<b>TABLE OF CONTENTS</b> <b>Volume 5, Issue 1, JANUARY 2017</b>		
<b>S. No.</b>	<b>Title of the paper</b>	<b>Page Numbers</b>
<b>1</b>	<b>BIOLOGICAL CONTROL OF SOIL BORNE PATHOGENS (FUSARIUM OXYSPORUM F.SP. CUCUMERINUM.) OF CUCUMBER (CUCUMIS SATIVUS) BY TRICHODERMA SP.</b>	<b>1-9</b>
<b>2</b>	<b>AUTOMATED TRAFFIC COUNTING AND CONTROL.</b>	<b>10-18</b>
<b>3</b>	<b>UNWED MOTHERS IN ODISHA: ISSUES AND CHALLENGES</b>	<b>19-22</b>
<b>4</b>	<b>SCREENING OF RESISTANCE SOURCE AGAINST SPOT BLOTCH DISEASE CAUSED BY BIPOLARIS SOROKINIANA IN TRITICUM AESTIVUM L.</b>	<b>23-28</b>
<b>5</b>	<b>FAMILY ENTREPRENEURIAL BUSINESSES AND NEW VENTURES: FORMATION, CHALLENGES, BEHAVIOR, RELATIONSHIP.</b>	<b>29-47</b>
<b>6</b>	<b>HERNIE INCISIONELLE POST-CŒLIOSCOPIQUE ETRANGLEE : A PROPOS D'UN CAS.</b>	<b>48-50</b>
<b>7</b>	<b>AUTOGENOUS VERSUS COMPOSITE GRAFT FOR THE AUGMENTATION OF ANTERIOR MAXILLA PRIOR TO IMPLANT PLACEMENT – A COMPARATIVE STUDY.</b>	<b>51-56</b>
<b>8</b>	<b>CHARACTERIZATION OF SOLIDUS STRUCTURES OF COMPOSITE MATERIALS.</b>	<b>57-65</b>
<b>9</b>	<b>SYNTHESIS AND EVALUATE OF SOME NEW 1,2,4-TRIAZOLES TO MODIFY EPOXY RESINS IN THE FIELD OF ANTI-MICROBIAL AND ANTI-CORROSIVE ORGANIC COATING.</b>	<b>66-77</b>
<b>10</b>	<b>LOCALISATION INHABITUELLE DE LA TUBERCULOSE OSTEOARTICULAIRE (TALUS) : A PROPOS D'UN CAS.</b>	<b>78-82</b>

11	<b>HISTO-MORPHOMETRICAL STUDY ON KIDNEY GLOMERULI AND CORTICAL TUBULE IN LATE PREGNANCY.</b>	<b>83-88</b>
12	<b>NIGERIAN PUBLIC PRIMARY AND SECONDARY SCHOOL TEACHERS' KNOWLEDGE AND ATTITUDE TOWARDS CARDIOPULMONARY RESUSCITATION.</b>	<b>89-95</b>
13	<b>DISABILITY IN BANK OFFICE WORKERS DUE TO CERVICOGENIC HEADACHE.</b>	<b>96-103</b>
14	<b>CLINICAL PROFILE OF ACUTE ANTERIOR UVEITIS IN A TERTIARY HEALTH CARE CENTRE IN WESTERN ODISHA.</b>	<b>104-107</b>
15	<b>ESTIMATED AVERAGE GLUCOSE, EAG – A MORE INTUITIVE UNDERSTANDING OF GLYCEMIC CONTROL</b>	<b>108-111</b>
16	<b>THE STUDY OF AMINO-ACIDE COMPOSITION OF HELIANTHUS TUBEROSUSE BLOOMS AND ORGANIC SOLVENTS' EXTRACTS BY PHYSIC-CHEMICAL METHODS.</b>	<b>112-117</b>
17	<b>“RADIOMORPHOMETRIC INDICES AND THEIR RELATION TO ALVEOLAR BONE LOSS IN COMPLETELY EDENTULOUSPATIENTS: A PROSPECTIVE STUDY”</b>	<b>118-134</b>
18	<b>SPATIAL AND TEMPORAL ANALYSIS OF WATER QUALITY PARAMETERS OF AHIMALAYANLAKE(DALLAKE)BY MULTIVARIATE STATISTICAL ANALYSIS.</b>	<b>135-143</b>
19	<b>SMOKING PATTERN IN A GROUP OF TUBERCULOSIS PATIENTS, EXPERIENCE OF A MEDICAL COLLEGE HOSPITAL OF BANGLADESH.</b>	<b>144-148</b>
20	<b>IMPACT OF MOBILE PHONE ON THE IRAQI SOCIETY.</b>	<b>149-157</b>
21	<b>ASSOCIATION MINING FROM BIOMEDICAL TEXT WITH NETWORK ANALYSIS</b>	<b>158-169</b>
22	<b>NEARLY QUASI PRIME SUBMODULES</b>	<b>170-180</b>
23	<b>QUANTITATIVE DETERMINATION OF RUBIADIN IN DIFFERENT ACCESSIONS OF RUBIA CORDIFOLIA LINN. BY ISOCRATIC RP-HPLC</b>	<b>181-186</b>

24	THE PREDICTIVE FACTORS OF THE CARDIOVASCULAR INFRINGEMENT IN THE RHEUMATOID ARTHRITIS	187-193
25	DETERMINATION AND QUANTIFICATION OF FLAVONOIDS AND PHENOLIC CONTENT OF WRIGHTIA TINCTORIA R.BR.	194-197

114	TRAITEMENT CHIRURGICAL DE LA RUPTURE DU LIGAMENT CROISE ANTERIEUR CHEZ L'ENFANT SELON LA TECHNIQUE DE MAC-INTOSH MODIFIEE JAEGER (A PROPOS D'UNE SERIE CONTINUE DE 23 CAS).	864-870
115	A STUDY ABOUT AVERAGE CYCLE TIME IN MAINTENANCE OF EQUIPMENT.	871-878
116	LASER DENTISTRY – “Enhancing Dental Perfection”.	879-884
117	SYNTHESIS AND STRUCTURAL PROPERTIES OF ZnO NANOPARTICLES BY ALTERNANTHERA SESSILE LEAVES EXTRACT.	885-899

118	<b>GAP ANALYSIS- A COMPARATIVE ANALYSIS OF CUSTOMER GAP BETWEEN PRIVATE AND PUBLIC SECTOR BANKS IN JAMMU AND KASHMIR.</b>	<b>890-906</b>
119	<b>EDUCATIONAL PHILOSOPHY OF THOMAS GAVAN DUFFY: WITH SPECIAL REFERENCE TO THE METHODS OF TEACHING IN THE PRIMARY SCHOOLS AND ITS SIGNIFICANT IMPACTS ON MODERN EDUCATION.</b>	<b>907-911</b>
120	<b>THE SELF NOMINATED DOCTORS: IRRATIONAL THE PRACTICE; HEADACHE THE PROFESSIONALS; HARMING THE PUBLIC; NATIONAL THE PROBLEM - THE INDUSTRY OF QUACKERY.</b>	<b>912-914</b>
121	<b>COMPARATIVE STUDY OF E-MARKETING IN INDIA &amp; CHINA.</b>	<b>915-918</b>
122	<b>THE ROLE OF MRI IN THE EARLY DETECTION OF MULTIPLE SCLEROSIS.</b>	<b>919-926</b>
123	<b>FACTORS AFFECTING GROWTH OF THE FISHING INDUSTRY IN PUNTLAND: A CASE STUDY OF EYL DISTRICT.</b>	<b>927-935</b>
124	<b>PULSED ND: YAGLASER VERSUS ULTRASOUND IN TREATMENT OF OSTEOPOROSIS.</b>	<b>936-941</b>
125	<b>SOFTWARE TO COMPUTE PILE LOAD CAPACITY IN CASE OF VARIABLE SOIL STRATIFICATION.</b>	<b>942-965</b>
126	<b>DRUG COMPLIANCE AMONG TYPE 2 DIABETIC PATIENTS IN JAZAN REGION, SAUDI ARABIA.</b>	<b>966-974</b>
127	<b>PSYCHO-SOCIAL PROBLEMS OF OBESITY AMONG MALE STUDENTS IN QASSIM UNIVERSITY IN SAUDI ARABIA.</b>	<b>975-979</b>
128	<b>MOTHERS KNOWLEDGE ABOUT THE OTITIS MEDIA RISK FACTORS AMONG CHILDREN: MULTI-CENTRIC SAUDI STUDY.</b>	<b>980-985</b>
129	<b>A DYNAMIC PANEL DATA MODEL FOR ANALYZING THE RELATIONSHIP BETWEEN MILITARY EXPENDITURE AND ECONOMIC GROWTH AND POPULATION IN 54 LESS DEVELOPED COUNTRIES.</b>	<b>986-992</b>

130	ASSESSMENT LEVEL OF AWARENESS TOWARD RADIATION EXPOSURE RISK AMONG COMMUNITY IN MAKKAH CITY.	993-1002
131	LOCATION OF POSTERIOR OCCLUSAL PLANE WITH REFERANCE TO RETROMOLAR PAD IN KASHMIRI POPULATION.	1003-1005
132	A PROPOSED ARCHITECTURAL FRAME WORK FOR SECURE THE CLOUD DATA STORAGE TO PRODUCT MULTIMEDIA DATA.	1007-1011
133	EXISTING AND FUTURE MSW GENERATION NEXUS POPULATION AND GDP GROWTH, THE CASE OF MEKELE CITY, ETHIOPIA	1012-1020
134	RECYCLED POLYPROPYLENE/BOEHMITE ALUMINA NANOCOMPOSITES: ENHANCED STRUCTURE, THERMAL AND MECHANICAL PROPERTIES.	1021-1028
135	PSYCHOLOGICAL STRESS AMONG UNDERGRADUATE MEDICAL STUDENTS OF SAUDI ARABIA: A CROSS SECTIONAL SURVEY.	1029-1035
136	DETERMINATION OF PHYSICOCHEMICAL PARAMETERS AND DIVERSITY PATTERN OF THREE DIFFERENT PLACES OF KANYAKUMARI DISTRICT.	1036-1039
137	CLINICAL CHARACTERISTICS OF GIST AND THE POSSIBLE ROLE OF SMOOTH MUSCLE ACTIN (SMA) AS A PROGNOSTIC FACTOR – INITIAL 5 YEAR EXPERIENCE IN A TERTIARY CARE CENTRE IN DAKSHINA KANNADA DISTRICT.	1040-1042
138	GENDER DISCRIMINATION IN EDUCATION: A VIOLATION OF HUMAN RIGHT.	1043-1047
139	GENETIC DIVERSITY STUDIES IN SIX BIVOLTINE RACES OF BOMBYX MORI L., BASED ON PHENOTYPIC CHARACTERS.	1048-1054
140	PROPERTIES AND APPLICATION OF MICROBIAL TRANSGLUTAMINASE PRODUCED FROM A NEWLY ISOLATED STRAIN OF STREPTOMYCES SP.	1055-1062
141	INTERNET ADDICTION AMONG STUDENTS OF HEALTH FACULTIES IN JAZAN UNIVERSITY, KSA.	1063-1069

142	AN AUTOPSY BASED COMPARATIVE STUDY OF PATTERN OF INJURIES IN PEDESTRIANS INVOLVED IN RAILWAY TRACK DEATHS.	1070-1077
143	SURVEY OF MINOR FOREST PRODUCTS AND THEIR VALUES IN SIRSI TALUK	1078-1086
144	OBSERVATIONAL STUDY OF ETOMIDATE AND THIOPENTONE AS INDUCTION AGENT IN CARDIAC SURGERY PATIENTS	1087-1092
145	IDENTIFYING EPIGENETIC ENDPOINTS OF PESTICIDE EXPOSURE CAN CURTAIL RISK TO DEVELOP CANCER: A REVIEW.	1093-1107
146	“AN OBSERVATIONAL STUDY TO COMPARE THE EFFECTS OF DEXMEDETOMIDINE AND ESMOLOL IN ATTENUATING THE HAEMODYNAMICRESPONSE TO LARYNGOSCOPY AND ENDOTRACHEAL INTUBATION”	1108-1113
147	ALPINIA CALCARATA: A NEW DISTRIBUTIONAL RECORD IN THE ZINGIBERACEAE FLORA OF MANIPUR.	1114-1115
148	EFFECT OF BACKGROUND PLASMA UPON PLASMA STRUCTURE FIRED FROM A PLASMA GUN	1116-1120
149	BIG FIVE PERSONALITY AND PSYCHOLOGICAL CAPITAL AMONG FINAL YEAR MEDICAL STUDENTS.	1121-1126
150	ANTIBACTERIAL ACTIVITY OF MICROORGANISMS ASSOCIATED WITH MARINE INVERTEBRATES FROM THE MOROCCAN ATLANTIC COAST.	1127-1133
151	STRUCTURAL VALIDATION AND HOMOLOGY MODELING OF DIFFERENTIALLY EXPRESSED PROTEINS IN RATTUS NORVEGICUS INDUCED BY BISPHENOL A AND PROBIOTIC TREATMENT	1134-1151
152	SURVEILLANCE AMONG ADULTS TO ASSESS KNOWLEDGE AND ATTITUDE TOWARDS ACNE VULGARIS IN SAUDI ARABIA.	1152-1154

153	EXPRESSION OF CD200 IN CD5 POSITIVE B-CELL LYMPHOPROLIFERATIVE DISORDER (B-CLL AND MCL) AND ITS ROLE IN THE DISCRIMINATION BETWEEN THESE DISORDERS.	1155-1160
154	CRACK TOOTH SYNDROME AND ITS MANAGEMENT.	1161-1166
155	AMELIORATIVE EFFECT OF THE AURELIA AURITA VENOM ON THE MURINE EHRLICH ASCITES CARCINOMA-INDUCED HEPATOTOXICITY AND NEPHROTOXICITY.	1167-1178
156	BACTERIAL CONTAMINATION OF HEALTHCARE WORKERS' MOBILE PHONES IN A TERTIARY CARE CENTER IN SAUDI ARABIA	1179-1183
157	CELL SUSPENSION CULTURE - AN IMPROVED SYSTEM FOR PRODUCTION OF COLCHICINE FROM GLORIOSA SUPERBA L.	1184-1190
158	ENHANCEMENT OF ENERGY EFFICIENT ROUTING PROTOCOL BY MINIMIZING ENERGY CONSUMPTION IN WIRELESS SENSOR NETWORKS.	1191-1194
159	EFFECT OF IMPELLER TYPE AND ROTATIONAL SPEED ON FLOW BEHAVIOR IN FULLY BAFFLED MIXING TANK.	1195-1208
160	PREVALENCE OF ASTHMA AMONG SAUDI CHILDREN IN MAKKAH, SAUDI ARABIA	1209-1214
161	DIABETES MELLITUS AMONG ADULT MALE POPULATION OF ARAR CITY, NORTHERN SAUDI ARABIA.	1215-1220
162	PREVALENCE AND AWARENESS OF OBESITY AMONG SAUDI FEMALE IN RIYADH, SAUDI ARABIA.	1221-1225
163	A STUDY ON CUSTOMER SATISFACTION OF HONDA BIKES WITH REFERENCE TO CHINNAMANUR TOWN, THENI DISTRICT.	1226-1232
164	METASTATIC OVARIAN TUMOR DISCOVERED ACCIDENTALLY DURING CESAREAN SECTION IN A 34-YEAR-OLD WOMAN: A CASE REPORT.	1233-1238

165	ACCELERATION OF DISTANCE COMPUTATION FOR MULTIPLE SEQUENCE ALIGNMENT ON MULTI-CORE ARCHITECTURES	1239-1245
166	ONLY EDUCATION IS NOT ENOUGH: A NECESSITY OF ALL-INCLUSIVE SERVICES FOR TECHNICAL EDUCATION.	1246-1253
167	MINERAL TRIOXIDE AGGREGATE (MTA) FOR APICAL BARRIER FOR IMMATURE NECROTIC PERMANENT TEETH - FOUR CASE REPORTS	1254-1258
168	NARRATING THINGS FALL APART THROUGH THE PRISM OF LANGUAGE	1259-1262
169	CLINICO ETIOLOGICAL PROFILE OF HYPONATREMIA IN IMCU OF KANNIYAKUMARI GOVERNMENT MEDICAL COLLEGE	1263-1270
170	LASER 805NM EFFECTS ON BACTERIAL GENETIC AND SENSITIVITY TOWARD ANTIBIOTICS.	1271-1275
171	HISTOPATHOLOGY OF GALLBLADDER IN IRON DEFICIENCY ANEMIA PATIENTS UNDERGOING CHOLECYSTECTOMY: A PROSPECTIVE STUDY	1276-1282
172	KNOWLEDGE & ATTITUDES TOWARD ELECTROCONVULSIVE THERAPY (ECT) AMONG A SAMPLE OF HEALTH FIELD STUDENT AND THE GENERAL PUBLIC IN SAUDI ARABIA AT "QASSIM"	1283-1289
173	PATCH-WISE IMAGE DE-NOISING TECHNIQUE FOR IMPROVED PMRI USING ITERATIVE BILATERAL FILTER, LRMD AND SVM OF MEDICAL IMAGES.	1290-1296
174	SCRAMBLING FACE IMAGES FOR PRIVACY PROTECTION USING ARNOLD TRANSFORM	1297-1303
175	PREVALENCE OF LOWER BACK PAIN AMONG TAIBAH UNIVERSITY STUDENTS.	1304-1313
176	“COMPARATIVE EVALUATION OF ETOMIDATE AND THIOPENTONE SODIUM WITH ROCURONIUM FOR RAPID SEQUENCE INTUBATION IN PREGNANT PATIENTS UNDERGOING LOWER SEGMENT CAESEREAN SECTION (LSCS)” A COMPARATIVE STUDY.	1314-1319

177	<b>BILATERAL SEQUENTIAL LUNG TRANSPLANT FOR PULMONARY ALVEOLAR MICROLITHIASIS.</b>	<b>1320-1322</b>

#### Abstract

Detection of the JAK2 V617F mutation is helpful in differential diagnosis, prognosis, and predication of therapeutic response in CMPD disorders. Because the mutation can be present in a small proportion of granulocytic populations in MPD patients, a highly sensitive detection method is required. The study was aimed to optimize ARMS-PCR for the detection of JAK2V617F mutations. This study was conducted at Prince Fahd Bin Sultan Research Chair. Fifty subjects were registered from the King Khaled Hospital of Tabuk -Northwestern part of Saudi Arabia among which 25 newly diagnosed MPD patients and 25 healthy controls. DNA was extracted done using DNA extraction Kit from Qiagen. ARMS was optimized in which a primers were designed in such a way that it is able to discriminate among templates that differ by a single nucleotide residue in one tube reaction. Both cases and controls were tested for JAK2 mutations by ARMS-PCR. Demographic data, spleen size, hemoglobin level, white blood cell and platelet counts were recorded. Independent sample t-test was used to study the correlation of JAK2 mutations with age, haemoglobin, blood counts and spleen size. Fisher's exact test was applied to compare disease progression in mutation positive and negative cases. This study was conducted on 25 newly diagnosed MPD patients among which 17 were polycythemia vera, 5 Essential thrombocytopenia and 3 primary myelofibrosis and 25 healthy controls. Both cases and controls were tested for JAK2 mutations by ARMS-PCR. The JAK2 mutation was detected in 17/25 samples among which 13 were Polycythemia Vera, 02 from Essential thrombocytopenia, 01 from Primary myelofibrosis. The JAK2 mutation was not detected in any of the healthy controls by ARMS-PCR. The main advantage of ARMS was that the amplification step and the diagnostic steps were combined, in that the presence of an amplified product indicates the presence of a particular allele and vice versa. For routine diagnosis, this characteristic of ARMS means that it is a very time-efficient method. It was concluded that the ARMS-PCR assay optimized allows the discrimination between homozygous and heterozygous individuals with the JAK2 V617F mutation and has a key role in acting as a reliable screening test for the presence or absence of the mutation in individuals with MPDs. The test will be potentially useful to follow minimal residual disease when targeted therapies against JAK2 kinase become available. The test is therefore a simple, fast, and inexpensive procedure that does not entail any special equipment other than a thermocycler.

#### Introduction:-

Myeloproliferative neoplasms (MPNs) are multipotent hematopoietic stem cell disorders characterized by uncontrolled proliferation of maturing blood cells<sup>1</sup>. Among its types, Chronic myeloid leukemia (CML) is the most common MPN, followed by polycythemia vera (PV), essential thrombocythemia (ET), and idiopathic myelofibrosis (IMF). The pathogenesis of myeloproliferative disorders (MPD), is still largely unknown except the chronic myeloid leukemia (CML), where the presence of the t(9;22) Ph' chromosome and of the underlying molecular abnormality has been known for decades and ultimately led to the development of target-specific drugs, the molecular lesion(s) at the basis of the other MPD has remained elusive.<sup>2-4</sup> JAK2 is a cytoplasmic tyrosine kinase that plays an essential role in the signaling pathways of cytokines and growth factors. An acquired G → T point mutation in exon 12 of the gene encoding the Janus tyrosine kinase 2 (JAK2), leading to amino acid substitution of phenylalanine for a highly conserved valine (V617F), in

the JH2 pseudo-kinase domain, renders JAK2 kinase constitutively active and leads to cell proliferation in the absence of the growth factors<sup>5-6</sup>. *In vivo* expression of  $JAK2^{V617F}$  in a murine transplant model induced erythrocytosis<sup>7</sup>. The mechanism of activation of JAK2 kinase activity by mutations in the JAK2 signalling pathway as depicted in figure 1. The  $JAK2^{V617F}$  and JAK2 exon 12 mutant kinases bind cytokine receptors and are phosphorylated in the absence of ligand, and lead to ligand-independent activation of downstream signaling pathways.

**Figure 1** The mechanism of activation of JAK2 kinase activity by mutations in the JAK2 signaling pathway

The  $JAK2$  mutation has been detected in 65 to 97% of patients with polycythemia vera, 23 to 57% of those with essential thrombocythemia (ET), and 30 to 57% of idiopathic myelofibrosis.<sup>7-8</sup>  $JAK2$  mutation is absent in normal individuals, in patients with secondary erythrocytosis and thrombocytosis, or in patients with chronic myelogenous leukemia; detection of the mutation thus aids in differential diagnosis in cases with similar clinicopathological features.<sup>9</sup> Methods for detection of  $JAK2^{V617F}$  mutation based on the analysis of genomic DNA obtained from peripheral blood granulocytes have been devised and already entered the clinical practice. Because V617F is an acquired mutation that can be present in a small proportion of granulocytic populations in some cases, especially of ET, a highly sensitive detection method is essential<sup>10</sup>. Methodologies reported in the literature include direct sequencing,<sup>6</sup> PCR-restriction fragment length polymorphism,<sup>10</sup> allele-specific polymerase chain reaction (PCR),<sup>11</sup> pyrosequencing,<sup>12</sup> and amplification refractory mutation system (ARMS)-PCR.<sup>13</sup> The modified assay detects mutation with a highly reproducible analytic sensitivity of 0.05 to 0.1%, making it suitable for the detection of low levels of  $JAK2$  mutation. The test will be potentially useful to follow minimal residual disease when targeted. The merits and demerits of the various methods used for  $JAK2$  mutation detection have been by studied described for principles and potential clinical utilities of each assay<sup>14</sup>. Some have adapted the use of mRNA as the basis for testing for  $JAK2$  mutations and have shown that RNA allows more sensitive detection of mutations than does DNA at early stages of disease. The use of RNA rather than DNA provides the additional advantage of capturing abnormalities in platelets and detecting alternatively spliced transcripts<sup>15</sup>. The reported frequency of  $JAK2^{V617F}$  mutation is around 80% (range, 65–100%) in PV, 40% (range, 23–57%) in ET and 55% (range, 35–95%) in IM patients<sup>16</sup>.  $JAK2^{V617F}$  mutation is found in either the heterozygote or the homozygote status, the latter arising from mitotic recombination; there are significant differences in the incidence of homozygosity, which involves about 30% of patients in PV and IM and less than 4% in ET.

There are indications that the clinical phenotype might be dependent on the proportion of mutated allele, as the expression levels of some aberrantly regulated genes in MPD, such as *PRV-1* or *NF-E2*, have been found higher in homozygote than in heterozygote patients.<sup>17-18</sup> In a large survey on ET patients, the presence of the mutation was associated to clinical and biological features suggestive of a PV-like disease, thus supporting the view that these two disorders represent a biological continuum; furthermore, according to the presence of the  $JAK2^{V617F}$  mutation, ET patients could be divided into two distinct subpopulations characterized by different disease presentation, clinical complications and response to therapy. We aimed to optimize the diagnostic values of the ARMS-PCR method for detecting mutations in exon 14 of the  $JAK2$  gene to diagnose myeloproliferative disorders.

## Material and Methods:-

### Patients and Controls:-

#### Selection criteria of patients:-

- ❖ The study was carried out at Prince Fahd Bin Sultan Research chair, Cancer Molecular Genetics Lab, Department of Medical Lab technology, University of Tabuk. The study was ethically approved from the Ethics committee, University of Tabuk.
- ❖ The subjects were recruited from the hematology OPD of King Khaled hospital, Tabuk and all the subjects obtained consent form before the sample collection.

#### Inclusion criteria for myeloproliferative disorders:-

- ❖ Myeloproliferative disorders with Ph negative .
- ❖ Clinically confirmed cases of polycythemia vera (PV), essential thrombocytosis (ET), myelofibrosis (MF).
- ❖ All participants were of Saudi origin.

#### Inclusion criteria for controls:-

- ❖ All controls specimens were timed around routine blood draws that are part of routine workout, and hence would not require additional phlebotomy.
- ❖ All participants were of Saudi origin

#### Exclusion Criteria:-

- ❖ Patients with any other significant malignancy.
- ❖ Non-Arab Saudi or recently-naturalized Saudi Arabia were excluded

#### Sample Size:-

- ❖ The study was conducted on 30 specimens .Twenty were healthy controls and 25 were clinically confirmed Myeloproliferative disorders.

### Experimental Design:-

#### Genomic DNA extraction from Blood samples of MPD patients and controls:-

The Blood samples were collected by venipuncture in EDTA tubes from MPD patients and healthy controls .The DNA extraction was done by using DNeasy Blood Kit cat 69506 from Qiagen as per the manufactures instructions. The QIAamp DNA Blood Mini Kit provides silica-membrane-based DNA purification. The QIAamp DNA Blood Mini Kit was designed for processing up to 200µl fresh or frozen human whole blood. QIAamp Mini spin columns can be easily processed in a centrifuge or on vacuum manifolds. Purification of DNA using the QIAamp DNA Blood Mini Kit was fully automated on the QIAcube .The DNA extracted was dissolved in nuclease-free water, and stored at 4°C until use. The DNA quality and yield was assessed using Nanodrop (optical density) and agarose gel electrophoresis

#### Amplification ARMS primers for the JAK2 mutation:-

ARMS-PCR was performed in a final volume of 5 uL containing 2uL of 50ng genomic DNA, 12.5 uL of PCR-master mix purchased from Epigentek (USA),0.25 uL of 25 pmol/L of each primer (Table 1) The Methylamp Taq 5x PCR Mix was premixed ready-to-use solution containing all reagents required for PCR (except template, primers and water). Methylamp Taq DNA polymerase ,5x Reaction Buffer: 1 0.4 M Tris-HCl, 0.1 M (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub>, 0.1% w/v Tween-20 ,12.5 mM MgCl<sub>2</sub>: 1x PCR solution – 2.5 mM MgCl<sub>2</sub> ,1mM dNTPs of each and remaining nuclease free ddH<sub>2</sub>O as depicted in Table 2. Finally the 2ul of DNA was added from each patient and control separately. The thermo cycling conditions for the PCR amplification of ARMS primers for JAK2 mutation were initial denaturation at 95°C for 10 minutes followed by 40 cycles 95 °C for 45 sec, 57.9 °C for 45 sec, and 72 °C for 45 sec followed by the final extension at 72 °C for 10 minutes.

**Table 1:-** Primers designed for ARMS PCR

Primer	Sequence	Annealing Temp	PCR product
<b>Forward outer</b>	5'- TCCTCAGAACGTTGATGGCAG- 3'	57.9	463bp
<b>Reverse outer</b>	5'- ATTGCTTTCCTTTTTCACAAGAT-3'		
<b>Forward wt</b>	5'-GCATTTGGTTTTAAATTATGGAGTATATG-3'		229bp
<b>Reverse mut</b>	5'-GTTTTACTTACTCTCGTCTCCACAAA-3'		279bp

**Table 2:-** Preparation of PCR coattail.

Reagent	1x	5 x
PCR master mix	5ul	25ul
Forward outer	0.25 ul	1.25 ul
Reverse outer	0.25 ul	1.25 ul
Forward wild	0.25 ul	1.25 ul
Reverse mutant	0.25 ul	1.25 ul
Nuclease free water	17.0 ul	85ul
Total volume	23ul	110ul

Finally 2 ul DNA was added.

### Results and Discussion:-

The purity of DNA extracted was checked by using Nanodrop1000 Spectrophotometer from Thermo .All DNA samples were screened for purity by measuring optical density (OD) at 260nm (OD<sub>260</sub>) and 280 nm (OD<sub>280</sub>). DNA concentration (ug/ml) was calculated based on the OD<sub>260</sub> reading .A ratio of ~1.8 was generally accepted as “pure” for DNA .The optimal rang of ratio obtained were 1.7-2 .The DNA 260/230: 1.7-2; Pure DNA must have a 260/280 ratio between 1.8 and 2. The quality of DNA was checked by running in 1% gel electrophoresis as shown in figure 2.

**Figure 2: Genomic DNA preparation from peripheral blood of myeloproliferative patients and healthy controls**

### Amplification Refractory Mutation System (ARMS-PCR) for JAK2V617F mutation:-

Tetra-primer ARMS-PCR was established for the analysis of single nucleotide polymorphisms (SNP), which employs two primer pairs to amplify, respectively, the two different alleles of an SNP in a single PCR reaction. Two forward and two reverse primers are used in different combinations to generate three potential PCR products. Primers FO and RO flank the exon 14 of the *JAK2* gene, resulting in a band of 463bp to control for DNA quality and quantity. Primers Fwt and RO amplify a wild-type allele, generating a band of 229bp, and primers FO and Rmt generate a band of 279 bp from the mutant allele as shown in figure 3.

**FIGURE 3. PCR amplification ARMS-PCR primers for the detection of JAK2V617F Mutation**

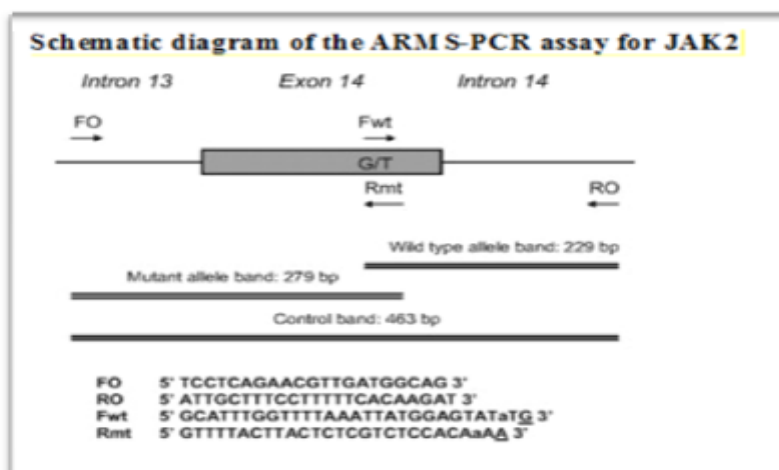

### JAK2 (V617F) mutation analysis by ARMS PCR in leukemia patients:

L= 100bp Ladder.

P1,P5,P6 and P7 = Mutation Negative.

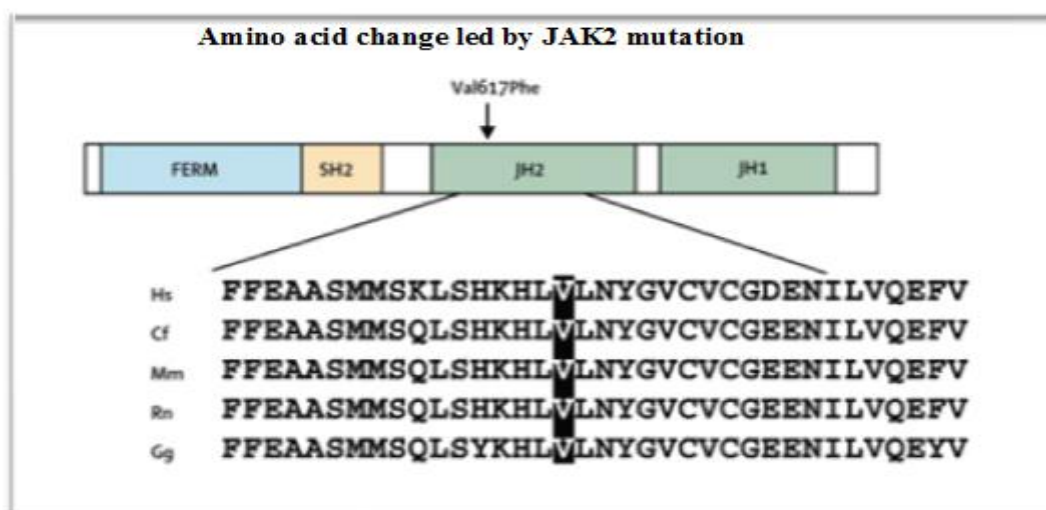

P2,P4,P4,P8 and P9= Mutation Positive.

The intended mismatches in Fwt and Rmt are shown in lowercase, and genotype-specific nucleotides are underlined as shown in figure 4. The amplification Refractory Mutation Screening (ARMS) PCR permits a single base change to be detected under ideal PCR conditions. This is ideal for detection of the single base G  $\rightarrow$  T transversion associated with the JAK2 mutation in question. The ARMS-PCR technique uses 4 primers as shown in figure 4 as follows; a forward outer primer, a reverse outer primer, a forward inner wild type specific primer and a reverse inner mutant specific primer. It requires two temperature programs during the PCR reaction. Due to the positioning of the outer primers at varying distance from the site of the mutation there is the generation of three fragments in this example in a heterozygote: two small allele specific fragments and a large control PCR product. DNA Fragments can be distinguished via electrophoresis on agarose gel.

**Figure 4. Primer designing for ARMS-PCR assay of JAK2V617F Mutation**

Performing a dilution series indicates the level of sensitivity of ARMS-PCR to be 1-2 %. The assay allows discrimination between homozygous and heterozygous individuals with the JAK2 V617F mutation and has a key role in acting as a reliable screening test for the presence or absence of the mutation in individuals with MPDs. An acquired mutation in the *JAK2* gene is a cytoplasmic tyrosine kinase that plays an essential role in the signaling pathways of cytokines and growth factors. The mutation 1849 G>T, which leads to amino acid substitution of phenylalanine for a highly conserved valine (V617F), (as shown in figure 5) renders JAK2 kinase constitutively active and leads to cell proliferation in the absence of the growth factors

**Figure 5. Primer designing for ARMS-PCR assay of JAK2V617F Mutation**

The study was conducted on 50 specimens 25 were controls and 25 were MPD cases. The 25 newly diagnosed MPD patients among which 17 were polycythemia vera, 5 Essential thrombocytopenia and 3 primary myelofibrosis and 25 healthy controls depicted in figure 6 . Both cases and controls were tested for JAK2 mutations by ARMS-PCR. The JAK2 mutation was detected in 17/25 samples among which 13 were Polycythemia Vera, 02 from Essential thrombocythemia, 01 from Primary myelofibrosis as depicted in figure 7. The JAK2 mutation was not detected in any of the healthy controls by ARMS-PCR.

JAK2 V617F - DNA Reference Standards (Horizon diagnostics) for wild as well as mutant allele were used along with ARMS-PCR assays. ARMS assay proved to be highly sensitive technique and can be used to monitor residual disease after treatment. The JAK2 mutation was discovered using direct sequencing after PCR. However, the method only detects the mutation present in more than 20 to 30% of total DNA. The JAK2 mutation has become an important diagnostic criterion for Philadelphia chromosome-negative myeloproliferative neoplasms (Ph-neg MPN), especially in polycythemia vera (PV).<sup>19</sup> accordingly, it has been included in the World Health Organization diagnostic criteria for Ph-neg MPN<sup>20</sup>. In Jak2 gene new exon 12 mutations involved in the pathogenesis of PV and idiopathic erythrocytosis have been described. These mutations are also important for the diagnosis of PV, as approximately 3% of PV cases have mutations in this exon.<sup>21</sup> In addition, other JAK2 exon 14 mutations that are distinct from JAK2 V617F, such as C616Y, D620E, and C618R, have been detected in patients with myeloproliferative neoplasms (MPN).<sup>22</sup> Despite this, the described JAK2 mutations are neither specific for this group of diseases, nor are they present in all patients with classical Ph-neg MPN (especially in essential thrombocythemia [ET] and primary myelofibrosis). In addition, infrequent occurrence of the JAK2 V617F mutation has been reported in chronic myelomonocytic leukemia, atypical MPN, myelodysplastic syndromes, systemic mastocytosis, and acute myeloid leukemia.<sup>23</sup> Detection of the mutation is helpful in differential diagnosis, prognosis, and predication of therapeutic response.

Amplification Refractory Mutation System (ARMS-PCR) has also been termed allele-specific PCR or PCR amplification of specific alleles (PASA). The amplification refractory mutation system (ARMS) is an amplification strategy in which a polymerase chain reaction (PCR) primer is designed in such a way that it is able to discriminate among templates that differ by a single nucleotide residue. Thus, an ARMS primer can be designed to amplify a specific member of a multi-allelic system while remaining refractory to amplification of another allele that may differ by as little as a single base from the former.

Several laboratory techniques have been developed for JAK2 V617F genotypic analysis. Because JAK2 mutation is an acquired mutation that can be present in a small proportion of granulocytic populations in some cases, especially of ET, a highly sensitive detection method is essential. Different sensitivity of various assay methods partially accounts for the wide range of mutation frequencies reported in the literature.<sup>23</sup> As a matter of fact, re-evaluation of the same cases with a more sensitive technique has increased the detection rate from 73 to 97% in patients with polycythemia vera.<sup>24</sup> In addition, a highly sensitive technique is potentially useful to monitor residual disease after treatment. Methodologies reported in the literature include direct sequencing,<sup>24</sup> allele-specific polymerase chain reaction (PCR),<sup>24</sup> PCR-restriction fragment length polymorphism,<sup>25</sup> pyrosequencing,<sup>26</sup> and amplification refractory mutation system (ARMS)-PCR<sup>26</sup>. The main advantage of ARMS is that the amplification step and the diagnostic steps are combined, in that the presence of an amplified product indicates the presence of a particular allele and vice versa. For routine diagnosis, this characteristic of ARMS means that it is a very time-efficient method. However, this combination of the amplification and diagnostic steps has resulted in a system that may not be as robust as some of the other methods in which these two important steps are separated, e.g., PCR followed by restriction enzyme analysis. Moreover, the data show that direct sequencing is not an adequate technique for exon 12 mutation identification; therefore, appropriate methodology should be considered for using this molecular marker in the process of diagnosis. It has been have demonstrated that this high sensitivity is not

accompanied by any significant compromise in the diagnostic specificity of the assay. In addition, the ARMS-PCR assay shows different patterns for normal, mutant, or mixed genotypes, minimizing the chance of misinterpretation. With simply one tube of PCR reactions and obviation for special equipment and reagents, ARMS-PCR represents a time- and labor-saving as well as cost-efficient method that is readily and broadly applicable in clinical molecular diagnostic laboratories.

#### **Conclusion:-**

It was concluded that the ARMS-PCR assay is an appropriate methodology should be considered for using JAK2 molecular marker in the process of MPD diagnosis and allows discrimination between homozygous and heterozygous individuals with the JAK2 (V617F and in exon 12) mutation and has a key role in acting as a reliable screening test for the presence or absence of the mutation in individuals with MPDs. The test is therefore a simple, fast, and inexpensive procedure that does not entail any special equipment other than a thermocycler.

#### Abstract

Films of 5% E-dicyclopentyl-methylene-(2,5-dimethyl-3-furylethylidene-succinic anhydride (E-DCPF) doped in PMMA polymer films, [E - (DCPF) - (PMMA) films], were prepared by casting method and then were irradiated with UV light (360 nm) for different exposure time (2- 38 min). The color of the films turned to deep pink after 38 min. The photo-bleaching time was 670 min. The absorbance spectrum was studied in the range from 190 nm up to 650 nm, where that spectrum showed four peaks. The onset one was related to the photo coloration effect at 516.44 nm, where it was increased in height and decreased in its width by the increasing of the exposure time of UV-Irradiation . The other three peaks were at 363 nm, 272.85 and 218 nm respectively. The spectra have an isosbestic point at (417 nm). The optical properties of the films were investigated using the spectrophotometric measurements of both the transmittance and reflectance in the spectral range from 400 to 1500 nm . Both the refractive index,  $n$ , and the absorption index,  $k$ , were calculated before and after coloration. For the first time ; the parameters of the molar extinction coefficient ( $\epsilon_{\text{molar}}$ ), oscillator energy ( $E_{0s}$ ), oscillator strength ( $f$ ), electronic dipole strength ( $q^2$ ) and the concentration of the coloring centers were evaluated. The analysis of the absorption coefficient ( $\alpha$ ) revealed three indirect transitions and only one direct transition for photo - bleached films , while two indirect transitions and only one direct transition for colored films .

#### Introduction:-

Dicyclopentyl fulgide (DCPF) has attracted a great attention because it is an important one of the organic photochromic compounds. These compounds are considered as promising candidates in photoswitchable system which require high reversibility [1-11] and in optical memory devices which depending on non -destructive readout stability[5-7]. Through all photochromic candidates; Fulgides showed a reversible photochromism with minimum photochemical fatigue [2,8], thermal stability [9] and nondestructive readout stability .The photochromism of fulgide occurs between the open E-isomer and the photocycle colored form(C-isomer) [2,5-7]. The molecular structure for E&C (isomers) of DCPF is shown in Fig.1(a)

**Corresponding Author:- A.M. A. El-Barry.**

Address:- Thin film laboratory, Physics Department, Faculty of Education, Ain Shams University, Roxy, Cairo, 11757, Egypt.

**Fig. 1(a):** The molecular structures of both E and C - (DCPF) compounds.

The present work is to introduce a new optical comparative studying of casting (C-DCPF) - PMMA film with its E-isomer, determine the concentration of the coloring centers, and many other important optical parameters for more promising photochromic application.

### Experimental Technique:-

films of (5% E-DCPF) doped in (PMMA), with 37.5  $\mu\text{m}$  thickness, were prepared using casting technique. The poly methyl methacrylate (PMMA), was obtained from Aldrich chemical company, while dicyclopropyl-methylene-(2,5-dimethyl-3-furylethylidene-succinic anhydride (E-DCPF) was obtained from TCI company, Japan. Pure chloroform was used as a common solvent for both DCPF and PMMA. The solutions were then mixed by using a magnetic stirrer for about 4.5 hours and under vacuum to reach a suitable viscosity and homogeneity. The solution then was casted on a glass plate and kept in a dry atmosphere at room temperature for 24 hours. UV-VIS absorption spectra of the unirradiated and irradiated films were carried out at room temperature in the wavelength range (190-650 nm). In addition, both the transmittance (T) and the reflectance (R) were measured at normal incidence in the spectral range from 190 to 1500 nm, using a double beam spectrophotometer (JASCO model V-670 UV-VIS-NIR) attached with constant angle specular reflection attachment ( $5^\circ$ ). The analysis of the obtained data of T, R and A were carried out in a similar manner as published before [10,12]. The relative uncertainty in the transmittance and reflectance given by the manufacturer was 1%. Transmittance scans were performed using the air in the reference compartment of the same type as the one used for film deposition. The reflectance was measured at the incidence angle of  $5^\circ$  with an aluminum reference mirror. The absolute values of measured transmittance and reflectance, after correcting for the absorbance and reflectance of the substrates, are given by the following equations;

$$T = \left( \frac{I_{ft}}{I_a} \right) (1 - R_a) \quad (1)$$

where  $I_{ft}$  and  $I_a$  are the intensities of the light passing through the film-air system and the reference air, respectively, and  $R_a$  is the reflectance of air. In addition, if the intensity of light reflected from the sample mirror reaching the detector is  $I_r$  and that reflected from the reflectance reference mirror is  $I_m$ , then;

$$R = \left( \frac{I_{ft}}{I_m} \right) R_m [1 + (1 - R_a)^2] - T^2 R_a \quad (2)$$

From the measured T, R and film thickness, d, the value of the refractive index (n) and the absorption index (k) were computed by a special computer program based on minimizing  $(\Delta T)^2$  and  $(\Delta R)^2$  simultaneously, where

$$(\Delta T)^2 = |T_{n,k} - T_{exp}|^2 \quad (3)$$

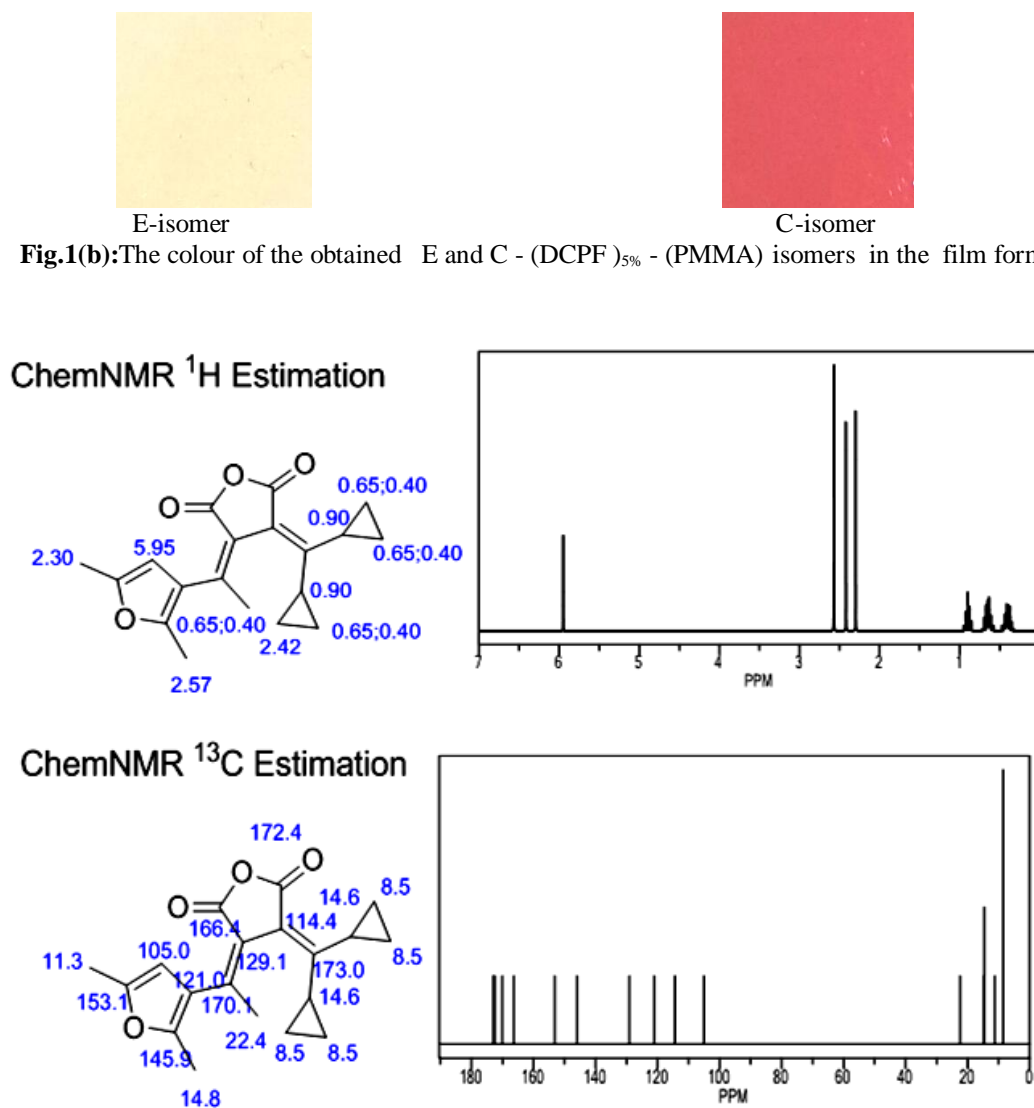

$$(\Delta R)^2 = |R_{n,k} - R_{exp}|^2 \quad (4)$$

where  $T_{n,k}$  and  $R_{n,k}$  are the calculated values of T and R using the Murmann's exact equations taking into account the experimental error in measuring the film thickness to be  $\pm 2.5\%$  and in T and R to be  $\pm 1\%$ , the error in the calculated values of n and k are estimated to be  $\pm 3\%$  and  $\pm 2.5\%$ , respectively.

## Results and Discussion

Fig.1(b) showed the experimental pictures of the bleached (E-isomer) and colored (C-isomer) (DCPF) 5% (PMMA) films, while Fig.2(a&b) represents the obtained patterns for NMR -  $H^1$  &  $C^{13}$  estimations for both E and C- DCPF films under our estimation.

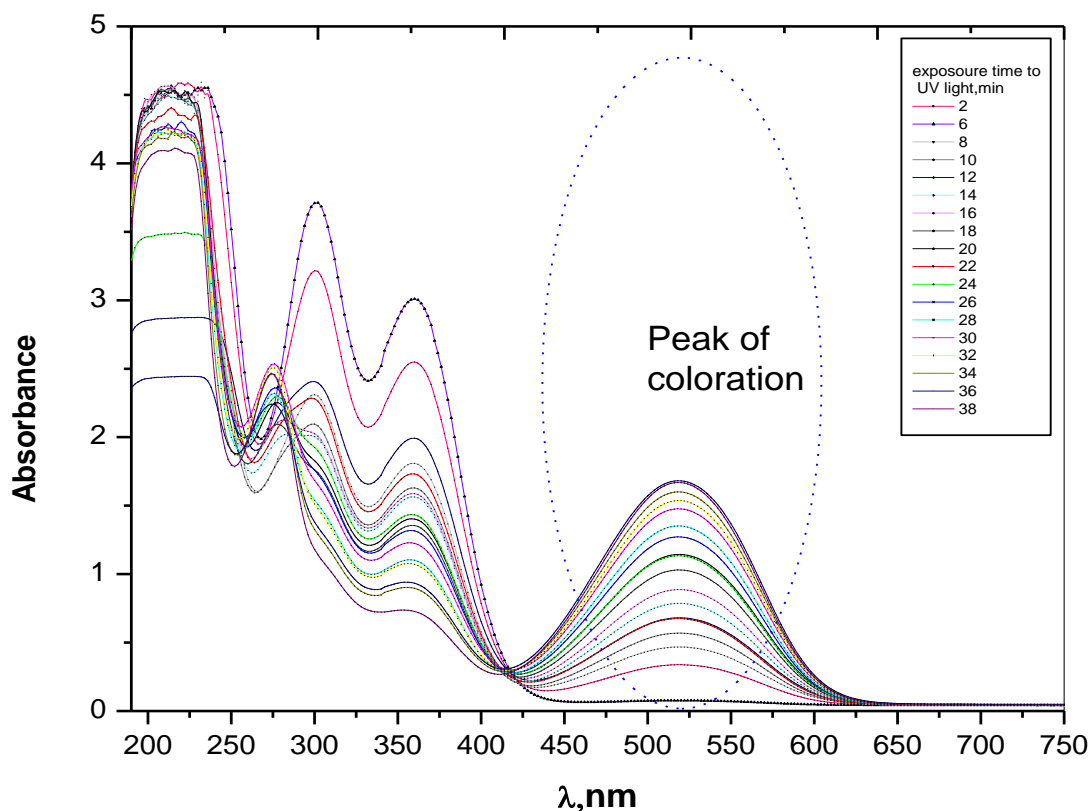

**Fig. 2(a):** The patterns of NMR-  $H^1$  &  $C^{13}$  estimations of (E-DCPF) 5% - (PMMA) film.

**Fig.2(b):**The patterns of NMR-  $\text{H}^1$  &  $\text{C}^{13}$  estimations of  $(\text{C-DCPF})_{5\%}$  - (PMMA) film.

Fig.3 shows the effect of the exposure times to UV light on absorbance spectrum of  $(\text{E-DCPF})_{5\%}$  - (PMMA) films. . The exposure time ranged from 2 to 38 min, where the absorbance reached to a saturation and a stability in its value. The absorption in VIS region increased with increasing of the exposure time up to 38 min then leave off, with photochromic absorption peak at 516,44 nm, see Fig.4(a). The spectra of absorbance in Fig.3 illustrated an isosbestic point at 417.079 nm, where the second absorption band was mentioned with an inverted response to light. The amplitude of the absorption peaks increased with exposure time to UV light. Fig.4(b) represents a comparison between the absorption spectrum of the saturated photo-colored and photo-bleached of  $(\text{DCPF})_{5\%}$  - (PMMA) films at room temperature in the wavelength range. (190-650 nm), while Table.1 involved a comparison between E and C of  $(\text{DCPF})_{5\%}$  - (PMMA) films.. The isosbestic point revealed the presence of only one product in photoreaction[13]. C-isomer product was then photobleaching using a white light. The photo-colored was gradually started disappeared after 670 min, where it returned to the original color which related to E-isomer. This behavior was found to obey a first order reaction with a rate constant,  $k = 0.158. \text{ s}^{-1}$  and a half-life time,  $t_{1/2} = 40 \text{ s}$ .

The spectral distribution of the molar extinction coefficient ( $\epsilon_{\text{molar}}$ ) was also determined and it is shown in Fig.5.  $\epsilon_{\text{molar}}$  and its companion parameters meanly, oscillator energy( $E_{\text{os}}$ ), oscillator strength (f) and the electric dipole strength ( $q^2$ ) were determined using the following equations [14].

$$\alpha = 2303 \left( \frac{\rho}{M} \right) \epsilon_{\text{molar}} \quad (5)$$

$$f = 4.38 \times 10^{-9} \int \epsilon_{\text{molar}} d\nu \quad (6)$$

$$q^2 = \frac{1}{2500} \epsilon_{\text{molar}} \Delta\lambda / \lambda \quad (7)$$

Where  $\rho$  is the solid's mass density, M is molecular's weight and  $\alpha$  is absorption coefficient. These parameters have been listed in Table 2

**Fig.5:** The molar extinction coefficient ( $\epsilon_{\text{molar}}$ ) vs., the wave number ( $\nu$ ) for both E and C (DCPF)<sub>5%</sub> - (PMMA) films.

**Table 2:** The Calculated spectral parameters,  $f$  and  $q^2$  of the different peaks for both E and C- (DCPF)<sub>5%</sub> - (PMMA) films.

No., of the peak in Fig.(5)	F		$q^2$ (Å)	
	C-isomer	E-isomer	C-isomer	E-isomer
1	0.689	1.3	0.59	0.79
2	1.681	1.75	0.37	0.48
3	0.456	0.94	8.002	11.90
4	0.73	-----	14.63	-----

Also, the concentrations of the coloring centers were calculated by the analysis of the peak of coloration and depending on approximate Smakula's equation, which can be represented by the following formula [ 15 ];

$$N_f = 0.89 \times 10^7 \left[ \frac{n}{(n^2 + 2)^2} \alpha \mu \right] \quad (8)$$

Where  $N$  is the density of the coloring centers,  $n$  is the refractive index of the films,  $\mu$  is the width at the half maximum of the absorption peak. The calculated centers were increased from  $\sim 4.57 \times 10^{10}$  to  $9.18 \times 10^{12} / \text{cm}^3$  as the time of coloration increased from 2 to 38 min.

On the other side, the spectral distribution of both T and R in the wavelength (400 to 1500 nm) for bleached, and colored films are shown in Fig.6. The analysis of both T and R gave us the ability to calculate the mean optical constants, the refractive index,  $n$ , and the absorption index,  $k$ .

**Fig. 6:** T% and R% vs.  $\lambda$ (nm) for both E and C - (DCPF)<sub>5%</sub> - (PMMA) isomers in the film form.

The refractive index  $n$ , was analyzed using the single oscillator model in the transparent region and all the optical data could be described to a very good approximation, by the following equations[16-17].

$$n^2 = 1 + \frac{E_0 E_d}{(E_0^2 - (h\nu)^2)} \quad (9)$$

$$n^2(\varepsilon_\infty) = \varepsilon_l - \frac{(e^2 N)}{(4\pi \varepsilon_0 c^2 m^*)} \lambda^2 \quad (10)$$

,where  $h\nu$  is the photon energy,  $E_0$  is the oscillator energy,  $E_d$  is the dispersion energy,  $\varepsilon_\infty$  is the high frequency dielectric constant,  $\varepsilon_l$  is the lattice dielectric constant,  $N/m^*$  is the ratio of the free carrier concentration to the effective mass,  $c$  is the speed of light, and  $e$  is the electronic charge. The dispersion parameters were obtained by plotting  $(n^2 - 1)^{-1}$  vs  $(h\nu)^2$  and  $n^2$  vs.  $\lambda^2$  (see Fig.7(a&b)) and the obtained results are listed in Table 3.

**Fig.7(a):**  $(n^2 - 1)^{-1}$  vs  $(h\nu)^2$  for both E and C - (DCPF)<sub>5%</sub> - (PMMA) isomers in the film forms.

**Fig.7(b):**  $(n^2)$  vs  $(\lambda)^2$  for both E and C- (DCPF)<sub>5%</sub> - (PMMA) isomers in the film form.

**Table 3:** Some Dispersion parameters for both E and C (DCPF)<sub>5%</sub> - (PMMA) isomers in the film form.

The dispersion parameters	E-isomer	C-isomer
$E_0$ , eV	5.107	3.397
$E_d$ , eV	8.626	5.9327
$\varepsilon_\infty$	2.689	2.7465
$\varepsilon_L$	2.794	2.927
$\varepsilon_L - \varepsilon_\infty$	0.105	0.181
$N/m^*$ , /Kg.m <sup>3</sup>	$3.345 \times 10^{46}$	$4.084 \times 10^{46}$

After the analysis of the dispersion curves we converted to determine both the type and the values of the energy gaps depending on the analysis of the absorption coefficient and according to Baradeen et al equation[16] for E and C- (DCPF)<sub>5%</sub> - (PMMA) isomers in the thin film forms. The results are listed in Table 4 and shown in Fig.8(a&b). These results supported the presence of three indirect transitions with 1.669, 2.61, and 2.787 eV for E-isomer, while two with 1.967 and 2.787 eV for C-isomer respectively and only one direct transition for the both isomers, in the thin film forms, with a value equal to 2.937 eV.

**Fig.8:(a)**  $(\alpha h\nu)^{1/2}$  vs.,  $(h\nu)$  and **(b)**  $(\alpha h\nu)^2$  vs.,  $(h\nu)$  for both E and C- (DCPF)<sub>5%</sub> - (PMMA) isomers in the film form.

**Table 4:-** The values the optical energies of both direct and indirect transitions for both E and C- (DCPF)<sub>5%</sub> - (PMMA) isomers in the film form.

The type of the optical transitions	The values of the	Optical energies ( $E_g$ ) in eV	
		E-isomer	C-isomer
Indirect	$E_{g1}^{in}$	1.669	1.967
	$E_{g2}^{in}$	2.61	-----
	$E_{g3}^{in}$	2.787	
Direct	$E_g^d$	2.937	

### Conclusion:-

Casting E- (DCPF)<sub>5%</sub> - (PMMA) isomer in the film form was prepared and then was irradiated with UV light (360 nm) for different exposure time. The film turned to deep pink color after 38 min. The photo-bleaching time was 670 min. The absorbance spectra showed four peaks. The onset one was related to the photo coloration effect at 516.44 nm, where it was increased in height and decreased in its width by exposure time of UV-Irradiation. The other three peaks were at 363.04 nm, 272.848 and 218.819 nm respectively. The spectra have an isosbestic point at (417.079 nm). The photo-coloring effect was gradually disappeared and return to the original color after 670 min, which related to E-isomer. This behavior was found to obey a first order reaction with a rate constant,  $k = 0.158 \text{ s}^{-1}$  and a half-life time,  $t_{1/2} = 40 \text{ s}$ . The analysis of both the transmittance and reflectance in the spectral range from 400 to 1500 nm revealed the presence of three indirect transitions with 1.669, 2.61, and 2.787 eV for E-isomer, while two with 1.967 and 2.787 eV for C-isomer respectively and only one direct transition for the both isomers, in the thin film forms, with a value equal to 2.937 eV. The application of Smakula's equation indicated the increasing of the concentration of the coloring centers from  $\sim 4.57 \times 10^{10}$  to  $9.18 \times 10^{12} / \text{cm}^3$  as the time increased from 2 to 38 min.

Training, Commitment, and strategies

### Abstract

Employee training is intended to provide an opportunity for advancement and may be perceived as the organization values their employees and their sense of self-worth, therefore will result to building a stronger affective commitment. Thus also resulting to a function of close psychological attachment to the organization and its goals, (McElroy, 2001). The purpose of this study was to analyse the effects of employee training and development strategies on employee commitment. The research hypotheses for the study were; Ho1 training opportunities have no significant effect on employee commitment. The study employed a case study research design that was conducted at Moi Teaching and Referral Hospital. The target population was three thousand two hundred (3200) respondents were targeted because that was the group highly affected by commitment and turnover issues in the organisation. A sample size of 340 was extracted from the target population and the sampling techniques used were stratified sampling. Data was analyzed using Multiple regression analysis was performed to test the hypothesized relationships. Based on the observed correlation results, training ( $\beta = 0.134$ ,  $p < 0.05$ ) indicated that there was a significant positive correlation between employee training opportunities and employee commitment. This implies that the perceived empowerment of employees by the hospital was likely to impact positively on their commitment to the hospital.

### Introduction:-

Training is essential for the livelihood of any employee in the public sectors and it is the only way employment can be maintained over careers. (Tomlinson., 2002) suggests that, it is critical that organization keep the leading edge by having their employees stay in organizations that promote career opportunities through learning and the ability to apply their newly acquired skills (Klein and Kozlowski, 2000). Employees might also develop a moral obligation to give the organization its money's worth (normative commitment), particularly if the company finds the training (McElro, 2001). Therefore, the main objective of this study is one fold in determining the extent to which training and development opportunities affect employee commitment.

**Review of literature:-****Employee Commitment:-**

In the competitive environment, most of the organizations have successfully developed, executed, evaluated, refined and perused employee empowerment and improvement as a prime human resource practice with business value (Kandula, 2004). So an employee committed and involved organization starts with the concept of strategic fit between people, tasks, technology, information processes, rewards and organization structure for which all must be in alignment before the organization can work efficiently (Kandula, 2004).

**Training and employee Commitment:-**

Training is defined as the opportunities provide by the organization to advance an individual's carrier prospects, such as challenging assignments, and being kept informed. Employee training is also likely to affect the employee commitment capacity. Continuous professional development is particularly important to knowledge workers. Firms need to offer internal and external training opportunities to develop and nurture required satisfaction and commitment of employees (Jaw and Liu, 2003). Fugate *et al.*, (2004) has encouraged organizations to assist employees to develop their careers through activities that are beneficial for both employees and the organization. Current literature points out variety of activities that are provided by organizations to assist in career development, this includes challenging work assignments, new learning opportunities Kinnieet *al.*, (2005), Career Counseling, (Leung, 2002), and access to information about the organization (Gubbinset *al.*, 2005).

Wetland (2003) asserts that training and development of employees is increasingly recognized as an important aspect of best human resource management practices. Training and development are commonly considered to be different forms of human capital invested for individual and organizational improvement. Organizations invest a large amount of its capital for training purposes and the development of its employees. It is worthy of probing whether the training is advantageous for the trainees, and to what degree can the process of training be enhanced. Stephen *et al.*, (2007) study shows the link between training associated with employee's productivity which further leads toward employee and customer satisfaction. Improvement in performance such as productivity, quality and services are the training outcomes provided that the job is strategically aligned to the organization's needs. Gold (2001) stresses that, the areas where training may be used in the enhancement of job specific skills, the correction of deficiencies in job performance and development may be provided to employees with abilities the organization might need in the future. However, higher degree of training increases employee satisfaction and loyalty towards the firm and decreases the chances of employee terminations and lay-offs (Chooand Bowley., 2007).

Landsman (2004), suggested that training is a valuable activity for enhancing skills and improving staff performance, and that training can address some of the factors contributing to staff retention, such as perceived support for the supervisor, the agency and community. Training can define roles more clearly to employees, thereby minimizing job stress. Organizations with sufficient training opportunities should have higher retention rate. Tomlinson (2002) asserts that, it is critical that organizations keep the leading edge by having their employees well trained in the latest technologies. While considering a training process it is essential to explore who is taking part in trainings, style and design of training and all about the main objectivity of the trainings being achieved or not, (Choo and Bowley., 2007). Stephen *et al.*, (2007) focus on the outcome of capital invested on training processes that further raise the efficiency of the employees and the organization. Employees may stay with an organization which promotes career opportunities, through learning and the ability to apply their newly learned skills (Cataldoet *al.*, 2000; Jiang *et al.*, 2000).

**Methodology:-**

Survey research design was employed in this study to investigate the effect of training and development strategies on employee commitment probability sampling design was used with a sample size of 320 employees from a target population of 3200 employees (Mugenda and Mugenda, 2003) Structured questionnaires were presented to the selected population in the hospital who were the respondents for the study data was done using descriptive statistics specifically mean and standard deviation. Inferential statistics were Pearson correlation coefficient and multiple regression analysis the multiple regression analysis models.

**Results:-****Table 4.1:-** Distribution of Respondents Response.

Sample size	Administrators		Section Heads		Other Employees	
	Number	Percent	Number	Percent	Number	Percent
Total sample size	10	100	30	100	300	100
Total responses	8	80	27	90	264	88.0
Total unusable	1	10	1	3.3	3	1.07
Total usable response	7	70	26	86.7	261	87.0
Description of unusable questionnaires						
Returned blank	1		0		1	
Incomplete questionnaire	0		1		2	

*Source: Survey Data (2015)***Training Strategy and Employee Commitment:-**

The second research objective focused on determining the extent to which training and development opportunities affect employee commitment. The six items proposed to measure this variable were all used in analyzing the prevailing status of training and development in the hospital. Respondents were asked to indicate their level of agreement on the selected items. Once again, responses were elicited on a five point scale ranging from strongly disagree (1) to strongly agree (5).

**Table 4.2:-** Descriptive Data on Prevailing Status of Training

	Mean	Std. Deviation	Skewness Statistic	Std. Error	Kurtosis Statistic	Std. Error
The organization provides employees with job specific training	3.80	1.155	-1.286	.143	.945	.285
Allocation of sufficient time for product and solution training	3.46	1.235	-.688	.143	-.428	.285
Employees can apply the training they receive from the organization	3.96	1.150	-1.162	.143	.578	.285
The organization provides enough development opportunities	3.56	1.229	-.508	.143	-.804	.285
Sufficient money is allocated for product and solution training	2.89	1.303	.064	.143	-1.173	.285
Employees are involved in activities that promote their professional development	4.03	1.140	-1.313	.143	.974	.285

*Source: Survey Data (2015)*

These results clearly show that the Moi Teaching and Referral Hospital underscores the importance of training and development for its employees. From table 4.2 above, it can be seen that in four of the six items, the mean response was approximately 4 which indicates that respondents tended to agree with most of the items. In particular, respondents tended to agree that the hospital provides employees with job specific training (M=3.80, SD = 1.155); that employees can apply training received from the hospital (M=3.96, SD=1.150); that the hospital provides through development opportunities (M=3.56, SD = 1.229) and that employees are involved in activities that promote their professional development (M=4.03, SD = 1.140). The respondents were however, neutral on whether sufficient money was allocated for product and solution training (M=2.89, SD = 1.303); and whether there was allocation of sufficient time for product and solution training. Once again, the responses regarding training and development were normally distributed as indicated by the skewness and Kurtosis statistics which fall in the range -3 to 3.

**Table 4.3:-** Descriptive Data on Prevailing Status of Employee Empowerment.

	Mean	Std. Deviation				
			Skewness Statistic	Std. Error	Kurtosis Statistic	Std. Error
Employees have the opportunity to determine how to do their job	3.59	1.215	-.832	.143	-.207	.285
The work makes good use of employees skills and duties	4.43	.663	-1.182	.143	1.930	.285
Employees make decisions about new ideas when doing their duties	4.08	.992	-1.187	.143	1.070	.285

**Source:** Survey Data (2015)

### Conclusions:-

On the basis of the findings highlighted above, the following conclusions were made. Use of training in the hospital as an employee strategy has a direct effect on employee commitment. A 1% improvement in employee training and development could result in a 0.134% increase in employee commitment.

### Contributions to academic debate and entire body of knowledge:-

These results clearly show that the organization in place underscores the importance of training and development for its employees. Consequently, by offering training and development opportunities, the hospital aims at upgrading the employee's abilities to cope with specific situations and performance of various specific tasks with a certain level of satisfaction. Furthermore, career development opportunities have been shown to result in higher levels of commitment among employees (Bashir and Ramsey, 2008; Paul *et al.*, 2004). Commitment has been proved to enhance employees (Browning, 2006), developing skills and competencies (Mahatanakoon 2007; Pettijohn, *et al.*, 2007; Lee & Bruvold 2003), as well as opportunities for growth (Armstrong *et al.*, 2008; Allen 2003).

### Recommendations for further study:-

The study should use a mediator role in order to study the variables in more detail to enhance the study further.

*Cucumerinum*, *Trichoderma sp.*

#### Abstract

*Cucumis sativus* (Cucumber) is very valuable crop plant in India. Direct application of *Trichoderma sp.* has proved effective in controlling the infection by *Fusarium* (soil borne pathogen) one of cucumber plants under greenhouse conditions. A wilt caused by *Fusarium oxysporum f.sp. Cucumerinum* is a major problem in the production of *Cucumis sativus* (Cucumber) plants. In dual culture a significant reduction was observed. Positive correlation between added *Trichoderma* and percentage of healthy cucumber seedlings were detected. Improved seedling vigour was noticed in fungal antagonist filtrate treated seeds evidenced by maximum shoot length (19.5 cm respectively) followed by fungal antagonist suspension treated pot (20 cm) while untreated seeds in inoculated control (respectively). Percent seedling mortality was recovered in untreated seeds in uninoculated soil was 40%, in coated seeds in inoculated soil was 6.25%, in filtrate treated seeds in inoculated soil was 12.5% and untreated seeds in inoculated soil was 87%. Percent disease control was calculated to be 86.99% for antagonist filtrate treated seeds in infected soil and 93.62% for antagonist coated seeds in infected soil over untreated seeds in *Fusarium* infested soil taken as check so the strongly suggest that *Trichoderma sp.* can be exploited for the biological control of soil borne pathogens ( *Fusarium oxysporum f.sp. Cucumerinum* ).

#### Introduction:-

Plant pathogens are estimated to cause yield reductions of almost 20% in the principal food and cash crops worldwide. Losses may be more severe when highly susceptible varieties are widely grown. Although these losses may be attenuated by the use of disease tolerant cultivars, crop rotation or sanitation practices. Fungicides are often essential to maximize crop yields. The predicted growth of world population from 5.7 billion in 1993 to approximately 8 billion by 2020 presents a major global challenge to meet the necessary increases in food production. Significant yield improvements are potentially achievable in staple food crops such as cereals, rice and maize through optimizing inputs, including fungicides. Fungicides also provide substantial benefits on good quality, which is related to the reduction of mycotoxins and phytotoxins.

Despite the many advantage conferred by fungicides, increasing public concern about environmental health is proving to be major hindrance in the use of the chemical pesticides including fungicides. Their indiscriminate use

Address:-Center of Excellence, Department of Botany, University of Lucknow, Lucknow-226 007. India

has led to several environmental problems including development of resistance in insects to insecticides, resurgence of non target, pests, and pesticides residues in food, fodder and feed, destruction of beneficial insects like honey - bee, pollinators, parasites and predators. Persistent residues of Dichlorodiphenyltrichloethane and Benzene hexachloride have been detected in vegetables, milk, oil, butter, meat and even in mother's breast milk. Besides impairment of ecosystem the modern chemical input based agricultural technology has also led to poor economic returns. Some of the pathogens and pests of crop have also developed bio-types or strains or races complicating their management with the available tactics. It is therefore, quite essential to continuously monitor the changing scenario of pest, disease and weeds complexes in various cropping systems across the country and also monitors their natural enemies, which keep them under check.

The consumption of technical grade pesticides on crop has gone up from over 7341 MT in 1960 to 80,000 MT in 1989-90. It has further risen beyond 100000 MT during the year 1994-95. The estimated annual growth rate of consumption of pesticide was about 10% in the last decade. More than 60% of the pesticides are consumed in the agriculture sector. Cotton, rice and vegetables consume maximum quantity of pesticide in the country. In case of millets, oil seeds, and pulses pesticide share is only 6-7%. The use of pesticide is also heavy in fruits, vegetables and plantation crops but very moderate in sugarcane. Among the chemicals pesticides, insecticides are used to a large extent of about 80% in India followed by fungicides 10%, herbicides 7% and other chemicals 3%. The level of pesticide residue is very high in India.

