The rock basin of Narmada is occupied by the Quaternary sediments of three domains viz. glacial, fluvio- glacial and fluvial which were deposited in distinct environments during Quaternary time. The glacial deposit comprised of thick pile of sediments occupied base of rock basin and was deposited by glacial activities in dry and cold climatic condition during early Pleistocene time. The study of these concealed sediments, their sedimentary environments and sedimentation and correlation both in vertical and horizontal columns indicates that the lower most units, Boulder bed (20 to 260 m. below ground level) is of glacial origin, where as the fossiliferous bed Boulder conglomerate (260 to 278m. above m.s.l.) is of fluvio-glacial and top four formations in increasing antiquity Sohagpur, Shahganj, Hoshangabad and Janwasa (278 to 350m. above m.s.l.) are of fluvial origin and represent the complete sequence of Quaternary sedimentation in Central India Khan & Sonakia (1992). ). The boulder conglomerate is a marker horizon of Quaternary sedimentation in Narmada Valley and as well in Central India, its disposition and relation with other deposits in the valley, indicates a significant change in regional climate from cold dry to warm and humid, during which the sediment were re-worked from glacial front intermittently and deposited in the valley over a very long time. The skull cap of *Homo erectus* (Narmada Man) and other fauna recorded along with calc- nodules within the boulder conglomerate; suggest that warm climatic phase prevailed for very long time. (Table No AB- 1-3 & Plate No AB-1).

The Boulder conglomerate is a persistent marker horizon in Narmada valley its disposition and relation with other deposits indicates a significant change in regional climate from cold dry to warm and humid, during which the sediment were re-worked from glacial front intermittently and deposited in the valley over a very long time.

The skull cap of *Homo erectus* (Sonakia 1984) and other fauna recorded along with calc- nodules near village Hathnora (22° 52' N; 77° 52' E) in fossiliferous boulder conglomerate; named as Hathnora formation Khan & Sonakia (1992). It is found to be associated with volcanic Ash bed of Quaternary age in the area around Hathnora, and upstream Khan et.al. (1991), the two levels of horizons of Ash bed are identified and designated as NAB-I and NAB-II in ascending antiquity in the valley. The Ash bed NAB-I is associated lower litho units of boulder conglomerate which is well preserved and persistent where as NAB-II is associated with younger deposits. The NAB-I contains three micro layer (L-1 to L-3) and NAB-II two micro layers (L-4 to L-5) in increasing antiquity.

In Narmada valley the association of Ash bed NAB-I with Hathnora formation at the depth of 78 m in Quaternary column and occurrences skull cap of *Homo erectus* at the depth of 83 m in decreasing antiquity from the top assumed that Toba eruption have taken place later than existence of *Homo erectus* which appeared and resided in the valley for long time before the fall of Toba ash. The association of Ash is NAB-II at the depth of 72 m with the younger deposit revealed the second cyclic fall of Toba ash which certainly have had influenced on hominines and had collective and cumulative impact on *Homo erectus* (Sonakia1984) *Homo sapiens* (Thobold 1860, 81 ), in Narmada valley and Indian sub-continent. Oppenheimer (2003) argues that *Homo. Sapiens* occupied India before ~74 ka and may have undergone “mass extinction” as a result of the Toba eruption. The argument of Oppenheimer (2003) is in strong conformity with the present observation of authors. As sediment & Ash bed sequence of Quaternary column of Narmada (325 m) and occurrences of fossil of skull cap of *Homo erectus* (Sonakia1984) at 83 m & human cranium *Homo sapiens* (Thebold 1960,1981) transported have existed prior to fall of Toba ash and they are among the few who inspite of mass extinction caused by mega dislocation in ecology and environment related with volcanic eruption survived in Narmada Valley. It is further documented by the rarest occurrences of these fossils in subcontinent which also confirm the intensive impact of volcanic ash fall on these hominines and their consequential mass extinction.

The study of assemblage of glass matrix of Ash bed, grain morphology of glass their- relation with other minerals shape, size, texture of litho fragments of pyroclastic origin suggest that sediments were brought from distant source by Aeolian agencies in the form of thick cloud containing volcanic dust, rock matrix and different gases which remained in atmosphere for very long time and settled down across the Indian sub continent during the different phases of river sedimentation. Further study of Ash bed material and silica revealed diagnostic morphological characters of glass shards which are typical of silica volcanism (Heiken, 1972, 1974) and show close similarity with those reported from the Quaternary tephra beds of the Narmada, Son, Purna and Kukdi basins (Basu et. al., 1987; Khan et.al. 1991 Basu and Biswas, 1991; Singaraju and Shivaji, (1991) Mukhopadhyay, (1992). It is significant to note that the occurrences and association of two marked horizons at different levels further reveal that the cyclic eruption and settling of volcanic matrix has taken place with pause in the valley.(Khan 2013& Khan 2015)

The Toba eruption of 74 ka was distinctly and clearly a mega event of very great magnitude and intensity, far greater than any known historical eruption, suggesting it had very devastating impact and repercussions. It has change the global climate environment and ecology. It is significant to note that the occurrences and association of two marked horizons at different levels further reveal that the cyclic eruption and settling of volcanic matrix has taken place with pause in the valley during sedimentation (Plate No\_1, 2 &\_9)

#### **Volcanic Ash Fall & Sedimentation:-**

The 74,000 year-old super eruption of the Toba volcano, located in northern Sumatra, is recognized as one of Earth's largest known eruptions and was certainly the largest of the Quaternary period (Smith and Bailey, 1968). It is presumed that it have led to both global climatic and environmental deterioration and had a impact on decimation of modern human populations (Rampino et al., 1988; Rampino and Self, 1992, 1993a) (Rampino and Self, 1993b; Ambrose, 1998, 2003a, 2003b; Rampino and Ambrose, 2000).

However, the severity of Toba's impact on climate and hominins has been contested and debated by scientist (Oppenheimer, 2002; Gathorne-Hardy and Harcourt-Smith, 2003). Geological, paleontological and archaeological evidence from the Indian subcontinent provides an excellent opportunity to address these issues. The intensity and scale of the Toba super eruption was multidimensional and its coloumn of eruption was so vast that it forma canopy of volcanic matrix led to the deposition of a blanket of volcanic ash across the continents and river valleys over India, Malaysia, the Indian Ocean, and the Arabian and South China Seas. Resulting persistent terrestrial tephra deposits have been documented in a number of river valleys throughout India. (Khan et.al 1991 Acharyya and Basu, 1993; Shane et al., 1995; Westgate et al., 1998). The occurrence of volcanic ash has been located in Narmada, Tapti, Purna Son valleys. These occurrences are associated and preserved with archaeological, paleontological sites in these valleys.

In Narmada valley and Indian sub continent the Environment and climate during late pleistocene has been significantly affected after Toba eruption, according to Rampino et al. (1988) the size of Toba at 74 ka could have induced a volcanic winter, similar to predicted nuclear winter scenarios, as modeled by Turco et al. (1983, 1990). The injection of vast amounts of gaseous aerosols and volcanic dust and matrix into the atmosphere, which follow large volcanic eruptions, is predicted to have detrimental and decisive consequences for changes of global climate. Past historical eruptions, such as Tambora in 1815 (Stothers, 1984) and Pinatubo in 1991 (McCormick et al., 1995),

have provided evidence of post-eruption climatic deterioration and climatic. With the eruption of Toba having been far larger than both of these historical eruptions, its consequences are therefore assumed to have been far more devastating.

The imprints of devastating impacts in the area of study and specific on human population are matter of scientific concern and yet to be investigated. The studies conducted of Ash bed associated with Quaternary deposits of Narmada Valley consist of sediments of two domains viz. deposits of interglacial domain (Boulder conglomerate-Hathnora formation) and fluvial deposit of paleo-domain of Narmada. The boulder conglomerate is fossiliferous horizon of Narmada and has yielded skull cap of *Homo erectus* Sonakia (1984) (Khan & Sonakia 1991). It is marker horizon and represents interglacial phase in the history of Quaternary sedimentation in Narmada Valley. The occurrence of ash bed reported from Quaternary sediments of Narmada are associated with two horizons of ash beds of middle and upper Pleistocene age (Khan et al. 1991). These ash beds are designated as NAB-I and NAB-II consisting of five layers designated as (L1 to L5) in ascending antiquity in the valley. The Ash bed NAB-I (L1- to L-3) is associated with upper gritty units of boulder conglomerate (Hathnora formation) and is identified at an elevation of about 290m. Above m.s.l. The Ash bed NAB-II (L-4 to L5) is associated with upper units of clay silt deposits of paleo-domain of Narmada (Shahganj formation) and is identified at an elevation of 310m. above msl. The study of grain morphology of glass matrix, their relation with other minerals shape, size, texture of lithic fragments and association of other ashy sediments of pyroclastic origin suggest that sediments were brought from distant source by Aeolian agencies, during the different phases of sedimentation in Narmada Valley. It is observed that in stratigraphic column two horizons of Ash bed occurred at the vertical distance of about 20 m. which indicate that there were two phases of settling volcanic ash in Narmada valley and Indian subcontinent as a whole with significant time break. The element of time break in terms of sedimentation perceptible appears to be related with global climatic changes induced by the super volcanic eruption. These ash beds are used as tool in correlation of different quaternary deposits and archeological sites in the valley. The occurrences of two horizons of Ash bed and their deposition by settling of volcanic dust with time gap suggest induced and defused atmospheric conditions in Narmada valley for a very long time after volcanic eruption.

The atmosphere contaminated by volcanic ash volcanic matrix and huge amount of gases and dust particles had definitely affected the atmosphere and climate had have led to temporarily darkened skies in the Narmada valley and Indian subcontinent for very long time.

The study of grain morphology of glass matrix, their relation with other minerals shape, size, texture of lithic fragments and association of other ashy sediments of pyroclastic origin suggest that sediments were brought from distant source by Aeolian agencies, during the different phases of sedimentation in Narmada Valley.

It is commonly argued that if Toba was truly devastating for *H. sapiens* then comparable bottlenecks should also be seen in many other species.

The critical three dimensional study of the area around Hathnora (22°52'77°52') between Vindhya and Satpura mountains vast industry sites of the same palaeo lithic implements have been located along the edge and pediment slope of the Vindhya and basaltic upland. These sites appear to have been inhabited by Narmada hominid and its contemporaries for generations together the left over stone industry sites and unfinished material haphazardly indicate sudden dissemination and migration of hominines in search of shelter and safe places after volcanic eruption. The reporting of remains of *H. sapiens*.

In the area of Bhambetaka about 20 Kms north of hominid locality of Hathnora and relicts of rocker shelter and ancient human signature documents the dispersal of hominines after the eruption of volcanic matrix and its fall Wakankar, V.S., 2002. The association of skull cap Sonakia, A (1984) and Sankhyan (2007) described two new hominine fossils from Netankheri up stream of Hathnora in the Central Narmada valley. They include a partial left humeral diaphysis and a distal shaft fragment of the left femur associated with Hathnora formation Khan & Sonakia 1992 and analysis of quartz grain morphology of sediment columns of Hathnora and quartz grain morphology of paleosol across the quaternary strata of bore hole sampling across 556 m of rock basin revealed that *Homo erectus* of Narmada partly sustain in the glacial and fluvio-glacial environment which is documented and witnessed by Hathnora formation which marks the end hostile climate and environment of sedimentation in Narmada valley Khan (2013). The study of quartz grain and their micro structures of paleo- soil identified in concealed blanket of quaternary deposits display relatively heterogeneity in Sediment characteristics throughout across the Quaternary column of Hathnora section in central Narmada valley. The quartz grain of paleo soil and sediments display

digonestic characters of glacial fluvio-glacial and fluvial concealed environment of sedimentation at different depth. The significant breaks in grain morphology of quartz grain, surface texture and associated elements and granular matrix in the sequence of quaternary strata is recorded at 150, 350 and 350 and beyond which linked to long evolution of glacial fluvio-glacial and fluvial environment of sedimentation in time and space in increasing antiquity in the valley from the base Khan (2013). In view of the recorded observation the concealed quaternary strata to the level of about 350 m below ground level further needs attention of geoscientist for the search of human remains in Narmada valley.

The skull cap of *Homo erectus* (Sonakia 1984) and other fauna recorded along with calc- nodules near village Hathnora (22° 52' N; 77° 52' E) in fossiliferous boulder conglomerate; named as Hathnora formation Khan & Sonakia (1992). It is found to be associated with volcanic Ash bed of Quaternary age in the area around Hathnora, and upstream Khan et al. (1991). The two levels of horizons of Ash bed identified are designated as NAB-I and NAB-II in ascending antiquity in the valley. The Ash bed NAB-I is associated lower litho units of boulder conglomerate which is well preserved and persistent where as NAB-II is associated with younger deposits. The NAB-I contains three micro layer (L-1 to L-3) and NAB-II two micro layers (L-4 to L-5) in increasing antiquity.

The study of assemblage of glass matrix of Ash bed, grain morphology of glass their- relation with other minerals shape, size, texture of litho fragments of pyroclastic origin suggest that sediments were brought from distant source by Aeolian agencies in the form of thick cloud containing volcanic dust, rock matrix and different gases which remained in atmosphere for very long time and settled down across the Indian sub continent during the different phases of active quaternary sedimentation. Further study of Ash bed material and silica revealed diagnostic morphological characters of glass shards which are typical of silica volcanism (Heiken, 1972, 1974) and show close similarity with those reported from the Quaternary tephra beds of the Narmada, Son, Purna and Kukdi basins (Basu et al., 1987; Khan et al. 1991 Basu and Biswas, 1991). It is significant to note that the occurrences and association of two marked horizons at different levels further reveal that the cyclic eruption and settling of volcanic matrix has taken place with break and pause in the valley related with eruption volcanic dust and storm. (Khan 2013 & Khan 2015).

The Toba eruption of 74 ka was distinctly and clearly a mega event of very great magnitude and intensity, far greater than any known historical eruption, suggesting it had very devastating impact and repercussions. It has changed the global climate environment and ecology.

The occurrences of these skull caps with short range of their occurrences in the stratigraphic column of Narmada with the Ash beds horizon NAB-I and NAB-II and specially with the Hathnora formation one at the top at an average elevation of about 268-273 m above the mean sea level and other with younger deposits had revealed the close association with volcanic activity with their existence. The Toba Ash fall is also in very close range with the sequence of sedimentation and occurrences with both the skull caps, which certainly has its impact on the middle and late Pleistocene Hominines in Narmada valley and Indian subcontinent.

The oldest fossil from India is represented by the Narmada hominine dated to not less than 236 ka (Cameron et al., 2004), or to some time in between 150 and 250 ka (Kennedy, 2001:167). Modern human remains have been discovered in an undated Late Paleolithic context at Bhimbetka rock shelter III-A-28 (Wakankar, 2002:5) which is situated about 70 km north of Hominid locality Hathnora and from three cave sites in Sri Lanka, dating from 27.7 ka (Kennedy 1999, 2001). Using phytogeographic data, Oppenheimer (2003) argues that *H. sapiens* occupied India before ~74 ka and may have undergone "mass extinction" as a result of the Toba eruption. The later argument is in conformity with the observation of authors as it is well illustrated by close association of Ash bed and *Homo erectus* in sediment sequence of Quaternary column of Narmada.

The volcanic eruption and consequential ash fall has created severe dislocation in ecology and environment and adversely affected hominines in Narmada valley and Indian subcontinent. It is witnessed by association of Ash bed NAB-I with Hathnora formation at the depth of 78 m in Quaternary column and occurrences skull cap of *Homo erectus* at the depth of 83 m in decreasing antiquity from the top assumed that Toba eruption have taken place later than existence of *Homo erectus* which appeared and resided in the valley for long time before the fall of Toba ash. The association of Ash is NAB-II at the depth of 72 m with the younger deposit revealed the second cyclic fall of Toba ash which have had influenced collective and cumulative the *Homo erectus* (Sonakia 1984) *Homo sapiens* (Thobold 1860, 81), in Narmada valley and Indian sub-continent.

The study of cyclic Toba ash fall and using phytogeographic data, Oppenheimer (2003) argues that *Homo. Sapiens* occupied India before ~74 ka and may have undergone “mass extinction” as a result of the Toba eruption. The argument of Oppenheimer (2003) is in strong conformity with the present observation of authors. As sediment & Ash bed sequence of Quaternary column of Narmada (325m) and occurrences of fossil of skull cap of *Homo erectus* (Sonakia 1984) at 83 m & human cranium *Homo sapiens* (Thebold 1960, 1981) (transported) have rarest occurrences of human fossils in Narmada valley and subcontinent which also confirm the intensive impact of volcanic ash fall on these hominines and their consequential mass extinction caused by mega dislocation in ecology and environment by volcanic eruption. (Plate No 1, 2 & 9).

#### **Indian *Homo erectus* China man & Sedimentation:-**

The Narmada basin contains fossiliferous Pliocene–Pleistocene volcanic fabrics sediments and volcanic rocks which were occupied by early hominid populations. The Main Narmada rift is both symmetrical and asymmetrical in different segments along its length of about 1300 km. Several paleoanthropological localities, archeological sites ranging in age from the Pliocene-Pleistocene times were discovered within these basins. The discovery of Human Skull *Homo erectus* from boulder conglomerate bed of Hathnora formation Khan (1992) by Sonakia (1984) De Lumley, and Sonakia, (1985): in Sehore district M.P. India was first fossil skull of man from Indian sub-continent. It is correlated with *Homo-erects* of China on Quaternary Platform is found to be the oldest homo-erectus in Asia Khan et.al (2013) & Khan et.al (2016).

The known Pliocene–Pleistocene paleoanthropological localities have given us information about ancestors who were habitants and sparsely concentrated in the Narmada rift valley. This is not a coincidence, because the volcanic and tectonic activities that were responsible for the formation of the rift basins and formed the loci of Quaternary sedimentation & created ideal environments for the proliferation of life and the preservation of faunal and floral remains. The Quaternary volcanic eruption, ash fall, repeated tectonic dislocation and were responsible for the quick burial and preservation of fossils during diagenesis. The assemblages of sediments and granulometric parameters, diagenetic processes involving silicification, calcification, feldspathization, clay formation, and pedogenesis all played vital roles in fossil preservation in the sediments. The various rock fabrics, ash bed, paleo- sole inter bedded with the fossiliferous sediments also provide temporal information about geologic processes, faunal evolution, pale -environment, and early hominid behavior and lithic technology.

The skull cap of Narmada Man *Homo erectus* was found in Narmada Valley near village Hathnora (22° 52' N; 77° 52' E) in fossiliferous boulder conglomerate, in district Sehore, M.P., India. The skull cap is completely fossilized undistorted, renal vault nearly complete except few left Supra-orbital and statures are nicely preserved. The various morphological features and robust form of skull and excessive thickness of the bones indicate that it belongs to adult male individual (Sonakia, 1984). The discovery of skull cap of *Homo erectus* in fossiliferous boulder conglomerate in association of other mammalian fossil is recorded in stratigraphic column of Quaternary deposits at the depth of 83 m, where estimated total thickness of deposits is about (325 m). This blanket consists of sediments of three domains viz. glacial, fluvio-glacial and fluvial, which were deposited in distinct environment during Pleistocene to Holocene time (Khan & Sonakia (1992), (Khan et.al. in press). The statistical analysis of sediments from these different domains in vertical column has been conducted to ascertain the environment of sedimentation and trace the breaks in climate (Khan et.al. in press). An attempt has been made for the first time Khan et.al (2013) to correlate the various stratigraphic columns of associated hominid fossils of Narmada valley (325 m) India and that of Luochuan sequence, (90-120 m) Chenjiawo (50m) and Congwanling sequence (36 m) of China on unified Quaternary platform tied up and developed at mean sea level. The study revealed that the depth of occurrence of Narmada skull cap on unified Quaternary platform is about (83 m) as compared to with that of Chenjiawo and Gongwangling of China which occur at very shallow depth of 38 and 26 m respectively. The estimated age of Narmada Man based on these parameters is about 1.38 m.y. (+), which is greater than *Homo erectus* of Chenjiawo 0.65 m.y. and Gongwangling 1.15 m.y. of China An Zhisheng and Ho Chuan Kun (1989). On the merits of correlation of stratigraphic columns of Quaternary of Narmada, accumulation of sediment, rate of sedimentation, palaeo- environments, lithostratigraphy and biostratigraphic position of boulder conglomerate in unified Quaternary Platform, author consider it as one of the earliest and oldest *Homo erectus* in Asia. Khan et.al (2013) Khan (2016). (Plate No 1 to 9).

#### **Paleosole & Sedimentation:-**

In addition to study of tephra the study of morphology of quartz grain of Quaternary sediment study of morphology quartz grain of paleo soil and present soil of Quaternary deposits of Narmada has been attempted for the first time to

supplement the data to decipher formation of paleo soil and present soil and over all environment of sedimentation of quaternary deposit in Narmada valley.

The statistical analysis of soil samples has been conducted from the representative and crucial section in the hominid locality of Hathnora in Narmada valley and Mean Size (MZ), Inclusive Graphic Standard Deviation, Inclusive Graphic Skewness (SKI) and Inclusive Graphic kurtosis have been computed. These parameters assist in the characterization of the samples by providing a concise summary of particle size distribution which provides a basis for an interpretation of the environments of source of derivation transport and deposition.

This study of quartz grain and their microstructures of fifteen paleosoil identified in the concealed blanket of Quaternary deposit display relative heterogeneity in sediment characteristics throughout across the Quaternary column of Central Narmada valley. The study quartz grain of soil and sediments display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from fluvial, fluvio-glacial and, glacial deposit (72 samples +25). The majority of quartz grain population show characteristic surface textures linked to long evolution in fluvial, fluvio-glacial and glacial environment of sedimentation in time and space in increasing antiquity in the valley. There exist a direct relationship between grain-size characteristics and the shape and surface texture of grains. The variations in shape and size of grain assemblages and imprints of particular microstructures in specific population and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial at the bottom of valley trough subsequently followed by fluvio-glacial and further overlain by fluvial deposits distinctly related with change of climate and tectonic changes in increasing antiquity in Narmada valley.

The study revealed that dissolution and precipitation features on quartz grain surfaces including pits, silica precipitation, crystal growth and adhering forms were present in soils at all positions. Evidence of mechanical damage including conchoidal fracture, angular edges, rounded edges and cracks were also recorded on quartz grains in valley. The statistical analysis of soil indicates particle size distributions that changes in size sorting due to glacial alluvial and colluvial transportation in valley. It is noticed that in valley sand content increases and clay content decreases from valley flanks to the central part, this assemblage increases in vertical column of quaternary blanket in valley. There is a large increase in the clay content in the toe slope soil due transport of sediments from colluvium front by reworking, winning of sediments which increases towards central parts of valley. (Plate No\_5 to 8).

#### **Quartz grain morphology & Sedimentation:-**

The grain morphology of quaternary deposits in vertical column across the depth of 320 m from the exposed section of strata and bore log samples from ETO, CgWB, GSI and other state and federal agencies were studied. The surface texture of quartz sand grains in sediments of different domain is important elements which register and record the entire process of sedimentation tectonism of mega and micro events source of sediment, erosion transportation and deposition of materials (Xiao et al., 1995; Helland et al., 1997). The weathering intensity may be revealed by surface rounding, etching or overgrowth on quartz grains (Asumadu et al., 1987; Marcelino et al., 1999). Hence in addition to the study of morphology of quartz grain of paleo soil morphology quartz grain of Quaternary sediment in increasing antiquity from the base of rock basin has been attempted for the first time to supplement the data to decipher the environment of sedimentation of quaternary deposit in Narmada valley. The representative samples were collected across the in crucial exposed cliff sections in vertical column and from the bore hole logs to identify the spatial variation in quartz grain morphology of quartz sand grain morphology and particle size distribution using SEM techniques.

The study revealed that dissolution and precipitation features on quartz grain surfaces including pits, silica precipitation, crystal growth and adhering forms were present in sediment strata at all positions. Evidence of mechanical damage including conchoidal fracture, angular edges, rounded edges and cracks were also recorded on quartz grains in valley. The statistical analysis of sediments indicates particle size distributions that changes in size sorting due to glacial alluvial and colluvial transportation in valley. It is noticed that in valley sand content increases and clay content decreases from valley flanks to the central part, this assemblage increases in vertical column of quaternary blanket in valley. There is a large increase in the clay content in the toe slope soil due transport of sediments from colluvial front by reworking, winning of sediments which increases towards central parts of valley.

This study of quartz grain revealed fifteen microstructures of quartz grain in the concealed blanket of Quaternary columns of Hominid locality Hathnora sections I to IV, which display relative heterogeneity in sediment characteristics across the Quaternary column of Central Narmada valley. The study quartz grain of sediment and

soil display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from fluvial, fluvio-glacial and, glacial deposit (72 samples +25). The majority of quartz grain population show characteristic surface textures linked to long evolution in fluvial, fluvio-glacial and glacial environment in time and space in increasing antiquity in the valley.

There exist a direct relationship between grain-size characteristics and the shape and surface texture of grains. The variations in shape and size of grain assemblages and imprints of particular microstructures in specific population and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial deposits at base of valley subsequently followed by fluvio-glacial and further overlain by fluvial deposits distinctly related with change of climate and tectonic changes in the region.

The study of quartz grain and fine siliceous matrix their analysis of shape size and surface textures from Quaternary columns of Harhnora section I to IV from deep bore sediment logs up to the depth of 550m indicate that occurrence of concealed blanket of Quaternary sediments deep in Narmada linear trench deposited in turmoil tectonic environment under dry and cold condition. Its configuration and its relation to the bed rock indicate that glacier was the dominant transport agent during lower and middle Pleistocene time and sediment were deposited on uneven platform in narrow and tight trench.. The depositional mechanisms were strongly influenced by tectonic and dry environment of sedimentation.

The grain morphology shapes and surface textures of sand-sized quartz grains from the sediments of various domains of Narmada Valley were studied to characterize and understand source of sediments, nature of weathering process, transport of sediments and overall environment of deposition and sedimentation. The study of sediment and fine matrix revealed that sediments were deposited in rinsing and sinking platform on tectonically adjusted blocks under different environments. The sediment assemblage is highly heterogeneous, assorted hybrid, and its distribution and its configuration is iritic and unpredictable. The source of sediments is multi provenance and there is strong mixing of sediment from multi sources of sediments including pre-existing Quaternary front of sedimentation. The configuration of sediments in the tectonic trench appears to be influenced by readjustment of various blocks in various phases the entire bulk of sediments were deposited a high-energy of glacial fluvio glacial and fluvial environment.

The initial stage of glacial sedimentation in deep Narmada rift trench is highly influenced by tectonics of SONATA lineament Zone. However, a fluctuation in energy condition in the sediment blanket has disclosed that detrital material dominantly derived from metamorphic meta- sedimentary and basaltic terrain by direct abrasion.

The 250- to 315-um-sized quartz fraction is characterized by a high percentage of sub angular grains (40%- 70%) at the depth of about 116 m b.g.l. The populations of the grain at upper Quaternary strata are surrounded and original morphic elements persist over quartz grain. The quartz grain indices between 166-255 m b.g.l depicts decrease in roundness and majority of population of grain show increasing percentage of angularity (40-60 %), further down quartz grains beyond 255 m b.g.l display high degree of angularity in isotropic pattern. The sub rounded grains have poor population and angular grains (10%-0%), which are dominant over rounded grains (0-5 %-), while well-rounded grains are minor (0%-2%). These grain-shape distributions indicate texturally immature sediments. The presence of both angular, sub angular to sub rounded grains suggests a mixing of grains with different degrees of wear and from several sediment sources. The variation of association associated constituents (mica, feldspar, carbonate, shale) also is indicative of multiple sediment sources. The grain-shape variations from sample to sample, particularly with the rock types in litho logic units are of different order and subjected. Amplitude However, these grain shapes do indicate consistency across the thickness of Quaternary blanket. It is observed that the shape and size mainly influenced by lithology and weathering processes which they are subjected, the indices of angularity indicates a general upward decrease of grains. However, the percentage of sub rounded grains does not increase significantly, and the well-rounded grains are present in the upper part of the blanket. This indicates a change of sediments homogeneous to wards heterogeneity and display inverse relation of size and shape and iritic dumping of sediments by glacial activity.

The concealed Quaternary sediments in lower segment (456m) is characterized by sediments that may contain a high percentage coarser-grained fraction and very low percentage of of fine sand. The percentage of rounded grains increases and the percentage of angular grains decreases when the fine sand content or the mean size increases. The percentage of well-rounded grains varies independently, but usually is lower when the fine sand content is higher.

The low proportion of sub rounded grains as well as well-rounded grains in the coarser-grained sediments are insignificant very rare and is inconformity with the modality of interpretation of these grains having been deposited under dynamic condition on platform of tectonic dislocation and instability during sedimentation by glacial agencies in the SONATA Lineament Zone the configuration of quaternary deposits with bed rock revealed that sedimentation is strongly influenced by repeated structural dislocation and anisotropic and asymmetric faulting.

The representative samples from stratigraphic sequence contain grains which show several different types of microstructures. Impact features Parallel striations grinding features Crescent-shaped features Solution of quartz Silica deposits Silica pellicle. Quartz crystal overgrowths Pressure-solution features. The study of sediments display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from fluvial, fluvio-glacial and, glacial deposit (72 samples). The majority of quartz grain population show characteristic surface textures linked to long evolution in fluvial, fluvio-glacial and glacial environment in time and space. An indication of glacial evolution (parallel striations or grinding features) was observed in samples (10%-60% of grains) in 35 samples from different levels between 390 to 525 m the percentage of grains showing a glacial origin having parallel striations, fresh silica pellicles, and polished silica pellicles and fresh impact features. As such evidences of glacial, fluvio-glacial and fluvial evolution is marked in the lower stratigraphic columns of Narmada. In addition some of grains exhibit fresh quartz overgrowths, old aeolian features, and silica pellicles at some level of sedimentation. This indicates a mixing of grains from different provenances. The parallel striations and fresh impact features are diagnostics of glacial environment and demonstrate consistency in occurrence. This implies a change of environment of sedimentation from glacial to fluvio-glacial and fluvial. This variation is accompanied by a decrease in the percentage of rounded grains and in the fine-sand fraction. The parallel striations are polished, were observed. The composite illustration of fresh striations and polishing of grains support to glacial environment of sedimentation in Narmada valley during lower Pleistocene time. The density of grains possessing such diagnostic elements of glacial origin decreases up ward in vertical column and their consistency has inverse relation which indicates sequential change of environment from glacial, to fluvio-glacial and fluvial in chronological sequence up ward in the Narmada trough.

The sediments confined up to 150 m below ground level represent paleo fluvial domain of Narmada and represent multi cycle sedimentation under varying energy condition on oscillating platform. A direct relationship between grain-size characteristics and the shape and surface texture of grains is observed. The variations in shape and size of grain and assemblages and imprints of particular microstructures in specific population and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial at the bottom of valley trough subsequently followed by fluvio-glacial and further overlain by fluvial deposits distinctly related with change of climate and tectonic changes in the Region. This study revealed diversity in the sediment sources and in the transport agents before the last stage of sedimentation on tectonic platform of SON NARMADA LINEAMENT ZONE.

The study of quartz grain form surface and subsurface quaternary blanket enveloped in the tectonic trench display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from fluvial, fluvio-glacial and, glacial deposit (72 samples + 25 ). The majority of quartz grain population show characteristic surface textures linked to long evolution in fluvial, fluvio-glacial and glacial environment in time and space. An indication of glacial evolution (parallel striations or grinding features) was observed in samples (10%-60% of grains) in 35 samples from different levels between 390 to 525 m the percentage of grains showing a glacial origin having parallel striations, fresh silica pellicles, and polished silica pellicles and fresh impact features. As such evidences of glacial, fluvio-glacial and fluvial evolution is marked in the lower stratigraphic columns of Narmada. In addition some of grains exhibit fresh quartz overgrowths, features, and silica pellicles at some level of sedimentation. This indicates a mixing of grains from different provenances. The parallel striations and fresh impact features are diagnostics of glacial environment and demonstrate consistency in occurrence. This implies a change of environment of sedimentation from glacial to fluvio-glacial and fluvial. This variation is accompanied by a decrease in the percentage of rounded grains and in the fine-sand fraction. The parallel striations are polished, were observed. The composite illustration of fresh striations and polishing of grains support to glacial environment of sedimentation in Narmada valley during lower Pleistocene time. The density of grains possessing such diagnostic elements of glacial origin decreases upward in vertical column and their consistency has inverse relation which indicates sequential change of environment from glacial, to fluvio-glacial and fluvial in chronological sequence up ward in the Narmada valley The study of statistical parameters across the entire thickness of Quaternary deposits revealed three breaks in sedimentation at 350 -290, 190-220, 100-150 in the valley where as an breaks in Hominid locality Hathnora I to IV section s is at 280m, at 210m and at 35m in

increasing antiquity from the base of rock basin which represent glacial, fluvioglacial and fluvial environment of sedimentation in the Narmada valley. The correlation of different sequential and sedimentological breaks indicate subsidence and up lift of different blocks and platform of sedimentation due to tectonic and neotectonic activity. (Plate No\_5 to \_8).

#### **Paleoanthropological Record & Sedimentation:-**

The area around Hominid locality of Hathnora area is occupied by thick Quaternary sediments which represent various domain of sedimentation. Based on sedimentological characters, depositional environments, and erosional processes and their correlation with depositional / erosional terraces revealed that quaternary blanket is consisting of three domains of sediments viz glacial, fluvio-glacial and fluvial. The lower most units (Boulder bed) is of glacial origin, the boulder conglomerate of glacio-fluvial (Khan *et. al* 1991) and fluvial terraces are of fluvial paleo- domain of Narmada. The top four formations Sohagpur, Shahganj, Hoshangabad and Janwasa are designated as (NT<sub>0</sub>-NT<sub>3</sub>). Boulder conglomerate is assigned an independent formational status based on distinct lithology and fossil assemblage. The sequence of Quaternary events and the history of sedimentation of Narmada indicate that the upper 70m to 90m of the Narmada alluvium was deposited in two distinct aggradations episode with a distinct and well defined break in sedimentation in rift system. The dissection of the quaternary blanket resulted two terraces (NT<sub>3</sub>-NT<sub>2</sub>), after break in sedimentation. The sediments of this aggradations episode constitute three lithostratigraphic units Sohagpur, Shahganj, Hoshangabad formation. The sediments of the alluvial phase are underlain by a boulder bed of glacio-fluvial origin. Thus, the fossiliferous boulder conglomerate, the basal unit of alluvium marks a disconformity between the lower glacial-boulder layer and upper fluvial sediments. The fossiliferous basal boulder conglomerate is being of middle Pleistocene age (Khan 1992).

In India Narmada basin considering the one of a main loci of Quaternary sedimentation, and assuming the uniform accumulation rate of sediment in the basin in the line of Ma. *et. al.* (1978) Yubin Sun & Zhisheng, An (2005) and comparing the Narmada sequence of Quaternary deposit (325 m.) with those of Luochuan standard sequence of Chenjiawo and Congwangling sequence of China. The skull cap of *Homo erectus* (Narmada Man) recovered from the boulder conglomerate of fluvio-glacial origin in middle part of Quaternary column from deep level of Narmada, at the depth of 83 m. above glacial deposits, in association of ash bed, as compared to Chenjiawo Hominid from inter bedded sequence of paleo soils loess and silty loess at the depth of 38 m. and Congwangling 26 m. from paleo soils which are younger than Narmada deposits.

The Narmada skull cap of *Homo erectus* which is recovered from the top of basal unit of boulder conglomerate at the depth of 83 m. (278 m. above m.s.l.) is estimated to be of upper segment of lower Pleistocene age. It is older than the *Homo erectus* of Chenjiawo, Congwangling of China which were recovered from paleo-soil and loess deposit at the depth of 38 and 26 m. The Quaternary sequence of Narmada (325 m.) as compared to Luochuan (136 m.) sections of China on unified Quaternary platform is older and represents the complete and type sequence of Quaternary sedimentation in Narmada Rift System in Central India. The occurrence of skull cap of early man at the depth of 83 m. in basal unit of boulder conglomerate of fluvio-glacial origin in Narmada Valley is one of the earliest and oldest *Homo erectus* in Asia.

The skull cap of Narmada Man *Homo erectus* was found in Narmada Valley near village Hathnora (22° 52' N; 77° 52' E) in fossiliferous boulder conglomerate, in district Sehore, M.P., India. The skull cap is completely fossilized undistorted, cranial vault nearly complete except few left supra-orbital and sutures are nicely preserved. The various morphological features and robust form of skull and excessive thickness of the bones indicate that it belongs to adult male individual (Sonakia, 1984). The discovery of skull cap of *Homo erectus* in fossiliferous boulder conglomerate in association of other mammalian fossil is recorded in stratigraphic column of Quaternary deposits at the depth of 83 m, where estimated total thickness of deposits is about (325 m). This blanket consists of sediments of three domain viz. glacial, fluvio-glacial and fluvial, which were deposited in distinct environment during Pleistocene to Holocene time (Khan & Sonakia (1992), (Khan *et.al.* in press). The statistical analysis of sediments from these different domain in vertical column has been conducted to ascertain the environment of sedimentation and trace the breaks in climate (Khan *et.al.* in press). An attempt has been made for the first time Khan *et.al.* (2013) to correlate the various stratigraphic columns of associated hominid fossils of Narmada valley (325 m) India and that of Luochuan sequence, (90-120 m) Chenjiawo (50m) and Congwangling sequence (36 m) of China on unified Quaternary platform tied up and developed at mean sea level. The study revealed that the depth of occurrence of Narmada skull cap on unified Quaternary platform is about (83 m) as compared with that of Chenjiawo and Gongwangling of China which occur at very shallow depth of 38 and 26 m respectively. The estimated age of

Narmada Man based on these parameters is about 1.38 m.y. (+), which is greater than *Homo erectus* of Chenjiawo 0.65 m.y. and Gongwangling 1.15 m.y. of China An Zhisheng and Ho Chuan Kun (1989). (Plate No 1 to \_9)

The Narmada Rift System provides a unique Quaternary landscape as sites of sedimentation setting which indicates human origins and evolution. Skeletal and cultural remains of hominids have been recovered from many locations within the basins. The most of localities occur on the rift floor in between Jabalpur\_Harda, in the east and Tilakwarda\_Bharouch in central in the west in the valley. The virgin and previously unknown areas of the rift basins were studied and inventory of paleoanthological and paleoanthropological resources were made. The survey indicated the potential of the Mio-Pliocene Pleistocene time and late and early Pleistocene Quaternary sediments of the Narmada Rift System for paleoanthological paleoanthropological research. The remarkable preservation of faunal and floral remains in the Pliocene–Pleistocene sedimentary rocks was possible because of quick burial by sediments. Moreover, these source rocks of rift system the Quaternary sediments and interbedded tuffs provided the necessary chemical components for the preservation of the fossils during diagenesis. There is a strong link between these dynamic processes, rapid sediment deposition, and fossil preservation. The most important primary and contextual data (fossils and artifacts) were embedded and preserved in sedimentary deposits until the recent exposure by tectonic driven erosional processes. The time-stratigraphic data obtained from tephra interbedded with fossiliferous Quaternary sedimentary deposits provided an important framework for the study of hominid origins, evolution, adaptations, and cultural changes. The paleoanthological Paleoanthropological information from these localities is remained closely associated with Quaternary sedimentary deposits boulder conglomerate and boulder bed often related to the trench Quaternary sedimentation, formation and development of rift and linear basin caused by repeated uplift, and the development of rift basins that began in the middle to late Pliocene and Pleistocene period. The unfortunate part of these deposits is that due repeated tectonic dislocation and faulting they are dislocated and distorted and at present are concealed under the thick pile of sediments of present and paleo domain of Narmada of late Pleistocene and Holocene time. These deposits do not provide adequate opportunity to scientist and researcher to study the human remain as postulated, except in limited section where they are exposed.

In Narmada valley the most of the hominid remains and associated artifacts in the would have been found associated with Miocene Pliocene–Pleistocene sediments of boulder bed and boulder conglomerate in increasing antiquity, unfortunately same are not exposed due rift system and tectonic setting. In the rift system the type development of Quaternary blanket is confined between Jabalpur\_Harda section, and Tilakwarda\_Bharouch which possess the complete sequence of all three domain in increasing antiquity in chronology in vertical column from the bottom of the rift trench viz Boulder bed (glacial), Boulder conglomerate (fluvio-glacial) sediments of paleo-domain of Narmada (fluvial). The intense tectonic activities within the basins of the Narmada Rift System during the Neogene and Quaternary periods have destroyed fossil record except the fossiliferous horizons exposed in river sections. The erosional-sedimentary cycle has persisted in the rift valley environment for millions of years as a result of the interplay between depositional and erosional forces driven by tectonic processes; there are numerous gaps in the fossil record, particularly in the important time period between Mio-Pliocene Pleistocene times. It is pertinent to the understand the origin of Hominid during the late Miocene, but it is difficult to disclose mysteries of human evolution in Narmada due to concealed nature of these deposits in rift system, however the complementary part of Tapti-Purna Quaternary blanket may be potential and possessive of human remain and should be studied to trace further the imprints of fossil man taking in to account of SONATA LINEAMAN ZONE as single ecosystem for evolution of man in Indian subcontinent.

The Narmada skull cap of Sonakia (1984), including other fossil assemblage suggest that the Narmada Rift System created productive ecosystems during Pliocene–Pleistocene time. The volcanic rocks within the fossiliferous sediments provide temporal information for calibrating and sequencing hominid and other faunal evolution. The detailed study geological, sedimentological, geochemical, aspects of interbedded tephra quartz grain morphology of sediments of quaternary strata paleo-sole and geochronological studies of different localities for establishing accurate biostratigraphic and lithostratigraphic data, sedimentation rates pale environmental and tectonic histories of different sediment columns in area along of the rift system, Interbedded volcanic rocks allow determination of the time of rifting, the beginning of sedimentation, sedimentation rates, and the oscillation of rift platform from glacial, fluvio-glacial lacustrine to fluvial environments. The cyclic environmental transitions recorded in the sedimentary sequences of the rift basins are caused by tectonic activities (uplift and subsidence), changes in relief, and climatic variations. The climatic changes in uplift, topographic and landscape features, coupled with block faulting, rising and sinking platform, created basins for the accumulations of thick lacustrine and fluvial sediments sequences with terrestrial and aquatic fossils. The sequential change in the sediment facies from finely bedded lacustrine deposits to fluvial sediments are commonly noted in the sedimentary sequences and reflect environmental

and tectonic changes that can be temporally determined. Moreover, regional correlation based on the chemistry and geochronology of interbedded tephra has made it possible to establish accurate stratigraphic relations that are useful for pale- environment reconstruction and evolutionary studies of fossil remains in the Narmada rift valley Khan et.al. ( 2013). Regional tephra correlation is being used increasingly to link sites together, and has already established that similar tephra layers are known from other parts of rift valley, as well as from other basin and peninsular India Basu, Biswas, and Acharyya, S.K. (1987): Achariya,( 1993), Khan, (1992) Khan et.al. (2013). There is a great potential for further correlation of tephra in the rift system and marine sediments in the Arabian Sea. The Arabian Sea has a continuous record of deposition that extends to at least 7 million years. The Quaternary sediments interbedded with tephra within the age range of the ODP Ocean Drilling Program 721/722 stratigraphic sections of the Arabian Sea are also present within the rift floor and the western rift margin of the region. The chemical and chronological correlations of ash beds within the rift sequences have been made with ashes described in marine sections. Detailed correlations based on orbitally calibrated time scales of pale magnetic stratigraphy Rao (1985) within Quaternary sediments of rift deposits will provide ties to establish global climate changes based on the terrestrial and marine sediments of the rift system.

The rift system and platforms of sedimentation bear the imprints of and evidence of the effects of tectonics on fauna and flora are distinct, however the signatures of subsidence dislocation and concealing of fossiliferous horizons are uncontrolled and ill defined in the ecosystem in the valley during the Pliocene–Pleistocene periods. The boulder conglomerate which yielded the skull cap of *Homo erectus* in Narmada rift from Hathnora Sonakia (1984) remained only discovery of hominid fossil in last two and half decade due to concealed and hidden nature of Mio-Pliocene Pleistocene deposits in rift system and inconsistency in exposure of fossiliferous horizon of Narmada rift system which is the handicapp in search of further human remains in Narmada valley after Sonakia (1984). (Plate No\_5 to 8).

#### **Sediment statistics & sedimentation:-**

The SONATA LINEAMENT ZONE embodies the two Quaternary basins of tectonic origin on the two margins of Satpura Crustal Block. The Satpura block traversed by enechelon system of faults and lineaments is characterized by thinner crust (33-38 km deep, basement depth >2.5 km) with series of ENE-WSW trending gravity high (viz. Sendwa, Khandwa, Chicholi, Tikaria etc.) with amplitudes of 10-35 mgal. The chain of gravity high indicates extensive magmatic and emplacement of derivatives at shallow crustal levels. The associated Narmada South (Satpura North) fault and Satpura South Fault marking the two hinges of the Satpura block are fundamental in nature and extend to Moho level. The Narmada Quaternary basin in the north and Tapi-Purna basin in the south are two Graben which formed prominent loci of sedimentation in lineament zone. The area of lineament zone studied tectonically encompasses two crustal provinces of Central India Shield, namely, the Northern Crustal Province (NCP) and the Southern Crustal Province (SCP). The two provinces are separated by a crustal level shear zone, referred as Central Indian Suture. The zone has been a major locus of episodic tectonism with evidences of reactivation.

The Narmada Rift valley forms ENE-WSW lineament where Quaternary deposits are confined in a trough like basin on unstable platform which forms a prominent lineament with profound geomorphologic and geological asymmetry between the northern and southern valley walls, giving it a tectonic significance. The alluvial deposits of the Narmada valley represent the thickest Quaternary deposits in peninsular India. These sediments were deposited in faulted and sinking platform under structural riparian rift trench remained silent and unrevealed. The quaternary blanket of Narmada consists of sediments of various domains which were deposited in different environment in vertical chronology in faulted trough in time and space.

The Quaternary sedimentation in Narmada Rift valley incepting from glacial activity, followed by fluvio-glacial, lacustrine and fluvial phase within the rifting and sinking environment, block faulting and linear displacement and dislocation, uplifting and isolated domal up- lift, Neogene rifting and Quaternary sedimentation. The rift-bound Pliocene–Pleistocene rifting and volcanic activities specifically during glacial and fluvio-glacial phase are major component of the Quaternary period and tectonic processes of the Rift System which form the base of quaternary deposits. The Narmada rift system basin platform provided a unique setting for dynamic ecosystems that were characterized by Rift-related subsidence and coeval sedimentation and environment for the accumulation of sediments volcanic fabrics sediments, burial, diagenesis, and preservation of organic remains.

The present disposition of Narmada blanket of Narmada, in SONATA LINEAMENT ZONE revealed that the rift occurred after widespread Quaternary sedimentation and accumulation of sediments in the linear trench by glacial activity in late Pleistocene. The Fluvio-glacial phase is represented by boulder conglomerate which has formed the persistent horizon in the valley. The Narmada has in the area under study has sculptured the alluvial tract into stepped sequence forming four alluvial terraces along its course. These are designated as NT0 to NT3, NT0 being the youngest terrace and NT-3 the oldest terrace where the sub terraces are designated NT2-A is NT2-B, NT2 B, besides NT2-C, NT3-A & NT3-B in increasing order of antiquity. These are both erosional and depositional terraces and confined at an elevation of, between 280 to 380 are separated by the scarp both of curvilinear and linear in nature facing towards river side. These are abandoned flood plains represent the level of former valley floor in the area, and were formed by cumulative climato-tectonic changes in the watershed of Narmada in the Quaternary times Khan et.al (2016).

The study of statistical parameters of MZ, STD, SKI, and KG of different domains of sediments in chronology and stratigraphic columns their relation in time space, their binary relation, trends of plots, their correlation with different columns in Jabalpur \_Bharuch section. The Quaternary deposits of Narmada valley represent the thickest sequence (320 m) which was deposited in faulted and sinking platform under structural riparian rift trench which remained silent and unrevealed. The work so far carried out is restricted to few exposed section of 18 m of river as such on work has been done on concealed strata of quaternary deposits. The synthesis of various parameters their binary relation, concentration of plots their pattern and trend revealed that the quaternary deposits consists of sediments of three mega lithostratigraphic units viz Boulder bed, boulder conglomerate and fluvial deposits. The fluvial deposits include sediments of paleo-domain of Narmada and present domain of Narmada which constitute fluvial terraces (NT1 to NT3) of Narmada. These three domains of sediments were deposited, from Pleistocene to Upper Pleistocene time in increasing antiquity in the valley.

The study of statistical parameters and their binary relation distinctly display contrasting and relative heterogeneity in sediment characteristics throughout across the Quaternary blanket in Narmada valley. The study of sediments display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from glacial, fluvio-glacial fluvial, and fluvial deposit (150 samples). The critical analysis of these parameters exhibits sediment textural linkage to long evolution in glacial, fluvio-glacial and fluvial environment in time and space in increasing antiquity in the valley. The characteristics inherited by the sediments from pre-existing domain of sediments are glacial & terrestrial & environment. The diagenetic and diagnostic features; varying degrees of heterogeneity, sediment angularity roundness, degree of sorting indicate evolution and sedimentation of quaternary sediments in a high-energy turmoil glacial environment on tectonically dislocated and unstable platform. The sediments confined up to 150 m below ground level represent paleo fluvial domain of Narmada and represent multi cycle sedimentation under varying energy condition on oscillating platform. The vertical variation in increasing antiquity in textural parameters and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial at the bottom of valley trough subsequently followed by fluvio-glacial and further overlain by fluvial deposits which is related with change of climate and tectonic in watershed of Narmada. The binary relation of these parameters effectively used in differentiating and fencing the sediments of these domains and their environment of sedimentation in time and space Khan et.al (2015). The study of statistical parameters across the entire thickness of Quaternary deposits revealed three breaks in sedimentation at 350 -290, 190-220, 100-150 in the valley where as breaks in Hominid locality Hathnora I to IV sections is at 280m, at 210m and at 35m in increasing antiquity from the base of rock basin which represent glacial, fluvioglacial and fluvial environment of sedimentation in the Narmada valley. The correlation of different sequential and sedimentological breaks indicate subsidence and up lift of different blocks and platform of sedimentation due to tectonic and neotectonic activity.

The study of statistical parameters of Hathnora sections I, II, III, & IV and their binary relation distinctly display contrasting and relative heterogeneity in sediment characteristics throughout across the Quaternary blanket in Narmada valley. The study of sediments display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from glacial, fluvio-glacial fluvial, and fluvial deposit (150 samples). The critical analysis of these parameters exhibits sediment textural linkage to long evolution in glacial, fluvio-glacial and fluvial environment in time and space in increasing antiquity in the valley. The characteristics inherited by the sediments from pre-existing domain of sediments are glacial & terrestrial & environment. The diagenetic and diagnostic features; varying degrees of heterogeneity, sediment angularity roundness, degree of sorting indicate evolution and sedimentation of quaternary sediments in a high-

energy turmoil glacial environment on tectonically dislocated and unstable platform. The sediments confined up to 150 m below ground level represent paleo fluvial domain of Narmada and represent multi cycle sedimentation under varying energy condition on oscillating platform. The vertical variation in increasing antiquity in textural parameters and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial at the bottom of valley trough subsequently followed by fluvio-glacial and further overlain by fluvial deposits which is related with change of climate and tectonic in watershed of Narmada.

The binary plots of co-efficient of sorting v/s kurtosis and coefficient of sorting v/s mean diameter have been used as effective tool in delineating an area of occupation of glacial and its activity. The plots of skewness v/s mean diameter and kurtosis v/s mean diameter have also been found effective to some extent in delineating areas glacial and fluvial activity. The fluvio glacial sediments in all the above plots show most erratic behavior and are not to be bounded by any pair of parameters. But however, the plot kurtosis v/s skewness is positive to some extent in demarcating a flexible boundary between glacial and fluvio-glacial sediments. As whol binary relation of these parameters effectively used in differentiating and fencing the sediments of these domains and their environment of sedimentation in time and space.

(Plate No \_5 to 8).

### Heavy Minerals & Sedimentation:-

The Narmada Rift valley formed a linear trench in the middle of Indian subcontinent was hospitable linear depression for accumulation of sediments. The rift trench is intruded by the dolerite and other mafic and siliceous dykes and sills along lineaments in different phases of tectonic deformation. The Quaternary sedimentation incepting from glacial, followed by fluvio-glacial, lacustrine and fluvial activity. The platform of sedimentation had rinsing and sinking environment, block faulting and linear displacement and dislocation, uplifting and isolated domal up- lift. The Neogene rifting and quaternary sedimentation, rift-bound Pliocene–Pleistocene rifting and volcanic activity specifically during glacial and fluvio-glacial phase are major component of the Quaternary period and tectonic processes of the Narmada Rift System which form the base of quaternary deposits.

The Narmada Valley in the Hathnora area is occupied by thick Quaternary sediments. These sediments are classified based on sedimentary depositional environments, sedimentological characters and correlation with depositional / erosional terraces. The lowermost units (Boulder conglomerate) is of glacio-fluvial origin (Khan *et al* 1991) whereas the rest of fluvial origin. The top four formations (Sohagpur, Shahganj, Hoshangabad and Janwasa) are classified based on morphostratigraphic state (NT<sub>0</sub>-NT<sub>3</sub>), degree of oxidation, calcification and compaction. Janwasa formation comprises of sediments of active channel deposition and is the older three (Sohagpur, Shahganj, Hoshangabad formation) are related to older flood plains deposits of paleo-domain of Narmada and are grouped under older alluvium. Boulder conglomerate of fluvio-glacial origin is assigned an independent formational status based on distinct lithology and fossil assemblage. The sequence of Quaternary events and the history of sedimentation of Narmada indicate that the upper 70m top 90m of the Narmada alluvium was deposited in a single aggradations episode with minor pauses when dissection of the alluvium produced two terraces (NT<sub>3</sub>-NT<sub>2</sub>). The sediments of this aggradations episode constitute three lithostratigraphy units viz. Boulder conglomerate, Sohagpur and Shahganj formation. The sediments of the alluvial phase are underlain by a boulder bed of glacio-fluvial origin. Thus, the fossiliferous boulder conglomerate, the basal unit of alluvium marks a disconformity between the lower glacial-boulder layer and upper fluvial sediments. The fossiliferous basal boulder conglomerate is being of middle Pleistocene age (Khan 1992). The Quaternary sediments in Narmada represent three distinct group of deposits viz. glacial, fluvio- glacial and fluvial; which was deposited in distinct environment in Quaternary times.

The Hathnora Sections \_I to IV (22° 52" N; 77° 58" E) are located around village Hathnora between Sardarpur\_Hoshangabad along Narmada from where the 203 sediment samples are collected for heavy mineral studies. In river section about 18 m scrap of sediments consisting of Boulder conglomerate and fluvial terraces deposit is exposed in increasing antiquity. The Boulder bed is hidden and concealed in the area under younger deposits as such samples have been taken from ongoing bore hole drilling log between the depths of 90 to 201 m below the surface for heavy mineral study. The qualitative and quantitative studies of heavy minerals of Quaternary deposits of different domain revealed five prominent heavy mineral suites viz, opaque suite; amphibole-pyroxene suite, biotite-muscovite-chlorite suite, garnet, sillimanite, kyanite, staurolite suite and zircon, rutile, tourmaline suite.

The Quaternary blanket has been studied in three dimension and about 907 sediment were collected to study of statistical parameters heavy mineral assemblage, quartz grain morphology, quartz grain morphology of paleosol, ash bed and other aspect across the depth of about 480 m. The study revealed that their binary relation distinctly displays contrasting and relative heterogeneity in sediment characteristics throughout across the Quaternary blanket in Narmada valley. The study of sediments display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from glacial, fluvio-glacial fluvial, and fluvial deposit (150 samples). The vertical variation in increasing antiquity in textural parameters and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial at the bottom of valley trough subsequently followed by fluvio-glacial and further overlain by fluvial deposits which is related with change of climate and tectonic in watershed of Narmada. The qualitative and quantitative studies of heavy minerals of Quaternary deposits of different domain from the same samples revealed five prominent heavy mineral suites viz, opaque suite; amphibole-pyroxene suite, biotite-muscovite-chlorite suite, garnet, sillimanite, kyanite, staurolite suite and zircon, rutile, tourmaline suite.. The mineral of stable group viz. rutile, zircon and tourmaline show uniform distribution in the entire domain of terraces in the area of study. The zircon rutile, tourmaline and sphene are highly stable minerals though their abundance is common in quaternary deposit, hence considered to be very significant. The grain morphology and imprints of sedimentation these mineral bear are of immense significance in understanding the source of sediment, its nature of transportation, mode of transport, kinetics of medium and sedimentation. Their relative frequency in critical column bear significance as regard to tectonic set up of various rock units in the watershed. The contrasting grain morphology of these heavies in the various domains of quaternary deposits is useful in tracing the environments of their deposition. Minerals with low stability such as hornblende, hypersthene, Illuminat and biotite are more significant as regards to the correlation and chronological status of quaternary deposit. These minerals show variable degree of stability and morphological characteristics, hence these parameters have been taken into account is deciphering the mode of environment of sedimentation and correlation of quaternary deposits in Narmada Valley. The zircon rutile tourmaline and sphene minerals occur as accessories mineral, mostly released from rock fabrics comprising boulder bed and were subjected to different degree of wear and tear and physical condition of weathering transport and deposition, the micro imprints acquired by different condition of sedimentation revealed the intense grounding and bed traction of sediments from the source. The striations on these minerals indicate intense glacial activity in the initial stage of sedimentation. These are generally angular to highly angular in shape and show very poor indices of sphericity and roundness typical of glacial environments. Occasionally sub-hedral partly broken prismatic crystals of tourmaline are also in these deposits.

The study revealed that sediments were primarily derived from metamorphic source comprising of kyanite-paragonite, muscovite schist, gneiss, garnet mica schist, and Para-amphibolite tourmaline garnet metasedimentaries and meta-volcanic. Apart these minerals are also reworked from older Quaternary deposits from Boulder bed glacial deposit, Boulder conglomerate of fluvio-glacial deposit and fluvial terrace and higher and other older terraces of fluvial domain. These heavies were basically transported from the sources area by glacial fluvio-glacial and fluvial agencies to the present site of their occurrence. The mode of transportation, environment of deposition and energy system of transporting media has greatly affected the frequency of concentration of heavies, their grain morphology and stability in that particular domain of deposit. These minerals, mostly released from rock fragments and other fabrics comprising boulder bed, subjected to intensive wear and tear and physio-chemical environment of weathering transport and deposition, the micro imprints acquired by different condition of sedimentation revealed the intense grounding and bed traction of sediments from the source. The striations on these minerals indicate glacial activity in the initial stage of sedimentation. These suites of minerals are stable as compared to the other suite of minerals of these deposits although these mineral are associated with all domain of quaternary deposits but show different frequencies of their occurrence and physical characters, shape size sphericity and roundness and bear the micro imprints acquired by different condition of sedimentation revealed the intense grounding and bed traction of sediments from the source. The striations on these minerals indicate glacial activity in the initial stage of sedimentation. These are generally angular to highly angular in shape and show very poor indices of sphericity and roundness typical of glacial environments. The configuration of minerals, rock clastic, ground mass, imprints and impact tectonics revealed the intense grounding and bed traction of sediments from the source to site of sedimentation. The striations on these minerals indicate glacial activity in the initial stage of sedimentation. These are generally angular to highly angular in shape and show very poor indices of sphericity and roundness typical of glacial environments. The configuration of minerals, rock clastic, ground mass, imprints and impact tectonics revealed the intense grounding and bed traction of sediments from the source to site of sedimentation.

The study of heavy mineral suites of Quaternary deposits in the area is suggestive of Narmada Boulder Bed, which forms the base of quaternary deposits is of glacial origin Boulder Conglomerate of Fluvio-glacial origin and river terraces of Narmada are fluvial origin, the sediments comprising these domain measuring 325 m thickness has mixed sediments source comprising of Lower protozoic and middle protozoic rocks consisting of gneisses granite metabasic, amphibolites, meta-sedimentaries, high grade biotitic gneisses, muscovite gneisses, kyanite, paragonite, muscovite – schist, gneiss, garnet-mica schist, para amphibolite, tourmaline garnet, meta – sedimentaries and meta - volcanics and Gondwana rocks. (Khan et.al 2016) (Plate No\_5 to 8).

#### **Hominid Locality Hathnora & sedimentation:-**

The Narmada Rift valley in the vicinity of Hominid locality Hathnora was a tectonic depression associated with a linear trench in the middle of valley it was an ideal locus for accumulation of sediments. The rift trench is intruded by the dolerite and other mafic and siliceous dykes and sills along lineaments in different phases of tectonic deformation. The Quaternary sedimentation inception from glacial activity, followed by fluvio-glacial, lacustrine and fluvial phase within the rising and sinking environment, block, faulting, uplifting, Neogene rifting, Quaternary sedimentation, rift-bound Pliocene–Pleistocene rifting and volcanic activity specifically during glacial and fluvio-glacial phase are major component of the Quaternary period and tectonic processes of the Narmada Rift System which forms the base of quaternary deposits. The quaternary landscape in this segment is confined in trough like basin which embraces the stepped sequence of Narmada terraces (NT1 to NT3), where Boulder conglomerate exposed at the base of these deposits. The Boulder conglomerate is persistent horizon and represent distinct fluvial-glacial phase of sedimentation. It is underlain by Boulder bed which is concealed under younger sediments in the valley. The Quaternary landscape embodies imprints of tectonism which revealed that sedimentation had been controlled by mechanics of SONATA LINEAMENT ZONE.

The Quaternary deposits of Narmada valley represent the thickest deposits in faulted and sinking platform under structural riparian rift trench which is undisclosed and remained unrevealed. The work so far carried out is restricted to quaternary deposits of exposed section of 18 m of river section only, no work has been done on concealed strata of quaternary deposits below the Boulder conglomerate source of sediments, mode of transportation, deposition tectonic and environment of sedimentation to conceive the model of quaternary sediment. The inadequate data of concealed quaternary strata, environment of sedimentation, their disposition and correlation in vertical chronology in time and space restricted the systematic search of human remains with precise strata in synchronization of mechanics of tectonics and sedimentation in rift valley. The records of search of human skull and its remains revealed that the search was mostly random and confined around to hominid locality Hathnora from where skull of *Homo erectus* was reported by Sonakia (1984) except Sankhyan, A. R. (1997b) no further addition in tracing the human remains and its evolution is made. The present studies on various aspects of sedimentology of exposed section and bore hole logs across the vertical column of about 280 m in synchronization of tectonism and environment sedimentation in vertical chronology in faulted trough may provide clues in understanding the modal of quaternary deposits in rift valley and in search of human skull and its remains.

In Narmada Rift valley about 202 samples collected from hominid locality from exposed sections and bore hole logs across the vertical column 550 m for study to trace environments of sedimentation in Pleistocene to Holocene time. The statistical parameters viz MZ, STD, SKI, and KG of sediment samples were computed of Quaternary blanket of Narmada. The synchronized study of these parameters revealed that the quaternary deposits consists of sediments of three domain viz glacial, fluvio-glacial and fluvial representing Boulder bed, Boulder conglomerate and Fluvial deposits of paleo-domain of Narmada (NT1 to NT3). The study of various parameters their binary relation, their concentration of plots cluster and trends and patterns revealed three breaks in vertical column at 000.m to 150, 150 to 350, and 350 to 550 m in increasing antiquity in Narmada valley. The extensive and intensive analysis of statistical parameters heavy mineral quartz grain morphology, paleo sole analysis ash bed matrix depict contrasting diagnostic characters of sediments in chronology of quaternary sequence in vertical columns. The statistical parameters and binary clusters of plots of mean size and sorting, mean size and skewness, mean size and kurtosis are used in delineating and fencing boundary between the glacial and fluvio glacial and fluvial sediments. The concentration of these plots separates 87 % sediments fluvial domain fluvio-glacial 94% of the fluvial-glacial from glacial. The glacial sediments are un-oriented and un-organized, fluvio-glacial moderately organized whereas, the sediments of fluvial domain are well organized in synchronization to shape size sorting, and display a balance harmony and ecology in conformity of sedimentation. Khan et.al (2015) which is also authenticated by heavy mineral assemblage of sediments of quaternary column (2016).

The boulder bed which yielded Hominid fossil from boulder conglomerate reported to be of fluvio-glacial origin for first time (Khan & Sonakia 1992). Beside occurrences of associated ash beds with fossiliferous boulder conglomerate (Khan & Rahate 1991) Acharya 1993 indicates volcanic source. It appears that close to the completion of cycle of deposition of the boulder bed there was violent volcanic eruption in around Middle to upper Pleistocene time which was subsequently settled down across the globe and in the peninsular India during the Quaternary sedimentation. The occurrences of association of two marked horizons at different levels further revealed the cyclic eruption and settling of volcanic matrix was occurred with a pause during sedimentation. Khan et al. (1991). Khan and Sonakia (1992) reported for the first time glacial and interglacial deposit in the Narmada valley, Central India which is represented by arid and humid cycles. The lithostratigraphy of Narmada valley described by Khan (1984), Khan & Benarjee (1984), Khan & Rahate (1990-91), Khan & Sonakia (1992), Khan et al (1991), Rahate & Khan (1985), Khan (1991), Khan & Sonakia (1992), Yadav & Khan (1996).

The Quaternary lithostratigraphy and sedimentological aspects were studied and in the Narmada valley (Khan 1984, Khan & Benarjee 1984, Khan & Rahate 1990-91-90 Khan & Sonakia 1992, Khan & et al 1991, Rahate & Khan 1985, Khan et al. 1991, Khan 1991, Khan et al. 1992, Yadav & Khan 1996. The Narmada valley embodied complete sequence of Quaternary deposits from lower Pleistocene to Holocene (Khan & Sonakia (1992). Khan, et al (1912), Khan (2012) et al Khan (in press), Khan (in press), The results of sedimentological studies Khan (2015), quartz grain morphology, Khan (2014), quartz grain morphology, Palesole Quaternary column section in Hominid locality in central sector of Narmada revealed the presence of complete sequence of Quaternary sediments in Narmada rock basin viz Glacial, fluvio-glacial and fluvial domain whereas the boulder conglomerate which has yielded human skull is of fluvio-glacial origin from Khan & Sonakia (1991). The Quartz grain morphology of sediment column Khan (2014) Quartz grain morphology of different paleo- sole, Khan (2014), Ash bed Khan & Maria (2012) Khan & Maria (1912) Heavy mineral assemblage Khan (2016) tephra stratigraphy, Khan et al (1991) Acharya, S.K. and Basu, P.K. (1993) Khan et al (2014) Khan et al.(2015) Ash fall and its impacts (2015) Khan (2016) magnetostratigraphy, and bio-stratigraphy and correlation of sediment columns intra valley wise, inter valley wise and on unified Quaternary Platform Khan et al (2012) focusing on hominid localities of China have been studied on Quaternary platform which have given new insight on the age of the Narmada *Homo erectus*. The Quaternary deposits of the Narmada valley represent the thickest Quaternary deposits in peninsular India which were deposited in a tectonic trench of SONATA LINEAMENT ZONE., the sedimentation has been controlled and synchronised by mechanism of tectonism during entire span of sedimentation from Lower Pleistocene to Holocene time. The association of fossils and stone implements with Quaternary deposits of Narmada are well described, quarries on various aspects on geology geomorphology, sedimentology, provenance of sediments, stream kinetics, stratigraphy, chronology, tectonics, neotectonic, subsurface geometry, and overall model of Quaternary sedimentation of Narmada in faulted and oscillating rift trench remained silent and disclosed and unrevealed hidden miseries needed attention.

In the present studies revealed mega sedimentological three breaks in vertical column at 000.m to 150, 150 to 350, and 350 to 550 m in increasing antiquity in increasing antiquity from the base which represent boulder bed boulder conglomerate and sediments of paleo domain in chronology and sequence representing Pleistocene, middle Pleistocene and upper Pleistocene phase of sedimentation in Narmada Rift valley.

The binary clusters of plots of mean size and sorting, mean size and skewness, mean size and kurtosis are used in delineating and fencing boundary between the glacial and fluvio glacial and fluvial sediments. The concentration of these plots separates 87 % sediments fluvial domain fluvio-glacial 94% of the fluvial-glacial from glacial. The glacial sediments are un-oriented and un-organized, fluvio-glacial moderately organized whereas, the sediments of fluvial domain are well organized in synchronization to shape size sorting, and display a balance harmony and ecology in conformity of sedimentation. Khan et al (2015) Khan et al (2016) which is also authenticated by heavy mineral assemblage of sediments of Quaternary column Khan et al (2016), Khan et al (2016), Khan et al (2016), Khan et al (2016).

In Narmada rift valley the Quaternary sediments are accumulated in two section viz Jabalpur-Harda section and Guredhwar and Bharouch section where as in other area Harda to Gurudeshwar section of valley rock cut terraces, rock cut platform and benches are notices which at many places over lie by caps and strips Quaternary deposits representing the former level of valley floor of Narmada. The rock cut terraces and rock cut benches are time equivalent to NT1 to NT3 which have developed in Jabalpur-Harda and Gurudeshwar –Bharouche sections. Khan et al (2016). The Quaternary events of the Narmada portys three prominent terraces and two sub terraces in these

sections which are designated NT1 to NT3 and sub terraces NT2-A is NT2-B, NT2 B, besides NT2-C, NT3-A & NT3-B besides NT-0 in the valley. They have been designed NT<sub>0</sub> to NT<sub>3</sub>, ( 280 to 400 m ), NT<sub>0</sub> being the low level terrace above the present-day course of the river, NT<sub>1</sub>-the younger terrace both of cyclic and of cyclic nature. The NT<sub>3</sub> terrace occurs as elongated strip and isolated caps and lenses along the margin of valley flanks has divergent relative disposition. These land forms indicate vigorous and abrupt incision of valley floor due to relatively & repaid uplift of watershed area during Upper Pleistocene time. The NT<sub>1</sub> to NT<sub>2</sub> are the major depositional terrace and have both convergent & divergent mutual disposition with other terrace. These terraces further downstream have matched equivalents along the valley flanks, whereas in the up stream section the matched equivalents are rare. The conspicuous divergent relation of these terraces the valley reveals successive uplift of catchments area and consequential incision of valley floor and adjustment of base level of Narmada during Upper Pleistocene time.

The sequence of quaternary deposits in this segment of rift system was deposited on uneven platform of valley floor of turmoil nature in tight and narrow basin which depicts cyclic transitional environmental of the rift basins are caused by tectonic activities (uplift and subsidence), changes in relief, and climatic variations. The climatic changes in uplift, coupled with block faulting, rising and sinking platform, created basins unstable platform for the accumulations of thick lacustrine and fluvial sediments sequences with terrestrial and aquatic fossils. The evidence of the effects of tectonics on fauna and flora are distinct and its signatures on dislocation and concealing of fossiliferous horizons are uncontrolled and ill defined in the ecosystem in the valley during the Pliocene–Pleistocene periods. The boulder conglomerate which yielded the skull cap of *Homo erectus* in Narmada rift from Hathnora Sonakia (1984) remained only discovery of hominid fossil in last two and half decade due inconsistency and concealed nature of fossiliferous horizon due faulting, and subsidence of Quaternary blanket of Narmada rift system as such researcher and scientist failed to add any further knowledge to hominid discovery in Narmada valley. The study of statistical parameters across the entire thickness of Quaternary deposits revealed three breaks in sedimentation at 350 -290, 190-220, 100-150 in the valley where as an breaks in Hominid locality Hathnora I to IV sections is at 280m, at 210m and at 35m in increasing antiquity from the base of rock basin which represent glacial, fluvioglacial and fluvial environment of sedimentation in the Narmada valley. The correlation of different sequential and sedimentological breaks indicate subsidence and up lift of different blocks and platform of sedimentation due to tectonic and neotectonic activity.

(Plate No\_5 to 8).

#### Sea level fluctuation and sedimentation:-

The Narmada before debouching into Gulf of Cambay a conspicuous quaternary blanket is encountered. This segment is about 90 km in length and forms the southern margin of the N–S extending Gujarat alluvial plains. A significant feature of the lower Narmada valley is the deposition of a huge thickness of Tertiary and Quaternary sediments in a fault controlled rift trench. To the south of the ENE–WSW-trending Narmada–Son Fault (NSF), the Tertiary rocks and basaltic flows of Deccan Trap Formation occur on the surface while to the north they lie in the subsurface and are overlain by Quaternary sediments. However, the overlying Quaternary sediments having a maximum thickness of 800 m (Maurya et al., 1995) still remain unclassified. Drill data from some of the deepest wells in the basin have revealed occurrence of Deccan Trap at depths of 6000 m followed by an Archaean basement (Roy, 1990). The Tertiary sediments, outcropping to the south of the NSF, represent the full sequence from Eocene to Pliocene overlying the Deccan Trap and show extensive deformation in the form of several ENE–WSW-trending anticlinal highs and ENE–WSW and E–W-trending reverse faults (Fig. 2A). Neotectonic studies along the NSF have been singularly lacking. However, some studies dealing mainly with the channel form, fluvial processes and hydrological aspects have been restricted to the middle and upper reaches of the Narmada River (Kale et al., 1994; Rajaguru et al., 1995; Gupta et al., 1999).

The Narmada–Son Fault (NSF) divides the Indian plate into two halves and has a long tectonic history dating back to the Archaean times (Ravishankar, 1991). The NSF trends in ENE–WSW direction and is laterally traceable for more than 1000 km. It demarcates the Peninsular India into two geologically distinct provinces: the Vindhyan–Bundelkhand province to the north and the Deccan province to the south. Ravishankar (1991) regards the Narmada–Son Fault as a part of the composite tectonically controlled zone in the middle of the Indian plate and termed it as the SONATA zone (abbreviated form of Son–Narmada–Tapti Lineament zone). The Narmada and Tapti Rivers all throughout their course follow these tectonic trends. Other synonyms used in literature to describe this zone include Narmada–Son Lineament (Choubey, 1971), Central Indian Shear (CIS) (Jain et al., 1995) and Central Indian Tectonic Zone (CITZ) (Radhakrishna and Ramakrishnan, 1988; Acharyya and Roy, 2000). Geophysical studies in the central part of this zone reveal this to be a zone of intense deep-seated faulting (Reddy et al., 1995). The zone

witnessed large-scale tectonothermal events associated with large granitic intrusions around 2.5–2.2 and 1.5–0.9 Ga (Acharyya and Roy, 2000). It was again reactivated during the Deccan volcanic eruption during Late Cretaceous–Palaeocene (Agarwal et al., 1995). Profuse occurrences of E–W-trending dykes suggest that the zone formed the main centre of eruptive activity (Bhattacharji et al., 1996). The entire zone is presently characterized by high gravity anomalies, high-temperature gradient and heat flow and anomalous geothermal regime (Ravishankar, 1991) suggesting that the zone is thermo mechanically and seismically vulnerable in the framework of contemporary tectonism (Bhattacharji et al., 1996). The westward extension of this zone into the lower Narmada valley exhibits a less complex structural setting. Data on the NSF in this part is mainly the result of extensive geophysical surveys for commercial exploitation of petroleum reserves in the subsurface. In the lower Narmada basin, it is expressed as a single deep-seated fault (NSF) confirmed by the Deep Seismic Sounding studies (Kaila et al., 1981). Seismic reflection studies have firmly established that the NSF is a normal fault in the subsurface and becomes markedly reverse near the surface (Fig. 2B) (Roy, 1990). Reactivation of the fault in Late Cretaceous led to the formation of a depositional basin in which marine Bagh beds were deposited (Biswas, 1987). The NSF remained tectonically active since then with continuous subsidence of the northern block, designated as the Broach block, which accommodated 6–7-km thick Cenozoic sediments (Biswas, 1987). The total displacement along the NSF exceeds 1 km within the Cenozoic section (Roy, 1990). However, the movements along this fault have not been unidirectional throughout. The general tendency of the basin to subside has been punctuated by phases of structural and tectonic inversion (Roy, 1990). The N–S-directed compressive stresses during the Early Quaternary, folded the Tertiary sediments into a broad syncline, the Broach syncline, in the rapidly subsiding northern block (Roy, 1990). The Broach syncline extends from the NSF to the Mahi river in the north. The E–W trending axis of this syncline lies to the north of the Narmada river. Corresponding anticlinal structures are found in the Tertiary rocks exposed in the southern up thrown block (Fig. 2A and B). Historical and instrumental records indicate that the compressive stresses still continue to accumulate along the NSF due to continued northward movement of the Indian plate. This is evidenced by the fault solution studies of the earthquakes at Broach (23 March 1970) and Jabalpur (22 May 1997), which suggest a thrusting movement (Gupta et al., 1972, 1997; Chandra, 1977; Acharyya et al., 1998). However, the underlying cause of the seismicity in the NSF zone is not yet understood (Quittmeyer and Jacob, 1979).

The Narmada River in its lower reaches defends in sinuous to meandering pattern which is solely guided by ENE to WSW to E–W lineament and its sympathetic fractures. It has chiseled the landscape into terraces, valley flats which form the prominent landscape of quaternary terraces breaking the monotony of close topography. The Narmada downstream of Garudeshwar flows in a general WSW direction where it displays meanders with wavelengths of 5–8 km. The Orsang, Aswan, Men and Bhuki are the major rivers joining the Narmada from the north. The Karjan River, which drains a major part of the trappean uplands in the lower Narmada valley, meets the Narmada from the south. The other tributary, the Madhumati River drains the western fringe of the trappean upland. In between the Karjan and Madhumati rivers there are several north flowing small streams meeting the Narmada at various points. The network of drainage in the lower Narmada is structurally controlled and developed and works under the mechanism of neoseismic ecology of pulsation variance evident by river terraces, linear scarp. The presence of ravineous tracts with incised deep gullies of 20–25 m is manifestation of deep seated water table due to subsidence of block along the lineament zone. The disposition of river terraces, entrenched meanders and alluvial cliff 15–30 m are suggestive of neotectonic activity in the area. The display of active Narmada channel configuration of terraces, meander scrolls, entrenched meander revealed misfit nature of Narmada in the area. The present channel of Narmada is strongly influenced by NSF and displays persistent tendency to shift towards north due to geotectonic activity along the fault. It also authenticates that there is perceptible up rise in the southern block of fault and subsidence of northern block which resulted into gliding and shift of Narmada towards north.

The tectonic uplift of the lower Narmada valley during the Early and Late Holocene suggests inversion of an earlier subsiding basin. Such inversions of the basin have been common in the Tertiary times and are well recorded in the sediments of that age (Roy, 1990). A symmetric convergence of the NT-1, NT-2 terraces, diagonal disposition of paired equivalent of terraces across the channel, divergent and linear disposition of cliff of NT-3 terrace in conformity of NSF constant subsidence of basin and in response to frequent movement and geotectonic activity along the NSF. The displaced Late Pleistocene sediments across NSF in the Narmada and Orsang Heran and Madhumati & Karjan valleys, the NNW tilting of the NT-1, NT-2 sediments litho units consisting of the Late Pleistocene sequence, the anomalous topographic slope in the same direction and the incised cliffs up to 25–30 m in the streams that flow along this slope in the area between NSF and the Narmada River, indicate unsynchronized neoseismic movements along the NSF during the Early Holocene. The displacement of sediments of NT-1 surface across the NSF indicates differential movement of about 35 m along the NSF during Early Holocene. The block

between the Narmada and Karjan rivers bounded by the NSF and the two other cross-faults suffered subsidence leading to the formation of a series, linear and curvilinear cuts of on terraces and flood plains. The 5–8-m incised cliffs of the streams also suggest that this block escaped the uplift induced large scale incision going on simultaneously in other areas of the lower Narmada valley. The occurrence of ravines and association of deep gullies with the river terraces is morpho-tectonic manifestation caused by the sudden vertical movement and block adjustment due subsidence resulting to sudden collapse of water table and ground water regime in the area.

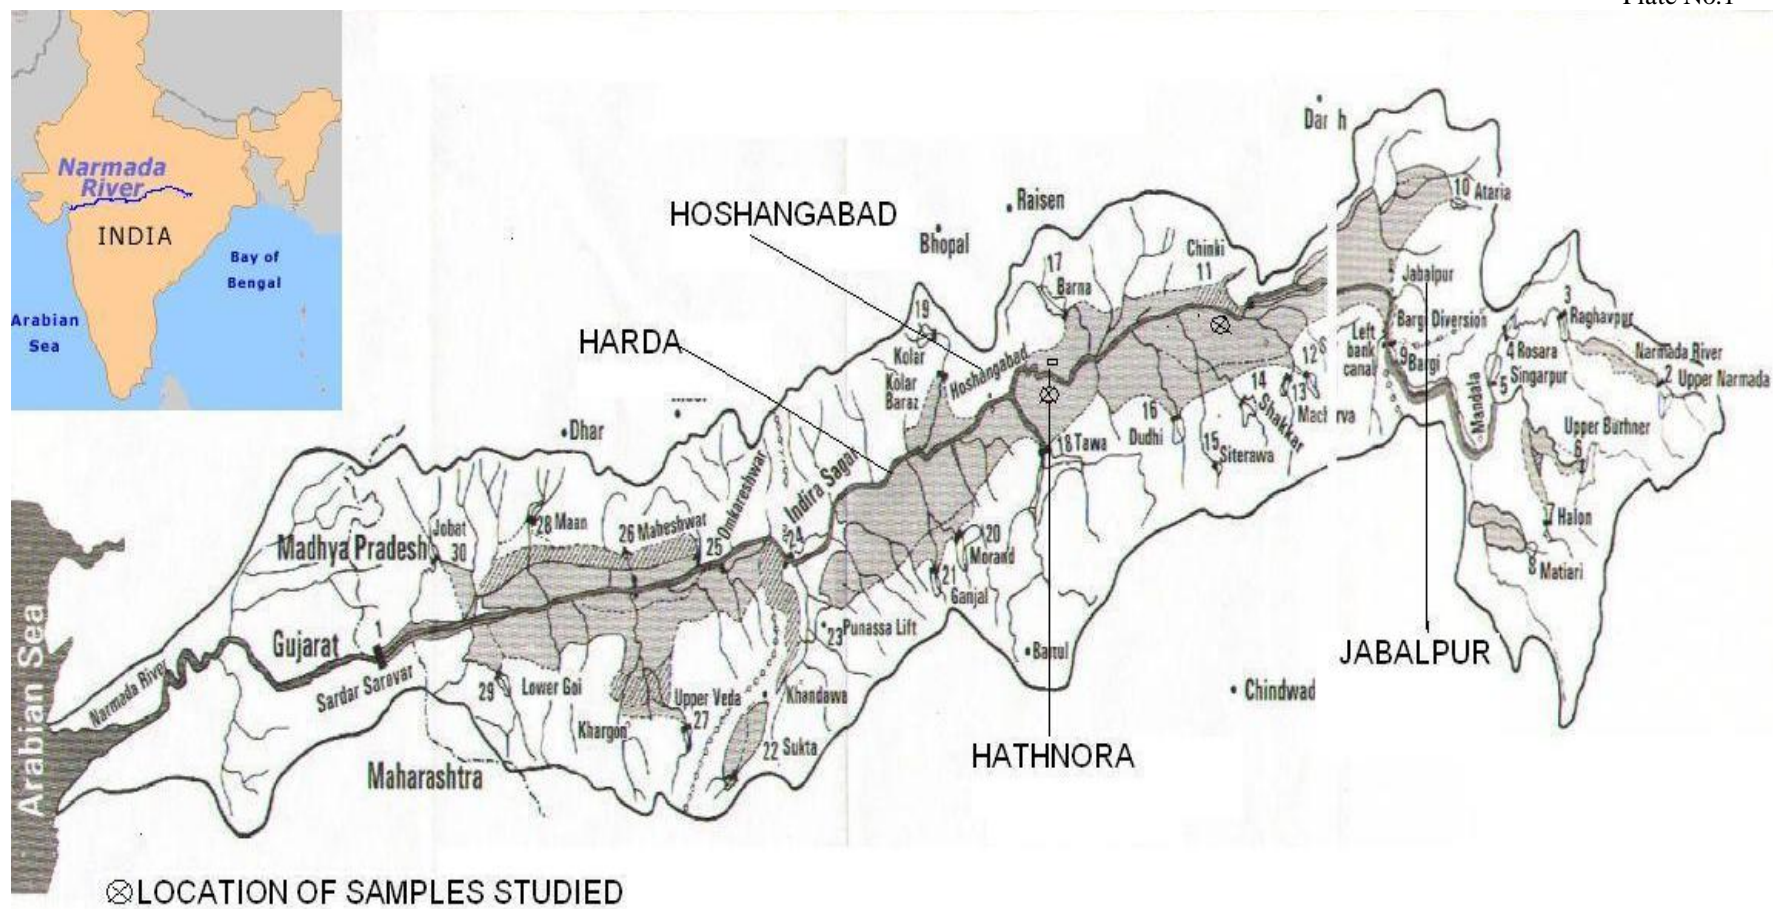

The strongest supporting evidence for the Early Holocene tectonic uplift of the area comes from the sea-level curves of the west coast of India which suggest a tectonic component of about 40 m at this time (Rao et al., 1996).

In the Narmada valley the River terraces (NT-3) has occupied large area on the both bank of. It extends from Orsang river in the north east to Mahi river in the west from Baroda in the north to Bharuch –Aliabet in the southwest. In the southern bank of Narmada it is developed around Ankleshwar and Rajpipla and further south. The average elevation of this surface is about 75 m above m.s.l, separated by both linear and curvilinear scarp from NT-2. The average height of cliff is about 40 m. The sediments comprised of this terrace are exposed in the cliff section. The oldest deposit of the exposed sediment successions a highly pedogenised mottled clay horizon showing vitriolic characters like extensive fracturing giving rise to blocky aggregates, pseudo anticlines and hydro plastic slickenside along the fracture surfaces. The sediments of this terrace are associated with a rich assemblage of shallow marine foraminifers. The basal unit consisting of rock pebbles with clays is overlain by thick fluvial sediments, which comprise alluvial plain facies. The pebbly unit which contains rock fragments of quartzite, granite basalt, and limestone sandstone is about 5.5.m thick, it is a persistent horizon and exposed in the cliff section. It is marker horizon, represent distinct phase of sedimentation in the valley.

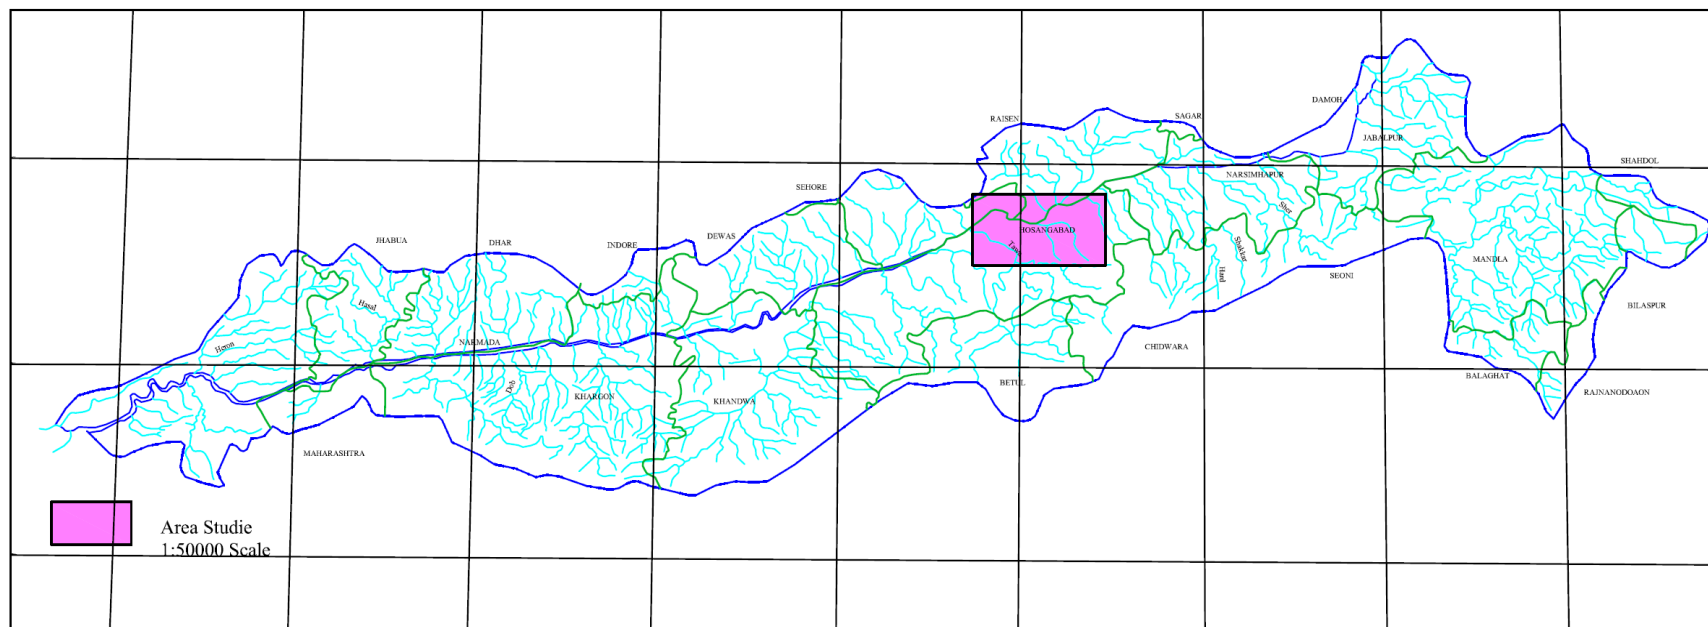

In the Lower Narmada valley the Mid–Late Holocene Quaternary valley deposits is the product of a Holocene high sea-level-induced deposition in a deeply incised valley trench trough highly influenced by NSF. The Mid–Late ey which resulted in both estuarine and fluvial sedimentation in the lower reaches. A significant slowing down of tectonic uplift facilitated the encroachment of the sea into the valley and the creation of a depositional wedge, which extended up to the deep in land foothills. The 5–10-m exposed thickness of the valley-fill sediments reveals tide dominated estuarine deposition in the lower reaches and fluvial deposition upstream of the tide reach.

The pre-existing quaternary platform of NT-3 of middle Pleistocene prior to induced sedimentation of tidal transgression was strongly induced by tectonic impulses of NSF. The relative disposition of terraces (NT-2 NT-3) cliff alluvial bluff ad scarp, reveals that the present mouth of the Narmada river has retained roughly the originally funnel shape of the estuary formed during the Mid–Late Holocene. However, the size of the estuary is now considerably reduced in space and time with sedimentation and t compressive tectonic environment. The stepped sequence of terraces NT0 to NT2A NT2B NT2C NT3A, NT3B) their disposition, their convergence & divergence, cyclic and non cyclic nature and mutual inter relation revealed at least three mega phases and four micro phases of up rise of sea level related with tectonics of the area in late to upper pleistocene time.

The incursion and transgression of tides, present estuarine reach contains several islands, which are coeval with the terrace surface above the present tidal range. Hence, they are the products of estuarine processes of the Mid–Late Holocene and not those of the present day. Funnel shaped morphology and increasing tidal energy landward are characteristics of tide-dominated estuaries (Wright et al., 1973). Existing data suggest that the Mid–Late Holocene sea level has remained at the same level up to the present with minor fluctuations (Chappel and Shackleton, 1986; Hashimi et al., 1995). The Mid–Late Holocene sediments show tilting of 10–20j which is more pronounced in the vicinity of the NSF suggesting that the incision and uplift of the valley-fill terraces well above the present day tidal limits is related to the continued differential uplift along NSF. Evidence of tectonic uplift has been reported from the coast also in the form of raised mudflats occurring 2–4 m above present sea level (Merh, 1993). Currently, the river occupies the northern margin of the Early Holocene channel belt and is clearly more sinuous. It exhibits a narrow channel with wide meanders inside wide belts of Mid–Late Holocene terraces ( NT-3) a typical pattern of under fit streams. (Khan2015) (Dury, 1970). (Plate No\_3, 4, 5 to 8)

### Conclusion and summary:-

The Indian Plate is currently moving northeast at 5 cm/yr (2 in/yr), while the Eurasian Plate is moving northeast at only 2 cm/yr (0.8 in/yr). This is causing the Eurasian Plate to deform, and the Indian Plate to compress leading to tectonic activity along major fault zones. In tectonically active areas sedimentary basins undergo phases of both crustal extension and contraction leading to basin inversion and hence display features typical of subsidence and uplift. Geomorphic attributes and deformation in late Quaternary sediments are the indicators of active tectonic activity in any sedimentary basin. The geomorphic evolution in such reactivated basins is primarily due to complex interaction between sedimentation processes and tectonics. The peninsular India has been undergoing high compressive stresses due to the sea-floor spreading in the Indian Ocean and locking up of the Indian plate with the Eurasian plate to the north. Much of this N-S directed stresses have been accommodated by the under thrusting of the Indian plate below the Eurasian plate. A part of these compressive stresses are accumulated along the Narmada-Son Fault (NSF), a major E-W trending crustal discontinuity in the central part of Indian plate. The Quaternary tectonic activity recorded in the Narmada valley possibly, has wider ramifications when viewed in the larger perspective of the Indian plate. This suggests a renewed phase of extreme compression of the Indian plate, which led to tectonic insecurity and may cause tumours and earthquakes in peninsular India.

In Narmada valley the association of Ash bed NAB-I with Hathnora formation at the depth of 78 m in Quaternary column and occurrences of skull cap of *Homo erectus* at the depth of 83 m in decreasing antiquity from the top assumed that Toba eruption have taken place later than existence of *Homo erectus* which appeared and resided in the valley for long time before the fall of Toba ash. The association of Ash is NAB-II at the depth of 72 m with the younger deposit revealed the second cyclic fall of Toba ash which certainly have had influence on hominines and had collective and cumulative impact on *Homo erectus* (Sonakia 1984) *Homo sapiens* (Thobold 1860, 81), in Narmada valley and Indian sub-continent. Oppenheimer (2003) argues that *Homo. Sapiens* occupied India before ~74 ka and may have undergone "mass extinction" as a result of the Toba eruption. The argument of Oppenheimer (2003) is in strong conformity with the present observation of authors. As sediment & Ash bed sequence of Quaternary column of Narmada (325 m) and occurrences of fossil of skull cap of *Homo erectus* (Sonakia 1984) at 83 m & human cranium *Homo sapiens* (Thebold 1960, 1981) transported have existed prior to fall of Toba ash and they are among the few who in spite of mass extinction caused by mega dislocation in ecology and environment related with volcanic eruption survived in Narmada Valley. It is further documented by the rarest occurrences of these fossils in subcontinent which also confirm the intensive impact of volcanic ash fall on these hominines and their consequential mass extinction. (Table No AB-1-3) & Plate No AB-2-8).

The study of assemblage of glass matrix of Ash bed, grain morphology of glass their relation with other minerals shape, size, texture of litho fragments of pyroclastic origin suggest that sediments were brought from distant source by Aeolian agencies in the form of thick cloud containing volcanic dust, rock matrix and different gases which remained in atmosphere for very long time and settled down across the Indian sub continent during the different phases of river sedimentation. Further study of Ash bed material and silica revealed diagnostic morphological characters of glass shards which are typical of silica volcanism (Heiken, 1972, 1974) and show close similarity with those reported from the Quaternary tephra beds of the Narmada, Son, Purna and Kukdi basins (Basu et. al., 1987; Khan et.al. 1991 Basu and Biswas, 1991; Singaraju and Shivaji, (1991) Mukhopadhyay, (1992). It is significant to note that the occurrences and association of two marked horizons at different levels further reveal that the cyclic eruption and settling of volcanic matrix has taken place with pause in the valley.

The occurrences of these skull caps with short range of their occurrences in the stratigraphic column of Narmada with the Ash beds horizon NAB-I and NAB-II and specially with the Hathnora formation one at the top at an average elevation of about 268-273 m above the mean sea level and other with younger deposits had revealed the close association with volcanic activity with their existence. The Toba Ash fall is also in very close range with the sequence of sedimentation and occurrences with both the skull caps, which certainly has its impact on the middle and late Pleistocene Hominines in Narmada valley and Indian subcontinent.

The skull cap of Narmada Man *Homo erectus* was found in Narmada Valley near village Hathnora (22° 52' N; 77° 52' E) in fossiliferous boulder conglomerate, in district Sehore, M.P., India. The skull cap is completely fossilized undistorted, renal vault nearly complete except few left Supra-orbital and sutures are nicely preserved. The various morphological features and robust form of skull and excessive thickness of the bones indicate that it belongs to adult male individual (Sonakia, 1984). The discovery of skull cap of *Homo erectus* in fossiliferous boulder conglomerate in association of other mammalian fossil is recorded in stratigraphic column of Quaternary deposits at the depth of 83

m, where estimated total thickness of deposits is about (325 m). This blanket consists of sediments of three domains viz. glacial, fluvio-glacial and fluvial, which were deposited in distinct environments during Pleistocene to Holocene time (Khan & Sonakia (1992), (Khan et.al. in press). The statistical analysis of sediments from these different domains in vertical column has been conducted to ascertain the environment of sedimentation and trace the breaks in climate (Khan et.al. in press). An attempt has been made for the first time Khan et.al (2013) to correlate the various stratigraphic columns of associated hominid fossils of Narmada valley (325 m) India and that of Luochuan sequence, (90-120 m) Chenjiawo (50m) and Congwangling sequence (36 m) of China on unified Quaternary platform tied up and developed at mean sea level. The study revealed that the depth of occurrence of Narmada skull cap on unified Quaternary platform is about (83 m) as compared to that of Chenjiawo and Gongwangling of China which occur at very shallow depth of 38 and 26 m respectively. The estimated age of Narmada Man based on these parameters is about 1.38 m.y. (+), which is greater than *Homo erectus* of Chenjiawo 0.65 m.y. and Gongwangling 1.15 m.y. of China An Zhisheng and Ho Chuan Kun (1989). On the merits of correlation of stratigraphic columns of Quaternary of Narmada, accumulation of sediment, rate of sedimentation, palaeo- environments, lithostratigraphy and biostratigraphic position of boulder conglomerate in unified Quaternary Platform, author considers it as one of the earliest and oldest *Homo erectus* in Asia. Khan et.al (2013).

This study of quartz grain and their microstructures of paleosols identified in the concealed blanket of Quaternary deposit display relative heterogeneity in sediment characteristics throughout across the Quaternary column of Central Narmada valley. The study quartz grain of soil and sediments display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depths and levels 000.m to 150, 150 to 350, and 350 to 550 m from fluvial, fluvio-glacial and, glacial deposit (72 samples +25). The majority of quartz grain population show characteristic surface textures linked to long evolution in fluvial, fluvio-glacial and glacial environment of sedimentation in time and space in increasing antiquity in the valley. There exists a direct relationship between grain-size characteristics and the shape and surface texture of grains. The variations in shape and size of grain assemblages and imprints of particular microstructures in specific population and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial at the bottom of valley trough subsequently followed by fluvio-glacial and further overlain by fluvial deposits distinctly related with change of climate and tectonic changes in increasing antiquity in Narmada valley.

The study of quartz grain from surface and subsurface quaternary blanket enveloped in the tectonic trench display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depths and levels 000.m to 150, 150 to 350, and 350 to 550 m from fluvial, fluvio-glacial and, glacial deposit (72 samples + 25). The majority of quartz grain population show characteristic surface textures linked to long evolution in fluvial, fluvio-glacial and glacial environment in time and space. An indication of glacial evolution (parallel striations or grinding features) was observed in samples (10%-60% of grains) in 35 samples from different levels between 390 to 525 m the percentage of grains showing a glacial origin having parallel striations, fresh silica pellicles, and polished silica pellicles and fresh impact features. As such evidences of glacial, fluvio-glacial and fluvial evolution is marked in the lower stratigraphic columns of Narmada. In addition some of grains exhibit fresh quartz overgrowths, features, and silica pellicles at some level of sedimentation. This indicates a mixing of grains from different provenances. The parallel striations and fresh impact features are diagnostics of glacial environment and demonstrate consistency in occurrence. This implies a change of environment of sedimentation from glacial to fluvio-glacial and fluvial. This variation is accompanied by a decrease in the percentage of rounded grains and in the fine-sand fraction. The parallel striations are polished, were observed. The composite illustration of fresh striations and polishing of grains support to glacial environment of sedimentation in Narmada valley during lower Pleistocene time. The density of grains possessing such diagnostic elements of glacial origin decreases upward in vertical column and their consistency has inverse relation which indicates sequential change of environment from glacial, to fluvio-glacial and fluvial in chronological sequence up ward in the Narmada valley.

In Narmada valley the most of the hominid remains and associated artifacts in the would have been found associated with Miocene Pliocene– Pleistocene sediments of boulder bed and boulder conglomerate in increasing antiquity, unfortunately same are not exposed due rift system and tectonic setting. In the rift system the type development of Quaternary blanket is confined between Jabalpur \_Harda section, and Tilakwarda \_Bharouch which possess the complete sequence of all three domains in increasing antiquity in chronology in vertical column from the bottom of the rift trench viz Boulder bed (glacial), Boulder conglomerate (fluvio-glacial) sediments of paleo-domain of Narmada (fluvial). The intense tectonic activities within the basins of the Narmada Rift System during the Neogene and Quaternary periods have destroyed fossil record except the fossiliferous horizons exposed in river sections. The

erosional-sedimentary cycle has persisted in the rift valley environment for millions of years as a result of the interplay between depositional and erosional forces driven by tectonic processes; there are numerous gaps in the fossil record, particularly in the important time period between **Mio-Pliocene Pleistocene times**. It is pertinent to understand the origin of Hominid during the late Miocene, but it is difficult to disclose mysteries of human evolution in Narmada due to concealed nature of these deposits in rift system, however the complementary part of Tapti-Purna Quaternary blanket may be potential and possessive of human remain and should be studied to trace further the imprints of fossil man taking in to account of SONATA LINEAMAN ZONE as single ecosystem for evolution of man in Indian subcontinent. The rift system and platforms of sedimentation bear the imprints of and evidence of the effects of tectonics on fauna and flora are distinct, however the signatures of subsidence dislocation and concealing of fossiliferous horizons are uncontrolled and ill defined in the ecosystem in the valley during the Pliocene–Pleistocene periods. The boulder conglomerate which yielded the skull cap of *Homo erectus* in Narmada rift from Hathnora Sonakia (1984) remained only discovery of hominid fossil in last two and half decade due to concealed and hidden nature of **Mio-Pliocene Pleistocene deposits in rift system and inconsistency in exposure of fossiliferous horizon of Narmada rift system** which is the handicap in search of further human remains in Narmada valley after Sonakia (1984).

The study of statistical parameters and their binary relation distinctly display contrasting and relative heterogeneity in sediment characteristics throughout across the Quaternary blanket in Narmada valley. The study of sediments display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from glacial, fluvio-glacial fluvial, and fluvial deposit (150 samples). The critical analysis of these parameters exhibits sediment textural linkage to long evolution in glacial, fluvio-glacial and fluvial environment in time and space in increasing antiquity in the valley. The characteristics inherited by the sediments from pre-existing domain of sediments are glacial & terrestrial & environment. The diagenetic and diagnostic features; varying degrees of heterogeneity, sediment angularity roundness, degree of sorting indicate evolution and sedimentation of quaternary sediments in a high-energy turmoil glacial environment on tectonically dislocated and unstable platform. The sediments confined up to 150 m below ground level represent paleo fluvial domain of Narmada and represent multi cycle sedimentation under varying energy condition on oscillating platform. The vertical variation in increasing antiquity in textural parameters and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial at the bottom of valley trough subsequently followed by fluvio-glacial and further overlain by fluvial deposits which is related with change of climate and tectonic in watershed of Narmada. The binary relation of these parameters effectively used in differentiating and fencing the sediments of these domains and their environment of sedimentation in time and space Khan et.al (2015). The study of statistical parameters across the entire thickness of Quaternary deposits revealed three breaks in sedimentation at 350 -290, 190-220, 100-150 which represent glacial, Fluvio-glacial and Fluvial environment of increasing antiquity in from bed rock in Narmada valley.

The study revealed that sediments were primarily derived from metamorphic source comprising of kyanite-paragonite, muscovite schist, gneiss, garnet mica schist, and Para-amphibolite tourmaline garnet metasedimentaries and meta-volcanic. Apart these minerals are also reworked from older Quaternary deposits from Boulder bed glacial deposit, Boulder conglomerate of fluvio-glacial deposit and fluvial terrace and higher and other older terraces of fluvial domain. These heavies were basically transported from the sources area by glacial fluvio-glacial and fluvial agencies to the present site of their occurrence. The mode of transportation, environment of deposition and energy system of transporting media has greatly affected the frequency of concentration of heavies, their grain morphology and stability in that particular domain of deposit. These minerals, mostly released from rock fragments and other fabrics comprising boulder bed, subjected to intensive wear and tear and physio-chemical environment of weathering transport and deposition, the micro imprints acquired by different condition of sedimentation revealed the intense grinding and bed traction of sediments from the source. The striations on these minerals indicate glacial activity in the initial stage of sedimentation. These suites of minerals are stable as compared to the other suite of minerals of these deposits although these mineral are associated with all domain of quaternary deposits but show different frequencies of their occurrence and physical characters, shape size sphericity and roundness and bear the micro imprints acquired by different condition of sedimentation revealed the intense grinding and bed traction of sediments from the source. The striations on these minerals indicate glacial activity in the initial stage of sedimentation. These are generally angular to highly angular in shape and show very poor indices of sphericity and roundness typical of glacial environments. The configuration of minerals, rock clastic, ground mass, imprints and impact tectonics revealed the intense grinding and bed traction of sediments from the source to site of

sedimentation. The striations on these minerals indicate glacial activity in the initial stage of sedimentation. These are generally angular to highly angular in shape and show very poor indices of sphericity and roundness typical of glacial environments. The configuration of minerals, rock clastic, ground mass, imprints and impact tectonics revealed the intense grounding and bed traction of sediments from the source to site of sedimentation.

In Hominid locality of Hathnora about 202 samples collected from Section I to IV from the exposed sections and bore hole logs across the vertical column 550 m for study to trace environments of sedimentation in Pleistocene to Holocene time. The statistical parameters viz MZ, STD, SKI, and KG of sediment samples were computed of Quaternary blanket of Narmada. The synchronized study of these parameters revealed that the quaternary deposits consists of sediments of three domain viz glacial, fluvio-glacial and fluvial representing Boulder bed, Boulder conglomerate and Fluvial deposits of paleo-domain of Narmada (NT1 to NT3). The study of various parameters their binary relation, their concentration of plots cluster and trends and patterns revealed three breaks in vertical column at 000.m to 150, 150 to 350, and 350 to 550 m in increasing antiquity in Narmada valley

The study further revealed statistical parameters to gather with heavy mineral assemblage, quartz grain morphology, paleo sole analysis ash bed matrix depict contrasting diagnostic characters of sediments in chronology of quaternary sequence in vertical columns. The statistical parameters and binary clusters of plots of mean size and sorting, mean size and skewness, mean size and kurtosis are used in delineating and fencing boundary between the glacial and fluvio glacial and fluvial sediments. The concentration of these plots separates 87 % sediments fluvial domain fluvio-glacial 94% of the fluvial-glacial from glacial. The glacial sediments are un-oriented and un-organized, fluvio-glacial moderately organized whereas, the sediments of fluvial domain are well organized in synchronization to shape size sorting, and display a balance harmony and ecology in conformity of sedimentation. Khan et.al (2015) Khan (2016) Khan (2016)

The Narmada before debouching into Gulf of Cambay a conspicuous quaternary blanket is encountered. This segment is about 90 km in length and forms the southern margin of the N-S extending Gujarat alluvial plains. A significant feature of the lower Narmada valley is the deposition of a huge thickness of Tertiary and Quaternary sediments in a fault controlled rift trench. To the south of the ENE-WSW-trending Narmada-Son Fault (NSF), the Tertiary rocks and basaltic flows of Deccan Trap Formation occur on the surface while to the north they lie in the subsurface and are overlain by Quaternary sediments. However, the overlying Quaternary sediments having a maximum thickness of 800 m (Maurya et al., 1995).

The Narmada River in its lower reaches defends in sinuous to meandering pattern which is solely guided by ENE to WSW to E-W lineament and its sympathetic fractures. It has chiseled the land scape in to terraces, valley flats which form the prominent landscape of quaternary terraces breaking the monotony of close topography. The Narmada down stream of Garudeshwar flows in a general WSW direction where it display meanders with wavelengths of 5-8 km. The Orsang, Aswan, Men and Bhuki are the major rivers joining the Narmada from the north. The Karjan River, which drains a major part of the trappean uplands in the lower Narmada valley, meets the Narmada from the south. The other tributary, the Madhumati River drains the western fringe of the trappean upland. In between the Karjan and Madhumati rivers there are several north flowing small streams meeting the Narmada at various points. The net work of drainage in the lower Narmada is structurally controlled and developed and work under the mechanism of neotectonic ecology of pulsation variance evident by landscape manifestation.

The tectonic uplift of the lower Narmada valley during the Early and Late Holocene suggests inversion of an earlier subsiding basin. Such inversions of the basin have been common in the Tertiary times and are well recorded in the sediments of that age (Roy, 1990). A symmetric convergence of the NT-1, NT-2 terraces, diagonal disposition of paired equivalent of terraces across the channel, divergent and linear disposition of cliff of NT-3 terrace in conformity of NSF constant subsidence of basin and in response to frequent movement and geotectonic activity along the NSF.

The strongest supporting evidence for the Early Holocene tectonic uplift of the area comes from the sea-level curves of the west coast of India which suggest a tectonic component of about 40 m at this time (Rao et al., 1996).

In the Lower Narmada valley the Mid-Late Holocene Quaternary valley deposits is the product of a Holocene high sea-level-induced deposition in a deeply incised valley trench trough highly influenced by NSF. The Mid-Late which resulted in both estuarine and fluvial sedimentation in the lower reaches. A significant slowing down of

tectonic uplift facilitated the encroachment of the sea into the valley and the creation of a depositional wedge, which extended up to the deep in land foothills. The 5–10-m exposed thickness of the valley-fill sediments reveals tide dominated estuarine deposition in the lower reaches and fluvial deposition upstream of the tide reach.

The pre-existing quaternary platform of NT-3 of middle Pleistocene prior to induced sedimentation of tidal transgression was strongly induced by tectonic impulses of NSF. The relative disposition of terraces (NT-2 NT-3) cliff alluvial bluff ad scarp, reveals that the present mouth of the Narmada river has retained roughly the originally funnel shape of the estuary formed during the Mid–Late Holocene. However, the size of the estuary is now considerably reduced in space and time with sedimentation and compressive tectonic environment. The stepped sequence of terraces NT0 to NT2A NT2B NT2C NT3A, NT3B) their disposition, their convergence & divergence, cyclic and non cyclic nature and mutual inter relation revealed at least three mega phases and four micro phases of up rise of sea level related with tectonics of the area in late to upper pleistocene time.

The incursion and transgression of tides, present estuarine reach contains several islands, which are coeval with the terrace surface above the present tidal range. Hence, they are the products of estuarine processes of the Mid–Late Holocene and not those of the present day. Funnel shaped morphology and increasing tidal energy landward are characteristics of tide-dominated estuaries (Wright et al., 1973). Existing data suggest that the Mid–Late Holocene sea level has remained at the same level up to the present with minor fluctuations (Chappel and Shackleton, 1986; Hashimi et al., 1995). The Mid–Late Holocene sediments show tilting of 10–20° which is more pronounced in the vicinity of the NSF suggesting that the incision and uplift of the valley-fill terraces well above the present day tidal limits is related to the continued differential uplift along NSF. Evidence of tectonic uplift has been reported from the coast also in the form of raised mudflats occurring 2–4 m above present sea level (Merh, 1993). Currently, the river occupies the northern margin of the Early Holocene channel belt and is clearly more sinuous. It exhibits a narrow channel with wide meanders inside wide belts of Mid–Late Holocene terraces ( NT-3) a typical pattern of under fit streams (Dury, 1970).

### Abstract

**Background:** Purpose of this study was to investigate of effect of visual feedback balance training on postural control and risk of fall in stroke patients.

**Methods:** Forty stroke patients were included in this study. Their age ranged from 40-60 years. They were evaluated using the Biodex Balance System pre and post treatment. They were divided into two equal groups (control group and study groups). Subjects in both groups participated in the conventional stroke rehabilitation program, one hour /day/ 5 days/week /3 successive months in addition, subjects in the study group received a 20 min of balance training once daily, five days a week for 3 months using the Biodex Balance System (BBS).

**Results:** Significant improvements in balance training measurements were found in the trained group at 3 months after completing the training program.

**Conclusion:** Patients in the visual feedback balance training group had significant improvements when compared with the control group in terms of improving of postural control and decreasing of risk of fall. The results showed that balance training was beneficial for patients after hemiplegic stroke.

### Introduction:-

Stroke is a form of cardiovascular disease affecting the blood supply to the brain. Also referred to as cerebrovascular disease. In stroke, there has been a disturbance in brain function, often permanent, caused by either a blockage or a rupture in a vessel supplying blood to the brain [1]. Stroke is a common neurological disorder, the second commonest overall cause of death, and a major cause of disability in survivors. [2]. Stroke is the leading cause of serious long-term disability, with over 1 million adults reporting difficulties in function as a result of stroke. In addition to the primary deficits associated with stroke, there is a high rate of secondary complications, including falls [3].

Balance problems in hemiplegic patients after stroke can be caused by different impairments in the physiological systems involved in postural control, including sensory afferents, movement strategies, biomechanical constraints, cognitive processing, and perception of verticality [4].

Clinical and laboratory evaluation in hemiparetic patients can show the asymmetrical distribution of weight in the lower limbs, with deviation of the center of mass to the uninvolved side, difficulty in actively transferring and keeping the center of mass in the hemiparetic side in the lateral and anterior directions and decreased frontal plane stability, impaired muscle selection with consequent increase in body oscillations during standing. Hemiparetic stroke patients may present difficulties in weight transfer from the affected to the unaffected side [4]. Postural sway for patients with hemiplegia can be twice that of their age-matched peers. hemiplegia can cause a reduction in patients' limits of stability, which is defined as the maximal distance that an individual can shift his or her weight in any direction without loss of balance [5].

To maintain balance in activities of daily living (ADL), posture control is essential, while motor, sensory and higher brain cognitive faculties all contribute to postural control [6-8]. Following a stroke, patients lose functions of the motor, sensory and higher brain cognitive faculties to various degrees which lead to diminished balance. [9-10]. The Biodex balance system (BBS) is an important valid and reliable balance assessment and therapeutic tool. It can be used for evaluating and training of patients with balance deficits as it includes many training and testing programs simultaneously. These assessment programs include Dynamic limits of stability (DLS), fall risk tests and others [11].

The Biodex Balance System has been used to evaluate postural balance in recent years. The BBS is a multi-axial device that objectively measures and records an individual's ability to stabilize the involved joint under dynamic stress. It uses a circular platform that is free to move in the anterior-posterior and medial-lateral axes simultaneously [12]. BBS allows up to 20° of foot platform tilt, which permits the ankle joint mechanoreceptors to be stimulated maximally. The BBS measures, in degrees, the tilt about each axis during dynamic conditions and calculates a medial-lateral stability index (MLSI), anterior-posterior stability index (APSI), and an overall stability index (OSI). These indexes represent fluctuations around a zero point established prior to testing when the platform is stable [13]. As far as we know, only a few studies have mentioned about the effects of visual feedback balance training for stroke patients using the Biodex balance system. Therefore, in this study, we evaluated the effects of this training program on postural control and risk of fall in stroke patients.

## Methods:-

### 2.1. Subjects:-

Forty stroke patients included in the study. Their age ranged from 40-60 years old. They were selected from al-Noor specialized hospital in Makkah. **Inclusive criteria:** Patients were required to meet the following criteria for inclusion in the study: (1) approximately 3 months or more after initial onset of an ischemic cerebrovascular accident (thrombotic and embolic stroke), (2) ability to understand and follow simple verbal instructions, (3) ambulatory before the stroke, (4) ability to stand with or without assistance and to take at least one or more steps with or without assistance, (5) no medical contraindication to walking. **Exclusive criteria:** Patients were excluded if they had a history of any other neurological pathology, conditions affecting balance, dementia, impaired vision or conscious levels or concomitant medical illness or musculoskeletal conditions affecting the lower limbs. All recruited patients were randomly assigned into two equal groups; control group and trained group. They were evaluated and treated in the laboratory of Physical Therapy Department, Faculty of Applied Medical Sciences, Umm Al-Qura University.

### 2.2. Intervention:-

#### 2.2.1. Measurement:-

Biodex Balance System SD: (BBS; Biodex Inc., Shirley, NY) was used as a valid and reliable equipment for performing Dynamic limits of stability and fall risk test. It consists of support handle, platform, display and printer. It has a static mode and 12 levels of dynamic platform tilt (static, 12 is more stable, 1 is less stable) as shown in **figure (1)**. This balance system was used for assessment of the changes in reactive postural balance control for the participated patients from standing position pre and immediately post training.

All participating were given several explanatory sessions before the evaluation process. During the evaluation, each patient was asked to stand bare feet in the center of platform while both arms at the side of the body and to look

straight and focus on visually feedback screen. They were tested on static level. Three trials were performed and the average of them was calculated.

The Support handles were adjusted and the evaluator stood close beside the patient to provide assistance in case of balance losses shown in **figure (2)**.

For postural stability testing, the overall stability index (OASI), mediolateral stability index (MLSI) and anteroposterior stability index (APSI) were obtained for the 40 patients by doing a test at static level for 20 seconds, with eyes open. The patients were asked for keeping the centre of pressure in the centre of a target displayed on the monitor. Patients not allowed to support themselves with their hands. Before the test, the patients did one training test. It was performed as a single test to reduce the potential effects of learning and fatigue as shown in **figure (3:A&B)**.

Test results were automatically compared to age dependent normative values stored in the higher risk of falling which is an indicator of poor balance. Lowering of this score post-training to be nearby normative values is a strong evidence for reactive balance control improvement.

### 2.2.2. Treatment:-

Subjects in both the experimental (A) (n=20) and the control group (B) (n=20) participated in our conventional stroke rehabilitation program, 5 days a week, one hour /day, for three successive months. The conventional program consisted of neurodevelopmental facilitation techniques, positioning, range of motion and progressive resistive exercises, together with training in endurance, walking and activities of daily living. Postural control exercises included maintenance of standing and shift of the weight loaded to the paretic side. Therapists combined elements of Brunnstrom's movement therapy, Bobath neurodevelopment treatment and proprioceptive neuromuscular facilitation techniques according to the patients' needs and performance. This personalized rehabilitative care was designed to help the patient to perform the daily activities of living independently in order to achieve the best possible quality of life. In addition to conventional program, the experimental group received 20 min. of balance training once daily, five days a week for three months using the Biodex Balance System (BBS). Subjects encouraged to maintain their posture steadily and symmetric weight bearing while adapting to different static sensory conditions through verbal or tactile cues. For dynamic function training, the patients were instructed to practice controlling their weight shifts by tracing the moving targets on the screen in every main direction [14].

The postural balance control training routine for group (A) was conducted in the form of postural stability training in every session through the usage of the Biodex balance system. The training program required the patient to perform training while standing bare feet in the same body position used during testing and followed the same instructions on the evaluation process for postural stability during every training session as shown in **figure (4B)**.

Weight shift training session consisted of three trials with five minutes rest between them. In each trial, the patient would complete the task requirements. Then each patient received 10 min rest before the application of the traditional training program for one hour as shown in **figure (4A)**.

### 2.3. Data analysis and statistics:-

Data were pooled across subjects according to group (control group and trained group). Differences in the continuous data (age, body weight, and body height) between groups were compared using an Independent sample *t*-test. Comparison between pre- and immediately post-treatment in each group was performed using paired *t*-test. While the comparison between both groups pre and immediately post treatment was carried out by using an unpaired *t*-test. SPSS computer program version 16.00 (SPSS Inc., Chicago, IL) was used for data analysis. *p* Value less to 0.05 was considered significant.

### Results:-

Forty stroke patients randomly distributed into two equal groups were participating in this study. The demographic characteristics of the included patients were illustrated in Table 1. The mean age of study group was  $(52.9 \pm 6.08)$  while the mean age of control group was  $(51.25 \pm 6.71)$ , the mean of weight as well as the mean of height for study group were  $(74.9 \pm 7.75 \text{ kg})$  and  $(175 \pm 6.43 \text{ cm})$  respectively while the mean of weight as well as the mean of height for control group were  $(73.5 \pm 7.15 \text{ kg})$  and  $(172 \pm 6.0 \text{ cm})$  respectively and a mean time from stroke onset was  $(9.6 \pm 1.9)$  months for study group while it was  $(9.45 \pm 1.73)$  for control group, (see Table 1). And there were no significant difference between two groups regarding to patient's age, weight, height, and time of stroke onset as *p* value  $> (0.05)$ .

**Table 1.**Demographic and clinical characteristics of patients.

Variables	Study Group A (n20)	Control Group B (n20)	P value
Age (yearsSD)	52.9± 6.08	51.25± 6.71	0.42
Height (cm)	175±6.43	172±6.0	0.23
Weight (Kg)	74.9±7.75	73.5± 7.15	0.55
Time from stroke onset (month)	9.6±1.9	9.45±1.73	0.79

The results of this study regarding to the mean values of overall stability index of postural stability from pre- to post-treatment showed significant improvement in the ability to control balance and minimizing the risk of fall in study groups( $p<0.05$ ) as illustrated in table 2. Comparing these results between both groups pre-treatment indicated no significant differences. While their comparison post treatment mean improvement scores as elucidated in Tables 2 demonstrated significant differences in favor of the study group (A)( $p<0.05$ ).

More illustration, before treatment evaluation revealed that; the mean Overall stability index was ( $3.82\pm0.68$ ) for study group while it was ( $2.76\pm1.07$ ) for control group and there was no significant different between two group as  $p$  value = (0.1).

Post treatment evaluation revealed that; the mean Overall stability index was ( $2.4\pm0.6$ ) for study group while it was ( $2.52\pm0.80$ ) for control group and there was high significant different between post treatment improvement score means of two group as  $p$  value = (0.003) as illustrated in table 2 and figure 6.

Comparing mean values of OASI within study group revealed that there was high significant differences between before and after treatment mean values as  $p$  value =(0.002), while comparing mean values of OASI within control group revealed that there was no significant differences between before and after treatment mean values as  $p$  value =(0.32)as illustrated in table 2 and figure 5.

Table (2): Comparisons of means values of Overall stability index within each group and improvement Score means values between groups.

	Overall stability index		
	Study Group	Control Group	P value
Pre-treatment mean value	3.82±0.68	2.76±1.07	0.1
Post-treatment mean value	2.42±0.78	2.52±0.80	
P value	0.002	0.32	
Improvement Score mean	1.4±0.42	0.24±0.47	0.003

Figure5: Comparisons of mean values of Overall stability index within each group.

Figure 6: Comparisons of mean values of overall stability and improvement scores between groups.

### Discussion:-

Cerebrovascular disease is an important health problem [15]. After stroke, some patients are unable to stand, and others have higher postural sway, asymmetric weight distribution, impaired weight shifting ability and equilibrium reactions may be delayed or disrupted [16-20]. There is also an increased risk of falling, resulting in high economic costs and social problems [21-23]. Hemiplegia can cause reduction in patient's limits of stability, which are defined as the area where the individual can shift his center of mass without loss of balance and without changing the support base. This describes a theoretical cone extending around a person's feet [24]. Impaired balance greatly influences the activities of daily living (ADL), independence and gait. Therefore, it's essential to rapidly achieve postural control in order to improve independence, social participation and general health. The aim of balance rehabilitation is to ensure safe ambulation [25]. In spite of the multiple therapeutic approaches to promote recovery of postural control, no definitive conclusions can be drawn on which one is the best.

Balance is essential to all functional activities during sitting and standing [26]. Postural control is fundamental to maintain balance. The important resources for postural control are movement strategies, biomechanical constraints, cognitive processing, perception of the verticality (visual and postural), sensory modalities (somatosensory, visual and vestibular) and the sensory reintegration and reweighting in central nervous system (CNS) [27], which can be impaired after a stroke.

Biodex Balance system is designed to provide visual or auditory feedback to patients regarding the focus of their center-of-pressure (COP). In these systems, feedback is defined as augmented extrinsic information about task success provided to the performer. It's thought that, by giving patients additional information, they will become more aware of the body's displacements and orientation in space. It is believed that the relearning of postural control through external biofeedback is an effective therapy for improving balance control [28]. Hocherman et al. concluded that the hemiplegic patient's stability of stance on a moving platform could be improved by regular training [29].

Shumway-Cook et al. showed that postural sway biofeedback was more effective than conventional therapy in retraining postural stability in hemiplegic patients [30]. In a Cochrane's review of seven randomized controlled trials, Barclay-Goddard et al. concluded that force plate form feedback improved stance symmetry after stroke, without repercussion on postural sway or measures related to gait and independency in ADL [31].

Geiger et al. concluded that combining force platform visual feedback training with conventional physical therapy did not enhance the effects of conventional physical therapy on balance and functional mobility skills in stroke patients with hemiplegia [32]. The present study is designed to assess postural stability, risk of fall and the effect of balance training using biodex training system visual biofeedback among patients with postural disturbances following stroke. Following stroke, postural deficits are common [33]. In the hemiparetic gait there is reduced weight-bearing on the paretic limb [34-36] and excessive postural sway [37, 38].

The results of this study show that there is a statistically significant improvement in OASI within study group as well as there is a statistically significant increased OASI improvement scores in study group when compared to those in control group. Postural control is considered to be a prerequisite for restoration of independent living. Sacle et al. studied the effect of the visual feedback after stroke in a randomized controlled trial. They assessed sway and stance symmetry, motor and ADL function at 0, 4 and 12 weeks. They concluded that significant improvements were seen in the treatment group in measures of sway, stance symmetry, motor and ADL function, but differences between groups had disappeared at 3 months [39].

Chen et al. studied the effect of balance training on hemiplegic stroke patients, using 2 groups that received a conventional program. Only the treatment group received visual feedback balance training. They concluded that there were significant improvements of dynamic balance function and ADL function at 6 months of follow-up in the treatment group [40]. Yavuzer et al. studied the effects of balance training on quantitative gait characteristics in a randomized controlled trial. They concluded that balance training using platform biofeedback in addition to a conventional rehabilitation program is beneficial in improving postural control and weightbearing on the paretic side, 6 months after stroke [41]. Like the fore mentioned studies we also found a balance improvement and hence decreased risk of fall in stroke after using biodex balance training system.

### Conclusion:-

Balance training using Biodexbalance Systems may increase stability in hemiplegic patient and decrease risk of falling and this may be confirmed when completing the study by more patients involve.

### Abstract

The study was conducted in Cengkeh Turi Binjai with a soil pH of 4.2. The source of mycorrhizal inoculation using mycofer from The Forest of Inter-University Center of Bogor Agricultural Institute, with mycorrhizal contents (*Gigaspora margarita*, *Glomus manihotis*, *Glomus etunicatum*, and *Acaulospora tuberculata*). Planting was conducted in January-May 2014. The upland rice variety used as the indicator plant was *Situ Bagendit*. This study used a factorial randomized block design (RBD) with two factors. The first factor is a mycorrhizal inoculation consisting of two levels, i.e. without giving mycofer and by giving 5 g of mycofer per planting hole. The second factor was giving oil palm empty fruit bunches (OPEFB) composts in 3 levels: 0, 3,375 g, 6,750 g/plot. The result of the research showed that (i) the dose of OPEFB composting of 3,375 g per planting hole can increase the number of productive tillers and panicles; and (ii) the addition of OPEFB compost (3,375 g/plot) and mycorrhizal inoculation (5 g mycofer/plot) can increase the number of filled grain of upland rice.

### Introduction:-

The utilization of dry land is one of the resources with great potential both for food self-sufficiency stabilization and for future agricultural development. The need for rice has been met by rice paddy fields requiring land characteristics with relatively high fertility rates in their production. The characteristics of cultivation of such rice paddy fields, thus limit the opportunities for increased rice production through the expansion of paddy fields. This is due to the narrowness of reserve lands suitable for rice fields and the increasingly tight competition of water usage by industry, mining, and households (Abdurachman et al., 2008). National rice production has been relying on paddy fields; therefore, the national rice production has not been able to meet the needs for food (rice) sustainably.

Rice production in North Sumatra during the 2003-2013 period increased at an average of 0.92% per year. The average growth in rice paddy field production was 1.12% per year, while upland rice decreased at an average of 2.78% per year (Biro Pusat Statistik, 2015). According to the Central Bureau of Statistics of North Sumatra Province (BPS), the upland rice harvested areas reached 50,792 hectares with total production of 163,143 tons and average productivity of 3.2 tons/hectare. The productivity of upland rice is still relatively low compared to rice paddy field productivity, which has reached 5.1 tons/hectare. The low productivity of upland rice is caused partly by very varied climatic and soil conditions, drought stress, and lack of a dryland rice cultivation technology. Some of

the obstacles leading to the low productivity of upland rice are thought to be caused by the land generally planted belongs to Ultisol soil with various problems, such as low of :soil fertility, organic matter content, and water holding capacity.

Developing upland rice cultivation on dry land is a strategic alternative in order to meet national food needs of its relatively large potential. Nevertheless, upland rice cultivation often encountered drought stress due to its full dependence on rainfall. Drought stress will affect crop growth, development and yield. Drought is one of the main constraints on crop productivity world wide and is expected to increase with climate change (IPCC, 2007 and the European Environmental Agency, 2011).

Such condition certainly requires efforts to improve upland rice production one of which is through improved cultivation system by adding compost from oil palm empty fruit bunches (OPEFB) and mycorrhizal fungi.

Compost from waste of oil palm mills in the form of empty fruit bunches (EFB) is one of potential raw material sources for composting because of its availability in large volumes. As an illustration, each ton of FFB (Fresh Fruit Bunches) processed would generate 20% or 200 kg of empty fruit bunches (Wijaya et al., 2001). OPEFB, which is 23% of the fresh fruit bunches, contains lingo cellulosic materials as much as 55-60% of dry weight (Rahmalia et al., 2006). OPEFB has several advantages such as enriching the nutrients in the soil, and improving physical, chemical and biological characteristics of the soil. In their research, Hanum Ch, et al. (2006) found that OPEFB compost contains such nutrients as N, P, K and Mg.

Loss of soil organic matter has caused agricultural losses of nearly 60 percent in sub-tropical areas and 70 percent in tropical areas. The loss of organic matter in the soil will cause loss of the energy source for soil microbes.

The allocation of soil organic carbon needed to associate with mycorrhizal fungi has been estimated to be around 5-20% of the total soil carbon (Hobbie and Hobbie, 2006).

Some of the research results revealed that there are nearly 80% of symbiotic associations between mycorrhizal fungi and vascular plants widespread in nature, and some ecophysiological studies indicate that symbiotic of mycorrhizal fungi is a key component in helping plants to overcome and improve resistance to abiotic stress (Auge, 2001; Ruiz-Lozano, 2003; Barea et al., 2011; Ruiz-Sanchez et al., 2010). Association of mycorrhiza in plants is one of the ways to overcome the growth inhibition due to drought stress. Mycorrhiza is symbiotic associations established between soil fungi and most vascular plants. The working principle of mycorrhiza is infecting root system of the host plant, producing intensively interwoven hyphae so that the plant containing such mycorrhiza will be able to increase its capacity in the absorption of nutrients and water.

Inoculation of plant roots with mycorrhizal fungi has been thought to be effective in increasing crop production in drought conditions. Root colonization by mycorrhizal fungi has been proven to increase crop productivity in drought stress (Al-Karaki and Clark, 1998). Increased productivity of plants inoculated by mycorrhiza is caused by nutrient absorption enhancements such as phosphorus, zinc and copper. In addition, other factors associated with mycorrhizal colonization can influence plant resistance to drought, including changes in leaf elasticity, improved leaf water and turgor potential, maintenance of stomatal opening and transpiration (Auge et al., 1987), increased root length and depth, and external hyphae development (Davies et al., 1992).

Mycorrhizal fungi can form a strong plant root structure, quick transplant establishment, healthy roots and quick closing of the plant canopy's green leaves. The root of seed plants that has been inoculated with vesicular arbuscular mycorrhizal is able to survive in marginal environmental conditions. Mycorrhizae can help the plant and protect the plant roots from extreme environmental disturbance so that it has the ability to survive.

The objective of these research was to study growth response and yield of upland rice by providing OPEFB compost and mycorrhizal inoculation.

### **Materials and Methods:-**

The study was conducted in Cengkeh Turi Binjai with soil pH of 4.9. The planting period was from January to May 2014, with the average rainfall within the five months was less than 100 mm (according to The Regional Agency for Meteorology, Climatological and Geophysics (RAMCG), Medan). The source of mycorrhizal inoculation used

mycofer from the Forest of Inter-University Center of Bogor Agricultural Institute with mycorrhizal contents (*Gigaspora margarita*, *Glomus manihotis*, *Glomus etunicatum*, and *Acaulospora tuberculata*). This study used a factorial randomized block design (RBD) with two factors. The first factor was mycorrhizal inoculation (M) consisting of two levels, without giving mycofer and by giving 5g of mycofer per planting hole. The second factor was giving OPEFB composts in 3 levels: 0, 3.375, 6.750g/planting hole. The examination on the percentage of endomycorrhizal infection was used a staining method.

The percentage of root infected by arbuscular mycorrhizal fungi (AMF) was calculated using the formula:

$$\% \text{ of infected roots} = \frac{\text{The number of infected roots}}{\text{The total number of observed roots}} \times 100\%$$

### Result and Discussion:-

Before been applied to the planting media, the analysis of chemical fertility of OPEFB compost as presented in Table 1 and chemical fertility of basic soil as presented in Table 2 had been carried out.

Based on the OPEFB fertility analysis, it was found that the nutrient content of organic materials generally have low criteria. The OPEFB compost was classified as alkaline, with moderate organic matter, content, different from the soil at the research location that had a low pH value (4.2) (See Table 2).

### Productive tiller per hill:-

The results of statistical analysis indicated that the treatment of OPEFB composts, significantly affected the number of productive tillers, whereas the provision of mycorrhizal fungi and the interaction between the two treatments do not affect significantly.

The increased OPEFB composting will increase the number of rice tillers (Table 1). There is a variety of assumptions concerning the high number of productive tillers in rice composted by OPEFB, i.e. an increase in pH and organic matter provision can increase the ability of soil to absorb water. The OPEFB composting analysis results (Table 1) indicate high organic matter content in the OPEFB. The higher of biomass and high seed production in wheat given mycorrhizal fungi than those which is not given is caused by the ability of plants to extract water from the soil solution (Al-Karaki et al., 2004).

The addition of OPEFB compost with this alkaline pH (pH: 8.63) will affect the balance of cations and anions in the soil. (Mc Cauley et al., 2009).

Soil organic matter contributes to biological, chemical, and physical properties of soil. The addition of organic matter to the soil will affect the amount and the rate of organic matter decomposition and nutrient mineralization. Organic matter helps the availability of nutrients by increasing the cation exchange capacity of the soil, providing chelates, and increasing the solubility of certain nutrients in the soil solution. Furthermore, the humus fraction of organic matter can improve soil structure by increasing soil, water storage capacity, infiltration and aeration. Plants need to maintain high internal water pressure or "turgor" to increase the formation of cellulose fiber cells. When the water supply to the plant is relatively low, one of the main consequences is the inhibition of the growth of shoots and leaves (Eastin and Sullivan, 1984).

This is assumed to be the factor leading to increase in the number of upland rice tillers added by OPEFB compost. The addition of organic matter can contribute to soil complex and a reduction of toxicity such as aluminum (Al) on acid soils (Tan and Binger, 1986), in addition to its ability to capture pollutants - herbicides or pesticides.

Mycorrhizal inoculation on upland rice has not been able to show an increase in the number of tillers. The results of observation on the mycorrhizal infection show that the highest average (70%) was obtained in the planting medium inoculated with mycorrhizal and without composting (Table 4).

The results of this study indicate that the better soil conditions the ones with the organic matter addition will cause a decrease in the degree of mycorrhizal infection. It is assumed that such condition is caused by mycorrhizal potential to be maximized on marginal soil conditions. Allen (2001) also found a decrease in the percentage of the degree of infection in adequate water soil.

Carrenho R et al.(2007) state that there is a close relationship between the percentage of the degree of infection and soil amendments (fertilization, organic matter and pH) in which changes in the soil will affect the inoculation effectiveness produced. The decreased degree of mycorrhizal infection at the chickpea roots by the addition of P on acid soils is also found by Alloush et al. (2000). Nevertheless, several research as related to the effect of organic matter adding to the percentage of infection degree are very varied such as the research done by Joner and Jakobsen (1995) who found an increased growth in the number of hypha with the addition of organic matter.

I Putu and Sukawidana's (2011) research shows that the increased use of organic matter that reached mycorrhizal dose of 30g/plant and organic fertilizer of 30 g/plant was able to increase the percentage of mycorrhizal infection on cashew. Increased provision of organic matter will stabilize pH: 7.6. Russell (1973) adds that a neutral soil pH, high organic matter content and low availability of nutrients (nitrogen and phosphor) can encourage the growth of mycorrhizae.

**Figure 1:-** The average rainfall during the planting period (January to December 2014)**Number of panicles per plant:-**

The addition of OPEFB compost increases the number of panicles per plant, with the highest average dose of 3,375g/plant hole (Table 5). The OPEFB addition that reached 6,750 g/plot would decrease the number of panicles per plant.

The low number of panicles per plant on the rice given high dose of OPEFB (K3) is assumed to have been caused by the uneven distribution of assimilates. The soils with a high water content as a result of the addition of high doses of organic matter will stimulate the number of tiller formations. Assimilates are more directed to the vegetative growth rather than generative one. Although the number of potential tillers contributes to the results of rice yields (Wu et al., 1998), the great number of tillers indicates inconsistency in the mobilization of assimilates and nutrients among tillers. As a result, there will be a variation of the distribution of assimilates between tillers and panicles formation (Miller et al., 1991).

**Number of filling grain:-**

The results of statistical analysis show that there is a significant interaction between OPEFB compost treatment and mycorrhizal inoculation to the number of filling grain per plant (Table 6). The highest average number of filling grain per plant is obtained in the treatment of interaction between K1 and M1 (OPEFB compost of 3,375g/planting hole and inoculated mycorrhizae), while the lowest average is obtained in the plants without being given compost and mycorrhiza. The results of this research indicate the ability of mycorrhizal inoculation to give P in the plants for energy fulfillment in seed formation.

**The number of empty grain per plant:-**

For the parameter number of empty grain per plant, there is a significant interaction between OPEFB compost treatment and mycorrhizal treatment. The highest number of filling grain parameter is obtained in K1M1, while the highest number of empty grain is obtained in K2M1.

The results of the research presented in Table 7 show that the increase in the addition of compost to the mycorrhizal-inoculated soil will increase the amount of grain hollow. The increased number of empty grain in the increased

doses of OPEFB compost and mycorrhizal inoculation is assumed to be caused by friable soil and soil with sufficient water that will lead to an increased number of tillers. The increased number of these tillers will lead to the distribution of assimilates to tillers growth resulting in a lack of assimilates in grain filling.

The research conducted by Wangiyana et al. (2009) shows that the great number of tillers results in the great number of empty grains because the grains are not filled through the process of photosynthesis and the high rate of photosynthetic partition during the grain filling phase. According to Soemartono et al. (1984), the number of productive tillers is determined by the number of tillers growing before reaching the primordial phase. However, there may be a chance that the tillers forming the last panicles may not produce a panicle with fully filled grains, so there is a chance of producing grain hollow. Feng et al. (2007) also found the different number of grains within the tillers. The results of their study concluded that the first tiller is more potential to produce seeds rather than the last tiller. This condition is assumed to be the factor causing an increase in the number of tillers, resulting in an increased number of empty grain.

### **Production per plant:-**

From the results of the statistical analysis, it is found that the addition of OPEFB compost treatment gives significant effect to the crop production, while giving mycorrhiza and interaction between the two treatments does not.

OPEFB composting equivalent to 6,750g/plot produces the highest yield per plant. Such increased production per plant is assumed to be caused by fairly high potassium content in the planting media. Potassium is the macro nutrients that play a role in the metabolism of carbohydrates.

Although OPEFB compost treatment and mycorrhizal inoculation treatment statistically does not give significant effect, but there is an increase in the average weight of 1000 grains (Table 9).

The average weight of 1000 grains of *Situ Bagendit* variety treated by OPEFB compost and mycorrhizal is only about 11-14 g (Table 9). If this weight is compared to the value on the description (27-28 g), the result obtained will be half of its potential. This result indicates a decrease in grain weight of rice seeds during the dry season. Rainfall data at the research location obtained from RAMCG of Sampali, Medan, the planting was done in the dry season with rainfall of less than 100 mm (Figure 1).

Water deficit in rice planting response more seriously to generative phase rather than to vegetative phase (Kato et al., 2007). Therefore, upland rice cultivation should consider minimum water requirement to avoid a decrease in the yield (Matsumoto et al., 2014), whose amount depends on its varieties. Water plays an important role in rice cultivation; therefore, a sufficient amount of water supply is one of important factors in the production of rice. Rice crops will usually encounter stress if there is too little water (drought) or too much water (flooding). Limited availability of water causes discrepancy and variability of yield (Papademetriou, 2001).

Akinbile (2010) also found a significant difference between the observed variables in biomass and grain yield, LAI, plant height and maximum root depth among treatments with or without water supply. This result of research indicates that water is the main factor affecting grain yield.

### **Conclusions:-**

The dose of OPEFB composting of 3,375 g per planting hole can increase the number of productive tillers and panicles. The addition of OPEFB (3,375 g/planting hole) and mycorrhizal inoculation (5 g mycofer/planting hole) can increase the number of filling grains of upland rice. The provision of mycorrhiza in the soil by adding organic matter causes the ineffectiveness of this microbial function.

#### Abstract

The current study was focused to investigate the phytochemical analysis, antibacterial and antifungal activity of plant extract of *Euphorbia nallamalayana* against different pathogens. Four solvent extracts were evaluated for antimicrobial activity using well diffusion method and MIC determination on different micro organisms. The shade dried plant material was subjected to different solvents for phytochemical screening. The antibacterial activity was done using well diffusion method against eight potentially pathogenic microorganisms *Aspergillus niger*, *Aspergillus flavus*, *Candida albicans*, *Saccharomyces cerevisiae*, *Escherichia coli*, *Staphylococcus aureus*, *Bacillus subtilis* and *Pseudomonas aeruginosa*. Phytochemical screening was done using standard qualitative methods which revealed the presence of Tannins, Saponins, Steroids, coumarins, Flavones, Flavanones, Phenols, Quinones and Carbohydrates. There was no antifungal activity with *Aspergillus flavus*, *Candida albicans* and *Saccharomyces cerevisiae*. The findings of this study indicate that the plant extract of *Euphorbia nallamalayana* showed significant antibacterial activity against both gram positive and gram negative organisms. We also found the antifungal activity against *Aspergillus niger*. However, further studies on isolation characterization of plant extract responsible for antibacterial activity is necessary to elucidate their mechanism of action and it would give comprehensive evidence of bioactive potential of medicinal plants at cellular and molecular levels. *Euphorbia nallamalayana* has a strong antimicrobial potential, which justifies its use in folk medicine for treatment of infectious diseases. Since this species is poorly investigated, further refined studies on its pure secondary metabolites are needed and very important, in the perspective to identify new antimicrobial molecules from this endemic plant.

**Introduction:-**

Medicinal plants are important source of therapeutic remedies of various ailments. Scientific experiments on the antimicrobial properties of plant components were documented in the late 19<sup>th</sup> century [1]. The use of plants and plant product as medicines could be traced as far back as the beginning of human civilization. The earliest mention of medicinal use of plants in Hindu culture is found in 'Rigveda', which is said to have been written between 4500-1600 BC. and is supposed to be the oldest repository of human knowledge. It is Ayurveda, the foundation of medicinal science of Hindu culture, in its eight division deals with specific properties of drugs and various aspects of science of life and the art of healing [2]. Plant derivatives, such as infusions and decoctions, have since long been used in traditional medicine for prevention and treatment of several pathologies [3,4]. Including common infectious diseases, leading causes of morbidity and mortality [5], which are directly responsible for 26% of annual deaths worldwide [6], were also treated by those plants preparations since ancient times [7]. In modern medicine, the discovery of bioactive molecules from microbial origin and synthetic antimicrobial agents decreased the use of traditional plant preparations, especially in developed countries. But in last decade, and besides their toxicities and side-effects [8], it has become clear that current antimicrobial drugs are losing their effectiveness [9], due to the emergence of resistance in pathogens to those antibiotics, which causes therapeutic failures and death of individuals [10]. Therefore, there is a continuing need to search for new antibiotics [5,9]. Since plant-derived antibacterial are always a source of novel therapeutics [11], many researchers in field of ethno-pharmacology have concentrated in studies of those compounds in the past few decades [7] on a promising and wealthy source for safe and effective new antimicrobial agents. Natural antimicrobials have been often derived from plants, microorganisms or animal tissues [12]. India is known for its rich diversity of medicinal world [13]. Nearly 70% of world population is dependent on the traditional medicines for primary health care. The knowledge of medicinal plants has been accumulated during the course of many centuries based on different medicinal system such as Unani and Siddha [14]. Phytochemical from medicinal plants showing antimicrobial properties have the potential of filling this need, because their structure are different from those of more studied microbial sources, and therefore their mode of action may too very likely differ [15]. There is a growing interest in correlating the phytochemical constituents of a medicinal plant with its pharmacological activity [16]. An antimicrobial is a substance that kill microbes or prevent the growth of the plants with a new eye for their antimicrobial usefulness and as an alternative source to the existing drug. Plants with their wide variety of chemical constituents offer a promising source of new antimicrobial agents as well as specific activity [17]. Phyto-chemical from medicinal plants sharing antimicrobial properties have the potential of filling this need, because their structure are different from those of more studied microbial sources, and therefore their mode of action may to vary likely differ [18]. *Euphorbia linearifolia* var. *nallamalayana* J.L.Ellis a synonym of *Euphorbia deccanensis* var. *nallamalayana* (J.L.Ellis) [19] belongs to the genus Euphorbiaceae family. In medicine, some species of Euphorbiaceae have proved effective against genital herpes [20,21].

There are several reports on the presence of antimicrobial compounds of various plants [22-26] but there are no reports on antimicrobial potential of *Euphorbia nallamalyana* which belongs to the family of Euphorbiaceae.

**Materials and methods:-**

The plant parts of *Euphorbia nallamalayana* were collected in and around Nallamala forest (Eastern Ghats) Pavuralagutta nearest to Nallakaluva village, Atmakur mandal of Kurnool district in Andhra Pradesh. The specimen was identified with the help of the regional floras [25-28] and the voucher specimen was deposited at Botanical Survey of India, Hyderabad.

**Preparation of Plant Extract :-**

The leaves and whole plant of *Euphorbia nallamalayana* were collected, shade dried, powdered and extracted with hexane, chloroform, methanol using soxhlet apparatus for 6hrs. The extracts were filtered and the filtrate was concentrated under reduced pressure at 40°C using a rotaflash evaporator. The crude samples were subjected to antimicrobial screening against pathogenic organisms.

**Preparation of Standard culture inoculums of the test organism:-**

All the cultures were obtained from the Department of Microbiology, Andhra University, Visakhapatnam, A.P, India. From mother culture the inoculums was streaked and subcultured. Three or four isolated colonies were inoculated in 2ml nutrient broth and incubated for 24hrs. The 24hrs cultured broth was used to check the antimicrobial activity.

**Antibacterial Assay:-**

Antibacterial activity of extracts was determined by cup diffusion method on nutrient agar medium. Nutrient agar medium was prepared, sterilized and 0.2 ml of 24 hrs broth culture was mixed in the nutrient agar medium and poured in Petriplates. After solidifying wells are made in nutrient agar plates using cork borer [29].

Different concentrations of the working suspension of plant extracts and the same volume of the solvent for control were filled in the wells with micropipette. Plates were kept for some time until the extracts diffuse and incubated at 37°C for 24hrs. After the incubation was completed, the plates were observed for zone of inhibition. The Minimum Inhibitory Concentration (MIC) was determined by the broth micro dilutions [30-31] using 96 well micro titer plates.

#### **Antifungal assay:-**

The antifungal properties with organic solvent (methanol, hexane and chloroform) extracts from the whole plants were investigated against pathogen. Potato dextrose agar medium was prepared allowed to cool and streptomycin sulphate was added to prevent bacterial contamination, and then was allowed to solidify. The fungal isolate was kept in the middle on the surface of the medium and the plant extracts were placed using disc diffusion method. All the plates were incubated at 27°C for 48hrs. The zone of inhibition was measured along the control plates maintained by using available standard antifungal agents.

#### **Determination of Minimum Inhibitory Concentration (MIC) and Minimum Bactericidal Concentration (MBC):-**

Determination of the minimum inhibitory concentration (MIC) was carried out using the Broth dilution method [32]. Briefly, 1.0 ml of the reconstituted *Euphorbia nallamalayana* extract solution at a concentration of 200 mg/ml was added to another test tube containing 1 ml of sterile broth so as to obtain a concentration of 100 mg/ml. 1 ml of this dilution was transferred to another test tube till the 7<sup>th</sup> test tube was reached. The 8<sup>th</sup> test tube did not contain any extract, but a solution of pure solvent and served as negative control. Then 1 ml of an 18 h old culture of each of the bacteria earlier adjusted at 10<sup>8</sup> cfu/ml was put into each tube and thoroughly mixed on a vortex mixer. The tubes were incubated aerobically at 37 °C for 18-24hrs. Two control tubes were maintained for each test batch. This is as follows: tube containing extracts and the growth medium without inoculums (antibiotic control) and the tube containing the growth medium, physiological saline and the inoculums (organism control). MIC was determined as the lowest concentration of the extracts permitting no visible growth (no turbidity) when compared with the control tubes. The MBC was determined by sub-culturing the test dilution on fresh solid medium and further incubated 37 °C at for 18-24hrs. The MBC values were determined by removing 0.10 ml of bacterial suspension from the MIC tubes that did not show any growth and subcultured into Muller Hinton agar plates and incubated at 37°C for 24 h. After incubation, the concentration at which no visible growth was seen was recorded as the MBC. The lowest concentration of MIC tubes with no visible bacterial growth on solid medium was regarded as MBC.

#### **Identification Tests for Photochemical Constituents:-**

The tests were performed to find out the presence of active chemical constituents such as alkaloids, terpenes, flavones, flavonoids, steroids, reducing sugars, proteins, amino acids, carbohydrates, tannins, anthraquinones, glycosides, cardiac glycosides by the following procedure. Phytochemical analysis was carried out for all the extracts using standard methods [33-34].

#### **Alkaloids:-**

Extracts were dissolved individually in diluted hydrochloric acid. The resulting acidic solution was tested for alkaloids by adding Mayer's reagent, Wagner's reagent, Dragendroff reagent and Hager's reagent.

The formation of a faint turbidity or precipitation on the addition of the above reagents indicates the presence of alkaloids.

#### **Flavanoids:-**

2-3ml of plant extract was dissolved in 50% of methanol separately on sand bath with a piece of magnesium ribbon and 1ml of concentrated Hcl was added. Red or yellow coloration of the solution indicates the presence of flavanoids.

#### **Steroids:-**

1ml of extract dissolved in 1ml of acetic anhydride, 1ml of chloroform and 1ml of conc. Hcl separately. Formation of green color indicates the presence of steroids.

**Triterpenoids:-**

To 1 ml of extract tin bit and thionyl chloride were added. Appearance pink color indicates the presence terpenoids.

**Coumarins:-**

To 1ml of plant extract, 1ml of 10%NaOH was added. The presence of yellow color indicates the presence of coumarins.

**Cardiac glycosides:-**

To the plant extract few ml of glacial acetic acid, ferric chloride and conc.H<sub>2</sub>SO<sub>4</sub> were added. Green color indicates the presence of cardiac glycosides.

**Terpenes:-**

To the plant extract few ml of chloroform was added, filtered. To the filtrate few drops of acetic anhydride and H<sub>2</sub>SO<sub>4</sub> were added. The color changing from blue to green indicates the presence of terpenes.

**Anthraquinones:-**

Benzene extract was taken to this 5ml of 10% ammonia was added .Pink, red or violet color indicates the presence of anthraquinones.

**Phlobtannins:-**

Plant extract was dissolved in distilled water. The filtrate was boiled with 2% HCl. Red precipitate indicates the presence of phlobtannins.

**Quinones:-**

To 1ml of extract 1ml of conc.H<sub>2</sub>SO<sub>4</sub> were added, formation of red color indicates the presence of quinones.

**Flavanones:-**

To few ml plant extract, 10% of few drops of NaOH was added yellow color indicates the presence of flavanones.

**Anthocyanins:-**

To the plant extract 10% NaOH was added, blue color indicates the presence of anthocyanins.

**Proteins:-****Biuret test:-**

To few ml of plant extract, 1ml of 40% NaOH solution and 2ml of 1%CuSO<sub>4</sub> were added. Violet color indicates the presence of proteins.

**Xanthoproteic test:-**

To few ml extract 1ml of conc.HNO<sub>3</sub> was added. White precipitate was observed boiled and cooled. Then 20% of NaOH or NH<sub>3</sub> was added. Presence of orange color indicates the presence of aromatic amino acid.

**Tannic acid:-**

To few ml of plant extract 10% of tannic acid was added. White precipitate indicates the presence of proteins.

**Carbohydrates:-****Molisch's test:-**

To few ml of plant extract 1ml of alpha-naphthol solution and conc.H<sub>2</sub>SO<sub>4</sub> was added along the walls of the test tube. Purple to reddish violet color at the junction of the two layers indicates the presence of carbohydrates.

**Fehling's test:-**

Equal volumes of fehling's - A & B were added. On heating the formation of brick red precipitate indicates the presence of carbohydrates.

**Benedict's test:-**

To 5 ml of Benedict's Reagent few ml of plant extract was added and boiled for 2min,cooled. The formation of red precipitate indicates the presence of carbohydrates.

**Aminoacids :-**

2 drops of Ninhydrin Reagent was added to the plant extract. Purple color indicates the presence of aminoacids.

**Glycosides :-**

The extract was mixed with a little amount of Anthrone on watchglass and 1 drop of conc.H<sub>2</sub>SO<sub>4</sub> was added and made to fine paste and boiled gently on waterbath. Presence of glycosides shows dark green coloration.

**Results:-**

Phytochemical screening of whole plant and leaves extract of *Euphorbia nallamalayana* showed the presence of various bioactive compounds like alkaloids, tannins, saponins, steroids, terpenes, triterpenoids, phenols and carbohydrates.

The results of the present antimicrobial assay of different solvent extracts like methanol extract, chloroform extract and hexane indicated that the plant exhibited antimicrobial activity against different test microorganisms at four different concentrations of 50,100,250,500ug/ml.

The activity of the plant extract was obtained against all the five microorganisms were tested and the zone of inhibition was recorded and presented below in the tabulation drawn.

**Discussion:-**

In the present investigation, the active phyto components of *Euphorbia nallamalayana* was studied and further the antimicrobial activity of the plant extract was also tested against eight potentially pathogenic microorganisms *Aspergillus niger*, *Aspergillus flavus*, *Candida albicans*, *Saccharomyces cerevisiae*, *Escherichia coli*, *Staphylococcus aureus*, *Bacillus subtilis* and *Pseudomonas aeruginosa* at different concentrations of the extract to understand the most effective activity.

Among the four solvent extracts methanol extract was more effective on test pathogens when compared to that of hexane, chloroform and Aqueous. Methanol extract showed significant inhibition zone ranging from 6-20mm against all the microorganisms. In the present study *Escherichia coli*, *Bacillus subtilis* were proved to be more susceptible at different concentrations of the plant extract. Among the fungal strains *Aspergillus niger* was susceptible to methanol extract and showed zone of inhibition ranging from 6-12mm at different concentrations. The

MBC was observed to be more when compared with that of MIC in *Staphylococcus aureus*, *Bacillus subtilis* and *Escherchia coli* in methanol extract.

