved in slant at 4°C [22].

**Identification of microorganisms:-**

Gram staining, Colony morphology, Biochemical tests( catalase test, gelatin hydrolysis test, indole test, methyl red and voges proskauer test, starch hydrolysis test, and simmon's citrate test), and motility tests were performed on the isolated strains of micro organism.

**Selection of plastic:-**

Plastic having 50 microns thickness are used for comparative investigation of their biodegradability nature. The plastic are used to made from a combination of virgin plastic vegetable starch (6%), organic minerals, and vegetable extracts.

**Pre-treatment of plastic:-**

The plastic are cut in small strips and transferred to a fresh solution containing 70 ml Tween 80, 10 ml bleach, and 983 ml distilled water and stirring for 30 to 60 minutes [23]. The strips were transferred to a beaker with distilled water and stirred for 1 hour. Further, they were aseptically relocated to ethanol solution 70% v/v for 30 min. Finally, the plastic strips were transferred to a Petri dish and incubated at 45 to 50°C overnight. Ethanol was used to disinfect the plastic and remove any organic matter adhering to its surface.

**Plastic degradation by broth culture method:-**

Pre weighed plastic strips were added to the flask containing 50 ml of mineral salt medium and the medium was inoculated with the isolated micro organism. The control flask was maintained with the mineral salt medium containing plastic strips but free of microorganisms. The test and the control samples were left in a shaker at 30°C for 1 month period. After the incubation period the strips were collected from the medium, washed with distilled water, dried and weighed. The weight loss in the plastic strips was calculated finally.

**Seed Bacterization for Growth Promotion:-**

Seed of *Cicer arietinum* were bacterized in twice way. For set 1: Seeds of *Cicer arietinum* were surface-sterilized with 70% ethanol, 1% sodium hypochlorite solution and sterilized double-distilled water repeatedly and sequentially up to 5 min. [24] and dried under a sterile air stream. Then seeds were bacterized separately with the selected isolates. 2ml of bacterial inoculums containing  $3 \times 10^8$  CFU/ml were separately centrifuged at 7000 rpm for 20 min (Cooling Centrifuge, REMI C-24 BL, India) and supernatant were discarded. Bacterial pellets were washed twice with sterile distilled water and finally suspended with carboxymethyl cellulose solution (1mg CMC in 100 ml sterile distilled water) [25]. Surface-sterilized seeds were then dipped separately in different bacterial solution for 3 hrs. For set 2: Sterilization was done but seeds were not bacterized. 2 seeds from every bacterial solution of set 1 were collected and

kept separately on thermal power-plant ash and general soil. Similarly, 2 seeds of set 2 were kept separately on two week treated thermal power plant ash by those different selected bacteria. After 7, 14, 21 and 28 days incubation plant growth-promoting activity was studied.

**Results and Discussions:-**

Bacterial strains were isolated from the contaminated waste water sample using Nutrient agar medium respectively. Among this study white bacterial colonies were noted in  $10^5$  dilution (Figure 1).

**Figure 1:-** Isolation of *Pseudomonas* sp. from waste water of paper mill effluents dump.

The *Pseudomonas sp.* from waste water are isolated and characterized on their morphological and biochemical characteristics (Table 1).

**Table 1:-** Morphological and biochemical characteristics of *Pseudomonous sp.* isolated from waste water of paper mill effluents dump.

Test/Assay Name	P <sub>s</sub> -waste water
Gram Staining	'-ve'
Capsule Staining	'-ve'
Endospore Staining	'-ve'
Form of Colony	Circular
Elevation of Colony	Convex
Surface of Colony	Concentric
Cell-shape	Small bacillus
Motility	'+ve'
Catalase Test	'+ve'
Indole	'-ve'
Methyl red	'-ve'
Voges Proskauer	'-ve'
Citrate	'+ve'

After 4 weeks of incubation in an incubator shaker at 40°C and 150 rpm, the culture flasks were removed and tested for the viability of bacteria and any contamination in the medium. The blanks and the treatments showed good stability of *Pseudomonas* in the medium with no sign of contamination. In addition, there was intense bio film formation by all the *Pseudomonas sp.* which was clearly visible in the broth. From the bellow (Tables 2,3,4,5) and (Figure 2) it can be interpreted that the degradation of plastic strips has taken place. Confirmation of the degradation can be done by observing the weight loss in the plastic strips. By the help of *Pseudomonus sp.* maximum biodegradation i.e, 45% was done after 21 days of incubation.

**Table 2:-**Weight loss determination plastic degradation bacteria after in 7days.

Organism	Initial weight	Final weight	Weight loss	% of weight loss
<i>Pseudomonas sp.</i>	0.50	0.43	0.07	14

**Table 3:-**Weight loss determination plastic degradation bacteria after in 14days.

Organism	Initial weight	Final weight	Weight loss	% of weight loss
<i>Pseudomonas sp.</i>	0.43	0.38	0.05	12

**Table 4:-** Weight loss determination plastic degradation bacteria after in21days.

Organism	Initial weight	Final weight	Weight loss	% of weight loss
<i>Pseudomonas sp.</i>	0.38	0.21	0.17	45

**Table 5:-** Weight loss determination plastic degradating bacteria after in28days.

Organism	Initial weight	Final weight	Weight loss	% of weight loss
<i>Pseudomonas sp.</i>	0.21	0.16	0.05	24

**Figure 2:-** Trend of biodegradation of plastic by *Pseudomonas sp.* from waste water.

Plant growth promoting effects and seed germination of plant was carried out on water agar media and fly ash containing soil and the results are shown in the given (Figures 3). After 3<sup>rd</sup> week the maximum plant growth was occurred. More experimental studies are required to verify the same results for other plants like rabi crop or large plants like mango, jackfruit, guava, banana etc. that can grow on fly-ash and produce flowers and fruits. Other types of cattle-dung can also be used for above experiments. So this is one of the best way to utilize fly-ash to solve the environmental problem.

**Figure 3:-** After 3<sup>rd</sup> week bacterial isolates plant growth promoting and seed germination on water agar media and fly ash containing soil.

### Conclusion:-

Biodegradation is a novel procedure to degrade different kinds of artificial substances in a biological manner. This helps to maintain balance in the surrounding. Bacterial strains were successfully isolated from waste water. Isolated bacterial strain are identified as *Pseudomonas sp.* Most of the plastics are degraded naturally in 2 years of decomposition. But LDPE degradation is carried out with microbes to reduce the environmental pollution.

The fly-ash of thermal power plant is a huge source of silica, aluminum, iron and calcium salts, which play as micronutrients for plant growth. Microbes not only play vital role in physical weathering of parental rocks for generation of fertile land or soil but also help in plant nutrition by microbes- plant symbiosis phenomena. Thus, if we apply microbes with fly ash, microbes make ash useful for plants and these plants keep clean the atmosphere. Fly-ash has great potential in agriculture to its efficacy in modification of soil health and crop performance. However, since there is a potential for harming the environment and human health, long term confirmatory research is necessary before planning agriculture as a venue to fly-ash utilization.

### Acknowledgments:-

Authors are thankful to Panskura Banamali College, Karry Mullis Molecular Biology Laboratory (Sponsored by Boost, Government of West-Bengal), India for providing facilities and financial support for the completion of this research work.