The problem of pesticide residue is due to use of recalcitrant pesticides and is particularly serious in case of cereals, pulses, milk, fruit, vegetable etc. It has also affected our export of tea, coffee, rubber, fruits etc.

Ideally a chemical compound should not only be safe to the human beings and other mammals, but also to the harmless resident microflora. It should cause minimum change in microbial balance of the environment. Such concerns have led to the development of novel crop protection chemicals with low use rates, a benign environmental profile and low toxicity to human and wildlife. Use of chemical fungicides has proven hazardous to air, water and soil.

Biocontrol agents are being used as an alternate strategy to chemical pesticides as they are target specific, environment friendly due to higher selectivity and biodegradable nature. For the last few decades, biological control of plant pathogens has been becoming very much popular. Some research workers from different parts of the world have tried to control fungal pathogens by applying other antagonistic microorganisms such as fungi and bacteria. Biocontrol agents form a component of integrated disease management system and can easily be integrated with other effective practices. Biocontrol agents are known as antagonists. The most important well studied antagonists against several plant pathogens are fungi like *Aspergillus sp.* (particularly *Aspergillus niger* and *Aspergillus terreus*), *Chaetomium globosum*, *Coniothyrium maintains*, *Fusarium sp.*, *Gliocladium virens*, *Penicillium citrinum*, *Trichoderma sp.*, particularly *Trichoderma harzianum* and *Trichoderma viride* and *Sporodesmium sp.* and bacteria like *Agrobacterium radiobacter* strain K84, species of *Bacillus*, *Enterobacter*, *Micromonospora*, *Pseudomonas* and *Streptomyces*. Microbial antagonists extensively used for soil-borne disease are species of *Trichoderma*, *Gliocladium virens*, *Coniothyrium maintains*, *Bacillus*, *Pseudomonas* and *Streptomyces*.

The study was conducted to evaluate the antagonistic property of *Trichoderma sp.* isolated from rhizosphere of peepal soil and its efficacy as seed coating in preventing seedling wilt.

## Materials and Methods:-

### Isolation:-

The fungus *Fusarium sp.* was isolated from infected cucumber (*Cucumis sativus*) fruit and fungus *Trichoderma sp.* was isolated from soil. Pure culture was obtained by repeated inoculation in fresh PDA medium. For it fungus mycelium was picked by help of red hot sterilized platinum -nickel alloy wire loop and transferred to the PDA plate under laminar flow. Fungus was allowed to grow for 7 to 8 days and then microscopically examined. Further by hyphal tip method pure culture plates were prepared.

### Soil Sampling:-

Soil sample was collected from the rhizosphere of peepal tree located in the garden of old Botany Department' of Lucknow University. The sample was drawn, demarcated into uniform portion. For soil sample collection 20x30x20 cubic cm pits were dug with sterilized spatula. Upper most 1 cm soil surface was scrapped off and soil surface from

all the sides of the pit in profil was collected in sterilized polythene bag. This sample was sealed to maintain their original moisture.

#### Isolation of Soil Mycoflora:-

100mg of peepal soil was taken in autoclaved eppendorf tube and 1000µl of distilled water was added to it to make stock solution and shake it well and other autoclaved eppendorf tubes were taken and labeled according to concentration  $10^{-1}$ ,  $10^{-2}$ ,  $10^{-3}$ ,  $10^{-4}$ ,  $10^{-5}$ ,  $10^{-6}$ . 900µl of distil water was added to each. Now 100µl of stock solution was added to the eppendorf tube of concentration  $10^{-1}$  and shake it well. 100µl of solution from concentration  $10^{-1}$  -was transferred to the eppendorf tube labeled  $10^{-2}$  concentration so as to make its solution 1000 µl. Now 100µl of solution from  $10^{-2}$  concentration transferred to  $10^{-3}$  labelled eppendorf tube and shake it well. Similarly 100 µl was transferred from  $10^{-3}$  concentration was discarded out. Plate 100µl of aliquots on PDA (Potato Dextrose Agar) plates from concentration  $10^{-2}$ ,  $10^{-4}$ ,  $10^{-6}$  with the help of micropipette and spread it with spreader. Plates were incubated at  $27\pm^{\circ}\text{C}$  for 24 hr. in the dark. There were three replicates for each concentration. The colonies were enumerated after 7 days of incubation. The fungi were isolated as pure cultures on PDA. Fungi were exarlined for colony characteristics and microscopically for morphological studies.

#### Bio-efficacy of *Trichoderma sp* in-vitro by Dual cultures:-

Bio-efficacy of *Trichoderma sp.* against *Fusarium oxysporum* was tested under in-vitro conditions by dual culture technique. Cultures were grown on PDA in Petri plates and incubated at  $27\pm 2^{\circ}\text{C}$  for 7 days in three replications. The colony diameter of test fungus in dual culture with each isolate of *C. globosum* was measured and growth inhibition was expressed as a percentage of the control. In the corresponding control an equal amount of PDA was added. Day by Day we examine the radial growth of test fungi.

Antimicrobial activity was expressed in term of percentage of mycelia growth inhibition & calculated as per formula.

In Petri plate, Percentage of mycelia growth inhibition =  $\frac{dc-dt}{dc} \times 100$

Where

dc= Average Diameter of fungal colony in control

dt= Average Diameter of fungal colony in treatment

#### Pot experiments:-

##### Soil Preparation:-

The culture inoculum of *Fusarium sp*-growing on broth was mixed in the potted sterilised soil at the rate of 1gm per kg. soil. Cucumber plants seeds (3 leaf stage) were shown in each pot two days after infestation with inocula of the antagonist.

##### Preparation of inoculums:-

Pathogen was multiplied on Potato Dextrose broth medium for 15 days at  $27\pm^{\circ}\text{C}$ . A 5mm diameter disc of pathogen was put into the broth medium.

##### Preparation of Antagonist:-

For antagonist preparation antagonist was multiplied on PDA plates for 6 days and in the broth medium (PDB) for 15 days at  $27\pm^{\circ}\text{C}$

##### Coating of Seeds:-

For seed coating the antagonist was multiplied on PDA and PDB medium for 15 days under alternate light (12 hrs.) and dark (12 hrs.) conditions. Spore suspension of the antagonist was prepared in sterile distilled water with .01% Tween 80, to give spore count of  $10^6$  spores per ml. This 100ml of suspension was used to coat about 5gm of seeds. 5gm of seeds were dipped in filtrate of fungal, antagonist broth culture for about 20 minutes. Seeds were dried overnight before sowing. A pot experiment was designed to find out the efficacy of antagonist in the control of 'wilting' disease of cucumber caused by *Fusarium sp*. Untreated cucumber seeds were sown at the rate of eight seeds per pot in sterilised soil. In second set, the biocontrol agent coated seeds were sown in pathogen mixed soil. In third set, the biocontrol agent filtrate treated seeds were sown in pathogenic soil; while in the fourth set untreated seeds were sown in pathogen inoculated Soil. There were three replicates for each set.

The pots were kept in wire house and after seven days and fifteen days the seedlings were observed for percent germination, seedling vigour and percent disease control. (Kharakrang *et. al.*, 2002)

$$Ds\% = \frac{Cm\% - Tm\%}{Cm\%}$$

Where,

Ds% = % Disease Control

Cm % = % mortality in control

Tm% = % mortality in treated seeds in inoculated soil

### Result:-

Soil sample collected from Department of Botany, Lucknow University contained higher fungal population (CFU/ml) in  $10^{-2}$  concentration ( $1.75 \times 10^7$  CFU/ml) followed by  $10^{-4}$  concentration ( $5.25 \times 10^5$  CFU/ml) followed by  $10^{-6}$  concentration ( $7.75 \times 10^3$  CFU/ml). Several genera had been isolated from soil including *Aspergillus sp.*, *Cladosporium sp.*, *Fusarium sp.*, *Penicillium sp.*, *Rhizopus sp.*, *Trichoderma sp.*, which were most frequent.

**Table 1:-** Antagonism between *Trichoderma sp.* (T-I) and *Fusarium sp.* in the dual culture test.

Day	Control diameter (mm)		Dual Diameter (mm)	
	<i>Fusarium</i>	<i>Trichoderma</i>	<i>Fusarium</i>	<i>Trichoderma</i>

**Description:-**

Identification of taxa was done after consulting the literature (Gilman, 1998). The taxa have been classified to genetic level in accordance to the classification of C.J. Alexopoulos and C. W. Mims.

***Aspergillus Flavous:-***

Colonies lime-green to mignonette green widely spreading. Conidiophores arise separately from the substratum, 400- 700 1000  $\mu$  long x 5. 15  $\mu$  in diameter, broadening upward, walls so pitted as to appear rough or spiny with low magnification, occasionally granular, gradually enlarging upward to form a vesicle 10-30  $\mu$  or 40  $\mu$  in diameter. Heads in every colony vary from small with a few chains of conidia to large columnar masses or both mixed in same area; small heads with small dome like vesicles and single series of few phialides upto 10-15 x 3-5  $\mu$  large head partly with simple phialides and partly with branched or double series or with both in the same head; primary phialides, 7-10x3-4  $\mu$ . Secondary 7- 10x2.5 -3.5  $\mu$ . conidia pyriform to almost globose, colourless to yellow -green sometimes. almost smooth, usually rough varying from 2x3  $\mu$ , 3x4  $\mu$ , 4x5  $\mu$  or 5x6  $\mu$  in diameter, or even larger. Sclerotia at first white, then brown hard, parenchymatous. Clitothecia not found.

***Aspergillus Niger:-***

Colonies black with streaks surrounded by white. From blue yellow coloured and shrinkage of agar medium occurs. Colonies on medium rapidly growing with abundant submerged mycelium. Conidiophores mostly arise directly from the substratum, smooth septate or non septate, varying greatly in length and diameter, 200-400 x 7-10  $\mu$  or several millimeters long and 20  $\mu$  in diameter. conidial heads fuscous, blackish -brown, purple brown, in every shade to carbonous black, varying from small, almost columnar mass of few conidial chains to the more common globose or radiate heads, upto 300-500, or 1000  $\mu$  or long; vesicles globose commonly 20-5  $\mu$  up to 40  $\mu$  in diameter, phialides typically in 2 series thickly covering the vesicles primary varying greatly in length, secondary 6-10x2-3  $\mu$ . Conidia globose, at first smooth, but later spinulose with colouring substances, mostly 2.5 -4  $\mu$  less frequently 5  $\mu$ .

***Cladosporium Sp:-***

Colonies on agar medium appeared greenish-black, large, thick, conidiophores at first erect, then falling, pale-green, conidia two to three celled, olive-green, 10-22  $\mu$  long x 4-6  $\mu$  thick.

***Fusarium Sp:-***

Colonies brownish -white to violet appearance. The lower of the stroma plectenchymatic, chlamydospores intercalary Sporodochia lacking. Conidia scattered on aerial mycelium, spindle or sickle shaped, straight or slightly curved, not pedicellate but often with attachment water on the base. Smaller conidia 0 to 2 septate, larger 3 septate seldom 4-5 septate.

***Penicillium sp:-***

The mycelium is profusely branched with septate hyphae. The cells are thin walled, one to multinucleate. It has smooth walled conidiophore stipes bearing divergent whorls of metulase usually without further branches. Conidia globose to sub-globose, smooth walled not exceeding 3  $\mu$  m diameter. Colonies grow restrictly reaching 2.0-2.5 cm diameter in 10-14 days at 27 $\pm$ °C.

***Rhizopus sp :-***

Colony appears light greyish in colour, the mycelium produces rhizoids formed specially at points where it contacts a hard surface sporangiophores erect it bears columella at upper side. After dehiscing it releases zygospores. Zygospores spherical 95-250  $\mu$  m in diameter.

***Trichoderma sp:-***

Conidia -oblong to ellipsoide, dull green, 3-4.5 x 2.1 -2.8  $\mu$  m Conidiophore -5-10  $\mu$  m diameter near the base, highly branched, primarily branches, relatively short, usually in whorls of 2-5, highly rebranched, ultimate branch one celled, barrel- shaped or short cylindrical, mostly 3.5-7 x 3.5  $\mu$ . Phialides -Sub globose to ellipsoidal or ampulliform, 3.3 - 5.6 x 2.8 -3.5  $\mu$  m arise in crowded whorls of 3-6. Chlamydospores -abundant, 33 x 18  $\mu$  m. Colony characters -Colonies grow moderately rapidly; limited aerial mycelium is floccose, white to grayish.

**Effect of antagonists on growth of *Fusarium* sp by dual culture method:-**

*Trichoderma* sp. T1 isolated from soil exhibited antagonistic activity chiefly through hyperparasitism on *Fusarium* spp. (Plate-3). In the dual culture *Trichoderma* sp. first grew slowly towards the *Fusarium* sp. then grew rapidly and overgrew the colony of *Fusarium* in a span of fifteen days. Interaction region of 20 days old dual culture showed that hyphae of *Trichoderma* sp frequently encircled *Fusarium* hyphae.(Table 1, Fig 1 a.)

**In vitro interaction between *Trichoderma* sp. and *Fusarium* sp:-**

Initial examination of the extent of fungal growth in dual culture revealed that the first apparent contact between hyphae of both fungi occurred 6 days after inoculation (Table-I). Interaction region of fifteen days old dual culture exhibited hyphal interactions between *Trichoderma* sp. and *Fusarium* sp. as seen under light microscope at 40X, *Trichoderma* sp. coiled around the host hyphae. The coiling was either loose or massive and the host hyphae became lysed and disintegrated. (Fig. 1b)

**Effect of *Trichoderma* sp. on plants grown in pot culture:-**

Results recorded for antagonistic effects of *Trichoderma* sp. to the soil borne pathogen, *Fusarium* sp. on cucumber plants revealed that the tested pathogenic fungi was effectively controlled by the antagonists. Percent Germination of plants was highly effective when *Trichoderma* coated seed sown in soil. (Fig2, Graph D).

**Effect on Seedling Vigour:-**

Improved seedling vigour was noticed in fungal antagonist filtrate treated seeds evidenced by maximum shoot length (19.5 cm respectively) followed by fungal antagonist suspension treated pot (20 cm) while untreated seeds in inoculated control (respectively). (Graph A).

**Effect on Percent Seedling Mortality:-**

Percent seedling mortality was recovered in untreated seeds in uninoculated soil was 40%, in coated seeds in inoculated soil was 6.25%, in filtrate treated seeds in inoculated soil was 12.5% and untreated seeds in inoculated soil was 87%.(Graph B)

**Effect on percent disease control:-**

Percent disease control was calculated to be 86.99% for antagonist filtrate treated seeds in infected soil and 93.62% for antagonist coated seeds in infected soil over untreated seeds in *Fusarium* infested soil taken as check (Graph C).

**Discussion:-**

In the present study, *Trichoderma* sp. was found to be very effective in the suppression of mycelial growth of *Fusarium oxysporum* grown on PDA medium. The results obtained in the present study are in accordance with the findings of Jee and Kim (1999), Fernandez (1992) and Elad *et.al.* (1980). Hadar *et.al.* (1979) observed that, an isolate of *Trichoderma* sp. directly attacked the mycelia of *Rhizoctonia solani* when two fungi were grown together on a glucose plus mineral medium. In another study Jee and Kim (1987) observed several mycoparasitism mechanisms such as coiling, penetration, overgrowing and lysis on dual culture of water agar between antagonistic fungi *Trichoderma harzianum*, *T. viride* and *F. oxysporum* fsp. *cucumeum*. Elad *et.al.*, recorded that an isolate of *T. harzianum* was capable of lysing mycelia of *Sclerotium rolfsii* and *Rhizoctonia solani*.

*Trichoderma* sp. was observed as one of the rapid growing fungus and covered most of the surrounding area of PDA plates. Elad *et.al.* (1980) also recorded same properties of mycelial growth of *T. harzianum* when it was grown with *Sclerotium rolfsii*. In their study *T. harzianum* grew better than *Sclerotium rolfsii* and invaded its mycelia under growth conditions adverse to pathogens. According to Moon *et.al* (1988), the mode of mycoparasitism of *T. harzianum* appeared to be coiling around and its attachment on the host or penetration into the host hyphae or breaking septa of both the hyphae and the conidia. While studying the direct application of *Trichoderma* sp. on the infection of *Fusarium* sp. a soil borne pathogen of cucumber plants grown in pots, no plant infection was recorded due to its antagonistic properties. Elad *et.al.* (1980) reported that under green house conditions, incorporation of the wheat bran inoculum preparation of *T. harzianum* in pathogen infested soil, significantly reduced bean disease caused by *Sclerotium rolfsii*, *Rhizoctonia solani* or both. Fernandez (1992) reported that application of *Trichoderma harzianum* to soyabean residue resulted in a significant decrease in the incidence of some wheat, soyabean, black oat pathogens including *Fusarium graminearum* and *Fusarium* sp. According to the study, *T. harzianum* was more effective in colonizing the substrate and in reducing the incidence of pathogen in wheat than in black oat.

The plants appeared more healthier and robust than those of control. These findings are supported by Weindling, *et. al.*, (1934) Cho *et.al.* (1989), Larena *et.al.* (2002). Manoranjitham *et. al.* (1999) reported increased. The germination, shoot length, root length, dry matter production and vigour index compared to control in *T. viride* treated seeds. Kharakrang *et. al.*, (2002) reported significant increase in growth fresh and dry weight of potato plants grown in *T. harzianum* treated soil. Disease control practices, especially those based on potentially hazardous pesticides, biological control measures are gaining support as a practical method for soil borne disease control. The idea to introduce antagonistic organisms to soil as control agents has long been considered. Therefore in our study, direct application of *Trichoderma* sp. has proved effective in controlling the infection by *Fusarium* (soil borne pathogen) one of cucumber plants. Moreover their abundance coupled with their ability to produce some biochemicals such as enzymes, antibiotics or functional inhibitors to inhibit pathogen development and to promote plant growth by virtue of their growth stimulating effect can revolutionize agriculture.

#### Abstract

Road traffic has become one of the main issues in Sri Lanka. Poor infrastructure facilities are unable to handle the increasing traffic and this resulted in generating higher traffic in town areas. Another reason for the road traffic is the poor traffic management systems implemented as well as the poor traffic management by the traffic police. Inexperienced traffic police handling the traffic might sometimes create more traffic rather than decreasing the traffic. Violation of the road rules and regulations also increase the traffic generated on the roads. The valuable time as well as the money spent on fuel is wasted due to this issue. To address this issue following system will first analyse video footage using object detection algorithms and count the number of cars entered into a particular road. Using the output counts prediction algorithm which the system consist will statistically generate a predicted time that the traffic light should be timed. This green time is the optimal time that the traffic light systems should be programmed in order to minimize the road traffic. Key benefits of this system is the reduction of the traffic thus save the valuable time of the citizens and saving the money which spent on fuel. And in the long run pollution of environment in air and sound forms will reduced as well as the increase of the productivity as a country will utilize the limited time due to the system.

#### Introduction:-

TODAY ROAD TRAFFIC has become a main issue in Sri Lanka. Sri Lankan government uses manual methods to count the number of cars which enter into a road on a particular date and time. Then the road development authority uses this data to time the traffic lights as well as to decide the size of the road project. In many cases traffic light systems are implemented not using statistical data but just numbers entered randomly and it's not based on the location or the traffic. Due to increased number of vehicles as well as poor traffic management, road traffic has become one of the recent issues Sri Lanka facing. There is no system to help in traffic management and to decrease the road traffic in Sri Lanka. When it comes to traffic police, traffic control is personal biased and lack of experience may cause bigger traffic. When implementing a traffic light system statistical data are collected manually using human resources. False data and incorrectly entered data counts will definitely produce false results thus creating chaos in each junction. Violation of road traffic causes many road accidents. In Sri Lanka, traffic police monitor this issue manually and penalize the drivers. There are many instances where drivers violate rules but no evidence or presence of a traffic police set them free. The purpose of the built system is to ease the road traffic generated due

low infrastructure facilities in Sri Lanka and poor traffic management systems implemented thus saving the time spent on the road and reduce the number of accidents occur.

### **Background and Related Works:-**

Uke and R. Thool [1] stated that vehicle counts, traffic classifications and speed estimation is done using C++ and OpenCV. Images from video streams are taken and background is extracted from them. Then the background is used to detect the moving traffic as well as classify the vehicle type. Based on the extracted subtraction objects which are not traffic are also detected and added into the counts thus creating false results in some instances.

Shukla and M. Saini[2] stated that in every vehicle detection system there are two stages. Hypothesis generation and verification. Sensing vehicle ahead before creating make it more sensible. Then formulating a dynamic traffic system helps to ease accidents and save time. There are few vehicle tracking approaches. One is region based tracking method. In this method the moving objects are tracked and those are taken for track the vehicles. These regions or area are divided using the subtracting process between the input image and background image which were stored before. For this model images taken from a stable camera was used. Contour tracking methods uses the boundary of the vehicle for detection. Its efficient is much greater than the previous method. 3D model based tracking methods uses 3D geometric shape of vehicles. Feature based tracking method, colour and pattern based tracking method are another two methods used for vehicle tracking.

Sharma et al. [3] proposed various image processing algorithms to detect vehicles. Their algorithm includes five steps in recognizing an object. Initial step would be to input an image then pre-process it, use differential morphology profile then threshold and filter. Algorithm is applied on frames which consist of the still images of the traffic. Then in the pre-processing step the true colour image would be converted in to grey level image according to the luminance converter. Morphology is a nonlinear technique in images processing where it can be used to noise filtering, image segmentation, pattern recognition, shape detection and shape decomposition. A feature vector is created from a single images using differential morphological profile. Then at the threshold stage grey level image is converted in to binary image using an equation. Target image would be extracted using computed shape index at the filtering stage. Finally, the vehicle is detected. The performance of the algorithm then will be calculated using three measures such as true, false and negative rate.

Wang et al. [4] stated that when it comes to vehicle detection algorithm based on deep belief network that there are two sets of categories existing. The first set is about vision based vehicle detection and the second set is on deep learning for object recognition. Vision based vehicle detection approach would be to use vehicle appearance characteristics such as local symmetry, edge, and cast shadow to detect vehicles. Features like Gabor features, scale-invariant feature transform (SIFT) features, speeded up robust features (SURF) are used for vehicle representations. For training vehicle detectors Support vector machines (SVM) and Adaboost are used.

Chien and L. Chen[5] stated that the canny edge detector is used for edge detection and localization in image processing. Edge detectors based on morphological gradient performs well in edge detection. But the edge localization is weak. It can be further improved with erosion operations. Changing the threshold values the user can generate different results.

P. Niksaz [6] conveyed that the road traffic had become a major problem which country faces today because of the increase in number of vehicles. The increase in number of vehicles follow-on to the need of a smart system that could resourcefully handle traffic congestion based on the density of traffic. To estimates the size of traffic in highways by using image processing has been proposed and as a result a message is shown to inform the number of cars in highway and aims to prevent heavy traffic in highways. There are lots of methods that can be utilized for Gamma correction.

Nagaraj et al. [7]mentioned that traffic control system can be built by image processing technique like edge detection to discovery the traffic concentration, based on traffic density can control the traffic signal light. There are current traffic control systems like Microcontroller, Vehicle-Actuated Control, Manual Controlling, and Automatic Traffic Light. Image processing alongside with object detection to sense traffic jam. It involves several steps of image processing to make decision about traffic jam. Main steps are Image Analysis, Object detection, typed object count, Motion detection, and Result representation.

In “Video Image Processing to Create a Speed Sensor”[8] stated that current methods to monitoring congested freeways and had neither the skill nor the expert to set lasting marks on the road. To do this they had used an algorithm for speed extraction first applies a sequence of operators to single images to create a set of boosted images. Then use this set of boosted images to create a speed approximation algorithm.

Hadi [9] mentioned about the main form of transmission & storage for information which has been by paper documents. Several good solutions exist for document processing and analysis, this research will give an outline for processing, analysis and grouping of document images. Today information technology has proved that there is a want to pile, query, search and get large amount of electronic information resourcefully and correctly. So document image processing is very interesting field of research with the continuous development of interest and growing security requirements for the growth of the modern civilization.

Margritet al. [10] stated that the digital image processing will be directing on analysis of remotely recognised images. These images are symbolised in digital form. When showed as numbers, brightness can be visible to statistical controls that are not possible if an image is accessible only as a photograph. Digital image processing of satellite data can be mainly clustered into three groups. Improvement is applied to image data to successfully show data for subsequent visual understanding. Information mining is built on digital classification and is used for making digital thematic map.

M. Kumar[11] stated about a real-time vision system that has been created that inspects color videos on a highway. This system uses a mixture of color, edge, and gesture evidence to identify and track the road limits, lane patterns and other vehicles on the road. Cars are identified by similar templates that are chosen from the input data online and by detecting highway scene features and measuring how they relate to each other. Cars are also identified by temporal differencing and by following gesture limitations that are for vehicles. Experimental results prove robust, real-time car discovery and tracing over thousands of image frames. The data contains video obtained under tough visibility situations. The total purpose of the research is to build a clever, camera-assisted car that is bright to understand its environments automatically, and in real time. Traffic size, driver behavior, lighting, and road conditions are hard to forecast. Their system examines the whole highway. It sections the road apparent from the image using color arrangement, and then identifies and tracks lane patterns, road limitations and vehicles.

Akram et al. [12] recognized that one of the important applications of video-based management systems is the transportation surveillance. Within many years the researches have examined in the Vision-Based Intelligent Transportation System (ITS) Transportation preparation and traffic engineering apps to get valuable and accurate data. It attention on vehicle detection, tracking, and classifying. The research team categorise the traffic monitoring systems built on detailed methods which used for evolving it.

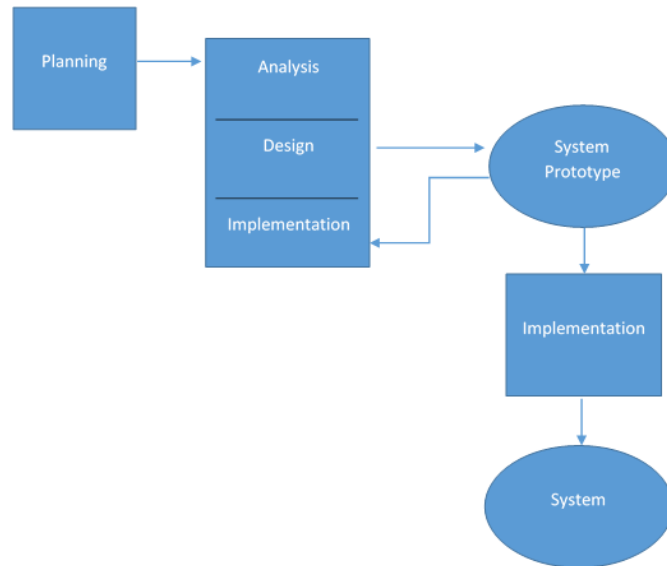

Jain et al. [13] stated that articles in numerous papers it appears rather tough to have straight contrast. The formation of noticing the state of traffic in critical areas can be used to prevent serious blocking. That system supposes specially in night time using density estimation algorithm but they can't find a good solution for it and tells that most suitable for low congestions in night time.

Loureiro et al. [14] founded about that in most of research papers, there are some common problems that can't solve in accurate manner such as shadows and vehicle occlusion. There are some technical problems such as the low quality of the stream available and sometimes the low frame rate. Although some algorithms can tolerate lower frame rates, but that is generally not true for low quality images. They also found some camera related issues such as the depth. Zoom level will also effect on the detection as well.

Atko et al. [15] and Harish et al. [16] mentioned, vehicle tracking, vehicle speed measurement, recognition of license plate of moving vehicles and lane detection can be found in different systems. To do vehicle number plate recognition car should move through the observational zone and recognition program localise the number plate and tracks it while car is in this zone. Symbol recognition module selects frame of the greatest quality and finds it as symbol combination. Vehicle tracking is also built on contour extraction.

### Methodology:-

This project uses prototype development methodology because the end target is to satisfy end user's which will result in a lot of implementations of updated versions of the previous systems that were created. Prototype is built, tested, and then reworked as necessary until an acceptable system is finally achieved from which the complete system or product can now be developed. This model works best in situations where not all of the project requirements are recognized in detail ahead of time. Fig 1, shows the prototype methodology.

**Fig. 1:-** Prototype Methodology

#### Planning:-

The final outcome was considered each and every time at the planning stage. There were many steps involved in planning.

The structure and design of the user interface was one stage of planning. The best user experience delivery was considered even though the project's objective was to predict the traffic. The interface creation was planned to implement using C# and the integrated development environment was the visual studio.

The next step at the planning stage was the data gathering methods for the analysis phase. Then how to design the most crucial parts such as the optimal green time prediction algorithm and object detection were considered.

#### Analysis:-

The second stage of prototyping methodology is analysing. The main objective of the analysis phase is to understand the processing requirement of this system. In the analysis phase the project team continues with gathering requirements about the research and prioritizing the requirements in order to achieve them step by step.

Project team identified the prediction algorithm and image processing as the main requirements and other methods as sub requirements. To analyse the current states information were gathered in many forms.

One of the main forms of information gathering was the interviews with the traffic police and the relevant parties in this field. Current issues when it comes to the traffic were thoroughly recognized and analysed through this method.

Literature review was also used as an information gathering method at the analysing phase. To gather the relevant videos, site visiting was also done. Through site visiting the absolute real scenario was able to recognize and based on that the system was built.

**Design:-**

The third stage of prototyping methodology is designing. In this phase the basis of the user interface was designed with the sketch of the entire system.

Then the prediction algorithm with the statistical point was developed taking into many considerations such as the circulation of the traffic lights for each lane, minimizing the waiting time, minimizing the accumulated traffic when the lane is closed and maximizing the traffic reduction of each lanes etc.

MySQL database was used when creating the system's database. MySQL Workbench was used as the visual database platform.

The interfaces for the system was built using visual studio as the integrated development environment. The programming language to do the above was C#.

The main components of the system are the prediction algorithm and the moving object detection algorithm. Both the components were built using C++ and R. For the prediction algorithm statistical methodologies and time prediction functions were also used. As the library OpenCV was thoroughly used for this has many methods and functions in image and video processing area. Fig 2, shows the system architecture.

**Fig. 2:-** System Architecture Diagram.

In fig 2, the upper most side picture is where live traffic is recorded into a video format where at the implementation stage it could be CCTV footage. Those footages are then send to the system and moving objects (vehicles) are then detected and counted. The results are stored on the database for predictions. The data processor represents the prediction algorithm which produces the optimal green time for each lane based on the traffic. The output would be the above predicted time.

**Implementation:-**

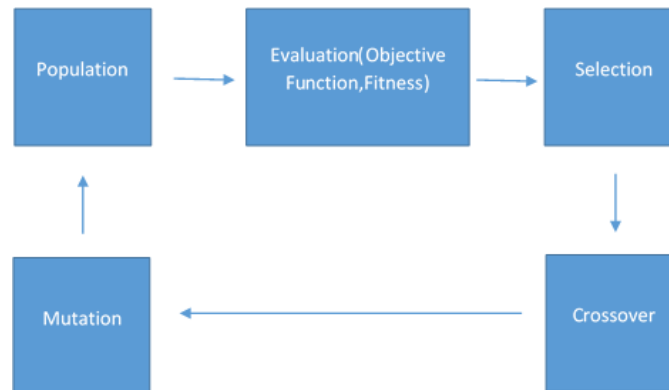

According to the information gathered a prototype of the system was developed. Also implementation was done by according to the requirements which we gathered. Following steps were done in this phase.

- Implementation of the database for the system.
- Implementation of the prediction and object detection algorithms.

- Connecting the interface with the database.
- Connecting the algorithms with the database.

Genetic algorithm is used in order to generate the optimal green time. This process involves several steps. First step is the process of deciding the inputs. Average number of cars are the inputs in this scenario. As the population size a number is selected between 5-20 (rule of thumb). Number of generations are the number of iterations which the process runs. Chromosome size represents the number of green times need to be optimized.

**Fig 3:-** shows the process of genetic algorithm.

**Fig. 3:-** Genetic Algorithm Process

In fig 3, the next step is the generation of initial set of chromosomes (some random numbers that are appropriate for green times.). If the objective is to optimize green times of a four-way intersection, then chromosome size is 4. If you decide to use population size of 10, then in order to generate the first set of chromosomes, generate  $4 \times 10 = 40$  random numbers between 10 and 110 (which are the maximum and minimum green times we initially designed) and arrange it as  $10 \times 4$  matrix (10 population members with chromosome size 4).

Generation 1.

Chromosome 1 : 10|25|30|40  
 Chromosome 2 : 10|30|35|45

Chromosome 10 : 15|35|35|40

Next step is to define our objective function and calculate the “fitness” of our chromosomes based on the objective function values. In our case let’s assume our objective function as following.

Objective function = Total accumulated cars / Total passed cars.----- (1)

Here the total accumulated cars are the number of cars accumulated of three lanes when one lane is opened. We want to minimize this objective function. And to do so the fitness is defined as,

Fitness =  $1 / (1 + \text{Objective function})$  .----- (2)

When objective function is minimized, the fitness will be maximized. Now using each of the 10 chromosomes in the population, fitness is calculated. Then set it aside and carry it into the next generation.

Next step is selecting the chromosome that has the highest fitness. After that the crossover phase begins. This is where new combinations are created from green times which will eventually become the best predictions. Then at the mutation process small changes to the created individual green times are added. Then the best solution will be selected at the end of the above processes.

Fig 4, shows the sample of green time prediction algorithm used in the system to calculate the optimal green time.

```
REngine.SetEnvironmentVariables();
REngine engine = REngine.GetInstance();
int[] avgCars = new int[] { lane1, lane2, lane3, lane4 };
int[] numGenerations = new int[] { 100 };
IntegerVector numGenerationsR = engine.CreateIntegerVector
(numGenerations);
IntegerVector avgCarsR = engine.CreateIntegerVector(avgCars);
engine.SetSymbol("avgCars", avgCarsR);
engine.SetSymbol("numGenerations", numGenerationsR);
engine.Evaluate("source('utils.R')");
NumericVector greenTimes = engine.Evaluate("best.soln <-
run.Genetic.Algorithm(minGreenTime, maxGreenTime,
populationSize, chromosomeSize, numGenerations, avgCars, alpha, cross
overRate, mutationRate)$best.solution").AsNumeric();
double lan1greentime = greenTimes[0];
double lan2greentime = greenTimes[1];
double lan3greentime = greenTimes[2];
double lan4greentime = greenTimes[3];
```

**Fig. 4:-** Green Time Prediction Algorithm Sample

In fig 4, as showed above the code represents the sample of the prediction algorithm which the system uses to predict the optimal green time. The C# code accesses the prediction algorithm written in R language through the Rengine function. The car counts retrieved from the object detection algorithm is passed as the parameters to the avgCars[] array, then the optimal time is calculated to minimize the traffic.

Object detection is accomplished by using C++ as the basic language and OpenCV as the image processing library. First the video file will be read and a line is created in order to detect the cars. Then each moving object is detected and whenever the object passes the above mentioned line car count for that video frame is incremented. This count is sent to the database where finally it will be used to predict the optimal green times.

#### Testing:-

The project team uses Unit testing method & Integration testing. Each member will be assigned separate sessions of testing. Generated results will be then checked for accuracy.

In unit testing the testing is subdivided into the components which the system offers. Image processing, accuracy and working functions of prediction algorithms and database connectivity of each component are separately tested before integration. After the integration of each and every component the system is then tested as a whole to see whether the system generates the accurate results. Finally, stress testing is implemented to figure out the true capacity of the system and to detect bugs.

#### Results and Discussions:-

The accuracy of the prediction algorithm is depending on several values. One is the accuracy of the car counts retrieved by the object detection algorithm. Next is how the prediction algorithm is built to generate the optimal green times.