In the present study, antibiotic potential of leaf extracts of *Euphorbia nallamalayana* plants has been determined against eight pathogens named *Aspergillus niger*, *Aspergillus flavus*, *Candida albicans*, *Saccharomyces cerevisiae*, *Escherchia coli*, *Staphylococcus aureus*, *Bacillus subtilis* and *Pseudomonas aeruginosa*. For the comparison positive and negative controls were used. Negative controls did not show inhibitory action on any of the test organisms, while positive controls significantly inhibited growth of all eight test organisms. The findings match with that of other findings [35-36]. It is often reported that Gram positive bacteria are more sensitive than Gram negative bacteria to plant based organic extracts [37-39]. But in our study, both gram positive and gram negative bacteria were found to be sensitive to plant extracts. In present study, *Staphylococcus aureus* was found to be most sensitive while *Aspergillus flavus*, *Candida albicans* and *Saccharomyces cerevisiae* were found to be least sensitive to plant organic extract than other organisms. The findings agree with that of other similar findings [40]. The antibacterial properties of medicinal plants may be due to presence of different chemical agents which were classified as bioactive antimicrobial compounds [41]. Phytochemical constituents such as alkaloids, glycosides, flavonoids, tannins, steroids, terpenoids and several other compounds are secondary metabolites of plants that serve as a defense mechanism against many microorganisms, insects and other herbivores. The present study also revealed the presence of medicinally active compounds like alkaloids, glycosides, flavonoids, steroid, terpenoid and tannins in most of the selected plants which could be responsible for the observed antibacterial property.

### Conclusion:-

The plant extract of *Euphorbia nallamalayana* showed significant antibacterial activity against both gram positive and gram negative organisms. However further studies on isolation characterization of chemical constituents of the plant extract responsible for antibacterial activity is necessary to elucidate their mechanism of action and it would give comprehensive evidence of bioactive potential of medicinal plants at cellular and molecular levels.

### Acknowledgements:

The authors acknowledge their profound gratitude to UGC-BSR-SAP for financial assistance to carry out the study. The authors wish to acknowledge Dr. A.Veerabhadra Rao, Centre for Cellular and Molecular Biology, Hyderabad for providing facilities for research work. We are highly indebted to Dr. B. Suresh and Dr. Zehera, Indian Institute of Chemical Technology, for their valuable suggestions.

#### Abstract

Over the past 30 years, the number of dental implant procedures has been increasing worldwide, reaching about one million dental implants per year. In Brazil, in the last decades, there has been a very rapid evolution in implant dentistry with high success rates. The development of biomaterials for use in dental clinics in recent years has represented a powerful therapeutic tool in the correction of bone defects. This study aims to analyze and discuss the main types of biological membranes, positives, negatives, their indications and results. For the development of the present revision work, we used a database such as Medline, Embase, Pubmed, Ovid and Cochrane. The main descriptors (MeshTerms) used were "Implantology", "Regenerative Surgery", "Biomembranes", "Bioengineering Bone". Based on the literary findings, both non-absorbable and absorbable membranes are effective in the process of bone regeneration. Absorbents do not require a second surgical time. However, there are information gaps, and further research is needed to ensure the perfect knowledge of the properties of the physical barriers to achieve a perfect bone regeneration of the periodontal bone defects and around implants. Due to bone regeneration and biological barriers in the Grafting surgeries, there was a technological growth of these materials because they pointed out as potential tools for the treatment of bone loss.

#### Introduction:-

In the last 30 years, the number of dental implant procedures has been increasing worldwide, reaching about one million dental implants per year [1,2]. In Brazil, in the last decades, there has been a very rapid evolution in the Implantodontia with high success rates [3]. The development of biomaterials for use in dental clinics in recent years has represented a powerful therapeutic tool in the correction of bone defects [3]. However, in spite of proven benefits, its use requires the professional to take clinical and ethical care in the analysis of the risks and benefits that each biomaterial can present.

**Corresponding Author:- Prof. Dr. Idiberto José Zotarelli Filho.**

Address:-Post graduate and continuing education (Unipos), Street Ipiranga, 3460, São José do Rio Preto SP, Brazil 15020-040.

A study of 123 dental surgeons using biomaterials showed that professionals are not aware of the risks and benefits of biomaterials, nor of their biological principles, since 45% believe there is no risk to the patient and 56% do not consider Biomaterial as medicine. About 70% felt secure with respect to the origin [3]. Despite this, 96% of respondents said that there should be greater control of health authorities. More than half of the interviewees (51%) reported little or no patient participation in the process of therapeutic choice [3].

Many patients, elderly or not, sought implant-supported rehabilitation, but there is a need for some adjustments that lead to the consequent demand for regenerative procedures for maxillary reconstructions [5]. These patients can often present pathological changes, or make use of medications, which may alter bone healing [5]. Several materials can be used as a bone graft, each with different properties; For example: for neovascularization, materials such as hydroxyapatite and calcium phosphate showed the highest expression rates of vascular growth factors (VEGF) and microvascular density; While the polymer grafts showed the lowest rates [8].

The search for a solution for large bone defects has begun studies based on guided tissue regeneration therapy or guided bone regeneration. These studies promote the use of fillers and epithelial barriers that aid in treatment as an adjunct to bone grafting techniques. Thus, they favor greater predictability in alveolar and peri-implant reconstructions and present a good prognosis [4].

The main problem is with non-absorbable membranes, because they require a second surgical act, they provide infections if there is any type of exposure; Have a consistent consistency, which makes it difficult to adapt to the bone defect and thus impairs blood supply and can cause dehiscence and tissue necrosis [5-7].

Guided bone regeneration (GBR) favors the formation of new bone tissue and prevents the gingival tissue from invaginating into the space between the bone and the implant [5,6]. Covani et al [9] in a prospective 10-year study comparing patients who received the GBR technique with patients who did not receive indicated the possibility of gingival retraction in the group that did not receive the technique when compared to the group that received [4].

The filling materials can be: hydroxyapatite, lyophilized and milled demineralized bone marrow, autogenous bone, which is considered gold standard, among others. In conjunction with fillers, it is often necessary to use features to isolate the implant by using biological membranes, which are epithelial barriers that guide tissue regeneration, function as a mechanical barrier separating the periodontal tissues from the Bone surface or implant, thus promoting a new bone formation, a containment of the filling material and a stability of the graft [6,8].

This study aims to analyze and discuss the main types of biological membranes, positives, negatives, their indications and results.

### **Methods:-**

For the development of the present review, we used a database such as Medline, Embase, Pubmed, Ovid and Cochrane (figure 1). The main descriptors (MeshTerms) used were "Implantology", "Regenerative Surgery", "Biomembranes", "Bioengineering Bone" (Table 1).

### **Main Continuous Predictors:-**

The main continuous predictors were the inflammatory processes and the chemical quality of the biomembranes.

### **Main Predictor Answer:-**

The main predictor response was massive bone regeneration.

### **Literary Review:-**

#### **Epidemiology and Justification:-**

According to data from the Brazilian organ transplant association, the number of bone transplants per million population reaches 450 (18,200 transplants) in the State of São Paulo, 110 (4,100 transplants) in the State of Paraná and 30 (1,200 transplants) in the State of Rio de Janeiro, made available by the 5 Tissue Banks of the 3 States, during the 10<sup>th</sup> quarter of 2012 [13].

The lack of bone in the alveolar ridges has been a major problem in functional aesthetic recovery in patients who have suffered dento-alveolar trauma, traumatic dental extractions, congenital dental absence, pathologies involving maxilla and mandible, as well as infections due to the emotional and Possibility of deformity and also the economic impact they cause in the National Health System (NHS) [11,13]. Bone loss can also occur due to periodontal disease, traumatic surgeries, or even for physiological reasons due to lack of adequate bite function or prosthetic load [14]. The trauma in the face region can reach both the soft tissues (skin, muscles, nerves) and hard tissues (bones, teeth), so these lesions can affect the quality of life as well as the health of the victim [14].

The trauma maxillofacial injury can be considered one of the most devastating aggressions found in traumatology and oncology, due to the emotional consequences and the possibility of deformity and also the economic impact they cause in the National Health System (NHS) [15- 18]. The face, more than any other region of the body, is affected by aesthetic changes, since it is always visible, and damages are perceived immediately [19]. For this reason the trauma of the face deserves attention in the treatment of polytrauma due to its high incidence and severity.

#### **Tissue Engineering:-**

The microscopic bone structure consists of osteoprogenitor cells, support cells (osteoblasts and osteocytes), remodeling cells - osteoclasts - and a non-mineralized extracellular matrix called the osteoid, composed of type I collagen and non-collagen proteins such as osteonectin, osteocalcin, Morphonetic bone protein (BMP), glycosaminoglycans (GAG) and bone sialoproteins [29]. The osteoprogenitor cells are small spindle cells found on all non-resorbable bone surfaces, derived from primitive mesenchymal cells and form a population and precursor cells that can differentiate into more specialized cells such as osteoblasts and osteocytes [15].

Regeneration of composite tissues such as periodontal tissue has also been demonstrated, proving that adipose stem cell associated with platelet rich plasma can regenerate alveolar bone, cementum and periodontal ligament eight weeks after implantation [22,23]. Clinically, there is a combined study of bone graft with fibrin glue, a biodegradable biomaterial and adipose stem cell for the reconstruction of extensive bony defect in the skull cap of a 7-year-old victim of trauma [22].

Osteoblasts are derived from undifferentiated stem-cells and are responsible for the production of bone matrix, rich in collagen (mainly type I) and essential for subsequent mineralization, by adherence of calcium hydroxyapatite crystals, magnesium, potassium, sodium and Carbonate in collagen fibrils [10,20]. Osteoblasts are also rich in alkaline phosphatase, which has a high value in periods of bone formation. The process of formation of new bone mediated by osteoblasts is called osteogenesis [10]. It is known that osteoblasts bind directly to collagen through integrin-RDG (-Arg-Gly-Asp-) sites of interaction.

The osteoinduction process is influenced by several factors and consists in the induction of mesenchymal stem cells of adipose tissue in osteoprogenitor cells [15,25]. Osteogenic differentiation requires the presence of inducers, which include  $\beta$ -glycerolphosphate, ascorbic acid and dexamethasone [25]. In the presence of these substances the mesenchymal cells acquire the morphology and components of osteoblast membranes and begin to express alkaline phosphatase, to deposit extracellular matrix rich in calcium and certain proteins, such as osteopontin and osteocalcin [25].

Organic phosphates, such as  $\beta$ -glycerolphosphate, promote osteogeny by their function in mineralization and modulation of osteoblast activity [15]. Thus, free phosphates can induce mRNA and protein expression, exemplified by the osteopontin protein. If organic phosphate, for example  $\beta$ -glycerolphosphate is present, the formation of a mineral content occurs, hydroxyapatite that is formed between the collagen fibers [21]. Other compounds such as phosphoric ascorbic acid are also used in osteogenic induction, in the involvement of increased alkaline phosphatase activity and in the promotion of the production of osteocalcin and osteopontin [25,27].

Bone morphogenetic proteins (BMPs) function as growth factors with a specific role in the proliferation and differentiation of mesenchymal stem cells from adipose tissue [17,24]. BMP-4 is involved in the early stages of osteogenesis; in addition, it has been shown that the differentiation of human adipose mesenchymal stem cells into the osteogenic lineage requires the presence of BMP-4 in the first days of culture and that these cells, after 21 Days express specific proteins of the osteogenic lineage such as osteonectin, osteocalcin and osteopontin [24]. There are three fundamental parameters in bone tissue engineering that will determine the ability of osteoinduction are the

presence of soluble osteoinductive signals, the viability of the undifferentiated mesenchymal stem cells to respond, the ability to differentiate into bone-forming cells and the production of extracellular matrix Adequate [24].

Tissue engineering encompasses numerous advantages that meet the needs of injured tissue or organ for the regeneration process [12,17]. For this, it is necessary the understanding of chemical, physical and biological processes both biological material and the biological niche of the host [13]. The cross-referencing of compatible information between the microenvironments allows cellular recognition and signaling cascades for neovascularizations [14]. Another advantage is minimally invasive surgical intervention, that is, it allows the use of surgical techniques that are faster and cause less risk to the patient [19].

Thus, tissue engineering is a tool that makes possible through a suitable biological niche the construction and regeneration of any tissues and organs [18,27]. For this, xenografts, autografts and allografts are used, with and without the use of cells [13,14]. According to the Conference of the National Institute for the Development of Health Consensus in 1982, biomaterials are beneficial organic compounds, or a combination thereof, that can be used for a period of time, wholly or partially as part of a system that treats, Replace any tissue, organ or function of the human body [18,27,30].

The great challenge is to understand that the science of biomaterials is multidisciplinary and its application requires adjustments of its processing, sterilization and structural modifications to favor the interaction with the tissue of interest. Bioengineering and cell therapy work together for Regenerative Medicine, favoring and improving biological conditions to accelerate repair and tissue regeneration, and thus naturally maintaining tissue homeostasis [16]. This condition is maintained because the required cellular elements, cell proliferation and differentiation factors, and supramolecular structures are provided which guarantee the functional stereochemical organization of the tissues generated and their systemic integration [18,27,30].

### **Biomaterials:-**

It is used to direct, through the control of interactions with components of a living system, the course of a diagnostic or therapeutic procedure, whether in humans or animals. Checking the history of biomaterials in the medical-dental area, countless researches have been carried out in the search for natural or synthetic substances that can replace lost, hard or hard bodied tissues [31].

Thus, ancient records show us the use of substances, such as ivory. Dry bone, gold, gold wire, silver alloys, among other materials. From 1800, it is observed the use of synthetic compounds for bone replacement, when researchers advocated the use of calcium sulfate in bone defects [31].

Due to the great technological development of biomaterials, associated with the advancement of knowledge about the biology of bone tissues, it has become possible to selectively influence bone formation, controlling the quality and quantity of bone inside the buccal structures [31].

In this way, there is a wide variety of biomaterials, synthetic or biological, with variable particle sizes and mainly classified according to their mode of action: osteoconduction, osteoinduction or osteogenesis. In implantology, implant placement should be used as complementary therapy, and it is necessary to know the biological potential of each material to indicate it in the various clinical situations [31].

We can find in the market a varied range of biomaterials, such as demineralized lyophilized bone, anorganic bone and bioactive glass. These biomaterials should have precise indications and should not require unreal biological demands from them. It is known that bone neof ormation is a biological process that happens at the expense of osteoblastic activity and that the quality of the neoformed tissue, when in the presence of these biomaterials, is not the same for all, and depends on the material, its origin, clinical conditions The recipient site, the field of indications and the surgical technique [31].

### **Maintenance Of Alveolus Size After Exodontia:-**

The concern of the implantant after the extraction, is the bone loss in volume of the alveolus [31-33]. When it is not possible to install immediate implants, after exodontia, the alveolar process, depending on the thickness of the buccal bone board at the end of the bone remodeling process, may present depression on the vestibular surface, which would imply the need for block autogenous graft [33].

In a study carried out in 1967, it was observed that in the anterior maxilla there is loss of 25% of bone volume in the first year after exodontia. In the posterior region it is twice as large as in the anterior maxilla [34].

It is believed that if the bone defect is five walls (alveoli with intact walls) the alveolar bone repair will happen naturally. However, if the vestibular wall is less than 1.5 mm thick or absent, the practitioner should use intra-alveolar materials (autogenous bone, mineralized bone or alloplastic material), associated with membranes that improve the predictability of Restoration of the original bone contour in the alveolar process [35]. There is an indication of the technique called Bio-col for preservation of alveolar bone walls.

The author uses Bio-oss (inorganic material of bovine origin) as osteoconductive material that according to the author's understanding is slowly reabsorbed and replaced with vital bone [18]. If the bone defect is more than 2/3 of the vestibular wall, the reconstruction should be done with autogenous bone. Authors evaluated the action of two types of bioactive glass particles on mandibular alveoli after exodontia in dogs, and concluded that both Biogran and Biossilicate preserve the alveolar bone height and enable the implantation of implants [36].

Regarding the use of bone-guided regeneration, a study confirmed bone ridges after exodontia with and without the use of biological membranes. After six months, bone crest loss of 0.38 mm versus 1.50 mm and horizontal bead reabsorption of 1.31 mm versus 4.56 mm respectively were observed.

For a better predictability of the guided bone regeneration technique there is a requirement that the membrane be totally protected by the mucoperiosteal flap and that, in the presence of teeth, it is at least 1 mm away from the periodontal space [37]. It is also necessary that the biological space be maintained by membrane memory, or that the membrane be supported by the interdental septal bone structure, or by the remainder of the alveolar bone walls. If this condition does not exist, autogenous particulate bone, mineralized or synthetic biomaterial can be used [38].

In bone defects of four walls the indication of reconstruction falls on the autogenous bone or mineralized bone with membrane. Using the technique, which seals the alveolus with tissue composed of mucosa and trabecular bone obtained from the tuft of the maxilla with the aid of trephine drill of 6.0 to 10.0 mm in diameter [39].

On the other hand, bone defects with two or three walls require that the biomaterial to be used to reconstruct be the autogenous bone combined with the use of biological membranes [39]. On the other hand, the bone defect of a wall requires block grafting with fixation by means of screws. Based on the work of several authors, the implantation of implants in reconstructed areas with any biomaterial should be 4 to 6 months [39].

#### **Border Outline:-**

There are cases where the remaining bone tissue is sufficient to stabilize the implant, but there is deficiency of vestibular border contour that causes at the time of implant installation, partial dehiscence of the buccal bone board. Biomaterials are used to improve the contour of the collar, consequently the harmony of the prosthesis [31-33].

Biomaterials most suitable for improving the border contour are the inorganic ones, which maintain the volume and are not reabsorbed. When using these biomaterials, biological membranes should be used to protect the area and prevent biomaterial detachment [34-36].

The incorporation of the material into the receptor bed and stabilization of the material by fibrosis or adjacent soft tissue is observed. There can be no exposure of the biomaterial to the oral environment. This would cause its contamination and the failure of the surgical procedure [36,37].

It is also possible to use particulate autogenous bone, being biologically more favorable, the area should be well selected presenting thick and keratinized gingival tissue. At the moment of implant opening, part of the material is seen next to the gingival tissue and part forming a mass adhered to the bone [38].

#### **Peri-implant Bone Defect Filling:-**

Authors conducted a histological study in humans and concluded that the spontaneous repair of the peri-implant defect occurs when the space between the implant and the bone wall is up to 2.0 mm. 25% of sites with gaps greater than 2.0 mm were found to be repaired compared to 78% of gaps less than 2.0 mm [34].

Peri-implant bone defects in implants immediately after extraction, less than 2.0 mm, do not need to be filled, because spontaneous repair will occur. However, if the gap is greater than 2.0 mm, space filling should be performed in association with biological membranes [35]. In this case, the biomaterials in the form of particles are trapped by the bone walls, making use of either demineralized, mineralized materials, bioactive glass or particulate autogenous bone.

It is intended to fill the space by neoformed bone, and for this reason, the material used must have osteoconductive properties; To avoid the peri-implant bone defect, which is more worrying in the anterior maxilla region, due to aesthetics; Preserving the height of the alveolar process, including the interdental septa and raising the maxillary sinus membrane, or sinus graft [38].

#### **Increase In Height And / Or Thickness Of The Alveolar Process:-**

Autogenous block-shaped bone is indicated for the use of homogeneous, heterogeneous or alloplastic materials. The most used donor areas are: iliac crest, skull cap, chin, or oblique line. It is suggested that for total reconstructions, the most indicated would be: iliac crest and skull cap. When the reconstruction encompasses height and thickness, simultaneously, the iliac crest is the most indicated [31].

For reconstruction in thickness, the skull cap is more advantageous because there is little remodeling of the graft during the period of repair; Because bone quality is more adequate for implant installation; By the preoperative period have the minimum of symptomatology and for the shortest period of hospitalization.

For partial reconstructions, with individual losses or two dental elements, the oblique line can be indicated and, in loss of up to four elements, the ment would be more adequate indication [31].

#### **Elevation Of Maxillary Sinus:-**

The maxillary sinus survey, using bone grafts, became one of the most frequent procedures of implantology and also the most investigated by the use of platelet concentrates. Another reason is that it is a good model of evaluation of bone remodeling and is a closed and protected cavity where the interferences with the oral environment are minimal [29,30].

Many studies have reported that the addition of platelet rich plasma to a bone graft is associated with positive clinical results and is a good method of handling the bone graft during insertion in the maxillary sinuses and stimulates bone regeneration around implants placed in the graft. However, it is difficult to emphasize the conclusions of the studies carried out due to the large variables present in the in vivo models, however, in general the authors affirm that the quality of the bone formed and that the surgical technique used does not present advantages in the therapy [29,30].

#### **Guided Bone Regeneration And Guided Tissue Regeneration:-**

Guided bone regeneration is the technique that uses osteopromotion as a biological principle. It is indicated for bone regeneration in fresh alveoli, bone defects that have remaining bone walls, to promote bone neoformation around implants installed immediately after extraction, to correct bone loss (Peri-implant) that occurred after osseointegration [31].

It is used for correction of defects, when it is desired, increase of bone volume, for this it is necessary, that the tissue recomposes cells with characteristics of the region without interference of the connective tissue [32]. Guided tissue regeneration promotes selective cellular response without producing an inflammatory reaction. Its use presents a degree of specificity to the type of tissue where it will be performed [32].

#### **Important Features Of The Biological Membrane For Bone Neoform:-**

It should function as a physical support to the surrounding soft tissue, preventing the collapse of this space that will be filled by the blood clot, necessary for bone formation. It should also possess permeability that allows diffusion of plasma and nutrients, but which prevents the passage of non-osteogenic cells, in addition to having biocompatibility integration with the host tissue without creating inflammatory responses [32].

The first membranes to be successfully used in bone regeneration were expanded polytetrafluoroethylene, non-resorbable. The eventuality of exposure posed a risk of infection, requiring premature removal. Due to this inconvenience they developed resorbable membranes, collagen or polylactic acid polymers [32].

#### **Membrane Characteristics:-**

They must have good tissue integration, ensuring the growth of cells without crossing the material; Prevent the early migration of the epithelium on the outer surface of the material or encapsulation of the material; To provide stability to the suprajacent retail; Be available in easy configuration for better adaptation; Present selectivity (passage of nutrients, gases) and have occlusive property. The right choice of membrane to take advantage of its basic characteristics will depend on the operator's ability and his mastery with the material [32].

#### **General Characteristics Of Indications For Each Thickness:-**

Fine membranes are used when the need is only for insulation of the site. Medium membranes are used for insulation, and should have greater or lesser degree of strength and stiffness according to the imposed deformation. Thick membranes confer structural action, creating ample space and sustaining in adverse conditions.

#### **Non-Absorbable Membranes:-**

They are formed by overlapping layers of Teflon, of highly ordered structure, giving a controlled porosity that allows passage of liquids. They consist of two parts, a peripheral part of greater porosity and flexibility, which guarantees the adaptation to the margins of the bone defects and another part of less permeability with greater rigidity.

The disadvantages of non-absorbable membranes are the need for additional surgical intervention for their removal and possible complications associated with membrane exposure, leading to infections, requiring removal and disruption of the regenerative process [32].

Expanded polytetrafluoroethylene membranes do not trigger inflammatory reaction, foreign body, has autoclave resistance, insoluble to a range of enzymatic solvents, has elasticity similar to bone tissue. It is reinforced with titanium and indicated for situations in which the formation of bone with great defects is desired.

They are composed of double layer polytetrafluoroethylene expanded with titanium interposed. These barriers incorporate into their structure a skeleton, formed by a thin titanium blade. Titanium membranes are capable of promoting the formation of significant amount of new bone and maintaining sufficient space without the use of a support device [32].

#### **Reabsorbable Membranes:-**

Reabsorbable membranes eliminate the need for additional surgery. They are classified in: natural and synthetic. They are degraded by the body through enzymatic hydrolysis, triggered by the inflammatory infiltrate that forms around the material. Collagen-based membranes are widely used today. Its efficacy is demonstrated by studies, however there is disagreement as to its use. They have their origin: bovine, swine and derived from the dura mater of the human brain, collected and submitted to the lyophilization process to eliminate antigenic substances. Before its positioning, it must be hydrated by immersion of the membrane in saline.

The resorbable membranes, diverts the body's attention to a process, which is its own removal from the site. Alumina is an alloplastic membrane that presents characteristics of passivity in the scarring process, makes isolation, spacing and stabilization, and does not generate any mechanism capable of altering the process.

The autogenous graft is considered the best because it guarantees predictable results, due to the lower rejection rate. Due to this, when coated with membrane, the autogenous bone can reach 50% of the original bone volume in up to six months. Bovine bone, when associated with non-absorbable membranes, begins the resorption process from the seventh month, and has a significant effect on bone filling parameters after a period of nine months [32].

#### **Discussion:-**

Based on the literary findings, both non-absorbable and absorbable membranes are effective in the process of bone regeneration. Absorbents do not require a second surgical time [33,34]. However, there are information gaps, and

further research is needed to ensure a perfect knowledge of the physical barrier properties to achieve a perfect bone regeneration of the periodontal bone defects and around implants [34,35,36].

In this context, the use of biomaterials and membranes contribute to an optimized outcome in the rehabilitations with osseointegrable implants. Another prospective 3-year study in patients receiving platform switching implants indicated predictability of the technique associated with guided bone regeneration for aesthetic area reconstruction [34]. In a 10-year longitudinal prospective study, they indicated the possibility of gingival retraction in a group of patients who did not receive guided bone regeneration when compared to a group of patients who received the guided bone regeneration technique.

Regarding the use of the biomaterial, clinical studies have indicated predictability of the technique [34,35]. Another study showed in a randomized controlled clinical study that the guided bone regeneration technique using different biomaterials (Bone Ceramic / Bio-Oss) presented predictability and that both materials are suitable for preserving width and interproximal bone height of the collar Alveolar [18,28].

Another important aspect is the creation of a provisional implanted implant, since this prosthesis presents several functions such as adaptation of the patient, choice of color and shape, allowing gingival conditioning that besides obtaining aesthetics, such conduct represents less clinical time to the prosthetist During the final restoration phase [34-36].

In addition, gingival conditioning allows the adjacent soft tissues to be directed during the osseointegration phase, thus avoiding gingival targeting maneuvers for esthetics [33]. The use of biomaterials in dentistry occurs on an increasingly wide scale. Several studies have demonstrated the synthesis of new biomaterials applied in all areas of dentistry with promising results [33-35].

Thus, the use of biomaterials at a clinical level should essentially be analyzed through the entire scientific evaluation process, ranging from in vitro laboratory tests to longitudinal clinical studies in vivo. Thus, the development of bioceramics and prostheses constituted by these materials must occur under the same interdisciplinary conditions that determine the development of any other dental material [19].

In addition, there is a need to know all the properties mentioned here by the Dentist, so that there is a critical discussion about the use of biomaterials, avoiding only commercial information that is often incomplete and superficial [19, 34]. The opportunity to discuss the use of biomaterials in dentistry, through the science of dental materials, expands the knowledge of this subject for professionals and researchers [19].

The diversity of applications of biomaterials, as well as their chemical, physical, biological and morphological differences, makes the research in this area of knowledge a work with eminently interdisciplinary characteristics. Within this context, professionals in the field of Materials Engineering can contribute significantly to the evolution of this area and to increase the range of its applicability, through the development of new and effective biomaterials and also in the elucidation of the mechanisms that govern the Bone regeneration [34-37].

AUTHOR	OUTCOMES
Caballé-Serrano et al. (2015)[33]	The protocols presented should encourage further revealing the paracrine effects of bone grafts during bone regeneration and pave the way for translational research in the broad field of reconstructive surgery.
Merli Met al. (2016) [34]	No substantial differences were obtained using different membranes and non-resorbable grafts, and the results were positive for the variables examined. A result of high heterogeneity has been observed in studies related to cross-linked membranes.
Moschouris Pet al. (2016) [35]	The recombinant protein Wnt3a in conjunction with GBR tissue can promote bone formation.
Caballé-Serrano (2016) [36]	These results demonstrated that collagen membranes can rapidly absorb the activity of TGF- $\beta$ released from bone splinters, a molecular process that may contribute to guided bone regeneration.
Saghiri MA et al. (2016) [37]	Angiogenesis is one of the key factors that plays a critical role in the success rate of the GBR technique and is seriously considered in the manufacture of bone and graft membrane barrier materials. However, there is still a lack of clinical and in vivo studies on the effect of angiogenesis on bone and graft treatments of barrier membrane materials.
Fujioka-Kobayashi M et al. (2016) [38]	The results indicate that the combination of collagen membranes with rhBMP9 significantly induced significantly higher mRNA expression and alizarin alizarin red staining when compared to rhBMP2. These findings suggest that rhBMP9 may be a suitable growth factor for future regenerative processes in bone biology.
Dai Z, Shu Y, Wan C, Wu C(2015) [39]	These microgels provided an extracellular matrix microenvironment that affect the biological behavior of mesenchymal stem cells, facilitating their potential applications in regenerative bone therapies.

### Conclusion:-

Because of bone regeneration and biological barriers in graft surgeries, there has been a technological growth of these materials because they are pointed as potential tools for the treatment of bone loss. Therefore, for its ethical and safe use, it is necessary for the professional to be careful in its use by assessing the advantages and disadvantages by means of prospective and randomized clinical studies of each material and with high casuistics.

#### Abstract

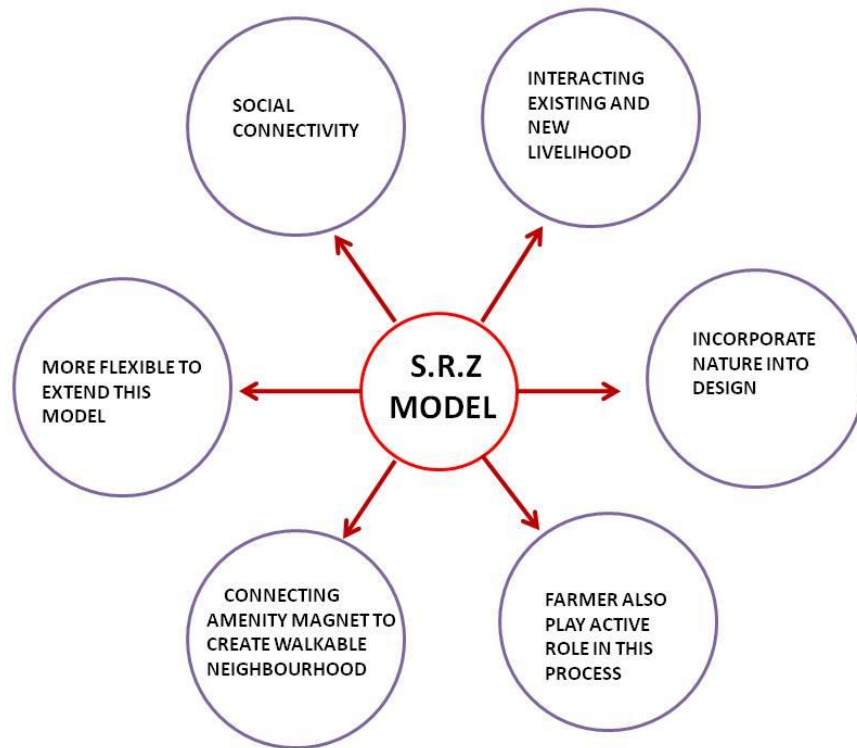

Special Residential Zone (SRZ) is an influence area of Special Economical Zone (SEZ). It is a dynamic area which changes with span of time. In India there are 173 new SEZ proposal has been in working condition. SEZ is a potential magnet which can disrupts the area where it emerges in terms of housing, land prices and quality of life. Some of these proposals emerge near the city or existing urban centre which directly affects the fringes of city, hence there is need to kind of sustainable development of SRZ to prevent the social turmoil, pressure on basic livelihood, impact on urban sprawl, declining natural vegetation and loss of wildlife and agriculture near the existing urban centre. This thesis has been focusing on the SRZ of Nagpur where the MIHAN (SEZ) as potential magnet which can disrupts the quality of life in SRZ.

*Copy Right, IJAR, 2016., All rights reserved.*

Intend of this project has been to create a model for special residential zone (SRZ) and module for farmers benefit in the tardy process of land acquisition. Focus is to create sustainable model which will suitable for newer development and approach to balance the convergence of the present and future in human settlements as well as a system for creatively coping with the growth of population, rapid change and the pressure of large scale high density housing. The goal is to give Urban Design strategies for SRZ. The focus of the project has been to collect the data and discuss issues and concern related to the new towns that come up in the SRZ area.

The quality of life (comprises of social infrastructure, recreational, community relationship with people and society and overall livability of an area) also plays very important role in urban areas, in city boundaries people living in comprehensive planning of cities and unplanned areas like the fringes which are newly developed. There are minimum standards of living for any given society. In absence of comprehensive planning the quality of life of SRZ are getting affected.

To understand Quality of life in city, the study intends to focus on industrial towns before 1970 and present scenario and analyze those towns in terms of land acquisition, number of people affected and displaced and livelihood of people. Identify why those towns were not been able to give proper remedy for surrounding area and give urban design proposal for it.

**Features of SRZ Model**

- 1) This model we can use everywhere in India where Special Economical Zones are suppose to come.
- 2) This model will prevent haphazard development, disconnected development, provide supportive infrastructure with respect to given population.
- 3) Reduce social turmoil of Farmers.
- 4) Making better livelihood for farmers.
- 5) Benefiting for both farmers and Government.
- 6) Enhance Quality of life in the Fringes.

#### Abstract

The present study is conducted among the 739 students of teacher trainees for analyzing the impact of Non cognitive factor on the academic achievement. Self made tool is adopted for testing an emotional intelligence of the teacher trainees. And also the researcher has developed academic achievement tool in 2015 with the help of the Source book, tested at the 0.05 & 0.01 percent level of significance. The participants are considered male and female students in, which strength of female more than male students. The result of study reveals that there is positive and significant difference between Emotional Intelligence and Academic Achievement of teacher trainees.

#### Introduction:-

Human life is full of events everyday and every event of a man's personal life is expressed in some emotional colouring. Behind every emotion there is a feeling. Feelings are described as emotions. Our emotions play quite a significant role in guiding and directing our behaviour. Many a time there are seen to dominate our behaviour in such a way that we have no solution other than behaving as per wish. On the other hand, if a person has no emotional current he then he becomes crippled in terms of living his life in a normal way. Hence, emotions play a key role in providing a particular direction to our behaviour and thus shaping our personality according to their development.

Emotional intelligence consists of two words Emotion and Intelligence. Emotion refers to intense feeling of human. Intelligence is basically based on mental ability of human to deal effectively with the environment. Emotional intelligence is the ability to sense and understand one's own emotions, to express and regulate them appropriately and to use them in the process of decision making. It includes the capacity to understand and feel for others, and so set up maintain quality relationships.

From Salovey and Mayer's theoretical model, EI is conceived as an authentic intelligence, based on the adaptive use of emotions such that the individual can solve problems effectively adjust to his or her surroundings. Mayer and Salovey's skill model considers that EI conceptualized through four basic skills. "the skill of accurate perception, appraisal and expression of emotions, the skill of taking on and/or generating feelings which facilitate thinking; the skill of understanding emotions and emotional knowledge and the skill or regulating emotions, thus promoting emotional and intellectual growth" (Mayer & Salovey, 1997).

**Corresponding Author:- J. Ramani.**

Address:- Ph.D. Scholar cum Lecturer, DIET, Munanjipatti, Tirunelveli.

**Emotional Intelligence and Academic Performance:-**

The ability to pay attention to their emotions, experience feelings with clarity and be able to recover from negative states of mind will be a decisive influence on students' mental health, and this psychological balance in turn is related to and ultimately affects academic performance. Persons with limited emotional skills are more likely to experience stress and emotional difficulties during their studies, and consequently will benefit more from the use of adaptive emotional skills that allow them to cope with these difficulties. EI may act as a moderator of the effects of cognitive skills on academic performance (Brackett, 2011)

**Need and significance of the study:-**

The result of present study will provide a base which may help in strengthening or improving the achievement of the adolescents. The findings will also act as a linkage of emotional intelligence and creative thinking ability which in turn imparts a significant role in the development and achievements of adolescents. In the words of Smith (2009) in Teachers for the Real World keeping in mind the present day requirements remarks, If a student's is to be prepared for the evolving world, than an essential attribute of effective teacher is awareness of the realities of the world. Therefore, the primary school teachers have a great role in moulding future generation. In order to be better teachers, they need to be emotionally intelligent, creative and effective in their performance. The foundational seed to reach to this state is being sown in the initial stages of schooling. The potential seed is sown by the primary school teachers. Therefore, the investigator inclines to study the variables emotional Intelligence, creative thinking ability and academic achievement of D.EI.Ed students.

**Title of the study:-**

Statement of the problem is entitled as Impact of emotional Intelligence on the Academic Achievement of D.EI.Ed Students.

**Objectives of the study:-**

The following objectives have been formulated for the purpose of the study:

1. To find out the level of emotional intelligence of D.EI.Ed students.
2. To find out the level of Academic achievement of D.EI.Ed students.
3. To find out the difference, if any, in the Emotional intelligence of D.EI.Ed students in terms of demographic variables such as gender, nature of institution and marital status.
4. To find out the difference, if any, in the Academic Achievement of D.EI.Ed students in terms of demographic variables such as gender, nature of institution and marital status.

**Methodology:-**

The investigator adopted survey method. This method of investigation which attempts to describe and interpret what exists at present in the form of conditions practices, process, trends, effects, beliefs etc. The survey method gathers data from relatively large number of case at a particular time.

**Sample:-**

The investigator had used stratified random sampling technique for selecting the sample. The investigator randomly selected the Teacher trainees from three districts are Tirunelveli, Tuticorin and kanyakumari. The selection was done on the basic of the type of institution and location of the institution. From these institutions, 739 teacher trainees were randomly selected on the basis of the criteria.

**Research Tools:-**

Emotional Intelligence tool designed by Rasel. Academic Achievement tool developed by the researcher in the year 2015, with the help of source book.

**Procedures:-**

The above inventory was administered to subjects. Each item was scored with the help of scoring key. The data thus collected are tabulated to arrive at meaningful inference.

**Statistical Techniques:-**

The tabulation and analysis of data done by using appropriate statistical techniques such as Mean, Standard deviation and 't' test.

**Data Analysis:-**

To find out the meaningful interpretation of the raw scores the data were analyzed, the results of the study are presented in the following tables.

**Table – 1 Level of emotional intelligence and academic achievement of d.ei.ed students**

Category	Low		Moderate		High	
	No.	%	No	%	No	%
Emotional Intelligence	100	13.5	547	74.0	922	12.4
Academic Achievement	146	19.8	485	65.6	108	14.6

The table indicates that 13.5 of the D.EI.Ed students have low level, 74.0 percent have average level and 12.4 percent have high level of emotional intelligence. It is inferred from the table reveals that 19.8 percent of the D.EI.Ed students have low level, 65.6 percent have moderate level and 14.6 percent have high level of academic achievement. Further it is concluded that a good percentage of D.EI.Ed students have average level of emotional intelligence and academic achievement.

**Table – 2 significant difference among the emotional intelligence of d.ei.ed students in terms of demographic variables**

Emotional Intelligence		N	Mean	SD	DF	Calculated 't' value	$\rho$ -value
Gender	Male	40	230.18	24.810	737	0.234	0.815NS
	Female	699	229.32	22.326			
Nature of Institution	Girls	329	226.21	23.616	737	3.450	0.001**
	Co-Education	410	231.90	21.160			
Marital Status	Married	86	233.56	17.811	737	2.237	0.027*
	Unmarried	653	228.81	22.946			

S\*\* = Significant at 1% level. S\* = Significant at 5% level NS = Not significant

The calculated  $\rho$  value for the variable of Emotional intelligence as a more than 0.05 level of significance and so are not significant at 5% level. It means that there is no significant difference in the Emotional intelligence of D.EI.Ed student due to their gender. Hence the formulated null hypothesis, 'there is no significant difference in the emotional intelligence of D.EI.Ed students due to their gender to which they belong' is accepted.

The calculated  $\rho$  value for the variable of Emotional intelligence as less than 0.01 and so they are significant at 1 percent level. It means that there is significant difference in the nature of institution of D.EI.Ed students. While comparing the mean scores, girls institute (mean = 226.21) and co-education institute (mean = 231.90). Further it is observed that the co-education institute D.EI.Ed students are better than their girls institute counter parts in Emotional intelligence.

The calculated  $\rho$  value for the variable of Emotional intelligence as less than 0.05 and so they are significant at 5 percent level. It means that there is significant difference in the marital status of D.EI.Ed students. While comparing the mean scores of married (men = 233.56) and unmarried D.EI.Ed students (means = 228.81). Further it is observed that the married D.EI.Ed students are better than their unmarried D.EI.Ed students in their Emotional intelligence.

**Table – 3 Significant difference among the emotional intelligence on the academic achievement of d.ei.ed students in terms of demographic variables**

Academic Achievement		N	Mean	SD	DF	Calculated 't' value	$\rho$ -value
Gender	Male	40	32.5	9.541	737	1.975	0.049*
	Female	699	34.92	8.890			
Nature of Institution	Girls	329	36.64	9.085	737	5.220	0.000**
	Co-Education	410	33.25	8.543			
Marital Status	Married	86	38.31	8.028	737	4.306	0.000*
	Unmarried	653	34.29	8.958			

S\*\* = Significant at 1% level. S\* = Significant at 5% level.

It is known that the calculated  $\rho$  value for the academic achievement is less than 0.05 at 5 percent level of significance. Hence there is significant difference in the academic achievement between male and female D.El.Ed students. Further it is observed that the female D.El.Ed students are better than the male D.El.Ed students in their academic achievement. While comparing the mean scores, female students (mean = 34.92) achieve more than male students (mean = 32.5)

The study reveals that, the calculated  $\rho$  value for the academic achievement is less than 0.01 and so it is significant at 1 percent level. It means that there is significant difference in the academic achievement of D.El.Ed students due to the nature of institution. Further it is observed that the girls' institution D.El.Ed students are better than the co-education institute D.El.Ed students in their academic achievement. While comparing the mean scores, girls institute (mean = 36.64) achieve more than co-education institute D.El.Ed students (mean = 33.35)

It reveals that, the calculated  $\rho$  value for the academic achievement is less than 0.01 and so it is significant at 1% level. It means that there is significant difference in the academic achievement between married and unmarried D.El.Ed students. Further it is observed that the married D.El.Ed students are better than the unmarried D.El.Ed students in their academic achievement. While comparing the mean scores, married D.El.Ed students (mean = 36.64) achieve more than unmarried D.El.Ed students (mean = 33.35).

### **Findings:-**

Findings based on the objectives and followed by data analysis are given as follows: According to the table shows that; there is percent of the elementary teacher trainees have low level, 74 percent have average level and 12.4 percent D.El.Ed students have high level of emotional intelligence. It is inferred from that; there is 19.8 percent of the D.El.Ed students have low level, 65.6 percent have moderate level and 14.6 percent have high level of academic achievement. It reveals that; there is no significant difference among the emotional intelligence of D.El.Ed students in terms of their gender. It is reveals that there is significant difference among the emotional intelligence of D.El.Ed students in terms of their nature of institution. It reveals that; there is significant difference among the emotional intelligence of D.El.Ed students in terms of their marital status. It reveals that; there is a significant difference among the academic achievement of D.El.Ed students in terms of their gender. They showed that; there is significant difference among the academic achievement of D.El.Ed Students in terms of their nature of institution. They showed that; there is significant difference among the academic achievement of D.El.Ed students in terms of their marital status.

### **Educational Implications:-**

Students should be able to recognize their abilities and capacities instead of feeling low develop ability to work and study in adverse emotional condition of life. It can help future teacher to well equip with handling new aims, objectives of education, method of techniques and ready to take the responsibility which is a tactful task. In curriculum impetus should be given for the training of emotional intelligence to increase academic achievement of students.

### **Conclusion:-**

In the present study, it can be stated that the outcome of all hypothesis is accepted. It is true that there is positive and significant difference between Emotional Intelligence and Academic Achievement. There is a great need to explore the awareness about the Emotional Intelligence. Emotional Intelligent people are more likely to succeed in everything they undertake. Quality emotions and feeling help student gave their best potential in the classroom. The students who are aversive and think negatively cannot concentrate for a long time and have more difficulty in reaching their potential than others. The emotions, feelings and values are vital for a person well being and achievement in life.

#### Abstract

Wetland is the most productive ecosystems in the world. Aquatic plants are vital components for the proper management of wetland ecosystem for biological productivity and support various organisms. In the present study, diversity of flowering plants surrounding the wetlands in Vadodara District was carried out at selected 19 wetlands in 6 talukas.

#### Introduction:-

Wetlands are “lands transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is covered by shallow water.” Its features were (a) at least intermittently, the land supports chiefly hydrophytes (b) the substrate is chiefly undrained hydric soil (c) the substrate is non-soil and is saturated with water at some time throughout the growing season of the year.

Over the last era significant struggle which directed to the conservation and wise use of wetlands (Jonauskas, 1996; Finlayson, Hall and Bayliss 1998; Blackman, 1995). However, available knowledge or information for some wetlands are at the most basic level, as information on physical and ecological features, values and benefits, land tenure and uses, threats and disturbances, and monitoring and restoration of all wetlands is not available (Finlayson, Hall and Bayliss 1998). The wise use and conservation of wetlands will be partly needful on a greatly expanded information base. Data on the ecological character of wetlands, which is the amount of wetland loss and degradation, conservation measures and the success of monitoring strategies will be required. Moreover, this information base requires linkage and integration with executive processes (Finlayson, 1995). Classification and account of wetlands are processes designed to deliver a key point on wetlands and their resources (Finlayson, 1933). Aquatic biodiversity is dependent on hydrologic regime; geological conditions and efforts are being made to conserve the biodiversity found in wetlands, streams and rivers. The goal of this irreplaceable biodiversity is to minimize its loss through sustainable management and conservation practices. The first step in conservation of biodiversity is to assess the diversity of natural resources present and identify those, which are important and most irreplaceable (Groombridge & Jenkins 1998). The total numbers of aquatic plant species exceed 1200 and a partial list of animal for aquatic and wetland system is given by Gopal (1995). Wetlands are also important as resting sites for migratory birds. Avifauna species found in India have been listed by Gopal (1995).

Wetlands are one of the most valuable and important natural environments. They provide suitable habitats to innumerable organisms including birds. Wetlands in India cover an area of 58.2 million hectares (Prasad et al., 2002). Of 1340 bird species found in India (Ali and Ripley, 1987), 310 species are known to be wetland birds (Kumar et al., 2005). Mitsch and Gosselink (2000) stated that wetlands help in maintaining biodiversity of flora and

fauna and it was further emphasized in the study that countless species of birds, mammals, reptiles, amphibians, fish and invertebrate species depend on water and wetland vegetation for their survival. Similar observations on wetlands were also made by Buckton (2007).

### Materials and Methods:-

**Study Area:** Vadodara is situated on the banks of the river Vishwamitri (whose name is derived from the great saint Rishi Vishwamitra). The city was once called Chandravati, after its ruler Raja Chandan, then Viravati, the abode of the brave, and then Vadpatra because of the abundance of banyan trees on the banks of the Vishwamitri. From Vadpatra it derived its present name Baroda or Vadodara. It is located at 22.30°N 73.19°E in western India at an elevation of 39 meters (123 feet) Occupying an area of 4138 sq. km.

In the present study 6 talukas are undertaken which are Vadodara, Karjan, Padra, Savli, Vaghodiya and Dabhoi.

Figure No 1: Map showing talukas of Vadodara District

**Methodology:** The study has been conducted in wetlands of different talukas of Vadodara district during 2012-14.

**Flora:** During the field study, plants were documented and plant specimens were also collected along with their flowering and fruiting parts for preparing herbarium. These herbaria are useful for identifying the specimens from the flora. The herbarium sheets were labelled, numbered and deposited in the Herbarium of Gujarat University. The plant species were identified with the help of available literature in the library (Department of Botany, Gujarat University, Ahmedabad). Photographs of plants were captured with a SLR camera.

**Fauna:** Observations were made by conducting field visits at regular intervals. Fieldwork was conducted from 2012 - 2014. Field visits were made every month during the study period, to monitor three distinct seasons (i.e. winter, summer and monsoon). The observations were carried out with a pair of binoculars and the species were identified using recognized field guides like those of Ali & Ripley (1983), Grimmett et al. (1998), Rasmussen & Anderton (2005), etc.

### Result and Discussion:-

In the present study 420 species and 330 genera of vascular plants belonging to 91 families were reported. Out of 420 species, there are 211 herbs, 94 trees, 81 climbers and 34 shrubs reported (Graph No. 1). List of plants found in the present study were listed in Table No. 1 along with Botanical name, family and local name. In the present study Fabaceae is found largest family (46 species), followed by Poaceae (29 speceae), Asteraceae (23species), Convolvulaceae (20 species) and rest are below 20 species.

**Graph No. 1:** Graph showing the habit of flowering plants.

**Graph No. 2:** Graph showing the top 10 families found in the present study.

**Table No. 1:** List of flowering plants found nearby the wetlands in Vadodara district.

### Conclusion:-

In the present study 420 species and 330 genera of flowering plants belonging to 91 families which provide basics for survival for others animal including birds, reptiles, amphibians and insects. Many wetlands are vital bird's habitats and bird's usage them as migratory resorts for breeding, nesting and rearing young once. Some water birds like Grebes have adapted to wetlands to such range to survive as an individual species depends on the accessibility of food and shelter in certain types of wetlands within their geographic ranges.

#### Abstract

Educational Philosophy is the applied philosophy. Education and Philosophy are closely interrelated and complementary to each other. Every aspect of education has a philosophical base. The aims of education, curriculum, methods of teaching, the system of discipline, the role of teachers etc., are influenced and determined by Philosophy. Thomas Gavan Duffy was an eminent Educational Philosopher who founded, guided and developed hundreds of schools in the Presidency of Madras from 1911 to 1941. He was a son of Sir Charles Gavan Duffy, the 8<sup>th</sup> Premier of Australia. He landed Pondicherry in 1911 for the Christian Mission and committed himself for the cause of education of the underprivileged. He was one of the members in the educational council of the British Government. He was the champion of village schools and venerated by thousands of beneficiaries of his schools. His pioneering efforts in the reform of elementary educational system in the Presidency of Madras made his name legendary even in his life time among the educationists. He had evolved and explored an educational philosophy which aimed at the holistic development of the children. With the aim of giving relevant, purposeful and helpful education, he constructed the curriculum which was practical and useful, invented and introduced innovative methods of teaching, advocated school discipline which ensured self discipline, self esteem and self governance and well drafted the role and function of the teachers to achieve the objectives of education. The methods of teaching introduced by Duffy were innovative, relevant, attractive, inspiring and useful and were based on life experiences with practical aids. These methods were well directed towards the wholistic development of the children. These methods of Duffy still have great influence and significant impact on the modern education.

#### Introduction:-

Thomas Gavan Duffy was “the Great Man” in every sphere of life. He was a great scholar, philosopher, educationist, social reformer and a man of God. He was born at Nice, France on 23<sup>rd</sup> December 1888 of an Irish father Sir Charles Gavan Duffy who fought for the freedom of his motherland and became the 8<sup>th</sup> Premier of

**Corresponding Author:- Anthony Arul Pushpam L.**

Address:- Ph.D., Research scholar in Philosophy of Education.

Victoria. Duffy had landed to Pondicherry in 1911 for the Christian mission. Till 1941, for three decades he had been founding, guiding and developing hundreds of 'Little Schools' in the Presidency of Madras. Duffy, who had been educated in different nations, travelled far and wide and had experience of different peoples and cultures had successfully synthesized different philosophies and came with the educational philosophy for the ordinary masses. His educational philosophy is very much Naturalistic in its setting, Idealistic in its aims and objectives and Pragmatic in its method and plan of action. His educational philosophy was more ideal, practical, natural and useful and aimed at the holistic development of all irrespective of origin or religion. In the Pondicherry Mission, Duffy brought a uniformity of practice in the administration and control of village schools. He introduced the common syllabus, the same texts, the same method of teaching and standards of examination to all the little schools in the Pondicherry Mission which comprises the present civil districts of Cuddalore, Villupuram, Chengulpet, Kancheepuram, Tiruvannamalai, Vellore, Salem, Namakkal, Dharmapuri, Krishnagiri, Kumbakonam, Thanjavur, Tiruvarur of the State of Tamil Nadu and the Union Territory of Pondicherry in Indi. (Brady Gerard, Thomas Gavan Duffy, p.334). His innovative methods of teaching were very relevant and helpful to impart the quality and holistic education to the children. These methods are being used even today in the modern education.

### **Duffian Methods of Teaching in the Primary Schools:-**

Method has an important place in education. It is through method the teacher establishes and maintains the contact between the child and subject matter. Duffy was an enthusiast for the employment of novelty and imagination in the educative process. He said that talking is easy, teaching is hard; and influencing the will of the child whom God has made free is a grace given only to those who seek it very earnestly". (Brady Gerard, Thomas Gavan Duffy, p.472). Hence Duffy introduced different innovative and useful methods of teaching in the Pondicherry Mission schools in the Presidency of Madras.

### **The Correlation method:-**

'Correlation' means 'connect or to be connected'. Correlation in teaching indicates a technique which shows the reciprocal relationship between various subjects of the curriculum for making knowledge concrete and permanent. For Duffy the most objective of education was to prepare the children for future life. This objective would be achieved only if education was correlated with life. Therefore he correlated the various subjects with various aspects of life in order to make the subject relevant and practical to the day to day life of the children. For an example, Duffy introduced the theme 'cattle' for the kindergarten class. The classes started with the conversation between teacher and the children about cattle known to the children, connected with the life. The teacher also made efforts to correlate the given subject with the other subjects like Arithmetic, drawing, clay modeling, bead and stick laying, song and storytelling. (Duffy, Siruvarkalin Thozhan, Vol.6 (1931) sheet No. I A 1(1)).

By using this method of correlation, Duffy had two purposes namely to correlate the main subject with all other subjects taught on the day and to connect the subject with the day today life. It was moving from known to the unknown, simple to the complex and concrete to the abstract. It was very useful method to learn the lessons thoroughly and remember it for a long.

### **The Psychological Method:-**

Modern education is based and founded on Psychology. Rousseau once remarked, "The child is a book which the teacher has to learn from page to page". (Walia J. S., Principles and Methods of Education, p.76). Hence the whole concept of education and its implications are based upon psychological methods.

Duffy in his book, "A Think in Time" had given many guidelines to the educators to understand the child and to develop its all round personality by studying the child's interests, aptitudes, natural faculties and the limitations of the child. He reminded his collaborators often the words of Chesterton "In order to teach Latin to John....you must first know John as well as Latin....". The personal files kept about each student were a wonder of precision and care' (Arokiasamy G., (Ed.) Thozhan, 1988, p.105). Duffy followed this method in his Mission schools already in 1913, long before it was known in the educational world. (Arokiasamy, G., Thozhan, 1988, P.36).

### **Activity Based Learning (ABL) :-**

Activity Based Learning (ABL) means that learning is based on doing some hands-on experiments and activities. The idea of activity based learning is rooted in the common notion that children are active learners rather than passive recipients of information. In 1918 itself, Duffy had, with his great innovation and imagination, constructed the curriculum with a lot of activities in teaching the children. He very aptly mentioned that "Children need change.

Vary the routine, the time table, and the occupations as often as you can. Introduce some new thing. Make a fresh start. Too many of our institutions have a tendency to stagnation.’ (Duffy, A Think in Time, p.21)

Duffy admonished the educators to have a good and prior preparation for everyday class and instructed them to collect and prepare teaching aids from their village itself. Beads, pebbles, small nuts, sticks, clay models are to be used in teaching numbers, addition, multiplication and deduction. (Duffy, Siruvarkalin Thozhan, Vol.III, 1919, part 1, p.12). Thus, Activity Based Learning introduced by Duffy at the dawn of 20<sup>th</sup> Century, made a tremendous impact on the learning process of the children.

#### **Play way method:-**

Play is regarded as the language of the child. What he cannot express through language, he expresses that through his behavior and that behavior is play.

Duffy, as an innovative educational philosopher, had introduced the play way method in his curriculum. He said that “If you want the children to listen, you have to interest them. Modern pedagogy has plenty of tricks for that very purpose; use them. Begin with a story, a true story if possible, and one as close as may be to the children’s own life and interests.” (Duffy, A Think in Time, p. 49).

The underlying activities like singing songs, Music, storytelling, drawing, band, craft, bead and stick laying, play, games and drill, scouting were typical examples for the play way method of Duffy. Thus Duffy had very much insisted to use the play way method as an effective and purposeful medium of educating the children. He also periodically invented new techniques to enhance the play way system and greatly encouraged the teachers to make use of the natural materials and their own imaginative thinking to achieve this goal.

#### **Basic Education:-**

Basic is something relating to or forming/ serving as a base or basis; fundamental. Basic education “(in India) means education in which all teaching is correlated with the learning of a craft” (www. Collinsdictionary.com/dictionary/English/ Basic Education).

Duffy felt that traditional and colonial forms of education were irrelevant and un-supportive, costly, abstract and useless for the ordinary masses. In his first village school in 1913, Duffy introduced the subject cultivation which suited to the needs of the district and the capacity of the pupils. It was important that the children should be better fitted to earn their livelihood in the fields later on. The agricultural side of the school was an immediate success and soon aroused keen interests among the parents. The people from the neighborhood also flocked in great numbers to see the experiments in the school. The attraction of such manual training was a greater one for the villagers than the mere book learning of reading and writing. (Brady Gerard, Thomas Gavan Duffy, pp.230-232). This personal and practical experience and its impact on the day today life of the people was a driving force for Duffy to extend this system ‘Basic Education’ later on to all mission schools long before the name was known in India (Michael Bosco, D., Souvenir for the twenty fifth death anniversary of Thomas Gavan Duffy, 1966, p.8).

Besides Gardening and Manual labour, Duffy had also included in his Basic Education, carpentry, ironwork, bricklaying, weaving, basket making, mat weaving and other rural local crafts. Thus basic education for Duffy was a part of education aiming at development of the all round personality of the pupils and make them to be rooted to the soil with a glorious vision of the future.

#### **Self Governance method:-**

Self governance means the exercising control or rule over oneself or itself. It also means of having the right or power of self-government; autonomous. (www. the freedictionary.com/self governance).

Duffy invented and introduced the self-governance education method in the Mission schools in order to train and form the future leaders of the oppressed community.

At every school, Duffy established a ‘Students’ Panchayat’. The Panchayat was headed by a head monitor and a group of Panchayat members. They were chosen for this Panchayat for a period of a month. There were twenty five other officers who were appointed with tenure of office for a week so that all might enjoy frequent terms of office. The object of this educational method was to establish order and to develop a sense of communal responsibility. Each function had its books of rules and privileges.

In this way by the frequent rotation of these offices the pupils were trained in a variety of useful occupations and were trained to value local institutions, to feel the need of order and to exercise authority- in other words they received grounding in the elements of enlightened communal living. "It is amazing, Duffy wrote, "how soon the students began to feel and exercise their power in the community, how promptly they played up the role committed to them and how universally they came to prefer the school to the jungle and the book to the bullock." (Brady Gerard, Thomas Gavan Duffy, pp.229-230). By this method, Duffy aimed at forming the leaders for the village community as well as for the nation.

#### **Participatory Rural Appraisal (PRA) method:-**

Participatory Rural Appraisal (PRA) means involving the rural masses to find out of information about problems, needs, and potential in a village and to help them to plan, to make decisions, and to take actions towards improving their own situations.

Duffy introduced the excursion to the village resources in his curriculum. During the excursion, the teachers' work must be mainly passive and the pupils must be encouraged to see things for themselves.

The following were a few things of common interest in the ordinary village for the participatory appraisal for the children: 1. A visit to an oil mill, 2. A smithy, 3. A carpenter's shop, 4. A cycle shop, 5. A common well, 6. A village fair, 7. A mountain, stream or lake or river, 8. A crow's nest, an ant hill or wasp's nest, 9. Post office, Panchayat office, 10. Observation of a well digging operation, 11. Making a note of the effects of a heavy rain or severe storm, 12. Observation of rainbow, and 13. Observation of crops and animal husbandry. This method of education made the children to involve themselves to observe and to acquire a practical knowledge from their own local resources. It also motivated the children to think about their obligation and responsibility to the growth and development of their village in future. (Gavan Duffy, T., Siruvarkalin Thozhan, 1919, p.34)

#### **Duffian Methods of teaching and its significant impacts on Modern Education:-**

Duffy was a paramount educationist who has the credit of founding, guiding and developing hundreds of Educational institutions in South India for over three decades. He evolved and explored his own innovative methods of teaching in his schools. Duffian methods of teaching had really made a great impact on the people in the presidency of Madras and it has been continuing its influence even on today's schools.

- ❖ By Correlation method, Duffy made the lesson relevant to one's life and made it practical and useful. This method is being used in many disciplines in all levels of education and found useful for gaining the comprehensive knowledge of the subject.
- ❖ Basic Education which included compulsory Gardening, manual labour and rural crafts aimed at the holistic development of the children and made them to be rooted to the soil. It had a place in the educational policy of the Government in India.
- ❖ Self Governance Education is a system of Students' Panchayat which had given importance to the achievement of Self discipline, Self esteem, and Self reliant education.
- ❖ Psychology is an essential element in education. Studying the Psychological bases of the child like the child's interests, aptitudes, natural faculties and limitations is much needed and indispensable even today.
- ❖ 'Excursion on Rural School' is very important to learn the historical, geographical and social and Natural resources of the place.
- ❖ The Activity based learning, though it was introduced at the beginning of 20<sup>th</sup> Century by Duffy, has resulted in the tremendous impact on Modern education.
- ❖ The play way method created a joyful and attractive atmosphere to the children. It was an effective and purposeful medium of educating the children. In modern education, the play way method is being used to make teaching and learning as conducive and congenial.

#### **Conclusions:-**

Duffian methods of teaching were very innovative, inspiring, attractive, relevant and useful. Having gained thorough knowledge of the place and people, searching a solution for the ever ending school question for the poor and responding to the needs of the hour, Duffy advocated, adopted and implemented the concrete methods of teaching for the poor and the downtrodden who were deprived of their right to education and life for centuries. The Concrete method of teaching helped the people to remember their poetic verses, arithmetic, songs or story or the event till

their life time. Some methods greatly encouraged them to involve themselves to find means for their life. On the whole, Duffian methods were of new explorations for the remote rural uncivilized masses for their upliftment in all walks of life.

 Final Accepted: 17 December 2016  
 Published: January 2017

##### Key words:-

Information security threats, information threat, security threats source and hackers.

#### Abstract

The purpose of this paper was to study information security threats, information threat, and security threats source with a threat agents. It focused on the meaning of hackers and perceptions of public against the word "hackers" with a special emphasis on different types of hackers within organizations and in the society. The empirical literatures provide the best way to prevent the problems of hacking in the society and shows that white hats, black hats and spy hackers motivation strategies are largely involved and effective to check organizations performance. It proposes quantitative approach with the design and descriptive for this study. The questionnaires will be used will be selected as a means to collect data with a simple random sample of the company's employees as observers / participants in the study.

#### Introduction:-

##### background of the study:-

Information is esteem, and more corporations have understood that information security dangers can impact business prepare coherence and open picture, relations, can bring about monetary misfortune, impact relations with customers and accomplices and their fulfillment, and additionally make the issues with lawful dominant presences if there should be an occurrence of non-compliance (marchewka, 2014).

The world has turned into a worldwide town because of the broad utilization of the web where with a tick of a mouse, a solitary thought can achieve billions of individuals over the globe. The advantages of information for corporations are obviously incomprehensible. Information is as of now the main thrust of organizations and economies because of the globalization of products and markets. The internet has empowered information accessibility in this manner making it a most important information source and a method for information transmission. The obstruction achieved by area is starting to die down as virtual organizations are as of now running round the clock. Increased dependency on information by organizations has consequently led to an increase on the dependence of the CIA (confidentiality, integrity and availability) are the three main features of information security. The privacy guarantees that data is accessed only by those who have rights, information integrity serve as the state of being complete and uncorrupted and availability will enable users or other systems to access information (solms, & niekerk, 2013; shedden, smith, & ahmad, 2010; whitman & mattord, 2008). The paper presents a thorough details on information security threats, overviews of threats with the security threats source through the internal and external threats caused. This causes may likely to be the positive impacts to better identify threat's characteristics in order to

propose suitable measures to reduce risks. The succeeding of the paper is organized as follows. The next segment outlines information threats agents (accidental, contributory and deliberate). Section 3.1 discussed with word “hacker”, 3.2 stated various types of hackers and the 3.3 section consider how the problems of hackers can be prevented in the society. While the last section 3.4 provide the recommendation and conclusion at the ends of the paper.

#### **information security threats:-**

'Information security is the assurance of data and its basic components' (whitman&mattord, 2008). Ferrari and thuraisingham (2006) portrayed information security as shielding information and frameworks from dangers, for example, unapproved access, unlawful use, exposure, interruption, alteration or destruction. According to ponemon institute (2014), and walters (2014) uncovered that information or security ruptures happen when information is not adequately secured and unapproved people can get to it. an information break can prompt to genuine outcomes. For organizations, a break regularly includes genuine budgetary misfortunes, expensive claims, reputational harm and in outrageous cases loss of business. Wholesale fraud, money related misfortune and harm shockingly appraising are a portion of the results of information crack for people. Information crack regain takes numerous years and the money related harms are cruel (ponemon institute, 2014).

Information security (infosec) is sweeping and incorporates specialized, behavioral, administrative, philosophical, and hierarchical methodologies that discourse the insurance and moderation of dangers to information resources (zafar&clark, 2009). Despite the fact that a portion of the information systems inquire about in the infosec field has considered socio-philosophical concerns or socio-authoritative concerns, it has basically cantered around specialized issues concerning the outline and usage of security subsystems (choo, 2011). For example, advanced technical approaches to deal with forestall interruption into authoritative frameworks (hansen, lowry, meservy, &mcdonald, 2007), discovery of denial of service attacks (zhi-jun, hai-tao, ming-hua, &bao-tune, 2012), and more advanced solutions for firewall protection (ayuso, gasca, &lefevre, 2012).

Although these technical, externally focused efforts are important, one zone that is an overwhelming shortcoming in legitimately securing information resources is the individual client inside an organizations (posey, bennett, &roberts, 2011; warkentin&willison, 2009; stanton, stam, mastrangelo&jolton, 2005). This is an especially critical problem since investigators evaluate that about half of intrusions and security violations happen from inside an organization by authoritative insiders (richardson, 2011; baker, goudie, hutton, hylender, niemantsverdriet, &novak, 2010). Until recently, research exploring the operational aspect of information security has been lacking.

However, the improvement of information and communication technologies and expanding availability to the internet, organizations get to be defenseless against different types of threats. Indeed, their information gets to be presented to digital assaults and their subsequent harms. Dangers originate from various sources, similar to representatives' exercises or programmer's assaults. The financial losses related misfortunes brought about by security ruptures, for the most part cannot definitely be distinguished, on the grounds that a critical number of misfortunes originate from smaller scale security episodes, created an underestimation of information framework security chance (shiu, baldwin, beres, mont, &duggan, 2011; farahmand, navathe, sharp, &enslow, 2005). Hence, managers need to know dangers that impact their advantages and recognize their effect to figure out what they have to do to counteract assaults by selecting suitable countermeasures.

To find these threats, threats sources and specific areas of the system that may be affected should be known, so the information security assets can be protected in advance (alhabeeb, almuhaideb, le, &srinivasan, 2010).

#### **statement of the problems:-**

As the modernity of cyber hackers intensifies keeps on expanding, their techniques and targets have likewise advanced. Rather than building the expansive internet worms that have turned out to be so well known, these offenders are presently investing more energy focusing on riches gathering violations, including misrepresentation and information theft (damico, 2009). Cyber-media india online ltd (2006), recommends that since home cuestas regularly have the poorest efforts to establish safety set up, they have turned into the most broadly focused on gathering. Cyber media reports that 86% of all hacking attackers are gone for home users. As attacks on homebased clients' increment, new systems are surfacing, including the utilization of noxious code to attacks web programs and desktop applications.

Damico (2009) posits that by surveying that is efficient and effective in technique can limit the probability of been hacked. Although personal system users may not feel like they are associated with a system, any action on the internet can be considered "arranged action." therefore, security measures utilized by systems may likewise profit the home users. Switches and firewalls can regulate admission to a home computer, yet more particular strides might be used.

Top layer security (2008) considered the variance in network intrusion prevention and network detection systems. Its findings suggest that prevention systems "automatically detect and block malicious network and application traffic, while allowing legitimate traffic to continue through to its destination". It further stated that system that is detected may notice an unwarranted activity, but where is the protection from fast acting attacks? A system that is fully secured can stop and prevent malicious sites from entering or gaining access to a computer system. "the prevention system must operate with switch-like latency at all times". Due to advancement in technology old users of technology cannot be protected based on previous technology, they have to be up to date in order to beat malicious software.

a system that is prevented against virus and malicious software's must not block sites which are not dangerous to the system even if the system is at risk of an attack. It must have an extent to prevent malicious programs from damaging the system and must be up to date at regular intervals.

as a matter of facts, personal users of system must be known to various techniques which is been used in hacking and breaking in to a computer system. in hacking, the person can make use of various instrument to access information via the world wide web. We should bear in mind that system is not always stealing useful data but can also be used in saving content (such as pirated movie downloads) or a system could be recruited into an online 'bot army' (damico, 2009). In order to increase private owner's security against hackers, some steps can be taking such as making sure that his computer system anti-virus is updated. Computer users have always been attacked by malicious software due to negligence on their own part in updating the software which has been paid for by them. Virus data base needs to be constantly updated because of malicious threats always keep on transforming that is the reason why software updates are always available, in a situation where it is not updated then the user system might be infected with malicious software.

Hackingalert (2008) suggested a means through which users can get solutions by installing appropriate firewall. The firewall's acts as a shield in stopping unwarranted access to a computer system. However, a firewall does not erase data which is stored on the system. To be more secured an anti-virus subscription is needed in case it was able to bypass the firewall it will not be able to pass through an effective anti-virus. We have so many trojan and virus software in the market and running a different type will help in eliminating threats to a network or system.

## **Chapter two: literature review:-**

### **Threats:-**

A threat is the adversary's goal, or what an adversary might try to do to a system. It is also described as the capability of an adversary to attack a system (swiderski&snider, 2004).

### **security threat source:-**

A threat can be caused by internal, external or both external and internal entities.

- Internal threats is a situation when someone that has access to network with his details or credentials is negligent in his duties. A threat that is within the firm is usually because the worker failed to follow the due process or because he failed to report a specific threat (silowash, et al 2012).
- Jansen (2011) posits that threats outside the organization can be from outsiders not working for the organization. They have no access given to them by the firm in assessing their system or network. Organizations have to make sure that by pass by outsiders is cut off of natural disasters: hurricanes, fires, floods and earthquakes. External threats is done when network are intertwined together (wired and wireless), physical intrusion, or a partner network.

### **information threats agents:-**

The threat agent is the on-screen character that forces the risk to the system. There are currently wide range of sorts of threats to information security that may achieve loss of confidentiality, integrity or availability. this

study identified three categories of information threats such as accidental or unintentional, contributory or instrumental, and deliberate or intentional (greitzer, strozer, cohen, moore, mundie, & cowley, 2014; afyouni, 2006).

#### **accidental or unintentional threats:-**

Accidental or unintentional threats are those brought on by events outside the IT hardware (i.e. Those that are outside human ability to control) such as natural disasters, technological disasters and human threats (bompard, huang, wu, & cremenescu, 2013).

#### **natural disasters:-**

Natural disasters are one of the primary dangers to information. The term 'environmental threats' is also used by some authors to depict these sorts of threats. Natural threats are dangers brought on by non-human agent. It comes, in the first place, from environmental threats like fire, lightning, flood, tidal waves, wind or water and likewise, due to animals and wildlife which cause extreme harm to information structures like lightning, tidal waves (like tsunami), floods and fire. Without a doubt, this class incorporates different dangers, for example, terrorist attacks, riots and wars (jouini, rabai, & aissa, 2014).

#### **2.2.1.1.2 technological threats**

Innovative dangers are created by somatic and compound procedures on factual. Physical procedures incorporate the utilization of physical intends to pick up passage into confined ranges, for example, to build, compound room, or whatever other assigned territory like burglary or harm of equipment and programming. Be that as it may, synthetic procedures incorporate hardware and programming innovations. It, additionally, incorporates indirect system support equipment like power supplies (jouini, rabai, & aissa, 2014).

#### **human threats:-**

This class includes threats caused by human actions such as insiders or hackers which cause harm or risk in systems (abdulkadir, & dzarma, 2015; shaluf, 2007).

#### **Contributory or instrumental:-**

Contributory or instrumental intimidations are presented by the disaster or non-existence of adequate measures. Uncontrolled access to IT equipment would constitute a procedural threat (alhabeed et.al, 2010; poulsen, 2003). Hayes (2014) posits that technical disaster causes the main procedure to be hacked. For instance, someone who has no authority may have an access to a computer data if there are no necessary measures to check people. If there is no restricted access to key places then important information or data can be accessed to unauthorized individuals. An organization that has control over its data and updates it regularly and usually amends it at interval bridges the gap of a potential hack. All computer operators that have unqualified system operators are usually prone to hacks. For these reasons, administrators must make sure that only qualified people are employed and people who are trusted are in such seats or positions. Similarly, in case of leave or if an employee's services are no longer needed, all organization ID card or anything that can make him have access to the premises must be collected at the point of exit.

Contributory or instrumental threats are presented by the disappointment or non-presence of satisfactory methods. Uncontrolled access to IT hardware would constitute a procedural risk (alhabeed et.al, 2010; poulsen, 2003). Hayes (2014) procedural threats cause the correct procedures to be by-passed. For instance, an unapproved individual may acquire access to computers hardware or media if there are insufficient checking systems. In the event that inadequate intelligent gate to systems exist then information might be perused or overhauled by individuals with no power. Control over the advancement of new structures and the change of existing ones averts inaccurate projects being put into live utilize. All methods are at hazard through temperamental work force. Personnel routines ought to guarantee that exclusive respectable staff are utilized in places of trust. Exit systems ought to guarantee that staff leaving the organization do not hold their distinguishing proof or means of access.

#### **Deliberate or intentional:-**

Deliberate or intentional threats can be defined as the threats designed for either benign or malicious purposes to destroy or abuse targeted information. These include malware, hacks, intrusions, denial of service (dos) attacks, theft, fraud, espionage and arson (ateeq, 2012).

**Malware:-**

Malware is programming that is intended for a noxious reason. The software can contain viruses, trojan stallions and spyware (dezfouli, dehghantanha, mahmod, sani, shamsuddin, &daryabar, 2013). Solomon and chapple (2005) archived that viruses contain malevolent code intended to adjust documents to perform unapproved activities. Viruses are intentionally coursed to computer users with the expectation of spreading to different clients and harming or obliterating their information. The impact can be harmless (for instance, a screen message), or it can be a genuine defilement of either data or software (shim, qureshi, &siegel, 2013).

**laptop theft:-**

Laptop theft is a critical threats to users of laptop computers. Casualties of laptop theft can lose equipment, programming and key data that have not been moved down. Criminals may likewise access touchy information and individual data (brown, 2009).

**Fraud:-**

According to action fraud (2011), described fraud as any purposeful or consider act to deny another of property or cash by cleverness, fraud or other out of line means. It is one of the threats that can genuinely influence information. Misrepresentation or fraud is utilized as a part of numerous areas for various purposes, for example, internet misrepresentation and financial fraud. Internet fraud has gotten to be one of the most effortless courses for vandals to pick up cash or essential data utilizing strategies, for example, phishing tricks.

**Intrusions:-**

Vacca (2009) revealed that interruptions are assaults utilizing any strategy to increase unapproved access to a system. Denial of service (dos) attacks are intended to avoid honest to goodness access to systems and cause the inaccessibility of assets (desai, patel, somaiya, and vishwanathan, 2016). Hacking in to a computer software or data occurs when an individual is not giving the permission to handle such data. Hacking is a process of bypassing a network while to tab means to connect to a cable (easttom, 2006). Hacking is usually performed to prove the technical skill of the hacker but may destroy the confidentiality, integrity and availability of data.

Hacking and tapping happen when some person sets out, without power, to investigate pc held information. Hacking suggests breaking into a system while tapping infers truly partner into a connection (easttom, 2006). Hacking is commonly performed to show the particular mastery of the developer however may wreck the mystery, genuineness and openness of information.

Hackers can abuse information by inserting a piece of code into a program. This code operates at some future date to corrupt files or software.

**Hacker:-**

hackers are wise individuals who might not have a passion for their talent initially but they do it for the money involve. The main motive of hackers is to make information available for everyone and they think it is right to use programs produced by someone else in achieving their objective. Before we proceed it is imperative to understand what hacker is (loader &thomas, 2013).

In the first instance, a hacker cannot be regarded as a criminal because he does not break the law nor does he release virus to the system. Similarly, a hacker cannot be regarded as a kid who just sits down and eats and watches his environment (sanglakhi, 2013).

some one that hacks is usually not a computer guru because he cannot enter security codes of all websites nor software applications. Similarly, he is not someone who just sits around to do carpentering work like assembling and coupling of wood to make a chair or furniture (sanglakhi, 2013). Similar to the findings of sanglakhi (2013) sees an hacker as some features and his characterized as someone with interesting features, he uses his brain to think out of the box and usually tries to do what other people do not believe in or even thought of doing.sabahi (2011) posits that someone that explores and creates new things, new episodes and also does things in ways which no one as imagined or thought of as a hacker

In 2013 all these definitions are have turned to significantly more negative meanings. According to the merriam-webster dictionary (2013) described "hacker" as "a person who illegally gains access to and sometimes tampers with

information in a computer system.” This definition has led many people to fear computer hackers but not all hackers are bad people. Hackers can be put into different categories which are discussed below.

#### **types of hacker motivation:-**

According to online safety expert for intel security, robert (march 16, 2011), xu, hu, and zhang (2013), and bratus (2007), reported that computer hackers are typically grouped into various types, white hats, black hats, grey hats, script kiddie, hacktivist, cyber terrorists, spy hackers, phreaker, and the final hacker is motivated by government popularly known as state sponsored hackers.

White hats attempt to help prevent weak systems from being hacked and attempt to make the web a safer place for individuals. Black hats do the opposite; they cause problems and can sometimes harm individuals and companies by stealing identities, money and other things as well. A grey hat hacker is someone who is between white hat hacker and black hat hacker. Grey hat normally do the hacking without the permissions from the administrators of the network he is hacking. But he will expose the network vulnerabilities to the network admins and offer a fix for the vulnerability for money. script kiddies is a derogatory term for black hat hackers who use borrowed programs to attack networks and deface websites in an attempt to make names for themselves. A hacktivist is a hacker with political intentions. The hacktivist has the same skills as that of a hacker and uses the same tools as the hacker.

The main reason of hacking is to create attention. Cyber hackers usually have a motive which is either politically or religiously in tuned towards their belief and they try to create chaos and tension by destabilizing critical facilities. Hackers usually plan to rob secrets and have access to top security files. Hackers can act within the jurisdiction of the organization where they act like spy or they may act from outside. The main reason for hacking is to get the job for which they are paid done. Someone who hacks a prepaid card without paying is also a hacker. Hackers can be used by a nation or by the government to gain secrets of it enemies. They use the world wide web to gather information about a particular government all nine of these groups use various different hacking strategies that they use in order complete their tasks. Many hackers, both black hats and white hats are involved in organizations.

#### **Chapter three: research methodology:- research method:-**

The primary research method for this study is based on literature review and the methodology selected for this proposed study will be detailed here: the planned research design, methods of selection, data collection and analysis of results will be explained. It is hoped that the chosen methodology will provide useful information through the collection and analysis of data on the information security threat and the hackers.

#### **recommendation and conclusion:-**

The whole problem with cyber-security presently is that since the cyber-criminal is constantly upgrading his knowledge and methods, most intrusion prevention software applications only deal with the methods previously used. the home user may benefit by subscribing to any one of a variety of newsletters that stay abreast of the hacker world. one such free newsletter can be offered by [hackingalert.com](http://hackingalert.com).

Therefore, all users must take a large role in understanding the issues regarding cyber security and implementing their solutions. There are few recommendation that being suggested by scholars such as :

**Education and training;** teaching a student to hack is still an issue we face today. Some feels that hacking should be put into curriculum in university and that they will teach students how to improve intrusion. It is same like giving a tools for the students on how to hack is simply like giving a crowbar for a burglar to break into a house. Certain policies need to be applied at university as we never know whether the acquired skills will be used for the good or bad. Policies need to address issue for students who conduct malicious acts by applying security checks on individuals which universities do certain courses such as ethical hacking. For example, a criminal background check, the requirement of some sort of professional certification, and student interviews are a few measures that could potentially weed out several, if not all, all students with potential malevolent intentions.

**Trusting the potential enemy;** some of skilled professionals use their abilities to harm the society by finding vulnerabilities in the system and attacking them. This is when we need the ethical hacker that may do the job. Two totally different individual would need to be hired to run tests for companies so that no on individual can have total freedom with any one system.

**Risk management;** ethical hackers can minimize the risk of impact by exploring vulnerabilities beforehand to minimize the risk. Allow the company to undertake penetration test to find if they are vulnerable to attack. There should be some leeway and the hackers should be allowed to use certain tools to help them with their job without any question to identify security vulnerabilities in the company's system.

**Penetration testing;** penetration testing defined as a legal and authorized attempt to locate and successfully exploit computer systems for the purpose of making those systems more secure. Includes probing for vulnerabilities as well as providing proof of concept attacks to demonstrate the vulnerabilities are real. Proper penetration testing always ends with specific recommendations for addressing and fixing the issues that were discovered during the test. This process will help to secure computers and networks against future attacks by finding security issues.

#### Abstract

Medical practice done by non-medical people in india and their propagation in medias, and also its implications are discussed in this article. Multidisciplinary approach is essential for eradicating the quackery industry.

#### Introduction:-

Nothing is impossible in Indian law even if you endanger the life of the people; medical practice is not an exception. Every one of us might experience with quacks in medical practice either in good or bad situations. Quacks are untrained, often illiterates who have some experience with medical profession involved in medical practice for earning easy money. Even a medical person from other branch of medicine those are practicing allopathic medicine to earn easy money [1,2,22]. In my childhood I had got severe ear pain in the middle of the night due to accumulation of wax and I was treated by a quack with injections and by removing my ear wax with some instruments. He relieved my symptoms afterwards I never met a qualified doctor for that problem. In our village we are calling him as "Doctor", although he is a doctor to us, he neither studied at high school or nor trained at medical school.

#### What makes nonmedical person to practicing medicine?

Money is the first reason; you can earn money without hard work and education. How long it takes to learn basic practicing skills and basic illnesses? Hardly in few hours of practice, you can learn basic medicines and minor procedures like giving injections, in a few days of time suturing minor wounds and doing minor surgical procedures. Most of them were worked as an assistant for a medical practitioner for some time. When the medical practitioner is busy, they are in the position to teach them for how to dress a wound and how to give injections; it is the basic foundation for them in quackery [2,3,24].

Non allopathic practitioners are promoted most often by the corporate hospitals and private hospitals, which require duty doctors with less salary for long working hours. These paramedical professionals were trained in a need based

**Corresponding Author:- Dr.P.Jayakumar.**

Address:-Department Of General Surgery, Government Rajaji Hospital and Madurai Medical College, Madurai 625 020, India.

manner for a particular specialty of the hospital. When they moved out they will engage in quackery. Some hospitals are giving hands to quacks to get referral cases and supporting them by managing complications results from quackery and providing referral charges to them for cases referred by them[3,4,5,24].

Most of the quacks are in big villages by doing mobile practice and some of them are having established clinics with few beds for intravenous fluid administration and most of them were charging more than General practitioners(GP) nearby. This is one of the reasons why private practitioners avoid practice in remote areas. Some places allopathic Medical Practitioners were threatened and defamed by these quacks by various means to avoid competing practice[6,7].

Laws which govern the people are not so stringent. Even though the law is not directly permitting the quackery, but it does in its own holes. Less captive punishment promotes the quacks to encounter this medical profession as a lovely profession. Some verdicts about these quackery permits anybody can practice modern medicine and government also not bothering them. Most of the time association of quacks obvious with well known local body members and politicians makes it difficult to handle. Indian Medical Association (IMA) voices against about this quackery are often unheard, sometimes with the effort of government quacks were stopped their practice temporarily but resumes once actions against them withheld[7,18].

Government run Health Sub-centers (HSC) are rooting the quackery in some places. Village health nurses are selling the drugs and collecting money for intravenous fluids and injections, which was supplied by government for free of cost. These village health nurses are less monitored by their medical officers.

Media also promoting quackery indirectly by promoting advertisements from the quacks and traders. Websites claiming magic cure for chronic non-curable diseases are not monitored by the government. Magic remedies and common cold, fever remedy advertisements results in selling of medicine in small shops without any knowledge of medicine. Websites claiming cure for HIV/AIDS is also possible in India and promoting alternate treatment for chronic diseases including cancers by avoiding surgery and adverse effect of chemotherapy too. Why not we nominate them for Nobel Prize? Like people disseminating wrong information about sex and infertility in state wide channels with local language in the name of native medicine, who is claiming a website also making the situation worse. Media which is also promoting quackery in many ways by advertising and interviewing quacks[8-10,25,26]. Medical shops owned in India are not run by pharmacists, but with license of a pharmacist anybody can own the medical shop. Most of the time medical shops are managed by uneducated person and they provide medicines for all your problems including medical termination of pregnancy. Some of these shops are providing injection facilities and Intravenous (IV) fluid administration too in their back doors. Their irrational prescription of combination medications results in mild allergic reactions to fatal anaphylactic reactions. Very few are buying drugs with prescription in medical shops, most are telling their symptoms and collecting over the counter medicines, even well educated people are doing the same. The worst scenario is over the counter medication moved from medical shops to "Petty shops", you can buy medicines in all the petty shops along with cigarette and gutka. Even though doctor's ratio increased considerably, people are lazy to care their health by professionals but often by quacks. People less often understood the difference between quacks and doctors; they are calling everyone as a doctor, who are all practicing medicine. Government officials were often bribed by quacks, medical shops are less monitored and some of them are attached to or run by quacks. Some medical shops are offering weekly visit of quacks in the name of "visiting doctor" but the public is not aware that they are not real doctors, but so called 'quacks'[11-14,27,28].

Even though some GP's were suffered by quacks, the real sufferers are public at present. In our practice, every day we encounter these quack treated patients and self medicated patients with adverse drug reactions. We should create awareness to the public regarding harms of these short of quacks and self medication[15-17,29].

A Non Governmental Organization's plan of training quacks in rural areas or Indian Governments plan of short medical courses will not provide the real and permanent solution rather than creating new medical colleges and good facilities for training medical students[19-21].

### **Conclusion:-**

Quacks are made by us for our convenience by forgetting the end result of condolences. It's the time to change ourselves from engaging and promoting quackery. Plan of training quacks and short medical courses to fulfill the gap of rural doctors is not the permanent solution. Any single approach is not going to change the situation; it should be a multidisciplinary approach by creating awareness to the public, enforcement of law and the involvement of government increasing quality medical colleges, verification in medical shops and private hospitals.

#### Abstract

The idea of practical reasonableness has been developed by John Finnis as one of the seven basic goods. The other basic goods are pursued with the help of this good. All these goods are objective goods which are self evident and they are not questionable. In order to know whether our decisions are practically reasonable or not Finnis has given nine requirements of practical reasonableness. These nine requirements are-coherent plan of life, non arbitrariness in the preference among values, non arbitrariness among persons, detachment, commitment, limited relevance of consequences, equal value to all the basic goods, following one's conscience. John Finnis is also against consequentialism or utilitarianism. This project therefore tries to study the idea of practical reasonableness as put forward by Finnis.

**Aim and Objective:** To study the idea of practical reasonableness put forwards by John Finnis.

##### Research Questions:-

- What is the idea of practical reasonableness?
- What are the requirements of practical reasonableness?
- How did Finnis criticized consequentialism?

**Scope and Limitation:** The scope of the project is limited to the idea of practical reasonableness of John Finnis.

**Review of Literature** John Finnis, *Natural Law & Natural Rights*( Paul Craig, 2<sup>nd</sup> Edition Oxford University Press 2011)

This book is the seminal work of John Finnis where he has discussed in detail his ideas of practical reasonableness. Practical reasonableness according to him is one through which we pursue the other basic goods. In his book he talks about the seven basic goods and practical reasonableness is one of them. He has listed down nine requirements of practical reasonableness. Through these requirements we can actually know if our decisions are practically reasonable or not. According to him consequentialists are not practically reasonable. They always talks about maximizing the net goodness but according to Finnis its not possible. Again what is good for one might be different for others.

Conor O' Mahony, ' The Failings of Practical Reasonableness: Another Look at John Finnis' ( *Cork Online Law Review* 2002)

<http://www.corkonlinelawreview.com/editions/2002/2002-5.pdf>  
accessed 10 October 2016

This article provides a critique to Finnis's idea of practical reasonableness. The author has criticized Finnis of giving more importance to practical reasonableness than other goods.

**Research Methodology:** The type of research is qualitative and doctrinal. Secondary sources are taken help of. Websites, blogs and books are taken help of to make the project.

## Introduction:-

Practical reasonableness is an idea developed by John Finnis while he discussed about the seven basic goods of human life. John Finnis is an Australian legal scholar and currently he is a professor at the University of Oxford. In his work *Natural Law and Natural Rights* he talks about the seven basic goods of human life.<sup>1</sup> He classified the seven basic goods of human life into Life, Knowledge, Play, Aesthetic experience, Sociability (friendship), Practical reasonableness and Religion. According to Finnis these seven basic goods are independent of human thought and to flourish as human beings we need these goods. They are universal and apply to all humans at all times.<sup>2</sup> These basic goods or values are objective and we will be able to know them through introspection. These goods are self evident. We can participate in practical reasonableness by participation in the other basic goods by prioritizing one project over another or one commitment over another.<sup>3</sup> These basic goods are irreducible. Basic values are not the same as basic human urges. Individuals have urges or inclinations, but a value is something that a person thinks is worthwhile to pursue independent of any urge. I have an urge to gain knowledge, but I also think that the pursuit of knowledge is worthwhile.<sup>4</sup> Practical reasonableness is the type of reasoning that we use to make decisions about how to act and how to order our lives. Now some classical exponents of the theories of natural law might say that a person with experience, and a desire for reasonableness will only be able to decide which decisions are practically reasonable. Even Aquinas mentioned that there are certain self evident goods which can be understood only by those who have experience and in fact the moral principles like the Ten Commandments are inferred from the primary self evident goods. Therefore thinkers like Aristotle might think that what is morally good or practically reasonable can be understood only by those who have good habits, right minded but there is a problem that arises here regarding the people who really want to know if their decisions are practically reasonable or not. Therefore for this there are certain methods to practical reasonableness. These are certain requirements that tell a person what one must do to arrive at the basic good of practical reasonableness. Therefore one who follows all these requirements are Aristotle's *phronimas* and has Aquinas's *prudential*. Thus, speaking very summarily, we could say that the requirements to which we now turn express the 'natural law method' of working out the (moral) 'natural law' from the first (pre-moral) 'principles of natural law'.<sup>5</sup>

## Requirements of Practical Reasonableness:-

There are nine requirements of practical reasonableness. The first requirement of practical reasonableness is coherent plan of life. One should not live their life from moment to moment but they should see their life as a whole. Commitment to one specific project or another requires direction and control of impulses and with that it also requires the abandonment or adoption of projects according to circumstances, formation of new habits and the redirection of inclinations. This means the harmonizing of all of one's deep commitments. Since human life is in fact subject to all manner of unforeseeable contingencies, this effort to 'see' our life as one whole is a rational effort only if it remains on the level of general commitments, and the harmonizing of them. Since forever it has been said that one should always remember his/her last day while doing something. It basically is said to help people to choose their proper perspective of life at present. Finnis takes the help of a Christian parable from Luke 12:20 "But

<sup>4</sup> Suri Ratnapala, *Jurisprudence* (ISBN-13 978-0-511-59483-0 2009, Cambridge University Press)

<sup>5</sup> John Finnis, *Natural Law & Natural Rights* (Paul Craig, 2<sup>nd</sup> Edition Oxford University Press 2011)

God said to him, 'You fool! This very night your life will be demanded from you. Then who will get what you have prepared for yourself?' This means that the person who has all the riches but only with a view to drinking and eating them up, if his life is taken away by god on that day or that moment itself then who will use that wealth or how will his wealth be utilized, none of this will put meaning to his life.<sup>6</sup>

The second requirement is that there should be no arbitrary preferences among the values. For a coherent plan of life it is natural people may prioritise one basic human value over another. But this prioritization should not be arbitrary. The commitment will be rational only if it is on the basis of one's assessment of one's capacities, circumstances, and even of one's tastes. A person should not undervalue one good than another or overvalue one good than another. One may have no taste or capacity for friendship or life but they cannot say that they are not real forms of good. Finnis is against the thin theory of good propounded by John Rawls. According to Rawls liberty, opportunity, wealth and respect are the primary goods and one should not really accord much value to truth, art, friendship etc. Rawls also doesn't give any satisfactory reasons for such discrimination. According to Finnis it is unreasonable for one be it teachers, statesmen or parents to think that play, truth etc. have no value and never ask oneself whether in their plan of life they could make reasonable allowance to participate in such values or not, then one can be properly accused both of irrationality and of stunting or mutilating oneself and those in one's care.<sup>7</sup>

The third requirement is that there should be no arbitrary preference among persons. There should be fundamental impartiality among the human subjects who are or may be partakers of those goods. My own well being is my first interest or claim. And this self preference is because it's through my determined self realization and self participation that I will be able to do what reasonableness requires and realize the other forms of basic goods.<sup>8</sup> However this third requirement is against selfishness, double standards, hypocrisy or indifference to the good of others whom one could easily help. In fact so much so that many have sought to found ethics virtually entirely on this principle of impartiality between persons. One should not treat one the way in which he doesn't want the other person to treat him/her. One should always put oneself in the shoes of others and should prevent others from achieving something which he/she wants for themselves. Not following these requirements of reason means arbitrariness and reasonableness on our part.<sup>9</sup>

However reasonable self preference is there but there are some bounds. But what are these bounds? In Christian, Greek and Roman law they adopted the heuristic device of approaching this question by adopting a viewpoint of the standards of justice, the principles of justice of the one who has the interest of everyone at heart and mind, a person who is an ideal observer. Such a person will allow some form of self preference but not all. It also helps one to make impartial decision in terms of life preferences. However it does not suggest impartiality about the basic aspects of human good. It does not authorize one to set aside the second requirement of practical reason by indifference to death and disease, by preferring trash to art etc. In Rawls's theory of original position he talks about the veil of ignorance. In such a situation the individual without any knowledge of his identity or any knowledge whatsoever will always choose a principle of justice which is fair. Thus Rawls's heuristic device is of help for the third requirement. the fact that a principle chosen in the Original Position would be unbiased and fair as between individuals, that a principle which would not be chosen in the Original Position must be unfair or not a proper principle of justice in the real world. For in the real world, as Rawls himself admits, intelligence can discern intrinsic basic values and their contraries. Provided we make the distinctions between basic practical principles and mere matters of taste, inclination, ability, etc., we are able (and are required in reason) to favour the basic forms of good and to avoid and discourage their contraries. In doing so we are showing no improper favour to individuals as such, no unreasonable 'respect of persons', no egoistic or group bias, no partiality opposed to the Golden Rule or to any other aspect of this third requirement of practical reason.<sup>10</sup>

The fourth and the fifth requirement are somewhat related. The fourth requirement is detachment. One should not take up an attitude towards one particular objective so that when the specific project fails one would consider one's life drained. Such an attitude renders the basic human good of self determination in which a person participates simply because he wants to do something sensible, whether or not that particular project comes to bear any fruit. We

<sup>7</sup> John Finnis, *Natural Law & Natural Rights*( Paul Craig, 2<sup>nd</sup> Edition Oxford University Press 2011)

<sup>8</sup> John Finnis, *Natural Law & Natural Rights*( Paul Craig, 2<sup>nd</sup> Edition Oxford University Press 2011)

<sup>9</sup> John Finnis, *Natural Law & Natural Rights*( Paul Craig, 2<sup>nd</sup> Edition Oxford University Press 2011)

<sup>10</sup> John Finnis, *Natural Law & Natural Rights*( Paul Craig, 2<sup>nd</sup> Edition Oxford University Press 2011)

should be able to detach ourselves from one particular project. Unconditional significance to one particular project should be avoided. Succumbing to such temptations have also the evil consequences of fanaticism.<sup>11</sup>

The fifth requirement is after making a commitment one should not abandon that. And this requirement of fidelity has a positive aspect. One should be looking creatively for new and better ways of carrying out one's commitments, rather than restricting one's horizon and one's effort to the projects, methods, and routines with which one is familiar. Such creativity and development shows that a person, or a society, is really living on the level of practical principle, not merely on the level of conventional rules of conduct, rules of thumb, rules of method, etc.

The sixth requirement is that one should calculate and plan one's actions so that they are the most efficient (in a utilitarian sense) and do the most good.<sup>12</sup>

The seventh requirement is one should never commit an act that directly harms a basic good, even if it will indirectly benefit a different basic good. For example, one should not kill even if it will indirectly save more lives later.<sup>13</sup> To pick a demonstration which in itself essentially (or fundamentally) harms a fundamental great is in this way to draw in oneself pell mell (however straightforwardly) in a demonstration of resistance to an incommensurable esteem (an angle of human identity) which one regards as though it were a protest of quantifiable worth that could be exceeded by commensurable objects of more noteworthy (or aggregately more prominent) worth. To do this will regularly accord with our emotions, our liberality, our sensitivity, and with our responsibilities and activities in the structures in which we attempted them. In any case, it can never be defended in reason. We should pick reasonably (and this sane judgment can regularly advance a move in our point of view and therefore a realignment of beginning emotions and hence of our responsibilities and ventures).<sup>14</sup> Reason requires that each essential esteem be at any rate regarded in every last activity. In the event that one would ever properly pick a solitary demonstration which itself harms and itself does not advance some essential great, then one could properly pick entire projects and establishments and ventures that themselves harm and don't advance essential angles of human prosperity, for their 'net useful outcomes'. Presently we have as of now observed that results, even to the degree that they can be 'predicted as certain', can't be commensurably assessed, which implies that 'net advantageous outcomes' is a truly ludicrous general goal or model. It just stays to take note of that in the event that one imagines that one's discerning duty to be continually doing and seeking after great is fulfilled by a promise to act dependably for best results, one treats each part of human identity (and without a doubt, subsequently, regards oneself) as an utensil. One holds oneself prepared to do anything (and in this manner makes oneself a device for every one of those ready to undermine adequately terrible outcomes on the off chance that one does not participate with them).

The eighth requirement is that one should look after the common good of the community.

The ninth requirement is that one should always follow their conscience and practical reason. If one is generous, open minded towards the basic human goods by inclinations then one would be able to make their practical judgments without any abstract reasoning. The first theorist to formulate this ninth requirement in all its unconditional strictness seems to have been Thomas Aquinas, if one chooses to do what one judges to be in the last analysis unreasonable, or if one chooses not to do what one judges to be in the last analysis required by reason, then one's choice is unreasonable (wrongful), however erroneous one's judgments of conscience may happen to be. (A logically necessary feature of such a situation is, of course, that one is ignorant of one's mistake. Even is our conscience brings about wrong judgments it should be followed.<sup>15</sup>

### **Practical Reasonableness and Consequentialism:-**

The sixth requirement of practical reasonableness is the limited relevance of consequences. There is a wide range of contexts in which it is possible and only reasonable to calculate, measure, compare, weigh, and assess the consequences of alternative decisions. Where a choice must be made it is reasonable to prefer human good to the

good of animals. Where a choice must be made it is reasonable to prefer basic human goods (such as life) to merely instrumental goods (such as property). Where damage is inevitable, it is reasonable to prefer stunning to wounding, wounding to maiming, maiming to death: i.e. lesser rather than greater damage to one-and-the-same basic good in one-and-the-same instantiation. Where one way of participating in a human good includes both all the good aspects and effects of its alternative, and more, it is reasonable to prefer that way: a remedy that both relieves pain and heals is to be preferred to the one that merely relieves pain. However sixth requirement is only one requirement among all the requirements. We should also take into account the first, second, third requirements which clearly say that one cannot arbitrarily prefer one value to another or one person to another. Again the seventh and eight requirement excludes acts such as fraud, intentional killing etc. We cannot measure the utility of one basic good over another. Finnis is against the utilitarian or consequentialist approach. Consequentialism is irrational for him as it requires one to choose an act that maximizes the net good. But for him we cannot find out the 'best consequences'. If consequentialism has to work then (a) human beings have to have some single, well-defined goal or function (a 'dominant end'), or (b) the differing goals which men in fact pursue should have some common factor, such as 'satisfaction of desire'. However only a fanatic will think that human being has only one purpose. Consequentialism doesn't give any reason why we have to choose altruism over egoism. The consequentialist have not given any proper reason as to why they should criticize those who try to maximize their own happiness as unreasonable. Finnis considered the example where a hostage taker demands that a named individual be killed in exchange for the release of the hostages, who otherwise would themselves be killed. He seemed to assume that in this situation, the consequentialist would say that killing the individual is justified as it saves many lives. Finnis called this a senseless argument, and surely it is. He contended that the release of the hostages is one consequence among a multitude of incommensurable consequences of the act of killing. Finnis said that the calculus 'one life versus many' is naively arbitrary.<sup>16</sup> Again, consequentialist method enjoins us to make the choice that would produce greater net good than could be expected to be produced by any alternative choice. But the alternatives that are in fact 'open' or 'available' to one are innumerable. A genuine consequentialist assessment of alternative possibilities could never end, and could begin anywhere. So it should never begin at all, in reason.<sup>17</sup>

### Criticisms to Finnis's Idea of Practical Reasonableness:-

Practical reasonableness is the good through which people pursue the other forms of basic human goods. All these goods are said to be objective. Because if practical reasonableness is subjective then everyone will have their own interpretation of what is good or bad. But in the ninth requirement of practical reasonableness, Finnis talks about that everyone should follow their conscience. Now for example whatever Hitler did during his dictatorship for him it might be for practically reasonable or his conscience urged him to do so and if we go by Finnis's theory then Hitler has done no wrong as he simply followed his conscience. So it's better if practical reasonableness is treated as an objective concept rather than a subjective one.<sup>18</sup>

Again everyone has a different reason so whose idea of practical reasonableness Finnis is talking about is not clear. And this might give an additional advantage to the powerful class to exert their influence through their practical reason.

Again through practical reasonableness we can pursue the other goods. Therefore it seems that he gives more importance to this good, on the other hand he says that all the goods are equal. But he contradicts his own view when practical reasonableness becomes both the ends and the means. Furthermore, Finnis himself suggests as much by stating that despite being free to choose which of the Basic Goods we choose to pursue and which to ignore, we have no good reason to leave Practical Reasonableness out of account. Thus from this we can infer that all goods are equal but some are more equal than others.<sup>19</sup>

### Conclusion:-

Presently we can see why a few thinkers have found the substance of "ethical quality" in the diminishment of mischief, others in the expansion of prosperity, some in social agreement, some in universalizability of down to

earth judgment, some in the inside and out prospering of the person, others in the safeguarding of flexibility and individual credibility. Each of these has a place in sound selection of responsibilities, activities, and specific activities. Each, in addition, adds to the sense, hugeness, and compel of terms, for example, 'moral', '[morally] should', and 'right'; not each one of the nine necessities has an immediate part in each ethical judgment, yet some ethical judgments do total up the course of each and the greater part of the nine on the inquiries in hand, and each ethical judgment totals up the course of one or a greater amount of the prerequisites.<sup>20</sup>

#### Abstract

A brief analysis of the taxonomy and the identification methods of corals are provided. The attention is drawn to difficulties and mistakes, which have occurred in their systematics, in the selection of type-species and their holotypes. Modern methods for morphometric, biochemical, and genetic researches are considered using examples in solving taxonomic problems and identifying corals. It is concluded that the taxonomy of corals came into the historical stage in the twenty-first century, when the previous nomenclature uncertainty began to be removed due to the availability of all data connecting taxonomic, phylogenetic, biogeographical, ecological, paleontological, and bibliographical, as well as environmental data.

#### Introduction:-

The known property of the human reasoning to look for similarities and differences in observed facts and phenomena, certainly to categorize and give names makes us to find or just to note features or characteristics, by which we get to know about familiar or similar subjects and to perceive unfamiliar ones. When perceiving a thing, a phenomenon, we find, what differences from other things and phenomena they have, what similarities to them they bear, and give them certain names. People have identified the term "species" as taxonomic category for convenience of sorting organisms. And we can only guess, what was at first – "snakes", "animals", and "plants" (the highest categories) or "adder", "wolf", and "wheat" (the lowest categories). At first, there were probably the last ones, and then they were combined into animals, birds, etc. even before the appearance of the first conscious systematist on the Earth. Then species concepts were developed and, consequently, the species problem is as result of the struggle of adherents of various concepts.

The taxonomy of corals as inherently subjective science has gone through three historical stages: (1) researches of collections performed during their discovery in the early expeditions; (2) researches performed directly on reefs using autonomous diving equipment; (3) molecular and biochemical researches. These stages, each of which is associated with a different methodology and perception, have little in common, but they have a common goal, which is a classification of corals according to the concept of their natural order.

In 2013, a great article by Ch. Veron dedicated to almost all questions and problems of the taxonomy of reef-building corals was published. Its main conclusion is that taxonomists can no longer rest on any one publication, method or concept. They should be based on the open access to updating websites connecting the whole information, such as taxonomic, phylogenetic, biogeographical, ecological, paleontological, as well as

environmental and bibliographical one. Such information sources allow systematists of any belief to see results of their efforts in the broad context, rather than just within their own subdisciplines (Veron, 2013).

Despite the appearance of hard calcareous skeletons of Scleractinia, they are very soft organisms and have some significant variations (30-40-fold changes of values of their features) of all their skeletal elements (Latypov, 1984). K. Gravier (1911) summarizing results of the previous researches (Pace, 1901; Wood-Jones, 1907) wrote: "Nothing really remains stable in these animals: neither the overall appearance of the colony, the coenenchyme nor even the theca". Consequently, the question of unusual intraspecies variability and establishment of its boundaries for each specific taxon or population concerning the problem of corals' species was extremely urgent (Latypov, 1984; Latypov, 2016a). "Healthy species theory" for corals was represented by T. Vaughan (1907) at the beginning of the last century, and it had almost no differences from the biological species concept appeared two years earlier. At the same time, it was emphasized that it was not about using different species concepts, but about a single biological approach when researching any corals. Only now, after more than two centuries, the coral taxonomists withdrawing from "peculiarities" of researching their material based on the biological species concept are adopting a population analysis and detection of variability limits along with using modern genetic and biochemical researches (Latypov, 1982, 1984; Veron, 1995; Latypov, 2014, 2016b).

## Results:-

### General provisions:-

The coral taxonomy came into the historical stage in the past century, when the nomenclature uncertainty began to grow rapidly. The main reason was a mandatory compliance with the species identification in historical classical monographs, which did not have necessary information on species at all, especially for the typical specimens if they have existed at all, or are often represented as their fragments out of all recognition. The historical problems including incorrect following redescription or synonymy of species have created uncertainty for many established species and genera, too.

The historical collections of corals with some exceptions were built *as separate specimens* representing new or unusual ones, rather than as representatives of the population or the taxonomic group. They were gathered in shallow lagoons and on reef flats, where the branching and placoid colonies usually developed in unusual forms of colonies. These collections representing biased samples and those devoid of taxonomic researches have led to the expansion of "type-species", which did not clearly represent the species destined for the identification.

Thus, the corals were gathered in quantities in museums throughout Europe and the United States more than 200 years ago. The collections are considered as critical contribution to the natural history, especially when they are described and published in monographs. In the historical perspective, these scientific publications were like works of art. These are books with excellent illustrations well-known among paleontologists and biologists (Müller, 1775; Ellis & Solander, 1786; Stutchbury, 1830; de Blainville, 1834; Dana, 1846; Edwards & Haime, 1857; Haeckel, 1876; Agassiz, 1880), in which the authors tried to make the taxonomic characters of corals available to the broader scientific community. However, despite their high status among the best monographs of the time, they contain descriptions of the species, which cannot always be used, because they lack many details of morphology (especially variability and comparison with other species), a habit and even a location. For this reason, modern taxonomists should rely only on illustrations of the holotype, rather than on description to determine the described species.

The coral taxonomists of the one before last century did not have an opportunity to observe and gather corals on the reef under water. They did not understand how species (zooids, colonies) actually looked including their differences in form, color and abundance. If a received new specimen looked different, it was easily proclaimed a new species and given a new name. Inevitably, many of these specimens were lost, because they got a new mark and included in another collection, usually without specifying their original source (Veron, 2013). It is also probably that many typical specimens never existed, as they were no more than interesting specimens selected for illustration and description and then were returned to the general collection as soon as the description was completed.

### Typical specimens and type-species:-

Today many historical typical specimens have a correct status, some of them deserve special mention, while the position of other ones is precarious. For Example, J. Dana (Dana, 1846), the most insightful coral taxonomist of the 19<sup>th</sup> century, was especially precise in selecting and describing typical specimens as distinct from A. Verrill, who has prescribed barely recognizable fragments, which he had deposited in various museums, to typical specimens following in the footsteps of Dana (Verrill, 1864). Some of Verrill's species now found in the Museums of Comparative Zoology of the Harvard University and the Smithsonian Institution were apparently taken from

different colonies actually belonging to different species, for which the reference to Dana was not taken into account (Veron, 2013).

Many type-species, on which the genera are based, seem obvious. In practice, however, the use of type-species as basis for taxonomic solutions is not always effective, because they generally are a quintessence of historical problems described above among the first selections of type-species of genera. Coral taxonomists documentarily selecting an update of the typical species according to Vaughan and Wells (Vaughan & Wells, 1943; Wells, 1956) have found many surprises. For example, little is known about the type of the species of the *Leptoseris* genus – *Leptoseris fragilis* Milne Edwards & Haime, 1849. It was neither included nor redescribed in the edition of Denisen (Veron, (2000). The type-species called *Montastraea* is a fossil coral from the Miocene of France or Italy, *Astreaguetardi* de Blainville, 1830. It is considered to be extinct long ago and can not be identified. Such cases were ignored according to an old saying "Let sleeping dogs lie", but because of this the genus may be subject to integration (Veron, 2013). However, the stability of the generic names would be quite adequate without type-species and bundle, which is enclosed with them. Even the *Acropora* genus, the most famous one of all corals, was confirmed by the International Commission on Zoological Nomenclature (ICZN) only in 1963.

### Species in situ:-

The taxonomic researches using undersea observations began in the early 1970-ies and immediately created various conflicts with almost all aspects of the traditional taxonomy. So, *Pocilloporadamicornis* described in more than 50 taxonomic publications has had a double number of non-taxonomic works prior to 1970, which have most frequently used this species in experimental researches. It was not clear: what the corals of the *P. damicornis* species are actually; how it can be reliably distinguished from other *Pocillopora* species; what the expansion of this species is. The original description of C. Linnaeus (Linnaeus, 1758, 20 words of the Latin language) cannot be used – the holotype is lost, its location is very undefined («O. Africano&Indico»). More importantly, when *P. damicornis* was researched in situ, it turned out, how many environmental variants were correlated with this species (fig. 1). The researches of corals in their natural environment using the undersea observation have become a reliable instrument for coral taxonomists (Veron, Pichon, 1976; Veron, 2013; Latypov, 1990, 2014).

### Traditional and modern taxonomy:-

When working with corals having the extraordinary variability of almost all features and generally with polytypic species, the question is often if these differences between samples (populations) are great enough to consider them as different species. In most cases, we have isolated geographic or stratigraphical allopatric populations. Unfortunately, we cannot use a reproductive isolation criterion in pure form. And besides, to breed zooids of two or one prospective species on the experimental basis, first of all, we have to determine that these are zooids of one or two allied species, and this is our key problem. It remains to base on the probabilistic data on the fact that the reproductive isolation is correlated with a certain degree of a phenotypic, externally visible difference and is constant enough within a given taxonomic group. That is to act by contradiction: if groups with sufficiently clear morphological differences, with a distinct gap of values of qualitative or quantitative features are identified within this taxon, we may assume that these groups are good species.

So, three phenons of *Pocillopora* were revealed in the collection of Scleractinia from the South China Sea. They had differences in width of their branches, number of polyps per area unit, presence or absence of verruciform corallites on major branches, but almost all these variations were partially overlapped. A sample of other corals of *Pocillopora* had different colonies with wide (from 30 mm to 50 mm thick) and long (up to 50-80 mm) branches. They had different distances between their branches. A more representative sample of all corals has discovered both the continuous variability of modal sizes of branches, the distance between them, and obvious gaps of various holotypes of the *Pocillopora* species.

The construction of different scattering diagrams induced more surely to divide these phenons, but left doubt on the final decision on their assignment to one or two species (fig. 2). Receiving the data on features of the individual growth and the fatty acid content of these corals (table, fig. 3) allowed to reveal distinct gaps in ontogenetic and biochemical characteristics and to divide these phenons in two species: *P. damicornis* and *P. verrucosa*. The same methods allowed to unite all samples of these corals under one species named *P. eyudouxii* in another case, as continuous variability of features, difference in ratio of the fatty acid content were not detected. The analysis of the fatty acid content ratio among colonies of various growth forms has confirmed their modification nature identifying differences only in percentage shares.

Meanwhile, many features were partially overlapped in two samples of *Pocillopora* or had a very little gap except for one. The frequency of the shedding of the corals dissepiments of one sample was by more than 4-5 times in comparison with corals of the other one. The ratios of the content of some fatty acids of different samples of *Pocillopora* were different by 2-3 times, too. Two unfilled gaps (table, fig. 3) in morphometric, ontogenetic and biochemical features allowed to consider these *Pocillopora*'s samples as ones belonging to different species (Latypov, 1984, 2014). The cluster analysis has also confirmed the findings on the congeniality of ones and the isolability of other species (fig. 4).

#### Genetic systematic:-

Since the beginning of the current century, a considerable attention is given to the molecular and genetic researches of different groups of Scleractinia (Manchenko et al., 2000; Fukami, 2008; Huang et al., 2009; Arrigoni et al., 2012).

A wide range of taxonomic questions can be reliably answered by using the molecular and biochemical methods, and it is clear that the continuing dissemination of such researches will have a major impact on the most aspects of the taxonomy of corals. These methods produce especially demonstrable and convincing results in the cases, when it is necessary to classify objects, which are hard to distinguish. It should be noted that such cases can occur when working with sibling species or phenotypically similar species, as well as when working with groups, the taxonomic content of which is obscured as a result of the application of subjectively selected features. The genetic researches of zooids in natural populations require a labour-intensive work on breeding under controlled conditions. Such researches might be carried out in the laboratory with only a few organisms – those, which are easy to maintain and have a very short period of reproduction and development. The sympatric groups, or the morphs belonging to the similar species, are one and the same evolutionary unit. Therefore, they should have (taking into account the calculated error of the experiment) the same gene frequency for each gene locus. The zooids from different biotopes belonging to the same species must freely interbreed and differ only in their loci coding their morphological differences and, maybe, in some closest loci. Even if these morphs have been subjected to a rigorous selection, the gene frequencies for all other loci should remain the same ones through their recombination (Wright, 1978; Thorpe, Sole-Cava, 1994).

The actinias are a very diverse group of the marine invertebrates. Meanwhile, the features suitable for the taxonomy of these animals are very few, and the taxonomic problems in this group of the invertebrates often arise because of their relative structural simplicity. The analysis of genotypic differences between closely related species of the actinias is now actively used and often produces some interesting results. Generally, sympatric populations are subject to the analysis. In addition, sets of stinging cells of the actinias with an unclear taxonomic pattern are compared along with the electrophoresis of isozymes.

On the littoral of Skrebtsov Island (the South China Sea), settlements of the actinias of the *Anthopleura* species, which were presented by two color morphs, were examined. These actinias looked very alike. The variations in column coloration, mouth opening, tentacles have caused continuous series of the variability in this population. It was just observed that some actinias had a light grey-green oral disc, and the others had both a colorful and dark one. The actinias of the light morph raise higher above the sand surface. It turned out that the actinias differing in coloring of the oral disc are distinct both in the substrate nature, to which they are attached by the foot, and in the degree of their submergence in the sand. The combination of these features allowed to identify two morphs of the actinias in the population (Manchenko et al., 2000).

The analysis of genotypes of the sympatric morphs was performed by the electrophoresis of enzymes according to the standard method using original modifications (Manchenko, 1984). A 21 gene locus coding 19 enzymatic systems was examined. Eight of them have showed lack of common alleles in compared morphs. It clearly proves that the morphs gene pools are separate, and they do not exchange their genes between each other. Consequently, these morphs are separate species. They were morphologically identified as *Anthopleuraorientalis* (light morph) and *A. sp. 1* (dark morph), respectively. The genetic differentiation between the species is very significant, what follows from the assessment of the genetic distance between them ( $D = 1,284$ ). The average level of heterozygoty ( $H_e$ ) for *A. orientalis* and *A. sp. 1* amounts to  $0,351 \pm 0,054$  and  $0,250 \pm 0,061$ , respectively (Manchenko et al., 2000).

### Conclusion:-

Thus, the problems arising when determining intra- and interspecific differences identified by morpho-physiological, ecological, and ethological means can be solved by using biochemical, cytogenetic, electrophoretic researches. But in any case, the original conclusion on similarities or differences between taxa is made based on absence or presence of the unfilled gap in certain sequences of features, identification and comparison of the specific characteristics of each taxon. Then it turns out, which biological reasons cause these differences and similarities of the features. And based on the facts of discretization of phenotypes identified between two feature complexes, a reproductive isolation of each separate species can be stated (Mayr, 1969; Latypov, 1984, 2014, 2015; Latypov et al., 1998).

More than two hundred years of experience of the coral taxonomy promise that coral systematists can avoid pitfalls if: 1 - the established names will be saved in the absence of any compelling reasons to replace them; 2 - the nomenclative priority should not be a reason to change the established names; 3 - the fossil names are not used for modern species (except in cases when the holotype is definitive); 4 - the names of the established genera cannot be changed due to the taxonomic problems of the type-species.

The taxonomy of corals came into the historical stage in the twenty-first century, when the previous nomenclature uncertainty began to be removed due to the availability of all data connecting taxonomic, phylogenetic, biogeographical, ecological, paleontological and bibliographical, as well as environmental data.

#### Research objectives:-

- To analyze about the importance of e-marketing in present scenario.
- To determine the difference of e-marketing between two countries: India & China.
- Current scenario of E-marketing in India and China and its impact on current markets.
- To know the online marketing methods of India and study Chinese consumer behavior.
- To forecast the future prospects of e-marketing in India & China.

#### Introduction:-

Any business process performed electronically is called e-business and today most of the business processes like recruitment, e-commerce, e-information, e-auction, e-marketing and so on, are being performed through e-business. E-marketing stands for 'electronic showcasing'. E-marketing is the idea that associate the reasonable and graphical parts of online instruments together, taking into account the reason, outline, exposure, brand improvement, advancement and deals.

#### Benefits of E-marketing:-

1. **Global reach:** A website can reach anywhere in the whole world who has the internet connection. We are just a search or a click of a button away from any internet source.
2. **Cost Effective:** It is very cheap and cost effective in terms of spending money on advertising on social media sites and other website as compared to broadcasting messages on radio and television in a particular timeslot period.
3. **24/7 online shopping:** The website enables communication with the customers at any point of time (24 hours\*7 days a week). They guide the customers about the product line in depth so that they can be fully educated.
4. **Website content has to be interactive and entertaining:** Unlike printed words or television, there is a possibility of opening up two-way communication with the customer.

This can occur as simply as an instant email response to customers and as complex as a regularly updated blog.

#### E-marketing tools:

- Search Engine Optimization
- Paid search
- Display Advertising

- Sponsorship
- Social Networking
- Blogging

When setting the e-marketing objectives, we need to make sure that they are:

- Specific: to specify what is to be achieved.
- Measurable: to express in measurable terms such as key performance indicators, outcomes, numbers, percentage, etc.
- Action-oriented: to state which actions need to be taken and who will take them.
- Time specific: to establish specified time frames.
- To increase online sales for all the products by 15% in the upcoming year trends.
- To grow email coverage to 50% of the current customers base by the end of the next year.
- Realistic: achievable with the resources available.

### **Research methodology:-**

**Research Methodology** is the way used to collect information and data for the purpose of making business decisions. The methodology may include publication research, interviews, surveys and other research practices, and could comprise both present and historic information.

There are basically two types of Research:

1. Descriptive
2. Exploratory

**Data Collection Method:** Data collection methods often used in program evaluations include literature search, file review, natural observations, surveys, expert opinions and case studies.

There are two types of data collection methods:

1. Primary Data: Data collected by an evaluation team specifically for the evaluation study.
2. Secondary Data: Data collected and recorded by another person or organization, usually for different purposes than the current evaluations.

Hereby, the current research is conducted through the information received from secondary sources such as:

1. Websites
2. Journals
3. Books.

### **Analysis of study:-**

Key drivers in Indian e-commerce are:

- Increasing the broadband internet connection and 3G penetrations across the country.
- Convenience of less availability of product ranges.
- Busy lifestyles, urban tie ups and the lack of our time for offline searching.
- Increasing usage of online classified sites, with a lot of consumers shopping for and merchandising second hand products.

E-commerce market in India was valued \$2.5 billion in 2010, and it went up to \$6.3 billion in 2011 and to \$14 billion in 2012. And basically 75% of that total value was related to airline tickets, railway tickets, building bookings and online mobile recharge etc. On March 7, 2014 E-retailer FLIPKART claimed its hit of \$1 billion sales, a deed it has managed to attain before its own target (2015).

Online retail in China generated \$121 billion sales last year, up 66% as compared to 2012. There are various factors for growth in China. Its impressively awesome that the online Chinese markets, ALIBABA and TAOBAO business is estimated that half of all the packets sent to the total account of China.

### **Examples of Indian internet companies with innovative business models:-**

- **Naukri.com:** It is the leader in Indian online job market. It offers free SMS-based job notifications, call centers with all the value added services.

- **Flipkart:** It's a pioneer in e-commerce in India. It has popularized the concept of online retail and has started its own logistics operations with 1500 employees. It even offers cash-on-delivery services in response to Indian consumer's low propensity to use cashless transactions
- **Redbus:** It was launched in 2006. Redbus.in is an online bus-ticketing portal with the current customer base of nearly 2millions. It primarily reaches customers through online platform. It has also introduced cash-on-delivery system due to customer's reluctance to use online payment methods.

#### **China's major market leading player companies:-**

The three big Internet market leading companies in China are ALIBABA, BAIDU, TENCENT, which dominate the three different categories of the market mainly: e-commerce, search and messaging, respectively. The vast majority of the online transactions happens in China which is around 85% as of 2009, that take place between consumers, ALIBABA-owned TAOBAO, is often described as the "eBay of China."

Like eBay, users on Taobao can usually purchase and sell new & used items at fixed or assigned prices, as well as through auction listings. Unlike eBay, most of the goods or items are new and there is no listing fees, the majority of the Taobao's income revenue comes from the advertising. Next year the company would bring in \$ 700 million pre-tax earnings and would be worth \$14 billion.

#### **China's Search Engine Marketing Planning and Execution:-**

1. Chinese SEO keyword research.
2. On-site SEO of Chinese web pages
3. Off-site SEO and online management/ online word of mouth marketing.

#### **China's retargeting banner and display stressing/promotion:**

1. Defining the Chinese targeted audience.
2. Defining the goals of the digital media.
3. Defining a China media way out.

#### **Methods of online marketing common in India:**

1. Social network
2. Online favorites and bookmarking
3. Blogging
4. E-mail marketing
5. Search engines
6. Pay-per-click advertising
7. Press release

#### **Learning outcomes:-**

##### **Comparative study of e-marketing in India and China:-**

- From the study related to the topic "Comparative study of e-marketing in India and China", it can be clearly stated that e-commerce scope is widely increasing at a fast pace. Total sales in Asia-Pacific region exceeds sales in North America and Europe combined.
- It's obvious that e-commerce in China and India is expected to grow quickly between in the years 2014 and 2018.
- At present, the Chinese e-commerce market is wholly dominated by Alibaba cluster, Taobao owner and sister Tmall web site. Together these 2 sites which are held by Alibaba cluster signify relatively ½ online purchases by Chinese customers.
- India, for the instant, it's estimated that the marketplace for e-commerce developed beneath 5% grow terribly quickly, at the rate of over 505 per projections by Forrester, the web retail can grow from U.S. \$2 billion in 2013 to over U.S. \$ 16 billion in 2018.
- If FDI are given the clearance to enter Indian markets, Indian e-commerce e-retailing websites would definitely face a severe drawback as many of the online buyers would definitely migrate to other FDI e-retailing companies. At instance, there would not be any issue regarding this but later in the upcoming online shopping trend it would be a gain to foreign companies.
- It has clearly shown that e-marketing influences upon businesses in a number of important ways. When used efficiently, e-marketing campaigns and strategies have the potential to reach customers in a speedy and low-cost manner and could definitely provide promotion for a wide range of products and services.

- The development of e-marketing and social media advertising has led to examples of businesses in recent years that appear to little more than categories and filter information relating to products and services on the internet, taking a small cut from any transaction that may occur as a result.
- The following five tips can surely help to alter a non-performing website into an efficient sales and marketing tool:
  1. Use control to get repeat visitors to the site, not showiness.
  2. Make sure that the potential customers can find the website on any search engines.
  3. Develop habitual e-newsletters & announcements to inform & keep up to date with current and potential customers (to only those who ask for them).
  4. Make sure that the website content is focused on customer's needs and interest, not company.

##### Key words:-

Diabetes, Diabetes Control, Pittsburgh Sleep Quality Index, Sleep quality, Risk factors, Saudi Arabia.

#### Abstract

**Objectives:** To explore the relationship between diabetes control among Saudi type 2 diabetics and their quality of sleep.

**Patients and Methods:** Following a cross-sectional study design, 400 Saudi type-2 diabetics (239 males and 161 females) registered at the Diabetes Center in Abha City, Saudi Arabia were included in this study. An interview questionnaire has been developed by the researchers. It comprised personal characteristics and diabetes-related variables and the Pittsburgh Sleep Quality Index Questionnaire (PSQI).

**Results:** More than three fourths of participants (77.3%) had uncontrolled diabetes (HbA1c >7%). Almost three fourths of diabetics (72%) had poor sleep quality. Poor quality of sleep was highest among illiterate diabetics (91.7%). Participants with longer duration of diabetes had significantly more prevalence of poor quality of sleep than those with shorter disease duration (75.9% and 66.3%, respectively,  $p=0.035$ ). Moreover, participants with uncontrolled diabetes had significantly higher prevalence of poor sleep quality than those with controlled diabetes (78.3% and 49.5%, respectively,  $p<0.001$ ). However, sleep quality among diabetics did not differ significantly according to their age, gender, or smoking status.

**Conclusions:** Type 2 diabetes is associated with high prevalence of poor quality of sleep. Risk factors for poor quality of sleep include less education, poorly diabetes control and long duration of disease. Detection and treatment of sleep disorders among diabetics is essential.

#### Introduction:-

Sleep is an active biologic function that is essential for life and is critical for physical, mental and emotional well-being. Any defects in sleep quality and quantity may lead to several complications, including metabolic errors (1).

It is estimated that sleep disorders are among the most common health problems in the general. Nevertheless, sleep disorders are frequently overlooked. About one-third of people in the general population suffer from a chronic disorder of sleep and wakefulness. The critical role of sleep and sleep disturbances in daytime functioning is becoming increasingly apparent (2).

A relation has been recognized between respiratory disorders during sleep, e.g., snoring and sleep apnea, and the early manifestations of diabetes, since sleep apnea and snoring may increase cellular insulin resistance, leading to hyperglycemia and increased difficulty to control blood sugar (3).

Sleep appears to moderate the neurohormones that regulate blood glucose. Sleep deprivation and sleep disorders contribute to patho-physiological changes associated with the development of type 2 diabetes. In people who already have diabetes, sleep deprivation contributes to elevations of glycosylated hemoglobin (HbA<sub>1c</sub>). Symptoms that occur as a result of diabetes, such as nocturia and neuropathic pain, may in turn contribute to sleep disturbance and exacerbate sleep deprivation (4).

Evidence suggests that sleep disorders may contribute to the development of diabetes; and conversely, diabetes may contribute to sleep disorders (4). Sleep is an emotional issue and all diseases particularly chronic diseases, like diabetes, invite emotional reactions which can also affect sleep adversely (1).

Sleep debt leads to harmful effects on carbohydrate metabolism, resulting in impaired glucose tolerance (5). Acute sleep deprivation, whether total or partial, is associated with an alteration in hypothalamo-pituitary-adrenal function on the following day consisting of an elevation of evening cortisol concentration (6). Moreover, it has been well demonstrated that glucose tolerance is markedly better in the morning than in the evening (7).

Gisalason and Almqvist (8) reported that diabetes is associated with difficulty in initiating sleep (21.1%), difficulty in maintaining sleep (21.9%) and excessive day time sleepiness (12.2%). The sleep complaints are often related to the presence of underlying Sleep disordered breathing, nocturia, physical complications of diabetes and underlying depression. Lamond et al. (9) added that diabetics experience several types of sleep problems, e.g., more wakefulness, a high number of awakenings and fragmented sleep.

The “gold standard” for diagnosis of sleep disorders is laboratory polysomnography. However, sleep disorders are far more prevalent than can be handled by the limited number of available sleep laboratories. Therefore, a screening tool is usually applied to screen patients according to their clinical symptoms, their physical examinations, and their risk factors (10).

In clinical practice, detailed sleep history is often missed. Detection and treatment of sleep disorders among diabetics is essential since their treatment is highly rewarding. Moreover, the concurrence of sleep disorders and diabetes necessitates aggressive therapy to treat and control both conditions (11).

This study aimed to explore the relationship between diabetes control among Saudi type 2 diabetics and their quality of sleep.

### **Patients and Methods:-**

This study was conducted during the period from January till June 2014. It followed a cross-sectional analytical comparative design has been followed. This study has been conducted at the Diabetes Center of Abha City, Saudi Arabia.

Following a simple random sampling technique, the researchers interviewed 400 Saudi type 2 diabetics whose diabetes was diagnosed since at least one year. Patients known to have psychiatric disorders or other chronic comorbidities (i.e., malignancy, heart, renal, or liver diseases) in addition to those on psychoactive drugs were excluded. Diabetes control among participants was assessed according to patient's glycosylated hemoglobin (HbA<sub>1c</sub>) level. Controlled diabetes was considered at HbA<sub>1c</sub> ≤ 7%, while those with higher HbA<sub>1c</sub> levels were considered as having uncontrolled diabetes (12).

Data collection tools comprised 2 parts, i.e., the "personal characteristics and diabetes-related variables" and the "Pittsburgh Sleep Quality Index (PSQI) Questionnaire".

The personal characteristics questionnaire was constructed by the researchers. It included the following variables: age, gender, educational level, smoking status, duration of diabetes and HbA<sub>1c</sub> levels.

The PSQI is a validated measure of self-reported sleep quality. It comprises 19 items in 7 component scales that assess sleep quality over the past month. The component scores of these scales are summed to yield a “global PSQI score” with a range of 0-21, with higher scores indicating worse sleep quality. A global PSQI score >5 has a

diagnostic sensitivity of 98.3% and specificity of 90.2% in distinguishing normal subjects from patients with sleep quality problems (13).

Data entry and analysis were performed using the Statistical Package for Social Sciences (SPSS version 22.0). Descriptive statistics were calculated in the form of frequency and percentage. Chi-square test was applied to test significance of differences between groups. Differences were considered as statistically significant when  $p < 0.05$ .

### Results:-

Table (1) shows that 9.8% of participants aged less than 20 years, 66.3% aged 20-60 years and 24% aged more than 60 years. More than half of participants were males (59.8%). About one fifth of participants (21%) were illiterate, 51.3% had school education, while 27.8% were university graduates. Most participants (87%) were nonsmokers. The duration of diabetes among more than half of participants (57%) was 10 years or more. More than three fourths of participants (77.3%) had uncontrolled diabetes ( $HbA1c > 7\%$ )

Figure (1) shows that almost three fourths of diabetics (72%) had poor sleep quality.

Table (2) shows that poor quality of sleep was highest among illiterate diabetics (91.7%) followed by university graduates (68.5%) and school educated (65.4%). Differences in quality of sleep among diabetics according to their educational level were statistically significant ( $p < 0.001$ ). Participants with longer duration of diabetes had significantly more prevalence of poor quality of sleep than those with shorter disease duration (75.9% and 66.3%, respectively,  $p = 0.035$ ). Moreover, participants with uncontrolled diabetes (i.e.,  $HbA1c$  level  $> 7\%$ ) had significantly higher prevalence of poor sleep quality than those with controlled diabetes (78.3% and 49.5%, respectively,  $p < 0.001$ ). However, sleep quality among diabetics did not differ significantly according to their age, gender, or smoking status.

### Discussion:-

Diabetes mellitus is being increasingly recognized as a worldwide significant public health problem (14). Patients with diabetes mellitus, by virtue of its numerous clinical and associated implications, suffer a poor quality of life. It is not surprising that sleep quality among these patients are significantly impaired. Diabetic patients frequently experience challenges to their sleep and wakefulness due to physiological imbalance and co-morbid sleep pathologies (15).

This study aimed to assess the sleep quality of diabetic patients and to identify the impact of diabetes control on patients' quality of sleep.

According to  $HbA1c$  level among participants, the current study showed that only 22.7% had controlled diabetes, i.e., with  $HbA1c$  level more than 7%. This finding is in agreement with those of Ji et al. (16), who reported that the rate of glycemic control of type 2 diabetes was only 16.8% and Lou et al. (17), who found that the glycemic control rate among diabetic patients was only 17%. However, some studies in USA reported glycemic control levels of 35–59% (18-21).

Results of this study revealed a high prevalence of poor sleep quality among type 2 diabetics.

This finding is in agreement with several studies which emphasized the high prevalence of poor sleep quality among diabetics. Tsai et al. (22) stressed the significant association between poor sleep and worse glycemic control among diabetic patients. Using PSQI  $> 5$  as a cutoff, Song et al. (23) reported that the prevalence of poor sleep quality among diabetics was 49.3%. Lou et al. (17) reported that the prevalence of poor sleep among diabetics was 33.6%.

This study showed that prevalence of poor sleep quality differed significantly according to participants' educational level, being highest among illiterate diabetics. However, it did not differ significantly according to their age, gender, or smoking status. Lou et al. (17) reported that diabetics with poor quality of sleep tended to be older, female, and less educated, compared with good sleepers.

The present study also revealed that prevalence of poor sleep quality differed significantly according to disease duration and diabetes control. Diabetics with longer disease duration and/or uncontrolled diabetes (i.e.,  $HbA1c$  level

>7%) had significantly higher prevalence of poor sleep quality than those with shorter duration of sleep and/or controlled diabetes.

Keinanen-Kiukaanniemi et al. (24) argued that the duration of diabetes is a risk factor for poor quality of sleep. Jin et al. (25) explained this finding by that diabetics with long duration are more likely to suffer from a greater number of diabetes-related complications and poorer glycemic control, which are possibly associated with the poor quality of sleep, rather than the duration of diabetes itself.

Redekop (26) added that maintaining good glycemic control could reduce the risk of complications. Intensified glycemic control is expected as an important way to reduce risk of complications and improve quality of sleep. Sundaram et al. (27) stressed that better glycemic control, as assessed by HbA1c, is associated with lower emotional distress, better well-being, better health status, better quality of life and better sleep quality.

Sleep disturbance is an important health concern, especially among diabetics, as lack of adequate sound sleep interferes with all aspects of person's health and daily living activities (28).

**Table 1:-** Personal characteristics of study sample.

Personal characteristics	No.	%
Age groups		
• <20 years	39	9.8
• 20-60 years	265	66.3

### Conclusion:-

In conclusion, type 2 diabetes is associated with high prevalence of poor quality of sleep. Risk factors for poor quality of sleep include being illiterate, poorly diabetes control (i.e., HbA1c level > 7%) and long duration of disease. Primary health care physicians should monitor the quality of sleep among type 2 diabetics. Early detection and treatment of sleep disorders among diabetics is essential.

chronic Multiple Sclerosis .

#### Abstract

**Background:** Multiple sclerosis (MS) is the most common inflammatory demyelinating disease of the CNS and the most frequent cause of nontraumatic neurological disability in young and middle-aged adults (1). Women are twice as likely to be affected as men, and onset typically occurs between the ages of 20 and 40 years (2). The diagnosis Depend on a detailed history; careful neurological examination; and supportive paraclinical investigations. According to the new McDonald criteria, the diagnosis of MS requires objective evidence of lesions disseminated in space and time. MRI findings may contribute to the determination of dissemination in time or space (4).

**Aim of the study:** the aim is to evaluate the role of MRI and find the most common findings in the early stages of the disease, which could provide the knowledge to help finding a higher quality care or even a cure to the disease.

**Methodology:** This retrospective descriptive study was conducted at security forces hospital, Riyadh city, kingdom of Saudi Arabia. Data was collected by chart and radiological images review of all patients from any age or gender who were 1<sup>st</sup> diagnosed with multiple sclerosis by MRI. From 01-01-2013 till 01-01-2016 to evaluate the MRI role and to find what are the most common MRI findings of multiple sclerosis in early stages of the disease.

**Results:** We have found that the MRI is the first choice of imaging in detecting Multiple Sclerosis. From our 50 patients 15(30%) were diagnosed by active demyelinating MS and 35 patients (70%) were diagnosed by chronic demyelinating MS. The most used sequence in all the cases was T2 weighted, FLAIR was performed in 49 of the cases (98%), T1 after IV contrast was used in 7 cases (14%). The common findings in the chronic demyelinating MS were high signal intensity in T2 weighted and in Axial FLAIR, in active demyelinating MS was characterized by enhancement after IV contrast and restricted diffusion.

**Conclusion:** Most common technique for detecting MS in the early stages is Multiplanar Multisequential technique, we have found that the most common findings in Chronic multiple sclerosis are high signal intensity on T2 weighted images and flair and the active multiple sclerosis is represented by high enhancement after administration of IV contrast and in some cases, restricted diffusion is considered a sign of activity. MRI is in fact the most sensitive modality to detect MS at early stages.

**Introduction:-**

Multiple sclerosis (MS) is the most common inflammatory demyelinating disease of the CNS and the most frequent cause of nontraumatic neurological disability in young and middle-aged adults (1). Women are twice as likely to be affected as men, and onset typically occurs between the ages of 20 and 40 years (2). The diagnosis depends on a detailed history; careful neurological examination; and supportive paraclinical investigations. According to the new McDonald criteria, the diagnosis of MS requires objective evidence of lesions disseminated in space and time. MRI findings may contribute to the determination of dissemination in time or space (4).

**General objectives:**

To evaluate the role of MRI in the early detection of Multiple Sclerosis (MS).

**Specific objectives:**

Find the best sequence for detecting MS in the early stages of the disease.  
Find the most common radiological findings in the early stages of MS.

**Hypothesis:**

Is there a best sequence for detecting MS in both active and chronic stages?

**Problem of study:**

Due to lack of full access of the patients recorded some information weren't able to reach.  
The short period due to the graduation semester didn't allow us to collect more data.

**Importance of the study:**

The disease is spreading among people. An early detection can help the patient to accept adapt and live with MS, because Managing MS is a process that begins with the very first symptom continuing throughout the disease.

**Ethical consideration:**

A signed consent was taken from princesses Nora university and from security forces hospital, Riyadh, Kingdom of Saudi Arabia. The data was managed confidential.

**Literature review:-****Definition:-**

Multiple sclerosis (MS) is considered one of the most common autoimmune diseases of the central nervous system (brain and spinal cord). (3)

MS is an inflammatory demyelinating condition; it is caused by damage to the myelin. Myelin allows the nerve to transmit its impulses rapidly. The loss of myelin (demyelination) is accompanied by a disruption in the ability of the nerves to conduct electrical impulses to and from the brain. This produces the various symptoms of MS. It is the speed and efficiency with which these impulses are conducted that permits smooth, rapid and coordinated movements to be performed with little conscious effort. (1)

In MS, the sites where myelin is lost (plaques or lesions) appear as hardened (scar) areas: in multiple sclerosis, these scars appear at different times and in different areas of the brain and spinal cord. (4)

**Incidence and prevalence:-**

MS is found in all parts of the world, its prevalence varies greatly, being highest in North America and Europe, and lowest in sub-Saharan Africa and East Asia. The number may be much higher as it is likely that many people with MS remain undiagnosed in certain parts of the world. There are about 2.3 million people in the world with MS. (1)  
It is almost unheard of in certain populations such as the Inuits, New Zealand Maoris and Australian Aborigines. (1)

**Risk factors associated with MS-**

The Risk factors affecting MS includes, Age, MS can occur at any age, but most commonly it affects people between the ages of 15 and 60. Sex, Women are about twice as likely as men are to develop MS, suggesting a role of

hormones in the disease's process. Family history, if one of the patient parents or siblings has had MS, they are at higher risk of developing the disease. (3)

There is a slightly higher risk of developing MS if the patient suffers from some types of disease for example, if the patient has thyroid disease, type 1 diabetes or inflammatory bowel disease. smokers usually have a higher risk of developing MS than nonsmokers especially if they experienced an initial event of symptoms that may signal MS. (7)

### **Signs and symptoms:-**

Multiple sclerosis signs and symptoms depends in the location of the damaged nerve fiber, they may differ greatly from one person to another and over the course of the diseases.

The Symptoms of MS may include; mental changes for example, decreased concentration, attention deficit and memory loss. Visual disturbances like, eye pain, loss of vision in one eye, blurred vision and color distortions. bladder and bowel dysfunction and some muscles disability like muscle spasms, fatigue, numbness and prickling pain. (3)

### **Stages of MS:-**

There are different forms of MS, depending on how it progresses. The disease can be: Primary progressive, this means that the symptoms are experienced by the patient regularly from the beginning. (4)

Secondary progressive, this means that the symptoms are not constantly experienced by the patient at first after that the attacks become more steady. This happens to many people who start out with relapsing-remitting disease. (7)

Relapsing-remitting, this means the symptoms of MS may come and go. Calling it an attack when the symptoms flare up. These attacks can last for days to weeks and usually refine slowly. Between attacks, people often feel ordinary While others may suffer from post attack effects. Relapsing-remitting is the most common type of MS. (6)

Progressive relapsing, this means that the worsening of the symptoms is steadily present from the beginning, and the attacks are also considered inconstantly occurring. (3)

### **Diagnosis of MS:-**

There are no specific tests for MS a diagnosis often relies on ruling out other conditions that might produce similar signs and symptoms, known as a differential diagnosis. (6)

Blood tests help to check for specific biomarkers associated with MS a, Lumbar puncture (spinal tap), in which a small sample of fluid is removed from the spinal canal for laboratory analysis. This sample can show abnormalities in antibodies that are associated with MS. (7)

MRI, is the diagnostic role that currently offers the most sensitive imaging of CNS. It can detect many more MS lesions than CT, and it can detect plaques in regions that are rarely abnormal on CT such as the brainstem, cerebellum, and spinal cord. Most lesions seen on MRI correlate with pathologic lesions. Patients with clinically definite MS have typical white matter lesions on MRI in nearly all cases. (2)

MRI evidence plays a supportive role in what is ultimately a clinical diagnosis of MS, in the appropriate clinical situation, and always at the exclusion of alternative diagnoses. (5)

A standardized MRI protocol for brain and spinal cord is crucial to differentiate between different diagnosis or between centers, this protocol called Multiplanar multi sequential technique. (6)

Gadolinium provides useful information about new lesion activity and is helpful in ruling out alternative diagnoses such as neoplasm, vascular malformations, and leptomeningeal disease. A single gadolinium-enhanced MRI can potentially provide evidence for dissemination in space and time. (7)

Spinal cord imaging is equally valuable to rule out spinal stenosis or tumor, and for detecting asymptomatic lesions when brain imaging is nondiagnostic in patients suspected of having MS. (3)

Evoked potential tests, which record the electrical signals produced by the nervous system in response to the stimuli. An evoked potential test may use visual stimuli or electrical stimuli, in which the patient watches a moving visual pattern, or short electrical impulses are applied to nerves in the legs or arms. Electrodes measure how rapid the information travels down the nerve pathways. (6)

The reason behind choosing this specific topic is how largely the disease is spreading among people. An early detection can help the patient to accept adapt and live with MS, because Managing MS is a process that begins with

the very first symptom continuing throughout the disease. Our study was held to evaluate the role of MRI in the early detection of MS, Since MRI is a powerful tool in detecting the disease it might provide an early detection even if the symptoms are not experienced by the patient yet and provide the knowledge to help finding a higher quality care or even a cure to the disease.

### Material and Methods:-

This retrospective descriptive study was conducted at security forces hospital, Riyadh city, kingdom of Saudi Arabia, to evaluate the MRI role and to find what are the most common MRI findings of multiple sclerosis in early stages of the disease. Data was collected by medical charts which include demographic data (age and gender) and the radiological images review of all the sequences performed for each patient who were diagnosed with multiple sclerosis by MRI from 1-1-2013 till 1-10-2016 and the data sample was 50 case.

#### Inclusion criteria:-

All cases that have been first diagnosed with Multiple Sclerosis By MRI.

#### Exclusion criteria:-

Relapsing stages of Multiple Sclerosis.

#### Date presentation:-

Data was presented by chart and tables

#### Data management:-

The data was analyzed by SPSS program.

### Results:-

This retrospective descriptive study was conducted at security forces hospital, includes 50 patients diagnosed with multiple sclerosis who have undergone MRI imaging of the brain and spine performed from 01/01/2013 to 01/10/2016, including 7 (14%) males and 43(86%) females. (table1).

Regarding age, the age range was between 17 to 58 years old and a median of 31 years old and a mean of 32 and a standard deviation of 10,34. our data were grouped into 3 categories, less than 26 years, includes 18 patients (36%), 26 to 40 years, includes 23 patients (46%), more than 40 years includes 9 patients (18%) (table1).

Multiple sclerosis affects women more commonly than men; we have found that 14% of the cases were males and the other 86% were females. The ratio of women to men having the disease is 43:7.

As showing in table 1 we have found two forms of the disease in the early stages: active demyelinating MS includes 15 patients (30%), while chronic demyelinating MS includes 35 patients (70%).

Table 1. Demographic data of 50 patients with Multiple Sclerosis

	Frequency	%
Age (years)		
Less than 26	18	36 %
26-40	23	46 %
40+	9	18 %
Gender		
Female	43	86 %
Male	7	14 %
Stages of MS		
Active demyelinating MS	15	30%
Chronic demyelinating MS	35	70%

Figure 1. Stages of Multiple Sclerosis

We have found that some of the cases haven't applied the standardized technique for Multiple Sclerosis which is called multiplanar multi-sequential technique (table 3).

T2 weighted was the most common sequence which used in 49 of the cases (98%), Axial T1, Axial Flair and Axial Gradient Echo are used in 49 of the cases (98%), T1 after IV contrast was used in 7 cases (14%), T1 FAT SAT after IV contrast was used in 43 cases (86%). Diffusion was applied in 49 of the cases (98%) (table 2).

Table 2. the sequences performed in 50 patients of Multiple Sclerosis

Sequence	Frequency	%
Sagittal, Axial, Coronal T2	49	98%
Axial T1	49	98 %
Axial Flair	49	98 %
Axial Gradient Echo	49	98 %
T1 After IV Contrast	7	14%
T1 Fat Sat After IV Contrast	43	86 %
Diffusion	49	98 %

Table 3. The dominant standardized technique in the study population

	Frequency	%
Performed with multiplanar multi-sequential technique	41	82%
Performed without multiplanar multi-sequential technique	9	18%

Figure2. multiplanar multi-sequential technique of Multiple Sclerosis.

Since comparable MRI abnormalities may be found in a variety of other diseases we have found that certain abnormalities are always present in the early stages of multiple sclerosis. We have found that Chronic multiple sclerosis shows high signal intensity on T2 weighted images and flair. The active multiple sclerosis is represented by high enhancement after administration of IV contrast and in some cases, restricted diffusion is considered a sign of activity.

All the cases (100%) shows high signal intensity on weighted T2. 45(90%) of the cases shows high signal intensity on flair. 2 (4%) of the cases shows small focal hemangioma. white matter changes appeared in 10 (19%) of the cases. 21 (42%) of the cases showed enhancement after IV contrast. Restricted diffusion appeared in 16 (32%) of the cases (table4).

Table 4. The MRI findings in the study population

Common MRI findings	Frequency	%
High signal intensity on t2 weighted	50	100%
High signal intensity on flair	45	90%
have a Few small focal hemangiomas	2	4%
White matter changes	10	19%
Enhancement after IV contrast	21	42%
Restricted diffusion	16	32%

### Discussion:-

The diagnosis of MS has traditionally relied upon accumulation of information, clinical and paraclinical, that leads to a positive diagnosis and can help to eliminate alternative diagnoses. The typical MRI findings in multiple sclerosis reflect the histopathology of the disease.

The result of Paty DW, Oger JJ, Kastrukoff LF, *et al.* (1988) research supports the hypothesis that consider MS a genetic disease which means that having a relative carrying the disease could increase the risk of developing it, however a valid evidence is not confirmed yet. We have noticed that some families have the disease more than others, but we couldn't determine if it is an actual factor or not, due to the lack of access to the patient's clinical history. (10)

We found in our 50 patients that Two stages of the disease are shown in the early diagnosis: active demyelinating MS and chronic demyelinating MS. We found a subtype of chronic MS the relapsing-remitting MS (RRMS) which is characterized by unpredictable relapses followed by a relative quiet period with no new signs of disease activity, we also found a subtype of active MS called Primary-progressive MS (PPMS) which is characterized by clearly defined relapses of increased disease activity and worsening symptoms, this matches the result of Barkhof F, Filippi M, Miller DH, *et al.* (1997) research. (11)

We have found that Some of our patients have a benign course of the disease. Which means that they only have mild symptoms and slow disease progression. Some studies show that some of these people experience some progression after 10 to 20 years.

We have found that Magnetic Resonance Imaging (MRI) offers the most sensitive imaging of the CNS, it can detect multiple sclerosis lesions better than CT and it can detect plaques in regions that are rarely abnormal on CT such as the brainstem, cerebellum, and the spinal cord. Therefore, we found that the first line of diagnosis in hospitals for MS is MRI.

As stated in Dalton CM, Brex, PA, Miszkiel KA, *et al.* (2002), research that There is a standardized MRI protocol for brain and spinal cord that is crucial for comparing between studies or to differentiate diseases that have similar symptoms as multiple sclerosis, such as seizure or stroke. our result matches this study, the protocol is known as the multiplanar multi-sequential technique which is a combination of all the sagittal, coronal and axial planes in addition to a before and after IV contrast images. (17)

We found that T2 weighted images always show high signal intensity in both active and chronic types which indicate the presence of a lesion, but it lacks the ability to distinguish between active and chronic lesions. The administration of gadolinium helps to determine the activity of the lesion and to roll out some other diseases.

A research by M Korostil and A Feinstein studied the relationship between alternative diagnoses and MS, it stated that there is a relationship between anxiety disorder and the onset of Multiple Sclerosis and patients with anxiety disorder should be scanned on a regular basis to look for Multiple Sclerosis. due to the social factors in Saudi Arabia there is less awareness about mental disorders, people here tend to ignore their mental health leading in a delay of the early diagnosis of MS in some cases. (3)

The findings of the study by Miller DH, Weinshenker BG, Filippi M, et al. (2008) assessed that a comparable MRI abnormalities may be found in a variety of other diseases, as shown in our result there are certain abnormalities that are always present in the early stages of multiple sclerosis. 20 percent of the cases showed changes in the white matter, some showed multiple periventricular/peri-callosal white matter changes and the other showed white matter edema. (22)

### Conclusion:-

The most common technique for detecting MS in the early stages was Multiplanar Multisequential technique, and the most common MRI findings in Chronic multiple sclerosis were high signal intensity on T2 weighted images and flair and the active multiple sclerosis is represented by high enhancement after administration of IV contrast and in some cases, restricted diffusion is considered a sign of activity. So, we conclude that the MRI is in fact the most sensitive modality to detect MS at early stages.

### Recommendation:-

Further studies should be done on the relation between the genetic factor and the onset of the disease. The benefit from these studies could assess an earlier detection of the disease if a relative carries it.

### Acknowledgement:-

We would like to show our gratitude for dr.Nermin Fahmy, who provided insight and expertise that greatly assisted the research and for sharing her pearls of wisdom with us during the course of this research and we are also immensely grateful for her comments on an earlier version of the manuscript and through the whole research.

#### Abstract

Globalization and other homogenizing developments, such as the free movement of citizens within the European Union, have brought people together from all corners of the earth, thereby increasing the need for skilled and culturally aware interpreters. In this paper, the authors reflect on their own experiences working with interpreters—both in research and in connection with the delivery of social services to marginalised women. When dealing with women of colour, the authors found, it is important to take into account principles defined by Black feminist writers and Anti-Oppressive Principles (AOP) designed to alleviate unequal, unfair, and otherwise oppressive conditions. Where women of colour are concerned, the authors further advocate using women from their cultures rather than men or women from outside their culture to interpret subjects' experiences. Using women interpreters from the same culture, the authors find, may increase the accuracy of research data and its interpretation and minimizes power inequalities associated with differences in gender, culture, and class. (160 words).

#### Introduction

In international development as well as in the provision of social services, practitioners today are generally aware that steps must be taken to diminish female oppression, equalize opportunity, and otherwise promote gender equity (Equality Act/UK, 2010; Kanbur, 2002; UNDP, 2003b). The recent influx of refugees and asylum-seekers has meant that European nations now have an urgent need to improve the way they glean information and provide services to immigrant populations. Where developed countries host large numbers of refugees, where ethnic and economic tensions have led to large numbers of internally displaced people in developing countries, where war causes people to flee their homes—both incomers and locals will have to learn how to adapt to differences of language, religion, and culture. Global statistics show, moreover, that war and poverty disproportionately affect women and children, and that the feminization of poverty, especially for women of colour, is on the rise (International Labour Organisation 2011; Horn, 2010).

As societies become ever more heterogeneous, both culturally and linguistically, the need for interpreters also increases. Newcomers need to know the rules and to recognize their new countries' established institutions, and to understand what social and economic resources are open to them. Most of all, both hosts and newcomers need to understand how best to accommodate and adapt to each other's cultural norms.

Studies show that even in places where the law and policy supports the right to language, more often than not, speakers of non-official language are still disadvantaged, both financially and socially. Their lives, moreover, are marred by a great variety of misunderstandings and complexities, which proper interpretation could go far to alleviate (Norma and Garcia-Caro, 2016; Bhopal, 2010; Farooq and Fear 2003; Westmeyer, 1990). In addition, interpreters not only help with language barriers but also help bridge other kinds of differences to achieve common goals. Interpreters link service users with service providers and researchers with their informants. Without this vital link to bring about understanding, neither successful service provision nor research is possible.

The Australian study by Norma and Garcia-Caro (2016) highlights the importance of training interpreters dealing with certain types of situations in words and ideas specific to relevant fields. This study found, for instance, that community interpreters assisting migrant women experiencing high rates of domestic violence were not familiar with social science ideas about how best to deal with gender-related issues. The authors therefore recommend tailoring the education of interpreters in a research study of abused women to include information about these issues, so as to make them less obtrusive and more effective in gathering information from informants. When Australian migrant women had to relate experiences of violence through male interpreters, for example, they frequently found them insensitive. They also sensed that these interpreters were distorting their words, and became extremely distressed (Amnesty International Australia, 2008; Hunter, 2006).

Several authors have demonstrated that gender differences between subjects and interpreters can skew results and diminish the quality of information gathered. These studies showed clear benefits, when collecting research data about women, or using women to interview and interpret for women (Oakely, 1981; Harding, 1991; Finch, 1984; Cook and Fonow, 1990). Other studies raise questions about the advisability of using men from the same culture as interpreters for women reporting on gender-sensitive issues (Bhopal, 2010). Male interpreters with cultural taboos related to sex, for instance, are likely to shy away from sex-related topics and may even fail to translate sex-related incidents their subjects report (Hale, 2007; Pardy, 1995).