Fig 5, shows the results of the prediction algorithm generated when the car counts are entered as parameters retrieved from the system's database.

```

**Fig. 5:-** Green Time Prediction Results

In fig 5, to generate the optimal green times the object value should be minimized. Until an optimal solution is selected the object value will be calculated up to the predefined iterations. The accuracy of the prediction algorithm

various when the maximum and minimum green times are defined. Only values between those values can be taken as answers. If there should be a green time that should be out of the range that correct value would not be taken as the green time. This was taken in order to make the system more realistic rather than trying to archive highest accuracy rate. So the accuracy rate varies from 60% to 70% percent. To check the accuracy of the system assigned green times for a particular junction is used. Based on the number of cars passed and accumulated due to the times allocated to each lane we were able to match the predicted green time versus the green times that particular junction already has. Based on the objective function to minimise the traffic each of the green times needed to be changed from the original value. This value is way off from the original green times assigned but are close to our predicted times. This method was able to calculate the system's accuracy level.

Fig 6, shows the detection of objects, in our instance the vehicles on the road. These are then counted and used for predict the optimal green times.

**Fig. 6:-** Moving Object Detection and Counting

The other feature of the system is to detect the violations. This function is also obtained by the object detection methodology. Same as detecting the vehicles, the system recognises the road lines and whenever the moving object passes the line the object is captured thus this is sent to the database as road violations.

Fig 7, shows a sample of road violation.

**Fig. 7:-** Road Violation

In fig 7, the object passes through the line which makes it a road violation and that image is captured and sent to the database as mentioned above.

### Conclusion:-

This paper describes the process of object detection and creation of prediction algorithm which provides the optimal time that can be used for a traffic light system.

There are several limitations faced throughout this system. Moving objects detection accuracy depends on the quality of the footage thus bad weather conditions create difficulties in detecting and capturing the vehicles. The memory required to process a quality image depends on the memory and the performance of the machine we are using. It is highly recommended to use a super computer or computer with high performance capabilities in order to implement and run the system without crashing or lagging off. The camera should be focused while able to detect more vehicles on the road and not taking other moving objects into the frame in order to maximize the accuracy of the system.

As future implements a feature like remote control can be added to the system. This will enable the authorized user to control the traffic light system from a remote distance based on the incidents occurred at each junction. Data mining component can be added later on when more and more data gathered through the system. This enables the user to identify traffic patterns and later use the information for other purposes.

##### Key words:-

Bureaucratic reform; Weberian model; New public management model; State civil apparatus.

#### Abstract

Since the implementation of decentralization in 1999, Bureaucratic reform has continuously become one of the main issues in the development of Indonesia, that is currently supported by the Grand Design and Roadmap for Bureaucratic Reform. However, the implementation of bureaucratic reform starting from the institutional level to national scale encounters many obstacles. One of the obstacles is the low capacity of bureaucrats who implement related policies regarding various issues such as decentralization and corruption. This study examines the 'gap' between the existing condition in Indonesia that applies the principle of Weberian model and implements New Public Management model stated by Law No. 5 Year 2014 regarding the State Civil Apparatus and what has happened in the bureaucratic reform in Japan to see how the model can be applied effectively in Indonesia.

#### Introduction:-

The governments of many developing countries, including Indonesia, are confronted with bureaucratic issues as challenges in development. As an institution, bureaucracy essentially runs the governance in the context of daily life and serves as an agent that implements the policies. It is in line with the opinion of Gina Kartasasmita (Kartasasmita, 2007) that bureaucracy is a working system, based on the system of relationship of cooperation between positions (or officials) officially (directly on the problems or the subject), formally (proper, according to relevant procedures and regulations), and impersonally (no sentiment, no emotion or favoritism, no strings attached or without prejudice).

This crucial role of bureaucracy shows the importance of bureaucratic institutions to operate effectively and efficiently and hold the principles of good governance. The implementation of those principles into the bureaucracy will encourage the changes on development paradigm related to the role of the government from the regulator and market participant to facilitator and a place to create a conducive climate for the public.

The inability of the bureaucracy to achieve such situation results in so-called bureaucratic reform, where the bureaucracy is both systematically and institutionally considered underachieved, undergoes a transformation, improvement and reinforcement in hopes that it can function properly and achieve good governance principles. Various problems that consistently occur in the bureaucracy leads to a bureaucratic reform, continuously performed since the end of the New Order in 1998.

This study examines the model of bureaucratic reform in Indonesia by using a model of bureaucratic reform at international level that has been successfully implemented to be later framed in the national framework of Indonesia.

This study begins with the first section that discusses the model of bureaucratic reform conceptually. The second section discusses the background and the situation of the bureaucracy in Indonesia that still faces the same obstacles despite having undergone bureaucratic reforms. The third section is a study of bureaucratic reform models that can be implemented in Indonesia. The fourth section is the conclusion as well as the closing of the study.

## **Concept and Model of Bureaucratic Reform:-**

### **Concept of Bureaucratic Reform:-**

Reform can be interpreted as an action of improvement for a deficiency without changing the existing institutions (Kristiadi, 2002). Institution is a system of official social behavior, as well as customs and norms that govern the behavior and its entire elements in a variety of human complexity in society. Max Weber (Weber, 1946) characterizes bureaucracy as an efficient institution run by people who are specifically trained, and view their job as a career and a division, whose jurisdiction is structured by the laws and rules, and whose duty is to implement the clear general rules in a particular field.

Bureaucratic reform can be interpreted etymologically as a change in the working system based on the relationship of cooperation between formal and impersonal positions without any damage (to change without destroying). In other words, it is to change while preserving; it is initiated by leaders in a system that is on the verge of destruction based on the awareness that the change is needed to save the system gradually and continuously (Rashid, 2001; Kartasasmita, 2007).

Bureaucratic reform is a process to improve or change the government bureaucracy towards clean (free of corruption, collusion, and nepotism), law-abiding, responsible, professional, ethical and moral bureaucracy (Kartasasmita, 2007). BintoroTjokroamidjojo also emphasizes the same idea in the concept of bureaucratic reform, as the process of improvement or change in the institutions in the governmental system towards good and clean governance (Tjokroamidjojo, 1995).

### **Model of Bureaucratic Reform:-**

The history of bureaucratic reform cannot be separated from its association with the development of economics and public administration theory. Those branches of science are specifically intended to encourage the emergence of bureaucratic models. There are three models most commonly encountered in the history of bureaucracy: 1) the model of patronage; 2) Weberian model; and 3) the model of New Public Management (NPM) (Setiawan, 2014).

The model of patronage is the most common form of bureaucracy during the reign of the monarchy, where the power of management and control of government lies in the hand of a singular person. To ensure the continuity of his power, the king/queen appoints/chooses the closest people to become 'government officials and employees' and help to manage the wheels of the royal government. Allegiance becomes the main indicator in the achievement of bureaucrats, regardless of whether the outcome is good or bad for the people and the country. The stagnation of politic and the state in this period (that triggers some major world events such as the French Revolution and War of Independence of the United States) encourage the abandonment of this bureaucratic model.

The second model is a system model of government administration formulated by Max Weber, called Weberian model, bureaucratic model or traditional model. The efficiency and productivity adopted from the patterns of industrial work of the Weberian model has similarities with the pattern of mass-industrial organizations. The model formulates that the government administration is based on written organized documents. In addition, the decision-making refers to the rules documented and based on the custom of implementation of previous activity. Weber emphasizes the importance of control over input and the decision-making process so that the documented rules allows the wheels of administration to continue to run in stable and permanent manner despite the presence of personnel transfers (Weber, 1946).

However, the model gets criticism, particularly with the advent of the era of knowledge-intensive society and economy where internet penetrates up to the governmental level, leads to the very rapid rate of communication and information. Weber Model is considered an 'obese', sluggish, ineffective and inefficient structure. Due to the design of hierarchical bureaucratic structure, commanding and concentrated in a group of bureaucratic elite, as well as

inflexible and absolute application of the rules, the Weberian model is considered unable to catch up with the dynamics of society and the market that demands rapid changes.

James Buchanan and Gordon Tullock then formulate public choice theory, using economic principles to analyze the behavior of individuals in the market and apply it to the decision-making analysis. The underlying assumption is that the individual has a self-interest motive when doing activities in the market (Buchanan and Tullock, 1962). These assumptions are applied to the model of government and produce what is known as New Public Management (NPM), namely a synthesis of various approaches such as the revitalization of neo-classical economics and new institutional economics, public choice.

There are three main characteristics in the model of NPM, namely (1) disaggregation that encourages breaking the hierarchy of the public sector to be more horizontal followed by adjustment of information, management, and leadership systems, (2) Competition between the providers of internal resources where the diversification of sources of input providers in the internal process of the organization encourages healthy competition in the bureaucratic hierarchy, and (3) remuneration scheme with the transition of the system performance to specific and remuneration-based incentive system in rewarding government officials in the bureaucracy

Market-based bureaucratic reform has some advantages: from an accounting perspective, it shapes the reform of budget transparency, and a bureaucratic organization run by the contract of employment based on performance efficiency. A disaggregated and decentralized bureaucracy allows a performance competition of inter-agency bureaucracy, and it minimizes the size of the bureaucracy yet improves the results in the provision of public services (Budd, 2007).

NPM includes many approaches, ranging from structural reform to the improvement of the accounting system. Therefore, it becomes an interesting word for the political leaders in the world. However, we should note that NPM is not a "magic sword" for government reform. It contains different and even conflicting values. When we try to adopt some measures of NPM, we have to distinguish which are adaptable and valuable for our government and which are not (Koike, 2000).

NPM model has been carried out in the various schemes of international organizations such as the policy transfer and learning of IMF, World Bank and OECD and by some developed countries such as the UK, New Zealand, USA, Canada, and Australia. Indonesia began to adopt this model since the implementation of Law No. 5 Year 2014 regarding the State Civil Apparatus.

## **The Bureaucratic Reform in Indonesia and Japan:-**

### **The Bureaucratic Reform in Indonesia:-**

The bureaucratic reform that has been implemented in Indonesia since 1999 reached a pivotal point in 2004 due to the system of decentralization and direct election of both central and local government leaders and both judicial and legislative representatives of people. The bureaucratic reform that continues to progress today refers to the Grand Design for Bureaucratic Reform, stipulated in Presidential Decree No 81 Year 2010 and Roadmap for Bureaucratic Reform stipulated in Regulation of the Minister of State Apparatus Empowerment and Bureaucratic Reform No 20 Year 2010. They confirm that all the central agencies had undergone a process of bureaucratic reform for agencies and had gradually achieved the increase of performance in 2011 in accordance with the indicators of success that have been outlined in 2014. Both documents provide strategic and operational direction on the implementation of bureaucratic reform at central and local levels.

The first stage of bureaucratic reform in Indonesia (2010-2014) shows bureaucratic improvement using bureaucratic reform model of Max Weber that emphasizes the importance of the control of input and decision-making process. Basically, this transition is a transition into a more complete Weber model since previously (New Order Era) the application is closer to the highly centralized model of patronage (royal bureaucracy) (Setiawan, 2014). In this initial period, the bureaucratic system is rearranged by eliminating aspects of the model of patronage through the preparation of main functions and duties, employment indicators and work capability assessment. The Ministry of Finance is one of the successful examples of bureaucratic reform in this first period. However, problems related to the principles of transparency, bureaucratic system stability (for example the processing time of public services) and the effectiveness and efficiency of the organizational structure ('obesity' in bureaucratic organization) are still encountered.

The bureaucracy in Indonesia still encounters existing problems, such as corruption, collusion and nepotism, not fully effective structure and function, overlapping legal rules and laws and multi-interpretations, abuse of authority, as well as the cultures and perspectives of bureaucrats that have not been in line with expectations.<sup>1</sup>In addition, Indonesian head of Ombudsman DanangGirindrawarna also states the lack of achievement of the performance of the bureaucracy of public services at the local level as well as the absence of a system of penalties for the regional heads (related to decentralization) whose performance is poor in improving the capabilities of local government bureaucracy (Girindrawardana, 2011).

Among the prevalent issues which can be regarded as the factors for such circumstances is the existing politicization of the civil service which is not conducive to the creation of public administration based on the NPM principles (Rajiani & Jumbri, 2011). The current political party system in Indonesia still maintain a strong influence over governance, not only in the executive but also in the civil service/government body itself, which on most cases render the civil service body ineffective and inefficient in terms of budget spending and its capabilities to do the job.

Another factor which arise is the prevalent culture of Javanese practices as a majority in civil service. While there are many other cultures in Indonesia, the influence of attitudes rooted in traditional Javanese practices seem particularly determinative of work attitudes especially in the public sector (Hess, 2001). This implies that non-Javanese Indonesian is demanded to behave as Javanese(Rajiani & Jumbri, 2011).

The society also views that the performance of the bureaucracy is not maximal, as generally stereotyped that Indonesian bureaucracy is slow, convoluted, progress-hindering, procedure-oriented rather than substance-oriented, and inefficient (Romli, 2008).

Criticism on the first phase of bureaucratic reform in Indonesia has become one of the motivating factors for the emergence of Law No. 5 Year 2014 regarding State Civil Apparatus, that in essence is the fundamental legal basis for the transfer of the Weberian model adopted in Indonesia into bureaucratic model of NPM. Within one year of its journey, the implementation of NPM model has started to manifest from the shift in the bureaucracy of the National Development Planning Agency (BAPPENAS) and the Ministry of Finance (Setiawan, 2014). Therefore, observing the implementation of NPM in other countries is important to predict the possibility of outcomes as well as lessons learned for Indonesia, in this case the NPM implemented in Japan as our fellow of significant economic actors in Asia.

#### **The Bureaucratic Reform in Japan:-**

Since the Meiji Restoration, the government of Japan, under the pressure of foreign countries, performs national movement to adopt Western sciences. However, domestic resistance related to the dominance of Japanese culture encourages the adoption of incomplete science. This is expressed in the term *wakonyonsai* defined as 'learning from the West yet still uphold Japanese personality' (Hori, 2004).

Japan has a tradition of "strong state" since the Meiji Era (Silverman, 1996). Although Japan changes from the old regime to the new, more democratic regime after World War II, and strong bureaucratic tradition still survives to lead the recovery of the national economy. As the result, in the 1970s, the United States and European countries had criticized Japanese market that was unfairly closed to foreign capital. In 1981, the Government established the Temporary Commission on Apparatus Utilization to "reconstruct government finances without tax increases" and to prepare for the era of "globalization."Toshio Doko, a well-known business leader, who proposed government reforms and recommending deregulation, decentralization and privatization (Wright & Sakurai, 1987), led the Commission. In 1985, one of the indebted government companies, Japanese National Railways, was privatized and split into several smaller private companies despite the presence of opposition from trade unions. Public opinion supports such idea of business-government.

While maintaining the spirit of Japan, the introduction of bureaucratic model of NPM into the government of Japan began to take place since the 1990s. This process also brought the concept of 'accountability' in the bureaucratic reform process in Japan referred to as *setsumei-sekinin*. *Setsumei* means to explain a new concept or program, particularly regarding the output and outcome of its implementation while the connotative meaning of *Sekinin* is

---

<sup>1</sup>The Government of the Republic of Indonesia(2013). Bureaucratic Reform in Indonesia.*APEC Policy Discussion on Bureaucratic Reform* (pp. 1-9). Medan: APEC

accountability. Thus, for Japanese bureaucrats, accountability incorporates elements of being accountable not only for output but also for the outcome of the bureaucracy (Hori, August 2002).

In the late 1990s, reformist Prime Minister Ryutaro Hashimoto formed the Administrative Reform Council, which then adopted the ideas of NPM bureaucratic model and implemented several measures to reform the bureaucracy in Japan (Hori, 2004) by way of:

First, establishing Cabinet Offices. The new Cabinet Office was the staff organization for the Prime Minister. This office coordinated the government policy under the direction of the Prime Minister. Some institutions and independent bodies (Defense Agency, Finance Agency, National Safety Commission, etc.) were transferred to the jurisdiction of the Cabinet Office.

Second, reorganizing the ministries and national agencies. The reorganization of central government agencies was the highest priority of Hashimoto's Government. Under the direction of the Prime Minister, the Council of Reform planned to reduce the number of central ministries and agencies by half. The reduction would be achieved primarily through the annexation of ministries and agencies. In addition, the government also decided to privatize the Ministry of Posts and Telecommunications in 2003.

Third, transforming national bodies into a form of independent administrative cooperation. The Government of Japan transferred 80 government agencies to Independent Administrative Corporation (IAC). This list includes money printing, national hospital, national museum and national laboratory. In IAC, the head of the institution prepared the medium-term performance plan and managed the budget provided by the government. The status of the employees was divided into two categories: public officials and non-public officials. The main objective of the implementation of this policy was to separate the functions of policy formation and policy implementation in the agencies and to improve the quality and efficiency of public services by giving autonomy and responsibility for government agencies.

Fourth, appointing vice-ministers in each ministry. To strengthen the political leadership in the ministry (to avoid the monopoly of political party influence in the ministry), the government introduced the vice-ministers in each ministry of Cabinet to assist ministers. twenty-two vice-ministers would be assigned to ministries in Cabinet. In addition, the government created 26 "parliament helpers" tasked specifically in the policy formulation and ministerial planning under the direction of the minister.

Fifth, conducting decentralization. According to the recommendation of the Committee for the Promotion of Decentralization, the government revised related laws to decentralize centered authority and strengthened stronger local autonomy.

Sixth, reforming public services. In 1999, the Administrative Reform Council submitted a report to reform the national civil service system. The Council proposed reform agenda as follows: revision of the admission-examination system; introduction of remuneration principle; establishment of ethics; extension of retirement; etc. Though it looks ideal, the reform of the civil service system was not fully implemented yet in Japan (Hori, 2004).

During his governance, Hashimoto also triggered Law of Evaluation of Government Policy in 2002, requiring every government agency to be evaluated in two stages by an independent third party (Yamamoto, 2003).

#### **Lesson Learned from Bureaucratic Reform in Japan for Indonesia:-**

Bureaucratic reform with NPM models that Japan has applied in the last decade of the 1990s for nearly 20 years should be a lesson learned for the new Indonesian bureaucratic reform implemented through ASN Law of 2014. From six measures of bureaucracy in Japan, almost half of them have been implemented in Indonesia such as the president's office, decentralization, appointment of vice-ministers, as well as the reorganization of ministries and government agencies. Reform of the civil state apparatus then focuses on other important matters, namely reform of public service and the transformation of national agencies as well as the strengthening of the previous implementation.

One thing that cannot be eliminated from the process of bureaucratic reform in Japan is the principle *wakonyonsai* that carries cultural values of Japan in the bureaucratic reform. In Indonesia, it is currently being encouraged by

President Joko Widodo through Mental Revolution slogan. The motto is basically not a new one, given what is emphasized is a revolution or transfer from mental corruption, collusion and nepotism to the work ethic based on the people that is contained in existing Indonesian cultural values. In addition, integrating the values of Indonesian noble culture into the government bureaucratic system opens the opportunity for adoption of NPM that is more grounded on national character.

With this framework, the model of bureaucratic reform in Indonesia toward the model of NPM by ASN Law of 2014 needs to include elements of democracy compared to the total result oriented that is carried by model of businesses-based NPM, such as what Japan applies by integrating models of NPM with the framework of *wakon yonsai*. The success of Japanese bureaucracy in reforming the system may be the most obvious example for Indonesia: NPM model of bureaucratic reform based on cultural values.

However, another lesson of bureaucratic reform implemented by Japan is the failure of Japan in shaping a transparent democratic element and accountability in the wheels of governance, particularly the bureaucracy. *Setsumei-sekinin* views accountability as a self-evaluation to exclude the public's role in the evaluation process although transparently conducted. To cope with that, Japan implements a two-stage evaluation by a transparent third party. This lesson must be applied by Indonesia in the executed bureaucratic reform process, so that the evaluation of government policies can be more transparent and accountable. The two-stage evaluation of public policies encourages continuous policy improvement and the public constantly monitors it not only in the end of the governance.

Democracy in question means re-integrating the balanced role of the government with NPM's business orientation through ASN Law. The balance of role between the principles of democracy (the government) with business principles can be achieved, for examples, by establishing a framework constructed by the government in collaboration with the private sector for the public services, or re-negotiating the existing cooperation, as described by Kudo (Kudo, 2015):

However, after a decade of outsourcing to private and social sectors experiences, some local governments are starting to distance themselves from the NPM-driven managerial style. After evaluating performance and considering consumer satisfaction, some decided not to renew contracts to the private sector, but to bring the service back into the hands of public administration, or to introduce new forms of collaboration between public and private sectors, mainly based on proposals from the private sector. There is evidence that some local governments have already shifted from NPM-driven management to post NPM or New Public Governance (NPG) orientation, while there is no domestic literature on NPG. In terms of practice, especially in case of childcare and elderly care, some local governments began to re-hire experts in order to develop internal personnel as managers and policy makers in the future.

A shift toward newer approach of NPM-based civil service which balancing the influence of government role and business-minded system should be considered by Indonesian officials with the implementation of Civil Service Apparatus Law of 2014 and beyond. Integrating the populist norm of "*gotong-royong*" and "*musyawarah*" into the already-implemented business model of NPM should be considered because of several factors.

**First, Indonesia still has high level of Uncertainty Avoidance (UA) as argued by Rajiani & Jumbri:-**

*People in low UA cultures are less structured in their activities and enjoy risk-taking, and such societies experience higher labor turnover and have more ambitious personnel. Employees are encouraged to use their own initiative, assume responsibility for their actions, and exercise greater discretion in decision-making (Hodgetts et al., 2006). This militates against the reforms initiated under NPM that aim to broaden managerial discretion and innovation in the interests of achieving substantive results. In terms of a propensity for corruption, high UA cultures are characterized by relationships of dependency and power. The uncertainty associated with such dependency can lead to corrupt, wealth-creating behavior in an effort to relieve the uncertainty (Rajiani & Jumbri, 2011).*

Countries with high level of UA, which can be seen in Indonesia, will face challenging obstacles as a threat and totally depends on superiors, that is, decision makers to solve and lead the civil service sector. It does not encourage initiative and risk-taking, and centrally-distributed power will affect the effectiveness and swiftness of civil service in tackling unexpected problems.

*Second*, Indonesia still has high level of Power Distance (PD) which is understood as how far subordinates in governmental organizations and institutions accept and expect that power within the said institution is unequally distributed. Countries with high level of PD are more prone to subordinates obeying superiors without question. This practices, coupled with the prevalent cultures in civil service is another issue to tackle with the implementation of Civil Service Apparatus Law of 2014 since it is incompatible with the business model of NPM introduced by the law.

Japan's experience shows that after implementing NPM for some time, the Government of Japan re-emphasized the balanced role of the government so that the implementation of public services in some different areas in Japan are based on the combination of business principles and local wisdom. This experience can be used as a study for Indonesia in the development of the two-year-old model of bureaucratic reform through ASN Law so that the process of bureaucratic reform in Indonesia does not have to go through a phase of trial and error as it happened in Japan. The strengthening of ASN Law using NPM model needs to be conducted, particularly by reflecting on the recent studies such as the post-NPM or New Public Governance (NPG), given that the NPM model has already undergone various developments since two decades ago.

A democracy-based effort of strengthening that can be carried out is to involve the citizens of Indonesia into the process of public service (citizen participation), particularly based on the decentralization of public services. The concept starts to emerge in Indonesia with the so-called smart city concepts such as Bandung and Surabaya. The active participation of the people in the public service is not only in terms of feedback on public services but also as a sub-provider for public services (such as cooperation between the government and various communities in Bandung in the construction of Green Open Space/RTH). ASN Law as the basis of the model of bureaucratic reform will be greatly assisted by the even distribution of this concept in Indonesia, such as carried by Japan through The Japan Center for Cities (Nakamura, 2013), as a study center of town-based development to support the national effort of decentralization of public services. This decentralization is one of the main strategies of NPM model, as stated by Nakamura:

In case of decentralisation policy, it is a typical NPM strategy, in which traditional values like “territory” are strongly concerned, while many stakeholders are involved in crucial decision making. The Japanese merger experiences confirm the international literature on public governance and public service delivery, thus confirming to be an example of public governance driven reform process.

Lately, the local governments in various regions in Japan encourage the institutionalization of public participation in local governance. In general, this encouragement arises because of supportive relationship between the principles of market-based bureaucratic reform of NPM with public participation (democracy), as stated by Nakamura:

*Statistical analysis shows that the population and monetary resources of citizens enlarge the demand for participation and encourage institutionalization. It is also shown that the independent and LDP councilors, traditional and alternative routes through which citizens transfer their requests to the public administration, affect the degree of institutionalization of participation (Nakamura, 2013).*

This opinion strengthens the argument that the monetary resources and the population will increase along with the increase of public participation in public services. This is primarily due to a sense of belonging within the society itself in the public services because of its involvement. This sentiment encourages additional resources, both monetary and human resources, coming from the society itself outside APBN/APBD and Civil Servants. In addition to ease the burden of the government, the addition allows the allocation of additional resources for other public purposes.

The second problem that emerges and can be used as a reference is how the administration of Japan experiences an internal resistance, in which the NPM has difficulties in obtaining internal legitimacy than the external legitimacy. One form of this resistance is shown when Yokohama City implements the "Yokohama Revival Plan," that gets skepticism and rejection from bureaucratic internal of the city government, particularly by the seniors (Yorozu, 2014):

*"I have gained the impression from inside the workplace that older staff are allergic to the term 'restructuring.' What is the measure of the success for the 'Yokohama Revival Plan'? To be honest, we have not shared the purpose of that plan though we are familiar with that popular term. There is a gap between the term and actual works.*

*Every time he uses the term, 'reform,' I feel heavy. I think the advances we try to make through daily work are 'reforms.' I do not feel that we need to change. The term, 'reform' has not mentioned what we need to do or change. It is a vague term."*

This view shows that the resistance of the bureaucratic internal is primarily caused by changes in work culture, inequality of vision and understanding, where the younger internal is more accepting to these changes. It is also often found in the effort of bureaucratic reform in Indonesia through ASN Law where a work culture that has been institutionalized for decades changes afterward, leading to resistance at various levels (Haryanto, 2014)

The problems faced by the Government of Japan in implementing bureaucratic reform of NPM model adapted to local values is said to be a common problem that occurs in the process of bureaucratic reform. Indonesia is also experiencing similar problem, particularly the presence of internal resistance associated with the reform of public services and public's lack of understanding in running a new public service model. Internal resistance in Indonesia is mainly related to the number of government organizations that is ultimately resulted in a high number of bureaucrats. The Former Minister of State Apparatus Empowerment and Bureaucratic Reform, Azwar Abubakar, states that:<sup>2</sup>

*Currently, HR of Indonesian state apparatus (Civil Servants) amounts to 4,362,805 people (data BKN per December 2013) consisting of 3,471,296 Regional Civil Servants and 891,509 Central Civil Servants. The main problem of HR of state apparatus is the allocation in terms of quantity, quality, and unbalanced distribution of civil servants by the territorial (regional), and low level of productivity of Civil Servants. The management of human resources has not been implemented optimally to improve the professionalism, employee's performance, and organization.*

According to Azwar Abubakar, this condition embodies the values and the old system that has not completely eroded, such as poorly-managed government management, the culture of corruption, collusion and nepotism (KKN), the ineffective and inefficient quantity-based rather than quality-based recruitment process, as well as the unbalanced distribution of civil servants by territorial (regional). The similarity of problems from the bureaucratic reform in Japan should be the lesson that can be learned to be integrated into the model of bureaucratic reform in Indonesia, particularly to improve Indonesia's competitiveness in the global competition.

Both lessons that can be learned from the implementation of the bureaucratic reform of the public service in Japan show a transition from a model of NPM oriented towards pure business principles into NPM that combines elements of business and local values. According to some experts, this transition is because the model of NPM as a basis of public service emphasizes more on the viewpoint of private sector management techniques in the public sector, so that public participation and democratic decision-making process are marred. Characteristics of the accountability of the public service have changed from the early period of NPM model is introduced. Today, the audit and social control by the society become necessary in the process of public service (Osborne & Ball, 2010).

Some studies show that the focus of the NPM model towards the measurement of business-based performance and monitoring & evaluation (M&E) encourages the strengthening of short-term political interests. However, it can be risky in the long-term ones so that it is not strategic and planned. Moreover, the threat of mismanagement by implementing the principles of NPM purely is proven by the collapse of the Local Government of Yubari, Hokkaido in 2007

### Conclusion:-

Japan's success in reforming its bureaucracy since the 1990s should be a motivation for Indonesia as a fellow of strong-economic country in Asia. With almost similar span of time and condition (1945 and equally harmed by the war), Indonesia should be able to catch up. The adoption of NPM through ASN Law of 2014 opens such opportunity, and as previously noted, Indonesia can integrate cultural values more quickly into this process given the fact that the bureaucratic reform of NPM model has been running for a year. The lessons given by Japan through the adoption of NPM model for bureaucratic reform by integrating *setsumeiki-sekinin* and *wakon yonsai* values should be a boost for Indonesia who similarly owns different cultures from the NPM of Western World.

Indonesia also needs to thread carefully in implementing the business-centered NPM model because Japan's experience shows that it does not fully compatible with our norms and culture thus leading Japan to implement a mixed approach of re-introducing the government role in public service.

Another issue to tackle is the existing norms which is still embedded in the civil service practice that is the lack of certainty and distant power distribution. These problems also arose in Japan and hampered Japan's government to fully implement the NPM. Unless Indonesian government address the prevalent issues of uncertainty avoidance and power distance which hamper the bureaucratic reformation process, the civil service sector cannot and will not achieve high level of effectiveness as previously planned.

The combination of democratic local values in Indonesia with NPM-style business management principles should be conducted by Indonesia immediately, reflecting on the implementation of NPM in Japan. This is to avoid a setback in the bureaucratic reform in Indonesia based on the ASN Law. Thus, there is a need to strengthen ASN Law based on the combination of these two values so that the bureaucratic reform that has been running in Indonesia can be implemented faster than previous countries.

#### Abstract

Unwed Motherhood is emerging as a serious concern in our society where women are sexually exploited and literally left on the streets in a state of unwed pregnancy. The issue of unwed mothers is generating devastation in the conventional Odia society. Odisha is a small culturally rich state of India having 30 districts and many famous tribes like Bonda, Bhumias, Kondhas, Santals, Sauras etc. Although Odisha has witnessed many positive changes resulting in development and growth an increased rate in crime and discriminatory behavior is observed towards its female citizens that is causing great unrest in the state. One such crime is the issue of unwed motherhood within the state especially in tribal areas. But as certain issues are more accepted in tribal areas like unwed motherhood or female headed households and their society has a matrilineal structure rather than a patriarchal one. But the above mentioned facts do not ensure egalitarian towards the tribal women. The notion that tribal women are less discriminated than their rural and urban counterparts is partly true as their society or community is more tolerant but a tribal woman is more discriminated in any given state or nation. Women in Odisha be it tribal women in particular or women in general have been facing discriminatory behavior in all aspects of life especially violence. And recently acts of violence against women have multiplied and are worryingly on the rise. One such issue that stems many times out of violence is unwed motherhood. This issue is plaguing the young female citizens in Odisha and is alarmingly on the rise.

*Copy Right, IJAR, 2016., All rights reserved.*

Odisha has an extraordinary figure of young unwed mothers between the age of 13 to 30. These girls are easy targets for further exploitation as they are not accepted by the society and nor their families and are used for trafficking due to which many women are unaccounted for. This issue is further intensified in Odisha by frequently occurring Natural disasters making many people destitute and increasing their vulnerability. Experts believe there are 40,000 unwed mothers in Odisha, 70% belonging to the tribal areas of Odisha. "Poverty" coupled with ignorance and innocence compound the problem of unwed mothers in tribal Odisha. The unwed mothers are treated as outcasts rejected by the society and are often viewed as prostitutes and even criminals.

A woman loses her dignity, pride and even her most basic human rights when she conceives a child without marriage. A woman usually faces all the problems of pregnancy even though making a child is a two way act the woman is left to take the burn if the child she is carrying is illegitimate, here the norms and culture of our society is

eagerly sought after where reserving sex for marriage is seen in almost a scientific light solving many problems like sexually transmitted diseases, abortions and children out of wedlock. The women who are raped and sexually abused are left by themselves on the streets once they are discovered to be pregnant. The issue of unwed mothers is perhaps the most unforgivable crime against women. In the third world countries where illiteracy, poverty, poor health and backwardness have a major influence on the populace the ostracism that the unwed mothers attain is quite a phenomenon in determining the status of women in the society. Here not only a woman is mauled for life but her innocent child faces stigma throughout his/her life.

From my research it was revealed that unwed mothers usually belong to lower caste families as out of 200 respondent's majority of them belonged to schedule caste, schedule tribe and other backward classes. ((34.5 per cent) belonged to the Schedule Tribe and (31.5 per cent) belonged to Schedule Caste whereas only 18.5 per cent of them belong to General Category and 15.5 per cent of them belong to the Other Backward Classes.)) Low levels of awareness along with low literacy level were found to be major causes behind the number of unwed mothers among the SC and ST community. Unwed mothers enjoy relatively a better status in tribal societies than in non-tribal ones". This is because tribal society is matriarchal society where bride price system is observed instead of dowry system. Equality of opportunity, equal right, and equal pay for equal work are some of the practices which differentiate the status of tribal women from non-tribal women.

'Poverty' is one of the major factors behind unwed motherhood. Unwed mothers usually come from poor families as 84 per cent of them belonged to the lower income group. This shows that high level of awareness, high literacy rate are some of the reasons for absence of unwed motherhood problem among rich or affluent class or society. It was seen that unwed motherhood usually results from women falling prey to 'false promise to marry' (out of 200 respondents 68% victims of false promise to marry). In such cases, the women very easily succumb to the interest of the man primarily because of the fear of betrayal. The knowledge of contraception and the outcome of unsafe sex were found to be staggeringly low, deliberately ignored or due to unavailability of any such measures. And once discovered to be pregnant their partners assures them of marriage but disappears and the woman is left behind to answer the questions or more often the man responsible denies to the father. These victims are vulnerable to several kinds of exploitation. They are treated as commodities.

This becomes one of the factors responsible for trafficking in women as in many cases the accused tried to sell the victim to some brothels or labour contractors. But false promise to marry is not the sole reason of unwed motherhood. This is evident from the study as many of them (32.9 per cent) were victims of rape and in many cases rape by their relatives. In such type of case the abuser is known to the victim, they are members of the family or its inner circle. Most middle class Indians grow up in large extended families, open households where family and friends come and go thus the accused in such cases are known. The inquiry into domestic violence especially sexual abuse was one of the most complex, controversial challenges to investigate. As the dominance of sexual abuse at the domestic level is rampant. The prevalence of incest is strongly felt in India and is also evident in Odisha. Incestuous conduct is almost never consensual. Instead, it is rooted in physical force as well as familiar and other power which the abuser uses to pressure his victim. This is a terrible truth hidden in our society that we do not discuss let alone own up to. The cases of unwed mothers as a result of incest were very visible in my study. Many times these accused go unpunished as the victims face denial and they are not believed by other family members. These rapes, unless the news becomes public due to unavoidable reasons, are never reported. It is found that the highest numbers of respondents from the rape cases were victims within the family and by the relatives. This shows the growing number of domestic violence in our state.

Women are not safe from physical abuse and torture even within the blood ties and the four walls of her home. Rape or sexual harassment at work place is also seen as a factor responsible for unwed motherhood. Unemployment is rampant these days so to retain a job has become very tough especially in the unorganized sector and it was found that, out of 200 respondents 4.7% were unwed mothers due to rape at work place. In a case study in Kalahandi a 16 year old girl who worked as a daily wage labourer was the victim of rape by the contractor who control these daily wage labourers and took them to distance places to work, the girls who go without any family members are the main targets for sexual assault by these contractors and other daily wage labourers. 25 per cent of unwed mothers' were victimized by strangers, these strangers were mostly found to be migrant workers. Migrant workers are becoming a major threat to the local young women and girls especially at grass root level. The level of awareness to different governmental policies and programmes and institutions for the women in general and destitute women in particular was found to be very low among the respondents as the ICDS programme is the oldest welfare programme for

women. But a large majority of respondents (84 per cent) are not yet aware of this. The Government of India has enacted a number of laws for women's liberty, rights, equality and development, but the respondents were not aware of a number of such laws like the protection of women from Domestic Violence Act". Only 12.5 per cent are aware of this Act and 87.5 per cent are not so. This shows that the government should take extra care to spread awareness about this problem because it is growing very rapidly. The study shows that rural and tribal women usually face the severity of the problem of unwed motherhood. This problem is magnified by poverty, ignorance, social stigma which forces these women towards humiliation which act as a hindrance in the path of their development. These women rarely become members of social, political and professional organizations due to the rigidity of our society in dealing with this problem. The unwed mothers are treated like out casts even their basic human rights are denied by the society, they were not accepted by the women of the same locality with the fear of polluting the public places hence are not allowed to the public places like ponds, river Ghats ect and they were not accepted easily even as an employee. Thus a large number of the respondents (43.2 percent) said that they were driven out of the job immediately after their unwed mother status was disclosed.

The futures of those children who remain with the unwed mothers are a source of primary concern, and attention needs to be given towards their welfare. It is seen that 57 percent of the respondents expressed the desire to put the child up for adoption. Some of the aspects that compel a mother to put her child up for adoption were the negative attitude of the society regarding the identity of the child's father, the possibility of marriage of the victims, financial crunch in raising the child etc. It is seen that 19 percent unwed mothers even blame the child for their present fate; this response especially noted among some of the mentally challenged women. Whereas 12 percent of the respondents wanted to keep the child as a proof of the relationship with the person involved.

### **Suggestions:-**

From the above study two major factors come into focus: the first one to eradicate this problem and the second one is if cases of unwed mothers are found care should be taken to improve not only their life but also the life of their children. From the present study certain suggestions have come into perspective i.e., all efforts should be made to identify and get the accused, and implement stringent laws and strict punishment along with financial penalty. Awareness campaign regarding welfare and legal measure should be given top priority and there should be women police station or Mahila desk in all the villages, special emphasis should be on awareness regarding safety measures like use of contraception, risks factors HIV/AIDs, and Sexually transmitted diseases etc should be imparted.

The society needs to be more sensitized about the problem of unwed mothers, the society should adopt measures to avoid domestic violence, mothers of the young girl along with their daughter should be made aware of the problems and how to protect themselves from such type of crime.

A major problem that cannot be ignored is poverty, thus more number of SHGs and microfinance scheme should be made available to rural women to empower them economically. Land rights to women should be given so that they could have a share on the labour they put in. The welfare schemes like Short Stay Homes and Swadhar Shelter homes for destitute should be available in rural and tribal areas so as to give these victims immediate relief instead of only being available at urban areas. Special attention needs to be given to rehabilitate them within the time span allotted to these homes. And special attention needs to be given to the children who live with these unwed mothers.

Print and electronic media should be active in the rural and tribal areas to spread the message of safe sex and knowledge regarding the risks involved in unprotected sex through pamphlets, showing documentaries on the life of unwed mothers and the life of their innocent children in schools and colleges.

These measures will in still in the youth greater sense of awareness and responsibility. As false promise to marry is one of the most common causes of unwed motherhood women must be educated against this act.

The severe laws and punishments for this crime should be highlighted. And most importantly the DNA test should be made available for such victims and not only to special cases.

Women's commission role should be highlighted and a women cell of representing the Commission should be established in every nook and corner.

Voluntary organizations should actively spread awareness regarding different welfare schemes and developmental programme in the rural areas. They should also identify unwed mothers and try to give them justice with the help of the police. They should provide training programmes to make these women economically independent.

Government hospitals, bus stands and railway stations are the areas where the unwed mothers are generally found. Thus “help desk” should be established in these areas.

It is imperative to initiate these steps not only to improve the conditions of unwed mothers in the state but to eradicate and prevent this problem from taking a strong hold in our society.

#### Abstract

One hundred spring wheat genotypes/ germplasm (*Triticum aestivum* L.) lines related to Indian, CIMMYT, and Chinese were evaluated for spot blotch tolerance against natural epiphytotic conditions, caused by *Bipolaris sorokiniana* at hot spot locations Coochbehar, Kalyani and Karnal (Polyhouse), India Out of 100 screened entries 20 number of genotype showed Highly resistant or Immune to the disease, where as 28 genotype were resistant, 22 genotypes moderately resistant, 15 moderately susceptible and 15 genotypes susceptible. Indian germplasm lines tended to be more susceptible compression to lines originated from CIMMYT and China. Chirya-1, chirya-3, chirya-7, Yangmai#6 and Mayoor, HRLSN lines from CIMMYT and LBRL lines from India showed high degree of resistance to the disease both under field and polyhouse conditions. On the basis of the disease severity under artificial epiphytotic polyhouse conditions, 20 promising lines were find highly resistant in field natural conditions for their genetic analysis & potential for spot blotch breeding. These lines can be used hybridization programmes and since they have different parental background, it will help in diversification of gene pool. Some of these also have better potential for high yield and adaptation.

#### Introduction:-

Wheat (*Triticum aestivum* L.) is the largest grown and second prominent produced cereal crops worldwide after maize (*Zea mays* L.) with 697.9 million tones every year (Velu and Singh, 2013). Global food production might be increase at least 70% by 2050 when global population may likely to reach 9 billion. In India, wheat production and productivity was 95.6 million tonnes respectively, in 2013-14 which reveal decline tend to comparison year. with previous years Several biotic and biotic stresses such as spot blotch, rust, terminal heat stress and drought stress have adverse impact on wheat productivity in eastern regions of south Asia especially in the eastern gangetic plains of India (Joshi *et al.*, 2007) It's a challenge for us, increasing production and productivity, enhanced level of multiple disease resistance in future genotypes will be very essential. Spot blotch, which is caused by the hemi-biotrophic fungal pathogen *Bipolaris sorokiniana* (Sacc.) Shoem sun. *Drechslera sorokiniana* (Sacc) Subrm and jain (syn. *Helminthosporium sativum*, telomprph Cochliobolus sativus), (Chowdhary *et al.*, 2013), has emerged as a major production constraint in the eastern part of India and south Asia's intensive cropping system (Chatrath *et al.*, 2007; Joshi *et al.*, 2007a). Green revolution played a key role in ensuring food security in this population dense

region of the world, which mainly comprises of India, Pakistan, Nepal and Bangladesh. Yield losses are significant, and depend on genotype, time of occurrence and severity of the disease, Sowing time, location and stress conditions. Saari (1998) reported that the average yield losses due to leaf blight in the Indian sub continent were as much as 17.5%. They are estimated to average 15-20 % but can be reach 40 to 70% in susceptible genotypes. Satvinder *et al.*, (2002) observed the yield losses ranged from 27% to 56.6% during 1998-99 in north eastern and north western plains of India, losses were estimated up to 15% on several farms over a number of years in Bangladesh (Alam *et al.*, 1994), 23.8% yield loss In Nepal the (Shrestha *et al.*, 1997). Yield losses between 20 and 52% have been reported on susceptible cultivars of south Asia (Sharma and Duveillar 2004). The disease becomes severe during the grain filling stage and causes significantly yield losses and grain quality deterioration in susceptible varieties. *B. sorokiniana* usually induces symptoms on leaves, sheath and stem (Chand *et al.*, 2003). However, under severe conditions it also infects spikelet's resulting in shriveled grains with black point at the embryo end of kernels. Although spot blotch has assumed a status of number one disease in the warmer parts of eastern India, More recently it has been expanded into the cooler, traditional irrigated rice-wheat production areas (Singh *et al.*, 2008, Singh R and Singh VN 2007). It is generally believed that the level of resistance in high-yielding wheat genotypes is still unsatisfactory and needs to be improved significantly in warmer and humid regions of south Asia (Sharma and Duveillar 2006). Resistance to spot blotch in wheat behaves like a Quantitative trait (Joshi *et al.*, 2004b), but until recently little has been known about its genetics and observed that wheat genotypes expressing leaf tip necrosis (LTN) in general showed less spot blotch symptoms and demonstrated a genetic association between this phenotypic marker and spot blotch resistance in a segregating population. Quantitative trait loci (QTLs) for resistance have recently been mapped in the resistance sources 'Yangmai#6' (Kumar *et al.*, 2009), 'Ning 8201' and 'Chirya-3' (Kumar *et al.*, 2010).

In the past 10 years, efforts have been made to identify spot blotch resistant wheat genotypes derived from new resistance source such as synthetic wheat, including *Thinopyrum curvifolium* and *Aegilops tauschii* derivatives (Sharma *et al.*, 2004a). Despite the realization of spot blotch as an important disease of wheat, the progress in breeding for resistance against this disease has not been satisfactory. One of the reasons for this slow progress is the lack of proper knowledge about the variability in the isolates of *B. Sorokiniana*. *Phenotyping and genotyping study on spot blotch disease is already done and in progress at Indian Institute of Wheat and Barley Research, Karnal, Haryana (India)* (Virender Singh *et al.*, 2012, Ashish Ojha *et al.*, 2012, Virender *et al.*, 2015) Therefore, there is a urgent need to exploit the existing genetic variability in wheat for evolving high yielding varieties that have wide adoptability and are highly productive under a changing climatic scenario. Hence present study is concerned to identify disease resistant donor parents for their utilization in wheat breeding and controlling the disease & ultimately provides the cheapest and easiest way of increasing the productivity.

## **Material and Methods:-**

### **Plant Materials and field evolution:-**

The study material comprised 100 (One hundred) Varieties, Genotypes/ germplasm or cultivars which have diverse genetic background and origin. Mostly wheat genotypes exotic to south Asia/Cimmyt and India were included in this study, because these genotypes were specially used as parents for improving spot blotch resistance. All genotype were evaluated during *rabi* season, wheat growing season (December to April) 2011, 2012 and 2013 under field and polyhouse at Indian Institute of Wheat and Barley Research, Karnal, Haryana and Coochbehar (West Bengal), which are identified as a hot spot for the spot blotch disease. The experimental Material was laid out following a randomized complete block design. Each line was sown in single row of 2 mt under polyhouse and row to row and plant to plant distance was 25 cm and 5 cm, respectively.

### **Creation of artificial epiphytotic conditions in the field:-**

To promote disease build up and spread, mixture of highly susceptible genotypes was planted as a border row after 15 lines. To provide maximum disease chance of disease spread during flowering time, late sown was done. The standard agronomic practices were followed while epiphytotic condition was created in the field. Although, Coochbehar and Karnal is a good hot spot for spot blotch of wheat, experimental materials were also provided additional inoculums artificially. A pure culture of Coochbehar isolates (most aggressive isolate) of *B. sorokiniana* was multiplied on sorghum grains and the spore were harvested in water. A spore suspension adjusted to approximately  $10^4$  spores/ml of water was uniformly sprayed at three different growth states (GS), viz., tillering (GS20), flag leaf emergence (GS37) and anthesis (GS65) during evening hours. The field was irrigated immediately after inoculation and total five to six irrigations were given in the entire crop period to provide a favorable environment for the development of spot blotch disease. The first irrigation was given 21 days after sowing.

**Under polyhouse conditions:-**

Out of the 100 genotypes only 20 genotypes which showed field resistance, were used for under polyhouse conditions mechanically inoculated by using hand atomizer under polyhouse conditions at Directorate of Wheat Research, Karnal during *rabi* season 2001, 2012 & 2013. (Table-2) Each genotype was also characterized under artificial inoculation. Each genotype sown by hill planting method consisted 3-5 seeds/hill. A pure culture of Coochbehar isolates of *B. sorokiniana* was multiplied on sorghum grains, and spores were harvested in water. A spore suspension of 50,000 spores/ ml was uniformly sprayed at the four to five leaf stage followed by a second spray after a week to build up sufficient disease pressure.

**Disease Assessment:-**

Assessment of Disease severity (%) was done using double digit scale (DD, 00-99), displayed by all the leaves of each row was recorded at three different growth stages(GS), viz., GS63 (beginning of Anthesis to half complete), GS 69 (Anthesis complete) and GS 77 (late milking). The area under disease progress curve (AUDPC) based on disease severity (GS63, GS 69 and GS77) over time was estimated using the following formula (Roelfs *et al.*, 1992)

**Result and Discussion:-**

One hundred wheat genotypes screened against native isolate of *B. sorokiniana* at the Directorate of Wheat Research, Karnal location on field and polyhouse showed different reactions, indicating that the genetic variability / variations for response to leaf blight among the entries scored at both environments as shown by disease score. Since high spot blotch score occurred in the experimental field and polyhouse, as shown by disease score of 89 (Sonalika and HD 2329) and 79 (HUW 234 and Raj 4015), indicating that the season and environments were compatible for disease screening and there would be low chance to susceptible genotypes to score as resistant lines. Out of these one hundred lines with 4 checks (Highly Susceptible lines) screened for resistance to leaf blight none of them were found totally immune or disease free. Out of total entries tested, 20 were highly resistant, 28 resistant, 22 moderately resistant, 15 moderately susceptible and 15 Susceptible lines (Table-1). Out of the 20 highly resistant lines category, 11 were CIMMYT lines, 05 Indigenous genetic stocks 04 Chinese lines, 01 other and 04 released Indian variety were used for as checks. The exotic lines comprised bred wheat and synthetic wheat lines from CIMMYT and China. The CIMMYT lines were Yangmai #6, Mayoor, HRLSN-2, and 9, 13, 14, 15, 16, 22, 23 and HRLSN 24. The Chinese lines, Chirya-1, 3 and 7 also showed resistance < 13 or 13 score. In addition of these exotic lines, 07 Indigenous genetic stocks LBRL-1, 6,12,13 and LBRL-14 lines which were established genetic stocks of NEPZ and NWPZ parts of India were also identified as highly resistant. All the 04 checks, Sonalika, HUW 234, Raj 4105 and HD 2329 were showed highly susceptible with > 79 and 89 score. Three *Thinopyrum curvifolium* derivatives Chirya-3, Chirya-7 and Mayoor recorded the lowest mean disease 12 score. These lines originate from CIMMYT, Mexico and have introduced in India in 1996. Yangmai#6 line originated from Cimmyt and Indigenous genetic stocks LBRL-1, 6, 12, 13 and LBRL14 also have a lower mean score 12 under artificial epiphytotic polyhouse conditions. These all 20 lines in field natural conditions, showed highly resistant or immune with disease score (00-03) for spot blotch.(Table-3) The distinct resistance in these lines identified here can be used as valuable source in wheat breeding for spot blotch infected areas in India and other countries. Most of the entries classified as resistant had score ranging 13 to 25(28 lines). As the disease progressed from the bottom to the top of the plant, the disease area on the leaf below the flag leaf (F-1) was greater than that of on the flag leaf. There were distinct differences between the lines characterized as resistant with a score between 00-12 and 13-23/25 and moderately resistant and moderately susceptible with the score of 36 to 45 and 56 to 68, susceptible and highly susceptible with the score of 78 to 89 and up to score 89. Twenty most resistant with four most susceptible lines (used as a Check) were selected for genetic analysis to characterize genotypic variations for resistance to spot blotch under artificial epiphytotic conditions created in polyhouse during same *rabi* season. The spot blotch reactions of the selected lines were category under polyhouse conditions as compared to field natural conditions (Table-2). Earlier Chaurasia *et al.*, (1999) had reported that of 1387 wheat lines screened between 1994 and 1997, at spot blotch hot spot location and find most of the resistant lines were represented by CIMMYT materials. Low to moderate level of resistance to spot blotch in international wheat germplasm was reported by Dubin *et al.*, (1998). Recently, Singh *et al.*, (2014) reported a set of recombinant inbred lines were screened for spot blotch disease under natural and artificial epiphytotic polyhouse condition at three hot spot locations in India and find some resistant lines.

**Table 1:-** Categorization of 100 germplasm line of wheat to their disease response to spot blotch caused by B. Sorokiniana during *rabi* season 2011-12, 2012-13 to 2013-14

Category	Double digit score	No of lines	Range of leaf area blighted (%)	
			Flag leaf Min-Max.	Flag-1 leaf Min to Max
Highly resistant (HR)	< 12	20	00	0-05
Resistant (R)	13-25	28	05-10	10-20
Moderately resistant (MR)	36-45	22	10-30	21-40
Moderately Susceptible (MS)	56-68	15	21-50	41-60
Susceptible (S)	78-89	15	41-70	61-80
Highly Susceptible (Hs)	> 89	--	61-80	81-100

### Abstract

New ventures are frequently started by entrepreneurial teams rather than lone entrepreneurs. Often, team members have family ties. In this research to study the formation and membership of the team, team challenges, behavior and performance of the team, successors of business and family relationships between members of the team. Combined, they suggest that relationships are more important than skill diversity in determining the effectiveness of both family business and new venture teams

### Introduction: -

Despite the popular legend of the heroic lone entrepreneur, the creation and management of new ventures is often a shared, team effort (Kamm et al., 1990; Gartner et al., 1994; West, 2007). Confronted with the simultaneous challenges of creating a firm that is unique and learning to manage in an unknown arena, new venture teams face what Stinchcombe (1965) describes as the liabilities of newness, which involve the difficulties of establishing market legitimacy in the face of time and financial pressures for survival. The distinctive nature and magnitude of the problems facing new ventures suggest they must be managed differently than established firms (Baron, 2002; Ensley, Pearson, & Amason, 2002; Schjoedt & Shaver, 2007) and that team involvement is often necessary for success. Thus, the formation, composition, and functioning of entrepreneurial teams can have a profound influence on the survival and growth of a firm. Furthermore, as such teams influence the founding conditions, behaviors, and practices that define the new venture, their initial decisions are likely to leave an enduring imprint on the venture's subsequent development (Beckman & Burton, 2008). The same can be said for teams in a family business setting. Such teams face unique challenges as well, because overlaid upon all of the problems normally facing entrepreneurial and/or management teams in nonfamily firms are the family relationships among team members that add materially to the complexity of the decisions made about the business (Mitchell, Morse, & Sharma, 2003).

Organizational teams have been studied extensively in the management literature (Mathieu, Maynard, Rapp, & Gilson, 2008; Stewart, 2010), and important work on teams in the unique contexts of family firms and new ventures has been done. Such work of the latter type has dealt with top management teams and behavioral dynamics (e.g., Ensley & Pearson, 2005; Ensley et al., 2002; West, 2007), team composition (Knockaert, Ucbasaran, Wright, & Clarysse, 2011; Ucbasaran et al., 2003; Zimmerman, 2008), compensation (Ensley, Pearson, & Sardeshmukh, 2007; Monsen, Patzelt, & Saxton, 2010), and performance (Beckman, Burton, & O'Reilly, 2007; Francis & Sandberg, 2000; Hmieleski & Ensley, 2007; Schjoedt & Kraus, 2009). However, there is still much we do not know, and there has been a lack of concerted effort to develop a theory that applies to the specific circumstances and contingencies facing entrepreneurial or family business teams. A notable exception is Harper's (2008) work, but his preliminary

theory of entrepreneurial teams takes an economic rather than a behavioral perspective, which is the focus of this special issue.

The development and application of a behavioral theory of entrepreneurial teams is dependent upon, among other things, a clear definition, common language, and system of classification. Some scholars use *ad hoc* definitions, while others neglect to define the concept at all (Birley&Stockley, 2000). Indeed, the term “team” has multiple meanings in the academic and popular press (cf. Hambrick, 1994, and Hambrick, 2007), and the proliferation of terminology is evident by the references to new venture teams, family entrepreneurial teams, core teams, top management teams, and, entrepreneurial teams found in the literature and even this special issue.

Extant definitions of groups and teams have similarities but also meaningful differences (Mathieu et al., 2008). For example, Katzenbach and Smith (1993), Kamm andNurick (1993), Cooper and Daily (1997), Cohen and Bailey (1997), and Cooney (2005) generally agree that while both teams and groups involve a relatively small number of people, teams are composed of members with identifiable features that set them apart such as interdependent skill sets, common goals, shared commitment, and mutual accountability. Unfortunately, if we defined and identified entrepreneurial or family business teams based on all of these characteristics, we would not have many teams to study. Aside from the criterion of small numbers, there are few characteristics common to all such teams. Teams can, and often do, differ in terms of the relationships, functional heterogeneity, and demographic diversity of their members (Mathieu et al., 2008).

Indeed, given the diversity of entrepreneurial or family firm teams and the numerous problems they deal with, we suggest that any definition that goes beyond the number of members and their common but possibly unequal concern for a small set of superordinate goals, which are themselves subject to negotiation, is really seeking to distinguish *effective* teams rather than teams. Although superordinate goals pertaining to the survival, growth, and ultimate success of a venture or family firm are held more *or less* in common by team members, the likelihood of differences in both individual and proximal goals for the organization is very large (e.g., Cyert& March, 1963). Differences in goals also imply differences in preferred strategies and variations in the extent of shared commitment. Furthermore, relationship conflicts can also develop both because of differences in goals and strategies and because of the diverse backgrounds, experiences, and personalities of team members that underlie the differences in their goals. Similarly, information asymmetries and the unobservability of intentions and certain behaviors suggest that mutual accountability will not preclude opportunism, even in family firms (Schulze, Lubatkin, Dino, &Buchholtz, 2001).

Therefore, teams, whether of the new venture or family firm variety, are really groups of individuals who attempt to work together to achieve a set of imperfectly overlapping and negotiated superordinate organizational goals, potentially for different reasons and often in spite of conflicts emerging from their backgrounds, personalities, and individual motives. In this respect, new ventures and family firms are two contexts in which teams function, and both contexts lead to a unique set of challenges owing to the nature of the problem, the composition of the team, and the behavioral dynamics that influence the process and content of team decisions. Interestingly, the articles in this special issue suggest that while the challenges may vary, the primary ingredient in effective team functioning, the relationships among team members, is consistent across different types of teams. Thus, it appears plausible that a behavioral theory of management teams for new ventures and family firms may be built on a common foundation. With this in mind, we now turn to the research in this special issue.

As argued by Ling and Kellermanns (2010: 323), the family firm indeed offers “a rich avenue for research on diversity, since the family provides an additional layer of complexity and unique sources of TMT<sup>1</sup>diversity not found in non-family firms.” Yet, although the world economy is dominated by this form of organization (La Porta, Lopez-de-Silanes& Shleifer, 1999) and EO<sup>2</sup>is recognized to be a determinant of family firm resilience and long-term survival (Chrisman, Chua &Steier, 2011; Sharma &Salvato, 2011), only a few studies have empirically explored the effects of TMT diversity on family firms’ EO. Indeed, most of the family business literature focused on the effects of TMT diversity on behavioral dynamics (e.g. Ensley & Pearson, 2005) and financial performance (e.g. Ling &Kellermanns, 2010) rather than EO. In addition, most of the family business scholars considered the horizontal distance among family members (e.g. Ensley & Pearson, 2005) and between family and non-family members (Naldi, Nordqvist, Sjöberg&Wiklund, 2007; Cruz &Nordqvist, 2012) as major source of TMT diversity.

---

<sup>1</sup>Top management team

<sup>2</sup>Entrepreneurship orientation

Following Ling and Kellermanns (2010), we focus on the vertical distance among family members as source of TMT diversity: Generational involvement, i.e. the number of family generations simultaneously involved in the firm TMT (Kellermanns&Eddleston, 2006; Ling &Kellermanns, 2010). Specifically, generational involvement produces knowledge diversity (cf. Jehn, Northcraft& Neale, 1999; Milliken & Martins, 1996) due to the different expertise and perspectives that family members belonging to different generations bring to the team (Chirico, Sirmon, Sciascia& Mazzola, 2011; Ling &Kellermanns, 2010). Salvato (2004), Zahra (2005), Kellermanns and Eddleston (2006) and Kellermanns, Eddleston, Barnett and Pearson (2008) argue that generational involvement is positively related to entrepreneurial behavior. However, they hold a position that is somewhat in contrast with most literature, according to which family firms are risk-averse and resistant to change (Jones, Makri& Gomez-Mejia, 2008; Gomez-Mejia, Haynes, Nunez-Nickel, Jacobson &Moyano-Fuentes, 2007; Naldi et al., 2007; Short, Payne, Brigham, Lumpkin &Broberg, 2009).

#### **The Formation of Entrepreneurial Teams: -**

Entrepreneurial teams differ from many other types of teams in businesses, in that they form voluntarily and are not imposed by others. Thus, entrepreneurial teams are naturally forming groups, but in contrast to many other naturally forming groups, they are task oriented (Hellerstedt, 2009): entrepreneurial teams' engagement in the identification, evaluation, and exploitation of opportunities is fundamental to their existence (Cooney, 2005; Wright &Vanaelst, 2009). Kamm and Nurick (1993) illustrate that the formation of an entrepreneurial team can be ignited by the recognition of an opportunity by an individual who then seeks others to pursue the opportunity; or by two or more individuals motivated to work together who then seek an opportunity. In addition, Cooney proposed that entrepreneurial teams might be formed due to a triggering event that entices them to identify and pursue opportunities. In practice, team formation and idea generation may emerge in a dynamic, reciprocal fashion (Beckman, 2006). Entrepreneurial team formation may occur long before the formal founding of a business (Wright &Vanaelst).

#### **The Membership of Entrepreneurial Teams: -**

Entrepreneurial team membership consists of individuals involved in the process to found or acquire a business venture together and its subsequent ownership and management (Cooney, 2005; Kamm et al., 1990; Ucbasaran et al., 2003). Studies have tended to contrast the need to have a variety of skills, experience, and ways of thinking with the desire for affinity and cohesion within the team (Forbes et al., 2006; Ucbasaran et al.). Social capital and diversity of prior affiliations provide entrepreneurial teams with access to ideas, opportunities, and resources (Beckman, 2006; Wright &Vanaelst).

Team members are often selected from preexisting networks of kin, friends, work colleagues, employees, or existing business associates (Anderson, Jack, &DrakopoulouDodd, 2005; Anderson & Miller, 2003; Casson&Giusta, 2007; Iacobucci& Rosa, 2010) and through existing strong relationships (Forbes et al., 2006; Francis & Sandberg, 2000).

The selection of additional team members may be related to the relative power of key stakeholders and interpersonal attractions and not based on a specific need (Forbes et al.). Ruef et al. (2003) pose that trust is paramount and strangers are avoided. Homophily may thus be a stronger driver of entrepreneurial team membership (Ruef et al.) than RBVperspectives indicate. However, Ruef et al. (p. 202) state that "a failure to control for the presence of kinship ties in founding teams may lead to inflated estimates of homophily."

#### **The Formation of FETs: -**

Entrepreneurial teams composed of family members have not been studied to any great extent. The pursuit of opportunities by families is assumed to be concentrated on existing family businesses and motivated by family circumstances such as the development of opportunities for offspring or wider family members; the division of the (existing)business to accommodate the succession of multiple siblings; or the search for alternative income opportunities when the core business faces unfavorable market conditions (Carter& Ram, 2003, p. 375). Hoy and Verser (1994) extend key themes of entrepreneurship to the context of family business and point to the transfer of the owner's vision to other family members, sustaining the innovativeness of the founder, intergenerational strategic thinking, and the influence of the family's values and priorities on the nature of the firm. They suggest that creating value involves "Entrepreneurship, i.e., intergenerational entrepreneurship leading to transformation" (p. 19). They do not expand on this, and it is not clear who or what will be transformed, but it offers an idea that may have the potential to provide an interesting perspective on the complex, dynamic interplay among the different generations, individuals, and businesses they are running.

Studies of portfolio entrepreneurship have examined the motivations and attributes of habitual entrepreneurs but tended to focus on the individual rather than teams (Kolvereid&Bullvag, 1993; MacMillan, 1986; Ucbasaran et al., 2003; Westhead & Wright, 1998). In family business studies, the enactment of opportunities is most often presented as being by individual family members, usually the senior generation (SG). And yet it is widely acknowledged that entrepreneurship is rarely enacted by lone individuals, and throughout the world, there is evidence of family members in a whole variety of transgenerational teams developing portfolios of businesses (Discua Cruz, 2010; Nordqvist& Zellweger,2010; Rosa, 1998).

Family business studies have shown that theories used to explain behavior in nonfamily organizations may be less valid in a family business context, most often because they do not capture the social and relational aspects of families in business. So while the formation of FETs may be driven by portfolio entrepreneurship, it is important to also consider social and relational theories that may be particularly relevant to families in business.

However, there is a danger of overgeneralizing to families in business and assuming that they are internally consistent and externally homogeneous (Westhead &Howorth,2007). Some families will not adopt a stewardship approach to being in business together.

Some families are characterized by rivalries, nepotism, shirking, and destructive behaviors that stem out of self-interest (Schulze et al., 2003). Davis et al. (1997) propose that stewardship relationships are more likely to prevail where individuals are motivated by higher order needs and intrinsic factors. If some family members indulge in opportunistic behavior, others exhibiting a stewardship perspective may feel betrayed and subsequently become more self-serving (Davis et al.). Where individual family members are self-serving but entrepreneurial, they are more likely to form individual businesses than a FET.

The relational dimension of familiness includes trust, norms, obligations, and identity(Pearson et al., 2008). Eddleston, Chrisman, Steier, and Chua (2010) suggest that stewardship theory, along with many of the theories of family business, is underpinned by trust. Where trust, norms, obligations, and identity are strong and focused on the collective, family members will be more committed to each other, and they may be more likely to form entrepreneurial teams. In the following sections, after considering the membership of entrepreneurial teams, we return to the dimensions of familiness in relation to the membership of FETs.

#### **Family Members in Entrepreneurial Teams: -**

Entrepreneurs looking for team members might look to family and friends, but this could provide a less heterogeneous composition of human and social capital, particularly if additional family members' experience, skills, and business-related contacts have been developed within the same family businesses. Family relationships might make it hard to exclude (or reject) members of kin, and altruism could lead junior family members being included with little human capital and to teams of family members that are less qualified.

However, junior family members may be provided with training and experience in specific areas that contribute to the human and social capital of the team (Howorth& Ali, 2001). Structural, cognitive, and relational dimensions of familiness are not consistent across a family and may influence the inclusion or exclusion of different family members in the entrepreneurial team. In particular, the relational dimension has potential for great variation within the family. Pearson et al. (2008, p. 958) state that the relational dimension consists of resources created through personal relationships, namely trust, norms, obligations, and identity.

Theories of trust indicate that trust, norms, obligations, and identity are interdependent (Howorth& Moro, 2006). Höhmann and Welter (2005, p. 4) state that "entrepreneurialbehavior cannot be understood without taking into account the phenomenon of trust." Eddleston et al. (2010) suggest that trust could underpin many of the theories that are used to explain behavior in family businesses and that "families throughout the world offer naturally occurring communities that generate trust relations" (Eddlestonet al., p. 1044). Trust's relevance to FETs is clear from trust's definition: "the willingness of a party to be vulnerable to the actions of another party [who] . . . will perform a particular action important to the trustor, irrespective of the ability to monitor and control that other party" (Mayer, Davis, &Schoorman, 1995, p. 712). Different forms or strengths of trust range from the weakest form, calculus trust, through knowledge-based trust, based on relationships (Lewicki& Bunker, 1996) to the strongest form of unconditional or identification-based trust. Family members may exhibit stronger forms of trust because they are

more willing to be vulnerable to each other's actions; there may be strong identification with each other's ideas, desires, and intentions and a strong reciprocal understanding in terms of values and standards of behavior.

Trust is believed to be important for entrepreneurial teams (Hellerstedt, 2009; Ruef et al., 2003), but trust is multifaceted, and we do not know which factors are most relevant to selection of entrepreneurial team members in family or nonfamily firms. Mayer et al. (1995) suggest that trustworthiness comprises three factors: ability, benevolence, and integrity. Higher levels of perceived integrity may be important because of the difficulty for entrepreneurial team members to control the agency risks of joint financial ownership and management. Membership of FETs may emphasize trust in integrity and benevolence more than ability.

In contexts where institutional trust is low, there may be greater dependence on personal trust (Hörmann & Welter, 2005) and social capital. Honduras is one such context as explained in the following section.

#### **Top Management Team Diversity and Entrepreneurial Orientation: -**

Upper echelon theory asserts that firm outcomes are a "reflection" of the actions of its TMT (Hambrick & Mason, 1984; Finkelstein & Hambrick, 1990). The theory assumes that managers act on the basis of their cognitive frames, through which situations are differently interpreted and different actions are taken. This construal is a function of TMT members' different education, experience, perspectives, values, affiliations and demographic characteristics.

Some scholars support the idea that TMT diversity leads to the consideration of many alternatives and that this enhances the likelihood that innovative decisions will be made (Bantel & Jackson, 1989; Wiersema & Bantel, 1992). TMT diversity should indeed lead to better problem solving and higher creativity and innovation because of the constructive dialogue built around top managers' multiple ideas, knowledge and perspectives not available in homogeneous TMTs (Talke, Salomo & Rost, 2010; Talke et al., 2011). The most prominent benefit of a heterogeneous group is thus related to knowledge diversity (Milliken & Martins, 1996), defined as the different expertise and perspectives possessed by individuals in a given domain to perform a task or activity in a team (cf. Jehn et al., 1999; Postrel, 2002). Knowledge diversity highly stimulates task-related conflicts, i.e. productive debate and criticism about the content of the task being performed (Jehn, 1995; 1997; Jehn et al., 1999), which promote knowledge integration (Grant, 1996; Nonaka, 1994) and thus entrepreneurial action (Boeker, 1997a, 1997b). For instance, Talke et al. (2011: 823) found that "top managers with diverse educational, functional, industry, and organizational backgrounds will combine different views of the world and have more constructive task conflicts, which encourages...a proactive innovation orientation of firm." Also, Boeker (1997a, 1997b) found that heterogeneous TMTs are more likely to be entrepreneurial and enter new product markets than homogeneous teams. Similarly, Simons, Pelled and Smith (1999) suggest diversity in educational background and tenure can create alternative views and foster innovative choices.

However, despite its merits, TMT diversity is also accompanied by costs. For instance, TMT diversity can produce high levels of relationship or emotional conflicts, i.e. "interpersonal incompatibilities among group members, which typically includes tension, animosity, and annoyance" (Jehn, 1995: 258) that undermine consensus and agreement, and thereby the potential entrepreneurial advantages of having a group with different knowledge and perspectives. Miller et al. (1998) for example found that more diverse TMTs make less comprehensive evaluations of opportunities and threats; and Knight et al. (1999) and Hambrick, Cho and Chen (1996: 664) showed that team heterogeneity is negatively related to strategic consensus and leads to "dispersion in the group's perspective", thus constraining or delaying entrepreneurial action. Also, Ancona and Caldwell (1992) and O'Reilly et al. (1993), among others, found that TMT diversity decreases entrepreneurship.

Such mixed results have induced most scholars to argue that TMT diversity is a 'double-edged sword' (cf. Milliken & Martins, 1996) in which the "effect of TMT diversity on innovativeness [and entrepreneurship]" is "mixed and ambiguous because of the dual impact of the benefits and costs associated with TMT diversity" (Auh & Menguc, 2005: 250). TMT diversity apparently brings the necessary knowledge to bear on complex strategic issues, but it is also likely to promote dysfunctional rivalries, impair social integration, and restrict knowledge flows – all of which serve to inhibit EO. In this research we aim to achieve a better understanding of this complexity and of the circumstances in which "potential benefits of diverse teams appear to be highly vulnerable to certain liabilities." (Michie, Dooley & Fryxell, 2006: 131).

**Founder Teams and Human Resource Values: -**

The early decisions made by the leadership team of a new venture are important in establishing the trajectory of development of the firm as it grows and matures, and therefore understanding how teams make these decisions regarding structures and processes will help explain firm behaviors and performance (Baron, Burton, & Hannan, 1996; Beckman et al., 2007; Francis & Sandberg, 2000; Fren, Cardinal, & O'Neill, 2012; Hmieleski & Ensley, 2007; West, 2007). Critical to the investigation of the composition of new venture teams is whether and when team heterogeneity or homogeneity (which includes the degree of diversity and what kind of diversity) is more effective. In the article by Leung, Foo, and Chaturvedi (2013), the assumption is that both can be important in terms of the internal consistency and distinctiveness of human resource values, which are important for the long-term performance of the firm because they will affect strategy implementation. The authors argue that common bonds through shared organizational experience indicate high-quality relationships among team members and therefore will increase the consistency and distinctiveness of human resource values.

Thus, their measure of homogeneity through shared organizational experience is quite similar in its theoretical justification if not its empirical operationalization to the measures of intra-team relationships used by Cruz et al. (2013), Lim et al. (2013), and Sciascia et al. (2013).

The authors also argue that functional diversity can increase or decrease the internal consistency and distinctiveness of human resource values. The former argument is based on the notion that functional diversity represents a firm's cognitive capability, an argument similar to Lim et al. (2013) and Sciascia et al.'s (2013) idea that functional diversity is linked to constructive task conflict and more coherent decision making. However, Leung et al. (2013) recognize that it is possible that functional diversity could reduce the likelihood of strategic consensus, which would negatively impact the internal consistency and distinctiveness of human resource values. Finally, the authors investigate the interaction effects of shared organizational experience and functional diversity, arguing that high levels of both will have the greatest positive impact on the internal consistency and distinctiveness of human resource values.

The findings of Leung et al.'s (2013) are consistent with those of the other studies in this special issue. Using a sample of 60 high-tech firms from Singapore, they find that shared organizational experience increases the internal consistency and distinctiveness of human resource values, but functional diversity only increases distinctiveness. Of more interest are the results of their tests of moderation, which were statistically significant but contrary to the direction proposed in their hypotheses. Thus, venture teams with high shared organizational experience and low functional diversity reported the highest levels of internal consistency and distinctiveness of human resource values.

Combined with the other studies in the special issue, the results of Leung et al.'s work again suggests that strong relationships among team members may be a more important ingredient for success for both family and nonfamily firms than a comprehensive set of skills among team members. Interestingly, these findings seem to be valid across cultures as the results of the various studies in this issue span samples in several different continents.

**Team fault lines and Opportunity Identification: -**

The conceptual article by Lim et al. (2013) reminds us that entrepreneurial teams are not necessarily homogeneous in terms of their goals and preferred strategies, nor are they immune to dysfunctional conflict that can inhibit the smooth development of the venture. Indeed, Lim et al. point out that often, teams devolve into subgroups of individuals who share a common background or orientation or set of demographic attributes that differ from those of other subgroups in the team. The divisions have come to be known in the literature as fault lines (Thatcher & Patel, 2012). Lim et al. apply the fault line concept to the sources and consequences of dissension among idea-conceiving founders and equity-based partners or investors.

Lim et al. (2013) propose that differences in the structure of the venture including the distribution of equity, the power to change the composition of the team, and the preexisting ties among the founders and investors can affect the strength of the fault lines between the two groups. Similarly, those authors argue that the extent to which founders and investors possess similar mental models with regard to the venture will also influence fault line strength. The authors go on to suggest that fault lines will influence the interactions among founders and investors in three ways: by affecting the extent of relationship conflict, task conflict, and knowledge exchange that occurs among the disparate groups. Finally, Lim et al. argue that relationship conflict, task conflict, and knowledge exchange will influence the quality of the opportunities identified by the venture, in effect acting as mediators in the relationship

between fault line strength and opportunity identification. Sciascia, Mazzola, and Chirico (2013, this issue) suggest that family teams can be much larger and more diverse and therefore prone to suffer from fault lines between different coalitions of individuals on the top management team or board of directors. For example, family teams that include in-laws, nonfamily members, different generations, or family members with dissimilar levels of commitment may develop fault lines, whereas family teams based solely on blood and shared values may not (Cruz et al.). This raises the question of whether Lim et al.'s model can be effectively applied to other team situations in its particulars and whether or not a wide variety of different structural and/or cognitive elements can likewise determine fault line strength.

There is also the issue of how fault lines can be diffused or when they exist how they can be used for productive rather than destructive ends. For example, Lim et al. (2013) suggest that task conflict will be low and relationship conflict high when fault lines are strong. However, this does not necessarily need to be the case, particularly with regard to task conflict, if an actual, as opposed to perceived, balance of power can be achieved among the two groups. Furthermore, by channeling disagreements toward material matters, petty strife might be minimized, and decision quality can be enhanced (Kellermanns, Floyd, Pearson, & Spencer, 2008). On the other hand, the ability of a powerful owner-manager to discipline other team members may prevent fault lines from developing, albeit with the risk of sacrificing task conflict (e.g., Ensley & Pearson, 2005). But we need more theory and research to understand if, when, and how the constructive management of conflict across fault lines might occur.

#### **Generational Involvement and Entrepreneurial Orientation: -**

In contrast to the studies of Cruz et al. (2013) and Lim et al. (2013) that deal with teams formed explicitly to seek and exploit entrepreneurial opportunities, Sciascia et al. (2013) deal with the entrepreneurial orientation of preexisting teams in a sample of 199 mature family firms located in Switzerland. However, their arguments and findings are highly congruent with those of the other articles contained in this issue. Sciascia et al. draw on upper echelons theory (Hambrick & Mason, 1984) to suggest that generational involvement is a proxy for knowledge diversity and therefore that entrepreneurial orientation suffers whenever too much or too little generational involvement is present. In the first instance, the involvement of only one generation is expected to lead to groupthink and a more conservative mode of business. Here, the firm suffers from too little task conflict, too few devil's advocates, too few risk takers, and too little creativity. In the second instance, the involvement of multiple generations increases the risk of relationship conflict owing to excessive kinship distance and difficult-to-reconcile disparities in goals and strategies. Here, what might evolve into constructive discussions of alternative courses of action is likely to turn into disagreements centered on personal rivalries, distrust, and deliberate or inadvertent misunderstandings. Consequently, Sciascia et al. hypothesize and find that generational involvement has an Inverted-U shape relationship with entrepreneurial orientation.

As noted above, Sciascia et al.'s (2013) findings can be compared with those of other articles contained in this issue. For example, their study suggests that the number of generations involved in a family firm and the possibility of fault lines emerging may be correlated. Using the work of Lim et al. (2013) as a guide, several explanations are possible including the natural differences that might occur given in congruencies between the current ownership of the older generation and the (often uncertain) residual ownership of the younger generation, as well as the obvious differences in mental models that are likely to occur when individuals representing three or more generations of a family are involved. On the other hand, Sciascia et al.'s study also suggests that fault lines between groups with somewhat different perspectives may be healthier than no fault lines at all, as long as they are not allowed to become too deep. These considerations are in line with research on surface and deep level diversity and on conflict within entrepreneurial teams (Schjoedt & Kraus, 2009), as well as with recent thoughts on how entrepreneurial orientation is not necessarily as homogenous and pervasive throughout the firm as many researchers have assumed (Wales, Monsen, & McKelvie, 2011). Sciascia et al.'s (2013) study also underscores an implicit message from the study of

Cruz et al. (2013); namely that beyond the years of its founding, a family business may only engage in significant entrepreneurial activity when members from the succeeding generation join and, in effect, challenge the leadership of the incumbent generation. Combined, those studies also suggest that significant entrepreneurial activity is less likely to occur when three or more generations become involved owing to a lack of a shared vision, lower trust, and potentially very different conceptions of what family stewardship is all about. Thus, these studies indicate that entrepreneurial activity is dependent on the "right" amount of diversity within the family-based team.

**Family Ties, Teams, and New Venture Creation: -**

Although the potential for relationship conflict among entrepreneurial teams consisting of unrelated individuals is high, having a team composed of family members does not ensure tranquility. In fact, given the extant literature one might conclude that relationship conflict is more likely in family firms than in nonfamily firms (Ensley & Pearson, 2005; Kellermanns & Eddleston, 2004). Moreover, teams of family members would also seem to lack the skill breadth seen as so important to new venture success. As a consequence, one might expect that nonfamily teams would outperform family teams. However, using social identity theory Brannon et al. (2013) suggest that this is not always or even usually the case. They argue that the nature of the relationships among team members matter in determining the effectiveness of family and nonfamily teams in new venture creation, because these influence their ability to adapt to the new roles that venturing requires.

Couples are likely to have the advantages of particularly strong relationships, shared venture goals, and the flexibility to negotiate mutually acceptable roles in the family and in the firm. By contrast, role adjustments are expected to be more difficult in biologically linked teams owing to relationships that are based on a long history of interaction that are both hard to change and prone to contain the seeds of dissension. Brannon et al. (2013) therefore expect that venture teams composed of couples will be more likely, and biologically linked teams less likely, to achieve first sales than teams composed of unrelated individuals. However, they also hypothesize that when biological teams are able to employ mechanisms, such as differential financial investment to reconcile family and firm roles among team members, their ability to achieve first sales will improve relative to teams composed of either couples or unrelated individuals. Using longitudinal data from a sample of 295 venture teams located in the United States, they were able to support all of their hypotheses.

Although their study is suggestive rather than definitive, Brannon et al. (2013) are able to provide evidence that substantiates the implications of the other studies found in this special issue. Brannon et al.'s study shows that relationships are a primary driver of the success of entrepreneurial teams. When relationships are strong and relational conflict can be avoided, the probability of team success is improved. By contrast, poor performing teams appear to lack the mechanisms necessary to overcome relational issues. What they add is a social identity explanation for why the potential for relationship conflict might either be curtailed or aggravated, depending on the circumstances.

While it seems intuitively appealing to argue that the cumulative skills of an entrepreneurial team are more important, none of the studies included in this special issue support that supposition. Cruz et al.'s (2013) work suggests that skills and abilities help determine roles and assignments in family entrepreneurial teams, but this appears to be clearly a secondary function. Furthermore, Leung et al.'s (2013) study indicates that if anything, skill diversity can undermine the utility of team relationships in ensuring the consistency and distinctiveness of the human resource values of a firm. On the other hand, Lim et al.'s (2013) conceptual model and Sciascia et al.'s (2013) empirical study seems to place more equal weightings on relational and task issues. Nevertheless, both suggest that the ability of individuals to function as a team outweighs the individual or collective abilities of the team. In line with previous research (Schjoedt & Kraus, 2009), these studies seem to indicate that deep level diversity (e.g., values) should be limited because of its potential to increase relationship conflict between team members as they engage in problem solving. Conversely, surface level diversity (e.g., educational background), if maintained (e.g., by replacement of team members), enhances the team's decision quality and performance (Schjoedt & Kraus, 2009). Brannon et al.'s (2013) study shows that family teams can be the best or the worst in achieving first sales, leading the authors to suggest that the types of relationships as well as the strength of relationships matter, that the ability of individuals to adapt is important, and that there are mechanisms that can be used to improve the probability of team success.

**Lack of Growth: Folklore and Fact: -**

The notion that family-owned businesses do not grow is supported by folklore as well as fact. The adage "from shirtsleeves to shirtsleeves in three generations" expresses the widespread perception that family firms do not survive over the long term.

As for the facts, a study of the fastest growing companies in the United States by the public accounting firm Coopers & Lybrand (Jones, Cohen, and Coppola, 1988) found that only 1% were firms run by family successors to founders, whereas 80% were led by their entrepreneurial founders. In a 1995 MassMutual Life Insurance survey of more than 1,000 family-business owners, growth was ranked sixth among seven possible business goals, with much

higher priority placed on increasing profitability, reducing debt, and increasing family wealth outside of the business (Greenwald, 1995).

Some of the most frequently quoted statistics on family business come from a 1987 study of a sample of family firms in Illinois (Ward, 1987). It found that over a sixty-year period, only 15% of the sample survived as independent business owners. Two-thirds of those that did survive did not grow at all through the decades. Similar results were found in a more recent study of European firms by the London-based accounting firm Horwath Group (Benson, Crego, and Drucker, 1990).

There are many theories on why family firms do not grow and rarely survive over the long term. The following are those most frequently seen:

- (1) Maturing business life cycles and increasing competition
- (2) Limited capital to fund both family needs and business growth needs
- (3) Weak next-generation business leadership
- (4) Entrepreneurial leadership's inflexibility and resistance to change
- (5) Conflicts among sibling successors
- (6) Disparate family goals, values, and needs

#### **Maturing Business Life Cycles: -**

Although all businesses struggle with Schumpeter's inevitable business life cycle, family-owned firms have some special burdens. Family firms frequently pride themselves on their loyalty to employees and their strong culture and traditions (Dyer, Jr., 1988). Both practices can create resistance to change, however. As an example, family firms carry loyalty too far by retaining long-standing suppliers and advisors who are past their prime and are no longer appropriate to the needs of the business.

Another problem is that most family-business leaders know and own just one business. When it matures, they have few options but to hold on to a declining asset. Most prefer to nurse the business along rather than shift their focus to new growth possibilities because the business is their creation, their identity, and their comfort (Lansberg, 1988). Low profitability reinforces this inherent unwillingness to change by increasing dependence on the historic core business.

#### **Limited Capital: -**

Like all businesses, family firms must satisfy the growing expectations of shareholders. Unlike their non-family counterparts, however, they face the challenge of providing capital to pay their owners' death taxes. Many surveys show that the value of the typical family firm represents about 80% of the family's total assets, and when the senior generation dies, the owning family faces the most onerous death tax rate in the world (Ward, 1987).

#### **Weak Next-Generation Leadership: -**

Many surveys show that one third to one half of all family businesses don't have available next-generation successors (Arthur Andersen, 1995). Those that do still face the reality of unlikely business growth because following in the footsteps of a very successful person who also is a parent or relative is, for many, an intimidating prospect. The next-generation leader must cope with many doubts and pressures:

- How can I make my mark in the land of a legend?
- How can I show respect for predecessors, yet remain my own person and foster change as a leader?
- How do I deflect the notoriety of a famous name and the constant comparisons with my namesake?
- How do I accept the responsibilities of leadership and for the welfare of others when the beneficiaries are my loved ones?
- How do I replace as leader of the family a person of an older generation who had not only the power of a parent or a senior, but also the authority of earned business success?

The odds of personal failure and the inevitability of disappointing others deeply affects the next-generation leader's style and decision making. Often, the result is a reluctance to take risks. Without risk-taking, however, the prospects for business growth wane.

Although many point to the

**Inflexibility and Resistance to Change: -**

Business psychologists have observed that successful leaders with very successful business strategies become fixated on that formula for success (Danco, strategy becomes inflexible, stifling growth. Other classic entrepreneurial characteristics also block growth opportunities.

For example, many entrepreneurial personalities reject planning as a managerial practice, often arguing persuasively that it brings more disadvantages than advantages (Mintzberg, 1994):

- Planning requires sharing information. Entrepreneurs frequently prize secrecy.
- Planning forces entrepreneurs to respond to the ideas of others and to defend their own views. Entrepreneurs often relish ambiguity.
- Planning increases the opportunity for conflict among management and family. Entrepreneurs tend to avoid negatives and conflicts.
- Planning concentrates limited resources in a more focused manner. Entrepreneurs prefer spreading risk among many products, customers, and lines of business.
- Planning implies long-term commitments. Entrepreneurs like to keep as many options open as long as possible.

**Sibling Successor Conflict: -**

Studies show that, more often than ever, U.S. family firms are owned by a team of siblings (Nelton, 1996). Nearly half of all business owners expect to pass on leadership and ownership to two or more of their offspring.

The challenges facing sibling partnership teams are unique. Relationships among siblings are intense, and if serious discord occurs it frequently is fatal to the existing ownership structure. Approximately half of all sibling partnerships result in a split-up (Ward and Aronoff, 1992), which not only disrupts the management process and business climate, but usually consumes tremendous capital and growth potential as one or more partners are bought out by the other(s).

For a sibling partnership to work, the teammates must continually invest in their relationship. They must be able to compromise, talk things through, and follow a code of mutual understanding. Fundamentally, they must “agree to agree,” because it is more vital to preserve the sibling relationship than to make optimal business decisions (Ward and Aronoff, 1992). In fact, it is better to short-change business growth if it preserves the strength of the partnership.

Good partnerships can overcome average business decisions, but bad partnerships will destroy even the best business.

**Disparate Family Goals: -**

Sibling and cousin-owned family businesses share an important challenge: How to reconcile the different goals, needs, and values of several family members. As families expand and grow older, goals and values inevitably become more diverse.

For most non-family-owned businesses, shareholders come and go as the nature of the investment suits their expectations. For most family-owned businesses, on the other hand, the investment is illiquid, carries emotional significance, and represents most of the shareholders’ wealth. Consequently, family shareholders struggle over whether to retain their investment.

If they choose to sell, they feel disloyal to their heritage and worry about getting full value for their shares. If they choose to stay with their investment, they feel they deserve special rewards and acknowledgment (Murdoch and Murdoch, 1991). Rewards may include hefty and consistent dividends, while acknowledgment may include involvement in business governance or extra efforts made to communicate information to them about the business. Both bring challenges to growth. Providing capital for share redemption draws funds from building the business, and paying dividends diverts profits from reinvestment. Time spent earning shareholder commitment diverts energies from day-to-day business.

The most serious threat to growth occurs when some family members feel the business is unfair to their cause or does not exemplify their beliefs. These owners attack management relentlessly. Just as detrimental are family owners who feel mistreated by previous generations and focus their resentments on current family managers who they perceive as unfairly privileged representatives of their forebears.

**Avoiding Stagnation: The Growth Model: -**

For most family-owned businesses, the path to survival is one of stagnation. How do these firms survive when they do not grow for so many years? The answer is in examining two unusual circumstances that benefit non-growing survivors.

First, the non-growing firms that have survived have kept ownership in one person's hands, rather than evolving into sibling partnerships or firms held widely by a variety of family members. In general, ownership by one family member who leads the business significantly increases the chances of growth and survival.

Second, the nature of their businesses and industries have spared them much competitive or technological change. In sum, most of the long-lasting survivors have avoided many of the business and family challenges faced by both family and non-family businesses (Ward, 1987).

In contrast, the family firms that have grown the most over time follow a different but no less predictable path: Each generation of leadership brings to the business new strategic ideas that build on underlying, long-held competencies developed for earlier strategies (Hamel, Jr., 1994). In addition, ownership control rests with one family manager, or if not one, as few as possible (Stoy Hayward, 1989). A good example of this growth model is Rosenbluth Travel, a \$1.3 billion Philadelphia-based firm that is more than one hundred years old. The first generation founder began by arranging steamship passage for immigrants. To succeed, the business developed excellent skills in customer service and in accounting for customers' monies.

A later generation shifted the focus to leisure travel. The same skills were important to success: providing outstanding personal service and applying the data processing and record-keeping talent to analyze customers' needs and rate structures. The current-generation leader added a new dimension, corporate travel. This new strategy draws on the firm's historic skills. Besides providing good customer service to corporate accounts, Rosenbluth maintains excellent recordkeeping and data processing in order to deliver on its "lowest possible fares" promise to its customers.

While the growth model exemplified by Rosenbluth accurately reflects the experience of most long-growing family firms, it does not explain the day-to-day management practices that spark that growth. Nor does it explain the leadership practices necessary to hold together more complicated forms of family ownership, such as sibling partnerships or more widespread family ownership. The next section outlines the best practices needed to make the growth model succeed.

**Best Practices: -**

Family-owned firms that grow through the decades must address each of the following requirements in order to promote expansion and overcome the special challenges inherent in family firms.

**Assure Fresh Strategic Insights.** Long-term growth requires ongoing sources of fresh strategic insights. In most industries, strategies must change every few years, if not continuously. Efforts to stimulate new thinking are particularly important for family-owned firms, because few successors have much breadth or variety of outside experience and most managers and leaders have long tenures. Family-business leaders can create an atmosphere that fosters and welcomes new ideas if they:

**Promote strategic experimentation.** Growing companies constantly test and stretch their current strategic limits (Mintzberg and Waters, 1990). They revise products, explore new markets or channels of distribution, refine the marketing mix of pricing and promotion, and create new ways to add value or differentiation.

New insights come most often from the trial-and-error experiments with current strategy, and experimentation helps jolt family firms out of the complacency that comes so naturally to many successful individuals and firms.

**Budget strategic expenses.** To assure that strategic development is a highly conscious process, successful firms establish a "strategic budget" that clearly identifies initiatives to promote strategic development (Mintzberg and Waters, 1990). Strategic expenses are spent on efforts that, for example, promise to increase market share volume in future years or to build new lines of business.

They do not include costs to maintain and protect the status quo. Many family firms find that setting up a strategic budget provides helpful tension to preserve needed funds in the family business against the temptation to pay increasing dividends or family-member bonuses and perks.

*Provide serendipity capital.* Creative managers need discretionary funds to explore and experiment with new ideas and to react to new circumstances that were not anticipated in the annual operating budget process. Some outstanding growth firms include such discretionary funds for each manager as part of their operating budgets. Managers are encouraged to spend these funds for the sake of the future, which creates a climate of experimentation and motivates creative, dynamic managers to achieve their best.

*Use independent directors on the board to challenge strategic assumptions.* The greatest way to avoid stagnation and decline is to have an absolute business mission. Business leaders who are committed to growth urge their independent outside directors to challenge the relevance of their mission and the validity of the assumptions underscoring it. Successful business leaders know that no one can challenge their thinking and the direction of the business better than highly respected outside directors.

*Encourage global experience for next-generation business leaders.* A famous study by Professor Miguel Gallo (Gallo and Point, 1994) of IESE in Barcelona found that the most successful international family firms were those in which the leaders' offspring had significant work or educational experience outside of their home country. However, most family-owned firms run a high risk of limiting international growth opportunities because successors often do not gain significant outside external experience.

*Attract and Retain Excellent Non-Family Managers.* Long-term growth demands a pool of talented non-family managers, but most family firms do not take this resource fairly enough. They are reluctant to invest in future talent when they are unsure of the effects of strong non-family managers on the family members' career paths. Frequently, business owners are too modest to believe they can attract people of the highest caliber (Tanner, 1994). To combat their tendencies, family business leaders must:

*Emphasize merit in personnel decisions.* The best non-family managers need to feel that they are valued, appreciated, and compensated on the basis of merit.

*Provide opportunities for the best managers to accumulate personal wealth.* Few family firms give stock or stock options to their key executives (Carlson and Nager, 1993). More often, they are given opportunities to participate in "phantom stock" plans or to invest alongside family members in special arrangements such as a new venture or a real estate opportunity.

*Assure career growth opportunities for the best non-family executives.* Talented on-family managers need assurance that they can continue to grow as professionals. Too often, the company's organization chart and the likely career paths of young family members do not give them that assurance. In response, some family firms restrict family members from entry into the business until they have ample, successful external experience. They also work hard to create more top management leadership positions than could be filled by family members alone.

*Create a Flexible, Innovative Organization.* Constant strategic experimentation requires a flexible, innovative organization that can:

*Share business information openly.* As noted earlier, secrecy is a common trait of business owners. They fear disclosing financial success, because it leads to demands by valuable employees, and financial failure, because it drives away good people. But without information and trust, creativity and loyalty are limited. Successful family-owned firms grow by sharing vital information among a large number of managers.

*Champion change and celebrate new ideas.* For innovation and flexibility to flourish, teamwork must be a part of the company's culture. Growing companies de-emphasize heroic leaders as the reasons for success (Danco, 1994). Instead, they credit the organizational team and the habit of past innovation that extends to the founding of the business itself.

*Constantly change some things.* The best way to encourage innovation is to foster positive feelings about change. One popular approach to increasing comfort with ongoing change is to tinker regularly with management systems

and processes, such as compensation bonus systems, information systems, organizational roles and structure, and reporting and personal performance review processes (Nelson, 1994).

**Create and Conserve Capital.** As the family grows, as death taxes arise, and as new strategies require increased financial resources, the demands for more capital are high. However, conserving as much cash as possible for the business is critical for growth. To help resolve the dilemma between family financial needs and growth's fiscal requirements, long-lasting, growing family firms become adept at creating and conserving capital. Among their strategies:

*Use other people's money.* Growing firms use more debt (Tennenbaum and Trien, 1992). They also are creative in securing capital from others who want to invest in the business's success, sometimes by offering ownership shares and opportunities for joint ventures.

*Manage strategy to be less capital intensive.* Over time, long-growing family firms shift their strategy to require less capital for growth (Flamholtz, 1986). They de-emphasize aspects that require significant capital (such as real estate or totally integrated production) and emphasize those that require less capital (such as servicing and franchising).

*Quickly establish a share redemption plan and dividend policy.* The sooner the formula for redemption is established, the less capital it will require. Long established redemption plans usually are less contentious and designed to give the business ample time and favored terms to make payouts. In addition, clear dividend policies usually lead to more content and less demanding shareholders (*Family Business Advisor*, 1994).

*Implement estate plans early.* Family-business experts agree that one of the best ways to conserve capital is to lessen the bite of death taxes by implementing the estate plan and its funding mechanism(s) as soon as possible (Blackman, 1994). The sooner the plan is implemented, the more taxes that can be saved. Prompt action also minimizes the cost of necessary insurance.

**Prepare Successors for Leadership.** Successors to family firms face unique job requirements that require specific skills to maximize their chances of leading business growth. Most of the education for successors is either unsupervised, on-the-job training or formal course work at a university or college (Cohn, 1992). Both neglect some critical aspects of the job of CEO of a family firm. To fill the gaps, family business leaders must:

*Support the successor in developing a culture of change in the business.* For family successors of successful parents, leading organizational change is extremely difficult. Promoting change is usually perceived as an indictment of the past or a criticism of the predecessor. Predecessors can help by focusing on how the company team contributes to the firm's success and by discouraging credit for themselves.

*Promote good mentoring for the successor.* Successors benefit from several mentoring experiences: working elsewhere before entering the family firm; learning how to cope with the expectations of the outside world of civic organizations, charities, and trade associations; and learning how to create a common strategic vision for the company and the owners.

*Set a date to transfer both responsibility and control to the next generation.* Successors can be inhibited by uncertainty over the date of succession. Predecessors who establish the date far in advance usually are more calm and prepared for retirement, and their successors are more motivated and committed to be the leaders the business and its growth require. Nothing frustrates the growth of a family firm more than the unwillingness or inability to empower and to entrust the next generation with control and authority (Jaffe, 1990).

**Exploit the Unique Strategic Advantages of Family Ownership.** Much of the early part of this paper outlined the disadvantages and special challenges to growth for many family firms. Successful family-owned companies know there are special advantages, too, and they strive to shape strategies that exploit them, such as:

*Seeking investments that reward patient capital.* Family firms have a unique opportunity to be long-term oriented. Security analysts can't punish their long term thinking. For a strong family, long-term value is much preferred to short term results. Highly successful family firms can therefore be more consistent in their business-building efforts and react less to bumps in the economy or their industry. Such efforts can include research and development, brand name development, market expansion, and even investments in out-of-fashion businesses, such as savings and loans and metal platers.

*Build strategy around relationships.* For the family-owned business, reputation is all-important (Donnelley, 1964). With the family name on the door and with the realization that future generations will be known, in part, by today's decisions, families in business have every advantage in dealing with each other. Mutual trust can lead to exciting new growth opportunities: More and more global alliances are being established by family firms.

*Concentrate on businesses in which fast decision making is a plus.* While quick decision-making certainly is a function of small firms, it also is a function of family firms. Decreased organizational politics and the resonance of ownership with managerial leadership allow family businesses to respond when quick decision-making is required.

### **Conclusion: -**

The number of family members in TMT certainly affects tending to EO. The findings represent that attending non family members in such teams not only promotes diversity in TMT but also results in rationality and no prejudice in decision making which reflects a significant decrease in family conflicts and increases professionalism level in doing business that finally causes changes and innovation. Non family managers basically improve the quality of strategic decisions and also managerial behaviors. Family managers prefer not to disturb social and financial welfare and family asset of future generations.

The relation between team members is more important than extension of skills in team success regardless of attending family or non-family members in team structure. There may be opportunities missed by focusing excessively on the downside rather than on the upside of competing coalitions in the firm.

A family team work needs altruism of family members, so to be more effective team should avoid family conflicts and its derived risks.

The businesses which established by family entrepreneurial groups are radically in the shade of family relations. Teams in which involve couples reflect completely different behaviors rather than other teams. The relations between the members of a team directly affect their output also investing on start up large family entrepreneurial team's helps improvement of the business and can harmonize both career and family personality of individuals.

The leaders of family businesses who conduct their own businesses by themselves, can produce specific output by utilizing the best methods. There are many specific characteristics for abovementioned leaders which are listed some of them as below: Their personal mission is to build an enduring institution that will last and be even more successful in the future (Tagiuri and Davis, 1992). On the other hand, they believe in responsibility for standing on the top either of the position or of the leadership since they have come to scene.

It is essential for entrepreneurship orientation of family businesses to attend more than one generation in those businesses and it demonstrates that to be successful during the time, they 'd rather strengthen their knowledge acceptability potential.

Family managers and owners are recommended to limit the existence of family generations by two, because attending 3 generations of one family in TMT may lead to lose efficiency of family relations in such companies. The most important factor in long lasting growth of a business is arranging family meetings which support goal and mission of the family, its values, motivations and logical reason for ongoing the ownership of business. By making agreement and desirable satisfaction it would be easier to make a better path toward achieving growth in the long run.

Finally, researchers in this area are suggested to investigate personal characteristics of entrepreneurs of family businesses and also to find methods of training managers among subsequent generation in order to study its impact on permanence of business growth.

##### Key words:-

female juvenile detainees, deviant behaviour, school vandalism, beating, harassment, sexual harassment.

#### Abstract

The objective of this study is to examine the Malay female juvenile detainees' deviant behavior before detention in rehabilitation institution. This study uses quantitative method. There were 41 respondents participated in this critical case study. Hence, data was collected using self-build instrument with 20 items and the reliability of cronbach alpha is 0.715. The finding of this study shows the most frequent deviant behavior elicited according to category were as follows: school vandalism, beating, harassment and sexual harassment. The places of eliciting deviant behaviour according to highest and lowest score; first, during recess hours in classroom, field or hall; near or under the stairs; and in the students' toilet. Second, during recess hours while taking food. Third, in the classroom while the teacher is teaching. Forth, during recess hour while eating. Fifth, while walking between change of class. Sixth, while walking between to and fro to the praying house; in the classroom before teacher enters the class and while queuing to buy food and seventh, during recess hour while taking food and eating in the canteen. Few unique findings in this study; first, only 1 respondent involved in doing damages to the school's playground facilities. Second, the area which mostly displayed of deviant behaviour was in the open area. Third, the act of deviant behaviour in classroom while a teacher is teaching and low score on deviant behaviour elicited during recess hour while eating, walking between change of classes, walking between to and fro to the praying house; in the classroom before teacher enters the class; while queuing to buy food, while taking food and eating in the canteen.

#### Introduction:-

Deviant behaviour of young adolescent is seen nowadays as a serious scenario as it hint on the corruption of morality of our younger generations especially in Malaysia which embraces so called the 'Malaysian Culture'. Nonetheless, the Malaysian culture and norms are changing due to the in-flow of other cultures into the society through the medium called 'borderless world' via social media (internet) as a medium of change and the influence of either broadcast and printed media itself (Bassey; Makinde; Rasheed; & Olumide, 2013; Baron, 2003). Nowadays, deviant behavior is seen 'acceptable' to our youngsters and now regarded as the 'trend' (Turner, 1987), that one must agree and follow if to be accepted (in group) in his or her community (Baker, 2006).

As quoted by Duffy & Nesdale (2004), younger generations tend to behave 'out of their norms' as they are in their development stage of finding and building their own unique personality (traits) especially female (Unruh, Povenmire-Kirk & Yamamoto, 2009). They wanted to have their own unique identity and be acknowledged by their peers (Ojala, Kris & Nesdale, Drew, 2004), whereby normally will involve the factors of power, wealth, strength and popularity (Paluck, Elizabeth Levy & Shepherd, Hana, 2012).

Subsequently, school is a place whereby most of youngsters spend their time and mingling with their own society which in a way acted as a perfect medium in eliciting deviant behaviour (Wan Pung, Pit; Yaacob, Siti Nor; Baharudin, Rozumah & Osman, Shuhaily, 2015), as the internal and external influence factors were so strong (Borum, 2000). Furthermore, school is the common ground for youngsters to show the sense of belonging' and embrace the concept of cohesiveness between group members (Paluck, Elizabeth; & Shepherd, 2012), which is a strong virtue among females (Weerman, F. M., & Hoeve, M., 2012).

Therefore, deviant behaviour if were not controlled can lead to crimes which has made juveniles being arrested and evicted into correctional schools and rehabilitation centers. In Malaysia alone, there were evicted cases of 29,642 juveniles detained into either correctional schools or rehabilitation centers all over the states in Malaysia in 2011 (Statistic Service, Malaysia & Department of Social Welfare, 2013).

#### Study framework:-

#### Research question:-

**There are two research questions explored in this study:-**

1. What are the types of deviant behavior elicited by the Malay female juvenile detainees in school before detention? And
2. The most common places of deviant behaviour elicited in school compound.

#### Main objective:-

The main objective of this study is to determine the Malay female juvenile detainees' deviant behaviour and where does the deviant behaviour elicited in school compound.

#### Specific objectives:-

1. To determine the Malay female juvenile detainees' deviant behaviour in school.
2. To determine the places in school compound that frequently visited by the Malay female juvenile detainees in eliciting deviant behaviour.
3. To examine the relationship between deviant behaviour in each category of school vandalism, beating, harassment and sexual harassment.

#### Hypotheses:-

Hypotheses were built according to the objectives of the study:

1. To determine the Malay female juvenile detainees' deviant behaviour in school.  
Frequencies of Malay female juvenile detainees' deviant behavior according to category:

- i. School vandalism
  - ii. Beating
  - iii. Harassment
  - iv. Sexual harassment
2. To determine the places in school compound that frequently visited by the Malay female juvenile detainees in eliciting deviant behaviour.  
Frequencies of places in school compound which was visited by the Malay female juvenile detainees' before detention in eliciting deviant behaviour.
3. To examine the relationships between deviant behaviour in each category; school vandalism, beating, harassment and sexual harassment.  
H<sub>a1</sub> There were significant relationships between deviant behavior in each category of school vandalism, beating, harassment and sexual harassment.

### **Significant of study:-**

#### **This study is significant to:-**

School and any parties concerned in promoting awareness programme. It is also important to identify the dangerous zone in school compound so that the authorities in school were kept alert on high risk areas and thus take precaution measures such as installing recording equipment ie. closed-circuit television.

#### **Limitation of study:-**

As of security and safety issues; name of the respondents, rehabilitation center and schools involved in this study was kept confidential.

### **Methodology:-**

#### **Population and sampling technique:-**

The population of this present study were Malay female juvenile detainees in a rehabilitation center. As this is a critical case study, there were only n=41 Malay female juvenile respondents involved in this study with (n=11; age 17 years old); (n=8; age 18 years old); (n=7; age 15 years old); (n=5; age 14 years old); (n=5; age 16 years old) and, (n=5; age 19 years old).

#### **Data Collection Procedure:-**

The questionnaires were self-administered by the researcher. Self-build instrument was being distributed and respondents were asked to answer the questions within 20 to 25 minutes.

#### **Instrument:-**

This study uses self-build instrument with 20 items. The reliability of this instrument is 0.715.

#### **Data Analysis:-**

Data was analyzed using the SPSS version 21. Frequency and descriptive analysis was utilized as to determine the Malay female juvenile deviant's behaviour in school compound before detention. Meanwhile, the correlational analysis is used to find the significant relationships between deviant behaviour and places visited by the Malay female juvenile detainees in school compound.

### **Findings:-**

1. To determine the Malay female juvenile detainees' deviant behaviour in school.  
Frequencies of Malay female juvenile detainees' deviant behavior according to category:
  - i. School vandalism
  - ii. Beating
  - iii. Harassment
  - iv. Sexual harassment

**Table 1:-** Frequencies of deviant behaviour according to category

	Mean	sd.
School vandalism	10.0732	1.95436
Beating	6.8293	3.47780
Harassment	5.9268	3.45246
Sexual harassment	0.8780	1.67623

Table 1 summarized the most frequent deviant behaviour elicited by the Malay female juvenile detainees before detention in school compound according to category; the school vandalism ( $\bar{x}=10.0732$ ); beating ( $\bar{x}=6.8293$ ); harassment ( $\bar{x}=5.9268$ ); and sexual harassment ( $\bar{x}=0.8780$ ).

**School vandalism:-****Table 2:-** Percentages of deviant behaviour according to school vandalism category

	Frequency	%
Equipment-facilities	37	90.2
Canteen-facilities	23	56.1
Teacher's transportation	18	43.9
Parent's-other's transportation	2	4.9
Playground facilities	1	2.4

Table 2 reports on deviant behaviour with 37 (90.2%) respondents vandalized on school equipment and facilities; 23 (56.1%) respondents damages on school canteen and facilities; 18 (43.9%) respondents vandalized on teacher's transportation with 2 (4.9%) respondents scratches on parents or other transportation. The lowest score is 1 (2.4%) respondent vandalizing on school's playground facilities.

**Table 3:-** Relationship between deviant behaviour in school vandalism category

	School vandalism1	School vandalism2	School vandalism3	School vandalism4	School vandalism 5
School vandalism1	1				
School vandalism2	-.200	1			
School vandalism3	.125	-.689**	1		
School vandalism4	.089	.200	-.291	1	
School vandalism5	-.140	-.036	.052	.140	1

\*\*p<0.01

\*p<0.05

Table 3 shows the result of correlation analysis to examine the relationship between each deviant behaviour in school vandalism category. There was a significant relationship between vandalizing on school equipment and facilities and, damages on school canteen and facilities ( $r=-.689$ ,  $p<0.01$ ).

**Beating:-****Table 4:-** Percentages of deviant behaviour according to beating category

	Frequency	%
Classmates	27	65.9
Friends-from other class	15	36.6
Other students	8	19.5
Friends-from home	4	9.8
Friends from other areas	3	7.3

Table 4 reports on percentages of deviant behaviour according to beating category with 27 (65.9%) respondents beats their classmates; 15 (36.6%) respondents beats their friends from other classes; 8 (19.5%) respondents beats on

other students; 4 (9.8%) respondents beats on friends from home and 3 (7.3%) respondents beats friends from other areas.

**Table 5:-** Relationship between deviant behaviour in beating category

	Beat1	Beat2	Beat3	Beat4	Beat5	Beat6
Beat1	1					
Beat2	-.094	1				
Beat3	-.165	.137	1			
Beat4	-.110	-.250	-.162	1		
Beat5	-.193	-.019	-.138	-0.92	1	
Beat6	.504*	.082	-.194	.224	-.211	1

\*\*p<0.01

\*p<0.05

Table 5 shows the result of correlation analysis to examine the relationship between each deviant behaviour in beating category. There was a significant relationship between others and friends from other areas ( $r = -.504$ ,  $p < 0.01$ ).

#### Harassment:-

**Table 6:-** Percentages of deviant behaviour according to harassment category

	Frequency	%
Classmates	40	97.6
Friends from other class	5	12.2
Friends from home	4	9.8
Other students	3	7.3

Table 6 reports on percentages of deviant behaviour according to harassment category which indicates physical, verbal and relational bullying. There were a total of 40 (97.6%) respondents harassing their classmates; 5 (12.2%) respondents harassing friends from other classes; 4 (9.8%) respondents harassing friends from home but who were schooling in the same school and 3 (7.3%) respondents harassing other students which is from the same standard/secondary level.

**Table 7:-** Relationship between deviant behaviour in harassment category

	Harass1	Harass2	Harass3	Harass4	Harass5
Harras1	1				
Harras2	.059	1			
Harras3	.044	-.105	1		
Harass4	.052	.129	-.092	1	
Harass 5	-.108	.254	-.211	.224	1

\*\*p<0.01

\*p<0.05

Table 7 shows the result of correlation analysis to examine the relationship between each deviant behaviour in harassment category. There is no significant relationship between each deviant behavior in harassment category.

#### Sexual harassment:-

**Table 8:-** Percentages of deviant behaviour according to sexual harassment category

	Frequency	%
Classmates	8	19.5
Friends from other classes	4	9.8
Friends from other areas	4	9.8

Table 8 reports on percentages of deviant behaviour according to sexual harassments that were mostly on non-verbal gestures and touching inappropriate body parts. 8 (19.5%) respondents sexually harassed their classmate either girls

or boys; 4 (9.8%) respondents sexually harassed friends from other classes and 4 (9.8%) sexually harassed friends from other areas.

**Table 9:-** Relationship between deviant behaviour in sexual harassment category

	Sex harass1	Sex harass2	Sex harass3
Sex harass1	1		
Sex harass2	-.162	1	
Sex harass3	-.162	.169	1

\*\*p<0.01

\*p<0.05

Table 9 shows the result of correlation analysis to examine the relationship between each deviant behavior in sexual harassment category. There is no significant relationship between each deviant behavior in sexual harassment category.

- To determine the places in school compound that frequently visited by the Malay female juvenile detainees in eliciting deviant behaviour.  
Frequencies of places in school compound which was visited by the Malay female juvenile detainees' before detention in eliciting deviant behaviour.

**Table 10:-** Frequencies of location in school compound in which deviant behaviour was elicited

	Frequency	Percentage
During recess(classroom/field/hall)	98	89.1
Near/under stairs	98	89.1
In students' toilet	98	89.1
During recess (while taking food)	88	80
In classroom (while teacher is teaching)	76	69.1
During recess (while eating)	51	46.4
Walking between change of classes	37	33.6
Walking between to and fro to praying house	16	14.5
Walking to and fro to praying house	16	14.5
In classroom (before the entrance of teacher)	16	14.5
During recess (queuing to buy food)	16	14.5
During recess (while taking food)	9	8.2
During recess (while eating)	9	8.2

Table 10 reported on the most frequent places in school compound in which deviant behavior was elicited. The most frequent compound that scores 89.1% was during recess hours in classroom, field or hall; near or under the stairs; and in the students' toilet. Second, is during recess hour while taking food that has a score of 80%. Next is in the classroom while the teacher is teaching with a score of 69.1%. 46.4% score during recess hour while eating followed by walking between changing of classes with a score of 33.6%. Meanwhile, walking between to and fro to the praying house; in the classroom before teacher enters the class; during recess hour while queuing to buy food has the same score of 14.5%. Subsequently, 8.2% score while taking food and eating in canteen during recess hour.

- $H_{a1}$  There were significant relationships between deviant behaviour in each category of school vandalism, beating, harassment and sexual harassment.

**Table 11:-** Relationship between deviant behaviour in each category

	School vandalisme	Beating	Harassment	Sexual harassment
School vandalisme	1			
Beating	.373*	1		
Harassment	.357*	.788**	1	
Sexual harassment	.127	.236	.183	1

\*\*p<0.01

\*p<0.05

Table 11 indicated on the result of correlation analysis to examine the relationship between deviant behaviour in each category of school vandalism, beating, harassment and sexual harassment. Results shows that the most significant relationship can be found between beating and harassment ( $r=0.788$ ,  $p<0.01$ ), followed by between beating and school vandalism ( $r=0.373$ ,  $p<0.01$ ); and between school vandalism and harassment ( $r=0.357$ ,  $p<0.01$ ).

### Conclusion and Discussion:-

The study has shown that the Malay female juvenile detainees were prone to vandalized school and canteen, equipment and facilities. This study also indicates strong vindictive behaviour of the Malay female juvenile detainees towards teaching staff when 43.9% admitted vandalizing their teacher's transportation. One unique finding on this study is that only 2.4% or 1 respondent involved in doing damages to the school's playground facilities. The assumption of this finding is that; the Malay female juvenile detainees had profound belonging awareness and the need to care on things that makes them happy.

Finding of this study also reported on the Malay female juvenile detainees who targeted those who were within their school socialization or communities in inflicting beating behaviour such as classmates, friends from other classes and other students who were schooling in the same school but not in the same standard or secondary level. All of these targeted victims went to the same school but they were not in the same area of residencies with the Malay female juvenile detainees. However, low rate of inflicting beating were to those who were from the same residency areas (where the Malay female juvenile detainees resides) and those who were from other areas.

This was probably, the Malay female juvenile detainees did not want to provoke or steer any unpleasant situation between their families and other families (community members where they resides) that know or who has established relationship with their families. It is the same with harassment behaviour which were mostly inflicted on those who were in the same school as the Malay female juvenile detainees but resides in different residency areas from the Malay female juvenile detainees. Nevertheless, few Malay female juvenile detainees involved in sexual harassment and the score is low as not more than 20% admitted in sexually harassed their classmates, friends from other classes and friends from other areas.

As for dangerous time and places in school compound where deviant behaviour mostly occurs; this study has concluded that the high risk time of eliciting deviant behaviour among Malay female juvenile detainees before detention was during recess hours. Surprisingly, the area which mostly displayed of deviant behaviour was in open area that is in the classroom, on field or at the school hall and in the canteen. The most probable reason; it is where the Malay female juvenile detainees was with their group of friends (in group) which has already retained and practices certain standard of acceptable behaviour such as bullying towards others who were not in their group (out group).

Another dangerous zone is under the stairs and in the student's toilet which is understandable as these is the 'dark' and secluded area where there were not so many visitors. Thus, it is easier for the Malay female juvenile detainees to take the opportunities to inflict deviant behaviour on other students as they felt safe. Furthermore, the chances of having no witnesses to anything that they might do to other students appealed them to go to these places in the first place.

Another interesting finding in this study is the Malay female juvenile detainees who without fear show deviant behaviour in the classroom while a teacher is teaching. It proves that there were changes in the Malay culture which were famously known to have highly respects on elders and to those who has the authority of nurturing and educating people especially in rural areas. It might also be an indicator of these Malay female juvenile detainees experiencing boredom in class as a result of not being able to understand the subjects taught or has not put any kind of interest in the subjects taught by the teacher and thus, creating 'negative event' such as picking on others to amused and entertained themselves.

Another intriguing finding is that the low score of deviant behaviour elicited during recess hour while eating, walking between change of classes, walking between to and fro to the praying house; in the classroom before teacher enters the class; while queuing to buy food, while taking food and eating in the canteen gives the impression that deviant behaviour were less elicited as the Malay female juvenile detainees were mostly busy focusing on the

activity at hand. It has strongly indicated that deviant behaviour can be significantly reduced if the Malay female juvenile detainees were given certain tasks to accomplished especially things which were closely connected to themselves (oneself), or bring benefits and interest to them.

In overlying these study's findings, it is highly suggested that there were further studies in the future especially using qualitative study focusing on the changing phenomenon of Malay younger generation's culture especially in life norms, belief, perceptions and nurturing concepts in explaining the deviant behavior.

##### Key words:-

*Carica papaya*, nutraceutical, medicinal plant, multi faceted plant.

#### Abstract

*Carica papaya* Linn belonging to family Caricaceae. The properties of papaya fruit and other parts of the plant are also well known in traditional system of medicine. Papaya possess excellent medicinal properties for treatment of different ailments. The different parts of the *Carica papaya* plant including leaves, seeds, latex and fruit exhibited to have medicinal value. The stem, leaf and fruit of papaya contain plenty of latex. The latex from unripe papaya fruit contain enzymes papain and chymopapain.

**Background:-** there is no background

**Method:-** there is no method because its focused on review on *Carica papaya* plant.

**Result:-** There is no result because it is a review article on *Carica papaya*

**Conclusion:-** this review focuses on different properties of papaya as a multi-faceted plant. Papaya is commonly known for its food and nutritional values throughout the world.

#### Introduction:-

*Carica papaya* Linn belonging to family Caricaceae is commonly known as papaya in English, Papita in Hindi and Erandakarkati in Sanskrit. Papaya is a powerhouse of nutrients and is available throughout the year. It is a rich source of three powerful antioxidant vitamin (C, A & E); the minerals (magnesium and potassium); the B vitamin pantothenic acid and folate and fiber.<sup>1</sup> The plant is native to tropical America and was introduced to India in 16th century. Papaya tree is basically a short lived Indian tree. In the historic times, it was considered as an exotic fruit because of its buttery taste and appearance.<sup>2</sup> The plant is recognised by its weak and usually unbranched soft stem and yielding copious white latex and crowded by a terminal cluster of large and long stalked leaves, is rapidly growing and can grow up to 20m tall. Traditionally leaves have been used for treatment of a wide range of ailments, like in treatment of malaria, dengue, jaundice, immunomodulatory and antiviral activity.<sup>3</sup> Young leaves are rich in flavonoids (kaempferol and myricetin), alkaloids (carpaine, pseudocarpaine, dehydrocarpaine I and II), phenolic compounds (ferulic acid, caffeic acid, chlorogenic acid), the cynogenetic compounds (benzylglucosinolate) found in leaves.<sup>4</sup>

Both leaf and fruit of the *Carica papaya* Linn. possess carotenoids namely  $\beta$ -carotene, lycopene, anthraquinones glycoside, as compared to matured leaves and hence possess medicinal properties like anti-inflammatory, hypoglycaemic, anti-fertility, abortifacient, hepatoprotective, wound healing, recently its antihypertensive and antitumor activities have also been established.<sup>3,4</sup> Leaves being an important part of several traditional formulations

### Botanical Description:-

#### Plant:-

Papaya plant is a large, single-stemmed herbaceous perennial tree having 20–30 feet height . The leaves are very large (upto 2½ feet wide), palmately lobed or deeply incised with entire margins and petioles of 1-3 feet in length. Stems are hollow, light green to tan brown in color with diameter of 8 inches and bear prominent of scars.<sup>4</sup>

#### Fruit:-

The fruits are big oval in shape and sometimes called pepo-like berries, since they resemble melon by having a central seed cavity . Fruits are borne axillary on the main stem, usually singly but sometimes in small clusters. Fruits weigh from 0.5 up to 20 lbs, and are green unlike ripe, turning yellow or red orange. Flesh is yellow-orange to salmon (pinkish orange) at maturity. The edible portion surrounds the large central seed cavity. Individual fruits mature in 5-9 months, depending on cultivator and temperature. Plants begin bearing fruits in 6-12 months.<sup>6,7</sup>

#### Flowers:-

Papaya plants are dioecious or hermaphroditic, producing only male, female or bisexual (hermaphroditic) flowers. Papaya as are sometimes said to be “trioecious” meaning that separate plants bear either male, female, or bisexual flowers .Female and bisexual flowers are waxy, ivory white, and borne on short peduncles in leaf axils, along the main stem. Flowers are solitary or small cymes of 3 individuals. Ovary position is superior. Prior to opening, bisexual flowers are tubular, while female flowers are pear shaped. Since, bisexual plants produce the most desirable fruit and are self-pollinating, they are preferred over female or male plants. A male papaya is distinguished by the smaller flowers borne on long stalks. Female flowers of papaya was pear shaped, when unopened whereas, bisexual flowers are cylindrical .<sup>8</sup>

### Geographical Distribution:-

Though the exact area of origin is unknown, the papaya is believed native to Tropical America, perhaps in Southern Mexico and neighbouring Central America. Successful commercial production today is primarily in Hawaii,

Tropical Africa, the Philippines, India, Ceylon, Malaysia and Australia, apart from the widespread but smaller scale production in South Africa, and Latin America. In India, papaya is cultivated in Maharashtra, Bengal, Bihar, Haryana, Punjab, Delhi, Andhra Pradesh and Uttar Pradesh.<sup>9</sup>

#### **Nutritional Value of Papaya:-**

The papaya is a large, tree-like plant, with a single stem growing from 5 to 10 m (16 to 33 ft) tall, with spirally arranged leaves confined to the trunk. The leaves are large, 50-70 cm in diameter, deeply palmately lobed, with seven lobes. The tree is unusually un-branched, unless lopped. The flowers appear on the axils on the leaves, maturing into large fruit. The fruit is ripe when it feels soft and its skin has attained amber to orange hue. Ripe and green papaya has difference in nutritional value.<sup>6,9</sup>

#### **Chemical composition of various part of *Carica papaya* plant are described:-**

##### **Part Constituents:-**

**Fruit:-** protein, fat, fibre, carbohydrates, minerals, calcium, phosphorus, iron, vitamin C, thiamine, riboflavin, niacin, and carotene, amino acid, citric acids and malic acid (green fruits), volatile compounds: linalol, benzylisothiocyanate, cis and trans 2, 6-dimethyl-3,6 epoxy-7 octen-2-ol. Alkaloid,  $\alpha$ ; carpaine, benzyl- $\beta$ -D glucoside, 2-phenylethyl- $\beta$ -D-glucoside, 4-hydroxyl -phenyl-2ethyl-B-D glucoside and four isomeric malonated benzyl- $\beta$ -D glucosides.<sup>6</sup>

**Juice:-** N-butyric, n-hexanoic and n-octanoic acids, lipids; myristic, palmitic, stearic, linoleic, linolenic acids-vaccenic acid and oleic acids.

**Seed:-** Fatty acids, crude proteins, crude fibre, papaya oil, carpaine, benzylisothiocyanate, benzylglucosinolate, glucotropacolin, benzylthiourea, hentriacontane,  $\beta$ -sitosterol, carcin and an enzyme myrosin<sup>8</sup>

**Root:-** Arposide and an enzyme myrosin.

**Leaves:-** Alkaloids carpain, pseudocarpain and dehydrocarpaine I and II, choline, carposide, vitamin C and E.

**Bark:-**  $\beta$ -sitosterol, glucose, fructose, sucrose, galactose and xylitol.

**Latex:-** proteolytic enzymes, papain glutamine cyclotransferase, chymopapain A, B and C, peptidase A and B and lysozymes.<sup>10,11</sup>

#### **Medicinal and Pharmacological properties of various parts of *Carica papaya* leaves.**

Biological activities of papaya are reported with the crude extracts and different fraction from latex, seed, leaf, root, stem bark and fruits.

##### **Leaves:-**

Papaya leaf has a numberless of benefits. In some parts of Asia, the young leaves of the papaya are steamed and eaten like spinach.

- Dengue fever :- Dr. Sanath Hettige, who conducted the research on 70 dengue fever patients, said papaya leaf juice helps increase white blood cells and platelets, normalizes clotting, and repairs the liver.<sup>2</sup>
- Cancer cell growth inhibition :- Recent research on papaya leaf tea extract has demonstrated cancer cell growth inhibition. It appears to boost the production of key signaling molecules called Th1 -type cytokines, which help regulate the immune system.
- Antimalarial and antiparasitic activity:- Papaya leaves are made into tea as a treatment for malaria. Antimalarial and antiparasitic activity has been noted in some preparations of the plant.<sup>8</sup>
- Facilitate digestion. The leaves of the papaya plants contain chemical compounds of carpain, Substance which kills microorganisms that often interfere with the digestive function.
- Antibacterial activity. It contains huge number of enzyme to kill the microorganism.<sup>12</sup>

##### **Fruit:-**

Papaya fruit is a rich source of nutrients such as provitamin A, carotenoids, vitamin C, vitamin B, lycopene, dietary minerals and dietary fibre. Danielone is a phytoalexin found in the papaya fruit.

- a. Laxative;- Ripe papaya fruit is laxative which assures of regular bowel movement
- b. Indigestion;- The milky juice which is tapped from the green, mature fruit while still in the tree contains an enzyme known as "papain". People use this in the preparation of different remedies for indigestion.
- c. Void the heart attack or stroke;- The folic acid found in papayas is needed for the conversion of homocysteine into amino acids such as cysteine or methionine. If unconverted, homocysteine can directly damage blood vessel walls, is considered a significant risk factor for a heart attack or stroke.
- d. Skin diseases;- it contains the vitamins which is used for skin disease.<sup>7</sup>

#### **Seeds:-**

The black seeds of the papaya are edible and have a sharp, spicy taste. They are sometimes ground and used as a substitute for black pepper.

- a. Nephro - protective activity;- In wistar rats nephro-protective activity was observed in dose related manner. Concentration of urine and creatinine were evaluated.
- b. More potent- The papaya seeds are very pungent and peppery, making them almost unpalatable. However the seeds seem to have more potent medicinal values than the flesh.
- c. Papaya seeds may protect the kidneys from toxin – induced kidney failure. Seeds can eliminate intestinal parasites, and help detoxify the liver. Used as a skin irritant to lower fever. Cure for piles and typhoid and anti-helminthic and antiamoebic properties.<sup>14</sup>

#### **Peel:-**

Papaya peel is often used in cosmetics. The papaya peel can also be used in many home remedies.

- a) Sunscreen and soothing slave- The presence of vitamin A helps to restore and rebuild damaged skin. Applied papaya peel used as skin lightening agent. When peel mixed with honey and applied it can act as soothe and moisturizers the skin.
- b) Fight dandruff- The papaya vinegar with lemon juice can be applied to the scalp for 20 minutes prior to shampooing to fight dandruff.
- c) Muscle Relaxant- Adding papaya oil and vinegar to bath water, along with essential oils like lavender, orange and rosemary can be nourishing, refreshing and relaxing, and can work as a pain reliever and muscle relaxant .<sup>15,3</sup>

#### **Roots:-**

Juice from papaya roots is used in some countries of Asia to ease urinary troubles. Papaya leaf when dried and cured like a cigar, is smoked by asthmatic persons. An infusion of fresh papaya leaves is used by person to expel or destroy intestinal worms. Fresh young papaya are also used to remedy colic, a certain stomach disorder or cramp. A decoction formed by boiling the outer part of the roots of the papaya tree in the cure of dyspepsia .<sup>16</sup>

#### **Latex:-**

The milky sap of an unripe papaya contains Papain and chymopapain. chymopapain was approved for intradiscal injection in patients with documented herniated lumbar intervertebra discs and who had not responded to "conservative therapy". Papain is also used to treat commercial beer, to degum natural silk, as a meat tenderizer and in the production of chewing gums. Cosmetically it is used in Shampoos and in a number of face-lifting operations. In humans papain slows down the heart and thus reduces blood pressure. It is also used in Antihelmintic, relieves dyspepsia, cures diarrhea, pain of burns and topical use, bleeding haemorrhoids, stomachic, whooping cough .<sup>17</sup>

#### **Other Uses:-**

- a. Colon cancer- The fiber of papaya is able to bind cancercausing toxins in the colon and keep them away from the healthy colon cells. These nutrients provide synergistic protection for colon cells from free radical damage to their DNA.
- b. Anti-Inflammatory effects- Protein enzymes including papain and chymopapain and antioxidant nutrients found in papaya; including vitamin C, vitamins E, and betacarotene, reduce the severity of the conditions such as asthma, osteoarthritis, and rheumatoid arthritis.
- c. Rheumatoid arthritis- Vitamin C - rich foods, such as papaya, provide humans with protection against inflammatory polyarthritis, a form of rheumatoid arthritis involving two or more joints
- d. Promote lung health- If you are smoker, or if you are frequently exposed to second hand smoke. Eating vitamin A rich foods, such as papaya, help your lung healthy and save your life.

- e. Anti-sickling activity- Current research proves that papaya is having an anti- sickling activity
- f. Prevent prostate cancer- Men consuming lycopene – rich fruits and vegetables such as papaya, tomatoes, apricots, pink grape fruit, watermelon, and guava were 82 % less likely to have prostate cancer compared to those consuming the least lycopene - rich .<sup>14,16</sup>

#### **Pharmacological activities of *Carica papaya* on laboratory animals:-**

##### **Antisickling activity:-**

Sickle cell disease (SCD) results from a mutation in hemoglobin inside the red blood cells, where a glutamic acid at 6th position is replaced by valine. Recent studies showed that unripe papaya fruit extract has anti-sickling activity .[18]. Another study showed the potent antisickling property of *Carica papaya* leaf extract in a dose- dependent manner.<sup>19</sup>

##### **Anthelmintic activity:-**

A wide range of plants and plant extracts has been used traditionally for the treatment of helminthes infections including papaya, which is rich in proteolytic enzymes known to digest nematode cuticles, have low toxicity and have been used in traditional medicine against gastrointestinal nematodes for decades . In 1940, the worm digesting activity of a preparation of papain from *C.papaya* latex was described as they rapidly digest the ascaris.<sup>20</sup>

##### **Antifungal activity:-**

The latex of papaya and fluconazole has synergistic action on the inhibition of *Candida albicans* growth . This synergistic effect results in partial cell wall degradation due to lack of polysaccharides constituents in the outermost layers of fungal cell wall and release of cell debris into the cell culture. Latex proteins appear to be responsible for antifungal action and minimum protein concentration for producing a complete inhibition was reported as about 138 mg/dl.<sup>21</sup>

##### **Antibacterial activity:-**

The seeds of *Carica papaya* were found to possess bacteriostatic activity against several enteropathogens such as *Bacillus subtilis*, *Enterobacter cloacae*, *Escherichia coli*, *Salmonella typhi*, *Staphylococcus*, *Proteas vulgaris*, *Pseudomonas aeruginosa* and *Klebsiella pneumonia*. Among the gram positive and gram-negative bacteria tested the gram negative bacteria were more susceptible to the extract.<sup>22</sup>

##### **Antioxidant activity:-**

reported a study on *Carica papaya* for its antioxidant activity, its phenolic content using the different parts of papaya. The total phenolic content of the extracts was determined by Folin-Ciocalteu method and antioxidant activity was assayed using DPPH method. The total phenolic contents and antioxidant activity of the extracts as Gallic acid equivalents were found to be highest in fresh extract .<sup>23</sup>

##### **Hypoglycemic and hypolipidemic activity:-**

Study show that oral treatment with 0.1 mg/kg/day of glibenclamide and 100-400 mg/kg/day of aqueous seed extract of *Carica papaya* induced significant, steady and progressive hypo-glycemic and hypolipidemic effect.<sup>24</sup>

##### **Antipyretic activity:-**

investigated the platelet increasing property of *Carica papaya* leaves juice (CPLJ) in patients with dengue fever (DF). An open labeled randomized controlled trial was carried out on 228 patients with DF and dengue hemorrhagic fever (DHF). Approximately half the patients received the juice, for 3 consecutive days while the others remained as controls and received the standard management. Their full blood count was monitored 8 hours for 48 hours. Gene expression studies were conducted on the ALOX 12 and PTAFR genes. The mean increase in platelet counts were compared in both groups using repeated measure ANCOVA. There was a significant increase in mean platelet count observed in the intervention group but not in the control group 40 hours since the first dose of CPLJ. Comparison of mean platelet count between intervention and control group showed that mean platelet count in intervention group was significantly higher than control group after 40 and 48 hours of admission. The ALOX 12 (FC=15.00) and PTAFR (FC=13.42) genes were highly expressed among those on the juice. It was concluded that CPLJ does significantly increase the platelet count in patients with DF and DHF.<sup>25</sup>

**Anti-inflammatory activity:-**

The anti-inflammatory property of plant cysteine proteinases were already noted in literature. In a clinical study, the histological severity of inflammatory bowel disease was determined for treatment of chronic inflammatory and related diseases papain has found to be safe and efficacious. Anti-inflammatory activity of papaya seeds were also reported. The anti-inflammatory effect of the leaves extract including the reference drug was very poor when using the carrageenan method, the 100 mg/kg extract produced its highest effect at 3 hr (2.7%) after carrageenan injection while the 200mg/kg extract also produced its effects at 3 hr (6.7%) after injection. The reference drug indomethacin produced time dependant reduction as the effect was more pronounced at 3 hr (11.4%) of carrageenan administration. The results of this investigation revealed that the aqueous extract of the leaves was slightly less effective than that of indomethacin.<sup>26</sup>

**Anti-fertility activity:-**

The anti-fertility effects of *Carica papaya* were investigated by feeding adult and pregnant rat with different components of the fruit. No attempt was made to force feed the animal and the result indicated that the unripe fruit interrupted the estrous cycle and induced abortion. This effect vanished as the fruit became stale or over riped. Chloroform extract of *Carica papaya* seeds induced long term azoospermia in langur monkey.<sup>27</sup> Papaya also showed the anti-implantation and abortifacient effect.<sup>28</sup>

**Anticancer activity :-**

Initially pharmaceutical preparations containing various proteolytic enzymes (papain) have been used as adjuvant in the treatment of malignant diseases, despite lack of knowledge of their mode of action. Experiments indicate that the effects after oral administration of polyezymes preparations are related to the induction of cytokines production by human peripheral blood mononuclear cells. Papaya in vitro study shows that it will treat many cancer cell line and they have anticancer activity. Papain enzyme from papaya effective against cancer. Papain breaks down the fibrin cancer cell wall and protein into amino acid form. Other than papain it also contain lycopene which highly reactive towards oxygen and free radical. Isothiocyanate effective against breast, lung, colon, pancreas, prostate as well as leukemia. These enzymes capable of inhibiting both formation and development of cancer cell.<sup>29</sup>

**Anti-hypertensive activity:-**

Papaya leaves decoction can be used as an anti-hypertensive agent. A study on villagers of Agboville located at 80 km of Abidjan (West Africa), showed the hypotensive activity of papaya plant when administered orally.<sup>30</sup>

**Immunomodulatory activity:-**

Papain induces human eosinophils to degranulate and to produce superoxide anion. The E-64 inhibitors abolished the activation by papain suggesting that the protease activity is required to trigger eosinophil response. It is likely that this action in eosinophils is mediated by protein G linked receptor. As it stands it appears that bromelain and papain depending on the target cell display opposite effects.<sup>31</sup>

**Wound healing:-**

The similarities between latex coagulation in papaya and the mammalian coagulation process led us to propose that some analogous factor may be present in both systems. If putative analogies do occur, it is possible that some plant metabolites intervening during plant healing may also act during the healing process ensuring clot formation in mammals. The proliferative effect of papain attained 15% above control, suggesting that this properly is specific for some proteolytic enzymes. Also one study showed that papain from *C. papaya* latex was effective in protecting histamine-induced ulcer in rat by blocking the acid secretion<sup>17</sup>. Papain major component of papaya latex is nonspecific cysteine proteinase that is capable of breaking down a wide variety of necrotic tissue substrates over a wide pH range from 3.0 to 12.0<sup>18</sup>. This factor may also have contributed to the faster wound healing and was facilitated by the action proteinases. Papain also known to be effective in disloughing necrotic tissue, prevention of infection and the antimicrobial and antioxidant properties related to hydroxyl scavenging and iron chelating properties. Moreover they decrease the risk of oxidative damage to tissue also they show burn healing properties as the increment in hydroxyproline content.<sup>32</sup>

**Anti- HIV agent:-**

Evaluation of anti-HIV-1 effect of *Carica papaya* aerial parts polar extracts and also the investigation of the chemical content from the polar extracts of the plant. The methanol and aqueous extracts of *Carica papaya* were tested for their anti-HIV-1 activity using the syncytia formation assay. Methanol and aqueous extracts of *Carica*

papaya aerial parts showed activity as anti HIV-1 agents, both of the extracts therapeutic index (TI) of 5.51 and 7.13 compared with the standard drug. Phytochemical analysis of both the extracts proves the presence of phytocomponents as flavonoids, tannins, alkaloids, carbohydrates and triterpenes. The results have shown that *Carica papaya* methanol and aqueous extracts have drug ability as anti- HIV agent<sup>33</sup>

#### **Taxonomy, Morphology and Distribution Botanical Classification.**

Domain:	Flowering plant
Kingdom	Plantae
Sub Kingdom	Tracheobionta
Class	Magnoliopsida
Subclass	Dilleniidae
Superdivision:	Spermatophyta
Phylum:	Streptophyta
Order:	Brassicales
Family:	Caricaceae
Genus	<i>Carica</i>
Botanical Name	<i>papaya</i> Linn

#### **Nutritional value:-**

Constituents	Ripe Papaya	Green Papaya
Water	89.1 gm	92.6 gm
Proteins	8.26 gm	10.8 gm

### Conculsion:-

Papaya (*Carica papaya* Linn.) is well known for its exceptional and medicinal properties throughout the world. The whole Papaya plant including its leaves, seeds, ripe and unripe fruits and their juices is used as traditional medicine. *Carica papaya* is a nutraceutical plant having a wide range of pharmacological activities. The whole plant has its own medicinal value. The wide range of enzymes, vitamins present in *Carica papaya* makes it a nutraceutical plant.

#### Abstract

Recent molecular studies of fetal hemoglobin (HbF) regulation have shown promise for the development of clinical HbF inducers to be used in patients with  $\beta$ -thalassemia and sickle cell disease. However, while numerous promising inducers of HbF, have been studied at past in  $\beta$ -thalassemia patient with limited success resulted no universally effective agents. Increased production of fetal hemoglobin (HbF) can ameliorate the severity of both  $\beta$ -thalassemia and sickle cell disease (SCD), the major disorders of  $\beta$ -hemoglobin. The defective production of the  $\beta$ -globin molecule in patients with  $\beta$ -thalassemia can be compensated for by an increase in the production of the  $\beta$ -like globin molecule,  $\gamma$ -globin, which pairs together with  $\alpha$ -globin chains to form HbF. Here we examined the clinical studies of one HbF inducer Trans-Resveratrol and found Complete Response (52.2%), Partial Response (18.2%) and Non response (15.9%) in patients who, after more than one year of treatment, remained at the different level of transfusion dependency with extended transfusion intervals. The present study is to provide a resource that will be valuable for the design of future studies of HbF inducers in  $\beta$ -thalassemia. According to our knowledge and literature review, probably this could be the first report for resveratrol clinical trial in eastern Indian population.

#### Introduction:-

Resveratrol (3,4',5-trihydroxystilbene) belongs to a class of poly-phenolic compounds called stilbenes (1) which is effective in response to stress, injury, fungal infection, or ultraviolet (UV) radiation (2). Resveratrol is a fat-soluble compound that occurs in a *trans* and a *cis* configuration in combination to glucose forming glucosides. Resveratrol-3-O-beta-glucoside is called piceid (3). Literature study revealed that, Scientists became interested in exploring potential health benefits of resveratrol in 1992 when its presence was first reported in red wine (4), and more recently, reports on the potentiality of resveratrol to inhibit the development of cancer (5) and extend lifespan (6) in cell culture and animal models have continued to generate scientific interest. From 2005 until the middle of 2010, there have been more than thousands new studies on cells, animals, and humans. Not a single commercially available drug was known to medical science which had the wide range of potential preventative, therapeutic, and quality of life enhancement properties as like as resveratrol. It has been shown to inhibit cancer, kill bacteria, viruses

and fungal infections, extend life span in animals, improve energy production in cells, quench free radicals, increase glucose tolerance in diabetics, improve cardiac function, enhance physical and mental fitness and concentration, repair damage of DNA, prevent cell damage from nuclear radiation, and much more.

The  $\beta$ -thalassemias are characterized by a very heterogeneous group of inherited mutations causing abnormal expression of globin genes, leading to total absence or quantitative reduction of synthesis of  $\beta$ -globin chains (7-9). This disease is frequent in the Mediterranean area, Middle East, Africa and Asia. More than 200 different mutations have been identified in  $\beta$ -thalassemia patients, including deletions of the  $\beta$ -globin gene region, stop codons leading to premature termination of a non-functional  $\beta$ -globin chain, mutations suppressing correct maturation of the  $\beta$ -globin RNA precursor, most of all need regular blood transfusions. (7-11). In addition to 'direct-costs', blood transfusions require accurate monitoring of the safety of the product which involves expensive technologies. As far as alternative therapeutic approaches are concerned, gene therapy and bone marrow transplantations are very promising strategies but they are expected to be useful for only a minority of patients, selected on the basis of biological/genetic parameters and the economic possibility of affording these therapies. Pharmacological therapy including possible exploitation of HbF inducers, is expected to be crucial. Induction of HbF in patients affected by  $\beta$ -thalassemia and sickle cell anemia (SCA) has been suggested as a very promising approach for the conversion of those patients to an independency from blood transfusion (12-19). On this context, the present study was conducted to detect the efficacy of resveratrol as a potent HbF inducing agent.

## Materials and Methods:-

### Study groups:-

Patients with HPLC-screened documented Sickle cell anaemia, S-beta thalassemia, beta thalassaemia, HbE thalassaemia, HbE-beta thalassaemia, HPFH genotypes have been considered in this primary analysis. Age distribution of Patients, Types of thalassaemia, duration of blood transfusion, duration of treatment of resveratrol was clearly depicted in Table-1, 2, 3 and 4 respectively.

**Table 1:- Age distribution of patients.**

Age group	Percent(%)
1-25 years	94.5
25-50 years	5.5

**Table 2:- Types of Thalassaemia**

Types of Thalassaemia	Percent(%)
HbE-Beta (Intermedia)	71.42
HbE	0.7
Beta	26.19
HbSS	0.7
HbD-S	0.7

**Table 3. Duration of Blood Transfusion.**

Duration	Percent (%)
monthly	17.5
< 1 month	5.6
2 months	5.6
> 2 y – 5 y	14.2
10 y	0.8
No Blood Transfusion	56.3

**Table 4:- Duration of Treatment on Resveratrol.**

Trans-Resveratrol therapy continued	Percent(%)
More than 1 year	35.19
More than 6 months	13.89

More than 3 months	24.07
Less than 3 months	6.48
No treatment	20.37

**Collection of Sample:-**

Sample was collected from OPD of Thalassaemia Foundation, Kolkata. Total 220 patients were evaluated. Among which 142 patients with Hb-E and 69 patients with Beta and HPFH and 11 patients with other hemoglobinopathies were observed.

**Hematological Analysis:-**

Analysis (Hb level / Total WBC / Mean Cell Volume / Mean Cell Hemoglobin / Mean Cell Hemoglobin Concentration / Red Cell Distribution Width / Hematocrit) was done by Automated analysis (Cell Counter : Medonic 530, EMERCK).

**Fetal hemoglobin studies:-**

Hb variants' (HbA / HbA2 / HbF & others) levels was estimated by HPLC (High Performance Liquid Chromatography) (Bio-Rad, USA). Estimation of HbF was also done by using HPLC method.

**Biochemical Analysis:-**

Liver Function test (Serum Alanine aminotransferase concentration / Serum Aspartate aminotransferase Concentration / Total protein levels) & Renal Function test (Serum Creatinine concentration) was performed by Biochemical Analyser [Microlab 300, EMERCK].

**Result:-**

The pre-treatment and post-treatment hematological analysis and fetal hemoglobin analysis about 87 patients with resveratrol therapy revealed that there was significant response in hematological parameters for the increase of transfusion time against control. Different blood parameters and their pre-treatment and post-treatment values in beta and E-beta thalassaemia patients were clearly depicted in **Table-5** and **Table-6**. The toxicity and side effect of resveratrol was evaluated by liver function test (LFT) and the bilirubin, SGOT and SGPT value against control were clearly depicted in **Table -7**. Baseline evaluation (clinical and biochemical) of all the patients result shows that, there was *three categories* of response: a **Complete Response** (52.2%) in patients who can able to maintain at an average Hb level of 6-9 gm/dL without blood transfusion, in this group 12.3% patients are without any previous H/O blood transfusion, others shifted from monthly blood transfusion dependency to a stable transfusion-free condition; **Partial Response** (18.2%) in patients who remained transfusion dependent but at longer intervals (2-3 months or more), and **Non response** (15.9%) in patients who, after more than one year of treatment, remained at the same level of transfusion dependency. [**Table 8**]