Psychiatrists have also noted the importance of research interpreters being familiar with the area of study, sensitive cultural issues, and words used in relevant fields (Farooq and Fear, 2003). Westmeyer (1990) reports a situation where an interpreter discouraged patients from divulging information seen as derogatory to their culture. Farooq and Fear (2003) found that interpreters unfamiliar with psychiatric-related words frequently introduced errors into the data gathered (see also Farooq et al. 1987).

Bhopal (2010), conducted research on how marginalised groups invariably deals with issues related to gender, identity, and personal experience. When properly handled, she observes, these three variables can create a “shared empathy and a shared understanding between the respondent and the researcher in which trust and rapport” encourage conversation. In her own research, Bhopal (2010) observed that her shared culture, experiences, and gender were instrumental in gaining access to Asian women and getting them to speak with her. She also discussed key issues for researchers and social service providers working with Gypsy communities, such as the separate spaces, both private and public, male and female Gypsies occupy. In this culture, women are prohibited from being in the company of men, including male interpreters, they are not related to (Bhopal, 2010). Bhopal’s research experience sheds light on the importance of gender as a key factor when recruiting interpreters and communicating with women from marginalised and non-indigenous cultures.

### **Black Feminist Thought and the “Anti-Oppressive” Principles**

Feminist theory overall is founded on the premise that women, although making valuable contributions to society globally, have been and still are culturally, economically, and educationally oppressed. This oppression has made it impossible for most women to achieve their full potential. Feminists therefore concentrate on ways to empower women, and to foster conditions likely to equalize access to education, power, and economic opportunity (Ropers-Huilman, 2002).

Emerging in the 1990’s and Informed by post-colonialist and post-modernist writings, Black Feminist Theory (BFT) is part of the third wave of the feminist movement as a whole. It goes beyond gender issues cited by earlier feminist writers and includes variables that specifically escalate female oppression (Hill 1991, Narayan 2004, Phoenix 2001). Black Feminist Theory contends, for instance, that the Black female experience goes beyond gender issues and must also include issues related to culture, class, and race. Hill (1991) and Phoenix (2001) contend that

the primary responsibility for defining a reality lies with the people who live it. Drawing on her own experience as a Black woman, Hill further confirms the Black feminist contention that race and class are essentials in the Black female life experience. Narayan (2004) additionally contends that lived experience confers a special expertise (an “epistemic advantage”) that allows a person to contextualize words and events with the understanding of a participant.

To understand the oppression of marginalised populations, Crenshaw (2007) emphasizes the importance of intersections where spheres of power overlap, and to compare them to marginalized peoples’ lived experiences. Social service professionals and academics may therefore find it useful, when working with marginalized women, to adopt the Black feminist practice of analysing human interactions and relationships in terms of race, culture, and class as well as gender equality (Burke and Harrison, 2002).

### **Understanding the Unknown Other:-**

Development specialists and researchers working in unfamiliar contexts obviously depend on interpreters to bridge the gap. They also draw on many different social work, sociological and anthropological theories about how best to analyse and understand information gleaned from other cultures—including Cultural Relativism (CR), Anti-Oppressive Principles (AOP), and Person-Centred Approaches (PCA).

Cultural Relativism denotes a person’s beliefs and activities must be understood in the context of that person’s own culture (Herskovits 1973, Lazer 1994). Anti-Oppressive Principles is the way we evaluate conditions and ways subjects’ powers (with regard to social status, race, gender, class, disability, sexual orientation, and age) can be used to shift power away from oppressive persons, organisations, structures, and communities. Clifton (1995) observes that our experiences, histories, geographical location, and place in society affect the way we understand and respond to the complex issues that lead to oppression. Helping to increase marginalised people (especially women)’s awareness of anti-oppressive principles helps them deal with issues arising from powerlessness. In Black Feminist Thought, black women are the best interpreters of the marginalised black woman’s experience. In Person-Centred Approach, Dominelli (2008) stresses the importance of using a Person-Centred Approach to reduce structural inequalities, because it helps to empower users and lessen the deleterious impact of social and economic inequality.

### **Interpreters: Reflections Working in Cross-Cultural Communities – Adelaide Lusambili**

In this section, I reflect on my own experience using male interpreters to speak with marginalized, non-English speaking women in both developed and developing countries. I then present my argument as to why I think black marginalised women’s accounts cannot be properly interpreted by men. It is my contention that, when recruiting interpreters, we need to apply Anti-Oppressive Principles and principles espoused in Black Feminist Thought and to minimise the damage done by chronic conditions of oppression and inequality in these women’s lives

The provision of services in the UK to minority ethnic groups from within the EU and from Commonwealth countries, many of whom come as refugees and asylum seekers and have limited proficiency in the English language, require help in interpreting their stories/views to professionals (Tipton, 2016). Scant research exists on the crucial role of interpreters in gathering information needed to provide culturally appropriate services. In the UK, trained and untrained interpreters work alongside each other. According to a National Health Service England (NHS) policy statement, patients should receive primary care services in a timely manner and should not be prevented from doing so because they do not speak English. and This means that the law requires they be provided with services designed to meet their language and communication needs.

Tipton’s (2016) research revealed some of the issues experienced by health professionals, interpreters, and service users. For example, her study revealed that interpreters are usually hired in a hurry and most of them have limited background in the subject matter. Despite this, interpreters are frequently called upon to provide opinions and give their views on material issues. Other issues raised were service users’ mistrust of interpreters and sometimes also of service providers, who are generally in a hurry to move on to the next appointment. Findings that there is a general feeling of mistrust and that frequent misunderstandings arise from poor quality interpretation, raise concerns about the quality of interpretation and also raise ethical concerns about the quality of treatment provided.

In 2016, I had the opportunity of working with marginalised non-English speaking women who needed interpreters to relay their messages to professionals so that they could be sign-posted to available community services where

they could obtain help. In one instance, a Gypsy male interpreter was called to interpret for a family whose child had undergone physical and sexual abuse. When the interview began, the female respondent whose child had undergone abuse began to explain what had happened in her language. The male interpreter looked on, and when his turn came to relay the message, all he said was, "She says people don't like her on this street...I think that is why her child was assaulted" and then kept quiet. The interpreter then went on to talk with her in their native language. The female interviewee then became emotional, went quiet and began to weep. We decided to cancel the session as we thought she was upset talking about her daughter's abuse. We decided that we would return another day. When we did so, we held the meeting in a community building, with a different male interpreter. This time, we completed the session; however, the male interpreter made it clear to us that he had not translated some words that may relate to sexual acts as the culture does not allow him to do that. He also intervened in the woman's account and told professionals that he knew the family the woman had mentioned that perpetrated the abuse and he did not think that they were capable of committing this act. He went further and spoke to the woman in their native language, which professionals learned later that she had put pressure on this woman not to implicate the family in this case.

This experience was not only with one family in this community but with many of the families with whom we worked. However, when Gypsy women were provided with interpreters from their culture who were women, conversations were detailed and professionals at the session were able to see and interpret the respondents' facial expressions for themselves. Women reported that they preferred their fellow women as interpreters and that male interpreters from the same community could not adequately report or talk about issues of physical or sexual abuse, especially when perpetrated by fellow men.

The experience of women feeling uncomfortable relaying their experiences of abuse in the presence of male interpreters and the issue of male interpreters not wanting to relay messages that they felt could stigmatise the women and their families were also experienced while working with some Black Africans and Asian women in the UK. For instance, while working with a Black African woman, she came to me after a male interpreter had left and revealed that, even though she had said she received welfare benefits, she did not personally receive and control the money, her husband did. She explained that she was afraid to share this information during the interpretation because the male interpreter, who hailed from the same community, might find a way of relaying the information to her husband. A similar instance was experienced when volunteering for an Asian Women organization in North of England who were working with ethnic minority families in fuel poverty. While interviewing an older lady, whose house was cold, the (male) community interpreter, who was familiar with the family, had deliberately omitted information that the bills had not been paid due to the son's financial abuse of his mother. The son had not paid the bills for many months, and the home was cold. When a female interpreter accompanied me, we learned that the son controlled the finances and was abusing the lady financially; however, the male interpreter had failed to tell us this information as he was familiar with the family, and it may be that he wanted to protect the son.

The experiences with interpreters working with black women living in developing countries are no different. Between 2005 -2008 and in 2009 and in the summer of 2016, I conducted research in the slums of Nairobi on differential impacts of environmental sanitation. One of the main findings of this study was women's physical and sexual abuse while accessing sanitation facilities in the night. Because women in these slums did not speak my native language, I employed a male research assistant to translate their stories from their native language into English. Women were uncomfortable sharing their experience of abuse with a male interviewer, while the male interviewer did not seem comfortable delving deeper into the topic.

Issues concerning physical and sexual abuse are very delicate. My experience demonstrates the role of gender identity in research. Research has shown that gender identity can create empathy between interpreters and service users. As such, trust and rapport can provide a conducive environment in which interpreters can open up and discuss their personal experiences (Bhopal, 2010). These experiences have also shown that tensions associated as a result of power relationships can impact the quality of information given by marginalised women. These experiences also highlight the need for professionals to be alert and able to use anti-oppressive principles to prevent ways in which poor interpretation could be detrimental to provision of services to marginalised groups. Adequate provision of services cannot be delivered if in the first instance the available information is not credible.

### **Interpreters, Gender, and Ethnic Conflict Research – Fr Kizito Muchanga**

In the following section, I reflect on my doctoral research conducted with women who had experienced rape and loss of property during the Post-Ethnic Violence (PEV) in Kenya. The purpose of this reflection is to share some

experiences from fieldwork and demonstrate how issues of power, gender and culture caused me to think that black women's – and in particular marginalised women's – stories of their experience of sexual abuse can be better researched or presented by other women. Secondly, based on my reflection, I want to add to the existing knowledge by arguing that women's stories must be understood holistically by locating them within social, cultural and political structures that are geographically and historically specific. Lastly, black feminist thought and anti-oppressive principles are crucial in understanding vulnerable people's experiences of abuse.

My study took place between 2012 and 2015 in Western Kenya. Before commencing this study, I was familiar with most of the women who had suffered physical and sexual abuse during Post-Ethnic Violence. This was through my work as a Catholic Priest in the area, who had provided shelter to these women during the violence. The objective of my study was to examine the effectiveness of the Catholic strategies in dealing with conflicts. As a clergyman and a researcher, I was also keen to understand the experience of these women and the ways in which the church could assist from a psycho-social point of view.

Many of the victims of Post-Election Violence came from a different ethnic group to mine, and spoke a language unfamiliar to me. As such, I had two interpreters helping with the research and alternating depending on their schedules. Because issues of physical and sexual abuse are sensitive culturally and can lead to long-time stigmatisation for individuals and their families in this culture, I decided to use a seminary nun and another clergyman familiar with their language to interpret these women's experiences. The interview process was slow, as potential interviewees who had been identified through the development project affiliated to the church either cancelled their interviews or recanted their testimonies of being raped. For a few of the interviews that we conducted, information received was scant and participants did not want to engage with me, the researcher, or the nun. One nun who worked with the majority of the women in the local health centre had noted that the women should be interviewed during their health sessions and that community health workers or nuns who spoke their language were better placed to interview them. This method was successful as women shared their experience comfortably with the nuns or community health workers. Even when it came to counselling, women preferred to talk to the nuns and they preferred to be counselled by the nuns.

My experience made me to reflect on ways in which development specialists working in Post-Conflict Violence can approach issues of physical and sexual abuse when working with women who have experienced male dominance. While women were willing to share other experiences with me, such as destruction of property they incurred during the violence, they were not comfortable divulging information on sexual abuse. Anti-Oppressive Approaches show how social differences and power can disempower some groups while empowering others. While I am not sure to what extent being male, a clergyman and from a different ethnic group may have caused the women to refrain from sharing their views, it was clear that they felt at ease with other women from their culture. This experience raises issues from Black Feminist Thought, in particular how to represent the subjects lived experience from an insider point of view while paying attention to the intersection between gender, class and culture.

### **Conclusions:-**

In this paper, the authors draw from Black Feminist Thought and Anti-Oppressive Principles' to reflect on the interpreters' role when working with marginalised women, especially women of colour, who are not native English speakers. The authors draw on their personal experience working with women from diverse cultures.

As developed countries are increasingly called upon to provide social services to people from many different cultures, the use of interpreters has also increased. Interpreters, in fact, provide the vital service of making service-users' accounts intelligible. These accounts ultimately guide which services are delivered, and how well interventions meet service users' needs. In questioning the efficacy of using male interpreters to communicate with marginalized female service users, this paper highlights a problem in social and medical service provision that is too often ignored.

Further research needs to examine ways in which social cultural and gender variables must be factored in the recruitment of interpreters. The reflections have also raised issues on the efficacy of male community interpreters in interpreting issues of sexual or physical abuse that are likely to be committed by men from the same culture. Even within countries that have internally displaced people, these reflections provide a platform upon which further research can be conducted that can inform how ethnicity and women speakers of local languages can be used to glean data from victims of sexual abuse in their own cultures.

#### Abstract

The oxidation of nitrite ion  $\text{NO}_2^-$  by Peroxodisulphate ion  $\text{S}_2\text{O}_8^{2-}$  was studied in high ionic strength and in phosphate and acetate media at around  $\text{pH}=7$  and  $60^\circ\text{C}$ . Under controlled conditions the reaction is of overall second order being first order with respect to reactants. Cations ( $\text{Na}^+$ ,  $\text{K}^+$ ,  $\text{Ca}^{+2}$ ,  $\text{Mg}^{+2}$  and  $\text{Cu}^{+2}$ ) catalyze the reaction and the extent of catalysis depends on the nature and concentration of the cations. The temperature effect on the redox reactions was studied and the activation energy is  $60.01 \text{ kJmol}^{-1}$ . The mechanism has been proposed. Based on experimental data and kinetic simulation, we have modified previous models for this reaction mechanism and show that the new model proposed here is consistent with experimental data. The stoichiometry was determined to be:-

And the experimental rate law is:

$$R_0 = k_1[\text{S}_2\text{O}_8^{2-}]_0 + k_2[\text{S}_2\text{O}_8^{2-}]_0[\text{NO}_2^-]_0 + \{\sum k_{\text{Mi}}^{n+}[\text{M}^{n+}]\}[\text{S}_2\text{O}_8^{2-}]_0[\text{NO}_2^-]_0 \quad (2)$$

#### Introduction:-

Peroxodisulphate ion  $\text{S}_2\text{O}_8^{2-}$  is one of the strongest oxidizing agents known in aqueous solution<sup>(1)</sup>. Peroxodisulphuric acid and its salts were suggested to be among the most useful oxidizing agents in aqueous solution<sup>(2,3)</sup>. Many studies on the thermal decomposition of Peroxodisulphate ions were made by many workers such as Cotton, Kolthoff, Miller, Vasudeva, Taha and Wasif<sup>(4)</sup> and there is general agreement that it follows first order kinetics. Reactions involving peroxodisulphate ion are generally slow at ordinary temperatures<sup>(5)</sup> but become more rapid in the presence of some metal ions like  $\text{Ag(I)}$ ,  $\text{Fe(II)}$  and  $\text{Cu(II)}$ . Therefore in this work we used  $\text{Na}^+$  and  $\text{K}^+$  in the redox reaction between Peroxodisulphate ion and nitrite ion.

The kinetic study of the reaction of nitrite ion has been of increasing interest due to its biological and chemical implications<sup>(6,7)</sup>. Nitrite ion is a common contaminant in water, and because its complexing ligand (with  $\text{Fe(II)}$ ) its presence can be dangerous. The kinetics of the redox reaction of  $\text{S}_2\text{O}_8^{2-}$  and  $\text{NO}_2^-$  was studied by a number of workers. Elamin<sup>(8,9)</sup>, who found that the oxidation of nitrite ion by peroxodisulphate was second order, being first order with each reactant.

**Corresponding Author:- Dr. Eeljali Elobeid Elhassan.**

Address:- Assistant Professor, Chemistry Department, Faculty of Education, Khartoum university, P.O.Box406 Omdurman-Sudan.

**Materials:-**

All chemicals used are of high purity (98%). The redox reaction of peroxodisulphate with nitrite ion proceeds at measurable rate at about 60°C and it is for this reason, that the temperature range 60<sup>0</sup>- 75<sup>0</sup>C was chosen. For each run two solutions A and B were prepared. A was freshly prepared –K<sub>2</sub>S<sub>2</sub>O<sub>8</sub>- while B was a mixture of NaNO<sub>2</sub>, added salts (NaNO<sub>3</sub> and KNO<sub>3</sub>) which maintained the constant ionic strength and phosphate buffer (Na<sub>2</sub>HKPO<sub>4</sub> – KH<sub>2</sub>PO<sub>4</sub>). Also solutions A and B were prepared in the same manner and acetate (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>Na – C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>) buffer is used instead of phosphate buffer. Solutions A and B were made in such way that the concentration of each species was double the value required in the final reaction mixture. Water carefully redistilled from alkaline KMnO<sub>4</sub> was used.

**Preparation of Solutions:-**

**(i) Solution A:** Calculated amount of K<sub>2</sub>S<sub>2</sub>O<sub>8</sub> (A.R) was dissolved in double distilled water to make 500cm<sup>3</sup> of solution A.

**(ii) Solution B:** Calculated amount of NaNO<sub>2</sub>, NaNO<sub>3</sub>, KNO<sub>3</sub> and Phosphate buffer (Na<sub>2</sub>HPO<sub>4</sub> - KH<sub>2</sub>PO<sub>4</sub>) or acetate buffer (C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>Na – C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>) are dissolved in double distilled water to make 500cm<sup>3</sup> of solution B. The additional components under study (i.e. allylacetate was added in each kinetic run to solution B.

**Reaction Conditions:-**

The redox reaction was carried out in the conditions: [S<sub>2</sub>O<sub>8</sub><sup>2-</sup>]<sub>0</sub>=[NO<sub>2</sub><sup>-</sup>]<sub>0</sub>, high ionic strength around one (I=0.80-1.34), Phosphate buffer [Na<sub>2</sub>HPO<sub>4</sub>]=[KH<sub>2</sub>PO<sub>4</sub>]=0.20 mol dm<sup>3</sup> or acetate buffer (Na<sub>2</sub>HPO<sub>4</sub> - KH<sub>2</sub>PO<sub>4</sub>).

**Kinetic measurements:-**

The progress of the reaction was followed by examining the concentration of peroxodisulphate ion at various time interval. The concentration of S<sub>2</sub>O<sub>8</sub><sup>2-</sup> was determined iodometrically during the kinetic run. Purified nitrogen gas was passed through the quenched iodine flask contain 10cm<sup>3</sup> sample so as to drive away any dissolved oxygen. Then 4gms of KI were added. It was then placed in the dark for about 10minutes till all the iodine was liberated. The liberated iodine was then titrated against standard sodium thiosulphate using starch as an indicator.

The concentration of nitrite ion was determined before the kinetic runs by two methods;

**(a) Titration method:** By using standard potassium permanganate solution.

**(b) Spectrophotometric method:** By reacting nitrite ion with a series of organic materials to form a purple dye, so that the measured absorption A was plotted vs. nitrite concentration. A straight line passing through the original point was obtained and thus providing that the solution obeys Beer's law.

**Results and Discussion:-****Kinetic order with respect to Peroxodisulphate ion**

The order of the reaction-in its initial stages-with respect to S<sub>2</sub>O<sub>8</sub><sup>2-</sup> was investigated under the constant conditions given in the captions of table (1) which shows the variation of the initial rate of disappearance of peroxodisulphate ion, R<sub>0</sub>, with its initial concentrations. A plot of R<sub>0</sub> vs. [S<sub>2</sub>O<sub>8</sub><sup>2-</sup>]<sub>0</sub> (fig.1) gives a straight line indicating that the reaction is first order with respect to S<sub>2</sub>O<sub>8</sub><sup>2-</sup>, thus:

$$R_0 = -d[S_2O_8^{2-}]_0/dt = k_{obs} [S_2O_8^{2-}]_0 \quad (1)$$

Where k<sub>obs</sub> is initial-pseudo first order rate constant. From fig(1) the slope = k<sub>obs</sub> = 3.7398X10<sup>-5</sup> s<sup>-1</sup>, at 60°C.

**Table (1) Variation of R<sub>0</sub> with [S<sub>2</sub>O<sub>8</sub><sup>2-</sup>]<sub>0</sub>**

[NO<sub>2</sub><sup>-</sup>]<sub>0</sub>=0.0752 mol dm<sup>-3</sup> [Na<sup>+</sup>]=[K<sup>+</sup>]=0.500 mol dm<sup>-3</sup>

#### Kinetic order with respect to Nitrite ion:-

The effect of varying the initial concentration of nitrite ion –while- keeping  $[\text{S}_2\text{O}_8^{2-}]_0$  and other factors constant, was investigated by plotting of initial rate of the disappearance of peroxydisulphate against the respective  $[\text{NO}_2^-]_0$  values, (fig 2) and (Table 2), a straight line intercepting the y-axis was obtained suggesting a rate equation of the form:

$$R_0 = -d[\text{S}_2\text{O}_8^{2-}]/dt = R_1 + k[\text{NO}_2^-]_0 \quad (2)$$

$R_1$  represents the thermal decomposition of peroxydisulphate in the absence of nitrite ion while the second term represents the redox ( $\text{S}_2\text{O}_8^{2-}$ - $\text{NO}_2^-$ ) path. Since the reaction is first order in  $\text{S}_2\text{O}_8^{2-}$  equation (2) can be rewritten as:

$$R_0 = k_1[\text{S}_2\text{O}_8^{2-}]_0 + k_2[\text{S}_2\text{O}_8^{2-}]_0 [\text{NO}_2^-]_0 \quad (3)$$

Where  $k_1$  is the thermal decomposition of peroxydisulphate and  $k_2$  is second order rate constant.

**Table (2) Variation of  $R_0$  with  $[\text{NO}_2^-]_0$**

$[\text{S}_2\text{O}_8^{2-}]_0 = 0.0751 \text{ mol dm}^{-3}$        $[\text{Na}^+] = [\text{K}^+] = 0.500 \text{ mol dm}^{-3}$   
 $[\text{HPO}_4^{2-}] = [\text{H}_2\text{PO}_4^-] = 0.20 \text{ mol dm}^{-3}$        $I = 1.23-1.27$   
 $\text{pH} = 6.47$        $\text{Temp.} = 60^\circ\text{C}$

$[\text{NO}_2^-]_0 / \text{mol dm}^{-3}$	0.0100	0.0350	0.0500	0.0750	0.1000
$10^5 \times R_0 / \text{mol dm}^{-3} \text{min}^{-1}$	4.1489	8.9667	12.1277	16.3176	21.7895

**Effect of hydrogen ion:-**

The pH of the redox reaction was changed in the range (4.65-8.41) by changing the ratio  $[\text{HPO}_4^{2-}]/[\text{H}_2\text{PO}_4^-]$  under otherwise constant experimental conditions table(3). The pH was measured directly using a pH-meter. From table (3.3) there is no clear effect on  $R_0$ . Therefore it is safe to conclude that the rate of the reaction is independent of pH.

**Table (3) Variation of  $R_0$  with pH:-**

$[\text{S}_2\text{O}_8^{2-}]_0 = 0.0750 \text{ mol dm}^{-3}$   $[\text{NO}_2^-]_0 = 0.0748 \text{ mol dm}^{-3}$   
 $[\text{Na}^+] = [\text{K}^+] = 0.500 \text{ mol dm}^{-3}$   $[\text{HPO}_4^{2-}] = [\text{H}_2\text{PO}_4^-] = 0.20 \text{ mol dm}^{-3}$   $I = 1.1-1.2$   
 Temp. =  $60^\circ\text{C}$

$10^7 \times [\text{H}^+], \text{mol dm}^{-3}$	pH	$10^4 \times R_0 / \text{mol dm}^{-3} \text{ min}^{-1}$

1.1939	6.923	1.650
0.1321	7.879	1.688
0.0389	8.409	1.711

**Effect of free radical scavengers:-**

The effect of adding allylacetate in multi concentrations was studied by carrying out the runs in experimental conditions given in the caption of table (4). From this table no clear effect is observed. This probably shows that free radicals are not involved in the rate-determining step although the result does not exclude the presence of free radicals in other fast steps.

**Table (4) Variation of  $R_0$  with Allyl acetate:-**

$[\text{S}_2\text{O}_8^{2-}]_0 = 0.0750 \text{ mol dm}^{-3}$   $[\text{NO}_2^-]_0 = 0.0750 \text{ mol dm}^{-3}$   
 $[\text{Na}^+] = [\text{K}^+] = 0.500 \text{ mol dm}^{-3}$   $[\text{HPO}_4^{2-}] = [\text{H}_2\text{PO}_4^-] = 0.20 \text{ mol dm}^{-3}$   $I = 1.24$   $\text{pH} = 6.47$   
 Temp. =  $60^\circ\text{C}$

$10^3 \times [\text{Allyl acetate}] / \text{mol dm}^{-3}$	Nil	6.1892	9.2193	11.2371
$10^5 \times R_0 / \text{mol dm}^{-3} \text{ min}^{-1}$	2.778	2.768	2.759	2.776

**Effect of added salts:-**

The effect of added the salts  $\text{NaNO}_3$ ,  $\text{KNO}_3$ ,  $\text{Mg}(\text{NO}_3)_2$ ,  $\text{Ca}(\text{NO}_3)_2$  and  $\text{Cu}(\text{NO}_3)_2$  on the redox reaction was shown in figs.( 3 and 4) by varying the concentration of the cation under otherwise constant experimental conditions given in tables (5 and 6). To investigate the effect of divalent cations ( $\text{Mg}^{+2}$ ,  $\text{Ca}^{+2}$  and  $\text{Cu}^{+2}$ ) the medium was changed from phosphate buffer to acetate buffer which does not form precipitates with the cations. Effect of  $\text{Na}^+$  and  $\text{K}^+$  were repeated in acetate medium. It is clear from figs.( 3 and 4) that the rate of the reaction is linearly to cations concentrations ( $[\text{M}^{+n}]$ ,  $n=1$  or  $2$ ), thus the rate of the reaction may be expressed by eq.4.

$$R_0 = C + k_{\text{obs}} [\text{M}^{+n}] \quad (4)$$

In which C is y-intercept at  $[\text{M}^{+n}] = 0$  and  $k_{\text{obs}}$  is slope of the straight lines, as defined by the equations (5) and (6) respectively:

$$C = k_1 [\text{S}_2\text{O}_8^{2-}]_0 + k_2^0 [\text{S}_2\text{O}_8^{2-}]_0 [\text{NO}_2^-]_0 + k_{\text{Mi}}^{+n} [\text{M}_i^{+n}] [\text{S}_2\text{O}_8^{2-}]_0 [\text{NO}_2^-]_0 \quad (5)$$

$$k_{\text{obs}} = k_{\text{M}}^{+n} [\text{S}_2\text{O}_8^{2-}] [\text{NO}_2^-] \quad (6)$$

where  $k_{\text{M}}^{+n}$  is the catalytic rate constant for the cation  $\text{M}^{+n}$  under study,  $k_{\text{Mi}}^{+n}$  is that of the residual cation  $\text{M}^{+n}$  and  $k_2^0$  is the second order rate constant at zero cation concentration. Substituting the relevant values of C and  $k_{\text{obs}}$  from each plot and the appropriate values of the other terms applicable to it leads to the results given in tables(5 and 6). Thus it is evident that the cations catalyze the redox reaction and that they do so in the ascending order  $\text{Na}^+ < \text{K}^+ < \text{Mg}^{2+} < \text{Ca}^{2+} < \text{Cu}^{2+}$ .

Fig. 3. Effect of added  $\text{Na}^+$  and  $\text{K}^+$  in phosphate mediumFig. 4. Effect of added  $\text{Mg}^{2+}$ ,  $\text{Ca}^{2+}$  and  $\text{Cu}^{2+}$  in acetate mediumTable (5) Effect of added  $\text{Na}^+$  and  $\text{K}^+$  cations in phosphate medium

$[\text{S}_2\text{O}_8^{2-}]_0 = 0.0750 \text{ mol dm}^{-3}$   $[\text{NO}_2^-]_0 = 0.0750 \text{ mol dm}^{-3}$   
 $[\text{HPO}_4^{2-}] = [\text{H}_2\text{PO}_4^-] = 0.20 \text{ mol dm}^{-3}$  pH=6.47 Temp.=60°C

Cation	$k_M^+ \times 10^4 \text{ mol}^{-2} \text{ dm}^6 \text{ s}^{-1}$
$\text{Na}^+$	$2.80 \pm 0.06$
$\text{K}^+$	$4.52 \pm 0.04$

**Table (6) Effect of added Na<sup>+</sup>, K<sup>+</sup>, Mg<sup>+2</sup>, Ca<sup>+2</sup> and Cu<sup>+2</sup> cations in acetate medium**

[S<sub>2</sub>O<sub>8</sub><sup>2-</sup>]<sub>0</sub>=0.0650 mol dm<sup>-3</sup> [NO<sub>2</sub><sup>-</sup>]<sub>0</sub>=0.0650 mol dm<sup>-3</sup> [C<sub>2</sub>H<sub>3</sub>O<sub>2</sub>Na]=[C<sub>2</sub>H<sub>4</sub>O<sub>2</sub>]=0.20 mol dm<sup>-3</sup> pH=4.67 Temp.=60°C

Cation	Cx10 <sup>6</sup> (intercept) mol dm <sup>3</sup> s <sup>-1</sup>	k <sub>obs</sub> x10 <sup>6</sup> s <sup>-1</sup>	k <sub>M<sup>+</sup>nx10<sup>4</sup> mol<sup>-2</sup> dm<sup>6</sup> s<sup>-1</sup></sub>	K <sub>2</sub> <sup>0</sup> x10 <sup>5</sup> mol <sup>-1</sup> dm <sup>3</sup> s <sup>-1</sup>
Na <sup>+</sup>	1.03	1.25	2.91±0.04	4.31
K <sup>+</sup>	0.77	1.94	4.54±0.03	4.01
Mg <sup>+2</sup>	1.35	5.92	13.84±0.09	4.35
Ca <sup>+2</sup>	1.36	6.75	15.80±0.01	4.35
Cu <sup>+2</sup>	1.36	11.88	27.50±0.08	4.36

The rate law for the reaction is thus detailed as in equation (7).

$$R_0 = k_1[S_2O_8^{2-}]_0 + k_2[S_2O_8^{2-}]_0[NO_2^-]_0 + \{\sum k_{Mi}^{n+}[M^{n+}]\}[S_2O_8^{2-}]_0[NO_2^-]_0 \quad (7)$$

Where k<sub>Mi<sup>n+</sup></sub> is the catalytic rate constant for i<sup>th</sup> ion.

Where i = 1,2 represents the cations present in the system. When only one cation is present the term within the Σ sign reduces to k<sub>M<sup>n+</sup></sub>[M<sup>n+</sup>] and equation becomes:

$$R_0 = k_1[S_2O_8^{2-}]_0 + k_2[S_2O_8^{2-}]_0[NO_2^-]_0 + k_M^{n+}[M^{n+}][S_2O_8^{2-}]_0[NO_2^-]_0 \quad (8)$$

### Effect of temperature:-

The effect of temperature on the k<sub>2</sub> path was studied over the temperature range 60-75°C<sup>0</sup> at otherwise constant experimental conditions of:

[S<sub>2</sub>O<sub>8</sub><sup>2-</sup>]<sub>0</sub> = 0.0660 mol dm<sup>-3</sup>, [NO<sub>2</sub><sup>-</sup>]<sub>0</sub> = 0.0663 mol dm<sup>-3</sup>  
 [Na<sup>+</sup>]=[K<sup>+</sup>] = 0.50 mol dm<sup>-3</sup>, [HPO<sub>4</sub><sup>2-</sup>]=[H<sub>2</sub>PO<sub>4</sub><sup>-</sup>]=0.20 mol dm<sup>-3</sup>  
 I=1.24 pH=6.47

The values of the first order rate constant for the thermal decomposition of S<sub>2</sub>O<sub>8</sub><sup>2-</sup>, k<sub>1</sub>, calculated by Elamin, were used in calculating k<sub>2</sub> at each temperature from equation(5). Results are summarised in table(7).

The effect of temperature on k<sub>2</sub> components (i.e. k<sub>2</sub><sup>0</sup> and k<sub>M<sup>n+</sup></sub>) was also studied in the range 60-75°C. For each temperature k<sub>2</sub> was calculated from equation(3), and then k<sub>M<sup>n+</sup></sub> was calculated from y-intercept of figures resulting from plot of [M<sup>n+</sup>] vs. R<sub>0</sub> by using the equation

$$R_0 - k_1[S_2O_8^{2-}]_0 = k_2[S_2O_8^{2-}]_0[NO_2^-]_0 + k_M^{n+}[M^{n+}][S_2O_8^{2-}]_0[NO_2^-]_0 \quad (9)$$

From plot of log k<sub>M<sup>n+</sup></sub> against 1/T the relevant Arrhenius parameters are calculated in table (7) for each path.

**Table (7) Thermodynamics parameters of activation**

Path	ΔE <sup>#</sup> /kJmol <sup>-1</sup>	A	ΔS <sup>#</sup> /JK <sup>-1</sup>	ΔG <sup>#</sup> /kJmol <sup>-1</sup>
K <sub>2</sub>	60.01	7.64x10 <sup>5</sup>	132.97	14.54
K <sub>2</sub> <sup>0</sup>	98.74	1.26x10 <sup>11</sup>	33.23	87.68
k <sub>Na<sup>+</sup></sub>	74.70	1.56x10 <sup>8</sup>	88.73	45.15
k <sub>K<sup>+</sup></sub>	66.40	1.34x10 <sup>7</sup>	109.03	30.09

### Discussion:-

#### A proposed mechanism:-

The rate law equation(2) may be explained by the following mechanism:

**Path(I):** Thermal decomposition of peroxodisulphate independent of nitrite ion which has its rate-determining step in equation(6)

Therefore the rate equation of this path may represent by the equation(7)

$$\text{Rate} = k_1 [S_2O_8^{2-}]_0 \quad (11)$$

Which corresponds to the right hand side (r.h.s.) of equation (2).

Some SO<sub>4</sub><sup>·-</sup> radicals seem to end up forming oxygen according to well established mechanism discussed by House<sup>(10)</sup>, while most SO<sub>4</sub><sup>·-</sup> radicals seem to oxidize NO<sub>2</sub><sup>-</sup> ion in some faster steps represented by the overall equ.(8) given by Elamin<sup>(7)</sup>.

**Path(II):** In this path the rate determining step involves both S<sub>2</sub>O<sub>8</sub><sup>2-</sup> and NO<sub>2</sub><sup>-</sup> which in presence of water leads to products as:

which the rate equation:

$$-d[S_2O_8^{2-}]_0/dt = k_2[S_2O_8^{2-}]_0 [NO_2^-]_0 \quad (14)$$

and this explains the second term on the r.h.s. of equation(2)

**Path(III):** Because of the divalent negative charge of  $S_2O_8^{2-}$  ion forms an ion-pair with the cation (in preference to the monovalent  $NO_2^-$ ) in fast equilibrium represented by equation(11):

$$\text{Which gives } K_e = [MS_2O_8^{n-2}] / [M^{n+}][S_2O_8^{2-}] \quad (16)$$

Nitrite ion is expected to react with the ion-pair faster than its reaction with the un-associated  $S_2O_8^{2-}$  ion<sup>(11,12)</sup> due to the decrease of coulombic barrier. The resulting activated complex formed by the interaction between  $NO_2^-$  and  $MS_2O_8^{n-2}$  decomposes to form reaction products in a series of steps represented by the equations:

Equation (13) is the rate determining step and therefore the rate equation is :

$$\text{Rate} = k_c[MS_2O_8^{n-2}][NO_2^-] \quad (19)$$

Substituting the value of  $[MS_2O_8^{n-2}]$  obtained from rearranging equation(12) in equ.14 gives:-

$$\text{Rate} = K_e k_c [M^{n+}][S_2O_8^{2-}][NO_2^-] \quad (20)$$

This equation explain the catalytic effect of the cations (i.e.  $Na^+$ ,  $K^+$ ,  $Mg^{+2}$ ,  $Ca^{+2}$  and  $Cu^{+2}$ ).

Which can be reduced to:-

$$\text{Rate} = k_M^{n+} [M^{n+}][S_2O_8^{2-}][NO_2^-] \quad (21)$$

This is equivalent to the third term of the r.h.s. of equation (2). When i is set equal to one and when:

$$k_M^{n+} = K_e k_c \quad (22)$$

Equation (2) can be rewritten as:

$$R_0 = k_1[S_2O_8^{2-}]_0 + k_2^0[S_2O_8^{2-}]_0 [NO_2^-]_0 + K_e k_c [M^{n+}][S_2O_8^{2-}]_0 [NO_2^-]_0 \quad (23)$$

#### Abstract

Bone cancer is a malignant (cancerous) tumor of the bone that destroys normal bone tissue. Malignant tumors that begin in bone tissue are called primary bone cancer. Primary bone cancer is far less common than cancer that spreads to the bones. Types of Primary bone cancer are Osteosarcoma, Chondrosarcoma. Diagnostic tests may include the following:-X-rays, Bone scan, Computed tomography (CT or CAT) scan, Magnetic resonance imaging (MRI), Angiogram. Treatment options depend on the type, size, location, and stage of the cancer, as well as the person's age and general health. Treatment for bone cancer includes Surgery, Chemotherapy, Radiation therapy, and Cryosurgery. Surgery is one of the main treatments for primary bone cancers and is very specialized treatment. Chemotherapy works very well for some types of bone cancer, particularly Ewing's sarcoma. Radiotherapy called Intensity modulated radiotherapy (IMRT) to treat bone cancer. Cryosurgery is used to treat some types of low-grade cancerous and noncancerous tumors of the bone & is sometimes used instead of conventional surgery to destroy the tumor. Regular follow-up care ensures that changes in health are discussed and that problems are treated as soon as possible. Participation in clinical trials is an important treatment option for many people with bone cancer. NCI, a part of the National Institutes of Health, is sponsoring clinical trials in many hospitals and cancer centers around the country. Several cases of long bone giant cell tumor have been reported in the literature. We report the case of a patient with a giant cell tumor in the distal ulna. This is very unusual, with a reported incidence of 0.45 to 6%. A 17-year male presented with a painful swelling of the left wrist. After performing an instrumental examination, a diagnosis of distal ulna giant cell tumor was made. The tumor was treated with an intralesional curettage, phenol application and bone grafting. This tumor may have a good prognosis if it is diagnosed early and radically treated. It is important to be aware of atypical cancer localizations in order to perform a proper diagnosis.

### Introduction:-

BONE CANCER-Is defined as the abnormal growth that are found in the bone which is affected. The growth may be malignant or may be benign<sup>1</sup>.

The bone tumor can be divided into two type's i.e.

- Primary bone tumor
- Secondary bone tumor

Primary bone tumor-this arises or originates from the bone.

Secondary bone tumor-this arises from other areas of body and then also starts spreading to the bone.

Figure 1:- Vicious cycle of bone destruction in metastatic bone.

### Epidemiology:-

he primary bone cancer involves less than 0.02 %of cancer. As per the analysis done by the Surveillance, Epidemiology and End Results Cancer Statistics Review of the National Cancer Institute<sup>2</sup>, they have an estimation of that 2,810 men and women will be diagnosed with and 1,490 will die of cancer of bones and joints in 2011. In UNITED STATES the malignancies diagnosed accounted for 0.2% of bone sarcomas.

Variable in Cox regression model	Deaths/PYs	HR	95% CI
Bone metastasis at or subsequent to diagnosis			
None	83,133 / 132,988	1.0 (referent)	-
Yes, without SREs	11,482 / 5,382	2.4	(2.4, 2.5)
Yes, with SREs	12,099 / 5,302	2.4	(2.4, 2.5)
Age at cancer diagnosis			
65-69	19,320 / 33,628	1.0 (referent)	-

Table 1:- Epidemiology and End Results Cancer Statistics

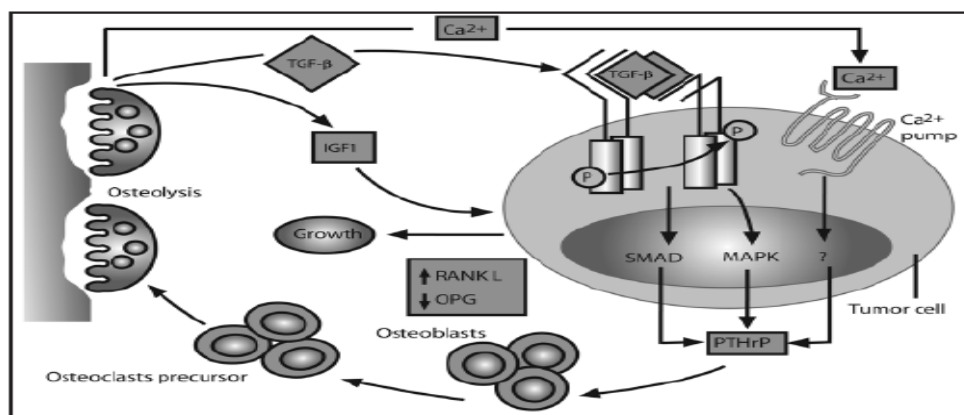

### Etiology(risk factors):-

The risk factors for the bone cancer includes as following-

- In general nobody knows the true cause of bone cancer.
- Patients with long term inflammatory diseases.
- Radiotherapy
- Paget's disease
- Hereditary renoblastoma
- Genetically heridited(close relatives)
- Li-fraumeni syndrome.

### Pathophysiology:-

Normal bone remodeling maintains an appropriate balance between the action of osteoclasts (bone-resorbing cells) and osteoblasts (bone-forming cells). Skeletal malignancies, including bone metastases, disrupt the OPG-RANKL-RANK signal transduction pathway and promote enhanced osteoclast formation<sup>3</sup>, thereby accelerating bone resorption and inducing bone loss. This osteolysis in turn leads to the release of bone-derived growth factors, contributing to a “vicious cycle” in which interactions between tumor cells and osteoclasts not only lead to increased osteoclastogenesis and osteolytic activity, but also aggressive growth and behavior of the tumor cells. The osteolytic complications associated with bone metastases are caused by tumor-induced alterations of the OPG-RANKL-RANK system, which are accompanied by enhanced bone resorption and disassociated from counterbalancing bone formation by osteoblasts<sup>4</sup>.

**Figure2: Physiology of osteolytic metastases.** Release of TGF- $\beta$  and IGF1 and increased concentrations of  $\text{Ca}^{2+}$  contribute to a “vicious cycle” in which interactions between tumor cells and osteoclasts not only lead to increased osteoclastogenesis and osteolytic activity, but also aggressive growth and behavior of the tumor cells.

### Consequences of bone metastases:-

#### Consequences of Bone Metastases

### Lab investigations:-

Tests that may be done include:- Alkaline phosphatase blood level, Serum phosphorus, Ionized calcium, Serum calcium, Bone biopsy, Bone scan, Chest x-ray, CT scan of the chest, MRI of the bone and surrounding tissue, X-ray of bone surrounding tissue. This disease may also affect the results of the following tests:- Alkaline phosphatase isoenzyme, Blood calcium level, Parathyroid hormone (PTH), Blood phosphorus level, ESR, Glucose tolerance test, CRP, PSA, PAP, Electrophoresis and Urinary Bence Jones protein<sup>5</sup>.

### Treatment of bone cancer:-

The treatment includes as follow-

Treatment options depend on the type, size, location and stage of the cancer, as well as the person's age and general health. The treatment options for the bone cancer includes as follows-

- Surgery
- Chemotherapy
- Radiation therapy
- Cryosurgery
- Genetics
- Analgesics
- Endocrine therapy
- Biologic therapy
- Radiopharmaceuticals
- Biphosphonates
- Supportive care

**Surgery:-**

This is the usual treatment for bone cancer<sup>6</sup>. Here the procedure is carried out by removing the entire tumor with negative margins. There are different types of surgeries done. They are as follows

- Surgery for cancer that does not affect the limbs.
- Surgery for removing the cancer while sparing the limb
- Surgery for removing a limb

Surgery for cancer that does not affect the limbs -is an surgical procedure performed for removing the bone and some nearby tissue if the bone cancer takes place in the bones apart from legs and arms<sup>7</sup>. The bone which is removed is then replaced with a part of bone from different place of the body or can be replaced by metal prosthesis<sup>8</sup>.

Surgery for removing the cancer while sparing the limb-here the surgical procedure is performed by sparing the limb if the bone cancer can be separated from other tissues and nerves. Then the lost bone can be replaced with other bone from the body or metal prosthesis<sup>9</sup>.

Surgery for removing the limb-this surgery is performed when the bone cancer is large by removing a part or all part of a limb. This is also done when it is located on very complicated point on the bone.

**Chemotherapy:-**

It is the use of anticancer drugs to kill cancer cell. It is the treatment which makes the use of chemicals for destroying cancer cells. These drugs or chemicals are given through a vein which travels in the entire body. Radiation therapy is often combined with the chemotherapy for shrinking the cancer to a manageable size so as to enable a surgeon to carry out a limb-sparing surgery. Currently chemotherapy is not being used to treat chondrosarcoma<sup>10</sup>.

The main chemotherapy drugs used in treatment of bone cancer are

DOXORUBICIN

CISPLATIN

CARBOPLATIN

ETOPOSIDE

IFOSFAMIDE

CYCLOPHOSPHAMIDE

METHOTREXATE

VINCRIStINE

Usually, several drugs (2 or 3) are given together. For example, common combination is cisplatin and doxorubicin.

**Side effects of chemotherapy:-**

Chemo kills cancer but it will also damage some normal cells. The side effects of chemo depend on the type of drugs, the amount taken, and the length of time they are taken.

Some common temporary side effects include -

- Nausea and vomiting
- Loss of appetite
- Hair loss
- Mouth sores

**Drugs used in chemotherapy and their side effects:-****Doxorubicin:-**

- Cardiomyopathy<sup>11</sup> leading to congestive heart failure
- Thyphlitis<sup>12</sup>
- Some may develop PPE characterized by skin eruptions on the palms of the hand or soles of the feet, swelling, pain and erythema.
- Dyspigmentation<sup>13</sup>

**Cisplatin:-**

- Nephrotoxicity
- Neurotoxicity (common neurological side effects include visual perception and hearing disorder)
- Nausea and vomiting
- Ototoxicity

- Electrolyte disturbance
- Haemolytic anemia

**Carboplatin:-**

- Relative to the cisplatin, the greatest benefit of carboplatin is that its reduced side effects, particularly the elimination of nephrotoxic effects.
- Nausea and vomiting are less severe and more easily controlled.
- Its main drawback is myelosuppressive<sup>14</sup> effect.(usually occurs 21-28 days after the first treatment, after which the blood cell and platelet levels in the blood begin to stabilize ,often coming close to its pre-carboplatin levels.

**Etoposide:-****Common side effects-**

- Low blood pressure
- Hair loss
- Pain and burning at the IV site
- Constipation and diarrhea
- Metallic food taste
- Bone marrow suppression leading to -
  - i. decreased white blood cells
  - ii. low red blood cell counts
  - iii. low platelet counts

**Less common side effects include-**

- Nausea and vomiting
- Rash
- Allergic type reactions
- Fever(occurring due to IV administration and not due to infection)
- Mouth sores
- Acute myeloid leukaemia
- When given with warfarin it may cause bleeding.

**Ifosfamide:-**

- Encephalopathy<sup>15</sup>
- Normal anion gap acidosis specifically renal tubular acidosis.

**Cyclophosphamide:-**

- Nausea and vomiting
- Bone marrow suppression
- Stomach ache
- Haemorrhagic cystitis
- Diarrhea
- Alopecia
- Lethargy
- Cyclophosphamide is itself carcinogenic and may increase the risk of developing lymphomas
- leukaemia
- skin cancer
- transitional cell carcinoma of bladder or other malignancies
- Cardiotoxicity is major problem with oncology patients treated with higher dose regimens.
- High dose IV can cause syndrome of inappropriate antidiuretic hormone secretion and a potentially fatal hyponatremia when compounded by IV fluids administered to prevent drug-induced cystitis<sup>16</sup>.

**Methotrexate:-**

- Common include-
- Black tarry stools
- Blood in urine or stools
- Bloody vomit
- Diarrhea
- Joint pain
- Reddening of the skin
- Sores in the mouth or lips
- Stomach pain
- Swelling of the feet or lower legs

**Vincristine:-**

- Blurred or double vision
- Constipation
- Difficulty in walking
- Drooping eyelids
- Headache
- Jaw pain
- Joint pain
- Lower back or side pain
- Numbness or tingling in fingers and toes
- Pain in fingers and toes
- Pain in testicles
- Stomach cramps
- Swelling of feet or lower legs
- Weakness

**Radiotherapy:-**

It is also known as radiation therapy which involves the use of high energy x-rays to kill cancer cells. This treatment may be used in combination with surgery. It is often used to treat chondrosarcoma<sup>17,18,19</sup>, which cannot be treated with chemotherapy, as well as EFTs. It is also considered in patients who refuse surgery. The high power beam of energy are targeted at precise points in the body. Radiation may also be used after surgery if cancer cells were present in the edges of removed tissue<sup>20</sup>.

**Types-**

- Intensity modulated radiation therapy<sup>21</sup>
- Proton beam radiation<sup>22</sup>

**Side effects of radiation therapy:-**

Common side effects include-

- Fatigue
- loss of appetite
- skin changes in the area being treated, ranging from redness and hair loss to blistering and peeling
- low blood counts
- nausea, vomiting and diarrhea (these are more common if radiation is given to the belly)

**Cryosurgery:-**

It is the use of liquid nitrogen to freeze and kill cancer cells. This technique is used sometimes in place of conventional surgery to destroy the tumor<sup>23</sup>.

### Genetics:-

In addition to clinical trials, researchers are making progress in learning about the causes of bone tumors. For example, changes to a certain part of chromosome 6 have been found in chordomas. Changes the *COL2A1* gene, which codes for a major form of collagen found in cartilage, have been found in many chondrosarcomas<sup>24</sup>. Further, more information about the DNA changes that cause bone cancers will eventually lead to treatments aimed at these gene defects<sup>25</sup>.

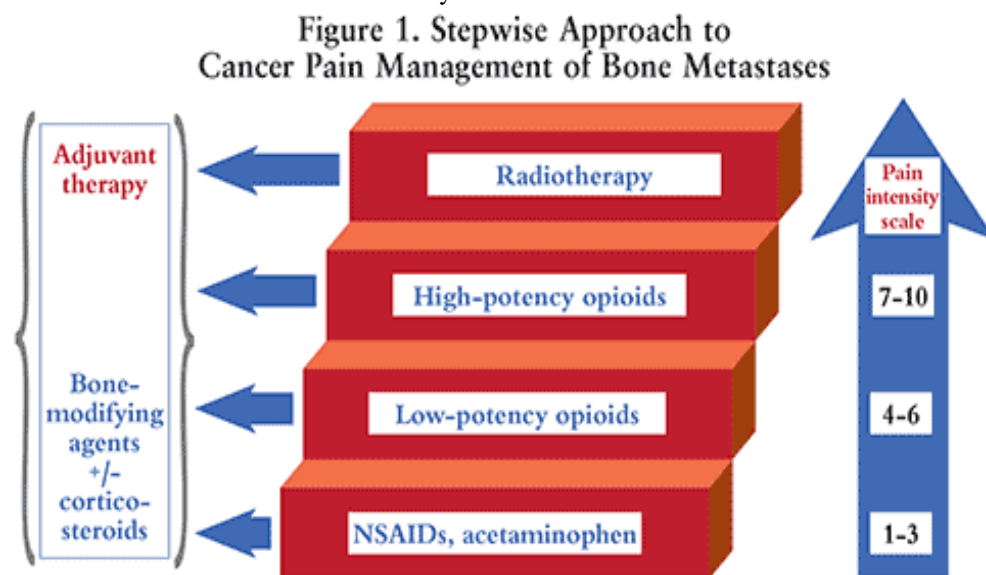

### ENDOCRINE THERAPY:-

Tamoxifen, aromatase inhibitors, ovarian suppression.

**Biologic therapies:-** Herceptin, Tykerb, Avastin

**Analgesics:-** Pain control medications

- Tylenol, NSAIDs (ibuprofen), narcotics, steroids
- Success can be limited by side effects.

NSAID: nonsteroidal anti-inflammatory drug. Pain intensity scale: 1-3 (mild); 4-6 (moderate); 7-10 (severe).  
Source: References 6, 7.

**Figure 1:- Stepwise approach to cancer pain management of Bone Metastases**

### Radiopharmaceuticals:-

Strontium-89 and samarium-153 are radioactive particles travel directly to tumor in bone, & Can reduce pain refractory to other measures, but they are infrequently used<sup>26</sup>.

### Biphosphonates:-

Bind to and inhibit osteoclast action

- Inhibit bone breakdown
- Prevent bone damage
- Improve bone density and strength

Recommended for almost everyone with breast cancer bone metastases

Figure 5:-Biphosphonate pharmacology: Mode of action

### Supportive care:-

Supportive care is critical. It includes managing the bone diseases, anaemia, infections, kidney failure, and pain associated with multiple myeloma<sup>27</sup>.

- ❖ Biphosphonates (medication) can prevent destructive bone lesions and spine fractures.
- ❖ Erythropoietin or occasional blood transfusions can manage anaemia.
- ❖ Antibody infusions and vaccination can help patients with recurrent infections.
- ❖ Corticosteroids and hydration can be used to treat high blood calcium concentrations (from bone loss) and dehydration<sup>28</sup>.
- ❖ Narcotics can decrease the pain associated with bone lesions.
- ❖ Operative intervention may be required to stabilize and control the pain associated with bone fractures<sup>29</sup>.

### What happens after treatment for bone cancer?

Bone cancer treatment may remove or destroy the cancer. Completing treatment can be both stressful and exciting. The patient may have fear of cancer recurrence after the treatment. This is a very common concern in people who have had cancer. Many cancer survivors have learned to live with this uncertainty and are leading full lives. For some people, the cancer may never go away completely. These people may get regular treatments with chemotherapy, radiation, or other therapies to try to help keep the cancer in check. Learning to live with cancer that does not go away can be difficult and very stressful. It has its own type of uncertainty<sup>30</sup>.

### Follow-up care:-

When treatment ends, the doctors will keep a watch on patient. It is very important to follow –up because doctors will look for signs of cancer recurrence and treatment side effects. Almost any cancer treatment can have side effects. Some may last for a few weeks to months, but others can last for rest of the life. Following extensive bone surgery, a program of rehabilitation and physical therapy will be an important part of helping patients regain as much of the mobility and independence as possible.

### Can I get another cancer after having bone cancer?

Survivors of bone and joint cancers can get any type of second cancer, but they have an increased risk of getting another bone or joint cancer (this is different than the first cancer coming back). Sometimes this is the same kind of cancer as the original tumor, but it can be a different type. For example, someone who had a chondrosarcoma<sup>32</sup> can get an osteosarcoma. Sarcoma of the soft tissues is also seen more often than expected after a cancer of the bone or joints. Survivors of bone and joint cancer also have an increased risk of:

- Lung cancer
- Esophagus cancer
- Stomach cancer
- Colorectal cancer
- Liver cancer
- Pancreas cancer
- Acute myeloid leukemia (AML)

The risk of leukemia is linked to treatment with chemotherapy.

### **Follow-up after treatment:-**

After completing treatment for bone cancer, the patient should visit the doctor regularly. The patient should undergo the tests to find out whether the cancer has recurred if they have any symptoms. Survivors of bone cancer should follow the guidelines as per American Cancer Society for the early detection of secondary cancer. The Children's Oncology Group has guidelines for the follow-up of patients treated for cancer as a child, teen, or young adult, including screening for second cancers. All patients should stay away from tobacco products. Smoking increases the risk of many cancers and might further increase the risk of some of the second cancers seen after bone cancer. To help maintain good health, survivors should also:

- Achieve and maintain a healthy weight
- Adopt a physically active lifestyle
- Consume a healthy diet, with an emphasis on plant foods
- Limit consumption of alcohol to no more than 1 drink per day for women or 2 per day for men These steps may also lower the risk of some cancers.

### **Lifestyle changes after treatment for bone cancer:-**

Doctors cannot change the fact that the patient have cancer but, can make their life better. Patient should make healthier choices by the following ways:

- Eating better
- Exercise can improve both the physical and emotional health.
- It improves your cardiovascular (heart and circulation) fitness. .
- It makes the muscles stronger.
- It reduces fatigue and helps in increasing the energy levels
- It can help lower anxiety and depression.
- It can make the patient feel happier.
- In long term, regular physical activity plays a role in helping to lower the risk of some cancers, as well as having other health benefits.

### **If treatment for bone cancer stops working:-**

If treatment is not successful, the disease may be called advanced or terminal cancer. If cancer keeps growing or comes back after one kind of treatment, it is possible that another treatment plan might still cure the cancer, or at least shrink it enough to help you live longer and feel better. If it does not respond to any treatment the cancer tends to become resistant. Then, the doctors will compare the advantages and disadvantages of the new treatments. When the doctor opt for new treatment, it is not likely to improve the health or change the outcome or survival of patients. The doctor can estimate how likely it is the cancer will respond to the treatment patients are considering. It is important to think about and understand the reasons for choosing the plan. The patient should receive treatment for symptoms such as nausea or pain. This type of treatment is called palliative care.

Palliative care helps relieve symptoms, but is not expected to cure the disease. It can be given along with cancer treatment, or can even be cancer treatment. The difference is its purpose - the main purpose of palliative care is to improve the quality of patient's life, or help them feel as good as possible. This may also requires use of drugs.

### **Case report on bone cancer:-**

#### **Introduction:**

A 17-year male presented with a painful swelling of the left wrist. After performing an instrumental examination, a diagnosis of distal ulna giant cell tumor(GCT) was made. The tumor was treated with an intralesional curettage, phenol application and bone grafting.

**Case presentation:-**

A radiographic examination of the left wrist was performed in a 17-year male as a result of a direct incidental trauma. No fracture was seen, but an osteolytic area was found in the ulnar meta-epiphysis. The initial diagnosis was 'juvenile bone cyst'. The patient presented with a painful swelling at the wrist dorsal ulnar side, about 2.5 cm, in the absence of any epidermal dyschromias. The skin was elastic and smooth. Wrist examination showed a range of motion (ROM) of 45° of extension, 70° of flexion, 15° of radial deviation and 10° of ulnar deviation; pronation, supination and circumduction were painful. Contralateral wrist ROM was normal. The diagnosis of 'juvenile bone cyst' did not seem right and a second radiographic examination was performed. At this time, a multilocular osteolytic area inducing an expansion of the distal ulna was seen. A cortical bone interruption was also visible. Although the patient had been the victim of a trauma, this was a poor prognostic sign. Therefore an Magnetic resonance imaging examination was performed. It showed a hypointense signal in the T1 sequences and a hyperintense signal in the short TI inversion recovery (STIR) sequences, characterized by enhancement after contrast administration, due to the presence of newly formed tissue.

**Figure 6:-**  
**X-rays and magnetic resonance imaging with and without contrast.**

**Discussion:-**

- It is a rare tumor, essentially benign, but it may behave unexpectedly, regardless of the results of radiological or histological examinations.
- It is usually located in the long bone meta-epiphysis and it frequently involves the subchondral bone without involvement of the articular surface; however, larger tumors may extend into the metaphysis and, more rarely, into the diaphysis. Proximal tibia, humerus, distal femur and radius are typical sites.
- GCT(Giant Cell Tumor) represents about 3% to 5% of all bone tumors and 21% of benign bone tumors<sup>34,35</sup>.

- In 70% of cases, it involves women in the third to fourth decade of life.
- The distal epiphysis of the ulna is an unusual place for a primary bone GCT; in fact, this occurs in only 0.45% to 3.2% of all primary bone GCT's<sup>36,37</sup>.
- In the past, these tumors were treated with amputation or large resections and ulnar reconstructions. Currently, surgical treatments are:
  - ❖ Intralesional curettage
  - ❖ Curettage and bone grafting
  - ❖ Cryotherapy of the cavity after curettage
  - ❖ Application of phenol after curettage
  - ❖ Radiation
  - ❖ Insertion of methyl methacrylate cement in the cavity after curettage
  - ❖ Resection followed by allograft
  - ❖ En-bloc resection with or without reconstruction or stabilization of the ulna and prosthetic reconstruction
  - ❖ Embolization of the feeding vessels
- The variables related to the tumor, such as size, location, biological activity, cortical bone destruction or pathologic fracture evidence, determine the treatment<sup>37</sup>.
- Although an en-bloc resection radically assaults the tumor, significantly reducing the risk of recurrence, functional outcome is very bad. A simple curettage provides an excellent functional outcome, but with a higher recurrence rate of approximately 40%<sup>34,35,36,37</sup> if compared with the patients who received adjuvant therapy (45% versus 18%).
- Therefore, various adjuvant therapies have been associated with the curettage: phenol, cryotherapy, cement<sup>39,40,41</sup> or polymethyl methacrylate (PMMA) used intraoperatively.
- The recurrence rate ranges from 5% to 8% when cement is used, and approximately 2.3% after cryosurgery<sup>39,40</sup>.
- However, it needs to be mentioned that a multicenter study of the Sarcoma Group<sup>43</sup> reported an overall recurrence rate of 17% and claimed that the filling material or the type of adjuvant would not have an absolute impact on recurrence.
- Furthermore, some studies show that the use of an adjuvant would not be necessary in some cases, such as intraosseous GCT<sup>44</sup>.
- According to Schajowicz<sup>44</sup>, curettage alone is an inadequate oncological procedure, but when it is combined with an adjuvant therapy, it globally provides a better result with respect to one-block excision, especially in terms of functionality.
- Therefore, the correct treatment must achieve a balance between oncological radicality and the restoration of skeletal segment functionality<sup>43,44,45,46</sup>.
- Curettage associated with bone grafting has been shown to be effective in many cases<sup>47</sup>. In this study it is used with phenol as an adjuvant, because it is capable of causing protein and DNA coagulation, inducing cell necrosis.
- In the present case intralesional curettage was possible because the tumor was a grade II and the reconstruction was carried out with synthetic cancellous bone, due to the young age of the patient<sup>48</sup>.

### Conclusion:-

Bone metastases are common in advanced breast cancer, and can cause significant symptoms. Multiple systemic and local therapies are available; standard therapy includes monthly zoledronic acid. Better understanding of toxicities can improve the safety of treatment. New agents take advantage of increased understanding of the biology of bone turnover. Women with advanced breast cancer may live with bone metastases for many years, therefore optimizing therapy is crucial. Neoformation bone diagnosis is difficult and requires a great deal of experience, especially in young patients. Osteolytic lesions incidentally found at a long bone epiphysis, can be misinterpreted. The tumor may have a good prognosis if treated early and radically. It is important to know atypical cancer locations in order to perform a proper diagnosis.

### Abstract

Fish harvesting in Somalia is very limited and unexploited natural resource due to existence of several factors that influence the growth of the fishing industry. This study focused on the factors influence growth of the fishing industry in Eyl district in Puntland State of Somalia. The general objective of this study was to examine the factors influence growth of the fishing industry in Puntland. The study examined how variables such as cultural practice and market accessibility influence growth of the fishing industry. The study was quantitative in nature; the study targeted population of 80 fishermen living in the two villages of Dawad and Badey. Due to the small number of the target population the study employed census technique method for the respondents who were only fishermen. Research instrument was primary data using Likert scale type of questions and close ended questionnaires. Pilot testing of the questionnaire was done to know whether the questions in the questionnaire were well worded and framed, the researcher identified that there are some errors in the questions and then replaced, one research assistant was trained. Lastly, data was analyzed by using Statistical Package for Social Scientists (SPSS version 20) with figures and tables. The findings from the study was that cultural practice have no influence on growth of the fishing industry in the study area. Another finding revealed by the study was poor market accessibility for the fishermen was the biggest challenge that influence on growth of the fishing industry. The recommendation is that there is need for the government to help the fishing communities to provide investment opportunities, loans, establish cooperative societies and banking systems, provide storage facilities and build cold rooms in every landing sites where fish is collected, improve roads leading to the fish collection centres so that the tracks and lorries transporting fresh fish to distant markets move within the stipulated time to avoid wastage.

**Introduction:-**

With a coastline of over 3,898km long, Somalia has one of the largest maritime zones in the western Indian Ocean that embrace a very important large marine ecosystem (LME) known as the Somali Current Marine Ecosystem. A prominent feature of this ecosystem is a seasonal upwelling which gives rise to high levels of biological productivity which in turn sustains rich fishing grounds, most notably in the area between Ras Aseyr and Ras Mabber off the Puntland coastline. Because of its location of the convergence zone of three seas, Somalia is regarded as a major ecotone between the fauna and flora of the Indian Ocean, the Red Sea and the Arabian Sea. Obviously, the Somali coastal and marine environments are of national and regional significance both in terms of biodiversity and fisheries resources. Other distinctive features of the Somali coast include fringing reefs and patches of coral reefs along the Gulf of Aden coast as well as in the south coast between Adale and the Kenyan border. Conservative estimates have put the country's yearly sustainable marine finfish production in the range of 300,000 tons, with the major commercial fisheries being small and large pelagics, demersal fishes, sharks and rays, as well as shallow-water and deep-sea lobsters and shrimps (UNEP, 2010).

In an effort to tap the fisheries resources, successive Somali Governments had implemented, with technical and financial support from bilateral and multilateral donors, various fisheries projects along the coastline including fish processing plants, icemakers, boatyards and acquisition of modern fishing vessels. The Government also established and operated a modern fishing fleet under the Ministry of Fisheries in order to exploit the abundant offshore resources. In the early 1970s, fishermen were organized into district cooperatives and drought-affected nomads were as well resettled in the coastal villages and encouraged to take up fishing. The nascent cooperatives were provided with assistance from various international aid agencies in the form of training and various fishing inputs such as motorized fishing boats, fishing gear and other related shore facilities. However, the cooperatives never become economically viable and eventually collapsed due to mismanagement, corruption and fishermen's dissatisfaction with collectivization programme in the first place.

In spite of the huge resources and the Government's efforts, Somalia has failed to transform itself into a fishing nation owing to various factors and as a result its fish production has never exceeded more than 20,000 tons even when the catch of the licensed foreign fishing vessels is included. The sector provided only 2% of the country's GDP in the 1980s.

Livestock and agricultural sectors have always been the main stay of the economy. More than 60% of the population is still nomadic pastoralists who depend on raising camels, cattle and goats for their livelihoods. Eating fish is therefore unusual in the Somali tradition and even fishermen themselves prefer red meat to fish, resulting in the country to have one of the lowest per capita fish consumption in the world – a mere 1.6 kg/per person/per year (FAO, 2010) . For comparison, average global and African fish consumptions are respectively 15 and 7 Kg/person/year.

The fisheries sector has been hit hard by the civil war and the cost of its revival may require millions if not billions of dollars given the fact that the entire fisheries infrastructure and facilities put in place by the previous governments were either looted or destroyed beyond repair or left to degrade in the course of the civil strife. Other problems affecting the sector include Illegal, Unregulated and Unreported (IUU) fishing activity, irrational inshore resources exploitation and lack of markets as well as the absence of effective fisheries governance in the country. If developed and managed in a sustainable manner, however, the fisheries sector has without any doubt great potential to contribute significantly to national development and economy at large through food security, foreign exchange earnings and creation of employment opportunities.

The first serious investment in the sector was initiated in 1940s when Italian businessmen established two fish canneries in Kandla and Habo on the Gulf of Aden coast east of Bosaso. A similar but bigger factory was also implemented in Las Qorey in 1960s with Soviet assistance. The three canneries together employed several thousand Somalis during their heydays. These initiatives were followed by the implementation of NECFISH project in Bari Region in the 1980s that resulted in the construction of a cold storage in Bosaso and several fish collection points in Kandala and Alula districts. With the exception of the Bosaso cold storage, all the factories and facilities have been looted after the collapse of the Government. The Bosaso cold storage may not fair better though as it lies idle thanks to a tussle between the Puntland Government and a group of Businessmen over its ownership.

It was only after the collapse of the Government in 1991 that local Puntland businessmen had realized the potential of the sector and made modest investments in the form of reefer trucks, mobile cold stores, boats and other fishing inputs, mainly to exploit lobster resources. The venture paid off and the lobster fishery had at one time become the main stay of the economy replacing the livestock as the number one foreign exchange earner through the export of frozen lobster tails to UAE. The ban of the Somali livestock export to the Gulf countries also drew more investors to the fishery further intensifying the pressure on the lobster populations.

#### **Problem Statement:-**

According to the FAO, the only fish stocks in the world that are actually “underfished” are in deep water off Somalia’s coast. Large schools of, primarily, tuna migrate from north to south and back along the east coast of Africa and concentrate off Somalia, where the upwelling of oxygenated deep water brings nutrients to the surface and, ultimately, smaller fish on which the tuna feed. As Somalis prize meat from livestock and consider fish to be second-class food, the domestic market for fish is very small – a principal reason why the industry has not developed further.

The fact that it is cheaper in Somalia to buy canned tuna from Thailand than to get high quality tuna from a few miles up the coast illustrates the industry’s weaknesses. The situation has been complicated by piracy, mostly of Puntland, which peaked in 2009 and allegedly began to stop overfishing. With neither coast guard nor navy, Somalia is incapable of policing its own waters. Foreign navy vessels implementing the international anti-piracy effort check Somali fishing boats, which has made it difficult for legitimate Somali fishermen to go to sea because their boats are unregistered and crew members may not have clear identification.

However, various factors have significantly influenced to growth of the fishing industry in most of coastal areas, this have resulted many coastal communities in Somalia not to benefit the marine resources, most of these factors influencing fishing industry they experience include but not limited to cultural practice and market accessibility. According Ministry of Fisheries and Marine Resources with partnership of FAO (2014), found that despite Somalia have the largest coast in Africa it regarded as one of the lowest per capita fish consumption in the world; they further found that only 4% of the working force are engaged with the fishing industry, and hence this small percentage are faced by a number of problems including poor infrastructure, cultural practices and marketing accessibility. Moreover, there is need to study this problem by examining how such factors influence growth of the fishing industry as well as to propose better solutions that could enhance the fishing sector. There is no study done on factors influencing growth of fishing industry in Puntland.

The study investigated the factors influencing growth of the fishing industry in Eyl district. It provided strong arguments on how the variables such as cultural practice and market accessibility may directly or indirectly influence growth of the fishing industry in Puntland with especial case study of Eyl district in Nugal region.

#### **Objectives Of This Study:-**

The objectives of this study were:

1. To determine the influence of cultural practice on growth of the fishing industry in Puntland.
2. To establish the influence of market accessibility on growth of the fishing industry in Puntland.

#### **Theory:-**

Each of the selected two variables (cultural practices and market accessibility) of this study were guided by theories.

#### **Cultural variability theory model:-**

This theory was first introduced by Hofstede (1972), in this theory culture is measured in terms of individual and collective behavior, it emphasizes emphasize personal rights and responsibilities, privacy, voicing one’s own opinions, freedom, and self-expression. The “I” identity places emphasis on individuals with less concern for the group. Reciprocity is voluntary, self-initiated or self-motivated Members feel interconnected in a group orientation system which creates more group solidarity. Management can appeal to this group-level solidarity. Seventy-five percent of the world’s population subscribes to some kind of collective outlook and approach.

This theory believes that individual’s cultural material and non-materials plays significant role in development, it urges that some cultures are friendly to development, for example, Japanese cultures directly relates to their

development, the culture of confusion which made Japan more developed society, it also urges that some cultures are not friendly with development, the theory further urges that continuity of cultures that are friendly with the development, while giving examples to other society, likewise, the theory model urges that culturally unfriendly societies should integrate and modernize their culture and to be in line with the modern world perspectives.

Culture's freedom produces uncertainty, which leads to stress and anxiety. These cultures may seek to avoid uncertainty by increasing rules of behavior, this theory further suggests that many southern European countries, as well as Japan and Peru, tend towards uncertainty avoidance. Other countries (including many northern European countries) are, it is argued, better able to tolerate freedom and diversity without excess stress and anxiety, culture's rigidity and dogmatism are a function of the uncertainty avoiding dimension. This dimension also influences communication between individuals; particular direct or indirect forms of communication can be used to reduce uncertainty.

### **Market theory:-**

The theory of market participation has developed many different perspectives, including asset-based approaches and agricultural developmental theory approaches. Boughton et al (2007) viewed market participation as both a cause and a consequence of economic development. Markets offer households the opportunity to specialize according to comparative advantage and thereby enjoy welfare gains from trade. Recognition of the potential of markets as engines of economic development and structural transformation gave rise to a market-led paradigm of agricultural development during the 1980's (Reardon and Timmer, 2006) in which market liberalization policy agendas were widely promoted in Sub-Saharan Africa (SSA) and other low-income regions. Furthermore, as households' disposable income increases, so does demand for variety in goods and services, thereby increasing demand-side market participation, which further increased the demand for cash and thus supply-side market participation. The standard process of agrarian and rural transformation therefore involves households' transition from a model of subsistence, in which most inputs are provided for and most outputs consumed internally, to a market engagement mode, with inputs and products increasingly purchased and sold off the farm (Timmer, 1988; Staatz, 1994). The asset-based theory was summarized by Omiti et al (2009), who held that as the market share of agricultural output increases, input utilization decisions and output combinations are progressively guided by profit maximization objectives. This process leads to the systematic substitution of non-traded inputs with purchased inputs, the gradual decline of integrated farming systems, and the emergence of specialized high-value farm enterprises.

Several models have been proposed to explain why limited market participation may exist. In short, Allen and Gale (1994), Williamson (1994), Vissing-Jorgensen (1999), and Yaron and Zhang (2000) have focused on how entry costs and/or liquidity needs have created limited market participation.

### **Methodology:-**

The target population of the study was a fishermen living in Eyl district which was a total of 80 fishermen, since the target population was small, census technique was adapted so that all the target population were selected as respondents. The study used quantitative research with research instrument of close ended questionnaires using Likert Scale type as primary data collection tool, ranging from Strongly Agree (SA), Agree (A), Neither Agree nor Disagree (N), Disagree (D) and Strongly Disagree (SD). The rating corresponds to 1 (SA), 2 (A), 3 (N), 4 (D) and 5 (SD). Pilot testing of the questionnaire was done to know whether the questions in the questionnaire were well worded and framed, the researcher identified that there are some errors in the questions and then replaced, one research assistant was trained. Lastly, data was analyzed by using Statistical Package for Social Scientists (SPSS version 20) with figures and tables.

### **Results and discussions:-**

#### **Influence of cultural practice on the growth of fishing industry:-**

From the data analysis in Table 1 when enquired respondents' views on the statements of "People engaged with fishing activities are regarded as inferiors and henceforth they are socially discriminated and subordinated" Majority of the respondents with spectacular percentage of 50 (62.7%) disagreed the statement, while on the other hand, 20 (25.4%) agreed the statement, 4 (4.5%) of the respondents strongly agreed the statement, only 1 (1.5%) Neither agreed or disagreed the statement. Hence, the study found that people engaged with fishing industry are not socially discriminated and subordinated. Thus, the study contradicts with Ivan Kyangwa and Konstantine Odongkara, (2005) findings that fishing activities are always engaged by the inferiors and most discriminated part of the society.

Table 1: Social discrimination and subordination of people engaged in fishing industry

		Frequency	Percent (%)
	Strongly Agree	4	4.5
	Agree	20	25.4
	Neither Agree nor disagree	1	1.5
	Disagree	50	62.7
	Strongly disagree	5	6.0
	<b>Total</b>	<b>80</b>	<b>100.0</b>

From the data analysis in Table 2 when enquired respondents' views on the statements of "fish is regarded as men's job, and women involved in fishing industry are considered as immoral and considered as a bad example" majority of the respondents with 53 (65.7%) disagreed the statement, while on the other hand, 21 (26.9%) agreed the statement, also 5 (6%) of the respondents strongly disagreed the statement, only 1 (1.5%) of the respondents strongly agreed the statement. Therefore, the study found that fishing is not regarded as men's job and also women involved in fishing industry are not considered as immoral and bad example. Thus, the study contradicts with Adhiambo Eunice Okello et al, (2015) finding that fishing is a man's job is still very strong. Culturally, women are supposed to be housekeepers taking care of children. Naturally, women fear the lake and fishing is mostly done at night which is hard for women.

Table 2: Fishing are regarded as men's job and women involved are regarded as immoral

		Frequency	Percent (%)
	Strongly Agree	1	1.5
	Agree	21	26.9
	Disagree	53	65.7
	Strongly disagree	5	6.0
	<b>Total</b>	<b>80</b>	<b>100.0</b>

From the data analysis in Table 3, when enquired respondents' views on the statements of "Individuals who consumes the sea food including the fish are cultural regarded as 'Jaji' meaning somebody who have deep poverty and not able or even keen to rear camels, cows and goats. Majority of the respondents with 48 (59.7%) disagreed the statement, while also 4 (4.5%) strongly disagreed the statement, on the other hand, 27 (34.3%) of the respondents agreed the statement, while also 1 (1.5%) of the respondents strongly agreed the statement. Therefore, the study found that individual who consumes fish are not culturally regarded as 'Jaji' and there are not considered as people with deep poverty.

Table 3: Individual who consumes fish are regarded as "Jaji"

		Frequency	Percent (%)
	Strongly Agree	1	1.5
	Agree	27	34.3
	Disagree	48	59.7
	Strongly disagree	4	4.5
	<b>Total</b>	<b>80</b>	<b>100.0</b>

From the data analysis in Table 4, when enquired respondents' views on the statements of "There are concerns that staying landing sites and consuming fish would lead to deteriorating health issue including sight loss, mouth illness and change of person's way of talking" Majority of the respondents with overwhelming percentage of 61 (76.1%) of the respondents disagreed the statement, while 5 (6%) of the respondents strongly disagreed the statement, on the other hand, 11 (13.4%) of the respondents agreed the statement, while 1 (1.5%) of the respondents strongly agreed the statement, only 2 (3%) of the respondents neither agreed or disagreed the statement. Therefore, the study found that consuming fish does not lead to deteriorating health issue such as sight loss, mouth illness and change of person's way of talking, thus, the study contradicts with Adhiambo Eunice Okello et al, 2015, findings that most of his respondent's with 73% believed that fishing activities leads to deteriorate health by causing diseases including sight loss, mouth illness and change of peoples' way of talking.

Table 4: Consuming fish leads to deteriorating health condition

		Frequency	Percent (%)
	Strongly Agree	1	1.5
	Agree	11	13.4
	Neither Agree nor disagree	2	3.0
	Disagree	61	76.1
	Strongly disagree	5	6.0
	<b>Total</b>	<b>80</b>	<b>100.0</b>

#### 4.2 Influence of market accessibility on growth of the fishing industry

Fishers' perceptions were sought on domestic market demand. When asked whether the domestic market demand of fish is low, Table 5 shows that most of the respondents 53 (65.7%) were disagreed and mentioned that domestic market demand is high in the study area, the rest of the respondents 24 (29.9%) and 4 (4.5%) were agreed and strongly agreed that domestic market demand of fish is low respectively. The result is similar to Ssebisubi Maurice (2010) in a study in Uganda; who reported that 77% of the respondents stated that there is high demand of fish from their customers.

Table 5: Domestic market demand of fish

		Frequency	Percent (%)
	Strongly Agree	4	4.5
	Agree	24	29.9
	Disagree	53	65.7
	<b>Total</b>	<b>80</b>	<b>100.0</b>

As shown in Table 6 the analysis of the data revealed that majority of the respondents approved that there are no banks that would provide loans to invest the fishing sector. The Table 4.11 indicates that 59 (73.1%) and 18 (22.4%) were agreed and strongly agreed that no single bank would provide loans or investment grants to the fishermen, while 2 (3%) and 1 (1.5%) were strongly disagreed and disagree in the subject respectively. The result is in line with the findings of Adhiambo Eunice Okello et al. (2015) who reported that 54.8% of the respondents agreed that there is lack of banking facilities thus hindered them from saving money. Most banks were situated in the towns of Hoima county in Kenya.

Table 6: There are no bank services

		Frequency	Percent (%)
	Strongly Agree	18	22.4
	Agree	59	73.1
	Disagree	1	1.5
	Strongly disagree	2	3.0
	<b>Total</b>	<b>80</b>	<b>100.0</b>

The study intended to find out whether there are companies that monopolize fish export to international markets. The findings in Figure 1 revealed that most of the respondents 37 (46.3%) agreed that there are companies that monopolize the export of fish to international markets, 7 (9%) were also strongly agreed the existence of monopoly for fish export to international markets while 32 (40.3%) and 4 (4.5%) of the respondents were disagreed and strongly disagreed respectively the existence of monopoly in exporting fish to international markets.

**Figure 1: Monopolizing fish export to international markets**

The study also sought to examine whether there are limited companies that export fish from landing sites to international markets. The results of Table 7 indicated that 66 (82.1%) of the respondents agreed that there is limited fish export companies, 8 (10.4%) were also strongly agreed that there is limited fish export companies that operates in the study area while 5 (6%) and 1 (1.5%) of the respondents were disagreed and strongly disagreed respectively that there are limited fish export companies in the study area.

**Table 7: There are limited fish export companies**

		Frequency	Percent (%)
	Strongly Agree	8	10.4
	Agree	66	82.1
	Disagree	5	6.0
	Strongly disagree	1	1.5
	<b>Total</b>	<b>80</b>	<b>100.0</b>

The study set out to find out whether there is lack of access to market information by the fishermen that makes them not to be aware the existing opportunities in the markets. The Table 8 indicated majority of the respondents 50 (62.7%) were agreed that there is lack of access to market information by the fishermen, 4 (4.5%) were also strongly agreed that lack of information by the fishermen in the study area, while 25 (31.5%) of the respondents were disagreed that there is lack of access to market information by the fishermen and only 1 (1.5%) were also strongly disagreed the subject. The study findings oppose to the FSAU-FAO study (2011) that found majority of the population have access to information on fish (benefits, preparation and handling) from health workers, local media, fish mongers and other fish consumers.

**Table 8: There is lack of access to market information**

		Frequency	Percent (%)
	Strongly Agree	4	4.5
	Agree	50	62.7
	Disagree	25	31.3
	Strongly disagree	1	1.5
	<b>Total</b>	<b>80</b>	<b>100.0</b>

The study intended to find out whether there is no government subsidies for the fishermen to facilitate them to access to the markets. The analysis in Table 9 revealed that majority of the respondents 49 (61.2%) were agreed that there is no government subsidies to support for the fishermen, 10 (11.9%) were also strongly agreed that there is no government subsidies for the fishermen while only respondent 1 (1.5%) was neither agreed nor disagreed the query. On the other hand, 19 (23.9%) of the respondents were disagreed that there is no government subsidies for the fishermen. Similarly, only 1 (1.5%) of the respondents was strongly disagreed that there is no government subsidies

for the fishermen in the study area. This is in agreement with the findings of Harrison Kwame Golo and Lawrence Odumah (2015) who found that majority of the respondents (85%) cited high prices of inputs such as nets, premix fuel and outboard motors are the key major problems hampering their fishing activities in rural coastal fishing communities in the Volta region of Ghana.

Table 9: There is no government subsidies for the fishermen

		Frequency	Percent (%)
	Strongly Agree	10	11.9
	Agree	49	61.2
	Neither Agree nor disagree	1	1.5
	Disagree	19	23.9
	Strongly disagree	1	1.5
	<b>Total</b>	<b>80</b>	<b>100.0</b>

### Conclusion:-

In the past, cultural practice in study area have framed fishing as an inferior industry, and fish meat has been considered to be of a 'lower status' than others. Recently though, there has been a shift that has seen a greater acceptance of fish and fishermen. Much of this has to do with communities increasingly recognizing the health benefits of eating fish. The healthfulness of fish has been promoted by local doctors. The study concluded that cultural practice have no influence on growth of the fishing industry in the study area. The study dealt with domestic market demand, banking services. Other challenges included limited fish exporting companies, lack of access to market information and lack of government subsidy to support for fishermen.

### Recommendations:-

Based on the findings of this study and the conclusions drawn, the following recommendations were made:

1. The fishing communities need to be provided investment opportunities, loans, establish cooperative societies and banking systems.
2. The government should help the fishermen acquire storage facilities and cold rooms be built in landing sites where fish is collected.
3. Roads leading to the collection centres need to be improved so that the tracks and lorries transporting fresh fish to distant markets move within the specific time to avoid wastage.

#### Abstract

A level luffing crane is very useful crane in industry as well as at dockyard, ports etc. A level luffing crane consists of a vertical mast which is a very important and supporting structure of crane. Due to various loads of crane like dead load of a crane, load carried by crane etc. the cross section of mast is subjected to deformation. Also changes in diameter occur due to welding is called distortion. The objective of this work is to reduce deformation and distortion of vertical mast. A distortion can be reduced by developing fixture and deformation can be reduced by designing and analysing of mast on software.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

The deformation occurs due to force applied on vertical mast of crane as it is constructed by 13 segments and a flange of 100mm height provided on mast.[1] It consists of mild steel(MS) E250J2 material of thickness 22mm. Outer diameter of vertical mast is 3520 mm and Inner diameter is 3476mm with a length of 14460 mm. As a dead load of 150 tone applied on mast it get deformed by maximum deformation occur on mast.

In material science, deformation refers to any changes in the shape or size of an object due to-

- an applied force
- a change in temperature

Depending of the type of material, size and geometry of the object and the force applied on various types of deformation may result. The different types of deformation occur are as follows.[2]

- Elastic deformation.
- Plastic deformation

#### Effects of deformation:-

Due to deformation the mast bend little downward and can damage the crane. As it is a main support on which crane rotates and carry load can cause damage in machinery and girder. It makes material uncap able to withstand[3].

#### Distortion:-

Distortion in weld results from the expansion and contraction of the weld metal and adjacent base metal during the heating and cooling cycle of welding process. There are various types of distortion and dimensional change including

**Corresponding Author:- Mohammed Aadil U.**

Address:- Dr. Jivraj Mehta Institute of Technology, Mogar, Anand, Gujarat, India.

longitudinal, transverse, angular twisting, buckling and bowing. Two or more types of distortion may occur at the same time[4]. In a weld joint, expansion and contraction forces act on the weld metal and on base metal. As the weld metal solidifies and fuses with the base metal, it is in maximum expanded form. On cooling it attempts to contract to the volume it would normally occupy at a lower temperature but it is restrained from doing so. Because of this stress developed between the weld and adjacent base metal[5]. Major effect of distortion are strength of weld joint has been reduced and strength of vertical mast reduces.

In the present study,

### Methodology:-

Firstly, for reducing weld distortion, welding was observed and measured the diameter of segments by using mechanical measuring tape. Afterward more knowledge about distortion was taken. The original diameter of vertical mast is  $\phi 3520\text{mm}$  outside and inside diameter is  $\phi 3476\text{mm}$ . When distortion occurs in first two segments, the diameter was  $3526\text{mm}$  and by joining 3<sup>rd</sup> segment, it becomes  $3531\text{mm}$ . But as per company requirement it should be maximum  $\pm 5\%$ , which is acceptable.

### Heat treatment method:-

When heat treatment method is used, the result is achieved  $3533\text{mm}$  which is 13% more than original diameter. But heat treatment method is time consumable method and very costly [6].

### Re-rolling method:-

But this method is not possible because it require huge machine for rolling and this also increases the industry cost so, it is not possible to apply [7].

### By using fixture:-

Fig.1. Implementation of Fixture

It is also made by mild steel material with a diameter of  $3476\text{mm}$  which is internal diameter of vertical mast. The four plate used is of  $750\text{mm}$  length,  $10\text{mm}$  thickness and long rod is attached which is welded to four plate, It holds the whole fixture tightly[8].

For reducing deformation of vertical mast, collected necessary data of mast, design it on CRE-O software and analyze it on ANSYS software[9]. So first a mast thickness of  $22\text{mm}$  and making 13 segments of different height were taken and apply a load of 150 Tone applied and result was found as follows.

The deformation was found  $25.478\text{ mm}$  maximum on top of the mast which is high and as per company requirement it has to be reduced up to  $10\text{ mm}$  at least. After getting the above result it was decided to increase the thickness of mast but overall thickness of mast will increase the cost so, finally just increased the thickness of upper two segments and one bottom segment on which deformation was high.

Fig: 2. Design and Analysis of vertical mast for Reduction of deformation

Increasing the thickness of upper two segments and bottom segment thickness from 22mm to 26mm as per standard given by ASME for material and again analysis is done, results are found as follows. Finally found the better achievement of problem as listed in table 1. Deformation of mast reduced up to 7.146mm max which is acceptable by company.

Table: 1

Load(Tonnes)	Segments	Thickness(mm)	Maximum Deformation(mm)
150	1 to 13	22	25.478
150	1st ,2nd and 13th	26	7.146

### Result and Discussion:-

When this fixture is welded and attached to one segment it reduced the segment distortion up to  $\pm 5\%$  which is acceptable in mast. So the distortion reduced and the diameter which was  $\phi 3534\text{mm}$  reduced up to  $\phi 3523$  which was just 3% more than its original diameter which is accepted. Same process was done in all 13 segments by applying 1 or 2 fixtures as per requirement and finally the distortion was reduced.

Table 2:

	Segments	Maximum Dia. of Mast(mm)	
		Before weld	After weld
Without Fixture	1 and 2	3520	3532
With Fixture	1 and 2	3520	3523

### Conclusion:-

With the new design for vertical mast by increasing thickness of top two segments and bottom segment, where maximum deformation occurs, for the same analysis was carried out. As a result of deformation, it was reduced to 7.146 mm maximum. With this the objective of the work was achieved. The problem of distortion is minimized with the use of fixture. After designing of fixture, fixture was implemented in two segments of vertical mast and check the maximum diameter after welding has been completed. The max diameter before weld and after weld was compared for two cases as mentioned in table no.2

#### Abstract

Cachexia is considered as a complex interplay of metabolic and behavioral parameters leading to deteriorated quality of life. In recent years many efforts by researchers and clinicians were made to improve our knowledge of cachexia. Cancer and many other chronic or end-stage diseases like AIDS, chronic obstructive pulmonary disease, rheumatoid arthritis, tuberculosis are associated with cachexia, a condition associated with weight loss and alteration in body composition. Cachexia in cancer is generally neglected and contributes to the poor prognosis. A more meticulous understanding of cachexia is needed that probably will lead to combination therapies being developed. Although its prevalence is less, it is a growing problem in Asia. This review is based on the computer-aided Pubmed database and general search for the term "cancer cachexia". Available free articles related to the pathophysiology, diagnosis and possible treatment modalities in cancer cachexia were downloaded for the review.

#### Introduction:-

Cachexia is a complex interplay of metabolic and behavioral variables leading to continuous deterioration of health and compromised quality of life. The word "cachexia" is derived from the Greek "kakos" meaning "bad" and "hexis" meaning "condition". Cachexia is a debilitating state of involuntary weight loss complicating malignant, infectious, and inflammatory diseases and contributing significantly to mortality. Anorexia, also a frequent complication of these diseases, is a major contributor to the development of cachexia; although the pattern of weight loss in cachexia differs from that seen with pure nutrient deprivation.<sup>1</sup> The anorexia-cachexia syndrome continues to be a very difficult problem in the management of cancer patients. Despite the vast literature that exists on the subject, the etiology of this syndrome is not clearly established. Reduced food intake and abnormal host metabolism are thought to be major factors leading to cachexia. However, the extent to which either of these factors are present in any one group of patients is unknown as are the mechanisms whereby anorexia or abnormal host metabolism develop. The aim of future clinical research must be to build on the limited benefits of conventional nutritional support through a greater understanding of the mechanisms of wasting in the cancer host.<sup>2</sup>

Cachexia is infrequently identified or diagnosed and rarely treated and there is no universally agreed upon definition. It was essential to have a specific definition so that clinicians can recognize the problem and institute corrective measures to treat cachexia. On December 13th and 14th, 2006, scientists and clinicians met in

Washington DC, to reach a consensus on the definition of the constellation of abnormalities that have been grouped under the name cachexia.<sup>3</sup>

#### **Search strategy:-**

The search for the review was based on the key word “cancer cachexia”. Pubmed search displayed total 3002 articles including 764 reviews and 586 free full text articles. In MeSH (Medical Subject Heading) search no items were found. Selected free articles were downloaded for the review. Other articles were selected from general web search. The decision to include the article was made by reading the title and the abstract. Articles related to animal studies and genetic studies were excluded while those related to pathophysiology, serum markers, treatment and nutrition were chosen for the review. The review discusses the pathophysiology, studies on diagnosis and treatment of cancer cachexia.

#### **Cancer cachexia:-**

About half of all cancer patients show a syndrome of cachexia, characterized by anorexia and loss of adipose tissue and skeletal muscle mass.<sup>[4]</sup> Although the etiology of cachexia is not well understood, several hypotheses like cytokines, circulating hormones, neuropeptides, neurotransmitters and tumor-derived factors are put forward. Decreased caloric intake and increased metabolic rate have been shown to be present in some cancer patients with pathological weight loss; however, the specific mechanisms by which these changes occur remain to be elucidated.<sup>[5]</sup> An emerging view is that the anorexia in cachexia is caused mainly by the cytokines produced by the cancer or released by the immune system in response to the presence of malignancy that induce profound lipolysis and protein degradation.<sup>1</sup>

Tumor products that have a direct catabolic effect on host tissues are lipid mobilizing factor (LMF), which acts on adipose tissue, and proteolysis-inducing factor (PIF), which acts on skeletal muscle.<sup>6</sup> Recent evidences suggest that an intricate interplay between multiple hypothalamic effector pathways and afferent hormonal signals of diverse systemic origin e.g. resistin, leptin and adiponectin from adipocytes, ghrelin and polypeptides from the gastrointestinal tract, and insulin from the pancreas are important in the regulation of energy intake and expenditure. Serum levels of these hormones play important role in cancer cachexia.<sup>7</sup>

Numerous cytokines, including Tumor Necrosis Factor- $\alpha$  (TNF- $\alpha$ ), Interleukin-1 (IL-1), Interleukin-6 (IL-6), Interferon- $\gamma$  (IFN- $\gamma$ ) and leukemia-inhibitory factor (LIF) have been postulated to play a role in the etiology of cancer anorexia-cachexia syndrome. Such cytokines may be produced by tumor or host tissue and are characterized by the induction of anorexia and a decrease in the clearing enzyme lipoprotein lipase. The ability to inhibit lipoprotein lipase varies among the cytokines. High serum levels of TNF- $\alpha$ , IL-1, IL-6 have been found in some, but not all, cancer patients, and the levels of these cytokines seem to correlate with the progression of some tumors. Chronic administration of these cytokines, either alone or in combination, is capable of reducing food intake and reproducing the different features of the cancer anorexia-cachexia syndrome.<sup>1,6</sup>

These cytokines exert a variety of behavioral and physiologic effects in addition to their immunologic and nutritional functions resulting in anorexia. The cytokine activity has both central and peripheral elements. The central effect is at the level of hypothalamic nuclei, which control feeding behavior.<sup>8</sup> The cytokines stimulate the expression of leptin and/or mimic the hypothalamic effect of negative feedback from leptin by disarranging the signaling pathway of neuropeptide Y (NPY), resulting in long-term inhibition of food intake. IL-1 antagonizes NPY-induced feeding and disrupts the orexigenic (feeding-stimulatory) pathway of NPY.<sup>9</sup>

As noted, muscle wasting is important in the pathophysiology of cachexia and a major cause of fatigue in patients. Accelerated or exaggerated loss of skeletal muscle mass distinguishes cachexia from the weight loss due solely to reduced energy intake. Several groups of investigators have suggested that actomyosin, actin and myosin are selectively targeted for degradation in clinical conditions associated with cachexia. Selective targeting of skeletal muscle is in part due to the systemic inflammation that frequently accompanies clinical conditions associated with cachexia. The common feature of cachexia, loss of muscle mass, suggests that therapies targeting muscle or inflammatory pathways may be effective in reducing the devastating effects of cachexia.<sup>2</sup>

Loss of skeletal muscle is characterized by a depression in protein synthesis and increased protein breakdown. There are also changes in the concentration of plasma amino acids, and most studies report a decrease in gluconeogenic amino acids, in contrast with severe malnutrition, where the concentration of branched-chain amino acids in plasma is normal or even increased. Protein degradation in muscle results in the release of amino acids, particularly alanine and glutamine. The former is channeled to the liver for gluconeogenesis and ATP synthesis, whereas glutamine is

taken up by the tumor to sustain the energy and nitrogen demands. Leucine oxidation to carbon dioxide is also increased in tumor-bearing animals.<sup>6</sup>

Cancer patients have a high turnover of both glycerol and free fatty acids and the elevated mobilization of lipids is often evident before weight loss becomes established. Loss of fat mass is a key feature of cancer cachexia and has been attributed to increased adipocyte lipolysis. Lipids have a high caloric value, and mobilization of lipids is required to meet the increased energy demands of the cachectic patient. As much as 85% of adipose tissue may be lost during the cachectic process, either through increased lipolysis or decreased lipogenesis. Increased production of lipolytic factors from adipose tissue such as IL-6 and TNF  $\alpha$  or by tumor-derived lipolytic factors such as zinc- $\alpha_2$  glycoprotein (ZAG) could explain increased lipolysis in cancer cachexia. Although some reports suggest reduced plasma levels of lipoprotein lipase (LPL) in cachectic patients, which is important in triglyceride synthesis, others have found no change in the total LPL enzyme activity. One of the characteristics of cytokines TNF-  $\alpha$ , IL-6, IL-1 $\alpha$ , INF- $\alpha$ , IFN- $\gamma$ , and LIF is that they inhibit LPL, thus inhibiting lipogenesis in adipose tissue.<sup>6, 10</sup>

### Diagnosis:-

The criteria for diagnosis of cachexia were put forward which include weight loss of at least 5% in 12 months or a body mass index (BMI) less than 20.0 kg/m<sup>2</sup> along with decreased muscle strength, fatigue, anorexia and low fat-free mass index. Abnormal biochemistry for increased inflammatory markers (c reactive protein and interleukin-6), anemia and low serum albumin should be evaluated. Diagnosis of cachexia in the presence of weight loss can be done if three of five conditions mentioned above are established.<sup>3</sup>

### Discussion:-

Many scientists and researchers have attempted to understand pathophysiology, role of tumor derived factors and cytokines, mechanism of weight loss through lipolysis, and loss of skeletal muscle in cachexia. Estimation of serum levels of various cytokines, tumor derived factors have been done to understand their role in cancer cachexia, anorexia and weight loss. Various treatment modalities in the form of drugs, nutritional supplementation, anti-tumor derivatives and hormones have also been tried for the alleviation of cancer cachexia.

Cachexia is a typical feature of infectious diseases where the invading pathogen may lead to stimulation of the immune system and cytokine production. However, the cachexia of cancer is not normally associated with the presence of infection and while the outward symptoms may look similar, it is unlikely that a single mediator could explain the heterogeneous pattern of changes seen in a wide spectrum of diseases. This raises the possibility that other factors in addition, or instead of the known cytokines, may mediate the changes seen in cancer cachexia. Further structural information of these factors is required for a full understanding of the condition.<sup>11</sup> It is suggested that despite a falling caloric intake, patients with cachexia frequently show elevated resting energy expenditure as a result of increases in Cori cycle (i.e., catalytic conversion of lactic acid to glucose) activity, glucose and triglyceride-fatty acid cycling, and gluconeogenesis. The presence of an acute phase response (APR) has been linked to accelerated weight loss and a shortened survival time. The APR is thought to be initiated by cytokines, the production of which is induced by a tumor factor, proteolysis inducing factor.<sup>4, 6</sup>

It was postulated that those tumors which are only slightly more active than the normal in their ability to concentrate amino-acids will grow slowly and produce only minor metabolic disturbances, while the more active ones will infiltrate faster, cause anorexia, and produce rapid cachexia and eventual death.<sup>12</sup> Anorexia is a common manifestation of cancer and the hypothalamus and probably other parts of the brain produce anorexigenic peptides. It is proposed that peptides, oligonucleotides, and other small metabolites produced by the cancer and by the tumor-bearing host are responsible for the genesis of the anorexia. They produce the anorexia through a peripheral effect on neuroendocrine cells and neuroreceptors and through a direct effect on hypothalamic and other central nervous system sensor and responder cells.<sup>13</sup> There are hypothalamic and extra-hypothalamic control components of feeding. Those control components mediated extra-hypothalamically get deteriorated during tumor growth. Eventually, the accumulated deletion of individual control components destroys the initial redundancy of the feeding control system and the system collapses, with overt cachexia.<sup>14</sup>

In an attempt to understand pathophysiology of cancer cachexia it was suggested that weight loss and failure to gain weight normally in cancer patients are attributable to negative energy balance and altered metabolism. Energy balance is negative because of decreased intake, increased expenditure, or both. Metabolic changes in lipids, proteins and carbohydrates result in muscle wasting in adult cancer patients and growth failure in pediatric cancer

patients.<sup>15</sup> The early appearance of circulating lipolytic activity may represent an early diagnostic marker of certain tumors, and since aberrations in lipid metabolism may be the initial step to generalized anergy (by a decline in all host metabolic pathways) and death, the characterization of the LPF would provide significant insight into the mechanisms of cancer cachexia and the eventual development of studies to reverse this phenomenon.<sup>16</sup> However the effect of recombinant human tumor necrosis factor on inhibition of LPL in adipose tissue was evaluated but the result was negative.<sup>17</sup>

It is proposed that yet unidentified factors among certain cancer patients increase the gene expression and thereby the protein production of hormone sensitive lipase (HSL) in fat cells. This enhances the stimulatory effect of lipolytic hormones and possibly of specific cachexia factors such as ZAG. Because the hormones are always present in the circulation, lipolysis is continuously activated because the action of the major antilipolytic hormone, insulin, is not altered. Therefore, HSL inhibitors may be useful in the treatment or prevention of cancer cachexia.<sup>10</sup>

It is suggested that decreased arginine availability is a specific feature of the presence of cancer and disturbances in arginine metabolism could contribute to the cascade of metabolic events leading to cancer cachexia.<sup>18</sup> Pathways specific to myostatin, nuclear factor  $\kappa$ B, and dystrophin glycoprotein complex have been identified and they maintain a link to the proteasome pathway. Further, proteasome remains a preferred choice for therapy and emerging upstream signaling molecules serve as additional promising therapeutic targets for the treatment of tumor-induced muscle wasting.<sup>19</sup> Serotonergic blockade for the treatment of the cancer anorexia-cachexia syndrome was undertaken that apparently improved the ability of patients to enjoy food but failed to prevent weight loss in patients with cancer cachexia or alter laboratory parameters of protein nutrition.<sup>20</sup> It is demonstrated that body fat was lost more rapidly than lean tissue in progressive cancer cachexia, a phenomenon that was related highly to alterations in the levels of circulating classic hormones and food intake, including both caloric amount and diet composition. The results showed importance in the planning of efficient palliative treatment for cancer patients.<sup>21</sup> While defining cancer cachexia, Fearon et al suggested a 3-factor profile i.e. weight loss, reduced food intake and systemic inflammation, which helps to identify the patient with adverse function and prognosis.<sup>22</sup>

The role of Parathyroid hormone-related protein (PTHrP) as a potential target of therapy for cancer-associated morbidity has been studied. It has been observed that PTHrP may cause not only hypercalcemia, but also elevation of the general production of proinflammatory cytokines. Further, PTHrP may be involved in the genesis of paraneoplastic syndrome, not only in terms of hypercalcemia, but also in deterioration of physical and mental activities (food and water intake, depression) and negative metabolic balance, which are frequently seen in patients with cancer, especially in near-terminal stages. He suggested that PTHrP is a promising molecular target for the development of a novel mode of treatment for patients with cancer-associated morbidity.<sup>23</sup>

The acute-phase response and elevated IL-6 are associated with cachexia and it is hypothesized that IL-6 may represent an important therapeutic target for head and neck squamous cell carcinoma patients with cancer cachexia.<sup>24</sup> It was also estimated that active ghrelin levels and the active to total ghrelin ratio were significantly increased in subjects with cancer-induced cachexia, compared with cancer and non-cancer controls.<sup>25</sup> Keram et al investigated the role of the adipocytokines, ghrelin and leptin in gastric cancer cachexia and found the elevated levels of ghrelin and leptin in cachectic patients.<sup>7</sup> The levels of various cytokines viz. serum leptin, IL-1 $\beta$ , IL-2, IL-6 and TNF- $\alpha$  in advanced head and neck cancer before and after the induction chemotherapy followed by concomitant chemoradiation therapy in advanced head and neck cancer were compared. It was found low serum levels of leptin and the high serum levels of proinflammatory cytokines. They also found correlation between lowering levels of leptin and increasing levels of proinflammatory cytokines, particularly IL-6, in patients who had a progressive disease during treatment, whereas the opposite occurred in patients responded to treatment.<sup>26</sup>

Various treatment modalities have been attempted for medical management of cancer cachexia (table I)<sup>27-32</sup>. Physical symptoms other than pain often contribute to suffering near the end of life. In addition to pain, the most common symptoms in the terminal stages of an illness such as cancer are fatigue, anorexia, cachexia, nausea, vomiting, constipation, delirium and dyspnea.<sup>33</sup> A number of drugs are available for the management of symptoms of cachexia, including corticosteroids and progestational drugs. Prokinetic drugs, either alone or in combination with other agents such as corticosteroids, are highly effective in the treatment of chronic nausea. For patients with asthenia, it should first be determined whether there are any reversible causes; if not, corticosteroids and psychostimulants may diminish the symptoms. Oxygen and opioids are effective in treating dyspnea, whereas there is limited evidence that benzodiazepines provide any relief of this symptom.<sup>34</sup>

The current medical treatment of cancer-related cachexia is been reviewed, in particular focusing on combination therapy and ongoing research. Among the treatments proposed for cancer-related cachexia, some proved to be ineffective, namely, cyproheptadine, hydrazine, metoclopramide, and pentoxifylline. Among effective treatments, progestagens are currently considered the best available treatment option for cancer-related cachexia. Drugs with a strong rationale that have failed or have not shown univocal results in clinical trials so far include eicosapentaenoic acid, cannabinoids, bortezomib, and anti-TNF-alpha MoAb. Several emerging drugs have shown promising results but are still under clinical investigation (thalidomide, selective cox-2 inhibitors, ghrelin mimetics, insulin, oxandrolone, and olanzapine).<sup>35</sup>

Forty years on from its worldwide withdrawal, thalidomide is currently undergoing a remarkable renaissance as a novel and powerful immunomodulatory agent. Over the last decade it has been found to be active in a wide variety of inflammatory and malignant disorders where conventional therapies have failed.<sup>36</sup> It has been demonstrated to suppress TNF-alpha production in monocytes in vitro and to normalize elevated TNF-alpha levels in vivo.<sup>37</sup> Thalidomide, an oral agent with antiangiogenic and immunomodulatory properties, is being investigated extensively in the management of advanced cancer. Multiple studies with large numbers of patients have confirmed that this drug has significant activity in multiple myeloma. The activity of thalidomide in solid tumors is less prominent. Studies in Kaposi's sarcoma, malignant melanoma, renal cell carcinoma and prostate cancer appear more promising especially when thalidomide is combined with biological agents or with chemotherapy.<sup>38</sup> Bruera et al suggest that thalidomide can be expected to be well tolerated and to have at least similar symptomatic effects as Megestrol Acetate.<sup>39</sup>

Eicosapentaenoic acid (an omega-3 fatty acid from fish oils) and the appetite stimulant, Megestrol Acetate have been tried for the management cachexia.<sup>40</sup> N-3 fatty acids in dose of at least 1.5 g/day for a prolonged time to advanced cancer patients with weight loss were associated with an improvement of clinical, biological and functional parameters and with amelioration of quality of life.<sup>41</sup> Gonçalves et al have tried conjugated linoleic acid supplements in patients with cachexia but their result was negative.<sup>42</sup>

It is demonstrated that the synthetic progestogen- medroxyprogesterone acetate has the potential to increase food intake and to concomitantly reverse fat wasting in weight-losing patients with cancer.<sup>43, 44</sup> But as an adverse effect, megestrol acetate may cause symptomatic suppression of the hypothalamic pituitary adrenal axis. In male patients with cancer, treatment with Megestrol Acetate may also suppress the gonadal axis, resulting in symptomatic androgen deficiency. In a study such three cases have highlighted the symptomatic burden of adrenal insufficiency and hypogonadism that warns clinicians about this complication.<sup>45</sup> Couluris et al found cyproheptadine hydrochloride and megestrol acetate very effective appetite stimulant in children with cancer/treatment related cachexia. Oral cyproheptadine hydrochloride was excellent in weight gain and they found elevated serum leptin levels. They recommend use of Megestrol Acetate as second-line therapy due to safety profile.<sup>46</sup>

Malnutrition is common in the cancer patient. The need for nutritional support should be considered in the light of the patient's condition and carefully planned along with specific antitumor therapy.<sup>47</sup> Appropriate clinical judgment is required in proper selection of the total parenteral nutrition candidate. Malnutrition is almost always a prerequisite, as is failure of the gastrointestinal tract. When the alimentary tract cannot be used effectively for feeding cancer patients, parenteral nutrition can be lifesaving. Moreover, patients who are poor candidates for any anti-neoplastic therapy because of their debility can be converted to reasonable candidates following a course of intravenous hyperalimentation.<sup>48, 49</sup> Consequently, in upcoming studies, it probably would be more rewarding to focus on improving the effectiveness of nutritional support using additional interventions, such as appetite stimulation and interactive hormonal therapy, perhaps in combination with palliative low dose chemotherapy.<sup>50</sup> In a study on total parenteral nutrition it is concluded that although it is unable to completely reverse some nutrition-related variables in cachectic patients with cancer, most patients were kept within a normal range and some improved. Therefore, further deterioration of the nutritional state, which is characteristic of this phase of disease, was at least prevented. Health care professionals should focus on physical health-related quality of- life indicators, such as nausea and emesis, dyspnea, and weakness, to gather prognostic clues in patients with terminal cancer.<sup>51, 52</sup> Patients and families as well as the medical community should use a comprehensive approach to improving the caloric and protein intake of patients who are still able to benefit from oral intake and further therapy.<sup>53</sup>

Palliative care is increasingly recognized as an essential component of a cancer patient's care both throughout the course of the disease and regardless of whether that patient's disease is potentially curable. Moreover, clinical application of the principles of palliative care need not and should not be limited to patients suffering from malignant disease. Optimal symptom control and care of the whole person are an integral part of the comprehensive care of any patient and deserve to be considered as such. Recent therapeutic advances in palliative care are exciting and some are controversial. They hold the potential to improve the quality of life of countless patients. To fulfill this role they require rigorous evaluation in properly conducted clinical trials.<sup>54</sup> Care of patients with cancer can be enhanced by continued involvement of the primary care physician. The physician's role may include informing the patient of the diagnosis, helping with decisions about treatment, providing psychological support, treating intercurrent disease, continuing patient-appropriate preventive care, and recognizing and managing or co-managing complications of cancer and cancer therapies.<sup>55</sup>

### Conclusion:-

The cancer cachexia is a clinical problem affecting many patients with cancer and other end-stage diseases. Correct identification of treatable, reversible causes must be aggressively sought and, when found, appropriately treated. New research into novel therapies directed at cancer cachexia is continuing, but there is a need of well-structured clinical trials. Professional participation and interventions from scientists and clinicians can have a profound influence on the diagnosis and treatment of patients with cachexia.

Maximum voluntary bite force,  
masticatory mechanism, jaw muscles.

#### Abstract

Bite force is an important aspect of masticatory system. Bite force assesses masticatory muscle function under clinical and experimental conditions. Measurement of maximum voluntary bite force (MVBF) in 100 individuals including males and females has been used for understanding masticatory mechanism, to evaluate the physiological characteristics of jaw muscles and study the effect of different physiological and morphological factors. The subject related factors includes- age, gender, periodontal support, height, weight, craniofacial morphology, malocclusion, temporomandibular disorder (TMD) pain. Therefore, bite force is used as a variable for evaluating masticatory function.

#### Introduction:-

Face, being the most admired point in the human body and Mandible, despite being the largest and strongest facial bone, the muscular attachments and their influence and presence of developing or developed dentition play an important role in producing the inherent weakness.

Bite force is the force applied in dental occlusion, which is the important aspect of masticatory muscular system. It is used to understand the underlying masticatory mechanism, to study the effect of different physiological and morphological factors such as age, gender, periodontal support of the teeth, height and body weight, craniofacial morphology, presence of malocclusion, temporomandibular disorder (TMD) pain and also to evaluate the physiological characteristics of jaw muscles. Other variables reportedly affecting the bite force are the type of recording devices, technique employed to measure the bite force, position of sensor in the oral cavity, patient position, unilateral or bilateral measurements and magnitude of mouth opening during measurements<sup>1</sup>.

Masseter, the anti-gravity muscle, has a special consideration among all the masticatory muscles such as masseter, temporalis, medial pterygoid and lateral pterygoid in the quantitative assessment of the strength of the muscles. The relationship of maximum voluntary bite force and masticatory system is well documented in literature to indicate the health of stomatognathic system<sup>2</sup>. The main aim of this study was to evaluate the Maximum voluntary bite force among different age groups in both males and females in Visakhapatnam District.

### Materials and methods:-

This study was conducted in 100 healthy individuals (51 males and 49 females) of Visakhapatnam District. The individuals were randomly selected for the study after the Ethical Committee approval. The total numbers of individuals are broadly categorized under six age groups i.e. 0-10, 11-20, 21-30, 31-40, 41-50, 51+ groups. Individuals with any kind of syndromes, degenerative diseases, mental deficiencies, malformation, changes of the temporomandibular articulation, open-bite and cross-bite, crowns and restorations, myofunctional changes of masticatory muscles and dental implants have been excluded from the present study.

The procedure involves a bite force meter which has a biting sensor. The individual is informed about the experimental procedure and the subject was seated comfortably in a chair in an upright position. A polythene sheet or a plastic wrapper was used to cover the biting sensor. The operator holds the holding instrument and it is used to load the bite force on the bite force sensor. It is placed on the incisal edge of the anterior teeth for measuring anterior bite force (ABF) and then placed on the occlusal surface of the first molar on the right side for measuring the right posterior bite force (RBF) and then placed on the occlusal surface of the first molar on the left side for measuring the left posterior bite force (LBF). The subjects were asked to bite hard on the sensor and the maximum bite force reading on the charge meter display was recorded. Three such readings were taken, alternated on each side, with an interval of 1 minute to avoid muscular fatigue. To reduce the error and bias in the study, a single operator has recorded the bite force in all the subjects. The highest among all these three consecutive records on either side was taken as the Maximum Voluntary Bite Force of that side. The mounting was repeated for each healthy subject on the anterior and bilateral posterior sides. The bite force transducers were disinfected before the experiments by immersing them in a disinfectant solution. The transducer was calibrated on each day of experimentation.

### Results:-

The statistical analysis was done by Mann Whitney Test to find of the statistical difference of bite force between males and females in different age groups. In both anterior and posterior region, the highest mean bite force is recorded in males in the age group of 41-50years (Fig 1, 2, 3). In the anterior and posterior region, the lowest mean bite force is recorded in females in the age group 0-10 (Fig 1, 2, 3). The mean bite force has increased as the age increases in the anterior and posterior region till the age group of 41-50 years. In the age group with above 51 years of age, there is a decrease in the mean bite force of all the males and females in both anterior and posterior region.

Fig 3. Mean of Left Posterior Bite Force

**Discussion:-**

Bite force is an important element of masticatory system. Masticatory performance is a cumulative contribution of various factors like bite force, severity of malocclusion, occlusal contact area, body loss of teeth, restorations, facial forms and other motor activities. Bite force has also shown to be affected by a number of variables such as

craniofacial morphology, age, gender, periodontal support of the teeth, height and body weight, temporomandibular disorders pain, and dental status and also other variables include the type of recording devices, technique employed to measure the bite force, position of the sensor in the oral cavity, patient position, unilateral or bilateral measurements and magnitude of mouth opening during measurements.

According to Suzana Varga et al<sup>3</sup>, bite force measurements were undertaken using a portable occlusal force gauge on both the left and the right sides of the jaw in the first molar region during maximal clenching. Two independent samples t-tests and multiple regressions were used for statistical analysis. MVBFs were age and gender related. Males showed a significant increase in bite force between 15 and 18 years of age, but gender differences were significant only in the 18-year-olds. In subjects with a neutral occlusion, MVBF could best be predicted using multiple regressions from age and gender. Morphological occlusion, jaw function, and BMI explained the remaining variance.

According to Virgilio F. Ferrario et al<sup>4</sup> conducted a study to assess the repeatability of maximal bite force estimates as obtained by sub-maximal electromyographic-force relationships performed simultaneously and symmetrically in both sides of the mouth. The protocol could be used in a clinical context to obtain indicative values for the occlusal loads to be resisted by the prosthetic reconstructions. Ten young healthy subjects performed; (1) a maximum voluntary clench (MVC) directly on their occlusal surfaces; (2) four simultaneous recording of sub-maximal bite forces on two transducers positioned on the left and right first mandibular molars) and surface EMG potentials of the masseter and temporalis anterior muscles. The actual force peak value was recorded. For each subject, a linear regression was run between the simultaneous bite force and EMG sub-maximal values recorded in the four tests. Using the EMG potentials obtained during the MVC tests, the best fitting line was used to estimate a maximum bite force. Two independent recordings were made by each subject (2 week interval) and analyzed by correlation analysis, paired Student's t-test, and Dahlberg statistic. Significant linear relationships were found between bite force and EMG potentials. The two series of indirect estimates of maximal bite force were correlated; without systematic differences. Simultaneously recorded sub-maximal bite forces and surface EMG potentials of mandibular elevator muscles had a linear relationship. The estimates of maximum bite force were repeatable on a short-term basis. The method limited the disadvantages of bite force recordings, and it could be used to obtain indicative values for the occlusal loads to be resisted by the prosthetic reconstructions.

According to Kazunori Ikebe et al<sup>5</sup>, investigated the effect of ageing, occlusal support and TMJ condition and general health status on bite force in older adults. The study sample consisted of 850 independently-living people over the age of 60 years. Bilateral maximal bite force in the intercuspal position was measured with pressure sensitive sheets. TMJ noise by palpation and limitation of mouth opening (less than 40 mm) were assessed. Subjects were grouped into three categories by occlusal support according to the Eichner Index. A multiple logistic regression analysis showed that whether participants had low bite force or not was significantly associated with gender, age, self-rated general health and occlusal support, but not TMJ noise or mouth opening limitation. Overall bite force showed a statistically significant but weak negative Spearman's correlation with age. However, there was no significant correlation between age and bite force in the Eichner C group for males or in any of the Eichner classification for females. Decline of occlusal support and general health might translate into reduction of bite force with ageing in older adults. Since tooth loss is not physiological ageing but pathological ageing, it cannot be shown that reduction of bite force is a natural effect of ageing.

According to C. M. Serra & A. E. Manns et al<sup>6</sup>, bite force has been measured by different methods and over a wide variety of designs. In several instruments, the fact that bite surface has been manufactured with stiff materials might interfere in obtaining reliable data, by a more prompt activation of inhibitory reflex mechanisms. The purpose of this study was to compare the maximum voluntary bite force measured by a digital occlusal force gauge (GM10 Nagano Keiki, Japan) between different opponent teeth, employing semi-hard or soft bite surfaces. A sample of 34 young adults with complete natural dentition was studied. The original semi-hard bite surface was exchanged by a soft one, made of leather and rubber. Maximum voluntary bite force recordings were made for each tooth group and for both bite surfaces. Statistical analyses (Student's t-test) revealed significant differences, with higher scores while using the soft surface across sexes and tooth groups. Differential activation of periodontal mechanoreceptors of a specific tooth group is mainly conditioned by the hardness of the bite surface; a soft surface induces greater activation of elevator musculature, while a hard one induces inhibition more promptly. Thus, soft bite surfaces are recommended for higher reliability in maximum voluntary bite force recordings.

Therefore, bite force is an important aspect of human masticatory system. Assessing the bite force provides the assessment of masticatory muscle function under clinical and experimental conditions. Maximum Voluntary Bite Force (MVBf) is an indicator of the functional condition of the masticatory system, resulting from the combined action of the jaw closing muscles and is modified by jaw biomechanics and reflexes. All the skeletal, muscular, and nervous systems will have an effect on bite force, and the condition of these systems will influence the biting ability of an individual.

Bone density.

#### Abstract

**Background:** Osteoporosis characterized by low bone mass and micro architectural deterioration of bone tissue, leading to enhanced bone fragility and a consequent increase in fracture risk. **Objective:** the aim of this study was to compare between pulsed high-intensity laser (HILT) and pulsed ultrasound (PUS) in treatment of osteoporosis in men. **Method:** Sixty male patients their age between 40- 65 years included in this study, the patients divided randomly into three equal groups. Laser group (LG,n=20), ultrasound group (USG,n=20), twenty patients and control group (CG,n=20). Patients in Laser and ultrasound groups received treatment for 12 weeks on the lumbar spine according to designed protocol ten minutes three times a week but the control group did not receive any treatment. Patients in the three groups evaluated at the beginning of the study and after completion using the DXA device for measuring the bone density and the results will be compared in the three groups. **Results:** The result of our study showed that there was significant improvement in bone density in LG and USG without significant difference between HILT and US. **Conclusion:** LASER and US was an effective physiotherapy modality in treatment of osteoporosis and improve bone mineral density.

#### Introduction:-

Osteoporosis is a progressive skeletal disorder characterized by decrease bone mass and deterioration of bone micro architecture, predisposing it to increased risk of fracture. Osteoporosis affects approximately 200 million people worldwide **Lin and Lane 2004.**

These fractures exert a great impact on public health, as they are often associated to increased morbidity, mortality, loss of function and high economic costs which, only in the United States, may reach 15 billion dollars a year **NIH Consensus Development Panel on Osteoporosis Prevention Diagnosis and Therapy, 2001.**

Osteoporosis is associated with significant morbidity and mortality and its-related fractures are an important public health concern; increasing in physical and/or psychological problems as depression, chronic disabling pain, fear and anxiety as well as decrease in functional mobility and thereby reduction in quality of life (QOL) and difficulty of the

**Corresponding Author:-Anwar AbdelgayedEbid.**

activities of daily life **NIH Consensus Development Panel on Osteoporosis Prevention Diagnosis and Therapy 2001, Totosy de Zepetnek et al., 2009.**

Pharmacological interventions are widely used to treat and prevent osteoporosis and its related fracture clinically. However, such interventions can be accompanied with undesirable side effects as venous thromboembolism, osteonecrosis of the jaw, a syndrome of myalgias and arthralgias, induce osteoporosis in children and gastrointestinal intolerance **Lewiecki 2010, Whyte et al., 2008, Nelson et al., 2002, Noller 2002.**

The beneficial effect of ultrasound on bone healing is due to the piezo-electric phenomenon **Sheng et al., 2001.** Bone is piezo-electric, which means that electric potentials are produced in bone when it is subjected to mechanical stress **Hadjiargyrou 1998.**

Previous study found that ultrasound stimulate osteogenesis in bone, stimulate osteoblasts to increase collagen production **Rutten 2008**, inhibiting mature osteoclasts from resorbing bone and stimulating osteoblasts for bone formation **Doan 1999**, stimulate vascularization **Trelles 1987**, organization of collagen fibers and ATP levels **Garavello-Freitas 2003.**

Laser has the ability to stimulate the attachment and proliferation of the human osteoblasts like cells cultured on titanium implant material indicating that LLLT can modulate the activity of cells surrounding implant material **Khandra 2008.** Also; laser improve collagen fiber deposition at early stages of the healing; increased amount of well-organized bone trabeculae at the end of the experimental period on irradiated animals **Márquez 2008.**

Laser light affects the mitochondrial respiratory chain and consequently their selective permeability for sodium, potassium and calcium ions, or by increasing the activity of certain enzymes such as cytochrome oxidase and adenosine triphosphatase. It also increases DNA synthesis, collagen and pro-collagen production and may increase the cell proliferation or alter locomotory characteristics of cells **Loevschall 1994.** There was no study evaluate the comparison between laser and US. So our study was conducted to compare between pulsed high intensity laser and pulsed ultrasound in treatment of osteoporosis.

### **Material and methods:-**

This was a 12-week randomized study with two measurement points' baseline (pre) and 12 weeks (post). Sixty osteoporotic patients were enrolled in this study. **Inclusion Criteria:** Their age between 40 to 65 years (to avoid inclusion of older patients with multiple medical problems) with no history of cancer, renal disease, gastrectomy, metabolic bone disease or any condition (such as a neurogenic, myopathic or connective tissue disorder) that could cause secondary osteoporosis. The participants did not intake any medications associated with accelerated bone loss (steroids) or any medications affected bone metabolism (calcium, vitamin D), nonsmoker, and led sedentary life style without participation at any exercise training during this study. All participants were given a full explanation of the treatment protocol and a written informed consent form giving agreement to participation and publication of results was signed by the patients.

### **Randomization:-**

The participants in this study were randomly assigned into one of three groups (three randomized groups in a pretest-posttest design): Pulsed Nd: YAG laser group (LG, n=20), Low intensity ultrasound group (USG, n=20) and control group (CG, n=20). Subject characteristics (Mean  $\pm$  SD) of all groups were listed in the table (1).

### **Pulsed high intensity laser therapy:-**

Laser group received pulsed Nd: YAG laser on the lumbar region (L<sub>1-5</sub>), 3 times/weeks, 10 minutes for 12 weeks by Pulsed High Intensity Laser, High intensity laser machine by ASASrl company, Hilterapia, HIRO 3.0, Italy. High intensity laser (Nd:YAG), with pulsed emission (1064 nm), Very high peak powers (1-3 KW), Elevated energy content (150 - 350 mJ), High levels of fluence (energy density) ( 810-1780 mJ/cm<sup>2</sup> ), Brief duration (120-150  $\mu$ s), Low frequency (10-40 Hz), Duty Cycle of about 0.1%. The delivery technique for this group was automatic scanning with total energy of 4000 joule.

HILT was delivered in two different phases, Initial phase and terminal phase. **In initial phase**, three sub-phases of fast manual scan (every 10 cm scanned in about 1.5 second) was performed to lumbar region with increasing fluences (710-910-1530 mJ/cm<sup>2</sup>) and decreasing frequencies (30-20-15Hz) with total energy of 2000 joules reached

lumber region. In Final phase: 3 sub-phases of slow scanning (every 10 cm scanned in about three second) with increasing fluences (710-910-1530 mj/cm<sup>2</sup>) and decreasing frequencies (30-20-15Hz) with total energy of 2000 juels reached lumber region. Scans can be longitudinal or transversal to the anatomical structure to be treated, ideally following a straight lines path. The irradiation was performed contact with the back and done in three phases (initial, intermediate and final phase) according to designed protocol for laser application.

#### **Pulsed low intensity ultrasound:-**

Ultrasound group received low intensity ultrasound on the lumbar region (L<sub>1-5</sub>), 3 times/weeks, 10 minutes for 12 weeks. Low intensity ultrasound was composed of a pulse width of 200  $\mu$ s containing 1.5MHz sine waves, with a repeated frequency of 1.0 kHz with a spatial-averaged temporal-averaged intensity of 30 mW/cm<sup>2</sup> **Warden et al., 2001**. Before the application of LIUS, its output characteristics were measured by hydrophonic scanning. The treatment procedure was explained to all subjects. Skin was cleaned with alcohol. During the irradiation, the position of the subjects was the same for both groups (prone lying position with a pillow under her abdomen).

**Outcome measures** include BMD assessed by DEXA (Dual x-ray Absorptiometry (DXA) (Model QDR-1000W, Hologic, Inc., Waltham, MA) was used for the qualitative assessment of BMD in the vertebral bodies of the lumbar spine for both groups. DEXA performs an imaging test that measures bone density by passing x-rays with two different energy levels through the bone. It is used to diagnose osteoporosis (decrease in bone mass and density). It is also called bone mineral density scan (BMD scan).

#### **Statistical analysis:-**

All data were assessed using SPSS version 16.0. Data were tested by Shapiro-Wilk test and were normally distributed. Data were statistically analyzed using repeated measures ANOVA to test hypothesis and to assess both within and between variabilities. Results are reported as means and standard deviations. For all procedures, significance was accepted at the alpha level of 0.05.

#### **Results:-**

Sixty subject participated in this study. Their age ranged from 40 to 65 years with a mean (54.47 $\pm$  5.17). Their weight ranged from 58 to 85 kg with mean weight 76.7  $\pm$  7.4 and their height ranged from 162 to 178 cm with a mean 172.04  $\pm$  5.46 cm. Un paired t-test showed a non-significant difference between the subjects age, weight and height as p value was 0.57, 0.45 and 0.36 respectively, also; there was no significant difference between all groups at baseline values (p=0.2289), table 1.

Table 1: The mean values of T- score for all groups at baseline and after 12 weeks.

	LG (n=20)	USG (n=20)	CG (n=20)	P value (between LG and USG)
Baseline	-2.8 $\pm$ 0.35	-2.9 $\pm$ 0.36	-2.7 $\pm$ 0.38	0.2289**
12 weeks	0.80 $\pm$ 1.34	0.700 $\pm$ 1.84	-2.5 $\pm$ 0.70	0.8453**
P value (within group)	<0.0001*	<0.0001*	0.2630**	

\*\* Non-significant\* Significant LG, Laser group USG, Ultrasound group CG, Control group

There was a significant increase in T- score after 12-weeks in the laser and ultrasound groups as compared with baseline values. By comparing the two values after 12 weeks there no significant difference in T- score between laser and ultrasound groups (p=0.8453 and t=0.1965) as shown in table 1.

#### **Discussion:-**

The result of the this study showed that the HILT and PUS was effective in increasing the bone mineral density after 12 weeks of treatment and the effect of both modality nearly equal without significant difference in between. Many studies have examined possible treatments and prevent ivestrategies to deal with the bone loss in osteoporosis. Low intensity pulsed ultrasound (LIPUS) was proven to enhance fracture healing effectively; also pulsed ultrasound can be applied clinically to enhance both normal and osteoporotic fracture healing **Wing-Hoi et al., 2012**.

The beneficial effect of ultrasound on bone healing is due to the piezoelectric phenomenon **Sheng et al., 2001**. Bone is piezoelectric, which means that electric potentials are produced in bone when it is subjected to mechanical stress. Since Wolff's law basically states that bone remodels according to functional demands, it is assumed that the stress generated potentials in bone serve as a signal which controls bone remodeling **Hadjiargyrou 1998**.

Application of low-intensity ultrasound (LIUS) to osteoporotic bones preserved the bone microarchitecture. It effectively decrease the risk of osteoporotic bone fracture by increasing the mechanical characteristics of osteoporotic bone via improvements in both its effective structural and elastic modulus and LIUS would be very effective clinically in preventing osteoporotic bone fracture **Dae-Gon et al., 2010**.

Ultrasound (US) is a potential nonpharmacological intervention for many people with an increased bone fracture risk due to osteoporosis **Warden et al., 2001**. US, refers to a high-frequency nonaudible acoustic energy that travels in the form of a mechanical wave, can be directed at osteoporotic sites to exert a mechanical stimulus. Recently, several studies have shown that low-intensity ultrasound (LIUS) with a 200  $\mu$ s burst of 1.5 or 0.5 MHz sine waves, 1.0 kHz pulse repetition and 30 mW/cm<sup>2</sup> intensity are capable of augmenting bone strength, particularly its irregular geometry. **Siffert and Kaufman 2007**. Signals from electromagnetic fields and ultrasound have a clinically significant effect upon bone repair, since electrical fields can be directly induced by electromagnetic fields and indirectly induced via the piezoelectric effect by ultrasound **Pilla 2002**.

Previous studies found that osteogenesis is stimulated by ultrasound can be found in vitro studies. Osteoblasts can be stimulated to increase collagen production **Rutten 2000** and increase the production of prostaglandin E<sub>2</sub>, an important bone-healing mediator that exerts different effects on bone cells in the same microenvironments, such as inhibiting mature rat osteoclasts from resorbing bone and stimulating osteoblasts for bone formation **Doan 1999**.

The majority of studies conducted over the last thirty years in laser therapy have been carried out with medium and low intensity Laser devices (Low Level Laser Therapy: LLLT), with wavelengths in the infrared and near infrared 600 - 900 nm. Within this spectrum the Laser beam is partially absorbed by the natural chromophores, like melanin, which withhold part of the energy irradiated. This study on the other hand is based on the use of Nd: YAG Pulsed High Intensity Laser Therapy (HILT), which characterized by a wavelength 1046 nm that allows it to penetrate and spread more easily through the tissue due to not having an endogenous chromophore **Parra et al., 1992**. Nd:YAG lasers can produce new collagen formation in the papillary dermis **Chrys et al., 2004**.

Laser has the ability to stimulate the attachment and proliferation of the human osteoblasts like cells cultured on titanium implant material indicating that LLLT can modulate the activity of cells surrounding implant material **Khandra 2008**. The study conducted on the effect of laser photo biomodulation on the repair of surgical defects on the femur of rats filled with lyophilized bovine bone showed that there was histological evidence of improved collagen fiber deposition at early stages of the healing; increased amount of well-organized bone trabeculae at the end of the experimental period on irradiated animals **Márquez 2008** indicating laser enabling maximal photoactivation and stimulation of biological processes.

Many mechanisms of action have been proposed trying to explain the stimulatory effects of laser therapy on bone healing, as the effects of the laser on the inflammation process and angiogenesis **Lan et al., 2006**.

One promising treatment is the use of the low level laser therapy (LLLТ), which seems to induce osteogenesis and stimulate fracture healing **Gauthier et al., 2005**. Its action is based on the absorption of the light by tissues, which will generate modifications in the cell metabolism. When the LLLT is applied on tissue, the light is absorbed by photoreceptors located in the cells, called chromophores. Once absorbed, the light can modulate cell chemical reactions and stimulate the mitochondrial respiration, the production of molecular oxygen and ATP synthesis **Stein et al., 2005**. These effects can increase the synthesis of DNA, RNA and cell-cycle regulatory proteins, stimulating cell proliferation.

In vitro studies using osteoblastic cells showed that LLLT is capable of increasing mitochondrial activity **Pires-Oliveira et al., 2008** osteoblast, DNA and RNA synthesis, bone nodule formation, osteocalcin and osteopontin gene expression and alkaline phosphatase activity. Also, the LLLT has demonstrated to be able to accelerate the process of fracture repair in rabbits and rats, increasing the callus volume and bone mineral density (BMD) **Liu et al., 2007**, **Rennó et al., 2007**.

A study conducted by **Paulo Sérgio et al 2012** on the effect of low level laser therapy (LLLT) on osteoporotic rat using two fluence of laser doses and the authors conclude that LLLT improves bone repair in the osteoporotic rats as a result of stimulation of the newly formed bone, fibrovascularization and angiogenesis.

Laser light affects the mitochondrial respiratory chain by changing the electric potential of cell membranes and, consequently, their selective permeability for sodium, potassium and calcium ions, or by increasing the activity of certain enzymes such as cytochrome oxidase and adenosine triphosphatase. It also increases DNA synthesis, collagen and pro-collagen production, and may increase the cell proliferation or alter locomotory characteristics of cells **Noble 1992**.

Some authors affirm that low laser light treatment can accelerate bone formation by increasing osteoblastic activity, vascularization, organization of collagen fibers **Noble 1992**. Recent studies are suggesting the use of higher laser dosages to stimulate bone metabolism **Rennó et al., 2006**. In an in vitro study, our group comparing the effects of the 830 nm laser, at the dosages of 1, 5 and 10 J/cm<sup>2</sup>, showed that the higher dosage was more efficient to produce an increase of osteoblast proliferation and alkaline phosphatase activity. These findings further support the notion of cell/tissue, and dose/wavelength specificities. Also; the 830 nm laser irradiation, at 120 J/cm<sup>2</sup>, was able to increase the biomechanical properties and bone mineral density of osteopenic rats **Rennó et al., 2006**.

### Conclusion:-

Pulsed high intensity Nd: YAG laser photostimulation and pulsed ultrasound have a favorable beneficial effects on bone mineral density in treatment of osteoporosis

PET/CT, Pediatric Malignancy.

#### Abstract

**Background:** Successful management of solid tumors in children requires imaging tests for accurate disease detection, characterization, and treatment monitoring. 18F-fluorodeoxyglucose positron emission tomography/computed tomography (18F-FDG PET/CT) is a highly sensitive and specific imaging modality for whole-body evaluation of pediatric malignancies. The study aimed to retrospectively evaluate the efficacy of FDG PET/CT imaging system in the management of some pediatric malignancy and to determine if it provided additional diagnostic information on disease status; during the last 4 years (y). **Methodology:** 180 pediatric patients (118 male and 62 female) were included in the study. Their ages ranged from 6 month to 19 y at their first PET/CT examination. 78.3% of the patients were below 10 years old. 100 patients had lymphoma (82 Hodgkin and 18 Non-Hodgkin), 26 had soft tissue sarcoma (STS), and 54 had neuroblastoma. The indication, purpose, and findings of each PET/CT examination were reviewed, in addition to other imaging findings as well as clinical information including follow-up results for >1 y from their last PET/CT examination. 720 scan was performed for whole body in all patients for initial diagnosis & staging and restaging of recurrent malignancy. It is also, performed to assess cancer response to therapy and after therapy as a routine follow-up procedure or for further evaluation of suspected recurrence or for secondary malignancy. 1080 suspicious sites were evaluated in the studied patients, and those whose reports indicated areas of increased FDG uptake were selected. PET/CT findings were compared with the results of other diagnostic procedures (including CT and ultrasound), biopsy findings and follow-up data. **Results:** The current study represents that the, 18F-FDG PET/CT may influence the treatment decision if distant metastases or second primary tumors are detected with regard to staging of the primary tumor. Post Chemo-radiotherapy (CRT) PET/CT does aid subsequent management decisions. The overall sensitivities, specificities & positive and negative predictive values of the imaging system for all the suspicious sites were 98.1%, 97.2%, 97.6% and 97.8% respectively. It was 94.60%, 97.50%, 92.10%, and 98.30% respectively for detecting the

local recurrence at the end of treatment; and 96.20%, 98.30%, 92.60%, and 99.10% after 1y of treatment. The sensitivities and specificities of  $^{18}\text{F}$ -FDG PET/CT for initial staging of malignant lymphomas are 83.3%-100% and 93.75%-100% respectively. It ranged 66.70%-100% and 91.30%-100% respectively in sarcoma and 86.70%-100% and 95.80%-100% respectively in Neuroblastoma. **Conclusion:** The study concluded that the  $^{18}\text{F}$ -FDG PET/CT is the gold standard for noninvasive functional imaging in oncology. Technical developments in PET scanning in cancer management may increase the precision of radiotherapy planning and thus improve tumor control and reduce treatment-related morbidity. Recommendation regarding the use of PET/CT in the management of pediatric malignancy to facilitates the sparing of normal structures and the escalation of dose.

## Introduction:-

The presence of distant metastases is one of the most important prognostic factors in most cancer patients. Most tumors are classified according to the TNM staging system, and treatment is modified when distant metastases are present. Disease localized to primary sites and to regional lymph nodes is generally treated with curative strategies, including surgery, chemotherapy, and radiotherapy. In contrast, palliative treatment of patients with metastatic disease consists of less aggressive strategies. Moreover, distant metastases usually occur late during the course of cancer, whereas second primary cancers may be found even in early-stage patients. Early detection of distant metastases and second primary cancers is a fundamental precondition for guiding precise staging and optimal management(Xu et al., 2012/2015).

Conventional imaging procedures (such as chest radiography, CT, abdominal ultrasonography, and bone scan) are commonly used to detect distant metastases and second primary cancers in patients with various cancers (Ng et al., 2009;Fuster et al., 2008). However, conventional imaging procedures often do not reliably characterize the extent of disease because it is difficult to identify small distant lesions on the basis of morphologic criteria and to distinguish potential metastatic lesions from benign findings.  $^{18}\text{F}$ -FDG PET is a functional imaging modality that is based on the increased glucose metabolism of malignant cells. However, anatomic information concerning distant lesions is limited on  $^{18}\text{F}$ -FDG PET images, and the resolution is insufficient to detect small lesions(Ng et al., 2009;Fuster et al., 2008;Antoch et al., 2005; Strobel et al., 2007;Veit-Haibach et al., 2009). Moreover, false-positive findings from inflammatory or granulomatous lesions in regions with a high prevalence of granulomatous disease are still problematic on  $^{18}\text{F}$ -FDG PET images. These issues may restrict its use for assessing distant malignancies in cancer patients. The introduction of PET/CT scanners combined the functional data of PET with the detailed anatomic information of CT into a single examination(Xu et al.,2012/2015).The poor spatial resolution of PET is substantially compensated for by integrated PET/CT, with co-registration of functional imaging with PET and anatomic imaging with CT. However, little is known about the validity of PET/CT relative to PET for detecting distant malignancies in cancer patients (Xu et al.,2012/2015). In several previous studies,  $^{18}\text{F}$ -FDG PET/CT was shown to be more sensitive and specific than conventional imaging procedures for the detection of distant malignancies in cancer patients at initial staging before treatment or restaging after treatment (Ng et al.,2009;Fuster et al., 2008;Antoch et al., 2005; Strobel et al., 2007;Veit-Haibach et al., 2009). For this reason, combined PET and CT systems (PET/CT) have emerged as promising imaging modalities and are being more routinely used in clinical situations (von Schulthess et al., 2006). Although many studies about whole-body PET/CT for various cancers were done, the results were still controversial and inconclusive. Despite growing numbers of reports on imaging adult malignancies with PET/CT, little data have been reported so far about the clinical relevance of this modality in pediatric patients(Xu et al.,2012/2015).

The study aimed to retrospectively reviewed our initial clinical experience with FDG PET/CT in pediatric malignancies to evaluate the efficacy of this new imaging system and to determine if PET/CT provided additional

diagnostic information on disease status; the study also, evaluate the efficacy of this imaging technique in the management of some pediatric malignancies.

### Materials and methods:-

One hundred and eighty pediatric patients (118(65.6%) male and 62(34.4%) female) with suspected or known malignancy, evaluated by  $^{18}\text{F}$ -FDG imaging using a combined PET/CT system, between January 2011 and January 2015, included in the study. The male to female ratio was 2.27:1. The patient's stage was from 6 month to 19 years (y) old with a median age of 12 y at their first PET/CT examination. 141 (78.3%) of the patients were below 10 years old. One hundred patients had lymphoma (82 Hodgkin and 18 Non-Hodgkin), 26 had sarcoma, and 54 had neuroblastoma. The indication, purpose, and findings of each PET/CT examination were reviewed, in addition to other imaging findings as well as clinical information including follow-up results for >1 y from their last PET/CT examination. PET/CT examination was performed for whole body in all patients (720 scan) for initial diagnosis & staging and for restaging of recurrent malignancy. It is also, performed to assess cancer response to therapy and after therapy as a routine follow-up procedure or for further evaluation of suspected recurrence or for secondary malignancy.

One thousand and eighty suspicious sites were evaluated in the 180 included patients. Patients were selected according to their reports which indicate areas of increased FDG uptake. PET findings were considered positive when uptake occurred at sites of previous disease, in asymmetrical lymph nodes or in nodes unlikely to be affected by inflammation (mediastinal, except for hilar, and abdominal). PET findings were adjudged negative for neoplastic localizations in the following instances: physiological uptake (urinary, muscular, thymic or gastrointestinal), symmetrical nodal uptake, very low uptake and non-focal uptake. PET findings were compared with the results of other diagnostic procedures (including CT and ultrasound), biopsy findings and follow-up data.

After at least 4 h of fasting, a total body PET scan was done one hour after IV injection of 300 MBq of  $^{18}\text{F}$ -FDG. 64 MSCT scan was performed using GE Discovery VCT simultaneously and used for attenuation correction, anatomical localization and diagnosis. Max. Variant of SUV; a semi-quantitative analysis would be done for selected ROI.s and the normal threshold is <2.5.

### Statistical Analysis:-

An important goal in diagnostic medicine research is to estimate and compare the accuracies of diagnostic tests which provide reliable information about a patient's condition and influence patient care. The purpose of a diagnostic test is to classify or predict the presence or absence of a condition or a disease. The clinical performance of a diagnostic test is based on its ability to correctly classify subjects into relevant subgroups (**Mandrekar and Mandrekar, 2005**). The diagnostic test consist the following events:  $D$ : Person has a disease,  $T+$ : Positive test result,  $\bar{D}$ : Person has no disease and  $T-$ : Negative test result (**Nyari, 2011**). The accuracy of any test is measured by comparing the results from a diagnostic test (positive or negative) to the true disease or condition (presence or absence) of the patient. The two basic measures of quantifying the diagnostic accuracy of a test are the sensitivity and specificity (**Mandrekar and Mandrekar, 2005**).

**-The sensitivity**  $P(T+/D)$  of a diagnostic test is the probability of a positive test result once the person has the disease:  $P(T+/D) = P(T+ \cap D)/P(D)$  = The number of ill persons with positive test results / The number of all persons who have the disease (**Nyari, 2011**).

**-The specificity**  $P(T-/\bar{D})$  of a diagnostic test is the probability of a negative test result once the person is healthy.  $P(T-/\bar{D}) = P(T- \cap \bar{D})/P(\bar{D})$  = The number of healthy persons with negative test results / The number of all healthy persons (**Nyari, 2011**).

Sensitivity and specificity are characteristics of the test but they do not help a clinician to interpret the results of an individual test (**Peacock and Peacock, 2011**). Therefore it is important to know how good the test is at predicting the true positives, i.e., the probability that the test will give the correct diagnosis. This is captured by the following predictive values (**Mandrekar and Mandrekar, 2005**):

**-Positive predictive value (PPV) (posterior probability)** is a probability that someone does have the disease once the test has given a positive result  $[P(D/T+)]$ .  $PPV = \frac{\text{the number of persons diagnosed as have that disease with positive test results}}{\text{the number of all positive test results}}$  (Nyari, 2011).

**- Negative predictive value (NPV)** is a probability that someone really does not have the disease once the test has given a negative result  $[P(\bar{D}/T-)]$ .  $NPV = \frac{\text{the number of healthy persons with negative test results}}{\text{the number of all negative test results}}$  (Nyari, 2011).

**-Prevalence (prior probability)** is defined as the prior probability of the disease before the test is carried out (Peacock and Peacock, 2011). It is a measure of disease that allows us to determine a person's likelihood of having a disease. Therefore, a prevalence rate is the total number of cases of a disease existing in a population divided by the total population (Health.ny.gov, 2015). PPV and NPV are dependent on the prevalence of the disease in the patient population being studied (Mandrekar and Mandrekar, 2005). Through Bayes Theorem of conditional probability, the prevalence, sensitivity and specificity lead to evaluation of the positive and negative predictive value (Walker et al., 1990).

$$PPV = \frac{\text{sensitivity} \cdot \text{prevalence}}{[\text{sensitivity} \cdot \text{prevalence}] + [(1 - \text{specificity}) \cdot (1 - \text{prevalence})]}$$

$$NPV = \frac{\text{specificity} \cdot (1 - \text{prevalence})}{[(1 - \text{sensitivity}) \cdot \text{prevalence}] + [\text{specificity} \cdot (1 - \text{prevalence})]}$$

## Results:-

The results of the present work are presented in tables (1-9).

Stage III was the most presenting stage in all malignant disease group (35%), followed by stage I (22.2%) then stages II (21.7%) and IV (21.1%) respectively. Tumor size was >5cm in 72.8% of patients. Chemotherapy (93.3%) and surgery (73.3%) was the most treatment modalities in all our patients but radiotherapy was used in 67.8% of them. However, 32.2% of patients didn't receive radiotherapy. On the other hands, 41.1% of patients presented with metastases, (table 1).

PPV: Positive predictive value, NPV: Negative predictive value

The sensitivities and specificities of 18F-FDG PET/CT for initial staging of malignant lymphomas were ranged 83.3%-100% and 93.75%-100% respectively. They ranged 66.70%-100% and 91.30%-100% respectively in STS and 86.70%-100% and 95.80%-100% respectively in Neuroblastoma. The negative and positive predictive values in evaluating the stage of lymphoma were 93.30%-100% and 40.00%-100% respectively. They ranged from 83.30%-100% and 33.30%-100% in STS and 95.10%-100% and 0.00%-100% in neuroblastoma respectively (Table 5).

**Table (5): Efficiency of PET/CT Scan in Evaluating the Stage of Pediatric Malignancy**

At the end	23.60%	94.60%	97.50%	92.10%	98.30%	96.80%
After 1 year	18.10%	96.20%	98.30%	92.60%	99.10%	97.90%

PPV: Positive predictive value, NPV: Negative predictive value

### Discussion:-

Successful management of solid tumors in children requires imaging tests for accurate disease detection, characterization, and treatment monitoring. Technologic developments aim toward the creation of integrated imaging approaches that provide a comprehensive diagnosis with a single visit. These integrated diagnostic tests are not only convenient for young patients but also save direct and indirect health-care costs by streamlining procedures, minimizing hospitalizations, and minimizing school or work time lost for children and their parents (Uslu et al., 2015). Pediatric malignancies are regarded as distinct from adult malignancies in view of their low frequency, treatment strategy, and expected prognosis. Special attention should be required in interpreting images of pediatric patients, taking these conditions into consideration (Tatsumi et al., 2007). However, modern radiotherapy techniques heavily rely on high-quality medical imaging. PET provides biologic information about the tumor, complementary to anatomic imaging. Integrated PET/CT has found its way into the practice of radiation oncology, and  $^{18}\text{F}$ -FDG PET is being introduced for radiotherapy planning. The functional information possibly augments accurate delineation and treatment of the tumor and its extensions while reducing the dose to surrounding healthy tissues. In addition to  $^{18}\text{F}$ -FDG, other PET tracers are available for imaging specific biologic tumor characteristics determining radiation resistance (Troost et al., 2015).

PET is used for many cancers for diagnosis, initial staging, assessment of treatment response (Meta et al., 2001), restaging, detection of clinically suspected recurrence, and surveillance (la Fougère et al., 2006; Freudenberg et al., 2007; Cohade et al., 2003). Compared with conventional PET, PET/CT provides greater accuracy in localizing  $^{18}\text{F}$ -FDG uptake, with resultant improvement in observer performance (von Schulthess et al., 2006; Podoloff et al., 2009; Patel et al., 2013). In the current study, The overall sensitivities, specificities & positive and negative predictive values of the PET/CT imaging system for all the suspicious sites were 98.1%, 97.2%, 97.6% and 97.8% respectively. It was 94.60%, 97.50%, 92.10%, and 98.30% respectively for detecting the local recurrence at the end of treatment and were 96.20%, 98.30%, 92.60%, and 99.10% after 1y of treatment. Tatsumi et al., 2007 also demonstrated that PET/CT exhibited significantly high sensitivity, specificity, and accuracy than conventional imaging (CI) and showed accurate findings in 90% (72/80) of lesions with discordant findings between them. Additional information of PET/CT relative to CI was observed in more than one third of examinations compared. Accordingly, Xu et al., 2012/2015 documented in his meta-analysis that whole-body PET/CT has excellent diagnostic performance for the overall evaluation of distant metastases with or without second primary cancers in cancer patients. On the other hands, Patel et al., 2013/2015 founded a lack of evidence supporting using the PET/CT in post-treatment surveillance and is reflected in practice guidelines (Special Report, Podoloff et al., 2007). He evaluates patients with lymphoma, colorectal cancer, and head and neck cancer. Current National Comprehensive Cancer Network guidelines also, do not recommend surveillance. Nevertheless, PET/CT is commonly used for surveillance (Wagner-Johnston et al., 2011). Possible risks of using PET/CT for surveillance include overtreatment based on false-positives and unnecessary radiation exposure (Huang et al., 2009; Patel et al., 2013/2015). Therefore, a negative follow-up  $^{18}\text{F}$ -FDG PET scan is a strong indicator of absence of disease relapse, whereas a positive scan should be validated with other imaging modalities or biopsy (Rhodes et al., 2006). Several recent studies have demonstrated that routine follow-up by  $^{18}\text{F}$ -FDG PET/CT and other imaging techniques may be

overused for routine surveillance of patients with HL, contributing to increased cost and radiation exposure without a clear survival benefit (Nivelstein et al., 2012; Levine et al., 2006; Rathore et al., 2012). More data are needed to determine which patient group will benefit from which surveillance test for how long and at which frequency (Uslu et al., 2015).

Early detection of distant malignancies in cancer patients is crucial for guiding subsequent staging procedures and treatment (Xu et al., 2012/2015). Accordingly to the results of the study of Tatsumi et al., 2007, PET/CT is expected to serve as a powerful imaging modality, especially in staging or in evaluating suspected recurrence, in pediatric malignancies. The sensitivities and specificities of 18F-FDG PET/CT or 18F-FDG PET for initial staging of malignant lymphomas are 96%–99% and 95%–100%, respectively (Kabickova et al., 2006; Furth et al., 2006; Cheng et al., 2013; Miller et al., 2006; Paulino et al., 2012; Punwani et al., 2010; Uslu et al., 2015). In the present study, the sensitivities and specificities of 18F-FDG PET/CT for initial staging of malignant lymphomas were ranged 83.3%-100% and 93.75%-100% respectively. They ranged 66.70%-100% and 91.30%-100% respectively in STS and 86.70%-100% and 95.80%-100% respectively in Neuroblastoma. Nevertheless, Uslu et al., 2015 reported that, some investigators found that the use of 18F-FDG PET/CT has shown high negative predictive value, and therefore an early negative scan is a reliable indicator for therapy response (negative predictive value, 85.7%–100%; positive predictive value, 41.2%–85.7%) (Riad et al., 2010; Bakhshi et al., 2012; Ilivitzki et al., 2013). In the present study, negative and positive predictive values in evaluating the stage of pediatric lymphoma were 93.30%-100% and 40.00%-100% respectively. Furth et al., 2009, reported that a negative 18F-FDG PET/CT scan after 2 cycles of chemotherapy is a strong indicator of relapse-free survival, with a negative predictive value of 100% in HL patients. Therefore, an 18F-FDG PET/CT scan has been advocated by many investigators and has led to early intensification of chemotherapy in apparent non-responders (Furth et al., 2009; Levine et al., 2006; Meany et al., 2007; Uslu et al., 2015). Additionally, PET or PET/CT has clear advantage in evaluating soft-tissue masses and, thus, has been reported to be useful in patients with lymphoma or other malignancies after treatment (Rohren et al., 2004; Kostakoglu and Goldsmith, 2003; Weber, 2005). Schaefer et al., 2004 reported that PET/CT was particularly useful in demonstrating absence of residual active disease in adult lymphoma after treatment (Uslu et al., 2015). As absence of FDG uptake on the residual soft tissue is known to be a strong indicator for better prognosis in adults, accurate interpretation with confidence is valuable in managing patients in a post-treatment status. PET/CT has an advantage over CI or PET alone in this regard as well (Tatsumi et al., 2007). Furthermore, Choi et al., 2014, in a study of 30 neuroblastoma patients, found that 18F-FDG PET is more sensitive than CT in the evaluation of distant lymph node involvement and can help in detecting recurrent lymph node metastases. Therefore, 18F-FDG PET/CT might be particularly helpful in older patients who present with small, resectable primary tumors and chronic lymph node metastases (Uslu et al., 2015). However false-positives were noted because of thymic rebound, inflamed lymph nodes, physiologic cardiac uptake (Depas et al., 2005), infections or inflammation (Rhodes et al., 2006), and reconverted marrow. This is a typical false-positive paradox, that is, false-positive results are more probable than true-positive when the overall population has a low incidence of a condition (Uslu et al., 2015).

The ideal timing for a PET/CT after CRT has yet to be established, although, most commonly, within the literature, scans 3 months post CRT are used with the hope of minimizing post-treatment inflammation, maximizing potential tumor cell kill after CRT and without delaying the scan for too long to allow progression of residual disease (Sherriff et al., 2015). On the other hand, post-CRT PET/CT does aid subsequent management decisions. Patients with a negative PET/CT scan after radical CRT have a 91.8% chance of remaining free of local recurrence 19 months post treatment. A higher  $SUV_{max}$  on the post-CRT PET/CT may predict local recurrence and warrants further investigation (Sherriff et al., 2015). A substantial fraction ( $\leq 65\%$ ) of patients with positive PET results will still be cured, and patients with negative or positive results seem to do well if their PET results are negative at the completion of chemotherapy (typically 6 cycles) (Sher et al., 2009). Therefore, other investigators suggest performing follow-up 18F-FDG PET/CT scans at later time points (Longo, 2013). In NHL patients, Yang et al., 2009 reported that a persistent tumor 18F-FDG uptake on 18F-FDG PET/CT scans predicted worse overall survival and event-free survival. However, this principle may not hold for all types of NHL (Bakhshi et al., 2012; Depas et al., 2005). A recent study on non-lymphoblastic lymphoma patients showed that 18F-FDG PET/CT and CT scans could not predict survival (Bakhshi et al., 2012). Reported sensitivities and specificities of 18F-FDG PET/CT for therapy response assessment of HL and NHL at 2 wk to 3 mo after completion of therapy showed wide ranges of 75%–100% and 75%–90.9%, respectively (Riad et al., 2010; Bakhshi et al., 2012; Furth et al., 2009; Levine et al., 2006; Meany et al., 2007). In the present study, the sensitivities and specificities of PET/CT scan for patients reaching complete remission (CR) at the end of treatment of pediatric malignancy were 100% and 76.50% in

lymphoma. It was 100% and 50.00% in STS and 100% and 92.30% in neuroblastoma. After one year of follow up, it becomes 96.60% and 100% in lymphoma, 100% and 77.80% in STS, and 100% and 92.70% in neuroblastoma. More systematic data evaluations are needed to determine the best time point for interim scans for response assessment of pediatric lymphomas. Information about the value of 18F-FDG PET or 18F-FDG PET/CT follow-up studies of pediatric HL and NHL after therapy is based on few non-responders per evaluated study population (Miller et al., 2007; Amthauer et al., 2005; Depas et al., 2005; Furth et al., 2009; Levine et al., 2006; Hernandez-Pampaloni et al., 2006; Rhodes et al., 2006; Wickmann et al., 2003). 18F-FDG PET/CT has shown high sensitivity and specificity for the diagnosis of disease relapse in HL and NHL (95%–100% and 90%–100%, respectively) (Riad et al., 2010; Depas et al., 2005; Rhodes et al., 2006). In the current study, the overall sensitivities and specificities of the imaging system for detecting the local recurrence were 94.60% and 97.50% respectively at the end of treatment and were 96.20% and 98.30% after 1y of treatment. More evidence is needed on diagnostic algorithms for the detection of tumor recurrence (Uslu et al., 2015).

### Conclusion:-

PET with the glucose analog,  $^{18}\text{F}$ -FDG PET, is increasingly recognized as a powerful tool in evaluating patients with various malignant tumors (Rohren et al 2004). Recently, combined PET and CT systems (PET/CT) have emerged as promising imaging modalities and are being more routinely used in clinical situations (von Schulthess et al 2006). Despite growing numbers of reports on imaging adult malignancies with PET/CT, little data have been reported so far about the clinical relevance of this modality in pediatric patients. This study aimed to retrospectively evaluate the efficacy of FDG PET/CT imaging system in the management of some pediatric malignancy and to determine if it provided additional diagnostic information on disease status; during the last 4 years (y). The study concluded that the  $^{18}\text{F}$ -FDG PET/CT is the gold standard for noninvasive functional imaging in oncology. It is a useful technique for the staging and follow-up of pediatric malignancy. Technical developments in PET scanning in cancer management may increase the precision of radiotherapy planning and thus improve tumor control and reduce treatment-related morbidity. It has a very high but not absolute specificity for pediatric malignancy. Thus, combined PET/CT imaging had an impact on patient management affecting both the diagnostic and therapeutic approach. **Recommendation** regarding the use of PET/CT in the management of pediatric malignancy to facilitates the sparing of normal structures and the escalation of dose.

### Abstract

Antibiotics excessive and abusive use is associated with increased resistance and complications that have been well recognized worldwide in the literature.

**Objective:** The aim of this study was to assess knowledge, behavior and attitude toward antibiotics use among residents of 'Asir region.

**Method:** Our study was carried out among a sample of 409 residents in Asir region. To reach our goal and in order to collect the necessary informations, consenting residents responded to a questionnaire and the descriptive approach was employed in data and facts collection, classification and tabulation.

**Results:** The sample is consisted of 65,8% women and 34,2% men. The sample of individuals was distributed according to age, gender and educational level. Our study showed that (46.7%) of sample individuals are taking antibiotics without doctor's advice. Among the respondents, (38,4%) do not usually complete the course of antibiotics, however, (69,9%) of sample individuals do believe that the bacterial resistance to antibiotics appears in a case of an uncompleted antibiotic course. The majority of respondents (59.4 %) of sample individuals are often taking the antibiotics by doctor, yet, (10.5%) of sample individuals are taking the antibiotics often by themselves and (9.3 %) of sample individuals said that common cold drives them to buy and take antibiotics. The majority of sample individuals (35.5 %) believe that the period in which they define treatment failure in their opinion is ranging from one day to three days; also, (35.7%) of respondents do not know what are the risks and complications of antibiotics and (76.5 %) review their doctor in the case of treatment failure.

Copy Right, IJAR, 2016., All rights reserved.

Future interventional directions to improve knowledge about antibiotic use among residents of Asir are necessary. To achieve this, fundamental keystones for controlling antibiotics misuse and subsequent antibiotic resistance should be taken.

## Methodological procedures of the empirical study:-

### Introduction:-

The goal of the current research is to measure the extent of the awareness and knowledge of the community towards the use of antibiotics and its risks in 'Asir region; this chapter deals with the description of empirical research procedures carried out by the researcher to achieve the research objectives, including determining the research approach, the research community, research sample, and presentation of the study findings.

### Research Methodology:-

In order to achieve the objectives of the study; the researcher will use the descriptive analytical approach:" The descriptive approach is specified in data and facts collection, classification and tabulation. Besides, analyzing the results adequately and in-depth. It also includes some kind of explanation for these results. That is the reason behind using of measurement, classification, and interpretation methods. In order to extract significant exclusions then get generalizations about the phenomenon included in the study.

### Community and sample of research:-

The current community of research includes all the residents in Asir region, as the research sample included (409) individual of them.

#### Research tool:

Having reviewed the educational literature, and the previous studies concerning the research subject, the researcher built and developed a questionnaire to measure the extent of the awareness and knowledge of the community towards the use of antibiotics and its risks in the region of Asir, Saudi Arabia. In order to obtain the necessary information from the sample items to answer the research questions, the researcher relied on the questionnaire as an essential tool to collect the required data in support of the theoretical aspect of applied research to answer her questions and to achieve her goals.

The researcher has designed the questionnaire by searching the theoretical literature research and reviewing the previous studies, as well as access to some tools and measurements of other studies that are related to the current research subject. The questionnaire has included a series of questions that supports the subject of research through its direct relation to research objectives and its questions. The questionnaire has been prepared to achieve these goals. Also, it has been applied to the individuals in the research sample, and the results were as follows:

### Presentation and discussion of the results of the first question relating to age

The frequencies and percentages of the sample individuals were calculated according to age.

1. The distribution of sample individuals according to age:-

**Table 1:-** Sample individuals' distribution according to age

No.	Age	Frequency	Percent
1	Less than 20 years	7	1.7%
2	From 20 to less than 30 years old	125	30.6%
3	From 30 to less than 40 years old	118	28.9%
4	From 40 to less than 50 years old	116	28.4%
5	50 years and more	43	10.5%
Total		409	100.0%

As it is shown in (Table 1) that a percentage of (1.7%) of sample individuals are of age less than 20, while there are a percentage of (30.6%) of individuals aged between 20 to less than 30 years old, a percentage of (28.9%) of sample individuals aged between 30 and less than 40 years old, and the percentage of (28.4%) of individuals aged 40 and less than 50 years old. Also, a percentage of (10.5%) of sample individuals have aged more than 50 years and more. These results were attributed to the increase in the number of youth with ages between 20 years and less than 30 years in Asir region.

**Figure 1:-** Shows sample individuals' distribution according to age**Presentation and discussion of the results of the second question relating to sex**

The frequencies and percentages of the sample individuals were calculated according to sex.

2. The distribution of sample individuals according to sex:

**Table 2:-** Sample individuals' distribution according to sex

No.	Sex	Frequency	Percent
1	Male	140	34.2%
2	Female	269	65.8%
Total		409	100.0%

As it is shown in (Table 2) that there is a percent of (34.2%) from the sample individuals are of males, and a percentage of (65.8%) from the sample individuals are of females. These results were attributed to the increase in the number of females more than males in Asir region.

**Chart 2:-** shows Sample individuals' distribution according to sex**Presentation and discussion of the results of the third question regarding the educational level**

The frequencies and percentages of the sample individuals were calculated according to the educational level.

3. The distribution of sample individuals according to the educational level:

**Table 3:-** Sample individuals' distribution according to the educational level

No.	The educational Level	Frequency	Percent
1	Primary	8	2.0%
2	Average	9	2.2%
3	Secondary	70	17.1%
4	Academic	322	78.7%
	<b>Total</b>	409	100.0%

As it is shown in table No.3 that a percentage of (2.0%) of sample individuals hold a primary qualification, while there are a percentage of (2.2%) of individuals hold an average qualification, a percentage of (17.1%) of sample individuals has a secondary qualification, and the percentage of (78.7%) of individuals hold a university degree. These results were attributed to the people of Asir who care about the educational process and keen to pursue their academic career and keep acquiring the highest degrees of knowledge.

**Figure 3:-** Shows Sample individuals' distribution according to the educational level

#### **Presentation and discussion of the results of the fourth question "Are you taking Antibiotics without Doctor's advice?"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "Are you taking Antibiotics without Doctor's advice?" question.

4. The distribution of sample individuals according to the answer of "Are you taking Antibiotics without Doctor's advice?" question:

**Table 4:-** Sample individuals' distribution according to the answer of "Are you taking Antibiotics without Doctor's advice?" question

No.	Are you taking Antibiotics without Doctor's advice?	Frequency	Percent
1	No	218	53.3%
2	Yes	191	46.7%
	<b>Total</b>	409	100.0%

As it is shown in table No.4 that a percentage of (53.3%) of sample individuals do not take antibiotics without doctor's advice, while there is a percentage of (46.7%) of sample individuals are taking antibiotics without doctor's advice. These results were attributed to the interest of the majority of individuals included in the sample to follow doctor's instructions, considering doctor as the worthier person to trust regarding taking drugs generally and antibiotics in particular.

**Chart 4:-** Shows Sample individuals' distribution according to the answer of "Are you taking Antibiotics without Doctor's advice?" question

**Presentation and discussion of the results of the fifth question on "Whether the high temperature or so called fever is a strong indication to use antibiotics"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "Whether the high temperature or so called fever is a strong indication to use antibiotics" question.

5. The distribution of sample individuals according to the answer of "Whether the high temperature or so called fever is a strong indication to use antibiotics" question:

**Table 5:-** Sample individuals' distribution according to the answer of "Whether the high temperature or so called fever is a strong indication to use antibiotics" question.

No.	Whether the high temperature or so called fever is a strong indication to use antibiotics	Frequency	Percent
1	No	261	63.8%
2	Yes	148	36.2%
	Total	409	100.0%

As it is shown in table No.5 that a percentage of (63.8%) of sample individuals do not consider having a high temperature or fever is not a strong indication to use antibiotics, while there are a percentage of (36.2%) of sample individuals consider having a high temperature or fever as a strong indication to use antibiotics. These results were attributed to the sample individuals' knowledge about the causes of high temperature which are numerous, variable, and don't require having antibiotics as a treatment. It may have another specific treatment. Also, they believe they need to take doctor's advice before using antibiotics.

**Chart 5:-** shows Sample individuals' distribution according to the answer of "Whether the high temperature or so called fever is a strong indication to use antibiotics" question

**Presentation and discussion of the results of the sixth question on "Do you usually complete the course (the period specified for use by a physician) of antibiotics?"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "Do you usually complete the course (the period specified for use by a physician) of antibiotics?" question.

6. The distribution of sample individuals according to the answer of "Do you usually complete the course (the period specified for use by a physician) of antibiotics?" question:

**Table 6:-** Sample individuals' distribution according to the answer of "Do you usually complete the course (the period specified for use by a physician) of antibiotics?" question

No.	"Do you usually complete the course (the period specified for use by a physician) of antibiotics?"	Frequency	Percent
1	No	157	38.4%
2	Yes	252	61.6%
	Total	409	100.0%

As it is shown in table No.6 that a percentage of (38.4%) of sample individuals do not usually complete the course (the period specified for use by a physician) of antibiotics, while there are a percentage of (61.6%) of sample individuals usually complete the course (the period specified for use by a physician) of antibiotics. These results were attributed to the majority of sample individuals' conviction about the importance of doctor's opinion. As they work on the implementation of the doctor's directions properly in order to eliminate the disease.

**Chart 6:-** shows Sample individuals' distribution according to the answer of "Do you usually complete the course (the period specified for use by a physician) of antibiotics?" question

**Presentation and discussion of the results of the seventh question on "Do you heard before about the bacterial resistance to antibiotics?"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "Do you ever heard about the bacterial resistance to antibiotics?" question.

7. The distribution of sample individuals according to the answer of "Do you ever heard about the bacterial resistance to antibiotics?" question:

**Table 7:-** Sample individuals' distribution according to the answer of "Do you ever heard about the bacterial resistance to antibiotics?" question

No.	"Do you ever heard about the bacterial resistance to antibiotics"	Frequency	Percent
1	No	164	40.1%
2	Yes	245	59.9%
	Total	409	100.0%

As it is shown in table No.7 that a percentage of (40.1%) of sample individuals had not heard before about the bacterial resistance to antibiotics, while there is a percentage of (59.9%) of sample individuals had heard before about the bacterial resistance to antibiotics. These results were attributed to the increase in the medical counseling and awareness about the different types of bacteria socially or through the media which contributed to increase the sample individual's knowledge about the bacterial resistance to antibiotics.

**Chart 7:-** Shows sample individuals' distribution according to the answer of "Do you ever heard about the bacterial resistance to antibiotics?" question

**Presentation and discussion of the results of the eighth question "Do you think that the bacterial resistance to antibiotics develops in a case of an uncompleted antibiotics course?"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "Do you think that the bacterial resistance to antibiotics develops in a case of an uncompleted antibiotics course?" question.

8. The distribution of sample individuals according to the answer of "Do you think that the bacterial resistance to antibiotics develops in a case of an uncompleted antibiotics course?" question:

**Table 8:-** Sample individuals' distribution according to the answer of "Do you think that the bacterial resistance to antibiotics develops in a case of an uncompleted antibiotics course?" question

No.	Do you think that the bacterial resistance to antibiotics develops in a case of an uncompleted antibiotics course?	Frequency	Percent
1	No	123	30.1%
2	Yes	286	69.9%
	Total	409	100.0%

As it is shown in table No.8 that a percentage of (30.1%) of sample individuals do not think that the bacterial resistance to antibiotics appears in a case of an uncompleted course of antibiotics, while there are a percentage of (69.9%) of sample individuals do believe that the bacterial resistance to antibiotics appears in a case of an uncompleted antibiotic course. These results were attributed to the majority of sample individuals' conviction about the importance of completing the medical course appropriately according to doctor's instructions. Perhaps, the reason behind this is due to the increase in medical awareness among the sample individuals, which enabled them to believe in the importance of completion of a specific course of treatment.

**Chart 8:-** Shows Sample individuals' distribution according to the answer of "Do you think that the bacterial resistance to antibiotics develops in a case of an uncompleted antibiotics course?" question

**Presentation and discussion of the results of the ninth question about "Taking the antibiotic often by whom?"**  
The frequencies and percentages of the sample individuals were calculated according to the answer of "Taking the antibiotic is often by whom?" question.

9. The distribution of sample individuals according to the answer of "Taking the antibiotic is often by whom?" question:

**Table 9:-** Sample individuals' distribution according to the answer of "Taking the antibiotic is often by whom?" question

No.	"Taking the antibiotic is often by whom?"	Frequency	Percent
1	Doctor	243	59.4%
2	Pharmacist	110	26.9%
3	Someone who take it before	13	3.2%
4	By yourself	43	10.5%
	Total	409	100.0%

As it is shown in table No.9 that a percentage of (59.4 %) of sample individuals are often taking the antibiotics by doctor, while there are a percentage of (26.9%) of sample individuals are taking antibiotics often by the pharmacist, a percentage of (3.2%) of sample individuals are taking the antibiotics often by someone who has tried it before, and the percentage of (10.5%) of sample individuals are taking the antibiotics often by themselves. These results were attributed to the conviction and belief of sample individuals in doctor's role which can't be replaced by anyone, even if they were people of confidence but are non-specialist. This makes them adhere to doctors' opinion before buying a particular antibiotic.

**Figure 9:-** showssample individuals' distribution according to the answer of "Taking the antibiotic is often by whom?" question

**Presentation and discussion of the results of the tenth question about "What are the symptoms that drive you to buy and take antibiotics?"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "What are the symptoms that drive you to buy and take antibiotics?" question.

10. The distribution of sample individuals according to the answer of "What are the symptoms that drive you to buy and take antibiotics?" question:

**Table 10:-** Sample individuals' distribution according to the answer of "What are the symptoms that drive you to buy and take antibiotics?" question

No.	What are the symptoms that drive you to buy and take antibiotics?	Frequency	Percent
1	Common cold	38	9.3%
2	Sore throat	251	61.4%
3	High temperature	107	26.2%
4	Diarrhea	13	3.2%
	Total	409	100.0%

As it is shown in table No.10 that a percentage of (9.3 %) of sample individuals said that common cold drives them to buy and take antibiotics, while there are a percentage of (61.4%) of sample individuals said that sore throat drives them to buy and take antibiotics, a percentage of (26.2%) of sample individuals said that high temperature drives them to buy and take antibiotics, and the percentage of (3.2%) of sample individuals are derived to buy and take antibiotics by diarrhea. These results were attributed to the fact that most of sore throat symptoms are caused by multiple types of colds and doctors often prescribe antibiotics for such a case, which is as a kind of experience of sample individuals due to the frequent exposure to common cold and their feeling of sore throat.

**Figure 10:-** Shows Sample individuals' distribution according to the answer of "What are the symptoms that drive you to buy and take antibiotics?" question

**Presentation and discussion of the results of the eleventh question about "Your choice to buy antibiotic depends on what?"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "Your choice to buy antibiotic depends on what?" question.

11. The distribution of sample individuals according to the answer of "Your choice to buy antibiotic depends on what?" question:

**Table 11:-** Sample individuals' distribution according to the answer of "Your choice to buy antibiotic depends on what?" question

No.	"Your choice to buy antibiotic depends on what?"	Frequency	Percent
1	Price	5	1.2%
2	Doctor	254	62.1 %
3	Experience or advice of someone who already used antibiotic	50	12.2%
4	Pharmacist	100	24.4%
	Total	409	100.0%

As it is shown in table No.11 that a percentage of (1.2 %) of sample individuals said that their choice to buy a specific antibiotic depends on the price, while there are a percentage of (62.1%) of sample individuals who said that their choice to buy a specific antibiotic depends on the doctor , a percentage of (12.2%) of sample individuals said that their choice to buy a specific antibiotic depends on a particular experience or advice from someone else already used the antibiotic, and the percentage of (24.4%) of sample individuals take their choice to buy a specific antibiotic depending on the pharmacist. These results were attributed to the fact that most of sore throat symptoms are caused by multiple types of colds and doctors often prescribe antibiotics for such a case, which is as a kind of experience of sample individuals due to the frequent exposure to common cold and their feeling of sore throat.

**Figure 11:-** shows Sample individuals' distribution according to the answer of "Your choice to buy antibiotic depends on what?" question

**Presentation and discussion of the results of the twelfth question about "Do you see the doctor if your treatment has failed?"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "Do you see the doctor if your treatment has failed?" question.

12. The distribution of sample individuals according to the answer of "Do you see the doctor if your treatment has failed?" question:

**Table 12:-** Sample individuals' distribution according to the answer of "Do you see the doctor if your treatment has failed?" question

No.	Do you see the doctor if your treatment has failed?	Frequency	Percent
1	No	96	23.5%
2	Yes	313	76.5%
	Total	409	100.0%

As it is shown in table No.12 that a percentage of (23.5 %) of sample individuals do not review their doctor in the case of treatment failure, while there are a percentage of (76.5 %) of sample individuals who review their doctor in the case of treatment failure. These results were attributed to the conviction of sample individuals in doctor as the worthier person who able to change the type of medication or determining another course for the treatment, which contributed to increase their review to doctor in the case of treatment failure.

**Chart 12:-** Shows Sample individuals' distribution according to the answer of "Do you see the doctor if your treatment has failed?" question

**Presentation and discussion of the results of the thirteenth question about "What is the period that determines treatment failure in your opinion?"**

The frequencies and percentages of the sample individuals were calculated according to the answer of "What is the period that determines treatment failure in your opinion?" question.

13. The distribution of sample individuals according to the answer of "What is the period that determines treatment failure in your opinion?" question:

**Table 13:-** Sample individuals' distribution according to the answer of "What is the period that determines treatment failure in your opinion?" question

No.	What is the period that determines treatment failure in your opinion?	Frequency	Percent
1	From one day to three days	145	35.5%
2	From four to six days	122	29.8%
3	One week	142	34.7%
	Total	409	100.0%

As it is shown in table No.13 that a percentage of (35.5 %) of sample individuals believe that the period in which they define treatment failure in their opinion is ranging from one day to three days, while there are a percentage of (29.8%) of sample individuals believe that the period in which they define treatment failure in their opinion is ranging from four to six days, and a percentage of (34.7%) of sample individuals believe that the period in which they define treatment failure in their opinion is a week. These results indicate that there is a convergence of cognitive levels among sample individuals concerning the period to be adhered to while taking the antibiotic but it varies from one person to another, making their responses nearest to choose the period of one day to three days as they were convinced that their symptoms doesn't worth more than that as a treatment period.

Figure (13)

Discussions around the 14<sup>th</sup> Question: Do you know the risks and complications of antibiotics?

The frequency and percentage of the surveyed sample have been accounted for regarding the knowledge of the risks and complications of antibiotics.

Distribution of the sample regarding their knowledge of the risks and complications of antibiotics.

Table (14)

The Distribution of the sample regarding the risks and complications of antibiotics.

	Risk and Complications of Antibiotics	Repetition	Percentage
1	No	146	35.7%
2	Yes	263	64.3%
	Total	409 – 100%	

It is shown in Table No. (14) that the percentage (35.7%) of respondents do not know what are the risks and complications of antibiotics, while the proportion (64.3%) of respondents know what are the risks and complications of antibiotics, and that outcome is attributed to awareness campaigns among members the sample result, that were exposed to this type of illness or awareness efforts by the Ministry of Health in the region of Asir.

**Figure 14:-** It shows the distribution of respondents according knowledge of risks and complications of antibiotics

Discussions around the 15<sup>th</sup> question: Whether or not do you know that antibiotics may interfere with other medications.

The frequency and percentage of the surveyed sample have been accounted for regarding the knowledge of interference of antibiotics with other drugs.

Distribution of the sample regarding their knowledge of interference of antibiotics with other drugs.

**Table 15:-** Distribution of the sample

	Do You know that Antibiotics may interfere with other drugs	Frequency	Percentage
1	No	101	24.7%
2	Yes	308	75.3%
Total	409		100%

As seen from the table (15) that the percentage (24.7%) of respondents do not know that antibiotics may contradict with their use with certain medications, while the proportion (75.3%) of respondents knowing that antibiotics may contradict their use with certain medications, Furthermore, aware respondents believed that each disease specific treatment and that some types of antibiotics, may interact with any type of chemical treatment/drug taken by the patient in the course of treatment of another disease and this is mainly the physician's role in raising awareness of patients.

**Figure 15:-** It shows the distribution of respondents according to knowledge of risk on antibiotic interference with other medication.

## Summary and Recommendations:-

### Introduction:

After the researcher presented the results of the search field results in the previous section. through the presentation of the research sample responses to questions from the research and statistically processed using descriptive statistics concepts and statistical methods, This chapter deals with the results of field research summary, and ends with providing a number of recommendations.

### First: Summary of Results

Presenting the most important findings of the research according to the asked questions as follows:

- That the percentage (30.6%) of respondents between the ages of 20 to less than 30 years.
- That the percentage (65.8%) of the sample are female members
- That the percentage (78.7%) of respondents hold a university degree
- That the percentage (53.3%) of respondents do not take antibiotics without a doctor advice

- That the percentage (63.8%) of respondents do not consider the high temperature (Fever) a strong motivation for the use of the antibiotic.
- That the percentage (61.6%) of the respondents usually complete the antibiotic course (the period specified for use by a physician) .
- That the percentage (59.9%) of the respondents had heard of before by bacteria resistant to antibiotics.
- That the percentage (69.9%) of the respondents believe that the bacteria resistant to antibiotics appear in the case of non-completion of the antibiotic course.
- That the percentage (59.4%) of respondents are taking the antibiotic often prescribed by a doctor.
- That the percentage (61.4%) of individuals driven by throat infections to buy antibiotics.
- That the percentage (62.1%) of respondents said that their choice to buy a particular antibiotic depends on the doctor.
- That the percentage (76.5%) of the respondents are head back to the doctor in the case of treatment failure.
- That the percentage (35.5%) of respondents believe that the period in which they define treatment failure, ranges from one day to three days.
- That the percentage (64.3%) of respondents know what are the risks and complications of antibiotics.
- That the percentage (75.3%) of respondents know that antibiotics may interfere with some other medicines

**Recommendations:-**

The researchers recommendations regarding the study:

- 1) Sticking to the antibiotic doses and timetable to ensure maximum efficiency
- 2) The need for the use of the antibiotic in adherence to medical guidelines, in other words, complete a full term, even if the patient feels better
- 3) The need to ask the doctor, if an antibiotic is taken on an empty stomach or not and what types of food to ingested if so.
- 4) You should not be grinding or cracking some antibiotic pills, either because of lack stability or that the drugs have a slow release that prolongs the effect f the drug
- 5) Some antibiotics expiry date vary after solved or added to water, the expiration date is often a period of two weeks after the drug is added to water, the solution may require keeping the medicine in the refrigerator.

#### Abstract

**Objective:** To explore the patients' knowledge about psoriasis and the association of knowledge score with the socio-demographic variables among community population in Almadina Almonawara City.

**Method:** This study (2016) was carried out among a sample of 461 subjects. The mean age of citizens was 28,82. To assess citizens' demographic factors and beliefs about Psoriasis, consenting citizens completed an anonymous online questionnaire. The data was entered and analyzed using SPSS version 20.

**Results:** The sample is consisted of 65,8% women and 34,2% men. Among the respondents 7,7% reported suffering from psoriasis and 13,6% confirmed having a history of Psoriasis illness in their family. The results of the study showed that 153 (34,8%) subjects had weak knowledge related to the disease, 260 (59,1%) subjects had average level of knowledge while only 27 (6,1%) subjects had good knowledge regarding Psoriasis. There was a statistical significant association between gender, educational level and the level of awareness about Psoriasis.

**Conclusion:** Psoriasis is a chronic disease that is potentially controllable but that cannot be cured. Education still be important overall the treatment of the patients.

*Copy Right, IJAR, 2016., All rights reserved.*

#### Background:-

Psoriasis is a chronic, non-communicable, painful, disfiguring and disabling disease for which there is no cure and with great negative impact on patients quality of life. it can occur at any age, and is most common in the age group 50–69<sup>[1]</sup>. The reported prevalence of psoriasis in countries ranges between 0.09%<sup>[2]</sup> and 11.4%<sup>[3]</sup>, making psoriasis a serious global problem. The etiology of psoriasis remains unclear, although there is evidence for genetic predisposition<sup>[4]</sup>. The role of the immune system in psoriasis causation is also a major topic of research. Although there is a suggestion that psoriasis could be an autoimmune disease, no auto-antigen that could be responsible has been defined yet. Psoriasis can also be provoked by external and internal triggers, including mild trauma, sunburn, infections, systemic drugs and stress<sup>[5]</sup>. Psoriasis involves the skin and nails, and is associated with a number of co-morbidities. Skin lesions are localized or generalized, mostly symmetrical, sharply demarcated, red papules and plaques, and usually covered with white or silver scales. Lesions cause itching, stinging and pain. Between 1.3%<sup>[6]</sup> and 34.7%<sup>[7]</sup> of individuals with psoriasis develop chronic, inflammatory arthritis (psoriatic arthritis) that leads to

joint deformations and disability. Between 4.2% and 69% of all patients suffering from psoriasis develop nail changes <sup>(8-10)</sup>. Individuals with psoriasis are reported to be at increased risk of developing other serious clinical conditions such as cardiovascular and other noncommunicable diseases <sup>[11,12]</sup>. Disfiguration, disability and marked loss of productivity are common challenges for people with psoriasis. There is also a significant cost to mental well-being, such as higher rates of depression, leading to negative impact for individuals and society <sup>[13,14]</sup>.

### **Our Study Was Designed To Examine Health Beliefs And Assessment Level Of Knowledge Toward Psoriasis Among Community In Almadina Almonawara City And Applies The Health Belief Model To Determine Barriers.**

#### **Rationale:**

There are very few studies on the psoriasis. psoriasis a serious global problem, it can occur at any age. Psoriasis has been associated other serious clinical conditions such as cardiovascular and other non communicable diseases and several other cardiovascular and metabolic disturbances. Psoriasis is not only a disease that causes painful, debilitating, highly visible physical symptoms. It is also associated with a multitude of psychological impairments. For many reasons, psoriasis can be psychologically devastating. Patients' lives become especially difficult when psoriasis is present in highly visible areas of the skin such as the face and hands.

#### **Objectives:**

##### **General objectives:-**

To assessment level of awareness toward Psoriasis Among Community In Almadina Almonawara City and to identify barriers of health beliefs.

##### **Specific objective:-**

The goal of this study was to examine community health beliefs regarding Psoriasis and their perceptions related to it, and evaluate the role of demographic factors in shaping beliefs about Psoriasis and assess possible associations between demographic characteristics with the preventive behavior of interest.

#### **Method:-**

##### **Setting and data collection:-**

We perform this survey analysis among community in Almadina Almonawara city. A pre-formed self-administered questionnaire will be distributed to Parents.

##### **Sample:-**

Subjects will be chosen according to geographical and sex distribution. Sample size was calculated based on web-site calculator <sup>[15]</sup>, taking the total size of Almadina Almonawara population (1180770)<sup>[16]</sup>, confidence level (95%) and margin error (5%) to be 385. Additional 20 % was added to cover the missing data. Number of refusals was 6. The total sample obtained was 461.

##### **Study population:-**

Subjects from Almadina Almonawara of both gender and who belonged to the age group of 8 to 71 years were included in the study.

#### **Study tool:**

Pre-formed Self-administered questionnaire that requires information about:

1. Socio-demographic data: age, nationality, gender, education level, income, marital status, and employment status.
2. Risk Factors Associated with psoriasis – clinical manifestation of prognosis - incidence and prognosis of psoriasis.
3. Beliefs about Psoriasis assessment including 8 questions. A score of 1 was given right answer and 0 otherwise. For each subject, a maximum score of 8 was calculated. A scoring system was applied to measure the respondents' beliefs about psoriasis. The awareness level was categorized into 3 levels indicated by weak (0–2), average (3-5) and good (6-8).
4. Knowledge about prevention behavior assessment including one question “Do you believe that psychological pressure is one of the psoriasis factors?”. A score of 1 was given to yes and 0 otherwise. For each subject, a maximum score of 1 was calculated. The knowledge level score was categorized into 2 levels indicated by poor knowledge (0) and good knowledge (1).

**Study limitations:-**

The following limitations are expected:

- Cooperation of sample
- Recall bias

**Ethical considerations:-**

All participants will give their informed consent before filling the questionnaire.

**Statistical analysis:-**

Data were entered into the Statistical Package for Social Sciences (SPSS, version 20) and descriptive analysis conducted.

Association of respondents' characteristics with beliefs about Psoriasis and knowledge about prevention behavior of interest was evaluated using:

1. Frequencies and percentages.
2. Chi-squared test.
3. Independent Samples Test (T-test).
4. ANOVA oneway test.

Statistical significance was accepted at  $p < 0.05$ .

**Results:-****I-Examine community health beliefs regarding Psoriasis and their perceptions related to it:-****1-Demographics of the studied subjects:-**

The socio-demographic characteristics are shown in table (1)

**Table 1:-** socio-demographic characteristics.

	Frequency	Percentage (%)
<b>Age (Years)</b>		
<b>Mean age: 28,82</b>		
<b>Gender</b>		
<b>Female</b>	<b>298</b>	<b>65,8</b>
<b>Male</b>	<b>155</b>	<b>34,2</b>

<b>Employment status</b>		
<b>Unemployed</b>	<b>277</b>	<b>61,7</b>
<b>Employed</b>	<b>172</b>	<b>38,3</b>

By looking at table (1), related to the distribution of respondents according to demographic factors:

- The mean age of population was: 28,82 years.
- With respect to gender, a majority of the subjects (298)( 65,8%) were Female.

- 395 (87,6%) subjects had Saudi nationality.
- We see that (278) of the respondents have a university degree with a percentage of 62,1%.
- We see that (219) of the respondents are married with percentage of 48,5%.
- We see that (183) of the respondents have an income (<3000 RS) with percentage of 42,5%.
- We see that (277) of the respondents are unemployed with percentage of 61,7%.

#### Knowledge regarding the diagnosis of Psoriasis:-

**Table 2:-** Do you suffer from psoriasis?

Do you suffer from psoriasis?		Frequency	Percent (%)
	No	360	79,3
	I dont know	59	13,0
	Yes	35	7,7
	Total	454	100,0

Out of 454 subjects, 360 (79,3%) subjects reported not being affected with Psoriasis, 13% did not know if they are affected or not and 35 (7,7%) respondents reported that they suffer from Psoriasis, as it is shown in the figure below:

**Figure 1:-** Do you suffer from psoriasis?

#### Community health beliefs regarding Psoriasis and their perceptions related to it

**Table 3:-** Responses to questions on beliefs regarding Psoriasis (Green: correct answer)

	No	Yes	Don't Know
<b>Do you suffer from psoriasis?</b>	<b>360 (79,3%)</b>	<b>35 (7,7%)</b>	<b>59 (13,0%)</b>
<b>Q1: Is there a history of Psoriasis illness in your family?</b>	<b>291 (64,0%)</b>	<b>62 (13,6%)</b>	<b>102 (22,4%)</b>
<b>Q2: you have or ever had any of the skin diseases?</b>	<b>246 (54,1%)</b>	<b>183 (40,2%)</b>	<b>26 (5,7%)</b>
<b>Q3: Do you think that psoriasis could be prevented?</b>	<b>59 (13,0%)</b>	<b>228 (50,2%)</b>	<b>167 (36,8%)</b>
<b>Q4: Do you think that heredity play a role in having psoriasis?</b>	<b>55 (12,1%)</b>	<b>273 (60,0%)</b>	<b>127 (27,9%)</b>
<b>Q5: Do you think that psychological pressure is one of the psoriasis factors?</b>	<b>75 (16,5%)</b>	<b>217 (47,7%)</b>	<b>163 (35,8%)</b>
<b>Q6: Do you think that psoriasis increases the risk of heart disease?</b>	<b>123 (27,1%)</b>	<b>65 (14,3%)</b>	<b>266 (58,6%)</b>
<b>Q7: Psoriasis may affect humans at any age category?</b>	<b>32 (7,0%)</b>	<b>250 (55,1%)</b>	<b>172 (37,9%)</b>
<b>Q8: If you have psoriasis, do you feel socially ashamed by being affected?</b>	<b>161 (36,3%)</b>	<b>101 (22,8%)</b>	<b>181 (40,9%)</b>
<b>Q9: Do you think that psoriasis can be cured?</b>	<b>47 (10,4%)</b>	<b>327 (72,0%)</b>	<b>80 (17,6%)</b>
<b>Q10: Do you think that psoriasis is contagious?</b>	<b>227 (49,9%)</b>	<b>88 (19,3%)</b>	<b>140 (30,8%)</b>

- Most of the respondents 228 (50,2%) answered that psoriasis could be prevented.
- 273 (60%) of the patients were aware that psoriasis was a genetically determined disease and 217 (47,7%) thought that psychological pressure is one of psoriasis factors.
- Only 65 (14,3%) subjects knew that psoriasis increases the risk of heart disease.
- Most of the subjects 250 (55,1%) knew that psoriasis may begin at any age.
- The majority of respondents 181 (40,9%) did not know if they will be ashamed or not, if they have psoriasis.
- The majority of respondents 327 (72%) think that psoriasis can be cured and only 10,4% of the subjects knew the fact that the disease is not curable.
- The results of the study suggested that 227 (49,9%) subjects were aware of the fact that psoriasis is not contagious.

**Figure 2:- Responses to questions With "Yes"**

## II-Evaluation of the role of demographic factors in shaping beliefs about Psoriasis

### Level of awareness

**Table 4:-** Respondents' awareness evaluation for Psoriasis

Level of awareness	Frequency	Percent (%)
0-2 : Weak	153	34,8
3-5 : Average	260	59,1
6-8 : Good	27	6,1
Total	440	100,0

Table 4 shows that overall level of awareness on psoriasis among the study participants showed that out of 440 subjects, 153 (34,8%) subjects had weak knowledge about the disease, 260 (59,1%) subjects had average level of knowledge whereas only 27 (6,1%) subjects had a good knowledge regarding Psoriasis (Figure 3).

Figure 3:- Level of awareness

## Association of the subjects' knowledge with socio-demographic variables

## 1-Age

N of Valid Cases	435		
a. 0 cells (0,0%) have expected count less than 5. The minimum expected count is 10,24.			

There is a statistical significant association between gender, educational level and the level of awareness about Psoriasis, respectively ( $p=0,01 < 0,05$ ) and ( $p=0,027 < 0,05$ ).

**Assessment of possible associations between demographic characteristics with the preventive behavior of interest:-**

Psychological pressure is one of the psoriasis factors, which is reported in the fifth question; that is why it is important to avoid stress as prevention of the disease.

**Table 5:-** Do you think that psychological pressure is one of the psoriasis factors?

Level of knowledge	Frequency	Percent (%)
Poor knowledge	238	52,3
Good knowledge	217	47,7
Total	455	100,0

238 (52,3%) of the respondents have a poor knowledge about psychological pressure as a factor of psoriasis while 47,7% of the subjects have a good knowledge.

**Age:-**

Group Statistics

b. Computed only for a 2x2 table					

There is a statistical significant association between age, gender, nationality, marital status and the level of knowledge about stress as factor of Psoriasis, respectively ( $p=0,17 < 0,05$ ), ( $p=0,42 < 0,05$ ), ( $p=0,19 < 0,05$ ) and ( $p=0,41 < 0,05$ ).

**Discussion:-**

Tham SN, Tay YK (17) and other studies (18) have reported in their work that many patients have a gap of knowledge about their disease and treatment aspects (17).

This study identified that:

- The majority of respondents have an average level of awareness toward Psoriasis.
- The majority of the studied subjects have a good knowledge about the fact that psychological stress is one of the factors of the pathology of Psoriasis.

Leovigildo et al. indicated that was an exacerbating factor of Psoriasis (19).

Our study showed that about half of respondents were not sure or were affirmative that psoriasis is contagious, respectively 30,8% and 19,3%.

Dika et al. have reported that physicians and dermatologists should be aware that their patients may have an inadequate understanding of their pathology (20).

**Recommendations:-**

- Therapeutic management is not limited to its molecular aspect by using drugs.
- Improving the health of a patient goes through many other aspects as essential as drugs: education, prevention, hygiene, listening, social solidarity... This change in vision has made it possible:
- To become aware of all the consequences of illness on the quality of life of the patient
- To identify the handicap and the resulting social exclusion
- To consider that psychological suffering is as important to take in charge as physical suffering, Indeed, the purpose of treatments is not only to eliminate the symptoms but, more generally, to improve the quality of life and, in the context of skin diseases, to return to the patient all his freedom in his relations with himself and with others (21).
- According to Jankowiak et al (22):
- Patients with psoriasis need to improve their knowledge of the disease and self-care methods to avoid exacerbation of disease.
- The disease requires systematic treatment and appropriate care.
- Health education is a main part of the management of psoriasis.

**Conclusion:-**

Our study showed that most of studied subjects had an inadequate level of knowledge about psoriasis. Efforts should be instaurated to improve the knowledge of people about psoriasis in order to ensure better well being and a better care of patients.

##### Key words:-

Pile Load Test, Soil Stratification

#### Abstract

High degree of uncertainty is associated with the geotechnical investigations as it is impossible to conduct the pile load test on each and every pile due to their expensiveness and tedious nature. As per the guidelines given by the IS 2911 (part1-section 2)-2014 considers only the granular or clayey (C or  $\Phi$  soils) throughout the depth of the pile. This is not actually possible in the actual field. So it is necessary to build the software which can calculate the pile load capacity for foundation soil having different soil strata, existing throughout the entire depth of pile. This software will eliminate excessive cost of investigations. **We have derived a new formula based on the existing formula given in the IS code 2911 and this formula is used for computation of result in the software.**

#### Introduction:-

Geotechnical engineering is sub-branch of civil engineering discipline that deals with the engineering behaviour of earthen materials. Geotechnical engineering also has uses and application in mining, military, petroleum and different engineering discipline. It uses the basic principles soil mechanics to investigate surface and subsurface conditions and materials. It also deals with stability of slopes, soil deposits earthwork design and foundation design. One of major geological problem of the earth's subsurface topography lies in the fact that the soil below the ground does not have uniform soil stratification. For a given smallest area of land one cannot say that the soil type and properties of the soil in this small area are uniform. These soil properties may change laterally (horizontally) as well as vertically (in depth). Soil stratification may change in type of soil, properties of soil, shear strength parameters, soil structure, permeability and porosity etc. It is therefore necessary to determine accurate soil stratification by use of modern paraphernalia which gives accurate results. The soil beneath plays a major role in the design of foundation and also the design of subsequent structure.

Accurate soil tests, results in increased life of structures, eliminating need of maintenance, if any. Geotechnical investigation only cost 1-2% of the total cost of the project but proves to be crucial.

Soil stratification is helpful in knowing the Pile Load Capacity (PLC) in case of variable soil stratification. PLC is the maximum amount of load a pile foundation can carry before failure.

In this project attempts have been made to accurately examine PLC in case of variable soil stratification with the use of the software/excel sheet.

**Literature review:-**

✚ Narayan V Nayak mentions in his book “Foundation Design manual” page number 1.81

“In a very stiff to hard clayey soils, particularly with N values of standard penetration test greater than 30, reliability of laboratory tests conducted on so called undisturbed samples is very low. In such cases dependence shall be on penetration test and/or pressuremeter tests.”

This software does not require N value or SPT value as inputs. In such a case we will not input “N” value and it will be evident from the software that the software will not show the same “N” value as derived from the test.

As the “N” value is not required as main input for the software, no computation of the software data will be based on the requirement of the “N” value and the results will be accurate.

✚ Further adding to the above contents Gopal Ranjan in his book “Basic and Applied Soil Mechanics” page number 589 wrote,

“Correlation of N value and soil parameters is available mainly for cohesionless soils. The use of N values for cohesive soils is limited, since the compressibility such soil is not reflected by N value”

Also P V Varghese mentioned that

“Even though are not considered as good measure of the strength of clays, it is used extensively as a measure of the consistency of clays. The consistency is then related to its approximate strength,” in his book Foundation Engineering page 16.

**Interpretation of pile load test result:-**

The interpretation of results PLT plays a crucial role in deciding the failure capacity of the given pile. Also the interpretation of the PLT load test results in finding out the maximum possible load a pile can take.

This computation is very complex problem requiring very careful consideration of factors like soil profile, pile installation method, sensitivity of the structure, possibility of negative drag etc.

Fellenius in the year 1975 described eight methods of pile failure and also with examples of full scale field test showed that the interpreted smallest and largest value differed by atleast 40%.

Chin Fung Kee in the year 1977 suggested a plot of settlement per unit load as abscissa against settlement as ordinate to determine the ultimate capacity of a test pile, assuming the load- settlement relationship is hyperbolic.

Some of the well-known fundamentals of the failure load are given below:-

Fig 2.1 LOAD V/S SETTLEMENT GRAPH

1.) De Beer in the year 1968 plotted the load settlement values in a log-log scale, where the values can be shown to fall on two straight lines. The intersection of the lines corresponds to the failure value of that pile. In this the interpreted analysed values is conservative and the corresponding pile settlement is also small.

Fig 2.2 LOAD V/S SETTLEMENT GRAPH

2.) Mazirkiewicz in the year 1972 proposed a method that allows the failure load to be extended even if the maximum load is smaller than the failure load.

The figure shows equal settlement lines are drawn corresponding to the load. From the junction of each load line with the load axis a  $45^\circ$  line is drawn to intersect the next load line which intersects the next load line. It is based on the assumption that load-settlement curve is parabolic.

Fig 2.3 LOAD V/S SETTLEMENT GRAPH

3.)Chin Fung Kee in the year 1977 suggest a graph of the settlement is divided by load versus settlement. The graph consist of 2 straight lines. During the initial loads, the ratio of settlement to load is almost constant and as pile approaches failure, the graph shows the straight line with steeper slope. The inverse of the slope for the second straight line indicates failure corresponding to the load value of the curve.

### Problem deifinition:-

#### 1.1 Problem Justification:-

For construction of any type of building it is necessary to determine various soil parameters. These parameters includes shear strength parameters, soil stratification, SBC etc. To determine the SBC of soil it is necessary to carry out Pile Load Test (PLT). Pile load capacity test is very expensive and cannot be performed at a very large number of stations and one pile load test can take about a month to get results. As it cannot be performed at many places accurate results cannot be obtained. By the use of the software of the software we made we can accurately or near to accurate results can be obtained.

The software is open source and is user friendly which a normal person can use. It doesn't require any specialised training for operation. Any soil stratification can be computed with the use of this software on the basis of the different soils.

There are approximate 5% piles that are tested for the design of the foundation. That means there are 2-5 piles which are tested and approximately 95% are remained untested. This give high percentage of uncertainty in the design. So it is therefore necessary to test all the piles at failure to get accurate design parameters.

If you look at any international codes as well Indian standard code, engineering designs are not 100% correct because of the assumptions made in the results. So use of software decreases this uncertainty and gives the best design conditions.

### Aim of the project:-

The aim of the study is to develop a software that can directly compute the pile load capacity upon the input of the certain parameters.

### Objectives of the project:-

- ✚ To find pile load capacity in terms of variable soil stratification.
- ✚ To eliminate the need of performing too many pile load test on the sub surface.
- ✚ To further reduce the cost of geotechnical investigation.
- ✚ To provide free, user friendly and completely robust software to geotechnical engineers for the betterment of the infrastructure.

**About software:-**

Actually in the field, hardly pure cohesive soil or purely granular soil is available. Hence in this software an approach is made to derive the pile capacity for C- $\Phi$  soil. Many professional softwares are available to derive pile capacity for C- $\Phi$  soil. (like GEO 5, All-pile, L-pile etc)

But the professional software are having many limitations like

- 1) They are not user friendly
- 2) They are very costly (in terms of lacs of rupees)
- 3) They do not automatically accept changes of revised codal provisions.
- 4) They do not provide detail calculation as per our requirement

**About our software:-**

The software is totally

- 1) User friendly and
- 2) Maintenance free

**Design for use, reuse and sustainability:-**

(I) Design for use:-

The software designed is ready to use if required data are available like

- 1) Diameter of pile
- 2) Length of pile
- 3) Shear parameters of soil (cohesion and angle of internal friction)
- 4) Unit weight of soil etc.

These data can be obtained from the traditional soil tests.

(II) Design for reuse

The software can be reused for n number of times, for different diameter, different length and different soil parameters.

(III) Design for sustainability

The software is sustainable for n number of years provided that necessary updates are incorporated time to time.

(IV) Prototyping

It is not applicable for software. But a prototype modeling of a pile load test can be prepared to check the pile load capacity calculated from software.

(V) Test the prototype

The prototype is made showing following components

- 1) Soil strata
- 2) Pile
- 3) Loading arrangement

(VI) Measuring instruments

Visual observation can be made that - as the load on pile increases, the settlement of pile also increases.

(VII) Comparison of existing methods

In IS 2911, method for calculation of pile capacity is given for pure granular soil and pure cohesive soil only. But in actual field conditions, the soil is hardly pure granular or pure cohesive in nature. Hence this software is prepared in excel to determine the capacity of pile for actual field conditions having mix nature of soil (granular+cohesive)

Few readymade softwares are available to calculate pile capacity for mix soil conditions, but they are very costly and not user friendly. This software is user friendly, transparent and updatable.

**Derivation of the formula:-**

To derive the capacity of pile, Guidelines are given in IS 2911 (Part 1 section 2) -2014 . In this code equations are given to determine ultimate capacity of pile in soil in Clause B-1 and Clause B-2

The equations are given for

- 1) Piles in Granular soils ( $\Phi$  soil) and
- 2) Piles in Cohesive soils (C soil)

**Limitations of the IS code:-**

1 IS code 2911 assumes that same type of soil i.e pure cohesive or pure granular soil is found through-out the depth of excavation. But in real practice this case does not come into practicality.

2 IS code 2911 does not consider the change in soil stratification.

The formulas given in the IS code are:-

## B-1 PILES IN GRANULAR SOILS

The ultimate load capacity ( $Q_u$ ) of piles, in kN, in granular soils is given by the following formula:

$$Q_u = A_p (\frac{1}{2} D \gamma N_\gamma + P_D N_q) + \sum_{i=1}^n K_i P_{Di} \tan \delta_i A_{si} \dots (1)$$

The first term gives end-bearing resistance and the second term gives skin friction resistance.

where

$A_p$  = cross-sectional area of pile tip, in  $m^2$ ;

$D$  = diameter of pile shaft, in m;

$\gamma$  = effective unit weight of the soil at pile tip, in  $kN/m^3$ ;

$N_\gamma$  = bearing capacity factors depending upon  
and  $N_q$  the angle of internal friction,  $\phi$  at pile tip;

$P_D$  = effective overburden pressure at pile tip, in  $kN/m^2$  (see Note 5);

$\sum_{i=1}^n$  = summation for layers 1 to  $n$  in which pile is installed and which contribute to positive skin friction;

$K_i$  = coefficient of earth pressure applicable for the  $i$ th layer (see Note 3);

## B-2 PILES IN COHESIVE SOILS

The ultimate load capacity ( $Q_u$ ) of piles, in kN, in cohesive soils is given by the following formula:

$$Q_u = A_p N_c c_p + \sum_{i=1}^n \alpha_i c_i A_{si} \quad \dots(2)$$

The first term gives the end-bearing resistance and the second term gives the skin friction resistance.

where

- $A_p$  = cross-sectional area of pile tip, in  $m^2$ ;
- $N_c$  = bearing capacity factor, may be taken as 9;
- $c_p$  = average cohesion at pile tip, in  $kN/m^2$ ;
- $\sum_{i=1}^n$  = summation for layers 1 to  $n$  in which the pile is installed and which contribute to positive skin friction;
- $\alpha_i$  = adhesion factor for the  $i$ th layer depending on the consistency of soil, (see Note);
- $c_i$  = average cohesion for the  $i$ th layer, in  $kN/m^2$ ; and
- $A_{si}$  = surface area of pile shaft in the  $i$ th layer, in  $m^2$ .

The formulas that are given in the IS code are manipulated to get the formula that is used in the software. The friction components of both the formulas are merged and end bearing components of both the formula are combined. This gives rise to the new formula.

The total friction component of the pile is given by **new formula**.

<p><b>Ultimate frictional capacity (<math>Q_u</math>)<sub>f</sub> = <math>[\sum K \times P d_i \times \tan \delta \times A_s] + [a \times C \times A_s]</math></b>  <b>[Granular soil + Cohesive soil]</b></p>
--

The total end bearing component of the pile is given by new formula.

$\text{Ultimate end bearing capacity (Qu)}_b = [A_p(1/2 D \times g \times N_g + P_d \times N_q)] + [A_p \times N_c \times C_p]$ <p>[Granular soil + Cohesive soil]</p>
--

### Analysis and result:-

#### General:-

To analyze the data we will first conduct the PLT on the actual site to obtain the soil sample. This soil sample will be taken to laboratory for further testing of the of the soil sample. Shear strength parameters (cohesion and angle of internal friction) of the soil sample are found out.

#### Testing of soil:-

Having collected the soil sample, the specimen is taken to the laboratory for further testing of the soil sample. Soil sample is tested for the shear strength parameters. We have collected the data from 5 different sites, whose shear strength parameters are as follows:-

### PILE LOAD TEST DATA:-

First of all pile load test equipment is set up at the actual field, having attached 3-4 deformation dial gauges. Suitable load increments are given at a definite interval of the time. Also the settlement due to loads is also recorded. From this set of readings a graph of load v/s settlement is plotted.

Here pile load test data from actual site is given and is compared with our software.

## COMPARISION OF RESULTS

We have collect the five numbers of pile load test data, which is sufficient to verify the accuracy of the software. By comparison of the actual field pile load test results are precisely same to the software results. Following table shows the comparison of the calculated results of the pile load test by the manually and by the software.

Sr no.	Field pile capacity(MT)	Calculated capacity in software(MT)
1	56.5	56.4
2	62.2	64
3	82.2	80
4	94.6	92
5	197	192

### Conclusions and future scope:-

On the basis of software we develop we conclude that pile capacity of soil calculated by software is precisely same as from pile load test. However necessary updates/modifications in the software should be incorporated time to time with any amendment in the IS code, new concepts and other modifications in the literature based on experimental results.

The software we are making can be used “n” number of times according to the changes in the IS codal provisions and any literature changes can be incorporated.

The software can be used for finding out the pile load capacity in case of different soil stratification and variable length of piles.

### FORMULA

The given formula is derived from the IS CODE 2911.

#### a) Frictional capacity of pile:

$$(Q_u)_f = [\Sigma K \times P_{di} \times \tan \delta \times A_s] + [a \times C \times A_s]$$

[Granular soil + Cohesive soil]

#### b) End bearing capacity of pile:

$$(Q_u)_b = [A_p(1/2 D \times g \times N_g + P_d \times N_q)] + [A_p \times N_c \times C_p]$$

[Granular soil + Cohesive soil]

#### Abstract

**Background:** Although adherence to prescribed medications is a key dimension of healthcare quality, there is no information about the magnitude of compliance of the diabetic patients in Jazan region of Saudi Arabia. **Objectives:** The purpose of this study is to measure the rate of adherence and the factors contributing to compliance among the diabetic patients in Jazan region. **Methods:** A total of 273 Type 2 diabetic patients who fulfill the inclusion criteria were recruited in the study. Adherence to the treatment was evaluated during patients' attending to the usual appointment in the randomly selected Primary Health Care centers and Diabetic Centers in Jazan region. The medication adherence was assessed during a personal interview using the 8-item Morisky Medication Adherence Scale (MMAS-8). **Results:** Twenty Three Percent of patients reported good medication adherence, 38.8 % medium adherence and 37.6 % poor medication adherence. The factors significantly associated with adherence in univariate analysis were socio-demographic factors: residence (  $p = 0.02$  ) and distance from the health care center (  $p = 0.023$  ); disease and health care related factors: Regularly attending to the appointments ( $p = 0.038$ ) and HbA1c  $> 8$  (  $p = 0.06$  ). **Conclusion:** The findings indicate that there is a high rate of non-compliance among the diabetes patients in Jazan region of Saudi Arabia and there is a definite need for improvement in the healthcare system, health education, and training of diabetic patients.

#### Introduction:-

Diabetes mellitus (DM) is a group of metabolic diseases characterized by hyperglycemia resulting from defects of insulin secretion and/or increased cellular resistance to insulin. Chronic hyperglycemia and other metabolic disturbances of DM lead to long-term tissue and organ damage as well as dysfunction involving the eyes, kidneys, and nervous and vascular systems. [1]

Diabetes is a serious condition with potentially devastating complications that affects all age groups worldwide. In 1985, an estimated 30 million people around the world were diagnose with diabetes; in 2000, that figure rose to over 150 million, and it is projected to rise further to 380 million by 2025. The International Diabetes Federation states

**Corresponding Author:- Jaber Sharahili.**

Address:-Faculty of Medicine, Jazan University.

that “everyten seconds, two people are diagnosed with diabetes somewhere in this world,” and given the current trend, more people will have diabetes in 2025 than the current populations of the United States, Canada and Australia combined. [2]

In the Eastern Mediterranean Region, there has been a rapid increase in the incidence of DM, consisting mainly of Type 2 (T2DM). Much of this increase occurs in developing countries and results from population ageing, unhealthy diet, obesity and a sedentary lifestyle. It is now the fourth leading cause of death in this region. [3]

A key dimension of healthcare quality is adherence to prescribed medications. According to the World Health Organization (WHO), adherence is the extent to which a person’s behavior – taking medication, following a diet, and/or executing lifestyle changes – corresponds with agreed recommendations from the health care provider. However, medication non-adherence is particularly common among patients with type 2 diabetes and inadequate adherence compromises safety and treatment effectiveness, leading to increased mortality and morbidity with considerable direct and indirect costs to the healthcare system. A recent WHO report states that, because the magnitude of non-adherence and the scope of its sequelae are so alarming, more health benefits worldwide would result from improving adherence to existing treatments than by developing new medical treatments [4]

Clinical experience confirms, however, that despite the availability of increasingly modern and effective methods of treatment at least half of the patients fail to achieve satisfactory therapy goals and that non-compliance is believed to be the most common cause of treatment failures. After several decades of research, it was concluded that medication non-adherence is due to many factors including lack of adequate knowledge about medication and treatment goals, beliefs about the medication, complex regimens that are difficult to manage, side effects, and costs associated with medications [5][6].

There are several types of non-adherence. Therapeutic or medication non-adherence which includes failure to have the prescription dispensed or renewed, omission of doses, errors of dosage, incorrect administration, errors in the time and frequency of administration, and premature discontinuation of the drug regimen. A second type of non-adherence is dietary/exercise non-adherence in which the patient fails to follow the diet and exercise recommendations. A third type is the appointment non-adherence in which the patient fails to show up at the clinics for the scheduled check up. The consequences of medication non-adherence may not only be dangerous for patient’s health, but also dramatically increase the financial costs of public health services [7][8]

There are several methods are used to measure therapeutic adherence. Indirect methods, like self reports and interviews with patient, are the simplest and most common methods for measuring medication adherence (Girerd et al) . Pill counts method is also used to assess compliance in medical drug trials, by measuring the difference between the number of doses initially dispensed and the number remaining in the container. The achievement of treatment goals might also be used to assess compliance, especially when the drug therapy is associated with a successful outcome like normal blood pressure, or blood glucose levels. Computerized compliance monitors are the most recent and reliable methods, like the Medication Event Monitoring System (MEMS). The system consists of microprocessor placed in the cap of the medication container, every time the patient removes the cap, the time and date are recorded. Direct methods like measuring drug concentration or biological markers in the patients’ biological fluids, could also be used to assess compliance. Of the various methods used to assess compliance, none is without disadvantages [9]

Few studies about patient adherence to OHAs in Arab Countries have been published. Most of these studies were carried out in Saudi Arabia. One study was performed at Al-Manhal primary health care center, aimed at identifying determinants of compliance among diabetic patients attending that clinic (Khattab et al., 1999). Other study has been conducted in Al Hasa region aiming to estimate the magnitude of the problem of non-compliance and explore the factors contributing to non-compliance of the diabetic patients [10]. A recent study was performed to gather data on current practices in the management of patients with T2DM in Saudi Arabia and to evaluate the degree of compliance with international guidelines (AIElq,2009 <http://www.ncbi.nlm.nih.gov/pubmed/19936419#> ).

To the best of our knowledge, there is little or no information on the magnitude of compliance of the diabetic patients in the Jazan region of Saudi Arabia. For this purpose we conducted this research study whose aim to investigate the variability in the rate of medication adherence among Type 2 diabetic patients. This may lead to a clear understanding about poor glycemic control among these patients as well as for a strict

and successful management of this chronic illness in the future.

#### **Study Objective:-**

To measure the rate of compliance and the factors contributing to compliance among the diabetic patients in Jazan region, Saudi Arabia.

#### **Specific Objectives:**

- 1- To measure the rate of compliance among the diabetic patients.
- 2- To determine the role of demographic and clinical features to patients Compliance.
- 3- To Identify the diseases and health-care characteristics that is contributing to Patients compliance.

#### **Patients and Methods:-**

This was a cross-sectional survey. Patients with diabetes were interviewed during their attending to the usual appointment in the PHCs and diabetes centers.

**Inclusion criteria** were registered diabetic patients who were attending the selected clinics and were getting medication on a regular basis. Subjects with age more than 18 years and at least a one-year history of diabetes, and who were on a fixed drug therapy for the last six months, were selected for this study [11].

**Sampling:-** Since the population proportion is not known so it considered as 50 % with 95% confidence intervals which is not more than  $\pm 5\%$  of true population proportion. The required sample size was 267 with 6% error. Two stages Cluster random sampling based on provinces and districts adopted to select the PHCs and Diabetic centers.

#### **Data Collection:-**

Patients who attended their regular appointments were interviewed using a structured questionnaire addressing the following aspects:

- (i) socio-demographic characteristics.
- (ii) health-care related factors,
- (iii) Disease and drugs related factors.
- (iv) assessment of patient adherence to medication using the 8-item Morisky Medication Adherence Scale (MMAS-8), translated into Arabic.

**The MMAS-8** contains eight questions with closed dichotomous (yes / no ) answers, designed to prevent the bias of positive response from patients questions asked by health professionals, by reversing the responses related to the interviewee's adherence behavior. Thus, each item measured a specific adherence behavior, with all questions must be answered negatively.

The degree of adherence was determined according to the score resulting from the sum of all the correct answers:

- High adherence (8 points)
- Average adherence (6 to < 8 points)
- Non-adherence (< 6 points)

In this study, patients was considered adherent when they had a score equal to eight in the MMAS-8 [12]

#### **Data Analysis:-**

The data obtained from the questionnaire were analyzed using **SPSS** for Windows, Version 17. Techniques involved **descriptive statistics** like frequency and percentage, and **inferential** statistics like Chi square test and logistic regression were used to analyze the significant associations between adherence rate and the and some selected factors. P-value < **0.05** was determined as significance.

**Results :**

Patients who satisfied the inclusion criteria were 237, 88.8% of the required sample. The **social-demographic** characteristics chosen in this study of the selected group of patients and their data, see Table 1.

**Table 1: Socio-demographic characteristics of 237**

Demographic Characteristic		Number	%
Gender	Male	156	65.8
	Female	81	34.2
Age	18-40	45	19.1
	41-60	110	46.6
	>60	81	34.3
Residence	City	99	41.8
	Village	138	58.2
Education	Uneducated	93	39.2
	Elementary	44	18.6
	Intermediate	23	9.7
	Secondary	18	7.6
	Higher Education	59	24.9
Marital Status	Single	12	5.1
	Married	202	85.2
	Divorced	5	2.1
	Widowed	18	7.6
Occupation	Student	5	2.1
	Employee	79	33.3
	Freelancer	13	5.5
	Retired	59	24.9
	Unemployed	81	34.2
Family income	Low	36	15.2
	Medium	166	70
	High	35	14.8

The majority of the participants were uneducated (39.2%, n = 93). Most were married (85.2%, n = 202).

There were 79% treated with OHA without insulin, most of them were taking medications for different diseases (45.6%, n = 108 ), for clinical characteristics chosen in this study of patients and their data, see Table 2

**Table 2: Clinical characteristics of 237 responders. N (%)**

Clinical characteristic		Total	Male	Female
Duration of the Disease	<2 years	24 (10.1)	15 (62.5)	9 (37.5)
	2-5 years	56 (23.6)	37 (66.1)	19 (33.9)
	>5 years	157 (66.3)	104 (66.2)	53 (33.8)
Treatment	OHA	135 (57)	100 (74.1)	35 (25.9)
	Insulin +/- OHA	102 (43)	56 (54.9)	46 (45.1)
Dosage	Once a day	26 (11)	19 (73.1)	7 (26.9)
	> once daily	210 (89)	137 (65.2)	73 (34.8)
Drugs	Monotherapy	48 (20.2)	34 (70.8)	14 (29.2)

	Combined therapy	81 (34.2)	61 (75.3)	20 (24.7)
	Drugs for deferent diseases	108 (45.6)	61 (56.5)	47 (43.5)
Hypertension	No	134 (56.8)	95 (70.9)	39 (29.1)
	Yes	102 (43.2)	60 (58.8)	42 (41.2)
CHD	No	216 (91.5)	142 (65.7)	74 (34.3)
	Yes	20 (8.5)	13 (65)	7 (35)

Twenty Three Percent of patients reported good medication adherence, 38.8% medium adherence and 37.6 % poor medication adherence. figure 1

**Figure 1: Medication Adherence**

So, as Adherent, Non-adherent prevalence, it was very high ratio as shown in figure 2 below.

**Figure 2: Adherence Ratio**

The non-adherence in the urban participants was significantly higher than in the rural participants (87.9 vs. 68.1%,  $P=0.02$ ).

People those were living near the centers showed high rate of non-adherence (80.3 vs 63.2%,  $P=0.023$ ) than those who live far. The non adherence was significantly higher in the patients they were not regularly attending their appointment than those who were regularly attending (88.1 vs. 72.2%  $P=0.038$ ) . see Table 3

Gender and duration since diagnosis did not affect medication adherence ( $P=0.74$ ,  $0.70$  respectively ). see Table 3

No significant association found between adherence and type of treatment ( $P=0.31$ ) or between poor-adherence and number of dosage taken by patients ( $P=0.6$ ). see Table 3

Seventy percent of poor adherence show low glycaemic control according to HbA1c test ( $>8\%$ ), see figure 3

**Table 3: Association** between **medication adherence** and some selected **demographic** and **clinical** characteristics, MMAS-8 (N = 237)

### Discussion:-

The control of diabetes is crucially dependent on the diabetic patient's compliance to medical advice [13]. compliance of diabetic patients is a complex issue. This study explored therapeutic adherence and the factors contributing to the adherence of diabetic patients in Jazan region.

Non adherence with medication in this study was similar to the earlier finding in Egypt [7], Palestine [10], France [4], Poland [14] and Saudi Arabia [11]

In Palestine study, non-compliance was divided into two categories ( 51.4 % poor compliance and 6.5 % non-compliance ) [10]. In France the non-compliance was divided into two categories also (49% medium adherence and 12% poor adherence ) [4].

In the Saudi study, which conducted in Al Hasa region they found that the therapeutic non-compliance of the participants was 67.9% [11].

There was a significant rural–urban difference in the non-compliance rate among the diabetic patients in this study. The non-compliance in the urban population was significantly higher than the rural population (87.9 vs. 68.1%,  $P=.02$ ). The same finding has been documented in the Saudi and Palestine study where the non-compliance among urban diabetic patients was higher than among the rural patients (71.04 vs. 60.15%,  $P = .023$ ) for Saudi study and (8.2 vs. 6.2%,  $P = .003$ ) for the study conducted in Palestine, This difference may be due to various lifestyles. Urban residents tend to be more sedentary with relatively poor dietary habits as compared to the rural population [10][11]

In this study, no significant difference in adherence was found between males and females, The effect of gender on the rate of adherence to medication in other research studies is contradictory. Female patients were found by some researchers to have better adherence [15] while some studies suggested otherwise [16]. In addition, some studies could not find a relationship between gender and adherence to medication, this difference may be due to geographical variation in their education, and social factors [7].

This study showed a significant association between poor-adherence and attending to the appointments, patients they were not regularly attending their appointments have a high rate of poor-adherence than those attending their appointments regularly ( 88.1 vs. 72.2%  $P=0.038$ ).

The same result has found in the Saudi study, Patients who were regular on follow- up had a significantly higher compliance rate than those who were irregular (46.88% for those who never missed an appointment, 35.53% for those who had missed an appointment once or twice in a year, 26.40% for those who had missed the appointment more than twice in a year and 18.19% for those who never attended the clinic,  $P=.039$ ) [11].

In the researches that published earlier, they found that the most important causes of Poor adherence with clinic appointments were the non-availability of transport, followed by forgetfulness. Forgetfulness has been widely published as an important cause of irregularity of follow-up. Besides, owing to socio-cultural factors females cannot go out on their own to a health care center [11].

Patients with poor adherence showed low glycaemic control (  $HbA1c >8$  ) and this is similar to the results found in other researches [4].

We didn't find any significant association between poor-adherence and level of education. Some studies have found the same result. while other's studies have found an association between lower education level and poor adherence. A study conducted in UK shown that patients with a lower level of education have better compliance. It may be presumed that patients with a lower educational level may have more trust in the physician's advice. However, these results show that education may not be a good predictor of therapeutic Adherence [11].

Results showed no significant association between poor-adherence and type of treatment or number of dosages.

This results similar to that's conducted in French [4], in contrast to the Saudi study that's found non-adherence was least with the single drug regimen while it was highest among patients who were on combined oral and insulin treatment [11].

### **Conclusion:-**

Medication adherence is vital for effective diabetes management. The study results showed that the rate of non-adherence of diabetic patients in Jazan region was high.

Attending the appointments regularly played an important role in medication adherence, so we suggest that there is a need to establish some sort of system by which contact can be made with those patients who have difficulty in attending clinics and medication delivered to them on time.

Since patients showed more committing to their appointment in diabetic centers than in PHC, although they usually farther because they are more advanced facilities, more caring and have a better and specialized staff, they give them the relief, trust and more willing to follow the medical advice, so we suggest that the diabetic centers should be enhanced and take the major of the diabetic patients care system.

For the improvement with medication adherence Physician-patient relationship as well as patient's knowledge of diabetes should be improved through proper educational and training programs

Although this study is the first of its type in Jazanregion , it has some limitations

- Time : since we had to complete this study just in three weeks because of modules schedule of the college.
- Small sample size.
- The study used only one method to assess compliance.

**Our recommendations** for future works are to use validated adherence measures, e.g., Computerized compliance monitors like the Medication Event Monitoring System (MEMS) and to run other methods concurrently for assessment of therapeutic adherence, e.g pill counts for a comparison study. Moreover, it is very important to conduct a research on larger sample population and from different clinical settings and areas.

#### Abstract

**Introduction:** Studies have shown that overweight and obese persons face psycho-social problems. We conducted a cross-sectional study in Qassim university to explore the psycho-social problems faced by male obese students.

**Objectives:** To determine the types of psycho-social problems, and find their prevalence among Qassim University overweight and obese students.

**Research Methods:** A self-administered questionnaire was designed and pretested. The questionnaire consisted of questions regarding age, college, social background and social problems that they encounter. An open ended question was also included so that the study subject may identify some social problems that they encountered which the questionnaire may have failed to list. The participants of the study were selected by convenient sampling. The sample size was 65.

**Results:** In studied overweight and obese students sample, 58(89%) were unhappy about their weight and 52(80%) tried to follow weight reduction program. Fifty-six students (86.2%) considered overweight and obesity as a disease and 44(67.7%) had positive family history. Mood swing and social pressure were reported by 37(56.9%) and 30(46.2%); respectively. low self-esteem and effect on social life reported by 24(36.9%) and 13(20%); respectively. Reporting overeating due to anger, sadness and boredom was 9(13.8%), 11(16.9%) and 37(56.9%); respectively.

**Conclusion and recommendations:** Our study showed a substantial proportion of psycho-social problems among overweight and obese students. The finding of the study cannot be generalized to all Saudi adolescent, since the sample is small and not representative of all Saudi adolescent therefore we recommend that a larger study on the topic should be undertaken to estimate more accurately the magnitude of the problem.

## Introduction:-

Obesity is now considered as an epidemic by WHO (world health organization)<sup>[1]</sup>.

The definition of overweight and obesity is:

**Overweight** : excessive increase in adipose tissue or in muscle and skeletal tissue .

**Obesity** : an increase in body weight beyond the limitation of skeletal and physical requirement, as the result of an excessive accumulation of fat in the body.

Overweight and obesity is best measured by calculating body mass index (BMI).

This definition lead us to what is the BMI ?

$$\frac{\text{weight (Kg)}}{\text{Height (m}^2\text{)}} = \text{BMI}$$

Regarding to BMI the meaning of overweight and obesity will be:

25.0 to 29.9 =overweight.

30 to 39.9 = obese.

The risk factors associated with obesity and overweight are:

- Diet (high fat and carbohydrate with excessive calories).<sup>[2]</sup>
- Sedentary lifestyle.<sup>[3]</sup>
- Genetics.<sup>[4]</sup>
- Illnesses (hypothyroidism, Cushing's syndrome, growth hormone deficiency).<sup>[5]</sup>
- Infectious agent.<sup>[6][7]</sup>
- Others causes of obesity like (insufficient sleep, decreased rates of smoking, increased use of medications that can cause weight gain, pregnancy at a later age).<sup>[8]</sup>

The Prevalence of Overweight& Obesity in all age groups in KSA<sup>[9]</sup>is:

14 % in men, and increasing level 30.7 %.

23.6 % in women, and increasing level 28.4 %.

In a study conducted by Wellman Friedberg in USA reports: "currently, the rates of both overweight and obesity in the US are 61% and 14% in adults and children, respectively. About 14% of children and adolescents are now seriously overweight."<sup>[10]</sup>

There're a lot of medical problems associated with obesity, including:

Mortality:

Obesity reduces life expectancy by six to seven years.<sup>[11]</sup>

Morbidity:

- diabetes mellitus type 2.
- hypertension.
- high blood cholesterol.
- high triglyceride levels.
- ischemic heart disease.<sup>[12]</sup>

## Beside Medical Problems, There're Also Psychological Problems Associated.

In astudy conducted by Wellman and Friedberg they report that:

"Emotional suffering may be among the most painful aspects of obesity. American society emphasizes physical appearance and often equates attractiveness with slimness, especially for women. Such messages may be devastating to overweight people. Many think that obese individuals are gluttonous, lazy, or both, even though this is not true. As a result, obese people often face prejudice or discrimination in the job market, at school, and in social situations. Feelings of rejection, shame, or depression are common."<sup>[10]</sup>

Low Self-Esteem<sup>[13]</sup>

Obese teens have significantly lower self-esteem than teens of normal weight. Low self-esteem often appears as loneliness, nervousness and sadness. Teens with low self-esteem may also engage in risky behavior such as

experimenting with drugs, alcohol or cigarettes. Obese teens who experience low self-esteem during childhood and adolescence often carry these feelings into adulthood.

#### Depression<sup>[13]</sup>

Depression is a common psychological effect of teen obesity. An obese teen who is heavier than her peers may experience feelings of sadness or hopelessness. Signs of depression include changes in sleep patterns, withdrawal from family or friends and loss of interest in activities she previously enjoyed. MayoClinic.com reports that some teens try to hide depression and appear emotionally flat rather than sad.

#### Anxiety<sup>[13]</sup>

Most children experience anxiety for various reasons throughout adolescence. Obese teens, however, may experience severe anxiety that often results in destructive behaviors or avoidance of friends and family. Overweight teens may also have social anxiety, the result of excessive bullying or teasing. Severe anxiety often interrupts the learning process and may lead to a decline in academic performance. Being an overweight teen can also affect an individual's anxiety level as an adult. Overweight teen girls may have a higher chance of developing anxiety disorders or depression in adulthood.

#### Poor Body Image<sup>[13]</sup>

Obese teens often experience poor body image as a result of being overweight. This may keep your teen from playing sports or engaging in physical activity, spending time with friends or wearing form-fitting clothing. Poor body image is connected to a number of psychological problems, including depression, anxiety and low self-esteem. Teens with poor body image are also at risk of developing an eating disorder.

#### Eating Disorder<sup>[13]</sup>

Obese adolescents are at risk of developing disorders such as bulimia, anorexia or compulsive overeating. An eating disorder is often the result of an overweight teen's effort to lose weight through risky and unhealthy behaviors.

A study from US has conclude the following "Obesity is associated with an approximately 25% increase in odds of mood and anxiety disorders and an approximately 25% decrease in odds of substance use disorders. Variation across demographic groups suggests that social or cultural factors may moderate or mediate the association between obesity and mood disorder."<sup>[14]</sup>

**The purpose of this study is to explore the psycho-social problems in obese student in four colleges of qassim university, by doing a Cross-Sectional study.**

### Research Objectives:-

#### Goal:

To get better understanding of the social and psychological problems that faced by Qassim university obese students.

#### Objectives:-

To determine the types of Psycho-social problems, and find the prevalence of it among Qassim University overweight and obese students.

#### Limitations of the study:

- 1-Since the selection of the study subjects was based on non-probability sampling technique, therefore it cannot be generalized to the entire obese population of students of Qassim university.
- 2-The study participants consent to participate in the study was voluntary, therefore there is a possibility of overestimation or underestimation of the result.
- 3-Only the male obese students were included in the study.

### Research Methodology:-

**Research setting:** The study was conducted in Qassim University, Colleges of Medicine, Dentistry, Pharmacy and Applied Health Sciences.

**Sampling and sample size:-**

All male obese students who agree to participate in the study were inducted in the study. Therefore, the sampling method was “convenient sampling”. The sample size was 65 male obese student.

**Data collection method:-**

For all obese students who agreed to participate in the study, BMI was calculated to confirm obesity. Those who do not fall in the category of obesity were excluded from the study. A self-administered questionnaire was designed and pretested. The questionnaire consisted of questions regarding age, weight, height, college, social background and the psych-social problems that they encounter. An open ended question was also given so that the study subject may identify other social problems that they encounter and were not listed in the questionnaire. The data were collected by the group members. Every 3-4 group members were assigned one college to collect the data.

**Data entry and analysis:-**

Before entering the data, the data were cleaned and edited. The data were entered and analyzed in SPSS program. Frequency tables were generated. Each variable frequency was analyzed and cross tabulation.

**Expected problems and their solutions:-**

The faculty members may not give the permission to conduct the study. This will be dealt by taking official permission from Deans’ of respective Colleges. The students may not cooperate for fear of their names being identified. This will be assured by having the questionnaire as anonymous.

**Results:-**

Question	No n (%)	Yes n (%)
1. Are you satisfied with your current weight?	58(89.2)	7(10.8)
2. Have you tried to follow a program to reduce your weight?	13(20)	52(80)
3. Do you believe the obesity is a disease?	9(13.8)	56(86.2)
4. Dose any of your family members have obesity?	21(32.3)	44(67.7)
5. Do you feel mood swing?	28(43.1)	37(56.9)
6. Do you feel social pressure due to your weight?	35(53.8)	30(46.2)
7. Does your overweight prevent you from going to public places?	58(89.2)	7(10.8)
8. Does your overweight prevent you from doing sport activity?	41(63.1)	24(36.9)
9. Did you try any dangerous method to reduce your weight?	45(69.2)	20(30.8)
10. Did obesity reduce your self-esteem?	41(63.1)	24(36.9)
11. Did you face difficulty in reduce your diet?	29(44.6)	36(55.4)
12. Did you thought that the obesity will affect you in the future?	9(13.8)	56(86.2)
13. Did you take any drug to reduce your weight previously?	47(72.3)	18(27.7)
14. Did your weight affect your study?	53(81.5)	12(18.5)
15. Did your weight affect your social life?	52(80)	13(20)
16. Did your overweight affect your activity?	30(46.2)	35(53.8)
17. Did you eat as a result of anger?	56(86.2)	9(13.8)
18. Did you eat as a result of sadness?	54(83.1)	11(16.9)
19. Did you eat as a result of boredom?	28(43.1)	37(56.9)
20. Did you eat as a result of frustration?	40(61.5)	25(38.5)
21. Your life style? Lazy, Active, Neutral	11(16.9) 8(12.3) 47(70.8)	

In studied overweight and obese studentssample, 58(89%) were unhappy about their weight and 52(80%) tried to follow weight reduction program. Fifty-six students (86.2%) considered overweight and obesity as a disease and 44(67.7%) had positive family history. Mood swing and social pressure were reported by 37(56.9%) and 30(46.2%); respectively. low self-esteem and effect on social life reported by 24(36.9%) and 13(20%); respectively. Reporting overeating due to anger, sadness and boredom was 9(13.8%), 11(16.9%) and 37(56.9%); respectively.

**Discussion:-**

In our study 36(56.9%) feels mood swing and 56(86.2%) thinks their obesity will affect them in the future while a study done in USA, shows that 25% obese adults have mood and anxiety disorder<sup>[14]</sup> Another study on psychosocial aspects of obesity suggest that in obese patients seeking treatment there is an increased prevalence (40-60%) of psychiatric morbidity, most commonly depression<sup>[15]</sup>, which is quite similar to the finding in our study.

**Conclusion and recommendation:-**

Our study showed a substantial proportion of psycho-social problems among overweight and obese students. The finding of the study cannot be generalized to all Saudi adolescent, since the sample is small and not representative of all Saudi adolescent therefore we recommend that a larger study on the topic should be undertaken to estimate more accurately the magnitude of the problem.

PCR, method sensitivity

#### Abstract

In Mongolia, there is a variable number of *Trichomonas vaginalis* (*T.vaginalis*) infections reported and therefore we need a detection tool which is highly sensitive and specific. At the present study, we compared wet mount, gram stain, culture and PCR for detection of *T.vaginalis* from 109 samples collected in “UlaanTuuz” hospital in NCCID. As a result, 21.1%(23/109) were positive by wet mount, 18.3%(20/109) were positive by gram stain, 28.4%(31/109) were positive by culture and 36.6%(40/109) were positive by PCR respectively as compared to other methods. Further *T.vaginalis* trophozoite isolate was used to determine PCR sensitivity. Trophozoite isolate was counted by using haemocytometer and  $10.1 \times 10^4$  was counted in one mL diluted swab sample. From that sample, trophozoite isolate was diluted 3156, 1578, 100, 50, 12, 3, 1.5 (1-2) per mL sample. PCR was performed serially diluted samples and as a result, all the samples had 102bp *T.vaginalis* specific DNA band and confirmed PCR method was sensitive. Out of 109 samples 17 (15.5%) were positive by all detection methods. Since PCR had highest number of positivity, we have used it as a “golden standart” to calculate sensitivity and specificity of these methods. PCR had 100% specificity as compared to 98% wet mount, 98.5% gram stain and 100% culture. On the other hand culture had the highest sensitivity 77.5% as compared to PCR 100%, wet mount and gram stain 47.5-77.5%.

#### Introduction:-

*Trichomonas vaginalis* commonly causes vaginitis and perhaps cervicitis in women, as well as urethritis in both sexes, 10-50% of those cases are clinically asymptomatic. Worldwide, more than 180 million people get the infection with this parasite annually. Statistics from NCCID reports every 4-6 (48-63.6% in 10000 population) people are infected with sexually transmitted diseases and *T.vaginalis* accounts 16.7-39.5% of those cases. Various methods have been used for the diagnosis of trichomoniasis such as wet mount, culture, Papanicolaou smear, and serologic test. Wet mount examination is an easy, simple, and rapid method but more than  $10^3$ /mL and live protozoa are required for detection. Culture demands a specialized medium and takes 2-5 days for the diagnosis. *T.vaginalis* is by indirect immunofluorescence test is the lack of sensitivity and specificity. In recent years, molecular biological

techniques have a sexually transmitted infection disease. Therefore highly sensitive and specific clinical diagnostic methods needed for detection of *T.vaginalis*.

### Materials and methods:-

#### Patients and diagnostic test:-

Total 109 female patients swab and vaginal secretions were employed in this study. All the patients had informed consent at "Ulaan tuuz" voluntary clinic in NCCID hospital. All samples were tested the presence of *T.vaginalis* by wet smear, gram staining, culture by Feinberg-Whittington medium and PCR using TV-650 primer. Further *T.vaginalis* trophozoite isolate was used to determine PCR sensitivity. Trophozoite isolate was counted by using haemocytometer and  $10.1 \times 10^4$  was counted in one mL diluted swab sample. From that sample, trophozoite isolate was diluted 3156, 1578, 100, 50, 12, 3, 1.5 (1-2) per mL sample. PCR was performed serially diluted samples and as a result, all the samples had 102bp *T.vaginalis* specific DNA band and confirmed PCR method was sensitive. Sensitivity and specificity of clinical diagnostic method were determined by chi square test (SPSS-17).

#### Result:-

*T.vaginalis* was detected in culture, direct wet smear, Gram staining, and PCR techniques as follows, 28.4% (31/109), 21.1% (23/109), 18.3% (20/109) and 36.6% (40/109), respectively. Total 15.5% (17/109) samples were examined positive with *T.vaginalis*. PCR amplification method had highest sensitivity and specificity and therefore set as the "gold standard". In PCR TV-650 primer set used which produces single band with 330bp length. The specificity of the direct wet smear was 79%, gram staining was 76% and culture was 88% as compared to PCR amplification method. The sensitivity of the direct wet smear was 95%, gram stain was 95% and culture was 100% and as compared to PCR amplification method. *T.vaginalis* isolate was prepared from culture positive samples where sub-cultured in Trypticase-yeast extract-maltose, Meingassner and Heyworth medium. *T.vaginalis* trophozoite in culture was counted and diluted to make 3156, 1578, 100, 50, 12, 3, 1.5 cells per milliliter and DNA was extracted and subject to PCR amplification by TV-A5, TV-A6 primer sets (102 bp band). The highest dilution, 1.5 cells per milliliter Heyworth medium was positive by PCR. There was no correlation observed between clinical outcome and laboratory detection ( $r=0.001$ ).

#### Conclusions:-

1. We diagnosed *T.vaginalis* new cases by different clinical laboratory methods wet smear (21.1%), and gram stain (18.3%) and culture (28.4%) and PCR, respectively.
2. Sensitivity of the PCR assay is 100% for detection of *T.vaginalis* and culture is 100% specific, 77.5% sensitive and kappa coefficient is much more significant. Sensitivity of Gram stain and wet mount are 47.5-55.0% and specificity is 98-98.5% and kappa coefficient is also significant.

Vegetable.

#### Abstract

To study the mortality of vegetable oil (Neem) on watermelon aphids, we carried out tests to compare it with the chemical synthetic Malyphos most used by farmers in our region. Because of this, we treated the aphid infested watermelon leaves with doses of vegetable oil (Neem) and Malyphos.

In summer, where there is a significant number of aphids on the leaves and after a controlled time, we determine the mortality rates of this parasite in order to obtain the mortality as a function of time and of the dose of the synthetic product and of this oil.

The comparison of the mortality of the aphids between the Malyphos and the vegetable oil made it possible to highlight the role of these natural extracts on the limitation of the losses of agriculture caused by these parasites. Then the possible use of Neem oil as a natural to replace this chemical product (Malyphos) without any side effect on human health and the environment.

#### Introduction:-

Current methods of curative control use liquid insecticidal products whose active ingredients belong to the family of organophosphates, pyrethroids and synthetic carbamates. These preparations have proved to be both very effective but also harmful on many other species. Insecticides cause a significant accumulation of active matter in treated ecosystems; they are sensitive to human health and contribute to the development of resistant insects.

In early summer, the vast majority of watermelon fields contain a large amount of aphid that is present. They are found in the neck and then colonize the stems and leaves. In our area, all stages of aphids feed on the underside of leaves in watermelon fields. According to studies, the most important parasitic diseases leading to the development of leaf spot appear first on lower leaves. These affected leaves turn yellow and fall (Michel, 2002).

To cope with the harmful effects of these insects, the means of control are essentially oriented towards the use of synthetic chemical insecticides. However, while most of these products are effective under optimum conditions, their intensive and uncontrolled use has enormous disadvantages (Salim, 2011). These include resistant strains in insects, consumer poisoning, environmental pollution (Benayad, 2008; Camara, 2009; Gueye et al., 2011). Faced with these nuisances, the search for an alternative that is more respectful of human health and the environment is essential.

We know that pesticides have contributed to increased crop yields, particularly pest control, but the side effects of using synthetic pesticides are numerous on the health of populations, fauna and flora. The increasing interest in the use of plant extract pesticides in the world is motivated by their effects comparable to those of chemical pesticides (Mouffok et al., 2007/2008).

Indeed, new preventive measures as well as new products are continuously sought to ensure on the one hand an effective protection of agricultural production and on the other hand to contribute to a sustainable management of the environment. From this point of view, the use of plant extracts with insecticidal effects offers certain potentialities. Already Volkonsky (1937) advocated the use of plant extracts for the control of migratory locusts. Among the most widely documented examples is the efficacy of extracts of *Melia azadirach* L. containing azadirachtin and from Neem on *Schistocerca gregaria* larvae (Wilps et al., 1992, Mordue, Blackwell, 1993, Linton and al., 1997).

This research aims to make a mortality comparison between the chemical insecticide Malathion and the vegetable oil of Neem on the aphids of watermelon fields. The aim is to reduce the damage caused by these pests by protecting the environment and by evaluating the natural insecticide used in this study.

### **Material and Methods:-**

#### **Synthetic insecticide (Malathion):-**

Plot: 35100.

Active ingredient: Malathion.

Field of action: flies, aphids, codling moth.

Dose of use: 200 ml / hl.

Product Company: Agri Chemistry (Morocco).

Nature of product: toxic insecticide and acaricide universal.

#### **Natural insecticide (Neem oil):-**

Reagents used in this work have been provided by Herb'Atlas, supplier of natural products, organic and conventional essential oils.

Neem vegetable oil: The botanical name of Neem, also known as Indian Lilac, is *Azadirachta indica*. Neem is an evergreen tree native to India, Burma, Java and the Lesser Sunda Islands (Mouffok et al., 2007/2008). Neem oil is obtained by cold pressing and sand filtration. The active molecule is azadirachtin (0.29 %). Its major constituents are oleic acid (46.8 %) and linoleic acid (12.8 %)

#### **Culture of watermelon:-**

The common name is watermelon. The latin name is *Citrullus Lanatus* (Thunberg) Matsumara & Nakai (also called *C. vulgaris*) and the Family name is Cucurbitaceae (David, 2008). The watermelon is a fruit with seeds or the arrangement of the plants is 2 m x 1 m between hills. Its varieties are the Sugar Belle and Royal Jubilee. Its duration of culture is from 70 to 95 days. The potential returns to high productivity of this fruit are of 5 to 12 kg. The watermelon prefers warmer temperatures and a long growing season.

#### **Description of the aphids:-**

The Common name is aphids and the latin name of aphids is *Adelgides*. There are the aphids of the cotton (aphid of melon), *Aphis gossypii* Glover on all cucurbits. It is an aphid-green blackish, about 1 to 2 mm long. The siphunculi and the cauda venenum' as the (the tail) are black in color. There is also the aphids green of the fish, *Myzus persicae* (Sulz). The adult aptere measure 1.5 to 2.6 mm long. It is a matte color olive green or light green, sometimes mixed with yellow. The antennae are as long as the body and the cornicles are green.

The adult wing has the head and thorax black in color. The length of its body is of 2.0 to 2.5 mm. It is a vector of cucumber mosaic and other viruses that can attack the cucurbits. To combat these aphids we used a spray of extracts of Neem, spraying of extracts of tobacco or use of ashes of wood (Bijlmakers and Verhoeck, 1995). The aphids were identified with a magnifying glass of 8x and they present the following characteristics: 0.25 mm – 2.5 mm long, dark and light green head, dark and light green chest, yellow-green and light green abdomen.

## Experimental conditions and method:-

### Conditions:-

The tests have been realized from the beginning of summer 2016 in watermelon fields. The geographical area chosen is near the Ziz Oasis Tafilalt in the Southeast Morocco. The area of the watermelon fields ranged from 0.1 to 0.5 hectare. In order to carry out these experiments, it was chosen randomly the plots of 1 m<sup>2</sup>.

### Experiments and procedures:-

Experiments were carried out to assess the mortality of aphids in the presence of dilute solutions using a methodology based on the World Health Organization protocol. Aphids parasitizing fields with a surface area of 1m<sup>2</sup> were collected after treatment in white plastic bags of 25 x 40 cm<sup>2</sup> for subsequent laboratory counting.

Stock solutions of each product sample were prepared in pure water and from these solutions the final dilutions of the assay were carried out at different concentration percentages (v / v) (0.5 % and 1 % of product in pure water). In order to verify the reproducibility of the results each test was repeated four times. A control sample of 100 ml of pure water and emulsifier enables to measure the natural mortality at the same experimental conditions. The count of dead aphids on the watermelon plants taken in a 1 m<sup>2</sup> surface area has been accomplished by means of a magnifying glass 8x, and this 3,5 and 7 hours after treatment.

## Result and Discussion:-

### Results:-

The action of different products on the aphids results in mortality after the time following treatment, as shown in table 1, figure 1 and figure 2. Each mortality percentage ( $m \pm \text{SEM}$  where  $m$  is the mortality and SEM is the Standard Error of Measurement) presented in table 1 is the average of sixteen tests which have the unavoidable uncertainty of the measurement.

**Table 1:** Aphid mortality percentage (%)

Time (h) Product	Concentration 0.5 % (v / v)			Concentration 1 % (v / v)		
	3	5	7	3	5	7
<b>Malyphos</b>	17.98±0.9	33.9±1.3	41.89±1.02	21.01±0.8	35.76±1.1	44.32±0.95
<b>Neem</b>	25.12 ±1.75	29.76 ±2	33.19 ±2.09	23.47 ±1.25	32.3 ±1.46	36.01 ±1.5
<b>Control</b>	5.25 ±1.08	07.6 ±0.99	12.5 ±1.05	6.8 ±0.41	8.89 ±0.85	12.06 ±1.01

**Figure 1:** Case of dose 0.5 %

**Figure 2:-** Case of dose 1 %

It is observed that at the 0.5 % dose the mortality is low at 3 hours for the Malyphos than for the Neem oil. But beyond 3 hours the product Malyphos becomes more deadly than the oil of Neem. At the 1 % dose, the same is observed for both products. The natural mortality of the control is too low at all times by contribution to the products used and does not exceed 12.5 %.

These mortality rates are clear at the end of each test and do not reach high mortality values over short periods, which proves that the effect of the products is long and similar. Also the Neem is active in the short term but the Malypfos becomes active in the long term. It is observed that mortality varies little, even at a high dose and over a long period.

To more accurately evaluate the insecticidal activity of these products against aphids, lethal times were calculated for mortality of 50 % ( $TL_{50}$ ) with 90 % ( $TL_{90}$ ) and lethal doses for mortality of 50 % ( $LC_{50}$ ) with 90 % ( $LC_{90}$ ) defined in table 2.

**Table 2:-**  $TL_{50}$ ,  $TL_{90}$ ,  $LC_{50}$  and  $LC_{90}$

	$TL_{50}$		$TL_{90}$		$LC_{50}$	$LC_{90}$
	0.5 %	1 %	0.5 %	1 %	After 7 hours	After 7 hours
<b>Malypfos</b>	8.2 h	7.6 h	14.6 h	13.8 h	1 %	1.9 %
<b>Neem</b>	9.8 h	9 h	18.2 h	16.6 h	1.25 %	2.35 %

### Discussion:-

In a watermelon field, aphids die slowly even at a high dose of 1 % and after 7 hours have a mortality value of 36.01 % for oil and 44.32 % for Malypfos. These values are close for both products and are very far from the natural mortality of the low and high dose control. It can be assumed that the mortality is mainly due to the different active compounds contained in these products, the dose used and the treatment time of the aphids. At high doses the oil and Malypfos become very active against the aphids with a superiority of the last product.

It is noted for the 0.5 % dose that the time to have 50 % mortality of the aphids for oil ( $TL_{50}$  = 9.8 hours) is close to Malypfos ( $TL_{50}$  = 8.2 hours). After 7 hours, the dose necessary to have 50 % mortality for oil ( $LC_{50}$  = 1.25 %) close to Malypfos ( $LC_{50}$  = 1 %). Viewing these results obtained in table 2, the insecticidal activity of Neem oil is closer to the synthetic product Malypfos often used by farmers in our country. These results are proved by Butler and Henneberry (Butler and Hennberry, 1990) who tested a 5 to 10 % solution of cotton seed oil on cabbage aphids.

In our study, we obtained results indicating that doses of 0.5 % and 1 % of the products applied to aphids have a close impact and sufficient insecticidal action. The high dose of 1 % showed that all samples had an unattractive activity on the aphids. Hour after hour, Neem extract in watermelon fields achieved a 90 % mortality rate for the high dose 1 % in less time than 16.6 hours close to that of Malypfos by 13.8 hours.

The natural insecticide will therefore have a great importance on human, animal and environmental health and will be better than the synthetic product. These results are consistent with Isman, the natural plant extracts have a real richness and can give many substances insecticides used in the fight against the parasites (Isman, 2001).

### Conclusion:-

The attack by the vegetable oil of Neem on the aphids of watermelon fields is also affected in the same way by the chemical Malypfos. This shows that vegetable oil with sufficient concentrations can cause death of the insect and replace the product Malypfos. These results show that natural plant extracts are a real wealth and can give many insecticide substances used in the control of parasites. It follows that the use of natural molecules of ecological and economic interest possessing insecticidal properties of lesser toxicity in humans proves to be an alternative approach to the use of synthetic insecticides.

#### Abstract

**Background:** Identifying common risk factors of otitis media (OM) among children by caregivers, particularly mothers will help in controlling the disease and reducing its adverse outcome.

**Objectives:** To determine the knowledge of mothers on the risk factors associated with OM and its determinants.

**Subjects and methods:** A quantitative cross sectional study was carried out at King Fahd Medical city, Riyadh, Saudi Arabia among a representative sample of mothers attending Otolaryngology, pediatric and well-baby clinics at PSMC throughout the study period (December, 2016), irrespective of the child's complaint provided that they had a child aged below 6 years. Data were collected using a modified Ear Infection Survey questionnaire, which included questions regarding the possible risk factors for otitis media.

**Results:** The study included 218 mothers. Their age ranged between 17 and 55 (33.8±7.8) years. More than one third of them (39.4%) had more than three children. The most frequently known otitis media risk factors were male gender (94.5%), recurrent chronic rhinitis (84.4%), and absence of breast feeding (80.7%) whereas the lowest known risk factors were no existence of a vaccine (6.4%), Low socio-economic status (12.4%), day care attendance (16.1%) and malnutrition (19.7%). Overall, inadequate knowledge was reported among 71.6% of them. None of the studied risk factors was significantly associated with mothers' knowledge regarding otitis media risk factors.

**Conclusion:** Mothers' knowledge of otitis media risk factors among their children is suboptimal. Therefore, a public health education campaign targeted mothers of young children is necessary.

#### Introduction:-

In both developed and developing countries, otitis media (OM) is a very common health problem and considered the main preventable reason (90%) for hearing loss among children.<sup>[1]</sup>

The prevalence of chronic OM differs in various countries, but the highest prevalence rates were reported in South East Asia, Africa and Western Pacific regions.<sup>[1]</sup>

**Corresponding Author:- Alaa Khalid Alatabani.**

Address:- King Fahd Medical city, Riyadh, Saudi Arabia.

Epidemiological studies for middle ear inflammatory conditions in the Kingdom of Saudi Arabia are scarce as only few regional studies were conducted through local universities to investigate prevalence of Otitis media in different provinces of KSA. In Riyadh prevalence of OM was 13.8 %<sup>[2]</sup> and in Abha it was 2.3%.<sup>[3]</sup> In Qassim region, it was 7.5%.<sup>[4]</sup>

Risk factors (RFs) of OM include recurrent upper respiratory tract infections,<sup>[5, 6]</sup> household tobacco smoke,<sup>[7]</sup> short duration of breast feeding,<sup>[5]</sup> artificial bottle feeding,<sup>[8]</sup> day care attendance,<sup>[6]</sup> family history,<sup>[9]</sup> male gender and low socioeconomic status (SES).<sup>[10-13]</sup> Many of these risk factors could be modified by adopting proper lifestyle changes which helps in control of OM and its associated sequel<sup>[13]</sup>

Identifying common risk factors by caregivers, particularly mothers will help in controlling the disease and reducing its adverse outcome, therefore this study was conducted to determine the knowledge of mothers on the risk factors (RFs) associated with OM for possible controlling of some of these factors and reducing the burden of the disease.

### Subjects and Methods:-

A quantitative cross sectional study was carried out at King Fahd Medical city, Riyadh, Saudi Arabia. Riyadh is the capital of Saudi Arabia with an approximate population of 6.5 millions. Mothers attending Otolaryngology, pediatric and well-baby clinics at PSMC throughout the study period (December, 2016), irrespective of the child's complaint were eligible for study inclusion provided that they had a child aged below 6 years.

The sample size was calculated by using the single proportion equation in Raosoft software package. The required sample size is 219 mothers at 95% confidence level (estimated frequency 50%, margin of error accepted was 5%). Systematic random sampling technique was implemented to select the study sample. Data were collected using a modified Ear Infection Survey questionnaire,<sup>[13]</sup> which included questions regarding the possible risk factors for otitis media (low socio-economic status, recurrent of chronic rhinitis, Exposure to household smokers, past history of otitis media in the last 12 months, otitis media of siblings, malnutrition, male gender, parents with history of otitis media, day care attendance, bottle feeding, and non-existence of vaccines. The questionnaire also included demographic characteristics of mothers (age, educational level, current marital status, number of children, job, husband's age, job, education, and family income). For illiterate mothers, Arabic-speaking nurses will help in data collection.

Knowledge score was computed in the way that mothers who answered correctly to each risk factor were assigned a score of "1" whereas those answered wrongly or didn't know were assigned a score of "0". Total knowledge score and its percentage were computed. Mothers who got 50% or more of total knowledge score were considered as having "adequate knowledge" whereas those who got less than 50% were considered as having "inadequate knowledge".

The data were coded before computerized data entry. The statistical Package for Social Sciences (SPSS) software version 22.0 was used for data entry and analysis. Descriptive statistics in the form of frequency and percentage were computed and analytic statistics, using chi-square test were applied. P-values <0.05 was considered as statistically significant.

### Results:-

The study included 218 mothers. Their age ranged between 17 and 55 (33.8±7.8) years. More than one third of them (39.4%) had more than three children. Most of them (73.9%) were university graduated or above. Slightly less than half of the respondents (48.6%) were working. Their husband's age ranged between 23 and 84 (39.5±9.3) years. Most of their husbands (70.6%) were at least university graduated. Almost two-thirds (61%) of their husbands were professionals whereas 17% were militaries. The family income of almost half of them (50.9%) exceeded 10000 SR/month.

Regarding mothers' knowledge of otitis media risk factors, the most frequently known were male gender (94.5%), recurrent chronic rhinitis (84.4%), and absence of breast feeding (80.7%) whereas the lowest known risk factors were no existence of a vaccine (6.4%), Low socio-economic status (12.4%), day care attendance (16.1%) and malnutrition (19.7%). Overall, inadequate knowledge was reported among 71.6% of them as illustrated in figure 1.

None of the studied risk factors (age, number of children, educational level, job, husband's age, education, job and family income) was significantly associated with mothers' knowledge regarding otitis media risk factors.

### **Discussion:-**

The identified risk factors for OM among children in many studies were acute suppurative otitis media, recurrent upper respiratory tract infections, exposure to passive smoking, bottle feeding, malnutrition, immuno suppression, infection, low socioeconomic status, overcrowding in homes, schools and day care centers.<sup>[14]</sup>

Identifying common risk factors by caregivers, particularly mothers will help in controlling the disease and reducing its adverse outcome. Therefore this study was carried out to assess their awareness of the common risk factors of OM among their children. We recruited mothers since in our culture, they are more likely to present with sick children to the hospital.

Male predominance of the disease was reported in many studies.<sup>[9, 15-17]</sup> However, some other studies did not observe a gender difference regarding prevalence of OM among children.<sup>[18-20]</sup> In the current study, majority of mothers recognized male gender of children as a risk factor for OM.

Low socio-economic status (SES) was proven to be the single largest risk factor of OM.<sup>[21-23]</sup> Also, in South-western (Nigeria), Lasisi et al., (2007) reported a strong association between low socioeconomic status and OM.<sup>[12]</sup> Low SES itself is a risk factor, and at the same time it is closely associated with others risk factors such as overcrowding. In addition, low socioeconomic status may explain the recurrence of otitis media seen in parents and siblings. Other risk factors may be responsible for greater incidence of OM in the low socio-economic status including exposure to household passive smokers, lack of access to proper healthcare and medication as well as malnutrition, which is common in the low SES as a result of impaired immunity.<sup>[24-25]</sup> In the present study, low socio-economic status itself was recognized by only 12.4% of mothers as a risk factor for OM. However, other related risk factors were recognized by higher percentages such as OM in siblings (26.1%), parents (40.4%), recurrent OM (56.9%) and malnutrition (19.7%).

Overcrowding in poor ventilated day care centres predisposes children to viral infection of the upper respiratory tract which can lead to congestion of the Nasopharynx, Eustachian tube dysfunction and subsequent otitis media.<sup>[16]</sup> In the current survey, only 16.1% of mothers could recognize that daycare center is a risk factor for OM among children.

Breast feeding has been proven to enforce children immunity, but this protection decreases as they grow; hence vulnerability to infection increases from the age of one year because breast milk could no longer meet their nutritional need.<sup>[15]</sup> In the current study, absence of breast feeding as a risk factor for children OM was recognized by 80.7% of mothers.

The poor knowledge of most risk factors of OM demonstrated in this study suggests that a public health education campaign targeted mothers of young children is necessary.

Among limitations of the study is the inclusion of mothers from one institution which could affect the generalizability of results. However, mothers from all socio-economic statuses attending this hospital.

In conclusion, Knowledge of modifiable risk factors of OM among mothers is generally inadequate. Therefore, healthcare educational programs should be directed to them. Additionally, training and encouragement of health care professionals is needed to disseminate information to mothers and other caregivers on risk factors of OM.

Diabetes Mellitus, Diabetic Nephropathy, Serum copper.

#### Abstract

associated with various complications such as diabetic nephropathy. It is most common cause of End Stage Renal Disease (ESRD) in diabetic individual. In various studies, altered levels of serum copper levels are associated with diabetic complications such as diabetic nephropathy. We studied serum copper levels in type 2 diabetic individual with and without nephropathy.

**Materials and Methods-** The study population consisted of 100 type 2 diabetic individual which was further divided into two groups, first group consisted of 50 diabetic individual with nephropathy and second group consisted of 50 diabetic individual without nephropathy. Diabetic nephropathy status was assessed by spot urinary albumin creatinine ratio and GFR. Serum copper levels were measured by colorimetric method.

**Result-** Mean serum copper levels were significantly higher in diabetic patient with nephropathy ( $111.8 \pm 13.9$  mg/dl) as compare to diabetic patient without nephropathy ( $102.3 \pm 16.2$  mg/dl), ( $p = 0.002$ ). Serum copper was also positively correlated with weight of subject ( $r = 0.263$ ,  $p = 0.009$ ), and negatively correlate with serum zinc ( $r = -0.263$ ,  $p = 0.009$ ).

**Conclusion-** Diabetic nephropathy is the leading cause of death in diabetic individual. Our study points toward the increased serum copper levels are associated with diabetic nephropathy. Thus we could use copper chelator in an attempt to decrease serum copper, so that

### **Introduction:-**

Diabetes mellitus is the chronic, lifelong metabolic disease, which is characterised by hyperglycemia and it produce the organ damage by various mechanism such as free radical injury, formation of advanced glycation end products and various toxic metabolite which accumulate during the metabolism of excess of glucose such as polyol intermediate, sorbitol, hexose-amine etc.[1] These abnormalities in the presence of chronic hyperglycemia ultimately lead to various chronic micro and macro vascular complication such as diabetic nephropathy, diabetic retinopathy, diabetic neuropathy and include cardiovascular, cerebrovascular and various peripheral vascular diseases respectively.[2]

The prevalence of diabetes mellitus and associated complication is increasing globally at a faster rate. At present there are approximately 220 millions of diabetic patient present globally as per World Health Organisation (WHO) and if the current growth is not checked, then number of diabetes patient would exceeds 435 million in 2030, according to International Diabetes Federation (IDF).[3,4] WHO has already declared India as world capital of Diabetes.

Diabetic Nephropathy (DN) is the leading cause of chronic kidney failure all over the world.[5] Clinical hallmark of diabetic nephropathy include elevated blood pressure, elevated urinary proteins and abnormal renal function test.

It is one of the most significant long term complications in terms of morbidity and mortality for diabetic patient which usually present in 40-50% of diabetic patients out of which 20 % patient progress to End Stage Renal Disease (ESRD). Thus it points toward the certain population of diabetic patient who are susceptible for the development of diabetic nephropathy. The potential modifiable risk factors for the its development and progression are hyperglycemia, hypertension, and other minor risk factors including diabetic factor.[6]

It has been shown in various studies that alterations in levels of various elements lead to development of diabetes mellitus and its associated complications such as diabetic nephropathy. It has been suggested that perturbations in mineral metabolism are more pronounced when metabolic control is poor or if vascular complications are present. It has also been shown that excess of Cu lead to increase predisposition of vascular disease in diabetic patient.[7]

So we framed the hypothesis that alter levels of copper is the culprit for the development of diabetic nephropathy as the complication of diabetes. There also lack of studies regarding alter levels of copper in North Indian diabetic patient with and without Nephropathy.

### **Materials And Methods:-**

#### **Study design:-**

This hospital based observational case control study was done for the period of 3 years from 2013 to 2015 in the Department of Medicine with the collaboration of Department of Biochemistry, Lady Hardinge Medical College (LHMC) and Associated Hospitals, New Delhi. Institutional Ethical Committee approved our study design.

#### **Study Population:-**

Our study included 100 diabetic patients who had visited diabetic OPDs and routine OPDs of Department of Medicine, LHMC, New Delhi. Study population was divided into two groups. First group consisted of 50 diabetic patients with nephropathy and second group consisted of 50 diabetic patients without nephropathy.

#### **Inclusion criteria:-**

Known cases of type 2 diabetes mellitus for minimum period of 5 years of duration.

#### **Exclusion criteria:-**

Patient not willing to participate in the study, acute and chronic illness excluding diabetes mellitus, patient having hormonal abnormalities, drug intake history which have nephrotoxic effect and deleterious effect on glucose profile of diabetic patient were excluded from the study.

Bilingual and informed consent was taken from the patient and his relatives. Thorough clinical history and medical examination was done especially related to diabetes and diabetic nephropathy.

#### Sample collection:-

Five ml of venous sample was taken from the subject under sterile condition into plain vials without anticoagulant for routine and special investigations, anticoagulant containing purple cap vials for hemogram and NaF with anticoagulant containing grey cap vials for blood glucose profile. The plain vials were kept for half an hour for clotting. After clotting, the plain vials were centrifuged at the speed of 2000 RPM for 5 minutes. The serum was separated and aliquot into serum tubes. For routine biochemical investigations serum was sent immediately for analysis. For special investigation the serum was kept at -20°C for batch analysis of serum copper.

For assessing the status of diabetic nephropathy in the study population, we measured spot urine albumin creatinine ratio (U-A/C) and GFR. U-A/C values included Normoalbuminuria: <30 mg/g of creatinine, Microalbuminuria: 30-300 mg/g of creatinine and Macroalbuminuria: >300mg/g of creatinine. Cockcroft – Gault equation was used to assess GFR.[8]

Batch analysis was done to measure serum magnesium in the preserved samples by using fully AUTOMATED ANALYSER SYNCHRON BECKMAN CX-9 using standard reagent and kits. All kits were of centronic GmbH, Germany. Serum copper measurement was based on direct colorimetric method without deproteinisation in serum. In a pH 4.7 buffer system, copper is released from its carrier protein, the ceruloplasmin, and forms complexant 3,5-DiBr-PAESA[4-(3,5-dibromo-2-pyridylazo)-N-ethyl-N-(3-sulfopropyl)aniline] a stable complex. The colour intensity of this complex is proportional to the amount of copper in the sample. Lyophilised control serum was used. The colour so formed was red which was measured spectrophotometrically at wavelength of 582 nm. Reagent kit name-Copper REF 17106. Lot number -20299.

The normal values for serum copper was considered as 70 – 140 µg/dl for male and 80 – 155 µg/dl for female.[9]

#### Statistical Analysis:-

All data are expressed as mean  $\pm$  SD. (standard deviation) and statistical analysis was conducted using SPSS statistical package, version 20.0 (SPSS Inc., Chicago, IL, USA). A  $p$  value <0.05 was considered as significant. The Student's  $t$ -test was used to compare the mean between two groups for normally distributed data. Pearson's correlation was used to find out the correlation among the various parameters.

#### Results:-

Table 1 showing the renal function of study population which shows that group 1 had diabetic nephropathy as compare to group 2.

Table 2 showing that in group 1, mean serum copper level had significantly higher value than that of group 2.

On Pearson's correlation, serum copper was positively correlated with weight of subject ( $r = 0.263$ ,  $p = 0.009$ ), and negatively correlate with serum zinc ( $r = -0.263$ ,  $p = 0.009$ ).

**Table 1:- Renal profile of study population**

Parameters	Diabetic patient with nephropathy (n = 50)		Diabetic patient without nephropathy (n=50)		p value
	Mean	SD	Mean	SD	
U-A/C (mg/g)	130.7	46.72	18.37	4.99	<0.001*
GFR (ml/min)	62.16	24.74	108.44	7.96	<0.001*

\* $p$  value  $\leq 0.05$  is considered statistically significant.

**Table 2:- Serum Copper status of study population**

Parameters	Diabetic patient with nephropathy (n = 50)		Diabetic patient without nephropathy (n=50)		p value
	Mean	SD	Mean	SD	
Serum copper (mg/dl)	111.8	13.9	102.3	16.2	0.002*

\* $p$  value  $\leq 0.05$  is considered statistically significant. SD= Standard Deviation

#### Discussion:-

Diabetes mellitus is a chronic metabolic disorder which affects carbohydrate, lipid and protein metabolism. It has already taken pandemic in terms of number of diabetic patient. It lead to various complications, one of them is diabetic nephropathy which is responsible for chronic kidney failure in diabetic patients. This complication is responsible for high mortality and morbidity of the person suffering from type 2 diabetes mellitus.

There is need of finding the risk factor for development of diabetic nephropathy and its proper management, so that we can prevent the death from renal failure in diabetic individual.

In various studies, it has been seen that there is a strong relation between some specific oligoelements and diabetes mellitus.[10] It has been seen that altered serum copper (Cu) levels are associated with diabetes and associated complications.[11]

Diabetes complications associated with the increased free radical production leading to oxidative damage, and many of the pathological effects of copper overload are consistent with an oxidative damage to membranes or various macromolecules. Cu is involved in oxidation-reduction reactions and has a dominant role in diverse proteins such as cytochrome oxidase at the terminal end of the mitochondria electron transport chain. This divalent cation is also involved in super oxide dismutase activity. Copper has the capacity to form covalent bounds and it takes part in many redox processes. Copper ions are involved in generation of reactive oxygen species through Fenton reaction, having a pro-oxidant action.[12]

Copper ion is well known for cytotoxic effect due to its redox chemistry. Excess of copper aggravate the hyperglycemia which causes glycation of various protein and also displaces copper from copper binding site of protein and thus further aggravates the hypercuperemia, which lead to more oxidative damage to various tissue and organs.[13]

There are lots of studies done in serum copper levels in diabetic individual with and without complications, but still there is no uniformity in the results levels of copper in these patients. Our study result is in agreement with the study done by Rusu et al [14] and Noto et al [15] in which serum copper levels are increased in diabetic individual with complications such as diabetic nephropathy, but Prabodh et al found no difference of serum copper level in diabetic patient as compare to healthy control.[16] Moreover Hazzim et al showed in his study that serum copper levels are significantly decrease in diabetic patient with complications as compare to diabetic patient without complications.[17]

So our study hints toward the increase serum copper levels in diabetic patients with associated complications. Moreover we can treat the diabetic patient with copper specific chelator, so that various complications of diabetes mellitus including diabetic nephropathy could be prevented as it has been proven beneficial in various animal models.[18,19,20,21,22] Our study could give new insight for understanding the risk factor for development of diabetic nephropathy and also therapeutic modality could be develop to remove excess of copper ions from the diabetic patient, so that overall management of diabetic patient improves by decreasing various complication associated with copper induce oxidative stress.

Strength of our study is well characterised study population and standardized techniques to measures various parameters of the study.

**Limitations:-**

Our study had small sample size and study populations were selected from local area. Even it was hospital based case control study, so it would be difficult to predict cause and effect relationship.

**Suggestions:-**

Large prospective, interventional studies need to be undertaken to confirm the cause and effect relationship and to assess the protective role of supplementing copper chelator in human for preventing the development and progression of nephropathy.

**Conflict of Interest:-**

No conflict of interest to declare.

#### Abstract

Aldosterone is an essential hormone plays an important role in the regulation of plasma electrolytes in the body. In case of Pseudohypoaldosteronism, resistance to the action of aldosterone will cause certain electrolytes abnormalities in the form of hyponatremia and hyperkalemia associated with dehydration and metabolic acidosis. Skin and ophthalmological manifestations were reported in rare cases to be part of the type one primary inherited Pseudohypoaldosteronism and might consider a possible early approach to differentiate this condition from congenital adrenal hyperplasia in the neonatal period. We report a case of Pseudohypoaldosteronism in a newborn with a characteristic dermatological rash accompanied the acute attack with an association of a global developmental delay.

Copy Right, IJAR, 2016., All rights reserved.

#### Background:-

Pseudohypoaldosteronism (PHA) is a heterogeneous group of disorders that is characterized by electrolyte abnormalities due to renal tubular unresponsiveness or resistance to the action of aldosterone (1). Aldosterone is the major mineralocorticoid secreted by the adrenal gland (2). Nearly 90 percent of the mineralocorticoid activity is carried out by the aldosterone (2). It works on the renal tubules – mainly the principal cells of the collecting tubules and to a lesser extent on the distal tubule and collecting duct resulting in an increase of reabsorption of sodium and excretion of potassium (2). PHA type one is a rare inherited disease which can be either autosomal recessive or dominant. (3). Clinically, these patients present with renal salt wasting, hypovolemia, hyperchloremic acidosis and hyperkalemia despite the elevated level of aldosterone in plasma and urine (3). The autosomal dominant form is milder than the autosomal recessive (3). In the dominant type, there is aldosterone receptor resistance limited to the kidneys mainly (4).

The autosomal recessive type is considered a systemic disease (4). It involves the sweat glands, lungs and reproductive organs in addition to the kidney (4). PHA type 2 also known as Gordon Syndrome is characterized by hyperkalemic acidosis, hypertension and suppression of renin and aldosterone (3).

PHA symptoms are well known worldwide but the special feature in our case is that we found a generalized maculopapular rash in the skin that presents most commonly on the face and on the trunk. Four cases with a similar presentation to our patient have been reported and the cases were as follow. The first case was reported in 2007 in France, the child presented in the first days of life with a rash (5). The second case was in 2014 in Al-Kuwait, the child started to develop Miliaria rubra-like eruption on the 4<sup>th</sup> day of life (6). The same mother of the Kuwaiti child, 13

**Corresponding Author:-Ahmad Makeen.**

Address:-MBBS, Umm Al-Qura University, Makkah, Saudi Arabia.

months later, delivered a female baby who developed similar manifestations to her brother including the same characteristic rash over the face and trunk on day 2 of life(6). The third case was in 2015 in Turkey of a female baby, on the 7th day of life, she presented with a skin rash noted on her face, her arms and her chest(4). All these cases came with rash in addition to the other symptoms of PHA.

#### Case History:-

Our patient is an 11-month-old Syrian boy delivered as a spontaneous vaginal delivery, full term, with uneventful antenatal period. Parents are second-degree cousins. His weight at birth was 3200g, height 54cm and head circumference 36cm. He was stable, and after the initial screening tests, he was discharged with his mother with no specific complaint. Just 4 days later, he was admitted to the neonatal intensive care unit (NICU) with complaints of poor oral intake, excessive crying and multiple episodes of diarrhea. The patient was severely dehydrated, lethargic, cyanosed and afebrile. There was an obvious maculopapular skin rash covering all the body. He was then intubated and connected to a mechanical ventilator for 6 days and kept NPO for 8 days. He was on intravenous fluid and on total parenteral nutrition (TPN). Full septic workup was ordered and antibiotics started. Results of blood chemistry showed hyponatremia  $Na = 119.9 \text{ mEq/L}$  (135-145), hyperkalemia  $K = 9.44 \text{ mEq/L}$  (3.5-5) and hypercalcemia  $Ca = 12.6 \text{ mg/dL}$  (8.5-10.5). Patient received insulin with 10% dextrose, Ventolin, Ca gluconate and Na resonium for Hyperkalemia. These laboratory results raised the suspicion of congenital adrenal hyperplasia. Hydrocortisone and fludrocortisone were started. 17-hydroxy progesterone, plasma renin and aldosterone levels were sent. Vancomycin was added because gram positive cocci were found on the blood culture. Moreover, candida was also discovered and Amphotericin B was added. He became stable and he showed improvement in his blood chemistry results.

Figure 1:- maculopapular skin rash at crises

On day 11 after admission he again developed hyponatremia  $Na = 128 \text{ mEq/L}$  along with hyperkalemia  $K = 9.22 \text{ mEq/L}$ . Although 17-hydroxy progesterone hormone assay was elevated  $= 16.49 \text{ ng/ml}$  (1.70-4.00 ng/ml), however both plasma renin  $= 500 \text{ uIU/ml}$  (4.4-46) and aldosterone  $100 \text{ ng/dL}$  (2.2-35.3) levels were elevated. Abdominal Ultrasound show normal kidneys. These results raised the suspicion of diagnosis of PHA especially when our patient did not improve with both hydrocortisone and fludrocortisone.  $NaCl$  3% was given orally in addition to  $Na$  polystyrene. He stayed in the NICU for approximately 3 months then discharged. Since that time, he has been admitted to our hospital several times with similar symptoms of repeated vomiting, poor oral intake, fever, severe dehydration, hyponatremia and hyperkalemia along with generalized maculopapular skin rash that resolves after each attack. In addition, despite our patient is an 11 month-old, he has obvious developmental delay. He cannot sit without support. Also he uses mama and dada indiscriminately and the primitive reflexes are still present. There is a family history of death of two siblings (boy and girl) at 5 and 9 days of life with similar symptoms but no diagnosis.

was made at that time. He has other 4 living siblings with a good health status and without similar disease. This patient was noted to have frequent admissions (twice per week), but now when he has become a one year old, the admissions rate become less frequent once per month hoping that it will be more spaced in future.

**Figure 2:-** maculopapular skin rash after resolving

### Discussion:-

Usually in infants who come in their early days of life with symptoms of shock and dehydration associated with electrolyte disturbances of hyperkalemia and hyponatremia, congenital adrenal hyperplasia (CAH) must be ruled out. In our case, the diagnosis of CAH was suspected, therefore treatment with hydrocortisone and fludrocortisone were restarted. Although our patient showed some improvement especially with the correction of hyponatremia and hyperkalemia, however he presented again with similar symptoms a few days later. As a result, further investigations for the cause of these symptoms were indicated and hormonal analysis was sent. Renin and aldosterone levels were elevated and the diagnosis of PHA was suspected despite high level of 17-hydroxy progesterone hormone. Renal ultrasound was done to exclude secondary causes. NACL 3% and NA polystyrene were started with I.V fluid to correct electrolyte abnormalities and the patient started to improve dramatically.

Maculopapular rash which involves mainly the face and trunk is a characteristic feature that accompanied the acute attacks of the disease (sometimes upper and lower limbs were also involved). This rash is similar to that found in the literature and is a hallmark of the systemic type of PHA. It is not itchy, always disappears with management of acute attack and never leaves any pigmentation or scars. The rash does not respond to local steroid or lotion creams. It may be attributed to the increase concentration of sodium in the sweat which in turn leads to blockage and inflammation of exocrine sweat glands (4-6). We thought that there may be an underlying immune process that may be explained by the presence of the rash with each acute attack, high white blood cells count and rapid disappearance of rash after use of antibiotics and electrolytes correction. Fever is not always present.

No evidence of eye manifestations were noticed during the assessment of the child (no conjunctivitis, sclerositis, or eye discharge). However, the developmental review revealed a delay in the gross motor function (cannot sit without support), speech (say Dada, Mama indiscriminately) and the presence of primitive reflexes that are not consistent with his age. This might be due to a cerebral injury earlier in life and an underlying immune-compromised state.

The family history showed two previous deaths of two siblings of a different gender at 5 and 9 days of life who presented with similar symptoms but unfortunately resuscitation failed and no diagnosis was made at that time. The presence of four other living siblings with a good health support the diagnosis of the autosomal recessive systemic PHA.

**Conclusion:-**

Biochemical feature of congenital adrenal hyperplasia and Pseudohypoaldosteronism may be indistinguishable initially, especially with a delay in obtaining hormonal assay results. The skin manifestation may give an important diagnostic guideline in which this will influence the management and prevention of recurrence electrolytes disturbance. PHA type one can lead to salt losing crisis and life-threatening hyperkalemia. High dose of sodium supplementation and potassium binding resins are the standard treatment in such case.

Military expenditure; Economic growth;  
Developing countries; and SGMM  
Estimates.

#### Abstract

Several alarming and largely ignored trends in the structure and size and of military spending of less developed countries (LDCs) have appeared during the past five decades. This study analyses the defense-growth relationship for 54 developing economies by using cross-section data such as random effect, fixed effect and system GMM model. The empirical results, bearing in mind the possible inaccuracies of the data set and given the chosen model, suggest that defence spending has a positive relationship with both the rate of economic growth and population in the sample countries.

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

Since Benoit's (1973) seminal work, the relationship between military spending and economic growth in developing countries has been the subject of widespread empirical study. Theoretically, however, there is no clear-cut prediction of the relationship between defense spending and economic growth. On the one hand, military expenditure may retard economic growth through what is generally referred to as an investment "crowding-out" effect, or a displacement of an equal amount of civilian resource use. Otherwise, military expenditure may also stimulate economic growth through Keynesian-type aggregate demand impacts. An increase in demand generated by higher military expenditure leads to increased utilization of capital stock, higher employment and profits, and, therefore, higher investment, which further generates short-run multiplier effects. In addition, economic growth stimulates spin-off impacts such as the creation of socioeconomic structures conducive to growth (Deger, 1986).

Even though defense spending would affect economic growth through these mechanisms, Joerding (1986) mentioned that economic growth maybe causally prior to military spending. For instance, a country with high economic growth rates wishes to strengthen it against foreign or domestic threats by increased military spending. In contrast, it is equally plausible that countries with high economic growth divert economic resources from defense into other productive sectors such as education and health sectors (Kollias, 1997). It is also possible that military spending increase less than proportionally at low levels of GDP, then greater than economic growth at middle levels of per capita income, and, finally, less than proportionally again at very high levels of growth. This would yield a nonlinear response to economic growth and even an appearance of a negative relationship between the two variables for certain countries over various time periods.

**Corresponding Author:-Masoud Ali Khalid.**

Address:-College of Financial & Administration-Department of Accounting & IT, Cihan University/  
Sulaiymani, Kurdistan Region Government/Iraq.

With the end of the Cold War, global military spending has been reducing and it is predicted that this reduction in military spending will lead to peace dividends for less developed nations. But many less developed countries still spend a large amount of scarce resources on defence sector. For instance, 12.18% of central government expenditures are spent on military sector in lower and middle income nations in 2008 (World Development Indicator, 2011). A lacking of investment and expenditures in health, education and other social-economic activities, many LDCs' economic growth will be impacted by high military spending. For these reasons, the relationship between military spending and economic growth in less developed countries needs to be explored and analyzed carefully.

The purpose of this paper aims to investigate the military–growth nexus for 54 less developed countries in Africa, Latin America and South Asia over the period of 2005–2010. And, different panel data techniques including System GMM is used to estimate the results.

This article is organized as follows: Section 2 provides a brief literature review of the defence–growth nexus studies. Sections 3 and 4 give data and empirical results. Section 5 presents some conclusions.

### Literature Review:-

The literature on military spending and economic growth dated back to the seminal work by Benoit (1973) in which a positive relationship was found. Benoit's work inaugurated a vast array of studies in the hope of identifying a definitive pattern between the two variables (e.g. Fredericksen and Weede, 1986; Stewart, 1991; Ward et al., 1991; Mueller and Atesoglu, 1993; Murdoch et al., 1997; Yildirim et al., 2005) generally appeal to Keynesian economic theory to clarify their results. Included amongst the possible economic benefits of increased military spending are enhanced infrastructure, increased aggregate demand, heightened production, lower unemployment and a more skilled workforce (Chletsos and Kollias, 1995; MacNair et al., 1995).

Conversely, other studies conclude that heightened military spending exerts a negative relationship with economic growth due to a tendency to crowd out investment and the wider impacts of tax increases that are often necessary to finance the new expenditure (Smith, 1980; Cappelen et al., 1984; Dunne et al., 2001). Furthermore, other studies found that the relationship between military expenditure and economic growth might be mixed, such as (Chowdhury, 1991; Madden and Haslehurst, 1995; Lai et al., 2002; Wilkins, 2004) or non-existent relationship such as (Grobar and Porter, 1989; Alexander, 1990; Huang and Mintz, 1990; Adams et al., 1991; Ram, 1995).

Moreover, even where defense expenditure exerts a positive relationship with economic growth, it may nonetheless prove to a sub-optimal means of economic stimulation due to the greater effect exerted by non-military expenditure (Batchelor et al., 2000; Shieh et al., 2002). Both negative and positive relationship maybe mediated by a range of region and country specific factors that not only significantly complicate investigation into the relationship between military spending and economic growth, but also render any broad conclusions elusive. For instance, where increases in military spending occur during a time of war, additional variables such as the length and severity of the conflict and the degree to which economic agents are able to predict these factors and alter their behavior accordingly will also affect these relationship (Schneider and Troger 2003).

### Methodology And Data:-

#### The Data:-

In order to examine the military-growth relationship in the 54 developing countries over the period 2005-2010 and a balanced panel of time series data was constructed. The data set is balanced and the same time periods are available for all cross section units. The data are taken from the SIPRI Yearbooks for military expenditure (Stockholm International Peace Research Institute, various years) and the data on GDP and population are drawn from the World Development Indicator (WDI).

**Table I:-** variables descriptions: Annual data: (2005-2010; N=54)

Variable	Description	Source
ME	Military expenditure	SIPRI (2010)
RGDPC	Real Gross domestic product per Capita	WDI (2010)
POP	Population	WDI (2010)
Algeria, Benin, Bolivia, Botswana, Burkina Faso, Cambodia, Cameroon, Central African, Chad, Chile, China, Colombia, Congo, Cuba, Dominican, Ecuador, El Salvador, Fiji, Gabon, Gambia, Guatemala, India, Indonesia, Iran,		

Jordan, Madagascar, Malawi, Malaysia, Mali, Malta, Morocco, Mozambique, Nepal, Niger, Nigeria, Pakistan, Panama, Papua Guinea, Paraguay, Peru, Rwanda, Saudi Arabia, Senegal, Sierra Leone, South Africa, Sri Lanka, Sudan, Syria, Thailand, Togo, Tunisia, Uganda, Uruguay, Zambia.

### Econometric Methodology:-

The empirical specification of this study is aimed at explaining the military- growth correlation in the less developed nations. Thus, the empirical model employed in the analysis is as follows:

$$ME_{it} = \alpha_1 + \alpha_2 ME_{it-1} + \alpha_3 RGDPC_{it-1} + \alpha_4 POP_{it-1} + \lambda_i + \varepsilon_{it}, \quad i = 1, \dots, N; t = 1, \dots, T \quad (1)$$

Equivalently, Eq. (1) may be written as follows:

$$ME_{it-1} = \alpha_1 + \alpha_2 ME_{it-2} + \alpha_3 RGDPC_{it-1} + \alpha_4 POP_{it-1} + \lambda_i + \varepsilon_{it-1}, \quad i = 1, \dots, N; t = 1, \dots, T \quad (2)$$

Where  $ME$  is military expenditure,  $RGDPC$  is real gross domestic product (GDP) per capita,  $POP$  is population, and the subscripts  $i$  and  $t$  index countries and time, respectively. In addition, the specification also contains an unobservable country-specific effect  $\mu$  and error-term  $\varepsilon$ .

Moreover, in this paper we employ Generalized Method of Moments (GMM) which is a semi-parametrically efficient estimation model and since Hansen (1982) has established its large sample properties, GMM has gained abundant deal of attention in the field of economics. The GMM methodology begins from a set of over-identified population of moment conditions and seeks to find an estimator that minimizes a quadratic norm of the sample moment vector.

The resulting estimation has been shown to be consistent and asymptotically normal under many circumstances. However, the GMM first difference estimator suffers from a significant weakness. Blundell and Bond (1998) found that when the independent variable is persistent over time, lagged levels of these variables are weak instruments for the regression equation expressed in first differences. Blundell and Bond (1998) also found that the instrument variable used with the first-difference GMM method (i.e. the endogenous variables lagged two or more periods) become less informative in models where the variance of the fixed effects is mainly relative to the variance of the transitory shocks. This is likely to lead to biased coefficients, and the issue is generally intensified in small samples size. To avoid this bias, Blundell and Bond (1998) suggested a system GMM (SGMM) estimator.

This method essentially combines in a system the first-differenced with the same equation expressed in levels. The instruments for the regression in differences are the same as those labeled above, while the instruments for the equation in levels are lagged differences of the corresponding variables. The main advantage of the SGMM method comprises in the fact that unlike (between or within - first differences) approaches, it does use the estimation in levels for estimation and this exploits not only the variation in data but also between the countries as well. It therefore allows preserving more information to identify the parameters of interest. Arellano and Bond (1991) display on the basis of Monte-Carlo simulation that this additional information results in a considerable gain in the precision of the estimates.

### The Empirical Result:-

Our sample countries include 54 less developed nations for which data are available for over period 2005–2010. We report first estimates of Eq. (3) for the whole sample period with the standard panel data estimates, cross section estimates, random effects models REM, between and within the fixed effects models. Moreover, we shall use the systems GMM approach (SGMM) of Blundell and Bond (1998) in which the specifications in the first-step GMM, second-step GMM with robust SE of the variables are estimated simultaneously. Estimates with these alternative methods are illustrated in Table II. Two sets of subsample estimates with REM and SGMM are reported in Table III and Table IV.

In order to specify whether a fixed and random effects model are appropriate for our study we performed the Hausman test which is distributed as  $\chi^2$ , where the degrees of freedom are equal to the number of regressors. The results illustrate that the fixed effects model is rejected, and this finding is consistent with Murdoch et al. (1997)

since random effect models are considered more appropriate than fixed effect models. Thus, the fixed effects model is not necessary in our case. Parameter estimates from the random effect and fixed effect are presented in Table II and Table III for the 54 less developed countries. The results obtained, similar to Smith and Dunne (2001); who positive and significant correlation economic growth and military.

Furthermore, we have employed System GMM analysis based on balanced data-set, to examine the military-growth relationship in the context of different political and welfare less developed nations. We have used an AR (1) and an AR (2) model to capture the persistence in our sample data. Moreover, AR (1) and AR (2) models are desirable based on the Arellano and Bond (1991) test for AR (2).

The system GMM estimation results of this study, presented in Table IV, and it indicates that there is a positive relationship between military expenditure, economic growth and population for the rest of the sample countries, and it's statistically significant, it means that, when economic growth, it encourages military sector to spend more on it, and also population is directly related to economic growth, meaning that when population increase, it rises military expenditure in the developing countries. All diagnostics for the models in each table is satisfactory. Generally, GDP and population are positively related with military spending in this study, and all variables are statistically significant at different level such as the 1%, 5% and 10% level. The results illustrate that as economic growth (GDP) and population are increase military expenditures as a percentage of government expenditures are increased as well. Furthermore, this finding suggests that military spending plays a significant role in the less developed nations despite of many problems such as civil war, conflicts and border tensions, and this result supported by earlier works done by Benoit (1973&1978) for 44 developing nations. Moreover, our findings are also confirmed and supported by Ali's (2007) findings in the developing countries. Moreover, these net positive relationships support the belief that military spending and economic growth are related through an expansion of aggregate demand in less developed countries. Moreover, investment in infrastructure and human capital development in LDC economies operating below full employment thus, it has positive Benoit-type spillover impacts from military expenditures. There is less evidence to suggest that military spending in developing nations negatively related to economic growth. The positive impacts that arise when relationship runs from economic growth to military spending imply that many LDCs are still at a stage where military expenditures are constrained by low income and will grow along with the economy. They are not yet in a position to have defense expenditures grow less than proportionally with economic growth.

Notes: All models are estimated using the Arellano and Bond dynamic panel GMM estimations (Stataxtabond command). The variables are defined as follows: ME = Military expenditure; RGDPC = real GDP per capita (in US dollars; POP = Population. Figures in the parentheses are *t*-statistics. (\*), (\*\*), (\*\*\*) indicate significance at 1%, 5%, 10% respectively. Time dummies were jointly significant and are not reported here to save space.

### Conclusion:-

The defense–growth relationship has been an issue of keen concern in defense economics and there is a huge amount of the literature investigating the military-growth relationship in less developed nations. However, the existing literature is inconclusive as to the military-growth relationship due to applying different theoretical models, different empirical techniques and different samples. This paper examines the relationship between defense expenditure and economic growth in 54 developing countries. Our panel regressions present reasonable and robust results by applying more recent econometric techniques such as the dynamic panel System GMM estimators. The empirical panel results show that defense spending has a significant and positive relationship with economic growth in 54 sample developing countries.

Thus, the empirical estimations support the positive relationship between defense spending and economic growth, and they are consensus of Kollias (1997) and Ali (2012). Furthermore, proper regression model and more advanced econometric methodologies do improve empirical results in this article which could make contributions to the defense economics literature.

#### Introduction:-

##### A rare case report

#### Introduction:-

A 40 year old Hindu female, housewife, with 2 children, of thin body build presented with chief complaints of shortness of breath for one year, which was progressive in nature and of MMRC grade II severity. She also complained of on off cough with scanty expectoration.

#### History of past illness:-

Her history of past illness revealed that she was on and off symptomatic since long with recurrent respiratory tract infections which got relieved with medications from local physicians.

She was not a known case of Pulmonary Tuberculosis / Diabetes Mellitus / Hypertension / Chronic Kidney Disease / Sickle Cell Disease.

She had no addictions.

#### General examination:-

On general examination, she was found to be febrile (temperature – 101.2 degree Fahrenheit). She had mild pallor and clubbing (grade II). Her pulse rate was 110 / minute, oxygen saturation was 86% at room temperature and her blood pressure was 100 / 60 mm Hg. Her respiratory rate was 32 / minute.

#### Examination of the respiratory system:-

Her respiratory system examination revealed that there was shifting of trachea to the left side. There was crowding of ribs on the left side. Diminished vesicular breath sounds were heard over left infrascapular and infra-axillary areas. Coarse crepitations were heard in the same areas.

#### Investigations:-

On investigations, her complete haemogram revealed a total leucocyte count of 12,600 / cumm. A differential count of neutrophils – 80 %, lymphocytes – 17 %, eosinophils – 3 %. Her haemoglobin was 8.2 gram %, her fasting blood sugar was 90 milligram / deciliter. Her blood urea was 27 milligram / deciliter and serum creatinine was 0.9 milligram / deciliter. Her ELISA test for HIV was negative.

**Corresponding Author:- priyanka das.**

Address:- M.d pulmonary medicine, Dept. Of pulmonary medicine, Mkcg behrampur.

Two of her sputum samples for AFB( acid fast bacilli) tested negative. Sputum for gram stain revealed gram positive cocci in chains. Sputum for culture / sensitivity revealed Streptococcus pneumonia sensitive to Amoxycillin, Piperacillin, Ofloxacin, Ceftazidime, Ceftriaxone and Cefaperazone.

**Provisional diagnosis:-**

With the patient's chief complains, present and past history, general and Systemic examinations, and investigations, our provisional diagnosis was " Bronchiectasis of the Left lung ( lower lobe )".

We then proceeded further with the imaging studies such as chest X – Ray ( postero anterior view), Contrast enhanced computerized tomography of the lungs followed by Bronchoscopy.

**Imaging studies:-**

CHEST X-RAY POSTERO ANTERIOR VIEW – revealed features of loss of lung volume of left lung and shifting of mediastinum to left side with cystic lesions in the left lower lobe.

**Ultrasound of thorax, abdomen and pelvis:-**

revealed there was no pleural effusion. No abnormality was detected in abdomen and pelvis.

**Contrast enhanced computerised tomography of chest:-**

revealed decreased volume of left lung with multiple cystic lesions and shifting of trachea to the left. There was compensatory hyperinflation of the right lung with herniation to the left.

**Chest x-ray pa view:-**

Features of loss of lung volume on the left side Shifting of trachea to left side Cystic lesions changes in the left lower lobe Hyperinflation and herniation of the right lung.

**Cect Of Chest:-**

Decrease volume of left lung with multiple cystic lesions Shifting of trachea to left Approximation of ribs on left side.

#### Non contrast ct study shows

Decrease vol. of left hemithorax Shifting of trachea & mediastinum to left Trachea normally divided to left and right bronchus.

#### Diagnosis:-

Unilateral left pulmonary hypoplasia with bronchiectatic changes. The diagnosis was confirmed with bronchoscopy which revealed the underdevelopment of left bronchial tree.

### Discussion:-

Hypoplasia of lung is a rare congenital anomaly in which gross morphology of lung is unremarkable ,but in which there is decrease in number or size of airways,vessels & alveoli.

Bronchiectatic changes have also been reported in the hypoplastic lung.

Development of the bronchial tree takes place at about 26<sup>th</sup> to 31<sup>st</sup> day of intrauterine life.

Monaldi divided the maldevelopment of lung in four groups.

Group I: No bifurcation of trachea

Group II: Only rudimentary main bronchus

Group III: Incomplete development after division of main bronchus.

Group IV: Incomplete development of subsegmental bronchi & small segments of the corresponding lobe.

**According to Boyden there are three degrees of maldevelopment**

### Agenesis:-

Complete absence of one or both lungs with no trace of bronchial or vascular supply or of parenchymal tissue

**Aplasia:-**

Suppression of all vascular supply & parenchymal tissue but a rudimentary bronchus that ends in a blind pouch

**Hypoplasia:-**

It refers to deficient or incomplete development of parts of the lung, resulting in an abnormally low number or size of bronchopulmonary segments or alveoli.

**Epidemiology:-**

The true prevalence is not well known (1.4% of all births according to Knox), but in cases of premature rupture of membranes at 15 - 28 weeks gestation, the reported prevalence of pulmonary hypoplasia ranges from 9 to 28%.

**Aetiology:-**

Causes can be primary or secondary. Secondary causes are more common. Secondary causes can be intra or extrathoracic

**Intra-thoracic causes:-**

congenital diaphragmatic hernia - most common intrathoracic cause extralobar sequestration agenesis of the diaphragm mediastinal mass(es) / tumour(s) mediastinal teratoma decreased pulmonary vascular (arterial) perfusion from a congenital cardiovascular anomaly - e.g tetralogy of Fallot unilateral absence of the pulmonary artery.

**Extra-thoracic causes:-**

oligohydramnios

Potter sequence

preterm premature rupture of membranes (PPROM)

skeletal dysplasias - especially those causing a narrow fetal thorax thanatophoric dysplasia

achondrogenesis

osteogenesis imperfecta

short rib polydactyly syndrome

Main differential diagnosis of hypoplastic lung is SWYER-JAMES SYNDROME which refers to hyperlucent lobe or lung and functionally by air trapping during expiration initiated by viral bronchiolitis.

#### **Pathological Diagnosis Of Pulmonary Hypoplasia:-**

is done by taking fresh lung weight, fixed lung volume, radial alveolar count and estimates of tissue maturity. Precise characterization of the morphological changes is best performed by morphometric measurement after inflation of the lungs to a known transpulmonary pressure.

In the autopsy specimens, hypoplastic lungs are smaller, weigh less than normally expected for their age. There is decrease in number of size of alveoli. Abnormalities of **pulmonary arterial system** have also been identified in the pathology specimens consisting of decrease elastic tissue in the larger arteries. There is Increased muscle in normally muscular arteries and extension of muscle into non-muscular arteries.

#### **Radiographic Findings:-**

There is partial or total absence of aerated lung in one or both hemithorax and approximation of ribs. There is also elevation of ipsilateral diaphragm and shifting of the mediastinum. In most cases the contralateral lung is over inflated & displaced along anterior mediastinum into the involved hemithorax.

Although both conditions are associated with decreased lung volume on one side, Swyer-james syndrome demonstrate air trapping on radiographs or HRCT scans performed at the end of maximal expiration.

#### **Clinical Findings:-**

depend on degree of pulmonary abnormality and presence of other congenital malformations. Usually, however the patient is symptomatic & may present during childhood or adult life. Diagnosis may be established with chest x-ray, computerized tomography of thorax, fiber optic bronchoscopy, and if possible pulmonary angiography.

The diagnosis may sometime be done antenatally by USG, DOPPLER or MRI.

#### **Antenatal Ultrasound:-**

It may show the presence of oligohydramnios and / or also show any of the causative anomalies. Several sonographic parameters may give indirect clues as to the presence and extent of pulmonary hypoplasia.

Fetal lung head ratio - reduced (ratios less than 1 usually indicate a poor prognosis) Fetal chest circumference (or thoracic circumference - TC) below 5<sup>th</sup> percentile - is reduced in the case of intra-thoracic causes, however both these parameters can be normal.

#### **Magnetic Resonance Imaging:-**

It is being increasingly used to predict the presence of pulmonary hypoplasia.

#### **Factors used for prediction are -**

Fetal lung volume

The relative lung volume

The ratio of lung volume to body weight

#### **Computerised Tomography Scan:-**

Is being used to assess the degree of underdevelopment and to differentiate hypoplasia from other conditions that may closely mimic it radiographically such as atelectasis from other causes and severe bronchiectasis with collapse and advanced fibrothorax.

#### **Treatment:-**

Treatment of hypoplasia is in form of medical as well as surgical care both before & after delivery.

Before delivery it is usually directed towards correcting maternal conditions.

After delivery respiratory support is given ranging from oxygen to mechanical ventilation including ECMO (Extracorporeal membrane oxygenation). Surfactant administration at 4ml/kg - has been reported to increase

survival rate In adults treatment consists of control of infections & other symptomatic treatment in the form of expectorants & bronchodilators.

Management of other complications are done accordingly.

**Conclusion:-**

Whenever a patient presents with progressive dyspnea ,recurrent respiratory tract infections and unilateral small hemithorax ,PULMONARY HYPOPLASIA should be kept in mind as an important diagnosis, although it is a very rare condition.

It is important to spread this vital message amongst the medical fraternity .

#### Introduction:-

Bladder cancer is the second most common cancer of the genitourinary tract. It accounts for 7% of new cancer cases in men and 2% of new cancer cases in women. The incidence is higher in whites than in African Americans, and there is a positive social class gradient for bladder cancer in both sexes. The average age at diagnosis is 65 years, with approximately 75% of bladder cancers are localized to the bladder, 25% have spread to regional lymph nodes or distant sites. *A detailed study of bladder cancer cases registered from 2005 to 2010 in our tertiary care hospital revealed that bladder cancer ranks as the 7<sup>th</sup> leading cancer and 5.9% of all prevalent cancers in the Kashmiri population(1).*

#### TNM Staging System:-

The TNM staging system is the most commonly used system. Table 13 (a and b)

#### Clinical features:-

Hematuria (painless) is the presenting symptom in 85–90% of patients with bladder cancer. It may be gross or microscopic, intermittent rather than constant. In a smaller percentage of patients, it is accompanied by symptoms of vesical irritability: frequency, urgency, and dysuria. Irritative voiding symptoms seem to be more common in patients with diffuse CIS. Symptoms of advanced disease include bone pain from bone metastases or flank pain from retroperitoneal metastases or ureteral obstruction. Patients with large-volume or invasive tumors may be found to have bladder wall thickening or a palpable mass—findings that may be detected on a careful bimanual examination under anesthesia. Hepatomegaly and supraclavicular lymphadenopathy are signs of metastatic disease. Lymphedema from occlusive pelvic lymphadenopathy may be seen occasionally. The most common laboratory abnormality is hematuria. It may be accompanied by pyuria, which on occasion may result from concomitant urinary tract infection. Currently, urine cytology is the standard non-invasive marker. In a recent literature reviews, specificity of cytology ranged from 83% to 99.7% with a mean  $\pm$  standard deviation (SD) of 99% and sensitivity ranged from 20% to 53% with a mean  $\pm$  SD of 34%(02).

#### Other tumor markers.

- ImmunoCyt/uCyt+ test .
- BTA TRAK Assay .
- BTA Stat Test .

- iv. NMP22 assay .
- v. NMP22 BladderChekTest .
- vi. UroVysion Test .
- vii. sCD147: A new marker sCD147 also known as (EMMPRIN extracellular matrix metalloproteinase inducer), tumor collagenase stimulatory factor (TCSF), Hab 18 G, OX-47, Neurothelin, Basigin(03) is a cell surface protein which is broadly expressed on human peripheral blood cells, endothelial cells, cultured cells of hemopoetic and non hemopoietic origin. Thymocytes strongly express sCD147 (04), significant expression of sCD147 has also been reported in neoplasms of urinary bladder, liver and lung (05).

Various imaging modalities can detect bladder tumors but their presence is confirmed by cystoscopy and biopsy. Superficial (Ta, Tis) bladder cancers are staged with a properly performed TUR. However, higher stage lesions are often understaged, and the addition of imaging by CT and magnetic resonance imaging (MRI) or both have been used to characterize the extent of bladder wall invasion and detect enlarged pelvic lymph nodes, with overall staging accuracy ranging from 40% to 85% for CT and from 50% to 90% for MRI (06,07). The diagnosis and initial staging of bladder cancer is made by cystoscopy and transurethral resection (TUR). Superficial, low-grade tumors usually appear as single or multiple papillary lesions. Higher grade lesions are larger and sessile. CIS may appear as flat areas of erythema and mucosal irregularity. Use of fluorescent cystoscopy with blue light can enhance the ability to detect lesions by as much as 20% (08). Assessment of molecular markers of disease, with immunohistochemical methods, in biopsy specimens, or in cystectomy specimens can yield useful prognostic information.

#### **Treatment [table 14]**

##### **CD147 (EMMPRIN):**

CD147 is a member of the immunoglobulin family of receptors. Members of this family play a role in intercellular communication involved in many immunorelated functions, differentiation and development. CD147 plays a role in spermatogenesis, lymphocyte activation, expression of monocarboxylate transporters (MCT) and has been identified as a regulatory subunit of the  $\gamma$ -secretase complex in Alzheimer's disease amyloid  $\beta$ -peptide production (09, 10-13). CD147 is involved in the transport of the MCT-1 and MCT-3 to the plasma membrane since reduced accumulation of these transporters has been observed in the retina of *cd147* knockout mice. CD147 has been implicated in many pathological processes, such as rheumatoid arthritis, experimental lung injury, atherosclerosis, chronic liver disease induced by hepatitis C virus, ischemic myocardial injury and heart failure (12). Treatment of transplant patients with a CD147 antibody was effective due to inhibition of T-cell activation (14).

The *emmprin* gene consists of seven exons and six introns spanning 7.5 kb. The 5' upstream sequence of the *emmprin* gene contains no TATA or CAAT box but has a CpG-rich island. A 470-bp fragment upstream of the coding region of *emmprin* has been shown to promote its transcription. A 30-bp element of this sequence (-142 to -112 bp) which contains a binding site for Sp1, was also demonstrated to be important for *emmprin* transcription. CD147, a transmembrane protein of the immunoglobulin (Ig) superfamily and has many designations such as M6, Neurothelin, 5A11, HT7, OX-47, CE9, EMMPRIN, Basigin, and gp42. The transmembrane region harbors a leucine zipper and a charged residue (glutamic acid). The corresponding gene is located on chromosome 19p13.3 and encodes a 29 kDa backbone protein. Three *N* glycosylation sites have been identified and migration on sodium dodecyl-sulfate polyacrylamide gel electrophoresis (SDS-PAGE) occurs between 39 and 65 kDa depending on the degree of glycosylation. Weak expression has been noted on resting T lymphocytes, whereas expression is increased on activated T lymphocytes and monocytes (15-20).

##### **Expression of CD147 in Cancer:-**

High incidence of expression of CD147 in different cancer entities making use of tissue microarrays and monoclonal antibodies (mAb) MEM-M6/1. A lot of 2348 and 608 tissue samples covering 129 distinct tumor types and 76 different normal tissues, respectively, were investigated for their CD147 status with these antibodies. CD147 expression was found in 112 out of 129 tumor entities with the following incidences: squamous cell carcinomas (60-100%), pancreatic (87%), chromophobe kidney (83%), hepatocellular (83%), medullary breast (83%) and glioblastoma multiforme (79%). Homogeneous expression of CD147 was found in tumor types such as squamous cell carcinoma of different types of organs and mesotheliomas. Interestingly, CD147 isoforms differing in presence or absence of Lewis X glycan structures were found on breast cancer cells. A lot of 28 tissue microarrays and 1117 pathological sections of breast tissue samples were analyzed. The incidence of CD147 expression was: cancer of the liver 80% (n=20), lung 62% (n=90), stomach 66% (n=44), colon 58% (n=19), rectum 59% (n=17), breast 64% (n=1055), cancer 80% (n=10), brain 90% (n=52), oesophagus 87% (n=16), ovary 75% (n=40), urinary bladder 85%

(n=41), skin (squamous cell carcinoma) 58% (n=41), larynx 85% (n=63) and kidney 73% (n=33), and 30% of sarcomas such as osteo, chondro- and fibrosarcoma (n=102).

It has been shown that CD147-positive tumor cells and their supernatants induce expression of MMPs such as MMP-1, MMP-2, MMP-3, MMP-9 and MMP-11, in cultured fibroblasts (21,22,23). Therefore, CD147 is also designated as extracellular MMP inducer (EMMPRIN). It was shown that MMP induction can also be mediated by soluble CD147. Soluble CD147 also has been detected in microvesicles (exosomes)(24). CD147 can also be induced in tumor cells by epidermal growth factor receptor (EGFR)-mediated signaling (autocrine mechanism). Controlled degradation of the extracellular matrix is a prerequisite for tumor invasion and metastasis. Transfection of breast cancer cells with *CD147* resulted in increased tumor growth and metastasis after implantation into the mammary gland and correlated with high levels of MMP-2 and MMP-9. The molecular mechanisms of these phenomena have been poorly resolved. Glycosylated CD147 was shown to be a prerequisite for MMP induction at the transcriptional level(25). Induction of MMPs by CD147 was prevented with a monoclonal antibody directed against CD147(25).

#### **Role in MMP dependent and independent Angiogenesis:-**

It was found that CD147 expression was significantly upregulated in activated human umbilical venule endothelial cells (HUVEC's). Inhibition of CD147 expression by RNAi led to significantly decreased angiogenesis *in vitro*. CD147 may regulate angiogenesis by several mechanisms including proliferation, survival, MMP secretion and phosphoinositide 3 kinase/protein kinase B (PI3K/Akt) activation. Modulation of remodeling of the extracellular matrix by MMPs and its impact on angiogenesis is a wellknown phenomenon. CD147 is involved in the induction of vascular endothelial growth factor (VEGF). CD147 stimulates VEGF production in tumor and stromal compartments and VEGF induction involves the PI3K/Akt pathway.

#### **Role of CD147 as an Anti apoptotic Protein and Mediator of Chemoresistance:-**

In several cancer cell lines, CD147 has been identified as a mediator of anti-apoptotic function and chemoresistance. In HO-8910 ovarian carcinoma cells, *CD147* RNAi reduces tumor cell invasion, tumorigenicity and chemosensitivity to paclitaxel. Up-regulation of CD147 has been observed in several multidrug-resistant cancer cell lines. Independently, involvement of CD147 in resistance of cancer cells to a variety of chemotherapeutic agents was reported. In addition, CD147 was identified as a receptor which promotes androgen-independent growth of tumor cells in hyaluronan-dependent manner. In human oral squamous carcinoma cells (SCC), CD147-directed RNAi reduced X-chromosome linked inhibitor of apoptosis protein (XIAP) expression and increased chemosensitivity to 5 fluorouracil. In breast cancer cell lines, it was shown that CD147 confers resistance to anoikis as demonstrated by activation of caspase 3, increased DNA fragmentation and lower cellular viability. Silencing of CD147 resulted in elevation of Bim protein levels. Treatment of cells with a MAP/ERK kinase (MEK) inhibitor (UO126) or a proteasome inhibitor (epoximycin) also induced Bim-1 accumulation and rendered cells sensitive to anoikis. These results suggest that CD147 protects cancer cells from anoikis and that this effect is mediated at least in part by a MAP kinase-dependent reduction of Bim. It has been shown that expression of CD147 leads to activation of ERK which phosphorylates proapoptotic Bim, resulting in degradation of Bim by the proteasome. Down-regulation of Bim suppresses anoikis and promotes survival of tumor cells detached from matrices as a prerequisite for cancer cell invasion and metastasis. CD147 was shown to stimulate hyaluronan production. Hyaluronan-tumor cell interaction is implicated in multidrug resistance due to activation of the PI3K/Akt pathway. Furthermore, it was demonstrated that CD147 is a mediator of multidrug resistance through hyaluronan-mediated upregulation of ErbB2 signaling and cell survival pathways.