### Discussion:-

Over the last few years a substantial number of medical schools and research institutions have undertaken studies of resveratrol's ability to prevent or treat disease in humans. The number of such clinical trials is increasing day by day and mostly done on diseases like diabetes, heart disease and thalassaemia. In Thalassaemia, either very few or no red blood cells being produced by the bone marrow after infancy. The treatment is monthly whole blood transfusions and the use of a drug which is extremely toxic and cannot be used safely with children. The disease dramatically impacts the sufferers' quality of life and often results in death around the age of puberty as it is more common in less developed countries where it is virtually impossible for anyone other than the very wealthy to obtain regular supplies of clean whole blood for the required transfusions. So, the fatality rate is high. Even if the patient is able to obtain monthly transfusions and is able to afford the drugs to treat the disease, he or she is constantly anemic and lacking of energy. After the discovery of Transmax resveratrol, the concentrated pure resveratrol supplement used by researchers in most clinical trials, was able to stimulate the production of embryonic red blood cells, the type that are produced when a baby is still in the mother's womb.

Resveratrol has been efficiently inhibiting ribonucleotide reductase as it possesses similar properties to HU toward erythroid differentiation. Resveratrol induces differentiation of K562 cells and augmentation of HbF in erythroid

precursor cells. Comparative analyses demonstrated that resveratrol, as HU, inhibits intracellular adhesion molecule-1 (ICAM-1) and VCAM-1 expression by endothelial cells. In addition, resveratrol possesses other properties similar to HU, including induction of nitric oxide synthase in cultured pulmonary endothelial cells and inhibition of human platelet aggregation in vitro. Interestingly, resveratrol exhibited minimal toxicity on normal hematopoietic cells, as suggested by Clement et al. (20).

In this present study, pre-treatment and post-treatment of resveratrol and evaluation of blood CBC parameters in patients with beta and E-beta thalassaemia shows three categories of response: Complete Response (52.2%; in patients who can able to maintain at an average Hb level of 6-9 gm/dL without blood transfusion, in this group 12.3% patients are without any previous H/O blood transfusion, others shifted from monthly blood transfusion dependency to a stable transfusion-free condition); Partial Response (18.2%; in patients who remained transfusion dependent but at longer intervals : 2-3 months or more) and Non response (15.9%; in patients who, after more than one year of treatment, remained at the same level of transfusion dependency), we observed increase of most of the CBC parameters which strongly indicate that resveratrol is a strong inducer of HbF and a selective stimulator of the expression in  $\beta$ -globin genes.

According to Bianchi et al, when erythroid precursor cells from normal subjects were treated with increasing concentrations of resveratrol, a clear increase in accumulation of  $\gamma$ -globin mRNA content was found. Increase in accumulation of  $\alpha$ -globin and  $\beta$ -globin mRNA was much lower. Taken together these data strongly indicate resveratrol as a strong inducer of HbF and a selective stimulator of the expression in  $\gamma$ -globin genes. (21)

### **Conclusion:-**

For HbF induction therapy to become part of the standard management for patients with  $\beta$ -thalassemia, there needs to be a great deal of work from both basic scientists and clinical researchers. Though several genetic, non-genetic and pharmacological factors reported to influence the Trans-Resveratrol response in different early studies, the response to Trans-Resveratrol is significantly different among good, moderate and non-responders among  $\beta^0$  or  $\beta^+$  thalassaemia mutations. To study whether HbF level has any relation to beta variants responding to Trans-Resveratrol therapy, it has been shown that even among good responders in some cases (8.39 %) patients are not showing high HbF values ( < 20% HbF values are taken). In our study, Trans-Resveratrol therapy completely replaces blood transfusion in 88% cases (79.5% HbE-beta intermedia, 13.6% in beta thalassaemia major and 6.8% in other haemoglobinopathies like HbE disease & Sickle Cell anaemia). Hence it is evident that some other element associated with beta globin gene framework which could related to good response to Trans-Resveratrol, for which further studies required.

### **Funding statement:-**

This research received no specific grant from any funding agency in the public, commercial or not-for-profit sectors. All the research work done by the affiliated institution funding.

### **Competing Interests Statement:-**

The authors declare that they have no competing interests.

### **Data Sharing Statement:-**

We cannot share any unpublished data with other laboratory or person.

### **Patients Consent Statement:-**

The signed consent from all the patients were taken before test was performed and kept them as official documents. In case of any unusual condition it will be presented in front of the concerned person.

### **Acknowledgement:-**

Author acknowledges Institute of Genetic Medicine and Genomic Sciences for funding and affiliation. We are also thankful to other laboratory members and other associated persons of IGE and IGMGS for their enthusiastic participation.

e-waste management, environmental pollution, recycling.

#### Abstract

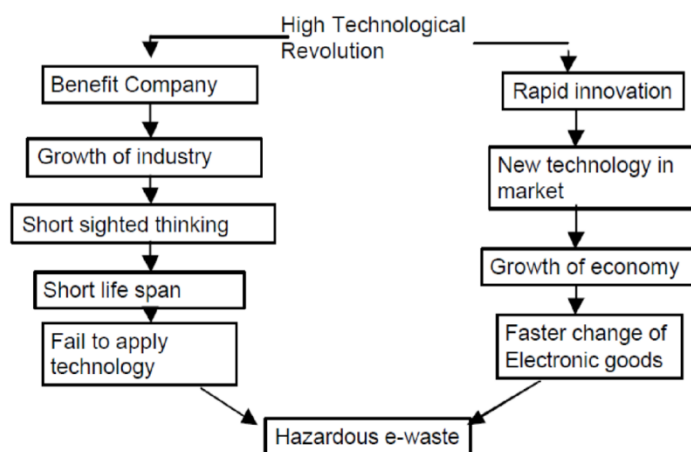

In this paper the environmental problems related with the discarded electronic appliances, known as e-waste. The current and the future production of e-waste, the potential environmental problems associated with their disposal and management practices are discussed whereas the existing e-waste management schemes in Greece and other countries (Japan, Switzerland) are also quoted.

#### Introduction:-

In recent years, there has been increasing acknowledgment of our impact on the environment due to our fast lifestyle, while the need to adopt a more sustainable approach concerning of our actions, our consumption habits emerges as of particular significance. This trend regards industrial sectors affecting the consumption habits and, especially, electronic industry where the short life cycles and the rapidly developing technology have led to increased e-waste volumes. The majority of e-waste elements are led to landfills. However, their partial recyclability, due to their material composition along with the unavoidable restrictions in landfills, has led to the development of retrieval techniques for their recycling and re-use, highlighting the significance of e-waste recycling, not only from a waste management aspect but also from a valuable materials' retrieval aspect.

#### Electronics Helpful Vs Harmful

#### What is E-Waste:-

The electronics industry is the world's largest and fastest growing manufacturing industry [1]. In the last few years, it has played a significant part in socio-economic and technological growth of societies. The Basel convention

defines wastes as substances or objects which are disposed of or are intended to be disposed of by the provisions of national laws.

“**Electronic waste** or **e-waste** describes discarded electrical or electronic devices. Used electronics which are destined for reuse, resale, salvage, recycling or disposal are also considered e-waste. Informal processing of e-waste in developing countries can lead to adverse human health effects and environmental pollution.

Electronic scrap components, such as CPUs, contain potentially harmful components such as lead, cadmium, beryllium, or brominated flame retardants. Recycling and disposal of e-waste may involve significant risk to workers and communities in developed and developing countries<sup>[2]</sup> and great care must be taken to avoid unsafe exposure in recycling operations and leaking of materials such as heavy metals from landfills and incinerator ashes.<sup>[3]</sup>”

**List of major Hazardous components of E-waste:-**

E-Waste Component	Processed Used	Adverse Health Effects
Americium	The radioactive source in smoke alarms. <sup>[5]</sup>	It is known to be carcinogenic
Lead	Solder, CRT monitor glass, lead-acid batteries, some formulations of PVC. A typical 15-inch cathode ray tube may contain 1.5 pounds of lead, but other CRTs have been estimated as having up to 8 pounds of lead.	Adverse effects of lead exposure include impaired cognitive function, behavioral disturbances, attention deficits, hyperactivity, conduct problems and lower IQ. These effects are most damaging to children whose developing nervous systems are very susceptible to damage caused by lead, cadmium, and mercury.
Mercury	Found in fluorescent tubes (numerous applications), tilt switches (mechanical doorbells, thermostats), <sup>[8]</sup> and flat screen monitors.	Health effects include sensory impairment, dermatitis, memory loss, and muscle weakness. Exposure in-utero causes fetal deficits in motor function, attention and verbal domains. <sup>[6]</sup> Environmental effects in animals include death, reduced fertility, and slower growth and development.
Cadmium	Found in light-sensitive resistors, corrosion-resistant alloys for marine and aviation environments, and nickel-cadmium batteries. The most common form of cadmium is found in Nickel-cadmium rechargeable batteries. These batteries tend to contain between 6 and 18% cadmium. The sale of Nickel-Cadmium batteries has been banned in the European Union except for medical use. When not properly recycled it can leach into the soil, harming microorganisms and disrupting the soil ecosystem. Exposure is caused by proximity to hazardous waste sites and factories and workers in the metal refining industry.	The inhalation of cadmium can cause severe damage to the lungs and is also known to cause kidney damage. <sup>[7]</sup> Cadmium is also associated with deficits in cognition, learning, behavior, and neuromotor skills in children
Hexavalent chromium	Used in metal coatings to protect from corrosion.	A known carcinogen after occupational inhalation exposure. <sup>[6]</sup> There is also evidence of cytotoxic and genotoxic effects of some chemicals, which have been shown to inhibit cell proliferation, cause cell membrane lesion, cause DNA single-strand breaks, and elevate Reactive Oxygen Species (ROS) levels.

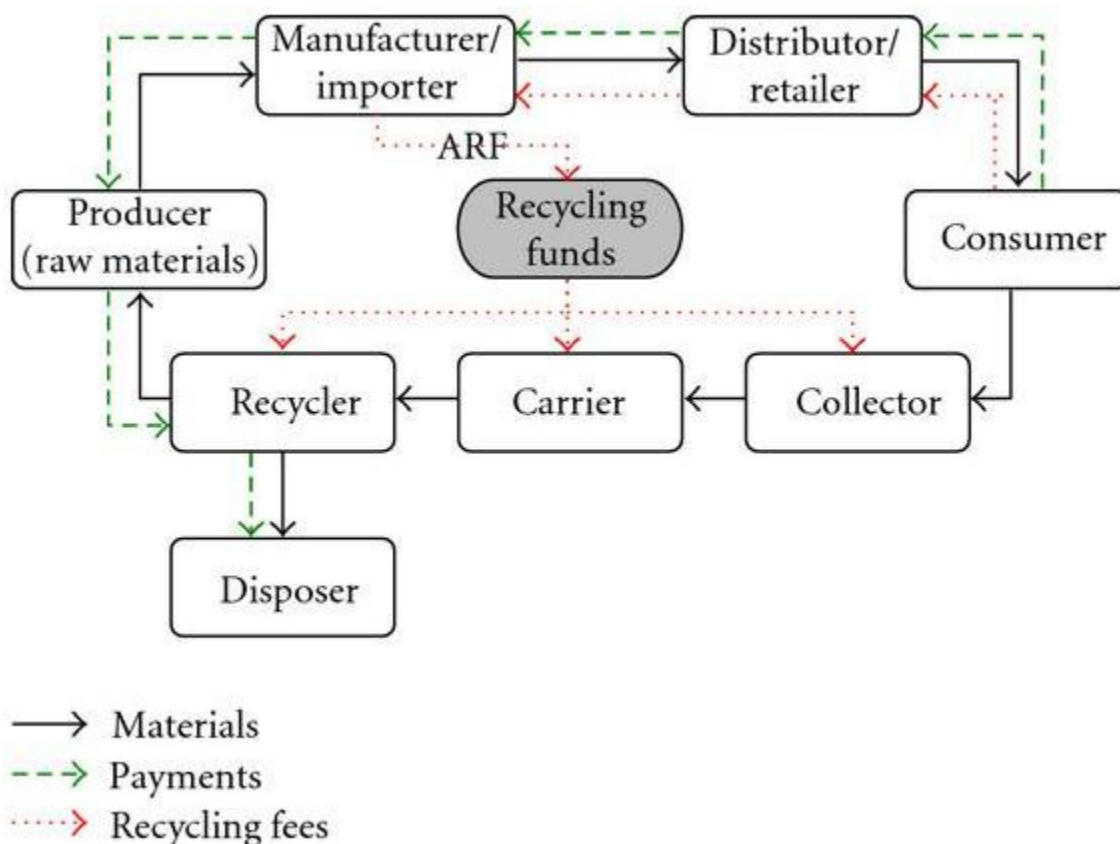

Sulphur	Found in lead-acid batteries.	Health effects include liver damage, kidney damage, heart damage, eye and throat irritation. When released into the environment, it can create sulphuric acid through sulphur dioxide.
Brominated Flame Retardants (BFRs)	Used as flame retardants in plastics in most electronics. Includes PBBs, PBDE, DecaBDE, OctaBDE, PentaBDE.	Health effects include impaired development of the nervous system, thyroid problems, liver problems. <sup>[9]</sup> Environmental effects: similar effects as in animals as humans. PBBs were banned from 1973 to 1977 on. PCBs were banned during the 1980s.
Beryllium oxide	Filler in some thermal interface materials such as thermal grease used on heatsinks for CPUs and power transistors, <sup>[11]</sup> magnetrons, X-ray-transparent ceramic windows, heat transfer fins in vacuum tubes, and gas lasers.	Occupational exposures associated with lung cancer, other common adverse health effects are beryllium sensitization, chronic beryllium disease, <sup>[10]</sup> and acute beryllium disease. <sup>[10]</sup>

**Generally non-hazardous:-**

E-Waste Component	Process Used
Copper	copper wire, printed circuit board tracks, component leads.
Zink	plating for steel parts.
Aluminium	nearly all electronic goods using more than a few watts of power (heatsinks), electrolytic capacitors.
Germanium	1950s–1960s transistorized electronics (bipolar junction transistors).
Gold	connector plating, primarily in computer equipment.
Tin	solder, coatings on component leads.

**The environmental impact of the processing of different electronic waste components<sup>[11]</sup>:-**

E-Waste Component	Process Used	Potential Environmental Hazard
Cathode ray tubes (used in TVs, computer monitors, ATM, video cameras, and more)	Breaking and removal of yoke, then dumping	Lead, barium and other heavy metals leaching into the ground water and release of toxic phosphor
Printed circuit board (image behind table – a thin plate on which chips and other electronic components are placed)	De-soldering and removal of computer chips; open burning and acid baths to remove metals after chips are removed.	Air emissions and discharge into rivers of glass dust, tin, lead, brominated dioxin, beryllium cadmium, and mercury
Chips and other gold plated components	Chemical stripping using nitric and hydrochloric acid and burning of chips	PAHs, heavy metals, brominated flame retardants discharged directly into rivers acidifying fish and flora. Tin and lead contamination of surface and groundwater. Air emissions of brominated dioxins, heavy metals, and PAHs
Plastics from printers, keyboards, monitors, etc.	Shredding and low temp melting to be reused	Emissions of brominated dioxins, heavy metals and hydrocarbons

**Process of E-waste:-**

Source: E-waste Inventory Project in Malaysia Report, 2009

**E-waste Global scenario:-**

As far as global e-waste management is concerned, Switzerland is the first country to implement the organized e-waste management system in the world. Extended Producer Responsibility (EPR) and Advance Recycling Fee (ARF) are the backbone of e-waste management system in Switzerland and other developed countries. Advanced countries like USA, UK, France & Germany generate 1.5 to 3 million tons of e-Waste annually and are among the largest generators of e-Waste. But these countries also have standardized e-waste management processes in place. Proper e-Waste management, from efficient sourcing and collection right upto extraction and disposal of material, has ensured that this huge pile of junk turns into a lucrative business opportunity.

**E-Waste Scenario in India:-**

Increased usage of gadgets, telecom, information and technology and appliances is collectively creating nearly 13 lakh tons of e-Waste annually in India according to an August 2014 report by the industrial body ASSOCHAM. The report also highlighted that Delhi-NCR, Mumbai and the IT capital of India, Bengaluru collectively produce over 2 lakh tons of e-Waste per year. Another January 2015 report from Markets and Research has forecast that the Indian e-Waste market will grow at 26.22% CAGR during 2014-2019. However, with so much electronic waste being generated in the country, a major portion is handled by the informal or unorganized sector using improper processes, which leads to environmental pollution and health hazards.

**Unorganized e-Waste Processing in India – An Environmental Hazard<sup>[12]</sup>:-**

Majority of the e-waste comprises computers, while telecom, electrical gadgets and health equipment account for the remainder. Apart from various toxic substances like lead, mercury and arsenic, electronic waste also contains valuable substances like gold, silver and rare earth elements. When it comes to managing e-waste, India is relying heavily on the unorganized sector which accounts for over 90 per cent of the entire e-waste recycling industry. Unorganized setups generally employ low paid workers, including over 4.5 lakh children (ASSOCHAM report), who are not trained properly to process e-waste. Working conditions in these informal e-scrap processing setups are

gravely hazardous. Dismantling or recycling of e-waste in the informal sector using crude and primitive methods with bare hands and no facemasks, like acid stripping and open air incineration releases numerous lethal components like polyvinyl chloride, chlorofluorocarbons, arsenic, nickel and barium, among others, into the environment causing medical conditions like cancer, asthma, bone diseases and brain diseases. Majority of the global waste is produced by the developed nations. Recycling of e-Waste in western countries is exponentially high as compared to developing nations like India which have abundant space to absorb any kind of waste. It is ten times cheaper to ship electronic waste to Asia than recycling for USA. United States of America (42%) tops the list of nations from which India imports e-Waste followed by China (30%) and European Union (18%) as reported in the ASSOCHAM paper. Import of e-waste for recycling is prohibited in India – however, according to a MAIT-GTZ survey 50,000 tons of electronic scrap is imported annually through miss declaration by companies making India one of the biggest yards of e-waste.

#### **Need for the Guidelines for Environmentally Sound Management:-**

Environmentally sound recycling/re-processing<sup>[14]</sup> of e-waste starts with decontamination/ dismantling where the concentration of hazardous material/chemical is reduced followed by recycling and recovery of the material of economic value and then disposal of the residue in TSDF (Treatment, storage & Disposal facility). The second category equipment like refrigerators, air conditioners and washing machines primarily contain steel plastics and copper wiring. It also contains potentially harmful substance such as CFCs/HCFs gases which have high ozone depletion potential. The compressor oils are hazardous waste that need proper disposal at TSDFs or can be processed in cement kilns. Environmentally sound recycling is required to ensure safe collection and disposal of these substances.

MoEF/CPCB after consulting various stake holders felt the need for preparing a guidance document for implementation of the provisions of the E-Waste (Management & Handling) Rules, 2011 that may help the Producers, Consumer & Bulk Consumer, Collection Center, Dismantler, Recycler and Regulatory agencies (SPCBs/PCCs) for effective compliance/implementation of these rules. This document also provides guidance on setting up collection mechanism, dismantling and recycling operations. As the E-waste Rules place main responsibility of e-waste management on the producers of the electrical and electronic equipment by introducing the concept of “extended producer responsibility”(EPR). The scope of implementing such EPRs is also discussed in these guidelines.

#### **The collection centre has to comply with following legal requirements:-**

- To obtain an authorization from the concerned SPCBs/PCCs
- To ensure that the e-waste collected by them is sent to registered dismantlers or recyclers in a secured manner.
- To maintain records of the e-waste handled in Form 1
- To file annual returns in Form 2
- To make the records available for scrutiny by the SPCBs/PCCs

#### **Conclusion:-**

Despite the various new technologies that are emerging for e-waste disposal, landfilling still remains the most common practice in the society. The establishment and closure of landfills could pose a potential hazard to ground water, due to leachate seepage, and air quality due to gases released. Unless proper maintenance and management is sustained for a fairly long time (30 years), public health may be compromised as a result. Such management is costly and potentially dangerous if faulty. Thus, a safer and more sustainable approach may be used for minimizing the number of landfills constructed and insuring their longevity so as not to continue taking viable land for waste disposal. It is therefore critical to divert waste from landfills through reduction and recycling.

##### Key words:-

Incisionnal hernia, coelioscopy, diagnosis, prevention.

#### Abstract

The post-laparoscopic incisional hernias are uncommon complications whose incidence has increased with the development and widening of indications for laparoscopy. Their diagnosis must be evoked clinically in front of any atypical parietal signs or occlusive table, confirmed in imaging. Their management depends on the seat and the hernial content. The prevention consists in preventing the worsening of the parietal defect induced by the trocars or the early tensioning of the abdominal wall.

Copy Right, IJAR, 2016., All rights reserved.

#### Introduction:-

Le développement de la cœlioscopie et l'élargissement de ses indications, ces dernières années, ont fait largement diminuer le nombre des complications classiques de la laparotomie. Toutefois, les hernies incisionnelles post-cœlioscopiques (HIPC) ou sur orifice de trocart restent peu fréquentes. Nous rapportons le cas d'une observation illustrant cette affection tout en rappelant les éléments de leur diagnostic, les facteurs prédisposant et les moyens de leur prise en charge.

#### Observation:-

Il s'agit d'une patiente âgée de 24 ans qui était opérée, 06 jours auparavant, pour kyste ovarien droit par cœlioscopie et qui présentait un syndrome occlusif. Le bilan biologique montrait un discret syndrome inflammatoire peu spécifique. L'échographie objectivait un épanchement péritonéal de moyenne abondance. La TDM abdominale mettait en évidence l'hernie d'une anse grêlique à paroi légèrement épaissie et rehaussée après injection de PDC iodé à travers un défaut pariétal latéral gauche avec une distension des anses grêliques, des niveaux hydro-aériques de type grêliques et une ascite de moyenne abondance sans signes de d'ischémie intestinales (**figures 1 et 2**). Le diagnostic d'une occlusion grêlique sur hernie incisionnelle étranglée post-cœlioscopique était posé. L'exploration chirurgicale objectivait l'incarcération d'une anse grêlique dans l'orifice du trocart latéral gauche. L'anse était rose sans signes de souffrance ou de nécrose visibles. L'anse avait été réintroduite avec fermeture pariétale. Les suites opératoires étaient simples avec bonne évolution clinique.

**Corresponding Author:- H. Doulhousne.**

**Address:-** Service de radiologie, Hopital militaire Avicenne, Marrakech, Maroc.

**Iconographies :**

Figure 1:- Hernie d'une anse grélique a paroi légèrement épaissie et rehaussée après injection de PDC à travers un défaut pariétal latéral gauche.

Figure 2:- Aspect TDM d'une distension des anses grêliques avec niveaux hydro-aériques.

**Discussion:-**

Les hernies post-coelioscopiques (HPIC) ou sur orifice de trocart sont des complications peu fréquentes avec une incidence approximative de 1 % [1,2]. Leur survenue est directement liée au diamètre du trocart utilisé [3]. Elles se voient le plus souvent avec des trocarts de diamètre supérieur ou égal à 10 mm [2,4]. Les manipulations répétitives, les interventions prolongées, les manœuvres de repositionnement et les extractions des pièces opératoires par les orifices provoquent des lésions de diamètre supérieur à celui du trocart lui-même [2]. De même, l'utilisation de trocarts coniques entraînerait moins d'HPIC que les trocarts coupants du fait de leur effet délabrant moindre [6]. Les HPIC ombilicales représentent 31 % des cas publiés [6]. Ceci s'explique par la faiblesse de cette zone anatomique et son potentiel herniaire, majorés par la présence d'une hernie ombilicale préexistante à l'intervention chirurgicale. En dehors de l'ombilic et de la ligne blanche, le risque herniaire est moindre. Cependant, l'évolution de la coelioscopie et l'élargissement de ces indications ont poussé vers des procédures plus complexes et une utilisation de trocarts opératoires et donc des manipulations itératives et prolongées dans ces orifices induisant des lésions plus larges [6,7]. Ces HPIC sont dans la plupart des cas symptomatiques et se voient généralement dans les jours ou les semaines qui suivent l'acte chirurgical. C'est le cas chez notre patiente. Le tableau clinique peut correspondre à une douleur pariétale simple, une voussure ou carrément un syndrome occlusif. Ce dernier était le mode révélateur dans notre cas. Toutefois, certains cas peuvent être asymptomatiques, diagnostiqués lors d'un examen systématique. Le contenu intra-herniaire dépend de la position du trocart incriminé. L'intestin grêle est le plus souvent concerné. L'incarcération du grand épiploon vient en seconde position avec 23 % des cas, celle du colon est beaucoup plus rare. Le diagnostic des HPIC est souvent clinique. L'échographie, ou mieux le scanner, permet de confirmer le diagnostic en montrant l'issue du sac herniaire à travers le défaut pariétal incisionnel, d'étudier son contenu et de

chercher d'éventuels signes d'occlusion ou de souffrance imposant une prise en charge chirurgicale [6]. La TDM a permis de poser le diagnostic chez notre patiente, de faire le bilan lésionnel et d'orienter la conduite thérapeutique.

La plupart des cas publiés ont nécessité une réintervention chirurgicale [1,6]. La laparotomie reste la voie d'abord la plus utilisée. Toutefois, des voies coelioscopiques ont été utilisées avec succès [6]. Certaines mesures de prévention ont été préconisées pour éviter la survenue de ces hernies. En préopératoire, la palpation de l'ombilic et la programmation d'une cure chirurgicale de toute hernie ombilicale sont systématiques [8]. En peropératoire, il est préférable d'utiliser des trocars de petit diamètre, d'éviter les manœuvres itératives et de repositionnement ainsi que l'extraction des pièces opératoires par les orifices étroits. Il est aussi souhaitable de s'assurer de l'évacuation du pneumopéritoine, en fin de l'intervention, pour éviter l'expulsion du contenu abdominal avec le CO<sub>2</sub> lors de l'ablation des trocars [2,3, 4]. La fermeture de la paroi semble être l'élément essentiel de cette prévention, elle est généralement admise pour les trocars de diamètre supérieur ou égal à 10 mm [6,9, 10]. Elle consiste couramment en la fermeture de l'aponévrose par un ou deux points. Pour cela plusieurs techniques de fermetures ont été proposées mais aucune n'est approuvée. Il est également recommandé aux patients d'éviter tout effort de port ou de sport dans le mois qui suit l'intervention [11].

### **Conclusion:-**

Les HIPC sont une complication dont l'incidence réelle est méconnue. Leur diagnostic doit être évoqué devant tous signes pariétaux inhabituels ou syndrome occlusif chez un patient ayant subi une intervention récente par coelioscopie. Leur prévention repose sur des mesures évitant d'aggraver le défaut pariétal, induit par le trocar, ou de mettre en tension précoce une paroi cicatricielle.

### Abstract

**Aim:** To evaluate the efficacy of autogenous and composite graft in anterior maxilla for implant placement.

**Material and methods:** A prospective, double blinded, randomised controlled study was conducted among 10 subjects between 2014 and 2015 who sustained injury due to road traffic accident associated with avulsion of anterior maxillary teeth and loss of labial cortical bone. These subjects were randomly categorized into two groups. Group A consisted of 5 subjects in whom autogenous chin graft was used to augment anterior maxilla while in Group B having another 5 subjects, composite graft (mixture of crushed alveolar bone and allograft - Bi-Oss powder) was used. All the patients were evaluated clinically for donor and recipient site morbidity, healing of soft tissue, and amount of bone formed with resorption pattern radiographically.

**Results:** There was no significant recipient site morbidity found in Group B, whereas in Group A all subjects manifested with mild swelling and pain (Visual analog scale score >3 on 10cm scale) and 1 subject has mild paresthesia of lower lip for few weeks.

**Conclusion:** Both the types of grafts used for augmentation of anterior maxilla prior to implant placement presented with the same amount of bone formation, graft resorption and healing of soft tissues. However, there was a difference noticed in recipient site morbidity and torque obtained which was in favour of using a composite graft.

### Introduction:-

Alveolar bone resorption secondary to extraction or loss of tooth is a natural phenomenon. Intensity of resorption is greater in the cases with traumatic loss of the tooth especially maxillary anterior teeth which is usually associated with the loss of labial cortical bone as well. Such patients seeking for the replacement of their missing teeth, wish to choose an option which is next to natural. Dental implants over a period of last two decades have shown promising results in this field but in most of these cases clinicians encounter inadequate width and depth of the bone required for the successful placement of a dental implant. Normally also when it comes to the replacement of teeth in maxilla, it presents with a cancellous and D3 type of bone density, amount of resorption is also high especially in the maxillary anterior region, which is of more aesthetic concern to the patient. In patients with history of traumatic tooth loss especially in anterior maxilla, the situation is even worst. Initial stabilization of an implant is quite difficult to achieve in such cases.<sup>1,2</sup>

The present study was conducted to weigh merits and demerits of autograft over composite graft in 10 subjects who reported to our unit seeking replacement of missing teeth in anterior maxilla with dental implants.

### Materials and Methods:-

A prospective randomised study conducted in 10 subjects with history of loss of maxillary anterior teeth due to road traffic accident reported to our unit for rehabilitation with dental implant. Their age ranged between 24-32 years and were randomly categorized into Group A and Group B. In Group A, alveolar augmentation was done using autogenous chin block graft while in Group B augmentation was performed using composite particulate graft (mixture of alveolar bone and allograft - Bio-Oss). The parameters evaluated were ease of implant placement, pain, paraesthesia, vitality of associated teeth, cost, amount of bone formed, graft resorption 3 months postoperatively.

### Surgical technique:-

The surgical procedure was performed in sterile surgical field and after obtaining adequate anaesthesia. In Group A patients, for harvesting the graft a vestibular incision extending from mandibular first premolar on either side was given and mucoperiosteal flap is reflected. Piezo-osteotome was used to make osteotomy cuts following Rule of 5 i.e. maintaining 5mm safety margin from mental foramen on both sides, 5mm below apices of teeth and 5mm above lower border of mandible as shown in Figure 01.<sup>3</sup> The recipient site is exposed using a crestal incision and the harvested graft was placed followed by fixation using Titanium screw, perforations were made in the recipient site to induce bleeding and allow rapid take-up of the graft. After 3 months Titanium screws were removed and implant was placed. In Group B after exposing the recipient site, autograft was collected by nibbling or scrapping the adjacent alveolar bone which was then mixed with the allograft. This prepared composite graft is then positioned and secured with a collagen membrane and closure was done.

### Results:-

Among 10 subjects included in the study were randomly categorized into 2 groups. Group A in which autograft was used for augmentation, and Group B where composite graft (Alveolar graft mixed with Bio-Oss and Biomembrane) was used. Demographic data in both the groups was comparable. Mean age in Group A was 27.8 and in Group B 28.2 with no statistical significance. Etiology for loss of teeth in all individuals was road traffic accident involving anterior maxillary alveolus. Amount of bone was measured clinically and radiographically before and after augmentation. Preoperatively the mean available bone when measured clinically was 2-3mm (mean 2.6mm) and when measured radiographically using CBCT was 2-3mm (mean 2.2mm) in both the groups. 3 months postoperatively the amount of bone available was 8-10mm (mean 2.6) in group A and 6-8mm (mean 2.2mm) in group B which may be attributed to the more amount of autogenous bone harvested.

Obtaining alveolar bone mixing with Bio-Oss and Biomembrane was comparatively easily as it consumed less time, machine and manpower. Whereas, Autogenous graft obtained required Piezo-osteotome, consumed time and associated with postoperative morbidity at donor site. Therefore, the need to develop an allograft, alloplast, or xenograft substitute is widely recognized.<sup>4</sup>

To utilise properties of both autograft and allograft we have preferred using composite graft (Alveolar bone along with Bio-Oss and Biomembrane) as a graft material. Bio-Oss and Biomembrane aids in formation of new bone as stated by Banwart JC et al.<sup>5</sup> After 3 months the recipient site was evaluated for amount of bone formed. Adequate bone height and width is formed clinically with mean of 8.8mm and radiographically mean of 8.8mm in Group A. In group B mean bone formed was 7.2mm clinically and 6.8mm radiographically. There was statistically significant difference in both groups clinically and radiographically 0.05mm and 0.02mm respectively as shown in Table 02. Implants were placed after 4 months. Mean torque obtained was 38mm and 33mm in group A and B respectively which was statistically significant (p 0.02) as shown in Table 03.

In all subjects there was ease in placement of implant. Postoperative swelling was measured both at recipient site and donor site 24<sup>th</sup>, 48<sup>th</sup> and 1 week duration. Postoperative swelling at recipient site was not statistically significant in both groups (0.072). There was no difference on 24<sup>th</sup> hr and 1 week postoperatively. However on 48<sup>th</sup> hr statistically significant difference in postoperative swelling at donor site was seen. (P- 0.011) In both the groups implants were placed successfully after 3 months of grafting. Postoperative paraesthesia was measured at both donor and recipient site. Amongst all 10 subjects one among them reported with mild paraesthesia for few weeks at recipient where block graft from chin was harvested for few weeks which was not statistically significant. (P

0.317). Postoperative pain at donor and recipient site was also not significant in either of the groups (P 0.134). Healing of soft tissue in either sites and groups was uneventful. (Table 01).

**Discussion:-**

The bone substitute needed for each bone regeneration procedure must be designated based on the individual's characteristics, and the surgical procedure itself. Features such as the osteogenic potential of the host residual bone, systemic condition of subjects and morphology of the defects, will delimit the ideal bone substitute for each situation. In maxilla, centripetal pattern of alveolar resorption, pneumatization of maxillary sinuses, presence of nasal fossae and nasopalatal duct, poor bone quality (D3) complicate implant placement.<sup>6</sup>

There are several methods available to augment the atrophic maxilla, including onlay bone grafting, sinus/nasal bone grafting, guided bone regeneration, interpositional grafting, ridge splitting, and distraction osteogenesis. The choice of a particular technique depends on the need for horizontal or vertical augmentation, degree of atrophy, type of prosthesis, and clinician or patient preference. Autogenous bone grafting offers a well-proven predictable method for ridge augmentation and defect repair for dental implant placement. There are several advantages of using autogenous bone grafts.<sup>7,8</sup>

Autogenous graft obtained can either be from intraoral sites or extraorally. Intraoral sites include chin, ramus of the mandible, maxillary tuberosity, anterior nasal spine, alveolar ridge, tori etc which can provide upto 3-11cc of bone volume. Extraoral sites include iliac crest, fibula, tibia etc and provides upto bone volume of 25-150cc.<sup>7,9</sup> Composite

graft can be obtained by combination of autogenous graft harvested from any intraoral or extraoral site combining it with Bio-oss and Biomembrane.

The structure of the bone harvested affects how the graft will incorporate into the recipient site. Cortical block grafts heal through creeping substitution which means once the graft is fixed to the site, osteoclasts begin to resorb the graft material through existing Haversian systems which allows ingrowth of fibrovascular tissue and the secretion of osteoid by osteoblasts. Unlike cortical block grafts, particulate grafts begin with apposition of osteoid and fibrovascular ingrowth through the existing particulate scaffold. Apposition is then followed by resorption and replacement of graft material by more organized lamellar bone. Due to increased vascularization, particulate grafts have greater resorption of the transfer bone and a larger percentage of newly formed bone in comparison with cortical grafts.<sup>9</sup> This is in conjunction with the findings of the present study. In group B when particulate composite graft was used the amount of resorption of the graft was more as compared to group A.

Mish CM et al stated advantages of the symphysis graft compared with other bone regenerative methods for implant placement in maxillary alveolar defects and a superior quality of bone was found with shorter healing period. Easy access, availability of greater quantities of bone over other intraoral donor sites, low morbidity, no hospitalization, minimal discomfort, no alteration in ambulation and no cutaneous scar.<sup>8,10</sup>

However there are few limitations and difficulties which the subject may encounter, as stated by Jaime Clavero et al<sup>11</sup> i.e. stiffness and limited mobilization of the vestibule in the anterior mandibular area during the postoperative period. Some subjects also complained of numbness in the anterior mandibular incisors and canines and decreased sensitivity in the innervation area of the terminal mental nerve branches.

Yildirim M et al<sup>12</sup> stated that augmentation using a mixture of Bio-Oss and bone harvested intraorally from the mandibular symphysis, retromolar space, or the tuberosity region and concluded that the combination of osteoconductive Bio-Oss and osteoinductive autogenous bone thus proved to be a material suitable for augmentation.

Grafts harvested from membranous bone show less resorption than endochondral bone grafts. Furthermore, membranous cortical grafts revascularization is more rapid than endochondral bone grafts. Therefore, embryological origin of donor bone is an important factor for a successful recovery period.<sup>13,14,15</sup>

Hising P et al<sup>16</sup> stated that from the time of implant placement and irrespective of loading time, a survival rate of 80.5% for the individual implants was estimated. In most patients (73%), Bio-Oss was mixed with autogenous bone from the chin. However, the results indicated that autogenous bone may be excluded from the Bio-Oss graft.

Healing of bone grafts takes place by either of the biological processes known as osteogenesis, osteoconduction and osteoinduction. Autogenous bone grafts take up by osteogenesis, osteoconduction and osteoinduction while alloplast is taken up by osteoconduction.<sup>9</sup>

In either of the cases postoperative healing of soft and hard tissue was uneventful. Both autograft and composite graft are equally effective with no significant donor site morbidity.<sup>17</sup> However, autograft has an edge over composite graft in providing adequate amount of bone.

### **Conclusion:-**

Dental implants being the most preferred option, has enhanced the usage of bone grafts and its substitutes. Both grafts were ideal in obtaining adequate bone volume, however the autogenous graft provided more bone volume. To conclude a combination of autograft and allograft (composite graft) gives adequate bulk of graft required and larger sample size and follow up is required.

Phase transition  
Specific heat.

#### Abstract

Thermodynamic properties of  $^{40}_{20}\text{Ca}$  and  $^{46}_{20}\text{Ca}$  have been calculated using an intergrated nuclear model substituted into the specific heat capacity formula. The transition temperature is obtained from the graphs of specific heat verses temperature. The transition temperature for  $^{40}_{20}\text{Ca}$  is  $1.9 \times 10^9 \text{ K}$  and  $2.31 \times 10^9 \text{ K}$  for  $^{46}_{20}\text{Ca}$ .

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

The properties and structure of an atomic nuclei are highly dependent on mass number (A) and on the ratio between the number of protons and the number of neutrons in the nucleus (Kenneth *et al*, 2002) since discovery of atomic nucleus, considerable efforts have been exerted to construct a general theory of the nucleus that would cover the entire range of known nuclei and have strong predictive power.

In infinitely extended nuclear systems such as neutron star matter and nuclear matter, such as neutron star matter and nuclear matter, the study of superfluidity and pairing has a long history (Cooper *et al*, 1959, Emery *et al*, 1960, Migdal 1959, Khanna 1962) even predating the 1967 discovery of pulsars (Hewish *et al*, 1968) which were soon identified as rapidly rotating magnetic neutron stars.

#### Material and Methods:-

The intergrated nuclear model (Ghahramany *et al*, 2001) predicts the binding energy based on some principles proposed by Weizsacker (Greenwood and Cottingham, 2001). It presents nuclear binding energy of all elements based on the following assumptions;

- 1) The nuclear binding energy is of the order of about one percent of the energy of the total rest mass of the constituent nucleons (Greenwood and Cottingham, 2001).
- 2) The nuclear binding energy is proportional to the volume of the nuclides ( $B \propto A$ )
- 3) The nuclear binding energy depends upon the asymmetry between the number of protons and neutrons (specially in heavy nuclides) and also depends upon the coulomb repulsion force between protons.

The binding energy is expressed as

$$B(Z, N) = \left\{ A - \left( \frac{(N^2 - Z^2) + \delta(N - Z)}{3Z} + 3 \right) \right\} \frac{mNC^2}{\alpha}, A > 5, \quad (1)$$

And

**Corresponding Author:- K.K. Sirma.**

**Address:-** Department of physics, university of Eldoret Kenya.

$$\delta(N-Z) = \begin{cases} 0 & \text{for } N \neq Z. \\ 1 & \text{for } N = Z. \end{cases} \quad (2)$$

Where  $\alpha$  is defined as an adjusting coefficient,  $\alpha = 90 - 100$ ,  $\delta$  stands for nuclear beta-stability line condition.

The temperature dependence is introduced by use of thermal activation factor  $e^{-B/KT}$ . The net energy of the nuclei is written as

$$E = Be^{-B/KT} \quad (3)$$

$$\text{The specific heat capacity is given as } C_v = \frac{B^2}{KT^2} e^{-B/KT} \quad (4)$$

$$\text{The transition temperature is derived from equation (4) and is given as } T_c = \frac{B}{2K} \quad (5)$$

### Result and Discussion:-

i)  ${}^{40}_{20}\text{Ca}$

Temperature (T)	Specific heat ( $C_v$ )
1020000000	2.66E-05
1040000000	2.76E-05
1060000000	2.86E-05
1080000000	2.95E-05
1090000000	2.99E-05
1100000000	3.04E-05
1200000000	3.45E-05
1400000000	4.07E-05
1600000000	4.44E-05
1800000000	4.62E-05
1900000000	4.66E-05
1950000000	4.66E-05
2000000000	4.66E-05
2100000000	4.65E-05
2200000000	4.62E-05
2400000000	4.51E-05

3400000000	3.65E-05
3600000000	3.48E-05

The transition temperature is  $1.9848 \times 10^9 \text{ K}$  as depicted from the graph above, this value is the same as one found from equation (5). The shape of the graph resembles an s-shape and is non linear.

ii)  $^{46}_{20}\text{Ca}$

Temperature (T)	Specific heat ( $C_v$ )
1200000000	2.71E-05
1400000000	3.45E-05
1600000000	4E-05
1800000000	4.36E-05
1900000000	4.48E-05
2000000000	4.56E-05
2200000000	4.65E-05
2250000000	4.66E-05
2280000000	4.66E-05
2300000000	4.66E-05
2310000000	4.66E-05
2320000000	4.66E-05
2350000000	4.66E-05
2400000000	4.66E-05
2600000000	4.6E-05
2800000000	4.51E-05
3000000000	4.38E-05
3200000000	4.24E-05
3400000000	4.09E-05
3600000000	3.94E-05
3800000000	3.78E-05
4000000000	3.63E-05

The specific heat capacity versus temperature is a non-linear graph as shown in figure 2. The phase transition happens at  $2.31 \times 10^9 \text{ K}$ , this process is related to a liquid-gas phase transition. The transition temperature of  $^{46}_{20}\text{Ca}$  is slightly higher than that of  $^{40}_{20}\text{Ca}$  this may be attributed by the effect of even-even and even-odd.

#### CHARACTERIZATION OF SOLIDUS STRUCTURES OF COMPOSITE MATERIALS.

**Parshotam Lal.**

ISCAS Institute of Solid State and Materials Science, Jammu University Campus, Jammu-180 006, India

#### **Manuscript Info**

##### **Manuscript History**

#### **Abstract**

Growth habits of composite materials from their respective molten states are established by scanning electron microscope and X-ray diffraction studies affirm composite alloys to be a terminal solidus solution of physically distinct and mechanical separable phases. Thermal stability of composite phases is ascertained using DSC. The solidification pattern of the individual constituent phases from the melt is comprehensively viewed and scanned after carefully studying the growth characteristics under scanning electron microscope (SEM). The microscopic observations reveal two types of growth habits of the homogeneous phases; one is edge-wise comprises of the round growth front lamellae distinctively termed nonfaceted lamellae and other is side-wise comprising of sharp growth front lamellae purposefully mentioned faceted lamellae. Evidentially, physical understanding of the single phase solidification predicts that the growth habits of combined constituent phases in binary, ternary and quaternary composite materials are discovered a composite of practically distinct and observable lamellae exploring three possible categories, namely nonfaceted-nonfaceted (nf-nf), faceted-faceted (f-f) and nonfaceted-faceted (nf-f). The classification of composite materials by growth of the lamellae of the homogenous phase in combination, verifies the J. D. Hunt and K. A. Jackson hypothesis.

*Copy Right, IJAR, 2016., All rights reserved.*

#### **Introduction:-**

A new classification of composites is proposed, based on the entropies of melting of the two composite phases. The classification is used to predict suitable transparent analogs of the metallic systems. Experimental confirmation was obtained consistent with the theoretical shape of the lamellar solidus-liquidus interface, for the fault mechanism of lamellar spacing changes, and for the development of low-energy solidus-solidus boundaries between the lamellae. An explanation is presented to account for the irregular and complex regular structures which are found in some composite systems. From experimental observations, single-phase materials can be divided into two groups according to their solidification characteristics, those that grow as faceted crystals and those that do not. Jackson's showed from thermodynamic reasoning that the type of growth depended on a factor  $\alpha$  which is almost the entropy of fusion in dimensionless units. Most non-metals have high entropies of fusion i.e.  $\alpha$  greater than 2 and grow with crystalline facets with sharp growth front. Most metals have low entropies of fusion i.e.  $\alpha$  less than 2 and grow almost isotropically with non facets implying with round growth front.

The authors propose that multiphase composites may be classified in a similar manner. In binary phase composites there are three groups of composites, those in which constituent phases have low entropies of fusion ( $\alpha < 2$ ), those in which one of the phases has high entropy of fusion ( $\alpha > 2$ ) and the other phase with low entropy of fusion ( $\alpha < 2$ ) and those in which constituent phases have high entropies of fusion ( $\alpha > 2$ ). Exactly, the same hypothesis is adopted in the present work to classify multiphase composites. Lamellar or rodlike structures are formed in systems in which both phases have low entropies of melting. In these alloys dendrites of phases may be formed or when the composite alloy is rich in the relevant component. Examples are Pb-Sn, Sn-Cd, Pb-Cd, Sn-Zn, Al-Zn. Irregular or complex regular, structures are formed in alloys in which one phase has high entropy of fusion and the other phase has low entropy of fusion. Examples binary phase's composites are Al-Si, Pb-Bi, and Sn-Bi. When the alloys are rich in the low entropy of fusion phases, dendrites are formed; when the alloys are rich in the high entropy of fusion phases, faceted primary crystals are produced. These crystals are sometimes called hoppers or pseudo dendrites. In the present work, the term dendrite will only be used to describe nonfaceted primary crystals. Dendrites are not formed during solidification in high entropy of fusion single-phase materials. The third group of composite includes alloys in which the constituent phases have high entropies of fusion. Each phase grows with a faceted solidus-liquidus interface. Since most metals do not have high entropies of fusion, metallic examples in this composite group are rare. However, they may occur between some intermetallics, semiconductors or semimetals such as silicon, germanium, and bismuth. Metals and metal alloys may be strengthened and hardened by the uniform dispersion of several volume percent of fine particles of a very hard and inert material. The dispersed phase may be metallic or non-metallic and oxide materials are often used. Again, the strengthening mechanism involves interactions between the particles and dislocations within the matrix, as with precipitation hardening. The dispersion strengthening effect is not as pronounced as with precipitation hardening; however, the strengthening is retained at elevated temperature and for extended time periods because the dispersed particles are chosen to be unreactive with the matrix phase. For precipitation-hardened alloys, the increase in strength may disappear upon heat treatment as a consequence of precipitator growth or dissolution of the precipitator phase. The high-temperature strength of nickel alloys may be enhanced significantly by addition of about 3 vol% of thoria ( $\text{ThO}_2$ ) as finely dispersed particles; this material is known as thoria-dispersed (TD) nickel. The same effect is produced in the aluminium-aluminium oxide system. A very thin and adherent alumina coating is caused to form on the surface of extremely small (0.1 to 0.2  $\mu\text{m}$  thick) flakes of aluminium, which are dispersed within an aluminium metal matrix; this material is termed sintered aluminium powder (SAP).

## Experimental:-

### Materials and their thermal revelation:-

The composite alloys Al-Cd; Al-Sn; Al-Bi; Al-Pb; Al-Cd-Sn; Al-Cd-Bi and Al-Cd-Pb-Bi were prepared in the pyrex tubes by weighing variable amounts of purity 99.999% Al [Alfa Aesar, AR, mp 949 K,  $\Delta_f H = 10.80 \text{ kJmol}^{-1}$ ], 99.999% Cd [99.5%, Alfa Aesar, AR, mp 597 K,  $\Delta_f H = 6.20 \text{ kJmol}^{-1}$ ], 99.999% Sn [Alfa Aesar, AR, mp 509 K,  $\Delta_f H = 7.30 \text{ kJmol}^{-1}$ ], 99.999% Bi (Alfa Aesar, AR, mp 551 K,  $\Delta_f H = 11.20 \text{ kJmol}^{-1}$ ) and 99.999% Pb [Alfa Aesar, AR, mp 584 K,  $\Delta_f H = 4.70 \text{ kJmol}^{-1}$ ] shots with Al-Cd (60 wt % Al & 40 wt % Cd), Al-Sn (60 wt % Al & 40 wt % Sn), Al-Pb (60 wt % Al & 40 wt % Pb), Al-Bi (60 wt % Al & 40 wt % Bi), Al-Cd-Sn (40 wt % Al, 30 wt % Cd & 30 wt % Sn), Al-Cd-Bi (40 wt % Al, 30 wt % Cd & 30 wt % Bi) and Al-Cd-Bi-Pb (40 wt % Al, 20 wt % Cd, 20 wt % Bi & 20 wt % Pb). The melting temperatures and enthalpies of fusion of the constituent metals, cited in the parentheses, were obtained by thermal analysis approaching very closely to their literature values. The ampoule tubes were sealed under vacuum to avoid oxidation and subsequently infused in a furnace set at a temperature  $\sim 900 \text{ K}$  for alloying Al, Cd, Sn, Bi and Pb metals. Homogeneity of the alloys were ensured by heat-chill process keeping the temperature of the heater (air oven)  $\sim 700 \text{ K}$  and that of the cooler (water bath)  $\sim 300 \text{ K}$ . The liquidus temperatures of the composite alloys Al-Cd (597 K), Al-Sn (505 K), Al-Bi (555 K), Al-Pb (602 K), Al-Cd-Sn (457 K), Al-Cd-Bi (429 K) and Al-Cd-Bi-Pb (370 K) were also ascertained by thermal analysis. The corresponding enthalpies of fusion  $\Delta_f H$  and dimensionless entropies of fusion  $\alpha$ , (where  $\alpha = \xi \Delta S_f / R$ ,  $R$  is the gas constant which equal to  $8.314 \text{ Jmol}^{-1}\text{K}^{-1}$ ,  $\xi$  a crystallographic factor which is slightly less than but almost unity and  $\Delta S_f$ , the entropy of fusion) of the homogeneous materials are provided in the tabular form (Table 1). The computed dimensionless entropy  $\alpha$  is found less than 2 ( $\alpha > 2$ ) for Al, Cd, Sn and Pb metals which grow from their melt as non-faceted (nf) crystallites having round growth fronts, whereas  $\alpha$  is found exceeding 2 for Bi metal that grows from its melt as faceted (f) crystals implying the crystallite with the sharp growth front.

**Table 1:-** Computed  $\alpha$  values of homogeneous materials

Material	Melting point ( $T_m$ )K	$\Delta H_f$ (kJ mol <sup>-1</sup> )		$\Delta S_f = \Delta H_f / T_m$ (Jmol <sup>-1</sup> K <sup>-1</sup> )	$\alpha = \xi \frac{\Delta S_f}{R}$	Growth front
		Experiment	Literature			
		Value	Value			
Al	949	10.80	10.47	11.38	1.35	nf
Cd	597	6.20	6.19	10.39	1.25	nf
Sn	509	7.30	7.03	14.34	1.72	nf
Bi	551	11.20	11.30	20.33	2.45	f
Pb	584	4.70	4.80	8.05	0.97	nf

**Oriented growth:-**

Anisotropic solidification composite of the composite alloys and their constituent metals from respective molten state was achieved in the following experimental setup. An experimental sealed pyrex tube containing half-full melt of a freshly prepared composite or metal, was clamped to the centre of an empty graduated beaker (volume capacity ~1dm<sup>3</sup>) manipulated midmost in an air oven set at a temperature 30K higher than the melting temperature of the samples. The molten mass in the tube was nucleated by circulating silicone oil at 18 different intervals spanned in the time range 50-60 min from the oil reservoir perforated and plugged with a glass tube carrying valve to control the percolation at ~300K. The melt in the tube started nucleating when the rising level of the oil just touched the bottom of the tube. Several samples of the composites and constituent metals were grown anisotropically at different but nearly consistent growth rates determined by circulating approximately the same volume of the oil for the aforementioned intervals.

**Instantaneous solidification:-**

Isotropic growth was performed by immersing an experimental pyrex tube containing the composite or metal melt in an ice bath maintained at ~ 273 K. The growth being instantaneous in nature is presumed of zero order. Likewise, a good many samples of composite phases were solidified for the isotropic growth for observations.

**Non Faceted- Non Faceted (nf-nf, regular) composite materials:-**

Composite materials have low entropy of fusion ( $\alpha < 2$ ).

**Faceted-Faceted (f-f, irregular) composite materials:-**

Composite materials have high entropy of fusion ( $\alpha > 2$ )

**Non Faceted- Faceted (nf-f, complex regular) composite materials:-**

Composites materials in which atleast one of the constituent phases with low entropy of fusion ( $\alpha < 2$ ) or high entropy of fusion ( $\alpha > 2$ ) in comparison to other phases

**Simple lamellar or rod-type structures:-**

Simple lamellar or rod-type structures are only produced in composites in which the constituent phases have low entropy of fusion ( $\alpha < 2$ ).

**Complex regular structures:-**

Complex regular structures are obtained in composites wherein at least one of the constituent phases has entropy of fusion less than two ( $\alpha < 2$ ) and others may have entropies of fusion greater than two ( $\alpha > 2$ ).

**Coupled growth:-**

Coupled growth occurs in composites phases having entropy of fusion less than two ( $\alpha < 2$ ).

**Dendrites:-**

When the alloys are rich in the low entropy of fusion phases ( $\alpha < 2$ ), dendrites are formed.

**Pseudo dendrites:-**

When the alloys are rich in the high entropy of fusion phases ( $\alpha > 2$ ), faceted crystal are produced. These crystals are called pseudo dendrites or hopper.

**Microscopic studies:-**

The specimen grown anisotropically and isotropically were polished at room temperature following a procedure similar to that adopted for analogous problem to reveal the microstructure, a thin layer of the specimen etched in ferric chloride was mounted on stub with gold-coated holder and examined under a scanning electron microscope for micro growth observation. Many samples of each specimen were viewed in this manner and the growth habits of the growing phases during solidification at different growth rates were accordingly photographed.

**X-ray diffraction studies:-**

The X-ray diffraction patterns exhibited by the experimental composite phases were recorded with Diffraction System-XPRT=PRO using  $\text{CuK}\alpha$  radiation of wavelength  $1.5408 \text{ \AA}$  at room temperature. The powder X-ray was recorded in a  $2\theta$  range of  $5^\circ$  to  $90^\circ$  with the step size of  $0.05$  and step time of  $1\text{s}$ .

**Results and Discussion:-****Lamellar growth:-**

In the present work, the growth of composite phases from the melt strictly follows the hypothesis proposed by J. D. Hunt and K. A. Jackson. An individual material having low entropy of fusion ( $\alpha < 2$ ) grows almost with isotropically. For example, pure aluminium metal has low entropy of fusion,  $\alpha = 1.35$  implying less than 2, grows from its melt as nonfaceted crystallites (Fig. 1). On the contrary, bismuth metal has high entropy of fusion,  $\alpha = 2.45$  obviously greater than 2, grows from its melt with crystalline facets (Fig. 2). As is evident from the following microstructures, lamellar or rod like structures are formed in composites in which constituent phases have low entropies of fusion ( $\alpha < 2$ ). The composite Al-Cd-Sn is an example of this structure (Fig. 5e), the constituent phases having entropies of fusion, pure Al ( $\alpha = 1.35$ ), pure Cd ( $\alpha = 1.25$ ) and pure Sn ( $\alpha = 1.72$ ). The lamellar structures proves to be less regular compare to rod type growth which does have a perfect ordered structure, particularly interrod spacing, whereas rod like lamellar structure is the intermediate case. Periodic growth of the composite phases tends to provide rod type growth wherein the values of the microstructure parameters, namely, lamella diameter, lamella length, lamella length distribution, volume fraction of lamellae, and the alignment and packing arrangement of lamellae, are repeating themselves exactly after each crystallographic orientation between the lamellae to generate symmetric relation which governs the consistency of the crystallographic orientation relationship in the microstructure entirety.

Complex regular structures are obtained in composites wherein at least one of the constituent phases has entropy of fusion less than two ( $\alpha < 2$ ) and others may have entropies of fusion greater than two ( $\alpha > 2$ ). The composite Al-Cd-Bi is an example of this structure (Fig. 5f). It may be pertinent to mention here that phases with  $\alpha < 2$  always grow in contact called coupled growth which does not occur in composite phases having dimensionless entropy of fusion greater than two ( $\alpha > 2$ ). The ingot microstructure of the composite phases, namely Al-Cd, Al-Sn, Al-Pb, Al-Bi, Al-Cd-Sn, Al-Cd-Bi and Al-Cd-Bi-Pb obtained by different modes of growth are presented in Figs. 3-5. The changes in the movement of the lamellae procedure corresponding changes in the mechanical properties which are made comprehensive in term of the approach adopted in the present work. Nevertheless, the orientation of the lamellae offers the possibilities of achieving optimum final products performance by controlling the microstructure parameters which do strengthen the matrix of the resulting lamina to exhibit maximum load bearing capability. Figure 3(a-g) reveals the distorted growth habits of the composite phases, namely, (a) Al-Cd; (b) Al-Sn; (c) Al-Pb; (d) Al-Bi; (e) Al-Cd-Sn; (f) Al-Cd-Bi and (g) Al-Cd-Bi-Pb experienced in an ice bath ( $\sim 273$  K) that at a large kinetic undercooling the lamellae formed are of short size, aggressive, disconnected, crossing each other and showing no matrix relationship. These lamella habits, in fact, arise from splitting of the main single lamella into separate single lamellae or group of single lamellae, apparently leading to the distorted morphology. However, the growth habits of the composite phases gradually structure themselves to nonaggressive, attaching and parallel to each other reinforcing the matrix with decreasing kinetic undercooling as is evident from Fig. 4 (a-g). An entirely distinct lamellar microstructures of the composite phases Fig. 5 (a-g) are obtained at the anisotropic growth velocity ( $\sim 1.71 \times 10^{-7} \text{m}^3 \text{s}^{-1}$ ) determined by setting the flow-interval of silicone oil at  $5 \times 10^{-4} \text{m}^3$  for 30 min, which enhances the hardness of the alloys to their optimum value in the present investigation. In the lamellar microstructure, some of the unfavorably oriented lamellae in the composite grains with high configuration energy grew out perpendicularly to the solidus-liquidus interface leaving other lamellae with orientation close to low configuration energy to grow in an aligned preferred crystallographic morphology. The growth habits of the composite phases comprising the rod-like lamellar microstructure from the melt present their relationship with the moderate anisotropic growth velocity. In a binary melt when one of the composite phases, usually the rich one, grows, the vicinal melt region acquires richness in the other phase, the first phase continues its growth as a lamella or a whisker unless and until the other phase nucleates at a certain super saturation. This is another supercrescent lamella growing over that of the first phase, which would also continue its growth till another supercrescent lamella of the first phase appears on it. Thus, the supercrescent lamellae growth of the composite phases from the melt produces a complete lamellar microstructure. The growth front contacting solidus-liquidus interface structure inside the experimental tube, and the rising level of silicone oil outside the tube would move upward nearly with the same pace in a single phase, effectively decreasing the kinetic undercooling which balances the undercooling due to composition, and originating lamella length. Likewise, the growth of composite phases from the ternary and quaternary melts would follow the similar pattern. Accordingly, the growth process produces long lamellae with undamaged surfaces Fig. 5 (a-g) which are embedded parallel to each other in attaching and nonaggressive unidirectional laminae. The mathematical model for the rod-like growth of the composite systems has been developed elsewhere. In the directional growth, the metals Al, Cd, Sn, Bi and Pb grow as lamellar cells where each cell crystallize either from the bulk of the melt or through secondary nucleation. Since the complete lamella is an attachment of two-, three and four nonaggressive ductile metal lamellae, the efficiency of the lamellae in stiffening and reinforcing the matrix decrease as the lamella length decrease. Lamella ends play an important role in the fracture of short lamella composites (Fig. 6) and also in continuous lamella composites (Fig. 7), since the long lamellae may break down into discrete lengths. As mention earlier the lamellae are aggressive, non attaching and irregular thin crystals producing distorted microstructures representing Fig. 3(a-g) which attain fragile matrix of the composite phases. The discontinuous change in spacing in absence of faults is the movement of lamellar-faults, which is an evidence for the fault-mechanism. It is this movement, not the formation of faults, which is an important factor in controlling the spacing among lamellae. The lamellar cells of the pure composite phases would acquire dislocations by virtue of their growth by fault-mechanism from the melt and consequently, exhibit fragile matrix.

### **Conclusion:-**

The thermal analysis reveals thermal stability and liquidus temperatures of the composites. X-ray diffraction patterns implicitly demonstrate that the composites are terminal solidus solutions comprising of physically distinct and mechanical separable materials because no unique X-ray pattern is observed in the composites other than constituent metals. The growth of composite phases expresses its obedience to the hypothesis proposed by J.D. Hunt and K.A. Jackson that single phase (homogeneous) materials can be divided into two groups according to their solidification characteristics, those that grow as faceted crystals and those that grow as nonfaceted crystals. The homogeneous materials having entropies of fusion less than two ( $\alpha < 2$ ) do grow as nonfaceted crystals marked with regular structures, and those having entropies of fusion greater than two ( $\alpha > 2$ ) do grow with crystalline facets projecting irregular structures. The morphology pattern of the composite alloys may also follow the microstructure classification of the single phase material. The composite alloys that those in which constituent phases have low entropy of fusion ( $\alpha < 2$ ) ; those which comprise constituent phases having high entropies of fusion ( $\alpha > 2$ ) and those in which any constituent phase is inconsistent to the other constituent phases whether low entropy of fusion ( $\alpha < 2$ ) or high entropy of fusion ( $\alpha > 2$ ) . The diversity of the micro morphologies, because of the complex nature of

the phenomenon involved in an anisotropically controlled solidification from the melt, is revealed by examining the crystalline specimens in a scanning electron microscope.

Epoxy resins, Anti-microbial coating,  
Anti-corrosive coating.

#### Abstract

Some recent amino triazole derivatives mainly 4-amino-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol (I), 4-((4-chlorobenzylidene)amino)-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol (II), 4-((furan-2-ylmethylene)amino)-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol (III) and Ni [ II ] complex (IV) were synthesized and their chemical structures were confirmed by spectral data. The synthesized amino triazole compounds (I-IV) were physically incorporated into epoxy coating formula by the ratio of 0.5, 1.0, 2.0 and 3.0% by weight, in order to achieve a proper ratio of amino triazole derivatives to produce a green epoxy formulation for surface coating application. The modified epoxy varnishes were evaluated as anti-corrosion performance of mild steel coated specimens by employing salt spray test, also their antimicrobial activity against six different microbial strains mainly are Gram-positive bacteria: Staphylococcus aureus (ATCC25923) and Bacillus subtilis (ATCC6635), Gram – negative bacteria: Escherichia coli (ATCC 25922) and Salmonella typhimurium (ATCC 14028) and Yeast: Candida albicans (ATCC 10231) and Fungus: Aspergillus fumigates were screened.

#### Introduction:-

The industrial use of thermoset polymers is rapidly growing worldwide due to their high performance capabilities in demanding environments. Epoxy resins are one of the most versatile thermoset polymers and are prevalent because of their ability to polymerize or “cure” under a wide range of conditions. Epoxy resins also offer a good to excellent mechanical properties, good electrical insulating properties and excellent adhesion to a wide variety of substrates, so it has a prevalently uses in a wide range of applications. Additionally, once cured, epoxy resins exhibit excellent chemical resistance as anticorrosive metal coatings<sup>(1-3)</sup>. It is generally believed that most organic coatings adhere to metals via hydrogen bonds or secondary bonds, therefore, these bonds develop when an organic coating and a metallic surface are brought closely together and so the binders with polar groups display excellent adhesion characteristics. The bond strength of epoxy resins on steel is strongly dependent on the hydroxyl group content. It was found that the epoxy compounds were dissociated between the phenoxy oxygen and the aliphatic carbon. The surface interactions were believed to be via the phenoxy and hydroxyl oxygen atoms<sup>(4)</sup>, as illustrated in Fig (1).

Figure 1: Adhesion of epoxy to steel by interfacial bonds

The three main applications for epoxy resins are coatings, composites, and structural adhesives<sup>(5)</sup>.

Antimicrobial coatings are useful in the development of hygienic surfaces. These are having some antimicrobial agent in their composition that either can kill or inhibit the growth of microorganisms<sup>(6)</sup>. These types of coatings have immense applications in the design of materials and devices in health care sector, hospital surfaces, surgery equipment, health-care products and water purification systems<sup>(7)</sup>. Commonly used antimicrobial surfaces contain some antibiotics, silver ions, quaternary ammonium cations, halogens or some heterocyclic compounds<sup>(8)</sup>.

Triazolic nucleus is nowadays considered an important moiety in the design and synthesis of bioactive compounds that are associated with numerous biological activities such as antibacterial and antifungal<sup>(9-12)</sup>. Also, there are some reviews indicate that 1,2,4-triazoles occupy a distinctive place in the field of medicinal and pharmaceutical chemistry<sup>(13,14)</sup>, as well as in industry<sup>(15)</sup>. Recently some triazole derivatives were added to polyurethane coating which demonstrate an impressive results as antimicrobial<sup>(16)</sup>.

Annual costs related to corrosion and corrosion prevention constitutes a substantial part of the gross national product in the world. Although the value of these numbers is always debatable, but the corrosion has great importance in modern societies in addition to economic costs and technological delay, corrosion can lead to failure of metal structures which have serious consequences for humans and the environment<sup>(17, 18)</sup>. Thus, the study of mild steel corrosion and the inhibition of mild steel corrosion have invited the attention of scientists and technocrats to devise ways to control the corrosion. Between the various corrosion control modes, the use of corrosion inhibitors is a familiar method. Inhibition efficiency always depends upon the number of active adsorption centers of inhibitor molecule may have, and the charge density, molecular size, mode of adsorption, and its capability to form metallic complexes<sup>(19-21)</sup>.

Over the last decades, both organic and inorganic coatings have been widely applied for the protection of metals against corrosion. In many areas of coatings technology, anticorrosive paint gave great attention. Most of the efficient inhibitors used in industry are organic compounds that mainly contain a nitrogen atom, a sulfur atom and multiple bonds in the molecules through which they are adsorbed onto the metal surface. Even though a large number of organic compounds are available, the choice of an appropriate inhibitor for a particular system is very limited, due to the specificity of the inhibitors and the great variety of corrosion-related applications<sup>(22, 23)</sup>. A survey of the available literature reveals that (amongst others) the inhibitive effects of alcohols, amides, amines, anilines, azoles<sup>(24)</sup>, mercaptans, oximes, thioethers, and dithiobiurets<sup>(25)</sup> have been studied.

Triazole-type organic compounds are good corrosion inhibitors for many metals and alloys in various aggressive media<sup>(26-29)</sup>.

In the present work, a study has been conducted on the effect of 1,2,4-triazoles such as 4-amino-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol (I), 4-((4-chlorobenzylidene)amino)-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol (II), 4-((furan-2-ylmethylene) amino)-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol (III) and Ni [II] complex (IV) on biological activity and anti-corrosion performances of epoxy resin varnish.

## Experimental:-

### Materials:-

Epoxy resin was obtained from Pachin Pints Company – Egypt, all other chemicals used are pure grade quality get from Sigma- Aldrich Chemical Co. All the melting points were determined by open capillary method and are uncorrected. Chemical structure of the prepared triazole derivatives were confirmed using, a Perkin-Elmer 240 micro-analyzer at the Micro-Analytical Center of Cairo University, IR spectra were determined as (KBr) pellets on a

Jasco FT/IR 460 plus spectrophotometer at Faculty of Science, Al-Azhar university.  $^1\text{H}$  NMR spectra were recorded using a BRUKER AV 300 MHz spectrometer using in  $\text{CDCl}_3$  or DMSO as an internal standard, MS were measured on a Shimadzu GC/MS-QP5 spectrometer at Faculty of Science, Cairo University and (TGA and DTA) were carried out using TGA-50H and DTA-50H at Ain Shams University Faculty of Science Central Lab.

#### Methods and techniques Synthesis of 1,2,4-triazole derivatives:-

New anti-microbial additives based on 1,2,4-triazole derivatives (I–IV) were prepared as represented in Scheme (1).

#### Synthesis of 4-amino-5- (trifluoromethyl)-4H-1,2,4-triazole-3-thiol ( I )<sup>(30)</sup>.

An equimolar mixture of thiocarbonylhydrazide ( 10 mmol) and trifluoroacetic acid ( 10 mmol) was warmed carefully between 160 – 170  $^{\circ}\text{C}$  until melting occurred, heating lasts for 15 minutes after melting . The reaction mixture was cooled and mixed with 80 ml of water. The precipitate was filtered, washed with water and oven dried. A colorless crystals; m.p:140 - 141 $^{\circ}\text{C}$  ; yield 85% ; IR (KBr)  $\text{cm}^{-1}$ :3314, 3200 (  $\text{NH}_2$  ), 2572 (S-H),1630 (C-S),1460(C=N in triazole),1242,1147 (C-N),1082,1005(C-F);  $^1\text{H}$  NMR (in  $\text{CDCl}_3$ ) ( $\delta$  ppm): 11.64 (s, 1H, SH), 4.83 (s, 2H,  $\text{NH}_2$ );  $^{19}\text{F}$  NMR (  $\delta$  ppm) 66.24 (s, 3F,  $\text{ArCF}_3$ ); MS: m/z (%):184[ $\text{M}^+$ ](100), 126(11), 111(5), 96(8), 85(1), 78(12), 69(30), 60(23), 57(13), 45(8); Anal. Calcd. for  $\text{C}_3\text{H}_3\text{N}_4\text{S F}_3$ : C, 19.57; H, 1.64; N, 30.43% Found: C, 19.45; H, 1.59; N, 30.06%.

#### Synthesis of 4-((4-chlorobenzylidene)amino)-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol ( II ):-

In 50 ml round bottom flask a mixture of compound (I) (10 mmol), (10 mmol) of p-chlorobenzaldehyde and (0.5mL) of acetic acid in 30mL of ethanol was refluxed for 5 h. , filtrated on hot , cooling ,the precipitate was filtered and washed with methanol. A pale yellow crystal from ethanol; m.p. 125- 126 $^{\circ}\text{C}$ ; yield 82%; IR (KBr)  $\text{cm}^{-1}$ : 3117 (Ar.H), 2539 (SH), 1508 (C=C), 1630 (C=N Schiff base), 1568 (C=N in triazole), 1298 (C-N in triazole) , 1016 (N-N in triazole);  $^1\text{NMR}$  ( $\delta$  ppm) ( in DMSO): 11.04 (s,1H-SH), 8.63 (s,1H-CH), 7.00-7.85 (m,4H-Ar-H) ;Anal. Calcd.for  $\text{C}_{10}\text{H}_6\text{N}_4\text{S F}_3\text{Cl}$ : C, 39.15; H, 1.96; N, 18.27% - Found: C, 39.76; H, 2.13; N, 17.83%

#### Synthesis of 4-((furan-2-ylmethylene)amino)-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol ( III ):-

In 50 ml round bottom flask a mixture of compound ( I ) ( 10 mmol), ( 10 mmol ) of furan-2-carbaldehyde and (0.5mL) of acetic acid in 30mL of ethanol was refluxed for 5 h. , filtrated on hot , cooling ,the precipitate was filtered and washed with methanol. A reddish – brown crystals from *N,N*-Dimethylformamide; m.p.147-148 $^{\circ}\text{C}$ ; yield 91%; IR (KBr)  $\text{cm}^{-1}$  : 2529 (SH), 1613 ( C=N Schiff base), 1551(C=N in triazole), 1480 (C=C), 1290 (C-N in triazole) , 1018 (N-N) ;  $^1\text{NMR}$  ( $\delta$  ppm)(in DMSO): 10.12 ( s,1H-SH), 8.09 ( s,1H-CH), 6.75-7.61( m,3H-Ar-H) ; MS: m/z (%):262[ $\text{M}^+$ ] (5.64),184.04 (59.46), 78.09 (23.64), 69.10 (100), 67.13 (23.55); Anal. Calcd. for  $\text{C}_8\text{H}_5\text{N}_4\text{S O F}_3$ :C, 36.64; H, 1.91; N, 21.37% Found: C, 36.76; H, 2.13; N, 21.52% .

#### Synthesis of Nickel [II] Complex ( IV ):-

A solution of nickel chloride (10 mmol) in absolute warmed ethanol (5mL) was slowly added drop wise to a solution of compound (I) (10 mmol) in absolute ethanol (10 mL). The mixture was stirred for 30 min. at room temperature and refluxed for 2 h. The complex was filtered in a vacuum system, washed with ethanol several times and dried. A pure pale green solid was obtained; m. p. > 300  $^{\circ}\text{C}$ ; yield 62%;

#### Preparation of epoxy paint films containing 1,2,4- triazole derivatives ( I – IV ):-

The epoxy paint compositions were prepared by physically incorporate 1,2,4- triazole derivatives, in the ratio of 0.5%, 1.0%,2.0% and 3.0% by weight into epoxy paint. The samples of different molar ratio were then applied to both steel and glass by means of a brush. All efforts were made to maintain a uniform film thickness of  $50 \pm 5 \mu\text{m}$ . for evaluating the physical and mechanical properties of the paint. The solid content was adjusted at 60%.

#### Physical and mechanical testing of coating films:-

A range of physical and mechanical evaluations of the painted films were conducted according to appropriate American Society for Testing and Materials (ASTM) standard test methods. The color of epoxy resin formulations was measured using the Gardner standard color scale (ASTM D1544). The prepared steel panels (ASTM D 609-95) were used for measuring, the measure of film coating thickness (ASTM D 1005-07), the adhesion 'cross hatch' test (ASTM D 3359-02) and the flexibility 'bend' test (ASTM D 522-93a). Glass plates (100 mm- 150 mm), coated with the individual formulations, were utilized to measure the degree of gloss at an angle of 60 $^{\circ}$  (ASTM D 523-08), and also to measure the film hardness by means of the pencil test (ASTM D 3363-00).

**Antimicrobial screening:-**

The anti-microbial activity of the synthesized triazole derivatives ( I – IV ) was tested against six different microorganisms such as; Gram- positive bacteria: *Staphylococcus aureus* (ATCC 25923) and *Bacillus subtilis* (ATCC 6635), Gram – negative bacteria: *Escherichia coli* (ATCC 25922) and *Salmonella typhimurium* (ATCC 14028), Fungus: *Aspergillus fumigates* and Yeast: *Candida albicans* (ATCC 10231) in nutrient broth medium.

**Paper disk diffusion method for the determination of antimicrobial activity <sup>(31)</sup>:-**

Paper disk diffusion is the official method used in many clinical microbiology laboratories to determine what antibiotics and compounds inhibit bacterial growth, or are bacteriostatic. The paper disks are soaked with a select antibiotic or chemical and then placed on a lawn of bacteria in a petri dish. The zones of inhibition are measured around where the disk was placed to determine whether the bacterium was resistant or susceptible to the particular antibiotic or chemical chosen. The sterilized (autoclaved at 120 °C for 30 min) medium at (40–50 °C) was incubated (1 ml/100 ml of medium) with the suspension ( $10^5$  cfu ml<sup>-1</sup>) of the micro-organism (matched to McFarland barium sulfate standard) and poured into a petri dish to give a depth of 3–4 mm. The paper impregnated with the test compounds (mg/ml<sup>-1</sup>) was placed on the solidified medium. The plates were pre-incubated for 1 h at room temperature and incubated at 37 °C for 24 and 48 h for anti-bacterial and anti-fungal activities, respectively. Chloramphenicol, Cephalothinin and cycloheximide (mg/disk) was used as a standard for Gram – positive, Gram – negative and anti-fungal activities respectively.

**Anti-corrosive performance evaluation of formulations through salt spray Accelerated Testing:-**

The test pieces of mild steel were 20 x 20 x 2 mm. The samples were first mechanically polished with a fine grade emery paper in order to obtain a smooth surface, followed by degreasing with acetone and then rinsed with distilled water, dried between two filter papers. A salt fog chamber was utilized for each of the resin formulations; with a set of three coated panels being placed in the salt spray chamber according to ASTM B117-03. The corrosion resistance was evaluated in terms of blistering, scribe failure and degree of rusting, in relation to ASTM standards, i.e. ASTM D714-02, D1654- 00 and D610-01 respectively.

**Results and Discussion:-**

In recent times triazole rich molecules have gained much importance in the field of polymer and material science so it is used prevalent in a wide range of applications because of their excellent properties like strong anti-microbial and anti fouling nature of the triazole ring along with easy synthetic procedures and exceptionally high yield of end product.

**Synthesis and characterization of triazole derivatives and nickel [ II ] complex:-**

In the present study, 1,2,4-triazole derivatives were successfully synthesized aiming to explore their antimicrobial and anticorrosion properties. The synthesis of triazole derivatives ( I-IV ) was performed according to indications mentioned in experimental section and shown in scheme ( 1 ). The compounds were obtained with yields (62- 91%) with high purity, the products confirmed by TLC analysis and evaluation of melting point. The formation of 1,2,4-triazole derivatives was proven by elemental analysis, FTIR and <sup>1</sup>H NMR, as well as by mass spectrometry for the compounds.

**Characterization of nickel [ II ] complex (IV):-**

Comparison of IR spectrum of the free ligand with IR spectrum of the nickel [ II ] complex gives an idea about the changes that might occur during complex formation. The IR spectrum of the complex displayed the ligand characteristic bands with appropriate shifts due to complex formation and there are three features in the IR spectrum of the nickel [ II ] complex. The first feature is the shift of the stretching frequencies of the amino group  $\nu(\text{NH}_2)$  in the nickel [ II ] complex to lower frequencies compared with the free ligand band in the region 3309- 3236 cm<sup>-1</sup>, indicating the formation of coordinate bond between nitrogen of amino group and nickel ion. This is consistence with the presence of a new weak band at 410 cm<sup>-1</sup> assignable to  $\nu(\text{M}-\text{N})$  vibration confirming the participation of amino group in coordination as was expected <sup>(32)</sup>. The second feature is that deprotonation of the thiol group as indicated by the absence of a characteristic band in the complex of  $\nu(\text{S}-\text{H})$  of ligand, indicating the formation of new bond between metal and sulfur. This is supported by the appearance a peak at 659 cm<sup>-1</sup> in the metal complexes due to  $\nu(\text{C}-\text{S})$  <sup>(33)</sup>. The third feature is that the appearance of broad band at 3401 cm<sup>-1</sup> which can be assigned to the stretching frequencies of  $\nu(\text{OH})$  of water molecules either in the coordinated or uncoordinated form associated to the complexes which are also confirmed by thermal analyses as well as appearance of the non-ligand band at 554 cm<sup>-1</sup> assignable to  $\nu(\text{M}-\text{O})$  <sup>(34,35)</sup>.

Scheme (I)

The measured effective magnetic moment value (3.36B.M) suggesting the magnetic behavior of the complex, in addition this value was consistent with the two unpaired electrons in tetrahedral geometry<sup>(36)</sup>. Mass spectrometry technique has been carried out to assisting the structural identification of the synthesized nickel [II] complex. The spectrum of this complex showed three important peaks. The first one shows the molecular ion peak with the highest value  $m/z$  (%) at 313.37 (2.29) (Calcd. 313.33 amu), which agree well with the suggested formula weight and indicate the monomeric nature of the complex. The second peak observed at  $m/z$  (%) = 97.14 (33.23) ( Calcd. 96.69 amu) due to degradation of complex into  $\text{NiF}_2$  which decompose to  $\text{Ni}^{2+}$  giving the third peak at  $m/z$  (%) = 57.12 (100.00) (Calcd. 58.69 amu).

Moreover, thermal studies of complex was carried out to complete the characterization process; to get information about the thermal stability of the complex; to suggest a general scheme for thermal decomposition and to ascertain the nature of associated water molecules as well as to determine the final product of decomposition<sup>(37)</sup>. The TG - DTG curve of complex presented in Fig. ( 2 ) and shows three steps of decomposition up to  $500^\circ\text{C}$ . The first one at  $40-42^\circ\text{C}$  with mass loss of 10.89% ( Calc. 11.50% ) due to the liberation of one hydrated and one coordinated water molecules. The second step with a weight loss of 25.17% ( Calc. 24.90% ) between  $371-387^\circ\text{C}$  was attributed to the liberation of by  $\frac{1}{2}\text{N}_2$ ,  $\text{F}_2$  and  $\text{CN}$ . The last step of decomposition corresponded to the liberation of  $\text{N}_2$ ,  $\text{HF}$ ,  $\text{HCl}$  and  $\text{CS}$  with a weight loss of 41.13% ( Calc. 41.03%) between  $457-501^\circ\text{C}$ . The overall mass loss is observed to be 77.19 % ( Calc. 77.43% ) leaving  $\text{Ni}$  and  $\text{C}$  as residue {calculated: 22.57% , found: 22.81% }. Hence, the suggested structure of the complex with the molecular formula  $[\text{NiC}_3\text{H}_2\text{N}_4\text{SF}_3(\text{Cl})(\text{H}_2\text{O})] \cdot \text{H}_2\text{O}$  was given in scheme[1].

**Figure 2 :- TG - DTG Spectrum of Nickel [II] Complex.**

#### **Physical and mechanical testing of modified coating films:-**

Modified epoxy resins were evaluated for some physical and mechanical properties; also their antimicrobial and anticorrosive properties were examined. The effects of adding modifiers triazole derivatives to epoxy resin formulation, were evaluated using a variety of standard test methods. This was done to ascertain any positive or negative aspects that might arise due to the presence of the additives. The color, gloss, hardness, adhesion, flexibility and impact were measured. The resulting data is shown in Table (1).

All films of epoxy paint compositions gave a very clear, transparent and homogeneous appearance and showed an excellent hardness.

#### **Color:-**

Color was measured using the Gardner standard colors, which consists of 18 colors numbered from (1 to 18). The method determines the color by comparison with standards of definite color compositions. It could be seen that addition of compounds ( I ) increased the color level slightly in high percent, while addition of compound ( II ) increased the color levels by increasing the percent. This is obviously a negative result which may be attributed to the introduction of sulfur and nitrogenous base into epoxy coating formulations. Epoxy coating which developed by compound (III) acquired dark color due to the presence of furan ring beside sulfur and nitrogen, also addition of complex (IV) produces a dark paint color.

#### **Adhesion cross hatch test:-**

This test is in conformity according to (ASTM D 3359-02) where adhesion is assessed on a 0 to 5 scale. When studying the hardness property of the neat epoxy and modified epoxy coating films, it was observed that the physical addition of the modifiers (I, II and III) increase hardness of coated films, and increasing the modifier percentage increases hardness value, while complex (IV) has slightly negative effects.

#### **Flexibility (bend) test:-**

The test was performed to determine the adhesion power of the coating to the substrate by bending apparatus. It is clear from the obtained results that the adding of new triazole derivatives didn't affect on the flexibility of the coating film, it can be stated that all the films showed a good flexibility. There was no significant difference between a blank epoxy coating film and modified epoxy coating films.

#### **Gloss:-**

This was measured using a Sheen UK gloss meter, it could be seen that the triazole additives (I, II and III) actually increased the gloss level. This result is attributed to the introduction of aromatic rings and a lone pair of electrons

into the varnish formulations. And vice versa when adding compound ( IV ) the gloss level decreases, this may be due to the presence of nickel complex.

**Table 1 :-** Physical and mechanical characteristics of modified epoxy varnish with new triazole derivatives (compounds I- IV).

Sample	Color	Adhesion	Flexibility	Gloss at 60 °	hardness
Blank epoxy resin	4	4	Pass	83	Excellent
Epoxy with comp. I 0.5%	4	4	Pass	87	Excellent
1.0%	4	4	Pass	85	Excellent
2.0%	5	5	Pass	90	Excellent
3.0%	5	5	Pass	95	Excellent
Epoxy with comp. II 0.5%	4	4	Pass	88	Excellent
1.0%	5	5	Pass	88	Excellent
2.0%	< 6	5	Pass	90	Excellent
3.0%	7	5	Pass	94	Excellent
Epoxy with comp. III 0.5%	>18	4	Pass	89	Excellent
1.0%	>18	4	Pass	90	Excellent
2.0%	>18	5	Pass	90	Excellent
3.0%	>18	5	Pass	96	Excellent
Epoxy with comp. IV 0.5%	14	4	Pass	80	Excellent
1.0%	16	3	Pass	81	Excellent
2.0%	>18	3	Pass	76	Excellent
3.0%	>18	3	Pass	73	Excellent

#### Evaluation of triazole derivatives as antimicrobial and antifungal additives to epoxy paint:-

Biocide additives are commonly used to prolong the life of surface coatings. They prevent, or slow down, the growth of organism on the coating surface. Without biocide additives, the biological species start to adhere to the coating surface and this can eventually lead to disbonding and blistering of coatings, under various conditions.

Some of 1,2,4-triazole derivatives have been reported as antibacterial and antifungal<sup>(38,39)</sup>. In the present study some novel triazole derivatives expected to have a biocide activity were prepared and physically incorporate by the ratios of [0.5%, 1.0%, 2.0% and 3.0%] as biocide against six different micro-organisms such as Gram- positive bacteria (*Staphylococcus aureus*, *Bacillus subtilis*); Gram-negative bacteria (*Escherichia coli*, *Salmonella typhimurium*); Yeast (*Candida albicans*) and Fungus (*Aspergillus fumigatus*). From the data give in the table (2) it is clear that epoxy varnish (blank) hasn't any antibacterial or antifungal activities, epoxy varnishes modified with compound (I) have high sensitivity to Gram - positive bacteria and Yeast and intermediate effect towards Fungi, epoxy varnishes modified with compound (II) may be used as antibacterial and antifungal for all six micro-organisms, while compound (III) the introducing of furan ring to 5-(trifluoromethyl) -1,2,4-triazole-3-thiol lead to reduce biocidal activity. Disappearance of free amino and thiol groups in complex (IV) lead to a lack of bacterial activity, but have a high resistance to fungi and yeast.

**Table 2:-** Antibacterial and antifungal activities of modified epoxy varnish with new triazole derivatives (compounds I- IV).

Organism Sample	Gram - <b>positive</b> bacteria		Gram - negative bacteria		Yeasts and Fungi	
	Staphylococcus aureus	Bacillus subtilis	Salmonella typhimurium	Escherichia coli	Candida albicans	Aspergillus fumigatus
Blank	-	-	-	-	-	-
Epoxy with comp. I 0.5%	14 I	23 H	-	-	30 H	8 L
1.0%	20 I	24 H	-	-	30 H	11 L
2.0%	27 H	30 H	-	-	30 H	14 I
3.0%	29 H	32 H	-	-	32 H	16 I
Epoxy with comp. II 0.5%	12 I	15 I	-	-	-	9 L
1.0%	20 I	18 I	14 I	11 L	-	11 L
2.0%	26 H	26 H	14 I	21 I	12 I	19 I
3.0%	26 H	28 H	15 I	24 I	17 I	23 I
Epoxy with comp. III 0.5%	-	-	-	13 I	-	-

3.0%	-	-	-	30 H	-	-
Epoxy with comp. IV 0.5%	-	-	-	-	17 I	9 L
1.0%	-	-	-	-	20 I	13 I
2.0%	-	-	8 L	7 L	25 H	18 I
3.0%	-	-	8 L	10L	28 H	22 I
<b>Control #</b>	35	35	36	38	35	37

Where: - = No effect.

L: Low activity = Mean of zone diameter  $\leq 1/3$  of mean zone diameter of control.

I: Intermediate activity = Mean of zone diameter  $\leq 2/3$  of mean zone diameter of control.

H: High activity = Mean of zone diameter  $> 2/3$  of mean zone diameter of control.