#### **CD147 Association with Cyclophilins (Cyps):-**

Cyps are a family of proteins that share peptidyl-prolylcis-trans isomerase activity which is involved in their chaperone function. However, there is also evidence that Cyps are involved in intracellular communication. Cyps are located intracellularly as well as extracellularly. A role of CypA in cancer is supported by the finding that CypA and macrophage inhibitory factor (MIF) are the most dominantly expressed proteins in non-small cell lung carcinoma and a novel cyclophilin similar to CypA has been associated with metastasis and shown to be overexpressed in bladder cancer, hepatocellular carcinoma, sarcoma and breast carcinoma.

#### **CD147 as a Target for Treatment of Cancer:-**

The molecular interactions of CD147 with associated proteins are poorly defined, interference with small molecules is presently in the focus of drug development. The most obvious mode of intervention is to block CD147 function with mAbs. RNAi-mediated intervention would need more progress regarding the targeted delivery to cancer cells.

A critical issue is the broad expression of CD147, requiring toxicity studies for mAbs in a cross-reactive species. The function of CD147 as a mediator across the blood brain barrier would call for appropriate experiments for a therapeutic mAb. On the other hand, dependence of tumor cells on energy supply by anaerobic glycolysis (Warburg effect) and inhibition of the latter by CD147 mAbs which disrupt interaction with MCT and amino acid transporters makes tumor cells vulnerable to modulation of CD147 function. However, CD147 clearly impacts on invasion, proliferation, angiogenesis, tumor cell metabolism such as glycolysis, and mediates prosurvival signals, multi-drug resistance and PI3K/Akt signaling, which are all hallmarks of oncogenesis.

Studies conducted by Han ZD *et al* in 2010(26) and R. Nawrothin 2010(27) concluded that emmprin can be promising target in the treatment of bladder cancer.

Material and methods:

In this study total of 32 patients were included. These patients were first evaluated for bladder cancer. The first sample was taken pre operatively at the time of admission and these patients were subjected to trans urethral resection of bladder tumor (TURBT). These patients were followed up for 3-5 months and second sample was taken. Same numbers of BHP cases were taken as control group.

#### Collection of samples:-

Peripheral blood (4ml) was collected from patients by venipuncture, following universal precautions and all aseptic conditions, in sterile serum collection tubes and allowed to clot. The tubes were subjected to centrifugation at 2500rpm for 5 minutes to separate the serum. The clear serum so obtained was aspirated using disposable plastic droppers and poured in 1.5ml microfuge tubes after proper labeling and stored at -20°C till assayed for sCD147 levels.

#### Test procedure:-

- (I). The standards and controls were prepared as described in the assay protocol and 0.1 ml of each standard and controls were dispensed in the respective wells.
- (II) 0.1ml of patients sample was dispensed in each designated well in the ELISA microplate.
- (III). The ELISA microplate was covered and incubated at 37°C for 90 mins.
- (IV). The contents of the plate were discarded and plate was blotted on to the absorbent paper.
- (V). 0.1ml of biotinylated anti-human Emmpirin antibody working solution was added to each well and plate was incubated at 37°C at 60 mins.
- (VI). The microplate wells were washed three times by wash buffer using an automated washer.
- (VII). The microplate wells were blotted on an absorbent paper and 0.1ml of Avidin-Biotin-Peroxidase-Complex working solution was added to each well and plate was incubated at 37°C for 30 mins.
- (VIII). Washing cycle was repeated five times as described above.
- (IX). 90µl of prepared Tetra Methyl Benzoate substrate solution was added to each well and plate was incubated at 37°C for 25-30 mins in dark.
- (X). The reaction was stopped by adding 0.1ml of stop solution to each well.
- (XII). The absorbance of the respective wells of the was recorded immediately at 450nm using an automated ELISA reader, which recorded the absorbance and calculated the corresponding concentration of sCD147 in the respective wells.

#### Observation:-

A total number 32 patients were subjected to evaluation for sCD147. The clinocopathological features of this study were:

##### Based on gender. Table 1

Bladder cancer was more common in males (24/32=75%) as compared to females (8/32=25%)

##### Based on age. Table 2

Out of 32 cases 20 were >50 yrs of age and 12 were ≤50 yrs of age.

##### Based on smoking. Table 3

Based on smoking status, out of 32 cases, 18(56.3%) cases were smokers and 14(43.7%) were non smokers respectively.

##### Presenting symptom. Table 4

On the basis of presenting symptoms 30(93.75%) presented with hematuria, 25(78.1%) presented with pain, 3(9.3%) presented with retention of urine 5(15.6%) had other symptoms respectively.

**Histopathological stage. Table 5**

Based on histopathological stage out of 32 cases, breakup is as, stage I 4(12.5%) cases, stage II 16(50%) cases, stage III 11(34.4%) cases and stage IV 1(3.12%) cases respectively.

**Lymph node involvement. Table 6**

Out of 32 cases only 1 case had lymph node involvement.

**Metastasis.**

Out of 32 cases only 1 had metastasis.

**Evaluation of sCD147.**

32 patients of bladder tumor showed mean preoperative plasma concentration of 1.0751 and controls had a mean of 1.07343. [Table 7]

**Preopvs postop: Table 8**

Mean preoperative and post-operative sCD147 levels were compared and showed significant results ( $p < 0.001$ ).

**Stage I Preopvs postop. Table 9**

Mean stage I preoperative and post-operative sCD147 levels were compared and results were not statistically significant.

**Stage II Preopvs postop. Table 10**

Mean Stage II preoperative and post-operative sCD147 levels were compared and showed statistically significant results ( $p = 0.017$ ).

**Stage III Preopvs postop. Table 11**

Mean Stage III preoperative and post-operative sCD147 levels were compared and showed statistically significant results ( $p < 0.001$ ).

**Preop intra stage-wise comparison. Table 12**

Stage wise comparison of mean sCD147 levels showed statistically significant results between stage I vs stage III and stage II vs stage III ( $p < 0.05$ ).

The suitable statistical tests like Students independent 't' test and paired 't' test have been used to analyse the data. Moreover Analysis of Variance (ANOVA) have been employed to measure the significant difference of the means in the three groups. All the results have been discussed statistically at 5% level of significance i.e, p value  $< 0.05$  considered significant. The variables have been represented with mean  $\pm$  SD and appropriate statistical charts.

**Discussion:-**

Bladder cancer is one of the common cancers worldwide. It was estimated that in 2005, 63,210 new cases of bladder cancer were diagnosed in the United States (Jemal et al, 2005)<sup>(28)</sup>. In our study bladder cancer was found more common in males (75%) as compared to females (25%). This is consistent with the study by Jemal et al, 2005<sup>(28)</sup>. Bladder cancer was found nearly three times more common in men than in women. Bladder cancer is a multifactorial diseases process. Incidence of disease increases with age and is more common in elderly  $> 60$  yrs of age. We also found that bladder cancer was more common in elderly age group. In our study bladder cancer was more common in smokers (56%) which is inconsistent with the study by Morrison et al, 1984<sup>(29)</sup>. Bladder cancer patients present with varied symptoms, commonest being painless hematuria. Painless hematuria was found in (93.75%) patients in our study group. Varkarakis et al, 1974<sup>(30)</sup>, found painless hematuria in about 85% of their patients. Histopathological examination of resected tissues showed Transitional cell carcinoma in all patients in our study.

In our study no significant association was found between mean sCD147 levels in bladder cancer patients as compared to the control group. However sCD147 levels were found to be significantly higher in preoperative bladder cancer patients as compared to postoperative bladder cancer patients ( $p < 0.001$ ). In our study, stage II and Stage III bladder cancer patients showed significant high expression of sCD147 as those bladder cancer patients who presented with stage I and stage IV bladder cancer ( $P < 0.05$ ). In our studied group we found sCD147 is over expressed in the serum of bladder cancer patients as has been already observed by various studies which showed its high expression in tumor tissues of bladder cancer patients. A study conducted in 2010 studied the expression and clinical significance of CD147 in genitourinary carcinomas (31). They found that CD147/EMMPRIN was expressed in neoplastic tissues, but not in normal tissues. Positive expression was shown in 41 of 58 (70.69%) of the patients with bladder carcinoma. Positive CD147/EMMPRIN staining was significantly associated with TNM stages and histological subtypes of patients with various urinary carcinomas ( $P < 0.05$ ). They concluded that this may assist in defining the suitability of CD147/EMMPRIN as a therapeutic target and as a method for predicting a poor outcome in patients with various urinary bladder carcinoma. Another study also supports our observation, which studied EMMPRIN (CD147) as a potential therapeutic and prognostic marker in bladder cancer and suggested that

EMMPRIN is a promising biomarker that has the potential for a better prognosis. EMMPRIN is also confirmed as an interesting target for new therapies in bladder cancer(120). A recent study conducted on Chinese patients in 2011 worked on CD147 overexpression is a prognostic factor and a potential therapeutic target in bladder cancer. In this study CD147 expression was detected in 108 bladder cancers CD147 protein expression was associated with poor prognosis ( $P < 0.001$ ), lymph node status ( $P < 0.001$ ), tumor stage ( $P = 0.003$ ), histological grade ( $P = 0.011$ ). Multivariate analysis showed that CD147 over expression was an independent prognostic factor ( $P = 0.019$ ). Their findings suggested that CD147 over expression plays an important role in progression of bladder cancer, and CD147 could be a potential target of bladder cancer therapy. Thus our results provide a new field of study for researchers, where serum sCD147 can be used as one of the prognostic marker for bladder cancer patients.

#### Tables:-

**Table 13 (a and b)**

<i>Primary tumor (T)</i>	
TX	Primary tumor cannot be assessed
T0	No evidence of primary tumor
Ta	Papillary noninvasive carcinoma
Tis	Carcinoma in situ
T1	Tumor invades subepithelial connective tissue
T2	Tumor invades the muscularis
T3	Tumor invades periureteral fat [for renal pelvis only] Tumor invades beyond muscularis into perinephric fat or the renal parenchyma
T4	Tumor invades adjacent organ, or through the kidney into the perinephric fat
<i>Lymph nodes (N)</i>	
NX	Regional lymph nodes cannot be assessed

N0	No regional lymph node metastases
N1	Metastasis to a single lymph node, 2 cm or less in greatest dimension
N2	Metastasis in a single lymph node, more than 2 cm but not more than 5 cm in greatest dimension; or multiple lymph nodes, none more than 5 cm in greatest dimension
N3	Metastasis in a lymph node, more than 5 cm in greatest dimension
<i>Distant metastasis (M)</i>	
MX	Distant metastasis cannot be assessed
M0	No distant metastasis
M1	Distant metastasis

The American Joint Committee on Cancer (AJCC) staging system and the TNM system compare as follows:

<b>AJCC</b>	<b>TNM</b>
Stage 0	T0
Stage I	Ta, Tis, T1, N0, M0
Stage II	T2, N0, M0
Stage III	T3, N0, M0
Stage IV	T4 or any T, N+, M+

**Table 14:- Cancer Stage wise Initial Treatment Options**

<b>Cancer Stage</b>	<b>Initial Treatment</b>
Tis.	Complete TUR followed by intravesical BCG.
Ta (single, low-to-moderate grade, not recurrent).	Complete TUR.
Ta (large, multiple, highgrade, or recurrent).	Complete TUR followed by intravesical chemo or immunotherapy.
T1	Complete TUR followed by intravesical chemo or immunotherapy.
T2-4	i.Radical cystectomy. ii.Neoadjuvant chemotherapy followed by radical cystectomy. iii.Radical cystectomy followed by adjuvant chemotherapy. iv.Neoadjuvant chemotherapy followed by concomitant chemotherapy and irradiation.
Any T, M+,N+	Systemic chemotherapy followed by selective surgery or irradiation

### Abstract

**Background:** Alcohol abuse is a major risk factor for various types of cancer, but strongest associations have been found for oral and pharyngeal cancers. Although the influence of alcohol on liver function has been extensively studied, studies correlating the liver function tests with prevalence of oral cancer are limited.

**Aims and Objectives:** The aim of our study was to assess the effect of alcohol in clinicopathogenesis of oral cancer, to test its synergism with tobacco use and to correlate this with serum aminotransferase levels.

**Materials and Methods:** A total of fifty patients with tobacco habit were equally divided into two groups: alcoholics with tobacco habit as cases (Group I) and non – alcoholics with tobacco habit as controls (Group II). A thorough intraoral examination was performed and histopathological grading for confirmation of oral cancer was done. Serum aminotransferases levels were assessed for all patients and the obtained results were analyzed statistically.

**Results:** Oral cancer was present in 84% of cases and 80% of controls and the result was not found to be statistically significant. Also, the relationship between levels of serum aminotransferases and occurrence of oral cancer in alcoholic patients was found to be statistically insignificant.

**Conclusion:** The combined deleterious habit of tobacco and alcohol increases the risk of oral cancer. The difference in prevalence of oral cancer in patients with and without alcohol habit was not found to be statistically significant. However, no correlation has been found between serum aminotransferase levels and prevalence of oral cancer in persons with alcohol abuse.

### Introduction:-

Oral cancer is a common cancer of global concern. It is known to be a devastating disease of tremendous consequence to the individual, to family and to society. Known risk factors include alcohol consumption and tobacco, together responsible for about 75% of oral cancers in developed countries.<sup>1</sup> It has been difficult to

distinguish the separate effects of these agents, however, since drinkers of alcoholic beverages tend to be smokers, and vice versa.<sup>2</sup> Oral cancer is related to these aetiological factors from qualitative as well as quantitative point of view. The consumption of alcohol is linked to the development of cancer due to combination of local toxic effects on the mucosa and systemic effects from the associated dietary deficiency, hepatic damage and possible alteration in patient's immunity.<sup>3</sup> Studies have shown that ethanol can increase the permeability of oral mucosa, resulting in epithelial tissue atrophy. Besides, alcohol is able to decompose the lipid composition of the outer epithelial membrane of mucosal tissue, which augments the susceptibility of oral mucosa to other carcinogens.<sup>4</sup> Liver function tests including estimation of serum aminotransferases (serum glutamic oxaloacetic transaminase and serum glutamic pyruvic transaminase) give objective information about alcohol consumption, changes in drinking habits and in decision making about the role of alcohol as an aetiological factor of disease.

Hence, a study has been planned to evaluate the effect of alcohol in the clinicopathogenesis of oral cancer and correlate these with the serum aminotransferase levels.

#### **Aims and objectives:**

- 1) To study the prevalence of oral cancer in persons with alcohol abuse.
- 2) To test the synergism of alcohol with tobacco use in oral cancer causation.
- 3) To correlate the prevalence of oral cancer in persons with alcohol abuse with serum aminotransferase levels.

#### **Materials and methods:-**

##### **1) Source of data:**

This case control study comprised of 50 patients visiting the Department of Psychiatry, BMCRI, Bangalore and Deaddiction Centre, Victoria Hospital, Bangalore.

The patients were selected on the basis of set inclusion and exclusion criteria and were further divided into two groups-

Group I- alcoholic patients with tobacco habit as cases- 25 patients

Group II- non-alcoholic patients with tobacco habit as controls- 25 patients

An ethical clearance from the institution and a written informed consent from the patients was taken prior to conductance of the study.

##### **2) Inclusion criteria:**

- a) Subjects with age group 21-79 years.
- b) Subjects with habit of tobacco use for more than one year.
- c) Histopathologically proven oral cancer patients.

##### **3) Exclusion criteria:**

- a) Subjects with habit history of less than one year of duration.
- b) Subjects who have undergone treatment for oral cancer.
- c) Subjects diagnosed with hepatitis, HIV and other systemic conditions affecting serum aminotransferase levels.

##### **4) Materials:**

- Sterilized Kidney tray
- Mouth mask
- Gloves
- Sterilized Mouth mirror
- Sterilized Straight probe
- Sterilized Metallic ruler
- Beckman Coulter AU analyzers

#### **Methodology:-**

All the participants were informed about the objectives and purpose of the study and their willingness was sought before conductance of the study. History was recorded on a specially prepared case history proforma. Questionnaire data collected through in person interviews was used to assess consumption of alcohol, use of tobacco, usual adult diet, medical and dental history and demographic characteristics. Under a well illuminated light source, a thorough

intraoral examination was performed with special emphasis on site, size, shape, margins and texture of the lesions. Histopathological grading for confirmation of oral cancer was done. The patients were further subjected to estimation of serum aminotransferase levels using Beckman Coulter AU analyzers. All measurements were performed by a single examiner to eliminate interexaminer variability. The collected data was subjected to statistical analysis.

### Results:-

In our study, maximum numbers of cases were found in 50-69 years age group (72%). The majority of patients in Group I were males (96%) whereas 60% of the patients in Group II were females. Oral cancer was present in 84% of patients in Group I and 80% of patients in Group II and the result was not found to be statistically significant [Graph1]. Majority of the patients in Group I had stage IV tumours i.e. 61.9% [Graph 2] and 52.3% had poorly differentiated tumours [Graph 3]. Tongue was the most common site of involvement in Group I patients (66.6%), whereas buccal mucosa was the most frequent site of involvement in Group II. Ventral surface of tongue was involved in 19.04% of patients in Group I [Graph 4]. In Group I, 32% patients had elevated SGOT levels as compared to 28% in Group II [Graph 5]. When comparing SGPT levels, 36% patients in Group I had elevated levels as compared to 40% in Group II and the result was not found to be statistically significant [Graph 6].

### Discussion:-

In this population based case control study, we have found the occurrence of oral cancer in patients with alcohol and tobacco use to be more in males in group I. The predominance of oral cancer in males (96%) may be related to the high prevalence of use of alcohol and tobacco, a major oral cancer risk factor.

Our results revealed that combined exposure to tobacco and alcohol is strongly related to development of oral cancer. i.e. 84% of cases had oral cancer. These results are similar to studies of P.K. Varshney et al. This suggests the synergistic effect of alcohol and tobacco in carcinogenesis. It is proposed that tobacco is an initiator while alcohol is a promoter, presumably by either increasing the permeability of mucosa lining cells to tobacco carcinogens or by cellular lesions induced directly by alcohol metabolism.<sup>5</sup> Also, after alcohol intake, acetaldehyde (the first metabolite of ethanol) is locally formed in the oral cavity by oral mucosal alcohol dehydrogenases and by the oral microflora, both of which are able to oxidize ethanol to acetaldehyde. Also tobacco smoke contains high levels of acetaldehyde. There is convincing evidence for acetaldehyde being the ultimate local and topical carcinogenic compound behind alcohol intake in humans.<sup>6</sup> Also, tobacco was found to be an important risk factor for oral cancer as 80% of cases in group II had oral cancer.

In our study, carcinoma of tongue was seen in 66.6% cases with ventral surface of tongue being the most common site (19.04%). These findings were not in accordance with those reported by P.K. Varshney et al. in 2003, in which

carcinoma of tongue was reported in only 24% of cases. Our findings can be explained based on the assumption that the ventral surface of tongue is lined by thin non-keratinized epithelium and most of the carcinogens readily penetrate this thin epithelium to reach the progenitor cell compartment. Also, tobacco products and alcohol in solution constantly accumulate in the floor of the mouth and bathe the tissues of the floor of the mouth and the ventrum of tongue.<sup>7</sup>

In our study, the prevalence of T<sub>3</sub> and T<sub>4</sub> tumours was extremely high, i.e. 57.14%, which is in accordance with the result of the study by GS Dias et al. in 2007 and the involvement of regional lymph nodes was observed in 76.2% of cases. A probable factor related to the occurrence of T<sub>4</sub> tumours could be that in alcoholics with tobacco habit, the carcinogenesis may occur at a faster rate. Therefore, in a short duration of time, tumour will reach T<sub>4</sub> size as seen in our study.

In our study, 52.3% of the cases were histologically diagnosed as poorly differentiated tumours while well differentiated tumours were seen in 33.3% of the cases. These results are similar to a study by Effiom et al (2008). It was also shown that histological grade could be possibly associated with the site of the tumours as oral carcinoma affecting the buccal mucosa, gingivobuccal sulcus and lower lip were predominantly well differentiated, while tumours affecting the floor of mouth, borders and ventral surface of the tongue were predominantly poorly differentiated.<sup>8</sup>

Although, some studies have reported that smoking and alcohol abuse affect the individual components of liver function tests (including serum aminotransferases) in different ways, our results were not found to be statistically significant as 68% cases and 72% controls had normal SGOT levels and 64% cases and 63% controls had normal SGPT levels.<sup>9</sup> This suggests that oral cancer occurs much earlier than changes in liver function are evident.

### Conclusion:-

The combined deleterious habit of alcohol and tobacco increases the risk of oral cancer. Also tobacco is a significant risk in causation of oral cancer. The difference in prevalence of oral cancer in patients with and without alcohol habit was not found to be statistically significant. However, a no correlation has been found between the serum aminotransferase levels and prevalence of oral cancer in persons with alcohol abuse.

### Abstract

Estimates of the total number of unemployed or underemployed people in India vary between 50 to 300 million. The Economic Survey of India has reported that the unemployment rate increased from 5.99 per cent in 1993-4 to 7.32 per cent in 1999-2000. To make matters worse, young people accounted for 53 per cent of the total unemployed in the country.

In absence of viable and reliable social or economic security of any kind, the majority of Indians have no option but to slave under appalling conditions for less than decent wages, often from childhood to old age. The case of brick kiln workers and also the efforts made by Swamy Agnivesh to get bonded labourers freed are telling. The brick kiln workers are not allowed to leave the work, even when some of them have no debt.

In 18 out of the 32 states and union territories where legislation on minimum wages applies, the minimum permissible daily wage is less than Rs 50; the range of minimum wages rises above Rs.100 only in four states. It goes without saying that even such low minimum wages are not always paid. To make matters worse, there are seasonal variations in availability of work and calamities of various kinds – from drought to social conflict – adversely affecting employment and livelihoods on a regular basis.

A number of programmes have been initiated in the country to provide gainful employment, enhancing rural peoples' skills, their income and thus to ensure their food security etc. but without the tangible and expected results from each of these programmes

Under the pressure of social groups, the congress party made NREGA a part of its election manifesto. Later on strong stand by the NAC and pressure of left parties on whose support the govt. was formed, it was made an essential aspect of National Common Minimum Programme of the UPA – I. The NREGA was passed in 2005 and brought into implementation in Feb. 2006, initially in 200 most backward districts spread over 27 states, another 130 districts in the following year (113 from 1<sup>st</sup> April and 17 districts of UP from 15<sup>th</sup> May). The entire country was covered in the third year of its implementation, i.e., from 1<sup>st</sup> April, 2008.

The Act aims to provide on demand employment subject to 100 days minimum per household in a year to the rural poor through public works. It is expected to have the additional benefit of developing the infrastructure base in the countryside. Further, and importantly, an unemployment allowance has to be paid if work is not provided for any reason.

### ..... **Introduction:-**

The Mahendergarh district of Haryana was one of those in the first phase. In its village Satnali, one Mr. Mahesh Kumar, 28 years of age, became the first person in the entire country to get himself registered on February 2<sup>nd</sup> to get 100 days employment @ Rs. 90/- a day. Now the wage rate under NREGA is Rs. 141 and minimum wage Rs. 151 in Haryana, which was revised on July 2009 from Rs 148 per day.

Along with Kumar, at around the same time, all 132 panchayats in the district held their special Gram Sabha meetings when work was a legal right. But in Haryana there had been labour shortage which was met by immigrant labour from states like Bihar on regular basis.

According to the information from the Department of Rural Development, Haryana fell short of the target in utilising funds as the number of applicants was insufficient.

The state could utilise only Rs 52.35 crore out of Rs 58.20 crore funds earmarked under NREGA in 2007-08.

Similarly, out of Rs 160.12 crore available, the amount spent under NREGA was Rs 110.00 crore in 2008-09. Thus only 70 per cent utilisation of the available funds could take place.

In the financial year 2007-08, 161,000 households were issued job cards which increased to 217,000 households in 2008-09.

The state has approved a labour budget of Rs 220 crore from the Union Ministry of Rural Development and this is for the first time that a labour budget has been sanctioned in advance, which is subject to revision, if required.

The Scope of NREGA has been enlarged which may help the state to fully absorb the funds which include land development, irrigation facilities and horticulture plantation which has been permitted to small and marginal farmers.

In Haryana, out of 1.5 million farmers, 998,000 (about 2/3<sup>rd</sup>) are small and marginal farmers. A number of reports have come out with unsatisfactory outcome of NREGA, particularly with regard to its implementation.

The present study based on Haryana experience attempts to look into the progress and achievements made in its implementation with the following specific objectives:

1. Identification of factors determining participation in NREGA
2. Impact of implementation of NREGA on employment generated, share of women in employment and change, if any, in their social status due to self earnings
3. Impact on wage differentials, across activities and also on non- NREGA works
4. Impact of NREGA on rural- urban migration.
5. Impact of NREGA on assets creation and their sustainability
6. Impact of NREGA on rural food security, and ,
7. Overall assessment and policy implications for further strengthening of the programme.
- 8.

For collection of data, five districts, Mewat, Ambala, Panipat, Sirsa and Rewari were selected. From each district two villages – one within a radius of 5 kms and the other beyond 20 kms were to be selected. From each village 25

respondents – 20 beneficiaries of NREGA and 5 non-beneficiaries were selected for detailed enquiry. Overall the study is based upon a sample size of 250 individual respondents and 10 villages represented by the respective sarpanches/ Panchayat secretaries/ village pardhans/ or village level workers of the state government.

#### **Functioning of NREGA:-**

We have used secondary data as available on the web site to analyse the functioning of NREGA in the state. The purpose was to have a broader picture of implementation of NREGA in the state. Data on the web site are given quite in detail covering households with socio-economic characteristics (scheduled castes, scheduled tribes and other backward castes as well as forward castes and women workers with regard to issuance of job cards, employment generation, work demanded and provided etc. We have used data for the latest three years, viz. 2008-09, 2009-10 and 2010-11.

The work on NREGA in the state was started with two districts, Sirsa and Mahendergarh in the beginning, followed by other two, Mewat and Ambala districts in 2007 and in the remaining 17 districts in the third year. District Palwal was created in 2009-10. The progress of issuing job cards is significant during the three years. The share of SC households in the issuance of job cards was more than 50% during the three years, though it decreased from 55% 2008-09 to nearly 50% in the latest year. The percentage growth of households issued job cards in the state as a whole was around 54%.

As far as generation of person days of work was concerned, there was almost 41% increase in women participation in 2010-11 over 2009-10 and 50% increase in 2010-11 over 2008-09. Overall the share of women in generation of work days was more than 30% in the three years.

Among the districts, Mewat and Jind created more than 41% work for women in the year 2010-11, while in Karnal about 44% work was created for women. The state and some districts have achieved magnificent growth in employment generation for scheduled castes.

So far as completion of works was concerned, share of Rural Connectivity projects within the districts as well as in the state was almost 1/3<sup>rd</sup> during the last three years and it was continuously increasing from 32% in 2008-09 to about 42% in 2010-11. It was followed by Water Conservation and Rain Water Harvesting measures with more than 20% share during the three years. Other

important projects getting about 15-16% share in the state as well as in the selected districts were Drought Proofing, Micro Irrigation etc. However, Rajiv Gandhi Gram Seva Kendra is also in focus. The utility of such Kendras is being questioned by the officials, village leaders and even by the conscientious NREGA workers.

About 25% of the total amount was spent in district Sirsa alone followed by Mewat among the selected districts in 2008-09. Among the activities about Rs.

5.5 crores were spent on renovation of traditional water bodies. In the following year the amount spent on ongoing/ suspended works increased by about 42%. However, in 2010-11, the amount spent increased by about 101% over 2008-09. Like 2008-09 district Sirsa topped the amount spent in the following two years as well, in 2009-10 by spending about 17% and in the year 2010-11 by spending about 19% of the total amount spent in the state. Rural Connectivity attracted maximum of the amount spent. It was more than 38% of the total amount spent in the state in the year 2009-10 and also in the year 2010-11. Water Conservation and Water Harvesting followed the Rural Connectivity, wherein about 16% of the total amount was spent.

In sum maximum amount has been spent on Land Development, Rural Connectivity and Water Harvesting related works and all of them will have long term economies for the communities associated with.

Social audit of the works, verification of muster rolls, and, gram panchayats' and gram sabhas' meetings are key to the functioning of NREGA.

Total number of muster rolls used in the year 2008-09 for the state as a whole was 25985 but 93.8% were verified during the year. Similarly in 2010-11 about 98% muster rolls in the state were verified. However, among the

districts selected for the sample, the muster rolls due and verified mostly match, except in Sirsa where only 67% muster rolls were verified.

The situation related with verification/ completion of Panchayats was no better than verification of muster rolls. In the state as whole, during the year 2010-11 about 40% verification of panchayats was not completed, whereas in the previous two years figure were about 29% and 40% less number than the total due.

In the state about 81 % and 78% works were inspected. During the first two years, whereas in the year 2010-11 almost all the works are shown as inspected, though at district level we find many lagging.

In many districts of the state meetings of the gram sabhas were not held, which as per the act was mandatory. It was in the year 2010-11 that in two districts, Ambala and Sirsa all the gram sabhas met. The assignment of social auditing is yet to mature.

We find number of individual and joint bank and post office accounts of NREGA workers increasing during the three years. But still a huge portion of wages is paid in cash. Secondly, money disbursed as wages through bank and post office accounts as percentage of total amount spent on completed and ongoing projects during the three years, 2008-09, 2009-10 and 2010-11 was merely 13.7%, 6.5% and 15.9. Keeping in mind the level of misappropriation of public funds, the disbursal of innocent workers' wages in cash is neither recommended and nor desired.

No unemployment allowance was paid even it had been reported as due for some considerable days during the year 2009-10 and for a few days in 2010-11. As far as work projection is concerned, about 7.8 million work days for unskilled workers were projected to be generated which would mean that 78, 000 workers getting 100 days work during the year. A similar act for the urban poor will lift the entire state out of hunger and poverty and many more evils.

#### **Demographic profile of the respondents:-**

The average size of the households of the beneficiaries was noted significantly large (5.59) than those non-beneficiaries (4.86) members per household. Also the earning members were more (2.68) in NREGA families than (2.36) in non- NREGA families. The ratio of male and female workers was about 55% and 45% under the NREGA category as compared to 56 and 44% under non- NREGA category. Also in the beneficiary households percentage of females was higher, 832 per 1000 males as compared to 783 in non-beneficiary households. In the working age groups of less than 60 more percentage of workers is found under beneficiary category as compared to non-beneficiaries. Whereas in the age group of more than 60 years, which is not considered suitable for physical labour a negative indicator, more people above 60 work under non-NREGA activities. Looking at the education level of both beneficiaries and non-beneficiaries, we find more percentage of people educated at primary level in the case of beneficiary households. But in the case of illiterate persons, the major difference of about 5% exists as more people are illiterate in the case of beneficiary households.

As far as card holding pattern is concerned, we did not find any worker holding AAY card holder availing benefits under NREGA. Workers below poverty line were more than 80% in aggregate and 80% in the case of beneficiaries.

As far as migration is concerned, a very small number of persons (only 2 out of 1356) migrated during the reference year 2009.

The percentage of total man days per household as main profession was highest under agricultural casual work for the beneficiaries and non- agricultural casual work for the non-beneficiary category. But non- agricultural casual work provides significant work for the beneficiary households also. Nonetheless for 25% beneficiary households work under NREGA was main profession. Moreover, the extra employment generated through NREGA would create extra income pushing up demand for other items like fruit and vegetables, resulting in more employment and income to the venders and growers with forward and backward linkages.

For the NREGA beneficiaries, about 25% per household income also was received from NREGA activities, about 37% from agricultural labour, 33% from working on other than agricultural operations, and about 4% income came from livestock. In the case of non-beneficiary sample households, the largest share of household income (60%)

came from non-agricultural wages, followed by (34%) wages received by doing casual agricultural work and about 5% income was generated by rearing livestock.

Across households the variation in income has been measured by Coefficient of variation. The CV in this case was the highest for beneficiaries, followed by income from agricultural wages. However, in the case of non-beneficiary households the highest variation was found in the case of income from agricultural wages then followed by non-agricultural wages.

As far as per capita monthly consumption of different edible items between beneficiaries and non-beneficiaries was concerned, no significant pattern emerged, except that overall food consumption was in favour of the beneficiaries. However, in terms of total monthly per capita consumption expenditure many important issues get highlighted. For example, monthly per capita consumption expenditure on food items works out to Rs, 487/- This small expenditure in both the cases of beneficiaries as well as non-beneficiaries may not be enough to save poor workers suffering from malnutrition, if not from hunger without NREGA. Even NREGA alone in the present form of providing 100 days' work at a fixed wage, will not address the issues of providing sufficient food, if the food was not provided at subsidized rates, mostly through the PDS. Because, per day per capita consumption expenditure of Rs. 13 per day in the case of beneficiaries and Rs. 12.4 in the case of non-beneficiaries, was not sufficient to provide two times food to satisfy one's hunger. Though NREGA seems to have benefited the poor directly by delivering some money and indirectly to non-beneficiaries by increasing overall wage rates, particularly during peak season, but to alleviate poverty and hunger some other steps need to be taken or improved. Wage rates need to be inflation neutral. Without effective PDS nothing will be effectively helpful to the poor to meet both ends. Many more items (food as well as non-food) need to be put under the PDS to increase their real income. Coming to the issues of beneficiaries vis-à-vis non-beneficiaries, overall persons benefiting from NREGA seem to be slightly better off, which further strengthens the arguments favouring NREGA.

In sum one can say that though progress of NREGA seems to be somewhat below targets to address the issues of gender equality with regard to employment generation and income, social equality by creating more opportunities for the deprived sections, it has helped in improvement of provision of food in the state, particularly in sections dependent mostly on wage labour.

#### **Work profile under NREGA:-**

As far as the work profile of the NREGA workers was concerned, the number of workers per household finding work under NREGA activities, varied from 1.35 to 1.98 in the selected districts. The average for the state as whole was 1.72 persons per household. Different social groups wise in the state as a whole, 1.75 members per household from the general category, 1.66 from scheduled Caste households, 2.33 from scheduled tribe households and 1.74 from the OBC households were getting work during the period. The number of females per household 0.62 working under NREGA activities was the lowest. Thus probably the targeted deprived sections like scheduled castes were the largest group of people to find per household work for number of family members under NREGA but the other deprived section the women, was the smallest.

The inter district variation observed in per household number of people finding work under NREGA was in the range of 1.98 in Mewat to 1.35 in Panipat. In other words, the most deserving region was able to generate more work for members per household. If the females could also be involved in a little more aggressive way, the objective of NREGA as far as involvement of different social and targeted groups and regional consideration was concerned, could have been largely met.

During the period under reference in aggregate 80 (exact 79.7) to 110 (109.5) days' work per household in the selected districts was provided, in two districts, Sirsa and Mewat, even exceeding the annual target of minimum 100 days work. In the state as a whole more than 94 days' work per household was provided during the period. Among different social groups ST households in districts Sirsa and Mewat were the largest beneficiaries getting more than 160 days' work per household during the period. In district Sirsa general category households got maximum work of 160 days. Overall in the state women got about 30 days' work per household in the state during the period.

However, per member work provided during the period varies drastically inter districts as well as inter social groups. In aggregate inter district variation is recorded from 44days (lowest) in district Rewari to 62 days in district

Ambala.

Similarly among the SC members lowest number of days was 29.34 in district Sirsa to highest being 112 days in district Mewat. The lowest variation among all the groups is found in OBC members, varying from 47.47 per member in district Ambala to 58 the highest variation in district Sirsa. Among the women, the variation was found between 37 days to about 52 days.

As far as wage rate was concerned, during the period the average wage rate was about Rs 150 per day, varying across sections marginally, among ST and women workers for example. The ST workers received lowest wages (Rs. 147) among all. Though the difference in minimum prescribed (Rs. 148) at that time and the lowest paid (Rs. 147) was marginal but considering the prevalent higher rate of wages in the state at that time, it was not that small too.

The average distance of work place from the residence in the state was about 2.23 Kms, varying from 1.28 kms. in district Ambala to 2.7 kms in district Rewari. In the state between January and December 2009 (reference period) about 6% households were employed to work on rural connectivity projects. In two districts, Ambala and Panipat, there was no work on this activity whereas in the remaining three, percentage of households employed varied between 12.5 (Mewat) the maximum to 5% the minimum in Rewari. Surprisingly In none of the selected districts work on water conservation was being undertaken.

As far as quality of these works was concerned, maximum respondents, 79%, reported it to be very good, and about 20% reported it to be of good quality. None of the respondents stated it of bad quality, and that is very significant response.

As providing employment allowance in lieu of work is state's responsibility, without any bearing on the central government, in the entire state efforts were made to see that not a single paisa is provided for allowance, and work to avoid stress on the state's resources is created as per demand. The introduction of more activities, such as developing horticulture, plantation, etc. will further reduce the pressure of finding and providing work to the needy in the village. If need be some categories of works presently covered under Khadi and village industries be considered for inclusion in NREGA. That will help provide work at door steps and open up more opportunities for the village panchayats to create jobs and productive assets.

The sample data show that there were negligible cases of immigration during the period.

#### **Household assets holdings:-**

The assets holding pattern of the respondents confirms that barring district Rewari, they were benefiting directly for the last two - three years in the state in the form of assured employment and extra income during the lean period. Barring utensils and other unspecified small items per household all major assets like land, house property, livestock, even a few ornaments of very little value were more valued in the case of beneficiary households vis-à-vis non-beneficiary households. The difference seems significant in the total value of assets. Aggregate value of all assets per household was Rs. 89 thousand and Rs.68 thousand respectively in the case of beneficiaries and non-beneficiaries. The major difference came from land and house property. Taking the value of beneficiary assets equal to one, we find that land in the case of non-beneficiary households is just 0.63, house property 0.88, live stock 0.91, ornaments 0.64 and some other assets 0.92. However, value of consumer assets was found slightly more than one, i.e. 1.18, and utensils 1.15 in the case of non-beneficiary households.

In fact, along with contribution in the creation of infrastructure like , water harvesting, land development, plantation, etc. contribution in enhancement of personal assets of the NREGA workers is important and NREGA seems to succeed in that area. Compared with Keynesian magical formula of digging the pits and then refilling them for the sake of creating jobs to lift the economy from depression, NREGA seems to be more effective way of doing many things simultaneously – removing poverty, ensuring food and nutrition for the most targeted sections, enhancing gender equality, productively utilizing the unused valuable human labour, creating infrastructure to be useful for future longer period, saving the society from turning chaotic or criminal, and most importantly, creating demand for the industry.

As far as financial position of the respondents was concerned, barring a solitary case of a loan of Rs. 50,000/- @

13% interest from the SBI for establishing a shop by one beneficiary household, not a single case was reported by any other household, neither by beneficiaries nor by non-beneficiaries households because for getting a loan one has to provide some assets as collateral, which for the households dependent on wage labour if not impossible would be difficult to provide. To begin with, there seems a very positive impact of NREGA that people have begun to create productive assets even by taking loan, which otherwise could not be envisaged.

But the households both beneficiaries as well as non-beneficiaries did borrow from the private money lenders. The amount and terms of loan might not have been revealed by the respondents. The other information gathered from the respondents does provide an indication of the strict terms of loan from private sources. For example, 22% respondents in aggregate (23% beneficiary households and 18% non-beneficiary households) did work for the lenders, they were indebted to.

Even though 18% reported that cooperative credit society was in existence in the village, 5% and 10% households respectively from beneficiary and non-beneficiary households were members of such a society, additionally, for the 12% respondents facility from formal credit society or Self Help Group was also available, about 7% family members were holding the membership of such a society or SHG. As much as 51% were also having live accounts in bank branch or post office, still no formal substantial credit line was opened to them.

Not only providing some material asset for collateral is essential to get loan from private sources, but also terms of repayment of loan in such cases are harsher ones, for example, high rate of interest, large repayment installments for fast recovery and some other conditions, like retention of some amount (may be one installment) even before making payment etc. That is what 23% beneficiary households and 18% non-beneficiary households reported doing wage labour for the lender.

As per the Act and rules the payment of wages to the NREGA workers has to be made either through the bank or through the post office. But only 53% beneficiaries and 44% non-beneficiaries reported having bank or post office accounts. Here also large percentage of bank accounts of beneficiaries is positive impact of NREGA. But only 78% respondents got the wages transferred to their bank accounts and 13% were paid by the sarpanch, In 21% cases of delayed payment and in 8% cases of less payment of wages complaints were lodged while 65% did not lodge any complaint.

Worksite facilities like child care, medical care or even first aid, except drinking water were not in existence.

A few things, need to be considered seriously: One, to ensure economic welfare of these groups, along with implementing the provisions of the act seriously, credit facility with convenient terms and easy availability has to be provided, two, to protect their health some strong medical/ health arrangement, through strengthening public health care system, medical insurance cover, etc. need to be put in place so that these groups if come above poverty line do not fall back due to any such reason. Recent arrangement made for bidi workers can be extended through the National Rural Health Mission to bpl card holders at least, NREGA workers and other targeted groups. To maintain quality of assets and to ensure that no genuine worker is left uncovered under NREGA, monitoring through regular meetings of the Gram Sabha and of the monitoring committee has to be made effective. In a good number of cases there was no monitoring at all. But still the assets created were rated very highly, either very good or in some cases of good quality and expected to last for 5 years.

Food expenses for the poor always remain main head of expenditure. In poor households, particularly AAY and BPL card holders many times meals for two times for the entire family is not secure. To mitigate such distressing situation it is expected that under NREGA, along with other income from non-NREGA work or from resources like live stock etc, if one has, one will secure at least two times meals for the family, and none would go to bed with empty stomach. Moreover, to ensure that, the minimum work days under NREGA can be increased to let us say to 200 per hh or 100 days per job seeker in the beginning. In Haryana, though people below poverty line as well as without any tangible resources do exist, but because state govt. has been providing social benefits, like old age pension, benefits to girl child for education, marriage etc. food for school children, some medical relief for the poor, the situation that people will go without food, is rare. But that does not mean that these measures will not be needed.

The NREGA has also successfully made the people more aware and conscious about the schemes, though they may not be very well versed with all the technical aspects of NREGA.

The NREGA through assets and infrastructure creation thus has generated great potential for the most deprived sections of the society, the poor, socially depressed classes and the women, who get employment and income during the lean period when it is most needed and thus helped them secure their food at least two times a day.

**Impact of NREGA on village economy:-**

The information gathered through village schedules shows that 90 % villages were connected with roads. In 50% villages there were double roads connecting the villages to different cities/ towns on different routes. It was only in one village that the nearest road was 2 kms away. No village was connected with railway station. The rail station on an average was 21 kms away. Telephone connectivity was 100%. In some villages even paid phone booths were noted. Post office facility was available only in 60% villages and the cooperative credit society in 40%. Despite the clear cut policy of the RBI that a bank branch with population of more than 2000 has to be opened, there was no bank branch, RRB, Cooperative Bank, or scheduled commercial one, neither public sector and nor private. In fact, the situation of rural banking is the poorest one.

Self help groups were working in 70% villages, primary school was working in all the villages, secondary school in 80% and senior secondary in 50%, PHC in 60%, dispensary and fair price shop in 40% each. The problem is related with distance also. On average the fair price shop was distanced at about 14 kms. The gram panchayat office was in all the villages.

The main concern of the nation now seems to be food security by providing nearly 70% people with subsidized food. In absence of fair price shops in 60% villages the task would be very difficult if not impossible. Therefore, urgent and effective steps would be needed.

Other infrastructure facilities like veterinary hospital/ dispensary, village purchase centre, mechanical workshop etc. did not exist in half of the sample villages. Village purchase centres have been a major successful story of the state, which helped not only the farmers to sell their produce at the nearest place, but many times at minimum support prices also. Additionally they have been a source of non-farm employment generation through linkages as well.

Historically with the development process, the people world over have been shifting away from agriculture. The percentage of cultivator households increased from 64.5% in 2001 to 65.2% in 2009. The percentage of agricultural labourers decreased from 33% to 30% in the respective years. Those involved in trade and commerce activities increased from 0.5% to 1.3%. The number of households doing other activities like working in household small industry, construction activities, transport and the like increased marginally from 2.1% in 2001 to 2.7% in 2009.

The number of cultivator households increased due to subdivision of households and holdings. The percentage of agricultural workers decreased due to availability of other less tiring and more rewarding works like small shops, trade etc. Overall, the development and nature of works do not suggest anything contradictory to the historical development process. Except that the rate of decrease of population dependent upon agriculture is much slower as compared to rate of decrease of share of agriculture in the GDP.

In Haryana higher wage rates have been the great attraction for immigrant workers from Bihar, eastern UP and Orissa.. Even the immigrant workers were not enough to reduce the prevailing wage rates. Introduction of NREGA has further increased the wage rates, probably due to, one - that number of immigrant labour has come down, though not eliminated completely, and two – because due to lean season earnings from NREGA local workers are not that much hard pressed to work under distress conditions. The increase in all type of wages both for male and female workers, during the period under reference has been noticed all around. In the wages of male workers almost 30% increase in agricultural wages, 40 % increase in non-agricultural wages, 36% rise in wages for construction work, more than 50% increase in mining, between 28% and 48% increase in the wages of semi skilled workers like electrician, plumber, pump set operators and mechanics has been noticed. Similarly in the case of female workers, almost 44% increase in wages for agricultural work, more than 49% for non-agricultural work, about 43% increase for construction work and 50% increase in the case of mining has been noticed. Along with effect of NREGA, general increase in price index and relatively more profits and more demand for work in construction and mining etc. due to overall increased growth rate of the economy and increase in value of

agricultural output due both to prices and production, can be the possible reasons.

Overall the average wage rate after NREGA has gone up handsomely.

It is pointed out by many studies/ reports. The latest being report by the Secretary Rural Development that NREGA has affected the wage rates positively by 2 to 2.5 times as compared to pre NREGA situation.

The labour charges per day for different agricultural operations have gone up two to three times in comparison to pre NREGA period. With so many changes all around, it is but essential that village economy, particularly cost of production, consumption pattern, migration and immigration etc, get affected. Shortage of agricultural wage labour at some point of time was reported by 70%. Even shortage of agricultural labour was expressed by 40%. Enhancement in cost of production by 20% to 50% was told by 10%.

Surprisingly and rightly too all the people agreed that there was no change after NREGA in the position of attached labourers, and probably it is the serious and negative aspect of NREGA. Because increase in wage affects them directly when they have to pay for the hired labourer by the land owner when they (attached workers) absent from work.

Finally on the question of improvement in NREGA two interesting suggestions were put forward – one more money, i.e., enhancement in wages and its immediate payment, and two, work for more than 100 days and not restricted to one member per household. Its scope needs to be enlarged to cover every one willing to work for as many days as one wants to work.

#### **Concluding Remarks:-**

From the above discussion and the relevant data, two issues come up clearly – one directly related with NREGA – its positive aspects and shortcomings in its implementation, and two, issues related with other aspects where NREGA and other schemes intermingle. It can be concluded that NREGA has helped improve the income level of the beneficiaries, through both, increase in wage rates and enhancement in their bargaining power, their food security, and that too with productively utilizing the scarce resources. The targeted groups, scheduled castes, scheduled tribes and women (to some extent) are the main beneficiaries of NREGA. The assets created are worth the money. The increase in percentage of school going children should be the major gain of NREGA combined with other measures like mid day meal, scholarship, free uniform, books etc. The position of attached workers who have not come out of the clutches of the rural rich is revealing.

However, many more things need to be done to improve the situation of rural India, for example, strict monitoring through Gram sabhas of the projects, list of beneficiaries, muster rolls, job cards, payment etc. In fact, the sarpanch centric system of panchayati raj needs to be made gram sabha centric through devolution of more democratic powers to the people. However, we would like to emphasize a few things for policy consideration:

1. Expansion of NREGA (200 days work per hh or 100 days work per job card) should be the minimum.
2. For improvement in the implementation, toll free application registration, complaint registration call centre scheme be made compulsory.
3. For accounts in banks, payments, job cards etc related issues administrative camps (like administration to the villages in Rajasthan, where all the officers camp in the village on specified day to settle all the issues) should be started.
4. Flow of Funds needs to be regular and not at the end of the year. For proper maintenance of records trained staff should be need based and recruited in a more liberal way instead of the present system of one project officer and one accounts assistant.
5. For monitoring of work, selection of work etc. involvement of workers' association along with some independent committee of village educated persons, may be teachers and retired government officials residing in the village, senior officers of the district, and academic staff of the local college etc. may be involved.
6. However, some other measures related with overall situation, other institutions also should be considered.
7. Credit facility through financial institutions needs to be improved to lift the poor above the poverty for longer periods.
8. For enhancement in real income through strengthening the PDS by inclusion of more edible as well as non-edible items at reasonable rates like CSD for the armed forces may be considered.

9. Immediate and effective steps for the welfare of the attached labour need to be taken.
10. More effective steps to strengthen the economy of the most backward sections of the society like artisans who have lost their traditional work under the new policies and development process like lohars, kumhars, carpenters, etc. need to be taken up on priority basis.
11. Health care of the rural poor needs to be taken care of either through the more effective way of public sector health services (NRHM) or through the insurance coverage.
12. For all these and many more welfare activities, the already going on schemes, like RKVY, Khadi and Village Industries, Sarve Shiksha Abhiyan.
13. Mother- Child care etc. need to be integrated and converged. Broad policy framework under the total monitoring of the Gram Sabha and grass root associations of the poor should be considered. The integration of schemes will help reduce the duplicity of works and projects.
14. Funds available under MPLAD, RKVY, RD and from other state and centre govt. departments should be pooled and used on the lines of RKVY and for that a greater coordination among centre and state governments, different ministries and departments need to be explored.

**Abstract**

**Background:** Radiological procedures are being used much more these days. Patients must be given sufficient information, in a way that they can understand, to be able to make the right decisions about their care.

**Objectives:** To examine health beliefs and assessment level of awareness toward radiation exposure risk among the general population of Makkah, Saudi Arabia.

**Methods:** A cross sectional analytical questionnaire based study among the general population of Makkah City.

**Results:** A total of 360 subjects answered the questionnaires. The mean age were 36 years, ranged from 16 to 70 and 45.2% females and 43.7% male respondents. Of these, 67% had attended college, 5% had postgraduate degree, 23.5% had completed high school, and 3.1% had basic school. The majority of participants had high level of monthly income (38%). The majority of subjects included in the research were (59.6%) married and (51.3%) were unemployed. Most subjects (338) had poor knowledge about hazards of exposure to radiation and there was no association between the knowledge and demographics of participants except for education as the higher the levels of education, the more significant association with good knowledge.

**Conclusion:** The knowledge of radiation exposure hazards was poor among the studied population. Also, education significantly impacts the knowledge of radiation risks thus there is a need for providing the patients with necessary information to improve their radiation awareness.

**Introduction:-****Background:**

Ionizing radiation in medical imaging is one of the powerful diagnostic tools in medicine. Radiation which is applied in radiology departments has hazardous effects on biological systems<sup>(1)</sup>. Ionizing radiation is a broad, complicated, and often misunderstood topic. Exposure to ionizing radiation is associated with both acute and chronic disease states, especially as the radiation dose increases<sup>(2-4)</sup>.

Overexposure to ionizing radiation is a significant factor causing biological diseases such as various cancers, lens opacity, erythema, and genetic mutations<sup>(5)</sup>. Children are particularly susceptible to ionizing radiation and, because of their young age, may be more likely to experience delayed manifestations of ionizing radiation exposure. Nevertheless, individuals are constantly exposed to ionizing radiation from a variety of sources: naturally occurring, medical imaging, and other human-made. Studies indicate a difference in both risk perception and knowledge of actual sources of ionizing radiation between the general public and radiation experts<sup>(6-8)</sup>.

There is no threshold level of radiation exposure below which it could be said with certainty that cancer or genetic effects will not occur. Doubling the radiation dose doubles the probability that a cancer or genetic effect would occur. Epidemiological studies on populations exposed to radiation showed a significant increase of cancer risk at doses above 100 mSv/yr<sup>(8)</sup>. Studies have suggested that the general public is not concerned about exposure to ionizing radiation from medical procedures because of a widespread notion that healthcare professionals have received extensive training in principles of radiation and are competent in minimizing risk<sup>(9, 10)</sup>.

Our study was designed to examine health beliefs and assessment level of awareness toward radiation exposure risk among community in Makkah City and applies the Health Belief Model to determine barriers.

#### **Rationale:-**

Over the past two decades there was an increase in demand for radiologic imaging procedures in health care services to help in medical design making. Ionizing radiation can cause serious effects on the hematopoietic system, digestive system, skin, testicles, ovaries, central nervous system, and ultimately, the entire body. In Saudi Arabia, there are few studies that assessed awareness on radiation hazards among community.

#### **Literature Review:-**

Nowadays, radiological procedures are being used much more with technological advances. Those procedures assist in the diagnosis and management of many medical conditions. Requesting imaging modalities comprise risk factor to the patients (ionizing radiation cancer-causing biological effects). Every year there is increasing in the number of patients who are in need of diagnostic radiology<sup>(11, 12)</sup>, especially computed tomography (CT) scanning. During the last few years, the doses of radiation have increased up to 40% per scan<sup>(13)</sup>.

The repeated exposure to radiation increases the possibility of getting cancer. The lowest dosage of radiation for which there is a real proof of cancer-causing is around 10–50 mSv. The regular exposure dosage for one chest radiograph taken is around 0.02 mSv, and for an abdominal CT is around 9 mSv. The radiation from chest X-ray (CXR) is almost certainly less than background radiation established in a whole year (0.01 mSv daily). Around 0.015 mSv is received during a three-hour airline flight<sup>(14)</sup>.

It is essential that doctors who request imaging to be well trained in determining whether diagnostic imaging is required, but also they need to be aware of the associated risk. It has performed in many studies that the knowledge of medical professional on radiation hazards and dosage is limited<sup>(15, 16)</sup>.

A study published in 2006 by the Pediatric Radiology Journal showed that about 87% of pediatricians misjudged the radiation dosage from a chest radiograph and 94% underestimated the radiation dosage from a CT<sup>(1)</sup>.

Not only doctors had insufficient knowledge about radiation risks and dosage. In 2010, a study was performed to study the knowledge of doctors showed that half of the senior medical students and intern doctors underestimated the radiation doses from usually requested radiological procedures. Some of them incorrectly think that ultrasound (US) and magnetic resonance imaging (MRI) produce ionizing radiation<sup>(17)</sup>.

A study conducted by Karsli et al., (2009) indicated that a significant percentage of physicians advice that informed consent should be obtained from patients undergoing radiological exams and the information about cancer-related risks involved should be provided by the radiological department<sup>(18)</sup>.

Most contributors did not talk with patients about the associated hazards of radiation. A sufficient information should be given to patients, in a way that they can understand, to be capable of making the right decisions about their care<sup>(19)</sup>.

Few projects are focusing on the patient's knowledge about radiation risk in the literature. Two recent studies confirmed that the most of patients (74%) would consider that having their situation diagnosed with CT is more important than disturbing about radiation and patients had insufficient knowledge about radiation protection (15, 20).

Surprisingly, a number of articles have appeared in the literature that predict hundreds of cancers and cancer mortality per year in the U.S. and U.K. caused by ionizing radiation from medical imaging procedures. It was estimated 100-250 deaths occur per year from cancers directly related to exposure to medical radiation in U.K.<sup>(21)</sup>. In U.S., the estimated number of fatalities attributable to CT was 700-1800 during a year<sup>(22)</sup>.

Also, a recent pilot study was conducted among the general population of Makkah, Saudi Arabia, 2016 showed that education significantly affects the knowledge of radiation exposure hazards<sup>(23)</sup>.

### **Objectives:-**

#### **General objectives:-**

To assess the level of awareness toward radiation exposure risk among community in makkah city and to identify barriers.

#### **Specific objective:-**

The goal of this study was to examine community health beliefs regarding radiation exposure risk and their perceptions related to it and evaluate the role of demographic factors in shaping beliefs about radiation and assess possible associations between demographic characteristics with the preventive behavior of interest.

### **Methods:-**

**Study design:** cross sectional study.

#### **Setting and data collection:-**

This survey analysis was conducted among community population in Makkah city. A preformed self-administered questionnaire was distributed among the community population.

#### **Sample:-**

Subjects were chosen according to geographical and sex distribution. Sample size was calculated based on web-site calculator<sup>(24)</sup> taking the total size of Makkah population (1,249,000)<sup>(25)</sup>, confidence level (95%) and margin error (5%) to be 285. Additional 20 % was added to cover the missing data . The total sample obtained was 360.

#### **Study population:-**

The study population included were both male and female in Makkah City.

#### **Study tool:**

Preformed Self-administered questionnaire that requires information about:

- 1- Demographic characteristics: age, gender, education level, monthly income, marital status, and employment.
- 2- Knowledge assessment including 7 questions about risk factor of radiation and factors associated with long exposure to radiation. A score of 1 was given to yes and 0 otherwise. For each subject, a maximum score of 7 was calculated. A scoring system was applied to measure the respondents' knowledge towards radiation impacts. The radiation knowledge score was calculated as a continuous variable by summing the participant's number of yes answers to the questions. One point was awarded for each yes, and zero for each no or don't know, with a maximum obtainable correct score of 7 for each respondent. The knowledge score was categorized into two levels indicated by poor (0-4.5), and good (5-7).

#### **Ethical considerations:-**

An informed consent was obtained from the participants included in this research before filling the questionnaire.

#### **Statistical analysis:-**

Data were entered into the Statistical Package for Social Sciences (SPSS, version 24, SPSS, Chicago, IL, U.S.A.) and descriptive analysis conducted. The results were reported as percentage (95% confidence interval).

The internal consistency was assessed using Cronbach's  $\alpha$  test. The test results were for the 7 statements of knowledge about radiation exposure hazard was 0.422.

Association of respondents' characteristics with about radiation exposure hazard, was evaluated using univariate logistic regression. Results were reported showing odds ratio (OR) and 95% confidence interval. Statistical significance was accepted at  $p < 0.05$ . The dependent variables: knowledge of radiation exposure risk (1 = Poor knowledge and 0 = good knowledge). The following independent variables were included: (1) age:  $\leq 20$  years, [21–30 years], [31–40 years], [41–50 years],  $> 50$  years; (2) gender: males and females; (3) level of education: low, for those who completed secondary school or less, intermediate for those who finished college degree or have bachelor degree and high for those who had postgraduate degree; (4) monthly income: low [ $< 3000$  Saudi Riyal (SR)], middle [3000–10000 SR] and high [ $> 10000$  SR]; (5) marital status: single and married; (6) employment: unemployed and employed.

## Results:-

### Demographics of the studied subjects:

The socio-demographic characteristics were shown in Table. 1.

**Table 1:-** Socio-Demographic Characteristics of Respondents (n = 360)

	Frequency	Percentage (%)
<b>Age (Year)</b>		
<b><math>\leq 20.00</math></b>	36	8.60%
<b>21.00 - 30.00</b>	125	29.70%
<b>31.00 - 40.00</b>	56	13.30%
<b>41.00 - 50.00</b>	47	11.20%
<b>51.00+</b>	63	15.0%
<b>Missing</b>	94	22.30%

<b>Employed</b>	194	46.10%
<b>Un Employed</b>	216	51.30%
<b>Missing</b>	11	2.60%

A total of 360 subjects were included in the study and answered the questionnaire. The age ranged from 16 to 70 years. The mean was 36 and about 8.6% of subjects were less than 20 years old, 29.7% of participants were from 21-30 years old, 13.3% were from 31-40 years old, 11.2% ranged from 41-50 years old, 15% were more than 51 years old and 22.3% of participants had missing data about age.

The gender distribution showed that 54.2% of participants were females, 43.7% were males and 2.1% had missing data about gender.

The study population represents a highly educated group of people, with 67% having attended university or college, 23.5% having completed high school, 5% having post-graduate degree and 3.1% completed basic school and 1.4% had missing data about education level.

The majority of participants had high level of monthly income (38%) more than 10,000 SR, followed by 21.4% of patients had monthly income less than 3000 SR then 19% had income ranged from 7000-10,000 SR, 10.95% had an income that ranged from 3000-5000 SR and 8.1% had an income ranged from 5000-7000 SR.

The marital status showed that the majority of subjects included in the research were (59.6%) married and 40.1% were un-married.

The most of subjects were unemployed (51.3%), and 46.1% were employed, however only 2.6% had missing data.

**Responses to questions of knowledge assessment questionnaire (Table. 2):**

The response of participants to question 1 showed that 76.5% of patients answered that they had good knowledge about radiation hazards, 58.4% of subjects answered yes to question 2 as they have knowledge about the importance of radiological assessment demanded by doctors.

As for question 3, 50.6% of participants had no knowledge about the hazards of excessive and unnecessary use of radiation and 49.4% answered yes to this question.

Regarding to Q 4, 95% of subjects said yes to their knowledge about the impact of radiation on pregnant women. But 76.2% of participants said that the majority of doctors underestimate informing patients about the risks of radiation in Q 5.

57.2% of subjects said that doctors doesn't give them enough protection from radiation and 42.8% had been given protection from radiation in question 6. In question 7, 78.9% of patients had knowledge about the impacts of radiation on children (Figure. 1).

**Table 2:- Responses to questions on assessment level of awareness toward radiation exposure risk**

	No	Yes	Don't Know
<b>Q1:</b> Do you think that the diagnostic radiation has risks?	99(23.50%)	322(76.50%)	0(0.0%)
<b>Q2:</b> Do you think that all radiological scans tests conducted by doctors are important?	129(30.60%)	246(58.40%)	46(10.90%)
<b>Q3:</b> Do you have knowledge about the damage caused by unnecessary use of radiology?	213(50.60%)	208(49.40%)	0(0.0%)
<b>Q4:</b> Do you think that the radiation cause damage to pregnant woman?	21(5.00%)	400(95.00%)	0(0.0%)
<b>Q5:</b> Do doctors clarify the impacts of radiological imaging before scans?	321(76.20%)	100(23.80%)	0(0.0%)
<b>Q6:</b> Do doctors provide adequate protection for people to avoid excessive radiation exposure?	241(57.20%)	180(42.80%)	0(0.0%)
<b>Q7:</b> Do you think that the excessive exposure of children to radiation may cause complications in the long term?	89(21.10%)	332(78.90%)	0(0.0%)

**Assessment of knowledge of participants regarding to the risks of exposure to radiation:-**

The mean knowledge score was 4.25 for all subjects (Table. 3). The overall mean knowledge score was 4.25 (1.44) (Table. 3). Based on Knowledge score respondents were Categorizing into: Respondents who had good knowledge about radiation exposure hazards corresponded to a score ( $\geq \text{Mean} + 1 \text{ SD} = 5.69$ ) which indicate about 81.2% knowledge % and those with bad knowledge corresponded to a score of ( $< \text{Mean} \pm 1 \text{ SD}$ ). So, it was found that the majority of (338) (80.29%) subjects had poor knowledge and only 83 subjects had good knowledge about radiation risks (Figure. 2).

**Table 3:- Knowledge of awareness toward radiation exposure risk**

	Knowledge Score
<b>Mean<math>\pm</math> SD</b>	4.25 $\pm$ 1.44
<b>Min.- Max.</b>	0-7
<b>Good Knowledge (<math>\geq 5.69</math>)</b>	83 (19.71%)
<b>Poor knowledge (<math>&lt; 5.69</math>)</b>	338 (80.29%)

**Figure 2:-** Respondent's Knowledge about radiation exposure risk

**Association between knowledge and demographics of included participants:-**

Univariate logistic regression to study the association between knowledge and participant's demographics showed that, neither age nor other demographic variables showed significant association with being aware of radiation exposure hazard ( $P > 0.05$ ). However, education level achieved statistical significance ( $p < 0.0001$ ) association with knowledge as higher education resulted in good levels of radiation exposure risks (Table. 4). Interestingly, it was found that respondents who have completed their college degree have had a higher likelihood to have poor knowledge about radiation exposure hazard with an OR (95% CI) of 8.07 (3.11 - 20.94) when compared with those who get higher post-graduate degree (Master of PhD). Nearly the same difference was found in respondents, who have completed either high school or lower, with % of poor knowledge about (80.4%) when compared with individuals with high post graduate degrees (Figure. 3).

**Table. 4:-** Univariate logistic regression model for association between radiation knowledge and socio-demographic variables:

	Good Knowledge (n=83)	Poor Knowledge (n=338)	OR (95% CI)	P-value
<b>Age</b>				
<= 20.00	5(13.9%)	31(86.1%)	1	0.434
21.00 - 30.00	30(24.0%)	95(76.0%)	0.51(0.18-1.43)	0.201
31.00 - 40.00	8(14.3%)	48(85.7%)	0.97 (0.29-3.23)	0.957
41.00 - 50.00	9(19.1%)	38(80.9%)	0.68 (0.21-2.24)	0.527
51.00+	10(15.9%)	53(84.1%)	0.86 (0.27-2.73)	0.791
<b>Gender</b>				
Female	39(17.1%)	189 (82.9%)	1	0.115

### Abstract

**Introduction:** Relocation of posterior occlusal plane is of prime importance in prosthodontic practice. Various landmarks are used to determine the occlusal plane like lateral border of the tongue, retromolar pad, ala- tragus line, cephalometry. The purpose of this study was to determine which part of the retromolar pad correlates with the occlusal plane in kashmiri population.

**Material and methods:** The study was done on 50 males and 50 females. A stainless steel scale was used to record the level of retromolar pad coinciding with the occlusal plane intraorally.

**Results:** In majority of subjects occlusal plane coincided with middle part of retromolar pad in both males and females.

**Conclusion:** In kashmiri population middle third of retro molar pad can be taken as a reliable landmark for relocating occlusal plane in complete denture construction.

### Introduction:-

Relocation of occlusal plane is of prime importance in prosthodontic practice. The position of occlusal plane of orientation forms the basis for ideal tooth arrangement. According to GPT 8 (Glossary of prosthodontic terms); Occlusal plane may be defined as “the average plane established by the incisal and occlusal surfaces of teeth.” Generally it is not a plane but represents the planar mean of curvature of these surfaces<sup>1</sup>. Lang & Swartz reported that occlusal plane in complete dentures shall be located in same position in which it existed in natural dentition<sup>2</sup>. Anteriorly occlusal plane mainly helps in achieving esthetics and phonetics while posteriorly, it forms a milling surface where tongue and buccinators muscle are able to position the food bolus onto it and hold it there during mastication<sup>3</sup>. If a clinician fails to place artificial teeth in alignment with the plane of occlusion, problems like food collection in sulcus and other extremes of cheek / tongue biting might occur.

Incorrect record of occlusal plane would hamper esthetics, phonetics and mastication resulting in instability of complete dentures and hence alveolar bone resorption<sup>3</sup>. A number of methods are employed for correct relocation of occlusal plane which include: Height of retro molar pad, Lateral Border of tongue, Parotid Papilla, HIP Plane, buccinator groove as intraoral landmarks and Ala tragus line, inter pupillary line, upper lip length as extraoral landmarks and cephalometry<sup>3</sup>.

Each of the above mentioned methods have their merits and limitations and they are subjected to inter population variation. So a need was felt to co- relate occlusal plane with the intraoral landmarks in kashmiri population to ensure quick and easy relocation. Considering retro molar pad height to be a prominent, stable and easily accessible

landmark, this study was conducted with a purpose of relating retro molar pad height with occlusal plane in kashmiri population, in order to eliminate inter population error. Effect of gender on various occlusal planes was also investigated. The purpose of this study was to check reliability of retro molar pad as an intraoral landmark in re establishing occlusal plane in kashmiri population.

### **Materials and methods:-**

The study was conducted on 100 dentate subjects (50 males and 50 females) selected from a group of approximately 200 dental students from Government Dental College Srinagar, Kashmir. Written consent of the subjects was taken and all of them participated in the study voluntarily. Clearance from Institutional Ethical Committee was obtained. Subjects within the age group of 17-21yrs, ideal arch form and alignment, no history of trauma, no spacing and crowding, no dental abrasion/attrition, no history of orthodontic treatment and no gingival/periodontal condition which would undermine a healthy tooth tissue relationship, were included in the study.

Impressions of mandibular arches were made with irreversible hydrocolloid material (alginate) and the casts were poured in dental stone. The casts were separated from the impression material 45min after pouring. The location of retro molar pad in relation to the plane of occlusion was determined by sliding a thin stainless steel scale posteriorly over the cusps of mandibular posterior teeth ensuring its contact with the tip of cuspid on one side of the mandibular arch extending to the disto-lingual cusp tip of second or third mandibular molar (Figure 1). Disto lingual cusp tip was used because it has more close anatomic relation with retro molar pad. The vertical height of the pad was divided into three parts (lower, middle and upper). The zone of contact between the scale and retro molar pad was recorded.

Initially this procedure was accomplished both intra orally and on the cast. Because of consistent correlation of these two determinants, the intraoral procedure was utilized. The procedure was carried out in both the right and left sides.

**Figure 1:-** Using stainless steel to obtain relation of retromolar pad with posterior occlusal plane**Table 1:-** Percentage distribution of different levels of retromolar pad in males and females

PART OF RETROMOLAR PAD	MALES No. Of subjects	FEMALES No. Of subjects	TOTAL %age
UPPER THIRD	0	0	0
MIDDLE THIRD	31	30	61
LOWER THIRD	19	20	39

**Results:-**

Our results suggested that in 61% of subjects, mandibular occlusal plane coincided with middle part of retro molar pad and in 39% it coincided with lower half. Upper half correlation was found in none of the patients. Hence forth these findings suggest that mandibular occlusal plane coincided with middle part in majority of patients. Inter gender variation seemed to be insignificant. (Table 1)

**Discussion:-**

Relocation of occlusal plane is of prime importance in complete denture therapy. It is advocated that establishing the plane of occlusion in full dentures as close as possible to the position which was previously occupied by the occlusal plane of natural teeth is must in order not to change the proprioceptive regulatory mechanisms which ensure normal function of cheek, tongue and masticatory muscles.<sup>4</sup>

Retro molar pad height is a prominent and stable anatomical landmark which is also easily accessible. A number of studies have been conducted in different populations comparing the relation of retro molar pad height with occlusal plane. Jack Piermatti(2006)<sup>5</sup> said the occlusal plane should terminate at upper level of retromolar pad while Arthur O. Rahn and Charles M. Heartwell (1986)<sup>6</sup> said posterior height should not exceed half of the height of retro molar pad. K. Shigli et al<sup>3</sup> concluded that mandibular occlusal plane was coincident with lower one third of retro molar

pad. Rubina et al<sup>7</sup> concluded that it coincided with the middle third of retromolar pad. Donald O.Lundquist and Colonel et al<sup>8</sup> concluded that occlusal plane coincided with the lower half of retromolar pad. Our study concluded that the middle third of retro molar pad coincided with the occlusal plane in both genders in kashmiri population. The results of our study coincided with study conducted by Rubina et al<sup>7</sup>.

### **Conclusion:-**

In kashmiri population middle third of retro molar pad can be taken as a reliable landmark for relocating occlusal plane in complete denture construction. This method is reliable, easily accessible, economical and less time consuming.

#### Abstract

In the modern communication era, the role of cloud computing is extensively utilized by most of the IT sector. In the characteristic of Data communication as well as data sharing among the consumers is conducting in different mode of communication mechsnaim. In the episode of data transmission and sharing is happen from the data storage for all the service providers. With irrespective of data access, each and every researchers focus on the safety measures of data transaction among different clients or between service providers and consumers. The data sharing by using clouds are generally carried out from the cloud data storage. In this research article deeply focusing a new architectural frame work for secure cloud data storage in the aspect of protect the multimedia data content by using the data compression mechanism. The entire work is divided into two sections, one of them is architectural framework and another one is implementation. The second one will carry as the continuation of this work.

*Copy Right, IJAR, 2016., All rights reserved.*

#### Introduction:-

The way of modern approach comprising to muddle up the concepts of cloud computing with the data compression mechanism in order to protect the multimedia content resided in the cloud storage. In general the data access of the cloud service providers are taken place with the help of cloud storage. The data resides in cloud storage is in the form encrypted text or any other format. It will easily interact by the third-party unauthenticated users and put a question mark for security. In order to apply the any one of the data compression mechanism on the cloud data storage, we can easily avoid such kind of interruption and protect the unauthorized data consumption in the cloud data transactions. The paradigm of the proposed work is clearly depicted by the following block diagram (Figure 1),

**Figure 1:-** Data sharing paradigm

Crucial data and submission may require an agency to undertake a negotiated service agreement in order to use a public cloud. Points of negotiation can negatively affect the economies of scale that a non-negotiable service agreement brings to public cloud computing, however, making a negotiated alternative less cost effective. As an alternative, the organization may be able to employ compensating controls to work around identified shortcomings in the public cloud service. Other alternatives include cloud computing environments with a more suitable deployment model, such as a private cloud, which offers an organization greater oversight and control over security and privacy [1].

Cloud computing encompasses both a server and a client side. With emphasis typically placed on the former, the latter can be easily overlooked. Maintaining physical and logical security over clients can be troublesome, especially with embedded mobile devices such as smart phones. Their size and portability can result in the loss of physical control. Built security mechanisms often go unused or can be overcome or circumvented without difficulty by a knowledgeable party to gain control over the device. More than ever the compression technique is used for saving disk space, reducing the time needed for communication or the time needed for data transfer and more. Data to be handled as well as software has been growing, and the amount of information communicated between systems has also been constantly increasing. The general communication between the cloud providers (CSP) and the clients are depicted in the following Figure 2.

**Figure 2:-** Data communication between CSP and the clients

### Related Work:-

Cloud computing is seen as the last revolution in information technology, providing cheaper services and agility and productivity of organizations. But, despite all the advantages there is still much discussion around the term Cloud Computing: what feature displays? What limitations in terms of storage, compression and security?

Data management in cloud computing and data storage is widely used and is available from different suppliers and different solutions. Can be used as a data repository or as infrastructure to support and implement applications

with the help of cryptography [1][2][3].

Cloud computing presents interesting features for all users with advantages at the level of storage cost, scalability, elasticity face to the constant needs of availability and quick access in different computing devices.

There are different types of services for cloud computing: Infrastructure-as-a-service (IaaS) where the cloud offers services of its infrastructure such as CPU, memory, and storage. Platform-as-a-service (PaaS) where it is available an execution environment for the user and Software-as-a-Service (SaaS) where the cloud provides a specific application accessible via browser in the form of encryption [4][5].

The management and monitoring of data is an essential requirement for organizations, since it allows the reduction of the risk of internal breaches and ensures the responsibility of administrators. Each type of cloud service provides security requirements for the organization and access to data and systems. Organizations that use cloud technology monetize their services extracting the greatest benefits of this new technology base.

These companies have embraced the cloud as a strategy that provides everything you need to create, operate, manage and allocate in the cloud with efficiency, speed and reliability. The system of cloud computing provides a computational power available to the needs of the user thanks to a dynamic scalability and to utilize the service for encryption [4][5].

However even considering the characteristics and advantages presented to maintain safe and reliable data presents itself as very problematic for users. The purpose of this thesis aims to design, implement and evaluate a system that allows access to management, kept in cloud storage. The proposed application is intended to be used as intermediate system, aggregating a set of components and services between the user and various public clouds of data storage, made available by internet providers and cloud service providers.

The Cloud Computing still motivates much discussion. The essence of its functioning, its boundaries, the development of new applications, becoming increasingly agile and collaborative, inspiring subjects for research [6].

As we enter the new century, it appears that the ability of data centers is limited and runs out [7][8]. The economy in sequences the trend of technological development and the solution is the adoption of grid services and/or utility computing as well as the use of virtualization to maximize the available resources.

As services and applications become more distributed, paradigms like Service-Oriented Architecture emerge in response to integration and service orchestration, and the organization and technologies used in data centers evolve.

Today the data centers that support environments and platforms for Cloud Computing components are designed to utilize more economical, safe, quick and easy replacement. Given these factors, software developers have come, to design applications that can address the needs of users, in a safe, efficient and cost-effective way to implement and/or maintain an infrastructure of Cloud Computing [10].

### **Proposed Work:-**

Cloud storage services have grown and diversified significantly this development eventually promote the emergence of contract services and with the feature of allowing users to choose to acquire the one that is more suitable for him/her. Services are provided in a common environment by centralized cloud storage facilities.

As data volumes processed by large-scale distributed data intensive applications grow at high-speed, an increasing input/output pressure is put on the underlying storage service, which is responsible for data management. With the emergence of cloud computing, data intensive applications become attractive for a wide public that does not have the resources to maintain expensive large scale distributed infrastructures to run such applications.

The main objective of this dissertation is to propose and validate a solution to the problem of secure and efficient transmission and storage of multimedia content in public cloud environments using joint compression and encryption.

Model Name  
ARCHITECTURE FRAMEWORK

Description  
This is the architectural components in the framework for a secure cloud data storage management as well as the comparison.

**Figure 3:- the Interface**

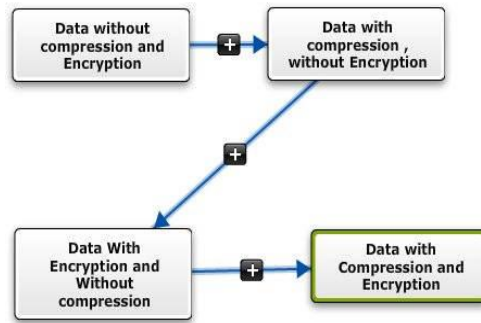

The architectural framework for the proposed work comprising the design specification in the aspect of Data transmission or communication in the first point of view is without compression and encryption, second one is with Compression and without Encryption, third one is with Encryption and without Compression, and the fourth one is With Encryption and Compression. The data analysis is performed with the help of the tool mental modeller 5.0. The interface is depicted in the above figure 3.

**Figure 4:- Architectural Framework**

From the figure 4, the components of the architectural frame work in order to prevent the unauthorized data access from the cloud storage management by the third party. The flow from the original data to the cloud services is clearly illustrated in this module. The module of compression is further classified in the following levels. It shown by the following figure 5.

Number of Concepts	4
Number of Connections	3
Density	0.1875
Number of Connections / Components	1.333333333
Driver Components	
	Data with Compression and Encryption 0.5
Receiver Components	
	Data without compression and Encryption 0.25
Number of Ordinary	2
Complexity Score	1
Highest Centrality Variables	
	Data With Encryption and Without compression 0.75
	Data with compression , without Encryption 0.5
	Data with Compression and Encryption 0.5
	Data without compression and Encryption 0.25

**Figure 5:- Components of Compression Cloud Storage**

**Figure 6:-** Components comparison in the Compression

#### **Iv. Conclusion And Future Work:-**

As per the above discussions provides the information about the proposed architectural frame work in the cloud computing data access mechanism. Especially it's designed the secure access of multimedia data content from the cloud data storage. The Original data storage is redesigned in the aspect of compression and it will further sub classified with the features of encryption. The detailed approach for the utilization of this architecture in the continuation of this research work.

##### Key words:-

Free radicals, medication therapy, management, Mouth opening.

#### Abstract

**Introduction:** Antioxidants relieve the signs and symptoms of oral submucous fibrosis by decreasing the load of free radicals.

**Aim:** The aim of this systematic review was to retrieve and analyse clinical studies investigating systemic antioxidants in the management of OSMF.

**Material and method:** Literature was searched in electronic search engines from 1995 to 2015. The identified titles / abstracts were independently screened according to set criteria for selection of abstracts. The full – text articles retrieved were assessed for eligibility and the eligible studies were assessed for qualitative and quantitative evidence. 9 full text articles were selected and assessed for eligibility. 6 full text articles were eligible for qualitative and quantitative analysis. Meta – analysis was done for mouth opening.

**Results:** The extracted data resulted in 207 subjects using systemic antioxidants. Meta – analysis of the combined data of the studies administering systemic antioxidants as a single entity or in combination with intralesional corticosteroids (n=121) as compared to other interventions (n=121) did not depict significant improvement in mouth opening (SMD = -1.446; 95% CI = -3.332 to -0.439) with significant test of heterogeneity (p = 0.0001 < 0.05). Meta – analysis of the combined data of all the interventional groups (n=207) and control groups (n=203) which depicted that systemic antioxidants as a single entity or in combination with intralesional steroids significantly improve mouth opening v/s controls (SMD = -1.235; 95% CI = -2.263 to -0.206) with a significant test of heterogeneity (and p = 0.0001 < 0.05).

**Conclusion:** Although the meta – analysis indicates that antioxidants appear to be effective in management of OSMF, the high degree of heterogeneity and limited amount of data in this systematic review and meta – analysis does not provide a credible evidence to support these observations.

Address:- Post Graduate Student, Room No.1, Department of Oral Medicine & Radiology, Govt. Dental College & Research Institute [Affiliated to Rajiv Gandhi University of Health Sciences (RGUHS)], Bangalore - 560002.

**Introduction:-**

Oral submucous fibrosis (OSMF) is a chronic, debilitating disease characterized by juxtaepithelial fibrosis of oral mucosa resulting in limitation of mouth opening and burning sensation.[1] Its etiopathogenesis is multifactorial with a high prevalence in areca nut chewers. OSMF is a potentially malignant disorder with a malignant transformation rate of 2.3 to 7.6%.[2][3] The most common debilitating symptoms of OSMF are burning sensation in the mucosa and inability to open mouth which also has psychological and social implications for patients.

Management of OSMF aims to reduce the symptoms and prevent the risk of malignant transformation. The current protocol for the management of OSMF can be divided into 3 broad groups: pharmacological, physical and surgical modalities.[4]

Pharmacological management includes usage of Vitamins and Antioxidants, anti – inflammatory drugs (principally corticosteroids), proteolytic agents (such as hyaluronidase) and anti - cytokines. Antioxidants act through their anti - inflammatory, anti – mutagenic and anti – carcinogenic properties. Moreover, Antioxidants stabilize and deactivate the free radicals which are induced by the ingredients of the betel nut. Various studies have shown that antioxidants are highly effective in controlling the signs and symptoms of OSMF and have been the mainstay of a conservative approach for management of OSMF.[4][5]

Several narrative and systematic reviews on management of OSMF have highlighted the beneficial role of various antioxidants like natural extracts, micronutrients, vitamins, nutritional supplements.[5][6][7] Nonetheless, no systematic review or meta – analysis has yet given evidence of efficacy of systemic Antioxidants in management of OSMF. Thus, this systematic review aimed to critically summarize and evaluate results of clinical studies investigating systemic antioxidants to improve signs and symptoms of OSMF.

**Aim:-**

To assess the effect of systemic antioxidants in the management of clinical signs and symptoms of OSMF by comparing them with each other and other treatment modalities through meta – analysis of retrieved data and to compare the effect of various systemic antioxidants used in the management of clinical signs and symptoms of OSMF.

**Material and methods:-****Review design:-**

The present systematic review was carried out by three investigators with an aim to systematically retrieve and analyse clinical studies investigating antioxidants in the management of clinical signs and symptoms of OSMF. The 3<sup>rd</sup> investigator performed an electronic search. Thus identified titles / abstracts through the search engines were independently screened by first and second investigators according to set inclusion and exclusion criteria for selection of abstracts. Full text articles of the selected abstracts were retrieved by the third investigator and further retrieval of titles / abstracts was done by cross – referencing of full – text articles. The full – text articles were assessed for eligibility by the first and second investigators and the selected studies are assessed for the quality of their reporting.

**Search strategy:-**

An electronic data base search was performed in PubMed and Science Direct for last 20 years from a time period of January 1995 to March 2015. The MESH keywords were ANTIOXIDANTS, MICRONUTRIENTS, VITAMINS, NUTRITIONAL SUPPLEMENTS combined with OSMF with Boolean term “AND”. A total of 1189 title / abstracts identified through the search engines and the 9 title / abstracts identified through manual search were independently screened according to set inclusion and exclusion criteria for selection of Titles / abstracts (Table.1). The investigators were not blinded to journal names or authors. Screening yielded total of 41 title / abstracts out of which 12 full text articles could be retrieved. 3 full text articles were excluded because of repetition. Finally 9 full text articles were selected and assessed for eligibility through PICO guidelines. Agreement concerning study inclusion or exclusion was achieved by thorough discussion among the investigators. Further 6 full – text articles were selected which fulfilled the PICO guidelines. These full – text articles are qualitatively analysed with consort

guidelines 2010 as modified by Friction et al. The extracted data was quantitatively assessed for the outcomes. (Flowchart - 1; showing the search strategy)

## 2.2 assessment of eligibility (With PICO guidelines)[8]-

The 9 full – text articles were evaluated with participants, interventions, comparators, outcomes (PICO) guidelines as follows-

### Participants-

Studies with human participants, who were diagnosed as having OSMF clinically or histologically or both.

### Type of interventions-

Systemic Antioxidants as a single entity or in combination, at any dosage and over any time period.

### Comparators (Control)-

Negative (placebo treatment), positive (other intervention; i.e other treatment modalities or antioxidant administered in any other mode).

### Outcomes-

The primary outcomes assessed were- maximal mouth opening, burning sensation, palpable fibrous bands, tongue movements. Secondary outcomes assessed were the adverse effects of the antioxidants used and Change or improvement of nutritional status by laboratory investigations and clinical evaluation.

### Data extraction and synthesis-

Data of the 9 full – text articles was extracted and recorded in a format designed for this purpose. The data extracted from all the studies were combined and the subjects who were administered systemic antioxidants alone or in combination with other treatment modalities were considered into interventional group. Subjects who were administered placebo, intralesional corticosteroids or topical antioxidants were considered in control group.

The data of the 9 full – text articles were assessed for eligibility according to PICO guidelines. However, only 6 studies could be included in the systematic review after assessment of eligibility (Table.2). [9] [10] [11] [12] [13] [14] [15] [16] [17].

The extracted data resulted in 207 subjects using systemic antioxidants these subjects were considered to be in interventional group in the systematic review and meta - analysis. 203 subjects were considered in the control / comparator group. Out of which, 82 were included in the placebo group, 121 controls were in the other treatment modalities group like intralesional corticosteroids or topical antioxidants.

### Quality assessment of selected studies-

The quality of reporting of RCTs was carried out by using the 2010 CONSORT criteria as modified by Friction, et al. 1<sup>st</sup> and 2<sup>nd</sup> investigators independently evaluated the method of randomization and blinding using points 8, 9, 10, 11, 15, 16 of CONSORT guidelines 2010 as they are the indicators of risk of systemic bias (Table 3 showing the details). In case of disagreement between the investigators, differences were discussed and a decision was made by consensus. The overall score of the studies gave an average of 6.83 which varied from a minimum of six to a maximum of 8 (scoring shown in Table 4).[18]

### Statistical analysis:-

The extracted data of the selected studies are tabulated. Meta – analysis could be achieved only for one primary outcome i.e mouth opening as the method of its assessment was uniform in all the included studies. Due to heterogeneity of data and methods of assessment the rest of the primary outcomes could not be taken for meta - analysis. The primary measures of effect between treatment and control groups for mouth opening were calculated as the standardized mean differences (SMDs) with a 95% confidence interval. A random and fixed effects model was used to calculate a pooled estimate effect. Cochrane's Q test, a statistic based on the chi – squared test was used to assess the existence of heterogeneity among the interventional and control groups for mouth opening.

### Results:-

#### Study characteristics:-

The electronic searches yielded a total of 1889 articles and manual search yielded total of 9 articles. Following a meticulous search strategy according to prisma guidelines (FIGURE.1), finally 9 full text articles were selected and assessed for eligibility through PICO guidelines. Further 6 full – text articles were selected which fulfilled the PICO

guidelines. These full – text articles were qualitatively analysed with CONSORT guidelines 2010 as modified by Friction et al. The extracted data was quantitatively assessed for the outcomes. The data analysis yielded complete information for only one of our primary outcomes i.e mouth opening. Meta – analysis could be achieved only for mouth opening as the methodology used for its assessment was same in all the included studies. All the other primary outcomes could not be taken for meta – analysis due to heterogeneous in complete data and different methodology used for their assessment.

### **Characteristics of outcomes:-**

#### **Mouth opening:-**

All the 6 included studies assessed change in mouth opening as one of their treatment outcomes. All the studies measured mouth opening using interincisal distance in dentulous patients and for edentulous patients, the opening between the upper and lower ridges was recorded (Table.2).

#### **Other primary outcomes:-**

Burning sensation was assessed by 5 of the included studies except from Patil et al 2014. This outcome was assessed by the 5 studies subjectively using different scales. Changes in palpable fibrous bands was assessed by Kumar et al.[9]. Karemore et al, Salvem et al, Patil et al 2014, Patil et al 2015 did not record changes in palpable fibrous bands. Changes in tongue movements was recorded by Kumar et al, Sudarshan et al and Patil et al 2014 however Karemore et al, Selvam et al and Patil et al 2015 did not record changes in tongue protrusion.(Table.2)

#### **Adverse reactions:-**

There were no side effects or intolerance to lycopene and other antioxidants reported by Kumar et al, Karemore et al, Selvam et al during the treatment period and follow – up. However, Karemore et al reported one case which showed ulceration and burning sensation of oral cavity for a period of one week during follow - up.

Patil et al 2014, reported mild abdominal discomfort due to Oxitard in 8 patients. Patil et al 2015 did not report any side effects of the antioxidants used.

#### **Meta analysis:-**

Metaanalysis was done for only one of our primary outcome i.e mouth opening. Forest plots were drawn for systemic antioxidants vs placebo, systemic antioxidants vs other controls (other treatment modalities) and systemic antioxidants vs controls (combining both placebo and other treatment modalities) using the standard mean deviations (SMDs) and pooled fixed and random overall effects were tabulated.

Patients administered 16 mg lycopene capsules (Kumar et al, Karemore et al) and 16 mg lycopene capsules with intralesional injection of betamethasone 8 mg daily (Kumar et al) v/s placebo depicted significantly improved mouth opening (SMD = -0.959; 95%CI = -1.284 to -0.635; for fixed effects and SMD = -0.941; 95%CI = -1.309 to -0.574; for random effects). Q test of heterogeneity was 2.4608, df = 2 and p value of 0.2922> 0.05 which was not significant.(Fig.2)

Patients administered oral lycopene (lycostar) 16 mg O.D with bi-weekly intralesional dexamethasone & hyaluronidase and oral antioxidant capsules (Multivitamin A – Z soft capsules) O.D with bi-weekly intralesional Dexamethasone & Hyaluronidase (interventional group) v/s bi-weekly intralesional Dexamethasone & Hyaluronidase (control group); (Salvem et al). Patients administered 2 oxitard capsules t.i.d (interventional group) v/s 5 mg aloe vera gel to be applied topically t.i.d. (control group); (Patil et al 2014). Patients administered 500 mg spirulina capsules b.i.d. (interventional group) v/s 5 mg aloe vera gel topically t.i.d. (control group); (Patil et al 2015). Patients administered aloe vera gel 5 mg on each side of buccal mucosa thrice daily for 3 months. (control group) v/s antioxidant capsules twice daily for 3 months (interventional group); (Sudarshan et al) did not significantly improve mouth opening considering the random effects model (SMD = -1.516; 95%CI = -1.853 to -1.179); for fixed effects and SMD = -1.446; 95% CI = -3.332 to -0.439; for random effects). Q test of heterogeneity was 122.9207, df = 4 with a significant p value of 0.0001. Hence, here emphasis should be placed on random effects model as test for heterogeneity is significant.(Fig.2)

A third forest plot was drawn combining all the interventional groups and control groups (placebo & other treatment modalities) which depicted that systemic antioxidants as a single entity or in combination with other treatment modalities i.e intralesional steroids significantly improve mouth opening v/s controls i.e topical antioxidants and intralesional steroids considering the random effects model. (SMD = -1.226; 95% CI = -1.459 to -0.993); for fixed

effects and SMD = -1.235; 95% CI = -2.263 to -0.206; for random effects). Q test of heterogeneity was 130.8958, df = 7 with a significant p value of 0.0001. Hence, here emphasis should be placed on random effects model as test for heterogeneity is significant. (Fig.2)

### Discussion:-

Antioxidants provide a non – invasive conservative approach for management of OSMF. Various studies have proved that antioxidants when used as a standard or adjunct are effective in controlling the signs and symptoms of OSMF. This systematic review aimed to assess the evidence of systemic antioxidants in management of signs and symptoms of OSMF and to compare the systemic antioxidants with other treatment modalities in improving the signs and symptoms of OSMF. This systematic review included only randomized controlled trials, as non randomized trials tend to show frequent “false - positive” results than randomized trials.

The primary outcomes assessed in this review were based on the signs and symptoms of OSMF. Mouth opening was measured in all the 6 studies as inter – incisal distance. Hence a Meta – analysis was carried out to assess the evidence of effectiveness systemic antioxidants in improving the mouth opening.

The systemic anti – oxidants reported in the RCTs of this systematic review are lycopene, spirulina, oxiard and antioxidant capsules.<sup>3</sup> Out of 6 RCTs administered lycopene in one of their interventional group. The Meta – analysis of lycopene as a single component or in combination with intralesional corticosteroids suggests an evidence that lycopene when given in a dosage of 16 mg twice daily for two months as a single entity or in combination with intralesional corticosteroids may be effective in improving the mouth opening in OSMF patients as compared with placebo (SMD = -0.959; 95% CI = -1.284 to -0.635).

Metaanalysis of the combined data of the studies administering systemic antioxidants as a single entity or in combination with intralesional corticosteroids (n = 121) as compared to other interventions (n = 121) i.e topical antioxidants and intralesional corticosteroids (Salvem et al, Patil et al 2014, Pati et al 2015, Sudarshan et al) does not depict significant improvement in mouth opening (SMD = -1.446; 95% CI = -3.332 to -0.439). This attributes to lack of credible evidence and high variability in between the studies as depicted significant test of heterogeneity ( $p = 0.0001 < 0.05$ ) to estimate the effect of intervention. However, it can be inferred that systemic antioxidants as a single entity or in combination with intralesional corticosteroids does not seem to be better than other treatment modalities i.e intralesional corticosteroids and topical antioxidants in improving mouth opening patients with OSMF.

Meta-analysis of the combined data of all the interventional groups (n = 207) and control groups (n = 203; placebo & other treatment modalities) which depicted that systemic antioxidants as a single entity or in combination with other treatment modalities i.e intralesional steroids significantly improve mouth opening v/s controls i.e topical antioxidants and intralesional steroids (SMD = -1.235; 95% CI = -2.263 to -0.206). However, this data also depicted high variability in between the studies as depicted by significant test of heterogeneity (and  $p = 0.0001 < 0.05$ ).

### Limitations:-

The meta-analysis and systematic review reported here combines data across studies in order to estimate treatment effects with more precision than is possible in a single study. The main limitation of this meta - analysis, as with any overview is that the antioxidant used and the outcome definitions are not the same across studies. Only one primary outcome could be assessed i.e mouth opening, rest of primary and secondary outcomes could not be assessed due to lack of consensus among researchers invalidation of other signs and symptoms of OSMF. Although, only two studies mention about the adverse effects of the systemic antioxidant used. This leads us to an observation that systemic antioxidants are relatively safe for the treatment of OSMF. Moreover, the lack of assessment of nutritional status by laboratory investigation or clinical evaluation further highlights the lack of clear markers in serum and saliva which can reliably estimate the overall status of the subjects suffering from OSMF.

At the study and review level our review did not include any grey literature and studies published in other languages were not considered in the review. Only 12 full – text article could be retrieved due to constrained resources available to the investigators. Although, randomization of the selected studies was adequate the quality of randomization varied and none of the studies could be given high scores according to CONSORT guidelines as modified by Friction et al.

**Conclusions:-****Implications for practice:-**

Although the investigators in all the trials concluded that the results indicated that antioxidants were safe, appeared to be effective in reducing symptoms and might prove beneficial in the therapeutic management of oral submucous fibrosis, the uncertain reliability of the limited amount of available data would not appear to support these contentions. Moreover, the meta-analysis carried out for mouth opening suggests that systemic antioxidants are not as effective when compared with other interventions but it does indicate a certain beneficial role of systemic antioxidants being used as an adjuvant with other medical intervention. Additionally other antioxidants like Oxitard and Spirulina have proved to be effective in alleviating the signs and symptoms of OSMF.

**Implications for research:-**

OSMF has proven to be a significant global burden, especially in the South Asian countries where prevalence of this debilitating disease is relatively more. But treatment of OSMF has been clearly inadequate owing to its multi-factorial pathogenesis and evaluation of the merits and disadvantages of individual drugs has been difficult because of empirical nature of the approach.

This systematic review opines that future research trials should be reported strictly adhering to the CONSORT guideline to ensure high quality research especially in terms of randomization and blinding of the subjects for better results. Further the effect of drug on progression of the OSMF can be assessed by using various classifications present in literature based on signs and symptoms of OSMF. However, this systematic review stresses the need of consensus among investigators for the various clinical criteria used to assess OSMF so that significant evidence of a particular treatment modality like antioxidant could be achieved in future review designs.

**Conflicts of interest - NONE****Table 1:-**Showing inclusion and exclusion criteria used for screening of title / abstracts

INCLUSION CRITERIA-	
1.	Randomised clinical trials which mention the use of antioxidants for management of OSMF on human subjects.
2.	Randomised clinical trials in the management of OSMF which include a group intervened with systemic antioxidants by random allocation.
3.	Randomised clinical trials in which effect of systemic antioxidants on signs and symptoms of OSMF could be clearly / separately identified.
EXCLUSION CRITERIA-	
1.	Publications written in languages other than English.
2.	Review articles on management of OSMF.
3.	Non-randomised studies on management of OSMF.

**Table 2:-** Showing assessment of 9 full text articles for eligibility according to PICO guidelines with the details of data extraction.

Author s & Year	Study type & participants	Interventions	Systemic antioxidant used	Interventional period / follow up	Outcomes	Assessment of eligibility	Reasons for exclusion
Kumar et al, 2007	Randomise control trial. GroupA=21 GroupB=19 GroupC=18	Gr A:Oral lycopene 16 mg b.i.d. Gr B: Oral lycopene 16 mg daily + intralesional injection betamethasone 8 mg twice weekly. Mekele City, MSW generation,  
Population and GDP growth

#### **Abstract**

Municipal Solid Waste (MSW) generation is an unavoidable phenomenon in any Economic levels and population size. The fast expansion of urbanization, agricultural practices and industrial activities encouraged by quick population growth has produced an enormous amount of solid wastes that pollute the environment and destroy resources. The data was generated from secondary data sources of various institutions. The range and the composition of MSW generation are highly variable and heterogeneous with the contemporary way of life experience of both in low, middle and high income inhabitants. The result showed that the current scenario of MSW generation rate is small but it is tremendously increasing in an increasing fashion parallel with population and GDP growth of Mekele City. Thus, it is important and advisable to undertake well comprehensive kinds of research works in the City to identify and predict the prospect MSW generation trends together with its integrated management options.

#### **Introduction:-**

Solid wastes are the materials which arise from various human and animal activities and discarded as useless or unwanted (Rana, 2007). Solid waste generation is an inevitable consequence of production and consumption activities in any economy (Eugenia et al., 2002). (UNEP, 2005) also reported that fast expansion of urban, agricultural and industrial activities spurred by rapid population growth has produced a huge amount of solid waste that pollutes the environment and destroys resources. Globally the per capita amounts of municipal solid waste generated on a daily basis vary significantly (WRI, 1996). Globalization can promote economic growth, a desirable outcome. However, this economic growth in addition to population increase and urbanization will seriously strain municipal resources to deal with booming amounts of wastes (Medina, 2002). Solid waste generation depends on the economy of the people and level of income of the family or individual. Previous studies have shown that for every Indian, an increase in income by Rs. 1000 results in an increase of solid waste generation by one kilogram per month. It is a common observation that with an increase of economic growth the waste generation grows in an equal manner. Economic growth and waste generation have not been decoupled in both developing and industrialized world (Visvanathan & Trankler, 2006). Medina (2002) also reported that a positive correlation tends to exist between a community's income and the amount of solid waste generated. Wealthier individuals consume more than lower-income ones, which result in a higher waste generation rate for the former. Income and household size are the most significant factors affecting the quantity of solid wastes from household consumption (Richardson & Havlicek,

**Corresponding Author: -Gebru/ Zinabu Marsie.**

Address: -UNEP-Tongji, Institute of Environment for sustainable development; College of Environmental Science and Engineering; 20092, Shanghai, China.

1974). Visvanathan & Trankler (2003) reported that in a family with rich socioeconomic condition, daily waste generation rates were generally higher than the lower socioeconomic families.

Increasing population levels, booming economy, rapid urbanization and the rise in community living standards have greatly accelerated the municipal solid waste generation rate in developing countries (Minghua et al., 2009). Municipalities, usually responsible for waste management in the cities, have the challenge to provide an effective and efficient system to the inhabitants. However, they often face problems beyond the ability of the municipal authority to tackle (Sujauddin et al., 2008) mainly due to lack of organization, financial resources, complexity and system multi dimensionality (Burntley, 2007).

#### Global MSW generation Scenario:-

Generally, in European countries and Organization for Economic Cooperation and Development (OECD) countries, MSW covers waste from households (82% of total MSW) including bulky waste, waste from commerce and trade, office buildings, institutions and small businesses, yard and garden waste, street sweepings, the contents of litter containers, and market cleansing waste (Eurostat, 2003). The definition of MSW excludes waste from municipal sewage networks and treatment, as well as municipal construction and demolition waste. However, national definitions of MSW may differ (OECD, 2007a).

The annual waste generation in East Asia and the Pacific (EAP) Region is approximately 270 million tons per year. This quantity is mainly influenced by waste generation in China, which makes up 70% of the regional total (UNEP, 2010; Wasswa & Schluep, 2008).

**Table1:- Waste Generation Per Capita by Region**

Region	Waste Generation per Capita(kg/capita/day)		
	Lower Boundary	Upper Boundary	Average
AFR	0.09	3.0	0.165
EAP	0.44	4.3	0.95
ECA	0.29	2.1	1.1
LAC	0.11	5.5	1.1
MENA	0.16	5.7	1.1
OECD	1.10	3.7	2.2
SAR	0.12	5.1	0.45

Source: Hoornweg et al., 2005)

In Eastern and Central Asia (ECA), the waste generated per year is at least 93 million tons. Eight countries in this region have no available data on waste generation in the literature. The per capita waste generation ranges from 0.29 to 2.1 kg/ person/day, with an average of 1.1 kg/capita/day. Latin America and the Caribbean (LAC) has the most comprehensive and consistent data (e.g. PAHO's Regional Evaluation of Solid Waste Management, 2005). The total amount of waste generated per year in this region is 160 million tons, with per capita values ranging from 0.1 to 14 kg/capita/ day, and an average of 1.1 kg/capita/day. Similar to the high per capita waste generation rates on islands in Africa, the largest per capita solid waste generation rates are found in the islands of the Caribbean. In the Middle East and North Africa (MENA), solid waste generation is 63 million tons per year. Per capita waste generation is 0.16 to 5.7 kg/person/day, and has an average of 1.1 kg/capita/day. The (OECD) countries generate 572 million tons of solid waste per year. The per capita values range from 1.1 to 3.7 kg per person per day with an average of 2.2 kg/capita/day. In South Asia Region (SAR), approximately 70 million tons of waste is generated per year, with per capita values ranging from 0.12 to 5.1 kg per person per day and an average of 0.45 kg/capita/day. Table 3 shows current waste generation per capita by region, indicating the lower boundary and upper boundary for each region, as well as average kg per capita per day of waste generated within each region.

**Table2:- Waste Generations Per Capita by Income Level**

Income Level	Waste generation per capita (kg/capita/day)		
	Lower Boundary	Upper Boundary	Average
High	0.70	14	2.1
Upper Middle	0.11	5.5	1.2
Lower Middle	0.16	5.3	0.79
Lower	0.09	4.3	0.60

Source: Hoornweg et al., 2005

Of the world's waste, while Africa and South Asia figure as the regions that produce the least waste. Table 4 below shows estimates of waste generation for the year 2025 as expected. According to Hoornweg et al., 2005, current trends in population growth in each region. In the coming 10 years the East Asia and Pacific regions are the most dominant solid waste producers.

**Table3:- Waste Generation Projections for 2025 by Region**

Region	Current Available Data			Projection for 2025			
	Total urban population (Millions)	Urban waste Generation		Projected Population		Projected Urban waste	
		Per capita (kg/capita/day)	Total (tons/day)	Total population (millions)	Urban population (millions)	Per capita (kg/capita/day)	Total (tons/day)

Source: Hoornweg et al., 2005)

Waste generation varies as a function of affluence, however, regional and country variations can be significant, as can generation rates within the same city. Throughout the report, when Africa is mentioned as a region, we refer to Sub-Saharan Africa (AFR). Data are particularly lacking for Sub-Saharan Africa. Waste generation in sub-Saharan Africa is approximately 62 million tons per year. Per capita waste generation is generally low in this region, but spans a wide range, from 0.09 to 3.0 kg per person per day, with an average of 0.65 kg/capita/day. The countries with the highest per capita rates are islands, likely due to waste generated by the tourism industry, and a more complete accounting of all wastes generated, (Wasswa & Schluep, 2008). For example the composition of wastes in East African Cities are illustrates on table 4:

**Table4:- Composition of solid wastes generated in East African urban centers**

#### **Current Waste Generation and in Emerging Cities of Ethiopia:-**

Waste management in Addis Ababa is fundamentally different from other emerging cities of Ethiopia. There has been no form of waste management in emerging cities until very recently. A few of these new municipalities, as seen in Figure 5, were designed to decrease human exposure to unsanitary conditions and environmentally degrading practices. Yet, as Table 3 illustrates, the collection and management of waste in most of the municipalities is still quite inefficient.

Two exceptions, Mekele and Dire Dawa, have recently experienced promising results for improved waste management and waste-to-energy conversion through biogas capture from landfills using both technical and

institutional strategies (Fikreyesus, 2011). International financing, such as the Clean Development Mechanisms, could support the transition to sustainable waste management in these emerging cities, similar to the Addis Ababa municipality.

**Table5:- Ethiopian municipalities and waste generation, in 2010**

City	Region	Population	MSWG	MSWC
Addis Ababa	Addis Ababa	2,979,100	1,132t/d	70% collected
Mekele	Tigray	261,200	78t/d	82% collected
Dire Dawa	Dire Dawa	256,800	77t/d	48% collected

Mekele is another Ethiopian city that has recently increased solid waste generation but lacks management to accommodate the growing rates of waste. The municipality currently offers poor disposal services throughout the city, with a total of 58 collection containers (Tadesse et al., 2008). Final collectors dispose of waste in two open dumping sites about 10km outside of the city (Tadesse et al., 2008).

## Materials and Method:-

### Area description:-

Mekele had a built up area coverage of 16 KM<sup>2</sup> in 1984 after ten years, in 1994 the size of built up area reached 23.04 KM<sup>2</sup> adopting a continuous increase with the rise of population size and the city administration has expanded its land holding to 100KM<sup>2</sup> in 2004 by engulfing the vast agricultural lands of neighboring villages and towns. The altitude of Mekele varies from 2150 m.a.s.l. - 2270 m.a.s.l. Mekele Experiences mild climatic condition with annual average maximum temperature of 24.1<sup>0</sup>C and annual average minimum temperature 11.11<sup>0</sup>C. June is the hottest month with a monthly mean maximum temperature of 27.1<sup>0</sup>C and monthly mean minimum temperature of 13.03<sup>0</sup>C. December is the coldest month with a mean monthly maximum temperature of 21.9<sup>0</sup>C and monthly mean minimum temperature of 8.51<sup>0</sup>C. There is one short rainy season, which starts on June and lasts on August. The rainy season is characterized by erratic, unreliable and uneven distribution. The city has annual average rainfall of 618.3mm/Year of which the substantial amount falls on July and August. The highest monthly rainfall occurs on August with a monthly rainfall of 229 mm (37% of the annual) and July is the second largest rainy month with a monthly rainfall of 207.7mm (33.5% of the annual).

### Data Collection Methods:-

The data was generated from the secondary data sources of Mekele City administration Municipality; Waste management and control stream. The projected population growth was estimated by the average growth rate of Mekele City; that is 4.4%, from Finance and Economic Development Office (October 2004), Mekele. The total current solid waste generated and projected waste generation was calculated based on the daily per capita generation of the City; the daily per capita waste generation of Mekele City is 0.268kg/c/d, (ECSA, 2010 and Feasibility study of ISWM for Mekele City, 2012). The GDP growth of Mekele City was also extrapolated from the Ethiopian GDP growth of the last 10 years by Statista, 2016 and [www.Trading Economics.com/](http://www.Trading Economics.com/) World Bank (2015). Its extrapolated by divided the yearly GDP growth to GDP per Capita and Multiplying by the total population of Mekele City for each year.

### The Existing Municipal solid waste generation Rate of Mekele:-

According to the Feasibility study in 2012 of Mekele City, the daily generation rate of every Kebele and City level is tracked with volume and weight per capita per day basis in table 6- below.

**Table 6:- Solid waste generation rate of inhabitants in Mekele Sub-City bases**

SN	Tabias	Per capita per day volume	Per capita per day weight	Per capita per day unit weight
		(cu m/c/d)	(Kg/c/d)	(Kg/cu.m)

**Population Size, GDP growth and Solid waste generation forecast:-**

The total solid waste generated from Mekele City was calculated based on the projected population number and the per capita waste generation. The population growth also calculated by using the average annual growth rate of the City and the following formula was used to calculate the annual increment of population number.

$$P_i = P_o * (1 + r)^t$$

Where:  $P_i$  = Total population number for the target year

$P_o$  = Total population number in 2010

$r$  = Annual growth rate

$t$  = number of years from 2006 to the target year

**Table8:-Population growth rate Trends of Mekele City**

Year	Growth Rate
1965-1970	4.6%
1970-1978	5.1%
1978-1984	6.3%
1994-2004	4.4%
2004+	4.4

### Result and Discussion:-

In the Solid waste generation rate of residential establishments of Sub-City bases; table 6, shows that the highest per capita per day volume, per capita per day weight and per capita per day unit weight of MSW is recorded in Hadnet, Addis Alem and Industry Sub-City respectively. There are also huge differences among the largest and the smallest waste generation Scenarios of the Sub-City; this is due to the economic level and the number of populations within the Sub-Cities. And generally in a City level the per capita per day volume, per capita per day weight and per capita per day unit weight are 0.924, 0.268, 371.13 respectively. Thus, Solid waste generation rate of inhabitants in Mekele Sub-City bases is elaborated below graphically (per capita per day (cu m/c/d) :

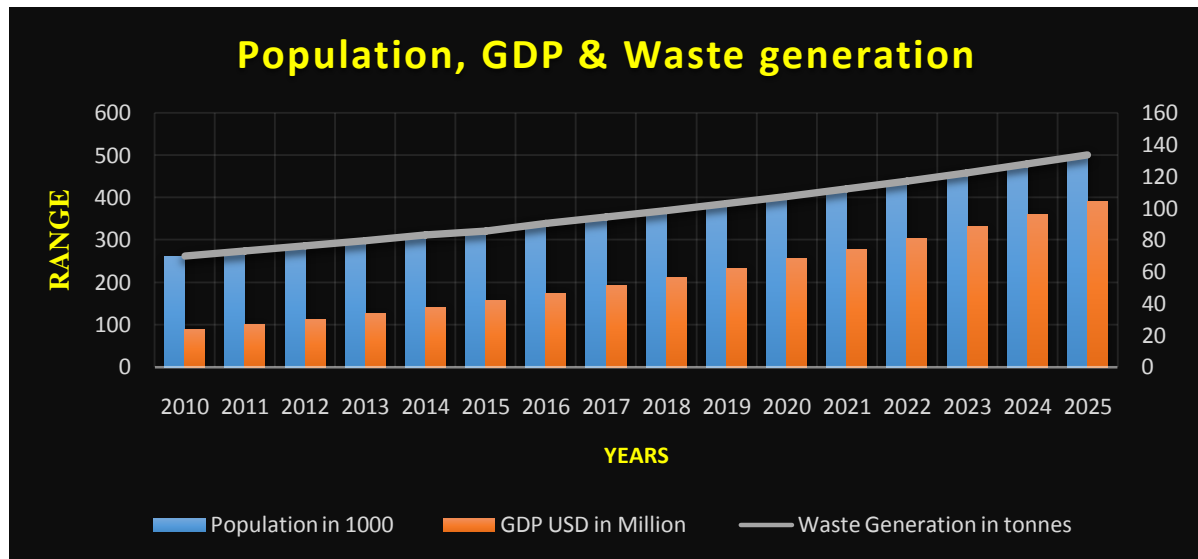

The rate of waste generation is known to be changed for every fiscal year. Among other factors economic status of residents is the main reason. However due to the difficulty of predicting the dynamics of economic changes and lack of previous recorded data to be used for trend analysis; so, the rate of generation is forecasted using probabilistic model. Thus, Solid waste generation rate of inhabitants in Mekele Sub-City bases is elaborated below graphically (Per capita per day weight (kg/c/d) :

From table six again the Solid waste generation rate of inhabitants in Mekele Sub-City bases is elaborated below graphically (Per capita per day unit weight (kg/cu m) :

According to table 9-results, the connection of population, GDP and waste generation is linear relationships. As the population and the economic growth increases the waste generation per capita also increase and the waste generation of the City per year is sharply increases. For the coming ten years of waste generation in Mekele City will also increasing tremendously by the influence of the population growth and the economic developments of the City as well. It was projected the future population growth by using the following population projection formula:  $P_t = P_0 * (1 + r)^t$

Mekele City solid waste generation in relative to the high income countries/ developed nations the recent rate of waste generation per capita is very small. The average waste generation of OECD countries (kg/capita/day) is 2.2, (Hoornweg et al., 2005). But the average waste generation of Mekele City (kg/capita/day) is 0.268; that is only 12% of the OECD countries is generated in Mekele City.

### Conclusion and The Way for wards:-

- ❖ Generally the Mekele City MSW generation is highly linked with the population size and the income level of the inhabitants. The MSW generation scenario of Mekele City in the Past six and the coming 10 years both the per capita and total annual generation rate for the City showed that ever increasing with linear relationships of the influencing Factors (Population and Income level of the Inhabitants).
- ❖ Even though the amount of waste generation is on the sharply increment Manner, it is very insignificant relatively to the high income level countries' generation rate.
- ❖ The population growth together with the economic development of the City has positive impacts in solid waste generation of the City; thus, the municipality should give serious concern on the controlling of the ever increasing MSW generation.
- ❖ The generated waste must be treated accordingly the nature, compositions and the characteristics of the MSWs.
- ❖ The Heterogeneity of MSW generation of the City should be managed by the participatory approaches of all stakeholders by involving in the waste Recycling, Reducing and Reuse (3R-Rules approach) responsibility roles.
- ❖ There should be a strong Policy and Laws to control and treat the generation and management processes of MSWs both in Sub-Cities and City levels.

#### Abstract

Boehmite alumina (BAL) powder was investigated in terms of its use as a filler in PP in order to improve the inherent properties of recycled polypropylene. Nanocomposites of recycled polypropylene with different loadings of BAL were prepared by melt compounding technique. The structural characterization and morphology of BAL nanopowder were characterized by X-ray diffraction (XRD) and Transmission electron microscope (TEM). The influence of BAL nanoparticle content on the thermal properties of recycled polypropylene (PP) was studied by means of differential scanning calorimetry (DSC) and thermogravimetric analysis (TGA). The effect of the BAL content on the mechanical properties and morphological analyses (SEM) of recycled PP/BAL nanocomposites was also studied. It was found that BAL significantly affected the crystallization temperature and the degree of crystallization of recycled PP. The results showed that the BAL effectively improved the mechanical properties of recycled PP. In comparison with neat PP, the tensile strength of PP/BAL (3 wt%) nanocomposites increased by ~21% and the modulus increased by ~101%. Recycled polypropylene/boehmite alumina nanocomposites have such properties that advise their relevance for application in the packaging industries.

#### Introduction:-

With the increasing usage of polymers, dwindling petroleum resources and high oil prices, there is the search for alternative virgin polymers. This search will also consider the financial viability of materials rather than produce them from raw materials. Recycling is a viable alternative to reduce the disposal of plastic products which contributes significantly to the negative environmental impact. Among all polymers, polypropylene (PP) is one of the most common plastic materials that is being used in various applications [1]. Therefore, annually, millions of tons

of PP materials are discarded as wastes and they are required to be recycled in order to reduce plastic waste. However, during the recycling process, polypropylene undergoes various operations that bring out several modifications in the molecular structure. As a result, the mechanical, thermal and melt flow properties of the recycled products and their structural organization are quite different when compared to those composed of virgin material [2]. Several approaches have been made to improve the processability, mechanical and thermal properties of the recycled PP. These include: blending with the other polymers, addition of reinforcing agents, such as: nanofillers, natural fibers and other reinforcing fillers.

Recycled PP has been blended with virgin PP in order to improve its mechanical and thermal properties. Raj et al. reported that a 10% virgin PP was the best combination to improve the mechanical properties of the recycled PP [2]. Sawdust has been used to improve the impact strength of the recycled PP [3]. Recycled PP were also utilized to produce co-composites with kenaf fiber [4]. In addition, secondary fiber (from the paper industry) reinforced recycled polypropylene composites have been successfully processed by extrusion by using 2% maleic anhydride modified polypropylene that acts as an efficient compatibilizer and promotes interfacial adhesion between secondary fiber and recycled polypropylene [5]. Besides that, nano  $\text{CaCO}_3$  filler was also utilized to improve the mechanical and thermal properties of recycled PP [6]. However, for the first time, Boehmite alumina was used as a filler to improve the mechanical and thermal properties of recycled PP. Boehmite alumina (BAL) with chemical composition  $\text{AlO}(\text{OH})$  is an inexpensive nanofiller and it can also be produced synthetically, in particulates form, with different aspect ratios. Boehmite nanocomposites with recycled LDPE has already been reported in a previous study [7].

The main objective of this study is to use low cost boehmite nanofiller as a reinforcing agent in order to improve the properties of the recycled PP, using a melt compounding technique and to investigate the effect of the recycled PP and BAL loadings (ranging from 1 and 5 wt%) in order to get a better dispersion of BAL in the recycled PP matrix. Moreover, the influence of BAL on the structure, thermal and mechanical properties of the recycled PP was investigated in detail by using different techniques.

## **Experimental:-**

### **Materials:-**

The recycled polypropylene was obtained from R.K. Polymers, South Africa. The BAL powder containing 80%  $\text{Al}_2\text{O}_3$  used is a commercial product manufactured by SASOL, under the trade name Disperal 40. With several years of experience, SASOL developed this product that is not only high in dispersibility, but also with significantly low levels of common impurities, such as: iron, sodium and silica.

### **Processing of recycled PP/ Boehmite aluminan nanocomposites:-**

PP/BAL nanocomposites were prepared by using an extruder, equipped with co-rotating twin-screws. The processing temperature was  $165^\circ\text{C}$  and the screw rotation speed of the microextruder was fixed at 100 rpm. After the fixed processing time (2 min) in the micro-extruder, the molten mixture was transferred to a pre-heated micro-injection moulding machine. The injection mould temperature was maintained at  $40^\circ\text{C}$ . Finally, the specimen was conditioned according to ASTM standards, prior to testing. In order to investigate the performance of the nanocomposites, the loading of the BAL in the recycled PP matrix was varied from 1 to 5 wt.%.

### **Mechanical Properties:-**

Tensile testing of the composite specimens was carried out by using a UTM (Universal Testing Machine), Instron 3382 instrument, as per the ASTM D638. For this, rectangular specimens ( $2.54 \times 15$  cm) from each sample were stretched at a cross-head speed of 50 mm/min. Ten replicates were tested for each sample and the average values are presented.

### **Morphology Analysis:-**

The microstructure of the surface of the tensile fractured composites was observed using a Field Emission Scanning Electron Microscopy (FE-SEM) (S-4800, Hitachi Co., Ltd., Matsuda, Japan), operated at an accelerating voltage,  $V_{\text{acc}}$  of 10 kV and a current,  $I_e$  of 10  $\mu\text{A}$  with samples coated in vacuum with sputter of Os. The morphology of BAL was observed using a Transmission electron microscope (TEM) (JEM-2100F, JEOL, Japan).

**Differential Scanning Calorimetry (DSC):-**

The thermal properties of the samples were determined using a DSC 22 System, Seiko Instruments, Inc., Japan. The heating rate used was 10°C/min, in a temperature range of between 30-300°C under nitrogen atmosphere. The percentage crystallinity was determined using the following equation (1).

$$X_c(\% \text{Crystallinity}) = [(\Delta H_m - \Delta H_c) / \Delta H_{m0}] \cdot 100\% \quad \text{----- (1)}$$

where  $\Delta H_m$  is the enthalpy heat of fusion and  $\Delta H_c$  is the heat of cold crystallization (in J/g). The term  $\Delta H_{m0}$  is a reference value and represents the enthalpy heat of melting of an “ideally” 100% crystalline polymer.

**Thermo-gravimetric analysis (TGA):-**

The thermal stability of the recycled PP and recycled PP/nanocomposite samples was determined with a thermogravimetric analyzer (TGA, Mettler Toledo, Schwarzenbach, Switzerland). About 5 mg of each sample was heated from room temperature to 600°C at a heating rate of 10°C/min under a nitrogen flow rate of 50 cm<sup>3</sup>/min.

**X-ray diffraction (XRD):-**

X-ray diffraction (XRD) pattern of the BAL was analyzed by using a PANalytical Xpert pro MRD diffractometer (Amsterdam, Netherlands). The XRD spectra were recorded using a Cu-K $\alpha$  radiation (wavelength of 0.1546 nm) with a nickel monochromator filtering wave at a voltage and current of 40 kV and 30 mA, respectively. The diffraction patterns were obtained at diffraction angles between 5° and 70° at a scanning rate of 0.4°/min at room temperature.

**Results and Discussion:-****TEM and X-ray diffraction analysis of BAL:-**

The morphology of BAL nanopowder are shown in **Fig. 1 (a)**. TEM images of the BAL exhibited some hexagonal, flake and rod-like shapes. It can also be observed that the BAL is slightly aggregated, with some particles clustered to each other. This slight aggregation of nanoparticles may be due to the drying process during the sample preparation. These self-aggregated nanoparticles are expected to be separated during the melt-mixing with the recycled PP. The crystalline structure of BAL nanopowder was observed by doing the XRD analysis. **Fig. 1(b)** shows the XRD pattern of BAL nanopowder. From the X-ray diffractogram of BAL nanopowder, intense peaks (*hkl* plane) at  $2\theta = 14.7^\circ$ ,  $28.5^\circ$ ,  $38.6^\circ$ ,  $49.5^\circ$  and  $55.5^\circ$  were recorded, which indicate the presence of typical orthorhombic crystalline form of BA [7-8].

**Fig. 1:-** (a) TEM micrograph and (b) XRD patterns of BAL nanopowder.

**Tensile properties:-**

The effect of BAL nanofiller content on the tensile properties of the recycled PP matrix is presented in **Table 1**. The mechanical properties of the recycled PP/BAL nanocomposites are significantly changed after blending with the BAL and the properties are influenced by the amount of the BAL nanopowder inclusion. The tensile strength increased from  $18.4 \pm 2.3$  MPa of the neat recycled PP to  $22.3 \pm 1.2$  MPa with 3wt% addition and then decreased with further addition of the BAL nanofiller. However, the strength of the recycled PP nanocomposites (with the highest amount of the BAL) is still higher than that of the neat recycled PP. The increased tensile strength of PP/BAL nanocomposites may be due to the better dispersion of BAL in to the PP matrix.

However, such reinforcing effect of the BAL nanopowder was reduced at high level of BAL additions (3 to 5 wt%). This is probably due to the formation of aggregation of the BAL at higher loading. Above 3 wt% of BAL loading, the interaction between the BAL nanopowder and polymer matrix is due to the non-uniform stress distribution in the composite, which consequently reduced the strength of the recycled PP nanocomposite. The tensile test result suggests that there is an optimum concentration of the BAL nanopowder in order to induce maximum increment of the strength of the recycled PP nanocomposite.

**Table 1:-** Tensile properties of PP and PP/BAL nanocomposites

Composites	TS (MPa)	TM (MPa)	EB (%)
PP	$18.4 \pm 2.3$	$91.8 \pm 40.6$	$522 \pm 121$
PP/BAL1%	$21.3 \pm 1.6$	$157 \pm 10$	$775 \pm 95.2$
PP/BAL2%	$21.1 \pm 1.5$	$161 \pm 18.6$	$748 \pm 72.2$
PP/BAL3%	$22.3 \pm 1.2$	$184 \pm 16.8$	$657 \pm 81.8$
PP/BAL 4%	$21.7 \pm 1.6$	$184.3 \pm 27$	$681 \pm 112$
PP/BAL5%	$20.5 \pm 0.9$	$166 \pm 13$	$719 \pm 59.5$

The tensile modulus (TM) of the recycled PP nanocomposites, which measures the extent or degree of stiffness of a plastic, also increased linearly with increasing concentration of BAL, up to 4 wt%. The stiffness of the recycled PP/BAL nanocomposites increased by 101% more than the neat recycled PP, when 3 and 4 wt% of the BAL were included. Streller et al. reported that the moduli of boehmite alumina reinforced recycled PP nanocomposites are due to the increased stiffness [9]. The elongation-at-break (EB), which measures the flexibility or ductility, of a material also varied, depending on the content of BAL. The pattern of change in the EB of recycled PP/BAL nanocomposites was similar to that of the tensile strength (TS), namely, it increased with increase in the content of BAL up to 5 wt%. The main advantage of the addition of BAL in the recycled PP is that there is no reduction in the EB, even at 5 weight % loading, which was reported by Svoboda et al. for similar nanocomposites [10]. Usually, the decrease in the flexibility of the composite, observed at high concentration of the filler is due to the restricted mobility of polymer strand, caused by the increased stiffness of the recycled PP nanocomposites.

**SEM analysis:-**

The tensile fractured surface of the neat recycled PP (i.e. without addition of nanofiller) and the recycled PP/BAL nanocomposites are presented in **Fig.2**. The fractured surface of the recycled PP shows brittle failure in layered planes. The presence of some cracks and slip lines are also observed. With the addition of BAL nanopowder, the fractured surface of the recycled PP nanocomposites fractured surface topography, changed (**Fig.2. (b), (c)**). **Fig.2 (b) and 2(c)** are the representative SEM micrographs of the tensile fractured surfaces of the recycled PP/BAL nanocomposite samples with 1 and 2 wt.% of nanofiller, respectively.

From **Fig.2 (b), (c)** the presence of rough surfaces and the occurrence of many short, rounded tear lines are highly discernable and the extent of which increases with 2wt% BAL concentration. The filler particles, due to the better polymer-filler interaction and adhesion, act as stress risers and hinder the smooth propagation of the stress paths. As a result, the elastic stored energy and tensile strength were found to be concomitantly improved with nanofiller addition [11].

Fig. 2:-SEM micrographs of tensile fractured (a) PP, (b) PP/1% BAL and (c) PP/2% BAL

#### DSC Analysis:-

The degree of crystallinity and the change in crystallization temperature of PP and its nanocomposites were analyzed using the DSC. The results of the melting temperature and the percentage crystallinity are presented in Table2.

Composites	$T_m (^{\circ}\text{C})$	$T_c (^{\circ}\text{C})$	$\Delta H_m (\text{w/g})$	$X_c (\%)$
PP	107	98	78.3	41.7
PP/BAL1%	108	98.2	79.6	45.0
PP/BAL2%	108	98.7	84.1	47.8
PP/BAL3%	109	99.3	83.7	45.3
PP/BAL4%	133	76.3	81.1	42.7
PP/BAL5%	132	76.2	82.5	43.6

**Table 2:-**DSC analysis of PP and PP/BAL nanocomposites

The crystallization exotherms and endotherm peaks of PP and PP/BAL nanocomposites at various compositions are presented in **Fig. 3(a) and 3(b)**. From these curves, it can be observed that the melting temperature of PP shifted to higher temperature with increasing BAL contents. High melting exothermic peak was observed in nanocomposites with 4 and 5 with% BAL contents.

**Fig. 3:-**DSC analysis of PP/BAL nanocomposites

This increase in the melting temperature, clearly supports the crystallinity data. It is well known that highly crystalline samples possess better thermal stability [12]. In the cooling scan (**Fig. 3(b)**), the thermograms of neat recycled PP and recycled PP/BAL nanocomposites, show a peak of melt crystallization temperature ( $T_c$ ). The thermogram of the recycled PP/BAL nanocomposite shows similar trend as neat recycled PP, but the  $T_{cs}$  of the composites are higher than that of neat recycled PP. The degree of crystallinity of recycled PP/BAL nanocomposites is higher than the neat recycled PP. From the above results the exothermal or endothermal observations confirmed that the recycled PP nanocomposites possess high degree of crystallinity. This can be attributed to the nucleating effect of BAL nanopowder on the crystallization of recycled PP [13].

**TGA analysis:-**

Thermal stability of the recycled PP and recycled PP/BAL nanocomposites was analyzed using TGA and the results are shown in **Fig.4**. The thermal degradation parameters, obtained from the TGA thermograms, are also summarized in **Table 3**. As observed in the thermograms, the weights of the samples decreased with increasing temperature, indicating the thermal destruction of the recycled PP samples. The onset of major thermal degradation temperature of the recycled PP/1 wt% BAL nanocomposite (431°C) was higher than the neat PP (414°C), which indicates that the recycled PP nanocomposite is more thermally stable than that of neat recycled PP. This was observed for all the content of BAL nanopowder reinforced recycled PP composites. The increased thermal stability of the recycled PP nanocomposites can be attributed to the higher degree of crystallinity of BAL reinforced recycled PP nanocomposites [14]. Similar behavior was observed as the  $T_{max}$  of all recycled PP nanocomposites are significantly higher than the neat recycled PP, which indicates that the PP/BAL composites are thermally stable at higher temperature.

**Fig. 4:-** TGA analysis of PP/BAL nanocomposites

At the end of the degradation of the recycled PP, it had a 0.25% char content and the char residue increased with increasing BAL content. The highest amount of charred residue formed (ca. 4%) is due to the limited transformation to a thermally stable charred material of the reactive species, during decomposition.

**Table 3:-** Thermogravimetric analysis of PP/BAL nanocomposites

Composites	$T_{onset}$ , (°C)	$T_{max}$ , (°C)	Char at 0.0°C, (%)
PP	414	456	0.25
PP/BAL1%	431	477	0.82
PP/BAL2%	422	470	1.05
PP/BAL3%	424	471	2.5
PP/BAL 4%	423	471	3.25
PP/BAL5%	424	471	4.4

**Conclusion:-**

Recycled PP/BAL nanocomposites with different filler contents have been developed. The effect of BAL on the morphology, mechanical and thermal properties of the composites has been studied. The nano filler increased the stiffness of the recycled PP matrix, leading to the enhancement in the mechanical properties of the composites. The results of TGA and DSC experiments indicated that the addition of filler enhanced the thermal stability of the recycled PP nanocomposites. In addition, it was found that BAL significantly affected the crystallization temperature and the degree of crystallization of the recycled PP. The morphology, evaluated using the scanning electron microscopy (SEM), indicated that a uniform dispersion of BAL in the PP matrix was obtained.

### Abstract

Environmental issues play a major role in the economic development of a country. It is an indispensable component for bringing about sustainable development. Environmental accounting refers to the compilation of data relating to the environment and natural resources into an accounting framework.

The objective of the study is to address the issues of environmental accounting for oil and gas resources in India and particularly for the states of Assam and Gujarat.

The present study is both analytical and empirical in its framework. It is based on select states of India, namely, Assam and Gujarat. According to literature on environmental accounting, the current national income measures did not provide adequate indicators of sustainable development of natural resources, as they exclude depletion and degradation of exhaustible resources.

As the conventional national accounts neglects depletion and degradation of natural resources, it is necessary to devise an analytical framework to assess the present situation in relation to the need for developing a practical approach which will establish a clear understanding of the relationship about Gross State Domestic Product (GSDP). The empirical analysis is based on the market valuation methods like Net Price Method and User Cost Method. These two methods are used to measure the economic value of natural capital depletion in the petroleum sector.

In this study the state level accounts are adjusted by compiling physical and monetary accounts for oil and gas resources and these accounts are then incorporated in GSDP.

The analysis presented in the study highlights the interstate (Assam and Gujarat) differences in the Environmentally Adjusted GSDP. The sensitivity of the estimated value to the choice of the methodology used (Net Price and User Cost) is also highlighted. The adoption of basic elements of green accounting will portray sustainability of resources in these states.

### Introduction:-

Environmental aspects are gaining importance in the political and economic agenda of developing countries. Apart from this environmental degradation seriously threatens economic and social progress. Environmental accounts

**Corresponding Author:- Mary Vimochana.**

Address:- Associate Professor, Head, Department of Economics, N.E.S. Ratnam College, Mumbai - 400078.

capture the interaction between environment and economy and also serve as a better measure for sustainable development of an economy.

Gross Domestic Product (GDP) is a national accounting term that accounts for the domestic output measured in value terms minus costs associated with input of goods and services. Thus GDP measures the value added of production, a value added that is available for payment of use of input factors like capital and labour. Environmental accounting takes care of the draw backs of conventional accounting. The correction helps to take into account the depletion of non-renewable resources, as well as various damages to the environment due to pollution to air, water and soil and also sometimes loss of eco system services due to pollution from economic activities.

Environmental accounting is an attempt to include measures of the depletion of important natural resources in the national income accounts to provide better measures of long sustainable development (Foy 1991)<sup>1</sup>. Thus environmental accounting, by working towards valuing depletion and degradation can help to prioritise the relative importance of environmental issues.

#### **Objective:-**

The main objective of this study is to analyse physical and monetary accounts for the mineral resources (Oil and Natural Gas) for Assam and Gujarat and to calculate Environmentally Adjusted GDP (GSDP).

#### **Methodology:-**

This study examines the natural capital depletion in India from 1991-2007. Market valuation method are used to measure the economic value of natural capital depletion in petroleum sector in Assam and Gujarat. Assam and Gujarat were specifically chosen because there is a higher probability of discovery of reserves of oil and gas in these states. The User Cost Method proposed by El Serafy (1989)<sup>2</sup> is followed in the estimation of natural asset depletion of oil and gas resources in India. The following formula is used to calculate the user-cost:

If R is the annual net revenues from the sales of the resource, assumed to be constant over its lifetime (of n years), a “true income” element X can be calculated such that

$R - X$  represents a “capital” element whose accumulated investment at an interest rate r during the n years would create a permanent income stream of income of X (per annum). X is calculated as  $X = R \left[ 1 - 1/(1+r)^{n+1} \right]$  and the user cost  $R - X = R/(1+r)^{n+1}$

i.e. the discounted (last) net revenue.

It is noticed that the user-cost method acts as a special case of defining depreciation as the change in the discounted value of a resource, e.g. over one year of exploitation, assuming that the yearly net returns are the same for the remaining life of the resource.

#### **Sources of Data:-**

Data used for reserves were collected from the compiled reports of the Ministry of Petroleum and Natural Gas (MoPNG)<sup>3</sup>. For Physical account, information about extraction of oil and Natural Gas is publicly available from Annual reports of the Ministry of Petroleum and Natural Gas. National Accounts Statistics<sup>4</sup>, an annual publication with time series data since 1988 -2008(CSO, 2008)

#### **Review of Literature:-**

Repetto et al. (1989)<sup>5</sup>, one of the best known natural resource accounting studies is the pioneering exercise by the World Resource Institute for Indonesia. They considered the changes in the stocks of natural resources (oil, forests and soil) in the capital and flow accounts. The valuation principle assumed for oil and forests (timber) is the net price method: rents are determined by the international resource commodity price less all factor costs incurred in extraction. This implies that domestic and international markets for these resources are assumed to be perfect, and optimal paths of extraction follow Hotelling Rule.

Vincent, et.al (1997)<sup>6</sup> examined the empirical significance of capital gains for petroleum depletion in Indonesia. The study covered the period 1971-1984 and included three resources, petroleum, timber and agricultural soils. For the calculation of economic depreciation of the resources, the study considered marginal cost. It assumed a discount rate of 12.5%. The results revealed that the capital gains associated with the rise in prices are much smaller than the

Hotelling rent estimates. It is understood that Indonesia has to invest more than the Hotelling rent due to the rise in price of oil.

European Commission (2000)<sup>7</sup> presented the framework for the subsoil asset accounts for several countries and was developed by the Euro Stat Task Force on Subsoil Assets, and has been tested in pilot studies in several countries. The numerical results and methodological findings of the pilot studies are documented. The subsoil accounts consist of balance sheets for oil and gas in physical and monetary terms, and parts of the production and capital accounts of the oil and gas extraction industry, as well as an estimate of the resource rent from extraction. They presented the physical balance sheets, which show stocks and changes in stocks of oil and gas in physical terms.

The main results of the study are as follows:

- U-15 proven subsoil reserves of oil can be estimated at 1 billion tones and the proven reserves of gas at 3.1 trillion standard cubic meters at the end of 1999. E
- With the inclusion of Norway has brought the proven reserves of oil in the European Economic Area (EEA) to 2.4 billion tones and the reserves of gas to 4.3 trillion Sm<sup>3</sup>. This is around 1.7% of the world's proven reserves of oil and 3.0% of the gas reserves. EU-15 has discovered reserves of oil, which include proven reserves as well as other discovered W
- Reserves with a lower probability of being produced can be estimated at 1.5 billion tones in 1999, i.e. around 50% higher than the proven reserves. EEA also discovered that oil reserves were about 4.1 billion tones. The reserves of gas are estimated at 7.7 trillion standard cubic meters in 1999, with 3.9 trillion standard cubic meters for the EU-15. R

Cairns (2008)<sup>8</sup> argued that income is flow of value to society; therefore, an economic modeler's choice of concept of value imposes a concept of income. The argument is used to distinguish three concepts of national income.

- In a discounted utilitarian model, which is usually the basis for theoretic discussion of net national income, the formulation of value imposes a concept of income that is not observable and hence does not provide income statistics. I
- In a perfectly competitive economy, national income is, in principle observable. Study of competitive model provides a theoretical foundation for national accounting, with extension to distorted economies. However, two unobservable components of ideal income, consumer surplus and capital gains are neglected. I

Cairns (2009)<sup>9</sup> provided an economic analysis of oil extraction. This paper summarises the findings of conventional macroeconomic modeling, the Hotelling analysis of the extraction of and green accounting for non renewable resources such as petroleum. The study reveals that the paths of shadow prices through time are determined by adjoint conditions. The adjoint condition for resources is known as Hotelling's rule, and hence per unit depreciation rises as the rate of interest changes. The study also shows that as the oil is depleted, the pressure and consequently quantity produced declines. Further, importance is given to increase in investment in oil industry.

Atkinson and H. Gundimeda (2006)<sup>10</sup> accounted for forest wealth in India. Changes in the timber and carbon wealth embodied in these forests are related to important green national accounting aggregates such as genuine saving and the change in wealth per capita. They found that, the annual losses due to release of carbon due to forest fires and loss in timber is 0.04% and 0.08% of GNP in India. Though the area subject to logging is less it translates into higher timber and carbon values. The contribution of forests due to harvesting timber contributes to 2.5% of GNP. However, the corresponding carbon loss due to usage of forests for timber and fuel wood is 0.53% of GNP.

Haripriya et al (2007)<sup>11</sup> estimated the value of educational capital formation in India by using a combination of the education stock based approach and the income and cost based approaches. The study focused only on the individuals in employment. The study found that, in all India level, the value of human capital formation is 5.1 times higher than the given fixed capital formation. The investment in education yields returns in the form of human capital, which is positive for all states.

**Empirical Estimation:-**

For empirical analysis was based on Physical Account, Monetary Account and Environmentally Adjusted GSDP. Physical Account is basically a summary of the reserves and changes of natural resources during a period of time, in physical units.

**Physical Account:-**

Physical Account shows an equation stating that opening stock plus growth and other additional reserves minus depletion equals closing stock.

**Monetary Account:-**

Monetary Account is derived by the application of monetary unit values, either market prices or estimated/ imputed values, to the Physical Accounts. This account can be obtained by multiplying each unit of commodity in the physical account by its economic rent. This is explained in Table No1 and 2.

**Table No:-1** Monetary Asset Accounts for Assam using Net Price Method.

Year	Opening stock Rs Cr	Addition Rs Cr	Depletion Rs Cr	Net change Rs Cr	Closing stock Rs Cr
	1	2	3	4	5
1997	14218.04	2883.34	3011.87	-128.53	14089.51

Source: The data for column1, 2&3 are obtained by multiplying the physical assets by the average of net price. Column 4 is obtained by subtracting column 3 from 2.

Column 5 is calculated by  $[(1+2)-3]$ .

Table 2 reveals the Monetary Asset Account of Gujarat for the period 1997-2007. It shows that the opening stock in 1997 was Rs. 12081.48 Cr and in 2007 it was Rs. 1, 41,868.28 Cr. In case of the closing stock, it was Rs8782.45. Cr in 1997 and increased to Rs.1, 01,511. 27 Cr in 2007, which was almost 28.4% less than that in 2006.

#### Calculation of Environmentally Adjusted GSDP:-

The current focus of research on integrating environment into national account is primarily concentrated on adjusting GDP. The United Nations has developed a framework for calculating an Environmentally Adjusted GDP (EGDP). Natural resource accounting provides a measure of environment degradation and resource depletion, which are used to adjust the conventional GDP. This study considers only User Cost approach to calculate oil and gas adjusted national accounts.

**Table No: 3:- Adjusted GSDP based on User Cost Method for Assam**

Year	GS DP Rs Cr	UC Rs Cr	Adjusted GSDP Rs Cr	UC as % GSDP	Growth Rate	
					GSDP %	Adj GSDP %
	1	2	3	4	5	6

Source: Data for column 1 are taken from National Accounts statistics (2008).

Data for Column 2 is calculated using the same procedure done for user cost calculation for India.

Column 3 is the difference between column 1 & 2.

Column 4 is derived by dividing column 2 by column 1.

Column 5 is derived by  $\text{NNP of (current year minus previous year) divided by previous year} \times 100$ .

Column 6 is by applying Adj NNP of (current year minus previous year) divided by previous year  $\times 100$ .

The Adjusted GSDP in Assam was 12.42% in 2000 and became negative i.e. -8.15 % in 2007 whereas in Gujarat it was 9.54% in 2000 and declined marginally to 7.77% in 2007

From the figure 1, it is clear that, the user cost approach yielded fluctuating values. When we compare the adjusted values of the two states, we find that though the Assam's Adjusted GSDP was less than that of Gujarat, the fluctuations in the growth rate of Adjusted GSDP was less erratic in Assam than in Gujarat.

### Findings:-

- Due to changes in the Exploration Policy of the Government in 1997 and public and private participation in the petroleum industry, the discovery of both oil and gas resources in various states had started increasing. As a result, the stock of the known reserves in India and the states of Assam and Gujarat also showed an increasing trend.
- The Monetary Asset Account for Assam using net price method. It shows that the opening stock in 1997 was Rs.14218.04 Cr and it has increased to Rs. 1, 67,848. 2 Cr in 2007, whereas the closing stock was Rs.14089.51 Cr in 1997 and increased to Rs.1,33,432.5 Cr in 2007, but it was almost 20.5% less than that in 2006.
- The Monetary Asset Account of Gujarat for the period 1997-2007. It shows that the opening stock in 1997 was Rs. 12081.48 Cr and in 2007 it was Rs. 1, 41,868.28 Cr. In case of the closing stock, it was Rs8782.45. Cr in 1997 and increased to Rs.1, 01,511. 27 Cr in 2007, which was almost 28.4% less than that in 2006.
- In the case of Assam the stock of reserves reached its peak level at 343.2 MMT in 2004. From 2004 onwards, the stock of the reserves started to decrease closing at a level of 316.68 MMT. In terms of extraction, the highest level was recorded in 2005 and the lowest in 2000. With respect to Gujarat, the opening stock of oil and natural gas was estimated at 279.80 MMT in 2004 and in 2007 it was declined to 263.90 MMT.
- At the end of the accounting period Gujarat's GSDP has increased more than that of Assam. In 2007 the Adjusted GSDP value of Assam is Rs. 46,730.92 Cr when compared to Rs. 2, 21, 226.50 Cr for Gujarat.
- The user cost approach yielded fluctuating values. When we compare the adjusted values of the two states, we find that though the Assam's Adjusted GSDP was less than that of Gujarat, the fluctuations in the growth rate of Adjusted GSDP was less erratic in Assam than in Gujarat.

### Summary and Conclusion:-

The aim of the present study is to explore the importance of oil and gas resources for the states of Assam and Gujarat by calculating environmentally adjusted output. In Gujarat, a large number of private sector firms have entered into exploration activities. This also increases the probability of discovery of reserves.

In the case of Assam the stock of reserves reached its peak level at 343.2 MMT in 2004. From 2004 onwards, the stock of the reserves started to decrease closing at a level of 316.68 MMT. In terms of extraction, the highest level was recorded in 2005 and the lowest in 2000.

Though there are difficulty in the measurement of natural resources on monetary basis, countries should introduce long term policies and plan to bring about sustainable development. Further, by adopting these methods of calculating natural resource depletion, it is felt that user cost method indicates a value for natural capital depletion twice that was found using the depreciation method. This result as claimed by many economists show that the depreciation Method places a high value on resource discoveries, allowing the anomalous situation where by the net output exceeds gross output.

### Abstract

**Background:** Psychological stress can negatively affect learning and performance of medical students. Medical studies are considered intrinsically more stressful than many other disciplines. This study was conducted to investigate stress among undergraduate medical students of Saudi Arabia, and to compare stress between pre-clinical and clinical students, and to compare stress between male and female students.

**Methods:** This cross-sectional survey was conducted in December 2016 among medical students by using a self-administered questionnaire. The data were entered and analyzed using IBM-SPSS-20. The data were summarized and analyzed by frequencies, percentages, means, standard deviation and Chi-square test.

**Results:** A total of 119 participants (54.6% males, 45.4% females) with mean age of  $21.8 \pm 2.1$  years participated in this study. Severe and moderate stress was present among 78% and 20% of the participants, respectively. Prevalence of stress was high in all the medical students irrespective of whether they were in pre-clinical or clinical years of study; there was no statistically significant difference between them. Majority (77%) of the male students had severe stress as compared to 79.6% of the female students; there was no statistically significant difference between them.

**Conclusions:** Most of the medical students of Saudi Arabia perceive their studies and training as either moderately or severely stressful. The risk of stress was high among most of the participants irrespective of their gender, and pre-clinical or clinical years of study during MBBS. It is recommended that stress management courses should be included in the curriculum of undergraduate medical students.

### Introduction:-

Stress can be defined as any challenge to homeostasis or to our body's ability to keep the internal environment constant (Bansal and Bhav, 2006). In psychology, stress can be defined as a feeling of strain and pressure. Stress is body's non-specific response to demands or to any disturbance in the environment. It is a process which enables us

**Corresponding Author: -Dr. Mudassar Ali Roomi**

Address: Assistant Professor Physiology, School of Health Sciences, CMNHS, FNU, Fiji Islands.

to perceive and cope with challenges or threats (Al-Dubai *et al.*, 2011). Stress can be good or bad. 'Good stress' is called as eustress. Eustress is a form of stress in which a person perceives a stressor as positive; it motivates and inspires the person to continue working. 'Bad stress' is called as distress and it is a negative form of stress which demotivates a person. Distress occurs when a person perceives that his capabilities or resources are less than the demands; stressors create tension and there is no fun in the challenge while a person is distressed (Le Fevre *et al.*, 2006).

Too much stress can affect physical and psychological health of individuals (Folkman, 1984). Perceived stress can create emotional instabilities leading to relationship problems, sleep disturbance, low self-esteem, anxiety, depression, drug addiction, and suicidal tendencies (Shapiro *et al.*, 2000; Moffat *et al.*, 2004; Stecker, 2004; Yousafzai *et al.*, 2009). Stress may also decrease the learning abilities and academic performance of students. Moreover, it can adversely affect the ability of doctors to provide high quality care (Firth-Cozens, 2003).

Tertiary medical education is regarded generally as being highly stressful. It has been observed that medical students and resident doctors experience more stress than students of other disciplines (Stewart *et al.*, 1999; Aktekin *et al.*, 2001; Dyrbye *et al.*, 2006). Medical students are prone to stress development due to vastness of their curriculum, length and depth of their courses, inadequate leisure time, lack of holidays, financial burden and career choices (Stecker, 2004; Yousafzai *et al.*, 2009; Waghachavare *et al.*, 2013; Oboko *et al.*, 2015). Some studies suggest that medical students are most prone to stress in their 1<sup>st</sup> year of study due to tremendous change in their lifestyle (Stewart *et al.*, 1999; Dyrbye *et al.*, 2006). Another study suggests that medical students are at risk of stress during transition from pre-clinical years to clinical training (Oboko *et al.*, 2015).

There seems to be limited information in Saudi Arabia relating to this important global issue, especially on comparison of stress between male and female students, and between pre-clinical and clinical students. Therefore, this study was conducted to: a) assess the degree of stress among undergraduate medical students of Saudi Arabia, b) compare stress between medical students of pre-clinical years and clinical years, and c) compare stress between male and female medical students.

### Methodology:-

This cross-sectional survey was conducted in December 2016 among medical students enrolled in various medical colleges of Saudi Arabia. The participants were male and female medical students aged  $\geq 18$  years studying in various years of MBBS from year 1 through year 6. A self-administered online questionnaire was created using Google Forms. The questionnaire had two sections; section 1 contained information on demographic characteristics of the participants while section 2 contained 25 standard questions to assess psychological stress. Section 2 of the questionnaire was taken from the website of International Stress Management Association-UK (ISMA, 2013).

Information on participants' age, gender and year of study were obtained. Medical students in years 1-3 and 4-6 of MBBS were considered doing their pre-clinical and clinical studies, respectively. Each participant was supposed to answer each of the 25 questions as 'Yes' or 'No'. 'Yes' carried 1 score and 'No' carried 0 score. Scores of all the 25 questions answered by a participant were added up. A participant with total score of 0-4 was supposed to have *least risk* of stress. A total score of 5-13 meant that the participant was *more likely* (moderate risk) to suffer from stress and stress-related illness. Stress score  $\geq 14$  meant that the participant is *most prone* (severe risk) to stress and stress-related illness.

All the participants were informed about the nature and scope of the study before their voluntary participation. To ensure anonymity, no questions about the name of the institution or the name of student were included in the questionnaire. We assured confidentiality of all the data. Moreover, we ensured to fulfill the ethical considerations in line with Helsinki Declaration.

The data were double entered and analyzed by using IBM Statistical Package for Social Sciences (SPSS) version 20. The data were cross checked to ensure accuracy. The data were summarized and analyzed by frequencies, percentages, means, standard deviation and Chi-square test. A *p*-value of  $\leq 0.05$  was considered statistically significant.

**Results:-**

A total of 119 participants (54.6% males, 45.4% females) with age of  $21.8 \pm 2.1$  (18-28) years participated in this study. More than half (61.3%) of the participants were students of pre-clinical (1-3) years and the rest (38.7%) were students of clinical (4-6) years (Table 1).

**Table 1:-**Demographic characteristics of the participants (n = 119)

Demographic characteristics	Frequency (%)
Age: Mean $\pm$ SD (Range)	21.8 $\pm$ 2.1 (18-28) years
Gender	
Male	65 (54.6)
Female	54 (45.4)
Year of study during MBBS	
1	23 (19.3)
2	24 (20.2)
3	26 (21.8)
4	12 (10.1)
5	9 (7.6)
6	25 (21.0)
Pre-clinical or clinical students	
Students of pre-clinical (1-3) years	73 (61.3)
Students of clinical (4-6) years	46 (38.7)

Cumulative responses of the participants to each question of the stress questionnaire are given in Table 2. Except questions 18, 20, 21 and 24, participants have predominantly reported a 'Yes' to all the questions of the stress questionnaire.

**Table 2:-**Participants' cumulative responses to each of the 25 questions of the stress questionnaire

Q.No.	Questions	Participants' Response		Total responses from the participants
		Yes n (%)	No n (%)	
1.	I frequently bring work home at night	93 (78.8)	25 (21.2)	118
2.	Not enough hours in the day to do all the things that I must do	89 (75.4)	29 (24.6)	118
3.	I deny or ignore problems in the hope that they will go away	65 (54.6)	54 (45.4)	119
4.	I do the jobs myself to ensure they are done properly	110 (92.4)	9 (7.6)	119
5.	I underestimate how long it takes to do things	80 (67.2)	39 (32.8)	119
6.	I feel that there are too many deadlines in my work / life that are difficult to meet	93 (80.9)	22 (19.1)	115
7.	My self-confidence / self-esteem is lower than I would like it to be	82 (69.5)	36 (30.5)	118
8.	I frequently have guilty feelings if I relax and do nothing	100 (84.7)	18 (15.3)	118
9.	I find myself thinking about problems even when I am supposed to be relaxing	103 (88)	14 (12)	117
10.	I feel fatigued or tired even when I wake after an adequate sleep	89 (76.7)	27 (23.3)	116
11.	I often nod or finish other people's sentences for them when they speak slowly	78 (67.2)	38 (32.8)	116
12.	I have a tendency to eat, talk, walk and drive quickly	81 (69.8)	35 (30.2)	116
13.	My appetite has changed, have either a desire to binge or have a loss of appetite / may skip meals	85 (73.3)	31 (26.7)	116
14.	I feel irritated or angry if the car or traffic in front seems to be going too slowly/I become very frustrated at having to wait in a queue	75 (64.7)	41 (35.3)	116
15.	If something or someone really annoys me I will bottle up my feelings	71 (61.2)	45 (38.8)	116
16.	When I play sport or games, I really try to win whoever I play	86 (74.1)	30 (25.9)	116

17.	I experience mood swings, difficulty making decisions, concentration and memory is impaired	90 (77.6)	26 (22.4)	116
18.	I find fault and criticize others rather than praising, even if it is deserved	49 (43)	65 (57)	114
19.	I seem to be listening even though I am preoccupied with my own thoughts	86 (74.1)	30 (25.9)	116
20.	My sex drive is lower, can experience changes to menstrual cycle	38 (34.9)	71 (65.1)	109
21.	I find myself grinding my teeth	45 (39.5)	69 (60.5)	114
22.	Increase in muscular aches and pains especially in the neck, head, lower back, shoulders	91 (78.4)	25 (21.6)	116
23.	I am unable to perform tasks as well as I used to, my judgment is clouded or not as good as it was	68 (59.1)	47 (40.9)	115
24.	I find I have a greater dependency on alcohol, caffeine, nicotine or drugs	52 (44.8)	64 (55.2)	116
25.	I find that I don't have time for many interests / hobbies outside of work	93 (80.2)	23 (19.8)	116

This study has shown that 78% of the total participants were most prone (severe risk) to stress and stress-related illness. A total of 20% of the participants were more likely (moderate risk) to develop stress, and just 2% of the participants had least risk (score 1-4) of stress (Figure).

**Figure:-**Three categories (with percentages) of risk of stress development among medical students

Majority (82.2%) of the pre-clinical (years 1-3) students were most prone (severe risk) to stress and stress-related illness as compared to 71.7% students of clinical years (years 4-6). Moreover, 16.4% of pre-clinical students and 26.1% of clinical students were more likely (moderate risk) to experience stress. Prevalence of stress was high in all the medical students irrespective of whether they were in pre-clinical years or clinical years of study, and there was no statistically significant difference ( $p=0.405$ ) of risk of stress between pre-clinical and clinical students (Table 3).