#: Chloramphenicol in the case of Gram-positive bacteria, Cephalothin in the case of Gram-negative bacteria and cycloheximide in the case of fungi.

### Corrosion:-

Since, 1,2,3-triazole compounds are heterocyclic compounds having three nitrogen atoms, when these moieties are adsorbed on the surface of the metal, each molecule covers large surface area and they can block the active sites by forming a co-ordinate covalent bond with the metal substrate, which leads to the decrease the rate of corrosion of the metal<sup>(40)</sup>. And also, the polarity of the triazoles induces an electrostatic attraction on the metal surface so as to protect the metal substrate from corrosive medium.

The epoxy paint compositions were prepared by means of physically incorporating triazole derivatives by ratio of 0.5, 1.0, 2.0 and 3.0% by weight into epoxy paint, were evaluated as the anti-corrosive. The paint formulations were evaluated on coated mild steel panels, the films thickness were adjusted about  $50 \pm 5 \mu\text{m}$ . The coated steel panels were exposed to salt spray tests according to CSN ISO 9227 for (500 h).

Photographic reference standards were used to evaluate the degree of blistering, creepage and rusting. The reference standards highlight the various degrees of blistering that can potentially develop when paint systems are subjected to these specific test conditions. The blistering size is graded from 10 to 0, where 10 represents of no blistering and 0 representative of the largest blister. Blistering frequency is denoted by [(few (F), medium (M), medium dense (MD) and dense (D)]. Coated specimens were subjected to a corrosive environment are also evaluated by recording the average (mean) maximum and minimum creepage from the scribe mark. Scribe failure is also rated on a scale from 10 to 0, with 10 being zero (mm) from the scribe mark and 0 is 16 (mm) from the scribe mark. Finally, visual

comparison of the surface with photographic reference standards, to determine the percentage of the area that has been rusted., is carried out according to Painting Council (SSPC), The rust grade is rated on scale from 10 to 0, where 10 is no rusting and 0 is suffering severe rusting.

The results of corrosion resistance of the painted films of prepared samples are given in (Table 3) and (Fig.3) explains the photo of the painted films after salt spray test (3.5% of NaCl). The results show that the compounds 4-amino-5- (trifluoromethyl)-4H-1,2,4-triazole-3-thiol (I) , 4-((4-chlorobenzylidene)amino)-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol (II) and 4-((furan-2- methylene)amino)-5-(trifluoromethyl)-4H-1,2,4-triazole-3-thiol (III) have an excellent anticorrosive properties due to of the presence triazole ring, all samples of compounds (II) and (III) approximately not affected during the probationary period due to the presence of the aromatic ring and imino group in addition to triazole ring, while complex (IV) has a poor anticorrosive properties.

**Table 3:-** Anticorrosive activities of modified epoxy varnish with new triazole derivatives (compounds I- IV).

Sample	Blistering		Scribe failure (mm)	Rust grade
	Size	Frequency		
Blank	2	D	13	3
Epoxy with comp. I 0.5%	5	M	7	5
1.0%	6	M	6	6
2.0%	8	F	4	7
3.0%	8	F	4	8

2.0%	4	D	8	4
3.0%	5	M	7	6

Figure 3: The photo of the painted steel after exposed to solid spray test

### Conclusion:-

This study proved that the adding of triazole modifiers (I, II, III) improved physical properties of modified resins, but compound (IV) has some negative physical properties compared with that of coatings based on the widely used commercial epoxy resin. All modifier epoxy coatings possess antibacterial and antifungal activity by different ratio and also may be used as anticorrosive agents.

#### Key words:-

Bone tuberculosis, talus.

#### Abstract

The talar tuberculosis is a rare bone localization of Koch bacillus. We report the case of a 50-year-old woman, with no special medical history, who complained of pain in the right foot with chronic evolution. Pathology study of a Bone biopsy led to the diagnosis of talar tuberculosis. A 6-months anti-bacillary treatment was given. The risk of degeneration compromises the functional future of the ankle joint.

#### Introduction:-

La tuberculose ostéo-articulaire représente environ 35% des atteintes extra pulmonaires et environ 1 à 3% de tous les cas de tuberculoses [1, 2]. La localisation à la cheville et au pied constitue 2% des formes squelettiques [3,4]. La forme talienne est une entité très rare dont le pronostic dépend de la précocité du diagnostic et l'instauration du traitement spécifique.

Nous rapportons l'observation d'une tuberculose ostéoarticulaire de localisation talienne avec revue de la littérature.

#### Observation: -

Il s'agissait de Madame M.R âgée de 50 ans, femme au foyer sans antécédents pathologiques particuliers. Elle s'est présentée dans notre formation pour douleur, tuméfaction et impotence fonctionnelle du pied droit avec une fistule purulente à la face externe de la cheville.

Le début de la symptomatologie remontait à quatre mois, avec l'apparition d'un gonflement douloureux de la cheville qui a été considéré comme une entorse bénigne négligée et traité comme telle. Deux mois plus tard, était apparue une fistule latérale avec issue d'un liquide d'aspect purulent, le tout évoluait dans un contexte d'apyrexie et de conservation de l'état général.

Devant ce tableau, la patiente avait consulté une autre formation hospitalière où elle avait bénéficié d'un bilan biologique standard et d'un examen bactériologique du liquide purulent. Cependant, les résultats n'étaient pas concluants, avec absence d'hyperleucocytose, une protéine-C-réactive négative et un examen direct négatif du prélèvement.

La patiente a été mise sous antibiothérapie à base de pénicilline M, mais sans amélioration notable.

A son admission dans notre service, l'examen clinique retrouvait (*figure 1*), une tuméfaction et une fistule active à la face externe de la cheville qui donnait du liquide séreux et une boiterie à la marche, l'articulation tibio-astragalienn

Address:- Service de Traumatologie-Orthopédie, Hôpital Militaire Avicenne, Marrakech, Maroc.

était libre. Les radiographies standards de face et de profil de la cheville (*figure 2*), montraient une lésion lacunaire de la partie supéro-médiale du corps du talus, grossièrement arrondie avec ostéosclérose périphérique. La tomодensitométrie de la cheville avait confirmé l'atteinte ostéo-articulaire et avait objectivé la présence d'une lésion ostéolytique du talus (*figure 3*).

La biopsie osseuse fut alors réalisée. L'abord a été latéral avec excision des tissus inflammatoires et nécrotiques, résection du trajet fistuleux et curetage biopsique talien large. Un nétoyage articulaire au sérum physiologique a été pratiqué et une immobilisation par attelle postérieure a été mise en place.

L'histologie permit d'affirmer le diagnostic de tuberculose par la présence de nombreux granulomes épithélioïdes et giganto-cellulaire centrés d'une nécrose caséuse, tandis que l'analyse bactériologique était non contributive avec mise en évidence d'une flore bactérienne polymorphe où prédominait le *Pantoea Agglomerrans*. Un bilan d'extension n'a pas montré de localisation pulmonaire ou extra pulmonaire.

Après un bilan hépatique, rénal et hématologique, un traitement antibacillaire a été instauré pendant six mois à base de Rifampicine (R) : 5mg/kg/j, d'Isoniaside (H) : 10mg/kg/j, de Pirazinamide (P) : 25mg/kg/j et d'Ethambutol (E) : 20mg/kg/j, avec deux mois de RHZE et quatre mois de RH.

La fistule s'est tarie en quatre semaines, mais la patiente garde toujours des douleurs séquellaires à la marche au dernier contrôle.

#### Iconographies:-

**Figure 2:-** Radiographie standard de face et de profil ; lésion lacunaire du talus.

**Figure 3:-** La tomodensitométrie en coupes sagittales ; lésion ostéolytique du talus.

**Figure 4:-** Radiographie du thorax de face normale.

**Discussion:-**

Selon les données de l'Organisation Mondiale de la Santé en 2014, 9,6 millions de personnes ont développé la tuberculose. Au Maroc, un total de 30.636 cas de tuberculose, toutes formes confondues, a été notifié en 2015. La proportion de la forme extra-pulmonaire était la plus élevée en 2015, avec 52% des cas, contre 48% des cas de tuberculose pulmonaire [6].

Les formes extra-pulmonaires sont dominées par l'atteinte rachidienne qui représente plus de la moitié des cas [7]. La localisation à la cheville est très rare et ne représente que 2 % des atteintes squelettiques. Zacharia *et al.* [5] ont revu une série de 14 cas de tuberculoses de la cheville, la localisation talienne et calcanéenne était la plus fréquente. Chez notre patiente l'atteinte était talienne.

La rareté de cette affection et les manifestations cliniques aspécifiques expliquent un retard diagnostique pouvant aller de quelques semaines à plusieurs mois [1]. Les principales manifestations cliniques sont la douleur, le gonflement et l'impotence fonctionnelle. Les signes d'imprégnation tuberculeuse sont rares. A des stades tardifs, on peut observer une fistulisation sur la peau [5].

La radiographie osseuse standard est aspécifique. Au début, la tuméfaction des tissus mous et l'ostéopénie peuvent être présentes avant les signes tardifs de destruction osseuse. La radiographie du thorax n'est pas d'une grande spécificité car plus de 80 % des patients n'ont pas de tuberculose active concomitante [8]. Dans notre étude la radiographie du thorax était normale (*figure 4*). La tomодensitométrie est en retard par rapport à l'imagerie par résonance magnétique pour la détection de l'atteinte osseuse et bien moins performante pour l'atteinte de tissus mous [8].

La biopsie est le seul élément clé du diagnostic, suivie d'une analyse histologique et bactériologique. La culture du prélèvement biopsique n'est pas toujours concluante et peut nécessiter plusieurs semaines à se positiver [9]; l'aspiration du liquide articulaire en cas d'atteinte associée de l'articulation paraît insuffisante pour étayer le diagnostic [10]. Les produits de drainage des fistules sont généralement contaminés par d'autres micro-organismes [10]. Cela a été le cas chez notre patiente où seule l'étude anatomo-pathologique du produit de curetage talien a permis de poser le diagnostic formel de tuberculose du talus.

Le traitement est essentiellement médical par les antibacillaires, il permet de limiter l'évolution vers les séquelles douloureuses et les déformations, la majorité des lésions guérissent en 6-12 semaines sous le traitement médical. Le traitement chirurgical, quant à lui, ne peut en aucun cas remplacer le traitement médical. Il trouve sa place, premièrement, dans l'obtention des prélèvements anatomopathologiques. Deuxièmement, il est indiqué en cas d'insuffisance du traitement médical, lorsque persiste une synovite, une fistule ou un abcès. La chirurgie interviendra enfin dans le cadre des corrections de déformation séquelle importante et douloureuse [11,12].

**Conclusion:-**

La tuberculose ostéoarticulaire, isolée, de la cheville est une entité rarement rapportée dans la littérature, l'atteinte du talus est exceptionnelle. C'est une localisation grave et de diagnostic difficile, pouvant mettre en jeu le pronostic fonctionnel du pied.

**Conflits d'intérêt:-**

Les auteurs déclarent ne pas avoir de conflits avec ce manuscrit.

**Contributions des auteurs:-**

Tous les auteurs ont lu et approuvé la version finale du manuscrit.

#### Abstract

FDI plays an important role in developing countries such as India where every sector is developing and the government sometimes faces the shortage of investments. In such situations FDI plays an important role. Indian railways are such an example which has shortage of funds. Our Indian Railways need robust investment which can be met only if private investors are attracted. Indian railways are the ONE single entity that touches lives of all Indians, some more regularly than others. The Indian Railways is known for its turnaround story going from a near bankruptcy in 2001 to strong behemoth in 2007. But now to the losses are increasing every year and operating ratio is also very high when compared the previous few years. Passenger trains are always running in loss which is subsidized by freight trains. Not only this, India loses as much as \$45 billion a year due to poor logistics infrastructure. This wastage could be cut by half and fuel needs could be reduced by 15-20 percent if the country fixes its transport infrastructure and moves more goods by rail. Only 33% of the total electricity route is electrified. Transport by electricity is much more energy efficient than by diesel. Vision 2020 plans to have more than 50% route electrified by 2020.

This paper looks into the problems faced by the Indian Railways and what can be the solution of these problems confronted by Indian Railways.

The objectives of this research are: do we need privatization of Indian railways? And why do we need it? For this secondary data is used and that data has been collected from different sources which is analyzed and interpreted properly.

#### Introduction:-

Indian railways (IR) started its 53 km journey between Mumbai and Thane on April 16, 1853 and is today one of the largest Railways in the world. The railway network invariably referred to as 'the lifeline of the Indian economy' is spread over 109,221 Km. covering 6906 stations. Now India has the world's fourth largest rail network and also second largest under single management, Operates more than 19,000 trains every day. It has 2,29,381 wagons, 59,713 coaches and 8,417 locomotives.

Address:- Research Scholar at Kousali Institute of Management Studies, Karnatak University Dharwad.

Indian Railways have joined the select club of countries comprising Chinese, Russian and United States Railways with an originating freight loading of 1008.09 million tonnes (i.e. one billion plus) in 2012-13. During 2013-14, Indian Railways carried 1.05 billion tonnes of freight and carried 1.1 billion tonnes in 2014-15. Indian Railways is primarily financed through Gross Budgetary Support from the union budget, its own internal resources (freight and passenger revenue, leasing of railway land, etc.) and Extra Budgetary Resources (market borrowings, institutional financing, etc.). The share of internal resources in Railways financing has been declining from past some years. Modernization of Railway infrastructure is a priority. Rail Budget 2015-16 has projected an investment plan of Rs 8,56,020 crore in the next five years, and in this FDI can play a very crucial role. Modernization of railways can be a significant engine of inclusive growth and development for the country and can potentially contribute an additional 1.5% to 2% to GDP (*Ministry Of Railways*). Railways have started many projects from the past two decades which are still incomplete and some projects are as old as 30 years. The progress in work is not happening because of the lack of funds and also the railways are incurring losses every year and the surplus is also decreasing. India needs about 5-8 lakh crore to complete its ongoing projects. But where from this huge money will come. Hence there is a need of FDI in this sector too.

### **Foreign Direct Investment:-**

Foreign direct investment (FDI) is an investment in a business by an investor from another country for which the foreign investor has control over the company purchased. The Organization of Economic Cooperation and Development (OECD) define *control* as owning 10% or more of the business. Businesses that make foreign direct investments are often called multinational corporations (MNCs) or multinational enterprises (MNEs). An MNE may make a direct investment by creating a new foreign enterprise, which is called a Greenfield investment, or by the acquisition of a foreign firm, either called an acquisition or Brownfield investment.

Global FDI inflow's rose by 9 percent to USD 1.6 trillion in 2014, USD 1.75 trillion in 2015 and will raise to USD 1.8 trillion in 2016 (*UNCTAD Report 2014*). India's FDI inflows have increased 26 percent in 2014 reaching \$35 billion which was \$47bn in 2008 and \$35.6 bn in 2009 with maximum growth in service sector, despite macroeconomic uncertainties and financial risks according to an *UNCTAD Report*. This growth is much faster than the rest of developing Asia, which saw a growth of about 15 percent across 40 economies.

FDI in services sector grew up by 46% in 2014-15. With the government taking steps to improve ease of doing business and attracting investments, FDI inflows into the services sector grew by over 46 percent to USD 3.25 billion in **2014-15**. The services sector, which includes banking & insurance, railways, telecom, outsourcing, R&D, courier and technology testing, had received foreign direct investment (FDI) worth USD 2.22 billion in **2013-14**. However, the total foreign inflow in 2014-15 in the services sector was low as compared to **2012-13** when it was USD 4.83 billion, according to the Department of Industrial Policy and Promotion (DIPP) data. So with the growth in FDI in important sectors like services, overall foreign inflows in the country too rose by 27 percent to USD 30.93 billion during the previous fiscal year. The amount was USD 24.29 billion in **2013-14**. Services contribute about 60 percent to India's GDP and it receives high foreign inflows in this sector.

### **Privatization:-**

As Indian Railways are incurring losses every year and there is a need of huge investment. Where from the funds will come when government has no funds to support it and also the earnings of the railways are so less that cannot meet the demands of the projects. FDI is needed in the infrastructure, signaling, doubling and tripling of tracks, logistics etc. Hence FDI in railways will result in increased efficiency of the railways.

### **Some of the major advantages claimed for privatization of railways are:-**

1. Better use of the railways
2. Great responsiveness to the customer; a higher quality of service
3. Greater emphasis on the profitability and better value for money for the public travelling by rail.

Japanese National Railways are evidence to support these claims, which was privatized in 1987. However, because of particular aspects of the operating environment in which the privatized railways in Japan have been functioning, the Japanese experience is not readily transferable to other countries, especially India. A panel was set up for Indian Railways and the key recommendations of the panel are below:

1. Accounting process needs to be simplified and as per international standard.

2. Streamline recruitment & HR processes.
3. Focus on core activities.
4. Decentralization - More authority at Zone level
5. Encouraging Private entity.
6. Indian Railway Manufacturing Company
7. Independent regulator
8. Social costs & JVs to bear them.
9. Changing relationship between government & Railways - Railway budget should be phased out progressively and merged with the General Budget. Merging Ministry of Railways with Ministry of Transport.
10. Raising resources for investments.

Hence the committee has recommended encouraging the private entities which can bring the railways out of ICU. "The radical measures suggested include switching over to commercial accounting, corporatization of production units and involving private sector in manufacturing coaches, wagons and locomotives." No doubt the fares will go up but according to *NCAER Morgan Stanley Report* Indian passengers are ready to pay extra if they are provided the best amenities on rail.

### Review of Literature:-

**Bhati Sonam et al(2014)** in their research article "Foreign Direct Investment In Indian Railways" say FDI is allowed now in Indian Railways which was earlier prohibited . FDI up to 100 per cent is allowed through automatic route for mass rapid transport system in all metropolitan cities. They say FDI is allowed in high speed train projects, infrastructure in industrial parks, mass rapid transport system (MRTS), freight lines, rolling stock, railway electrification, signalling system, freight terminals and passenger terminals. **Rastogi Ankit (2012)** according to him Spanning 64,456 km with more than 7,133 railway stations, India's rail network is the largest in Asia and the second largest in the world (behind the US). However India's rail infrastructure suffers from chronic under-investment, due to which its potential for freight movement remains largely untapped. Rail freight has grown at around 7 % over the past five years. According to him there is a huge opportunity of FDI in Indian railways. **Kaur Manpreet et al.(2010)** According to these authors, the availability of developed infrastructural facilities is a sine-qua-non of progress of the economy. Adequate infrastructure is necessary not only to facilitate domestic investment but also to woo foreign investment. Many sectors are attracting FDI like infrastructure, retail, and transport and there is a great need of FDI in all such sectors. **Dwivedi Priya et al (2013)** in their paper say that in India FDI is allowed almost in all sectors except a few like arms and ammunition, atomic energy, railway transport, coal and lignite, mining of iron, manganese, chrome, gypsum, sulphur, gold, diamond, copper, and zinc. According to them FDI should be allowed in all these sectors especially Indian railways because it is not able to meet the current demand of passenger and freight. **Ramesh Nanaji (2002)** says most of the railway fatalities were accidental in nature and in the bread earning age group particularly among the males. The increasing number of population, overcrowding in the trains, reckless and careless behavior of the passengers, pedestrians and the train drivers towards safety norms are the constant causes of railway fatalities. The high levels of the railway fatalities make a strong case for the necessary accident control interventions. Public as well as the railway authorities must take some measures to bring down these fatalities. In such a case there is a need of huge investment to prevent such fatalities. According to **S. Sriraman in (2009)** complementary nature of the relationship between the two main modes of transportation, rail and road, needs to be promoted. Indian railways showed a huge cash surplus with the figure touching nearly Rs 25,000 crore in 2007-08 (revised estimates) and the operating ratio improving from 84 per cent in 2005-06 to 76 per cent in 2007-08; almost 20 per cent more than last year's figure. Partnership like public-private partnership would go a long way in giving rise to a more optimal modal split when viewed from the perspective of the economy. Though a small beginning has been made by giving licenses to private parties to run container trains, the complementary nature of the relationship between the two modes needs to be promoted in a much more significant way if efficiency and environmental concerns are to be met.

### Statement of problem:-

Indian railways are incurring loss every year. In the previous fiscal year it incurred a loss of about Rs 30,000 cr and the operating ratio is not coming down which is still at 92%. The scheduling process is another problem that has to be considered. Railways lack new coaches and even they do not have capacity to repair old ones at the rate they are being unfit to run. The cleanliness hygiene has been degrading for the past 5-10 years consistently. Billions of

rupees are blocked in projects which are yet to be completed. The waiting list number for the trains during normal times is alarming and during the time of festivals is mind boggling.

### Objectives:-

1. To study the operational efficiency of Indian railways from past 15 years.
2. To study where is the need of privatization in Indian Railways.
3. To study why there is need of privatization of Indian Railways.

### Research Design & Data collection:-

Data collection is a systematic approach to collecting information from a variety of sources to get a complete and accurate picture of an area of interest. For this study the data collected is purely secondary data.

**Secondary data:-** Secondary data is the data that is already collected in the past.

The secondary sources of data for the study are:

1. Indian railway board.
2. Economic Survey, WTO and RBI Reports, World Investment Reports, World Bank Reports, SIA Newsletter.
3. Secretariat of Industrial Assistance (SIA).
4. Central Statistical Organization (CSO).
5. DIPP.
6. Ministry of Commerce and Government of India.

### Tools Used For Analysis:-

Compounded Annual Growth Rate (CAGR) has been used for the study.

### Data analysis and interpretation:-

#### Operating ratio from past 15 years:-

(Source: ministry of railways)

#### Net revenue from past 15 years:-

(Source: Ministry Of Railways)

**Losses in passenger services from past 15 years: -**

(Source: Ministry Of Railways)

**CAGR of FDI from 2009-10 to 2015-16:-**

(Source:DIPP)

**Following are a few areas where immediate private investment is required:-**

1. Shut down or sell of loss making low revenue routes in parts to private players.
2. Warehouses and security of the same must be sold to private players.
3. Freight and passenger operations can be privatized partially, with track access charges. This is a perfectly sustainable model, as and when there is a loss, the private player will vanish and govt will takeover.
4. The freight portion can be subcontracted out.
5. Excess land can be handed to a private company for lease management.
6. Manufacturing of locomotives and coaches is one thing that immediately needs to be privatized.

**Rolling stock requirement during the Twelfth Plan:-**

Type of stock	Requirement * on additional account (2012-13 to 2016-17)	Requirement ** on replacement account (2012-13 to 2016-17)	Total requirement (2012-13 to 2016-17)	Anticipated acquisition 2012-2017
Coaches	25,440	7,626	33,066	24,000
Diesel locos	1,500	500	2,000	2,000
Electric locos	1,800	210	2010	2010
Wagons( in vehicle units)	76,396	29,263	1,05,659	1,05,659

\* Requirement of coaches includes EMUs, MEMUs and DEMUs.

\*\* Requirement on replacement account for all rolling stocks are based on actual over age arising and the trend of average condemnation.

**Unexecuted projects as of F2015:-**

Project type	No of projects	Cost(Rs. Bn)
Rolling stock	1,287	1,750
New lines	132	1,336
Road safety works	1,739	437
Doubling	174	396
Gauge conversion	42	245
Metro projects	16	217
Track renewals	2,355	152
Electrification	39	67
Others	2,084	315
Total	7,868	4,914

(Source: Final Report On Mobilization Of Resources For Major Railway Projects)

Looking at these requirements there is need of private funds so that Indian Railways can meet the increasing demand of passengers and freight. If it is not done at the earliest, the higher end passenger will shift to airways and lower end to roads.

**Findings:-**

1. From the analysis of the above data the operating ratio which is as high as 98% in 2000-01. Post to that in 2007-08, Indian Railways had shown an excellent improvement in the net revenue and decrease in the operating expenses. But soon after that it again showed an increase and is still stagnant at 90% which is not good for railways. It has CAGR of -0.63%.
2. From the above graph it is clear that the net revenue is showing a CAGR of 34%. Indian railways was about to bankrupt in 2000 but after that due to certain policy changes it gained back its momentum and now it is doing well when compared to the previous years.
3. From the above graph it is clear that there is an increase in the losses of passenger services. These losses are because of the subsidy in the passenger fares and these losses are increasing at a CAGR of 7.7%.
4. The data related to FDI is collected from past seven years. The FDI inflow is fluctuating but has a satisfactory CAGR of 12.94. There is a need of FDI in Indian Railways because first it is running in losses and second government has no funds to provide support to Indian railways.
5. The unexecuted projects are showing astonishing figures which needs to be addressed soon.

**Suggestions:-**

1. As per the study, increase the investment to increase the speed of freight carriers and passenger trains rather than throwing more number of trains on tracks as our tracks are running above optimal (80%) capacity utilization.
2. There should be transparent accountability.
3. Increasing the electrification of railways as the rate paid by Indian Railways for diesel is 50% higher than the rate paid by US Railways, while the rate at which the Indian railways can get electricity is 45% lower than that paid by US transporters.
4. Policies to shift road freight to rail freight.

5. Attract investment to expand the infrastructure.
6. Shut down Railways running nursing colleges, bottling companies or making electricity boards.
7. Transfer local train services to states or city corporations.
8. Advanced signalling systems like AWS instead of traditional block signalling system.
9. Stations can be operated under contract.

### Conclusion:

In developing countries like India, there is a constant demand for opening new railway services in order to meet the transport needs and Indian Railways is the backbone of the nation as it moves Aam Admi to every corner of the nation. It is not financially viable because of subsidy in passenger fares and is incurring losses in thousands of crores every year. Such loss making services will have to be minimized. Operating ratio is very high which needs to be taken care of in order to improve the financial viability of Indian Railways. There is a need of technology that can be installed or used in order to enhance the speed of rolling stock and passenger trains. As the government has not enough funds to invest in the expansion plans hence it should make the railways attractive for the private investors who can take up different projects and invest in them.

### Abstract

**Background:** Maternal accommodation to normal pregnancy begins shortly after conception, during pregnancy the anatomical and histological changes occur in the kidney as a maternal adaptation for physiological changes.

**Aim:** Evaluation morphological changes in the kidney glomeruli and tubules during pregnancy, Histomorphometrical assessment of glomeruli and tubular changes with pregnancy.

**Material and Method:** This study carried on 40 mature mice divided into two groups, 20 pregnant mice served as experimental group and 20 non-pregnant mice as a control group, kidneys were removed; the weight is measured and then fixed, dehydrated in ascending grades of alcohol, cleared in xylene and infiltrated with paraffin. The paraffin blocks were made and 5µm thin sections were obtained using a rotary microtome. The sections were stained with H&E stain, PAS examined under light microscope.

**Result:** Under the light microscope, the kidney in experimental group show the many anatomical changes as increase in Wight, elongated and increase in width, and showed many histological changes as a glomerular enlargement with decrease of urinary space and dilation in proximal and distal tubule. A statistically significant differences have been shown in the diameter of renal corpuscle, glomerular tuft and Bowman's space, and also in the renal tubules proximal and distal convoluted tubules ( $p < 0.001$ ). And in Wight, elongation and width as ( $p < 0.001$ ).

**Conclusion:** The results of the present study indicated during pregnancy kidney undergo to anatomic change as increase in size and Wight, and histologic change as elongation in glomeruli, and dilation in diameter of tubule.

### Introduction:-

Pregnancy causes definite and marked changes in urinary tract. The most important changes as dilation of the ureter and kidney pelvis, this phenomena is common and might well be said normal concomitant of pregnant state<sup>(1)</sup>. All mammalian kidney show a morphohistological feature which describe as a cortex enclosing a pyramid-shaped medulla, the tip of which protrudes into the renal pelvis, the medulla is divided into an outer and an inner medulla;

**Corresponding Author:-** Asawer K.M. Al- fatlawee.

Address:- High institution for infertility diagnosis and ART, Al Nahrin University.

the outer medulla is further subdivided into an outer and an inner stripe <sup>(2,3)</sup>. Each kidney has about one million of tiny filters called nephrons. The components of the nephron include the renal corpuscle (glomerulus and Bowman's capsule), the proximal and distal tubules, and collecting tubule. <sup>(4)</sup>

The glomerulus is a spherical structure having a capillary network lined by a thin layer of endothelial cells, in the central region mesangial cells, and the visceral region of epithelial cells podocytes and the parietal epithelial cells of Bowman's capsule and associated basement membrane. These two epithelial layers are separated by a narrow cavity identified as Bowman's space or urinary space. <sup>(5,6)</sup> Proximal and distal tubule are parts of a nephron, proximal tubule is the portion of tubule that starts at Bowman's corpuscle which is highly convoluted and located in cortex, then descending in medulla to become continuous with another tubule. <sup>(7)</sup> Distal tubule is a less convoluted and shorter tubule than proximal and has a smaller diameter. <sup>(8)</sup> Morphometry is a stereological method that has been used to study physiological function of an organ or tissue from the morphological point of view, the words of morphometry include quantification of three-dimensional properties of an object from two-dimensional plans.

### Material and Method:-

The study was performed on albino mice (*Mus Musculus*). Healthy males and females were obtained from the animal house of High Institute of Infertility Diagnosis and Assisted Reproduction Technologies / Al-Nahrain University. 40 healthy mature female mice were divided into two groups equally, Group I non-pregnant served as control group, and Group II pregnant mice in between (15-21) used as experimental group. The kidneys of control and experimental group were removed and washed by normal saline then the weight of the kidneys measured, then fixed in formaldehyde solution for (24-48) hours, dehydrated in ascending grades of ethanol alcohol (70%, 90%, 100%), cleared in xylene and infiltrated with filtered paraffin. The paraffin blocks were made and 5µm thin sections were obtained using a rotary microtome. The sections were stained with (H&E) and (PAS) stain; then sections were examined under light microscope at magnification 10X, 20X, 40X, 100X.

### Morphometric parameter:-

The image analysis program is used to measure the diameter of renal corpuscles, glomerular tuft and Bowman's space in corticomedullary area at magnification 40X and also measure the diameter of proximal and distal convoluted tubules at magnification 100X.

### Result:-

Observation of anatomical criteria of kidney in both groups yielded the facts that both kidneys were found to be situated on the posterior abdominal wall on each side. In control group the measurement of kidney dimensions were as follows: Length 10mm, width 5mm, thickness 2.5mm. This was done by using vernier. While in pregnant group the dimensions showed a slight increase especially in regards to the length where 1-2mm increase was recorded. In regards to kidney weight both kidneys were weighed and the mean weight of kidney in control group was 0.19±0.003 gram, while pregnant group kidneys showed a marked increase in the weight 0.28±0.006 gram. This increase is statistically significant increase was recorded as shown in table (1).

**Table 1:-** Showing the statistically significant increase in length, width and weight of kidney during pregnancy.

Parameter	Control Mean ±SE	Pregnant Mean ±SE	P-Value
Kidney length(µm)	778±3.1	888±7.6	*P≤0.05
Kidney width (µm)	417±3.1	443±4.4	*P≤0.05
Kidney weight (gm)	0.19±0.003	0.28±0.006	*P≤0.05

### The histological aspect of the glomeruli:-

The glomeruli is a tuft of blood vessels located inside the renal corpuscle. Examination of the corpuscle under light microscope revealed the following: Group A: showed normal arrangement and size of renal corpuscle and glomeruli with well identified wide space. That continuous to form proximal convoluted tubule.

Group B: pregnant group showed number of changes both histologically and morphometrically. The glomeruli in pregnant group were enlarged in size, this enlargement was assessed morphometrically using ImageJ software. The glomerular area was calculated and statistically analyzed.

Control group showed a mean glomeruli area of  $658 \pm 19 \mu\text{m}^2$ . While in pregnant group the mean area of glomeruli was  $710 \pm 13 \mu\text{m}^2$ . A significant P value was estimated in between these two group in regards to glomerular area. Figure (2) & Table (2) Bowman's Space (urinary space) showed a marked decrease in pregnant group, Figure (1). Morphometric analysis of this result showed that urinary space area changed from ( $156 \pm 1 \mu\text{m}^2$ ) in control group to ( $72 \pm 1.5 \mu\text{m}^2$ ) in pregnant group, table (2).

Table (2): showing the statically significant increase in glomerular area and urinary space.

parameter	Control Mean $\pm$ SE	Pregnant Mean $\pm$ SE	P- Value
Glomerular area( $\mu\text{m}^2$ )	$658 \pm 19$	$710 \pm 13$	*P<0.05
Urinary space ( $\mu\text{m}^2$ )	$156 \pm 1$	$72 \pm 1$	*P<0.05

#### Histological observation of proximal convoluted tubule (PCT):-

As a part of nephron, proximal tubule poses two different portion as a convoluted part and straight part. Examination of PCT in pregnant group reviewed the following criteria (Figure 3, 4, 5, 6): The size of the tubule where more than seen in group A, The cells forming PCT where long cuboidal, eosinophilic, with large prominent nucleus and densely stained cytoplasm, Brush border of PCT cells was dens, thick, occupies the lumen totally and was densely stained by both H&E and PAS stain, A striking Feature of vaculation was noticed in these cell apical surface. Pregnant group showed a high mean area for PCT ( $545 \pm 14 \mu\text{m}^2$ ) while the control group PCT area was ( $424 \pm 24 \mu\text{m}^2$ ). A statistical analysis of these result showed a significant P value of (\*P<0.05) between these two group.

#### Histological observation of distal convoluted tubule (DCT):-

Distal convoluted tubule were found to be located in between glomeruli and proximal convoluted tubule. They were Small, Wide, Pale type of Tubule with wide clear lumen. The cells form in this type of tubule were low type of cuboidal cell, with fain eosinophilic cytoplasm and small round centrally located nuclei. The Number of DCT in compered to PCT were less in the cortex. Compression in regards to morphological point of view between pregnant and non-pregnant group showed dilation in DCT in pregnant group seen in H&E (Fig 7)& (Fig 8). A morphometrical measurement for the size of DCT was performed using Image J software. A total tubular area was chosen as a criteria to detect the include in size of DCT recorded by visual examination. Pregnant group showed a high mean area for DCT ( $369 \pm 9 \mu\text{m}^2$ ) while the control group DCT area was ( $263 \pm 4.5 \mu\text{m}^2$ ). A statistical analysis of these result showed a significant P value of (\*P<0.05) between these two group.

**Figure 1:-** shows the glomeruli tuft (G.T) and glomeruli with urinary space (U.S) in control group. (H&E, control group, 400 X).

**Figure 2:-** shows the glomeruli tuft (G.T) and narrow urinary space (U.S) in pregnant group. (H&E, pregnant group, 400X).

**Figure 3:-** Showing the PCT diameter in control group, H&E, 1000X.

**Figure 4:-** Showing the PCT diameter in pregnant group, (pregnant group, H&E, 1000X)

**Figure 5:-** Showing the PCT in pregnant group and a thin basement membrane (PAS stain, pregnant group 400X).

**Figure 6:-** Showing proximal convoluted tubule PCT with it brush border, thickening in basement membrane (B.M) in control group (PAS stain, control group 400X).

**Figure 7:-** showing DCT with clear lumen, no brush border and thickened in basement membrane, collecting duct (C.D) & PCT. (H&E, control

**Figure 8:-** showing DCT with clear lumen, no brush border, enlarged diameter and less thickened in basement membrane & PCT. (H&E, pregnant group, 1000X).

### Discussion:-

It was reported that the volume of right kidney in normal individuals was significantly smaller than that of the left because the spleen is smaller than the liver so the left kidney has more space for growth.<sup>(9)</sup>

The volume of the kidney is greatly affected by the method of fixation, we used the immersion method in this study but actually the perfusion method was more reliable for calculating the absolute weight and volume of the kidney before processing.<sup>(10)</sup>

From an anatomical view we demonstrated an increase in the weight and size of the kidneys in pregnant group due to increase in two dimensions of three (length & width). These results agree with some previous studies which reported normal increase in size of the kidney up to 30% with 1–1.5cm increase in length in pregnant females mainly due to changes in the vascular and interstitial spaces or hydronephrosis.<sup>(11, 12)</sup>

There were another possible reasons explain the increase in the renal size during pregnancy for example the renal plasma flow might be increased by 25% and the glomerular filtration rate increases up to 50% above normal. The increase of renal function had been attributed to the growth, hormone-like metabolic effects of placental lactogen and to increased free cortisol. Hormone secretion by the fetus might be responsible for the hypertrophy of the maternal organs. From the available evidence the kidneys might take several months to return to normal form of the non-pregnant state. On other hand the change in the renal dimensions might be an indicator of presence or progression of disease.<sup>(13, 14).</sup>

Glomerular size selectivity appeared to be altered in pregnant women and oncotic pressure was decreased because of expansion of the plasma volume, thus contributing to a rise in GFR. There may also be modest changes to glomerular ultrafiltration coefficient due to changes in the surface area for filtration and the hydraulic permeability.<sup>(13)</sup> Even severely hydronephrotic kidney had the normal number of glomeruli, this agrees with our results where it often realized that the glomeruli may be surprisingly well preserved in cases of marked tubular and interstitial changes.<sup>(15)</sup>

In normal adult non pregnant mice the means diameters of the lumen of the proximal convoluted tubules, the distal convoluted tubules, thick, and thin loop of Henle were  $11.5 \pm 4.183 \mu\text{m}$ ,  $16.5 \pm 2.850 \mu\text{m}$ ,  $12.6 \pm 1.596 \mu\text{m}$ ,  $18.6 \pm 1.294 \mu\text{m}$  respectively. These results disagree with ours because we demonstrated larger cross sectional area in proximal convoluted tubule than distal convoluted tubule in control and pregnant groups.<sup>(16)</sup>

This study agree with Bentley et al, who reported that the proximal tubules had large diameters and opaque walls, whereas distal tubules, connecting tubules, and collecting ducts had smaller diameters and less opaque walls.<sup>(17, 18)</sup>

This study reported an increase in the surface area (diameter) of proximal and distal convoluted tubule in pregnant group with respect to control group. The previous studies reported 20% increase in length of the proximal tubule within 5-6 days after mating without further significant changes to term. The increase in length would represent an increased area for reabsorption. While the proximal tubular diameter remains constant during pregnancy. The proximal tubular elongation was not detected at 2-3 days of pregnancy but it occurs later when both the absolute and fractional amounts of salt and water reabsorbed were significantly greater than control values during the high rate of infusion.<sup>(19, 20)</sup>

The pregnancy caused slight changes in shape of the proximal convoluted tubules and over 10% height reduction of the cuboidal epithelium lining the proximal convoluted tubules were observed in the kidney. The changes in the convoluted tubules proceed in a heterogeneous way and lead to a mixture of atrophic and hypertrophic units. The dilatation of the tubules due to accumulation of fluid tends to shortening of the tubules. The increase in the tubular diameter will reduce the number of the tubules profiles counted per section of tissue.<sup>(20, 21)</sup>

#### The Concept Of Person:-

The treatment of disease, the relief of suffering and the extension of basic care, according to the principle of fairness and justice, are the basic medical art characters. From this perspective comes the need for humanization of medicine that animates and sustains the very idea of scientific progress and the status of medicine, whose purpose is the person. Many differences are born in the indication of the initial moment of its existence or even in the definition of death or when there is no longer the person failing in some capacity. Boethius said that the person is the individual substance of a rational nature, so an individual of a rational nature which is man. But the person is not a concept, its rationality is linked to human nature regardless of its operations, namely the ability or not to try to be rational. Unlike the concept of utilitarian Peter Singer where every person be rational and self-conscious and therefore the quality of the person is based on the ability to experience pleasure and pain. Undoubtedly self-awareness and rationality are the person indices, but these operations which indicate the person does not identify with it. You can not identify the acts with the subject that produces them. Is there a subject self-conscious, rational and free capable of implementing concepts that would otherwise remain only abstract concepts. Conceive of man as a person means to consider it in its entirety as spirit and body. The transition from power to act never changes the nature of a being, but simply encourages its full manifestation. A being can become what it is by its nature and so nothing can become a person without already being a person. The human individual is ontologically the same substance as a person he was. The substance is not subject to change, but changes its ability to possess certain skills. So all human beings are

persons. We could even say that the person is a unique and unrepeatable individuality of transcendent nature which carries an ontogenetic law of development. The transcendent and spiritual nature of man indicates the sublimity of his being that Christ has revealed himself as the image of God and the source of which is the act of God the Creator: The question of personal identity is reflected in the doctor-patient relationship, as symbolic expression of the human condition marked by the vulnerability. A key issue is the ability to grasp the unity prior to the relationship, namely the experience and living of the person, whose spiritual and psycho-physical integrity, always requires protection, proportionate care, political and social choices based on the principle of Justice. Our person is more of a non-continuous components together: something integrates all the information coming from inside of our bodies both from the outside world, as well as from our personal history, the illusion of being a unique identity. It understands that every human being is a person and that the orderly coexistence for the good implies respect for human rights are grounded in human nature. From the concrete phenomenological existence, you can recognize the dignity of each person, in a universal way. Hence the assumption of responsibility towards their own, but also towards the choices and consequences that decisions and medical actions are likely to cause. In reference to the new biomedical emergencies, together with the challenges of neuroscience, ethics is not enough to restricted regime. The enlargement of the view of the world can promote, through the technological age critical consciousness, a progressive globalization of rights such as the right to life, to subsistence, to the care and protection of persons whose preciousness and beauty transcends the cramped and austere space the individual profit. In the perspective of personalistic bioethics that seeks to reflect on the spiritual integrity, psycho-physical and relational, the ontological status of the person includes a reference to the starting point, that is the original synthetic unity of body and spirit of the human being unit .

The dignity of every person is therefore justified in the same dynamic order of his being. Human dignity resides in the act of the whole person; the presence of the human being stands as question of being and therefore being the person asks as an act of justice Recognition, warmth, hospitality and the defense of its integrity. The transcendent, spiritual dimension of the person has its ultimate roots in the truth of man's creation, intelligent finite being, who lives in a relationship with God in whose image and likeness. Sacred Scripture teaches that man was created "in the image of God" capable of knowing and loving his Creator, and which was formed by Him above all earthly creatures which of them ladies, to govern them and use them for glory of God. And 'within this communion of love that the mystery of all being finds its full meaning.

### **Health and Disease:-**

Reflect on the themes of health and disease, suffering and hope of the human person, it means researching the sense that these experiences have in the personal project of a person's life. I introduce reflection observing what the attitude of contemporary culture in the face of health and pain, in front of the living and dying, has changed in recent decades; a change of the rest are still in place, was so evolution. In a general way we can say that the man of our time has increased the sense of responsibility towards these life situations, from a behavior that accentuated the feeling of passivity and dependence, to a way of being and to manage these conditions in a much more active and responsible. Then the concept of health-illness is then considered in a wider and more articulated. One would say that today's man wants to not only live, but "live fully", attentive to the various dimensions of his being: organic, psychological and social. Against the suffering, it has become more aware of the plurality of causes that can provoke, as well as the variety of ways in which it can express itself. The experience of suffering also is experienced today more as a provocation and challenge not as a reality to accept and to bear patiently. It 'a trend that emphasizes the free and active aspect that arises before the reality with a positive attitude. The result is that every situation of pain, such as illness, failure, and other misfortunes, are seen primarily as a call of freedom and responsibility, as a denunciation of a need, a lack of which it requires the commitment of freedom. And 'then it grew the sense of human responsibility for both the causes that induce suffering and disasters, both man himself must do when a misfortune, suffering is taking place. There is to be borne in mind also the change of the cultural horizon of science and technology of our time, which refers to the evolutionary model of the cosmos and human existence, not without major repercussions on the meaning that illness and pain, health and they have hope for the contemporary man. In science and contemporary culture goes increasingly asserting the dynamic and evolutionary conception of the world and human existence. This conversation begins with a consideration on contemporary medicine. This opening is developing more and more to the totality of the human person. And 'now it entered the common language to talk about a psychosomatic or holistic medicine in order to understand the disease not only as a fact that affects the natural data of the patient, but that affects the existential given, the experience of the subject. No longer considered sufficient to cure the disease, you must get to take care of the sick person, seen in the plurality of its needs that maybe the disease blew chaotically. This is known, in the health sciences of the passage to be implemented by not

only cure, but also to take care of others. It is time to understand the reasons that are driving this transition. I will analyze this aspect taking the concept of health and to disease, trying to bring out the status of the human person when it enjoys the status of good-health and vice versa, when it is in ill-health. In a second step, I propose to raise the interest on the type of rationality suited to the world of health now seen in this broader perspective.

### **Concept of Health:-**

Recently it was Hans Georg Gadamer to draw attention to the difficulty encountered in wanting to define the health condition: We know roughly what they consist of diseases, as they are as it were characterized by the revolt of the fault. They manifest themselves as an object, as something that resists and then must be broken. It 'a phenomenon that one can observe carefully, judging the clinical value, and do it with all the methods provided by a knowledge objectively based on modern science. Health rather curiously exempt from everything, can not be examined, since its essence is precisely to hide. Unlike the disease, health is never a cause for concern, indeed, you are almost never aware of being healthy. It is not a condition that invites or cautions to take care of themselves: In fact implies the amazing ability to be forgetful of themselves. Some help to understand the sense of health as integrity, can be the use of linguistic root of the word "health." Be whole, be identical to themselves it means two things. First, be free from anything that impairs or prevents the integrity; secondly, be intact indicates the implementation of the entire 'potential' available, the achieve the goal using what is proper to man. It reports the conclusion arrived at Jaeger, a scholar of the problems of medicine: the doctor's task is to restore the hidden proportion, when it has been disturbed by the disease. In the state of good health is the very nature that restores or, if you will, is itself the right proportion. The concept so important to 'blend', actually means a kind of balance of body forces, closely connected with that of proportion and symmetry. The nature of work in the sense of a sensible norm. Comment on Real: These concepts of 'proportion', the 'symmetry', as well as those of 'more' and 'less', connecting closely with the concept of "measure", rather than "right size": this is the key concept of Platonic metaphysics, on which it depends to health. Health: "right fit", "harmony", "balance" The concept of health then, for Plato, it depends on the "right fit" or proportion of the parts of the whole organism of the human person, and this is the essential ontological character of reality same.

The conclusion is that you can not treat the human body without addressing the totality of the body. But even you can heal the body, or a part thereof, without even cure his soul, his psyche, ie the totality of man. This is confirmed by the latest medical research, where it is increasingly clear that the explosion of a disease, be it organic or psychological, is always the culmination of a story with complex ramifications and not always easy to decipher, however, where it is clear that the ultimate roots of evil invariably belong to two orders that constitute us, the body and the spirit. There is always a connection between the two dimensions, even if the specific origin is in either dimension. In connection with the plan of life, the person's health is therefore to be considered in a dynamic way, as tension to establish a balance between the different dimensions that make up the human person, and in the multidimensional sense that concerns man in his unit and in 'articulation of its size. Health can still be understood and studied at different levels, from the physical and psychological, to the level of interaction between the body and the psyche, or a good balance between individual and community. It should however be understood in its entirety then targeted on the basis of the "meaning of life" and located a spirit level: human well-being depends essentially on living a meaningful existence. And 'therefore a dynamic-evolutionary condition and not a "state" fixed and stable, but a point of arrival, a route to go, a vocation to answer in dialogue with other experiences of life: joy, suffering, disease, successes and failures, disappointments and achievements. It meets the human subject in the first person, because it is not a condition that just "happens" to the man, an event which should only take note, but it involves a definite stance on the part of man. Also in this case the man is a "you decide", that decides about himself, the manner in which it now intends to handle this situation. And 'note the definition of WHO's health since 1948 as a "state of complete physical, mental and social." Therefore understand properly the condition of man, means inscribe in their personal "biography", ie taking it in his conscience, make it the object of decisions integrated into a framework of values within which be implementing their own existence. Summarizing, I would say that the state of man's integral well-being can be understood in various ways, depending on the level of integration of man's essential dimensions:

- a. at a first level, which depends on the good functioning of the organism. We are in the order of the plant or animal life; this first conception of health is dependent on the condition of well-being of the human person, solely or mainly on the person's well-being. To which the man gets sick when there is a dysfunction in his psychophysical organism. In this case, health is the recovery of the lost wealth, and if it is obtained, it is considered life existentially over, meaningless.
- b. At the second level, health is seen in the order of interaction between body size and mental and moral dimension of man, as well as the good relationship between the individual and the community. The spa at this

level is primarily a condition of equilibrium: within the subject in the first case; Good personal relationships in the second. If that balance is missing, here is the "disease" and "ill-being"; the state of health is in restoring the right proportion.

- c. The third level of the concept of health, refers to the "meaning of life", and is located in the order of the spirit: human well-being now depends on living a meaningful existence. As there are many examples of men and women who have given meaning to their lives while living it in situations of poverty, or suffering, of illness or misfortune! Experience shows, then, that the same condition of illness or suffering of another, does not necessarily exclude the meaning that life continues to have. The subject experiences this inner balance, this paradoxical correspondence between the condition of poverty or pain, and their own life project. Sometimes it even get the impression that the same pain, misfortune, illness or other, play a positive role in conferring an important meaning to life. Not the evil in itself is capable of so much, but rather it is the attitude with which the person lives that experience to confer this sense. It seems therefore that even a disease, or another experience pain and sorrow, can play a sort of "task" or function in a life "significant." In a personalistic conception of health, it is clear that the three levels that I mentioned, are designed in mutual reciprocity: what happens at one level, is reflected in the other, as there is a deep connection between biopsychic size, socio-environmental and ethical -spiritual. The person "healthy", then, is first of all he / she who lives in a harmonious and balanced manner the relationship between these different dimensions of health, in an order that tends to the affirmation of a meaningful existence. And 'therefore also capable of integrating the inherently limited character of man, and does not allow you to isolate health since suffering ... A healthy man should also be able to face suffering, he is called to live it ... you can not detach the subjective experience of a person from the values with which that person faces life. there can be a positive experience if you can not make sense of suffering, to the limit and death.

### **Existential Analysis of the disease state:-**

To the extent that is emerging this conception of good or bad health condition, it understands the need for medicine, having to move from one approach to the person primarily of sick character "natural" and "objectivist", an attitude that embraces "subjectivity" of the patient, her past psychological, social and spiritual. At this stage of our reflection, it is essential that the health care professional is aware of what happens in the sick person. The human sciences and philosophy, especially that attentive to 'Humanum', applied to the world of health, they offer a very thoughtful and provocative description of the existential condition in which people suffering from a serious medical condition. E 'was above all the existential analysis of this situation to describe acutely real and what is happening in the inner space of the person seriously ill. I present concisely the results. In this case, the existential analysis is to describe "how the man in suffering." We must begin by recalling the human figure in his opening to life. Now the man emerges into existence, by asking questions; He is a seeker of meaning. Kant summed up that incessant ask three key questions: What can I know? What should I do? What can I hope? These questions arise on the spur of the desire for life, then he asks to be made true in a specific project. This is then implemented through a network of relationships that the subject establishes with others, with things and with the environment and with himself. Whether it is of a believer, it is also crucial the type of relationship that he lives with God. If we take into account cross this attitude with which the human person is placed in life, you realize what is happening in his inner space when surprise and overrun with a serious illness. That desire for life and the existence of the project are now being questioned, if not crushed. The new condition of life is first lived as a negation of the vital dynamism. Change the attitude towards existence under the pressure of a life form that is especially expressed as a breakdown in communication with the reality of existence. We can clarify this statement by resorting to studies on the disturbance produced by the "disease state". Reflexive analysis the disease is as "a concrete form of existence, not reducible to pure organic accidental." From the point of view of phenomenology, disease status is expressed as pain and weakness. For the sufferer becomes essential anxiety of what will come next. On a purely psychological level, there is a narrowing of his world, a self-centered attitude of tyranny and addiction at the same time. At a deeper level, in the interior and existential space, you can be glimpsed:

- a. the occurrence of a subjective unit break, a fracture between "body" and "cogito". The body degrades in "object representation", is unrelated to the subject of acquiring a condition of otherness and strangeness: psychosomatic states, such as fatigue, fever, pain, showed a rupture personnel unit, an inner disharmony;
- b. towards others and things, the sufferer experiences a crisis of communication and interpersonal relationships. The disease fact compels the sufferer to attention almost exclusively to itself, which in itself implies the darkening of the consciousness of others. The universe shrinks in your room. It has a strong awareness of the dependence on the 'other self, which is the loss of autonomy;

- c. the power of attorney disease a strong experience of limits: it is known that this experience arises fundamentally from the inadequacy of the ego with itself, there is therefore innate and always accompanies our consciousness. But there is a pathological condition in a specific manner, concrete and immediate experience of the radical fragility of one's being. And 'experience of limits of life, in its duration and in its quality. For this reason the idea of death is always present, albeit in different forms and at different levels of consciousness, in every type of disease;
- d. you can then derive a feeling of dereliction especially if the evil is getting worse and branching, or you see a way out. And 'the feel abandoned, "thrown away" from life, as a last and summary accordingly. Have various moods that lead: the anxiety of the post, the sense of boredom and frustration, existential emptiness, the feeling of inconsistency of all, fear, boredom, sadness. It 's all a path that leads to the annihilation of personality. It 'a state of anxiety that threatens to invade the entire inner space of the person. If there is a sense in this situation, it is easy to fall into obscurity, in rebellion or despair and see the disease in view of the totality of the person. Now more and more and the empirical sciences, and humanities and philosophy, they inform us that this patient's state of existence is not a "neutral" condition in respect of organic disease. If health and disease, as I quickly called, must be read and interpreted in the light of the complex and articulated unity of the human person, it is clear that both the diagnosis and treatment should take into account the totality of the subject, the diversity and complementarity of size compose it. You can not, in other words, treating the biological dimension, regardless of "taking care" of the entirety of the person, because "sick" is not so much a "part" of the person, but is the subject that is such. It must therefore implement a shift "from the illness the sick person". In medicine so-called "natural" there is a darkening of subjectivity, which is put in brackets. The new approach that is being born, or which in many ways is re-emerging, asks to introduce the subject in the same biology; short calls attention to what is specifically "human" in sickness and in care. Healing in fact, in this perspective, it is no longer seen as mere reintegration into previous state, but as an existence regain by the patient. By itself the cure always involves a novelty in the patient compared to the previous condition; It includes an increase in the consciousness, of a change in lifestyle, a different understanding of self and others. This type of healing, can not exist without the active participation of the patient: the subject - that is, the sick - is the fundamental unifying moment between the different dimensions: biological, psychological, relational, which then converge on the personal biography of the subject itself. But it is the subject itself which can hinder this dynamism, because they generally prefer to delegate to others "specialists" in the industry, responsible for managing the process of the disease and therapy. The greatest obstacle to the integration of the illness or healing process in the biography of the subject, to say the scholars of the phenomenon, is in not wanting to see the truth in other aspects of our spiritual life. And this concerns both the patient and the physician. Bioethics wants to help deal with this task, in the belief that you can not have a proper orientation toward life, understood in all its forms, even those tiring and painful, if not through the assumption of responsibility in the management of existence . In the case of disease-healing, liability case concerns both the health professional that the patient, to be exercised in a different way by each other, but always in mutual complementarity. Mostly we have the tendency to oppose the two attitudes that they face to the disease: understanding and delete. We just play the first function of the second. And if it happens, it remains in the disease with all the risks that I reported above. As should learn to integrate those two attitudes, identifying the position that healing is still in the very first attitude: in fact understand the meaning of the symptom, in itself it brings in a certain sense to integrate it, to add that in a broader context of meaning of life. And yet it is clear that the doctor is asked to deal with a specific dimension of the human subject, ie organic aspect. Yet, from the perspective of "cure and care" he will constantly present the entirety of the sick person, including attention to the proper subjective dimension of the patient.

### **What is "rational" for the world of health?**

Compared to the promising development of neuroscience, and attention to the marvelous progress of modern medicine, however, it remains perplexed by the emergence in recent years, within the cultivators of the same medical sciences, of a strong trend that refers only the technical-scientific rationality for understanding the reality of life and of human life itself. Recent acquisitions extraordinary understanding of the human brain, are considered by many scholars to such a value to consider them the "turning point" more radical than any change that so far human history has known. And yet, from these acquisitions they originate questionable claims of some scholars of this trend. They believe that only this kind of rationality is capable of understanding the reality of human life, and therefore it can only tell us what human life in its origin, in its development and in its decline; also they claim that only this science can and must address the problems of bioethics and humanization, or there is more to expect reliable answers from philosophy, ethics, religion or human and theological sciences; and it is just this kind of science that can give sensible answers to the questions of "who" or "what" is the man, when and why it actually

becomes "human beings" and when and why you fell from this condition. The reason that justifies these statements are essentially the epistemological status of the techno-scientific rationality: this deals with the given immediate and immediately perceptible, empirically verifiable, while the other rationality remain ambitious and smoky in their results, always postponing to an indefinite "beyond" achieving the goal of happiness. For this, they conclude, the techno-scientific rationality is the only proper use of human reason. And this is where the error: reduce the way of seeing and understanding the human life to what happens in it only biologically, neglecting what is the *proprium humanum*, that man as such. The medicine in the time of modernity If we wanted to trace the origins of this thought, we should take care of two problems: one concerns the history of thought in the West, the other that of knowledge, scientific and philosophical. In fact, we should revisit the eighteenth-century Enlightenment, and some of his deviance in modern and contemporary. These seem to have originated the claims of some researchers, for which reason it is conceived only in the version empirical-positivistic. But we should also analyze the cognitive dynamics of the human person according to what they tell us the sciences, natural and human perception. We should understand what requirements or "prejudices" that allow people to know and to progress in his cognitive capacity. Would emerge as the "mental patterns of perception" that if on the one hand enable man to know and to evolve his mind, on the other hand can also block this dynamism, leaving him "fixed" to previous thought patterns or mental patterns reductive. I do not think that this is the moment to go into these issues. Here it presses rather occur in practice these claims of that kind of rationality applied to health care world. For if now all of Western medicine is committed to recovering his ability to understand the patient's person in the multiplicity of its dimensions for a proper diagnosis and appropriate therapy, doubts inevitably arise in relation to such claims and pretensions

#### Abstract

Biodiesel is a green and clean burning alternative fuel for conventional fuels. This study compares the catalytic transesterification of coconut oil by using CuO nanocatalyst with the conventional base catalyst (NaOH). The needle-shaped CuO nanoparticles were synthesized by simple precipitation method. All the characterization studies (UV-Vis, FTIR, XRD, and FESEM with EDX) were proved the formation of CuO nanoparticles. The XRD study revealed the formation of CuO nanostructures with the monoclinic phase. The crystallite size of CuO was estimated to be 48 nm using Debye-Scherrer's formula. The surface morphology of the obtained CuO nanoparticles is needle-like in shape. The conversions of FAMES were verified by using both FTIR and GCMS analysis. The investigation of producing biodiesel using GC-MS spectroscopy indicated that fatty acids were transformed into corresponding methyl esters. From this study, it has been concluded that CuO nanocatalyst could be a good promising catalyst for the green and eco-friendly production of biodiesel.

#### Introduction:-

It is an undeniable fact that recently so much of attention is drawn to the field of renewable energy as an alternative to the traditional energy sources [1]. This was necessitated and encouraged due to the issues like shortage of petroleum, hike in fuel price, greenhouse gas emissions and global warming [2-4]. Biodiesel is one of the promising options for the alternative renewable fuels that can be used in existing engines [5]. Adding to the benefits, it is biodegradable, environmentally friendly, non-toxic and has potential in reducing levels of pollutants [6-8].

Vegetable oils are becoming a promising source for the production of biodiesel. Among the available edible oils, coconut oil is considered to be one of the potential sources for the biodiesel production [9]. The transesterification reaction of oil and alcohol with a homogeneous catalyst is the common method for the production of biodiesel. [10-13]. The homogeneous catalysts have many limitations, such as requiring large amounts of water, difficulties in product separation and environmental pollution caused by the liquid wastes etc. [14]. But the heterogeneous catalysts based biodiesel preparation is considered to be a green and environmentally friendly method [15-17].

The focus on the development of new heterogeneous nanomaterials as a catalyst is a novel concept. It has been reported that the main advantage of nano-sized materials is its large surface area [18]. The Nanocatalysts have many

**Corresponding Author:- Johnson. I.**

advantages such as high catalytic activity, reusability, high resistance to saponification reaction and simpler in purification processes etc. [19, 20]. There have been very few studies on nano metal oxides catalysed transesterification to produce FAME (Fatty Acid Methyl Ester) [21-23]. Among the available transition metal oxides, CuO is one of the potential p-type semiconductors and gains considerable attention due to its excellent optical, physical and magnetic properties [24-27].

This study compares the catalytic transesterification of coconut oil by using CuO nanocatalyst with the conventional base catalyst (NaOH). The CuO nanoparticles were synthesized by simple precipitation method. The characterization of CuO nanoparticles was studied using FTIR, UV-Vis spectroscopy, XRD, FESEM and EDX. The obtained biodiesel was examined with Gas Chromatography-Mass Spectrometry (GC-MS) and the infrared spectroscopy (FTIR).

## Materials and Methods:-

### Materials:-

All the reagents were of analytical grade and were used without further purification. Copper acetate [Cu(CH<sub>3</sub>COO)<sub>2</sub>] was obtained from Sigma Aldrich, Germany. Methanol (99.9% purity), ethanol and sodium hydroxide (NaOH) were obtained from Merck, Germany. Coconut oil was purchased from a local market. For the entire experiment, double distilled water was used.

### Preparation of CuO Nanocatalyst:-

CuO Nanocatalyst was synthesized by direct precipitation method using copper acetate and NaOH as precursors. In this work, the aqueous solution (0.2 M) of copper acetate was prepared with deionized water. The NaOH solution was slowly added into the copper acetate solution and mixed together by constant stirring for 30 minutes with the help of a magnetic stirrer. It was kept at room temperature for 4 hours for the completion of the reaction. A large amount of black precipitate was formed. The nanostructures were collected after centrifugation (4000 rpm). The obtained nanoparticles were washed with absolute ethanol and distilled water several times to remove the possible residual impurities. The particles were dried in an oven at 80°C for 3 hours. After grinding, a dark brown nanopowder was obtained.

### Transesterification process:-

The transesterification reaction was performed in Teflon-lined stainless steel autoclave. The sample was loaded (1:4 oil to methanol, 0.75 wt % catalyst) into the autoclave and kept in an oven for 2 hrs. After the completion of the reaction, the mixture was cooled to room temperature and the biodiesel phase was separated. At the end of the experiment, the autoclave was cooled and the catalyst was separated from the reaction mixture by centrifugation and filtration.

## Results and Discussion:-

### Characterization of CuO nano catalyst:-

#### UV-Vis analysis:-

In order to explore the optical properties of CuO nanoparticles, the optical absorption spectra were taken using the UV-Visible spectrophotometer. Fig.1 shows the obtained peak at 380 nm which is assigned to the surface plasmon resonance band of the CuO nanoparticles and is in coincidence with the literature values [28].

Fig.1:-UV-Vis analysis of CuO nanoparticles

**FTIR Analysis:-**

Fig. 2 shows the peak at  $1606.75\text{ cm}^{-1}$  which indicates the presence of primary amines and the C-H stretches of alkanes appearing at  $1373.34\text{ cm}^{-1}$ . The three infrared absorption peaks reveal the vibrational modes of CuO nano structures. The major peaks were found with  $503.82\text{ cm}^{-1}$ ,  $696.13\text{ cm}^{-1}$  and  $931.76\text{ cm}^{-1}$  respectively. The vibration at the region of  $503.82\text{ cm}^{-1}$  has been attributed to CuO. The EDX analysis was used for further confirmation of the structure.

Fig 2:-FTIR pattern of CuO nanoparticles

**XRD analysis:-**

From fig.3 it can be clearly appreciated that all the peaks in the XRD patterns are consistent with the JCPDS data (89-5895) and the results were found to be in agreement with the reported diffraction pattern of CuO nanoparticles [29]. The major peaks located at  $2\theta = 32.47^\circ$ ,  $35.58^\circ$ ,  $38.75^\circ$ ,  $48.81^\circ$ ,  $53.27^\circ$ ,  $58.24^\circ$ ,  $61.47^\circ$ ,  $66.23^\circ$ ,  $68.05^\circ$ ,  $75.05^\circ$  and  $82.92^\circ$  are assigned to (110), (002), (111), ( $\bar{2}02$ ), (020), (127), ( $\bar{1}13$ ), (022), (220), ( $\bar{2}22$ ), ( $\bar{3}13$ ) plane orientation. The spectrum is identical to that of pure CuO, indicating the formation of single-phase CuO with monoclinic structure. The average crystallite size of the CuO nanoparticles calculated by Debye-Scherrer's formula is 48 nm.

Fig 3:-XRD pattern of CuO nanoparticles

**FESEM with EDX Analysis:-**

Fig.4 (a) illustrates the surface morphology of the obtained CuO nanoparticles. The surface morphology of the obtained CuO nanoparticles is needle like in shape.

**Fig 4:-FESEM & EDX images of CuO nanoparticles**

The corresponding EDX spectrum is shown in fig.4 (b) which confirmed the elemental presence of Cu (75.92 %) and O (21.60 %) as the major constituent along with C (2.48 %) in fewer amounts.

#### **Analyses of transesterification products:-**

##### **Visual analysis:-**

Fig.5 displays the color of synthesized biodiesel with two different catalysts. It is noted that the NaOH (Fig. 5a) biodiesel sample is slightly brighter than that of nano catalyzed based one (Fig.5b). The advantages of using CuO nano catalysts include ease of separation and purification of the reaction products. So, it could be considered as a green and environmental friendly catalyst for biodiesel production.

**Fig 5:-Coconut oil biodiesel sample**

##### **GC-MS Analysis:-**

The GC chromatogram of FAME of coconut oil using NaOH and CuO catalyst are visualized in Figs 6 & 7. The FAME conversion has calculated up to 79.52% and 86.56% by using two different catalysts NaOH and CuO respectively. The GC-MS result shows the chemical composition of FAMEs of coconut oil biodiesel in tables 1. In table 2, the GCMS results of produced FAME are compared with previous works.

**Fig 6:-GC Chromatogram of coconut oil using NaOH catalyst**

**Fig 7:-GC Chromatogram of coconut oil using CuO catalyst**

**Table 1:- FAME composition of Coconut oil biodiesel**

FAMES	Using NaOH catalyst	Using CuO nano catalyst
Total FAME conversion (%)	79.521	86.574
Others	20.479	13.426

**Table 2:- Comparison table of GCMS result with literature**

Catalyst	Oil/methanol	FAME content (%)
KOH	1:7	82.5 [30]
TiO <sub>2</sub> /SiO <sub>2</sub>	1:4	88.44 [31]
ZnO	1:6	98.9 [32]
CaO	Excess	91.5 – 95.7 [33]
NaOH	1:3.5	79.52 (present work)
CuO nanoparticles	1:3.5	86.56 (present work)

#### FTIR Analysis:-

The FTIR spectrum of produced biodiesel from two different catalysts is shown in fig. 8. Biodiesel samples found in table 3 are very much similar to that of standard petro diesel and biodiesel samples [34]. The observed bands at 1459.56 cm<sup>-1</sup> and 1458.56 cm<sup>-1</sup> attribute to methyl group. The bands at 1169.77 cm<sup>-1</sup> and 1173.94 cm<sup>-1</sup> for ester group reveal the formation of biodiesel. The presence of two groups namely methyl (CH<sub>3</sub>) and ester (C-O ester) in samples indicates that the transesterification of coconut oil occurred due to the addition of methanol and CuO nanoparticles [19].

<sup>a</sup> Data from Hussain et al [34]

### Conclusion:-

The production of biodiesel from coconut oil was successfully completed by using CuO nano particles as a heterogeneous catalyst. The nano catalyst was characterized using different techniques which were confirming the formation of CuO nanoparticles. From the XRD, the average crystallite size of CuO was estimated to be 48 nm. The surface morphology of the obtained CuO nanoparticles is needle like in shape. From the GC-MS analysis, 86.56% and 79.52% of FAME components were calculated for CuO and NaOH catalysed biodiesel respectively. The presence of two groups, namely methyl (CH<sub>3</sub>) and ester (C-O ester) were verified from FTIR analysis. This study recommends that the CuO nanocatalysts could be a promising option for the production of biodiesel with green and clean technology.

### Abstract

Over 200 clinically normal desert Egyptians baladi sheep from multiple geographic areas were sampled. The goals of this study were to develop comprehensive reference intervals for hematologic and biochemical analytes. Because of the large sample size, wide geographic range, and uniform sample and handling protocoling this study, these reference intervals should be robust and applicable to other sheep populations.

Copy Right, IJAR, 2016., All rights reserved.

### Introduction:-

Measurement of key hematological and biochemical values can provide objective information about the condition of an animal at the moment of sampling, revealing its nutritional status, disease conditions or stress it has been subjected to (Perez et al., 2003).

Serum bio-chemical and haematological references constitute important panels in the diagnosis, prognosis and treatment of livestock diseases via the investigations of myriads of parameters influencing blood and serum biochemical indices among which are packed cell volume (PCV), total blood (TBC), total protein (TP), urea, creatinine, uric acid, alanine transaminase (ALT), aspartate aminotransferase (AST), alkaline phosphatase (ALP), concentration in livestock animals (Yokus et al. 2006).

### Materials and Methods:-

Blood samples of 200 sheep (150 females and 50 males) were collected from randomly selected clinically healthy herds. The sheep were bled through jugular vein and 10 ml of blood was collected from each animal, 4 ml of the blood was collected into plastic tube containing 0.5 M

Ethylene Diamine Tetra acetic Acid (EDTA) for haematological studies and the remaining 6 ml of blood samples was deposited in clot activating

tubes for biochemical studies and allowed to clot at room temperature within 3 hours of collection. The samples were stored at -20 °C for analysis by Hitachi U-1800 spectrophotometer (using Egyptian Biochemical diagnostic kits)

### Statistical Analysis:-

SPSS statistical package was used for statistical analysis. All the values were expressed as mean  $\pm$  Standard Deviation (SD). One way ANOVA was applied to compare various hematological and serum biochemical parameters. All the measurements were analyzed by generalized linear model results.

### Results:-

The hematological values were: erythrocytes for Male sheep  $9.8 \pm 1.5\% 10^6 \text{cm}^3$  and Female sheep  $9.18 \pm 0.22\% 10^6 \text{cm}^3$ . The haemoglobin for Male sheep  $8.9 \pm 1.1 \text{g/dL}$  and Female sheep  $9.09 \pm 0.22$ ; leukocytes for Male sheep  $8.1 \pm 1.8\% 10^6 \text{cm}^3$  and Female sheep  $9.11 \pm 0.61\% 10^6 \text{cm}^3$ ; and Packed cell volume (PCV) % for Male sheep  $37.08 \pm 0.1$  and Female sheep  $35.82 \pm 0.88$ . Neutrophils (%)  $31.04 \pm 0.85$  for Male sheep and Female sheep  $41.43 \pm 0.84$ . Lymphocyte (%)  $4.06 \pm 0.38$  for Male sheep and Female sheep  $3.93 \pm 0.27$ . Monocytes (%) for Male sheep  $2.05 \pm 0.15$  and Female sheep  $2.78 \pm 0.16$ . Eosinophils (%) for Male sheep  $0.23 \pm 0.07$  and Female sheep  $0.30 \pm 0.05$ . Basophiles (%) for Male sheep  $0.20 \pm 0.05$  and Female sheep  $0.36 \pm 0.05$ .

The values of biochemical parameters were: total protein for male sheep  $6.5 \pm 1.2$  and female sheep  $6.7 \pm 1.5$ ,  $76.4 \pm 6.1 \text{g/L}$ ; glucose for male sheep and female sheep  $2.87 \pm 0.60 \text{mmol/L}$ ; total cholesterol  $1.65 \pm 0.33 \text{mmol/L}$ ; aspartate aminotransferase (AST) for male sheep  $115.5 \pm 6.4$  and female sheep  $155.9 \pm 49.2 \text{U/L}$ ; alanine aminotransferase (ALT) for male sheep and female sheep  $9.36 \pm 0.05$ . creatinine for male sheep  $9.2 \pm 0.05$  and female sheep  $102.0 \pm 2.1 \mu\text{mol/L}$ ; total calcium for male sheep and female sheep  $2.53 \pm 0.25 \text{mmol/L}$ ; phosphorus for male sheep  $2.39 \pm 0.20$  and female sheep  $2.29 \pm 0.21 \text{mmol/L}$ ; magnesium for male sheep  $36.08 \pm 0.1$  and female sheep  $34.82 \pm 0.88 \text{mmol/L}$ ; sodium for male sheep  $140.04 \pm 0.85$  and female sheep  $141.43 \pm 0.84 \text{mmol/L}$ ; potassium for male sheep  $5.20 \pm 0.22$  and female sheep  $5.70 \pm 0.26$ ,  $99.66 \pm 0.70 \text{mmol/L}$ ; chloride for male sheep and female sheep  $99.59 \pm 0.75$ , iron for male sheep  $138.50 \pm 0.15$  and female sheep  $140.50 \pm 0.16$ . copper for male sheep  $10.39 \pm 0.36$  and female sheep  $11.78 \pm 0.37$ .

## Discussion:-

### Hematological parameters:-

The RBC values was observed to be higher in the males than in the females. The difference due to age and sex is a signal of the health status of the various age groups and sex among the sheep breed studied which is in agreement with the findings of (Schalm et al. (1975) and Addas et al. (2010).

The values of leucocyte count (WBC) was higher in adult female sheep than the values obtained for male sheep. The WBC values of the adults are comparable to the young sheep. This finding is similar to the reports of (Egbe-Nwiyi et al. 2000) and (Addass et al. 2010), (Bani et al., 2008). The higher leucocyte count (WBC) is due to infections or toxic substances in the organism and a low count is an indication of pathogenic infection or presence of antigens in the organism (Bradbury et al., 1999) but the higher WBC in female adult sheep was not in agreement with (Schalm et al., 1975). Lymphocytes are slightly high in male than female and neutrophils levels are high in female than male comparable among the breed, age and sex groups of animals. There was significant influence of age, sex and breed on lymphocyte count. The lymphocytes constituted majority of the WBC counts and the cells increased with age in early life in both sexes of sheep and goats this agree with (Egbe-Nwiyi et al., 2000). The high lymphocyte counts in the animals in this study are favoured by the findings of (Milson et al., 1960) and (Wilkins and Hodges, 1962) and it might be attributed to stress and immune response to the environment (Cole, 1980), (Ganong, 2005).

Results present in Table (1) showing the effect of sex on hematological parameters. The PCV in adult female sheep were generally higher than in adult males while it was observed to be higher in the young males than in young females. The result generally showed adult sheep to have higher values in PCV than in lambs. In the sheep, age and sex exhibited remarkable influence on the PCV values.

The packed cell volume (PCV) obtained in the present study was higher in male than the female sheep (Baneejee, 2007). The increase in PCV might be attributed to high environmental temperature. These results were consistent with those obtained by (Pouliot et al. 2009), (Khan (2013).

On the other hand, there were no significant sex differences in HB, PCV and ESR. These results were in agreement with (Tibbo et al., (2004) and (Shumaila et al., 2012). While, (Egbe-Nwiyi et al., 2000) was reported the sex differences in HB and PCV of Nigeria sheep. This result was in agreement with (Tibbo et al., 2004). In contrast, (Egbe-Nwiyi et al., 2000) showed a higher value in male than female. stress and immune response the environment (Coles, 1980)

### Biochemical parameters:-

Results present in Table (2)

#### Protein:-

In the present study variations in physiologic values due to gender were assessed. Total protein is an important factor for blood viscosity, acid-base balance, and supplying necessary enzymes (Keresan Bilal, 2008).

The mean total protein values obtained from sheep males and females used in this study were within). Plasma protein level was slightly higher in male lambs than ewe lambs but the difference was not statistically significant. This finding is in agreement with the results obtained by (Khan et al. (2013) who also reported higher total protein values in ram lambs.

#### Creatinine:-

Plasma creatinine concentration was slightly higher in males than females but the difference was not statistically significant. The amount of creatinine secreted daily is a function of the muscle mass and is not affected by diet, age, sex. Female excrete less creatinine than males because of their smaller muscle mass (Gray and Howarra, 1980) (Alex

and Laverne, 1983). The creatinine values in the present study were within normal range and no differ among male and females (Gray and Howarra, 1980).

#### AST and ALT:-

The results of the present study showed that the effect of gender on both plasma enzymes and electrolytes is not significant. Enzymes are protein catalysts synthesized by all living organisms. They are constantly and rapidly degraded but the supply is renewed by new synthesis (Coles, 1986). ALT is an enzyme found in the highest amount in liver and typically used to detect liver injury (Shumaila et al., 2012). ALT values were slightly higher in males than females. AST is found in practically every tissue of the body, the measurement of the AST levels is helpful for the diagnosis and following case of myocardial infarction, hepatocellular disease and skeletal muscle disorders (Njidda et al., 2013). AST values for males were lower ( $129.6 \pm 47.8$ ) than those of females ( $140.8 \pm 31.9$ ). Higher metabolism and functional status for males compared with females. (Rumosa Gwaze et al. 2012) found that higher plasma AST and female lambs, in male than in female.

#### Minerals:-

Concentrations in the blood of the animal were not influenced ( $p > 0.05$ ) by sex whereas season has significant effect on blood minerals of sheep and goats. Mean mineral concentrations in the blood of the animals are within the normal range (mmol/l) of Ca, P, and K, respectively this agree with (Meyer and Harvey, 1998). (Ramprabhu et al. 2010), (Perez et al. 2003), (Devendran et al., 2008), (Pratt, 2010), but the magnesium of high values in male than females in the present study, this may be due to the increase of magnesium concentration in under water. The iron values in females is higher than males this agree with (Devendran et al., 2008), (Ramprabhu et al. 2010), (Jawasreh K et al. 2010), (Pratt D S (2010), (Piccione et al. 2010).

#### Electrolytes:-

Maintaining electrolytes in appropriate amounts is essential for normal biochemical and physiological functions of the body. Electrolytes are distributed in body fluids and play a key role in all parts of animal life (Kaneko et al., 2008). (Latimer et al., 2004).

The plasma potassium level was higher in females than males and sodium level was also higher in females ( $136.7 \pm 9$ ) than males ( $132.8 \pm 5.5$ ). While the values for chloride were higher in males ( $118.4 \pm 5.8$ ) than females ( $115.1 \pm 1.6$ ) but the difference for all three electrolytes between both genders was not statistically significant. (Al-Hadithy et al. 2012) (Sowande et al. 2008). The results also showed that main effect of sex and interaction between sex and season had no significant effect ( $p > 0.05$ ) on blood plasma mineral concentration of sheep and goats (Sowande et al. 2008).

#### Glucose:-

Also no the results indicated there were significant differences for sex on glucose. The last effects were in agreement with values reported by (Shumaila et al., 2012) whose shows that the age and gender had no significant effects on serum glucose and cholesterol of sheep.

#### Urea:-

Plasma urea level was significantly higher in males than females. Similar observation was reported by (Borjesson et al. 2000), (Oduye and Adedevon 1976).

#### Conclusion:-

Haematological, biochemical parameters and its knowledge can be used to assess the health as well as physiological status of farm animals under consideration. Changes of these parameters have been studied in sheep. There is great variation in the haematological parameters as observed between sex. Moreover, it is important to establish a baseline indices for haematological parameters on the basis of the factors studied and also carry out further studies to determine the effects of other factors on these indices like breed, age and management systems.

#### Abstract

**Objective:** To assess the Nigerian primary and secondary school teachers' knowledge and attitude towards cardiopulmonary resuscitation (CPR).

**Methodology:** A questionnaire-based cross-sectional study of Post NCE Sandwich students (primary and secondary school teachers) involving 322 – 213(71%) females and 87(29%) males aged 22-60 years from 14 out of the 36 States of the Federal Republic of Nigeria. Originally, 325 copies of the questionnaire were distributed, giving a response rate of 92%. The data was analyzed using both descriptive and non-parametric statistics with statistical significance set at  $P < 0.05$ .

**Results:** 64.29% gave wrong answers to questions on CPR knowledge with rejection of the null hypothesis on their CPR knowledge, meaning that the participants significantly had poor knowledge of CPR ( $P < .05$ ) while 79.9% showed positive attitude towards CPR with the null hypothesis on their attitude towards CPR (meaning that the teachers significantly wanted CPR teaching and training in Nigerian schools,  $P < .05$ ).

**Conclusion/Recommendation:** This first Nigerian study on cardiopulmonary resuscitation in relation to teachers have shown generally poor CPR knowledge of the primary and secondary schools teachers which was statistically significant but very statistically significant positive attitude towards CPR. Nigerian school teachers should be trained in CPR so as to teach their school children while CPR incorporation into the Nigerian schools' curricula should be implemented as soon as possible.

#### Introduction:-

Globally, the teaching of cardiopulmonary resuscitation (CPR) in schools is encouraged<sup>(1-13)</sup> Although recently few reports in Nigeria have drawn attention to the need to encourage the teaching and eventual incorporation of CPR into the secondary school curriculum,<sup>(14-20)</sup> there is obvious need for more work.

In the United States of America, according to Compton et al.,<sup>(21)</sup> recent legislation and public policy has placed new responsibilities on public school teachers, requiring that they be trained to respond to medical emergencies, especially cardiac arrest. Recently, it was reported that majority of the teachers in Al-Qassim, Saudi Arabia had a low level of knowledge and skills regarding basic life support techniques, especially CPR but they wanted more training and were willing to take a free course on CPR.<sup>(22)</sup>

It is known that survival of victims of out-of-hospital cardiac arrest (OHCA) is enhanced when there are enough trained bystanders who can perform cardiopulmonary resuscitation when the need arises.<sup>(23-25)</sup> Teachers can be very useful in increasing the number of potential bystanders if they can teach and train their students. According to Al Enizi et al.,<sup>(22)</sup> in order to increase the likelihood of having a CPR-skilled person present at the cardiac event, there must be an adequate number of people trained in the community. School teachers are expected to play a role in teaching cardiopulmonary resuscitation (CPR) to schoolchildren, but little is known about their attitudes, actual knowledge and willingness to do so.<sup>(26)</sup> This statement is very true in Nigeria as there is no published data concerning Nigerian teachers in this respect hitherto. Kanstad et al.<sup>(6)</sup> opined that by providing students with good quality basic life support (BLS) training in school, the upcoming generation in Norway may strengthen the first part of the chain of survival in out-of-hospital cardiac arrest (OHCA).

In pursuit of the goal of encouraging the introduction of CPR teaching and training into the Nigerian secondary school curriculum, there is a need to provide enough baseline data in this respect. Therefore, the aims of this study were to find out the level of CPR knowledge of some Nigerian teachers, as well as their attitudes towards CPR.

### Materials and Method:-

A questionnaire-based cross-sectional study of the teachers, who came for the Post NCE Sandwich Programme at the Faculty of Education of the University of Port Harcourt in September / October, 2015, was conducted. Three hundred and twenty five (325) copies of the questionnaire were distributed to the teachers but three hundred (300) copies were properly filled and returned, giving a response rate of about 92%.

The questionnaire had three (3) sections: Section A (demographic data), Section B (Knowledge of CPR) and Section C (Attitude to CPR) as shown in the Appendix.

The gender distribution of the teachers that participated in the study was as follows: 87(29%) males and 213 (71%) females. Their ages ranged from 22 to 60 years. The teachers came from different primary and secondary schools in the following fourteen (14) States in Nigeria: Akwa Ibom, Cross River, Abia, Anambra, Enugu, Imo, Ebonyi, Rivers, Delta, Edo, Ondo, Ogun, Benue, and Kogi States.

The following two (2) null hypotheses were generated and tested:

**Ho1:** The CPR knowledge of the teachers would not be significantly low

**Ho2:** The attitudes of the teachers towards CPR would be significantly poor

### Statistical Analysis:-

The Statistical Package for Social Sciences (SPSS) was used to analyze the data. Descriptive statistics and non-parametric statistics (One-Sample T-test) were employed in the analysis and the test of the hypotheses with significance level set at  $P < 0.05$ .

### Results:-

Table 1 shows the descriptive statistics of the response of the teachers to the questions on knowledge of cardiopulmonary resuscitation (CPR). This table shows that well over 64% of the teachers gave wrong answers to the questions on CPR knowledge while over 35% were right in the responses.

**Table 1:-** Descriptive statistics of the responses of the teachers to the questions on CPR knowledge

	Questions Testing CPR Knowledge	Right Answer	Wrong Answer
1.	First thing to do if a person collapses	83(27.7%)	217(72.3%)
2.	Why would you shake and shout at a collapsed victim	87(29%)	213(71%)
3.	What action(s) would you use to open airway	58(19.3%)	242(80.7%)
4.	What do you look for in assessing breathing in a collapsed victim	230(76.7%)	70(23.3%)
5.	What does CPR stand for	209(69.7%)	91(30.3%)

6.	For how long does a rescue breathe last?	43(14.3%)	257(85.7%)
7.	Number of chest compressions & rescue breaths /cycle	40(13.3%)	260(86.7%)
	<b>Cluster %</b>	<b>750(35.71%)</b>	<b>1,350(64.29%)</b>

The null hypothesis (Ho1) was tested as shown in Table 2 which was rejected ( $P < .000$ ).

**Table 2:-** Test of the Null Hypothesis (Ho1: The CPR knowledge of the teachers would not be significantly low) using the One-Sample T-test

	Test Value = 0					
	t	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval of the Difference	
					Lower	Upper
CPR Knowledge	129.764	2099	.000	1.35714	1.3366	1.3777

$P < 0.05$

Table 3 shows the responses of the teachers on questions that tested their attitude to CPR. The positive attitudes to CPR gave 79.9% while the negative accounted for 20.1%.

**Table 3:-** Descriptive statistics of the responses of the teachers to the questions on CPR attitude.

		Agree (Positive attitude)	Disagree (Negative attitude)
1	I would like to learn CPR	285(95%)	15(5%)
2	After learning CPR, I would like to teach others.	277(92.3%)	23(7.7%)
3	I would perform mouth-to-mouth ventilation on a stranger.	160(53.3%)	140(46.7%)
4	I would perform CPR on a trauma victim, if needed.	217(72.3%)	83(27.7%)
5	I would perform CPR on a relative, if needed.	244(81.3%)	56(18.7%)
6	I would perform CPR on an elderly victim, if needed	224(81.3%)	76(25.3%)
7	I would like to perform CPR on a child	235(78.3%)	65(21.7%)
8	I would perform chest compression alone	230(76.7%)	70(23.3%)
9	CPR is just a trial and error	257(85.7%)	43(14.3%)
10	There is increased hope of survival for a victim of sudden collapse who receives bystander CPR	261(87.0%)	39(13%)
11	Sudden Cardiac Arrest victims cannot survive	223(74.3%)	77(25.7%)
12	I believe there could be survival through CPR	241(80.3%)	59(19.7%)
13	CPR should be taught often on Television	221(73.7%)	79(26.3%)
14	CPR should be formally taught in Nigeria Universities	269(89.7%)	31(10.3%)
15	CPR should also be taught to other citizens who are not in schools	253(84.3%)	47(15.7%)
	<b>Cluster %</b>	<b>3,597(79.9%)</b>	<b>903(20.1%)</b>

Table 4 shows that the null hypothesis (Ho2) was also rejected ( $P < .000$ ).

**Table 4: Test of the Null Hypothesis (Ho2: The CPR attitude of the teachers would be significantly poor) using the One-Sample T-test**

## Discussion:-

It has been documented that school teachers can effectively teach CPR to school children. <sup>(27, 28)</sup> Secondary school teachers, previously trained in basic cardiopulmonary resuscitation (b-CPR) could teach the skills effectively to 14-16-year-old students using PROCES. <sup>(29)</sup>

Chew et al<sup>(30)</sup> reported that only 29% of the total 128 participants said that they would offer to perform CPR under any cardiac arrest condition and 69% said that they would just offer to call the ambulance but they would not offer to perform CPR. When analyzed separately, only 16.4% of the school teachers said that they would perform CPR as compared to 45.5% of dental students ( $P < 0.001$ ). They concluded that knowing how to perform CPR did not necessarily translate into willingness to perform CPR. In the present Nigerian study, the teachers consistently showed poor knowledge of CPR generally. However, the general attitude of the teachers to CPR is very positive as reflected in their responses to the questions except the one which said that 'CPR is trial and error' which suggests that they did not interpret that question properly.

In the related study by Mpotos et al,<sup>(26)</sup> it was concluded that although a majority of teachers received previous CPR training, awareness of CPR as a mandatory part of the secondary school's curriculum was poor. Only a minority consisting of mostly primary school teachers felt competent in CPR and was willing to teach it to their students. Unlike in this present Nigerian study where none of the teachers had received any earlier exposure to CPR teaching and training, in the study by Mpotos et al<sup>(26)</sup> 59% of the teachers had previous exposure to CPR training. Meanwhile, Patsaki et al<sup>(31)</sup> reported about 21% had earlier exposure to CPR training in their study. The poor knowledge of the CPR as reflected in their responses to the various questions in the questionnaire as shown in Table 1 is consisted with the report of Patsaki et al<sup>(31)</sup> where the number of incorrect answers to knowledge questions was found to be directly related to the absence of a previous course.

Our current study discovered that 92.3% of the participants indicated willingness to teach others after learning CPR while only 39% were interested in teaching others CPR.<sup>(26)</sup> This Nigerian percentage of participants willing to teach others CPR is a very welcome development as this gives hope for the success of producing many bystanders in Nigeria if the teaching and training in CPR is incorporated in the school curriculum. However, the relatively low percentage (39%) of teachers willing to teach CPR in Mpotos et al<sup>(26)</sup> report was still considered possibly being sufficient because of the option of the teacher being a facilitator for self-learning or blended learning, thereby requiring only minimal changes in their curriculum to implement CPR.

#### **Strength and Limitation of this Study:-**

Although our study sample was a convenient sample and not randomly selected because they were those who came for the long vacation Sandwich programme in our University, the present study has teachers from both primary and secondary school covering 14 out of the 36 States of Nigeria which gives a considerable spread and a fair idea of the true knowledge and attitude of Nigerian teachers towards cardiopulmonary resuscitation (CPR) since there is no other published data on CPR concerning teachers hitherto in Nigeria.

#### **Conclusion:-**

This first Nigerian study on cardiopulmonary resuscitation in relation to teachers have shown generally poor CPR knowledge of the primary and secondary schools teachers (participants) which was statistically significant but very statistically significant positive attitude towards CPR.

#### **Recommendations:-**

1. There is need to get Nigerian school teachers trained in CPR so as to make them ready for the urgent need of training Nigerian school children accordingly, in line with the growing global trend.
2. The need to incorporate the teaching and training in CPR into the Nigerian primary and secondary schools' curricula is re-emphasized, as earlier recommended<sup>(15, 16, 20)</sup>

## Appendix:-

### QUESTIONNAIRE ON CARDIOPULMONARY RESUSCITATION (CPR)

#### Section A: Personal Data

Please tick as it applies to you.

1. Gender : Male:

☐

Female:

☐

2 Age in Years: -----

3. Official status at workplace-----

4. Name of workplace: -----

5. For how long have you been teaching? -----

6. In which state is your work place ? -----

7. As a Sandwich student, please state your department here in Uniport-----

#### Section B

Concerning a collapsed victim, please tick only one option in questions 5 to 11 below.

5. What is the first thing you should do if you come across a collapsed person?

- ☐ Call an ambulance
- ☐ Try to get the person to respond to you
- ☐ Check to see if the person is breathing normally

6. Why would you shake and shout at a collapsed person?

- ☐ To open the airway
- ☐ To restart the heart
- ☐ To check for response

7. What action would you use to open the person's airway?

- ☐ Tilt the head back and lift the chin
- ☐ Tilt the head and push the chin down
- ☐ Tilt the head down and turn the chin to the right

8. When assessing a person's breathing, what do you look for?

- ☐ Chest movement
- ☐ Movement of the eyes
- ☐ Movement of nose

9. What does CPR stand for?

- ☐ Call Respond React
- ☐ Cardiopulmonary Resuscitation
- ☐ Citizen Please Respond

10. When giving rescue breaths, for how long do you breathe into the person's mouth?

- ☐ 1 second  
☐ 5 seconds  
☐ 10 seconds

11. How many chest compressions and rescue breaths would you give per cycle of CPR?

- ☐ 20 presses and one breathe  
☐ 30 presses and two breaths  
☐ 30 presses and three breaths

### Section C

**For each of the statements, please rate under the following scales: Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD).**

		SA	A	D	SD
12	I would like to learn CPR				
13	After learning CPR, I would like to teach others.				
14	I would perform mouth-to-mouth ventilation on a stranger.				
15	I would perform CPR on a trauma victim, if needed.				
16	I would perform CPR on a relative, if needed.				
17	I would perform CPR on an elderly victim, if needed.				
18	I would like to perform CPR on a child.				
19	I would perform chest compression alone				
20	CPR is just a trial and error				
21	There is increased hope of survival for a victim of sudden collapse who receives bystander CPR				
22	Sudden Cardiac Arrest victims cannot survive				
23	I believe there could be survival through CPR				
24	CPR should be taught often on Television				
25	CPR should be formally taught in Nigerian Universities				
26	CPR should also be taught to other citizens who are not in schools.

Anterior cruciate ligament - Mac Intosh

- Ligamentoplasty - Fascia lata -

Cartilage growth

### Abstract

Waiting for the end of growth for treating lesions of the anterior cruciate ligament seems to be mistake. Inadequate results of conservative treatment can harm the harmonious development of the child, thus surgical treatment has become a necessity. A conventional ligament as embodied in adults is not possible in children because of the risks of secondary growth disorder. With our experience in adults of mixed tuck the fascia lata using the technique of modified Mac-Intosh amended Jaeger, we have adapted this technique to the child respecting the growth of cartilage. We report the experience of the surgical management of 23 children in our institution between January 2000 and December 2009, according to the technique of Jaeger and their followed and we discuss our results by comparing to literature data recent.

### Introduction:-

La fréquence et la gravité des lésions du ligament croisé antérieur de l'enfant ont longtemps été minimisées. Devant l'évolution défavorable de nombreuses lésions traitées de manière conservatrices, le traitement chirurgical est devenu une nécessité. Une ligamentoplastie conventionnelle telle qu'elle est réalisée chez l'adulte n'est pas envisageable chez l'enfant du fait des risques de troubles de croissance secondaires. Fort de notre expérience chez l'adulte de la plastie mixte au fascia-lata selon la technique de Mac-Intosh modifiée Jaeger, nous avons adapté cette technique à l'enfant en respectant le cartilage de croissance.

### Méthodes:-

#### Description de la technique [1]:-

L'intervention est précédée d'un examen clinique systématique réalisé sous anesthésie général. Il confirme le diagnostic et précise avec exactitude l'importance des laxités. Il facilite la mise en évidence d'un ressaut rotatoire. Ces recherches peuvent être difficiles sans anesthésie, particulièrement chez l'enfant.

Le jeune patient est ensuite installé en décubitus dorsal, le genou maintenu à 80° de flexion par un appui placé à la racine de la cuisse sous le garrot pneumatique. L'intervention débute par la réalisation d'une mini-arthrotomie antéro-médiale de 3 à 4 cm (*Fig.1*). L'examen de la cavité articulaire permet un bilan lésionnel précis, les ménisques sont testés à l'aide d'un crochet, un geste chirurgical approprié sera réalisé devant une lésion méniscale,

malheureusement fréquente chez l'enfant, en évitant par tous les moyens une ménisectomie même partielle. Enfin les surfaces du cartilage seront vérifiées.

L'incision est prolongée distalement afin de repérer le cartilage de croissance à l'aide d'aiguilles fines. Le tunnel tibial doit respecter ce cartilage. Son point d'entrée sera proximal par rapport au cartilage fémoral tibial et situé au bord médial de la tubérosité antérieure tibiale. Son trajet aboutit au pied du LCA rompu, son diamètre de 4,5 à 6 mm sera adapté à l'âge de l'enfant (Fig.2).

L'incision cutanée latérale débute en regard du tubercule infra-condylien tibial et se prolonge sur la face latérale de la cuisse (Fig.3). Le transplant du fascia-lata est prélevé en respectant son insertion distale au tubercule infra-condylien tibial, sa largeur est de 10 mm en distal et de 30 à 40 mm en proximal. La longueur du transplant varie de 10 à 15 cm en fonction de la morphologie de l'enfant. La bandelette du fascia-lata est tubulisée sur ses derniers centimètres (Fig.4).

Pour faciliter la fermeture sans tension du fascia-lata, le muscle vaste latéral est décollé du septum intermusculaire latéral, jusqu'à son insertion fémorale, le septum est alors sectionné au raz du fémur. Le ligament collatéral fibulaire est repéré et disséqué. Une rigole condylienne fémorale est réalisée en sous périoste, son point d'entrée se situe en arrière de l'insertion fémorale du ligament collatéral fibulaire, son trajet est réalisé au ciseau de Smilie jusqu'à la face médiale du condyle latéral, cette rigole respecte le cartilage de croissance fémoral distal en étant plus proximal (Fig.5).

Par l'arthrotomie antéro-médiale, on perfore la capsule articulaire postérieure afin de préparer le passage du transplant (Fig.6). Il est ensuite récupéré dans l'articulation à travers la brèche capsulaire postérieure. Le transplant est enfin passé dans le tunnel tibial. Sa tension est réglée par traction manuelle le pied en rotation neutre, genou fléchi à 80°. Sa fixation est assurée par une agrafe métallique crantée, positionnée sous le cartilage de croissance métaphysaire tibial (Fig.7).

Le trajet du transplant comporte donc une partie extra-articulaire et une partie intra-articulaire assurant une stabilisation antérieure optimale tout en respectant le cartilage de croissance. Avant la fermeture, on contrôle l'absence de déficit de mobilité en flexion et en extension. L'absence de tiroir antérieur en flexion et en sub-extension est contrôlée. La fermeture du fascia-lata est réalisée afin de réparer le hauban extérieur fondamental pour la stabilité du genou. Les incisions cutanées sont suturées par surjet intra-dermiques. L'appui complet est autorisé. Le protocole de rééducation sera adapté à l'âge de l'enfant.

#### **Description de la série:-**

Il s'agit d'une étude rétrospective portant sur 23 enfants opérés au sein de notre établissement selon la technique de Jaeger entre Janvier 2000 et Décembre 2009. Notre série se composait de 18 garçons et 5 filles, souffrant d'instabilité post-traumatique du genou retentissant sur leurs activités physiques. 15 patients pratiquaient un sport de type pivot ou pivot-contact, dont 13 en compétition. Les scores préopératoires de Lysholm et de Tegner étaient respectivement de 74 (58 – 90) et 8,1 (4 à 9). Nous avons opéré 17 genoux droits et 5 genoux gauches. Les patients ont été opérés par deux chirurgiens du service selon la même technique, décrite précédemment. Les détails techniques opératoires ont été soigneusement notés, ainsi que les traitements complémentaires et la chronologie de la reprise des activités sportives.

#### **Resultats:-**

La durée moyenne du garrot a été de 42,5 min (35 – 50). L'exploration articulaire a permis d'objectiver des lésions chondrales chez 1 patient et de traiter 4 lésions méniscales en zone avasculaire (blanche-blanche). La sortie du service s'est effectuée en moyenne au 7<sup>ème</sup> jour post-opératoire (8 – 9) en centre de rééducation pour la majorité des patients ou à domicile directement.

Au premier jour post-opératoire les douleurs sur une échelle visuelle analogique sont en moyenne à 4 (1 – 6). Deux patients se plaignaient de gonflement du genou opéré à l'effort. . Aucun patient n'a rapporté d'épisode d'instabilité. La flexion est supérieure à 130° pour tous les patients à 6 mois post opératoire. A 6 semaines un déficit d'extension chiffré à 1,15° est retrouvé chez 1 patient, sans qu'il y ait de différence avec le programme de rééducation entre les patients. Aucun patient n'a de ressaut rotatoire. Un arrêt dur, retardé, au test de Trillat-Lachman a été retrouvé chez 5 patients (21,7%) à un an. Tous les patients ont bénéficié d'un test isocinétique à trois et six mois. Le score IKDC

fonctionnel subjectif moyen était de 80,3% (41 à 100%). Le *Lysholm Knee Score* moyen était de 83% (31 à 100%). Tous les patients ont eu une radiographie du genou opéré au 6<sup>ème</sup> mois post-opératoire.

Nous avons recensé un hématome de cuisse qui s'est résorbé spontanément au huitième jour post opératoire, un sepsis superficiel traité par 15 jours d'antibiothérapie per os (Pristinamycine) et soins locaux, La mesure des laxités au KT 2000, chez les 42 patients revus en consultation dont le genou controlatéral était sain, a retrouvé une laxité différentielle moyenne de 2,1 mm (0 à 6 mm).

### **Discussion:-**

#### **Resultats cliniques:-**

Il n'y a pas dans notre série de douleur antérieure comme c'est le cas dans les plasties au tendon rotulien où ces douleurs sont estimées entre 19% [2] et 38% [3] selon les séries et rendent dans 53% des cas la marche sur les genoux impossible. Les séries de patients analysées dans le service pour le Mac Intosh au fascia-lata par arthrotomie retrouvaient des mobilités à la 6<sup>ème</sup> semaine de 100° en moyenne [4]. A 6 semaines un déficit d'extension est retrouvé chez 1 patient, il est de 1,15° sans qu'il y ait de différence avec le programme de rééducation entre les

patients. Un arrêt dur, retardé, au test de Trillat-Lachman a été retrouvé chez 5 patients (21,7%) à un an d'évolution. Pour Balabaud [5], le Trillat-Lachman est coté à cinq ans à une croix dans 28% des cas et deux croix pour 10% des patients. Il n'y a pas de ressaut rotatoire à la manœuvre du "Jerk test" à un an. C'est en accord avec les résultats des plasties mixte dans la littérature. Pour la ligamentoplastie au fascia lata selon Mac Intosh modifiée JH Jaeger", le pourcentage de "Jerk test" négatif est de 100% à un an, 96% à cinq ans pour Balabaud [6] et de 98,8% avec 6,7 ans de recul moyen pour Dodelin. De même pour les ligamentoplasties au tendon rotulien avec retour externe, Stapleton *et al.* [7] et Jorgenson *et al.* [8] rapportent 96% d'absence de ressaut rotatoire.

Dans cette dernière série une mesure arthrométrique au KT 2000 a été réalisée et retrouve à 89N une différence inférieure à 3 mm dans 84% des cas à 6 mois et 86 % à 5 ans. Il y a donc une détente de la greffe dans les premiers mois puis une stabilisation qui se maintient dans le temps. Ce petit jeu articulaire constaté lors de tests statiques a toutefois peu d'influence sur les résultats fonctionnels. Noyes *et al.* [9] rapportent que 12% de ces patients ont un jeu de plus de 3 mm par rapport au genou controlatéral alors que plus de la moitié n'a aucune plainte avec un score de Lysholm moyen de 100 points et aucun ressaut. L'évaluation du résultat objectif devrait donc être testée en dynamique plutôt qu'en statique comme le suggère Lefebvre *et al.* [10]. Pour notre étude, la mesure des laxités au KT 2000, chez les 23 patients revus en consultation dont le genou controlatéral était sain, a retrouvé une laxité différentielle moyenne de 2,1 mm (0 à 6 mm) à un an.

#### **Les complications:-**

Un patient a présenté un hématome de cuisse au site du prélèvement, on a relevé un cas de sepsis superficiel. Ces complications ne compromettent pas le pronostic fonctionnel quand elles sont prises en charge à temps. Ainsi ces deux patients ont une mobilité normale et ont pu reprendre leurs activités sportives antérieures au sixième mois post opératoire comme prévu.

#### **La technique chirurgicale:-**

L'affaiblissement du hauban externe, évoqué par certains auteurs, est à nos yeux évité par la réparation systématique du fascia-lata en fin d'intervention [11]. Cette réparation étant devenue toujours possible grâce à la section du septum fémoral latéral proposée par J.H. Jaeger [12]. Le préjudice esthétique a été également mis en avant. Or, actuellement il est possible de réaliser cette technique avec une incision latérale de 6 à 8 cm associée à une mini-arthrotomie. Il n'y a pas d'intervention proposant des cicatrices plus petites qui associe une plastie intra et extra-articulaire.

L'expérience du service en matière de ligamentoplastie nous a conduits à choisir le Mac Intosh au fascia-lata car avec un même transplant nous pouvons réaliser une plastie intra et extra-articulaire équilibrée. En effet le fait que les 2 plasties ne soient pas indépendantes l'une de l'autre évite d'éventuelles différences de tension qui pourraient rendre l'une d'elle inutile.

Le retour externe systématique avec cette technique joue selon nous un rôle fondamental par son effet « anti-jerk » et son rôle protecteur de la plastie intra-articulaire pendant la phase de nécrose des 6 à 12 semaines. Même si Noyes et coll [9], en 2003, n'ont pas montré de différence significative dans les résultats à long terme entre une plastie au tendon rotulien seul et une plastie intra et extra-articulaire, le sujet fait toujours débat puisqu'une conférence de la SOFCOT 2006 y sera consacrée.

Un autre avantage du Mac Intosh au fascia-lata est le diamètre du transplant de 6 mm qui permet :

1. De conserver l'environnement synovial autour du transplant et ainsi de favoriser sa ligamentisation et de préserver les éventuels mécanorécepteurs restés fonctionnels au sein d'un ligament croisé antérieur cicatrisé en nourrice.
2. D'éviter les conflits avec l'échancrure fémorale qui exposent aux risque de distensions secondaires de la plastie ou de raideurs, voire de ruptures ou pour le tendon rotulien de cyclope syndrome.
3. De réaliser des tunnels osseux de diamètre moins important.

En effet , des études biomécaniques faites par moyen et coll. [11] et par Harner et coll. (12) ont montré que le transplant du droit interne et gracilis a une surface de section de presque 2 fois la surface du ligament croisé antérieur. Ce qui accroît le risque potentiel de conflits avec l'échancrure fémorale.

Nous expliquons également nos bons résultats précoces par le fait que nous sommes partisans d'une rééducation « agressive » [13]. En effet les patients débutent la rééducation au 1<sup>er</sup> jour post-opératoire, le travail porte sur les

mouvements actifs et passifs du genou, sur la levée de la sidération du quadriceps permettant le verrouillage actif du genou. 2 à 3 fois par jour les patients sont installés sur des arthromoteurs pour une durée totale d'environ de 2 heures par jour.

### Conclusion:-

L'insuffisance des résultats du traitement conservateur des ruptures du ligament croisé antérieur de l'enfant justifie la nécessité du traitement chirurgical. La procédure chirurgicale réalisée doit respecter le cartilage de croissance. Si la technique est bien conduite, le risque de retentissement sur la croissance est moindre car la majorité des troubles rencontrés dans la littérature est secondaire à des fautes techniques. La technique de Jaeger mérite une place de choix dans la mesure où les résultats sont constamment excellents, lorsque les indications sont bien posées et la technique est conduite de façon rigoureuse.

### Conflits d'intérêts:-

Les auteurs ne déclarent aucun conflit d'intérêts

#### Abstract

**Objective:** Osteoarthritis (OA) is a common arthritic disorder and responsible for 2 % of disability in all world. OA affects all joint parts including cartilage, bone and synovium which characterized by degradation of cartilage, subchondral bone turn over and osteophytes formation.

**Aim of the study:** To evaluate the effect of alendronate sodium (ALN) on disease activity and physical function, evaluate the biochemical parameters that are related to OA patients and study the impact of ALN on bone anabolic and degradative marker, and to determine its effectiveness in slowing progression of disease.

**Patients and methods:** 116 OA patients over 45 years old with Kellgren and Lawrence X-ray grade II and more were enrolled in this study. Base line assessment was done, Kellgren and Lawrence X-ray grading, WOMAC scoring, body mass index and the biochemical parameters with enzyme-linked immunosorbent assay (ELISA) analysis of serum TGF (transforming growth factor) beta 1 and C-terminal cross linked -telopeptide of type II collagen (CTXII). They were instructed to take ALN 10 mg daily. Reassessment was done after 3 months.

**Results :** A significant symptomatic improvement in WOMAC scoring regarding pain and stiffness were observed associated with significant reduction in serum CTXII, TGF beta 1. A no significant reduction in serum calcium with no significant changes in serum Alkaline phosphatase C-reactive protein function and joint space width were also reported.

**Conclusion:** ALN in patients with OA has clinical efficacy in reducing symptoms especially pain probably through inhibition of TGF beta 1 with no significant structural improvement despite reduction of CTXII, and may help delay and prevent further disease progression probably through inhibition of TGF β1 activity in the subchondral bone.

## Introduction:-

Osteoarthritis (OA) is a slowly progressive degeneration of articular cartilage with subsequently joint space width (JSW) reduction (Blagojevic *et al.*, 2010), a common form of arthritic problem (Abramson *et al.*, 2006). In spite of the fact that OA has been believed to be principally a cartilage defect associated with focal articular cartilage degradation (Felson, 2006). It has been found that a solid and stable aspects of subchondral bone is needed for articular cartilage in load-bearing articular joints, which affects the activity of subchondral bone in OA (Mahjoub *et al.*, 2012 ; Suri and Walsh, 2012). the structural changes throughout OA progression including decreased mineralization of the trabecular structure, amplified turnover in the subchondral bone, defects in bone marrow and subchondral plate sclerosis (Karsdal *et al.*, 2014). OA is characterized by a repetitive inflammatory aspect of the articular cartilage due to focal defect or erosion of the cartilage and hypertrophic changes of osteoblastic function or osteophytosis (Esser and Bailey, 2011). These defining abnormalities result in a reduction in JSW leading to painful, immobile, and disabling joint (Ringdahl and Pandit, 2011). Meanwhile, when bone resorption is decreased a range of biochemical investigations has demonstrated positive events on cartilage health (Radin and Rose, 1986). OA is a multifactorial disorders (Berenbaum, 2013). risk factor for OA like age, OA is highly age-related because old cartilage expresses changes in TGF (transforming growth factor)- $\beta$  signaling with decrease protection capacity (Van der, 2014). Other factors like gender (Patricia *et al.*, 2011), race (Cruz-Almeida *et al.*, 2014), over stress (Voelker, 2011) and sex hormone (Jorge *et al.*, 2009). OA can be classified as primary (idiopathic) if its cause is not well defined and secondary when there is a certain events causing OA (Brandt *et al.*, 1986).

Cytokines such as TNF- $\alpha$  and IL-1 increase matrix metalloproteinases (MMP) gene expression and block chondrocyte balancing pathway (Scanzello and Goldring, 2012). IL-4, IL-10, and IL-13 have the ability to reduce synthesis of both TNF- $\alpha$  and IL-1 $\beta$ , and to control MMP activity (Fernandes *et al.*, 2002). IL-1 further affects the action of certain growth factors, such as transforming growth factor-beta (TGF- $\beta$ ) (Alejandro, 2011). TGF  $\beta$  1 responsible for maintaining homeostasis between articular cartilage and subchondral bone (Gehua and Xu, 2014). TGF- $\beta$ 1 is found in high level in subchondral bone from humans with OA (Gehua *et al.*, 2013). High concentrations of TGF- $\beta$ 1 enhance formation of nestin-positive mesenchymal stem cell clusters, which enhances the generation of marrow osteoid islets associated with high levels of angiogenesis (Gehua *et al.*, 2013). It has been found that spinal osteophyte formation is associated with alternation in the TGF- $\beta$ 1 gene in Japanese women (Yamada, 2000; Yamada *et al.*, 2000) and targeting TGF  $\beta$ 1 could be a therapeutic approach to managing OA patients (Gehua *et al.*, 2013).

Findings in OA joints include increase size of bone tissue, crepitus, effusions, and decreased range of motion. Tenderness on palpation and pain on passive movement are also common, even though not exclusive to OA (Joseph *et al.*, 2009). Primary OA is typically diagnosed according to clinical and radiographic imaging findings (Hunter, 2008). Kellgren and Lawrence (K-L) system is the most often used (Kellgren and Lawrence, 1957). It has been discovered that a combination of both pharmacological and non-pharmacological therapies exert a beneficial role in managing patients with knee osteoarthritis (Alshami, 2014).

Alendronate sodium (ALN) is a nonhormonal therapeutic agent, synthetic analogs of pyrophosphate attach to the hydroxyapatite, one of bone contents. It considered as a member of bisphosphonates. ALN is a 4-amino-1-hydroxy-1-phosphonobutyl, hydroxyphosphinate, bisphosphonic acid monosodium salt trihydrate. ALN is a potent antiresorptive agent poorly absorbed from the gastrointestinal tract, eliminated by active secretion of drug by renal transport system, with very long half-life (1 to 10 years) of bisphosphonates in bone, which related to different levels of bone turnover among species (Lin, 1996). The bisphosphonate inhibitory action on bone resorption is resulted from accumulation of bisphosphonate in osteoclasts after released from bone surfaces during bone resorption. Bisphosphonates inhibit farnesyl pyrophosphate synthase. This prevents the synthesis of isoprenoid lipids by disruption normal function. Isopentenyl diphosphate metabolite trapped. Thus, bisphosphonate disrupt osteoclast function leading to reduction of bone resorption (Michael *et al.*, 2011 ; Frank *et al.*, 2011). Bisphosphonates, including ALN were reversing the pathophysiological features, leading to decrease bone turn over and significant increment in mineral density of bone, of postmenopausal osteoporosis (Richard *et al.*, 2011). Animal model of study, it has been demonstrated that ALN protects chondrocyte from OA events induced by IL-1 $\beta$  by increasing Collagen II and reduction of MMP-13 within chondrocytes (Wang *et al.*, 2011).

ALN is used in osteoporotic postmenopausal lady (Nijs *et al.*, 2006 ; Rogers, 2003), corticosteroid-associated osteoporosis (Nijset *et al.*, 2006), paget's disease (Reid and Hosking, 2011) and osteogenesis imperfecta (Evans *et al.*,

2003 ). In spite of the high benefit of ALN, it induces gastric mucosal damages (İşeri *et al.*, 2005), esophageal problem (Naniwa *et al.*, 2008). Osteonecrosis of the jaw (Khosla *et al.*, 2007).

The certain contraindications to ALN are acute inflammations of the gastrointestinal tract (Cryer and Bauer, 2002), hypersensitivity (Naniwa *et al.*, 2008), abnormalities of the esophagus (Naniwa *et al.*, 2008), inability to stand or sit upright for at least 30 minutes (Zentiva, 2016), hypocalcaemia (Zentiva, 2016), renal impairment (Miguel *et al.*, 2013) and osteomalacia (Lenart *et al.*, 2008).

A potential benefit of antiresorptive agents, bisphosphonates, results from experimental studies have shown promising results in treatment of OA (Tim, 2003). ALN intake, in symptomatic hip OA, is effective in pain reduction associated with no significant observation obtained in OA pathology after 2 years treatment (Nishii *et al.*, 2013). ALN was associated with less spinal osteophyte and joint space narrowing progression (Neogi *et al.*, 2008 ; Siebelt *et al.*, 2014).

Animal model of study has suggested that Local elution of ALN acid leads to a dose-dependent increment of bone formation (Boby *et al.*, 2014) and the subcutaneous ALN injections for rabbits OA resulted in reduction of cartilage degeneration, stopping of bone loss with observed improvement in subchondral bone microarchitecture (Mohan *et al.*, 2013). Both in vitro and in vivo studies have found that ALN has the ability to protect chondrocytes by decreasing MMP-13 expression (Hu *et al.*, 2009). ALN has the ability to reduce remodeling of subchondral bone leading to important protective effect on articular cartilage (He *et al.*, 2012 ; Mohan *et al.*, 2013). TGF beta can be defensive as well as harmful for articular cartilage in OA. High levels of active TGF- $\beta$ 1 in subchondral bone leads to initiation of the pathological events of OA (Gehua *et al.*, 2013) and a potential role of TGF beta signaling in OA development were observed, with significant correlation between activin receptor-like kinase 1 (ALK1) receptor, (receptor for action of TGF beta) and MMP-13 expression (van der *et al.*, 2010). In rat with anterior cruciate ligament transection model, bone resorption markedly elevated, ALN inhibit Subchondral bone remodeling, which play a role in the OA pathogenesis, suggesting that ALN or other bone resorption inhibitors could potentially express DMOAD (Hayami *et al.*, 2004). Old cartilage finds to be less protected by TGF- $\beta$  and express significant changes in TGF- $\beta$  signaling pathways. during aging, Loss of the protective Smad2/3 pathway can give an explanation for the relationship between aging and OA (van der, 2014). High-dose ALN leads to complete blockage in the local elevation in MMP-13 and TGF  $\beta$  , which could decrease TGF  $\beta$  enhancement by blocking MMP-13 expression in chondrocytes, important in the pathogenesis of OA, so ALN or other bone resorption inhibitors could potentially be used in OA treatment DMOAD (Tadashi *et al.*, 2004). ALN treatment and physical activity exercised increased cartilage content and reduce OA progression (Siebelt *et al.*, 2014).

### Patients and methods:-

116 OA patients over 45 years old with Kellgren and Lawrence X-ray grade 2 and more will enrolled in this study. The male patients were 32 while the female were 84 giving the male to female ratio of 1:2.63. The patients were habitants of the city of Al-Diwanyhia and Baghdad cities and had the Iraq nationality. Laboratory equipment and reagents were of the highest available grades. Base line assessment were done in form of Kellgren and Lawrence X-ray grading (Kellgren and Lawrence, 1957), WOMAC scoring (Falk *et al.*, 2008), body mass index and the biochemical parameters (serum calcium (Ca), alkaline phosphate (ALK), CTXII (ELISA) and TGF beta 1 (ELISA kit)). OA patients were instructed to take 10 mg alendronate sodium tablet orally at the morning, reassessment was done after 3 months. Statistical analysis: Data were expressed as mean standard deviation. Comparison was done using paired t-test.

### Results:-

Demographic characteristic of the study population: The total number of cases enrolled in the present study was 116, 32 male and 84 female with a male to female ratio of 1:2.63. mean age of patients was 54.68 $\pm$ 5.16 years and the age range was 45-65 years, whereas the mean body mass index (BMI) was 30.21 $\pm$ 5.91 and it ranged from 21.87 to 37.81 kg/m<sup>2</sup>.

There was no significant change in mean Alkaline phosphatase before and after treatment, with no significant reduction in mean serum calcium and CRP as shown in table (1) and figures (1 and 2) through (3).

**Table 1:-**Biochemical and serological parameters: Comparison of mean serum Alkaline phosphatase, calcium and CRP before and after 3 months treatment with ALN.

Parameter	Before(mg/dl)		After(mg/dl)		P-value
	Mean	SD	Mean	SD	
Alkaline phosphatase	105.64	25.69	108.08	24.05	0.055
Serum calcium	9.79	0.74	9.67	1.30	0.245
CRP	9.05	7.93	8.28	8.21	0.221

### Discussion:-

The mainstay of pharmacological therapy of OA is reducing pain and cartilage protection. Significant improvement in Western Ontario and McMaster Universities (WOMAC) scores together with no significant alteration in Kellgren-Lawrence grade (KL) joint space width (JSW) were stated by the current study. The present study showed that ALN use was associated with reduced knee pain severity as assessed by WOMAC scores. In agreement with our finding, Carbone and coworkers in 2004 reported significant reduction in pain according to WOMAC score in patients with OA after 3 years treatment with ALN. In agreement with current results, placebo control trial has found that there was a substantial improvement in total WOMAC score after ALN treatment and best improvement happened at week 4 (Jokar et al., 2010). Nishii and coworkers in 2013 suggested that 2 years ALN intake is effective in pain suppression associated with no significant alteration obtained in OA changes (radiological JSW). Same advantages for bisphosphonate obtained in reducing pain symptoms were reported with clodronate (Rossini et al., 2015) and risedronate (Spector et al., 2005). Clifton and coworkers in 2006 demonstrated that there was no significant changes in WOMAC between the placebo and risedronate treated groups.

The current study demonstrated that changes in mean serum calcium, three months after treatment with ALN, were not significant despite minor reduction in calcium level. The early prevention of resorption of bone produces a decrease in serum calcium which resulted to raised parathyroid hormone (PTH), and eventually a rise in 1,25-dihydroxyvitamin D. The bisphosphonate induced secondary hyperparathyroidism also resulted in conservation of urinary calcium and phosphaturia, and a decrease in serum phosphate. The rise in the PTH after bisphosphonate treatment is a response to the variation in serum calcium and may happen even in the presence of hypercalcaemia, and this can lead to confusion in the explanation of PTH results (Vasikaran *et al.*, 2001). This finding is go with the results were obtained by Heckbert and coworkers in 2008, Poole and coworkers in 2007, Reid and coworkers in 2002 and Vasikaran and coworkers in 2001.

Regarding C-reactive protein (CRP), the current study showed an insignificant reduction in its level. It has been found that the two main acute-phase proteins reaction are C-reactive protein (CRP) and serum amyloid A, both of which can rise up to 1000 times over normal range following an acute phase reaction (APR) (Ceciliani *et al.*, 2002). The pathogenesis of APR has been disclosed only recently. It has been hypothesized that intravenous bisphosphonate are taken up by endocytic cells, possibly monocytes or dendritic cells, resulting in the inhibition of farnesyl pyrophosphate (FPP) synthase. This inhibition results in a lack of geranylgeranylation and farnesylation of translated little guanosine triphosphate (GTP). GTPase participate with several essential cellular actions for survival. Moreover, the FPP synthase stoppage causes intracellular accumulation of isoprenyl pyrophosphate metabolites upstream of FPP synthase in the pathway of the mevalonate (Roelofs *et al.*, 2006). Especially, this results in the aggregation of dimethylallyl pyrophosphate and isopentenyl pyrophosphate (IPP), that are powerful assists of the gamma delta T-cell receptor (Galluzzo *et al.*, 2007). They are naturally detected by gamma delta T cells with eventual activation and liberation of TNF (tumor necrotizing factor)-beta, IFN (interferon) - gamma and IL (interleukin) - 6, that are the proinflammatory cytokines enrolled in the initiation and maintenance of APR (Galluzzo *et al.*, 2007). The current CRP result is in accordance with finding of Evio in 2006 who found no significant alteration in its CRP level in ALN treated osteoporotic patients and Bertoldo and coworkers in 2010 who stated that CRP shows significant rise within 2 days after intravenous infusion of bisphosphonate then it returns to normal levels.

No significant change in mean alkaline phosphatase (ALP) before and after treatment with ALN was reported in current study. Measurement of serum bone specific ALP may be used for monitoring bone anti-resorption treatment as the reduction in bone turnover is reflected in the form of reduced serum bone specific ALP (Kress, 1998); This may be explained by the fact that measuring serum total ALP may not reflect minor changes in bone specific ALP and also that patients in the current study had no significant osteoporosis. Failure of ALN in reducing bone resorption cannot be accepted as an explanation for the lack of the change of serum ALP because bone density has been shown to increase in studies carried out by Horikawa and coworkers in 2015 and Waikakul and coworkers in 2011. The current finding in agreement with Waikakul and coworkers in 2011, who studied the effect of ALN in patients with osteoporosis for 12 months; Horikawa and coworkers in 2015, who studied the effect of intravenous and oral treatment with ALN in patients with osteoporosis for one year. However, these results are in contradiction to the results obtained by Kress in 1998, who found that, in osteoporosis, there was highly significant reduction in bone specific alkaline phosphatase after three months ALN treatment. However serum total ALP did not show significant reduction neither in the present study nor in the studies carried out by Horikawa and coworkers in 2015 and Waikakul and coworkers in 2011. This is a good indicator that treatment with ALN did not affect liver metabolism.

Significant reduction in serum transforming growth factor beta 1 (TGF- $\beta$ 1) levels following ALN treatment was made in the current study. It has been shown, in an experimental study, that TGF- $\beta$ 1 is activated in the subchondral bone as a response to changed mechanical force in an anterior cruciate ligament transection (ACLT) in mouse model with OA (Zhen *et al.*, 2013). High levels of TGF- $\beta$ 1 caused the existence of nestin positive mesenchymal stem cell (MSC) clusters causing aberrant bone formation associated with increased neovascularization. Stoppage of TGF- $\beta$  activity in subchondral bone reduced degeneration of OA joint cartilage (Zhen *et al.*, 2013). It is worth to mention, deactivation of the TGF- $\beta$  type II receptor (T $\beta$ RII) in nestin-positive MSCs minimized process of OA in ACLT mice (Zhen *et al.*, 2013). Thus, high levels of functioning TGF- $\beta$ 1 in the subchondral bone started the pathological events of OA, blockage of which may be a possible therapeutic approach (Zhen *et al.*, 2013; Livshits *et al.*, 2010). An experimental study has reported that induction of high level of TGF- $\beta$ 1 in bone marrow of mouse leading to abnormal bone remodeling, defects in the subchondral bone, including abnormality in bone mineral density and microstructure (Jiao *et al.*, 2014). However, increase TGF- $\beta$ 1 associated with abnormal reshaping of subchondral

bone which increase the possibility of progressive degradation of mandibular condylar cartilage and OA progression (Jiao *et al.*, 2014). Aberrant functioning of TGF  $\beta$  in the subchondral osseous tissue in response to an aberrant mechanical load induces development of osteoid islets at the starting of OA. Subsequently, modulation of subchondral bone structure varies the distribution of stress on the joint cartilage and causes its degeneration. Thus, stoppage of TGF- $\beta$  activity in the subchondral osseous tissue may give a new approach for treatment of OA (Zhenet *et al.*, 2014). Others, response to aberrant mechanical load, TGF- $\beta$ s were liberated, stimulated and aggregated in subchondral bone to activate abnormal bone synthesis and neovascularization through recruitment of nestin-positive MSCs or osteoprogenitor cells throughout the pathological events of OA; prevention of this process may be a possible therapeutic avenue to treat OA (Jie *et al.*, 2014). In contrary to our results, it has been shown that ALN treatment increased serum TGF- $\beta$ 1 levels in experimental rat one year after treatment (Jia *et al.*, 2013); however, other published articles showed that administration of ALN has markedly reduced TGF- $\beta$ 1 expression. So it is well obvious that reduction of TGF- $\beta$ 1 by ALN, as shown in the present study, is of great help in ameliorating OA.

The current study showed significant reduction in serum CTXII, a cartilage degradative marker. In agreement with Nishii and coworkers in 2013, the importance of reduction in CTX-II on suppression of cartilage degeneration confirmed by other studies (Willemet *et al.*, 2013; Damet *et al.*, 2009) so the reduction in level of CTX-II in the present study may be considered as one of the mode of ALN action in OA.

### Conclusions:-

The use of Alendronate in patients with osteoarthritis has clinical efficacy in reducing symptoms especially pain probably through inhibition of TGF beta 1 with no structural improvement and may help delay and prevent further disease progression probably through inhibition of TGF  $\beta$ 1 activity in the subchondral bone. The reduction in level of CTX-II in the present study may be considered as one of the mode of actions of alendronate in patients with OA.

#### Abstract

Peroxidases (EC 1.11.1.7) are enzymes whose primary function is to oxidize a variety of hydrogen donor at the expense of hydrogen peroxide. In the present study, peroxidase was partially purified from Iraqi radish. Crude extract was prepared by blending and centrifugation of local radish roots. The enzyme was salt precipitated using 80% ammonium sulfate, dialyzed and then partially purified using DEAE-Cellulose ion exchange chromatography. Two fractions of peroxidase activity were eluted; the first was purified 35.62 folds and showed a final specific activity 41.85U/mg with a 51.29% yield. The second was purified 23.45 folds and showed a final specific activity 27.551U/mg with a 42.12% yield.

#### Introduction:-

Peroxidase (POD) an oxidoreductase is a heme protein, catalyses the oxidation of a wide variety of organic and inorganic substrates using hydrogen peroxide as the electron acceptor (1). Peroxidases are widely distributed in living organisms including microorganisms, plants and animals (2). POD is mainly located in the cell wall (3) and it is one of the key enzymes controlling plant growth and development (4).

From the economical point of view, peroxidase is an important enzyme. POD is widely used for clinical diagnosis and microanalytical immunoassays because of its high sensitivity. It is used in diagnostic kits for enzymatic determination of glucose, uric acid, cholesterol and many other metabolites in biological fluids and is also an important enzyme in ELISA systems (5). Other applications include synthesis of various aromatic compounds and removal of peroxide from foodstuff and industrial wastes (6). It was reported that peroxidase had been used for biotransformation of organic molecules (7). Because of its broader catalytic activity, a wide range of chemicals can be modified using POD. Also, it can be used for the applications such as synthesis of various aromatic compounds, removal of phenolics from waste waters and the removal of peroxides from foodstuffs, beverages and industrial wastes (8).

Although, peroxidases are widely distributed in the plant kingdom, the major source of commercially available peroxidase is roots of horseradish. Many investigators extracted and purified peroxidases from their local radish, in UK (9), Turkey (2), Pakistan (10) and Japan (11) in order to find peroxidases with different specificity for promoting the development of new analytical methods and potential industrial processes (9).

The aim of this work was the extraction and partial purification of local radish peroxidase in order to find a locally available and economical source of peroxidase which can be used for practical application.

## Materials and Methods:-

### Extraction of local radish roots:-

White radish roots were collected from local market, washed, minced and homogenized in blender 1:1 with 0.1M phosphate buffer pH (7.0), then the homogenate was filtered and centrifuged for 3000rpm/5min, 4°C the supernatant were collected and stored at -20°C until use (10).

### Enzyme Assay and Protein Estimation:-

Peroxidase assay was carried out in a reaction mixture containing: 0.1M phosphate buffer (pH 7.0), 0.02M H<sub>2</sub>O<sub>2</sub> (Substrate), 0.05M guaiacol (chromogen), and water (1:1:1:7). The absorbance of the colored complex was read on spectrophotometer at 420 nm wavelength after 30 sec of reaction interval (fig.1). One unit of activity was defined as the amount of enzyme that causes an increase of 0.001 absorbance per min (2). The protein concentration was determined by lowery method (12) using bovine serum albumin as a standard.

Fig 2:- Bovine serum albumin standard curve using lowery method.

### Ammonium sulfate precipitation:-

Ammonium sulfate precipitation was carried out in homogenate on an ice bath for 20, 30, 40, 50, 60, 70 and 80% salt saturation. Ammonium sulfate was slowly added to the homogenate stirred until complete dissolution. Then the mixture was centrifuged at 3000 x g for 60 min, 4°C and the precipitate was dissolved in 2 ml of 25mM phosphate buffer (pH 7.5). The concentrated sample with maximum specific activity was selected and dialyzed in a dialysis tube three times for 2 days against 1 L above buffer at 4°C for further use (2).

### Ion exchange chromatography:-

Ion exchange chromatography was done for dialyzed sample using DEAE-cellulose column (2 X 30 cm) equilibrated and washed with 25mM phosphate buffer (pH: 7.5) and eluted with [25mM potassium phosphate buffer (pH 7.0) buffer and 0-300mM KCl gradient], at a flow rate (3ml/5min) (10).

## Results and Discussion:-

The enzyme was extracted by blending the radish roots with time intervals in order to avoid heating up the blended material. Blending is efficient method for breaking plant cells (10). Centrifugation for the blended material was done in order to remove particular materials and intact nuclei.

Several salt saturation percentages were used to precipitate the enzyme, the maximum activity was obtained with 80% salt saturation (fig.3). The fold of purification using ammonium sulfate was 15.28 times. Ammonium sulfate salt is widely used for protein precipitation because of its highly solubility which make the solutions have highly ionic strength (10). Several investigators precipitate peroxidase from their local radish using ammonium sulfate at 90% (13), 85% (10), and 60% (2) saturation. This differences in salt percentages used may be due to the different isozymes of peroxidase which precipitated at these percentages, since it was reported that seven isozymes were eluted from radish (13), the Korean radish roots contain six isozymes (14).

DEAE-cellulose chromatography was mostly used for peroxidase purification (10). Two fractions of peroxidase activity were eluted from DEAE-cellulose column (fig.4), the first was purified 35.62 times and showed a final specific activity 41.851U/mg with a 51.29% yield. The second was purified 23.45 folded and showed a final specific activity 27.551U/mg with a 42.12% yield. Other investigators were used DEAE-cellulose get 14.08 (10) and 9.7 (2) times of purification.

**Fig 2:-** Ion exchange chromatography for peroxidase extracted from radish roots. DEAE-cellulose column (2×30cm) equilibrated and washed with 25mM phosphate buffer (pH: 7.5) and eluted with [25mM potassium phosphate buffer (pH7.5) buffer and 0-300mM KCl gradient], at a flow rate (3ml/5min).

Specific activity of POD in crude extract was 1.175 and increased during purification to 41.85 for the first eluted fraction and 27.55 for second (table1) from DEAE-cellulose column.

**Table 1:-** purification profile of peroxidase extracted from radish root

Purification step		Volume (ml)	Activity (U/ml)	Protein (mg/ml)	Specific activity (U/mg)	Total activity	Yield %	Fold of purification
Crude extract		25	0.141	0.120	1.175	3.525	1	1
Dialysis		10	0.295	0.038	7.763	2.950	83.86	6.61
DEAE-Cellulose Ion exchange chromatography	Peak1	8	0.226	0.0054	41.85	1.808	51.29	35.62
	Peak2	11	0.135	0.0049	27.55	1.485	42.12	23.54

The purification steps in this study seems to be suitable for fractionation of POD from Iraqi radish roots as the purification parameters showed (table1) in comparison with purification processes in other studies.

##### Key words:-

cervicogenic headache, neck pain, bank office workers.

#### Abstract

**Background:** Headache affects 80-90% of the population.

Approximately 47% of the global population suffers from a headache, and 15-20 percent of those headaches are cervicogenic headache. Epidemiological researchers suggest prevalence of cervicogenic headache in office workers with neck pain. Cervicogenic headache are usually on one side of the head but can occur on both sides. The pain tends to be dull; not throbbing and can become moderate to severe in intensity. The pain is usually caused by awkward or sustained neck positions and can usually be reproduced by applying pressure to the back of the head and neck.

**Aim and objective:** To find the incidence of cervicogenic headache in bank office workers.

**Methodology:** Nationalize bank were downloaded maximum banks were selected. Total 500 subjects were evaluated then concern form was signed and they were assisted for cervical flexion rotation test and Neck disability index.

**Results:** Mean age ( $\pm 40.98$ ) 20% had cervicogenic headache with neck pain in bank office worker Neck disability index is as follow Mild=405, moderate=15, no disability=80

**Conclusion:** 20% cervicogenic headache in bank office workers.

#### Introduction:-

Chronic headache is a significant medical and socioeconomic problem resulting in severe disability and impairment. The term "cervicogenic headache" was coined by Sjaastad in 1983, who also proposed criteria for its diagnosis. Cervicogenic headache as described by Sjaastad et al is characterized as recurrent, long lasting, severe unilateral headache arising from the neck.

Exact pathoanatomic and pathophysiologic basis for cervicogenic headache is unclear. Numerous authors have proposed various theories ranging from neurophysiologic basis involving ascending fibers from the C1 and C2 nerve roots to multiple pain generators in pain-sensitive structures involved in head movement.

Headache affects 80- 90% of the population. Cervicogenic headache (CEH) is a symptomatic headache characterized by chronic unilateral headache and symptoms and signs of neck involvement(1,2) CEH is often

**Corresponding Author:- Raaequa Awati.**

Address:- Presenter, final yr.student, Tilak Maharashtra Vidyapeeth, Pune.

worsened by neck movement, sustained awkward head position or external pressure over the upper cervical or occipital region on the symptomatic side (1,2). Cervicogenic headache (CGH) is a challenging complaint that is commonly faced by physiotherapists in clinical practice. The International Headache Society (IHS) placed cervicogenic headache in the secondary headache sub-group. The global prevalence of headache is about 47%, whereas 15% to 20% of those are CGH. Females are four times more prone to CGH than males (3). Persons with chronic CGH experience significant restriction of everyday function and are limited to social involvement, and emotional sufferings. Beside this, the poorer quality of life is seen in these individuals than normal. (4, 5) The IHS defines cervicogenic headache (CGH) as “pain, referred from a source in the neck and perceived in one or more Regions of the head and/or face.” It is often exaggerated by neck movement, constant uncomfortable head position or external force over the occipital region or upper cervical on the painful side. Headache may arise from various structures of the cervical spine, containing the zygapophyseal joints (occiput-C1, C2, C3). (5,6) Key features of CGH usually are unilateral headache without side-shift combined with neck pain and decreased movement. (6) Up to about 70% of frequent intermittent headache are reported with associated neck pain making CGH difficult to diagnose. The C1-C2 segment is considered essential to be examined in CGH diagnosis. The relative importance of C1-C2 as a prime cause of CGH has been well established. The cervical flexion-rotation test (FRT) is used to assist in the diagnosis of CGH and, in particular, C1-C2 segmental dysfunction. This manual test involves moving head to fully flexed position, so that spinal movement is ideally controlled to C1-C2, then measuring cervical rotation in this position. Normal range of movement is 44° to each side. Hall and Robinson have found that subjects with CGH are seemed to have about 17° less rotation toward the pain side in the FRT, as compare to those with no head pain or migraine with aura. FRT has 91% sensitivity and 90% specificity for diagnosis of CGH (7)

The co-occurrence of headache has been found to be 4 times higher in individuals with musculoskeletal symptoms than in those without. In particular, individuals with neck pain have been found to experience headaches more frequently than those with symptoms in other areas. This classification system is mainly based on scientific diagnosis that requires the cervical nociceptive source to be identified via a confirmatory diagnostic block and the headache to have resolved after treatment. In contrast, the diagnostic methods described by the Cervicogenic Headache International Study Group (CHISG) (8,9) are more practical and involve identifying important clinical markers specific for this type of headache. According to the CHISG, the most characteristic aspects of CEH are: 1) unilateral and radiating pain that often starts in the neck or the occipitocervical area and spreads to the oculo-fronto-temporal region 2) temporal pattern of pain that is often continuous but fluctuates in intensity 3) pain induced by improper neck postures or external pressure to the structures in the neck and the occipital region. Neuralgias, such as the greater, lesser, or third occipital neuralgias, affect similar regions at the back of the head. In contrast to patients with CEH, those with neuralgia often use terms such as “stabbing,” “jabbing,” or “shooting” to describe the pain intensity. In addition, neuralgias do not typically present with associated facial or trigeminal-referred pain. The reason for this observation is that the purported mechanism underlying the development and progression of CEH is the convergence of sensory inputs at the trigeminocervical nucleus. (9,10) A connection between the trigeminal and cervical nerves was postulated in the late 1940s (11), but it was only in 1961 that Frederick Kerr hypothesized a pathogenetic model for headache stemming from the cervical region and the posterior fossa. (12) The trigeminal spinal nucleus comprises a rostral sub nucleus oralis, a middle sub nucleus interpolaris and a caudal sub nucleus caudalis (13). The pars caudalis of the spinal tract nucleus of the trigeminal nerve is continuous with the grey matter of the dorsal horns of the spinal cord (14). The spinal terminals of the small sensory fibers enter the cord from the lateral part of the entry zone and have collateral branches that may ascend or descend for up to 3 segments, in the Lissauer’s tract, before synapsing in the dorsal horn laminae (15, 16). Therefore, along with the 3 upper segments, the middle and lower part of the neck may also be involved in the development of CEH (17, 18). These changes in neural connectivity are also evident in the findings of neurophysiological tests. The eye blink reflex (BR) is mediated via the afferent fibers to the trigeminal sensory nuclear complex and their central connections in the trigeminal nucleus. The R1 and R2 components of the BR are mediated via the tactile A $\beta$  afferent fibres. The R3 components are mediated via the thinly myelinated A $\delta$  fibers. Sand et al. (19) compared the BR in patients with CEH, tension-type headache, and migraine with that in the controls. The initial study showed that shorter R1 latencies were found on the symptomatic side than on the asymptomatic side in patients with CEH. In a later study, they reported that stimulation of the symptomatic side in patients with CEH showed a decrease in the R2 duration and the amplitude of the R2 component. These findings point to an associated brainstem hyperactivity (20, 21), possibly involving the ipsilateral trigeminal nucleus. The findings of the quantitative sensory testing (QST) of trigeminal hypersensitivity were consistent with those of the above-mentioned neurophysiological study. La Touche et al. (22) have reported that, compared to the pain-free controls, patients with chronic neck pain showed sensitivity to bilateral mechanical pain over the face. In these patients, pressure hyperalgesia was found over both the masseters

and temporalis muscles, but not over the tibialis anterior muscle (reference area). However, Chua et al (23).have shown that, compared to chronic neck pain patients without CEH, those with CEH showed lateralization of pressure hyperalgesia accompanied by thermal hyperesthesia on the painful side of the face. Their suggestion of a rostral neuraxial spread of central sensitization, probably to the ipsilateral trigeminal spinal nucleus, is consistent with Kerr's (6) hypothesis. Understanding the mechanisms underlying the development of CEH is the first step toward providing these patients with a better treatment outcome. This understanding will help rationalize the proposed mechanistic approaches that target central sensitization, ablative therapies that focus on primary nociceptive sources, and physical therapies that help relieve pain in secondary areas.

#### **Need of study:-**

Headache affects 80-90% of the population.

Approximately 47% of the global population suffers from a headache, and 15-20 percent of those headaches are cervicogenic. Epidemiological researchers suggest a higher prevalence of headache in adults with neck pain. Bank office workers mainly sit in erect posture and work continuously on computer so there is high chances of cervicogenic headache in them. Therefore the purpose is to study the incidence of cervicogenic headache in bank office workers.

#### **Aim and objectives:-**

To find the incidence of cervicogenic headache in bank office workers.

#### **Hypothesis:**

**Null:-** There is no incidence of cervicogenic headache in office workers.

**Alternative:-** There is prevalence of cervicogenic headache in office workers.

#### **Materials and Methodology:-**

**Study design:-** Survey Study setting: nationalize banks.

Target population: office workers in banks.

Sample size: 500

1. Inclusion criteria: bank office-worker, constant or frequently occurring neck pain.
2. Exclusion criteria: specific disorders of the cervical spine, instability.
3. List of nationalised banks around Pune were made.
4. Banks with more than 200 workers were considered and visited.

Sampling: 500 subjects were selected having headache and neck pain irrespective of their gender, age, and working period.

#### **Questionnaire:-**

All persons received a questionnaire with a standard letter containing information about the project. Apart from ensuring confidentiality and emphasizing the importance of participation, it was stated that the object was to study the cervicogenic headache.

#### **Cervical flexion rotation test:-**

During the Cervical Flexion Rotation Test (CFR), the patient is supine and the examiner flexes the cervical spine fully in order to block rotational movement below the atlanto axial articulation. The examiner then passively rotates the head left and right, determining range of motion (ROM) and end-feel. A firm end-feel with limited ROM presumes limited rotation of the atlas on the axis.

The CFR has been shown to have an overall diagnostic accuracy of 85- 91%.

#### **Results:-**

Ages	No. of people
21 to 30	98
31 to 40	189
41 to 50	111

51 to 60	102
total	500

Interpretation: In the sample of 500 people the age group which was mostly affected was in between 31 to 40 (189 peoples) after that 41 to 50(111 peoples); 51 to 60(102 peoples) and are less in age group 21 to 30(98 peoples)

Mild	291
Moderate	6
No Disability	53

**Interpretation:-** In a sample of 500peoples, 291 peoples have mild (81%); 06 peoples have moderate (3%); 53 peoples have no disability (16%)

Positive	Negative
100	400

## Cervical Flexion Rotation Test

Interpretation: In sample of 500 people the cervical flexion rotation test was positive in 100 peoples (20%); and negative in 400peoples (80%)

### Discussion:-

Cervicogenic headache is a complex syndrome caused by a variety of lesions that might reproduce pain on the contralateral side (24). Patients with bilateral headache or neck pain after whiplash injury are diagnosed as cervicogenic headache in many headache centers. It is also difficult to be absolutely sure of how strictly the criterion of unilaterality has been followed in other epidemiological studies. The majority of headache days were characterized by a unilateral moderate/severe pressing/ tightening pain without accompanying symptoms.

#### A study says that cervicogenic headache may occur because of:-

Bad sitting posture, Prolonged periods of sitting or static postures in general , Having an inappropriate workstation, Getting overtired to the point of exhaustion.

As the bank office workers have mainly all of the above conditions so the study was done on them.

Typically, the headache: is recurrent, long-lasting and severe. Arises from the neck . has a unilateral dominance (but can bilateral). is in the low occipital and temporal region (with possible radiation in the face, per orbital, frontal and parietal region and ipsilateral shoulder and arm).Is accompanied with a reduced cervical spine range of motion.Can be precipitated with certain neck motions.

Considering that Cervicogenic headache is a daily chronic pain, surprisingly only 2% had consulted a neurologist and only 10% had consulted a pain clinic. This may be due to moderate pain intensity. The lack of consulting a headache specialist may also contribute to medication overuse.

This study is the first to investigate the incidence of cervicogenic headache in bank office workers.

Determining the etiology of cervicogenic headaches is often frustrating for both the patient and physician. Differentiating between cervicogenic headache and other forms of headache is difficult because not only is there variability in headache presentation, but there is also considerable symptom overlap. Many authors have suggested varying methods to diagnose and differentiate cervicogenic headache from other various forms of headaches. Use of clinical criteria has been strongly advocated (25,26,27). Significant variations in the definition of cervicogenic headache among clinicians have clouded not only the incidence and prevalence of cervicogenic headache, but also its treatment recommendations and outcomes (28).

All the patients in this study were between the age group of 20-60 years.

Cervicogenic headache has an involved biomechanical and neural mechanism with cervical association, which makes the task of studying cervicogenic headache challenging.

In order to grasp the concept of cervicogenic headache, it is important to understand the background. We naturally started our search for such cases among patients in whom headache was the main complaint. We more or less had to start our search from scratch, and when one does not know what one is searching for, the search is going to be characterised by trial and error. A decisive feature in identifying the first case around 1980 was the mechanical precipitation mechanism. Once the first case was identified, other cases followed suit.

Criteria for cervicogenic headache. Unilaterality without sideshift, Pain triggered by neck movement and/or sustained awkward position, Pain elicited by external pressure over the ipsilateral upper, posterior neck region or occipital region, Ipsilateral non-radicular neck, shoulder, and arm pain, Reduced range of motion in the cervical spine, Non-clustering pain episodes, Pain episodes of varying duration or fluctuating, continuous pain, Moderate, non-excruciating pain, usually of a non-throbbing nature, Pain starting in the neck, eventually spreading to oculo-fronto-temporal areas where the maximum pain is usually located, Anaesthetic blockades of the major occipital nerve; C2 root or other appropriate structures on the symptomatic side abolish the pain transiently, provided anaesthesia is obtained, Female sex, Head and/or neck trauma, Nausea, Vomiting, Ipsilateral edema, and - less frequently - flushing, mostly in the periocular area, Dizziness, Phono- and photophobia, Ipsilateral "blurred vision", Difficulties on swallowing

The available studies that can tell something useful about the incidence of Cervicogenic headache can be divided into two groups: (i) regular hospital/outpatient series that compare the incidence of Cervicogenic headache with the incidence of, for example, migraine and tension headache; and (ii) population studies.

Maciel et al. (29) found a 15% frequency of CEH in a headache clinic series (n = 1,229). This frequency is probably far above what can be expected for e.g. cluster headache. Their view that CEH is one of the three major headaches may be defensible.

In Vincent & Luna's series (30), there were 33 CEH patients, 29 episodic tension headache patients, and 65 common migraine patients.

It is remarkable that in two studies both claiming to have used the IHS criteria (31, 32), one (32) found 44 times as many cases of CEH as the other (31). This indicates that the time is ripe for an appreciable upgrading of the IHS criteria (30, 31). In addition, proper population studies with proper criteria must be carried out as regards CEH.

The purpose of study was to find out the incidence of cervicogenic headache in bank office workers. The cervicogenic headache is mostly neglected or left untreated. The bank office workers population was considered for study as they work continuously on computers and have chances of occurring musculoskeletal problems and cervicogenic headache. The aim was to find out the percentage of cervicogenic headache in bank office workers. The study was conducted as survey method. Study was done at various banks around pune city. The data were collected by questionnaire method and cervical flexion rotation test. The Target population was office workers in banks. Samples that have specific disorders of the cervical spine, instability were excluded. In this study the 500 samples were selected based on the inclusion and exclusion criteria. The exclusion criteria was specific disorders of the cervical spine, instability etc. The inclusion criteria considered was bank office-worker, constant or frequently occurring neck pain.

The samples were included in the bases of their willingness of self-participation individually. The investigations were done on the bases of validated scales.

Results show that there is 20% of incidence of cervicogenic headache in bank office workers.

### **Conclusion:-**

In our study 500 bank office workers were assisted for CGH by doing cervical flexion rotation test and neck disability index questionnaire from which we found that 100 peoples were having positive cervical flexion rotation

test with neck disability index in which 291 persons had mild pain, 06 persons have moderate pain and 53 persons had no neck disability.

Therefore there is 20% of incidence in bank office workers.

### **Limitation and scope:-**

#### **Limitations:-**

Duration of working hours were not considered, Ergonomic conditions were not included, Years of working were not considered, Posture analysis was not done.

#### **Scope:-**

Can be done in particular age group. Can be done in any particular gender. Can be done in various types of office workers.

##### Key words:-

Maintenance, cycle time, control chart, quality level, Taguchi method of quality control.

#### Abstract

Maintenance of equipment nowadays has a larger role in the firms as a result of huge development of equipment, and the production shifted from workers to machines, the control chart is a main tool in the statistical process control, it is used to promote quality level of maintenance of equipment, and control chart can assure lower average cycle time of maintenance procedure under using of Taguchi method of quality control, and several mathematical equations in the procedure will be used to find value of average cycle time in maintenance of equipment in the firm, because the role of maintenance increased, and it will force to reduce failure rates and defects amount which are proportional to higher quality level of applied maintenance.

As a new subject, the research will study to combine four factors of maintenance, average cycle time,  $\bar{x}$  control chart, and quality level.

As a new methodology, Taguchi method of quality control was used to obtain the result of aims of the research which are to achieve small average cycle time in the maintenance procedure.

#### Nomenclature:-

**The following abbreviations and symbols are the list of Nomenclature used in the research:-**

$y_0$ : Failure rate parameter of exponential distribution of the average time for occurrence of assignable cause. It is the average time for occurrence of the assignable cause exponentially distributed with mean  $1/y_0$ .

$y$ : Failure rate parameter of exponential distribution of average interval for occurrence of the assignable cause. It is the average interval for occurrence of the assignable cause exponentially distributed with new mean  $(1/y)$  and  $y = Ar * y_0$ .

$Ar$ : Extension rate in the age of the equipment. It is proportional  $(1/r)$  to the original one.

$\delta$ : Value for the shift of "in-control" process

$\mu$ : Process mean.

$\mu_0$ : Process mean to out-of-control condition

$\mu_1$ : Process mean in the control chart

$w$ : Warning coefficient. It is maintenance threshold or it is warning width, and in this research, we assign  $w$  as two third of the magnitude of control width  $k$ .

$\beta$ : Standard deviation of the process.

$s$ : Sample size

$k$ : Control limit coefficient of control chart or control width.

**Corresponding Author:- Abdul khalek M. Kadir.**

Address:- Erbil Technical Engineering College, Erbil Polytechnic University-Iraq.

$P_w$ : The probability when the process is under control state, and there is no any extra action required.

$P_r$ : The probability when the process is under control state but the process mean falls in the warning zone.

$\Omega(\cdot)$ : A cumulative density function of normal distribution.

$h$ : Sampling interval.

$T_{cm}$ : Average maintenance time. It is required elapsed time for each action of maintenance procedure.

$h_0$ : Expected sampling interval

$\psi$ : Average time of occurrence of the assignable cause within an interval.

$T_0$ : Mean time duration in which the procedure is in the beginning to the first sampling after the process shifts.

$M_p$ : Magnitude of process mean shift if an assignable cause occurs.

$\overline{P}_w$ : Probability that the mean falls inside warning control limit.

$\overline{P}_r$ : Probability that the mean falls between the warning and control limit.

$h_1$ : Expected sampling interval when the process is out-of-control state.

$\theta$ : Error probabilities.

ARL: Average-run length when the process shifts to the out of control state.

$T_1$ : Expected time interval within the faulty process.

$T_{tap}$ : A constant average time to testing the sample, analyzing the results, and plotting which is considered as a consistent time.

$T_{art}$ : A constant average time for repairing but after the assignable cause has been identified, and to bring a process back to an in-control state after assignable cause has been identified.

$T_{com}$ : Complete average cycle time length.

### Introduction and literature Review:-

The control charts are the important tools of statistical process control SPC, they can be used in order to detect process shifts in both line of mean and variance, the tool of x control chart can monitor and indicate average cycle time, and to show if the procedure of maintenance of equipment is not under statistical control, the corrective action will be done in order to prevent further nonconforming products and to be manufactured by defected equipment and to stop losses [1], it means that the maintenance will return production to the corrected condition, the maintenance with SPC is used to achieve an optimal product quality, the x control chart is used for this purpose, therefore it is regarded as a main tool in maintenance procedure in the manufacturing firms, and it can give greater chance to designate a model to value statistical criteria in this procedure, the first model of economic design of x control chart was applied by the researcher, and later he extended his research from single to multiple assignable causes in which the failure mechanism was assumed to be an exponential distribution [2], by its equations, it can really give lower time and minimum cost when compared with other models such as Shewhart's model, because the researcher added an optimum methodology in his research in order to get three design parameters: subgroup size (n), sampling interval (h) and control-limit width (+ k & - k standard deviation), and this initial model was made for minimizing cycle time [3].

### Literature review:-

Several previous studies have been completed in order to improve control charts and determine average cycle time. After Duncan's study, there were many papers proposed an economic design of control charts, therefore an optimization procedure was developed for determining parameters of cycle time for the x-bar control chart [4]. Then a literature review achieved about average cycle time in economic design of control charts between years 1981-1991 [5], they concluded improvements on the models and cycle time. Thus, several other recent studies achieved and made other developments and variable results so as to achieve theoretical development of average cycle time of economic design for control chart subjects. According to the Duncan cost model, the researcher "Engin - 2004" developed an application for the use of economic statistical x chart design in the textile yarn industry as experimental study and searching for the optimum n, h and k the author considered the power of the control chart to be at least 0.95 and the penalty-cost as minimal as possible [6]. An integrated model of control chart and maintenance management was developed, in which the control chart was used in order to monitor the equipment and to provide signals which indicate equipment deterioration, while planned maintenance is scheduled at regular intervals to obstruct equipment failures [1]. In more developed subject, other studies focused on software to detect algorithm for economic design of x-bar charts parameters, and majority applications were carried out by using MATLAB, C, and SAS, it proposed a genetic algorithm for economic design of x-bar charts by using these programs [7&8].

### Taguchi method of quality control:-

The Japanese engineer-statistician Dr. Genichi Taguchi developed Taguchi method which is defined as a quality control methodology because it can combine control charts with process design to achieve a robust total design, this method aims at reducing product variability within a production system to develop design and specifications into the products in firms [9], thus the maintenance of equipment can have their control enforced, Taguchi method of quality control was expanded by many studies so as to be used in various fields of engineering and involve identification of proper control factors to obtain optimum results of the production process [10], therefore the aims of the maintenance of equipment as an engineering service are to gain best results, and it can be applied in manufacturing process. The Taguchi method of quality control recognizes the roles of researches through research development programs, and in reducing the occurrence of defects and failures in maintenance by firms. Figure 1 shows the losses, target value, both lower and upper limits of specifications, and rework and waste areas resulted by any maintenance procedure or manufactured products, they happened when it is out of control, thus, the main contribution of Taguchi method lies in several mathematical formulas with quality improvement technique to gain suitable average cycle time of maintenance of equipment in the firms, a study affirmed consideration of this method that the task of economic design of control charts is important in manufacturing process and quality control, therefore it tries always to eliminate variances in the process before they can occur [11].

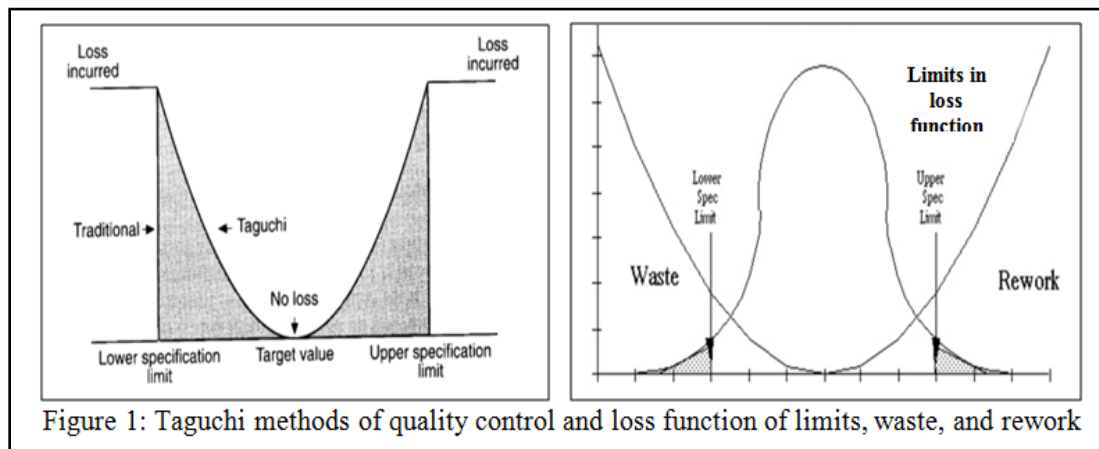

Figure 1: Taguchi methods of quality control and loss function of limits, waste, and rework

Several researches indicated the importance of Taguchi method of quality control, they proved that they can overcome bad design of products and bad plans of maintenance, in addition, it can increase design and inspection features, and focus on robust design during manufacturing process, it uses way of statistical procedures and relies on developed model rather than statistical techniques during manufactured phases [12], in addition, Taguchi presented his views about design of products by a program with three phases such as: system design, parameter design, and tolerance design [13] which can enhance maintenance of equipment during manufacturing process by reducing variations in the process and minimizing average cycle time through robust design of experiments which is a new concept and related to the maintenance procedures, and the method tends not to defect and high quality level of the procedures, Taguchi method of quality control takes place in four steps of defining all factors specific for the optimization problem, selecting suitable control factors, analysis of results, and conducting of the verifiable experiments [14].

### Options of new Developments:-

After great development of technology and production methods and as a result of increased uses of automated machines and robots in the firms, the manufacturing process were shifted from workers to equipment or machines, therefore the number and quantity of maintenance of equipment became bigger and took more importance by the firms.

This new state took an evident role to continual production by equipment and decreasing stoppage, therefore, it takes now a vital role to control main options of quantity, quality, time, and cost of maintenance of equipment, the effects of these options became larger more than ever because the relation among these options and maintenance became more stronger, nowadays most academicians and technicians recognize that there is a strong relationship between product quality and equipment maintenance [15], therefore the interrelation among several options, product's