**Table 3:-**Comparison of the risk of stress development between medical students of pre-clinical years and clinical years

Year of study during MBBS	Frequency and percentage of the medical students showing risk of stress development. n (%)			Total Frequency (%)	p-value
	Least risk (Score 1-4)	Moderate risk (Score 5-13)	Severe risk (Score $\geq 14$ )		
Pre-clinical years (1-3)	1 (1.4%)	12 (16.4%)	60 (82.2%)	73 (100%)	0.405
Clinical years (4-6)	1 (2.2%)	12 (26.1%)	33 (71.7%)	46 (100%)	

Majority (77%) of the male students were most prone (severe risk) to develop stress and stress-related illness as compared to 79.6% of the female students. Furthermore, 20% of the male students and 20.4% of the female students were more likely (moderate risk) to experience stress. Prevalence of stress was high in all the participants irrespective of their gender, and there was no statistically significant difference ( $p=0.429$ ) of risk of stress development between male and female medical students (Table 4).

**Table 4:-**Comparison of the risk of stress development between male and female medical students

Gender	Frequency and percentage of the medical students showing risk of stress development. n (%)			Total Frequency (%)	p-value
	Least risk (Score 1-4)	Moderate risk (Score 5-13)	Severe risk (Score $\geq 14$ )		
Male students	2 (3%)	13 (20%)	50 (77%)	65 (100%)	0.429
Female students	0 (0%)	11 (20.4%)	43 (79.6%)	54 (100%)	

### Discussion:-

Findings from this study suggest that most of the Saudi medical students are stressed out during their studies. We also found that most of the study participants have high stress irrespective of whether they are in their pre-clinical or clinical years of study. Furthermore, we observed that the risk of stress is high in all the medical students irrespective of their gender.

High (78%) prevalence of severe stress in our study participants is similar to the findings of some other studies which have reported 75% to 90% risk of stress (Saipanish, 2003; Ofili *et al.*, 2009; Yousafzai *et al.*, 2009; Koochaki *et al.*, 2011). A study conducted by Oboko *et al.* (2015) to investigate the prevalence of stress, stressors and coping strategies among male medical students of Nigeria found that 70.3% and 22.1% of medical students perceived their studies and training as very stressful and moderately stressful respectively which is very similar to the findings of our study. However, some studies have reported a lower risk of stress among medical students than our findings. For example, Bhatti *et al.* (2016) have observed 13.3% risk of severe stress development among medical students of a Pakistani university; although they have used same ISMA stress questionnaire to assess the risk of stress development, the difference in the risk of stress development in their study may be due to differences in the educational curriculum and system, and social and cultural differences. Some other studies (Sherina *et al.*, 2004; El-Gilany *et al.*, 2008) have also reported a lower (41.9% and 43.7%, respectively) risk of severe stress than our findings (78%). These differences may be due to different tools used for assessment of stress in their studies.

We have observed a high (82.2%) prevalence of severe stress among our pre-clinical (years 1-3) students as compared to 71.7% prevalence among students of clinical years (years 4-6). The prevalence of severe stress was high among all participants irrespective of whether they were in pre-clinical years or clinical years of MBBS. Contrary to our findings, Oboko *et al.* (2015) observed a significantly higher (97.3%) prevalence among pre-clinical students than 88.5% prevalence among clinical students of a Nigerian medical college. This difference may be attributed to the use of different tools for assessing the risk of stress. Furthermore, it seems as if Nigerian study has combined the very stressful and moderately stressful categories, it is likely they might have over-reported prevalence of stress than our study.

We found that more than three-fourths of both male and female medical students were stressed during their studies and training, and there was no statistically significant difference between them. These findings are a bit lower than the findings of a Nigerian study (Oboko *et al.*, 2015) which has also described a high prevalence (above 90%) of stress in medical students irrespective of their gender. This difference may be attributed to the use of different tools for the assessment of stress; the Nigerian study has used DASS-21 guidelines to classify stress.

Very high prevalence of stress in our participants may be a serious concern as too much stress can affect physical and psychological health of individuals (Folkman, 1984). Perceived stress can create emotional instabilities leading to relationship problems, sleep disturbance, low self-esteem, anxiety, depression, drug addiction, and suicidal tendencies (Shapiro *et al.*, 2000; Moffat *et al.*, 2004; Stecker, 2004; Yousafzai *et al.*, 2009). Stress may also decrease learning ability and academic performance of students. Moreover, it can adversely affect the ability of doctors to provide high quality care (Firth-Cozens, 2003).

One of the strengths of this study is that we have studied three categories of stress among medical students by using a standardized questionnaire of International Stress Management Association, UK. Additionally, we have compared stress between male and female students, and also between pre-clinical and clinical students. A relatively small sample size as compared to other similar studies may be one of the limitations. Cross-sectional nature of this study may also limit the generalizability of the results of this study. Reporting bias cannot be entirely eliminated as we have used self-administered questionnaire; respondents' understanding of the questions or their wish to report their emotions in a certain way may have caused some degree of bias. Some possible confounding factors e.g. psychiatric problems and current emotional states of the participants, teaching styles and faculty characteristics were not considered for this study.

### Conclusions:-

This study has shown that most of the undergraduate medical students of Saudi Arabia perceive their studies and training as either moderately or severely stressful. The risk of stress development is high in most of the participants irrespective of their gender or year of study during MBBS. Since medical studies are intrinsically stressful and there are some stressors which are unavoidable, it is recommended that stress management courses should be included in the undergraduate medical curriculum. It is also important that we cooperatively discuss these results with students and offer them support in the form of counseling. Further studies are recommended to investigate stressors, consequences of stress, coping strategies, prevention and treatment of stress.

#### Abstract

The current investigation suggests that the physicochemical parameters were analysed from three different places of Kanyakumari district. Population diversity of fungi also determined with reference to microfungi. The soil physicochemical parameters such as pH, electrical conductivity, organic matter, organic carbon, organic nitrogen, phosphorus, potassium, zinc, copper, iron, magnesium, calcium, manganese, nickel and potassium were analysed. Maximum amount of chemical parameters were recorded in the study site of Thengapattinam when compared to other places Erayumanthurai and Kollemcode site was 67, 44 and 36 total number of colonies recorded respectively. Minimum number of colonies was Kollemcode area represented due to the nutrient content of the study site. Maximum *Aspergillus* genera were presented. Some of the rare species of *Penicillium lanosum* also recorded from the all three different places of Kanyakumari District. The results were discussed in detail.

#### Introduction:-

Soils are natural unconsolidated materials on the surface of the earth and are composed of solid, liquid and gas. They have organic and inorganic matter which are intimately mixed together by natural processes. That is aggregated into a porous body that accommodates air and water (Osman, 2013). Soil is an essential component of biosphere and it can be used sustainably or even enhanced, under careful management. Soil fungi play an important role as major decomposers in the soil ecosystem. They also provide mankind with very useful pharmaceutical product like antibiotics. The fungal derivatives like organic acids, enzymes, pigments and secondary metabolites are being used in the food industry and fermentation technology. In addition, some of the product from soil fungi and biological control agents for plant pathogens and insect pests. (Manoch, 1998). Fungi are not only beautiful but also play a significant role in the daily life of human beings besides their utilization in industry, agriculture, medicine, food, textiles, bioremediation, and many other ways.

Biological diversity encompasses the variety of living forms like animals, plants and microbes. According to Hawksworth (2002), fungi are a major component of biodiversity, essential for the survival of other organisms and are crucial in global ecological processes. Soil contains a vast array of microorganisms such as bacteria, viruses, fungi, actinomycetes, protozoa and algae (Alexander, 1977; Olowonihi, 2003) have been found that more number of fungi exist in soil than in any other environment (Nagmani, 2005). Contributing to the nutrient cycle and

**Corresponding Author:- R. Rathish.**

Address:- P.G and Research Department of Microbiology, Marudupandiyar College, Vallam, Thanjavur.

maintenance of ecosystem, fungi play an important role in soil formation, soil fertility, soil structure and soil improvement (Hao, 2008). The present study was planned to study the diversity and abundance of fungal species in the soil sample.

## Materials And Methods:-

### Soil physicochemical properties:-

Soil samples were collected from Thengapattinam, Erayumanthurai and Kollemcode Kanyakumari, District brought to the polythene bag and sieved through 2mm sieve at field moist conditions and determination of soil moisture content and pH also analysed. Air dried ground and sieved (0.25mm) samples were used for the estimation of organic carbon, total nitrogen. soil pH was measured in a 1:5 water suspension using a portable digital pH meter. Colorimetric method (Anderson and Ingram, 1993), Micro kjeldhal distillation and titration method (Jackson 1967) were applied to estimate organic carbon, total nitrogen, available phosphorus and exchangeable potassium respectively. The soil parameters were tabulated.

### Fungal population in the soil sample:-

For population of mycoflora by serial dilution plate method (Johnson and Curl 1972) was followed by Rose Bengal Agar Medium (Martin, 1950) was used. The inoculated petriplates were incubated at  $25\pm 1^\circ\text{C}$ . Colony Forming Units (CFU) were estimated by counting the number of colonies after five days. Fungi were identified according to their macroscopic and microscopic features. Identification at the species level was carried out according to the morphological characters found principally in publications by Gilman (1957), Barnett and Hunter (1972), Ellis (1993) pure cultures of fungi were maintained in test tubes slants containing Czapek Dox agar medium and preserved in deep freezer at  $-20^\circ\text{C}$  for future work.

## Results And Discussion:-

**Table 1:-** Analysis of physicochemical parameters of three different places of Kanyakumari District

S.No	Parameters	Thengapattinam	Erayumanthurai	Kollemcode
1	pH	8.3	8.5	8.2
2	Electrical conductivity ( $\text{dsm}^{-1}$ )	0.51	0.28	0.24
3	Organic matter (%)	0.52	0.46	0.48
5	Organic carbon (%)	0.26	0.23	0.24
6	Available Nitrogen (mg/kg)	126.2	102.2	104.5
7	Available Phosphorus (mg/kg)	4.62	4.52	4.16
8	Available potassium (mg/kg)	148	138	145
9	Available Zinc (ppm)	0.87	1.08	1.15
10	Available Copper (ppm)	0.59	0.95	0.86
11	Iron (ppm)	4.06	4.36	4.56
12	Available Mn (ppm)	2.06	2.24	2.21
13	Calcium ( $\text{C.mole}^+/\text{Proton}$ )	14.6	13.5	14.2
14	Magnesium ( $\text{C.mole}^+/\text{Proton}$ )	8.6	7.5	7.3
15	Sodium ( $\text{C.mole}^+/\text{Proton}$ )	1.48	1.36	1.46
16	Potassium ( $\text{C.mole}^+/\text{Proton}$ )	0.32	0.27	0.31

**Table 2:-** Biodiversity pattern of different places of Kanyakumari District

S.No	Name of the fungi	Thengapattinam	Erayumanthurai	Kollemcode	Total no. of colonies
1	<i>Alternaria alternata</i>	5	2	-	7
2	<i>A.awamori</i>	11	8	4	23
3	<i>A.flavus</i>	6	-	-	6
4	<i>A.fumigatus</i>	5	8	10	23
5	<i>A.niger</i>	8	6	7	21
6	<i>A.nidulans</i>	2	-	1	3
7	<i>A.oryzae</i>	-	2	-	2
8	<i>Cladosporium sp</i>	-	1	-	1
9	<i>Fusarium sp</i>	2	-	1	3
10	<i>Fusarium oxysporum</i>	3	1	-	4

12	<i>Penicillium sp</i>	9	7	6	22
13	<i>P. lanosum</i>	4	3	3	10
14	<i>Trichoderma harzianum</i>	4	2	-	6
15	<i>T.viride</i>	3	1	-	4
	Total no. of colonies	67	44	36	147

In the present investigation analysis of physicochemical parameters such as pH, electrical conductivity, organic carbon, organic nitrogen, phosphorous, potassium, zinc, copper, iron, manganese, calcium, Magnesium, sodium and Potassium was 8.3, 0.51dsm<sup>-1</sup>, 0.52 %, 0.26 %, 126.2 mg/kg, 4.62 mg/kg, 148 mg/kg, 0.87ppm, 0.59ppm, 4.06ppm, 2.06ppm, 14.6 C.mole<sup>+</sup>/Proton, 8.6 C.mole<sup>+</sup>/Proton, 1.48 C.mole<sup>+</sup>/Proton and 0.32 C.mole<sup>+</sup>/Proton from Thengapattinam area soil sample were recorded respectively. Where as in the case of minimum physico-chemicals of Kanyakumari district was observed. Similarly, the physico-chemical parameters recorded during the present study was not adversely affected the distribution of fungi. Salinity and temperature are the major factors affecting the diversity of marine fungi as well illustrated by Booth and Kenkel, 1986.

The organic layer at these sites could be attributed to the supply of raw materials and the different types of fauna presented. The evidence of soil fauna activity could be seen under a thick litter above the ground of the plantation site (Fisher, 1995). Macronutrient tends to be less available in soil with low pH, while the micronutrient tends to be less available with high pH. The pH of the soil samples was between 9.5 and 10.2; hence all soils were slightly alkaline in nature. According to Kadir *et al.*, (2001), the higher acidity in the surface soil was associated with hydrolysis of Aluminum which was released under strongly leaching conditions and which subsequently lower pH, causing toxicity.

In the present investigation diversity patterns from the Thengapattinam was 67 fungi, Erayumanthurai was 44 fungi and Kollemcode was 36 fungi recorded respectively. Totally 146 fungal colonies were represented and analysis of parameters vice versa. The rare species of *Penicillium lanosum* was 10 colonies recorded from the all three different sit of Kanyakumari district. So, the fungal diversity was more useful for the content of environmental conservation. The ocean of the world is varying greatly in intertidal amplitude and salinity of the waters, all features that can dramatically affect fungal biodiversity.

Afreen Arshi and Nasreen (2016) reported that the soil samples were analyzed with respect to different types of fungi. The most common fungi, *Aspergillus niger* and *Penicillium stoloniferum* are found in all three soil samples *Aspergillus niger*, *Penicillium stoloniferum*, *Penicillium sp.* and *Rhizopus sp.* are found in site A (Roadside soil). *Aspergillus niger*, *Aspergillus flavus*, *Aspergillus terrrus*, *Penicillium stolonigerum*, *Pencillium sp.* *Fusrium oxysoprum*, *Alternaria solani*, *Trichoderma viride*, *Trichoderma sp* and *Rhizopus sp.* was observed in site B (garden soil). *Aspergillus niger*, *Pencillium stoloniferum*, *Alternair solani*, *Trichoderma sp.* and *Rhizopus sp.* was observed in site c (pot soil of rose plant).

### Abstract

A study about Gist - the most common mesenchymal neoplasm of the git in the population in a small district in Karnataka (India)

Copy Right, IJAR, 2016,. All rights reserved.

### Introduction:-

- Primary mesenchymal tumors of the gastrointestinal tract are a heterogeneous group of tumors with a wide clinical spectrum, of which gastrointestinal stromal tumors (GIST) typically occur in middle-aged to older individuals.
- Most common mesenchymal neoplasm of the gastrointestinal tract.
- Has been frequently studied in tertiary care centres around the world and in India, but no long term study has been conducted in South Kannada district of Karnataka till now.

### Objectives of the Study:-

- To observe
- Modes of presentation.
- Clinical course of gastrointestinal stromal tumours.
- To evaluate
- Possible role of the marker Smooth Muscle Actin as a prognostic factor.

### Gist In Brief:-

- Known presentations
- Management (surgical and chemo) (as short as possible)
- Defining feature of GIST is the expression of CD117, a marker of KIT activation, which is sensitive although not entirely specific
- Five percent of GISTs are known to be negative for CD117 (KIT protein), although they resemble KIT-positive GISTs by cytomorphology.

Why the trial with SMA as another prognostic factor?

- CD 117 stains many carcinomas and melanomas (lack of specificity)  
(<http://suropathcriteria.stanford.edu/gitumors/gist-gastrointestinal-stromal-tumor/differential-diagnosis.html> )
- Expressed in both benign and malignant GISTs
- Activating mutations in the exon 11 of some c-kit genes, classified as high risk
- Overall 5 year survival rate of patients with KIT-negative GISTs supposedly lower than that of patients with KIT-positive GISTs

- SMA tends to be positive in small bowel GISTs, and negative in rectal and esophageal GISTs (significance unknown)
- Long term studies regarding prognostic effects of SMA positivity not carried out

### **Subjects and Methods:-**

- Observational study conducted in YMC
- From January 2011 to December 2015
- Presenting features and clinical course were noted
- Clinically suspected to be GIST – 25
- Out of which 17 were histopathologically confirmed to be GIST
- These 17 cases were subjected to immunohistochemistry – CD 117 and SMA

### **Results:-**

- Clinical features:
  - Abdominal pain : 9
  - Abdominal mass : 6
  - Bleeding PR : 4
  - Dyspepsia and fullness of the abdomen : 3
  - Hematemesis : 2
  - Fever : 2
  - Vomiting : 2
  - Loose stools : 1
  - Weight loss : 1
  - k/c/o NHL : 1
- Location wise:
  - Small bowel: 7
  - Large bowel: 2
  - Stomach: 5
  - Omentum: 1
  - Pylorus extending on to duodenum: 1
  - Ileocecal junction: 1
- Histopathologically
  - Malignant: 8
  - Non malignant: 9
- Immunohistochemistry:
  - CD 117 positivity and SMA positivity: 9
  - CD 117 negativity and SMA positivity: 4
  - CD 117 positivity and SMA negativity: 3
  - CD 117 negativity and SMA negativity: 1
  - Total CD 117 positive cases: 12
  - Total SMA positive cases: 13
  - Total CD 117 negative cases: 5
  - Total SMA negative cases: 4

#### **Relation between Malignant GIST and CD 117**

- Malignant cases with CD 117 positivity: 5  
(total number of CD 117 positive cases: 12)
- Malignant cases with CD 117 negativity: 3  
(total number of CD 117 negative cases: 5)

Statistical significance

	<b>Malignant</b>	<b>Nonmalignant</b>	<b>Total</b>
SMA positivity	5	8	13
SMA negativity	3	1	4
Total	8	9	17

**Fisher's exact test:**

- The two-tailed P value equals 0.2941 The association between rows (groups) and columns (outcomes) is considered to be not statistically significant.

**Conclusion:-**

- Multiple possibilities in which patients can present.
- With the limited number of cases that we have encountered till now, the Fisher's exact test is not able to provide a correlation between SMA positivity and malignancy.
- With more number of cases being included and with the application of Chi square test, a correlation may be established in the future.

#### GENDER DISCRIMINATION IN EDUCATION: A VIOLATION OF HUMAN RIGHT.

**Anthony Arul Pushpam L.**

Ph.D., Research Scholar in Philosophy of Education, Satya Nilayam Research Institute (SNRI), Thiruvannamiyur, Chennai-41.

#### **Manuscript Info**

##### **Manuscript History**

Received: 19 November 2016  
Final Accepted: 21 December 2016  
Published: January 2017

##### **Key words:-**

Human Rights, right to education,  
Gender discrimination, Challenges,  
Violation.

#### **Abstract**

The right to education is a core human right. It should be free and compulsory for every child without any discrimination. The Universal Declaration on Human Rights adopted in 1948 proclaims that “everyone has the right to education” (Art.26). Since then, this right has been affirmed in numerous global agreements and duly incorporated into various regional treaties. In practice, however, there are numerous obstacles to the realization of the right to education. This paper first outlines the legal framework for the right of girls’ to education, and then identifies the main challenges limiting girls’ access to education. Finally, the paper proposes a few recommendations aimed at ensuring the right of girls to education to be realized and fulfilled. The most important objective of this paper is to contribute to a better understanding of the status of access to education for girls worldwide and to ensure that all girls are able to go to school, raise their voices and realize their dreams.

*Copy Right, IJAR, 2016,. All rights reserved.*

#### **Introduction:-**

Education is essential for all and is fundamental to their holistic development. Education has continued to evolve, diversify and extend its reach and coverage since the dawn of human history. Education has been formally recognized as a human right since the adoption of the Universal Declaration of Human Rights in 1948. Since then, this right has been affirmed in numerous global human rights treaties. These treaties establish an entitlement to free, compulsory primary education for all children; an obligation to develop secondary education, supported by measures to render it accessible to all children, as well as equitable access to higher education. In practice, there are numerous obstacles to the realization of the right to education. Education continues to be denied to girls as a result of cultural and social norms and practices that perpetuate harmful stereotypes about appropriate roles for women and reinforce the idea that education is wasted on girls. Gender-related violence and other forms of discrimination within the schools also contribute to a high rate of school abandonment by girls. Besides the socio-cultural factors, there are other legal, political and economic obstacles that may limit the full implementation of the right to education for girls. The right to education must be effectively put into practice with clear implementation methods and strong monitoring systems.

#### **The Legal Framework of Girls’ Right to Education:-**

“The United Nations is committed to the principle of equality of men and women, meaning equality in their dignity and worth as human beings as well as equality in their rights, opportunities and responsibilities”. The principles of

**Corresponding Author:- Anthony Arul Pushpam L.**

Address:- Ph.D., Research scholar in Educational Philosophy, Satya Nilayam Research Institute (SNRI), Thiruvannamiyur, Chennai-41.

gender equality and non discrimination are at the core of all fundamental human rights treaties. There is a strong legal framework which protects and promotes the Girls' right to education.

#### **Human Rights Obligations and Global Political Commitments:**

International Human rights law prohibits discrimination against women in the area of education instead it guarantees the right to education as fundamental for all men and women. The Universal Declaration on Human Rights, adopted in 1948, proclaims that "everyone has the right to education" (Art.26). Since then, the right to education has been widely recognized and developed by a number of international instruments elaborated by the United Nations. The following are the important pronouncements of the global conventions on girls' right to education.

- i) The International Covenant on Economic, Social and Cultural Rights (1966) requires the States, "to ensure the equal right of men and women to the enjoyment of all economic, social and cultural rights" (Art.3) set forth in the treaty, including the right to education.
- ii) The Convention on the Rights of the Child (1989) in article 28, provides the States to recognize the right of the child to education, and in particular: (a) Make primary education compulsory and available free to all; (b) Encourage the development of different forms of secondary education, including general and vocational education; (c) Make higher education accessible to all on the basis of capacity by every appropriate means; (d) Take measures to encourage regular attendance at schools and the reduction of drop-out rates.
- iii) The Convention on the Elimination of All Forms of Discrimination against Women (1979) in Article 10, details a number of measures which should be taken to eliminate discrimination against women in order to ensure to them equal rights with men in the field of education.
- iv) The United Nations Educational, Scientific and Cultural Organization's Convention against Discrimination in Education also bans discrimination in education on the basis of sex, referring to all types and levels of education.
- v) The Beijing Platform for Action in 1995 recognized education as an essential tool for achieving more equal relations between women and men and urged the States to ensure a number of strategic objectives, including: equal access to education, the closing of the gender gap in primary and Secondary education, development of non-discriminatory education and training by developing and using curriculums, textbooks and teaching aids free of sex-stereotyping.
- vi) United Nations Millennium Declaration, (2000) in goal 2 calls for Universal Primary Education and goal 3 to "Promote Gender Equality and Empower women".

The above mentioned global pronouncements about the right to education has been incorporated into various States' treaties and enshrined as a right in the vast majority of national constitutions.

#### **The 4A Scheme:-A tool to achieve gender equality:**

The former UN Special Rapporteur on the right to education, Katarina Tomasevski developed the 4A framework, and it was adopted by the CESCR in 1999. Many elements in this scheme are focus points to guide States in overcoming the many hurdles for girls' right to education.

##### **i) Availability**

Availability means the establishment of schools and the availability of free primary and affordable education for all school age children. There should be an adequate infrastructure and trained teachers for the delivery of education.

##### **ii) Accessibility**

Educational institutions and programs have to be accessible to everyone without discrimination. The CESCR committee distinguishes the non-discrimination principle, the physical accessibility and the economic accessibility as the triple elements of education accessibility.

##### **iii) Acceptability**

Acceptability requires a guaranteed quality of education, minimum standards of health and safety, and professional requirements for teachers which are set in a standardized manner, monitored and enforced by the Government.

##### **iv) Adaptability**

Adaptability means that education should be adaptable to "the changing needs of the society and contribute to challenging inequalities, such as gender discrimination, and that it can be adapted locally to suit specific contexts".

The above 4A scheme can assist States Parties to fulfill their obligations under international human rights law to implement the right to education. Implementation of this scheme adequately accommodates the right to education for girls.

**States' Obligations to the right of girls to education:**

States have the primary responsibility for delivering and protecting the right to education. They should undertake all appropriate legislative and administrative measures for the implementation of the right to education for all children. In the context of the denial of education for girls States should take all appropriate measures to change discriminatory behaviors, such as strategic planning, legislation, and monitoring, awareness-raising, education resource allocation and information campaign. States should also include all stakeholders in their programmes to achieve gender equality within education.

**Responsibilities of the Stakeholders:**

In order to adequately implement the right to education for all children, the role of the stakeholders is very important. The role of the multilateral intergovernmental agencies, such as UNESCO, OHCHR, UNICEF, is of importance in providing technical and financial assistance. Civil society plays a crucial role in holding the State accountable for its obligations. Parents have the responsibility to direct and guide girls to exercise their right to education and have the obligation to contribute to the achievement of gender equality.

**Gender discrimination in education is a violation of human right:-****The Status of Gender Equality in Practice:-**

There is a strong international legal framework which affirms girls' rights to have access to education. This access to education for girls is promoted through many initiatives such as Millennium Development Goals and the Education for All movement led by UNESCO. But the world continues to face many obstacles to achieve the MDGs. Within primary education alone, gender equality remains a serious challenge, 68 countries still need to achieve this goal. Globally, there are still 57 million children out of primary school, of whom 32 million are girls. Again worldwide, 123 million youth of the aged between 15 to 24 lack basic reading and writing skills, of whom 61 percent are young women. Of the 774 million adults who cannot read and write in the world, about 70 percent are female. Despite the many international, regional and local regulations and programmes on gender equality, a lack of translation of these commitments into practice persists, limiting many girls' ability to achieve to their fullest potential.

**Rising violent attacks on girls who pursue the right to education:-**

According to United Nations' sources, attacks on schools in at least 70 different countries were documented during the period 2009-2014, with a number of these attacks being specifically directed at girls, parents and teachers advocating gender equality in education. Hundreds of schoolgirls have been abducted by Boko Haram Militants in Nigeria and more than 100 children, including girls died in a Taliban on their school in Peshawar, Pakistan. In Somalia, the girls were forced in 2010 from their schools to become "Wives of Al Shabaab rebels. In India girls were abducted and raped at a Christian School in 2013.

The removal of girls from education due to the fear of their safety may result in additional human right violations such as child and forced marriage, domestic violence, early pregnancy, female infanticide, trafficking, sexual and labor exploitation. Thus "Failure to respect and protect the rights of girls to education violates their rights as human beings".

**Challenges in Girls' Education:-**

In order to overcome gender inequality and ensure access to education for girls, the challenges such as cultural customs, religious practices, poverty, insecurity, low quality of education and political unrest need to be addressed by States and other Stakeholders.

**i) Cultural and Religious Customs:-**

Cultural and religious customs mean that in many parts of the world, the role of women in society is largely limited to the domestic sphere. As a result, many parents would prefer to send their sons to school, then sending their daughters to school. Parents may not be convinced of the benefits of girls' education, as boys will become responsible for the income and care of the family, whereas girls will likely go to another family through marriage. Such perceptions of the role of the women can present a serious obstacle for girls to have access to education.

**ii) Poverty:-**

Poverty is another important factor contributing to the denial of access to education for girls in many parts of the world. A state of poverty may lead the parents to make decisions which result in their daughters being involved in child labor and or being subjected to child marriage. Due to living in a state of poverty, children in many parts of the world are taking some menial jobs to provide for the primary needs of their families. In some cultures and regions of the world, girls may be subjected to child marriage due to financial reasons and cultural practices. Both child labor and child marriage blocks the access to education. Another factor which prevents access to education is the cost of education which forms an additional burden on poor families; therefore it is very important to make school affordable for all families.

**iii) Safety risks for girls:-**

The above mentioned brutal attacks and harassment on girls going to school clearly show the insecurity for the girls to education. Compared to boys, girls are more likely to be victims of discrimination, sexual abuse, punishment and social intolerance. The safety issue is even more challenging in rural areas where schools are established in geographical locations which are difficult to reach and appropriate transport is lacking. Many parents in such areas may choose to keep their girls at home rather than risking their safety.

**Recommendation for girls' right to education:-**

- a) There should be a national vision for girls' education and the Government must engage with the community, media, states, and other stakeholders to create an environment and mechanism to ensure implementation at every level for girls' education.
- b) Education must be child-centered, child friendly and empowering, and that education goes beyond formal schooling to embrace a broad range of life experiences through which positive development and learning occur.
- c) To ensure the safety of girls accessing to education and to protect girls' hygiene, there must be facilities like safe transport, separate female only sanitation, appointment of adequately trained teachers and establishment of separate girls only school.
- d) To discourage child labor, Governments can provide family grants on the condition that all girls in the family attend the school.
- e) Re-dedication of global community and the State Parties to the commitments that they have made to achieve the goals related to education and gender equality.

**Conclusion:-**

"If we invest in girls, we invest in our humanity" says Hauwa Ibrahim. It is clear that long term investment is essential to enable girls to go to school, raise their voices and realize their dreams. As outlined in this paper, many key international human right instruments affirm the importance of ensuring that girls have access to education. Failure to ensure this access cannot be justified on any ground, including gender, religious or cultural grounds. The 4A scheme can be used to detect the hurdles that each society encounters when implementing gender equal education. When the obstructions to access to education are attended to and lifted, parents often have no objection to sending their daughters to school. Educated girls are better informed and therefore better equipped to build an independent and strong future for them.

### Abstract

Comparative studies of phenotypic characters in some developmental stages of mulberry silkworm, *Bombyx mori*. L was carried out in order to access their genetic diversity. Three Jam and three Pam races evolved in J&K were selected for the study. The egg, larvae and cocoon stage were studied for the various phenotypic and economic parameters; these qualitative and quantitative characters were put into various statistical analysis like correlation studies of length and weight changes during V instar and clustering on the basis of UPGMA, Ward's method and Single linkage analysis. Results indicated highly significant differences for all the studied characters; high positive correlation between larval length and weight change during the V instar larval stage. Also, the races were divided into few clusters/groups on the basis of weight gain characteristics. The present study will help in selection of parents for various breeding programmes and evolving new locally acclimatized, high yielding superior quality silk producing races.

### Introduction:-

The silkworm *B. mori* was domesticated over 5000 years ago (Nagaraju and Goldsmith, 2002) and is well known for its industrial importance in sericulture (Goldsmith *et al.*, 2005). It has a number of varieties viz; univoltine, bivoltine, and polyvoltine. *B.mori* has become a model organism for studying other lepidopteron insects that cause serious agricultural damage and is also an important model for scientific discovery in the areas of microbiology, physiology and genetics.

silkworm breeds play a vital role in the success of sericulture industry. Thus the breed development and improvement is a continuous process which aims at providing suitable genotypes with desired traits (Datta, 1984; Rao *et al.*, 2006). Enrichment of silkworm breeds / hybrids have always been one of the important factors contributing to increase the productivity in sericulture sector. Continuous development, evaluation, renewal and change of existing breeds/hybrids with new superior varieties and their commercialization is the prime factor to increase silk quality and quantity (Chandrashekharaiyah and Ramesh Babu, 2003).

The state of Jammu and Kashmir is known for producing bivoltine silk of international quality. Being one of the traditional agro-based industries of the state producing high quality bivoltine silk comparable to international quality helps in improving the economic conditions of landless farmers and weaker sections of the society and providing employment opportunities during pre- and post cocoon activities. Realizing the importance of sericulture, the

Address:-Department of Zoology, University of Jammu, Jammu and Kashmir-180006, India.

genetic diversity of the silkworm should be maintained and analyzed for various traits so that it may help in evolving new locally acclimatized, high yielding superior quality silk producing breeds.

In the present study, six bivoltine races of *B.mori* were reared in sub-tropical conditions of Jammu, assuring the same micro-climate conditions, being fed with same variety of mulberry leaves. The egg, larval, and cocoon characters were analyzed for the differences and similarities. Agglomerative hierarchical clustering was done for the weight gain during the V instar development and dendrograms were prepared based on different indices that may help in selective breeding.

### Material And Methods:-

The study was conducted in Regional Sericulture Research Station, MiranSahib (RSRS, Miran Sahib) and Department of Zoology, University of Jammu simultaneously during Feb-Apr 2013. For the present study, two disease free layings (DFL's) each of six races (Jam 103, Jam 110, Jam 118, evolved in Jammu were obtained from RSRS, MiranSahib, Jammu and Pam 101, Pam 102, Pam 103 evolved in pampore were transported from CSRT&TI, pampore. Eggs were incubated for 9-12 days in a neat and clean, disinfected room at 80-85 % Humidity and 24-25°C Temperature with 18 hrs light till pin head stage, at this stage black -boxing was done to ensure maximum hatching on exposure to bright light. The hatched larvae were reared separately under uniform laboratory conditions as described by Yokoyama (1963) and Krishnaswami (1978).

During the entire period of research, same micro-climate and feeding conditions were ensured as per the larval stage (Table 1). The whole evolutive period was studied for Egg, Larval and Cocoon characters as follows:

**At egg stage:** egg shape, egg colour, hatching percentage and average fecundity per female moth were studied. **At larval stage:** larval colour, markings, mean length and mean weight of 10 larvae on each day of V instar were studied and analyzed. Correlation of larval length and weight was done and changes in length and weight of larvae of different races were compared. The statistical analysis was done with the help of software PRIMER. Length of larvae was measured with the help of vernier calipers and weight of larvae was measured with electronic balance.

Measurements performed for the determination of length and weight of 10 larvae, were done at each day of V instar larvae at 11:00 a.m. for five days before cocooning. The results obtained show high homogeneity in different races. The larval weight from day 1 to day 5 of V instar larvae was subjected to cluster analysis and similarity matrix was obtained. The races were clustered into different groups on the basis of Euclidean distances according to grouping from UPGMA method, ward's method and single linkage using PAST 3 and relationships were represented as Dendrograms. **At cocoon stage:** cocoon shape, cocoon colour and cocoon grain was noted.

### Results And Discussion:-

**Egg Stage:** Analyzing the biological parameters of eggs, colour of eggs was granite grey for all Jam races and Pam 101, while eggs of Pam 102 were nut brown and of Pam 103 were steel grey. Shape of eggs of different races being same, the highest average fecundity per moth was 515 in Pam 101 and lowest was 302 in Pam 102. The lowest hatching percent (89.31%) was obtained in Pam102 race and the highest (94.34%) was obtained in Jam 110 race, with a mean of 93.23% in all studied races. (Table 2).

**Larval stage:** The biological characters of larval stages were recorded as given (Table 3). Under ideal conditions it has been reported that the total larval duration is 25-30 days (Raina, 2000). The total larval duration in the studied races was 23-25 days with maximum in Jam 103 (24.38 days) and minimum in Pam 102 (23.11days). The V age larval duration was also maximum in Jam 103 and Jam 118 (6.05 days) and minimum in Pam 102 (5.54days). The V age 5 day larval colour was steel grey in Jam 110, Jam 118, Pam 103 and marble grey in Jam 103, Pam 101, Pam 102. All the larvae were plain with semi-plain in Pam 101 and marked in Pam 103. (Fig 1-fig 6). The length and weight of 10 larvae, is given in Table 4 and Table 5. The length of each race was correlated with the weight on each day. The results obtained show high homogeneity in different races with highest correlation coefficient in Jam 118 (0.9966) and lowest in Pam 102 (0.9799)(Table 6). The larval weight from day 1 to day 5 of V instar larvae was subjected to cluster analysis and similarity matrix was obtained (Table 7). The races were clustered into different groups on the basis of Euclidean distances according to grouping from UPGMA method, ward's method and single linkage using PAST 3 and relationships were represented as Dendrograms.(fig. 7, fig 8. and fig.9.)

**Cocoon stage:** Of these few phenotypic characters studied, all the races have oval shaped cocoons except Pam 101 having elongated constricted shape and Pam 102 with constricted shape, cocoon colour being white as of bivoltine races and cocoon grain medium in all except Jam 103 and Pam 103 with fine grain. (Table 8). (Fig 10-fig 15)

Varietal differences for studied traits in *B.mori* has been reported by Ahsan *et al.*, 2000, Li *et al.*, 2001; Furdui *et al.*, 2010. Similar studies on varietal diversity have also been sustained by the findings of Reza *et al.*, 1993, Mistri and Jayaswal, 1992; Ahsan *et al.*, 1999; Umashankara and Subramanya, 2002; Nezhad *et al.*, 2009; Nguku *et al.*, 2007; Nguku *et al.*, 2009; Zannata *et al.*, 2009; Pal and Moorthy 2011). The Cluster analysis (UPGMA) divided the 6 strains into 2 groups as shown in (fig.1, fig.2 and fig.3). All races were grouped together and 2 were far from other silkworm strains, indicating it might be suitable for future crossings, maintenance of germplasm so as to maximize heterosis and to avoid inbreeding depression. As studied by Peters *et al* 1989 UPGMA yields more accurate results for classification purposes than other hierarchical methods.

**Fig 1-fig 6:-** Showing Vth instar larval markings in 6 *B.mori* races

**Fig. 7:-** Dendrogram based on similarity matrix using UPGMA.**Fig 8:-** Dendrogram based on similarity index using single linkage analysis.**Fig 9:-** Dendrogram based on similarity index using Ward's method.

**Fig 10- fig 15:-** showing cocoon shape in 6 *B.mori* races studied.**Conclusion:-**

The obtained data showed that there are highly significant differences among the races for all the studied characters. There is a high positive correlation between larval length and weight during V instar. The differences in obtained results are due to the variability and genotype characters for each individual of every race.

**Acknowledgements:-**

Author is highly thankful to Prof. Roopma Gandotra, HOD Zoology, University of Jammu for providing necessary Lab facilities. Thanks are also due to Dr. S.K.Raina, Deputy Director, RSRS, Miransahib for providing seeds of Jam races and necessary rearing conditions and CSR&TI, Pampore, for providing seeds of Pam races for present study. Author is indebted to CSIR for providing financial assistance.

### Abstract

In the present study, the chromosomal analysis of mulberry silkworm, *Bombyx mori* L. was carried out in order to study its chromosome behaviour and karyotype from larval gonadal tissue. The observed diploid number was  $2n=56$ . The mean total length, RL% and TCL% were measured at metaphase stage of gametogenesis. The chromosomal behaviour during meiotic stages viz., leptotene, zygotene, pachytene, diplotene, diakinesis and anaphase were also analyzed. Results indicate that the samples studied were males with a diploid chromosome number of  $2n=56$ .

### Introduction:-

The order Lepidoptera includes moths and butterflies. It is a species rich order and among this order are some commercially important insects like silkmths and many serious agricultural pests too. The mulberry silkworm is a commercially important insect which is completely domesticated and one of the most genetically studied insect and well known as lepidopteran model insect (Nagaraju and Goldsmith, 2002) apart from its importance as a producer of silk-“the queen of textiles”.

As in most Lepidoptera, the chromosomes of *Bombyx mori* L. are holocentric (Murakami and Imai, 1974) i.e. they possess centromeres throughout the chromosome body. These chromosomes are highly condensed and appear dot-shaped at mitotic and meiotic metaphase stages. Their diffused centromeres and lack of special features make them difficult to identify individually. The chromosome number is known with  $n=28$  (Kawaguchi, 1928) and  $2n=56$  (Kawamura 1979, Yoshido *et al* 2005). In the present investigation, an attempt has been made to prepare a karyotype of *Bombyx mori* L. on the basis of decreasing chromosome length from meiotic metaphase complement. The chromosome behavior during the meiotic stages was also studied from the larval gonadal cells.

### Material and Methods:-

#### Rearing of silkworm larvae:-

The IIIrd instar larvae of mulberry silkworm, *B.mori* L. were collected from RSRS Miransahib, Jammu and transported to Cytogenetics Lab., Dept. of Zoology., University of Jammu. About 20 larvae were reared in rearing cage for further development (fig. 1). The temperature and relative humidity was maintained as  $26^{\circ}\text{C}$  and 80% RH for the IIIrd instar,  $24-25^{\circ}\text{C}$  and 75% RH for IV instar and  $23-24^{\circ}\text{C}$  temperature and around 70% RH for the V instar, the larvae were fed with mulberry leaves during larval period.

**Corresponding Author:-Anita Kumari.**

Address:-Department of Zoology, University of Jammu, Jammu and Kashmir-180006, India.

**Cytological preparation of slides:-**

The gonads of IV and V instar larvae were used for cytological preparations (fig 2). The slides were prepared by using the technique of Murakami and Imai 1974 with slight modifications. Briefly, the larval gonads were dissected in colchicine-hypotonic solution (0.01 % colchicine in 0.45% sodium citrate solution) and then put in fresh hypotonic solution for 30-45 minutes at room temperature, the gonads were transferred to glass slide and torn into pieces in 60% acetic acid and fixed in Carnoy's fixative for 2-3 minutes. The material was squashed and stained with Aceto-orcein for 10 minutes. The prepared slides were scanned under Olympus camera aided microscope and photographed by CH20i B1MF microscope attached with Sony -SSC-DC378P camera under 1000x magnification. Histogram was prepared by taking chromosome pair number on X-axis and corresponding relative length percentage on Y-axis. The chromosomes were paired on the basis of size only as they lack any primary or secondary constriction.

**Results:-**

Spermatogonial metaphase (fig.3) showed the diploid chromosome number of  $2n=56$ , the chromosomes were numerous, darkly stained, highly condensed and dot-like without conspicuous centromere. The karyotype prepared on the basis of decreasing chromosome lengths showed 28 pairs of chromosomes with their homologous chromosomes. Sex chromosomes were not distinguished from others. The karyotype (fig.4) was prepared from well spread spermatogonial metaphase that revealed the presence of 56 elements and showed 28 pairs of chromosomes gradually decreasing in length. Histogram (fig. 5) was prepared on the basis of decreasing value of RL% from chromosome pair 1 to 28. The maximum TCL% i.e., 5.66% was found in first chromosome and the minimum 1.548% was found in the last chromosome pair. The RL% varied from 27.33% in the last chromosome pair to 100% in the first chromosome pair. The total complement length of the haploid set was  $132.35\mu\text{m}$  (Table 1). The other meiotic stages observed were leptotene, zygotene, pachytene, diplotene, diakinesis, anaphase and metaphase (side view)(Fig 6 to 13). The leptotene stage possessed chromosomes in the form of long and thin threads which crossed and inter-crossed each other forming a network. In zygotene stage, (fig. 7) all chromosomes are attached to the inner nuclear membrane. End to end synapsis of homologous chromosomes is also seen. The early pachytene stage showed cross-over between homologous chromosomes as in fig 8. The chromosomes are extended and lightly stained having recombination nodules. The late pachytene (fig 9) shows well spread chromosomes which are slightly more condensed. The points of chiasmata can be easily seen, the chromosomes are shortened and darkly stained (fig 10). These are not countable due to its small size and high number. In fig 11, the chromosomes are condensed and form ring like structures showing terminalisation of chiasmata. The chromosomes are dark, small and numerous at this stage marked with further condensation and not countable. This stage is the diakinesis stage of Prophase I. In metaphase stage, chromosomes lying at the equatorial plane are clearly seen in the side view as shown in fig. 12. Early anaphase with parallel alignment of chromosomes is seen in fig. 13 and the chromosomes are seen pulled to opposite poles. The point of attachment is not detectable due to holocentric nature of the chromosomes.

### Discussion:-

The Lepidoptera have a great range in chromosome number than any other group of animals. ( $n=7$  to  $n=220$ ). In case of mulberry silkworm, *Bombyx mori* L. the diploid chromosome number has been reported for the first time by Toyama (1894) to be  $2n=28$ , which was later reported to be a haploid number and was a result of old microscopy techniques and large number and small size of the chromosomes. Kawaguchi (1928) reported the diploid chromosomal number to be  $2n=56$  and haploid set to be 28 chromosomes. Further, Yoshido *et al* (2005) prepared the *Bombyx mori* karyotype using genetically mapped *Bombyx mori* bacterial artificial chromosomes as probes and assigned already established genetic linkage groups and the correct orientation in the chromosomes. The present study done on *Bombyx mori* L. under the subtropical conditions of Jammu region further established the diploid chromosome number to be  $2n=56$  in mulberry silkworm as reported by Kawaguchi (1928), Kaur (1988) and Yoshido *et al* (2005).

The chromosomes in lepidopterans are holocentric with a presence of multiple and diffused kinetochores. In holocentric chromosomes, the attachment region of spindle is spread throughout the chromosome. Holokinetic chromosomal organization in Lepidoptera was deduced from the missing primary constrictions and a parallel separation in mitotic anaphase (Murakami and Imai, 1974), viability of chromosome fragments (Maeki 1981), high rate of viability of X-ray induced translocations (Bauer, 1967), high doses of X-ray necessary to induce sterility and chromosome fragmentation and fusion in evolution giving rise to highly different chromosome numbers in related species. (Suomalainen, 1953). Similar findings have been observed in the meiotic prophase stages like pachytene, metaphase-I, diplotene, diakinesis and anaphase stages. Murakami and Imai (1974) provided cytological evidence for holocentric chromosomes in *Bombyx mori* and *Bombyx mandarina*, Friedlander and Wahraman (1970) demonstrated some electron micrographs of silkworm chromosomes in which microtubules penetrate all along the polar faces of the chromosomes as in case of *Ostrinia nubilalis* and concluded that silkworm chromosome lacks a localized centromere.

Chromosome behavior in *B. mori* is essentially same in both the sexes from initial pairing at zygotene and formation of synaptonemal complex but the process of crossing over and chiasmata formation are limited to males only, and the females of *Bombyx mori* undergo achiasmatic meiosis and the pachytene chromosomes are synapsed side to side until metaphase-I, as studied by Sturtevant (1915), Tanaka (1913), Traut (1976) and Rasmussen *et al* (1977). In the present investigation, all the meiotic stages viz., recombination nodules at early pachytene, chiasmata at diplotene and diakinesis and similar 28 chromosome pair suggests that the samples studied were males thus the sex can be determined by using cytological techniques in *Bombyx mori*.

### Acknowledgements:-

Author is highly thankful to Prof. Roopma Gandotra, HOD Zoology, University of Jammu for providing necessary Lab facilities. Thanks are also due to Dr. S.K. Raina, Deputy Director, RSRS, Miransahib for providing larvae of mulberry silkworm. Author is indebted to CSIR for providing financial assistance.

##### Key words:-

family functioning; positive mental states; negative mental states.

#### Abstract

**Background:** Women disproportionately suffer from mental health disorders and are more frequently subject to social causes. Most findings implicate negative mental states are the offshoots of inadequate interaction with the environment and family environment is the chief cause. This study extends existing research in the field of mental health that focuses on the effects of family functioning on positive and negative mental states in females.

**Aims:** This study tested the hypothesized model that healthy family functioning leads to increased positive mental states and, subsequently, reduced negative mental states in females.

**Methods:** A sample of undergraduate and postgraduate ( $n = 201$ ) female students completed survey packets in order to test this sequence of relationships on the General Family Functioning Scale, Oxford Happiness Questionnaire, Herth Hope Index, Life Orientation Test and Depression Anxiety Stress Scale.

**Statistical analysis used:** A Structural Equation Model was then constructed and evaluated based on the tested measurement model of latent factors.

**Results:** The model yielded significant effect. The findings from the study indicated that healthy family functioning and positive mental states are positively related to each other, but negatively related to negative mental states. The findings provide compelling empirical evidence that healthy family functioning reduce the negative mental states by enhancing the positive mental resources. Thus negative mental states can be accurately modeled as an outcome of family functioning mediated by positive mental states.

**Conclusions:** This study suggests that combined interventions, targeting family functioning and increasing positive mental states may be particularly useful in addressing negative mental states in females. The research contributes recommendations for policy, practice and further studies.

#### Introduction:-

Women's health within the policy domain is often defined as reproductive and identified with women's children's health. Although, this perspective is well-founded given that the health of women is well documented to have a positive impact on the general health of all members of a society (Marcia, 1997; Ware & Good, 1995). But, the

**Corresponding Author:- Eshrat Ara.**

Address:- Research Scholar, Department of Psychology, University of Kashmir, Hazratbal, Srinagar, 190006, J&K, India.

question rises, what about programs designed to address women's needs as women? Such question challenges the traditional health policies and programs and calls for definitions of women's health which are broader than the reproductive and the maternal, incorporating mental health as well (Rosenfield & Maine, 1985). Women's well-being is not solely determined by biological factors and reproduction, but also by psychological factors. So the need is to mainstream mental health issues as well, because women disproportionately suffer from mental health disorders and are more frequently subject to social causes that lead to mental distress (Van der Kwaak, Vanden Engel, & Richters, 1991).

#### **Previous research on mental states:-**

Comparative analysis of empirical studies of mental disorders reveals a consistency across diverse societies and social contexts, revealing negative mental states more prevalent among women which can be related to the social circumstances of many women's lives (Ware & Good, 1995). Most findings implicate negative mental states are the offshoots of inadequate interaction with the environment and family environment is the chief cause (Chauhan, 2006; Chorpita & Barlow, 1998; Das, 1994; Joshi & Tomar, 2006; Parker, 1983; Sharma, Verma & Malhotra, 2008). Links between emotional deprivation or affectionless control, and psychological distress in women have also been documented in many studies, including work carried out in Brazil, Mexico and Pakistan (kaya, 1985; Malik, Bukhtari, & Good, 1992; Naeem, 1992; Nancy, 1995; Nations & Rebhun, 1988). Chorpita and Barlow (1998) articulated a model of the environmental influences on the development of negative mental states. Evidence from a variety of sources suggests that life experience with diminished control may foster a cognitive style characterized by an increased probability of interpreting or processing subsequent events as out of one's control, which may represent a psychological vulnerability for mental distress.

Psychologists have discovered that there is a set of human strengths that are the most likely buffer against mental illness: happiness, courage, optimism, interpersonal skill, hope, honesty and perseverance (Khordzanganeh, Heidarie, & Naderi, 2014; Seligman, 1998). A number of positive predictors of happiness have been identified, including satisfaction with relationships with people from whom support has been received (Lu & Argyle, 1992). This speaks to the importance of positive relationships with others for the well-being of an individual. Research suggests that hope and optimism are beneficial for physical and psychological well-being (Aspinwall & Taylor; 1992; Scheier, Carver, & Bridges, 1994). Carr (2004) contended that positive mental states are positively correlated with, and are predictive of, physical and mental health. Seligman and Csikszentihalyi (2000) called for counselors and psychologists working with families and other settings to develop climates that foster these strengths.

#### **Family Functioning:-**

From the work of Ackerman (1959), Jackson (1965), Minuchin (1974), and Bowen (1978) came family systems theory, developed on the basis of general systems theory (Bertalanffy, 1973). General systems theory includes basic ideas from Gestalt psychology, focusing on the whole, and Kert Lewin's field theory (1951) (Schwab, Stephenson, & Ice, 1993). A primary concept in the family systems theory is that the family includes interconnected members, and each member influences the other in predictable and recurring ways (Fingerman & Bermann, 2000; Van Velsor & Cox, 2000). Family functioning is more related to the transactional and systematic properties of the family system than to the intrapsychic characteristics of the individual (Westley & Epstein, 1969). Family functioning refers to set of basic attributes about the family system that characterize and explain how a family system operates (McCubbin & Thompson, 1991). Family therapists and theorists have identified different attributes of family functioning. McMaster's Model of Family Functioning (Epstein, Bishop, & Levin, 1978) conceptualizes family functioning as comprising of six dimensions: problem solving, communication, roles, affective responsiveness, affective involvement, and behavioural control. McMaster Model of Family Functioning (MMFF) (Epstein et al., 1978) is a clinically orientated conceptualization of families. It describes the structural and organizational properties of the family group and the patterns of transactions among family members which have been found to distinguish between healthy and unhealthy families. Many studies have examined family functioning of patients with psychiatric disorders, including depression, adjustment disorders, anxiety disorder, etc. (Friedmann, McDermut, Solomon, Ryan, Keitner, & Miller, 1997; Keitner, Miller, & Ryan, 1993; Miller, Keitner, Whisman, Ryan, Epstein, & Bishop, 1992).

#### **Contributions and Limitations of previous research:-**

Despite the importance of research investigating mental states in women, several key limitations of the research exist. These limitations are detailed below. In detailing these limitations, however, we also recognize the contribution of previous studies, and indicate how these contributions relate to the limitations identified.

Positive mental states have usually been shown to be related with negative mental states in research studies because positive mental states are assumed to be psychological beliefs which are known to be protective of mental health (Taylor, Kemeny, Reed, Bower, & Gruenewald, 2000). The elements in the environment are also considered to support the development and maintenance of mental health (Seligman, 2002). Research studies have portrayed unhealthy family environment as a precursor of mental distress. Further it has been shown that healthy family functioning is supportive of development of positive beliefs, thoughts and behaviours.

Most of the research studies relating family functioning and mental problems have been conducted on adolescents. When studies have focused on mental states as a dependent variable, they have (like the present study) often focused on reducing negative mental states. However, in doing so, previous studies have adopted the general approach identifying antecedent social or psychological variables to mental states. However, these studies often investigate these variables in a general or theoretical sense, without direct psychological measurement or modeling, and/or using weaker methodologies. This study, in contrast, examines antecedent social and psychological variables of mental states by directly modeling negative mental states as the casual outcome of a network of these variables. In this way, this study follows the more rigorous approach.

#### **The present study:-**

For the reasons above, we sought to investigate mental states: (a) as a dependent variable, (b) using sophisticated latent variable modeling approaches, (c) with a focus on identifying a network of interrelated antecedent variables that may reduce negative mental states and (d) taking gender specific sample of women, (e) in a non-western context. More specifically, we propose to test a model hypothesizing that healthy family functioning leads to increased positive mental states and, subsequently, reduced negative mental states, i.e.,

Healthy Family Functioning  $\longrightarrow$  Increased Positive Mental States  
 $\longrightarrow$  Reduced Negative Mental States

The structural model tested in this research implies that healthy family functioning leads to increased resources of positive mental states. In turn, positive mental states have the strength to provide a cognitive and affective defense against negative mental states. Importantly, we hypothesize that the direct effects of family functioning on negative mental states will be less important than the indirect effects of family functioning acting on negative mental states through positive mental states. It is assumed that when healthy family environment leads to increased positive mental states then negative mental states are potentially reduced significantly because positive mental states implies resources of strength which are expected to counteract the negative mental states.

In this study the antecedent variable family functioning is defined as measured by General Family Functioning Scale, an overall measurement of family functioning, one of the subscales of Family Assessment Devise (FAD), developed on the basis of McMaster's Model of Family Functioning (Epstein, et al., 1978). The mediating variables in model is positive metal states defined as happiness, as measured by Oxford happiness Questionnaire; hope, as measured by Herth Hope Index; and optimism, as measured by Life Orientation Test – Revised. And the causal variable in the model i.e., negative mental states is defined as depression, anxiety, and stress, as measured by Depression anxiety Stress Scale.

#### **Purpose of the study:-**

The specific purpose of the study was to test the veracity of a model hypothesizing mental states to be the consequence of family. In order to achieve this purpose the measures in the study were first tested in a measurement model. Based on the measurement model, a Structural Equation Model (SEM) of Negative Mental States with family functioning and positive mental states as antecedent variables was then constructed and evaluated.

For the purposes of operationalizing our SEM model, we accepted the validity of certain relationships between constructs of interest already postulated in the literature, but noted that these relationships have not been tested within a causal modeling framework. In other words, for the purpose of constructing testable causal and measurement models, we assumed that the postulated relationships drawn from the literature, and operationalized in the models tested in this research, were at least plausible. At the same time, for the purpose of actually testing the models, we did not automatically assume that the postulated relationships operationalized in the models would hold in any particular sample/population. The study, then, both accepts the validity of the postulated relationships (for

model construction purposes), and does not (automatically) accept the validity of the postulated relationships (for model testing purposes).

### **Method:-**

#### **Participants:-**

The study was conducted in the Kashmir valley of India. Data were collected from 201 undergraduate and postgraduate female students, studying in University of Kashmir, Srinagar. They ranged in age from 18 to 30 years, with the average age of 23 years.

#### **Instruments:-**

The present study utilized self-reported instruments which are as follows.

- a. McMaster General Family Functioning Scale is a 12-item (6 phrased positively and other 6 negatively) sub-scale of McMaster Family Assessment Device (FAD) developed by Epstein, Baldwin, & Bishop (1983), on the basis of the McMaster Model of Family Functioning (MMFF; Epstein, et al., 1978; Westley & Epstein, 1969). General functioning scale assesses the overall health/pathology of the family. Scores range from 1 (*strongly agree*) to 4 (*strongly disagree*).
- b. Life Orientation Test – Revised (LOT-R; Scheier, Carver, & Bridges, 1994) consists of 10 items, 3 items measure optimism, 3 items measure pessimism, and 4 items serve as fillers. It has a 5-point scale ranging from 0 (*strongly disagree*) to 4 (*strongly agree*). Items 3, 7, and 9 are reverse scored. Items 2, 5, 6 and 8 are fillers and are not scored.
- c. Herth Hope Index (HHI; Herth, 1992), an abbreviated version of Herth Hope Scale, consists of 12 items that are based on three dimension, namely, temporality and future, positive readiness and expectancy, and interconnectedness. It is a 4 point scale, response ranging from 1 (*strongly disagree*) to 4 (*strongly agree*). Items 3 and 6 are reverse scored.
- d. Oxford Happiness Questionnaire (OHQ; Argyle & Hills, 2002), has been derived from the Oxford Happiness Inventory (OHI). The OHQ short scale includes eight items of the OHI, (some are phrased positively and others negatively) which can be endorsed on a six-point Likert scale, ranging from “strongly agree (6)” to “strongly disagree (1)”. Items 1, 4, and 8 are reverse scored.
- e. Depression Anxiety Stress Scale (DASS-21) has been developed by Lovibond and Lovibond, 1995. It consists of 3 subscales of 7 items each: Depression (assesses dysphoria, hopelessness, devaluation of life, self-deprecation, lack of interest/involvement, anhedonia and inertia); Anxiety (assesses autonomic arousal, skeletal muscle effects, situation anxiety and subjective experience of anxious effect); and Stress (assesses levels of non-chronic arousal through difficulty relaxing, nervous arousal and being easily upset/agitated, irritable/over-reactive and impatient). The rating scale ranges from 0 (*never*) to 3 (*almost always*).

#### **Procedure:-**

Participants were asked to complete a survey package consisting of all the instruments described above with proper instructions. The questionnaires were distributed to the participants in the different departments and collected on the subsequent days

#### **Data analysis:-**

A measurement model of three latent variables (LVs) was created corresponding to family functioning, positive mental states, and negative mental states, and the strength of the relationships between the three LVs was the subject of investigation. Confirmatory factor analysis (CFA), using Analysis of Moment Structures (AMOS 20.0), evaluated the adequacy of the measurement model, prior to testing more complex SEM. The key interest of the present study was the relationships between family functioning, positive mental states and negative mental states. In this study, Hierarchical Structural Equation Modeling (HSEM – Byrne, 1998; Kaplan, 2000) was used to test these relationships.

Structural equation modeling (SEM), conducted with AMOS 20.0, was used to test the study hypotheses. SEM was used because it corrects for measurement error and can estimate both direct and indirect (mediated) effects simultaneously. Constructs were represented with item-parcels (i.e., sums of items) (Bandalos & Finney, 2001). The use of parcels is considered acceptable as long as the indicators represent a single dimension and are closely related to one another (Little, Cunningham, Shahar, & Widaman, 2002).

**Model fit:-**

Model fit in CFA and SEM Models may be assessed through a combination of parameter investigations (all parameters should be within acceptable values), the chi-square/ degrees of freedom ratio (which, ideally, should be close to, or less than, two), and various relative fit indices (which measure model fit relative to a “baseline” model hypothesizing a unidimensional factor structure) and information criteria, which provide a numerical estimate of the explanatory power of model based on certain assumptions about, and characteristics of, the model (see Hu & Bentler, 1999). In this study, we used standard indices and cut-off values to evaluate fit: the Root Means Square Error of Approximations (RMSEA < .08), and the Goodness-of-Fit Index (GFI > .90) and Comparative Fit Index (CFI > .90) (see Kline, 1998), as measures of model fit, with all parameters estimated using the maximum likelihood procedure.

**Results:-****Confirmatory factor analyses:-**

A correlation matrix was computed among the family functioning, positive mental states, and negative mental states variable domains (see Table 1). With three exceptions in the, all intra-domain correlations were found significant, demonstrating overall medium to high size relationship (Cohen, 1988).

CFA was conducted on the overall measurement model, including all three latent variables, and it produced satisfactory model fit,  $X^2(17, N = 201) = 53.58, p < .001$  (ratio = 3.15); CFI = .93; GFI = .94; RMSEA = .10, indicating that the observed variables were good indicators of the latent variables and the three latent variables represented separate constructs. Fig. 1 indicates that the indicators displayed high factor loadings. The average factor loading for all indicators was 0.71 (approx.).

Table 2 indicates that mental states (positive and negative) factors are negatively and statistically significantly related to each other. Family functioning factor is positively and statistically significantly related to positive mental states, but negatively related to negative mental states. This pattern of relationships is precisely as predicted theoretically.

**Structural Equation Modeling (SEM):-**

To test of the relationship between the predictor latent factor, that is, healthy family functioning and outcome latent factors of positive and negative mental states, a SEM was applied. Table 3 indicates that the model fit the data well. The chi-square/degrees of freedom ratio was close to two for the SEM model, GFI = .96, CFI = .96, and the RMSEA = .07, less than 0.08.

Fig. 1 indicates that all relationships between the latent variables were as predicted. Healthy family functioning is significantly and positively related to positive mental states, which is significantly and negatively related to negative mental. Thus, positive mental states act as mediating variable between healthy family functioning and negative mental states in women. The substantially good fit of all models allows for valid inferences to be drawn from the models. These inferences include that: (a) The survey scales represent substantially good measures of the factors they are intended to measure; (b) Negative mental states can be accurately modeled as an outcome of family functioning mediated by positive mental states.

**Table 1:**Correlations among Family Functioning, Positive and Negative Mental States Indicators

M2	SEM model for Mental states	35.75	17	2.10	.96	.96	.07

**Discussion:-**

The findings from the study indicate that healthy family functioning and positive mental states are positively and statistically significantly related to each other, but negatively related to negative mental states. This pattern of relationships is consistent with the findings of previous research studies conducted in both western and non-western contexts.

However, these variables have not been extensively modeled together as interacting variables influencing important outcomes. In this study we demonstrate that positive mental states mediates the relationship between family functioning and negative mental states – thus clarifying the way these two variables may work together to influence outcome, i.e., healthy family functioning leads to increased positive mental states and reduced negative mental states.

Theoretically, then, the observed relationships support our model which suggests that healthy family functioning ought to increase positive mental states, but with positive mental states having the larger direct impact on negative mental states. Put another way, our underlying hypothesis is that family environment is necessary for a reduction in negative mental states not because they directly impact on negative mental states, but because they directly enhance positive beliefs and thoughts, with the latter resulting in a direct reduction in negative mental states.

Earlier studies have typically explored the relationship of the variables with adolescents. In this study we examined this relationship in female students at the university level, and demonstrated that positive mental states is an important mediating variable in negatively influencing the negative mental states in women. This finding lends empirical weight to interventions designed to enhance both the environmental and individual strengths. However, because positive mental states was modeled (and identified) as a mediating variable in the present study, we suggest that successful interventions designed to enhance the family functioning may reasonably be expected to lead to both development of strengths, and subsequent reduced negative mental states in women. Thus, even though reduced mental distress is ultimately the desired outcome, the focus of interventions can remain on the enhancement of family functioning. One practical implication of this analysis is that we need not to attempt to directly target the negative mental states. In contrast, by remaining focused on developing the healthy family functioning, emphasizing strengths and capacities, we can expect development of positive mental states and subsequent reductions in negative mental states.

Although not explicitly tested in this study, the results of this study suggest that combined interventions targeting family functioning and increasing positive mental states may be particularly useful in addressing negative mental states in women.

**Limitations and recommendations:-**

The present study has several limitations. First, the sample was limited to female students enrolled in University of Kashmir. The study is also limited by fact that it did not use longitudinal data. Longitudinal data would enable an estimation of the causal effects of family functioning on mental states taking into account previous levels of each of these variables. Often when longitudinal modeling is undertaken, the size of the effects between variables is attenuated by effects within variables across time. Thus, although the structural paths in the present model were estimated in such a way as to reduce measurement error, it is nevertheless possible that the magnitude of these structural paths would be less in a longitudinal study.

Given the limitations noted above, we suggest that future studies could incorporate more diverse samples, providing longitudinal data, in order to verify the results of the study under more robust sampling and statistical conditions.

**Conclusion:-**

In this study we demonstrate that mental states in women can be accurately modeled as a function of family. This modeling suggests that both family functioning and positive mental states are key variables for negative mental states in women.

Cryptography, finite fields, Elliptic curves

#### Abstract

This paper studies the mathematics of elliptic curves, starting with their derivation and the proof of how points upon them form an additive abelian group. I then worked on the mathematics necessary to use these groups for cryptographic purposes, specifically results for the group formed by an elliptic curve over a finite field,  $E(F_q)$ . I examine the mathematics behind the group of torsion points, to which every point in  $E(F_q)$  belongs, and prove Hasse's theorem along with a number of other useful results. I finish by describing how to define a discrete logarithmic problem using  $E(F_q)$  and showing how this can form public key cryptographic systems for use in both encryption and decryption key exchange.

#### Introduction:-

An elliptic curve is usually defined to be the graph of an equation

$$y^2 = x^3 + Ax + B$$

where  $x, y, A$  and  $B$  belong to a specified field. These curves are of great use in a number of applications, largely because it is possible to take two points on such a curve and generate a third. In fact, we will show that by defining an addition operation and introducing an extra point,  $1$ , the points on an elliptic curve form an additive abelian group. Such a group can then be used to create an analogue of the discrete logarithm problem which is the basis for several public key cryptosystems. This project will introduce the mathematics behind elliptic curves and then demonstrate how to use them for cryptography.

#### Elliptic curves:-

Elliptic curves have, over the last three decades, become an increasingly important subject of research in number theory and related fields such as cryptography. They have also played a part in numerous other mathematical problems over hundreds of years. For example, the congruent number problem of finding which integers  $n$  can occur as the area of a right angled triangle with rational sides can be expressed using elliptic curves. In this chapter we set out the basic mathematics of elliptic curves, starting with their derivation and definition followed by the proof that points upon them form an additive abelian group.

1. A study on cryptography technologies, which is the basis for the four security services that are authentication, confidentiality, data integrity and non-repudiation.
2. A study on Elliptic Curve Cryptography applications and its standards.
3. A study on algorithms, architectures and implementations of ECC.
4. A study on Binary Galois field and the implementations of Galois Field arithmetic units.

## 5. The implementation of Scalar Multiplication.

In the mid-1980s, Miller and Koblitz introduced elliptic curves into cryptograph, and Lenstra showed how to use elliptic curves to factor integers. Since that time, elliptic curves have played an increasingly important role in many cryptographic situations. One of their advantages is that they seem to offer a level of security comparable to classical cryptosystems that use much larger key sizes. For example, it is estimated in that certain conventional systems with a 4096-bit key size can be replaced by 313-bit elliptic curve systems. Using much shorter numbers can represent a considerable saving in hardware implementations.

**An elliptic curve E is the graph of an equation:-**

$E: y^2 = x^3 + ax + b$ , and denoted by  $E_p(a,b)$ .

Where a, b are in whatever is the appropriate set (rational numbers, complex numbers, integers mod n, etc.). We also include a “point at infinity,” denoted  $\infty$ , which is most easily regarded as sitting at the top of the y-axis. It can be treated rigorously in the context of projective geometry, but this intuitive notion suffices for what we need. The bottom of the y-axis is identified with the top, so  $\infty$  also sits at the bottom of the y-axis.

When we are working with real numbers, the graph E has one of two possible forms, depending on whether the cubic polynomial in x has one real root or three real roots. In the figure below are shown example of elliptic curves illustrated using Matlab files

Figure 1

We assume that the cubic polynomial  $x^3 + ax + b$  has no multiple roots

### Technical point:-

Given two points  $P_1$  and  $P_2$  on  $E$ , we can obtain a third point  $P_3$  on  $E$  as follows: Draw the line  $L$  through  $P_1$  and  $P_2$  (if  $P_1 = P_2$ , take the tangent line to  $E$  at  $P_1$ ). In third point  $Q$ . Reflect  $Q$  through the x-axis (i.e., change  $y$  to  $-y$ ) to get  $P_3$ . Define a law of addition on  $E$  by

$$P_1 + P_2 = P_3$$

Note that this is not the same as adding points in the plane

Figure 2:-

**Elliptic Curves Mod n:-**

If  $n$  is an integer, we can work with elliptic curves mod  $n$  using the aforementioned ideas. For example, consider  $E: y^2 \equiv x^3 + 2x + 3 \pmod{5}$ .

The points on  $E$  are the pairs  $(x, y) \pmod{5}$  that satisfy the equation, along with the point at infinity. These can be listed as follows. The possibilities for  $x \pmod{5}$  are 0, 1, 2, 3, 4 substitute each of these into the equation and find the values of  $y$  that solve the equation.

**Historical point:-** Elliptic curves are not ellipses. They received their name from their relation to elliptic integrals such as

$$\int_{z_1}^{z_2} \frac{dx}{x^3+ax+b} \text{ and } \int_{z_1}^{z_2} \frac{xdx}{x^3+ax+b}$$

**Point addition: Elliptic Curve Addition:- A Geometric Approach:**

- 1  $P + Q = R$  is the additive property defined geometrically.
- 2 Elliptic curve groups are additive groups; that is, their basic function is addition. The addition of two points in an elliptic curve is defined geometrically.
- 3 The negative of a point  $P = (X_1, Y_1)$  is its reflection in the  $x$ -axis: the point  $-P$  is  $(X_1, -Y_1)$ . Notice that for each point  $P$  on an elliptic curve, the point  $-P$  is also on the curve.

**Adding distinct points P and Q:-** The resulted point of adding two different points on the elliptic curve is computed as shown below in figure 2

When  $P = (X_1, Y_1)$  and  $Q = (X_2, Y_2)$  are not negative of each other,  $(X_1, Y_1) + (X_2, Y_2) = (X_3, Y_3)$ ; where  $X_1 \neq X_2$

$P + Q = R$  where

$$\lambda = (Y_2 - Y_1) / (X_2 - X_1)$$

$$X_3 = \lambda^2 - X_1 - X_2 \text{ and}$$

$$Y_3 = -Y_1 + \lambda (X_1 - X_3)$$

- 5 Note that  $\lambda$  is the slope of the line through  $P$  and  $Q$ .

Figure 2:-

**Point Addition:-**

Suppose that P and Q are two distinct points on an elliptic curve, and the P is not -Q. To add the points P and Q, a line is drawn through the two points. This line will intersect the elliptic curve in exactly one more point, call -R. The point -R is reflected in the x-axis to the point R. The law for addition in an elliptic curve group is  $P + Q = R$ .

**Arithmetic in Elliptic Curve Group over  $F_p$** **Point addition:-**

Note that these rules are exactly the same as those for elliptic curve groups over real numbers, with the exception that computations are performed modulo p.

There are several major differences between elliptic curve groups over  $F_p$  and over real numbers. Elliptic curve groups over  $F_p$  have a finite number of points, which is a desirable property for cryptographic purposes. Since these curves consist of a few discrete points, it is not clear how to "connect the dots" to make their graph look like a curve. It is not clear how geometric relationships can be applied. As a result, the geometry used in elliptic curve groups over real numbers cannot be used for elliptic curve groups over  $F_p$ . However, the algebraic rules for the arithmetic can be adapted for elliptic curves over  $F_p$ . Unlike elliptic curves over real numbers, computations over the field of  $F_p$  involve no round off error - an essential property required for a cryptosystem.

**The rules for addition over  $E_p(a,b)$ :-** Correspond to the algebraic technique described for elliptic curve defined over real numbers. For all points  $P, Q \in E_p(a,b)$ ;  $P+O=P$ .

If  $P=(x_p, y_p)$ , then  $P+(x_p, -y_p)=O$ . The point  $(x_p, -y_p)$  is the negative of P, denoted as  $-P$ . For example, in  $E_{23}(1,1)$ , for  $P=(13,7)$ , we have  $-P=(13,-7)$ . But  $-7 \bmod 23=16$ . Therefore  $-P=(13,16)$ , which is also in  $E_{23}(1,1)$

if  $P=(x_p, y_p)$  and  $Q=(x_q, y_q) \neq -P$ , then  $R=P+Q=(x_R, y_R)$  is determined by the following rules:  $x_R=(\lambda^2 - x_p - x_q) \bmod p$ ,  $y_R=(\lambda(x_p - x_R) - y_p) \bmod p$

Where

$$\lambda = \begin{cases} \frac{y_q - y_p}{x_q - x_p} \bmod p & \text{if } P \neq Q \\ \frac{3x_p^2 + a}{2y_p} \bmod p & \text{if } P = Q \end{cases}$$

Multiplication is defined as repeated addition; for example,  $4P=P+P+P+P$ .

For example let  $P=(3,10)$  and  $Q=(9,7)$  in  $E_{23}(1,1)$ . Then

$$\lambda = \left( \frac{7-10}{9-3} \right) \bmod 23 = \left( \frac{-3}{6} \right) \bmod 23 = \left( \frac{-1}{2} \right) \bmod 23 = 11$$

$$x_R = (11^2 - 3 - 9) \bmod 23 = 109 \bmod 23 = 17$$

$$y_R = (11(3 - 17) - 10) \bmod 23 = -164 \bmod 23 = 20$$

so  $P+Q=(17,20)$ . To find  $2P$

$$\lambda = \left( \frac{3(3^2) + 1}{2 \times 10} \right) \bmod 23 = \left( \frac{5}{20} \right) \bmod 23 = \left( \frac{1}{4} \right) \bmod 23 = 6$$

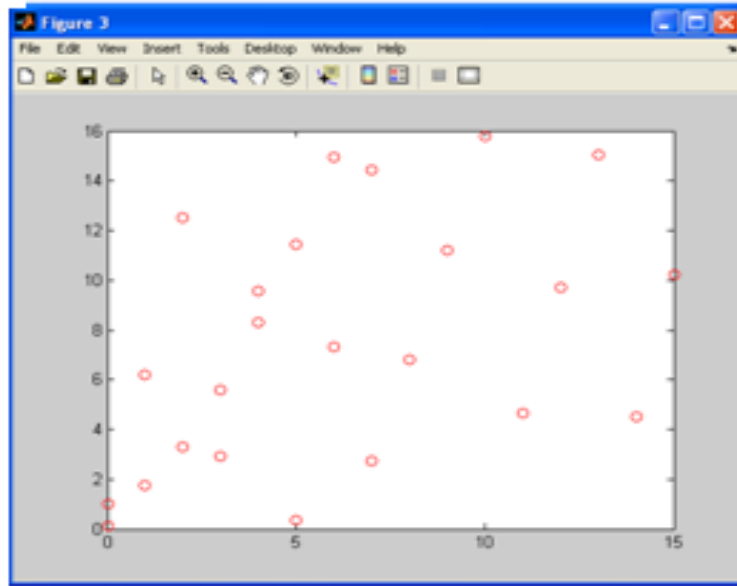

Figure 1.2:-

## 2 The Elliptic Curve Discrete Logarithm Problem:-

Discrete logarithms are fundamental to a number of public-key algorithms, including, Diffie-Hellman key exchange and the digital signature algorithm (DSA). This section provides a brief overview of discrete logarithms.

The power of an Integer, modulo  $n$

For  $a^{\phi(n)} \equiv 1 \pmod{n}$

Where  $\phi(n)$ , Euler's totient function, is the number of positive integers less than  $n$  and relatively prime to  $n$ . Now consider the general expression:-

$$a^m \equiv 1 \pmod{n} \quad (1)$$

If  $a$  and  $n$  are relatively prime then there is at least one integer  $m$  that satisfies the Equation (1), namely,  $m = \phi(n)$ . The least positive exponent  $m$  for which equation holds is referred to in several ways:

- The order of  $a \pmod{n}$
- The exponent which  $a$  belongs  $\pmod{n}$
- The length of the period generated by  $a$

To see the last point, consider the powers of 7, modulo 19:

$$\begin{aligned} 7^1 &\equiv 7 \pmod{19} \\ 7^2 &= 49 = 2 \times 19 + 11 \equiv 11 \pmod{19} \\ 7^3 &= 343 = 18 \times 19 + 1 \equiv 1 \pmod{19} \\ 7^4 &= 2401 = 126 \times 19 + 7 \equiv 7 \pmod{19} \\ 7^5 &= 16807 = 884 \times 19 + 11 \equiv 11 \pmod{19} \end{aligned}$$

There is no point in continuing because the sequence is repeating. This can be proven by noting that  $7^3 \equiv 1 \pmod{19}$  and therefore  $7^{3+j} \equiv 7^3 7^j \equiv 7^j \pmod{19}$ , and hence any two powers of 7 whose exponents differ by 3 (or multiply by 3) are congruent to each other  $\pmod{19}$ . In other words the sequence is periodic and the length of the period is the smallest positive exponent  $m$  such that  $7^m \equiv 1 \pmod{19}$ .

In the multiplicative group  $\mathbb{Z}_p^*$ , the discrete logarithm problem is: given elements  $r$  and  $q$  of the group, and a prime  $p$ , find a number  $k$  such that  $r = q^k \pmod{p}$ . If the elliptic curve groups is described using multiplicative notation, then the elliptic curve discrete logarithm problem is: given points  $P$  and  $Q$  in the group, find a number that  $P^k = Q$ ;  $k$  is called the discrete logarithm of  $Q$  to the base  $P$ . When the elliptic curve group is described using additive notation, the elliptic curve discrete logarithm problem is: given points  $P$  and  $Q$  in the group, find a number  $k$  such that  $Pk = Q$ .

**Example:-****In the elliptic curve group defined by:-**

$y^2 = x^3 + 9x + 17$  over  $F_{23}$ , the discrete logarithm  $k$  of  $Q = (4,5)$  to the base  $P = (16,5)$ ?

One (naïve) way to find  $k$  is to compute multiples of  $P$  until  $Q$  is found. The first few multiples of  $P$  are:  
 $P = (16,5)$   $2P = (20,20)$   $3P = (14,14)$   $4P = (19,20)$   $5P = (13,10)$   $6P = (7,3)$   $7P = (8,7)$

$8P = (12,17)$   $9P = (4,5)$

Since  $9P = (4,5) = Q$ , the discrete logarithm of  $Q$  to the base  $P$  is  $k = 9$ .

In a real application,  $k$  would be large enough such that it would be infeasible to determine  $k$  in this manner.  
 An Example of the Elliptic Curve Discrete Logarithm Problem

**Discrete logarithmic problem:-**

Consider the multiplicative group  $(Z_p^*, p^*)$ , where  $p$  is a prime. Let  $g$  be a generator of the group ,i.e, successive powers of  $g$  generate all elements of the group .So

$$g^1 \text{ mod } p, g^2 \text{ mod } p, \dots, g^{p-1} \text{ mod } p$$

Is a re-arrangement of the integers in  $Z_p^*$

Let  $x$  be an element in  $\{0, 1, 2, \dots, p-2\}$ . The function

$Y = g^x \text{ (mod } p)$  is referred to a modular exponentiation with base  $g$  and modulus  $p$ .

The inverse operation is expressed as  $x = \log_g^y \text{ (mod } p)$  And is referred to as the discrete logarithm. It involves computing  $x$  given the values of  $p, g$  and  $y \in Z_p^*$

**Example Discrete logarithm in  $(Z_p^*, 29^*)$  with  $g=2$** 

Y	$\log_2^y \text{ (mod } 29)$	22	26
1	28	23	20
2	1	24	8
3	5	25	16
4	2	26	19
5	22	27	15
6	6	28	14
7	12		
8	3		
9	10		
10	23		
11	25		
12	7		
13	18		
14	13		
15	27		
16	4		
17	21		
18	11		
19	9		
20	24		
21	17		

From the above problem it gives value of x given p&g means that  $2^7 \bmod 29 = 12$  i.e.  $\log_2^{12} = 7$  Similarly  $2^{21} \bmod 29 = 17$  i.e.  $\log_2^{17} = 21$  and so on Example let  $p=131, g=2$

Y	$\log_2^y(\bmod 131)$
1	2
2	4
3	8
4	16
5	32
6	64
7	128
8	125
9	119
10	107
11	83
12	35
13	70
14	9
15	18
16	36
17	72

The discrete logarithmic problem is  $2^{17}(\bmod 131)=72$ , i.e.  $\log_2^{72}(\bmod 131)=17, 2^{11}(\bmod 131)=83$  i.e.  $\log_2^{83}(\bmod 131)=11$

The discrete logarithm of  $Q(-0.35, 2.39)$  to the base  $P(-1.65, -2.79)$  in the elliptic curve group  $y^2 = x^3 - 5x + 4$  over real numbers is given by figure 3

Elliptic curve equation:  $y^2 = x^3 - 5x + 4$

### Abstract

The use of new technologies in thoracic surgery has become well established. Vacuum Assisted Closure (VAC) device is one of such technologies. Surgeons were spectacle about its use since it was thought to interfere with the negative intrapleural pressure. Few reports have been published in regards to its use in cases of empyema thoracis. We report a case of empyema thoracis that was managed surgically. Thoracotomy and decortication complicated later on by surgical site infection for which debridement and application of VAC device was used to drain the intrapleural collection as well as the subcutaneous collection. We concluded that the use of VAC device in empyema thoracis is feasible with very good outcome.

### Introduction:-

Vacuum-assisted closure (VAC) therapy has been effectively used for a wide of range wounds and infections. These include infected surgical wounds, diabetic foot ulcers, pressure ulcers, traumatic wounds and venous stasis ulcers(1). In 2006, the VAC therapy was applied for the first time in the management of empyema thoracis(2). The use of VAC device was used later for various intrathoracic infections such as, postresection empyema, mediastinitis related to esophageal surgery, as well as necrotizing pleuropulmonary infections. In all these conditions, VAC therapy has been a useful tool that accelerates the healing process with an excellent safety profile(3). Moreover, its use is usually associated with a better outcome in terms of decreased morbidity, shorter hospital stay, greater patient acceptance and it can provide an outpatient based management (3,4).

### The Case:-

A 50-year-old male who is smoker and diabetic on insulin presented to our service with pleuritic chest pain, dyspnea and fever. On initial presentation he was tachypnic, temperature 37.3C° and oxygen saturation was 93% on 5 Liters of oxygen. Auscultation revealed reduced air entry with bronchial breathing over the right hemithorax. Complete Blood Count (CBC) showed marked leukocytosis and neutrophilia. His initial chest x-ray revealed right lower lobe consolidation with air bronchogram. Community acquired pneumonia was the provisional diagnosis and was started on ceftriaxone and azithromycin. Over the next few days the patient did not seem to improve and was still spiking despite the use of broad spectrum antibiotics. Computed Tomography (CT) showed multiloculated right-sided pleural effusion with lower lobe consolidation (Figure 1). A Sagittal reconstruction demonstrate the loculation more clearly (Figure 2). Pleural tap was done. It yielded an exudate and the culture and stain were negative for growth. The patient underwent Video Assisted Thoracoscopic Surgery (VATS) which revealed multiple, well-formed adhesions with multiloculated empyema space that was filled with frank pus. Conversion to thoracotomy, decortication and drainage of the pus with placement of drainage thoracostomy tubes was done. A pleural biopsy was sent for tissue culture and sensitivity, cytology and histopathology which came negative for an infection or

granulomas. On the 6<sup>th</sup> post-operative day, the wound demonstrated signs of surgical site infection (SSI). This was associated with new onset of pneumothorax evident radiologically. The patient was taken to the operating room and exploration of the wound was done with debridement of all unhealthy tissue. VAC device was placed into the communicating wound with the pleural space without thoracostomy drainage. The VAC device was changed twice on 3-day interval with vacuum pressures of around -120Hgmm. The VAC device was removed after complete healing of the wound. The patient was discharged with no subsequent complications. His last follow up at 6 months showed complete recovery. This has demonstrated that application of VAC with communication to pleural space without the usual thoracostomy drainage is feasible and did not interfere with the mechanics breathing.

Axial CT scan of the chest demonstrating the loculi which is consistent with empyema thoracis. The pockets of air can be seen within the collection..

Sagittal reconstruction demonstrate the multiloculated nature of this empyema thoracic.

### Discussion:-

Accumulation of pus within the plural space is referred as empyema thoracis (5). Though the commonest cause of this condition is poorly managed bacterial pneumonia, empyema may also complicate thoracic procedures or surgeries, thoracic trauma, lung abscess, spontaneous pneumothorax and esophageal perforation (6). The commonly isolated bacteria include *Streptococcus milleri* group species, *Streptococcus pneumoniae*, methicillin-sensitive *Staphylococcus aureus* (MSSA) and the *Enterobacteriaceae* group. However, *Mycobacterium tuberculosis* is not uncommon isolated (5). Parapneumonic effusion may progress through exudative, fibrinolytic, and organized stages. Although the clinical course varies among patients, about 5% of pneumonia patients and 20% of patients with parapneumonic effusion will progress into empyema regardless of appropriate management. The mortality rate of patients with empyema, especially patients with co-morbidities, accounts for 20% (7). The potential complications of empyema include broncho-plural fistula, empyema necessitans, osteomyelitis of the ribs, bronchoesophageal fistula, pericarditis and brain abscess which can develop either early or late during the clinical course. Managing the empyema properly depends on the stage of empyema, degree of lung function restriction and the patient tolerance and it requires control of the infection, evacuation of the purulent fluid and obliteration of the cavity. This can be achieved by an appropriate antibiotic therapy, closed chest tube drainage, intrapleural fibrinolytics, VATS and thoracotomy-decortication (6). Open window thoracotomy and decortication can be used in organized empyema; however decortication is associated with considerable morbidity and mortality rate. VAC therapy is a well-known modality in wound treatment. Intrapleural application of VAC shown to aid in local infection control, enhances chest expansion and shrinks the empyema cavity (8). The negative pressure applied by the VAC device accelerates wound healing as it enhances the blood flow in the treated area and promotes healthy granulation tissue growth. Moreover, it decreases edema and excessive fluid from the wound and limits bacterial colonization (9). Our case was bit different in terms of using the VAC as a solo arm in draining the SSI as well as the communicating empyema without thoracostomy tubes. The author has published the use of the same technique in an empyema necessitans case with excellent outcome (10).

### Conclusion:-

Application of negative pressure through the VAC system is valuable in the management of complicated intrathoracic infections such as empyema. This modality of treatment offers a faster recovery with less patient

discomfort, therefore it decrease the hospital stay and the overall treatment costs. We advocate this modality of treatment for further evaluation by larger studies and clinical trials.

Transglutaminase, *Streptomyces* sp, cross-linking, *Shamy* bread.

#### Abstract

The aim of the present work is to study some physical properties of microbial transglutaminase (MTGase) produced from a newly isolated strain of *Streptomyces* sp. Also, its application in producing *Shamy* bread from a mixture of wheat and corn flours was investigated. The results revealed that the enzyme exhibited optimum activity at 45°C; it retained about 80% of the initial activity after incubation for one hour at this temperature. The optimum activity was at pH 6.5 and was stable at this pH for one hour.

The cross-linking effect of the enzyme was tested through cross-linking of wheat dough prepared for *Shamy* bread. The results indicated that the enzyme have a cross- linking effects towards the free amino and thiol groups of wheat dough. The free amino groups of the wheat dough were 0.538 µM/ mg flour without adding the enzyme. It decreased to 0.378 µM/ mg flour when treated with the enzyme; the percent of reduction was 29.74. Mixing corn flour with wheat flour decreased the free amino groups of the resulted dough. It decreased to 0.248 µM/ mg flour in the sample treated with the enzyme and containing 30% corn flour with percentage of reduction 34.39.

In general, increasing the percentage of corn flour in the blends treated with MTGase decreases the free thiol groups. The free thiol groups of the wheat dough (without enzyme) were 11.222µM/ g flour, it decreased to 10.342 µM/ g flour when treated with the enzyme, with percentage of reduction 7.849 %. When the levels of corn flour increased to 30% the free thiol groups decreased and the percent of the reduction increased to 8.575. It was noted that the prepared *Shamy* bread from dough containing 70% wheat flour and 30% corn flour and treated with the enzyme have a higher volume with pronounced improvement in the general appearance and quality than that without the enzyme.

## Introduction:

Transglutaminase (TGase) ( EC 2.3.2.13 ) is an enzyme that catalyses an acyl transfer reaction using peptide – bond glutamine residues as acyl donors and several primary amines as acyl acceptors (Yokoyama et al., 2004).

The enzyme is active over a wide range of temperatures and stable between pH 5 and 9 which is the range for most food processing ( Kuraishi et al., 2001). With respect to substrate specificity; most food proteins, legume globulins, wheat, egg yolk and milk caseins, as well as many other albumins could be cross linked by MTGase ( Nonaka et al., 1997).

MTGase is capable of gelling concentrated solutions of proteins such as soybean, milk, beef, chicken and fish proteins. Also, two or more different proteins can be covalently conjugated to produce new proteins with novel functionalities (Nielsen, 1995; Zhu et al., 1995).

The characteristics of MTGase obtained from various microorganisms vary even among strains. MTGase from *Streptomyces libani* showed slightly lower optimum reaction temperature and thermal stability than from *Streptomyces mobaraensis* (Umezawa et al., 2002).

The enzyme has many applications in the food industry because its effect of crosslinking which is useful in texturization, foaming and emulsifying properties as well as for improvement of nutritional properties.

Several studies reported that the use of TGase improves baking properties and products quality. The action of enzyme reinforces the protein network structure changing the viscoelastic properties of the dough (Larre et al., 2000). Gerrad et al. (2001) reported that addition of the enzyme to dough improved its stability and loaf volume, as well as, improved the lift of puff pastry. Many applications showed that TGase increased the crumb strength of baked loaves and improved the water absorption of the dough, which lowering processing costs for commercial baking (Dube et al., 2007). Ap et al. (2011) reported that the enzyme modified chemical and functional properties of glutenins fraction of proteins, improving dough strength and bread volume. The addition of 1.0% TGase increased both foam stability and emulsion activity of cake batter. Also, it had the maximum specific volume and the softest texture (Wang et al., 2013).

Corn flour is one of the most valuable cereal flours from a nutritional point of view. However, corn flour is unable to hold gas produced during fermentation for baked products. So, the aim of the present work is to study some physical properties of microbial transglutaminase produced from a newly isolated strain of *Streptomyces* sp. Also, its application in producing *Shamy* bread from blends of wheat and high levels from corn flour was investigated.

## Materials and Methods:-

### Microorganism:-

The actinomycetes strain used in the present study was isolated from soil samples collected from Alexandria Governorate, Egypt. The strain was identified as *Streptomyces diastaticus* as reported in the previous paper ( Eshra et al., 2015 )

### Chemicals and reagents:-

N-carboxybenzoyl-L-glutaminy-L-glycine (CBZ) was purchased from Sigma-Aldrich, Co., USA. All the other chemicals were of analytical grade.

### Preparation of tryptic casein hydrolyzate (TCH):-

Twenty grams of alkaline soluble casein were dissolved in 100 ml Tris-buffer pH 8.0, and then 0.2 g of trypsin (E-Merck) were added and incubated for 18 h at 37°C. The mixture was boiled for 5 min, cooled in ice bath and centrifuged at 3000 rpm for 20 min and preserved at - 4°C. The activity of equal volumes of pure enzyme solution (Ajinomoto Activa WM MTGase) was measured separately by both the prepared TCH and CBZ. A correction factor was calculated to convert the enzyme units measured by TCH to the more common units measured by the synthetic substrate CBZ. The correction factor was measured for each prepared batch of the tryptic casein hydrolyzate. The average of this factor was ranged between 1.42 to 1.55.

**MTGase Activity:-**

The enzyme activity was measured using the colorimetric hydroxamate procedure using TCH and CBZ as substrates. The absorbance was measured at 525 nm (Spectronic 20, Bausch & Lomb, USA). One unit of MTGase activity was defined as the amount of enzyme which causes the formation of one micromole of hydroxamic acid per min at 37°C. A calibration curve was prepared using  $\gamma$ -glutamic acid  $\gamma$ -monohydroxamate (Macedo *et al.*, 2007).

**Effect of Temperature:-**

The effect of temperature on the enzyme activity was tested at temperatures ranging from 25 to 60°C at pH 6. The relative activity was determined by maximal activity of the enzyme at a specific temperature as 100% (Cui *et al.*, 2007).

Thermal stability was determined by incubating the enzyme at 25 to 60°C for 1 hr. The percentage of stability was determined as follow:

$$\% \text{ stability} = \frac{\text{Residual units}}{\text{Initial units}} \times 100 \quad (\text{Cui et al., 2007}).$$

The effect of pH on the enzyme activity was determined using 50 mM citrate buffer (pH 4.0 – 6.5) and 50 mM Tris-HCL buffer pH (7.0-9.0) after 30 min at 35°C. To check the pH stability, the enzyme was incubated with the previous buffers at 37°C for 1 hr and the enzyme activity was determined (Cui *et al.*, 2007).

**Shamy bread making:-**

*Shamy* bread was prepared as described by Gujral and Rosell (2004) with some modifications. The following ingredients were used: 500 g wheat flour (72% extraction), 450 ml water, 15 g active dry yeast, 10 g salt and 40 g sugar (yeast was previously mixed with sugar and dissolved in 30 ml water). All ingredients were mixed in the Nouval dough mixer (Image, Egypt) for 5 min. MTGase was incorporated at level of 100 units/ 500 g wheat flour.

The resulted dough was left to ferment for about 20 min at 30°C, and then divided into pieces. The pieces were arranged on a wooden board and left to ferment for about 60 min at the same temperature. The fermented dough pieces were flattened. The flattened loaves were baked at 220°C for 5 min in muffle furnace (Vulcan<sup>TM</sup> A-550 Yucaipa, California, USA) 10-15 min. The loaves of bread were allowed to cool then packed in polyethylene bags.

The effect of using MTGase on *Shamy* bread containing different levels of corn flour was studied. Corn flour was added at levels of 10, 20, 30, 40 and 50% based on the weight of wheat flour. The same method was used for *Shamy* bread prepared from wheat flour only.

**Quantification of free amino groups:-**

Free amino groups in control and MTGase-treated dough samples were determined by the method described by Nielsen *et al.* (2001). The O-phthaldialdehyde (OPA) 40 mg was dissolved in 1 ml of ethanol. In a separate solution, 1.905 g of di-sodium tetraborate decahydrate and 50 mg of sodium dodecylsulfate were dissolved in 40 ml of distilled water. The two solutions were mixed and the volume brought to 50 ml with distilled water. The OPA reagent was stored in an opaque bottle in a refrigerator. One part of 2- mercaptoethanol was mixed with 21.27 parts of the OPA reagent just before use in the assay. Supernatant of each sample was obtained by mixing 100 mg dough with 90  $\mu$ l of distilled water, adding 1 ml 0.1 M HCl, mixing the suspension on a vortex mixer for 10 min and then centrifuging (Cell Refrigerated Centrifuges, Bunsen) at 16000  $\times$  g for 5 min. To 50  $\mu$ L of the dough supernatant, 250  $\mu$ l of the OPA reagent containing 2-mercaptoethanol was added. Absorbance at 340 nm was recorded for the mixtures after 2 min using a UV-spectrophotometer (Thermospectronic, UV- visible Spectrophotometers , Helios). The results were calculated against a serine standard curve (Gujral and Rosell, 2004).

**Quantification of free thiol groups:-**

Free thiol groups in control and dough samples –treated with MTGase were determined with a procedure using Ellman's reagent (Rao *et al.*, 2002). Tris-glycine (Tris-Gly) buffer (pH 8.0) was prepared by dissolving 10.4 g Tris, 6.9 g glycine and 1.2 g ethylenediamine tetraacetic acid (EDTA) in 1 l of distilled water. A solution (GuHCl/ Tris-Gly) containing 5 M guanidine hydrochloride (GuHCl) in Tris-Gly buffer was prepared. Ellman's reagent contained 4 mg of 5,5' dithiobis-2-nitrobenzoic acid in 1 ml of Tris-Gly buffer pH 8.0. To obtain supernatant, 200 mg of dough was added to 1 ml of (GuHCl/ Tris-Gly) solution, mixed on a vortex mixer for 10 min, and centrifuged (Cell

Refrigerated Centrifuges, Bunsen) at  $16000 \times g$  for 5 min. (GuHCl/ Tris-Gly) solution (150  $\mu$ l) and Ellman's reagent (50  $\mu$ l) were added to 100 $\mu$ l of the supernatant and the absorbance measured at 412 nm (Spectronic 20, Bausch & Lomb, USA). The results were calculated against a cysteine standard curve (Gujral and Rosell, 2004).

## Results and Discussion:-

### Effect of temperature:-

The results presented in Table (1) indicated that the enzyme exhibited optimum activity at 45°C. At 60°C, 52.0% of the maximum enzyme activity was detected. Decreasing the temperature to 25°C conserved only 48.0 % of the maximum activity. The enzyme retained about 80% of the initial activity after incubation for one hour at this temperature. The optimum activity was at pH 6.5 and was stable at this pH for one hour. Ho et al. (2000) reported that the optimal temperature of TGase enzyme purified from *Streptovorticillium ladakanum* was 40°C. It conserved more than 90% of its activity even after 30 min incubation at 35°C. Cui et al. (2007) mentioned that the optimum activity of MTGase from *Streptomyces hygroscopicus* was at 37-45°C. Also, they reported that the purified enzyme maintained full activity after incubation for 30 min at 20°C. When the temperature was above 50°C, the enzyme was rapidly inactivated and preserved only 7% of the initial activity when it was exposed to 60°C for 30 min.

**Table 1:-** Effect of temperature on MTGase activity produced from *Streptomyces diastaticus*.

Temperature (°C)	Relative Activity (%)	Stability (%)
25	48.00	97.15
30	54.00	98.06
35	65.33	100.00
40	82.67	96.15
45	100.00	80.77
50	70.67	67.31
55	54.00	48.08
60	52.00	40.38

### Effect of pH:-

The optimum activity was at pH 6.5. The activity decreased rapidly at alkaline pH, but it decreased gradually at acidic side being only 36.36% of its maximum activity at pH 4.0. MTGase was stable at pH 6.5 for one hour. At pH 5.0 the retained activity was about 50% of the initial activity. The activity decreased greatly below pH 5.0 and above 8.5 (Table 2).

**Table 2:** Effect of pH on MTGase activity produced from *Streptomyces diastaticus*.

pH	Relative activity (%)	Stability (%)
4.0	36.36	16.39
4.5	48.48	37.70
5.0	48.48	50.82
5.5	68.18	65.57
6.0	86.36	78.69
6.5	100.00	100.00
7.0	81.82	90.16
7.5	48.48	81.97
8.0	18.18	55.74
8.5	9.09	44.26
9.0	3.0	29.51

These results are in agreement with other authors (Cui et al., 2007) who reported that, the enzyme exhibited optimum activity in a range of pH 6.0- 7.0. Also, they declared that, the purified MTGase was stable within a wide range of pH 5.0- 8.0 at 10°C. The enzyme was stable at pH 5.0- 7.0 after 30 min of incubation at 37°C and about 50% activity was retained at pH 8.0. The activity decreases greatly outside this pH range.

**Attest the cross-linking effect of the prepared enzyme:-**

The attest of the occurrence of cross-linking and/ or its effect have to be proofed prior to its application in food. The cereal products mainly bread is one of the common applications of MTGase in food industry. So, the cross-linking effect will be tested through cross-linking of wheat dough prepared for *Shamy* bread making. The amount of the enzyme used was 100 enzyme units per 500 g of the flour used. The *Shamy* bread was prepared as described in the materials and methods section.

The free amino groups which representing the direct cross-linking by forming a new iso-peptide bonds and the free thiol groups which indicate the indirect effect refer to the oxidation of free sulfhydryl group and formation of disulphide bonds were investigated. The changes of the free amino and thiol groups content will be used as a tool for tracing the cross-linking occurred.

The results indicated that the enzyme have a cross-linking effects towards the free amino and thiol groups .These results are in agreement with those reported by all authors used MTGase (Gujral and Rosell, 2004 ; Ahn et al., 2005).

**Tracing the effect of MTGase in dough prepared from blends of wheat and corn Flours:-**

The following experiments were carried out to investigate the possibility of incorporating corn flour into wheat flour at higher levels for making *Shamy* bread with the aid of MTGase cross-linking. Corn flour was mixed with wheat flour at levels of 10, 20, 30, 40, and 50 % of the weight of wheat flour.

**Free amino groups:-**

The data in Table (3) revealed that the free amino groups of the dough. The results indicated that the enzyme have a cross- linking effects towards the free amino and thiol groups of wheat dough. The free amino groups of the wheat dough were 0.538  $\mu\text{M}/\text{mg}$  flour without adding the enzyme. It decreased to 0.378  $\mu\text{M}/\text{mg}$  flour when treated with the enzyme; the percent of reduction was 29.74. Mixing corn flour with wheat flour decreased the free amino groups of the resulted dough. It decreased to 0.356  $\mu\text{M}/\text{mg}$  flour, in dough containing 10 % corn flour and treated with the enzyme. Increasing the level of corn flour to 30% caused a decrease in the free amino group to 0.248  $\mu\text{M}/\text{mg}$  flour with reduction of 34.39%. The cross-linking effect was 0.142 and 0.130  $\mu\text{M}/\text{mg}$  flour in the blends containing of 10% and 30% corn flour, respectively. When the level of corn flour increased to 50%, a slight decrease in the cross-linking effect was observed. Generally increasing the corn wheat to 30% did not affect or have a slight positive effect on the enzyme activity.

**Table 3:-** Effect of prepared MTGase on the free amino groups in dough of wheat and corn flour blends

Flour blends	Control	Free amino groups ( $\mu\text{M}/\text{mg}$ flour)		
		After treatment "Residual"	Cross-linking effect	Reduction (%)
Wheat flour 100%	0.538	0.378	0.160	29.74
Wheat flour 90% + Corn flour 10%	0.498	0.356	0.142	28.51
Wheat flour 80% + Corn flour 20%	0.414	0.288	0.126	30.43
Wheat flour 70% + Corn flour 30%	0.378	0.248	0.130	34.39
Wheat flour 60 % + Corn flour 40%	0.288	0.208	0.080	27.78
Wheat flour 50% + Corn flour 50%	0.258	0.184	0.074	28.68

Gujral and Rosell (2004) reported that when rice flour was treated with different concentrations of MTGase, a progressive decrease in the amount of free amino groups was observed on addition of MTGase up to 1.0%. Beyond that concentration no significant differences in the amount of free amino groups were detected. This could be due to the disappearance of the lysine groups exposed to the enzyme effect. Ahn et al. (2005) indicated that, the amount of free amino groups in TGase-treated wheat, barley and soy flours and their blends were decreased with TGase treatment.

**Free thiol groups:-**

The data in Table (4) indicated that, the free thiol groups of the control samples (without enzyme) in the dough of wheat and corn flour blends decreased with increasing the percentage of corn flour.

**Table 4:-** Effect of prepared MTGase on the free thiol groups in dough of wheat and corn flour blends

Flour blends	Control	Free thiol groups ( $\mu\text{M}/\text{g}$ flour)		
		After treatment	Cross-linking effect	Reduction %
Wheat flour 100%	11.222	10.342	0.88	7.849
Wheat flour 90% + Corn flour 10%	10.861	10.008	0.853	7.854
Wheat flour 80% + Corn flour 20%	9.411	8.604	0.807	8.575
Wheat flour 70% + Corn flour 30%	9.103	8.626	0.477	5.240
Wheat flour 60 % + Corn flour 40%	8.612	8.211	0.401	4.656
Wheat flour 50% + Corn flour 50%	8.114	7.834	0.28	3.573

In general, increasing the percentage of corn flour in the blends treated with MTGase decreased the free thiol groups. The free thiol groups of the wheat dough (without enzyme) were  $11.222\mu\text{M}/\text{g}$  flour, it decreased to  $10.342\mu\text{M}/\text{g}$  flour when treated with the enzyme, with reduction of 7.849 %. The free thiol groups of the dough (without enzyme) contain 10% corn flour was  $10.861\mu\text{M}/\text{g}$  flour, it decreased to  $10.008\mu\text{M}/\text{g}$  flour when treated with the enzyme. When the levels of corn flour increased to 30% the free thiol groups decreased from  $9.103\mu\text{M}/\text{g}$  flour in the untreated sample (control) to  $8.626\mu\text{M}/\text{g}$  flour in the sample treated with the enzyme. Increasing the level of corn flour caused a gradually decrease in the free thiol groups. At a level of 50% corn flour the cross-linking was  $0.28\mu\text{M}/\text{g}$  flour with a reduction reached 3.573 % in the sample treated with the enzyme.

Gujral and Rosell (2004) declared that, there was a significant decrease in the free thiol groups content of rice flour treated with TGase. The decrease in thiol groups was more significant at a TGase concentration of 0.5% compared with 1 and 1.5%. The reduction in thiol groups concentration suggests the formation of disulphide bonds is most likely favored by the proximity of the cross-linked polypeptide chains.

Ahn et al. (2005) mentioned that, significant decrease in the number of free thiol groups of the blended samples (wheat, barley and soy flour) up on TGase treatment. Sulfur-containing amino acids may come close to each other during the TGase reactions leading to the formation of disulfide bonds via oxidation.

Ap et al. (2011) reported that the enzyme modified chemical and functional properties of glutenins fraction of proteins, improving dough strength and bread volume.

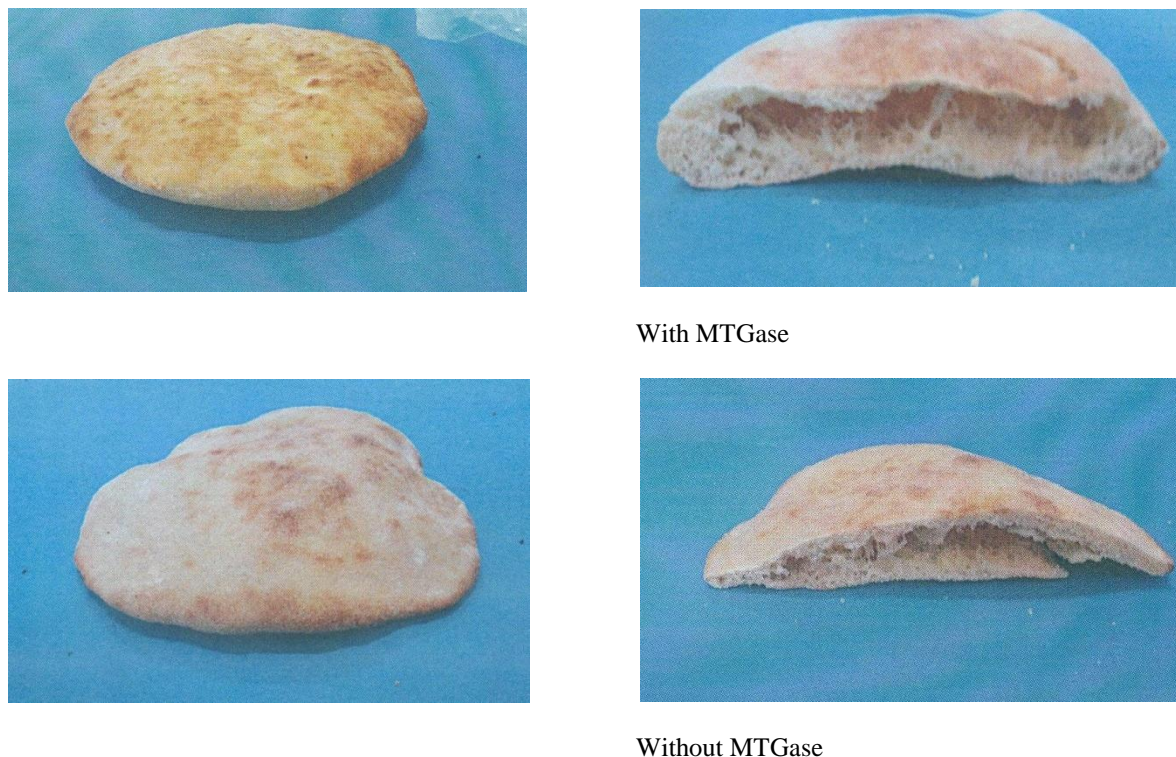

#### **Application of MTGase in Shamy bread using wheat and corn flour blends:-**

Wheat flour is the main flour used for production of bread and many other bakery products. Wheat flour contains proteins, mainly gluten which is the dominant proteins that characterize dough properties and play an important part in the quality of bread. Disulfide bridges between gluten proteins strengthen the gluten network, which is beneficial for the quality of the baked loaf (Kaufmann et al., 1986).

Corn flour is one of the most valuable cereal flours from a nutritional point of view. However, corn flour is unable to hold gas produced during fermentation for baked products. The properties of corn flour are very different from wheat flour this is because of the absence of gluten.

The previous results of tracing the cross-linking effect revealed from the free amino and thiol groups (Tables 3 and 4) indicated that the maximum effect was observed when using a flour blend contains 70% wheat and 30% corn flour. So this blend was used for making *Shamy* bread as indicated in the materials and methods section.

Figure (1) shows a complete and cross section of the prepared bread. The figure indicated that, the prepared loaf from the dough treated with the enzyme have a higher volume with pronounced improvement in the general appearance and quality than that when no enzyme was used.

**Figure 1:-** Baking performance of dough prepared from 70% wheat flour and 30% corn flour with and without the purified enzyme

De Jong and Koppelman (2002) stated that, articles describing the use of TGase in cross-linking of proteins are mostly focused on one single type of protein. The cross-linking reaction can however also be applied to the glutamines and lysine of two different types of proteins. By coupling two proteins with different structures, totally new functionalities can be created.

Basman et al. (2003) reported that, bread from TGase-treated samples prepared from different blends of wheat and barley flours had higher loaf volumes and better crumb and crust characteristics, and were apparently softer than those from untreated samples up 30% barely flour supplementation level. The increases in loaf volumes of TGase-treated samples might be the result of TGase transforming weak gluten into a strong one due to TG-catalyzed cross-linking reactions between and within wheat and barley proteins.

Gujral and Rosell (2004) reported that, the specific volume of rice bread which treated with MTGase increased by increasing the concentration of MTGase up to 1%, but negative effects was observed at higher concentrations. They attributed this behavior to the ability of the TGase to transform weak gluten into a strong one and suggest that at high TGase concentrations excessive cross-linking produced over-strong dough. Ap et al. (2011) reported that the enzyme modified chemical and functional properties of glutenins fraction of proteins, improving dough strength and bread volume.

### Conclusion:-

It can be concluded that the prepared enzyme have a cross-linking effects towards the free amino and thiol groups. Also, it is possible to produce *Shamy* bread with a good quality from a blend of wheat flour mixed with a high level of corn flour reached to 30% with the aid of the prepared enzyme. This is due to the cross-linking effect of the enzyme. The maximum level of corn flour which used previously was 20% only without using the enzyme.

#### Abstract

Increased population, industrialization and urbanization are responsible for environmental contamination. The discharge of industrial waste water, without any prior treatment in to the environment has always affected the health of human beings, plants and animals. These effluents contain toxic chemicals which are not degradable via chemical and microbial processes. However, they are very likely to accumulate in the soil, aquatic environment and in the plant organs. 2. In this genomic era development of science and technology facilitates the use of the potential of biological diversity for pollution removal which is termed as Bioremediation. 3. In any bioremediation study, site characterization is the preliminary step and is very important with respect to future application or augmentation of the organisms into the particular site involved. 4. In view of this the present study was undertaken to characterize the phytodiversity in fluoride contaminated site near Coromandel area in Visakhapatnam for their possible use in phytoremediation.

#### Introduction:-

The problem of environmental pollution has existed since early time and is still growing rapidly as a result of industrialization in developing countries like India (Naheed et al, 1986). Industrial pollution is caused by discharge of various chemicals in the form of gases, liquids, and solids which affects the physical, chemical and biological conditions of the environment and is harmful to all living beings (Dueck and Endenjik, 1987). Various industrial pollutants affecting the plants have been reported which include many metalloids, heavy metals and other phenol's etc.

Metals in general are a class of chemical compounds that are good conductors of heat and electricity (Ghosh and Singh 2005). From past 10 to 15 years the disturbance caused by these metals to the nature has been of great concern. Among such metals, special attention is drawn with reference to fluoride which is a strong electronegative element wide spread in the environment (Jha et al.2009), Chemically active in nature and found mostly in combination with other metals like cadmium, zinc etc. Fluoride is a serious contaminant, even present at low levels as it can persist for a long time in the environment and exert negative effects at all levels of an ecosystem (Ares. J .O. Villa and Mandodari 1980).

Address:- Research scholar, Centre for Research, Dr.V.S.Krishna Govt. Degree & PG College (A); Maddilapalem.

The exact mechanism by which fluoride causes damage to plants is little understood. Nevertheless, certain physiological processes are known to be markedly affected by fluoride. For example, a decrease in chlorophyll (McNulty & Newman, 1961), a diminished rate of photosynthesis (Thomas & Hendricks, 1956), decreased plant growth (Bonner & Thimann, 1950) and increased respiration in growing plants (McNulty & Newman, 1957) have been reported. An effect of fluoride on a physiological process may be a reflection that one or more enzyme systems are affected by fluoride.

The determination of fluoride contamination has received extensive attention because of its significant effects in plants and animals. The number of articles published on determination of fluoride has increased significantly in the recent years. Numerous methods have been developed to determine the amount of fluoride in various samples, which include, electrochemical methods (potentiometry, voltammetry) Chromatography, Sensors, Micro fluidic analysis, Titration and spectroscopy. Among them, Potentiometric determination by F-ISE (ion selective electrode) is the widely used method (Borjigin et al 2009, Krishna et al 2012).

#### **Need for remediation:-**

The use of biological diversity for the removal of chemicals in soil and water called bioremediation which is the emerging, efficient and innovative tool for management of a wide array of contaminants. This technology includes phytoremediation (use of plants), microbial remediation (use of microbes) and rhizo remediation (plant and microbe interaction) among which phyto remediation is the most evolved one, which is applicable for removal of contaminants in soil, surface water, ground water and sediments in air (Bindu Madhavi and Gaurav Reddy 2014.).

The present study was undertaken with the objectives of investigating the phyto diversity of area adjacent to the Coromandel Fertilizer limited that has high fluoride content and also to study the quantitative characters of the plant species so as to identify the abundantly growing plant species which may be the possible fluoride tolerant species that can be used to phytoremediate the fluoride contaminated sites.

#### **Study area:-**

Visakhapatnam is located on the east coast of India on 17°-43'N latitude 83°-17'S longitude and in between Calcutta and Madras. The surroundings of Visakhapatnam are rich in natural flora and approx. 550 species belonging to many Angiosperm families (Venkateswarulu J. Bhirava murthy and P. Narasimha Rao 1972). Vishakhapatnam is surrounded by many industries which discharge their effluents containing chemical pollutants in to the environment. Among them Coromandel Fertilizer Limited (fig 1,2) is the major one, which is spread over an area of about 480 acres of land at Sriharipuram lying to south of Visakhapatnam. A vast stretch of barren and vacant land remained adjacent to the industry where the effluents (raw material containing fluoride) released from the industry are flowing through a narrow stream into the surrounding area. The effluent affected area is occupied by herbaceous vegetation (fig3), with a limited number of species. Few of them are capable of accumulating high amounts of fluoride in their tissues (P.V. Arjun Rao, 1992)

Fig:- 1, 2 Google maps showing the study area with location

Fig3: photograph showing the plants growing and canal flow adjacent to the Fertilizer industry

### Materials and Methods:-

The phyto diversity of an area adjacent to the Coromandel Fertilizer Limited that has high fluoride content was studied. The quadrats were laid 500 m apart (10 m x 10m) by using standard quadrat method (Trivedi and Geol 1986).

The species available inside the quadrats were collected and identified with the help of floras namely Flora of The Presidency of Madras by Gamble (1915-1938), the Flora of The Presidency of Bombay by Cooke (1967) and Mangroves in India - Identification Manual by Banerjee et al. (1989) and other taxonomic literature. Quantitative characters like Abundance, Density, Frequency and their relative values and Importance Value Index (IVI) were calculated for each species by applying the following principles of *Curtis and McIntosh (1950)*, *Misra (1968)* and *Muller-Dombois and Eilenberg (1974)*

$$\text{Frequency (\%)} = \frac{\text{Number of quadrats in which the species occurred} \times 100}{\text{Total number of quadrats studied}}$$

$$\text{Density} = \frac{\text{Total number of individuals of a species in all quadrats}}{\text{Total number of quadrats studied}}$$

$$\text{Abundance} = \frac{\text{Total number of individuals of a species in all quadrats}}{\text{Total number of quadrats in which the species occurred}}$$

$$\text{Relative density (RD)} = \frac{\text{density of individual species} \times 100}{\text{Total Density of all species}}$$

$$\text{Relative abundance (RA)} = \frac{\text{abundance of Individual species} \times 100}{\text{Total abundance of all species}}$$

$$\text{Relative frequency (RF)} = \frac{\text{frequency of individual species} \times 100}{\text{Frequency of all species}}$$

#### IMPORTAT VLUE INDEX =RA+RD+RF

To determine the amount of total fluoride present in the plants whole plant were collected and washed with tap water several times and thoroughly washed with double distilled water to remove the dust on the surface of the plants. Samples were shade dried for twenty days and ground in a grain mill to fine powder, passed through a 50mm mesh sieve. Samples were decomposed by alkaline carbonate fusion using  $\text{Na}_2\text{CO}_3$  in platinum crucible at  $450^\circ\text{C}$  for 12 hours. After extraction of the samples into  $\text{Na}_2\text{CO}_3$ . The extract were acidified with dilute HCl to pH 5.5 and mixed with total ionic strength adjustment buffer (TISAB) to maintain the pH at 7.5 and the fluoride content determined by using fluoride ion selective electrode (ORION 4 star) (k. prabhavati devi, ch.sita Bindu et.al 2016) the data is shown in table IV.

#### Results and Discussion:-

In the present investigation a total of 22 plant species were identified in the vast area of land present adjacent to Cormandal industry. Out of these 22 plant species 21 plants belonging to 12 families are dicots and 1 plant species of Poaceae is from monocots. The taxonomic position of plants and family wise percentage occurrence of species are shown in table I and II. The details of phytosociological attributes of the identified species is shown in table III the IVI values are plotted in graph I. the amount of fluoride determined is presented in table IV.

**Table I:-** The taxonomic categories of plant species encountered in the study area

Traditional plant group	Families	Genera	Species
dicotyledons			
Polypetalae	4	7	7
Gamopetalae	7	9	9
Monochlamydae	2	5	5
Monocotyledons	1	1	1
Total	14	22	22

**Table II:- Family wise percentage occurrence of plant species in the study area.**

S.No	Name of the family	No. of species	No. of genera	% Species to the total species recorded

### Discussion:-

The present study on the Taxonomic distribution of plants in families (table I) shows that majority of them belong to Gamopetalae i.e...7 families which include 9 genera and Polypetalae with 4 families which include 7 genera and only one from monocotyledonae. The percentage occurrence of species is highest in Fabaceae i.e...18.18 followed by Euphorbiaceae with 13.63 and the lowest number is seen in few families namely Malvaceae, Acanthaceae, Apocyanaceae, Cucurbitaceae with 4.54 (table II). The IVI values is highest for *Abutilon indicum* (L.) with 0.271 and second highest is *Brachiaria distachya* with 0.245 and least value in *Tridax procumbens* with 0.04. The Plants were examined for fluoride content and the results show highest accumulation in *Suaeda maritima* (L.) with 82mg/kg and followed by *Prosopis juliflora*(Sw.) with 57mg/kg and, *Scoparia dulcis L.* with 37mg/kg .

From the results it observed that the plants like *Prosopis juliflora* (Sw.), *Scoparia dulcis L.*, *Suaeda maritima* (L.) are showing high amount of fluoride indicating their capacity to tolerate and grow which was supported by (Fatemeh et.al 2013). Further detailed study of plant, soil and microbe interactions is needed to affirm these plants as phytoremediants .

### Conclusion:-

From the results it's proved that few plant communities are dominating even in the high Fluoride polluted area. So obviously, further detailed studies are needed to decide whether these species can be regarded as indicator species of fluoride pollution and the form of the fluoride stored is whether in elemental or free form in the plant. It is worthwhile to carry this kind of test to evaluate the variety of plant species so that it can serve the purpose of providing a green cover for industrial area.

#### Abstract

**Introduction:** The paraoxonase has anti-atherogenic activity which may be altered by the coding gene polymorphisms. The purpose of this study was to assess the genotypic distribution and allelic frequencies in paraoxonase 3 gene Ala99Ala polymorphism in Beninese *Adja* and *Mahi* ethnic groups.

**Materials and methods:** The paraoxonase 3 gene Ala99Ala polymorphism of 144 subjects of Beninese *Adja* and *Mahi* ethnic groups was studied using Polymerase Chain Reaction-Restriction Fragment Length Polymorphism technique and compared with that in Beninese Abomey-Calavi population and others world populations.

**Results:** The alleles A and G frequencies were 67.0 percent and 33.0 percent respectively of *Adja* ethnic group; and 66.0 percent and 34.0 percent respectively of *Mahi* ethnic group. There were no significant ethnic differences for these allelic frequencies between these two ethnic groups.

**Conclusion:** The genotypic distribution and allelic frequencies of paraoxonase 3 gene Ala99Ala polymorphism in Beninese *Adja* and *Mahi* ethnic groups were significantly different from those in Beninese Abomey-Calavi population and in others world populations respectively.

#### Introduction:-

The paraoxonases (PON) enzymes are associated with many inflammatory diseases, such as cardiovascular diseases, by protecting the cells against oxidative stress (Aviram and Rosenblat, 2004). They are associated with high-density lipoprotein (HDL), hydrolyzed lactones and inhibited the oxidation of low-density lipoprotein (LDL), a function that is believed to slow the initiation and progression of atherosclerosis (Seres et al, 2004 and Zhang et al, 2010). The paraoxonase gene has three isoforms, PON1, PON2 and PON3 (Draganov et al, 2005) located on chromosome 7q21.3–22.1 and covers approximately 136kb (Primo-Parmo et al, 1996). Various populations' studies have reported inter-ethnic differences in the allele frequencies for PON gene polymorphisms (Campo et al, 2004 and Wu et al, 2010). This variability suggests that ethnic differences, gene-gene interactions and susceptibility to environmental factors might modulate the relationship between PON polymorphisms and many inflammatory diseases (Wang et al,

**Corresponding Author:- Julien A. G. Segbo.**

Address:- Department of Human Biology Engineering, Research Laboratory of Applied Biology, Abomey-Calavi Polytechnic School, Abomey-Calavi University, Republic of Benin.

2003). Many studies have been conducted on the relation between PON polymorphisms and genetic susceptibility to coronary heart disease (Erlich et al, 2006 and Zhang et al, 2013). The paraoxonase 3 (PON3) have a similar role to PON1 (Sanghera et al, 2008). The expression of PON3 gene occurs mainly in the liver and bind to HDL in blood stream (Reddy et al, 2001). The PON3 gene has five commons Single Nucleotide Polymorphisms (SNPs) Ala99Ala, Asp107Asn, Glu146Lys, Ala179Asp and Tyr233Cys (Robertson et al, 2003; Li et al, 2004; Pasdar et al, 2006 and Sanghera et al, 2008). Despite the importance of the paraoxonase gene and its implications on the genetic susceptibility to coronary heart disease, no studies on African black populations have been reported. The purpose of this study was to assess the distribution of PON3 gene Ala99Ala polymorphism in Beninese ethnic groups, *Adja* and *Mahi* in order to investigate the genetic basis of PON3 gene related diseases in Beninese population.

## Materials and Methods:-

### Subjects:-

This study has been conducted on two Beninese ethnic groups *Adja* and *Mahi*. In June 2015, fifty (50) unrelated volunteers 13 men and 37 women, aged between 17 and 72 years old; were selected randomly from *Adja* ethnic group from Lokossa, a south-west city in Benin; and in November 2015, ninety-four (94) volunteers, 33 men and 61 women, aged between 6 and 70 years old; were selected randomly from *Mahi* ethnic group from Savalou, a central city in Benin.

### DNA extraction and genotyping:-

Venous blood samples were collected from each volunteer after written consent. Genomic DNA was extracted by phenol-chloroform method at Genetics and Biotechnologies Laboratory (GBL) at Abomey-Calavi University. The Polymerase Chain Reaction (PCR) primers sequences for the PON3 Ala99Ala SNP (rs1053275) were designed as previously described by Wu *et al* (2010) and synthesized by SANGON Biotech (Shanghai, China). The sequences were: forward 5'-TCCAGGCATGCCAACTTT-3' and reverse 5'-TTTCCCTCATTCCCCCTT-3' were used to amplify 197 bp fragment containing the polymorphism site Ala99Ala on PON3 gene. PCR was performed using thermocycler PTC 100™ (*Programmable Thermal Controller*; Perkin Elmer) in a final volume of 25 µL as follows: 3 µL (3 ng) DNA sample was added to a reaction mixture containing 2.5 µL of 10×PCR buffer, 1.5 µL of 25 mmol/L MgCl<sub>2</sub>, 1 µL of 200 µmol/L dNTPs, 1U Taq DNA polymerase (1 µL) (Fermentas) and 2 µL of 0.2 µmol/L of each primer, dimethyl sulfoxide (DMSO) was added to a final concentration of 5% and ultra-pure water (Merck) to a final volume of 25 µL. The fragment amplification was performed under the following conditions: 10 min pre-denaturation at 94 °C followed by 30 cycles of 45 sec denaturation at 94 °C, 45 sec hybridization at 50 °C and 45 sec extension at 72 °C; and finished by 7 min extension at 72 °C. Then 10 µL of PCR products was digested with 2 µL of 10×NEB buffer, 2 µL of HhaI endonuclease (Promega) and ultra-pure water to a final volume of 20 µL. Tubes were incubated at 37°C for 4h before separation on a 2% agarose gel and visualization by staining in ethidium bromide under UV trans-illumination. Digestion recognition sequences were GCGC, thus the G allele version would be digested by the enzyme HhaI. The expected results for this polymorphism were the electrophoretic profile with 112 bp, 63 bp and 22 bp bands corresponded to the homozygote genotype G/G; 175 bp and 22 bp bands to the homozygote genotype A/A; and 175 bp, 112 bp, 63 bp and 22 bp bands to the heterozygote genotype G/A. The 63 bp and 22 bp bands were not visible on the agarose gel.

### Statistical analysis:-

Alleles and genotypes frequencies were calculated by gene counting. The chi-square test on SPSS V 11 software was used both to estimate the Hardy-Weinberg equilibrium and to compare the allelic frequencies observed in Benin population with those reported in other world populations. Value of  $p < 0.05$  was considered statistically significant.

## Results:-

### PON3 gene Ala99Ala polymorphism identification:-

The PON 3 gene Ala99Ala polymorphism (rs1053275) is a G to A substitution resulting a synonymous change, Ala (GCG) to Ala (GCA). One-hundred-forty-four (144) samples from Beninese *Adja* and *Mahi* ethnic groups were used to amplify a 197 bp fragment, digested with HhaI. The figure 1 represents the electrophoretic profile of the different genotypes. The PCR products 197 bp fragment were represented on the gel by SG band. On the gel, the individuals A9, A12, M1 and M7 were genotyped G/A (with both fragment of 175 bp and 112 bp); the individuals A1, A3 and M2 were genotyped A/A (with only one fragment of 175 bp) and the individuals A19 and M22 were genotyped G/G (with only one fragment of 112 bp).

**PON3 gene Ala99Ala polymorphism genotypes distribution and alleles frequencies:-**

The genotypic and allelic frequencies of PON3 Ala99Ala polymorphism in Beninese *Adja* and *Mahi* ethnic groups was shown in Table 1. Two alleles and three genotypes were observed in Beninese *Adja* and *Mahi* ethnic groups. The homozygote individual G/G was found in these two ethnic groups. The observed and expected frequencies for the polymorphisms were at Hardy-Weinberg equilibrium ( $p > 0.05$ ).

The comparison of PON3 A99A allelic frequencies within Beninese different ethnic groups was shown in Table 2. There were no significant ethnic differences between *Adja* and *Mahi* for PON3 gene Ala99Ala polymorphism allelic frequencies ( $p > 0.05$ ). But significant differences were observed for PON3 gene Ala99Ala polymorphism allelic frequencies in these two ethnic groups compared to Beninese Abomey-Calavi population respectively ( $p < 0.05$ ).

The comparison of PON3 gene Ala99Ala allelic frequencies in Beninese *Adja* and *Mahi* ethnic groups with those in other world populations was shown on Table 3. There were significant differences in PON3 Ala99Ala polymorphism allelic frequencies in Beninese *Adja* and *Mahi* ethnic groups compared to Chinese *Li* minority and British *Caucasians*.

**Discussion:-**

The present study has determined the genotypes distribution and the allelic frequencies of PON3 gene Ala99Ala polymorphism in Beninese *Adja* and *Mahi* ethnic groups. Two alleles and three genotypes were observed. These genotypic and allelic frequencies of PON3 gene Ala99Ala polymorphism in the Beninese *Adja* and *Mahi* ethnic groups were compared with previously described frequencies in Beninese Abomey-Calavi population and others world populations (Chinese and British).

No significant ethnic differences in PON3 gene Ala99Ala polymorphism genotypes distribution between *Adja* and *Mahi* ethnic groups were observed. These two ethnic groups were referred as homogenous population in Benin, so may have the same characteristics in genetic information's transmission. However, there were significant differences in PON3 gene Ala99Ala polymorphism genotype distribution and alleles frequencies in Beninese *Adja* and *Mahi* ethnic groups compared to Beninese Abomey-Calavi population respectively (Segbo et al, 2014). In contrast with this previous study, the homozygote individual G/G was found in *Adja* and *Mahi* ethnic groups. Abomey-Calavi population, the major ethnic group is among the heterogeneous ethnic group; living in the south-central area (Abomey-Calavi city), the denser area in the country. While *Adja* and *Mahi* ethnic groups were considered as much homogenous populations within which the genetic traits transmission were much conservative. So the transmission of PON3 gene Ala99Ala polymorphism genotypes distribution in Beninese *Adja* and *Mahi* ethnic groups were much conservative and this polymorphism site may be used as an excellent genetic marker for DNA analysis in Benin.

There were significant differences in PON3 Ala99Ala polymorphism genotype distribution and allelic frequencies in Beninese *Adja* and *Mahi* ethnic groups compared to Chinese *Li* minority respectively (Wu et al, 2010). The G/G genotype frequency in *Adja* ethnic group (10.0 %) was similar to that observed in Chinese *Li* minority (8.0 %), but was significant different from that observed in *Adja* ethnic group (19.0 %). There were also significant differences in PON3 Ala99Ala polymorphism distribution in Beninese *Adja* and *Mahi* ethnic groups compared to British *Caucasians* ( $p < 0.05$ ) (Robertson, 2003; Pasdar, 2006).

Additional studies on large cohorts from different ethnic groups in Benin may be needed to determine the real genotypes distribution of PON3 Ala99Ala polymorphism in Beninese population

**Conclusion:-**

In this study, the genotypes distribution and allelic frequencies of the PON3 gene Ala99Ala polymorphism in Beninese *Adja* and *Mahi* ethnic groups were described and compared with other world populations. The PON3 gene Ala99Ala polymorphism distribution in Beninese *Adja* and *Mahi* ethnic groups were significant different from other populations. These ethnic variations in PON3 gene polymorphisms can be used as basis for further investigation on the association of this polymorphism with the risk of cardiovascular diseases and other inflammatory diseases.

**Table 1:-** Genotypic and allelic frequencies of PON3 gene Ala99Ala polymorphism in Beninese *Adja* and *Mahi* ethnic groups

Ethnic groups	n	Genotypes			Alleles	
		A/A	G/A	G/G	A	G
<i>Adja</i>	50	44.0	46.0	10.0	67.0	33.0
<i>Mahi</i>	94	51.0	30.0	19.0	66.0	34.0

**Table 2:-** Comparison of PON3 A99A allelic frequencies within Beninese different ethnic groups

	<i>Adja</i>	<i>Mahi</i>	<i>Fon</i>	<i>Adja</i> vs <i>Mahi</i>	<i>Fon</i> vs <i>Mahi</i>	<i>Fon</i> vs <i>Adja</i>
				<i>p</i> value	<i>p</i> value	<i>p</i> value
Alleles	33.0	34.0	2.0	<i>p</i> > 0.05	<i>p</i> < 0.05	<i>p</i> < 0.05

**Table 3:-** Comparison of PON3 A99A allelic frequencies in Beninese *Adja* and *Mahi* ethnic groups with those in other world populations.

Ethnic groups	n	Allelic frequencies (%)		<i>p</i> values
		A	G	
Beninese <i>Adja</i>	50	67.0	33.0	<i>p</i> > 0.05
Beninese <i>Mahi</i>	94	66.0	34.0	<i>p</i> > 0.05*
Chinese <i>Li</i> <sup>a</sup> minority	150	75.0	25.0	<i>p</i> < 0.05**
British <i>Caucasians</i> <sup>b</sup>	450	52.0	48.0	<i>p</i> < 0.05**

\*no significant ethnic difference was observed when compared to Beninese *Adja* ethnic group;

\*\* significant differences were observed when compared to *Adja* and *Mahi* ethnic groups;

#### Abstract

हिन्दी साहित्य अंतर्गत लेखिकाओं द्वारा रचित साहित्य में मन्नू भण्डारी द्वारा रचित साहित्य अपनी एक अलग अमीट छाप छोड़ता है। इनके साहित्य का मुख्य केन्द्रबिन्दु नारी रही है। समाज में नारी के प्रति सामाजिक दृष्टिकोण को उजागर करना लेखिका का महत्वपूर्ण दृष्टिकोण रहा है। मन्नू भण्डारी एक सशक्त कहानीकार के रूप में उभरकर सामने आयी हैं। उनका समग्र साहित्य ही समाज में घटित महत्वपूर्ण तथ्यों को उजागर करता है। मन्नूजी द्वारा रचित कहानियाँ सामाजिक यथार्थ को प्रस्तुत करती हैं, तथा नारी के विभिन्न पक्षों को हमारे समक्ष उपस्थित करती हैं। जहाँ शोषण दिखाई देता है वहाँ मन्नू भण्डारी विरोध दर्शाती हैं। मानवीय गुणों की दृष्टि से यदि विचार करें तो हमारे ध्यान में आता है कि पुरुष की तुलना में नारी अधिक मानवीय है। मानव जाति की सभ्यता एवं संस्कृति का परिचायक या विकास का मूलधार नारी रही है। मन्नू भण्डारी कहानियाँ कहानी विधा की एक प्रमुख और विशेष रही हैं। उनकी कहानियों का मूलभूत आधार मौलिकता से परिपूर्ण दिखायी देता है।

#### प्रस्तावना

भारतीय संस्कृति में पुरुष प्रधानता प्रमुखता रही है। जितना महत्व पुरुष को है, उतना महत्व स्त्री को नहीं मिल पाया। यही इस समाज का सबसे बड़ा दुर्भाग्य रहा है। यह एक निर्विवाद सत्य है। जिसे अनदेखा नहीं किया जा सकता। भारतीय नारी अपने अनुभवों का सच पूरी तरह बोलने की हिम्मत जुटा नहीं पायी है। पुरुष प्रधान समाज ने नारी को विभिन्न बंधनों में बँधकर रखा। वह नारियों को मात्र घरेलू श्रमशक्ति और भोगविलास की वस्तु बनाए रखने के लिए सदा प्रयत्नशील रहा है। नारी का दमन और शोषण इस दुनिया की पुरानी, गहरी और सबसे जटिल व्यवस्था है जिसकी जड़ें धर्म, संस्कृति और परम्पराओं में घँसी हुई हैं। इन जटिल विचारधारा को चिरकर महिलाएँ अपने विचारों को तथा अपने मन के भावों को तथा धीरे-धीरे अपनी बिखरी हुई और असंघटित हालात से निकलकर अपनी आवाज को सुनाने लगी हैं। इसीलिए हमें महिलाएँ घरेलू बंधनों से निकलकर सामाजिक, राजनीतिक, साहित्यिक और सांस्कृतिक कार्यों में अपनी अमीट छाप छोड़ती दिखाई देती हैं। नारी की पुरुष प्रधान समाज में अपने अस्तित्व की तलाश ही नारी का अपने अधिकार एवं अहसास को प्रदर्शित करता है।

#### मन्नू भण्डारी के कहानी में नारी

साहित्य की मुख्यधारा पुरुष-वर्चस्व से निर्मित है, ऐसे कृतिकारों ने नारी को जिन बिम्बों की रचना की, भोगलालसा, स्त्री-दमन आदि के पोषक हैं। मन्नू भण्डारी की रचनाशीलता का प्राणतत्व भी भारतीय नारी की मुक्ति है। सदियों से जो बंदी बनकर अपना जीवन मात्र जी रही है, ऐसी नारियों को जीवन का वास्तविक और सही रास्ता दर्शाने का प्रयास या फिर कहे कि उस ओर देखने का दृष्टिकोण दिखाने में जो अहम और महत्वपूर्ण भूमिका दर्शायी ऐसे नारियों में मन्नू भण्डारी की रचनाएँ अपना महत्वपूर्ण योगदान रखती हैं। मन्नू भण्डारी मध्यवर्ग में जीवन जी रही नारी को घुटन से मुक्त करना चाहती हैं।

बदलते परिवेश में नारियों को सजग और अपने अस्तित्व को लेकर तथा नारी जीवन में नई चुनौतियों और नई दिशाओं के प्रति, नई-नई समस्याओं को लेकर तथा सामाजिक बदलाव की सजगता की आवश्यकता है। मन्नू भण्डारी का जन्म किसी मेट्रो शहर में नहीं बल्कि एक साधारण और छोटे गाँव में हुआ। अपने जन्म को लेकर स्वयं मन्नू भण्डारी जी ने अपनी आत्मकथा 'एक कहानी यह भी' में बताया है—“जन्मी तो मध्य-प्रदेश के भानपुरा गाँव में थी, लेकिन मेरी यादों का सिलसिला शुरू होता है अजमेर के ब्रह्मपुरी मोहल्ले के उस दो मंजिले मकान से जिसकी ऊपरी मंजिल में पिता जी का साम्राज्य था, जहाँ वे निहायत अव्यवस्थित ढंग से फैली बिखरी पुस्तकों-पत्रिकाओं और अखबारों के बीच या तो कुछ पढ़ते रहते थे या फिर 'डिवटेशन' देते थे।” 1

## दशा एवं दिशा

तात्पर्य यह है कि भारतीय समाज में प्रधानता पुरुष वर्ग की ही है, और रही है। इस सत्य को या इस वास्तविकता को नकारा नहीं जा सकता। मन्जूजी ने विपूल साहित्य की रचना कर इस साहित्य द्वारा समाज में एक नवचेतना जागृत करने का महान कार्य किया है। विशेषता: मानवीय जीवन से संबंधित सभी मूल्य उनकी रचनाओं में प्रमुखता से दिखायी देते हैं। 'मूल्य' समाज के जीवन में सामाजिक, धार्मिक, आर्थिक, नैतिक पृष्ठाभूमि के लिए एक महत्वपूर्ण वैचारिक इकाई है, उनका समग्र साहित्य विशेषता: नारी जीवन के सभी पक्षों को उजागर करता है। इनकी रचनाओं में जो नारी का स्वरूप चित्रित किया गया है वह हमें समाज में भी दिखाई देता है।

दर्शनशास्त्र में जगत, जीव एवं प्रकृति के साथ मानव एवं मानवीय मूल्यों पर भी विशेष बल दिया गया है। जैसे— " भारतीय दर्शन में चरम मूल्यों पर अधिक बल दिया जाता रहा है, जबकि 'पश्चिम में विघटन की स्थिति आने पर ही मूल्यों की चर्चा आरम्भ हुई।' " 2

अर्थात् मूल्य ही हमारी सबसे बड़ी धरोवर होती है, जिसके सहारे हमारा जीवन—यापन होता है। मन्जू भण्डारी की कहानियों में हमें मूल्य चेतना दिखायी देती है। जैसे मन्जू भण्डारी की 'चश्मे' कहानी है, जिसमें प्रेम पर आधारित एक आदर्शवादी मूल्यों की स्थापना करती है। तो दूसरी कथा प्रेम के आदर्शवादी मूल्यों का खण्डन करती दिखाई देती है। जैसे— " लीला चाहती है कि वह अपने कांतिकारी पति को हँसते हुए विदा दे, किन्तु अन्तिम घड़ियों में वह रो पड़ती है। फिर भी एक अलौकिक सन्तोष और तृप्ति की भावना उसके मन में है कि मरने से पहले वह अपने पति को अपना सब कुछ दे सकी। अपने आपको लुटाकर उसने उसे सुखी बनाया, धनी बनाया। " 3

उसीप्रकार उनकी 'तीन निगाहों की एक तस्वीर' कहानी यौन जीवन का चित्रण मनोविज्ञानिक ढंग से प्रस्तुत करती है। इस कहानी में शरीर को महत्वपूर्ण बताया गया। तथा शरीर की भूख 'काम' के आगे समाज के नैतिक मूल्यों को थोथा साबित किया गया है। हर स्त्री को ऐसा लगता है कि अपने पति से काम—वासना की तृप्ति हो। इस कहानी की नायिका 'दर्शना' भी यौन भावनाओं से त्रस्त है। उसका पति शादी के दिन से ही टी.बी. के कारण बीमार। वह हरीश के प्रति लगाव रखती है। जिससे वह घरवालों से दूर और अंत में दूनिया से चली जाती है। तीन निगाहों की तस्वीर' कहानी की दर्शना भी ऐसी स्त्री है, जो पति द्वारा घर से निष्कासित किए जाने के बावजूद नौकरी करके एकाकी जीवन—यापन करती है।

आज समाज में भी ऐसे कई उदाहरण मिलते हैं जो अपनी काम—पूर्ति हेतु कभी—कभी गलत रास्ता अपना लेते हैं, जिससे परिवार उथल—पुथल होते हुए दिखाई देते हैं। लोकजीवन के सघन कटू पारिवारिक, सामाजिक, सच्चाई को मन्जू भण्डारी ने अपनी कहानीयों के विषय बनाये। 'मैं हार गई' सन 1957 में प्रकाशित प्रथम कहानी संग्रह अर्तगत 'मैं हार गई' इस कहानी में राजनीति का वास्तविक चेहरा दिखाया। राजनीति पर तीखा व्यंग्य करने वाली श्रेष्ठ कहानी है। जिसमें लेखिका के मित्र ने राजनीति पर जो सवाल खड़े किए थे, उन सवालों पर करारा जवाब हेतु तथा उड़ायी गयी मजाक का कड़ा उत्तर देने हेतु लेखिका की असफलता। अंत: सहर्ष स्वीकार करना की मैं हार गई। डॉ. सुखवीरसिंह लिखते हैं,— " छोटे से कैनवास पर सामाजिक ढोंचे के बीच पनपने वाले कटु सत्य की अभिव्यक्ति जिस सांकेतिक रूप में इस कहानी में हुई है, उसमें निश्चित ही परंपरागत नैतिक अवधारणाओं के प्रति नकारात्मक रुख स्पष्ट हो जाता है। " 4

इस कहानी से यह स्पष्ट हो जाता है कि आज के इस आधुनिक, भूमण्डलीकरण, नीजिकरण, वैश्विकरण के युग में आदर्श नेता की कल्पना करना और उसमें भी सृजन करना मुश्किल है। इस कहानी के माध्यम से वर्तमान युग में राजनेताओं को लक्ष्य किया गया है। अपने व्यक्तिगत स्वार्थ से और सम्पन्न तथा विकासीनता से जकड़े हुए है।

पितृ प्रधान समाज में 'अकेली' कहानी की सीमा बुआ बेटे के आकस्मिक अवसान एवं पति के सन्यासी हो जाने के बाद नाना प्रकार के मानव सर्जित कटू अनुभवों से जूझती है। " मुझे क्या बावली ही समझ रहा है जो बिना बुलाए चली जाऊँगी? अरे वह पड़ोस वालों की नंदा अपनी आँखों से बुलावे की लिस्ट में नाम देखकर आई है। और बुलावेंगे क्यों नहीं? शहरवालों को बुलावेंगे और समधियों को नहीं बुलावेंगे क्या?—5

मन्जू भण्डारी पूर्ववर्ती एवं समकालीन नारी मनोविज्ञान का बराबर ध्यान अपनी कहानियों में रखती दिखायी देती है। लेखिका के अनुसार आज दास प्रथा, सामंती प्रथा एवं पूँजीवादी प्रथा से कहीं ज्यादा खतरनाक वैश्विकरण, निजीकरण, उदारीकरण एवं विश्वग्राम है। 'छोटे सिक्के' कहानी में खन्ना साहब मजदूरों से पूरा काम लेते हैं। दो प्राध्यापिकाओं के साथ बीस—बाइस छात्राएँ टकसाल देखने जाती हैं तो खन्ना साहब जिस भाव से लड़कियों से मिलते हैं वह भाव प्राध्यापिकाओं के साथ नहीं रहता है। " काम करने। अरे एक ही जगह खाली होती है तो पचासों टूट पड़ते हैं। आप जानती नहीं हमारे देश में इन्सान का जान बड़ी सस्ती है। " 6

मन्जू भण्डारी के अनुभव संसार की व्यापकता और वैविध्यता कबिल—ए—तारीफ है। उनकी यह व्यापकता हर कहानी में देखने को मिलती है। नारी मनोविज्ञान की अनछुई मन: स्थितियों को मन्जू भण्डारी भलीभाँति जानती पहचानती है। मन्जू भण्डारी की कहानी 'स्त्री सुबोधिनी' एक अविवाहित उन्मुक्त यौन सम्बन्ध रखने वाली नारी की कहानी है। कहानी की नायिका अपने बॉस शिंदे से यौन सम्बन्ध रखती है। उनके अनुसार प्रेम कतई कैरियर ओरिएंटेड नहीं है। मात्र शिंदे वैवाहिक व्यक्ति है, वह केवल शौकिया तौर पर उससे यौन सम्बन्ध रखता है, उससे महसूस होता है कि " प्रेम का बीज मन और शरीर का पवित्र भूमि से नहीं ठेठ घर परिवार की उपजाऊ भूमि में ही फलता—फूलता है। " 7

मन्जू भण्डारी की कहानी का दर्द समाज में भी मौजूद है। ऐसी कहानियाँ समाज में भी घटित होती दिखाई देती हैं। कहानी पारिवारिक मूल्यों की हिमायती है। सामाजिक मूल्य परिवर्तन में विशेष रूप से परिवार, प्रेमविषयक धारणाएँ आदि के परिणामस्वरूप मूल्य परिवर्तन की अटलता, शाश्वत मूल्यों को सुरक्षित रखने का प्रयास भी किया जाना आवश्यक है। आज हालात बिल्कुल विपरीत दिखाई देते हैं। वास्तव में यह समय मूल्यहीनता का है। सामाजिक, धार्मिक और सांस्कृतिक स्तर पर मनुष्य के व्यवहार में मूल्यहीनता आ गयी है। मूल्यहीनता की स्थिति परिवार के विघटन, दाम्पत्यों सम्बन्धों में बिखराव, उन्मुक्त—यौन संबंध आदि सब यह उसी के परिणाम हैं। स्वाधीनोत्तर हिन्दी कथा साहित्य को जिन लेखिकाओं ने समृद्ध किया है, उनमें मन्जू भण्डारी का अग्रणीय रहा है। मन्जू भण्डारी की रचनाओं में मानवीय संवेदनाओं के उफान के साथ नारी संघर्ष और शोषण के विरुद्ध स्वर तथा नारी मन की करुण व्यथा है। उनके पात्र नैतिकता और अनैतिकता के प्रश्नों से न उलझकर परिस्थितियों के अन्तर्द्वन्द्व को ही विशेष रूप से रेखांकित करते हैं।

मन्जू भण्डारी द्वारा लिखित कहानी 'रानी माँ का चबूतरा' में गुलाबों सामाजिक प्राणी होने के कारण कई कठिनाईयों से जूझती दिखाई देती है। स्वयं भूखी रहकर बेटी के लिए चूड़ियाँ खरीदती और बेटे को शिशु सुरक्षा केन्द्र में भर्ती कराती है। 'मजबूरी' कहानी में पात्र बूढ़ी अम्मा में मातृ वात्सल्य, त्याग और कर्तव्यनिष्ठा जैसे जीवन मूल्य दृष्टिगत होते हैं। "दो कलाकार" कहानी की नायिका अरुणा में त्याग, समर्पण और समाजसेवा के भाव लक्षित होते हैं। 'नकली हीरे' कहानी में इन्दु ऐसी नारी है, जो अपनी धनवान बहन द्वारा दिया गया हीरे का हार स्वीकार नहीं करती। 'नशा'

कहानी की आनन्दी में आत्म-सन्मान कूट-कूट कर भरा है। बंद दरवाजों के साथ कहानी में विवाह का बदला हुआ स्वरूप दिखाई देता है। कहानी की मंजरी को अपने पति के पूर्व जीवन के बारे में पता चलते ही वह उसे त्याग कर चली जाती है और दिलीप नामक अन्य युवक से शादी करके अपना नया जीवन आरम्भ करती है। 'यही सच कहानी की दीपा में स्थायी प्रेम लक्षित नहीं होता। वह कभी संजय की ओर आकर्षित होती है तो कभी निशीथ की ओर।

आज के समाज में व्यक्ति अपने संस्कारों भूलकर नारी पर अत्याचार, बलात्कार, उसका शोषण कर उसे अनुचित रूप से स्त्रियों को अपने मोह-जाल में फसाने की चेष्टा करता है। मन्नू भण्डारी की कहानियों में जो सच दिखायी देता है, वह आज समाज में घटित होता दिखाई देता है। अंधकार, बलात्कार, स्त्री के साथ अनुचित व्यवहार, उसपर अत्याचार कर उसके मौलिक अधिकारों पर हनन। 'वर्तमान समाज में स्त्रियाँ उपेक्षित और एक अर्थहीन जीवन को अभिशप्त हैं। चारित्रिक दृष्टि से रसखलित पुरुषों की वृत्ति तो दुषित है ही किन्तु स्त्रियों की आत्मबल क्षीणता भी निर्दोष नहीं, अन्यथा जैसी प्रताड़नापूर्ण घृणित घटनाएँ देखने, सुनने और पढ़ने में आती हैं, सम्भवतः न होती।' 8

ऊँचाई इस कहानी में लेखिका ने ऐसी नारी को रूपायित किया है। जो एक ही समय पत्नी और प्रेमिका दोनों भूमिकाओं का निर्वाह निर्वन्ध भाव से करती है। नारी के विवाहोत्तर-संबंध को सहज मानने का, विवाहिता नारी का नया नैतिक बोध इसमें दर्शाया गया है। नैतिक नियम पुरुष और स्त्री दोनों को समान होने चाहिए। पुरुष के लिए अलग और स्त्री के लिए भिन्न। ऐसा नहीं होना चाहिए। शिवानी की निर्भीकता और स्पष्टवादिता से पति निर्णय बदलता है। जिस समर्पण में वासना नहीं होती वह पाप नहीं होता ऐसे विचार शिवानी के होते हैं। इस संबंध में डॉ. कपूरिया का कथन विशेष उल्लेखनीय है—“एक प्यार की स्वीकृति के लिए दूसरे प्यार का झूठा सिद्ध करना आवश्यक नहीं है। कहीं ऐसी भी ऊँचाई है कि जहाँ शरीर का एक से अधिक व्यक्तियों के साथ संबंध बहुत नगण्य होकर दिखाई दे।” 9

शिवानी को विवाह बाह्य संबंध रखने में न कोई पाप बोध होता है न ही कोई तनाव, बल्कि एक साथ पत्नी और प्रेमिका का दायित्व निर्वाह करने का संतोष होता है। इस सन्दर्भ में वह कहती है—“नारी एक साथ एक से अधिक पुरुषों से प्रेम करती हुई उनसे शारीरिक संबंधों का निर्वाह करते हुए उस ऊँचाई पर रह सकती है, जिसे नैतिक ऊँचाई चाहे न भी कहा जाए, किन्तु वह उसके स्वतंत्र अस्तित्व एवं व्यक्तित्व की ऊँचाई अवश्य है।” 10

शिवानी सामान्य परिपाटी से अलग जीवन जीने में विश्वास रखती है, पवित्रता और नैतिकता का संबंध शरीर के साथ होता ही नहीं ऐसा विचार वह निर्भीकता से रखती है। वह सामान्य परिपाटी से निकलकर वह वैवाहिक जीवन के परंपरागत बंधनों को चुनौती देती है, तथा विद्रोह कर वह अति आधुनिक रूप सामने लाती है। परम्परा का घोर तिरस्कार आधुनिकता की देन है। भूमण्डलीकरण, निजीकरण, औद्योगीकरण और आधुनिकीकरण के फलस्वरूप परिवारों का स्वरूप टूटने लगा है। इस संदर्भ में डॉ. ब्रज मोहन शर्मा विशेष उल्लेखनीय कथन कहते हैं कि—“चिरकाल से पुरुष के हथकंडों की शिकार और अपने अधिकारों से वंचित नारी आज पूर्णतः जागरूक है।” 11

परम्परा को नकारनेवाली नारी की सूरत को मन्नू भण्डारी ने दीवार बच्चे और बरसात, यही सच है, ऊँचाई आदि कहानियों के द्वारा स्पष्ट दिखाया है। बरसात कहानी अंतर्गत बरसात के बहाव से दीवार का ढह जाना वास्तव में परम्परागत रुढ़ियों से नारी के मुक्त होने की सूचना ही देता है। एक एक पल की सार्थकता से जीवन की सम्पूर्णता को रूप देना क्षणबोध की विशेषता है।

### निष्कर्ष

मन्नू भण्डारी की कहानियाँ समाज के समक्ष एक वास्तविक सच उजागर करती हैं। उनके कहानी के विभिन्न पात्र समाज में चल रहे द्वन्द्व को अपने चरित्रों के जरिये उजागर करते हैं। मन्नू भण्डारी रचित कहानियों मध्यवर्गीय जीवन को संयुक्त परिवार का विघटन एवं जीवन्त चित्रण, अभिव्यक्त मध्यवर्गीय नारी पुरुष, परिवार समाज के निम्न लिखित रूप उभरकर सामने आए। संयुक्त परिवार का विघटन, अणु परिवार का उदय, दाम्पत्य विघटन, स्त्री-पुरुष सम्बन्धों में द्वन्द्व, पुरुष प्रधान समाज व्यवस्था, राजनीतिक आदर्शों की निरर्थकता, नैतिक मूल्यों का —हास, आर्थिक तनाव, तथा पूँजीपतियों की हृदयहीनता। मन्नू भण्डारी की रचनाओं में मानवीय संवेदनाओं के उफान के साथ नारी संघर्ष और शोषण के विरुद्ध स्वर तथा नारी मन की करुण व्यथा है।

Jeddah, Health Beliefs.

### Abstract

**Background:** Osteoporosis has been recognized as a major public health problem by healthcare providers in Saudi Arabia.

**Objective:** The present study was designed to examine health beliefs about osteoporosis and osteoporosis radiological screening in a large group of older women and men to determine barriers to screening.

**Methodology:** This is a self-administrated questionnaire conducted among a sample of 460 man and women in Jeddah, Saudi Arabia.

**Results:** The majority of the subjects had poor knowledge about osteoporosis and 50.4% of the subject had no practice to avoid the disease. The level of education showed a significant correlation with knowledge of osteoporosis. Also, the young age, higher level of education and females had significantly higher correlation with good practice.

**Conclusion:** This study indicated a lack of awareness and practice about osteoporosis. There was a significant association between knowledge and practice with level of education. Also, the female gender and age showed higher practice scores. All these results showed the significance of more health staff involvement regarding to awareness campaign about osteoporosis.

### Introduction:-

Osteoporosis is systemic skeletal disease affecting bone density and its quality leading to bone strength weakening. It is now an established fact that low bone mineral density increases the frequency of bone fractures systemic skeletal disease affecting bone density and its quality leading to bone strength weakening<sup>(1)</sup>. Osteoporosis is a major public health problem in Saudi Arabia and the contributor of mortality and morbidity among elderly people<sup>(2, 3)</sup>. According to the International Osteoporosis Foundation (IOF) reports 1,461,401 Saudi persons aged 50 years or more, 8768 would suffer femoral fractures yearly at a cost of \$1.14 billion<sup>(4)</sup>. After 30 years there is a 1% - 2% decline in bone mass each year until menopause, in which 40% of their total bone mass decrease rapidly due to low estrogen levels<sup>(5)</sup>. Most individuals with osteoporosis are asymptomatic, undiagnosed, and untreated<sup>(6)</sup>. Men appear to be diagnosed and treated less often than women<sup>(7)</sup>. Previous studies suggest that health beliefs are important determinants of whether individuals participate in health screening<sup>(8, 9)</sup>. Lack of concern and knowledge can be attributed to lower perceptions of susceptibility<sup>(10, 11)</sup>.

The Health Belief Model is a widely used conceptual framework to explain and predict health-related behaviors. This model indicates that patient-level factors related to undertaking health-related action such as disease screening

include perceived susceptibility to a condition, perceived severity of the condition, perceived benefits to taking a health-related action, perceived barriers to taking action, cues to action (external events that prompt the desire to make a health change), and self-efficacy (belief in one's ability to improve health by taking action)<sup>(12, 13)</sup>. Despite the magnitude of this preventable health problem, osteoporosis preventive care has not been incorporated into standard primary care practice<sup>(14)</sup>. For example, a 2002 survey of 1,500 women ages 40–69 in a managed care health plan showed that only 49% had ever discussed osteoporosis with a health care provider, and only 12%–34% of high-risk women had bone density testing<sup>(15)</sup>. Although evidence-based guidelines support routine osteoporosis screening in women age 65 and older<sup>(16)</sup>. Low levels of risk factor assessment, bone density testing, counseling, and prescription of osteoporosis medications have been documented in primary care practices<sup>(6, 17, 18)</sup>.

Diagnostic imaging and interventional radiological techniques are increasingly used to diagnose a wide range of diseases, and to give life-saving treatment for many diseases. The use of radiation in medical practices has evolved since its beginning and 30% to 50% of medical decisions are based on radiological examinations<sup>(17, 18)</sup>.

Our study was designed to examine health beliefs about osteoporosis and osteoporosis radiological screening in a large group of older women and men to determine barriers to screening.

#### ***Rationale:-***

Osteoporosis has been recognized as a major public health problem by healthcare providers in Saudi Arabia, according to the International Osteoporosis Foundation (IOF) reports 1,461,401 Saudi persons aged 50 years or older adults demonstrate several beliefs that may be barriers to osteoporosis screening, including low belief in susceptibility to osteoporosis.

These beliefs should be targeted with patient education to improve radiological screening rates.

#### ***Objectives:-***

##### **General objectives:-**

To examine older adults' beliefs about osteoporosis and osteoporosis radiological screening to identify barriers to screening.

##### **Specific objective:-**

The goal of this study was to examine elderly health beliefs regarding osteoporosis and their perceptions related to radiological screening for the disease, and evaluate the role of demographic factors in shaping elderly beliefs about osteoporosis and assess possible associations between demographic characteristics with the preventive behavior of interest.

#### ***Methods:-***

##### ***Setting and data collection:***

This survey analysis was performed among elderly population in Jeddah city. A pre-formed self-administered questionnaire will be distributed to male and female.

##### ***Sample:***

Subjects were chosen according to geographical and sex distribution. Sample size was calculated based on web-site calculator<sup>(19)</sup>, taking the total size of Jeddah population (3,976,000)<sup>(20)</sup>, confidence level (95%) and margin error (5%) to be 385, additional 20 % was added to cover the missing data. The total sample obtained was **460**.

##### ***Study population:***

Both old age male and female in Jeddah city were included in this study.

##### ***Study tool:***

Pre-formed Self-administered questionnaire that requires information about: (osteoporosis and general health-related characteristics, and beliefs about osteoporosis severity, susceptibility, screening self-efficacy, and screening response efficacy).

##### ***Study limitations:***

The following limitations are expected:

- Cooperation of elderly
- Recall bias

#### ***Ethical considerations:***

An informed consent was maintained from all participants before filling the questionnaire.

#### ***Statistical analysis:***

Data were fed to the computer and analyzed using IBM SPSS software package version 20.0. Qualitative data were described using number and percent. Significance of the obtained results was judged at the 5% level.

#### **The used tests were**

##### **1 - Chi-square test**

For categorical variables, to compare between different groups

##### **2 - Fisher's Exact or Monte Carlo correction**

Correction for chi-square when more than 20% of the cells have expected count less than 5.

#### **Results:-**

This study was carried out on 460 elderly both male and female in Jeddah city.

#### ***Demographic data:***

Table (1), show the demographic data of the studied subjects, the most frequent age group was 61-70 years, the females was slightly higher than male, the education of the majority of the population was university educated (Fig. 1-3).

**Table 1:-** Distribution of the studied patients regarding demographic data.

Table (12), show the relation between level of knowledge and education, it was found that there was a significant positive effect of level of education on good practice to avoid the disease. ( $p < 0.01$ ). I.e. The high educated had a good practice (Fig. 13).

**Fig. 13:-** Relation between level of practice and education

### Discussion:-

Osteoporosis has been recognized as a major public health problem by healthcare providers in Saudi Arabia. Sufficient information about knowledge, health beliefs, and some of the life habits are important to plan for the disease prevention. The present study examined the osteoporosis knowledge, and some of the life habits of Saudi participants in Jeddah to examine health beliefs about osteoporosis and osteoporosis radiological screening in a large group of older women and men to determine barriers to screening.

In this study, the majority of the subjects had poor knowledge about osteoporosis and 50.4% of the subject had no practice to avoid the disease. In partial accordance with these results, a recent study in Saudi Arabia showed that the majority of women in this study had a modest knowledge on osteoporosis. Regarding to practices towards preventing osteoporosis, it was inadequate in studied groups<sup>(21)</sup>.

However, another study among adults in Riyadh showed that participants' knowledge score was about 57 % of the total score and practice score was 51.7 %<sup>(22)</sup>. These scores are higher than our results and this could be attributed to different age and population size between the two studies.

The level of education showed a significant correlation with knowledge of osteoporosis. Also, the young age, higher level of education and females had significantly higher correlation with good practice. In agreement, there were significant associations between the level of awareness, practice and the sociodemographics of the participants including age, female gender and education<sup>(23)</sup>.

In conclusion, this study indicated a lack of awareness and practice about osteoporosis. There was a significant association between knowledge and practice with level of education. Also, the female gender and age showed higher practice scores. All these results showed the significance of more health staff involvement regarding to awareness campaign about osteoporosis.

#### Abstract

**Objectives:** To compare the differences between the incidence of respiratory tract infections before and after performing Hajj and to identify the risk factors that may increase the prevalence of respiratory tract infections during Hajj. **Methods:** During the Hajj season of 1437H in Al Madinah, a prospective cohort study consisting of 566 pilgrim patients was admitted to ER in King Fahad Hospital (160 patients), Al Anssar (100), Bab Jebril Primary Health Clinic (70) and Al Safiah Primary Health Care (236). A face-to-face semi-structured questionnaire was given to each participant a week before and after the Hajj.

**Results:** During the two-week examination period, 92% of patients suffered from respiratory symptoms. It was the first visit to the doctor with the same symptoms for 82.3% of pilgrims. The age group of a vast majority of the patients who participate in the study was 46-65 years. Findings indicate that 89.2% of participants had been in crowded places during the pilgrimage period. Also, 15.9% of participants were smokers, and 81.3% of them had a good ventilation in their residential places. The residential areas of participants (63.4%) were very far from any sources of air pollution. Besides, 82.2% of them did not use their personal belongings during the pilgrimage period..

**Conclusion:** Most pilgrim patients suffered from and shown respiratory symptoms during Hajj. The study noted a reduction in most risk factors which increase respiratory tract infections except the problem of overcrowding during the Hajj season, a problem that cannot be avoided during the pilgrimage to Makkah Al Mukarramah and Al Madinah Al Munawarah, Saudi Arabia.

## Introduction:-

### Rationale and significance:-

The Islamic pilgrimage is unarguably the largest crowded event in the world. As at today, about two million pilgrims from more than 180 countries gather annually for Hajj to the holy cities of Makkah Al Mukarramah and Al Madinah Al Munawarah, Saudi Arabia. During this annual gathering, pilgrims are usually in close contact with one another, especially during Tawaf. As a result, this holy assembly usually exposes religious travellers to a high risk of infectious diseases, especially acute respiratory tract infections. (1) Evidence from the literature has also showed that pilgrims suffer from common infectious diseases such as common cold and other ailments such as influenza and pneumonia, both of which may lead to many complications and thus require urgent medical attentions. (2)

Furthermore, the congregation of such large number of pilgrims may present many public health risks and challenges. (3) In other words, the gathering in populous and limited places for a short time amplifies health risks and hazards. Physical exertion, overcrowding and any existing medical conditions such as diabetes mellitus and cardiovascular illness increase the chance of acquiring infectious diseases among pilgrims. (4)

The demographic characteristics of patients in the previous studies showed that cases of respiratory infections in males (43.5%) were higher than those of females (33.5%). According to the age demographic breakdown of participants, the elderly group (more than 50 years) were involved in more than 94 % of cases. Put simply, elderly people are more prone to infectious disease due to the disruption of diets and sleep and the impairment of the immune system. As for the nationality, most cases of infectious diseases were traced to Indonesian pilgrims (18%), Saudis (17%) and Pakistani (11%) pilgrims (4).

Many previous studies about respiratory tract infections found that cases of such infections increased during Hajj. Although an infection in the upper respiratory tract is very common, lower respiratory tract infection (pneumonia) can occur, and the latter is much more deadly than the former. The leading cause of these ailments includes influenza virus, other viruses and bacteria.

An increase in the incidence of respiratory tract infection during Hajj has a serious impact on the general health of the population as it could lead to an epidemic infection and have adverse effects on the economic by increasing healthcare costs and hospital bed demands as well as contributing to the loss of workdays. The purpose of this study is to compare the differences between the incidence of chest infection before and after performing Hajj and to proffer solutions and identify the risk factors that may increase the prevalence of such infection during Hajj.

### 1.2. Specific objectives:

- To compare the differences between the incidence of respiratory tract infections before and after performing Hajj.
- To identify the risk factors that may increase the prevalence of respiratory tract infection during Hajj.

## Methodology:-

During the Hajj season of 1437H in Al Madinah, a prospective cohort study had been conducted a week before and after the pilgrimage. Data were collected using face-to-face semi-structured questionnaire from patients in King Fahad Hospital (160 patients), Al Anssar (100), Bab Jebril Primary Health Clinic (70) and Al Safiah Primary Health Care (236).

The interviewed was developed based on the literature, sociodemographic data, common respiratory complaints that brought pilgrims to ER, related risk factor and medication. The inclusion criteria were nasal discharge and congestion, cough, sneezing, sore throat, pleuritic chest pain and fever. The data were consequently entered into a portable computer file of access program, and the statistical analysis was done using SPSS version 20.

## Population & Sample of the Study:-

The study population included all pilgrims of 1437H who were treated in one of the hospitals designated to receive them. As a result of the exposure to respiratory diseases before or after performing the pilgrimage, a random sample of 566 patients was selected. The participants were interviewed, and a questionnaire was given to each of them. Table 1 shows the characteristics of the participants according to their personal data.

**Table (1):- The participants personal data.**

Personal Data		# (%)	P- value
Gender	Male	405 (71.6)	0.00**
	Female	161 (28.4)	
Age	25 or less	11 (1.9)	0.00**
	26-35	71 (12.5)

	More than 5000 sr	40 (7.1)	

\*\*Chi Square test - Significant at the 0.01 level.

As shown in Table 1, 71.6% of the participants were males, and 28.6% of them were females. Based on the distribution of their ages, some participants were 56-65 years old (26.9%), 46-55 years old (25.3%), 36-45 years old (23.7%), 26 -35 years old (12.5% ), more than 66 years old (9.7%), and less than 25 years old (1.9%).

As for the demographic of marital status, A number of sample members were married (89.8%), singles (5.1%), widows (4.1%), and divorced (1.1%).

The participants' distribution according to their educational level was as follows; 26% of them were illiterates, 34.3% had secondary school certificates, and 34.1% had bachelor degrees, and 5.7% were postgraduates. Lastly, their distribution according to their monthly income was as follows: 65.4% of the participants earned less than 2500 SAR, 27.6% received 3000-5000 SAR, and 7.1% were paid more than 50, 000 SAR. The personal diagram of participants is shown below (see Figure 1):

**Graph (1):-** The participants personal data.

### Results:-

Table 2 shows the participants' distribution based on whether they were suffering from symptoms of the respiratory system; 92% of them suffered from the symptoms of the respiratory system, while 8% did not show any of sign of respiratory disorder.

**Table (2):-** Shows the participants' distribution according to whether they were suffering from symptoms of the respiratory system.

Answer	Frequency	Percent
Yes	521	92.0
No	45	8.0
Total	566	100.0

The following diagram highlights some of the disease symptoms experienced by the participants and the proportions of each of them. As indicated in Figure 2, 32% suffered from flu, 23% had a sore throat, 13% were vulnerable to dry cough, 10% were susceptible to dry cough, 6% had a high temperature, and 5% suffered from chest pain.

**Graph (2):** Shows some of the disease symptoms experienced by the participants in the study.

The next table indicates the participants' distribution according to whether they had been in crowded places during the pilgrimage period. As depicted in Table 3, unlike 89.2% of them, 10.8% were not crowded places during the pilgrimage period.

**Table (3):-** Shows the participants' distribution according to whether they had been in crowded places during the pilgrimage period.

Answer	Frequency	Percent
Yes	505	89.2
No	61	10.8
Total	566	100.0

Table 4 shows the participants' distribution according to whether they utilised their personal belongings (towels, pillow, eating utensils, etc.) during the pilgrimage period; on one hand, 82.2% of them did not use their personal belongings during the pilgrimage period; on the other hand, 17.8% utilized their personal belongings during Hajj.

**Table (4):-** Shows the participants' distribution according to whether they participated their personal belongings during the pilgrimage period.

Answer	Frequency	Percent
Yes	101	17.8
No	465	82.2
Total	566	100.0

The following diagram shows the means of transportation used by the participants to navigate to Medina. As shown in Figure 3, some participants used planes (49%), buses (35%), cars (8%), and ships (8%).

**Graph (3):** Shows the means of transportation used by the participants during their journey to get to Medina.

The next table shows some of the diseases that were suffered by the participants and proportions of each; 35.7% suffered from diabetes, 36% of them suffered from hypertension, 13.8% of them suffered from asthma, 1.4% of them suffered from immune diseases, and other diseases by 13.1%.

**Table (5):**Diseases suffered by the participants..

Answer	Frequency	Percent
diabetes	106	35.69%
hypertension	107	36.03%
asthma	41	13.80%
immune diseases	4	1.35%
Others	39	13.13%

Based on whether they have had an organ transfer process before, 99.8% of them have never had a transfer process, whereas only 0.2% of them have done so (see Table 6).

**Table (6):**Participants distribution according to whether they have had an organ transfer process before.

Answer	Frequency	Percent
Yes	1	.2
No	565	99.8
Total	566	100.0

The next table shows some of the medicines used by the participants and the proportion of each medication. As illustrated in Table 7, a number of participants used analgesics (35.3%), 10.7% for steroids (10.7%), chemotherapy (4.3%), antidepressants (4.3%), antibiotics (2.7%), and other medicines (42.8%).

**Table (7):**Medications used by participants.

Answer	Frequency	Percent
steroids	20	10.7
antibiotics	5	2.7
chemotherapy	8	4.3
antidepressants	8	4.3
analgesics	66	35.3
Others	80	42.8

The next table shows the participants' distribution concerning smoking. As shown in Table 8, 84.1% of them were non-smokers and 15.9% were smokers.

**Table (8):** Participants' distribution concerning smoking.

Answer	Frequency	Percent
--------	-----------	---------

Yes	90	15.9
No	476	84.1
Total	566	100.0

The following diagram shows the distribution sample of ers according to the period which they spent smoking. As indicated in Figure 4, some patients smoked for less than 10 years (23.3% ), 10-20 years (42.2%), and more than 20years (34.5%).

**Graph (4):** Shows the distribution of smokers according to the period of time they spent in smoking.

Table 9 explains the participants' distribution regarding whether the ventilation was good in their place of residence during the pilgrimage period; 81.3% of them had a good ventilation in their place of residence, while 18.7% did not have such semblance of atmosphere

**Table (9):-**Table 9: Participants' distribution regarding whether the ventilation was good in their place of residence during the pilgrimage period.

Answer	Frequency	Percent
Yes	460	81.3
No	106	18.7
Total	566	100.0

The next table also shows the participants' distribution in terms of whether their place of residence close to any air pollution such as traffic jam or torched places... etc., during the period of pilgrimage; 63.4% of them said that their residence places weren't close to any air pollution sources, while 36.6 % said that their residence places were close to the air pollution.

**Table (10):-** shows the participants' distribution in terms of whether their place of residence close to any air pollution during the period of pilgrimage

Answer	Frequency	Percent
Yes	207	36.6
No	359	63.4
Total	566	100.0

The next table shows the participants' distribution regarding whether this meeting was their first visits to the doctor with the same symptoms. As shown in Table 11, 82.3% of participants maintained that this meeting was their first visits to the doctor with the same symptoms. On the other hand, 17.7% of them pointed out that this meeting was not their first visit to the doctor with the same symptoms.

**Table (11):-**Participants' distribution regarding whether this meeting was their first visits to the doctor with the same symptoms.

Answer	Frequency	Percent
Yes	466	82.3
No	100	17.7
Total	566	100.0

Table 11 indicates the number of times the participants, who have had several visits to the doctor with the same symptoms, visited the doctor with the same symptoms; 45% of them visited a doctor once before this visit, 39% visited a doctor twice for the same symptoms prior to this meeting, 12% of them visited a doctor thrice for the same symptoms, and 4% had visited a doctor more than three times for the same symptoms.

**Table (12):-**The number of times the participants visited the doctor with the same symptoms prior to this visit.

Answer	Frequency	Percent
One	45	45.0
Two	39	39.0
Three	12	12.0
More than three	4	4.0
Total	100	100.0

The next table shows participants' distribution in terms of whether They been stayed in the hospital or not; 96.5% of them have not been stayed hospital, while only 3.5% were stayed hospital.

**Table (13):-**Participants' distribution in terms of whether they have stayed in the hospital..

Answer	Frequency	Percent
Yes	20	3.5
No	546	96.5
Total	566	100.0

## Discussion:-

The Hajj is the largest annual gathering in the world, bringing millions of people in a small and geographically confined area together. Evidence from the literature suggests that overcrowding increases the chances of trauma and the transmission of communicable diseases. Moreover, pilgrims are subjected to fatigue and bad weather conditions during this period. Hence, crowding, fatigue and extreme climatic conditions are important factors for transmitting air- and droplet-borne infections. In fact, respiratory tract infections are one of the leading types of infections observed during the Hajj season (7,8). Hence, this study aims to compare the difference between the incidence of respiratory tract infections before and after performing Hajj as well as identifying the risk factors that may increase the prevalence of respiratory tract infections during this pilgrimage.

This study includes 566 pilgrim patients of year 1437H. Most of them (92%) suffered from respiratory symptoms, and the results of this study conform with those of Bakhsh et al., who found that most patients were suffering from respiratory problems (9). In this study, the majority of participants (71.6%) were male. Another similarity of this study with other research is that in contrast to females, males are more prone to pneumonia infections (10). However, this finding is different from that obtained by Madani et al (11). It is somewhat illogical that most pilgrim patients are males as both genders are subjected to the same environment and physical activities during the Hajj journey.

Furthermore, we found that most patients attending the King Fahad Hospital, Al Meeqat Hospital, and Alanssar in Al Madinah belonged to the age bracket of 46-65 years old. Bakhsh et al. noted that most patients attending the Haram Medical Centre Facilities belonged to the age group of 41-60 years old (43.7%) (12). Generally, elderly pilgrims are susceptible to infections due to exertion, lack of sleep, disturbance in dietary schedules, etc.; they develop serious medical complications due to decreased immune functions (10,11,13,14).

As noted earlier, this high ratio of infection of the respiratory system is considered normal due to the extremely high crowding density to which people from many parts of the world are exposed when performing Hajj rituals. The seasonal flu vaccination, which is regarded as a preventive measure, has been recommended especially for high-risk individuals or people above 65 years old (15,16,17). Besides, the recommendations for the prevention of influenza

include wearing face masks (18). Although wearing mask may not provide complete protection from infections, it may reduce the exposure to droplet nuclei, which are considered among the main modes of transmitting most URTIs (18). We found that 32% of participants suffered from flu and 23% from a sore throat. It has been observed that the use of seasonal influenza vaccine prolongs the period of a sore throat (19). The prevalence of dry coughs (not dry coughs), high temperature, and pain in the chest was less nonetheless.

Most participants (89.2%) had been in crowded places during the pilgrimage period. This behaviour is considered normal because of the large number of pilgrims and the limited time and space. Also, about 82.2% of the participants did not use their personal belongings during the pilgrimage period. This attitude is also considered a good indication of the awareness of pilgrims.

In our study, participants suffered from diabetes (35.7%) and hypertension (36%), a result which was very similar to that of Khan et al. in which 31.9% suffered from diabetes mellitus, and 37.2% had hypertension (20). Like the result of Emamian et al. in which 9.47% of respondents were smokers, our finding shows that 15.9% of the participants in this study were smokers (21).

The majority of our participants (81.3%) had good ventilation in their place of residence. Such atmosphere is commendable because poor ventilation contributes to the rapid spread of infections. Besides, 63.4% of the participant's residential areas were not close to any sources of air pollution.

For the first time, approximately 82.3% of the participants visited the doctor for the same symptoms. This result means that they exhibited these respiratory symptoms during Hajj. Nonetheless, Al-Jasser et al. reported that a significant proportion (53%) of pilgrims from Riyadh experienced a URTI during or immediately after the Hajj (18).

As in many mass gatherings, it is important to understand how to prevent the occurrence of a heavy burden of symptoms of the respiratory system. Given the circumstances of the Hajj, it is almost impossible to control the spread of illnesses facilitated by crowding adequately. The use of personal protective measures such as vaccination, chemoprophylaxis, frequent hand washing/sanitising, and face mask can provide a level of sufficient protections (22).

### **Conclusion:-**

The recent study found that most of the patient pilgrims suffered from respiratory symptoms and that the majority of them showed these symptoms during Hajj. Regarding the risk factors which increase respiratory tract infection, most pilgrims did not use their personal belongings during the pilgrimage period. Moreover, non-smokers had a good ventilation in their place of residence, and residential places were not close to any sources of air pollution. All these factors are considered good indicators. Nevertheless, most pilgrims had been in crowded places during the pilgrimage period. Such gathering, which cannot be avoided due to a large number of people and the limited time and space, increases the chances of respiratory symptoms.

### **Recommendation:-**

- Further studies on the same subject should include larger groups of pilgrims in various health centres in the city of Medina and Mecca.
- There should be awareness campaigns for pilgrims about the need to take proactive actions and preventive measures such as vaccination, chemoprophylaxis, frequent hand washing/sanitizing, and using face mask to provide a level of sufficient protection.
- The WHO and other global stakeholders in the health sectors should cooperate with the Saudi authorities on how to mitigate infectious diseases during Hajj.

### **Study Strength:-**

- This study can help the world control the spread of both epidemic and pandemic diseases.
- The combination of using questionnaires and personal interviews helps increase the accuracy of the research results.

### **Study limitations:-**

- Difficult to communicate with participants due to the language barrier.
- Poor organisation by hospitals.
- Overcrowding.

Finance and Economic Growth.

#### Abstract

The Micro, Small and Medium Enterprises are back bone of the India. They contribute the significant amount to the GDP. They are located equally in both urban and rural areas and it provides high employment. So the governments also taking many actions to the growth of the MSME sector. Even though, the MSMEs in India are still struggle to survive, most of the MSME run loss or very smaller profit. The key issue of the MSME sector is funding. They cannot be able to raise as much funds from public for meet out their requirements. The MSMEs are mainly depend on the debt from other sources rather than banks. Now the MSMEs have many alternative sources to raise the funds. In that sources the external equity is one of the important sources to raise the investment. They have own advantage while considering other sources of finance. It is one of the less used sources of finance by the MSMEs. It is most suitable finance source to the MSMEs. The equity finance will help to avoid some of the major drawbacks like repayment, fixed interest payment of the MSMEs for raising and using of funds.

#### Introduction:-

The Micro, Small and Medium Enterprises (MSME) plays a vital role in the economic and social development of the country. They often act as a nursery of entrepreneurship. They also play an important role in the development of the economy with their flexible, effective, efficient and innovative entrepreneurial spirit. The Micro, Small and Medium Enterprises (MSME) sector has been a significant contributor to the country in the stream of generating the highest employment growth and it also accounts for the major share of industrial production and exports.

Micro, Small and Medium Enterprises (MSME) fuels the economic growth across the globe and they are the key instruments for promoting equitable development. The primary attribute of the sector is its employment potential at low capital cost. The labour intensity space of Micro, Small and Medium Enterprises (MSME) are much higher than that of large enterprises. Micro, Small and Medium Enterprises accounts for about 90 per cent of total enterprises in most of the economies. On the domestic front, MSMEs play an essential role in the overall industrial economy of the country. In recent years, the MSME sector has been consistent in registering a higher growth rate compared with the overall industrial sector. Further with qualities such as agility and dynamism, the sector has shown admirable innovativeness and adaptability to survive the recent economic downturn and recession.

**Corresponding Author:-Mr. Pr. Sreejith.**

Address:-Pursuing Mba Finance and Marketing, Gnanam School of Business, Thanjavur.

The Indian Micro, Small and Medium Enterprises (MSME) sector space is immensely heterogeneous with regards to the size of the enterprises, variety of products and services, and levels of technology. The sector not only plays a crucial role in providing employment opportunities at comparatively lower capital cost than large industries but also helps in industrialization of rural and backward areas, reducing regional imbalances and assuring more equitable distribution of national income and wealth.

The Micro, Small and Medium Enterprises (MSME) are now the backbone of India's industrial landscape. With about 40 million units employing around 100 million people, directly and indirectly, the sector is the largest job provider in the country. They contribute about 8 per cent to the GDP, has a share of 45 percent in the country's manufacturing output growth, and contributes 40 percent to the country's exports.

#### Definition:-

Definitions of MSME in accordance with the provision of Micro, Small & Medium Enterprises Development (MSMED) Act, 2006 they are classified in two Classes:

**Manufacturing Enterprises-** The enterprises are engaged in the manufacturing or production of goods pertaining to any industry specified in the first schedule to the industries (Development and Regulation Act, 1951) or employing plant and machinery in the process of value addition to the final product having a distinct name or character or use. The Manufacturing Enterprise are defined in terms of investment in Plant & Machinery.

<b>Manufacturing Sector</b>	
<b>Enterprises</b>	<b>Investment in plant &amp; machinery</b>
Micro Enterprises	Does not exceed twenty five lakh rupees
Small Enterprises	More than twenty five lakh rupees but does not exceed five crore rupees
Medium Enterprises	More than five crore rupees but does not exceed ten crore rupees

**Service Enterprises:-**The enterprises engaged in providing or rendering of services and are defined in terms of investment in equipment.

<b>Service Sector</b>	
<b>Enterprises</b>	<b>Investment in equipment</b>
Micro Enterprises	Does not exceed ten lakh rupees:
Small Enterprises	More than ten lakh rupees but does not exceed two crore rupees
Medium Enterprises	More than two crore rupees but does not exceed five crore rupees

#### Classification of MSMEs by location (%):-

MSMEs have played an important role in the development of States in terms of the employment generation. More than 55 per cent of these enterprises are located in six major States of the country, namely, Uttar Pradesh, Maharashtra, Tamil Nadu, West Bengal, Andhra Pradesh and Karnataka.

The MSME sector has slowly come into the limelight, with increased focus from the government and other non-government institutions, corporate bodies and banks. The changes based on the policies, investments into the sector, globalization and India's growth story have giving several business opportunities for this sector.

According to this chart 55 per cent of MSMEs are located in urban areas of the country. But almost equal number 45% of about MSMEs are located in the rural areas. So the MSMEs in India playing a vital role in the development of rural areas and employment of rural peoples. Since India having more rural areas rather than the urban areas, the employment and development of rural peoples are more important to the development of the nation.

#### Classification of MSMEs by sector (%):-

Indian MSMEs are mostly on the Manufacturing sector. The graph shows 67% of the Indian MSMEs in the manufacturing sector. The small manufacturing units are more important than the big manufactures in India because the small manufacturing units are contributing more in the economy rather than the big ones. After the manufacturing the Indian MSMEs are concentrating on the service sector. The 17 per cent of the MSMEs are in the service sector. The total Indian economy is concentrated more on the service sector but MSMEs are different in this case. They are more on manufacturing sector and lesser on the other sector sectors. It's a good sign to the government. Because now the government try to concentrate on manufacturing sector (E.g.:- Make In India program). The government can boost the MSMEs since they are more on manufacturing sector. For that the Indian government made many initiatives.

#### MSME Funding – Challenges:-

##### Loan Finance:-

The most dominant factor that stands as a hurdle to the MSME sector has been access to loan finance, sufficiently and timely. This problem is persistent despite clear instructions from the Reserve Bank of India (RBI) and the Ministry of Finance to encourage flow of funds from the commercial banks to small enterprises. It is examined that, there are strong structural underpinnings to the inadequate flow: the organizational structure of banks, and processes within them, have taken them far from task orientation, and have created a specific bias against small loan portfolios. With the proper guidelines and direction from RBI and an absence of performance-based incentive

system for proactive bankers have all constricted easy flow of loan finance to small firms, it is much more difficult for tiny sectors.

It is observed that, transparency of the financial conditions of MSME is still lagging. This due to the lack of evaluation of the financial conditions by the owners themselves. This results in hesitation from banks to lend loan to small scale units. In fact, there is evidence to establish that a fairly significant proportion of loans given to small enterprises in the past have compounded the problem of non-performing assets (NPAs). Unless there is fairly detailed information on small firms, banks would hesitate to take risk. So to ensure transparency in decision on finance, loan finance is the alternate source.

#### **Issues in loan finance:-**

There are many issues and challenges that MSME's faces in getting loan from financial institutions.

#### **Lack of Information:-**

The adequacy of information about the MSME borrowers is the real problem for decision-making by banks in the lending process. Where information asymmetry exists, lenders may respond by increasing lending margins to levels in excess of that which the inherent risks would require. However, the low size of MSME lending makes it unviable for banks to invest in development of information systems about MSME borrowers. In such situations, banks may also reduce the extent of lending even when MSMEs are willing to pay a fair returns to them. The implication of raising interest rates and/or curtailing lending is that banks will not be able to finance as many projects as otherwise would have been the case.

#### **Granularity:-**

This is a situation where the risk grading system at banks does not have the requisite capability to discriminate between good and bad risks. This will lead to tightening of credit terms, or an increase in prices, or both. From the borrower's perspective, this leads to an outcome where the bank is over-pricing good risks and underpricing bad risks. The fact that most banks in India have not developed adequate expertise in MSME lending risk assessment exercises leads to the problem of granularity when it comes to MSME lending. Most banks in India are not having an effective risk assessment technique when it comes to MSME lending.

#### **Pecking order Theory:-**

This theory flows from the above mentioned issues that make MSME lending highly difficult for banks. Under this hypothesis, the sector which faces a cost of lending that is above the true risk-adjusted cost will have incentives to seek out alternative sources of funding. Evidence suggests that in such situations MSMEs prefer to utilize retained earnings instead of raising loans from banks.

#### **Moral Hazard:-**

Loans even though provided by banks to the MSME's the owners of the companies preference goes towards getting finance through other sources. One reason for this situation is that the owner of the firm benefits fully from any additional returns but does not suffer disproportionately if the firm is liquidated. This is referred to as the moral hazard problem, which can be viewed as creating a situation of over-investment. The moral hazard problem may thus lead to MSME lending turning bad in a short period of time, a situation that all banks would like to avoid.

#### **Switching Costs:-**

MSMEs may find it harder to switch banks, when countered with any issue. It is a known fact that the smaller the business, the more significant the switching costs are likely to be and, therefore, it is less likely that the benefits of switching outweigh the costs involved. This situation results in MSME lending becoming a seller's market, which may not be attractive to MSME borrowers.

#### **Alternative Financing:-**

##### **Securitization of Trade Credit:-**

The Trade credit is one of the source of financing for MSMEs, as they sell on credit to their large customers and then wait for long periods for payment. If these receivables (trade credit) could be packaged as a securitized asset, which would essentially be a commercial paper with the credit rating of the large firm, it could help MSMEs reduce their investment in working capital and their need for finance significantly. The credit worthiness of a typical MSME would also improve, qualifying it for greater bank funding. Though the securitization process which is similar to

factoring, could be more cost-effective than bank funding, factoring, and letters of credit. But the Securitization of credit also depending on the borrowings.

#### **Angel Funds / Venture Capital Funds:-**

Angel investors are investors who typically invest their own funds, who manage the pooled money of others in a professionally-managed fund are increasingly becoming another alternative source of funding for MSMEs in India.

Venture/ Risk capital is often a more appropriate financing instrument for high-growth potential and start-up MSMEs. However, the ability of MSMEs (especially those involving innovations and new technologies) to access alternative sources of capital like angel funds/risk capital needs to be enhanced considerably. Although the sector commonly uses traditional debt, this type of financing is often not accessible for fast growth and start-up firms. During their initial phase, firms need finance to study, assess and develop an initial concept (seed phase) or for product development and initial marketing (startup phase). At this stage, firms may be in the process of being set up or may exist, but have yet to sell their product or service commercially. High-growth firms usually develop an idea, concept or product that requires an incubation period before generating revenues and profits.

#### **Private Equity Funding:-**

Private Equity (PE) investment provides another source of raising capital for MSMEs. Private Equity funds have been invested in Indian firms since 1990s. These financial enterprises are typically focused on funding a company early, adding value to them and making an exit at a later stage. They are stable sources of capital and tend to have an investment horizon of 3-5 years looking at a multiple return on their investment. Private Equity investors not only bring capital but also expertise and experience from established businesses and from the global markets. Private Equity companies will expect the portfolio of companies in which they are going invest should be best in practice. They also work extensively with their portfolio companies and encourage management to undertake operational improvements in case of any strategic opportunities such as mergers, acquisitions and joint ventures. The Planning Commission recently released a preliminary approach paper regarding its 12th five-year plan (2012-2017). A key focus area in the plan is to promote equity investment in MSMEs by constituting a Working Group devoted to the concept.

But the inclusion of private equity leads to some problems. The private equity investors will demand larger share of the business. So the existing owner will lose their ownership power and also their control on the business.

#### **Mezzanine Financing:-**

Mezzanine refers to hybrid financial instruments that possess characteristics of both debt and equity. It lies somewhere in the midst of debt and equity on the risk-return spectrum. In the hierarchy of creditors, mezzanine debt is subordinate to senior debt but ranks higher than equity. Mezzanine financing, usually completed with little due diligence on the part of the lender and little or no collateral on the part of the borrower, it is treated like equity on a company's balance sheet. Mezzanine debt is also called subordinated debt or second mortgage. Commensurate with their subjugated position in the claim over the assets of a corporation which is tantamount to the assumption of relatively higher risks, mezzanine financiers typically demand a higher rate of return as compared to debt providers but lower than that required by equity investors.

Mezzanine financing requires the business owner to give up some measure of control over the firm. Business owners who agree to mezzanine financing may be forced to accept restrictions in how they spend their money in certain areas of the business. It is more expensive compare to the other traditional debt arrangements and arranging the Mezzanine finance is a lengthy process.

#### **Role of capital in MSME sector:-**

The challenges faced by Micro, Small and Medium Enterprises (MSME) sector arise from many areas. These enterprises are small in sizes have limited ability to withstand any economic problems. They are generally running with inadequate amount of capital. A large number of enterprises depend completely on the owner's capital and borrowing from individuals, without borrowing funds from financial institutions. It naturally inhibits their potential to grow their businesses. Many of the concerns of this sector like low technology level, lack of product variants, inability to increase manpower etc. cannot be addressed without adequate and timely availability of credit. It is only when these enterprises are adequately funded. Also, these enterprises often being the suppliers of larger enterprises suffer from the problem of the realization of payments for their products or services. These issues make pressure on

their working capital which impacts severely their operations. Therefore, in the one hand they have limited capital to invest in fixed assets to expand their operations; on the other hand, due to lack of adequate working capital they find it difficult to continue their existing operations. The concerns are not confined to issue of credit availability; it's also about cost of credit. If the cost of credit cannot be made attractive for the borrowers of this sector, loan disbursal cannot be improved. The MSME sector, therefore, urgently needs more capital at a reasonable cost. The availability of funding can help it to address some of its key concerns. It needs more seed capital to start new ventures. Long term capital is needed to help the enterprises to invest in infrastructure in terms of land, plant & machinery, technology sourcing etc. and to augment its operations. Working capital is required to ensure the running of day to day operations of the business. The flow of funds is critical for the survival and growth of MSMEs in the present competitive market. Not only these firms need debt financing, the growth cannot take place without equity financing. There is a possibility of growing firms taking only bank finance, getting over-leveraged. At that point further bank financing is hard to get. Therefore, the MSMEs can grow by having the access to both debt financing and equity financing options.

#### **Equity Finance:-**

Equity financing is the process of raising capital through the sale of shares in an enterprise. Equity financing essentially refers to the sale of an ownership interest to raise funds for business purposes. So the MSME have an option to raise the funds through Equity or issuing of shares.

Access to Equity Capital through SME Exchanges: Access to equity capital from the stock market is a genuine problem for MSMEs. Till some years ago, there was no great flow of equity capital into this sector. Absence of equity capital poses a serious challenge to the development of knowledge-based industries, particularly those promoted by the first-generation entrepreneurs with the requisite expertise and knowledge. Further, for efficient capital structure decisions, an optimal mix of equity and debt is very important. Keeping this in mind, the Report of the Task Force on MSME Chairman (Shri. T.K.A. Nair, 2010) had recommended the setting up of a dedicated Stock Exchange/Platform for MSMEs to access institutional and retail capital. This would also facilitate greater financial inclusion in the country. Following this, SEBI laid down the regulatory framework for the SME Exchanges with relaxed listing conditions and accorded approval to BSE and NSE to launch an SME Exchange in September 2011 and October 2011 respectively. Successful examples of SME Exchanges across the World include AIM (London), Canada (TSXV), Hong Kong (GEM), Japan (Mothers), Korea (KOSDAQ) and US (NASDAQ).

In March 2012, both BSE and NSE launched their SME exchange platforms to enable MSMEs to raise funds and get listed as public entities. BCB Finance Ltd. was the first Indian SME to get listed on the BSE SME Exchange. This was an event of immense significance for MSMEs as they have a huge listing potential but mostly had debt-financing options. The launch of SME exchanges will play an important role in growth of MSMEs and the need of the hour is to improve the awareness among MSMEs about equity capital, stock markets and funding options, other than banks. The capital markets can play a crucial role in helping MSMEs improve their visibility and raise capital for their growth and expansion, offering an effective way to improve financial inclusion. They can also offer investors opportunities to invest in growing businesses at an early stage. Since its launch in March 2012, 13 companies have listed with BSE SME exchange, and BSE is negotiating with other companies for listing. BSE's rival NSE has also followed suit and launched its own SME platform called 'Emerge' with the proposed listing of Chennai-based SME Thejo Engineering. A vibrant equity market for MSMEs would also provide an added incentive for private equity and venture capital investments by providing an exit option for them. Listing on exchanges will also offer MSMEs an opportunity to offer equity ownership to their employees, thereby, increasing their commitment to their company and working for its future success.

The MSME sector is an important factor for growth of the country's economy, and presents a significant business opportunity for both banks and alternative finance providers. The improvements of financial exclusion in MSMEs is high and in spite of the increase in credit outstanding in recent years, fetching the adequate and timely credit from a bank is still a critical problem faced by the Indian MSME sector. So the alternative sources of finance can step in and assist MSMEs in their growth and development. In recent years, the amount of alternative finance options have improved and have proven to be an important source of financing for Indian MSMEs. The alternative financing avenues discussed above truly have the potential to bridge the financing gap for MSMEs from banks. Access to finance is essential for improving MSMEs competitiveness, as MSMEs have to invest in new technologies, skills and innovation. On their part, the MSMEs should be responsible borrowers, should use the finance in a judicious manner and take advantage of the business opportunities both within and outside the country. They should improve

their governance and risk management practices, maintain proper books of accounts, submit correct information to banks and all authorities, and make their operations more efficient and productive to get easier access to finance from banks and other investors. This way the MSME sector would become more competitive and efficient and contribute further to the economic development of our country.

#### Equity Demand:-

**Figure 19: Viable and Addressable<sup>[55]</sup> Equity Demand in MSME Sector (in INR trillion)\***

\*Figure in brackets is in USD Billion

Source: MSME Census, SIDBI, Primary Research, IFC-Intellectcap Analysis

The picture shows the overall equity demanded by the MSMEs are 6.5 trillion rupees. In the total demand 71 per cent (4.6 trillion) contributed by the entrepreneur or the real one owner of the firm. The MSMEs are demanded the 1.23 trillion rupees excluded equity. The graph clearly shows that the Indian MSMEs are more depend on the Entrepreneur equity. The most of the MSMEs in India running with depending more on the individual owner's money and borrowed capital.

#### Small Size of Equity Investments in the MSME:-

Enterprise	Average Investment Size (in INR Million)
Micro	0.04-0.05 (800 – 1000)
Small	0.3 – 0.5 (6000 – 10,000)
Medium	7 – 10 (0.14 – 0.2 Million)

\* Figures in bracket in USD; Source: IFC – Intellectcap Analysis

Micro and Small Enterprises have less access to external equity initially because only low number of players supplying early-stage equity capital. If the equity were made available, the absorption would remain low because of:-

- Legal structure of enterprises that prevent infusion of external equity;
- Low level of willingness and ability of entrepreneurs to manage formal sources of equity capital
- Entrepreneur's concern regarding control and management.

However, the equity demand from small enterprises that have legal structures other than proprietorship and partnership is considered as viable and addressable in the near term.

Medium-scale enterprises have a more balanced debt-equity ratio (2:1). It is maintained because of the high ability of the entrepreneur to invest in capital. The debt-equity ratio maintaining through the high levels of contribution of the individual owner of the firm.

#### Equity Demand in Early-Stage and Growth-Stage Enterprises:-

\*Figure in brackets is in USD Billion

\*\*Includes equity demand by micro enterprises

Source: MSME Census, SIDBI, Primary Research, IFC-Intellect Analysis

Early-stage enterprises are defined as those that have an operational history of one-year or less. Their equity demand is very less compare to the Growth stage enterprises. The total equity demanded is 1.9 trillion, in that 1.32 trillion demanded by Growth-stage equity enterprises. The balance will demand by the Early-stage equity enterprises.

#### Benefits for MSME Using External Equity:-

##### Permanent Source of Finance:-

One of the permanent solution for finance needs of an MSME is equity financing. No company's main focus or objective can be financial management only. If one organization raise the funds from borrowings. But they should repay the debt amount over a period of time. But the equity finance never be repay because it do not have any maturity period. Equity finance provides that leverage to the management to continuously focus on fulfilling their core objectives. It keeps management away from the hassles of raising funds again and again like other sources of financing. So the MSMEs do not worry about the maturity period of the raised funds and repayment of them.

##### Retained Earnings:-

If company having the external equity finance in their capital structure through that they can develop an internal source of finance. The earnings which a company generates using the capital can be retained with the company to finance the increased working capital and other fund requirements. The company can effectively achieve its objective of shareholder's wealth maximization by the way of using this funds in projects with higher returns compared to what is available to the equity shareholders. Through the retained earnings the MSMEs can rise more funds with less expenses.

##### Dividend Payments:-

Equity finance for a new company is like the blessings of an angel. The main limitation of a new company is the uncertainty of cash flows. No fixed obligation to pay dividends will help to avoid the problems arising from the uncertainty of cash flows. A company can choose to pay no dividend or smaller dividends as per the earnings of the company. It help to the MSMEs to avoid the burden of monthly payment of higher interest rates for other raised funds.

**Less burden:-**

Using equity finance, there is no loan to repay. This offers relief in several ways. First, the business doesn't have to make a monthly loan payment. This can be particularly important if the business doesn't initially generate a profit. This also frees you to channel more money into growing the business.

**Challenges for MSMEs in Equity Infusion:-**

The legal structure will influence the ability of an enterprise to accept external equity funds. The investors can invest in the firms through that the enterprise will be extent their liability is limited to their respective shareholding in case of Limited companies and limited liability partnerships. In the case of proprietorship and partnership transfer unlimited liability to the equity investor, hence discouraging equity infusion in such enterprises.

Approximately 96 percent of MSMEs in India are proprietorships or partnerships. Because of that the MSMEs can't able to attract external equity. While change in the legal form of an enterprise to limited company or limited liability partnership is an option, it entails taxation and compliance overheads for the enterprises, often rendering the business model financially unviable. Most of the entrepreneurs do not have much awareness of alternative sources of finance. So the benefits of changing their legal structures are not always obvious. Limited presence of external equity, entrepreneurs use informal sources (usually debt) to meet the needs of their enterprise.

Most of the mature small enterprises and medium enterprises which are able to keep their financials transparent, and tend to attract more equity investors. Also, the legal structure of mature small enterprises and medium enterprises allows for inclusion of external equity. It is because the external equity investors expects transparency in both financial record-keeping and governance.

**Conclusion and Suggestions:-**

The growth of MSMEs sector in India is far reaching. The government special programs to develop this sector are stronger.

The central government of India has a separate minister to take over the MSME sector. Which makes the sector more powerful. Because they can make separate programs for the development of the MSMEs in India.

The real drawbacks of Indian MSMEs are insufficient funds. MSMEs can't able to raise as much funds to invest and develop. Indian MSMEs are raising funds by way of debt. For this also they not getting much assistance from banks. So the MSME owners are focus on other debt sources apart from the banks. The banks also do not have enough information about the MSME organizations to provide the loans. Because the MSMEs are mostly failed to keep their records correctly.

Another important sources of funds are single owner investment. According to the capability of the owner can contribute the funds to the organization from his wealth (equity). So, mostly Indian MSMEs are depending on single owner funds and Debt.

The use of external equity is one of the finest solution to the Indian MSMEs for the issues of raising funds. But it is the one of the less used way of fund raising by the MSMEs especially micro enterprises. Using external equity in the capital structure will help to the MSMEs to avoid some key issues faced by them. The issues are like fixed monthly payment of the interest amount, Repayment of the raised amount and problems of paying return to the investors if the firm get losses in initial stages. The organization need not to pay the dividend if they get loss.

The MSMEs get another fund raising option called retained earnings. They choose less or no dividend payment option. This will give another pool of funds to further more growth of the organization. The investors also happy because the value of their share will go up through the growth of the organization.

The Indian MSMEs are have great opportunities to raise the funds through the external equity. For that the main Indian exchanges BSE and NSE are opened the particular platform. So the Indian MSME owners also should take some initiatives to grab this opportunity.

##### Manuscript History

Received: 29 November 2016  
Final Accepted: 26 December 2016  
Published: January 2017

##### Key words:-

AVK, hemorrhage, complication.

#### Abstract

**Introduction:** occurrence of bleeding is the most feared complication of warfarin and prevention remains a key concern in monitoring. The purpose of this study is to identify the characteristics of patients with severe accidents AVK and its management.

**Material and Methods:** We conducted a prospective study of 100 patients conducted in the cardiology department chu Mohamed VI in Marrakech from Mai 2014 to Mai 2016.

**Résultat:** The average age of our patients is 55 sex ratio of 1, 27. Atrial fibrillation was the main indication identified. Gastrointestinal bleeding origin was the most frequent in 60% of cases. The majority of patients experienced at least one bleeding risk factor: age in 30% of cases, the biological overdose of INR 80% of cases, drug interactions in 10% of cases of hypertension in 40 % of cases, cerebrovascular diseases in 13% of cases and the antecedent of bleeding in 10%. 60% of our patients did not have a good biological monitoring based INR default means. The emergency conduct was based on the cessation of AVK, the administration saw K, transfusion of packed red cells and fresh frozen plasma. The average hospital stay is 2 days

**Conclusion:** The prognosis The AVK is one of the most effective treatments. However, their handling is difficult and the risk of bleeding complications is present. The new oral anticoagulants offer another alternative.

#### Introduction:-

L'intérêt clinique des antivitamines k (AVK) a été démontré dans de nombreuses situations pathologiques, leur prescription ne cesse d'augmenter. La survenue d'un saignement reste la complication la plus redoutée des AVK et la prévention demeure un souci essentiel dans le suivi.

Le but de cette étude est de préciser les caractéristiques des patients présentant des accidents graves aux AVK et sa prise en charge.

#### Matériels et méthodes:-

Nous avons réalisé une étude prospective portant sur 100 malades, réalisée au service de cardiologie chu Mohamed VI de Marrakech.

Du Mai 2014 au Mai 2016.

**Corresponding Author:- M. Ztati.**

Address:- Service de cardiologie CHU Mohammed VI Marrakech.

Pour chaque patient une fiche de recueil des données a été utilisée. Elle comprenait les données anthropométriques, les antécédents, l'indication et la dose de l'AVK, l'ancienneté de sa prescription et les traitements associés. Les paramètres biologiques recensés étaient principalement l'INR. Les résultats ont été analysés à l'aide du logiciel de biostatistique SPSS.

### Résultats:-

Sur 100 patients 44 hommes et 56 femmes soit un sexe ratio de 1,27 (femme/homme). La moyenne d'âge était de 55,6 ans, avec des âges extrêmes allant de 30 à 65 ans.

Leurs antécédents étaient variés:

**Tableau 1:-** Antécédents de nos patients

Antécédents	Pourcentage
Hypertension artérielle	46%
Insuffisance cardiaque	33%
Diabète	45,6%
Tabac	32%
Antécédents d'insuffisance rénale	4%

La fibrillation auriculaire était la principale indication recensée dans 56 %, Le remplacement valvulaire dans 26% des cas, l'embolie pulmonaire dans 10% des cas et l'AVC dans 8 % des cas.

**Figure 1:-** Les indications du traitement anticoagulant

70% des patients étaient poly médicamenteux au moment de l'accident. 20 % prenaient un ou deux médicaments et 10% n'en prenaient aucun.

Le saignement par le tractus gastro-intestinal était le plus fréquent 60% mais d'autres motifs d'admission figuraient : Les signes neurologiques 20 %, le Traumatismes dans 14% ; l'anémie profonde 4 % et l'hématome de la paroi 2 %.

**Figure 2:-** Les étiologies du saignement

Dans 80 %, l'accident correspondait à une manifestation hémorragique, l'hémorragie était extériorisée dans 80 % des cas et interne dans 20 % restant. La dose moyenne de L'AVK était de 1/2 comprimé par jour, avec des extrêmes de 1/4 cp et 1cp 1/2. La durée moyenne du traitement était de 18 mois avec des extrêmes allant de 15 jours à 10 ans.

La majorité des patients ont présenté au moins un facteur de risque de saignement : l'âge dans 40 % des cas, le surdosage biologique de l'INR dont 80 % des cas, les interactions médicamenteuses dans 10% des cas, l'HTA dans 20% des cas, les pathologies cérébro-vasculaires dans 13% des cas et l'antécédent de saignement dans 15%.

**Figure 3:-** facteur de risque de saignement chez nos patients

Évaluation du comportement du patient envers son traitement antivitamines K (AVK) :

Erreur par automédication chez 1 patient soit 1%, la non-respect d'un plan de prise fixe chez 30 de nos patients soit 20% des cas, Surveillance biologique insuffisante (moins d'une fois/mois) chez 44 de nos patients soit 24% des cas, Patients handicaps 8%.

60% de nos patients ne bénéficiaient pas d'une bonne surveillance biologique à base d'INR par défaut de moyen.

**Figure 4:-** comportement du patient envers son traitement

La conduite en urgence était basé sur l'arrêt des AVK, l'administration de vit K, la transfusion de culots globulaires et plasma frais congelé.

La durée d'hospitalisation moyenne est de 3 jours, avec des extrêmes de 2 à 10 jours.

50% des patients ont été transfusés par des culots globulaires, 40 % ont reçu des unités de plasma frais congelé et 80% ont reçu de la vitamine K.

**Tableau 2:-** Comparaison entre les cas qui ont présenté un accident hémorragiques et les patients du groupe témoin.

### Discussion:-

Les accidents hémorragiques sous AVK sont des événements fréquents qui surviennent chez une population fragile.

L'incidence annuelle de ces complications varie selon les séries publiées entre 0,25 et 0,8% pour les complications mortelles, et entre 1,1 et 4,9% pour les accidents graves mais on a pu définir quelques facteurs de risque prédictifs de saignement durant notre étude, à prendre en compte au cours du suivi des patients sous traitement par les AVK(1).

Les facteurs de risque que les différentes études ont révélé et qui ont contribué à augmenter le risque de survenue des complications hémorragiques des AVK ne prennent pas en considération les pratiques professionnelles et le comportement du patient envers son traitement. Une évaluation de ces pratiques a été envisagée dans notre étude. Celle-ci s'appuie sur la validation des contre-indications, des doses, des interactions médicamenteuses, le suivi du patient de la part du médecin, l'intervention du pharmacien en cas d'erreur au niveau de l'ordonnance, ainsi que le comportement du patient envers son traitement(2,3).

Le sexe du patient n'intervient pas dans la survenue des accidents des AVK. La nette prédominance féminine concorde avec d'autres études; alors que les statistiques européennes sont tout à fait contraire: prédominance masculine pour Costecalde et coll.(4) L'âge avancé est un facteur sensibilisant à l'action des AVK.

Le risque d'accident hémorragique est trois fois plus fréquent dans la population de plus de 70 ans (5,6°

La prescription des AVK doit tenir compte des contre-indications absolues et relatives qui tiennent au terrain et à l'état digestif hépatique est rénal. Berrutti, dans son étude portant sur 151 accidents hémorragiques dus aux anticoagulants a mis en évidence; Une HTA dans 27 cas; Un diabète et un éthyisme chronique dans 7 cas respectivement(7,8).

L'éducation constitue alors une étape majeure pour l'amélioration de l'observance et des connaissances des patients : un patient connaissant son traitement sera plus enclin à respecter la prescription (9). Cette stratégie demeure sans doute pertinente du fait qu'elle réduit la probabilité de survenue des hémorragies (10) et, par suite, réduit le coût d'hospitalisation pour événements iatrogènes médicamenteux

Un score HAS- BLED  $\geq 3$  indique que le patient a un risque élevé d'hémorragie (11). Blas.-Châtelain C, et al rapportent que le risque d'hémorragie grave est 3,9 fois plus élevé lorsque le score HAS-BLED est supérieur ou égal à 3 (11). Les données retrouvées dans notre étude corrélaient ainsi les données de ces articles : La moyenne de HAS BLED est de 3 chez le groupe des cas contre 2 chez les témoins, avec une p value très hautement significative (<0.001). La mauvaise observance du traitement varie selon les études de 10 à 26% (12). Et selon plusieurs auteurs, elle serait associée à une augmentation du risque hémorragique. Dans notre étude, elle représentait la principale cause des saignements, retrouvée chez 69% des cas. L'hémorragie d'origine gastro-intestinale constitue la complication la plus fréquente de notre série avec 60%, ce qui rejoint les données de la littérature avec des

pourcentages plus importants. C. Blas. Châtelain et ses collaborateurs rapportent 50% de complications hémorragiques digestives (11). Dans une autre étude, hémorragiques digestives représentaient 60% de l'ensemble des complications hémorragiques (13).

### Conclusion:-

Les AVK sont utilisés depuis plus d'un demi-siècle dans la prévention des accidents thromboemboliques et sont l'une des thérapeutiques les plus efficaces. Cependant leur maniement est délicat et les risques de complications hémorragiques sont très présents. Les nouveaux anticoagulants oraux offrent une autre alternative.

##### Key words:-

uterine inversion, AMTSL, Shock,  
hysterectomy.

#### Abstract

Complete inversion of uterus after delivery of the baby is always the consequence of strong traction on umbilical cord attached to the placenta implanted in the fundus. With AMTSL the incidence is decreasing. In this article we discuss about a 21 yrs primi who was referred as uterine inversion to our tertiary care centre in a state of shock. The prompt resuscitative measures with hysterectomy done at appropriate time saved the patient's life.

Copy Right, IJAR, 2016,. All rights reserved.

#### Case Report:-

A 21 yrs primipara delivered an alive term female baby of birth wt - 2.9kg by labour natural on 15.09.11 at 9.00pm at PHC. Referred from peripheral hospital as inversion of uterus at 9.50pm. Patient was received on 16.09.11 at 1.30am – 4 1/2hrs after delivery. Patient was in a state of shock. On examination patient was unconscious with peripheral pulses absent, BP not recordable, carotid felt, heart sounds muffled. P/A – Uterus was not palpable per abdomen. L/E – entire uterus with placenta lying outside the introitus, bluish black in color. Simultaneous resuscitation with Nasal O<sub>2</sub>, IV crystalloids, O+ve blood transfusion, Dopamine drip and Endotracheal intubation done in labour ward. Under GA in OT repositioning of uterus done after removing placenta. Endometrium blackish color. 20 units synto drip, iv methergine, im prostadin given. Uterus was atonic. Decision for Laparotomy was taken. Uterus was flabby intraoperatively. Conservative surgical management failed. Proceeded with hysterectomy. 3 units of whole blood and 2 units FFP transfused. Patient shifted to IRCU for ventilatory support. Post operatively one unit FFP given. Treated with Inj. Piperacillin + Tazobactam 4.5g iv tds. Suture removal done on 8<sup>th</sup> POD. Wound healthy. Discharged on 28/9/11. Investigations revealed normal LFTs, Blood sugar, urea and creatinine.

### Discussion:-

#### Govt. Rajaji Hospital, Madurai Statistics:-

YEAR	2001	2002	2003	2004	2005	2006	2007	2008	2009
INCIDENCE	5	1	4	6	5	2	3	1	4

Totally 32 cases reported – all were referral cases. There was an average of 12000 deliveries per year in this period of observation. Incidence of MMR depend on the time interval between delivery/inversion and resuscitation with repositioning. Between 2009-2010 - 3 cases of death occurred. 2 cases died due to neurogenic shock, 1 case cause of death was uremic encephalopathy. Patient died after 40 days. This case of acute inversion of uterus is presented as unique in the sense that after 4 hrs of delivery and inversion, patient survived.

**Contributing factors for uterine inversion** are uterine atony ,improperly applied pressure over fundus, traction of umbilical cord, placenta accreta , parenteral  $MgSO_4$  in women with PIH. Uterine inversion is most often associated with shock disproportionate to the blood loss. It is fatal without prompt treatment and delay in treatment increases mortality. The degrees of inversion are 1° – Dimpling of the fundus, 2° – Fundus passes through internal os, 3° – Uterus at introitus. Simultaneous resuscitation with two intravenous infusion system, iv fluids and cross matched blood and if placenta is attached, it can be removed and then repositioning of the uterus done. Portion of the cervical canal that is the last to come down is to be replaced first and the fundal portion the last. Simultaneous oxytocics to contract the uterus should be given. Conservative methods used are Huntington, Kellog and Haultain method. When conservative management fails hysterectomy is done as life saving procedure as in this case.

### Conclusion:-

AMTSL is preventive against acute inversion of the uterus. Training to VHN, Maternity assistants and Staff nurses should be given about proper care in the conduct of 3<sup>rd</sup> stage of labour and to avoid injudicious traction on the cord, applying pressure over fundus, forcible expression of non-separated placenta. Thus uterine inversion is an obstetric complication that, due to its gravity, requires a rapid diagnosis and immediate clinical action. Its low incidence leads to scarce experience in solving this kind of situation. Regardless of the treatment, vaginal or surgical approach, the best prognosis occurs in situations when the diagnosis and maneuvers for uterine reversal are made early.

#### Abstract

MSME is the most developed sector in India. It contributes the growth in GDP. This article is mainly concerned with micro, small and medium enterprises (MSMEs) and its market linkage based on their profitability. MSME plays a crucial role to India to generating employment and contributing to regional economic growth. It gives opportunity to rural people those who have minimum capital to invest in small business and make earnings on the daily or weekly basis. To start MSME, the people should utilize all the optimum resources available in their place. This paper presents the consequences the MSME faced by to get linkage with top companies. The level of profitability should lead linkage with other companies. This article gives brief idea about the MSME and importance of their market linkage.

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

In India MSME plays a vital role in the economic development of the nation by contributing 11.5% of GDP consistently every year. It is a stimulus for the socio economic transformation of the society not only by generating employment opportunities in both rural and urban areas of the country but also by promoting rapid industrialization in the country to the length and breadth of the country eliminating regional imbalances. The sector identification and the requirements of the area and utilization of the available resources locally to reduce the cost of production is the most important factor of this sector. It helps a lot to prevent poverty and rural migration to towns in search of employment.

The Sector consisting of 36 million units, as of today, provides employment to over 80 million persons. The Sector through more than 6,000 products contributes about 8% to GDP besides 45% to the total manufacturing output and 40% to the exports from the country. The MSME sector has the potential to spread industrial growth across the country and can be a major partner in the process of inclusive growth.

#### Objectives:-

1. To understand the impact of poor profitability of poor market linkage
2. To overall study of the relevance of MSME in Indian economy
3. To general study about MSME and helps to contribute our GDP
4. To review the challenges to be faced by MSMEs in India

**Understanding msme:-****Understanding MSME:**

'The MSME Act 2006' modifies the definition of MSME in India. Under the said Act, the sector is broadly classified into two parts, manufacturing and service. The unit is identified based on investment made as shown in the following table.

	<b>MANUFACTURING UNIT</b>	<b>SERVICE UNIT</b>
A micro enterprise	Investment in plant and machinery does not exceed Rs.25 lakhs	Investment in equipment's does not exceed Rs.10 lakhs
A small enterprise	Investment in plant and machinery is more than Rs.25 lakhs but does not exceed Rs.5 crores	Investment in equipment is more than Rs.10 lakhs but does not exceed Rs.2 crores
A medium enterprise	Investment in plant and machinery is more than Rs.5crores but does not exceed Rs.10 crores	Investment in equipment is more than Rs.2 crores but does not exceed Rs.5 crores

**Micro Small Medium Enterprise Development (MSMED) act definition of MSME:-**

<b>Initial Investment in Plant and Machinery (in INR Million)*</b>			
<b>Category/ Enterprise Size</b>	<b>Micro</b>	<b>Small</b>	<b>Medium</b>
<b>Manufacturing</b>	<2.5 (<50,000)	2.5 – 50 (50,000 – 1 Million)	50– 100 (1 Million – 2 Million)
<b>Services</b>	<1 (<20,000)	1 – 20 (20,000 – 0.4 Million)	20– 50 (0.4 Million – 1 Million)

*\*Figures in brackets are in USD: Source: MSMED Act*

As per the private financial institutions in India, the internal definition of MSME can be explained with the help of the following table.

**Internal Definitions used by Private Financial Institutions (Indicative):-**

<b>INTERNAL DEFINITIONS USED BY BANKS FOR MSME</b>						
<b>ENTERPRISE SIZE</b>	<b>MICRO</b>		<b>SMALL</b>		<b>MEDIUM</b>	
<b>Institution Type</b>	<b>Turnover(INR Million)</b>	<b>Credit Size (INR Million)</b>	<b>Turnover(INR Million)</b>	<b>Credit Size (INR Million)</b>	<b>Turnover (INR Million)</b>	<b>Credit Size(INR Million)</b>
<b>Private Commercial Banks</b>	1.5-50 (30000-1 million)	0.2-1 (4000-20000)	50-200 (1 million-4 million)	5-150 (0.1 million - 3 million)	200-2000(4million-40 million)	50-200(1 million -4 million)
<b>Non-banking financial companies</b>	0.05-1 (1000-20000)	1-5 (20000-0.1 million)	5-25 (0.1 million- 0.5 million)	0.3-5 (6000-0.1 million)	10-1000 (0.2million-20 million)	2.5-50 (50000-1 million)

**Source:** Primary Research

However, all should use the official definition given by the MSMED Act for reporting purposes.

**Online Indian MSME's finance providers:-**

In India, only less number of players are there who provide money to MSME through online. The online startup have shown interest towards starting new business. The finance service providers collectively have disbursed loans worth INR ~ million in 2015. Some companies launched their operations in 2015. The online market for MSME finance in India has seen presence of players such as Faircent, Indifi technologies, Leading kart, ME Corner, Capital Float, Mandii.com and others.

**MSME's in India: challenges and opportunities:-**

The MSME is a highly unorganized sector even though it highly contribute in multiple ways towards the economy. Being a highly unorganized sector with fragmented nature of reach, the sector has always been a laggard in enjoying the full flow of Government policies and financing company's empathy and understanding. In order to understand the obstacles ; probable steps to be taken to exploit the opportunities offered by MSMEs, lets discuss the details of the working dynamics of MSMEs as under:

**Shortage of finance and credit instruments:-**

Finance is the major constraints of all the business especially it is very high in MSME. Most Indian MSMEs start out with minimal capital, which eventually stalls their growth after a certain point. The lack of easy credit tends to stagnate the growth of MSMEs, which in turn affecting generic growth in terms of GDP, import, export and employment. Unavailability of credit at the right time can also affect business growth at many seals leading to many small businesses shutting shop due to inadequate margins. Some major problems that approximately 80% MSME Entrepreneurs face on a day-to-day basis while trying to obtain credit assistance for their business operations are:

1. Need more collateral security to get loan
2. Import Export cost
3. To obtain of Private Equity Funding is difficult
4. Banks offer high rates for term loans
5. Private equity (PE) dilutes control in the company
6. Un-standardized project appraisal system for term loans

**Complicated Regulatory Policies for Starting a Business:-**

India is ranked at 130th position out of 189 countries who participated in the World Bank's Ease of Doing Business Ranking primarily due to unfavorable business climate for its enterprises, especially the MSMEs. India is full of regulatory policies like taxation, dealing with construction permits, registering property, enforcing contract, resolving insolvency, etc. Indian MSMEs are weighed down by inflexible and complicated regulatory policies like Owing to this prohibitive business climate, this leads to many innovative entrepreneurs and are not able to enter the markets or sustain a business. The following points show a breakdown of how inflexible regulatory policies affect the functioning of MSMEs :

1. Absence of a common regulatory body
2. Procedures of setting up business is complicated
3. Less special schemes for start-ups
4. Book keeping regulations is difficult

**Unavailability of modern, affordable technology:-**

In a present competitive business environment, the need to align people processes and technology is stronger than ever. Latest technology can help enterprises reduce cost and time taken to innovate and offer sophisticated products and services. To adopting new technology, helps to MSMEs differentiate from peers, optimize cost structures and most importantly compete on a global level. However, MSMEs in India face struggles because of accessing and using the latest technological advancements. While knowledge, access and funds continue to implementation of technology, absence of an ecosystem that enables technology transfer and interaction with experts is a critical reason of limited adoption. The absence of a common platform for interaction with technology providers continues to be the most critical challenge faced by MSMEs in this area. The below mentioned are the key reasons why MSMEs fail to adopt latest technology to innovate and transform their businesses.

1. MSME have less number of linkage so there is less interaction between tech providers and seekers
2. Ecosystem for technology transfer is absence
3. To Access modern technology is expensive

4. MSME have only minimum knowledge about upcoming technologies
5. Unavailability of e-Governance systems
6. Lack of effective information systems
7. Limited funds to support Innovation and R&D

**Lack of basic infrastructure facilities:-**

Adequate and modern infrastructure powers is the emerging growth of a nation's economy. The absence of proper infrastructure can cause serious problems to an enterprise's daily business operations of manufacturing, consumption, and distribution of goods and services. It affects businesses at every level and ends up being a warning to healthy growth. The following reasons are the major consequences of the infrastructure facilities.

1. Lack of electricity resources
2. Inadequate supply of water
3. Lack of facilities like customized warehouse
4. Insufficient methods of industrial waste management
5. Inadequate cluster infra reducing competitiveness
6. Lack of reliable electricity resources
7. No minimum price for power fixed for MSME
8. Volatility in prices of basic fuels

**Absence of exclusive marketing platforms and distribution networks:-**

The nature of marketing changes the habits of customer. With consumer, habits changing rapidly it leads to competition from both local and global brands, market dynamics and customer loyalties are in a state of flux. While offering best-in-class products and services, enterprises also need to enhance the quality of customer interaction at each opportunity. Enhancing customer engagement is not a matter of choice anymore and to succeed, Market intelligence, tools and well-trained workforces are required to respond these external pressures. The below mentioned are the key reasons why domestic MSMEs in India are unable to approach marketing and distribution effectively.

1. Lack of monetary support/schemes
2. Knowledge about digital marketing is less
3. Limited expertise in new-age marketing
4. Less aware of technology for marketing
5. Not enough trade fairs and buyer-seller meets
6. Due to lack of networks losing to large competitors

**Inflexible labour laws and availability of affordable skilled labour:-**

Indian MSMEs employ 40% of the country's workforce, making them the employment powerhouse of the country. However, India today faces the big challenge of outdated labour laws that are still in use. Bigger organizations like Maruti too have faced labour problems in the recent past. This leaves many MSMEs struggling with problems of culture and scale and not being able to meet their workforce demands. A labour law reform overhaul is required to regulate large influx of workforce, which will enter the working landscape. The following points highlight some of the key issues that enterprises face related to workforce:

1. Retaining talent due lack of ability to pay
2. Low productivity of labours
3. Common minimum wage policies
4. Lack of skilled workers

Nonetheless, the sentiments towards Micro, Small & Medium Enterprises is growing positive, putting them back in the spotlight. There is an expectation that their growth would be much faster over the next few years. However, the companies, which would emerge winners, would need to find a way around to leverage their strengths and remain ahead of intense competition. The use of technology to progress a competitive advantage would be key defining point to look out for having access to the right talent, adequate sources of funding will develop a 'value proposition', which embeds itself into the journeys of improving customers experience and benefit for the country as a whole. This has to be supported by a defined framework and deft handling of the challenges of MSMEs in India.

**Different types of ownership and Growth impacted by multiple constraints:-**

There are more than five types of ownerships in MSMEs in India. Among them proprietorship of business is common (94.5%) whereas the rest all-together only 5.5%.

**Ownership Structure of Enterprises in the MSME Sector:-**

Ownership Structure in the Sector	
Type of Structure	Share of MSME Enterprises
Proprietorship	94.5%
Partnership, Cooperatives	1.2%
Private Limited, Public Limited	0.8%
Others	3.5%

Source: MSME Census

Although the MSME sector has been growing at a faster rate than the overall industrial sector, MSMEs experience multiple constraints that threaten to further development of MSME. Some of key hindrances that MSMEs face

Source: Report of working group on rehabilitation of MSMEs RBI

**Lack of infrastructure:-**

Inadequacy of infrastructure such as power, water and roads upsurges operating costs for MSMEs and marks their businesses uncompetitive. Insufficient access to backing of infrastructure dejects these units from implementing newer technologies, where available.

**Inadequate finance:-**

MSMEs ponder encounters in accessing finance as one of the biggest constrictions in growth. Various researches on the MSME sector also proposes that the multiple growth constraints can be mostly related to insufficient access to finance.

**Lack of managerial competence:-**

Micro and small enterprises in particular largely comprise first-generation entrepreneurs, who have had a limited structured training on resource planning, capital management and labour management.

**Outdated technology:-**

While large industries like automotive, forging, software development sector want cutting-edge expertise in operations, the majority of the small and medium enterprises are lacking the same. A low technology base outcome in low productivity, which makes these initiatives not reasonable in nature.

**Inadequate market linkages:-**

Other than cluster-linked and ancillary MSMEs that have natural linkages with large enterprises, MSMEs are having poor market access. The poor market linkage leads to poor profitability of MSME and hence, are unable to shape themselves to compete with the market in order to reduce purchase cost from large enterprises or reorganize the retail chain.

**Msme profitability:-****Performance of MSME, Employment and Investments:-**

As per the results of Fourth All India Census of MSME, the sector contributes significantly to the number of enterprises, employment and output of the country. Based on the data sets of Fourth All India Census of MSME, augmented with data sets of EC, 2005 and growth rate observed during Fourth (1998) and Fifth (2005) Economic Census, the performance of MSME.

S.No	Year	Total Working Enterprises(in lakh)	Employment (in Lakh)	Market Value of Fixed Assets(Rs.in Crore)
I	II	II	III	IV
1	2006-07	361.76	805.23	868,543.79
2	2007-08	377.36	842.00	920,459.84
3	2008-09	393.70	880.84	977,114.72
4	2009-10	410.80	921.79	1,038,546.08
5	2010-11	428.73	965.15	1,105,934.09
6	2011-12	447.64	1,011.69	1,182,757.64
7	2012-13	447.54	1,061.40	1,268,763.67
8	2013-14	488.46	1,114.29	1,363,700.54

**Number of enterprise in msme Sector:-**

Projected data for the years 2007-08 to 2013-14

**Employment in MSME Sector:-**

Projected data for the years 2007-08 to 2013-14.

**Fixed investment in MSME Sector:-**

Projected data for the years 2007-08 to 2013-14.

**Interpretation:-**

As per the above given data it has been shown a gradual increase in context of performance of MSME, employment and investments from the dated year 2006-2014. In the year, 2006 the total working enterprises was Rs.361.76 and in 2014 was Rs. 488.46 so the difference seen was Rs.126.7. In Employment in the year 2006, it was Rs.805.23 and in 2014, it was Rs. 1,114.29 so the difference seen was Rs. 309.06. In Market Value of Fixed Assets in the year 2006, it was Rs. 868,543.79 and in 2014, it was Rs. 1,363,700.54 so the difference seen was Rs. 4,95,156.75.

**Contribution of manufacturing output of msme in GDP:-**

Year	Gross Value of Output of MSME Manufacturing Sector (in crore)	Share of MSME sector in total GDP (%)		Share of MSME Manufacturing output in total Manufacturing Output (%)	
		Manufacturing Sector MSME	Services Sector MSME	Total	
2006-07	1198818	7.73	27.40	35.13	42.02
2007-08	1322777	7.81	27.60	35.41	41.98
2008-09	1375589	7.52	28.60	36.12	40.79
2009-10	1488352	7.45	28.60	36.05	39.63
2010-11	1653622	7.39	29.30	36.69	38.50
2011-12	1788584	7.27	30.70	37.97	37.47
2012-13	1809976	7.04	30.50	37.54	37.33

**Interpretation:-**

The above given data shows the Contribution of Manufacturing output of msme in GDP from the dated year 2006-2013. In the year 2006 Gross value of output of msme manufacturing sector was Rs. 1198818 in 2013 Rs. 1809976 so the difference seen as Rs. 6,11,158. In Share of MSME sector in total GDP (%) in the year 2006 Manufacturing Sector MSME shows 7.73% but in the year 2013 it has reduced to 7.04% and Services Sector MSME in the year 2006, 27.40% and in the year 2013 30.50%. It shows a gradual increase in every year. So comparing both Manufacturing and Service Sector it was 35.13% in 2006 and in 2013 37.54% has been increased. Share of MSME Manufacturing output in total Manufacturing Output (percentage) was noticeable declining in the year 2013 compared to the year 2006

**Market linkage:-**

Market Linkage is a word give the real success essence to the MSME. It helps to connect the medium level business to top level where the medium enterprise can get various linkage. The objective of the market linkage is an attempt to combine the strengths of value chain analysis with the promotion of sustainable, market-based solutions that respond to the recurrent needs of micro, small, and medium scale enterprise (MSME). Market linkage is essential in understanding market potential, inter-firm relationships, and critical constraints that limit MSME growth and industry competitiveness, while market based, commercially viable solutions can result in solutions that are sustainable in the end and that do not distort local markets.

**Market linkage requires effective value chain to sustain:-**

**Step 1:** Value Chain Selection– Choose a value chain with the greatest potential for growth in MSME income and employment.

**Step 2:** Value chain Analysis – Gain a greater understanding of the operating context for MSMEs and intelligence on the market players, their roles, and interrelationships.

**Step 3:** Identification of obstacles and opportunities – Appropriately identify key issues hindering growth and competitiveness in the value chain.

**Step 4:** Identification of (Potential) Market linkage – Determine which sources can best address the obstacles identified in Step 3.

**Step 5:** Selection of suitable Market linkage Solutions – Target specific market-based solution(s) for more in-depth analysis.

**Step 6:** Assessment of Targeted Market-Based Solutions – Recognise limitations to the viable supply/demand of the battered solution.

**Step 7:** Identification of Enabling Activities – Appropriately identify various activities helps to address the constraints of the target market based solution.

**Step 8:** Selection of Easing Activities – Choose the most suitable facilitation activities to implement.

**Msme Financing & Strengthening Msme linkages:-**

1. India MSME units is 25% are presented in East and North - Eastern region. It was contributing GDP of 13% for our country. All are micro enterprises. The recent statistics say 4259 MSME clusters, 1086 industrial cluster and 2682 handicraft clusters in the Eastern and North Eastern region of India.
2. To develop MSME, the Indian government to conduct various programs like, Credit Guarantee Scheme, yet new MSME application registration has remained very low in the Eastern and North Eastern region compared to the Southern and Western side of the country. The rating coverage has not spread across this region properly.
3. Except west Bengal the regional imbalance, inadequate infrastructure, low income statistics dependence on agriculture are counted to be the major hindrance for the growth of MSME units in the region
4. The MSMEs faced problems like, non-availability of timely and adequate credit at reasonable interest rate is one of the barriers for growth of MSMEs, so the first generation entrepreneurs are not access to credit at reasonable interest rate. The high risk perception of the banks in lending to MSMEs and it is difficult for the micro and small entrepreneurs to set up new business or expand the existing one.
5. Tax submission of Micro and small enterprises has been very poor in India. Because of the high tax rates and complex filing procedures to lead crucial factor to MSME.
6. The Reduction of tax rate on the MSMEs to provide enough fund for expansion and better survival of MSMEs in viable market. The entrepreneurs need to engage to increase in tax exemptions and tax holidays. Therefore, those initiatives will also eventually attract investors who are potential taxpayers in future.

7. The upcoming entrepreneurs need more update in the modern technology in packaging to increase the product competitiveness not only in domestic market, but also in international market. The technology up gradation leads to good linkage in domestic as well as international market.
8. The MSME earning level is very low so they do not reveal their financial pattern. Therefore, it leads to limited transparency between bank and the entrepreneurs to establish direct linkage between banks the MSME entrepreneurs.
9. Technology and IT services play a vibrant role for the growth of MSMEs. Most of the investments are currently done in traditional technology, but they should follow the new trends to expand the technology. Investment should rise in R&D, particularly in areas of emerging technologies including mobility, data analytics and cloud computing to improve the core business.
10. Creation of social entrepreneurs is preferred to encourage e-commerce among rural consumers. There lies a possible market for e-commerce in rural areas, which can be explored by undertaking certain policy initiatives and using modern technological tools.
11. The high constraints of MSME units in the form of land acquisition, availability of power, transport, logistics, credit disbursal, skilled labor, adequate marketing initiatives and issues in taxation. The essential issues should be addressed by the government for the growth of MSMEs
12. Absence of innovative initiatives and interest among people are counted as the major reasons for this region to lag behind. They have to support awareness among youth about entrepreneurship and they need to be encouraged.

### Conclusion:-

Micro, Small and Medium Enterprises (MSMEs) contribute to economic development in various ways such as creating employment opportunities for rural and urban population, providing goods & services at affordable costs by offering innovative solutions and sustainable development to the economy as a whole. The MSMEs continue to struggle on proper market linkage. In present scenario government frame many policies that will give benefit to the MSME to earn minimum profit and the policies. However, it is not enough to getting linkage with blue chip companies. The companies initiate to give some orientation to MSME's and lead to successful linkage. While credit and finance issues challenge some, others are struggling to cope with stringent regulatory environments. The role and importance of MSME sector in the vital growth. The problems MSMEs face which also become the reason for slow-paced growth of this sector and these have been detailed in the paper. In a close, this paper has tried to offer some suggestions to overcome those challenges and offer a ray of hope for the MSME sector in India.

The need for enterprise to increase market coverage, improve operational efficiencies and enhance customer engagement is imperative. However, this requires readiness on two accounts-the company and government regulation and policies, including MSME special programs, initiatives and funds.

Diabetes, obstructive sleep apnea.

#### Abstract

**Introduction:** Many studies provided a positive relationship between Obstructive sleep apnea and diabetes mellitus type2. It has been revealed that almost one third of middle aged Saudi papulation are at risk for OSA. The aim of this study is to compare the risk of OSA between diabetic patients and non-diabetic middle aged Saudi population.

**Materials and Methods:** This was a cross-sectional questionnaire-based study conducted in King Fahad hospital diabetes center in AL-Ahsaa, Saudi Arabia. Saudi patients aged 18 years and above with diabetes type 2 who visited the outpatient clinics in July and august 2015 where engaged in the study. Medical records were reviewed for demographic characteristics, weight, height, body mass index (BMI), blood pressure, glycated hemoglobin, and chronic medical conditions. Berlin questionnaire was used to assess the risk of OSA.

**Results:** Based on berlin questionnaire, 45 out of 147 of sample (30.6%) are at high risk for OSA. 43.4% who have hypertension in high risk of OSA. Also, 33% of patients with BMI above or equal 25 are in high risk for OSA. There is no significant relation between age, gender and HA1C. Contrariwise, there is significant relation between presence of HTN and BMI above or equal 25 with increased risk for OSA.

**Conclusion:** Hypertension, overweight and obesity contribute in high risk of OSA in diabetic patients. There is no difference between diabetic patients and middle aged Saudi population regarding the risk of OSA.

#### Introduction:-

Obstructive sleep apnea (OSA) is defined as intermittent cessation of breathing during sleep due to episodic collapse pharyngeal air way. The severity of OSA is usually determined using apnea-hypopnea index (AHI) which measures the number of apneic and hypopneic events per hour of sleep. The prevalence of this disorder among middle-aged American population is 24% for men and 9% for women. Unfortunately, the available data about OSA prevalence in Saudi Arabia is not sufficient but it has been revealed that the prevalence of OSA risk and symptoms among middle aged Saudi men and women is 30% and 40% respectively. [1,2]

Obesity, male gender, aging, metabolic disorders such as hypothyroidism and structural abnormalities of the upper airway including (nasal polyps, enlarged tonsils, adenoids and others) are predisposing factors for OSA. Obesity is

**Corresponding Author:- Lamyaa A Alghafli.**

**Address:-** King Faisal University, King Faisal University, King Faisal University.

present in 70% of OSA patients which indicate that it's one of the most important risk factors. Age of 65 and older has 2-3 folds higher prevalence of OSA than middle age population. [1,3]

Obstructive sleep apnea has a negative impact on the quality of life and is also associated with cardiovascular disease, stroke, hypertension, motor vehicle accidents and the development of diabetes. [1,4]

Many studies provide a positive relationship between Obstructive sleep apnea and diabetes mellitus type2. 70% to 90% of patients with diabetes show apnea-hypopnea indices (AHIs) > 5/h, which is a higher prevalence of OSA than general population. Untreated OSA complicates glycemic control and encourages diabetes, which, consecutively, alters respiratory control. [5]

The under-recognition of OSA leads to 10 years delay between symptoms onset and referral to sleep centers in Saudi Arabia that was suggested by many studies caught our attention to this problem and the urgent need to do more researches in this field.[2]

The aim of this study is to compare the risk of OSA between diabetic patients and non-diabetic middle aged Saudi population.

### **Patients And Methods:-**

This was a cross-sectional questionnaire-based study conducted in King Fahad hospital diabetes center in AL-Ahsaa, Saudi Arabia. The consent was obtained from King Fahad Hospital Health Affairs prior conducting the study. The approval of each participant was taken.

Data was collected from Saudi patients who have visited the outpatient clinics during July and august 2015. They were screened for OSA by using an Arabic version of Berlin questionnaire. This questionnaire is a valid tool which is used to screen for OSA. It is classified into three categories. Category 1 includes five questions on apnea and snoring. The second category consists of three questions on wake time somnolence and drowsiness behind the steering wheel. The third category contains diagnosis of high blood pressure and body mass index (BMI). The questionnaire consider the first and second category positive if two or more questions were positive three times/week or more, whereas the third category 3 is positive if contributor have been diagnosed as hypertensive or his BMI was greater than 30 kg/ m<sup>2</sup>. Contributors that fulfilled the criteria in two or more categories were considered as high risk for OSA and others considered low risk for OSA.

Medical records were reviewed for demographic characteristics, weight, height, body mass index (BMI), blood pressure, glycated hemoglobin, and chronic medical conditions. Regarding polysomnography test results, medical records didn't contain enough information.

The patients who were included in the study are adult patients ( $\geq 18$  years old) with established diagnosis of type 2 diabetes and visited the diabetes center during the study period.

The analysis was done using SPSS software, version 20. Proportions and frequencies were used to present qualitative data whereas quantitative data were presented in mean, median, mode and standard deviation. Chi-squared test was used to assess the relation between OSA and the subsequent categories: age, gender, body mass index, duration of diabetes mellitus, medications and presence of hypertension and its duration.

### **Results:-**

Berlin questionnaires were distributed among 160 patients who visited diabetes center at King Fahad hospital, all of the included contributors are Saudi patients who are eighteen years and older, with confirmed diagnosis of type 2 diabetes mellitus. Thirteen questionnaires were excluded due to incomplete data.

Out of 160 questionnaires, 147 were analyzed. The mean age of participants is  $53 \pm 10.79$ . Seventy nine of the contributors are men (53.1%) and sixty eight are women (45.6%) (Table 1). Berlin questionnaire shows that forty five have high risk of OSA (30.6%) and one hundred and two have low risk (69.4%).

There is no significant relation between risk of OSA and age groups (P value = .463) (Table 2). Moreover, no significant relation between risk of OSA and gender (P value= .770).

**Table 1:-** number of men and women and relation to berlin questionnaire.

Berlin			Total	
positive		negative		
gender	Male	25	54	79
	Female	20	48	68
Total		45	102	147

### Discussion:-

The research revealed that forty five (30.6%) of patients with type two diabetes are at high risk of OSA. In addition, having a body mass index of overweight or obese classes has a significant role in increasing this risk. There is no difference between age groups, males and females regarding the prevalence of OSA, Also having hemoglobin A1C result below seven which is the recommended value for DM type 2 patients according to World Health Organization (WHO) doesn't have a role in increasing the risk.

The gold standard method to diagnose OSA is overnight polysomnography. In this research, berlin questionnaire was used and it's a valid screening tool for OSA that has been used in many previous studies.

The research demonstrated that the prevalence of obstructive sleep apnea among diabetic patient is (30.6%). In other researches a close percentage was shown (48.6%, 27%) respectively [6,7].

In general, questionnaire often has lower sensitivity in assessment compared to sleep study analysis. So, the actual prevalence of sleep disorders and apnea may be higher than reported in this study. [8]

A lot of studies showed that presence of obesity (BMI  $\geq 30$ ) or prior diagnosis of hypertension increase the risk of OSA, and this study shows similar outcome [9,10,11,12].

A study revealed that a 96.8% of patients with high risk for OSA had a positive third category of berlin questionnaire (BMI greater than 30 and/or presence of hypertension). Other study shows that patients with comorbid obesity (BMI  $> 40$ ) were 12 times probabilities of having OSA compared with normal weight patients (18.5-24.9) [14, 19].

This study reports that 43.4% of hypertensive patients have high risk for OSA which indicate that it's a significant risk factor ,many previous studies had shown hypertension as a risk factor for OSA. [15,16,17]

Untreated OSA can contribute to the development or progression of other disorders. OSA has now been shown to be a cause for systemic hypertension, and there is some evidence suggesting that it can also cause pulmonary hypertension [20, 21, 22].

Other studies presented that male gender is a strong predictor for OSA, one of them revealed that men twice at higher risk than women for OSA. Meanwhile in this study there was no difference between males and females patients [13,18,19].

As mentioned above obesity is a significant risk factor for OSA, female patients had higher prevalence of obesity (67.65%) than male patients (51.9%). This might has a role in the lack of gender difference in risk shown in this study. This high proportion of obesity in female and the absence of gender difference was also seen in other study [14].

### Conclusion:-

Overweight, Obesity , hypertension play an important role in increasing the risk of OSA in diabetic patients , the risk of OSA among diabetic patients with the mean age of 53+- 10.79 is 30.6%. Comparing this result with the risk among middle aged Saudi men and women which is 30%, 40% respectively, this will indicate that there is no difference between diabetic patients and middle aged Saudi population regarding the risk of OSA.[1,2]

#### Abstract

India is the second major producer of fruits and vegetables in the world. According to India Agricultural Research Data Book 2004, the total waste generated from fruits and vegetables comes to 50 million tons per annum. Peel waste is a serious problem to the processing industries and pollution monitoring agencies. Waste utilization in fruits and vegetable processing industries is the one of the important and challengeable job around the world. The effect of resources depletion and environmental concerns have triggered new regulations and growing awareness throughout the world, thus promoting the use of more and more fruit and vegetable waste to obtain by-products with health benefits. Thus, in the present study an attempt was made to bring the utilization of two vegetable peel waste by investigating the presence of various phytochemicals in the different extracts of *Lagenaria siceraria* (Molina) standl. and *Luffa cylindrica* (L.) M. Roem. peels. Ten different extracts of the selected vegetable peels were made using water and organic solvents. Various phytoconstituents were found to be present in different extracts of *Lagenaria siceraria* (Molina) standl. and *Luffa cylindrica* (L.) M. Roem. peels.

#### Introduction:-

Plants are the essential and integral part in medicine because of their ability to form secondary metabolites like proteins, flavonoids, alkaloids, steroids and phenolic substances that are in turn used to restore health and heal many diseases [1]. Food of plant origin is capable of contributing appreciable quantities of nutrients, including proteins needed by both children and adults [2].

In various plants, fruits and vegetables form the rich source of bioactive molecules and are considered to be rich in antioxidants due to presence of compounds like polyphenols and vitamins, which play an important role in scavenging of free radicals [3].

Waste are generated in many forms and at various stages, ranging from domestic to industrial processing and its improper disposal has detrimental effects on the environment as well as human life. It has been observed that of the

**Corresponding Author:- Shivani C. Kakkar.**

Address:- Shivani C. Kakkar, Department of Biotechnology, Birla College, Kalyan.

enormous supply of food for human consumption, about one-third gets wasted globally. India, with rich agricultural resources, accounts for 50 MT of vegetable waste which is about 30 % of its total production [4].

Waste generated from food industries is a source of an untapped energy which is mostly dumped inland fills whereby it releases greenhouse gases into an atmosphere. It is very difficult to treat and recycle food waste due to its composition. These wastes lead to increasing waste disposal problem and can pose severe pollution problems and represent a loss of valuable biomass and nutrients [5]. Thus, there is an increased attention in bringing useful products from waste material. Suitable methods have to be adopted to utilize them for the conversion into value-added products [6].

Thus, in the present study an attempt was made to bring the utilization of *Lagenaria siceraria* (Molina) Standl. and *Luffa cylindrica* (L.) M. Roem. vegetable peel waste by detecting the presence of various phytochemicals in the different extracts.

## Material and Methods:-

### Collection of Sample:-

The vegetables of *Lagenaria siceraria* (Molina) Standl. and *Luffa cylindrica* L. M. Roem. used in the present study were collected from the local market of Kalyan. These vegetables were identified from the Department of Botany, Agharkar Institute, Pune. The peels of these vegetables were washed properly under running tap water to remove dust particles. The peels were then shade dried for 5 days and once the moisture was reduced the peels were then completely dried in an oven at 50°C. The dried peels were then powdered using grinder and stored in air tight bottles.

### Preparation of peel extracts:-

#### Aqueous extract:-

5 gm of dry peels powder were suspended in 50 ml of distilled water. Extraction was done in orbital shaker at 100 rpm (25°C) for 60 mins, followed by filtering of the extracts using Whatman filter paper No.1. Extracts were then evaporated at 50°C. The dry and sticky extracts were refrigerated until further use.

#### Organic extract:-

5 gm of dry peel powder were added in different solvents. Extraction was allowed to stand in orbital shaker at 100 rpm (25°C) for 24 hours, after which they were filtered using Whatman filter paper No.1. Extracts were then evaporated at 50°C. The dry and sticky extracts were refrigerated until further use.

### Qualitative phytochemical screening:-

Petroleum ether, chloroform, ethyl acetate, methanol, ethanol, butanol, acetone, hydroxymethanol, hydroxyethanol and distilled water extracts of *Lagenaria siceraria* (Molina) Standl. and *Luffa cylindrica* (L.) M. Roem. peel powdered samples were tested for the presence or absence of various phytochemicals using standard methods.

### Test for Carbohydrates:-

To 1 ml of the extract, 0.5 ml of  $\alpha$ -naphthol solution was added. After 2-3 mins incubation, 2 ml of concentrated sulphuric acid was added through the sides of the test tube. Formation of reddish violet color at the junction of the two liquids revealed the presence of carbohydrates.

### Test for Amino Acids:-

Two drops of freshly prepared 0.2% ninhydrin reagent was added to the 2 ml of extract solution and boiled for 2 mins. Development of violet ring revealed the presence of amino acids.

### Test for Protein:-

To 1 ml of extracts add 1 ml of alkaline sodium carbonate solution and 2 drops of 1% copper sulphate solution. Formation of blue color indicated the presence of proteins.

### Test for Alkaloids:-

To 1 ml of extract, 1 ml of Dragendorff's reagent was added. An orange-red precipitate indicated the presence of alkaloid.

**Test for Cardiac glycosides:-**

To 1 ml of extracts, 1 ml of glacial acetic acid containing 2.5 ml of ferric chloride solution was added. Carefully 2 ml of concentrated sulphuric acid was added. A reddish brown layer forms at the junction of the two liquids and the upper layer slowly becomes bluish green, darkening with standing indicated presence of cardiac glycosides.

**Test for Terpenoid:-**

1ml of chloroform was added to 2ml of each extract followed by a few drops of concentrated sulphuric acid. A reddish brown precipitate produced immediately indicated the presence of terpenoids.

**Test for phenols:-**

An aliquot of the extract was mixed with 5 ml Folin-Ciocalteu reagent and 4 ml of sodium carbonate. The tubes were vortexed for 15 sec and allowed to stand for 30 min at 40°C for colour development. An appearance of blue colour showed the presence of phenols.

**Test for Flavonoids:-**

2ml of extracts was treated with few drops of 20% sodium hydroxide solution. Formation of intense yellow colour, which becomes colourless on addition of dilute hydrochloric acid, indicated the presence of flavonoids.

**Test for Saponins:-**

1 ml of extracts was shaken with 2 ml of distilled water vigorously 5 minutes. Formation of foam indicated the presence of saponins.

**Test for Tannins:-**

To 1 ml of the extracts, 1 ml of 5% ferric chloride solution was added. Formation of dark blue or bluish black color showed the presence of tannins.

**Test for Anthraquinone:-**

To 1 ml of extracts, 1 ml of 1% potassium hydroxide solution was added. Formation of orange to yellow colour indicates presence of anthraquinone.

**Test for Phlobatannins:-**

About 2 ml of extract was added to 2 ml of 1% HCl and the mixture was boiled. Deposition of a red precipitate was taken as an evidence for the presence of phlobatannins.

**Tests for Steroids:-**

Development of a greenish colour when 2 ml of the organic extract was dissolved in 2 ml of chloroform and treated with sulphuric and acetic acid showed the presence of steroids.

**Test for Phytosterols:-**

A little quantity of the extract was dissolved in 5 ml of chloroform separately. This chloroform solution was treated with a few drops of concentrated sulphuric acid. To this a few drops of dilute acetic acid and 3ml of acetic anhydride was added. A bluish green colour confirmed the presence of phytosterols.

**Result and Discussion:-**

Each extract was subjected to phytochemical screening and various phytoconstituents were found to be present in different extracts of *Lagenaria siceraria* (Molina) standl. and *Luffa cylindrica* (L.) M. Roem. peels (Table 1, 2, 3 and 4).

Carbohydrates were found to be present in all the extracts of *Lagenaria siceraria* (Molina) standl. and *Luffa cylindrica* (L.) M. Roem. peels. Amino acids and proteins were found to be present in aqueous, methanolic, ethanolic, hydroxyethanolic, hydroxymethanolic and acetone extract of *Lagenaria siceraria* Molina standl. and *Luffa cylindrica* (L.) M. Roem. peels and were absent in butanol, petroleum ether, ethylacetate and chloroform extracts.

Flavonoids were found to be present in all the extracts of *Lagenaria siceraria* (Molina) standl. peels whereas in case of *Luffa cylindrica* (L.) M. Roem. peels, flavonoids were present in all the extracts of *Luffa cylindrica* (L.) M. Roem. peels except in chloroform extract. Alkaloids were found to be present in aqueous, methanolic, ethanolic,

hydroxyethanolic, hydroxymethanolic extracts of *Lagenaria siceraria* Molina standl. and *Luffa cylindrica* (L.) M.Roem.peels.

Saponins were found to be present in aqueous extract of *Lagenaria siceraria* Molina standl. and *Luffa cylindrica* (L.) M.Roem.peels. Phenols were found to be present in all the extracts of *Lagenaria siceraria* Molina standl. and *Luffa cylindrica* (L.) M.Roem.peels except in petroleum ether and chloroform extracts.

Tannins were found to be present in aqueous, methanolic, ethanolic, hydroxyethanolic, hydroxymethanolic extracts of *Lagenaria siceraria* (Molina) standl. and *Luffa cylindrica* (L.) M.Roem.peels. Phlobatannins were absent in all the extracts of *Lagenaria siceraria* (Molina) standl. and *Luffa cylindrica* L. M.Roem.peels.

Cardiac glycosides were found to be present in all the extracts of *Lagenaria siceraria* Molina standl. and *Luffa cylindrica* L. M.Roem.peels except in petroleum ether extract. Phytosterols were present in methanolic and acetone extract of *Lagenaria siceraria* (Molina) standl. and only in the acetone extract of *Luffa cylindrica* (L.) M.Roem.peels.

Steroids and terpenoids were found to be present in all the extracts of *Lagenaria siceraria* (Molina) standl. and *Luffa cylindrica* (L.) M.Roem.peels except in petroleum ether extract.

Anthraquinone were found to be present in aqueous, methanolic, ethanolic, hydroxyethanolic, hydroxymethanolic and acetone extracts *Lagenaria siceraria* (Molina) standl. and *Luffa cylindrica* (L.) M.Roem.peels.

### Conclusion:-

Recycling of fruit and vegetable waste is one of the most important means of utilizing it in a number of innovative ways yielding new products. The secondary metabolites (phytochemicals) and other chemical constituents of medicinal plants account for their medicinal value. The phytochemical evaluation can be used for further assessment of secondary metabolites. The preliminary phytochemical tests are helpful in finding chemical constituents in the plant material that may lead to their quantitative estimation and also in locating the source of pharmacologically active chemical compound.

### Abstract

**Objective:** the aim of our work was to study the effects of physical therapy versus weight reduction and their combined effects in obese patients with knee OA.

**Methods:** 156 obese patients (137 females and 19 males) with knee OA were recruited. their BMIs ranged from 30.2 to 50.8. Patients were randomized to three groups: Group I: underwent physical therapy only. Group II: underwent weight reduction only. Group III: underwent combined physical therapy and weight reduction. Changes in body weight and body composition were examined as independent predictors of changes in knee OA symptoms. Symptoms were monitored by the Western Ontario and McMaster Universities' (WOMAC) OA index.

**Results:** the mean changes of group II and III ( $-16.9 \pm 2.7$  and  $-15.7 \pm 2$ ) were highly significant respectively while mean change of group I ( $-0.6 \pm 0.4$ ) was non significant. Group II had the best improvement of BMI with mean change of ( $-6.6 \pm 0.8$ ) followed by group III ( $-4.9 \pm 0.7$ ) while group I had the worst ( $-0.3 \pm 0.2$ ). The total WOMAC index improved within each group after two and four months from baseline ( $p < 0.001$ ), The best mean change of WOMAC score was found in group III ( $-14.8 \pm 4.9$ ).

**Conclusion:** Combination of both weight reduction and physical therapy gives better results as regard improving knee pain and function in patients with OA, reduces disability and improves quality of life compared to each method alone

### Introduction:-

OA is the most common cause of musculoskeletal disability in the elderly, and it places an enormous economic burden on society (1).

Osteoarthritis (OA) of the knee is a degenerative joint disease with progressive degradation of articular cartilage and subchondral bone. Clinical manifestations may include joint pain, tenderness, stiffness, locking and joint effusion depending on the stage of the disease (2).

Obesity is one of the most significant and potentially most preventable risk factor for the development of OA and numerous studies have shown a strong association between body mass index and OA of the knee (3).

**Corresponding Author:- Heba A. Seliem.**

Address:- Department of Rheumatology and Rehabilitation, Faculty of medicine Zagazig University.

Obesity and knee OA are two of the most common chronic diseases and are often co-morbid. The risk of knee OA related to weight gain and obesity begins from an early age. Weight loss reduces the risk of incident knee OA and, in established disease, reduces symptoms, improves function and is likely to reduce disease progression (4).

The precise mechanism by which obesity leads to OA remains unknown, but is likely to be due to a combination of mechanical, humoral and genetic factors. Weight loss has clear medical benefits for the obese patient and seems to be a logical way of relieving joint pain associated with degenerative arthritis (5).

Exercise therapy reduces pain and activity limitations in OA of the knee. Classical exercise therapy is aimed at improving muscle strength, aerobic capacity, range of joint motion, and training of walking and activities of daily living (6).

Weight loss, preferably combined with exercise therapy, reduces pain and activity limitations in OA patients who are overweight (6).

#### **Aim of the work:-**

The aim of the work was to study the effects of physical therapy versus weight reduction and their combined effects in obese patients with knee osteoarthritis

#### **Patients and Methods:-**

This study was carried out at rheumatology and rehabilitation department at Zagazig university hospitals, Egypt on 156 obese patients (137 females and 19 males) aged between 38 and 57 years old with disease duration of 1 to 9 years of primary knee OA diagnosed according to The American College of Rheumatology (ACR) classification criteria of OA (7).

After taking a written consent from them for ethical consideration, patients were randomly divided into three groups: Group I: They underwent physical therapy only. Group II: They underwent weight reduction only. Group III: They underwent combined physical therapy and weight reduction. All patients in this study had radiographic severity grade I or II according to the Kellegren-Lawrence grading system (8).

Major exclusion criteria were: Other rheumatic diseases that might be responsible for 2ry OA, haematological disorders., CVS, renal or hepatic diseases, DM or other endocrinal disorders, patients having grade III and IV knee OA or history of knee trauma. Before inclusion in the study, fasting blood glucose was measured as well as hemoglobin and TSH. All patients meeting the previously mentioned inclusion criteria were initially assessed at 1st visit by full medical history, general and systemic examination, Local examination of both knees, assessment of pain severity using visual analogue scale (VAS). (9), measuring functional disability using WOMAC questionnaire (Western Ontario and McMaster Universities Arthritis Index) (10), determination of ambulation activity by measuring the walking speed (time needed (in seconds) to complete a distance of 100 meters on a treadmill as tolerably and quickly as possible) (11), measuring body mass index (BMI) for all patients included in the study using the following equation :  $BMI = (\text{Weight (in Kgs)} / \text{Height (in meters)})^2$  (12).

Calculating Estimated Nutrient Needs: Nutritional needs were calculated for patients in group II and III according to Harris Benedict Equation which calculates the resting energy expenditure (REE) (13) and recalculated every 2 weeks to change diet program.

#### **Physical therapy programs:-**

Physical therapy programs were done for patients in group I and III in the form of TENS, quadriceps exercise, ultrasonic, cold packs, infra-red or faradic stimulation. These modalities were chosen according to severity of symptoms and reevaluated every 2 weeks to change the program.

#### **Follow up sessions:-**

All patients in this study were reevaluated after 2 and 4 months by: Full medical history and physical examination, reassessment of VAS scale and WOMAC index, reassessment of ambulation activity by measuring walking speed and reassessment of BMI.

**Statistical analysis:-**

The statistical analysis of data was done by using SPSS program (statistical package for social science) version 20.0. The description of the data was done in form of mean and standard deviation for quantitative data, frequency and proportion for qualitative data. For quantitative data one way ANOVA test was used to compare the means of the three groups. Repeated measure ANOVA test was used for the comparison of the means of each group at the three readings during the follow up. For qualitative data (frequency and proportion), Chi-square test was used. The correlations between the quantitative variables was tested using the Pearson correlation test.

The mean change was calculated by calculating the difference between the mean of the variable after the intervention and the mean of the variable at the baseline. All data were tested for normality of distribution prior to any calculations. Statistical significant difference was considered at  $P < 0.05$ , and highly significant difference at  $P < 0.001$ .

**Results:-**

The study was a clinical trial conducted on 156 cases with disease duration of 1 to 9 years of primary knee OA who were divided into three groups, each of which included 52 cases. Seven cases were dropped during the study (4 refused to continue and 3 had depression). Finally, we had 149 patients divided into 3 groups; 50 patients in group I (44 females and 6 males) aged between 38-52 years who underwent physical therapy only, 50 patients in group II (45 females and 5 males) aged between 38-57 years who underwent weight reduction only using weight reduction program and 49 patients in group III (44 females and 5 males) aged between 38-55 years who underwent combined physical therapy and weight reduction (using same weight reduction program).

### Discussion:-

This study compared the efficacy of physical therapy, weight reduction and their combined effects on 149 obese patients (132 females and 17 males) aged between 38-57 years complaining for 1 to 9 years of primary knee OA.

Patients were divided into 3 groups; group I underwent physical therapy only, group II underwent weight reduction only and group III underwent both physical therapy and weight reduction.

At the beginning of this study as shown in table 1 , body weights of the studied group ranged from 81 to 130 kg , their BMIs ranged from 30.2 to 50.8 while their heights ranged from 151 to 170 cm.

Among all patients, 64 patients had grade I knee OA while 85 patients had grade II. Also, 79 patients had quadriceps wasting. Most of patients (113 patients) had tender joint line while only 53 patients had deformity. Effusion was absent in 64 patients, mild in 55 patients and moderate in 30 patients only.

Regarding pain and functional scores of studied groups at the beginning of the study shown in table 2, WOMAC scores ranged from 6 to 44, VAS score ranged from 3 to 7 and walking speeds ranged from 78.8 to 105.7 seconds.

A special equation (Harris –Benedict equation), (13) was used to calculate nutritional needs for patients undergoing weight reduction in group II and III. Also, different modalities of physical therapy were used including TENS, quadriceps exercise, ultrasonic, cold packs, infrared and faradic stimulation which were chosen according to severity of symptoms for patients in group I and III.

In the present study, there was no significant difference between patients in all groups regarding their demographic data, pain and functional scores, clinical signs and radiographic grades of OA at baseline.

In this study, there was no significant difference between the three groups at baseline as regard body weight and BMI while highly significant difference was present between the three groups after 2 and 4 months. Highly significant difference was present regarding body weights and BMI of patients within group II and group III after 4 months while no significant difference was found in group I. Group II had the best improvement of body weight and BMI followed by group III while group I had the least as detected by comparing the mean change of the 3 groups after 4 months .

These results agreed with Huang et al., (11) who classified 126 obese osteoarthritic patients into 3 groups. Group (a) underwent weight reduction, group (b) underwent electrotherapy and weight reduction while group (c) underwent electrotherapy only. They reported significant change of body weight after 6 months in group (a) and (b). But, they used different protocol than this study as they used triple regimen for weight reduction including auricular acupuncture, diet control and aerobic exercises.

Also a study by Lee and Kean, (14) was in agreement with this study. They found significant difference of body weight among the studied groups in their meta analysis on a total number of 36 different studies on obese patients with knee OA. They all used diet control with exercise program to achieve weight reduction.

In the present study, highly significant difference was found regarding WOMAC, VAS and walking speed among the three groups at the end of the study from baseline. Improvement was better in group III followed by group II while group I had the least improvement as detected by comparing the mean change of WOMAC, VAS and walking speed of the three groups at the end of the study.

Results of the present study were in agreement with the results of Huang et al., (11). They used VAS and walking speed similar to us but they used different 112 functional index (lequesne index) to assess functional disability. They had significant difference of pain and functional indices at the end of their study in those groups who underwent combined weight reduction and physical therapy better than the other groups who underwent one method alone.

Results of the present study agreed also with the results of Christensen et al., (15). They also used Lequesne index to assess knee function while walking speed and VAS was used to assess knee pain. They found significant difference as regard knee pain and functional measures in patients who did both weight reduction and physical therapy better than patients that underwent one modality alone.

In the current study, change of body weight was significantly correlated with change of WOMAC score, VAS pain score and improvement of walking speed among patient in groups II and III as shown in tables 4 and 5 while no significant correlation was found in group I regarding all previously mentioned parameters as shown in table 3.

The study of Huang et al., (11) was in agreement with results of the current study as they found that weight reduction was a practical adjuvant treatment in the rehabilitation of patients with knee OA. They suggested that the amount of weight reduction must be greater than 15% of the initial body weight to provide effective treatment of joint pain. Furthermore, if the weight reduced were more than 12% of initial body weight, an acceptable functional status would be obtained.

Another study agreeing with our study was done by Christensen et al., (16) who showed that the efficacy of weight reduction on improvement of function in 80 patients with knee OA and showed that weight reduction of 10% improved knee function by 28%.

Messier et al., (17) concluded that the combination of modest weight loss plus moderate exercise provides better overall improvements in self-reported measures of function and pain and in performance measures of mobility in older overweight and obese adults with knee OA compared with either intervention alone.

A study by Miller et al., (18) suggested that intensive weight loss intervention incorporating energy deficit diet and exercise training improves physical function in older obese adults with knee OA. But they said that greater improvements in function were observed in those with the most weight loss.

Results of the present study were in agreement with meta analysis made by Christensen et al., (15) which indicated that physical disability of patients with knee OA and overweight diminished after a moderate weight reduction regimen. The analysis supported that a weight loss of >5% should be achieved within 20 weeks period.

Grundy et al., (19) found that combination of weight loss and exercise provide better improvements in physical function and pain in obese adults with knee OA compared with either intervention alone. Exercise used in association with weight loss provides better improvements in physical capacity and muscle strength

The study of Riddle and Stratford, (20) suggested a dose response relationship between changes in body weight and corresponding changes in pain and function. The threshold for this response gradient appears to be body weight shifts of  $\geq 10\%$ . Weight changes of  $\geq 10\%$  have the potential to lead to important changes in pain and function of the knee.

Jenkinson et al., (21) studied the effects of weight loss and quadriceps exercise on 389 men and women aged 45 and over with a body mass index (BMI)  $\geq 28$ . They disagreed with this study as they suggested that simple knee strengthening exercises can significantly reduce knee pain and improve knee function in 114 overweight and obese people with knee pain. A moderate sustained weight loss was achieved with dietary intervention but with no apparent influence on pain or function.

At the end of the present study, we found that physical therapy is an effective method of reducing pain and improving function in obese patients with grade I and II of primary knee OA. Weight reduction is also an effective treatment modality in improving pain and knee function in obese patients with grade I and II of primary knee OA. Combination of both physical therapy and weight reduction gives superior results to using either method alone in obese patients with knee OA regarding reduction of disability, improvement of knee pain, physical function, daily activities and quality of life.

#### Abstract

Since ancient times spiritual and religious practices proved their worth in management of many disorders. In fact, religious and spiritual leaders were once strongly against the practice of modern medicine. As the time passed modern medicine laid firm foundation in human civilization and people slowly forgot about spiritual and religious practices. Few physicians and surgeons noticed great improvement in patients who were practicing spiritual and religious practices. Further studies aimed to find effect of religious and spiritual practices in diseased patients proved that, religious and spiritual practices in combination with modern medical therapy work synergistically and a high number of patients were cured in due time. This paper highlights the role of spiritual and religious practices in modern medical therapy.

*Copy Right, IJAR, 2016,. All rights reserved.*

Spiritual and religious practices are important aspects of medical care. However physicians are not sure about, when and how to address about religious issues. Physicians who spent a lot of time in reading modern medicine have little or no knowledge about religious or spiritual healing. There is an ethical issue in practicing spiritual healing according to which, a physician should not try to impose his or her belief on their patients. Apart from ethical issues as the modern medicine is being more directed towards science and technology physicians find it difficult to concentrate themselves on religion or spiritual healing. There are innumerable example in history where spiritual and religious healing proved to be successful. However, the question remains unanswered that, how spiritual or religious healing works or what is the exact science behind the spiritual healing. According to ancient literature spiritual and religious practices helps to initiate and regulate biofeedback mechanism. Yoga and Meditation are claimed to regulate secretion from pineal and pituitary glands<sup>1</sup>. If we combine the role of meditation and other spiritual practices we can find that these can have important role in prevention and management of various diseases related to cardiovascular, nervous , immune and reproductive system. various studies<sup>2,3</sup> have found positive effect of yoga and meditation on nervous and cardiovascular system. As written in history books that, many saints possessed the power of healing as they eliminated illness in human using some supernatural power. Mother Teresa of Kolkata, India recently given the honor of being a saint as she has said to have healed an ailing patient through her prayers and supernatural power. The reality behind supernatural power is beyond the reach of science or beyond the imagination of human mind, as said by great saints and scholars of Hindu mythology.

Sometimes the physician or the patient is not religious and there is lack of understanding in between patient and physician. In this condition one must not try to impose his belief over another. Imposing the beliefs can have negative impact both upon the treatment and on the interpersonal relationship. Various researches which were focused on quality of life of patients having spiritual or religious beliefs have found that, overall quality of life of

patients suffering from psychiatric and stress disorders is better than those not practicing spiritual or religious practices<sup>4,5</sup>. Similarly few other studies in patients having cardiovascular disorders found that, spiritual and religious practices have profound effect on maintaining optimal health of cardiovascular system<sup>6,7</sup>. It was found that meditation has very critical role in maintaining good blood pressure in hypertensive and stressed patients. These finding again point towards possible effect of meditation and spiritual practices on pituitary, pineal glands and on the cardiovascular system. Apart from these disorders there are numerous infective, metabolic, inflammatory and neoplastic disorders which cannot be treated by using spiritual and religious practices. However if knowledge of spiritual practices is applied accurately, this can be used as an aid to reinforce patient to take proper medicine at right interval and for longer duration. Simkin. P et al in 2004<sup>8</sup> published an update over non pharmacological method of labor pain control in which he focused on possible role of spiritual and religious practices to control labor pain. In fact spiritual practices are ancient method of labor pain control for generations till the analgesics and anesthesia were discovered. According to him, spiritual and religious belief help overcome maternal stress and other psychological problems related to premature delivery, abortion or infant death<sup>9</sup>.

In cancer patients receiving palliative therapy to extend life expectancy and in those cancer patients whose death is near spiritual practices again prove their worth. Most patients who were found have practicing the religious practices have fewer treatment related complaints or complications than those who were not practicing<sup>10</sup>. A study which was performed on female patients who were getting treatment for breast cancer, it was found that, those women practicing spiritual and religious practices had better immune response<sup>11</sup>.

### Conclusion:-

Spirituality and religious practices are very strong tool in modifying body hormonal response and functioning of central nervous system. Together with modern medicine many psychological, psychiatric and cardiovascular diseases can be managed efficiently.

## 10 YEARS PREVALENCE OF HEPATITIS B INFECTION AMONG WOMEN DELIVERING AT KAMC-JEDDAH AND THEIR INFANTS.

Taghreed Shams, Aishah Saeed Alasmari, Daniyah Hassan Saleh and Hawazin Abdul Rahman Fallatah.

### Manuscript Info

### Abstract

### Introduction:-

Hepatitis B infection is a common infectious disease worldwide. There are nearly 2 billion people with hepatitis B infection throughout the world. About one million people die yearly from its complications(1). In Saudi Arabia, the ministry of health considers hepatitis B virus infection as second most common viral disease after chickenpox with almost 4700 new cases diagnosed annually(2).

Hepatitis B is an inflammation of the liver caused by specific type of virus called B virus, interaction of the virus and host immunity lead to liver injury which may be complicated by cirrhosis and hepatocellular carcinoma (HCC). HBV is transmitted through infected body fluid such as blood, semen and vaginal secretions. IV drug users, infected sexual contact, infant born to infected mothers are all at risk of development of the infection. Infected individual can be symptomatic or asymptomatic(3).

Mother-to-child transmission, is one of the most important cause of HBV carriers(4), that's why recommended to screen all pregnant ladies for HBsAg in the first antenatal visit specially in endemic areas (e.g. Saudi Arabia). Infection with hepatitis B in newborns of carrier mothers is the leading cause of development of chronicity state up to 80% of the disease, Interrupting of HBV transmission through administration a highly effective neonatal immune-prophylaxis by vaccination and intra-venous immunoglobulin (IVIG) in the first 24 hours of life has a major impact in reducing the prevalence of cases. Despite immune-prophylaxis there are still documented cases of vertical transmission of HBV(5). In study conducted in china (2014), Vertical transmission rate has been reported around (5.44%) of infants despite immune-prophylaxis. they recommended further studies should work on prevention of immune-prophylaxis failure. Several studies implied that Mothers with positive HBeAg, high maternal viral load and positive cord blood for HBV DNA are most important factors that contributed to immune-prophylaxis failure(6).

Other studies shows a correlation between risk factors such as mode of delivery, ante-partum complications, procedures, intra-partum intervention and HBV vertical transmission(7).

**Corresponding Author:- Taghreed Shams.**

The aim of study is to measure SCREENING RATES of mother and their infants for HBV and the failure rate immune-prophylaxis in preventing vertical transmission of HBV at King Abdul-Aziz Medical City, National Guard Hospital Affairs (KAMC, NGHHA).

#### **The Research Problem:-**

To screening rates for mother and their infants for HBV and to measure failure rate of immune-prophylaxis in preventing vertical transmission of HBV at King Abdul-Aziz Medical City, National Guard Hospital Affairs (KAMC, NGHHA).in the period between 2005-2014.

#### **Research objectives:-**

- To Identify screening rate of HbsAg of mothers and their infants.
- To Estimate the incidence of vertical transmission of HBV in infants of HBV carrier mothers.
- To count the incidence of HBV carrier state in pregnant women at KAMC in the period between 2005-2014.
- To correlate risk factors for failure of HBV immune-prophylaxis.

#### **Research Methodology:-**

This retrospective cross-sectional study was conducted at KAMC between Sep 2009 until Dec 2014. Medical records of all pregnant women with positive HBsAg and their infants were collected and reviewed. Maternal Demographic data, hepatitis serology, liver function test, antepartum procedures and duration of rupture of fetal membrane, mode of delivery, and perinatal tears were collected. Infant timing of initial HBV vaccination and administration of IVIG, subsequent HBV vaccination, and screening were collected.

The primary outcome was the screening rate of HbsAg in infant HBV among pregnant women delivering in KAMC-Jeddah.

The secondary outcomes were failure of infant immune-prophylaxis to achieve positive HBsAb at age of 6-12 months, and rate vertical transmission of HBV from carrier mothers to their infant's defined as HBsAg positive at age 6-12 months. All Data was managed by SPSS version 21.

#### **Results and Discussion:-**

This study is the first done in Saudi Arabia that addresses a health issue with a significant burden of disease. Hoping in results can help in primary prevention of HBV infection. Although Saudi Arabia is one of endemic areas of hepatitis B but still ante-natal screening for mothers is low for many reasons such as decrease awareness about HB infection among health care providers and society. Even after mothers being HBsAg positive after screening only about 38.18% of these infants was screened for HBV for many reasons such as maternal poor compliance, no booked appointment and emergent delivery cases. Which is despite recommendation against invasive intervention of mothers with infectious diseases (8).

Among 23,756 deliveries in the period between 2005-2014, 152 women with positive HBsAg were identified. Those women gave birth to 251 children during study period. Only 16.7 % (42/251) of infants were screened, none was found to have HBsAg.

7% of all children (18/251) were screened between age of 2-6 years. Only one child was found to have HbsAg positive at age of 5 years. Among screened children, 20% (14/60) were found to be susceptible at time of screening. 23.9 % (60/251) of children had antenatal invasive testing. 60 of them had done Fetal scalp electrode and with Chorionic villous sampling. 14 of them had HbeAg (9%) and 54% had abnormal liver function test. The mean age of screened mother was 31.17 years, with gestational age mean of delivery 38.99 weeks.

All 251 children that delivered were documented received first dose vaccine and 199 (79%) of them found to have IVIG within the first 24 hours after delivery.

In previous studies suggested the role of caesarian deliveries to achieve a better outcome in decreasing rate of vertical transmission by minimize the direct contact between mother and fetus in compare with vaginal deliveries (7).

One of changes dealt through conducting the study HBV It is relatively rare disease. Retrospective nature that relies on documentation and limited access all medical records due to lack of computerized health information system before 2009. A lot of infant got immunized in other health care facilities other than KAMC.

**Table 1:-** The rate of HBV screening among infant of HBV infected mothers

Rate of screening			
screened	60	23.9% of all HBV mothers	
First year	44	70 %	
Second	8	3.18%	
Third	2	0.79%	
Forth	1	0.39%	
Fifth	2	0.79%	
Sixth	3	1.19%	

**Figuer: Intra-partum risk factors of total 251**

**Figure 1:-** Intra-partum risk factors of total 251 deliveries.

### Conclusion:-

Screening rates of HbsAg of 251 (38.18%)for infants and (23.9%) for of total 152 women whom found with positive HBsAg period between 2005-2014 whom delivered in KAMC, NGH. 70% of them during first year of infancy.

All 251 about 38.18% of these infants and children that delivered were documented received firstdose vaccine and 199 (79%) of them found to had IVIG within the first 24 hours after delivery.

There were an observed decreased numbers of maternal and infant screening rates for HBV. A Further studies are needed to determine the risk factors associated with failed immune-prophylaxis.

**Acknowledgment:-**

We would like to express our Acknowledgment

Dr. Taghreed Shams(Consultant General Obstetrics & Gynecology) for her strong support and guidance and Dr. Hashem AlHashemi Consultant Physical Rehabilitation Medicine (MNGHA, KAMC-WR) for statistical analysis support.

**Perspectives:-**

Educating health care worker regarding the WHO recommendation for prevention of HBV vertical transmission. Institute a strong policy regarding screening and follow up for infant of HBV infected mother Educating the HBV infected mothers regarding the importance of infant screening. We will calculate the rate of HBV screening among pregnant women.

#### Abstract

Participating in school sports is an important means to increase physical activity among adolescents. While participation in schools can play an important role in increasing physical activity levels, school sports participation alone may not be sufficient to meet the current physical activity recommendations for adolescents. Therefore sports participation should not be seen as a replacement for physical education in schools but rather as a supplement to the solid foundation provided by physical education.

*Copy Right, IJAR, 2016,. All rights reserved.*

#### Introduction:-

It has been usually believed that myofascial trigger points (MTrPs) are significant pathologies in the muscles and sometimes these points become painful and extremely irritating. The common definition of MTrP is described as the presence of local tenderness due to the existence of a contraction knot in a taut band of the muscle tissue (Figure 1). These points are painful and may produce referred pain, either spontaneously or due to direct pressure. MTrPs might be considered as one of the most frequent causes of pain and disability in the muscular and skeletal system (Cummings and Baldry, 2007). However, what are the existence theories and explanations regarding MTrP mechanism and its relation to pain?

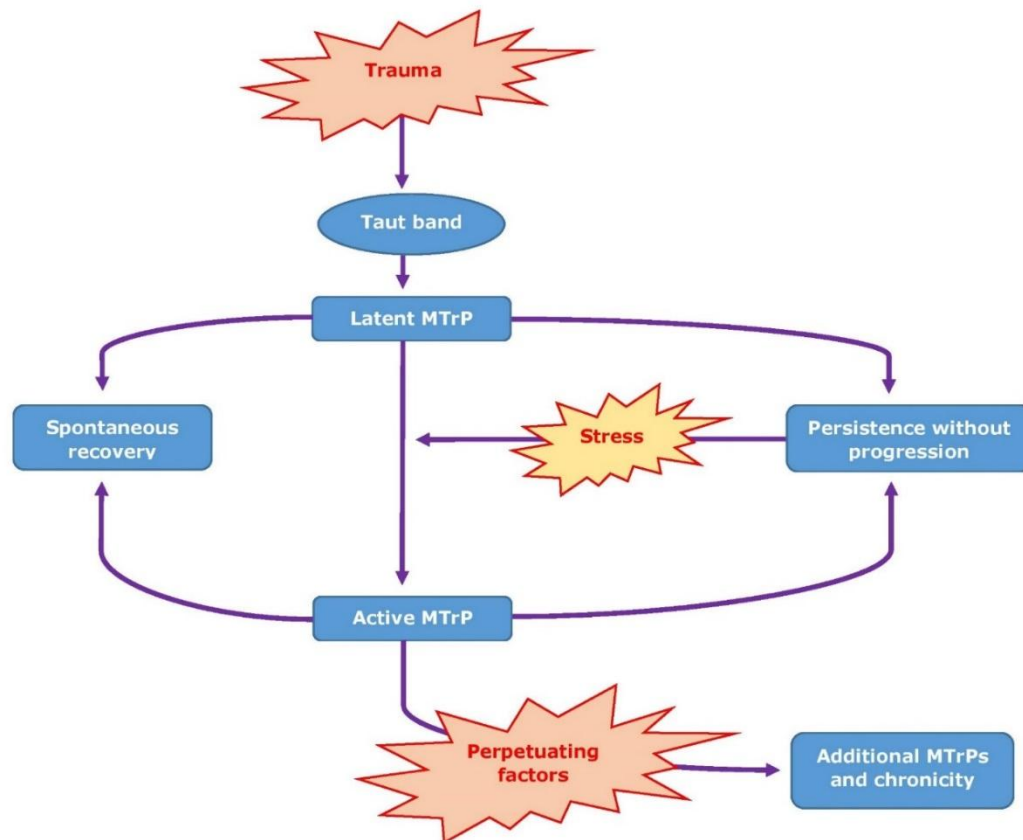

**Fig 1:-** Diagram of a Myofascial Trigger Point (taken from <http://www.healbodypain.com>)

**Corresponding Author:-** Mansour Abdullah Alshehri.

**Address:-** Physiotherapy Department, Faculty of Applied Medical Sciences, Umm Al-Qura University, Saudi Arabia.

It seems possible that MTrPs are not a serious condition but it is important to clearly understand the concept of MTrPs pain mechanism. MTrPs can be divided into two main types. One of them is referred to as a latent trigger point, while the second is called an active trigger point. Latent trigger points are inactive points without spontaneous pain but which might be painful as a result of deep and direct compression. On the other hand, active trigger points are painful and spontaneous, and may be associated with referred pain. This might also present some other symptoms such as muscle weakness, a limited range of motion of the affected area and temperature alterations (Huguenin, 2004).

It is possible for a latent trigger point to become an active point. Many factors such as traumatic injuries, muscle overuse, poor posture, psychological stress and systemic pathology may contribute to the development of a local palpable latent MTrP. Therefore, latent MTrP could become active MTrP if subjected to mechanical stress or to other hurtful factors (Saxena et al., 2015). An active MTrP may spontaneously recover, return to the latent stage, or continue without progression. Moreover, an active MTrP could remain in a dynamic state, so it can change from being a latent MTrP to becoming an active MTrP, and back again in a vicious cycle, all of which is probably controlled by stressors (Figure 2). MTrPs can be also classified as primary and secondary MTrPs. A primary MTrP occurs from overloading or the overuse of specific muscle tissue, with the cause of their activation not being due to the action of another muscle. Secondary (satellite) MTrPs develop due to mechanical stress and/or neurogenic inflammation as a result of activity of a primary trigger point. The activity of nociceptive receptors in various structures (somatic or visceral) can develop secondary MTrPs (Simons et al., 1999).

**Fig 2:-** Myofascial trigger point vicious cycle (adapted from Saxena et al., 2015)

### Pathophysiology of MTrPs:-

There is a heated debate about the pathophysiology of MTrPs. There are a number of hypotheses about its mechanism. For example, an integrated hypothesis suggests that the cause of MTrP is due to overloading or overuse of a muscle that might cause micro-trauma which might lead to a release of acetylcholine (ACh). An increased in the amount of ACh contributes to a contraction knot, which is the area where there is a localized shortening in the

sarcomere. This contraction is sustained and leads to local ischaemia and hypoxia (Simons, 2004). Consequently, a loss of the energy supply (oxygen) leads to a release of sensitizing noxious substances, which may be the cause of the associated pain with MTrPs. This hypothesis is called the energy crisis theory and has been widely accepted by many healthcare professionals. There is another hypothesis, which is similar to the previous one, which is that blood vessel compression resulting from a continued contraction knot causes local hypoperfusion (Gerber, 2011). As a result, the ischemic tissue is usually associated with pain and tenderness.

In contrast, there are some theories that focus more on neurological models and are opposed to the previous theories. These theories propose that neuro tissue or process involvement is the major cause of myofascial pain, while the trigger point is just a minor phenomenon. One of their explanations is that the properties of myofascial pain based on myofascial trigger points are not discernible from neural pain. Therefore, they believe that the main cause is due to the nervous system such as neuritis (inflammation of the nerve), allodynia (pain sensation from non-painful stimulus) or hyperalgesia (exaggerated sensitivity to pain) (Quintner, 2014).

There are lots of studies which have discussed the factors that cause, lead, or maintain myofascial pain. Saxena et al. (2015) identified three categories of perpetuating factors that may have a negative effect on the body, and could lead to the development and increase in the number of MTrPs and which, with time, might also develop myofascial pain syndrome. These factors are divided into three main components: structural factors (such as scoliosis, functional leg length inequality and osteoarthritis of main joints), ergonomic factors (for example, poor posture and work related activities) and medical factors (such as hormonal imbalance, nutritional deficiencies and infectious diseases). However, these categories did not take into account the psychosocial factors that probably play an important role in developing MTrPs. It has been acknowledged that psychosocial factors such as anxiety and depression are frequently found in patients with chronic pain (Kuch, 2001). Therefore, muscle tension might cause fatigue, and with high loads in the muscle tissue, could lead to the development of MTrPs. Therefore, it is necessary to look deeply at all possible factors.

#### **MTrPs Diagnosis:-**

The MTrPs examination is not supported by high evidence. This because the fact that MTrPs assumed to be localized and are identified as a result of the clinical examination of the clinicians. However, the methods of clinician's examination do not follow gold standard criteria, and if any other therapists try to undertake such an examination they may identify different MTrPs or may identify nothing. Another issue is that these points can be palpated only if located in the superficial layer of the muscle tissue or if they are associated with areas of localized muscle shortening. Thus, there is always a question, how the therapists can differentiate between muscle stiffness, localized adhesions, allodynia, and tender points without a contraction knot from MTrPs. Therefore, a high level of manual skill is required to detect these points properly. There are four major clinical features of MTrPs (Cummings and Baldry, 2007):

- A tender point in the taut muscle tissue
- A possible pattern of pain distribution (Figures 6 and 7)
- Patient/client recognition of pain on continued pressure over MTrPs
- A local twitch response (LTR), which is a temporary and a quick contraction of the muscle fiber during pincer palpation of MTrPs. LTR could be visible or palpable, or may both.

MTrPs can be palpated and assessed in three ways. These are direct pressure, flat palpation and pincer palpation. The first two are used for superficial muscle tissue, while the third is used for deep muscle tissue (Simons et al., 1999). However, the force and the accuracy of performance that is applied during the assessment may influence the process and production of referred pain and, as a result may affect the judgment of the clinician about the diagnosis. Even complementary and instrumental testing such as ultrasound, electromyography, algometry and thermography are still controversial and their ability to diagnose MPS and detect MTrPs have not been confirmed due to the lack of sensitivity and specificity (Vázquez-Delgado et al., 2009). However, they are usually used simply to confirm the diagnosis of the clinician.

As a result, the relationship between MTrPs and myofascial pain syndrome (MPS) is a controversial one, for many reasons. There is no definite, validated and a significant diagnostic criteria to detect trigger points in the body as well as the overlapping symptoms of MPS with other musculoskeletal pain disorders may lead to confusion with regard to the diagnosis. Furthermore, most of the evidence, which support the idea of MPS based on trigger points, relates to low quality studies or ones conducted using in small groups, which may not allow us to generalize

the results. However, some recent studies look at other causes of MPS such as central sensitization (Giamberardino et al., 2011; Quintner, 2014).

### **Conclusion:-**

MTrPs are of two types: active or latent, which may be part of a vicious cycle that is usually controlled by stressors. There are many theories about the causes of MTrPs and how they produce pain but no theory has been significantly confirmed and stand out above the other theories. There are several perpetuating factors which may play a primary or secondary role in the development of MTrPs or which might activate the latent MTrPs. Clinicians should be considered these issues when using any interventions that based on the detection of MTrPs. Future studies need to investigate the relationship between pain and MTrPs involving patients with different musculoskeletal disorders in order to provide an adequate recommendation.

### Abstract

**Introduction:** Stroke is considered the second leading cause of death globally. Chronic kidney disease (CKD) has been identified as a risk factor for stroke. However, little is known about the impact of renal dysfunction on early mortality following acute ischemic stroke. The aim of the current study was to evaluate the prevalence of renal dysfunction among acute ischemic stroke patients and its role on the early overall mortality.

**Patients and methods:** This prospective cohort study included a total of 889 patients with first ever ischemic stroke who were hospitalized within 24 hours of symptoms onset. All patients were clinically evaluated to determine stroke risk factors. Stroke severity was assessed using National Institute of Health Stroke Scale (NIHSS) in the 1st day of admission. Baseline investigations were obtained within 24 hours of admission, including serum creatinine and estimated Glomerular Filtration Rate (eGFR) that was calculated from the equation of the Modification Diet for Renal Disease in ml/min/1.73m<sup>2</sup>. Patients were followed up for 30 days after admission or at least until death.

**Results:** Of the 800 stroke patients who completed follow up during the study period, 242 (30.2%) had renal dysfunction, and 128 (16%) died within 30-days of stroke onset, whereas mortality was higher (19.8%) in patients with eGFR <60 ml/min/1.73m<sup>2</sup> than in patients (14%) with eGFR ≥60 ml/min/1.73m<sup>2</sup>. In multivariate analysis, 30-days mortality risk of stroke was higher in patients with eGFR < 60ml/min/1.73 m<sup>2</sup> (HR= 1.7, 95% CI=1.4-2, P=0.002), stroke severity (HR= 1.5, 95% CI=1.3- 1.7, P=0.001), and presence of atrial fibrillation (HR= 1.4, 95% CI=1.1-1.7, P=0.007). Meanwhile, the odds of mortality risk increased by 1.7 for each 1 mg/dl increase in baseline serum creatinine.

**Conclusion:** The prevalence of renal dysfunction in our cohort of acute ischemic stroke patients was high. Presence of baseline renal dysfunction was recorded as an independent predictor of early mortality in the setting of acute ischemic stroke beside other well-known prognostic factors.

## Introduction:-

Stroke represents a continuously evolving medical and social problem, being the second leading cause of death globally after ischemic heart disease. It was responsible for 1 in 10 deaths worldwide<sup>1</sup>. Predictors of early mortality identification are considered to be an important issue for clinicians, so that specific therapies and management strategies can be applied to patients at high risk of mortality. However, limited information is available for short-term mortality after acute ischemic stroke<sup>2</sup>.

Being a worldwide health problem as it was recorded in up to 15% of the adult population, chronic kidney disease (CKD) was considered a substantial risk for cardiovascular morbidity and mortality.<sup>3</sup> Stroke and CKD share a common cardiovascular risk factors including high blood pressure, smoking, high cholesterol and diabetes. Although CKD had been recognized as a risk factor for stroke with a glomerular filtration rate (GFR) of <60 mL/min/1.73 m<sup>2</sup>, little is known about the prevalence of renal dysfunction in the setting of ischemic stroke<sup>4</sup>.

Although CKD has been shown to be associated with poor early outcome after an acute myocardial infarction<sup>5</sup>, there are only few data about the impact of renal dysfunction on mortality in patients suffering from ischemic strokes<sup>6-8</sup>.

The aim of the present study was to assess the prevalence of renal dysfunction among acute ischemic stroke patients and its role on the early overall mortality.

## Patients and Methods:-

This study was a prospective cohort study conducted on 889 consecutive patients with first ever ischemic stroke who were admitted to Intensive Care Unit (ICU) and stroke unit of Neurology Department as well as ICU of Internal Medicine Department of Zagazig University Hospitals during the period from May 2013 to May 2015. Patients who were hospitalized within 24 hours after symptoms onset with a CT-confirmed diagnosis of stroke were included and followed up for 30 days after admission or at least until death.

The follow-up data were available for 800 (90%) of patients who were included in the present analysis. Informed consents from patients or their relatives about the study were obtained. We excluded patients with neurological deficits due to hemorrhagic brain insult transient ischemic attack (TIA), non-stroke causes (e.g. brain tumor), patients on dialysis, patients with missed data or missed follow-up.

All patients of this study were subjected to the following: detailed medical and neurological history taking from either patients or relatives with stressing on stroke risk factors (especially ischemic heart disease, hypertension, smoking, diabetes) complete general and neurological examination with special emphasis on National Institute of Health Stroke Scale<sup>9</sup> (NIHSS) which was done on admission. Electrocardiography was performed for all patients.

Laboratory investigations were done within 24 hours of admission, including complete blood count, random blood sugar, lipid profile (cholesterol, LDL, HDL, and Triglycerides), liver and kidney function tests, uric acid and electrolytes measurements. Calculation of glomerular filtration rate using The Modification of Diet in Renal Disease (MDRD) Study equation<sup>10</sup>:  $eGFR \text{ (ml/min/1.73 m}^2\text{)} = 175 \times (S.\text{creatinine})^{-1.154} \times (\text{Age})^{-0.203} \times (0.742 \text{ if female})$ . CKD was defined according to the National Kidney Foundation definition as kidney damage reflected by an estimated GFR of <60 mL/min/1.73 m<sup>2</sup> of body surface area and state that prediction equations have greater consistency and accuracy than serum creatinine in the assessment of GFR. In addition, prediction equations are equivalent or better than 24-h urine creatinine clearance.<sup>11</sup>

All patients were subjected to Computed Tomography (CT) scan of the brain to confirm diagnosis of ischemic stroke. Repeated CT scans were done 48 hours later if the initial scans were normal. All survivors were followed up in outpatient clinics. This study has been ethically approved by the local ethical committee of our faculty.

## Statistical Analysis:-

Collected Data were tabulated and analyzed using IBM, SPSS Version Statistics 20.0 software package<sup>12</sup>. Descriptions of data in the form mean  $\pm$  standard deviation (SD) for all quantitative variables, and frequency and percentage for all qualitative variables. The independent t-test or chi-square test was used to compare differences between the patient groups with and without renal dysfunction. Significance levels measured according to p value

(probability) where  $p < 0.05$  is significant and  $p < 0.001$  is highly significant. The associations between renal dysfunction and 30-day mortality were evaluated by multivariate Cox proportional hazards models. In the multivariate analysis, patients with  $eGFR < 60 \text{ mL/min/1.73 m}^2$  were further subdivided into two categories: those with  $60 > eGFR \geq 30$  and those  $< 30 \text{ mL/min/1.73 m}^2$ .

### Results:-

The mean age of the 800 ischemic stroke patients was  $62.25 \pm 9.7$  years (range, 37–86 years) with 424 were males (53%) and 376 were females (47%). According to the  $eGFR$  values, we found that 558 patients (69.8%) had normal renal function with  $eGFR \geq 60 \text{ mL/min/1.73 m}^2$  and 242 of patients (30.2%) had renal dysfunction ( $eGFR < 60 \text{ mL/min/1.73 m}^2$ ). 128 of the studied patients (16%) died within 30-days of stroke onset.

The demographics, clinical and laboratory characteristics of the studied patients were shown in **Table (1)**. There was a significant difference between ischemic stroke patients with low and those with normal  $eGFR$  regarding most of the studied variables. The stroke severity (NIHSS) was higher in those with impaired than those with normal renal function ( $13.4 \pm 1.42$ ,  $8.98 \pm 2.75$  respectively). Deceased patients were older than survivors and had a higher percentage of IHD, AF, high glucose levels and more renal impairment than survivors (**Table2**). In the multivariate Cox proportional hazard analysis model adjusted for age and sex (**Table 3**), risk of 30-days mortality was significantly increased in patients with high blood glucose on admission, presence of AF and IHD,  $GFR < 60 \text{ mL/min/1.73 m}^2$ , high NIHSS on admission, and high Uric acid. 30-days mortality risk was increased with  $30 \leq eGFR < 60 \text{ mL/min/1.73 m}^2$  ( $HR = 1.7$ , 95%  $CI = 1.4-2$ ,  $P = 0.002$ ),  $eGFR < 30$  ( $HR = 1.9$ , 95%  $CI = 1.6-2.2$ ), stroke severity ( $HR = 1.5$ , 95%  $CI = 1.3-1.7$ ,  $P = 0.001$ ), presence of atrial fibrillation ( $HR = 1.4$ , 95%  $CI = 1.1-1.7$ ,  $P = 0.007$ ) and IHD ( $HR = 2.1$ , 95%  $CI = 1.6-2.6$ ). **Table (4)** showed predictors of overall mortality after acute ischemic stroke. The risk of mortality was related to age (per 10-year increase), baseline creatinine (per  $1 \text{ mg/dL}$  increase), and NIHSS score (per 5-point increase).

## Discussion:-

Renal dysfunction is considered a valuable predictor of poor outcomes including mortality in patients with ischemic stroke<sup>13-15</sup> as well as in the general population.<sup>16-17</sup> Renal function can be roughly assessed by serum creatinine level but more accurately evaluated from estimated glomerular filtration rate (eGFR), which is usually automatically calculated in a clinical setting, based on serum creatinine and basic demographic findings.<sup>18</sup>

From this study, we observed that approximately one-third (30.2%) of the stroke patients had a low eGFR level ( $\text{eGFR} < 60 \text{ ml per minute per } 1.73 \text{ m}^2$ ). Also, this study showed that patients with renal dysfunction were older, had a higher prevalence of hypertension, a higher NIHSS score and a higher blood glucose level on admission. Similar results were found by Hoshino and colleagues<sup>19</sup> in their study among stroke patients with mild to moderate renal dysfunction. Tsagalis et al.,<sup>20</sup> observed a similar rates (28%) of renal dysfunction in acute stroke patients suggesting a significant prevalence of CKD in stroke sufferers.

Chronic kidney disease was defined as estimated glomerular filtration rate  $< 60 \text{ ml/min/ } 1.73 \text{ m}^2$  according to Yahalom and colleagues<sup>21</sup> who showed in their study that CKD was present in 36% of patients with acute stroke based on MDRD formula and in only 18% if based on Mayo Clinic formula.

It was postulate that the aetiology for the high prevalence of cerebrovascular disorders in patients with renal dysfunction is enhanced atherosclerosis<sup>22-23</sup>. In patients with CKD, advanced asymptomatic atherosclerosis in the carotid arteries compared with healthy control subjects was observed<sup>24</sup>. Moreover, Preston et al.,<sup>25</sup> reported that the increased intima media thickness was directly related with the level of renal dysfunction.

This study showed that early mortality after acute ischemic stroke was quite high and even increased in patients with associated renal dysfunction. This increased risk of mortality appeared to be associated with severity of baseline renal dysfunction.

In this study, the 30-day mortality of all ischemic stroke patients was 16%, whereas it was 14.3% in patients with baseline  $\text{eGFR} \geq 60 \text{ ml/min/ } 1.73 \text{ m}^2$ . Similar rates were reported from the European Registries of Stroke Collaboration in which 1-month mortality after stroke ranged from 13 to 27%<sup>26</sup>. While a lower rates of 13% were observed by Yahalom and colleagues.<sup>21</sup>

However a lower rate of 10% mortality at 30 -days were reported by De Jong et al.,<sup>27</sup> in 998 patients with first-ever cerebral infarction. In addition 5%<sup>28</sup>, 7.6%<sup>29</sup> and 8.2%<sup>30</sup> mortality at 30 days after stroke were reported in previous Studies.

The present study revealed that old age, presence of AF, IHD, baseline creatinine, and high uric acid level, low eGFR, higher NIHSS on admission were associated with early mortality. These results were in agreement with previous studies<sup>31-32</sup>

From this study, we observed a higher mortality rates (19.8%) in patients with baseline  $\text{eGFR} < 60 \text{ ml/min/ } 1.73 \text{ m}^2$  in comparison to those with normal eGFR (14.3%). Also, the severity of impaired kidney function was associated with increased risk of early mortality (odd ratio= 1.7, 95% CI =1.4- 2 , per 1mg/dl increase in serum creatinine). Similarly, Carter et al<sup>33</sup>. showed that serum creatinine level was a strong predictor of mortality in patients with ischemic stroke. Furthermore, other studies showed that low eGFR was associated with a higher in-hospital mortality rates.<sup>3,34</sup>

Data from Nationwide Inpatient Sample study showed that among 1 million of stroke hospitalizations during the study period, 6.1% had a co- morbid diagnosis of CKD, and 9% of those with CKD died in hospital. Presence of CKD was independently associated with higher odds of dying during stroke hospitalization regardless of stroke type<sup>8</sup>.

The association between kidney function and survival following an acute ischemic stroke could be due to shared risk factors underlying vascular diseases including age, diabetes mellitus, hypertension, AF, smoking, coronary artery disease and dyslipidemia.<sup>35</sup> In addition, Ovbiagele<sup>8</sup> stated that hospitalized stroke patients with CKD are less likely to receive evidence-based therapies compared to patients without CKD that contribute to poorer clinical outcomes in these patients. Other reasons for poor early outcomes in stroke patients with compromised kidney function include the association of CKD with conditions that hinder rapid recovery such as oxidative stress, elevated uremic toxins, including plasma dimethylarginine, electrolyte derangements, and procoagulation.<sup>36</sup>

Large sample size could be a point of strength in this study. However, some limitations should be mentioned. The diagnosis of CKD requires the presence of kidney damage for  $\geq 3$  months. GFR was only estimated once, meaning that some patients with acute kidney injury may have been misclassified as having CKD. Also, no

differentiation was possible between the different subtypes of ischemic stroke as the localization and extension of ischemic stroke may have prognostic significance. Moreover, our center is a tertiary care center with a large referral base, so patients included may have more severe strokes than patients treated at community hospitals, which may explain higher mortality compared to other studies.

In conclusion, impaired kidney function (assessed by eGFR) was prevalent in patients presented with acute ischemic stroke and associated with increased early mortality. This finding suggests that eGFR can be added to the other known prognostic factors of ischemic stroke and emphasizes the importance of monitoring and proper management of kidney disease in those patients.

##### Key words:-

plastic waste, brick, mould.

#### Abstract

This project reviews one of the sustainable and effective ways of managing plastic waste in urban and rural parts of India in order to minimize their adverse environmental impacts. The requirement for such a research is validated as it is desirable to change the unsustainable arrangement of consumption, production and disposal associated with these materials. After studying the whole scenario, I developed an effective way of utilizing the soft plastic waste and recycling it into plastic bricks which are very light in weight and can withstand high amount of pressure as compared to standard modular bricks. However due to some physical and chemical properties of plastic which can be disadvantageous to the brick created from it, some changes in its design and manufacturing processes can be made.

#### Introduction:-

Environmental engineering is the branch of engineering bothered with the application of scientific and engineering principles for conservation of human populations from the effects of adverse environmental factors; preservation of environments, both local and global, from the potentially destructive effects of natural and human activities; and improvement of environmental quality. Relating to this, environmental engineers also work upon the different strategies and effective ways of managing the waste created naturally and artificially within the environment. Among the different types of wastes generated, plastic waste is one of the most hazardous wastes which need to be treated in a proper systematic way.

Plastic Waste management is all the activities and actions required to manage plastic waste from its inception to its final disposal. This includes amongst other things, collection, transport, treatment and disposal of plastic waste together with monitoring and regulation. It also encircles the legal and regulatory framework that relates to plastic waste management enclosing guidance on recycling etc.

As more cities become industrialized, the surplus problem of plastic waste management comes along with it. Technological and economic advancement has made the types and kinds of plastic wastes very diverse and their management much more complex. The complex nature of disease outbreaks; cases of cholera as well as other diarrheal diseases in recent times authenticate this fact. Furthermore, the changing economic trends and rapid urbanization disarrange plastic waste management (PWM) in developing countries. Consequently, plastic waste is not only increasing in composition but also changing in quantity from a few kilograms to tonnage proportions.

The plastic brick is compressed by the two iron rods. Firstly the plastic waste is being collected in bulk amount. Then a modular brick mould is being taken and plastic waste such as crisp bags and polythene bags are filled in it.

**Corresponding Author:- Shikhar Shrimali.**

Address:- Civil Engineering, Neotech Institute of Technology.

Air tight amount of plastic waste has to be filled in the mould. After that the mould is closed with a metal plate on it and allowed to heat in a solar grill oven for 1 hour. Then the mould is taken out from the oven and cooled down immediately with a jet spray. After this with the help of mechanical means the plastic brick is being removed from the mould.

### **Literature Review:-**

The need of creating this plastic waste brick is as mentioned.

Municipal control board emphasizes the current scenario of plastic waste in india.

The leading factor for plastics is its functional convenience and cost effectiveness. By upright economies of scale, plastics have disintegrated the traditional industries in india and have slowly conserved the throwaway culture in the indian society.

The bottled water, junk foods and pepsi coke culture in the country distributes to the increasing plastic waste generation in india. The problem becomes very vast when there is no effective end of life management to take care of the litter, and this creates an environmental, social as well as economic problems.

The increasing use of plastics as a packaging material has resulted in the landscapes of india being littered with non-biodegradable plastic bags and PET bottles, with plastic bags commanding the litter.

High amount of plastic waste has a value, and is constantly taken care of by the informal recycling sector.

Market executives guide the informal sector, and they contribute to the waste system excessively by collecting waste material that has a value, thereby taking over a part of the responsibilities on the municipalities.

Inspite the attempts from the formal and the informal sector, massive quantities of the plastic waste remain uncollected. Waste management is also embarrassed by the lack of public awareness and low municipal finances in the country.

Most municipalities are malnourished of finances and this blemish the system of waste collection and disposal in many cities in india. Even when budgets are consequent for collection, safe disposal remains a primary problem.

Taking in consideration, improper waste management leads to so many environmental problems. The situation is more immense in countries like india where economic growth as well as urbanization is quite frequent.

A total of 36.5 million tonnes per year that is 36.5 kg per individual of municipal solid waste is generated in the country. Considering the fact that the plastic consumption in the country is 4 million tonnes and 52% of the plastics is used for packaging, and then we could estimate that the plastic waste generated is at least 2 million tonnes and not more than 4 million tonnes.

In view of the limited resources and availability of land for disposal, especially in the mega cities, there is a great need for an effective effort to develop cost-effective and feasible policy options for overcoming the waste management problems.

### **Problem Definition:-**

For effective plastic waste management, it is necessary to carry out the work in a systematic step by step manner. For this areas where waste management is required is studied out and then which techniques of waste collection and disposal will be the most suitable is being analyzed and carried out.

Plastic waste contains high amount of polythene bags and crisp bags which is further collected and used for manufacturing of newly designed plastic brick which proves to be cost effective and beneficial as it is used in a proper way rather than disposing or burning it in the atmosphere.

Also the waste disposing techniques of plastic waste such as pyrolysis, chemical decomposition of waste, land filling, incineration, composting are quiet time consuming techniques and does not offer to clear out large quantities

of waste in a short period of time. Hence this method of using soft plastic waste for a beneficial purpose of making out bricks which are very light in weight and gives high pressure handling capacity would prove to be very useful as it would minimize the plastic waste at a large extent.

**Aim of the Project:-**

The aim of the project is to study the plastic waste management strategies and provide an effective way to minimize it and use it for a beneficial purpose.

**Further adding to this, the main project work also relates the following:-**

- Compilation of data on plastic waste from rural and urban areas.
- Analysis and study of plastic waste to understand its utilization or disposal.
- To measure the willingness of help and co-operation provided by people for plastic waste management.
- To review the methods for waste collection, transportation and disposal as available for municipal solid waste.
- To provide an effective way of using plastic waste into a very beneficial way and giving a plastic brick as a final product by using plastic waste.
- The need of developing such a brick was to minimize the plastic waste by using it in the best possible way and replacing these bricks with raw mud as a constructing material for houses so that the major issue of houses getting washed away during floods and damaging during earthquakes can be minimized.

**Design of brick:-****OVERVIEW:-**

- ❖ In present times, in rural and coastal regions of India, there is no waste management system present to deal with the continuous increase of plastic waste that come into the villages everyday due to improper dumping by the localities.
- ❖ The villages due to lack of education and understanding about the importance of waste management, just burn away the waste in their stoves or in open places or may throw it in the nature, which creates problems such as foul smell around the region, blockage of drainage pipes, which are created to prevent flooding in the area, unhealthy environment for living and polluting the nearby river banks.

**The Prototype:-**

- A prototype of the block made from plastic waste has been made.
- This will give a basic idea of how the block can be used in real life.
- The block will be used as a kind of fundament for the houses, covered with clay, so they maintain the look as from today.
- After completion of the monsoon seasons, the house will still be existing with the roof on so there's no need to build up the house again from the scars as they need to do it today.

**Fig 4.1:-** Sketchmatic Diagram Of Brick

**Fig 4.2:- Plastic Brick Arrangement.**

#### **Required Materials:-**

- Plastic waste such as crisp bogs, polythene bags.
- Standard brick mould for preparing bricks of dimension 19\*9\*9 cms.
- A solar grill oven or an electric oven of heating capacity 100 to 500° C.
- A metal cover plate and a compressing/tamping rod.
- A water jet sprinkler.

#### **Preparation Methodology:-**

- At initial stage, waste soft plastic (polythene bags, crisp bags) of (approximate 4 to 5 kgs) is filled up in a brick mould of dimensions 19\*9\*9cms and then it is made air tight so as to prevent the leakage of viscous plastic.
- After filling the mould with plastic bags, it is compressed with a tamping rod until fully filled and then it is closed with a metal plate.
- The brick mould is now placed in a heating oven and heated at 175 to 200°C for one and a half to two hours.
- Further the mould is taken out from the oven with accurate precautive measures and for sudden cool down, a jet of water is sprayed on the mould.
- Finally with the help of mechanical means, the final product a plastic brick is obtained.

#### **Result and Analysis:-**

##### **General:-**

To analyze the compressive strength and the technical features of plastic brick, we will conduct the laboratory test and thus the brick sample will be taken to the laboratory.

##### **Standard and nominal brick sizes in India:-**

In India, according to recommendation of BIS, standard modular brick size is 190 mm x 90 mm x 90 mm.

With mortar thickness, the dimension of the brick becomes 200 mm x 100 mm x 100 mm which can be also called as the nominal size of the modular brick.

##### **Compressive /Crushing Strength of Bricks:-**

Compressive strength of bricks are very unsteady, and may vary from 30 kg/sq. cm to 150 kg/sq. cm for hand-made burnt bricks, while compressive strength of heavy duty bricks which are machine pressed may have compressive strength as high as 450 kg/sq. cm, and even 500 kg/sq. cm. The minimum compressive strengths of burnt bricks tested flat-wise described are:

1. Common building bricks—35 kg/sq. cm,
2. Second class bricks—70 kg/sq. cm,
3. First class bricks— 105 kg/sq. cm.
4. Compressive strength of bricks, not less than 140 kg/sq. cm are graded as AA class.

The strength of brick decreases by about 25 percent when drowned in water.

Strength of sun-dried bricks is from 15 to 25 kg/sq.cm

Water absorption of bricks after 24 hours is shown as follows:

1. First class brick-20%
2. Second class brick-22%
3. Third class brick-25%

Heavy duty machine made bricks should not absorb more than 5% of their weight.

### Testing of Plastic Brick:-

#### Determining the compressive strength of three different graded bricks:-

##### Theory:-

- Bricks are categorized into three different grades as per IS 1977-1976. The minimum compressive strength of the brick is at the class A that is equal to 350 kg/cm.sq.
- The minimum compressive strength of class 'c' bricks should not be less than 350 kg/cm.sq
- Also the compressive test of individual bricks would not fall below the maximum requirement by more than 20%.

#### Instruments and Materials Required:-

- 1) Compressive testing machine.
- 2) Plastic bricks sample.
- 3) Scale / Ruler.

#### Application:-

Compressive strength is one of the prime property of bricks as various types of bricks are used for different purpose of work. It is important to check out it's compressive strength for given grades of brick.

#### Diagram:-

Fig 5.1:- Compression testing machine

#### Procedure:

- Take a sample of plastic and measure its dimension.
- After measuring the dimension, calculate cross sectional area of bricks with help of it.
- Place the block between the mouth of compression testing machine.
- Apply the load continuously on the block until cracks are formed on the brick.
- When cracks are recognized on bricks, stop the machine and measure applied load and note down the readings.
- Repeat the above procedure for three different types of machines.

**Precautions:-**

- There should not be any kind of cracks on the brick before testing its compressive strength.
- Mechanism of crack on the brick should be noted delicately.
- Reading should be taken without any mistakes.

**Observation Table:**

Sr No.	Types of bricks	Size of bricks	Plastic used (in kgs)	Cross-sectional area of bricks	Load applied	Compressive strength
1)	A	22*10*5.5	5kg	55.06cm.sq	5000kg	90.86kg/cm.sq
2)	B	22*10*5.6	10kg	54.30cm.sq	7000kg	128.91kg/cm.sq
3)	C	22.5*9.5*5.8	15kg	50.39cm.sq	10000kg	198.45kg/cm.sq

**Calculation:-**

$$\text{Compressive strength} = \frac{\text{Maximum load at failure (N)}}{\text{Average area of bed face (mm}^2\text{)}}$$

- a) Compressive strength of bricks (A):  
 $P/A = 5000/55.06 = 90.86 \text{ kg/cm.sq}$   
 b) Compressive strength of brick (B):  
 $P/A = 7000/54.30 = 128.91 \text{ kg/cm.sq}$   
 c) Compressive strength of brick (C):  
 $P/A = 10000/50.39 = 198.45 \text{ kg/cm.sq}$

**Results:-**

Compressive strengths of plastic bricks are as follows:

- 1) For class 'A' bricks, compressive strength is 90.86kg/cm.sq
- 2) For class 'B' bricks, compressive strength is 128.91kg/cm.sq
- 3) For class 'C' bricks, compressive strength is 198.45kg/cm.sq

**Conclusion:-****Future Scope:-**

After preparing a brick out of plastic waste it can be concluded that this project will be proved very helpful for the rural and coastal region people and will have a great impact on environmental pollution created by plastic wastes. Local people of these areas will be free from the hazardous issues of waste around them and this brick will be used for redesigning their houses which used to get washed away in the monsoon season. This project is an innovative and new idea in itself because it deals with the problem at a very macro level but solves it in a very micro perspective view. This project can be further implemented in the other parts of the world after its success in india.

**Final Compressive Strength:-**

After testing the three samples of the plastic brick, the average compressive strength comes out to be as follows:

$$\text{Average compressive strength} = \frac{90.86 + 128.91 + 198.45}{3} = 139.40 \text{ kg/sq.cm}$$

The average compressive strength of the plastic brick is 139.40 kg/sq.cm

Adoption of smartphone, Organization  
and business, Diffusion of innovation

### Abstract

Telecommunication technology through smartphones currently provides many benefits and convenience to users. However, not all users are optimizing their smartphones. Currently, there are minimal knowledge of the reasons that entrepreneurs adopted and used smartphones to manage the organization and business. For this purpose, the operational framework applied to this research was adapted from Unified theory of Acceptance and Use of Technology. This quantitative approach research through questionnaires examined 104 respondents' perception on social influence, facilitating conditions, performance expectancy, effort expectancy, the importance of adopting and use of smartphones within entrepreneurs for managing business. The contribution of this research revealed the significance of smartphone usage for business management. The outcomes of this investigation indicated that there was no significant social influence toward entrepreneurs to use smartphone for managing business. Overall, entrepreneurs believed that smartphone was easy to use and managing business using smartphone can help them increase their performance. This contributed to an increase in their intention to use them. However, the findings showed that the smartphone usage for business management by entrepreneurs is low. Regarding the limitations, these happened because of finance and time factor. To overcome the limitations, this research recommends further studies that apply qualitative research.

### Introduction:-

The success and importance of smartphone, especially for business users have very important implication in business management. The Internet has already profoundly changed the way entrepreneurs acquire information about business, managing their company and interact with others, and smartphone plays a large part in this process. The development of the mobile operating systems and software applications has impact on the usage and consumption to manage business.

Smartphone is a phone with an integrated computer feature that can perform more compare to standard phones. According to the Malaysian Communication and Multimedia Commission (2014), the number of smartphone user in Malaysia was 53.4% from 30,387,862 populations in 2014. The most popular operating system that used in Malaysia is Android (53%), iOS (23%) and Windows (10%). Today, smartphone not only for communication, it also use for

browsing, social networking, entertainment, and others. The smartphone is a phone that provides more functions and applications than standard phones. The arrival of smartphones has impacted not only to how people communicate but also to business, entertainment and journalism (The Denver Post, 2012).

The advancement of ubiquitous business management will accelerate the productivity of managing business. In order to survive, companies must quickly recognize these various changes that have a major impact on their business and react with the client in a timely manner. Utilizing the existing telecommunication technology, smartphone, it will increase the effectiveness and productivity of an organization. Using smartphone can offer flexibility that will always allow managing companies ubiquitously. According to SME Cloud Malaysia (2015), 91% of SMEs don't optimize their smartphone for business management. The most common application like telephone, SMS and in the meantime camera functionalities are widely used. This research recognizes the importance of smartphones for managing business. For this, an aim of this paper is to determine and examine the effect of smartphone adoption for business management by applying Unified Theory of Acceptance and Use of Technology (UTAUT).

#### **Small and Medium Enterprise (SME):-**

The main criterions that predominate to define SMEs are the number of employees, turnover and the balance total (Burns, 2001). For example, the European Union (EU) define an SME as enterprises that employ no more than 250 employees, a maximum annual turnover of 40 million Euros and a maximum annual balance sheet total of 27 million Euros (Levy et al., 2003). The few other defining characteristics of SMEs are: (a) Independent ownership and operations, (b) Close control by owners/managers who contribute most, if not all the operating capital and (c) Principal decision-making by the owners/managers (ABS, 2001).

SMEs are very large heterogeneous group of businesses usually operating, among others in the service, trade, agriculture, and manufacturing sectors. According to Ritchie and Brindley (2005), SMEs are significant because of their entrepreneurial spirit and adaptive capabilities. More importantly, SMEs are recognized for being the driver of economic growth and innovation that are crucial for fostering competitiveness (Levy et al., 2003). Their knowledge allows them to innovate on the product or process, which helps them form a competitive advantage to generate more profits (Loh and Koh 2004).

#### **Smartphone:-**

Cassavoy (2012) defined smartphone as a device that enables the user to make telephone call and at the same time has some features that allow the user to do some activities that in the past was not possible unless using a computer or a personal digital assistant (PDA), such as sending and receiving e-mails and amending an office document.

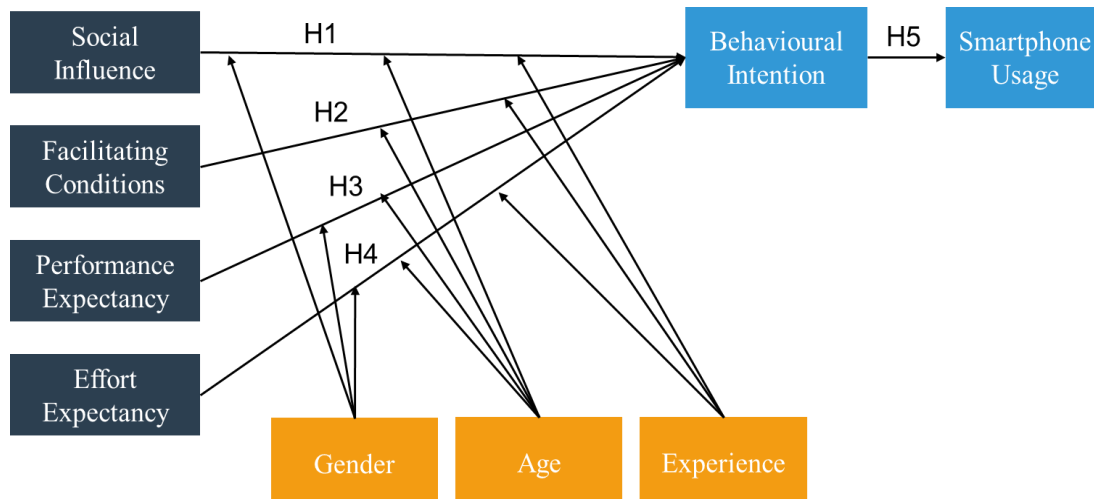

The important things that distinguished smartphone from cell phones are the feature. The operating system allows the smartphone to run its applications such as iPhone runs iOS, other kind of handsets runs Google's Android operating system such as Samsung and Lenovo, and some other runs Microsoft's Windows Phone. Cui and Roto (2008) found that the main use of smartphones was task-oriented with goals of information seeking, communications, online transactions, and managing personal information.

#### **Application of UTAUT:-**

Adoption and use are imperative in this research. The main theories applied in adoption studies are the Diffusion of Innovation (DOI) theory (Rogers, 2003); Unified Theory for the Acceptance and Use of Technology (UTAUT) (Venkatesh et al., 2012, 2003a) and Technology Acceptance Model (TAM) (Davis, 1989). It was found that TAM is the most popular, followed by UTAUT. For instance, DOI and TAM were combined to explain the adoption of smartphones in a logistic industry (Chen et al., 2009). However, UTAUT are preference within the perspective of adoption and use in this research.

The operational framework involved independent variables constructs include social influence, facilitating conditions, performance expectancy and effort expectancy that are drawn from UTAUT as shown in Figure 1. Theory also revealed that all the factors that affect user behavioral intention (Venkatesh, 2012). Finally, the mediating variable behavioral intention is influenced by the smartphone usage. Usage measured by the features of a smartphone, which are e-mailing, browsing, using social media, taking a photo and playing games.

Source: Venkatesh(2003)

**Figure 1:-** Operational Framework.

### Methodology:-

The UTAUT model integrates four core determinants, social influence, facilitating conditions, performance expectancy, and effort expectancy significantly predicts intention suggested by Venkatesh et al. (2003). The UTAUT model is well suited to the context of this study. Based on these observations, the hypotheses of this study are:

- Hypothesis 1: Social Influence has an influence on the behavioural intention moderated by gender, age and experience.
- Hypothesis 2: Facilitating Condition has an influence on the behavioural intention moderated by gender, age and experience.
- Hypothesis 3: Facilitating Condition has an influence on the behavioural intention moderated by gender, age and experience.
- Hypothesis 4: Effort Expectancy has an influence on the behavioural intention moderated by gender, age and experience.
- Hypothesis 5: Behavioural intention has an influence on the smartphone usage.

The questionnaire utilized in this research consisted of 3 sections meant to examine the demographics and background of respondents, questions related to independent variables and mediating variables namely the social influence, facilitating condition, performance expectancy, effort expectancy and behavioural intention, and questions to seek the smartphone usage as the dependent variable of this study. The questionnaires applied the Likert scale 1 to 5 except the demographic section.

The survey questionnaire was distributed among the SMEs in Malacca, Malaysia. The population was 72,806 comprises of enterprises registered with the Companies Commission of Malaysia (SSM) in Malacca, Malaysia. Krejcie and Morgon (1970) suggested the number of sample must depend on the number of population. From the population, the respondents targeted were 381 samples. This study applied simple random sampling where every single element in the population has a known and equal chance of being selected as a member of the sample.

Given the nature of the research topic, it is most suitable to employ both primary and secondary data collection method. Correlation analysis and regression analysis were applied using the Statistics Package for Social Science (SPSS) Version 20. The validity and reliability of the primary data was ascertained before further analysis of the data been computed. Pilot test were carried out involved 3 academicians, 5 students and 2 people at large adopting smartphone.

### Result:-

Data analyses were done after the process of cleaning up the data had been performed. From 600 questionnaires distributed only 104 respondents replied.

**Demographically:-**

The respondents represented by 46 males and 58 females. In term of age, 58.7% represent 21 – 30 years old, 22.1% represent 31 – 40 years old, 14.4% represent 41 – 50 years old, and 51 years old and above is the lowest at 4.8%. In term of race, majorities were Malay(74%) compared to Chinese, Indian and others. In term of position, 12.5% were owners, 10.6% were managers, 12.5% were executives, 8.7% were supervisors, 23.1% were administration staff, 28.8% were secretary/clerk and 3.8% were other positions. In term of monthly income, with more than half of the responses earn RM 3,000 and above in a month. All the respondents were smartphone user but only 55.8% use their smartphone for managing business. Approximately 42.3% of the respondents had experience using smartphone more than 6 years.

Total of 26 questions were used in the research. Reliability analysis showed that the Cronbach's alpha for overall variables was 0.943 indicates that very high and good reliable research.

**Correlation analysis:-**

Bivariate correlation was conducted to examine the interrelationships among the variables in this study. There were six variables investigated to understand the adoption of smartphone usage for managing business. As shown in Table 1, the mediator variable in this study (behavioural intention) was significantly and positively correlated with all four independent variables, namely social influence ( $r=.741$ ,  $p=.000$ ), facilitating condition ( $r=.803$ ,  $p=.000$ ), performance expectancy ( $r=.790$ ,  $p=.000$ ), and the highest correlate was effort expectancy ( $r=.860$ ,  $p=.000$ ).

Despite that, the independent variables namely the performance expectancy ( $r=.413$ ,  $p=.000$ ), effort expectancy ( $r=.452$ ,  $p=.000$ ), and the mediating behavioural intention ( $r=.512$ ,  $p=.000$ ) were significantly and moderately correlated to the smartphone usage. Nevertheless, social influence ( $r = .293$ ,  $p = .003$ ) and facilitating condition ( $r = .402$ ,  $p = .000$ ) were significantly and weakly correlated.

Table 1:0- Correlation Analysis for All Variables

Variables	SC	FC	PE	EE	BI	SU
Social Influence	1					
Facilitating Condition	.749**	1				
Performance Expectancy	.761**	.743**	1			
Effort Expectancy	.670**	.779**	.743**	1		
Behavioural Intention	.741**	.803**	.790**	.860**	1	
Smartphone Usage	.293**	.402**	.413**	.452**	.512**	1

Notes: Independent Variables: Social Influence, Facilitating Condition, Performance Expectancy, Effort Expectancy. Mediating Variable: Behavioural Intention. Dependent Variable: Smartphone Usage.

\*\* . Correlation is significant at the 0.01 level (2-tailed)

**Multiple regression analysis:-**

Table 2 shows the model summary of independent variables as predictors. It suggested two models where Model 1 was independent variables to mediating variable and Model 2 was independent variables to mediating variables includes moderating variables. Table 2 shows that R square value for Model 1 was 0.815, which means that 81.5% of independent variables influence the behavioural intention. However, R square for Model 2 after considering the moderator had slightly increased which was 0.818 (81.8%). It shows that 0.3% increasing when gender, age and experience moderated the social influence, facilitating condition, performance expectancy, and effort expectancy. This result shows the consistency of previous study which was all four independent variables have huge contribution when measuring behavioural intention on smartphone adoption.

**Table 2:-** Model Summary of Independent Variables.

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	0.903 <sup>a</sup>	0.815	0.807	0.94915
2	0.904 <sup>b</sup>	0.818	0.804	0.95644

**Notes:**

**Predictors:** (Constant), Effort Expectancy, Social Influence, Performance Expectancy, Facilitating Condition

**Predictors:** (Constant), Effort Expectancy, Social Influence, Performance Expectancy, Facilitating Condition, Gender, Age, Experience

Table 3 shows the contribution of behavioural intention as mediator towards smartphone usage. The value of R square presented 0.262 of predictors, which was contributed 26.2% towards dependent variable.

**Table 3:- Model Summary of Mediating Variables**

Dependent Variable	R	R Square	Adjusted R Square	Std. Error of the Estimate
Smartphone Usage	0.512 <sup>a</sup>	0.262	0.255	4.49596

Notes:a. Predictors: (Constant), Behavioural Intention

#### Anova Analysis:-

Following to multiple regression, ANOVA was run simultaneously to check the F-test to compare the means of the groups and whether there is a significant difference in strength of independent variable. Table 4 shows the significance level of the multiple regression analysis (MRA). The result of dependent variable show (F=61.456, p=.000) for behavioural intention after considering the moderator and (F=36.200, p=.000) for smartphone usage where behavioural intention as predictors. This means that the probability of these accruing by chance was less than 0.05 means a significant relationship present between independent variables and dependent variable. In addition, there is also significant relationship when independent variables and dependent variable after considering the moderating variables. It can be seen that the regression model is a fit to the data.

**Table 4:- Anova.**

Dependent Variable		Sum of Squares	df	Mean Square	F	Sig.
Behavioural Intention	Regression	393.528	7	56.218	61.456	0.000 <sup>a</sup>
	Residual	87.818	99	0.915		
	Total	481.346	103			
Smartphone Usage	Regression	731.738	1	731.738	36.200	0.000 <sup>b</sup>
	Residual	2061.791	102	20.214		
	Total	2793.529	103			

Notes:

Predictors: (Constant), Effort Expectancy, Social Influence, Performance Expectancy, Facilitating Condition, Gender, Age, Experience  
Predictors: (Constant), Behavioural Intention

#### Hypotheses:-

The study sought to investigate the effects of social influence, facilitating condition, performance expectancy, and effort expectancy on entrepreneurs' behavioural intention, which in turn, influences smartphone usage to manage business. In order to test these hypotheses, a linear multiple regression analysis method was conducted to examine the effect of these predictors on mediator variable. Table 5 summarized the hypothesis findings.

**Table 5:- Result of Hypotheses Testing.**

No.	Hypotheses	Result
1	Social Influence $\geq$ Behavioural Intention	Not Supported
2	Facilitating Condition $\geq$ Behavioural Intention	Supported
3	Performance Expectancy $\geq$ Behavioural Intention	Supported
4	Effort Expectancy $\geq$ Behavioural Intention	Supported
5	Behavioural Intention $\geq$ Smartphone Usage	Supported

**H<sub>1</sub>:** Influence between social influence to behavioural intention moderated by gender, age and experience. The result of regression analysis shows that this construct yielded no significant and positive effect on behavioural intention on using smartphone for business management ( $\beta=.133$ ,  $t=1.804$ ,  $p=0.74$ ). Therefore, there was no evidence to reject  $H_0$ .

**H<sub>2</sub>:** Influence between facilitating condition to behavioural intention moderated by gender, age and experience. The result of regression analysis shows that this construct yielded significant and positive effect on behavioural intention on using smartphone for business management ( $\beta=.183$ ,  $t=2.280$ ,  $p=0.25$ ). Therefore,  $H_2$  was fully supported.

**H<sub>3</sub>:** Influence between performance expectancy to behavioural intention moderated by gender, age and experience. The result of regression analysis shows that this construct yielded significant and positive effect on behavioural intention on using smartphone for business management ( $\beta=.192$ ,  $t=2.475$ ,  $p=0.15$ ). Therefore, H<sub>3</sub> was fully supported.

**H<sub>4</sub>:** Influence between performance expectancy to behavioural intention moderated by gender, age and experience. The result of regression analysis shows that this construct yielded significant and positive effect on behavioural intention on using smartphone for business management ( $\beta=.486$ ,  $t=6.479$ ,  $p=0.00$ ). Therefore, H<sub>4</sub> was fully supported.

**H<sub>5</sub>:** Influence between behavioural intentions to smartphone usage. The result of regression analysis shows that this construct yielded significant and positive effect on using smartphone for business management ( $\beta=.512$ ,  $t=6.017$ ,  $p=0.00$ ). Therefore, H<sub>5</sub> was fully supported.

#### Effect of Demographic as Moderated Variables:-

The results of the moderated variables as shown in Table 6, disclosed that all the moderator as not significant to the independent variables ( $p>0.05$ ).

**Table 6:-** Exclude Variables.

Model		Beta In	t	Sig.	Partial Correlation	Collinearity Statistics
						Tolerance
1	Gender	0.049 <sup>b</sup>	1.095	0.276	0.110	0.934
	Age	0.004 <sup>b</sup>	0.087	0.931	0.009	0.755
	Experience	0.030 <sup>b</sup>	0.642	0.522	0.065	0.865

Notes: a. Dependent Variable: Behavioural Intention

b. Predictors in the Model: (Constant), Effort Expectancy, Social Influence, Performance Expectancy, Facilitating Condition

This means that the effect of social influence, facilitating conditions, performance expectancy, and effort expectancy not contributed by gender, age, and experience. The implications of these results are gender, age, and experience of individuals have no influence on adopting smartphone for business management.

#### Discussion:-

The total respondents were 104 entrepreneurs who involved in business in the area of Malacca, Malaysia. From the analysis, majority of the respondents agreed that social influence, facilitating condition, performance expectancy, effort expectancy, and behavioural intention influence them to use smartphone for managing business. However, this study find out the respondents utilize their smartphone to managing the business still low.

#### Smartphone Usage towards Business Management:-

It can be seen that there are several aspects of smartphone technologies that can be explored. Therefore this research on smartphone and entrepreneurs should provide a contribution that focuses not only on the device, but also the use aspect including the frequency of use for business activities. This research provides the relationship between the factors that influenced the behaviour intention that effect the usage of smartphone for managing business.

In terms of the use of smartphone, making phone calls, texting, e-mailing, general Internet browsing, downloading application, and online social networking proved to be the most popular cases among respondents. Previous research has shown that e-mail, an application offered by all smartphones is identified as an important feature (Kim, 2011). To achieve ubiquitous business management, one of the factors should be utilizing their smartphone for managing the business. However, the result showed that only small number of user used smartphone for managing business using Voice over IP and business management application where the means were 2.95 and 2.76. The percentage of respondents using business management application constantly low (18.3%), whereas 30.8% of respondents never used it before.

#### Social Influence and Behavioural Intention:-

Findings show a social influence is not supported in this research. It was suggested that respondents would not be influenced by their friends and family to use smartphone for managing business even though smartphone is a

necessity of today. Demographically, most of respondents are smartphone user and almost half of them used it for more than 6 years.

#### **Facilitating Condition and Behavioural Intention:-**

This research findings confirmed that entrepreneurs need to have time, money, knowledge, fit well and solving problem of using quickly in order to adopt smartphones for managing business. For a new adopter, familiarization of the smartphone and the application will be motivated by the performance expectancy.

#### **Performance Expectancy and Behavioural Intention:-**

In this study, the hypothesis was supported because entrepreneurs aware that smartphone can help them to increase their productivity and performance, to become a ubiquitous business management.

#### **Effort Expectancy and Behavioural Intention:-**

Effort Expectancy is related to the ease of use of smartphones for entrepreneurs for managing business. This hypothesis can lead to an understanding for smartphone developers and application developers that they should attempt to develop devices and technologies for entrepreneurs that are user friendly.

#### **Behavioural Intention and Smartphone Usage/Actual behaviour:-**

The effect of behavioural intention to smartphone usage can be identified with simple regression analysis. This study found there have positive relationship between behavioural intentions to smartphone usage.

There are limitation to the result such as lower response rate may have affected the analysis of cultural differences in the intention to use a smartphone. The overall response rate for the survey should be 30% to 60% (Fowler, 2009). The lacking of top level management as the respondents limits the generalizability of the results (Nenty, 2009). The third limitation was that 44.2% of the research participants not used their smartphones for managing business. This limits the generalization of the results those who do not use their smartphone for managing business, it is just a mere perception of individual.

#### **Conclusion:-**

This research focused on a trend that are currently occurring in society and in the technology sectors – an entrepreneurs and smartphone technology. Smartphones provide advanced telecommunication and mobile phone functions, which can provide seamless benefits to the users and to work productively that can contribute to better quality of life. From the statistical analysis it was found that many individuals are connected globally through their mobile phones. However, those entrepreneurs are using the smartphones at a basic level only for making a phone call, SMS, email, and browsing. Entrepreneurs were also likely to use their smartphones for online social networking and downloading application, but surprisingly more than half of them did not use smartphones for business management purposes. It can be concluded that smartphone adoption can offer critical mass adoption but the gap is still exists within entrepreneurs used towards business management.

#### Abstract

Ethylenediamine modified date palm trunk an attractive approach for improvement of lead (II) uptake from aqueous solutions. Factors influencing Pb(II) adsorption onto MDPT such as initial Pb (II) concentration, pH, contact time, and adsorbent dosage were investigated. The adsorption equilibrium was established within 120 min. Before and after adsorption, MDPT was characterized by Fourier transform infrared spectroscopy (FTIR). The results showed that the pseudo-second order model fits the experimental data very well. The equilibrium data have been analysed using Langmuir and Freundlich isotherm models. The recovery of Pb(II) adsorbed on MDPT was found 98.5% using 0.2 M HCl. Desorption experiments showed the feasibility of the regeneration of MDPT.

#### Introduction:-

A large variety of heavy metals is discharged into the environment and constitutes the most significant environmental pollutants found in wastewater. Long-term exposure to those solvated metal ions and consequently the effects on human health and natural ecosystems are critical issues. Lead is considered severe toxic and more hazardous to the environment and organisms compared to “the big three” of heavy metals (others are Cd and Hg) [1]. Lead is generated into the environment from various industrial effluents such as metal electroplating, mining, extractive metallurgy and battery manufacture [2]. Biosorption is a promising method for removal of heavy metals from waste water because of its advantage of low cost and good adsorption potential. Adsorption is the most preferred method for removal of heavy metals from aqueous solutions due to its simplicity and its high effectiveness [3-5].

In recent years, many agro wastes, including sawdust [6], carrot residue [7], sugar beet pulp [8], tree fern [9], rice husk [10], papaya seed carbon [11], eucalyptus bark [12] and date palm trunk [13], had been used to adsorb heavy metals from aqueous solution. The agricultural wastes being abundantly available with low cost mainly comprise of cellulose which is a natural biopolymer with sorption property. For improving the adsorption capacities of agro wastes, various chemical modifications have been reported [14, 15].

The purpose of this study is to utilize date palm trunk (cellulosic agro wastes) after its chemical modification as a potential adsorbent for treatment of wastewater containing Pb(II). The values of well-known kinetics and isotherms

studies have been performed to elucidate the equilibrium adsorption behavior of Pb(II) onto the adsorbent. The effect of contact time, pH, concentration and dosage on the adsorption capacity has been investigated.

## Materials and Method:-

### Chemicals and Instrumentation:-

All the chemicals used were of analytical reagent grade. Stock solution of 1000 mg/L of Pb(II) was prepared by dissolving 1.6 g of Pb(NO<sub>3</sub>)<sub>2</sub> in distilled water and making the volume up to 1000 mL in a volumetric flask. The pH of each of the working solutions was adjusted by using 0.1M HCl or 0.1 M NaOH. Systronic digital pH meter was used for pH measurements. FTIR spectrometer (Perkin Elmer System- 1600) was used for IR spectral studies. UV-visible double beam spectrophotometer (Systronics UV-Vis-2203) was used for determination of Pb(II) concentration using 1,5- diphenyl thiocarbazone in aqueous micellar solution. An electrically thermostatic rotary shaker (IEC-56, India) was used for agitating the samples.

### Preparation of MDPT:-

Date palm trunk (DPT) was obtained from rural areas around Kanpur (India), cut into a length of approximately 1 cm, washed thoroughly with demineralized water (DMW) to remove water soluble materials, dried overnight at 100 ± 2°C in a hot air oven, and allowed to cool down to room temperature. It was ground and sieved to obtain an average particle size of 75 µm. DPT powder (10 g) was treated with 80 mL of NaOH solution (1.25 mol/L) and epichlorohydrin (30 mL) at 40 °C for 1 h. Then mixture was filtered, rinsed with water, oven-dried and stored in a desiccator. During the treatment, the hydroxyl groups of DPT reacted with epichlorohydrin. Modified date palm trunk was prepared by adding ethylenediamine (10 mL), water (100 mL) and Na<sub>2</sub>CO<sub>3</sub> (1 g) to the epichlorohydrin treated DPT. The mixture was stirred using magnetic stirrer at 60 °C for 2 h, MDPT was filtered, washed with water, dried and stored in desiccator. The following chemical reactions occurred during the modification.

### Batch Adsorption Studies:-

For adsorption studies, 0.1g MDPT was added to a series of Erlenmeyer flasks filled with 20 mL lead (II) solutions (12.5-100 mg/L) and pH (1-6) sealed with parafilm and then shaken at 30°C till equilibrium was reached. The sample solution was filtered using Whatman No. 4 filter paper and the filtrate was analyzed for Pb(II) by spectrophotometric method using 1, 5-diphenyl thiocarbozone in aqueous micellar solution [16]. The adsorption capacity (q<sub>e</sub>) and percentage removal of Pb(II) from aqueous solution is calculated by following equations,

$$q_e = \left( \frac{C_i - C_e}{M} \right) V \quad (1)$$

where, C<sub>0</sub> and C<sub>e</sub> (mg/L) are the initial and equilibrium concentrations of Pb(II) ions in solution; V is the volume (L) of the solution and M is the weight (g) of dry adsorbent.

$$\% \text{Removal} = \left( \frac{C_i - C_e}{C_i} \right) 100 \quad (2)$$

## Result and Discussion:-

### FT-IR analysis:-

FTIR spectra (fig. 1) shows MDPT and Pb(II) loaded MDPT. The broad peak around  $3410\text{ cm}^{-1}$  in MDPT is attributed to  $\text{-NH}$  stretching vibration. This absorption band is shifted towards lower wave number ( $3381\text{ cm}^{-1}$ ) in case of with Pb(II) adsorbed MDPT. This suggests the formation of complex between Pb(II) ions and N-atoms (The characteristics band at  $1056\text{ cm}^{-1}$  corresponding to C-O-C stretching is observed in both spectra ).

Figure 1:- FTIR spectra of MDPT and MDPT-Pb(II) loaded.

### Effect of pH:-

The pH of solution is an important controlling parameter in the adsorption process. Since, pH influences the solution chemistry of the heavy metals (i.e. hydrolysis, complexation, redox reactions and precipitation), and the solution chemistry of the heavy metals also strongly influences the speciation and the adsorption availability of the heavy metals. The binding of metal ions by surface functional group ( $\text{-NH}$ ) is strongly pH dependent [17]. Fig. 2 shows that Pb(II) removal is minimum at pH 1 and increases with the increase in pH. Removal of Pb(II) was found maximum at pH~5.

Figure 2:- Effect of pH of solution on the removal of lead(II).

**Effect of Adsorbent Dose:-**

Effects of dosage on the removal of Pb(II) ions is shown in Fig. 3. It was observed that the removal of lead(II) increases rapidly with increasing dosage from 0.0 to 0.5 g/L. After certain adsorbent dosage the removal efficiency does not increase significantly and reached the maximum at dosage of 0.6 g. The removal of Pb(II) for concentrations 12.5, 25 and 50 mg/L using 0.6 g/L MDPT was 98.2%, 95% and 90%, respectively. On increasing adsorbent dosage, more surface area is available for the adsorption due to an increase in active sites on the adsorbent and its availability for adsorption.

Figure 3:- Effect of adsorbent dose on the removal of lead (II).

**Effect of Contact Time:-**

Figure 4 shows that with increase in contact time removal increases rapidly during the first 15 min, and then it was moderate up to 30 min and there after remained constant. This behavior may be due to saturation of the available adsorption sites present on MDPT. At the initial stage, the removal efficiency was rapid due to abundant availability of active binding sites on the biomass and with gradual occupancy of these sites; sorption became less efficient in the later stages. The equilibrium is established with in 120 min.

Figure 4:- Effect of contact time on the removal of lead(II).

**Adsorption Kinetics:-**

In order to evaluate the kinetic mechanism that controls the adsorption process, the pseudo-first-order and pseudo-second-order models were used. The pseudo first-order equation [18] is generally expressed as follows:

$$\log (q_e - q_t) = \log q_e - (k_1/2.303) t \quad (3)$$

where  $k_1$  ( $\text{min}^{-1}$ ) is the pseudo-first-order adsorption rate constant,  $q_t$  (mg/g) denotes the amount of sorption at time  $t$  (min), and  $q_e$  (mg/g) is the amount of sorption at equilibrium. The pseudo-second-order equation [19], based on adsorption capacity at equilibrium, can be expressed as:

$$t / q_t = 1/k_2 q_e^2 + (1/q_e) t \quad (4)$$

where  $k_2$  (g/mg min) is the rate constant of the pseudo-second-order equation,  $q_e$  (mg/g) is the maximum adsorption capacity, and  $q_t$  (mg/g) is the amount of adsorption at time  $t$  (min).

The values of pseudo-first order rate constants,  $k_1$  and  $q_e$  were calculated from the slopes and the intercepts of the plots of  $\log (q_e - q_t)$  versus time (Fig. 5). The  $k_1$  values, the correlation coefficient  $R^2$ , and theoretical and experimental equilibrium adsorption capacity  $q_e$  are given in Table 1. The  $R^2$  values in Table 1 suggest that adsorption of Pb(II) onto MDPT does not follow pseudo-first-order kinetics. In addition the theoretical and experimental equilibrium adsorption capacities,  $q_e$  obtained from these plots varied widely. This confirms that the pseudo-first-order model was not appropriate for describing the adsorption kinetics of Pb(II) onto MDPT. On the contrary, the kinetics data showed excellent fit to the pseudo-second-order equation. The plot of  $t/q_t$  against  $t$  at different concentrations is shown in Fig. 6. The pseudo-second-order rate constant  $k_2$ , the calculated  $q_e$  values, and the corresponding  $R^2$  values are given in Table 1. From Table 1, it is evident that the calculated  $q_e$  values agree with experimental  $q_e$  values well, and also the correlation coefficients for the pseudo-second order kinetics plots at all the studied concentrations are higher ( $R > 0.99$ ).

It can be concluded that the adsorption proceeds via pseudo-second-order mechanism rather than a pseudo first-order mechanism.

**Table 1:-** Adsorption kinetics for removal of Pb(II) onto MDPT

Conc. (mg/L)	$q_{e \cdot \text{exp.}}$ (mg/g)	Pseudo-first-order			Pseudo-second-order		
		$k_1$ ( $\text{min}^{-1}$ )	$q_e$ (cal) (mg/g)	$R^2$	$k_2$ (g mg <sup>-1</sup> min <sup>-1</sup> )	$q_e$ (cal) (mg/g)	$R^2$
12.5	21.0	0.024	5.97	0.875	0.0448	21.27	0.999

#### Adsorption Isotherms:-

Langmuir adsorption isotherm [20] was applied to equilibrium adsorption assuming monolayer adsorption onto a surface with a finite number of identical sites. The following Langmuir sorption isotherm equation can be used:

$$C_e / q_e = 1 / b K_L + C_e / b \quad (5)$$

where  $q_e$  is the amount of Pb(II) adsorbed per unit mass of adsorbent (mg/g),  $C_e$  is the equilibrium concentration of the Pb(II) in solution (mg/L),  $b$  is the maximum Pb(II) uptake (mg/g),  $K_L$  is the Langmuir biosorption constant (L/mg) relating the free energy of biosorption. The essential characteristics of the Langmuir isotherm can be conveniently expressed in terms of a dimensionless term  $R_L$  (a constant separation factor or equilibrium parameter for a given isotherm) and is defined as:

$$R_L = 1 / (1 + K_L C_0) \quad (6)$$

where  $C_0$  is the initial concentration of Pb(II) and  $R_L$  value indicates the type of the isotherm.

Freundlich adsorption isotherm [21] is an empirical relationship established upon adsorption onto a heterogeneous surface on the assumption that different sites with several adsorption energies are involved, and is given below:

$$\ln q_e = \ln K_F + 1/n \log C_e \quad (7)$$

where  $q_e$  and  $C_e$  are the equilibrium concentrations of Pb(II) in the adsorbed and liquid phases in mg/g and mg/L, respectively.  $K_F$  and  $n$  are the Freundlich constants.

The correlation coefficients ( $R^2$ ) obtained using Langmuir (Fig. 7) and Freundlich (Fig. 8) have been listed in Table 2.  $R^2 > 0.99$  obtained with Langmuir model supports that the biosorption of Pb(II) onto MDPT followed the Langmuir model. According to McKay et al. [22]  $R_L$  values between 0 and 1 indicate the isotherm favourable, and it is unfavourable if  $R_L > 1$ . The obtained  $R_L$  values (0.089-0.439) indicate that the adsorption of Pb(II) onto MDPT is favourable and attributed to chemical ion-exchange mechanism.

**Table 2:-** Langmuir and Freundlich parameters for the adsorption of Pb(II) onto the MDPT.

<i>Isotherm</i>	<i>Parameters</i>	<i>Values</i>
Langmuir	$q_m$ (mg/g)	108.2
	$b$ (L/mg)	0.101
	$R^2$	0.997
Freundlich	$K_f$ (mg/g)	16.26
	$n$	2.17
	$R^2$	0.978

**Figure 7:-** Langmuir isotherm plot for Pb(II) adsorption onto MDPT.

**Figure 8:-** Freundlich plot for Pb(II) adsorption onto MDPT.

**Desorption:-**

Desorption studies were conducted in order to explore the feasibility of recovering both the metal ion and MDPT. MDPT (0.1g) was transferred into 20 mL of 0.01-0.2 M HCl solution in a conical flask, and shaken for 4 hours at room temperature ( $30 \pm 1^\circ\text{C}$ ). The rate of desorption increases with the increases in conc. of HCl upto 0.2 M and remains unchanged at higher conc. of HCl. The maximum percentage recovery of lead was 98.5% (Fig. 11). The results of desorption studies show that the most of Pb(II) ions on MDPT surface might be held through ion-exchange/ complexation type of binding. Therefore, recovery of the adsorbed lead(II) and repeated usability of MDPT is feasible as an adsorbent in the practical applications of treatment of industrial effluents containing Pb(II).

**Figure 9:-** Effect of HCl concentration on the desorption of Pb(II).

**Conclusions:-**

Adsorption of Pb(II) onto MDPT was studied. The adsorption was found greatly dependent on pH and contact time. The adsorption equilibrium was best described by the Langmuir isotherm model. The maximum adsorption for Pb(II) was found to be 108.2 mg/g at pH 5. The adsorption is followed by pseudo-second order kinetics, which shows the chemisorptions process. The adsorption capacity of MDPT is higher than many of the biosorbents reported earlier. The desorption percentage was 98.5% using 0.2 M HCl as an eluting reagent.

#### Abstract

For more than ten years, Astritsi gorge constituted a very useful learning environment for the interdisciplinary approach of many cognitive objects taught in Meleses Lyceum, in the projects of the Environmental Education. It offered ample opportunities and possibilities to activate, in collaboration, many teachers, students, scientists, authorities, bodies, etc. and promote the principles and values of Environmental Education and Education for the Sustainable Development. This paper (consists of ) is a narrative reflection of the two teachers who developed many educational activities in Astritsigorge, carrying out many school environmental projects following the UNESCO decade of Education for the Sustainable Development.

The purpose of the research was to present, in a summarized way, the extracting data from the collected archival material in a review study for teachers who materialize projects of Environmental Education in Secondary Education. The archival material of the applied projects studied, through a reflection point of view, the goals which have been explicitly expressed or implied, on the thematic subjects, the criteria of the issue selection, the purposes and objectives, the educational methodology, the educational activities, actions and interventions inside and outside the school and gorge, reflections and evaluation, recommendations and dissemination of the projects' results with impact on the local society.

#### Introduction:-

The term "Sustainability" etymologically derives from the 'eternal' and 'bring' with the meaning that 'will bring forever', dealing with the exploitation of natural resources in ways that ensure their existence in the future as they exist today. The Sustainable Development (SD) is the development done with eyes on the future, trying to meet the needs of the present generation without compromising the effort of future generations to meet their own needs, as first reported by world Commission on Environment and Development (Brundtland Commission, 1987). Brundtland Commission's report considers ways and means by which the international community can deal more effectively with environment concerns and define shared perceptions of long-term environmental issues and appropriate efforts

needed to deal successfully with the problems of protecting and enhancing the environment, a long term agenda for action during the coming decades and aspirational goals for the world community.

The main purpose of the ESD is to create Active Citizens (2014: thematic year of the UNESCO Decade for ESD). The profile of critical thinking, active citizen, as it is constructed through UNESCO documents for ESD, has two main characteristics, the participation and the action (Ziaka et al, 2000; UNESCO, 2005). The active citizen must have the ability of systematic and comprehensive consideration of social, economic, cultural, political components of a problem. ESD is political, and the political literacy is an essential core developed on five main axes of the public debate (Flogaiti, 2006): the resources and production, the distribution and redistribution, the power and decision making, the social organization, the culture and ideology. To promote ESD, each institution needs to have a shaped shared vision, broad-based, fully harmonized with the spirit and the social ethical values (Scott, 2007). The cultivation of Active Citizenship through ESD Projects (ESDPs) guides to the culture of active, creative, critical, global citizen, the citizen with democratic accountability and individual responsibility, who is able to combine theoretical knowledge with innovative ideas and practices, to develop initiatives, manage risks and overcome obstacles (Hernandez & Monroe, 2000; Huckle, 2006). Creating environmentally literate citizens requires a different culture, reorientation of the school education, which starts in school years and continues into adulthood, which introduces students, from a very early age, to/ into issues related to the care of the local, national and global environment, the sense of responsibility, the perception of daily life and capacity for intervention and change for better quality of life without harmful consequences for the Earth (Scott & Gough, 2003; Huckle, 2006). By ensuring the active participation of all relevant stakeholders and drawing on best practices and models with exploring new mechanisms to promote transparency and the effective engagement of civil society, guaranteed the way forward to SD (Rio+20, 2012).

The General Secretariat for Youth of Greek Ministry of Education, Lifelong learning and Religion developed a students' initiatives support Program "Inside, outside and on the same: Students in Action" of (Youth, 2012) which had the purpose to support actions and initiatives organized on the basis of volunteerism for secondary school students. Its purpose was to promote the collaboration between of students, teachers, local authorities and bodies, in the broader context of the curriculum and school activities, under the supervision of School Councils and local Councils of School Community. The program 'Youth' (2012) started (was initiated) in response to the experience of the European Year of Volunteering in order to mark and to actively promote the importance of volunteering of young people, from adolescence, giving added value to schools and local communities. The areas of the program concerned the environment, health, social assistance, innovation and entrepreneurship. In any educational process, the progress in the acquisition of knowledge and skills related to SD and global citizenship, needs to be monitored, even if it is not linked to changes in attitudes and behaviors (UNESCO, 2015).

Meleses Lyceum and Gymnasium participated in to this Program with activities concerning in (the areas of) environment and entrepreneurship. The tourist development of the area is of particular interest to locals, as the place is ideal for leisure and walks and the gorge is already used for summer cultural events. Astritsi Gorge has a total length of 3 km. It is about 300m from the village center. It is situated 8 km northeast of Meleses village where the school is located, and 25 km south of Heraklion, the capital of Crete, in the inland. The gorge has with its dense and lush vegetation and is crossed by the river Triton which is a tributary of Karteros, the river passing running close to Knossos and flows/ends into the Cretan Pelagos of Mediterranean Sea, in Karteros position. Alongside, it is crossed by narrow road with asphalt, associated with rural roads and paths. Many SPEEs, eight in number, were implemented in Astritsi gorge during the school years 2002-2013, some of them funded by national economic resources, but most of the times it was the teachers, students, parents and local authorities involved who supported the projects. The last SPEE, with the title "A Pathway from past to present and future in the natural and cultural heritage of Astritsi gorge" carried out by the Meleses Lyceum of Heraklion prefecture, in collaboration with the Meleses Gymnasium, during the school year 2012-2013, funded by the Youth (2012) Program, and summarized all the previous experience in EE applied in Meleses Lyceum. For more than ten years, Astritsi gorge constituted a very useful learning environment for the interdisciplinary approach of many cognitive objects taught in Lyceum. It offered ample opportunities and possibilities to activate, to many teachers, students, scientists, authorities, bodies, etc. to collaborate and promote the principles and values of EE and ESD through the school General Education. The educational purpose of all SPEEs was that students get acquainted with the synthesis of bio-communities of Astritsi ecosystem and ways of management and protection that have been already successfully implemented in Crete and elsewhere, enabling them to understand the need of the environmental care and the ecological sustainability.

This paper is a narrative reflection of the two teachers who developed many educational activities in Astritsi Gorge, carrying out eight school environmental projects during the UNESCO Decade of the Education for the Sustainable Development (UNESCO, 2005). It is based on the aims of the materialized SPEEs and derives as reflection on a long term educational design to incorporate in the teaching courses the EE and ESD, following the national and international upgrades.

### Research Method:-

Eight SPEEs, with many educational activities mentioned below, were carried out in Astritsi gorge from 2002 to 2013. Parentheses contain the numbers and dates on which these educational projects have been entered in the Register by the Teachers' Association of Meleses Lyceum & the School Activities Commission of Heraklion Secondary Education. 1. "The forests, water sources and gorges of municipality N Kazantzakis: getting awareness and sensitization of students for their protection" (14/20.11.2001 & 7/11.21.2001). 2. "Ways of intervention of students in conservation and enhancement of the natural environment on the water sources of Kato Vrisi in the Astritsi gorge" (9/26-9-2002 & 334/21-1-2003). This program was submitted for funding to the Aegean University, EPEAEK II Program and evaluated first, nationwide, in February 2003. 3. "Sound and Nature" (11/23-10-2003 & 128/10-1-2004). 4. "The sounds of Nature will release the soul and feelings of students and will guide thinking to the beginnings of human speech". This program was also submitted for funding to Aegean University, EPEAEK II Program and evaluated first by Cretan candidates in January 2004. 5. "The sound and art in Nature" (5/14-9-2004). 6. "Forest, biodiversity and quality of life" (17/15-10-2007). It was funded by the Ministry of Education 'Callisto Program' (Circular of Greek Ministry of Education 587/28-11-2008) with the subject 'Open Environmental Classes'. 7. "Diversity, a right in of life" (12/26-11-2010). 8. "Pathway from yesterday to tomorrow in the natural and cultural heritage of Astritsi gorge", in the framework of the Initiatives Support Program 'Inside, outside and on the same: Students in Action' of the General Secretariat for Youth, Greek Ministry of Education (Youth, 2012).

The purpose of the research was to present, in summarized way, the extracting data from the collecting huge archival material of the materialized SPEEs, in a review study for teachers who undertake SPEEs' implementation in Secondary Education. The researchers, focused only on the aims of the SPEEs, mainly written in the Application Forms (AFs), and with discourse analysis, extracted those references which are in accordance with the principles and objectives of EE and ESD. (By making synthesis like all the projects were only one with a unified conceptual and methodological framework, combining theory and practice, the research derived as a personal narration.)  
δεν βγαίνει νομικά

In the archival material of the applied projects searched the aims which had been explicitly expressed or implied, on the subjects, the educational goals, methods and activities of the SPEEs, the recommendations and dissemination of the projects' results to the local society. Following the axial coding, firstly we fixed the categories and then inserted the data. The complexity of the research questions and their mixed character, theoretical and applied, permitted the use of the sentence, and not the word, as the recording unit in the examining of the research question from the point of view of the social and critical nature of EE. All the recorded data, concerning the design and implementation of the projects coded and entered in the following thematic areas (Kalathaki, 2016). The research material was the archival material of the projects, in printed and electronic form, which examined in a semi-structured manner by making qualitative Content Analysis (Bell, 1997; Bird, 1990).

The archival material of the above projects was studied through a reflection point of view, searching for data in the aims of the AFs, combined with the memories of the researchers, to answer the research queries: a. the thematic subjects, b. the criteria of the issue selection, c. the purposes and objectives, d. the educational methodology, e. the educational activities, actions and interventions inside and outside the school and gorge, f. reflections and evaluation, g. recommendations and dissemination of the projects' results with impact on the local society.

### Results and Discussion:-

The extracted data from the collected archival material is summarized in the thematic areas of the researched projects' design. Combining the past tense of the narrative and the future tense of the objectives and results, we decided that our presentation would be in the past tense, since the aims have been achieved through the many educational activities which took place in the SPEEs.

**The subject of the project:-****Selection criteria of the topics:-**

The gorge and the crossing river is part of the students' lives as they are close to their villages, namely the Project subject is linked to their experience. All these years, the Municipality of N. Kazantzakis cultivated, with great sensitivity, the cultural sector and supported all educational actions developed in the gorge. What emerged through discussions with our students, was a need to upgrade the gorge with participatory interventions. "The risk of pollution and aesthetic degradation of the gorge was high" (P1, P2) and it still remains high, the students realized it more and more each time they visited it. "The relatively easy access of environmental groups to the gorge, due to its proximity with the school, strengthens the choice for frequent and many visits. Most Students come from neighboring villages, so it was easy to work together in the afternoons and weekends" (P2, P3, P4, P8). Lyceum students are closer to adulthood and therefore the ESDP aim to the environmentally literate active citizen, that's why the Projects' themes were selected to correspond to scientific and cultural background of students and be compatible with many subjects taught in Lyceum. SPEEs supported us with educational material and innovative ideas since the school was a member of National and European Environmental Networks for many years, eg 'Young Reporters for the Environment', 'Sound and Nature', 'Biodiversity'.

**The content of the projects:-**

The "Path in the great natural and cultural heritage of Astritsi gorge-from the past, the present to the future", which was the title of the last materialized SPEE, summarized all previous knowledge and experience based on the conceptual frame 'Co-responsible in the past & Co-indebted in the future', conscious of the big capital that current generations have to manage in order to inherit to their descendants. This was the topic and the title of the student Conference which took place in 2010. The educational approach was enriched with activities inside the Astritsi gorge: "observation and recording of plant and zoo communities" (P2, P3, P8), "historical monuments that abound in the gorge" (P2, P3, P8), "navigation route signage" (P2, P3, P8), "cleaning interventions in the natural environment" (P2), "setting of billboards" (P2, P8), "waste bins" (P8), "localization of pollution sources and how to deal them" (P2), "promotion of Mythology with dramatization of the myth of Neraidos pilios in 2003" (P2), etc. According to Vygotsky (1997), cognitive development is a process inseparable from the historical-social dimension and the cultural context in which it occurs.

**Educational purpose and objectives:-****Purposes and conceptual frameworks**

The purpose of all projects that were implemented, related to the Astritsi Gorge, was the creation of the Environmentally literate Active Citizen based on the principles and values of ESD. The main objective of all actions was the initiative of the students and teachers of Meleses Lyceum, the volunteer spirit culture, the development of innovation and creativity as the basis for the enrichment and strengthening of the educational work, the promotion of critical and creative thinking of students and teachers, spearhead of the Decade of Education for Sustainable Development 2005-2014 (UNESCO, 2005). The 2009 was the European year dedicated to Innovation and Creativity. "It is the benefit of our students, their families and the local communities that we aim at through these projects, that promote public volunteering and youth creativity in entrepreneurship (P8). "We aim to become the school core of the local community, providing knowledge and experience, with two-way, through an intergenerational partnership that ensures lifelong learning in our students" (P6).

**Educational Objectives:-**

Cultivation of environmentally literate citizens requires reorientation of the educational process through the foundation of ESD in formal and non-formal Education by enhancing lifelong learning (Sterling, 1996; Rio+20, 2012, UNESCO, 2015). ESD is seen as a lifelong process that begins in early childhood, continuing through higher Education and adult Education, exceeding the limits of formal Education (EC, 2006). That's why the objectives of SPEEs must be harmonized with the ESD targets as set by UNESCO and the EU (UNECE, 2005; EC, 2007). Many cognitive, psychomotor, sensitive objectives are written in the AFs of the studied projects and some of them, even they are not explicitly mentioned, are derived from the educational activities which are referred in the projects' FR. The educational activities were designed "to exploit natural and cultural resources of the local community, the great heritage of students and their families, such as the Astritsi gorge" (P1, P2, P8) and "open the way to a school that seeks continuous improvement, change, conservation of biodiversity and cultural diversity" (P2, P6, P7) with new educational methods," with the development of youth entrepreneurship in the region" (P6, P8). From the educational point of view, "these actions are expected to bring added value to the existing school educational processes" (P6) and "to support the goal that students 'learn to learn', contributing to personal, social and professional development"

(P6, P8), "serving the objectives of the Lisbon Strategy and the Europe 2020 Strategy" (P6, P8, P10). Of course, a key question is the extent to which evaluation and assessment of school's performance can take into account the socio-economic and educational profile of students, thereby highlighting the school's added value. There is considerable variation across Europe in the extent to which schools have the autonomy to set their objectives, to shape their curricula, to select and remunerate their staff and to implement any changes that evaluations may show to be necessary (CEU, 2009; Chircop, 2015).

### **Educational Methodology:-**

20-30 students of A and B classes of Lyceum, ages 15-17 year old usually participated in each research project. The students attending, the last class didn't participate due to the burden of preparation for the National Exams at the end of school year. Some actions, took place in collaboration with students of the Meleses Gymnasium situated in the same building. Two teachers, one of Greek Language and one of Biology, the co-authors of this research paper were responsible for the projects, ensuring the interdisciplinary approach through history, literature and Natural Sciences. They collaborated with many teachers with the same or different specialties, scientists and bodies for carrying out various and specified activities.

### **Methodological framework and techniques:-**

EE and ESD are learner-centered Education programs using a wide variety of innovative methods in schools of Primary and Secondary Education. Projects' design was based on the principles of EE and ESD, as they were introduced by UNESCO declarations and European Community strategies (UNESCO, 2005; UNECE, 2005; EC, 2006, Rio+20, 2012). It was chosen, and utilized in practice, a combination of educational methods and techniques to achieve them. It combined the method of Research Essay (Method Project) with the "Problem Solving Method" (P2, P6) and "Role Play and Dramatization" (P2, P6). In all cases, bibliographic research in the school library and web, in Interdisciplinary / Multidisciplinary / Holistic approach was applied (Aegean 2004, NTUA, 2007). The method of Research Essay was implemented in all SPEEs with team and individual work in various ways. Many learning environments designed to support the SPEEs in the school science lab, in the field, in the Library, in cyberspace, with local authorities and communities (Kalathaki, 2016).

The modern labor market demands individuals who have the capacity for cooperation and communication within groups and networks. This makes the modern school imperative to cover the socialization deficit that exists in the families with a few members with the cultivation of group-cooperative spirit (Matsagouras, 2007). The collaborative nature of scientific and technological work should be supported again and again by the frequent group activity in classrooms. The paradigm is the scientists and engineers who usually work in groups and less frequently as isolated investigators (Meyer & Avery, 2001). Educational institutions that develop environmental ESD programs need "to promote social learning in the community" (P2, P6, P8) with a systemic view of the world, "to assess the environmental, experiential and exploratory learning as an instrument for effective engagement with original issues" (P6, P8).

### **Stages of the projects' implementation:-**

A. Preparation Stage: The whole information on the collected material and data about Astritsi gorge to the following environmental teams were undertaking each subsequent year, the two accountable teachers for SPEES applying in school. The topic selection, and the project's subjects clarifying, was hypothesis of the beginning of each school year, in the discussions of the Environmental and Pedagogic Teams.

B. Implementation Stage: Work in the school and the field took place inside the classrooms, school library and Science laboratory, with visits to places of high scientific and cultural interest, carrying out measurements of physico-chemical parameters (P2), observation and recording of organizations and monuments, "geological formations and other structures" (P2, P6), dramatization of the myth of Neraidospilios (P2), interviewing locals and discussing with authorities (P2, P6, P8). Within the framework of the ecological approach of the physical object, we made extensive/ detailed observations, surveys and discussions about the synthesis of the gorges' bio-communities and the special characteristics of the natural biotopes, the special geological formations which affect them, and additionally the effects of human interventions (P2, P6, P7, P8). The outcome of recording, analysis and reporting of the environmental problems that were identified in the gorge as aesthetic and chemical pollution helped us to make suggestions and recommendations to the Mayor and the President of the Cultural Association of Astritsi (P2). In 2001, a Conference with the local authorities, students, parents, and teachers took place, with initiative of the school environmental team, to discuss the existing situation of the gorge and future developmental plans. In this way,

students negotiated and were involved in solving environmental problems of their region, becoming part of the problem, and in a way complicit to the resolution.

C. Actions' Evaluation: Throughout the project, thoughts, opinions, feelings, and suggestions for improvements were expressed by the participants. Each year, experience and knowledge, along with youthful ideas (in a broad discussion and feedback, gave new impetus for creation and new horizons in the educational process. Capitalizing the needs and experiences of students, in grouped teachings with interchanging roles of teachers and students, resulted in a variety of attitudes and behaviors towards social and environmental problems. "With representation of situations, highlighted convergences, conflicts and disputes" (P6), students exercise in informed debate and find compromises (P6).

"The final evaluation is not considered complete by the Head teachers. There is a need for discussion among students and teachers in order to emphasize the strengths and highlight what could have been done, but was not achieved in the past years. This could be useful in future implementations" (FRs of P6, P8). "The objectives of the Project have been achieved without much anxiety and trouble, almost spontaneously. This, is attributed to the detailed design of the AFs of the projects" (P2) and the extended experience of the Head teachers and their collaborators.

#### **The funding of educational actions:-**

In the region of school, the municipality has invested a lot of money in basic infrastructure for hosting the Cultural Camping, inside the gorge for one month in the summer. As the years passed, it needs improvement but the economic crisis does not permit extra expenses. For this, the teachers made proposals of volunteering interventions of the students and their families which both the Municipality and the Secretariat of Youth supported, economically. The response of the Municipality to such proposals was always immediate and positive, so it established the cooperative promotion of all SPEEs' objectives, both of the school and the municipality. School years 2002-2003, 2003-2004, 2004-2005 and 2012-2013 Environmental Education projects involving Astritsi gorge funded by the Ministry of Education. The budgets concerned only the purchase of materials and the supplementary equipment available to the school. The rest of the expenses, were covered by the teachers and the students' parents.

#### **Educational Actions:-**

##### **Places of projects' implementation:-**

In terms of Constructivism, learning is not free but is embedded in the complex context of social, political and cultural environment, emerging from the biography and the learner's culture. Our individual mental structures, that shape the way we perceive the world, build through continuous interaction with the world around (Robottom, 2004). The activities and actions of SPEEs were planned and developed within and outside the school following the Aegean University (2004) guidelines. More specifically, we used: 1. the School Library for bibliographical research, 2. The Lab of Informatics for exploring in internet, to create Power Point presentations, handle correspondence via emails and to create the final product that was the 'Guide of Gorge Astritsi Gorge', 3. the Science Lab to create herbarium, which was exhibited in the school (P8), 4. the Hall of the City Council, for a meeting which was organized with the City Council on the subject of the gorge management and development. At the end of the P2, at a meeting with the City Council, students, with the help of their teachers, presented the results of the project and delivered the final product for utilization by the Municipality, 5. the school yard, at the end of the project, hosted all students, their parents and teachers of the two partner schools, in a final conference, where the results of the projects were announced and the final products were presented. There, the Municipality, Bodies and locals involved in the Astritsi gorge management were invited to be informed about the plans and current works of the environmental teams. This meeting was used to rewarding and public highlighting volunteerism, the initiative and good educational practices of students and teachers who carried out the projects, 6. Astritsi gorge for field work, study of bio-communities and geology and sign of tour-route of the trail with special marking on stones, trees and signs. Also, planting a particular area of the gorge and the school with species that already exist in the gorge and just enriched (P2, P8), action of pedagogic character.

##### **Projects' outcomes:-**

"Creating a herbarium with native species of the gorge for deeper understanding and retention in the school library. The herbarium will stay in the school library and in the Fresher of the gorge with the plant species collected in study visits" (P8). "Engrave of a path of history, ecology and culture in Astritsi gorge for highlighting our natural and cultural heritage, for maintaining it in the future (P2, P8). "The path will be marked as navigation route crossing the

gorge and will be described in text, audio and video in printed and digital material. All partners will be actively involved with the management, restoration and enhancement of the area, making interventions of pedagogical and aesthetic character" (P2, P8). At the trail tour which was engraved in 2004 were made improvements to labeling, description and reference points in the years later. "Production of printed 'Tour Guide of Astritsi Gorge', with the species of plants and ~~zoos~~ animals that a traveler may meet on the route, with useful historical and topographical information" (P5, P8). "The Tour Guide will utilize all the collected visual material and can, if it is used by businesses from the local community, ~~to~~ strengthen the demanding, alternative tourism in the region" (P5, P8). Artistic creations of students with gorge materials will decorate the school and the offices of the Municipality, artwork using natural materials, at no cost, promoting anti-consumerist model of living, according to the principles of ESD (P3, P8). "Plastic tabs on the species of the gorge plants will be placed in many points of the trail, next to the plants advising informing the traveler about the names of the plant and their possible use by the locals" (P8). "Construction of billboards deterrent for hunting and the use of pesticides" (P2, P8). Billboards had serenades related to death and imprisonment of birds and other animals, regret and complaint those they feel but they cannot express in words. "Commemorative Inscription of the project will place was placed in the gorge in a special visit of the whole school in the spring of 2004" (P2), "Information Posters of all project activities for the school and local community and the Project Results" (P2, P8). "Construction of cleaning bins and seats/ benches in harmony with the natural environment, CDs and DVDs with all materials (texts, photos and video) and notes useful to the travelers and participants" (P8). "Video Production of a theatrical happening in Neraidospilios of Astritsi gorge, near Kato Vrissi sources, where girls of the environmental team danced dressed as fairies and boys spent a few hours at a traditional cafe in the village, representing a forgotten myth about Neraidospilios" (P2). The theatrical happening constitutes educational improvisation, in the context of an unprecedented learning process, through which the participant enters the mentality of the locals at the beginning of the last century and gets to know their habits. The past came to present, the legend became reality!

#### **Impact to the local society:-**

"Apart from the students of the project, the local residents are also beneficiaries of the project, as well as every visitor of the gorge, and of course the university students who come every summer to camp in the gorge and participate in high quality artistic activities" (P8). Several visits of students and teachers from schools from Romania, Turkey and Cyprus participants to bilateral Educational Exchange Projects with Meleses Lyceum were organized at the gorge. What makes us really happy is that students who participated in SPEEs when they were in Meleses Lyceum, participated, also, in the creation of the Cultural Camping as university students, and continue to support and contribute in any cultural event that take place in the gorge, as residents of the region of the school and active, environmentally literate students.

#### **Management of Astritsi Gorge:-**

"The exploitation of project results and the continuation of educational activities and interventions, their viability after the implementation, was a key concern of all groups in perennial ESD developed in the learning environment of Astritsi gorge" (P8). The findings and proposals which addressed to the management bodies of Astritsi gorge concern the following (P2, P8): the adoption of certain areas inside the gorge by associations, residents, students, the disruption of the life of all organisms that have their habitat in the gorge by the human presence, the pollution of land and aquatic ecosystem which threatens biodiversity and balance, modifying the residential reformation of the gorge, study of required correct lighting with underground cabling, preparation of a Pavilion Information Desk for Visitors and Tourists, taking protection measures relating to free and uncontrolled grazing, hunting and use of pesticides, conservation of the historical monuments, meticulous cleanliness of the river, toilets, concert place, generally of the gorge.

#### **Dissemination of the projects' Results:-**

The presentations and dissemination of the project results were done with the expiration of each school year, where all the students of the school, the local community, Municipality, teachers, scientists and the educational authority were invited. In the final Conference a variety of activities were organized, lectures, open discussion, round table, the delivery, awarding of students and giving commemorative diplomas to the project's external partners. "Delivery of the Tour Guide to schoolchildren, local residents and the local council can be an important motivation for new business operations in the place of the gorge and the surrounding area" (P6, P8). "The placement of hunting prevention billboards in the gorge will contribute to jointly confrontation the reduction of biodiversity from human interventions" (P2, P8). With the multiple and various educational activities, actions and interventions, with questionnaires, conferences, roundtables, group discussions, were recorded knowledge, opinions and ideas relating

to the Astritsigorge expressed by the old, the present and the future generation of the school region. With meetings and presentation of the SPEEs, students and teachers came in contact with all stakeholders, parents and many other members of the local community, so they managed to disseminate the project results and motivate local people to cope with greater seriousness and rationality the exploitation of natural resources of the gorge. "With articles published, (and will continue to be published,) as well as interviews published in the local press, the local community will be encouraged by the younger members for more active participation" (P8). The studied SPEEs was adapted to local conditions and needs to create incentives for higher expectations, develop relationships and patterns similar to those attempted in Samaria Gorge, considering the Astritsi gorge as National Park. SPEEs functioned as vehicles carrying sustainable education policy from the local to national and global level. "In psychomotor and emotional level we aim to contribute to the strengthening of relations between students originating from different villages, between teachers residing in the city and the local agricultural and livestock society, changing attitudes and behavior of all of us towards the local community, the environment, for better quality of life" (P8).

### Conclusions:-

Materializing so many SPEEs, which had the Astritsi gorge as main learning environment, students practiced in the scientific observation of natural ecosystems and taking measurements of physicochemical parameters. They experienced the developmental policies of public bodies and local authorities. They experienced the value of a collaborative team spirit, based on equality, understanding, mutual support and open communication. Students became stakeholders and shared responsibility in the management of a habitat of their region, developed initiatives in organizing discussions, questionnaires, conferences and interviews and so realized the need for the evaluation of the initiatives, activities and actions whenever they choose. They came closer to their teachers, worked at a different level and experienced different pedagogical methods and procedures from those they had previously experienced in traditional classrooms. They were able to get acquainted with new technologies, computers, video, Fax, Internet, emails, with presentations, producing educational material and SPEEs' final products, also publication of articles on the Web, in the 'European Young Reporters Network for the Environment', in national and international Conferences and seminars. Developed artistic activities such as theater happenings, photography, painting structures with natural materials coming from the gorge. The theatrical happening about the Fairies of Astritsi gorge, adapted to two related legends of the region, was written and filmed in a short video on the experiential acquaintance and perception of a legend.

### Recommendations:-

In the end, remarks are given for further development of the educational activities in the future both at local and national level, regarding the way of students taught to be environmentally literate active citizens, in accordance with the principles and goals of UNESCO and European Union for SD. The produced knowledge in the materialized SPEEs and the tried methodology could be implemented in school curriculums as good educational practices and to be translated into educational policies.

The economic crisis, with the insecurity and the problems it has caused to schools, affected the last project's implementation. Strikes, student occupations, delays in implementation of educational reconstruction and many other created a negative atmosphere, causing inadequate disposal to all of us, we often got frustrated with significant impact on the activities and actions we desired, but finally we overcame it. Within a short time, we managed many outcomes and outputs, we pressed ourselves to achieve all the set objectives. We feel that these projects have not been over yet ... We hope that the gorge will become a source of life and social upgrading, so that neighboring settlements will not be affected. We had the need to establish that educational culture which will empower locals, students and parents, provide with responsibility opportunities, build rewards leadership and maximize collaboration, share responsibility, involve students in the planning and decision making, demonstrate innovation, assume the risk and safety, valuing the diversity of views with resilience and flexibility, where the experience reviews the progress and the people learn from everyone, as Scott (2007) suggests.

### Abstract

Neglected fracture neck of femur is a challenging condition to treat. Preservation of the head of femur is desirable in young patients. In order to preserve the femoral head in femoral neck non-union in young adults, the preferred option of treatment is open reduction and internal fixation. Where there are no facilities for microvascular surgery, non-vascularized fibular strut grafts can be used with screws. This paper describes the use of fibular strut graft and cancellous screws in the open reduction and internal fixation of a neglected femoral neck fracture associated with avascular necrosis of femoral head in a young adult that was followed up for four years. The use of non-vascularized fibular strut grafts and screws for fixation of non-united fractures of femoral necks, even in the presence of avascular necrosis, could lead to union. It is cost-effective and technically less demanding, and associated with good outcomes.

### Introduction:-

Fracture neck of femur is popularly known as, "unsolved fracture." [6] The choice of treatment depends on the patient age, duration of injury, activity level, extent of displacement, and extent of osteoporosis. The treatment goals are anatomic reduction, stable fixation, preservation of blood supply to the bone fragments, and early active mobilisation to prevent stiffness. Treatment options include valgus osteotomy and osteosynthesis with or without bone grafting (muscle pedicle, free vascularised, or nonvascularised fibula), hemiarthroplasty, and total hip arthroplasty. [1,8] Nonunion and avascular necrosis are common complications. Recent studies have shown improved results with decreased rates of avascular necrosis (AVN) and nonunion. [2,9] But neglected fracture neck of femur still poses a major challenge for the treatment. Barnes et al. [3] showed that the rate of complication significantly increases once the treatment is delayed beyond 1-week. Thus some additional procedure to salvage the femoral head is warranted. For this, there are large numbers of options including osteotomies and bone grafting procedures. The dilemma today is to choose among these options, as the literature is not clear about the ideal treatment. One recognized treatment option is the combined use of open reduction, internal fixation with screws and non-vascularized fibular strut graft. This method is relatively easy to perform, does not require microvascular anastomosis, offsets both the biologic and biomechanical causes of non-union, contributes to the repair of any incidental avascular necrosis, and is not encumbered by the complications of intertrochanteric osteotomy like limping. This was the technique used in the current report for the subject who had a neglected femoral neck fracture and radiological evidence of aseptic necrosis of the index femoral head. His fracture healed after three months and

**Corresponding Author:- Dillip Kumar Chand.**

Address:- Post Graduate Student, P.G.Dept. of Orthopaedics ,VSSIMSAR , Burla , Sambalpur University ,Odisha.

he had no evidence of aseptic necrosis. After a follow-up of two years, he had a Harris hip score of ninety seven. The rationale behind this option is discussed and the relevant literature is reviewed. The patient gave his consent for this study.

### Case Report:-

A 22 year old man presented to the outdoor patient department of our hospital with complaining of pain around groin, limping, not able to bear weight on right limb for the last 2 months. He had a history of fall from bike 2 months back. He was treated by a local bone setter. On examination affected limb was externally rotated and shortened. Anterior joint line was tender, vascular sign of Naranjo negative. Range of movement was restricted and painful. Limb length discrepancy by 3 cm. Telescopy test positive. Trendelenberg test could not be elicited. X ray pelvis with both hip AP view 20° internal rotation was taken. X ray showed displaced fracture of neck of femur with sclerosis of margins, patchy sclerosis of head. Shenton's line was broken. His Harris hip score (HHS) was 55. He was admitted and proximal transtibial skeletal traction given for seven days prior to surgery. An anterolateral approach was used to expose the right hip joint and to estimate the required length of fibular strut. Nine centimetres of the mid ipsilateral fibula was harvested subperiosteally through a lateral right leg incision. The graft was prepared by multiple drill holes along its length and nibbling of its interosseous border. Upon exposure of the hip, fibrous tissue and cartilage were noted to be covering the fractured ends. These were curetted off to freshen the ends with the aid of Steinman pins attached to separate the greater trochanter and femoral head as joysticks. The entire neck appeared shorter than normal. The neck was then reamed over the third guide wire using the 8 mm part of the triple reamer. The fibula strut graft was then hammered over the third guide wire. The graft was subsequently introduced into the reamed tract. Two cancellous screws were then used to fix the fracture. Unfortunately, varus could not be prevented because of the extent of neck resorption but the construct was stable. The wound was closed in layers over a suction drain which was removed after 2 days. Boot and bar cast was given. He was advised on strict non-weight bearing for 2 months. Mobilization was started on the third postoperative day depending upon the pain tolerance. Hip strengthening exercise was initiated 6 weeks after surgery. All the patients were kept nonweight bearing for initial 6 weeks. After which the patient was mobilized using crutches, with toe touch weight bearing. The weight bearing was increased gradually as tolerated by the patient, allowing full weight bearing after 12 weeks of surgery. All the patients were followed for 6 weeks, 3 months, and 6 months of surgery, and every 6 months thereafter. Partial weight bearing started with the use of walker for another six weeks. Serial radiographs showed progressive healing. Full-weight bearing was started about a 7 month post operatively when the right hip radiograph showed fracture consolidation with incorporation of the fibular strut graft. Twenty-two months postoperatively, the screws were removed. Patient was seen in the outpatient department 2 years postoperatively and the Harris hip score was ninety-four.

### Discussion:-

There is no proper definition for fracture neck of femur to be called neglected, Meyer's et al.[10] have considered a criteria of 1-month whereas most other workers including Nagiet al.[11] and Sandhu et al.,[14] have considered a criteria of 3 weeks, beyond which the fracture was considered neglected. The patient whose case was presented had neglected his femoral neck fracture for two months. He then presented with an ununited femoral neck fracture and radiographic features that suggested aseptic necrosis of the ipsilateral femoral head. He was placed on a seven-day skeletal traction in order to offset the effects of contracture of hip abductors, overlap of fracture fragments and limb shortening

- (1). The anterolateral approach was chosen because it avoided the posterior retinacular vessels and thereby limited the damage to the blood supply to the femoral head
- (2). Bone graft was used to assist union and treat aseptic necrosis. It had been shown with ample evidence including experiments in dogs that cortical grafts provided structural support to the necrotic femoral head preventing its collapse and, with time, provided scaffold for revascularisation and osteogenesis along the length of the graft to the subchondral bone [4,12]. By this means, union was achieved and the aseptic necrosis was treated. This had been demonstrated in recent studies . The triangular shape of the fibular strut used in this case report strengthened the immobilization of the fracture by providing rotational stability at the fracture site [7,14]. Additionally two cancellous screws were used to obtain compression and more stability at the fracture site . It had been stated that the

two-screw-and-fibular-strut-graft construct was sufficiently stable for one not to use hip spica [14]. The total period of restricted weight bearing was the time it took for union to be evident - three months. The emphasis on restricted weight bearing until obvious evidence of union has been shown to give better results [14]. In this case report, a fibular strut graft and internal fixation with two screws were chosen for the treatment of a neglected femoral neck fracture in a young adult with radiological features of aseptic necrosis of the femoral head. Fibula being cortical bone provides mechanical strength besides stimulating the union and getting incorporated. The trifin shape of the fibula stabilizes the fracture and prevents rotation. Hence is rightly described as a biological Smith-Petersen nail.[5] Union was achieved albeit with coxavarus. As per the meta-analysis of Roshan and Ram,[13] the results of nonvascular fibular grafting in neglected fracture neck by different authors have given nonunion rates between 0-17% and AVN rates of 0-33%. The functional outcome is difficult to compare as different studies have used the different criteria for evaluating the functional status of the patient. The 28 patients in the case series of Roshan and Ram[13] treated by this method had an average HHS of 87.1 at a mean follow-up of over 6 years. At two-year follow-up, there were no features of aseptic necrosis of the femoral head and his Harris hip score was 94%. The patient was told of the possibility of future osteoarthritis of the index hip and the need for regular follow-up. In conclusion, the use of non-vascularised fibular strut grafts and screws for fixation of non-united fractures of femoral necks, even in the presence of avascular necrosis, could lead to union. Fixation with cancellous screws and fibular strut grafts for neglected femoral neck fractures is cost effective and technically less demanding and associated with good outcomes. The femoral head is preserved; this can be converted to bipolar or total hip replacement if needed in future.

Bloodstain Pattern Analysis (BPA),  
 Crime Scene Reconstruction, Transfer  
 Patterns and Crime Investigation

### Abstract

Bloodstain Pattern evidence can be used for sequencing events at a crime scene. Again, it can be used to trace the direction in which a body was dragged. In addition it can also be used to draw useful conclusions about the relative position of the victim/s, perpetrator/s and bystander/s (if any) in a crime scene. Stain patterns can be used for predicting the probability of events that might have occurred at a crime scene. Bloodstain Patterns cannot in particular be associated with an individual. DNA analysis of blood samples, blood serology test can be used as associative evidence for uniquely identifying an individual. This paper illustrates the process of bloodstain analysis in crime scene.

### Introduction:-

Violent crimes accounted for roughly 26.6 % of the total number of crimes reported and hence recorded in the year 2014[1]. The FBI's (Federal Bureau of Investigation) Uniform Crime Reporting (UCR) Program, has defined offenses which involve force or threat of force as violent crime [2]. The investigation phase in itself can broadly be classified under the following 3 heads - 'Defining the Crime Scene', 'Processing the Crime Scene', and 'Information collection from and about the crime scene'[3]. The information in the form of testimony, hearsay evidence, real and original evidence is used for reconstruction of criminal events and thereby placement of such evidence before the juridical system to draw well analyzed conclusions [4]. So collection and interpretation of evidence does play an integral role in shaping the proceedings of a criminal case [4].

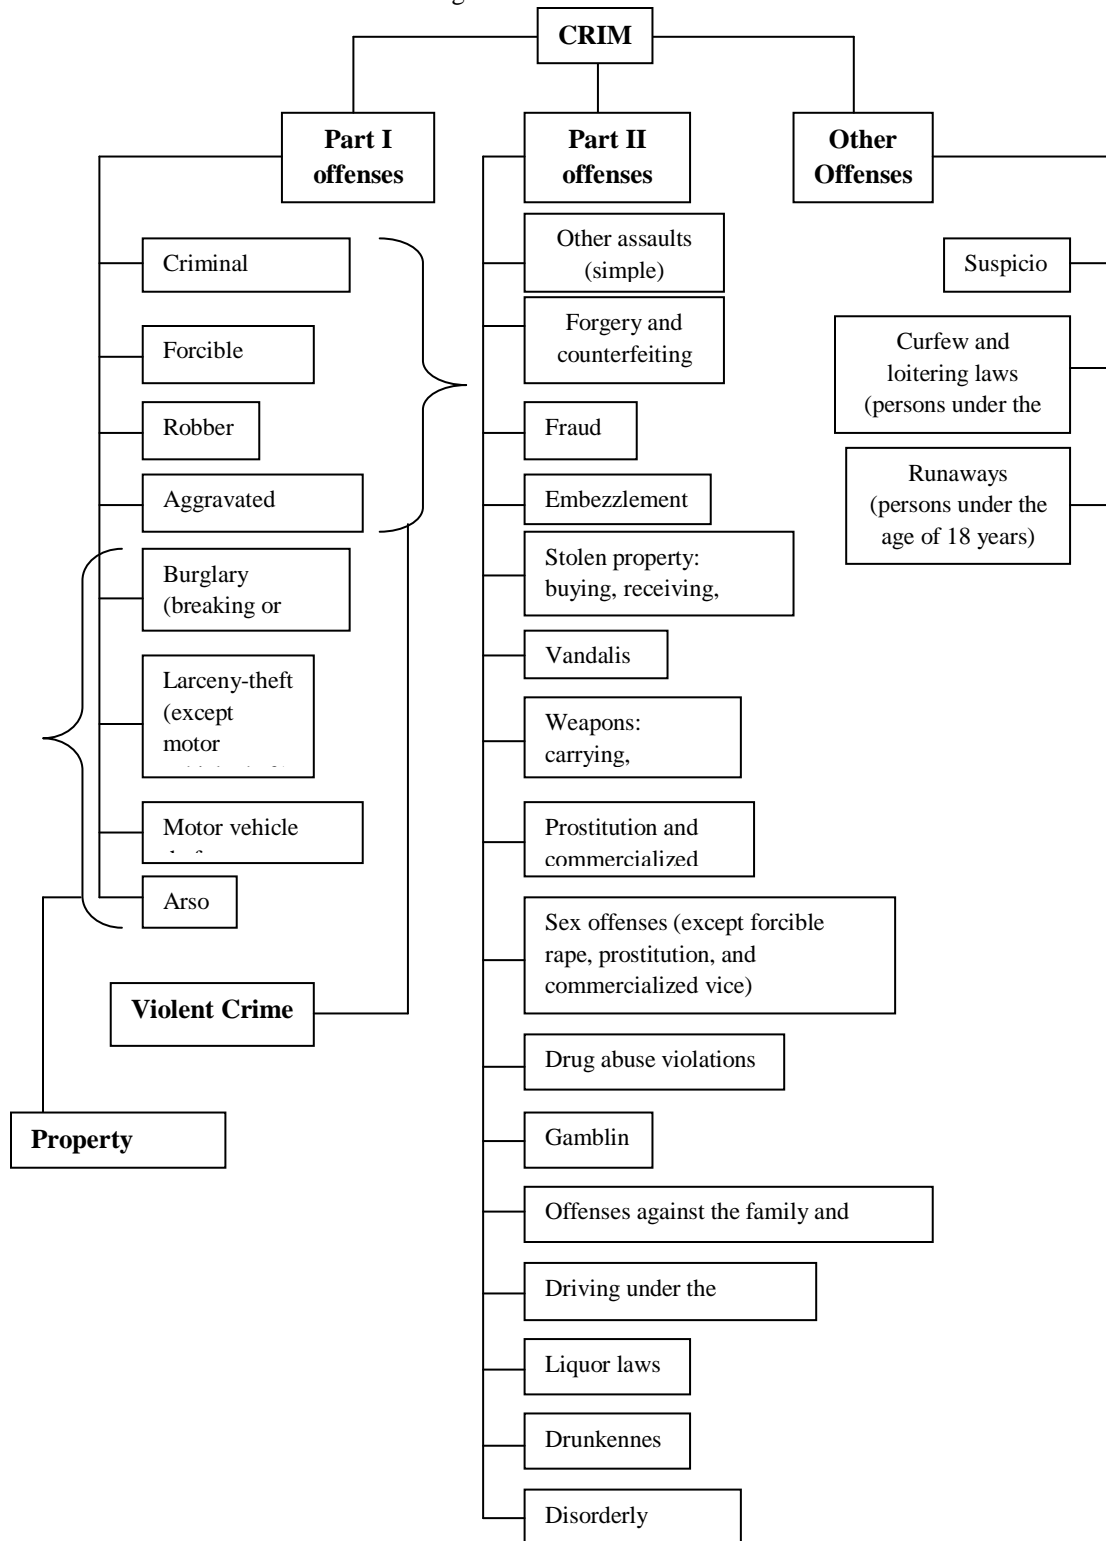

Most violent crime scenes are characterized by large scale blood spillage. The bloodstain patterns often are a static consequence of the dynamic events that had perspired at the crime scene. With a particular rise in homicide cases, stain patterns are often considered reconstructive evidences of great importance for reconstructing a crime scene, validating eyewitness testimony etc. Crime in itself forms the basis of 'Crime Scene Reconstruction'. Figure 1 provides a graphical description of the crime classification system endorsed by the UCR program conducted by the FBI [2].

As per the UCR program conducted by the FBI, Violent Crime primarily comprises of murder and non-negligent manslaughter, forcible rape, robbery and aggravated assault. The UCR program defines Violent Crime as those offenses which involve force or threat of force. In coherence with the crime definitions put forward by the UCR program, the National Crime Record Bureau, India, categorizes violent crime under the following heads – Murder, Attempt to Commit Murder, Culpable Homicide not amounting to murder, Rape, Kidnapping and Abduction, Preparation and assembly for Robbery, Riots, Arson and Dowry Deaths[1]. These crimes are under most circumstances accompanied by bloodletting events. It is this subset of crimes that we intend to work on this

particular project. The 'Crime in India Report 2014' published by the National Crime Record Bureau, suggests that there has been a subsequent yet persistent increase in violent crime rate over the last 4 years (span 2010-2014). The crime classification chart is shown in figure 1.

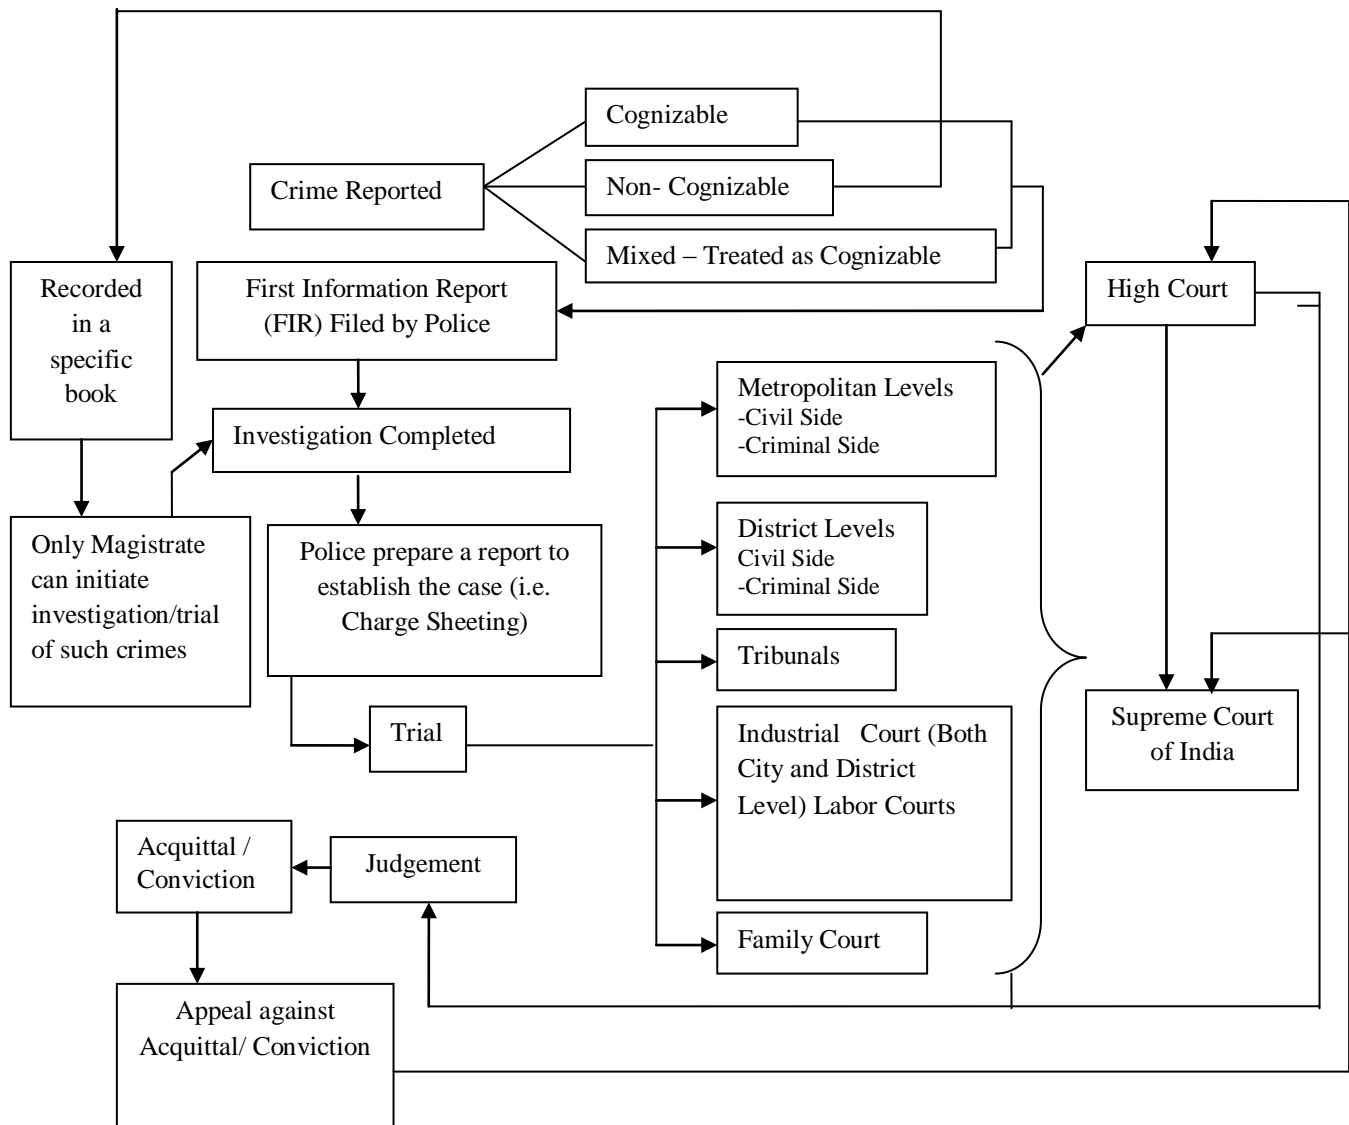

**Figure 1:- A Crime Classification Chart.**

### **Bloodstain Pattern Analysis:-**

The Scientific Working Group on Bloodstain Pattern Analysis (SWGSTAIN) defines ‘Bloodstain Pattern’ as ‘a grouping or distribution of bloodstains that indicate through regular or repetitive form, order, or arrangement the manner in which the pattern was deposited’ [6]. J.J. Nordby, Ph.D., D-ABMDI defines ‘Bloodstain Pattern analysis’ as ‘the scientific study of the static consequences resulting from dynamic blood shedding events’ [7].

As a prelude to the use of Bloodstain pattern as a reconstructive evidence in a court of law, it would not be out of place to provide a graphical overview of how criminal offense is dealt with within the Indian juridical setting. Figure 2 summarizes the Juridical setting relevant to trial of a criminal complaint within the Indian juridical system [8].

**Figure 2:-** Flow Chart describing the trial of a criminal complaint within the Indian juridical setting [8]

Once a complaint is made, based on the crime type reported (refer Figure 2), the criminal proceedings that take place can broadly be classified into 3 basic phases - Investigation, Inquiry and Trial[8]. Figure 3 provides a graphical overview of the process of criminal case proceedings within the Indian juridical system [8].

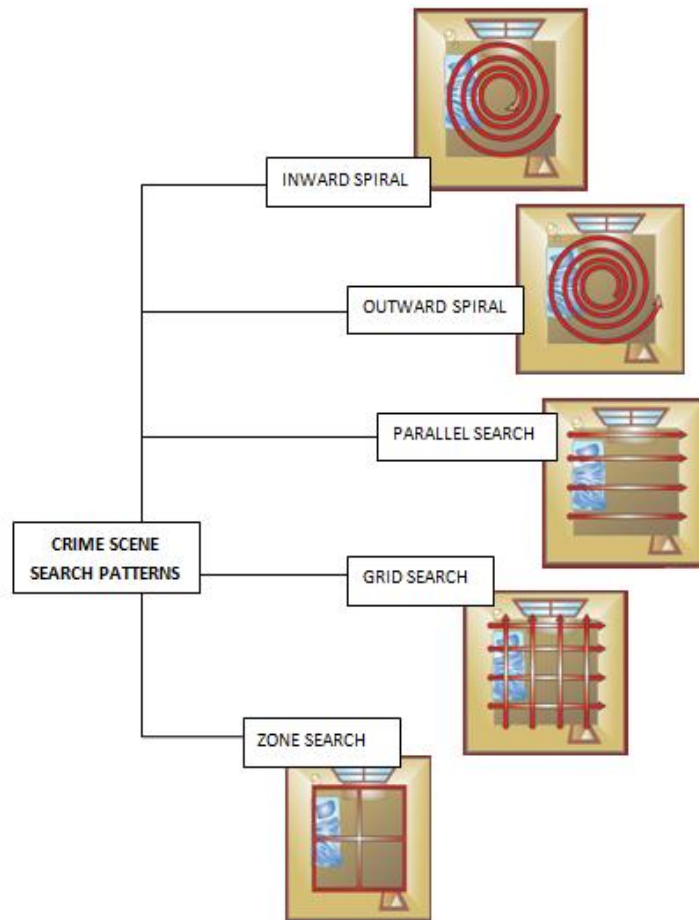

**Figure 3:-** A flowchart documenting how a criminal case is processed within the Indian juridical system [8]

### Crime Scene Investigation and Reconstruction:-

Crime Scene Investigation and thereby Reconstruction in its turn particularly involves 3 basic phases (refer Figure 4). They are,

- Defining the Crime Scene
- Processing the Crime Scene
- Information Collection from and about the Crime Scene [3]

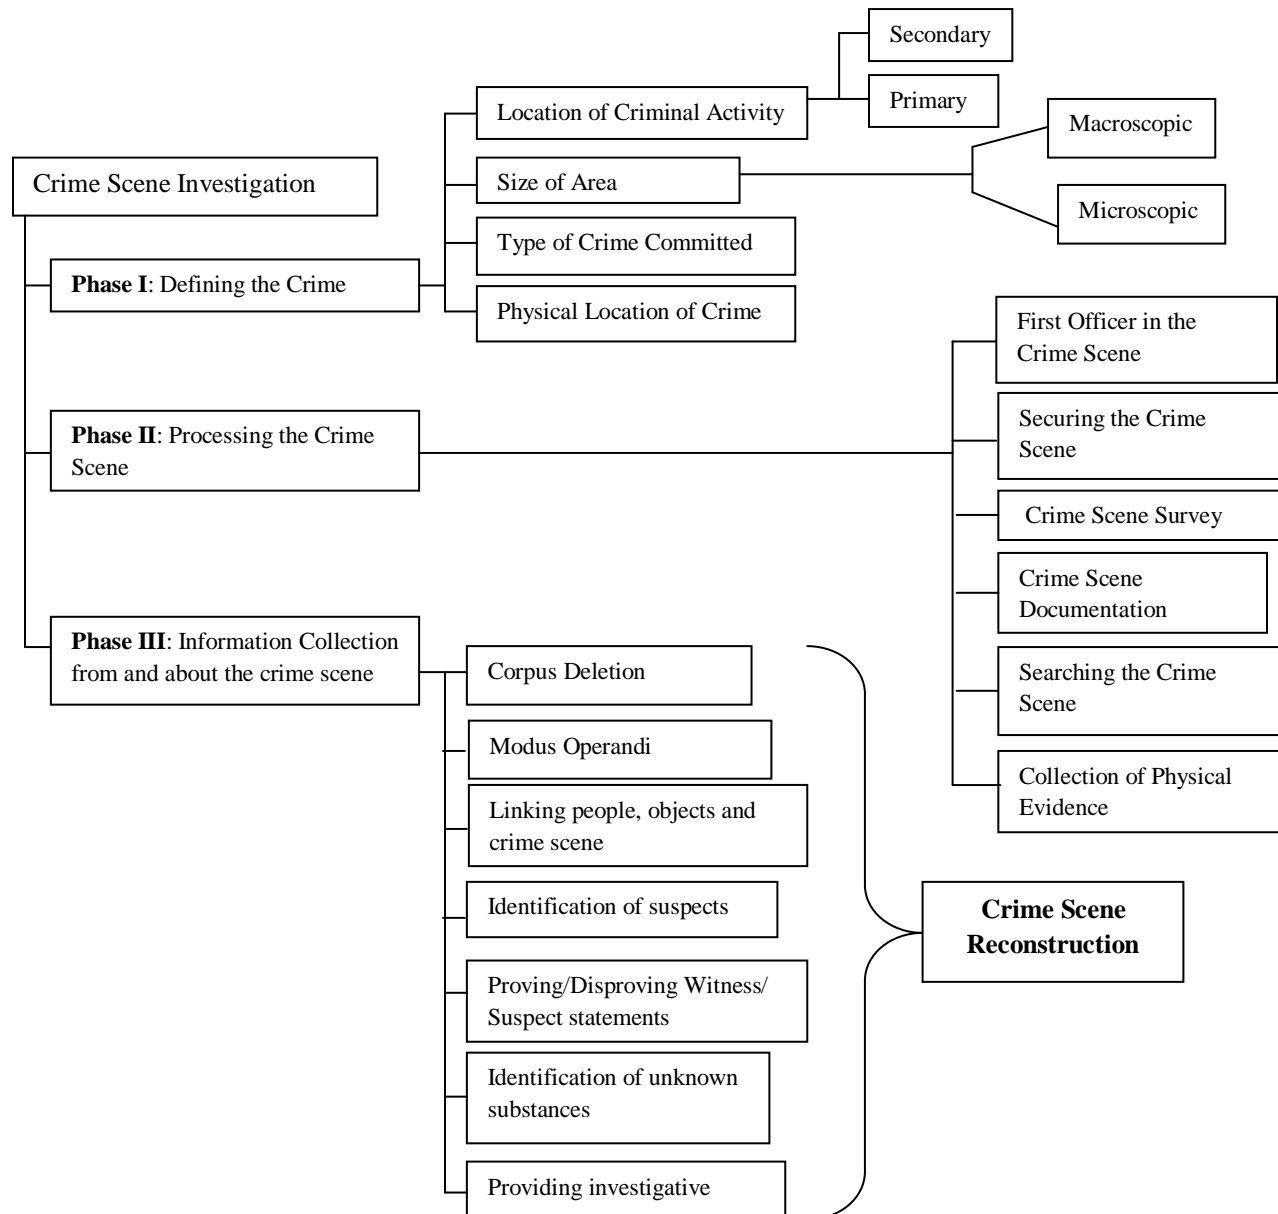

Defining the crime scene refers to identifying the activity areas relevant to a particular criminal event [3]. The Primary Crime Scene is the area where the original crime occurred. The Secondary Crime Scene comprises of the subsequent crime scenes [3]. The size of the crime scene can further be classified as Macroscopic and Microscopic [3]. While Microscopic focuses on specific type of physical evidence at the crime scene, Macroscopic refers to one particular crime location composed of many microscopic crime scenes [3]. In defining the crime scene, it is of utmost importance to understand the type of criminal offense that has been committed at the scene [3]. It can range from homicide, robbery, rape or an admixture of all. In analyzing evidence, it often stands integral to know the physical location of the crime scene (i.e. Indoors, Outdoors, Vehicle etc.)

**Figure 4:-** Crime Scene Investigation – a broad overview [3]

Once the Crime Scene is broadly defined, the next phase of the Investigation process deals with 'Processing of the Crime Scene'. At the very onset, the Crime Scene Investigator establishes contact with the Law Enforcement Officer in charge of the crime scene. Also he/she makes a list of other people such as other law enforcement officers, coroner's personnel, public safety personnel, civilians etc. who have or have had access to the crime scene in question. The next step towards processing a crime scene is securing the scene by use of police line tape or other means in order to prevent unwanted access to the scene by casual passerby, people with malicious intentions etc. The scene is secured in order to leave all evidence at the crime scene undisturbed by wandering individuals. Once secured, the scene is subjected to initial overall survey by investigating officials. At this point, the officials leave all evidence undisturbed and develop initial theories based on apparent understanding of the crime scene. The officials also mark out potential evidence in the initial walk through phase. The first responders as also enforcement officials take into account the entry /exit points in the scene that require attention. This phase also requires the officials to make a list of equipments and precautions that the officials would need to take in order to document as also search the crime scene. The crime scene is thoroughly documented by way of Notes, Videotaping, Photographing and Sketching [3]. Once clearly documented, systematic search patterns are used in order to avoid missing out on any piece of physical evidence present at the crime scene [9]. The different search patterns that are used to search a crime scene have been graphically documented in Figure 5[9].

**Figure 5:-** Search patterns used for collecting evidence from a crime scene [9]

#### **Evidence – Legal Perspective:-**

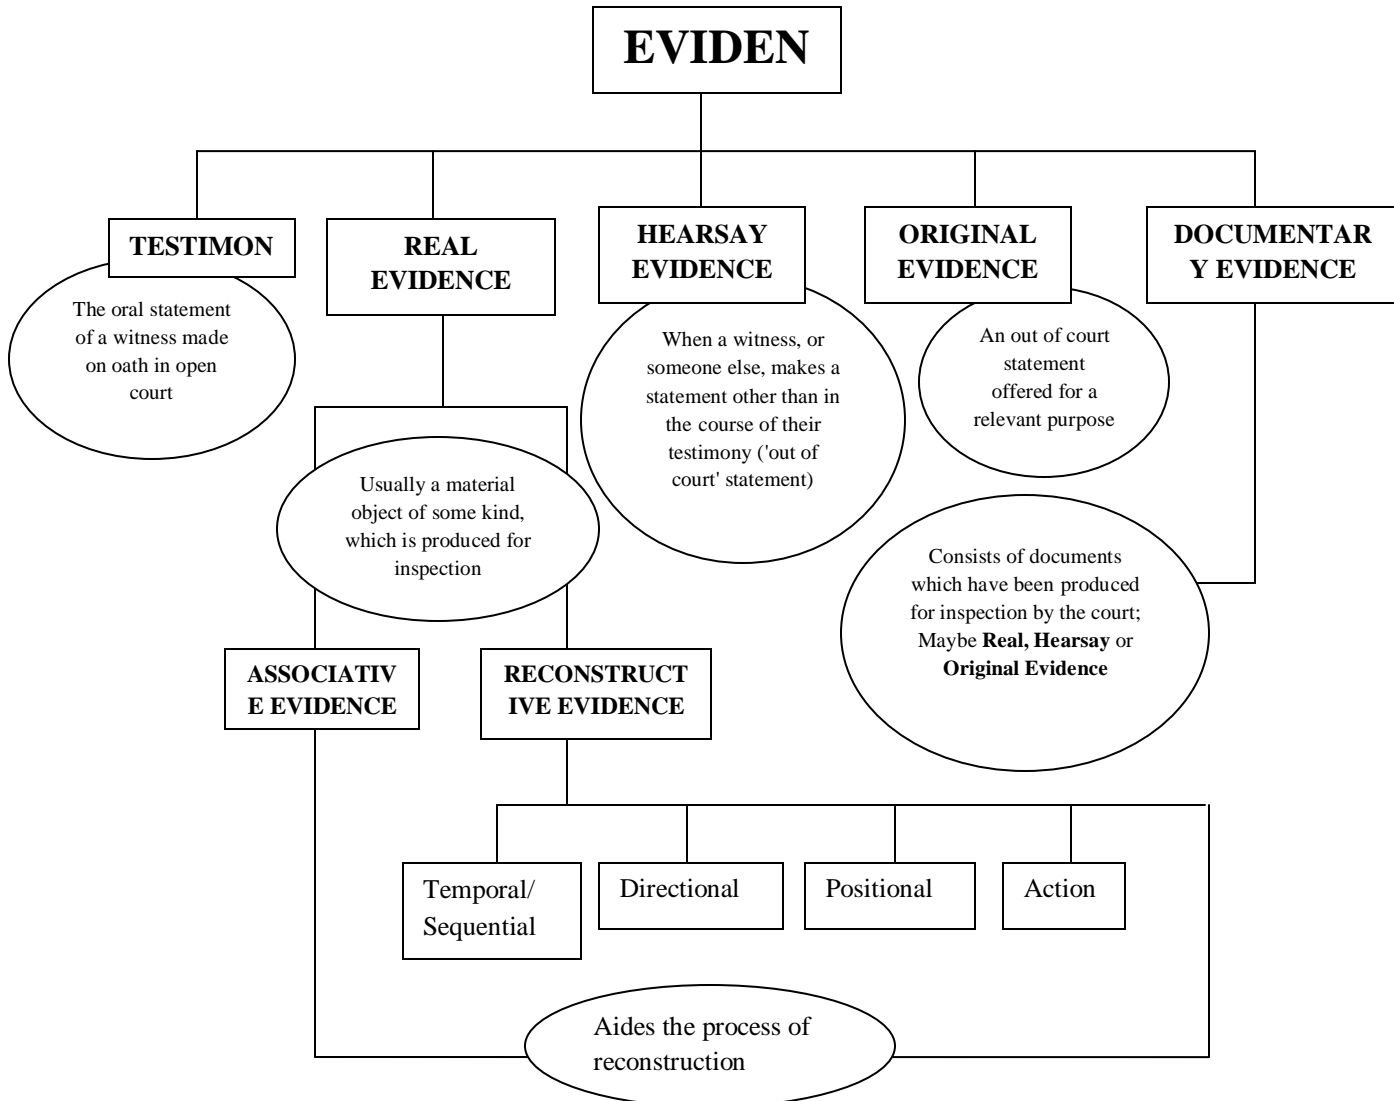

In order to prove/disprove a hypothesis formulated, the court warrants evidence and its interpretation by an expert. The legal system classifies evidence or rather ‘relevant’ evidence as – Testimony, Real evidence, Hearsay evidence, Original evidence, and Documentary evidence (refer Figure 6)[4]. Evidence is termed ‘relevant’, when the facts that are subject to prove or disprove in a court of law amount to

- Facts in issue, i.e. those which need to be proved by one party;
- Relevant facts, i.e. those which tend to prove the facts in issue;
- Collateral facts which may for example affect the credibility and/or competence of a witness [4].

Evidence based on its use in understanding a crime scene can broadly be classified into two broad groups – Associative Evidence and Reconstructive Evidence. Associative evidence, in its turn, can also be used for reconstructive purposes. While Finger-mark, Fingerprint, Foot-mark, DNA(from Hair, body fluids), Ear-mark, Bite-mark, Handwriting can particularly be used as associative evidence for uniquely identifying an individual, evidence

such as Firearm, Shoe-mark, Fibers, Paint, Glass, Tool-mark, Soil, Drugs, Fire debris, Explosives, Pollen Grain help, Bloodstain Pattern help in crime scene reconstruction.

The different types of Reconstructive Evidence are Temporal/sequential evidence, Directional evidence, Positional Evidence, Action and Associative Evidence [10].

**Figure 6:-** Evidence classification table [4]

#### **Evidence Interpretation- a case study:-**

A core concept in crime scene analysis is that 'nothing is co-incidental, nothing just happens'. This core concept of crime scene reconstruction is based on four basic principles. They are, Locard's Exchange Principle, Nicolas Stenos Principle of Superposition, Principle of Lateral Continuity by Steno and the concept of chronology [13][14]. As of date, Locard's principle forms the backbone or rather the basics of forensic science and provides the foundation for the forensic linkage triangle (refer Figure 7) [13].

**Figure 7:-** Based on evidence and the principle of exchange, the forensic linkage triangle is used by forensic scientists to establish the interrelationship between the scene, subject and victim [13].

Based on the Principle of Superposition, it can be considered that the artifacts at a crime scene are also deposited in layers in a time order, from oldest to youngest, unless otherwise disturbed or altered [13]. Figure 8 represents an image from a crime scene that emphasizes this order or time sequence of events at the crime scene.

**Figure 8:-** A crime scene image exemplifying Steno's Principle of Superposition.

From the image it can be clearly predicted that The sledge hammer head was placed (had it fallen on the blood pool blood would have spilled on all sides of the pool) on the blood pool, was allowed to dry and later when it had almost dried the hammer was removed leading to the formation of the void in the stain pattern. The events that led to the formation of this stain pattern can clearly be sequenced.

In relation to the crime scene, Steno's Lateral Continuity states that two layers that are near in time and space but are not directly associated belong to the same time frame if they have sufficient evidence of similarity(i.e. similar spatter stains) and have only been dissociated due to subsequent alteration(refer Figure 9) [13].

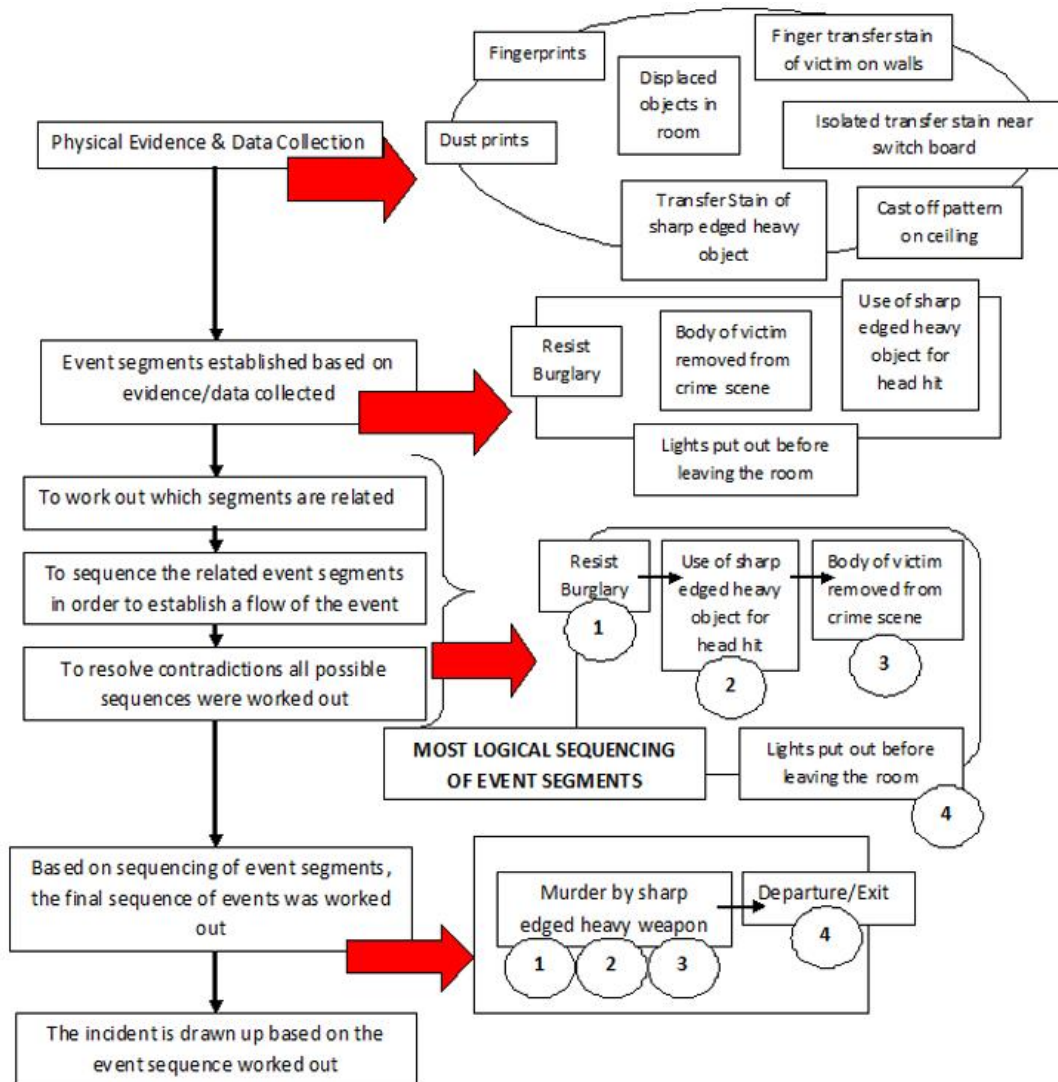

**Figure 9:-** A crime scene image exemplifying Steno's Principle of Lateral Continuity.

Though apparently dissociated, if substantial similarities exist (eg DNA, size dispersion) between the stain patterns deposited then they can be considered to be the result of a single deposition and caused by the same event. The void pattern in itself clearly mirrors the concept of Steno's Lateral Continuity [13]. When encountered with a void pattern the analyst can easily infer that, the pattern of blood did not stop abruptly but has been interrupted by the presence of an object or living being ; or has particularly been altered(i.e. removed) .

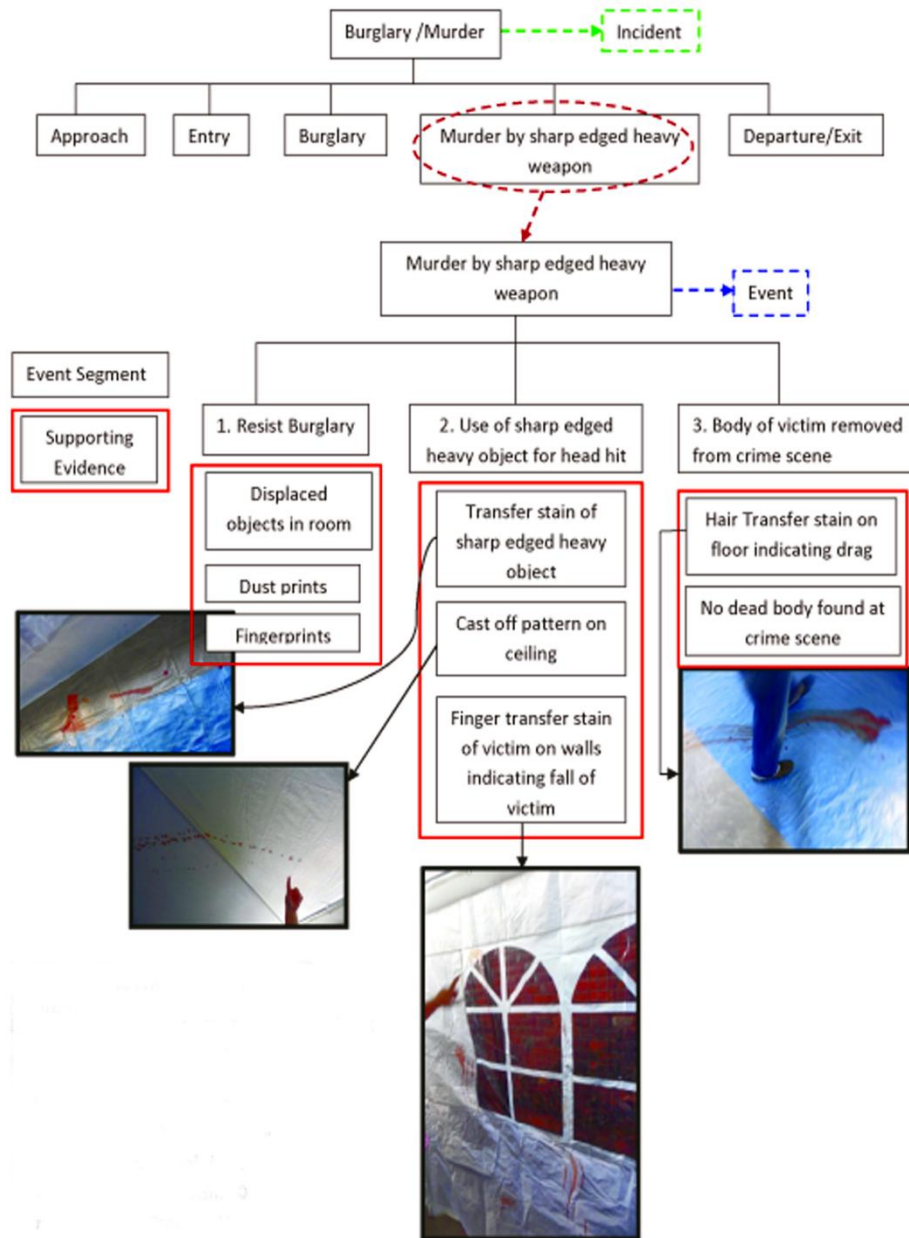

As per Bevel and Gardener [13], the steps taken to reconstruct a crime scene can be summarized as follows (refer Figure 10).

- Physical evidence and data collection from crime scene
- Specific event segments are established based on data/evidence collected(time snapshots)
- To work out which event segments are related to each other
- Sequencing the related event segments, to establish a flow of the event
- In order to resolve contradictions, all possible sequences are considered and auditing of evidence is done as and when required
- Based on sequence of the event segments, preparation of the final sequence of events is done.
- Finally the flowchart of the entire incident is prepared and the sequence is validated.

**Figure 10:-** Graphical representation of the different steps used for crime scene reconstruction.

The round structures numbered 1, 2, 3 and 4 represent the order of the associated event segments that contribute to a particular event. The event segment 'Resist Burglary' is marked as '1', the segment 'Use of sharp edged heavy object for head hit' is marked as '2' as it succeeds event segment 1. Similarly, event segment 3, 'Body of victim removed from crime scene' succeeds event segment 2 and logically precedes event segment 4, which is not related to event segments, 1, 2 and 3. Event segments 1, 2 and 3 in sequential order add up to form event 'Murder by sharp edged heavy weapon'. Event segment 4 is a part of the event segments that build up event 'Departure/Exit'.

**Figure 11:-** A crime scene reconstruction with the help of physical evidence, which directly contribute towards drawing up of respective event segments, which in their turn contribute to making up of event/events. The events add up to explain the criminal incident that has perspired [13]

A crime scene of burglary together with the murder of the victim was recreated/ simulated. Figure 10 represents a particular event from the scene and the ancillary event segments. The optimal sequence of events that had occurred at the crime scene was worked out based on available circumstantial evidence and data collected from the crime scene (refer Figure 11). A probability value is attributed to each event sequence based on previous similar crime events and logical reasoning. The sequences are ranked based on the probability value calculated. The optimal solution of the sequencing problem is found by marking out the sequence that has the highest probability. 4. Scope for Research

It is particularly difficult to backtrack what had perspired at a crime scene based on evidence. This is because uncertainty is a characteristic feature of most violent crime scenes. Even for an expert it is difficult to be sure of what has actually occurred at the crime scene. Often an expert's opinion is affected by contextual and confirmation

bias. One only gets to know the flaws in a crime scene reconstruction process when an individual present at the scene at the time of crime confesses without inhibitions. This uncertainty and overwhelming number of parameters that govern the flow, formation of a bloodstain pattern is what makes this domain a multi-disciplinary treasure trove of research opportunities.

Considerable interest has been taken towards tracing/backtracking the possible source dimensions for a passive drip stain from a weapon. A system has been proposed to predict the possible radius of a particular drip stain. Now the radius might be similar for two particular sources from which or along which blood drips. Herein lies the need for study of other circumstantial evidence at the crime scene. Again, passive blood drops often overlap. Someone might walk over the drip stains. All these parameters add to the complexity of the study and interpretation of bloodstain patterns at the crime scene. Complex, particularly mixed stain patterns, diluted stains even on plain, smooth, non-absorbent target surface are difficult to analyze. Temperature plays a crucial role in relation to blood flow characteristics. How does fat content in blood affect stain patterns? Does it at all have any effect on bloodstain patterns at a crime scene?

Fabrics are a common occurrence at any crime scene. Does a worn out piece of linen fabric of a certain thickness record stain patterns similarly to a 5 times washed linen fabric of similar weave, thickness? Is the difference statistically significant? The experiments undertaken and the work done by White and Slemko [14-16] on stain patterns recoded on fabric target surface answers the aforementioned questions only in part. On most occasions it is impossible to calculate the area of origin (i.e. the 3D position of impact) from impact spatter stains on fabric. No mathematical model has yet been devised to calculate the impact angle of a stain formed on fabric target surface. The reason for this being the large inter and intra class variability in fabric texture, thickness, absorption/porosity etc. Again salivation, sweating on fabric affects the stain patterns formed on fabric. However, human sweat as also saliva composition varies based on food habits of an individual, environmental condition in which he/she lives etc. As a result, experiments with sweat vary from one laboratory to the other and are difficult to standardize.

Transfer stains on fabric and smooth, plain, non-absorbent target surface often provide essential support for crime scene reconstruction. Interpretation of weapon transfer stains, foot, shoe, hand print transfer stains in relation to the amount of blood in contact, target surface texture etc. forms an important area of research.

Positional prediction of victim/s, bystander/s (if any), perpetrator/s in a crime scene involving blunt force trauma, rifle shot, sharp edged weapon can be done on the basis of bloodstain patterns. Unavailability of a wide benchmarked dataset, large number of variable parameters such as room dimensions, height of concerned individuals, human joint movement, fragile nature of stain patterns etc. make development of such a mathematical model complex thereby facilitating extensive research within the domain. Difference between a wipe and swipe stain still stand unexplored.

### **Conclusions:-**

Evidence or rather Physical evidence does not speak up for itself, Physical evidence warrants proper interpretation. Primarily, Associative and Reconstructive evidence contribute towards the reconstruction of a crime scene. Bloodstain Patterns can effectively be used in coherence with other circumstantial evidence for the reconstruction of a crime scene, to validate the statement of eyewitness/es (if any), to sequence events that might have occurred at a crime scene etc. Crime Scene Reconstruction in its turn aids the process of crime scene investigation and the presentation and interpretation of evidence in a criminal court.

However, evidence interpretation within a juridical setting as of date is largely dependent on the discretion of a skilled expert witness. A mathematical model could particularly help towards minimizing contextual, cognitive and confirmation bias and reinstate faith of the scientific system on the whole process in place for Crime Scene Investigation and presentation with a juridical setting.

Owing to the large number of environmental parameters that affect stain pattern formation and the uncertainty that plagues crime scene reconstruction Bloodstain pattern stands as a multidisciplinary domain that warrants inputs from research communities of widely varying disciplines.

#### Abstract

**Background;** Breast cancer is the commonest malignancy and the second cause of cancer-related death in women worldwide. Understanding the underlying molecular biology of breast cancer allow better management to decrease its mortality. The S100 P is a member of S100 family of Ca<sup>2+</sup>-binding proteins. Apoptosis is a physiologic mechanism of cell death that has been shown to play important role in cancer development. Bcl-2 is an anti-apoptotic gene that has the ability to block apoptotic signals, while Bax is another member of the Bcl-2 family that has an apoptosis-stimulating function.

**The aims** of our study were to elucidate the prognostic role of S100P, bcl2 and bax in breast cancer, clarify the relation between their expressions and the prognosis of that type of cancer.

**Method:** The plasma S100P levels ( by ELISA ) and expressions of bcl2 & bax ( by Immunohistochemistry ) were evaluated in 90 women; 70 metastatic breast cancer patients (MBC), 12 primary breast cancer patients (PBC) and 8 healthy controls, then we assessed the prognostic value of S100P, bax, bcl2 in breast cancer patients.

**RESULTS:** the plasma S100P level was nearly the same for PBC patients and controls, but was higher than that of MBC patients ( $p < 0.001$ ). There is significant correlations between the level of S100P with capsular invasion ( $p = 0.018$ ), stage, bcl2 and bax ( $P < 0.001$ ). In MBC there is a significant association between elevation of S100P level, number and site of metastasis ( $P < 0.001$ ).

Bcl2 expressions in breast cancer patients had negative significant correlations with grade ( $P < 0.001$ ), ki67 ( $P < 0.021$ ), molecular subtype ( $P < 0.050$ ), stage ( $P < 0.001$ ), and S100p ( $P < 0.05$ ), also its expression in MBC patients was statistically significant with number of metastasis ( $P = 0.014$ ).

Bax high expression is statistically significant with grade ( $P = 0.003$ ), stage ( $P < 0.001$ ), ER ( $P < 0.010$ ), PR ( $P < 0.023$ ), Her-2 neu ( $P < 0.002$ ),

but in MBC patients it is statistically significant with the site of metastasis ( $P=0.003$ ).

The plasma of S100P level is significantly correlated with response to therapy, disease progression ( $P<0.001$ ) and Overall survival (OS) of patients ( $P=0.014$ ). Bcl2 expression is significantly correlated with response to therapy ( $P<0.001$ ), disease progression ( $P=0.004$ ) and OS ( $P=0.014$ ).

**Conclusion:** S100P, BCL2 and bax are promising prognostic markers in breast cancer patients

## Introduction:-

Breast cancer is the most common neoplasm and the second leading cause of cancer-related death in women worldwide (1). In Egypt, breast cancer represent 33.8% of all cancer cases in females, and the estimated number of breast cancer in 2015 is 19105 cases (2). Understanding the underlying molecular biology of breast cancer allow earlier diagnosis and efficient treatment options that will help to decrease its mortality (2).

The S100 P is a member of S100 family which is EF-hand superfamily of  $Ca^{2+}$ -binding proteins that have intracellular and extracellular functions. It contributes to cancer progression by promoting cell proliferation, survival, angiogenesis, and metastasis. It is over expressed in many types of cancer such as pancreatic cancer, hepatocellular carcinoma, oral squamous cell carcinoma, esophageal cancer, gastric, colorectal cancer, lung cancer, prostatic cancer, ovarian cancer, cervical cancer. It correlates with poor prognosis in these cancer patients and also could be a promising therapeutic candidate. In addition, many studies suggested an important role of S100P in occurrence of chemoresistance. However, its diagnostic and prognostic value for metastatic breast cancer (MBC) is still unknown (3-6).

Apoptosis is a physiologic mechanism of cell death that has been shown to play a role in the onset and/or development of cancer (7). Defects in the cellular program that control apoptosis can lead to disturbances in tissue homeostasis, i.e., balance of cell proliferation and cell death (8, 9). Most anticancer agents, independently of their mechanisms of action, kill cancer cells by inducing apoptosis in response to a drug-induced damage. Alterations in the regulatory mechanisms of apoptosis are responsible not only for the progression of cancer, but also for different response to treatment (10). Apoptosis is controlled by several genes. Among the most crucial regulators of this process are members of the Bcl-2 gene family. Bcl-2 is an anti-apoptotic gene that was first identified in follicular non-Hodgkin lymphoma (11). Bax is another member of the Bcl-2 family, but in contrast to Bcl-2 it has an apoptosis-stimulating function (12).

## The aims of our study:-

were to elucidate the role of plasma S100P level in breast cancer prognosis, evaluate the immunohistochemical expression of bcl2 & bax in breast cancer patients, clarify the relation between their expressions and patient prognosis, and also to correlate plasma S100P level with bcl2 and bax immunohistochemical expressions in our patients.

## Patients & method:-

In our study, 90 women were included; 70 metastatic breast cancer patients (MBC), 12 primary breast cancer patients (PBC), and 8 healthy controls, the study was conducted in Clinical Oncology and Nuclear Medicine, Medical Oncology, Clinical Pathology, Pathology, General Surgery departments, faculty of medicine, Zagazig University, Egypt. Informed consent was obtained from all cases; the study protocol was approved by the Ethical Committee of Faculty of Medicine, Zagazig University. The patients' specimens and data were collected from March 2011 to February 2013 and were followed up till March 2016.

## Plasma S100P measurement:-

Plasma S100P level was measured using S100P ELISA kit (ElabScience, product code E-E1-H1294) and an ELISA plate reader b (Tecan-Austria GM bit.8 Gro dig. Austria, following the manual of the procedure. All plasma samples were measured in duplicates. Correlation coefficient between duplicate: 0.99, detection range (0.313-20 ng/ml), sensitivity: 0.188.

Sample collection and storage collect plasma using EDTA as anti-coagulant, centrifugation the sample at 1300g at 2-8°C for 20 minutes of collection the plasma. Collect the supernatant and stored at -80, then before the assay the sample kept at RT (8-25°C). Determine optical density (OD) value of each well at microplate reader (450nm).

**Tissue specimens:** Formalin fixed paraffin embedded blocks of PBC and MBC patients were collected. The seventh edition of the American Joint Committee on Cancer staging system (AJCC-7) classification was used for pathologic staging (13) and the Nottingham (Elston-Ellis) modification of the Scarff -Bloom-Richardson grading system was used for pathologic grading (14).

**Immunohistochemical staining:** Immunohistochemical staining was carried out using the streptavidin-biotin immunoperoxidase technique (15), the slides were incubated with mouse monoclonal Anti-Bcl-2 antibody [Bcl2/100] ab117115 was used at a dilution of 1:100 and primary rabbit polyclonal Anti-Bax antibody ab10813 diluted 1:1000 (Abcam, Cambridge, MA, USA) at 4°C overnight. Sections from normal tonsils were used as positive control for bcl2, sections from normal colon for bax and the negative control is by adding non-immune serum instead of the primary antibodies.

#### **Evaluation of immunohistochemical expressions of Bcl2 proteins:**

Cytoplasmic staining of bcl-2 was scored as followed; bcl2 negative—no tumor cells stain or weak heterogeneous positive stain in less than 10 % of tumor cells and bcl-2 positive—more than 10 % of tumor cells stained (16).

#### **Evaluation of immunohistochemical expression of bax:**

Bax cytoplasmic expression was scored as positive if at least 20% of tumor cells showed clear cytoplasmic immunostaining (17).

#### **Statistical Analysis:-**

Continuous variables were expressed as the mean  $\pm$  SD & median (range), and the categorical variables were expressed as a number(percentage). Continuous variables were checked for normality by using Shapiro-Wilk test. Percent of categorical variables were compared using Pearson's Chi-square test or Fisher's exact test when was appropriate. Receiver operating characteristic (ROC) curve analysis was used to identify optimal cut-off value of S100 level with maximum sensitivity and specificity for discrimination between breast cancer and control. Overall Survival (OS) was calculated as the time from diagnosis to death or the most recent follow-up contact (censored). Progression Free Survival (PFS) was calculated as the time from start of treatment to date of progression or the most recent follow-up contact that patient was known as progression free. Stratification of OS and PFS was done according markers. These time-to-event distributions were estimated using the method of Kaplan-Meier plot, and compared using two-sided exact log-rank test. All tests were two sided. A p-value <0.05 was considered significant. All statistics were performed using SPSS 22.0 for windows (SPSS Inc., Chicago, IL, USA) and MedCalc windows (MedCalc Software bvba 13, Ostend, Belgium).

#### **Results:-**

##### **Patient Characteristics**

Our study included 70 MBC patients, their age range was (29-65) years, mean  $\pm$  SD was 47.25  $\pm$  9.77. Forty four patients (62.9%) were less than 50 years while 26 patients (37.1%) were more than 50 years. Premenopausal and post menopausal patients were presented in 30 (42.9%) and 40 (57.1%) respectively. Fifty five patients (78.6%) had IDC, 12 patients (17.1%) had ILC while medullary and mucinous carcinoma were presented in only one and two patients respectively. The majority of our patients (70%) had G2 whereas only 30% had G3. Capsular invasion and positive Ki67 were demonstrated in 15 (21.4%) patients and 20 (28.6%) patients respectively. The majority of our patients had Luminal A subtype (57.1%) but luminal B and Her-2 amplified subtypes were presented in (15.7%) for each one. whereas the minority of our patients (15.7%) had triple negative subtype. T1, T2, T3 and T4 were present in 12, 19, 12 and 17 patients respectively where N0, N1, N2 and N3 were present in 16, 15, 2 and 37 patients respectively. S100P mean were 13.27  $\pm$  6.66, the median (range) were 13.10 (8.2-19.3). Negative bcl2 and bax expression were present in 47 and 23 patients respectively, while positive bcl2 and bax expression were present in 23 and 47 respectively (Table 2).

##### **Comparison between the studied groups as regard the 3 studied markers**

- The median of plasma S100 P level was nearly the same for PBC patients and healthy control, in addition its level in MBC patients was higher than both PBC patients and healthy control (near the double) ( $p_1 < 0.001$  between MBC vs Non-MBC;  $p_2 < 0.001$  between MBC vs control) both of them are significant while  $p_3 = 0.834$  between Non-MBC vs control (non significant).
- Regarding Bcl2 immunoexpression positive expression was found in 23 (32.9%) of MBC, 11 (91.7%) of Non-MBC and in 8 (100%) of the normal breast tissue ( $p_1 < 0.001$  between MBC vs Non-MBC;  $p_2 < 0.001$  between MBC vs control) both of them are significant while  $p_3 = 0.402$  between Non-MBC vs control (non significant).

•Regarding Bax immunoexpression; positive expression was found in 47 (67.1%) of cases of MBC but no positive expression was detected in either Non-MBC or in the normal breast tissue ( $p_3 < 0.001$ ). ( $p_1 < 0.001$  between MBC vs Non-MBC;  $p_2 < 0.001$  between MBC vs control;  $p_3 < 0.001$  between Non-MBC vs control all of them are significant (**Table 1**).

### Effect of clinicopathological parameters on plasma S100p level in breast cancer patients

plasma level of S100 in all breast cancer patients showed statistical correlation with capsular invasion (p =0.018), T (p=0.031), stage, bcl2 and bax expression (P <0.001 for each of them ),while S100 level in metastatic breast cancer patients showed significant correlation with capsular invasion and bcl2(P =0.002&<0.001 respectively). Furthermore, there is a significant association between elevation of S100P level and both the number and site of metastasis (P<0.001 for both); {presence of liver metastasis P=0.002, brain metastasis P=0.009 and bone metastasis P<0.001} (Table 2, 3 ).

### Correlation between clinicopathological parameters and Bcl2 expression in breast cancer patients

Bcl2 was cytoplasmic and its protein expressions in breast cancer tissues were lower than those in the relatively healthy and adjacent breast tissues .Bcl2 was positively expressed in 41.5% of all studied breast cancer patients, 32.9% of MBC, and 91.7% of PBC . Moreover, its low expression in all breast cancer patients was significantly negatively correlated with grade(P 0.001), ki67 (P 0.021), molecular subtype (P 0.050) , and each one of T ,N , stage ,BAX( P <0.001 for each of them ) ,S100p (P<0.05 ) . But its expression in MBC patients was statistically significant with, ki67 (P 0.044), molecular subtype (P 0.050) , and each one of grade, T ,N ,BAX( P <0.001 for each of them), number of metastasis (P=0.014) and presence of bone metastasis (P=0.013) (Table 2,3 ).

**Correlation between clinicopathological parameters and bax expression**

Bax was cytoplasmic and its protein expression in breast cancer tissues was significantly higher than that in the relatively healthy, adjacent breast tissues. . Bax was positively expressed in 57.3% of all studied breast cancer patients, 67% of MBC, while all PBC didn't express bax.. Furthermore ,its high expression is statistically significant with grade (P=0.003) ,every one of molecular subtype ,T ,N and stage (P<0.001 for each ) ,ki67 (P<0.004) ,ER (P<0.010), PR(P<0.023) ,Her-2 neu (P<0.002) ,both bcl2 and BAX (P<0.001 for both) in all breast cancer patients . However in MBC patients it is statistically significant with grade (P=0.001), every one of molecular subtype, T, N (P<0.001 for each), ki67 (P<0.002) , site of metastasis (P=0.003), presence of brain metastasis (P=0.004) and lung metastasis (P=0.032)} (**Table 2,3**).

#### Effect of plasma S100p level, (bax and Bcl2) expression on treatment outcome in metastatic breast cancer patients:

The implication of plasma S100P levels on the prognosis of our 70 MBC patients was studied in our trial. Our patients were undergone follow up for 3 years (the median follow up period was 19 month) . The cut off points of plasma S100P was 7.6 ng / ml, which indicates that the values above it are high but the values below it are low.

Evaluation of the effect of the markers on treatment outcome (response to treatment , occurrence of progression and mortality ) was done , which reveals significant correlation between plasma S100P level with each one of the following; response , progression, and mortality (  $P < 0.001$  for each ) (**Table 4**) . Similarly ,Bcl2 expression is significantly correlated with response (  $P < 0.001$  ) , progression (  $P = 0.004$  ) and mortality (  $P = 0.01$  ) (Table 4 ) . However, bax expression bax was not significantly correlated with response (  $P = 0.78$  ), progression (  $P = 0.80$  ) or mortality (  $P = 0.80$  ) .

**Table (4):** immunohistochemical staining for( bcl2, Bax) and plasmaS100p level on treatment outcome and survival in metastatic breast cancer patients (N=70).

#### Effect of plasma S100p level, (bax and Bcl2) expression on Survival in metastatic breast cancer patients:

Mean PFS was 24.14 months, 3 y PFS was 57.9%. Mean OS was 30.75 month, 3y OS was 70.9%. The association between plasma S100P levels and PFS was assessed in our MBC patients. As illustrated in Kaplan-Meier curve, MBC patients with lower plasma S100P level had significantly longer PFS in comparison to those who had higher plasma S100P levels (the mean PFS 35.36 months VS 9.94 months respectively,  $P=0.000$ , **Fig.1B**). Moreover, patients with positive bcl2 expressions had significantly longer PFS when compared to those who had negative bcl2 expression (the mean PFS time was 30.96 months VS 19.69 months respectively,  $P=0.005$ , **Fig.1C**). While, there is insignificant increase in the mean PFS time for the patients who had BAX positive expression versus BAX negative patients (the mean PFS time was 24.34 months VS 19.78 months respectively,  $P=0.860$ , **Fig.1D**).

Overall survival (OS) in the studied MBC patients ( $N=70$ ) showed that, patients who had low plasma S100P levels had significantly better OS than those who had high plasma S100P levels (the mean OS was 36.3 months VS 16.56 months respectively,  $P=0.000$ , **Fig.2B**), as well, patients with positive bcl2 expressions had significantly longer OS when compared to those who had negative bcl2 expression (the mean OS was 36.30 months VS 27.38 months respectively,  $P=0.014$ , **Fig.2C**). Whereas there is insignificant increase in the mean OS for the patients with bax positive expression versus bax negative patients (the mean OS was 30.93 months VS 26.34 months respectively,  $P=0.903$ , **Fig.2D**).

**Discussion:-**

Breast cancer is the most common diagnosed cancer all over the world and the main cause of cancer-related death among females (18). In addition, up to 30 percent of women with early-stage breast cancer at time of diagnosis will develop distant metastatic disease. Although metastatic breast cancer (MBC) is not curable; the introduction of newer systemic therapies leads to survival improvement (19-21).

In our study ; we followed the patients for 3 years (the median follow up period was 19 month). The cut off points of plasma S100P was 7.6 ng / ml, which indicates that the values above it are high but the values below it are low . S100P level in metastatic breast cancer patients are higher than PBC and healthy tissue. Elevation of Serum S100P level in metastatic breast cancer patients showed significant correlation with capsular invasion, bcl2(P =0.002 and <0.001 respectively), increased number of metastasis, metastatic site (P<0.001 for both ); { presence of liver metastasis P=0.002, brain metastasis P=0.009 and bone metastasis P<0.001}.

There is a significant correlation between plasma S100P level with response, progression, and mortality (P<0.001 for each). MBC patients with lower plasma S100P level had longer but non-significant PFS time in comparison to those who had higher plasma S100P levels (the mean PFS time 35.36 months VS 9.94 months respectively, log-rank test P=0.000) Patients who had low plasma S100P levels had better but non-significant OS than those who had high plasma S100P levels (the mean OS time was 36.3 months VS 16.56 months respectively, log-rank test P=0.000)

The small, calcium-binding protein S100P has gained the attention of researchers from different scientific fields due to its potential roles in both healthy and neoplastic tissues(22). S100P is a member of the large family of S100 calcium-binding proteins that mediate  $\text{Ca}^{2+}$  dependent signal transduction pathways (23). Its expression has been found frequently and at high levels, in a variety of different tumor types in addition to its role in chemoresistance (3, 4). S100P could potentially serve as diagnostic marker, prognostic ,predictive indicator and therapy target for different carcinomas through its inhibition or inhibition of its targets, or its interactions which result in a decrease of cellular motility and metastatic potential(7, 24).

S100P plays an important role in oncogenesis (tumor cell proliferation, differentiation, apoptosis, weakening of cell: cell adhesion contacts, stimulation of cell motility and invasion and metastasis (25, 26).

S100 P is expressed in tumor tissue and absent in most healthy tissues, so it was evaluated as a novel biomarker for detection of several cancers by using immunohistochemistry approaches (24). But in our study we used ELISA as a new modality for measurement of S100 P.

Indeed, anti-S100P antibodies have shown promising results (in vitro and in vivo) as single agents and in combination with other chemotherapeutic agents, such as gemcitabine in pancreatic cancer (3). So blocking S100P function is expected to improve responses to chemotherapeutic agents. However, this needs further investigations because there are other reports showed that overexpression of S100P (in vitro) led to sensitization of cancer cells to carboplatin, paclitaxel (27) and oxaliplatin (28) in ovarian and gastric cancer cells respectively. Despite this, S100P still represents a potentially very effective anti-cancer target, at least for in some cancer types, and further development of anti-S100P specific therapies will likely prove to be a fruitful and productive field of investigation (29).

In breast cancer, S100P expression is associated with immortalization of neoplastic cells and aggressive tumor behavior, indicating that this protein may have adverse prognostic value and poor survival in breast cancer patients (30).

Univariate and multivariate analyses in early breast cancer patients (stage II) showed that higher expression of nuclear S100P (S100Pn) was observed in cases of a shorter overall survival and disease-free time. No relationship could be documented between expression of S100P and sensitivity of breast cancer cells to cytostatic drugs. The preliminary data indicated that, this protein might become a therapy target and warrants further studies with respect to its prognostic, predictive and potentially therapeutic value.(30).

Plasma S100P levels were measured in 381 women, including 60 healthy controls, 48 primary breast cancer patients (PBC) patients, and 273 metastatic breast cancer (MBC) with correlation between increased its level and MBC . In addition, assessment of prognostic value of S100P with enumeration of CTC and clinicopathological factors were done .The follow up period was 3.5 years. They found that the plasma S100P cut off point was 7 ng / ml and also there is association between high plasma S100P level (>7 ng/mL) and poor prognosis of MBC patients (median progression-free survival time: 5.0 vs. 8.7 months, log-rank test  $p < 0.001$ ; median overall survival time: 22.5 vs. 31.6 months, log-rank test

$p < 0.001$ ). The plasma S100P level added additional prognostic relevance to the prognostication model with clinicopathological factors and CTC enumeration. Furthermore, The examination of the value of plasma S100P levels as treatment monitoring marker was done and revealed, its significant reduction after treatment, This indicates its value in evaluation of treatment outcome. They concluded that plasma S100P level is a simple and cost-effective marker for the prognosis of metastatic breast cancer (4).

The results of this trial are consistent with our result where, the cut off points of plasma S100P was 7.6 ng / ml, which indicate that the values above it are high but the values below it are low. S100P level in metastatic breast cancer patients are higher than PBC and healthy tissue. There is significant correlation between plasma S100P level with response, progression, and mortality ( $P < 0.001$  for each). MBC patients with lower plasma S100P level had significant longer PFS time in comparison to those who had higher plasma S100P levels (the mean PFS time 35.36 months VS 9.94 months respectively, log-rank test  $P = 0.000$ ) Patients who had low plasma S100P levels had significant better OS than those who had high plasma S100P levels (the mean OS time was 36.3 months VS 16.56 months respectively, log-rank test  $P = 0.000$ ).

There are many theories about the lack of activity of anti-cancer drugs in breast cancer. The disruption of the apoptotic pathways may be one of reasons. We therefore decided to assess the expression of those factors involved in apoptosis in the normal mammary gland, benign mammary dysplasia and primary cancer. The most significant findings of our study are that, Bcl2 positive protein expressions in breast cancer tissues were lower than those in the healthy and adjacent breast tissues. Moreover, its expression in all breast cancer patients was significantly correlated with good clinic pathological parameters like low grade and stage ( $P < 0.001$ ) and low ki67 level ( $P = 0.021$ ). Also its positive expression in MBC patients was statistically significant with low ki67 level ( $P = 0.044$ ), molecular subtype ( $P = 0.050$ ), and low grade, T, N, Bax ( $P < 0.001$  for each of them) decreased number of metastasis ( $P = 0.014$ ) and presence of bone metastasis ( $P = 0.013$ ).

Bax positive protein expressions in breast cancer tissues were higher than that in the relatively healthy, adjacent breast tissues. Furthermore, its positive expression was significantly correlated with poor clinic pathological parameters like high grade ( $P = 0.003$ ) and stage ( $P < 0.001$ ), high ki67 level ( $P < 0.004$ ), positive ER ( $P < 0.010$ ), PR ( $P < 0.023$ ), Her-2 neu ( $P < 0.002$ ) and negative bcl2 level ( $P < 0.001$ ) in all breast cancer patients. However in MBC patients its positive expression is statistically significant with high grade ( $P = 0.001$ ), every one of molecular subtype, T, N ( $P < 0.001$  for each), high ki67 level ( $P < 0.002$ ), and site of metastasis ( $P = 0.003$ ) {brain ( $P = 0.004$ ), lung ( $P = 0.032$ )}. However, bax expression is not significant with either response ( $P = 0.78$ ), progression ( $P = 0.80$ ) nor mortality ( $P = 0.80$ ). Similarly, Bcl2 expression is significantly correlated with response ( $P < 0.001$ ), progression ( $P = 0.004$ ) and mortality ( $P = 0.01$ ) Mean PFS was 24.14 months, 3 y PFS was 57.9%. Mean OS was 30.75 month, 3y OAS was 70.9%. Patients with positive bcl2 expressions had significantly longer PFS when compared to those who had negative bcl2 expression (the mean PFS time was 30.96 months VS 19.69 months respectively, log-rank test  $P = 0.005$ ). Meanwhile, there is insignificant increase in the mean PFS time for the patients who had Bax positive expression versus Bax negative patients (the mean PFS time was 24.34 months VS 19.78 months respectively, log-rank test  $P = 0.860$ ). Patients with positive bcl2 expressions had significantly longer OS when compared to those who had negative bcl2 expression (the mean OS time was 36.30 months VS 27.38 months respectively, log-rank test  $P = 0.014$ ). But, there is insignificant increase in the mean OS time for the patients who had Bax positive expression versus Bax negative patients (the mean OS time was 30.93 months VS 26.34 months respectively, log-rank test  $P = 0.903$ ).

**Liu et al.**, showed that a high apoptotic rate is associated with a high grade of tumor, large tumor size and with a shortened disease-free survival period (31). In the study of **Ioachim et al. (2000) (32)** Bcl-2 protein was detected in 85.2% of benign hyperplastic lesions of the mammary gland and 40% of breast cancers. On the other hand, **Bargou et al. (1995) (33)** observed no difference with regard to Bcl-2 (and Bcl-XL) expression between normal breast epithelium and breast cancer tissue. Similarly to **Bargou et al. (1995) (33)**, In the study by **Gee et al., (1994) (34)** Bcl-2 was detected in 70% of breast cancers. It has also been shown that Bcl-2-positive patients had a better prognosis than Bcl-2-negative patients (35).

**Rochaix et al. (1999) (36)** suggested that Bcl-2 and Bax expression were associated with a regulation of apoptosis in breast cancer. They found that Bcl-2 expression in tumours was associated with a better differentiation of the cancers (G1 — 100% of Bcl-2-positive tumours, G2 — 81%, G3 — 60%), but there was no relationship between Bax and tumor grade.

In the study of **Berardo et al. [1998] (37)** high Bcl-2 expression was associated with favourable prognostic factors such as ER positivity, low S phase fraction, a lower number of positive lymph nodes and overall survival. Our findings confirm the results of **Berardo et al. [1998] (37)** with regard to the favourable prognostic significance of Bcl-2 expression in breast cancer. **Honma et al., 2015 (38)** Compared Bcl-2 expression with other clinicopathological factors, Bcl-2 positivity was

significantly correlated with smaller tumor size, lower grade, ER positivity, PR positivity, and HER2 negativity, in both groups, confirming Bcl-2's association with favorable prognostic factors.

**Dawson et al 2010(39)** revealed that BCL2 continues to be associated with favorable outcome. BCL2 belongs to a group of related proteins that are key regulators of apoptosis or programmed cell death (**Cory et al, 2003(40)**).

BCL2 protein expression in breast cancer is associated with an indolent phenotype of low-grade, slowly proliferating, ER $\beta$  breast tumours (**Silvestrini et al, 1994; Lipponen et al, 1995(41,42)**). This 'paradoxical' favourable prognostic effect of BCL2 in breast cancer could be related to its non-apoptotic functions (**43**). Increased expression of BCL2 protein may also disrupt the balance with other members of the BCL2 family, including the expression of pro-apoptotic proteins (**40**). The exact mechanism of differential BCL2 protein expression in breast cancer is complex. BCL2 is expressed in normal breast glandular epithelium and is known to be upregulated by oestrogen, possibly as a direct result of transcriptional induction (**44**).

Also no differences in treatment response were found in patients with early breast cancer related to Bax expression in the tumor cells (**45**). While **Krajewski et al.** detected that, MBC patients with low Bax expression had poorer response to treatment and shorter OS (**46**).

**Pluta P, et al** studied 62 breast cancer patients and control group of 11 breast fibroadenoma patients, bax expression was assessed by flow cytometer, bax expression was found in 82% of patients. Bax expression was lower in breast cancer patients than in controls, and this could be one of the mechanisms of apoptosis escaping by tumor cells (**47**).

Novel markers that could be used to save women from unnecessary cytotoxic adjuvant therapy are urgently needed and BCL2 provides valuable additional prognostic information to guide clinical decision making in this setting. In summary our results proved that bcl2 and bax are independent and powerful prognostic protein marker in breast cancer patients more than other prognostic factors.

Our results indicate that overexpression of pro-apoptotic proteins could contribute to an increase in cell turnover and breast cancer development and progression, but we suggest that further studies should be carried out with increased sample size to fully assess Bax expression in breast cancer progression.

**Conclusion:** S100P, BCL2 and bax are promising prognostic markers in breast cancer patients but we recommend further studies with large sample size to be done to increase statistical power of the results.

##### Key words:-

Antiseptic, povidone-iodine,  
Chlorhexidine, Alcohol, ototoxicity,  
cochlear toxicity, vestibular toxicity.

#### Abstract

**Background:** There is a wide variation in practice in the use of surgical preparation solutions among otolaryngologists in ear surgery. Chlorhexidine gluconate, povidone-iodine and alcohol are common topical antiseptics solution. The literature for risk and mechanisms of the ototoxicity by Antiseptics solution if reaches the tympanic cavity and inner ear causing functional impairment and cellular damage to tissues is being reviewed and compared.

**Aim:** We present the current antiseptics solutions used during ear surgery and their risk of ototoxicity. Depending on the available clinical trials that have shown their clear effect on both animal models and human ears.

**Result:** The three widely used topical antiseptics preparations for ear surgeries and have been studied in literature are: Alcohol, Chlorhexidine gluconate and Povidone-iodine. Alcohol and chlorhexidine gluconate have a toxic effect on the vestibular and cochlear function proven by significant changes in Vestibular evoked myogenic potential (VEMP) and Auditory brainstem response (ABR). On the other hand, low concentration of Povidone-iodine (5%) does not have this adverse effect, However non-significant changes in the ABR was found to be related to a high concentration of Povidone-iodine (10%).

**Conclusion:** Chlorhexidine gluconate and alcohol have a clear ototoxic effect and are not safe in ear surgery especially with perforated tympanic membrane, whereas diluted low concentration povidone-iodine is safe and to date is the standard topical antiseptic solution to be used for ear surgeries.

#### Introduction:-

Till date there is no current standards regarding which antiseptic solution should be used preoperatively to prevent surgical site infection in ear surgery(1). Povidone-iodine, Chlorhexidine and Alcohol are the commonly used in surgical preparation. Till date, there is a wide variation in practice in the use of surgical preparation solutions among otolaryngologists performing ear surgery. Lai Philip and colleagues 2011 did an electronic survey among members of the Canadian Society of Otolaryngology-Head and Neck Surgery. Under "do you perform tympanoplasty" in terms of the choice of preparation solution. The result was 96% used an antiseptic preparation solution at surgery,

whereas 4% did not. 5% used a chlorhexidine-based preparation, 4% used an alcohol-based solution, 86% used aqueous povidone-iodine and 4% used others. 29% of the surgeon used a barrier method, 31% answered "always," 24% answered "sometimes" and 7% answered, "I don't know" (2).

The risk and mechanisms of the ototoxicity by Antiseptics solution if reaches the tympanic cavity and inner ear causing cellular damage to tissues and functional impairment are reviewed, and compared in our presented review.

The aim of this review is to highlight the use of current standards and safe antiseptics solutions during ear surgery with their risk of ototoxicity. Depending on the available clinical trials that have shown their clear effect on both animal models and human ear

### Methods:-

A systematic English articles search was performed looking at data base science pub-med. Since February 2016 in both, animal and human studies in the relevant key words. Including (Patient) human and animal going to ear surgery, (Intervention) use of antiseptic, (Compare) antiseptic type either Chlorhexidine and Alcohol or povidone-iodine and (Outcome) ototoxicity effect. After filtration, we found out 15 studies that closely match our aim of review.

### Result:-

All in English. Two articles on both Chlorhexidine and Alcohol, only one Prospective controlled article on antiseptic was found. While seven specific articles on Chlorhexidine, five specific articles on povidone-iodine were included.

### Mechanism of action:-

#### Povidone-iodine:-

Iodine was first used in the treatment of wounds in (1839) (3). Iodine is complexed by iodide and polyvinylpyrrolidone via a hydrogen bond between the two pyrroles. It has affinity to deliver the iodine directly to the bacterial cell membranes. Depending on the concentration of the povidone-iodine solution, the free iodine can act as bactericidal component. Iodine and iodophors have a wide range of activity against Gram-negative bacteria and Gram-positive, tubercle bacilli, fungi, protozoa and viruses. At the same time, having some activity against bacterial spores (4, 5).

**Figure 1:-** Structure of povidone-iodine

The antiviral mechanism of action of iodine is not clear. However, lipid enveloped viruses are thought to be more sensitive than non-lipid enveloped viruses and parvoviruses (6). Manufacturer's data show that iodophors are bactericidal, virucidal, fungicidal and tuberculocidal but are not sporicidal at recommended use dilutions (7).

#### Chlorhexidine:-

In 1950s it was considered as an antiseptic agent in Manchester UK by Imperial Chemical Industries (8). Chlorhexidine is colorless and odorless. In addition, it is water insoluble and when formulated with acetic acid or gluconic becomes soluble. Chlorhexidine is a bisbiguanide that consists of two chloroguanide chains linked by a hexamethylene chain (9).

**Figure 2:-** Structure of chlorhexidine.

It disrupts the cytoplasmic membrane of bacteria at bacteriostatic concentrations and causing leakage of components of cytoplasm and bactericidal at higher concentrations via irreversible damaged the intracellular nucleic acids and adenosine triphosphate. The bactericidal effect increases with prolonged exposure for most bacteria. Chlorhexidine has an increased affinity for the cell wall of gram-positive organisms than for gram-negative bacteria. Also, has fungicidal, fungistatic, and some virus-killing properties. The antimicrobial activity of chlorhexidine is not affected by the body fluids such as blood (10).

#### **Alcohol:-**

Alcohols exhibit rapid broad-spectrum antimicrobial activity against vegetative bacteria (including mycobacteria), fungi and viruses but are not sporicidal. At the same time having activity against spore germination and sporulation (11), but reversible effect (12). Because of the lack of sporicidal activity, it not recommended for sterilization. Lower concentrations can be used as preservatives and to potentiate the activity of other biocides. Many alcohol products include low levels of other biocides (in particular chlorhexidine), which remain on the skin following evaporation of the alcohol, or excipients, which decrease the evaporation time of the alcohol (13).

**Figure 3:-** Structure of ethanol alcohol and isopropyl alcohol.

Dependent on the concentrations of both the active agent and the test microorganism, ethyl alcohol is more potent against viruses (14). Isopropyl alcohol considered slightly more efficacious against bacteria (15).

#### **Ototoxicity in animal studies:-**

Several animal studies have been performed to re-examine both histologic and electrophysiologic evidence of potential ototoxicity of Topical Antiseptics in ear. Özkiriş and colleagues, he investigated the ototoxic effects of different concentrations (5%, 7.5% and 10%) of povidone-iodine solutions applied to the middle ear cavity of rats using distortion product otoacoustic emissions. The animals were tested before, 1 and 10 days after solutions administration to the middle ear. The resulting of distortion product otoacoustic emissions were evaluated at different kHz. Reductions in distortion product otoacoustic emissions gram amplitudes were noted at high frequencies that is statistically significant in the group that received 5% at first day but this effect return at 10th day on. The other hand, significant differences were recorded in groups that received 7.5% and 10% povidone-iodine at low and high frequencies according to the control group at day 1 and 10. Based on results of this study, high concentration povidone-iodine solutions should not be used for ear surgery (16). Yagiz at, used fixed concentrations of povidone iodine (0.1ml of 10%) and investigated in guinea pigs by measuring transiently evoked otoacoustic emissions 10 days and four weeks. No change in transiently evoked otoacoustic emissions after 10 days and after 4

weeks of the application in the saline (negative control) group. Responses had cochlear toxic effect and disappeared in all ears of the gentamicin (positive control). Recording before and after povidone-iodine injection it similar to those done in positive control group with Pathological edema in the external auditory canal(17). Ichibangase T and colleagues used two different concentration of Povidone-Iodine (5% and 10%) in different age groups of the guinea pig and the compound action potential was measured at 24h, 7 days, and 28 days after application. The results of this study show mild hearing loss at 24h and 7 days using 10% solution, but no hearing loss with 5% solution at 7 days with the Outcome of the ototoxicity it affected by age of the animals and more toxic in infant(18). Morizono T, Sikoro MA, studied the ototoxic effect of povidone-iodine solution in the chinchilla and one day after topical application of dilutions of 1% povidone-iodine solution, a 1:4 dilution showed a substantial ototoxic effect on compound action potentials, while a 1:10 dilution did not(19). Aursnes J, did animal experiments that investigated ototoxicity of iodine when introduced into the tympanic cavity in guinea pigs and sacrificed 2 weeks later as surface preparations in phase-contrast microscopy. The duration of exposure was 10, 30, or 60 min. It was found that slight damage had occurred in the basal parts of the organ of Corti of those ears exposed to iodine or iodophor in 70% alcohol for 60 or 30 min and damage to the vestibular receptors was observed in ears exposed to iodophor in 70% alcohol for 60 min. on the other hand, chlorhexidine caused extensive damage to the neuroepithelial receptors of the inner ear(20).