quality, control chart, and maintenance procedure is the working axle by the firms, but there is another interrelation between control chart and maintenance procedure which was enlarged and still continue, many results of studies affirmed the actual integration between control chart and maintenance procedure, even they approved more benefits to the firms, and they determined jointly optimal design parameters on an  $\bar{x}$  control chart and time of maintenance [16]. Others prepared economic design model of control charts as essential basic to maintenance of equipment in the firms, because of the maintenance frequency that may take a long time in the firm, therefore to reduce unnecessary extra time, they developed an integrated model of control chart and maintenance management [17], the equipment will be accepted by firms when their measurements meet required specifications of maintenance procedures time and there will be no loss of cycle time and there will be no loss of quality according to associated standards, and this is the main objective of all firms. Therefore all aforementioned losses should be minimized until measurements of equipment will accept limits of cycle time in control and take free state of defects, deficiencies, and significant variations, and the average cycle time will be at right value when the results are same target in the maintenance procedure, this concept is used in most models of economic design of control charts, therefore Taguchi suggested that any deviation from value results of target is a loss of cycle time [18].

### Cycle parameters and variables:-

There are several parameters and variables related to cycle time in control chart, they are considered in the economic design of control charts [19], there are 29 of parameters that will be inserted into control chart in order to find average cycle time, they are expressed by symbols as Nomenclature, in addition, there are some decision variables and other parameters noted in other references [16].

There are three variables that should be selected and assumed as decision variables in control chart in order to find average cycle time when designing control chart and to monitor the maintenance of equipment, the variables are: sample size ( $n$ ), interval between successive subgroups ( $h$ ), control limits ( $k$ ), and warning coefficient [20]. Also, it is necessary to mention essential assumptions about maintenance procedure which begins in-control state, and a study [16] suggested as follows:

- The maintenance procedure is either in-control or out-of-control condition, and it will be in-control at beginning of the operation, but later it is shifted and it cannot be back to the start of in-control automatically.
- There is one assignable cause in the maintenance procedure, but there is shifts ( $MP\ \beta$ ) if an assignable cause occurs, also, during repair the procedure will be in continuity as the  $\bar{x}$  are in normal distribution.
- The maintenance procedure will be conducive when the statistic character is located over two third magnitudes of the control width.

### Aims of the Research:-

This research has following aims:

- It tries to find average cycle time of maintenance of equipment in the control chart
- It uses Taguchi method of quality control and several mathematical equations to find value of average cycle time.
- It tries to minimize loss of average cycle time, and to minimize loss of quality according to associated standards.

### Methodology of the Research:-

The methodology consists of several steps, the research will:

- Take parameters and decision variables from analyzing previous and recent studies, then using them in the research after some changes.
- Collect options of quantity, quality, cost, and time of maintenance of equipment, and illustrate strong interrelation among options, maintenance, control chart, and cycle time of control chart.
- Affirm that the actual integration between control chart and maintenance become more beneficial to firms, and to confirm that these interrelation is maximized and developed.
- Use Taguchi method of quality control and mathematical equations to find average cycle time of maintenance of equipment through control chart.

### Average cycle Time:-

The cycle time represents the time of the cycle work of maintenance procedures of equipment, its value determined in control chart by solving several mathematical equations in which they can be inserted within production process

in the firm, the cycle time is regarded as expected average cycle time because it will be defined as the total time length required for maintenance of equipment [19], it will start in-control condition, but if an assignable cause occurs on this stable condition, the cycle will begins to be detected in the procedure in order to be brought back to an in-control state, the cycle time has 4 time intervals [16] such as:

- (1) The interval in which the production process is in-control
- (2) The interval in which the production process is out-of control but still undetected
- (3) The interval between the time at which the assignable cause is detected and identified
- (4) The interval between the time at which the assignable cause is identified and repaired

In many maintenance procedures, the average time for occurrence of assignable cause is exponentially distributed with mean  $(1/y_0)$ , and value of the cycle time can be referred as a good kind after achieving each one of correction actions, but the cycle time cannot be specified as a realistic value state when the failure rate of the maintenance is increased after each action of the maintenance, hence the extension in the age of the equipment inside production process is proportional  $(1/Ar)$  to the original, therefore the average interval for occurrence of assignable cause is exponentially distributed with new mean  $(1/y)$  and  $y = Ar * y_0$ .

The operating of equipment and average cycle time are important factors that should be precisely measured and necessary to produce high quality maintenance of equipment in the firms, they are required to perform inspection about in-operation equipment, but the inspection process has limited time to perform on-control state of related equipment activities, and this will lead to fix each of:

- Value for the shift of "in-control" process  $\delta$
- Process mean to out-of-control condition  $\mu_0$
- Process mean in the control chart  $\mu_1$

Therefore, the selection of corrected value for shift size can be assumed as a difficult decision tackled by the quality practitioner due to the lack of former process knowledge [20], in such case we should have a state in which if the quality characteristic is located between the zone called "warning zone" of  $(\mu + w\beta/\sqrt{s})$  and  $(\mu + k\beta/\sqrt{s})$  or between the zone of  $(\mu - w\beta/\sqrt{s})$  and  $(\mu - k\beta/\sqrt{s})$ , then an action of maintenance of equipment should be taken and to be done, as affirmed by the study [21], the process will start "in-control" at a random time, then a step shifts during research for the assignable cause, but it is allowed to continue in operation, it is considered cycle time as depicted in Figure 2. [6], and it should be mentioned that the major function of control charting is to detect the occurrence of assignable causes so that the necessary corrective action may be taken before a large quantity of nonconforming product is manufactured [22], because the production process by equipment in the firms is assumed as a series of independent cycles over time, and each cycle begins with the production process in the "in-control" state and it will continue until the process changes and its change is detected and identified [23].

**Figure 2: The production cycle time in the Duncan's model**

To find expected sampling interval  $h_0$  when the maintenance procedure is in-control state, it is supposed that both probabilities  $P_w$  and  $P_r$  as mentioned in above Nomenclature, and to find average cycle time, several equations will be used and some of them are presented by a study and as follows [16]:

At first, both probabilities are expressed by:

$$P_w = \Omega(w) - \Omega(-w) \dots \dots \dots (1)$$

$$P_r = 2[(\Omega(k) - \Omega(w))] \dots \dots \dots (2)$$

Later, let  $h$  be the sampling interval and the  $T_{cm}$  is the required in elapsed time for each action of maintenance procedure, then the  $h_0$  will expressed as:

$$h_0 = h * P_w + (h + T_{cm}) * P_r \dots \dots \dots (3)$$

In order to find the time value of occurrence of assignable cause within an interval  $\psi$ , it can be shown as following equation as came by Duncan-1956 [2]:

$$\psi = \frac{e^{y h_0} - (1 + y h_0)}{y (e^{y h_0} - 1)} \dots \dots \dots (4)$$

But in order to find a complete average cycle time length  $T_{com}$ , at first it is necessary to find  $T_0$  and  $T_1$ , and to get their values, the next steps should be followed:

- Equation 5 is ready to find Mean time duration in which the procedure is in the beginning to the first sampling after the process shifts  $T_0$  which expressed as:

$$T_0 = (h_0 * e^{-y h_0} + h_0 * e^{-y 2 h_0} + h_0 * e^{-y 3 h_0} + h_0 * e^{-y 4 h_0} + \dots) \dots \dots \dots (5)$$

- The mean process  $\mu$  will shifts to  $(\mu + M_P \beta)$  when the process fails,  $\overline{P}_w$  and  $\overline{P}_r$  can be shown and expressed as equation 6 and 7:

$$\overline{P}_w = \Omega(w - M_P \beta) - \Omega(-w - M_P \beta) \dots \dots \dots (6)$$

$$\overline{P}_r = \Omega(-w - M_P \beta) - \Omega(-k - M_P \beta) + \Omega(k - M_P \beta) - \Omega(w - M_P \beta) \dots \dots \dots (7)$$

- The expected sampling interval when the process is out-of-control state  $h_i$  can be shown and expressed as equation 8:

$$h_1 = h * \overline{P}_w + (h + T_{cm}) * \overline{P}_r \dots \dots \dots (8)$$

- To find Average-run length when the process shifts to the out of control state  $ARL$  we need to find error probabilities  $\theta$ , it will be as equation 9 and 10:

$$\theta = \overline{P}_w + \overline{P}_r \dots \dots \dots (9)$$

$$ARL = \frac{1}{(1 - \theta)} \dots \dots \dots (10)$$

- To find Expected time interval within the faulty process  $T_1$ , equation 11 assures it:

$$T_1 = h * \overline{P}_w * ARL + (h + T_{cm}) * \overline{P}_r * ARL \dots \dots \dots (11)$$

- It is essential to mention other two times in the maintenance procedure, **such as**: a constant average time to testing the sample, analyzing the results, and plotting which is considered as a consistent time  $T_{tap}$  and a constant average time for repairing but after the assignable cause has been identified, and to bring a process back to an in-control state after assignable cause has been identified  $T_{art}$ , it is necessary to add them into the  $T_{com}$ , then it can be shown by:

$$T_{com} = T_0 + T_1 + T_{tap} * s + T_{art} \dots \dots \dots (12)$$

## Results and Discussion:-

### Results:-

Large development of machinery and technology of production occurred, the process of manufacturing is shifted from workers to equipment, as a result, the maintenance becomes more important to continual production and decreasing stoppage in operated equipment, and the number of maintenance of equipment becomes higher after manufacturing process shifted from workers to equipment. It is resulted that many studies recognized that there is a strong relationship between equipment maintenance and product quality produced by the equipment, as results

indicated interrelation among several options of quantity, quality, time, and cost of maintenance of equipment, and the effects of these options become larger more than ever because the relation among these options and maintenance become more stronger. There are 12 mathematical equations used to find value of average cycle time, the cycle time has 4 time intervals in production process, the cycle time is defined as total time length required for maintenance of equipment and it will start in-control condition, there are 29 parameters that will be used and inserted into control chart, they are mentioned in Nomenclature in this research. The maintenance procedure has two states, it is either in-control or out-of-control condition in the firms and the in-control at the beginning.

**Discussion:-**

The maintenance becomes more important procedure in the firms because large numbers of maintenance are necessary after increasing role of equipment because the manufacturing process is shifted from workers to equipment. The in-operation equipment needs for larger amount of maintenance in order to continue production and generating new condition of higher quality maintenance and an interrelation crucial role to control main options of quantity, quality, time, and cost of manufactured equipment in the firm. If an assignable cause occurs on in-control condition, the cycle time begins to be detected and identified by a model in order to be brought back to an in-control state. The equipment will be accepted by firms when their measurements meet the required specifications of maintenance procedures time and there will be no loss of cycle time and there will be no loss of quality according to associated standards, the average cycle time of maintenance can be found but after using of 12 mathematical equations because it contains 29 parameters.

**Conclusions and Recommendations:-****Conclusions:-**

The control charts are the important tools of statistical process control, they use to detect process shifts in line of mean and variance, the tool of  $\bar{x}$  control chart can monitor and indicate average cycle time, and to show if the maintenance is under control or not, the correction action will be done in case of no control to prevent further nonconforming products.

The cycle time represents time work of maintenance of equipment, its value determine in control chart by mathematical equations, the cycle time is regarded as expected average cycle time as total time length required for maintenance of equipment, to enhance maintenance of equipment during manufacturing process by reducing variations in the process and minimizing average cycle time through robust design of experiments, the equipment will be accepted by firms when their measurements meet required specifications of maintenance procedures, Taguchi method is defined as a quality control methodology because it can combine control charts with process design, Taguchi method lies in several mathematical formulas with quality improvement technique to gain suitable average cycle time of maintenance of equipment in the firms. When designing a control chart and monitor the maintenance of equipment, the variables are: sample size ( $n$ ), interval between successive subgroups ( $h$ ), control limits ( $k$ ), and warning coefficient ( $w$ ). Taguchi method of quality control used in various fields of engineering and involve proper control factors to obtain optimum results of production process, and used in order to continual production by equipment and decreasing stoppage, and to enforce equipment maintenance, this new condition has an evident role and plays vital role to control main options of quantity, quality, time, and cost of maintenance of equipment. After great development of technology of production and the increased uses of automated machines and robots in the firms, the manufacturing process are shifted from workers to equipment or machines, therefore the number of maintenance of equipment became higher, also it took bigger importance for the firm's level.

The maintenance procedure is either in-control or out-of-control condition, it assist to find average cycle time, the effects of options became larger more than ever because the relation among these options and maintenance became stronger, there are strong relationship between product quality and equipment maintenance, and there are many parameters and mathematical equations to find time cycle. The new studies use software programs in order to detect arithmetic state for economic design of  $\bar{x}$ -bar chart parameters, and majority applications are carried out by using MATLAB, C, and SAS.

**Recommendations:-**

The research recommends to use control chart according to Taguchi method of quality control, and to use software programs to find value of average cycle time of maintenance of equipment in the firms.

## RESEARCH ARTICLE

### TRADITIONAL AND MEDICINAL USES OF PLANTS OF DUNYAPUR DISTRICT LODHRAN.

Hina Saeed.

Department of Biochemistry, Bahauddin Zakariya University, Multan-60800, Pakistan.

#### Manuscript Info

##### Manuscript History

Received: 29 November 2016  
Final Accepted: 26 December 2016  
Published: January 2017

#### Abstract

The plants being utilized by man for various purposes. In this study 29 families and 62 species are studied people of locality used plant for fodder, stuffing, pickles, sausage and for medicinal remedy. Most plant used in treatment of digestion, diarrhoea, constipation, toothache, flu, hepatitis, skin infection, diabetics.

#### Key words:-

Dunyapur, ethnomedical, fodder, pickle, medicinal remedy.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

Ancient citizens mainly depend on plants for their endurance. They acquired knowledge of remedial plants by methods of trial and error. Subsequently, they became the store-house of knowledge of valuable as well as injurious plants, accumulated and enriched through generations and passed on from one generation to another, after refining and additions. Many people, particularly in the poor, underdeveloped countries, rely on wild plant resources for food, construction materials, fuel wood, medicine and various other uses. Internationally, it is a conventional reality that native societies are very knowledgeable about plants and other natural resources on which they are immediately and intimately dependent. Unluckily, much of this possession of knowledge is very fragile today due to erosion of traditional cultures. Ethnobotanists can play very important roles in saving this disappearing knowledge and returning it to local communities. It is, therefore, important that before this rich unwritten folklore on uses of plants and plant resources becomes lost forever through the recent accelerated 'civilization' of the aborigines (tribal), it should be properly renowned and conserved (Rao & Henry, 1997).

#### Study Area:-

Dunyapur located between (29°-32° N, 71°-38° E) in district Lodhran Punjab province, Pakistan. Its boundaries join with Lodhran, Kahrora Pakka, Melsi, Khanewal, Multan. The average rainfall is 71mm.

#### Methodology:-

Questionnaires and interview method is used to collect data.

#### Result & Discussion:-

The utilization of plants for the survival of human being is as aged as the human race itself. The increase of knowledge of plants uses however co-evolved with human society through the experiential use of plants, generation after generation. People would have stayed rendering to pandemic, common and persistent diseases, as well as severe diseases (Hamayun, 2003). The people of Dunyapur, Punjab, Pakistan have constantly used remedial flora for different ailments and have been reliant on locally available plants. During the survey, information attained regarding the utilization of plants against diverse therapeutic problems practiced by the people. The local area uses 62 species belonging to 29 families for various purposes. They used approximately 17 plants for remedial of different diseases.

(Table 1). In addition other plants are used for numerous other reasons such as timber, fuel, fruit, furniture, pickles, potherb and fodder (Gul jan *et al.*, 2011; Harish Singh., 2008; Ahmad *et al.*, 2009; Khan *et al.*, 2011). The basic health facilities are accessible but high-priced; so the individuals of the locality mostly depend on plants for the alleviation of diseases. It was observed that old age people are more prone to the use of plants as primary health care in comparison with young generation (Qureshi & Bhatti, 2009; Qureshi *et al.*, 2009, 2010, 2011; Shedyai *et al* 2014; Ahmad *et al.*, 2010).

**Table 1:-** Botanical name, family, common name and uses of plants of Dunyapur district Lodhran

Sr.No	Botanical Name	Family	Common Name	Uses	Remark
1	<i>Aerva javanica</i>	Amranthaceae	bhooi	Use as fuel, fodder for animal, stuffing pillows	Non Cultivated
2	<i>Fumaria officinalis</i> (Hausskn.) Pugsley	Fumariaceae	Fumitory, papra	Soaked in water over night drink for skin infection e.g. pimple	Non Cultivated
3	<i>Leucas capitata</i> Desf.	Lamiaceae	charta	Soaked in water over night drink for skin infection e.g. pimple	Non Cultivated
4	<i>Cichorium intybus</i> L.	Asteraceae	Chicory, Kasni	Leaves soaked overnight in water and water used as remedy against hepatitis	Non Cultivated
5	NA	NA	oak	Used by healer in medicine, fruit milk injurious for eyesight	Non Cultivated
6	<i>Eclipta alba</i> Hassk.	Asteraceae	Babri, naiazbho	Seeds are used to decrease thirst	Cultivated
7	<i>Mentha spicata</i> L.	Lamiaceae	Podina, mint	Used in chatni, boil in water for treatment of cramp and to lose weight	Cultivated
8	<i>Coriandrum sativum</i>	Apiaceae	Coriander, dania	Reduce hypertension(one tea spoon of seed), flavour in cooking, used in chatni	Cultivated
9	<i>Spinacia oleracea</i> L.	Amranthaceae	Spinach, palak	Used in cooking	Cultivated
10	<i>Chenopodium album</i> L.	Amranthaceae	batho	Used in cooking saag	Non Cultivated
11	<i>Sesamum indicum</i> L.	Pedaliaceae	til	Used to increase body temperature in winter, decrease rate of late night urination, bakery, oil used for massage to decrease pain	Cultivated
12	<i>Foeniculum vulgare</i>	Apiaceae	Sonaf	Help to improve eyesight	Cultivated
13	<i>Allium cepa</i> L.	Liliaceae	Onion, piyaz, wasal	Used in cooking, pickles, given to cattle to reduce smell in milk	Cultivated
14	<i>Allium sativum</i> L.	Liliaceae	Garlic, Lasan Thom	Used in cooking, pickels	Cultivated
15	<i>Capsicum frutescens</i>	Solanaceae	Chili, Mirach	Used in cooking, pickles, given to cattle to reduce smell in milk	Cultivated
16	<i>Abelmoschus esculentus</i> L.	Malvaceae	Okra, bindi	Used in cooking	Cultivated
17	<i>Cucurbita pepo</i> var.cylindrica	Cucurbitaceae	Toori	Used in cooking, hard cover of vegetable used to remove dead skin of feet	Cultivated
18	<i>Solanum melangena</i>	Solanaceae	Brinjal, Bangan,	Used in cooking	Cultivated

			Batooue		
19	<i>Cucurbita maxima</i>	Cucurbitaceae	Kadoo	Used in cooking	Cultivated
20	<i>Praecitrullus fistulosus</i>	Cucurbitaceae	Tanda	Used in cooking	Cultivated
21	<i>Momardica charantia</i> L.	Cucurbitaceae	Bitter gourd, Karella, kerla	Used in cooking, its water used to reduce pimples	Cultivated
22	<i>Daucus carota</i> L.	Apiaceae	Carrot, gajar	Used in cooking, pickles, juices, salad, improve eyesight	Cultivated
23	<i>Raphanus satvus</i> L.	Brassicaceae	Raddish, moli	Used in cooking, help in stomach diseases	Cultivated
24	<i>Brassica rapa</i> var. <i>rapa</i> L.	Brassicaceae	Turnip, Shaljam, Gonglo	Used in cooking	Cultivated
25	<i>Solanum tuberosum</i>	Solanaceae	Potato, Aloo	Used in cooking	Cultivated
26	<i>Lycopersicum esculentum</i>	Solanaceae	Tomato, Tamatar	Used in cooking,	Cultivated
27	<i>C. limon</i> L.	Rutaceae	Lemon, Lemoo, nemboo	Used in cooking, pickles, used in skin whitening	Cultivated
28	<i>Mangifera indica</i> L.	Anacardiaceae	Mango, Aam	Fruits edible	Cultivated
29	<i>Citrus sinensis</i>	Rutaceae	Orange, Malta	Edible fruits, peel of fruit mixed with equal volume of milk used in freshens skin	Cultivated
30	<i>Musa acminata</i>	Musaceae	Banana, Kala	Edible fruit, peel of fruit and fruit used by people having oily skin	Cultivated
31	<i>Psidium guajava</i> L.	Myrtaceae	Guava, amrood	Edible fruit, fruit is heated used in flue treatment	Cultivated
32	<i>Syzygium cuminii</i> Skeels	Myrtaceae	Black plum, Jamoo, jaman	Edible fruits, its leaves used in treatment of cattle disease rick (a type diaherea due to indigestion), fruit used to control diabetics and stomach diseases	Cultivated
33	<i>Grewia asiatica</i> L.	Malvaceae	Phalsa	Juices, edible fruits, reduce constipation, Improve digestion, control thrust	Cultivated
34	<i>Punica granatum</i> L.	Puniaceae	Pomegranate, Anar	Juice used to reduce hypertension, dry peel of fruit used in treatment of diaherea in humans	Cultivated
35	<i>Rosa indca</i>	Rosaceae	Rose, gulab	Used in gulcand (a medicine of constipation having equal volume flowers petal and sugar), iraq glub used in eye to reduce irritation and improve eyesight	Cultivated
36	<i>Jasminum officinale</i> L.	Oleaceae	Jasmine, chambali, chamba	Oil,	Cultivated
37	<i>Tagetes erecta</i> L.	Asteraceae	Gota	Used in marriages in traditional occasion myau, ornamental	Cultivated
38	<i>Triticum aestivum</i> L.	Poaceae	Wheat, gandam,	Roti, fodder for cattle,	Cultivated

			kank		
39	<i>Zea mays</i> L.	Poaceae	Corn, maki	Fodder for cattle, Flour	Cultivated
40	<i>Gossypium arboreum</i> L.	Malvaceae	Cotton, kapas	Stuffing pillows and blankets, bnola khal fodder for animal, source of oil	Cultivated
41	<i>Sacchaaram officinarum</i>	Poaceae	Sugarcane, ganna	Juice, local people prepare saker and gour from its juice, fodder for cattle, fule for klin	Cultivated
42	<i>Brassica campestris</i>	Brassicaceae	Sarsooo, Sarue	A special dish saag is prepared from leaves, oil, fodder for animal	Cultivated
43	<i>Cassia fistula</i>	Caesalpiniaaceae	Amaltaas	Legume of plant used in treatment of constipation	Cultivated
44	<i>Acacia nilotica</i> L.	Mimosaceae	Kikar	Bark of plant boil with water used in treatment of bleeding gums, stem used in cleaning teeth, furniture, lecoria treatment	Cultivated
45	<i>Dalbergia sissoo</i>	Fabaceae	Shesham, Tali	Furniture	Cultivated
46	<i>Phoenix dactlifer</i> L.	Arecaceae	Date, Khajoor, Khaji	Edible fruits, soft branches are used in making hand fan	Cultivated
47	<i>Albizzia lebbeck</i>	Mimosaceae	Shri	Plant leaf hang in the room of newborn child	Cultivated
48	<i>Eucalptus citriodora</i> Hook.	Myrtaceae	Safada	Steam of water boil with leaves used in treatment of flu, furniture, roof material	Cultivated
49	<i>Azadirachta indica</i> A. Juss	Meliaceae	Neem	Dry seeds powder mix with oil used to finish lice, boil leaves in water used decrease scabbies	Cultivated
50	<i>Melia azedarach</i> L.	Meliaceae	Bakain		Cultivated
51	<i>Moringa oleifera</i> Lam.	Moringaceae	Sawajna, Bata	Legume used in pickles, flower are used in cooking	Cultivated
52	<i>Bauhinia variegata</i>	Caesalpiniaaceae	Kachnar	Flower are used in cooking	Cultivated
53	<i>Zizyphus jujuba</i> Mill.	Rhamnaceae	Chinee tree, Bari	Edible fruits, Boil leaves in water are used in bathing	Cultivated
54	<i>Medicago sativa</i> L.	Fabaceae	Alfalfa, Looson	Fodder	Cultivated
55	<i>Trifolium alexandrinum</i> L.	Fabaceae	Barseen	Fodder	Cultivated
56	<i>Festuca idahoensis</i>	Poaceae	Grass, Gas, Cha	Fodder	Non Cultivated
57	<i>Ficus religiosa</i>	Moraceae	Pepal		Non Cultivated

Knowledge Assessment, Hand Hygiene.

### Abstract

**Objectives:** This study aims to assess the knowledge and practice of hand hygiene among graduate medical students in Asir governmental hospitals in Asir region.

**Methods:** A cross-sectional survey design was used to gather data from the graduate medical students who were practicing how to provide care services in Asir region hospitals. A sample of 100 members was selected randomly from the total working individuals in Asir region Hospitals. WHO standard questionnaire for hand hygiene for healthcare workers was used to collect data about workers knowledge.

**Results:** Results regarding the knowledge assessment indicated that there is a Good knowledge of the graduate medical students about the main route of transmission of potentially harmful germs between patients. Moreover, results revealed that this knowledge level must be improved by further Medical educational sessions.

### Introduction:-

Hand hygiene represents a self vaccination of the workers, since it reduces the infection probability though several efficient means such as scrubbing, rinsing, drying...etc. Effective hand hygiene both before and after the required tasks in the health settings will minimize the gremial population and helps avoiding getting infected by different types of germs.

In hospitals, hand hygiene could be the most common effective way to control the infection caused by the hospital resident microbes. Those infections are believed to kill thousands of people every year.

The World Health Organization (WHO) had worked hardly in the last decades to increase the awareness and importance of hand hygiene in the health care providing sector, and issued specific recommendations regarding this matter. World Health Organization (WHO) recommendations included the purpose of hand hygiene, the correct and effective procedure of hand hygiene and who is required to perform that task.

The purpose of hand hygiene as stated in WHOM standards included controlling the hospital source infections, and avoids transmitting microbial organisms among patients and care givers.

Hand Hygiene Knowledge Assessment among Graduate Medical Students in Asir Governmental Hospitals, Saudi Arabia

Moreover, WHO determined who is required to be committed to hand hygiene protocols during their jobs, and those included health care workers ,caregivers ,and anyone who is involved in direct or indirect patients care task.

Despite considering hand hygiene as an infection control limiting factor, and a measure for controlling infections related to hospitals, the compliance of the workers in the health sectors with the recommended hand hygiene was under the required satisfying measures.

Specific key factors played a role in the insufficient health workers compliance towards hand hygiene protocols, those factors included lack of knowledge about the importance of following and applying hand hygiene procedures and its role in eliminating resident germs, consequently minimizing the infection opportunity . Another factor is the shortage of hand hygiene facilities when correlated to staff number, and the absence of administrative commitment to hygiene protocols in specific health care providing places.

In 2002, the Centre of Disease Control (CDC) issued a guideline for hand hygiene in health care settings. And recommended the usage of the waterless alcohol based protocols for hand hygiene, because of the efficiency of these materials in eliminating the germs, minimizing the infections, and preventing the transmitting of germs within the health care setting environment.

Three years later, the World Health Organization (WHO) published its hand hygiene guideline which contained the recommendations to the health care settings for establishing effective strategies for promoting hand hygiene approaches. WHO guidelines pointed to the importance of hand hygiene in infection control procedures, as well as recommended of the health care settings administrators commitment of applying the hand hygiene procedures within their institutions. Several studies have indicated that it could improve the hand hygiene compliance by several means such as the application of alcohol based protocols as recommended in CDC guidelines, improving the health workers knowledge, and commitment of the stakeholders in the health sector to hand hygiene guideline application within their setting.

In a study performed by Pittet *et al.*, the application of a hand hygiene program, they concentrated on promoting alcohol based hand hygiene, had resulted in significant improvement in hand hygiene compliance.

The increment of hand hygiene compliance improvement consequently leads to the reduction of both MRSA and nosocomial infections.

Graduate medical students represent one of the largest percentage of health care workers in the health care settings, and they are of the most exposed elements to deal with the patients more compared any other health care workers. Therefore it's important to identify study and assess their knowledge about the suitable hand hygiene strategies and procedures that contribute to promote the hand hygiene compliance.

Saudi Arabia, as a developing country suffers from the spread of nosocomial infections in health care settings, due to the resources limitations.

A study conducted by Basurrah *et al.* , to investigate the hand washing and gloving practice among health care workers in medical and surgical wards in a tertiary care centre in Riyadh city , had found that hand hygiene practice should be improved by multifaceted strategies , and this requires the increasing of hand washing and alcohol based hand rubs settings and providing them in the health care institutions.

## **Methodology:-**

### **Aims of the study:-**

This study aims to assess the knowledge and practice of hand hygiene among graduate medical students in Asir governmental hospital in Asir region.

**Research questions and hypothesis:-**

In light of the purpose of the study, this study will address specific questions:

Q1.	<i>What's the level of knowledge among graduate medical students in Asir region hospitals about hand hygiene?</i>
Q2.	<i>What are the lowest fields of knowledge and what could be done for improvement?</i>
Q3.	<i>Is there any strong indicator of graduate medical students hand hygiene compliance?</i>

**Research Methodology:-**

The methodology of the research indicates the general pattern to valid and reliable data for the problem under investigation.

**Significance of the study:-**

This study is significant for several reasons. Such as providing an overview of graduate medical students' knowledge about hand hygiene in Asir region hospitals , and represents an introduction for other studies to be performed regarding infection control procedures in the same hospital to reduce the nosocomial infections.

**Research Design:-**

The research design used in this study is a cross sectional design. A cross-sectional survey design was used to gather data from the graduate medical students who were providing care services in Asir region hospitals.

**Research Setting:-**

The study was conducted at Asir governmental hospital in Asir region.

**Research population:-**

The population of the study included all the graduate medical students practicing and providing health care services in Asir governmental hospital in Asir region in the kingdom of Saudi Arabia.

**Sample Size:-**

Convenient sampling technique was used. A sample of 100 members was selected randomly from the total working individuals in Asir region Hospitals.

**Data Collection:-**

WHO standard questionnaire for hand hygiene for health workers was used to collect data about workers knowledge. 150 questionnaire were distributed, 119 returned, 19 empty questionnaire were excluded .

The questionnaires were delivered to the respondents in the hospital and were collected soon after. they were provided with envelopes and instructed to drop them at the designated collection point. Data was analysed by SPSS Software.

**Results:-**

It can be seen from table (1) that the majority of the sample was of the age range 19-25 years, which constitutes 45% of the sample, while 35% of the sample was within the second age range that was 26 to 35 years.

The third age range of 36 to 45 years was represented by only 15% of the sample. While the lowest representation was for the age range 46 to 65 years, that was only 5% of the total sample. The second demographic variable was gender, in which females constituted the majority of the sample with a percentage of 82%, while males were only 18%.

The following table represents the demographic variables distribution within the study sample (Table 1)

**Table 1:-** Study sample distribution according to the demographic variables.

Variable	Frequency	Percentage
Age		
19-25	45	45%
26-35	35	35%

36-45	15	15%
46-65	5	5%
<b>Gender</b>		
Male	18	18%
Female	82	82%

### Knowledge assessment results

The following table shows the knowledge assessment results for the respondents (Table 2 ).

**Table 2:-** Study sample responses to Hand Hygiene questionnaire items.

No	Item	Percentage
1.	Which of the following is the main route of transmission of potentially harmful germs between patients? ( Health care workers hands when not clean )	68%
2.	What is the most frequent source of germs responsible for health care associated infections? ( Germs already present on or within the patients )	49%
<b>Which of the following hand hygiene actions prevent transmission of germs to the patients</b>		
3.	Before Touching a patient (Yes)	96%
4.	Immediately after risk of body fluid exposure ( yes)	97%
5.	After exposure to immediate surroundings of a patient ( No )	31%
6.	Immediately before a clean / aseptic procedure (Yes)	90%
<b>Which of the following hand hygiene actions prevent transmission of germs to the health care workers</b>		
7.	After touching a patient ( Yes )	96%
8.	Immediately after risk of body fluid exposure ( yes)	82%
9.	Immediately before a clean / aseptic procedure (No)	53%
10.	After exposure to immediate surroundings of a patient ( Yes )	80%
<b>Which of the following statements , on alcohol-based hand rub and hand washing with soap and water is correct</b>		
11.	Hand rubbing is more rapid for hand cleansing than hand washing ( True )	76%
12.	Hand rubbing causes skin dryness more than hand washing ( True )	42%
13.	Hand rubbing is more effective against germs than hand washing ( False )	39%
14.	Hand washing and hand rubbing are recommended to be performed in sequence ( False )	35%
15.	What's the minimal time needed for alcohol based hand rub to kill most germs on your hands? ( 20 seconds )	41%
<b>Which type of hand hygiene method is required in the following situation</b>		
16.	Before palpation of the abdomen ( Rubbing)	33%
17.	Before giving an injection ( Rubbing)	39%
18.	After emptying a bed pan ( washing)	78%
19.	After removing examination gloves ( rubbing/washing)	73%
20.	After making a patients bed ( rubbing)	39%
21.	After visible exposure to blood ( washing)	63%
<b>Which of the following should be avoided as associated with increased likelihood of colonization of hands with harmful germs</b>		
22.	Wearing jewellery ( Yes )	98%
23.	Damaged skin ( Yes )	96%
24.	Artificial fingernails ( Yes )	93%
25.	Regular use of hand creams ( No )	76%

**Discussion:-**

Results regarding the knowledge assessment indicated that there is a moderate knowledge of the graduate medical students about the main route of transmission of potentially harmful germs between patients, where 68% of the sample answered correctly that the health care workers hands when not clean is the main route while 32% gave incorrect answer and have no knowledge about that item.

Regarding the most frequent source of germs responsible for health care associated infections, 49% answered correctly that germs already present on or within the patient, which indicates to a poor knowledge about that part.

Four items were used to investigate and assess the knowledge level about hand hygiene actions that prevent transmission of germs to the patients.

Items representing the actions were ; before touching a patient and immediately before a clean / aseptic procedure, indicated a very high level of knowledge with a percentage of 96% and 90%, respectively.

While the item concerned with the action of immediately after risk of body fluid exposure, got a moderate to high correct answer response with a percentage of 79%.

The lowest percentage was for the item regarded to ( After exposure to immediate surroundings of a patient ) which got a percentage of 31% .

Next field was to examine the knowledge about the hand hygiene actions that prevent transmission of germs to the health care workers. Four items were examined here ; the first was ( After touching a patient ) that got the highest percentage of 96%, the second was ( Immediately after risk of body fluid exposure ) ,82% answered correctly (Yes).The third item that got the lowest percentage was ( Immediately before a clean/ aseptic procedure ) , was 53% of the total sample.

The last item examines the action (after exposure to the immediate surroundings of a patient ) got a percentage of 80% as a correct answer among the total sample response.

Hand hygiene knowledge assessment also included investigating the sample response whether specific statements about alcohol based hand rub and hand washing with soap and water are correct or not .

First statement stated that hand rubbing is more rapid for hand cleansing than hand washing got 76% agreement to be correct, while the statement that says that hand rubbing causes skin dryness more than hand washing showed low to moderate knowledge indicator with a 43% of the total sample. On the other hand 39% of the sample believed that hand rubbing is more effective against germs than hand washing which is incorrect statement.

Investigating if the hand washing and hand rubbing are recommended to be performed in sequence indicated that a poor knowledge of the graduate medical students about hand hygiene, and that was obvious by the low percentage of the correct answer which was 35%.

Last statement in the field examined the knowledge about the minimal time needed for alcohol based hand rub to kill most germs on your hands, which is 20 seconds, but low knowledge about that was detected by a 41% of the tested sample of graduate medical students.

Furthermore, knowledge assessment examined the most suitable method of hand hygiene in specific situations. Respondents were asked about the suitable methods in six different situations, the first was (Before palpation of the abdomen), only 33% answered correctly by choosing the rubbing method, while the second situation was (before giving an injection), 39% responded correctly by choosing rubbing method. In the third situation ( after emptying a bed pan ) , washing was the right method which was chosen by 78% of the respondents .Fourth item( after removing examination gloves ) , 73% of the respondents had chosen both methods; rubbing and washing , correctly.

Next item regarding the suitable method after making a patient bed, 39% of the respondents had chosen a suitable method which is rubbing. While in the last situation which is ( after visible exposure to blood ) , 63% had chosen the correct method which is washing by soap and water. Last topic to be investigated regarding graduate medical

students knowledge of hand hygiene, was the role of specific items in increasing the likelihood of colonization of hands with harmful germs.

Wearing jewellery, damaged skins, and artificial fingernails, were detected to be the highest associated factors in germs colonization on hands with a percentage of 98%, 96%, and 93%, respectively. While 70% answered correctly on the association of (Regular use of hand creams).

### Conclusion:-

According to the previous results it can be concluded that graduate medical students in Asir region hospitals have a good knowledge about hand hygiene, but this knowledge must be improved in several parts, such as:

1. Frequent source of germs responsible for health care associated infections.
2. Hand hygiene procedure after exposure to surroundings of a patient.
3. Knowledge about hand hygiene immediately before a clean/ aseptic procedure and its importance in preventing the transmission of germs to the health care workers.
4. Knowledge about alcohol-based hand rub and its difference from washing by water and soap.
5. More knowledge about the cases of hand hygiene and the suitable method for each case.

### Future work:-

- ✓ Conducting training programs and workshops about hand hygiene and its importance in minimizing nosocomial infections in hospitals.
- ✓ Activating the infection control team role to educate the graduate medical students regarding hand hygiene protocols.
- ✓ Encouraging the health care settings stakeholders to show more commitment towards WHO guidelines of hand hygiene.

Uveitis, Acute anterior uveitis.

#### Abstract

**Aim:** The aim of our study is to find out the clinical profile of patients presented with acute anterior uveitis attending the Ophthalmology Department in a tertiary health care centre in western odisha.

**Materials and Methods:** A subset of 102 patients presented with acute anterior uveitis attending the Ophthalmology Department of VSS Medical College, Burla, Sambalpur over a period of two years were included.

**Results:** In our study, it was found that acute anterior uveitis is noticed in 2.94% in 10 – 20 years age, 21.57 % in 21 – 30 years age group, 40.20 % in 31 – 40 years age, 14.71% in 41 – 50 years age, 10.78% in 51 – 60 years age, 9.80 % in >60 years age group, males were affected more than females of ratio 1.4:1, unilateral presentation (91.18%) is commoner than bilateral presentation (8.82%), nongranulomatous type of inflammation (93.14%) is more frequent presentation than granulomatous (6.86%). The etiology is found to be idiopathic in 31.37 % cases followed by phacolytic (20.59%) cases, herpetic iridocyclitis (16.67%), blunt trauma (13.73%) cases, iridocyclitis with arthritis (6.86%) cases, tuberculosis (5.88%) cases and inflammatory bowel disease (0.98%) cases.

**Conclusion:** From our study it was concluded that acute anterior uveitis is most commonly involved in middle aged person with increased incidence in males with unilateral and nongranulomatous type of idiopathic etiology.

#### Introduction:-

Uveitis is one of the most common forms of intraocular inflammation involving the uveal tract and affects mainly children and young adults. It includes a large group of intraocular inflammatory diseases of diverse etiology. On several occasions, it reflects diseases that are developing elsewhere in the body and uveitis may be the first evidence of such systemic diseases<sup>1</sup>. Variation in the spectrum of disease is largely due to complex geographic, ecological, racial, nutritional, and socioeconomic differences. The anterior uveitis is the most common type of all uveitic

**Corresponding Author:- Dr. Kanhei charan Tudu.**

Address:- Associate professor, Department of Ophthalmology, Veer Surendra Sai Institute of Medical Science and Research, Burla, Sambalpur, Odisha-768017.

entities. On the basis of overall clinical presentation is acute, unilateral, noninfectious and nongranulomatous forms<sup>2</sup>. The precise cause of anterior uveitis is often obscure and the correct diagnosis is often challenging. The cause of inflammation might be infections agent or trauma, but in most cases the underlying mechanism appears to be autoimmune in nature<sup>3</sup>. In order to enhance understanding and management of ocular inflammation International ocular Inflammation Society (IOIS) has been founded<sup>4</sup>.

The aim of our study is to find out the clinical profile of all patients presenting with acute anterior uveitis attending the Ophthalmology Department of VSS Medical College, Burla, Sambalpur over a period of two years.

### Materials and Methods:-

A prospective clinical study was conducted between December 2012 to October 2014. A standard clinical proforma was filled in all cases, which included salient feature in history, visual acuity using Snellens visual acuity chart, clinical findings, laboratory investigations, and the final etiology. The anterior uveitis associated with penetrating ocular injuries, corneal ulcer, intraocular surgeries, intermediate, posterior or panuveitis and masquerade syndrome were excluded from the study. All patients were examined under slit lamp. Details on disease severity, laterality, chronicity, ocular signs and associated systemic conditions were noted. Presentation was considered as unilateral if active inflammation was present in only one eye and bilateral if both eyes presented with active inflammation. Intraocular inflammation was assigned as anterior uveitis which include iritis, anterior cyclitis, iridocyclitis based on International Uveitis Study Group Criteria. The inflammation was defined as acute if symptoms were present for less than three months, chronic if symptoms were present for three months or more and recurrent if two or more episodes of inflammation separated by a disease free period. A short differential diagnosis was made in each case. Subsequently, a tailored laboratory investigation was carried out. Investigations included, total and differential counts, erythrocyte sedimentation rate, urine and stool examination, Mantoux test, Serological tests for syphilis, HIV, rheumatoid factor were done in all cases. Radiological investigations included x-ray of chest, lumbosacral and knee joints. Other special investigations were considered whenever necessary like skin tests, ELISA for IgG, IgM, etc. Consultation was done with other medical specialities, whenever needed. Final etiological diagnosis was made based on history, clinical features, laboratory investigations and systemic evaluation by other medical specialities. The anterior uveitis was considered to have idiopathic etiology when it was not associated with HLA-B27 haplotype and neither with defined clinical syndromes nor with definitive aetiology<sup>5</sup>.

### Results:-

This study was conducted in the Department of Ophthalmology, V.S.S Medical College & Hospital, Burla, Sambalpur, Odisha between December 2012 to October 2014. 102 patients in the age group of 10 – 80 years were included and during the study following observations were found.

**Table 1:-** Age distribution.

Sl. No.	Age (yrs)	Number	Percentage
1	10 – 20	3	2.94
2	21 – 30	22	21.57
3	31 – 40	41	40.20
4	41 – 50	15	14.71
5	51 – 60	11	10.78
6	> 60	10	9.80

In the present study anterior uveitis accounted to 2.94% in 10 – 20 years age, 21.57 % in 21 – 30 years age group, 40.20 % in 31 – 40 years age, 14.71% in 41 – 50 years age, 10.78% in 51 – 60 years age, 9.80 % in >60 years age group [Table-1].

**Table 2:-** Sex distribution

Sl. No.	Sex	Number	Percentage
1	Male	59	57.84
2	Female	43	42.16

As observed in the [Table-2], males accounted higher (57.84%) than that of females (42.16%).

**Table 3:-** laterality distribution

Sl. No.	Laterality	Number	Percentage
1	Unilateral	93	91.18
2	Bilateral	9	8.82

In the present study unilateral involvement was seen in 91.18 % as compared to bilateral involvement in 8.82 % of cases. [Table 3]

**Table 4:-** Type of inflammation

Sl. No.	Type	Number	Percentage
1	Nongranulomatous	95	93.14
2	Granulomatous	7	6.86

In the present study 95 (93.14 %) patients had non granulomatous inflammation and as compared to granulomatous inflammation 07 (6.86 %) patients. [Table 4]

**Table 5:-** etiology

Sl. No.	Etiology	Number	Percentage
1	Idiopathic	32	31.37
2	Phacolytic	21	20.59
3	Blunt trauma	14	13.73
4	Herpes	17	16.67
5	Tuberculosis	6	5.88
6	Septic focus	2	1.96
7	Iridocyclitis with arthritis	7	6.86
8	Leprosy	2	1.96
9	Inflammatory bowel disease	1	0.98

In this study aetiology remain undetermined in 32 (31.37 %) cases followed by blunt trauma was seen in 14 cases (13.73 %) and phacolytic uveitis was detected in 21 cases (20.59 %). Herpes zoster was responsible in 17 (16.67 %) cases and tuberculosis in 06 (5.88 %) cases. Iridocyclitis associated with arthritis in 07 (6.86 %) cases, Septic focus in 02 (1.96 %) cases, leprosy in 02 (1.96 %) cases and inflammatory bowel disease was observed in 01 case (0.98%) each. [Table 5]

### Discussion:-

The incidence was found to be high between 21 – 40 years of age (61.77%) and less common over sixty years (9.8%) as compared to Rathinam et al<sup>2</sup> age incidence is <16 years (7.34%), 17-59 years (83.37%) and >60 years (9.29%). Alejandro Rodriguez et al<sup>9</sup> reported 31-40 years (35%) followed by 61-70 years (25%), 51-60 years (20%), 71-80 years (10%), 41-50years (5%) and 21-30 years (5%) of age group.

In our study males were affected more (57.84 %) compared to females (42.16 %). This may be because men tend to seek medical attention more often than women and socio-economic habits may put male patients at a greater risk for development of anterior uveitis as compared to Rathinam et al study 61.3% were males and 38.7% were females and Alejandro Rodriguez et al reported 38.9% male and 61.1% female involvement in their study.

In our present study unilateral involvement was seen in 91.18 % as compared to bilateral involvement in 8.82 % of cases. In our study 95 patients (93.14%) had non-granulomatous inflammation and in 7 patients (6.86%) it was granulomatous. Findings are comparable with previous studies.

In the present study idiopathic (31.37%) was the most common cause of anterior uveitis followed by phacolytic (20.59%) aetiology. Although herpes zoster accounted for 16.67% of the cases, which is comparable with other two studies where it stood first, is not the most common in present study. However it was the most common infectious cause in our study. 5.88 % of the patients had tubercular anterior uveitis which is comparable with Rathinam et al and Singh et al<sup>8</sup> study, where as there is no data in Henderly et al<sup>10</sup> study. This difference may be because all other studies were conducted at referral centers, where cases usually chronic and recurrent ones, are referred from primary and secondary centers. Whereas present study was done in a general ophthalmic clinic and most people were from villages.

**Conclusion:-**

In this study it was found that acute anterior uveitis is more common in 21-40 years age group ( 61.77%) and less common over 60 years (9.8%), males were affected more than females of ratio 1.4:1, unilateral presentation (91.18%) is commoner than bilateral presentation (8.82%) and nongranulomatous type of inflammation (93.14%) is more frequent presentation than granulomatous (6.86%). The etiology is mainly idiopathic in 31.37 % cases and specific diagnosis was reached in 68.63% cases. However further research is required with quite sufficient number of cases to reveal definite etiology, management and to decrease the morbidity conditions associated with it.

#### Key words:-

Glycated hemoglobin, HbA1c; eAG;  
Diabetes mellitus

### Abstract

**Objective:** Glycosylated hemoglobin (HbA1c) is considered as an index of glycemic status over the preceding 2-3 months. Because the HbA1c level is a marker of blood glucose for the previous 60–90 days, average blood glucose levels can be estimated using HbA1c levels. Our aim in the present study was to investigate the relationship between estimated average glucose (eAG) levels, as calculated by HbA1c levels, and fasting plasma glucose (FPG) levels.

**Methods:** Retrospective analysis of 1000 patients in the Department of Biochemistry for FPG and HbA1c was done. The eAG levels were calculated using the following formula:  $(28.7 \times \text{HbA1c}) - 46.7$ . FPG and HbA1c levels were determined using glucose oxidase-peroxidase method and turbidimetric inhibition immunoassay (TINIA), respectively. According to FPG levels, the patients were divided into Group A (FPG < 126 mg/dl), Group B (FPG 126–200 mg/dl) and Group C (FPG > 200 mg/dl).

**Results:** A strong positive correlation between FPG levels and eAG levels ( $r=0.83$ ,  $p<0.0001$ ) was observed. The difference was statistically significant.

**Conclusion:** The discrepancy between HbA<sub>1c</sub> and blood glucose level units is problematic and confusing among patients. So we suggest, eAG which shows strong correlation with FPG, to be reported along with HbA1c. This will help promote positive patient outcomes, as well as enhance each individual's understanding and ability to manage his or her diabetes more effectively.

### Introduction:-

Diabetes mellitus is a chronic metabolic disorder characterized by rise in blood glucose level and derangement in protein and fat metabolism.<sup>1</sup> Its management requires an accurate evaluation of blood glucose control to assess the efficiency of a particular therapy.<sup>2</sup> HbA1c is the gold standard for assessment of glycaemic control in patients with diabetes.<sup>3</sup> Because the HbA1c level is a marker of blood glucose for the previous 60–90 days, average blood glucose levels can be estimated using HbA1c levels.<sup>2</sup>

Despite its wide international use, there is a substantial lack of standardization among HbA1c determination methods. The desire to standardize the HbA1c results obtained from different techniques led to the development of a

reference method.<sup>4</sup> However, the new method results in lower values expressed in different units (millimoles per mole of unglycated hemoglobin), which may cause confusion for patients and health care providers.<sup>5</sup>

The relationship between the mean blood glucose level and the level of HbA1c has been investigated in different studies, and various equations have been obtained.<sup>6,7,8</sup>

Using Nathan's regression equation, which has been recommended by the American Diabetes Association (ADA), the estimated average glucose (eAG) level calculation and its relationship to the fasting plasma glucose (FPG) level were investigated in the present study.

### Materials and Methods:-

Retrospective analysis of 1000 patients in the Department of Biochemistry for FPG and HbA1c was done. FPG and HbA1c levels were determined on fully automated analyzer ROCHE MODULAR P 800 using glucose oxidase - peroxidase method and turbidimetric inhibition immunoassay (TINIA), respectively. The eAG levels were calculated using Nathan's regression equation,  $(28.7 \times \text{HbA1c}) - 46.7$  recommended by American Diabetes Association. According to FPG levels, the patients were divided into Group A (FPG<126mg/dl), Group B (FPG 126-200 mg/dl) and Group C (FPG>200 mg/dl).

All statistical analyses were performed using the Statistical Package for Social Sciences (SPSS, version 11.0 for Windows). Data were expressed as the means  $\pm$  standard deviation of the mean (SD). A p-value <0.05 was accepted as significant. The Pearson correlation coefficient was used to test the correlation between FPG, eAG and HbA1c levels, and independent t-test was used to find the difference between male and female.

### Results:-

The mean FPG, eAG, and HbA1c levels in the whole group are presented in Table1. A positive significant correlation was found between FPG and eAG levels for the entire study group ( $r = 0.8364$ ,  $p < 0.0001$ ).

The mean FPG, eAG and HbA1c levels in groups A, B and C are shown in Table1. When the data was split based on FPG it was observed that the three groups showed significant positive correlation with eAG. The eAG levels were higher compared to FPG levels in the three groups.

The mean levels of FPG, eAG and HbA1c were higher in males than in females. However, there was no significant gender difference for the following variables (Table2).

**Table 1:-** The levels of the glycemic parameters and the correlation coefficients for all groups (mean  $\pm$  SD)

	Entire Group (n=1000)	Group A (FPG<126mg/dl) (n=558)	Group B (FPG:126-200 mg/dl) (n=272)	Group C (FPG>200mg/dl) (n=170)
<b>FPG (mg/dl)</b>	146.00 $\pm$ 77.99	99.80 $\pm$ 13.34	153.40 $\pm$ 21.08	285.82 $\pm$ 88.67

<b>HbA1c (%)</b>	8.27 $\pm$ 2.65	7.96 $\pm$ 2.66	0.0677

### Discussion:-

Monitoring of glycemic status has been considered the cornerstone of diabetes care. The results of monitoring are used to assess efficacy of therapy and to guide adjustments in lifestyle to achieve best possible glucose control. The most common tests used today for this purpose are blood glucose and glycated hemoglobin (HbA1c).<sup>9</sup>

HbA1c results are expressed as the percentage of hemoglobin that is glycated and reflects the average blood glucose control over a period of approximately three months. In contrast, blood glucose levels are expressed in mg/dl and are used for daily monitoring by the patient and healthcare professionals. The discrepancy between HbA1c and blood glucose level units has always been problematic and has created confusion among patients. To eliminate this confusion, a mathematical relationship has been established translating HbA1c results into estimated average glucose (eAG). In using eAG, HbA1c results can be reported to patients in units they are already familiar with from their experience in self-monitoring. Similar to HbA1c, eAG evaluates a patient's overall success at controlling glucose levels and helps patients understand the monitoring of their long-term treatment.<sup>5</sup>

Using the Nathan's regression equation, we calculated the eAG levels of our study group and investigated their relationship with the FPG levels. The eAG levels were positively correlated with the FPG levels. In addition, the decrease in the significant strong correlation coefficient showed that the association depended on the patients' levels of glucose control. As glucose control worsened, the association became stronger. Similar findings were reported by Bozkaya et al.<sup>2</sup>

Most patients who come to the clinic for plasma glucose determination pay more attention to fasting and diet rules. The eAG levels in the study group were higher than the FPG levels (93.3%) not only because patients come to the lab in a fasting state but also because the eAG level is reflective of all plasma glucose levels over the previous three months, including the postprandial glucose levels. Our results were in harmony with the previous studies that showed eAG levels being higher than FPG levels, concluding that the eAG and FPG values cannot be used interchangeably.<sup>2,10</sup>

The effect of gender on eAG, FPG and HbA1c levels was also studied. Our results revealed lower eAG, FPG and HbA1c levels in females than those of males (Table 2), otherwise this decrease was non-significant. In concordance to our results, a previous study has observed that these variables did not differ significantly between males & females.<sup>10</sup> However, a study reported a significant gender difference with respect to eAG and HbA1c levels.<sup>2</sup> The

above reported variation can be explained by the difference in the population studies and possibly, the different laboratory methodologies used.

In concordance to the results reported by other studies<sup>2</sup>, the eAG levels of males and females were found to be higher than the FPG levels in most cases ( 92.6% and 94.2% , respectively), similar to the results found for the group as a whole ( 93.3%).

It is thought that diabetic patients require better strategies to improve self-management.<sup>11</sup> One of these strategies is the use of eAG levels together with HbA1c values.<sup>12,13</sup> Although the clinical usefulness of eAG is not clear, it is believed that every patient's eAG level should be calculated and provided in addition to the HbA1c level. This will help patients better understand the importance of keeping their blood glucose levels within acceptable limits and may rescue them from invasive approaches for glucose homeostasis.<sup>14</sup>

### Conclusion:-

According to our data, patients with good to moderate blood glucose control are not entirely successful at managing their blood glucose, as reflected by their eAG levels, and the association between FPG and eAG levels depends on the extent of glycemic control. The study concludes that there is a positive correlation between eAG and FPG, hence it seems intuitive that the reporting of eAG together with the HbA1c level will assist patients and doctors determine the effectiveness of blood glucose control measures.

#### Abstract

The quality of being pleasing is aesthetics. The aesthetic of a building vary in responses to human observers, if it partly follows proportion, if there is symmetry of measurement. In this paper we try to explain domains that are not easily quantifiable and thus can be used to communicate information between individual perceptions.

*Copy Right, IJAR, 2016., All rights reserved.*

#### Introduction:-

##### Definition of aesthetics:-

Is the quality of being pleasing, especially to look at, something that gives great pleasure, when looking at it.

The aesthetic of a building or designs vary in responses in human observers. It is not trivial, however, to relate these responses to particular characteristics of the art. The impacts on our emotional and mental world. In particular, it refers to the responses that indicate the degree of discrimination in perception when confronted with a design. This perception depends on the individual's interpretation, which may arise from emotional responses and/or comparison with previous experiences. The concern for most scholars contemplating aesthetic research is (at least) twofold:

1. How can aesthetic preference are empirically assessed.
2. How can aesthetic preference be compared pan-humans and cross-culturally. In most instances, what counts as empirical data for aesthetic preference relies on overtly expressed or articulated views at the level of verbal discourse (van Damme, 1996).

This paper addresses the issues concerned with variables or parameter use in measuring aesthetics of a building.

##### Aesthetics:-

Aesthetics has been described as dealing with "the philosophy of the beautiful as well as with the standards of value in judging art and other aspects of human life and culture" (Lawal, 1974). The term aesthetics was first used by Baumgarten, a German philosopher, in the mid-1700s. Fay Sudweeks and Simeon J. Simoff. The perception of aesthetics is verbally described by closely interrelated terms like style, taste, originality and beauty.

Taking the example of an aesthetic design again, a style refers to designs that have identifiable common characteristics. For example, 'state style' in Adamawa state (Yola) Nigeria West Africa, building design usually refers to characteristics such as red brick walls with cement mortar, asbestos roof, and veranda columns. Personal preferences in style are connected with individual taste. Style and taste are connected with the originality and individuality of a design, although not everything original is aesthetic. Beauty is an even more abstract term and is

often used to characterise aesthetics. Beauty is sometimes understood as a part of aesthetics, sometimes as a synonym of aesthetics, which introduces additional confusion.

1. Visual aesthetic appeal, according to Berlyne (1971), depends partly on the level of arousal triggered by a stimulus. Arousal is characterised in terms of the related variables of novelty, complexity and fronted with appropriate proportions of these collative variables.
2. Usurprisingness is measured by the degree of exploratory behavioural response in humans when conniversal aesthetics. The possible existence of universal aesthetics has piqued the interest of scholars from many disciplines, including philosophers, psychologists, anthropologists, cultural scientists and sociologists. According to Forge (1973), the existence of a universal human aesthetic is a matter of faith with neither those supporting nor those opposing the notion of a basic or genetic response to certain forms or proportions being able to prove their beliefs.

### **The Vitruvian design principles:-**

Vitruvius (1st century BC) is probably the first person to lay forth systematic and elaborated principles of design. It is not surprising that architecture was the subject of his elaborated writings, being the most salient and complex design discipline, which has affected human. It is not difficult to see that there is much in common for architecture (Brooks, 1975; Hooper, 1986; Lee, 1991; Kim et al., 2002; Visser, 2009).

Considering Vitruvius's three core principles of sound architectural work.

### **Firmitas, which is the strength and durability of the building:-**

utilitas –the utility of the building, its usefulness and its suitability for the needs of its intended inhabitants and users;

venustas - the building's beauty. In architecture, the Vitruvian principles have been influential since their rediscovery in the 15th century (Johnson, 1994; Kruff, 1994). To evaluate the design quality of a building (Whyte et al, 2003).

### **The appearance of a building:-**

Attributes of the choice process were found to moderate the relation between aesthetic evaluation and product choice, especially when users are required to trade-off aesthetic for other system qualities. For example, Ben-Bassat et al (2006) found that system preference or choice were affected by aesthetics under ordinary conditions (e.g., questionnaires) but not when the participants had to bid for a system with which they will perform competitive tasks. Diefenbach and Hassenzahl (2007) showed that under a beauty-usability trade-off, although people may prefer more beautiful products to more usable ones, they choose the more usable product if they cannot justify choosing the more beautiful one.

### **In Accordance With Good Taste:-**

1. Contextual factors, such as domain and type of task are mentioned by Norman (2004) as important considerations for the type of aesthetic design required for users' performance and satisfaction. He argues that in certain domains (e.g., control rooms) attractive design may not necessarily be desired. Ben-Bassat et al (2006) found that people weighed more usability over aesthetic factors when faced with a performance-oriented task, and Van Schaik and Ling (2008) demonstrated that attractiveness ratings were affected by providing context for the evaluation task.
2. Individual factors may also affect how antecedent variables (e.g., objective design attributes) are perceived differently by people with different aesthetic tastes (Hoyer and Stokburger-Sauer, 2011). In the domain of web-site design, Park et al., (2004) found that variability in user tastes is associated with aesthetic fidelity (i.e., the degree to which users felt the target impressions intended by designers). Individual differences were also found to affect the relative importance of aesthetics in people's preference of web-sites (Hartmann et al., 2008).

### **Variables:-**

1. Cross cultural studies have shown that national and professional cultures affect various relationships between aesthetic evaluations, their antecedents and their consequences. Hartmann et al (2007) found that the aesthetic evaluations and the importance of aesthetics are contingent on users.
2. The contingent nature of the aesthetic process is exemplified by Moshagen et al's finding that high visual aesthetics improved performance under poor usability but had no effect under high usability. Consequently, they

quoted Liu's (Liu 2003) principle that ergo-aesthetic design does not imply that workplace or product designers should only use designs that are pleasing or attractive. On the contrary, ergo-aesthetic design advocates the careful and proper selection of aesthetic levels of design to fit the needs and characteristics of the intended use.

### **Conclusion:-**

These paper is on the assumption that beauty is on eye of the beholder, as various philosopher tries to conclude that aesthetic depend on individual perception, the appearance is pleasing and in accordance with good taste.

biological active substances, amino acids, helianthus tuberosuse, gas-chromatographic methods, UV-spectroscopy.

#### Abstract

In this article the definition of Helianthus tuberosuse blooms' amino-acid composition by the gas-chromatographic using "Karlo-Erba-4200" device is given. As a result, 20 amino acids such as glutamine, aspartate, lactic acid, proline, arginine, leucine, serine, isoleucine, tyrosine, etc. were defined. Also, UV-spectra of organic solvents' extracts were made with the usage of "Evolution 600" device. It is determined that the basic components of the extracts are lipochromes (vitamin A) and  $\alpha$ -chlorophyll.

Biologically active substances are such substances that affect biological processes in a human and animal body. They can be product of primary (vitamins, fats, carbohydrates, albumens) and secondary (alkaloids, glycosidas, tannins) biosynthesis. Plant always contain a complex of biologically active substances, but only one or few of them have therapeutic effect. They are called active substances and used in production of medicinal drugs.

Plants also contain called accompanying substances. This a conventional name of plants' primary and secondary synthesis products (menthol, papaverine, tanning agents). Some accompanying substances positively influence a human body as they have a supplement effect to basic active substances. For example, vitamins, mineral substances, flavanoids increase absorbability of active substances and their useful effect, and decrease a harmful effect of strong bonds [1,5].

Nowadays plants' generating biologically active substances arouses a great interest. Among these are Helianthus tuberosuse composite plants.

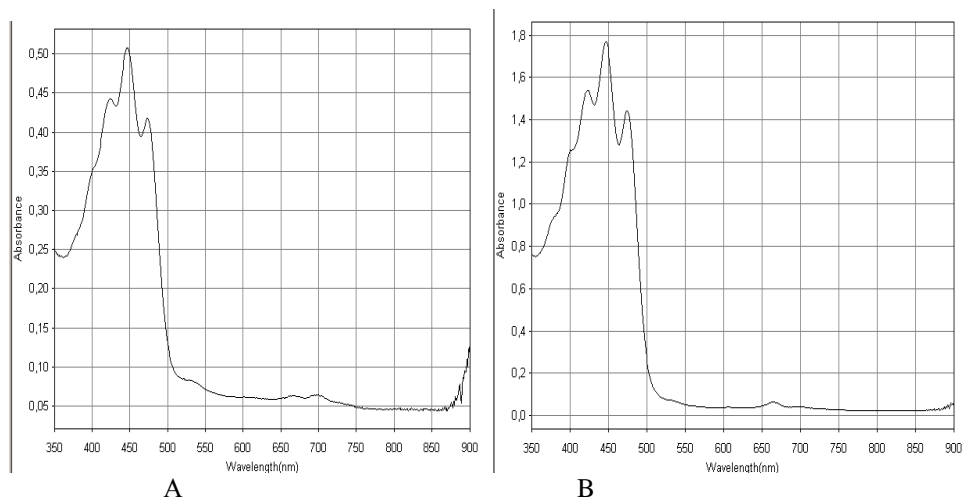

#### Research methods and Materials:-

The purpose of this work is the Helianthus tuberosuse blooms' definition of amino-acid composition and study of their organic extracts by the UV-spectroscopy method.

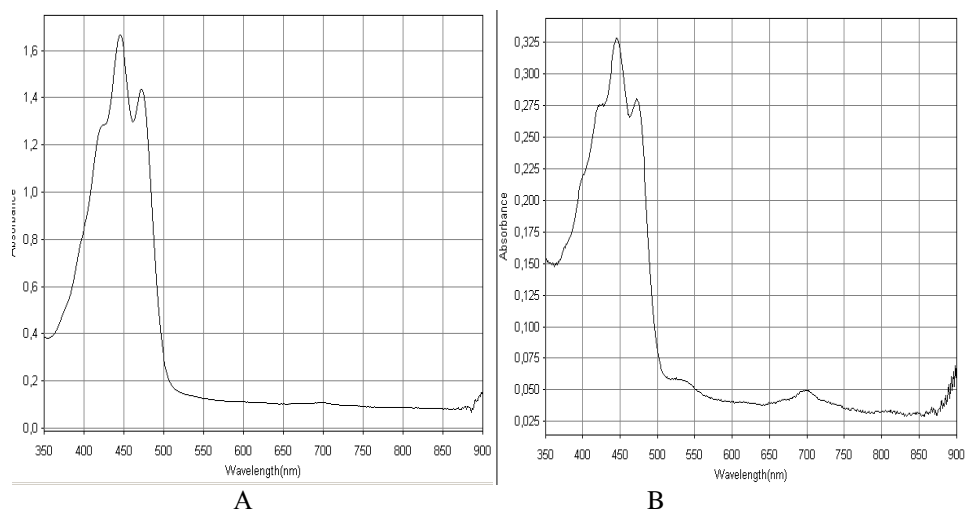

The object of the research is Almaty and Tashkent regions "Interes" cultivar's blooms picked in the end of September-middle of October 2013-2015.

To carry out UV-spectroscopic research the extracts of organic solvents (chloroform, benzole, acetone, hexane) were used, as well as the definition of amino-acid composition by the gas-chromatography with the usage of "Karlo-Erba-4200" device (Italy-USA) [2]. The results of amino-acid composition are listed in table 1.

**Picture 1:-** UV -spectra of *Helianthus tuberosus* blooms' acetone extracts in Almaty ( A) and Tashkent (B) regions.

**Picture 2:-** UV -spectra of *Helianthus tuberosus* blooms' hexane extracts in Almaty (A) and Tashkent (B) regions.

**Picture 3:-** UV -spectra of *Helianthus tuberosus* blooms' chloroform extracts in Almaty ( A) and Tashkent (B) regions.

**Picture 4:-** UV -spectra of *Helianthus tuberosus* blooms' benzole extracts in Almaty (A) and Tashkent (B) regions.

	442	0,444	lipochrome
	447	0,508	lipochrome
	473	0,418	lipochrome
	535	0,081	
	667	0,064	$\alpha$ -chlorophyll
	698	0,064	

According to the results of blooms' chloroform extracts in Almaty region, they are characterised by the absorption band's presence of 445-475 nm, and the intensity index is 0,638-0,516 A°; in Tashkent region the absorption band's presence of 445-475 nm, and the intensity index is 0,749-0,615 A°, which corresponds to lipochrome. Blooms' benzole extracts in Almaty region are characterised by the absorption band's presence of 445-472 nm, and the intensity index is 0,673-0,557 A°; in Tashkent region the absorption band's presence of 445- 474 nm, and the intensity index is 1,053-0,874 A°, which corresponds to lipochrome.

Blooms' hexane extracts in Almaty region are characterised by the absorption band's presence of 446- 473 nm, and the intensity index is 1,67-1,42 A°; in Tashkent region the absorption band's presence of 446-472 nm, and the intensity index is 0,32- 0,280 A°, which corresponds to lipochrome.

Blooms' acetone extracts in Almaty region are characterised by the absorption band's presence of 446- 473 nm, and the intensity index is 0,508-0,418 A°; in Tashkent region the absorption band's presence of 447-475 nm, and the intensity index is 1,77-1,44 A°, which corresponds to  $\alpha$ -chlorophyll.

Blooms' chlorophormic extracts in Almaty region are characterised by the absorption band's presence of 665 nm, and the intensity index is 0,068 A°; in Tashkent region the absorption band's presence of 667 nm, and the intensity index is 0,86 A°, which corresponds to  $\alpha$ -chlorophyll [4].

### Conclusion:-

1. The definition of Helianthus tuberosuse blooms' amino-acid composition by gas-liquid chromatography with the usage of "Karlo-Erba -4200" device (Italy-USA) is given. As a result, a considerable amount of glutamate, aspartate, lactamic acid and proline is attained: in Tashkent region it reaches 2194 mg/100g, 1820mg/100g, 1675mg/100g, 1295mg/100g, and in Almaty region it reaches 2015mg/100g, 2015mg/100g, 1550mg/100g, 1248mg/100g.
2. Helianthus tuberosuse blooms' extracts of organic solvents of chloroform, benzole, acetone, hexane by the UV-spectrum methods using "Evolution 600" device are studied. According to research, it is determined that the basic components of extracts are lipochromes (vitamin A) and  $\alpha$ -chlorophyll.

#### Abstract

Budget is the financial statement for a period of time helps in aiding the plan of actions which may focus for the development. This study entitled "AWARENESS ON AGICULTURAL BUDGETING - AN OVERVIEW" helps to understand about the budget, agricultural budgeting, History of evaluation of budgeting, its role, purpose and importance. Study also focus on statistics of national and international budgeting and contributions of agricultural budgeting to overall budgeting. Agricultural budgeting from the union budget over a five year period was test analyzed and awareness was test among 45 samples includes Farmer, extension officials and students. Suggestion was also sorted and provided to helps in future policies implications and references for future studies.

#### Introduction:-

The word budget is derived from bowgette, which means 'a leather bag' in French. The budget is announced to disclose the government's future expenditures intended to strengthen the nation's economy and consolidate economic stability through tax proposals.

A **Budget** is a quantitative expression of a plan for a defined period of time. It may include planned sales volumes and revenues, resource quantities, costs and expenses, assets, liabilities and cash flows. It expresses strategic plans of business units, organizations, activities or events in measurable terms. A budget is the sum of money allocated for a particular purpose and the summary of intended expenditures along with proposals for how to meet them. ([www.investopedia.com/university/budgeting/](http://www.investopedia.com/university/budgeting/))

Budgeting makes it easier for people with incomes and expenses of all sizes to make conscious decisions about how they'd prefer to allocate their money ([www.practicalmoneyskills.com/personalfinance/savingspending/budgeting/](http://www.practicalmoneyskills.com/personalfinance/savingspending/budgeting/)). A budget can help you keep track of your spending, prepare for unexpected expenses and find ways to save money ([www.practicalmoneyskills.com/personalfinance/savingspending/budgeting/](http://www.practicalmoneyskills.com/personalfinance/savingspending/budgeting/)). A budget can help you keep track of your spending, prepare for unexpected expenses and find ways to save money ([www.getsmarteraboutmoney.ca](http://www.getsmarteraboutmoney.ca)) > Home > Managing your money)

The budget is announced to disclose agenda regarding government's future expenditure to strengthen nation's economy and consolidate economic stability through tax proposals. In India budget is prepared by the Budget Division Department of Economic Affairs of the Ministry of Finance annually. This includes supplementary excess grants and when a proclamation by the President as to failure of Constitutional machinery is in operation in relation to a State or a Union Territory, preparation of the Budget of such State. The railway budget is presented separately by the Ministry of Railways. Thus budget is presented in two categories: The General Budget and The Railway Budget. In this paper the trend of agricultural contribution in union budget over the past five years and awareness on agricultural budgeting is analyzed.

### Indian Budget: A Brief History:-

In history of Indian budget, budget was first introduced in India on 7 April, 1860 by the East-India Company to the British Crown. Pre-independence finance minister, James Wilson presented the budget in 1860. India has had 25 finance ministers since Independence. One week prior to the disclosure, publishers of the budget under the finance ministry, are kept isolated from the press and other sources. Earlier budget papers were printed in Rashtrapati Bhavan. The printing venue was shifted to Minto Road in New Delhi. Since 1980, budget papers are printed in the North Block. Shanmukham Chetty, first Finance Minister of India presented the budget in November 1947 without any tax proposals. However, he presented the analysis of the economic scenario of Independent India just 95 days before the budget presentation in 1948. Liaquat Ali Khan was the finance minister of the All India Muslim League from October 1946 to Independence in 1947. Till now there are nineteen finance ministers the list and frequencies are given in the following table.

**Table 1:-** Frequencies of finance minister from Independence.

S.No.	Finance ministers	Frequency

### Objective:-

- To understand about the budgeting.
- To analyse the trend of agricultural budgeting in union budgeting .
- To test analyse the awareness of agricultural budgeting among different stake holders.
- To analyse the constraints and provide suggestion for future studies and policy implication

### Budget:-

A budget is the sum of money allocated for a particular purpose and the summary of intended expenditures along with proposals for how to meet them (<https://en.wikipedia.org/wiki/Budget>)

Budgeting is the process of creating a plan to spend your money. This spending plan is called a budget. Creating this spending plan allows you to determine in advance (<http://www.mymoneycoach.ca/budgeting/what-is-a-budget-planning-forecasting>)

#### **Purpose:-**

Budget helps to aid the planning of actual operations by forcing managers to consider how the conditions might change and what steps should be taken now and by encouraging managers to consider problems before they arise. It also helps co-ordinate the activities of the organization by compelling managers to examine relationships between their own operation and those of other departments. Other essentials of budget include:

- To control resources
- To communicate plans to various responsibility center managers.
- To motivate managers to strive to achieve budget goals.
- To evaluate the performance of managers
- To provide visibility into the company's performance
- For accountability

#### **Types:-**

**Sales budget:-** an estimate of future sales, often broken down into both units and currency. It is used to create company sales goals.

**Production budget:-** An estimate of the number of units that must be manufactured to meet the sales goals. The production budget also estimates the various costs involved with manufacturing those units, including labor and material. Created by product oriented companies.

**Capital budget:-** Used to determine whether an organization's long-term investments such as new machinery, replacement machinery, new plants, new products, and research development projects are worth pursuing.

**Cash flow/cash budget:-** A prediction of future cash receipts and expenditures for a particular time period. It usually covers a period in the short-term future. The cash flow budget helps the business determine when income will be sufficient to cover expenses and when the company will need to seek outside financing.

**Marketing budget:-** an estimate of the funds needed for promotion, advertising, and public relations in order to market the product or service.

**Project budget:-** a prediction of the costs associated with a particular company project. These costs include labour, materials, and other related expenses. The project budget is often broken down into specific tasks, with task budgets assigned to each. A cost estimate is used to establish a project budget.

**Revenue budget:-** Consists of revenue receipts of government and the expenditure met from these revenues. Tax revenues are made up of taxes and other duties that the government levies.

**Expenditure budget:-** includes spending data items.

**Corporate budget-** short term financial plan but it not an finished budget

**Event management budget:-** to manage the event

**An analysis of agricultural budgeting–trend and awareness analysis:-**

#### **Methodology:-**

Agricultural budgeting from the union budget over a five year period was test analysed among 45 samples includes Farmer, extension officials and student. To detect the awareness, questioners were developed and asked to fill the respondents and result was calculated using Trend and simple percentage analysis. The awareness on Farmers, student and extension officials was studied, suggestion was also sorted and provided to helps in future policies implications and references for future studies.

### I. Trend analysis - contribution of agriculture in union budget:-

Trend analysis tries to predict a trend. Trend is the general direction taking during a specified period of time, trend can be both rise or fall. Trend analysis is the process of trying to look at current trends in order to predict future ones. Here trend is analyzed in union budget over past five year and their contribution to agricultural sector is analyzed.

**Table 2:-** Contribution of agriculture in union budget for past five years

Year	Union budget outlay	Agriculture	% Contribution
2012-13	781507.3	<b>40243.88</b>	5.14
2013-14	816377.4	<b>43373.02</b>	5.31
2014-15	822940.9	<b>77592.77</b>	9.42
2015-16	783165.7	<b>30747.5</b>	3.92
2016-17	948148.8	<b>30124.06</b>	3.17

The above trend analysis in the union budget shows continuous improvement except in 2015 – 2016 shows slight decrease and improvement. For contribution of agriculture in union budget shows the increase in trend over a three years and decrease thereafter for the remaining two years.

### Finding and Discussion:-

#### Gender

Gender is the range of characteristics pertaining to, and differentiating between, masculinity and femininity. The distribution of respondents according to different gender is presented in Table 3.

**Table 3:-** Distribution of Respondents according to gender (n=45)

S. No.	Category	Number	Per cent
1	Male	26	57.8
2	Female	19	42.2
	<b>Total</b>	<b>45</b>	<b>100.00</b>

Table 3 revealed that 57.8 per cent of the respondents were found to be male and the remaining 42.2 per cent were found female. The higher in female participation is due to higher contribution of female members in PG education.

#### Participation:-

Participation in formal and non-formal community organizations might have paved way to have interaction with varied people which would help an individual to improve his knowledge and behavior. The distribution of respondents according to total participation is presented in Table 4.

**Table 4:-** Distribution of Respondents according to total participation (n=45)

S. No.	Category	Number	Per cent
1	Farmers	15	33.3
2	Extension officials	15	33.3
3	Students	15	33.3
	<b>Total</b>	<b>45</b>	<b>100.00</b>

Table 4 revealed that equal sampling of respondents selected for the study.

**Awareness:-**

Awareness is the degree to test the consciousness on particular topic. The distribution of respondents according to awareness is presented in Table 5.

**Table 5a:-** Distribution of Respondents according to awareness on budgeting (n=45)

S. No.	Category	Number	Per cent
1	Yes	43	95.6
2	No	2	4.4
	<b>Total</b>	<b>45</b>	<b>100.00</b>

**Table 5b:-** Distribution of Respondents according to awareness on agricultural budgeting (n=45)

S. No.	Category	Number	Per cent
1	Yes	44	97.8
2	No	1	2.2
	<b>Total</b>	<b>45</b>	<b>100.00</b>

Table 5a revealed that 95.6 per cent of the respondents were found to be aware on budgeting and the remaining 4.4 per cent were found to be non aware on budgeting. Table 5b revealed that 97.8 per cent of the respondents were found to be aware on agricultural budgeting and the remaining 2.2 per cent were found to be non aware on agricultural budgeting. The higher awareness is seen mainly because of budget reach.

**Usefulness of budgeting:-**

The degree in which the test measures the intent to measure is based on usefulness. The distribution of respondents according to responses based on usefulness of budgeting in the aspect of favouring farmers is presented in Table 6.

**Table 6:-** Distribution of Respondents according to responding usefulness (n=45)

S. No.	Category	Number	Per cent
1	Yes	30	66.7
2	No	15	33.3
	<b>Total</b>	<b>45</b>	<b>100.0</b>

Table 6a. revealed that 66.7 per cent of the respondents told that budgeting was in the aspect of favoring the farmers and the remaining 33.3 per cent were told it not at all favours. As the result majority of the respondents told that the budget is usefull and favours thefarmers.

**Table 6b:-** Distribution of respondents according to usefulness (n=45)

S. No.	Category	Number	Per cent
1	Unfavour	12	26.7
2	Up to 25%	5	11.1
3	25% - 50%	10	22.2
4	50% - 75%	9	20.0
5	75%-100%	9	20.0
	<b>Total</b>	<b>45</b>	<b>100.0</b>

Table 6b revealed that 26.7 per cent of the respondents were told budget unfavour the farmers and 22.2 per cent told that budget favours farmers 25%-50% , the higher responses reveals unfavourness because of some constraints like lack of technology reach to the unreached farmers

**Table 7:-** Sugestions (n=45)

Sugestions	Frequency	Percent	Rank
No idea	2	4.4	-
Extensionist should be a good and effective mediator in transferring the technology	3	6.7	VI
High awareness should be given through practicing improved transfer of technology tools	6	13.3	III
Agri in budgeting should be bottom up approach	9	20.0	I
Should treat all farmers equal while framing budget without segregation of small, medium and large farmers	3	6.7	VI
Improving number of field assistant in agriculture for technology transfer	1	2.2	X
Awariness about budgeting should given through popular channel other than Pothigai etc.,	7	15.6	II
Export, import and marketing aspects in agri in budgeting should be improved	1	2.2	X
Separate agriculture budget in budget is needed	4	8.9	IV
Allocating budget in the form of subsidies should be impressive schemes other than waiving loans	3	6.7	VI
Correct time ,correct delivery of input in the form of subsidy should be monitor properly to rectify the delay reach to the farmers	4	8.9	IV
Entire budget monitoring approaches should be digitalized to reach the effectiveness in reach	2	4.4	IX

\* Multiple responses

Table 7 reveals the sugestion given by the respondents to increase awareness and to reach the unreach farmers

### Conclusion:-

Awareness on agricultural budgeting reveals the awareness level on budgeting and agricultural budgeting aspects at markable level, the trend analyzed for past five years shows increase trend line with slight fluctuations, from the overall study it is clear that the awareness about budgeting and agricultural budgeting is high among the respondents.

#### Abstract

**Introduction:** Studies have shown that overweight and obese persons face psycho-social problems. We conducted a cross-sectional study in Qassim university to explore the psycho-social problems faced by male obese students.

**Objectives:** To determine the types of psycho-social problems, and find their prevalence among Qassim University overweight and obese students.

**Research Methods:** A self-administered questionnaire was designed and pretested. The questionnaire consisted of questions regarding age, college, social background and social problems that they encounter. An open ended question was also included so that the study subject may identify some social problems that they encountered which the questionnaire may have failed to list. The participants of the study were selected by convenient sampling. The sample size was 65.

**Results:** In studied overweight and obese students sample, 58(89%) were unhappy about their weight and 52(80%) tried to follow weight reduction program. Fifty-six students (86.2%) considered overweight and obesity as a disease and 44(67.7%) had positive family history. Mood swing and social pressure were reported by 37(56.9%) and 30(46.2%); respectively. low self-esteem and effect on social life reported by 24(36.9%) and 13(20%); respectively. Reporting overeating due to anger, sadness and boredom was 9(13.8%), 11(16.9%) and 37(56.9%); respectively.

**Conclusion and recommendations:** Our study showed a substantial proportion of psycho-social problems among overweight and obese students. The finding of the study cannot be generalized to all Saudi adolescent, since the sample is small and not representative of all Saudi adolescent therefore we recommend that a larger study on the topic should be undertaken to estimate more accurately the magnitude of the problem.

**Introduction:-**

Obesity is now considered as an epidemic by WHO (world health organization)<sup>[1]</sup>.

The definition of overweight and obesity is:

**Overweight:-** Excessive increase in adipose tissue or in muscle and skeletal tissue.

**Obesity:-** an increase in body weight beyond the limitation of skeletal and physical requirement, as the result of an excessive accumulation of fat in the body.

Overweight and obesity is best measured by calculating body mass index (BMI). This definition lead us to what is the BMI ?

$$\frac{\text{Weight (Kg)}}{\text{Height (m}^2\text{)}} = \text{BMI}$$

**Regarding to BMI the meaning of overweight and obesity will be:**

25.0 to 29.9 = overweight.

30 to 39.9 = obese.

**The risk factors associated with obesity and overweight are:**

- Diet (high fat and carbohydrate with excessive calories).<sup>[2]</sup>
- Sedentary lifestyle.<sup>[3]</sup>
- Genetics.<sup>[4]</sup>
- Illnesses (hypothyroidism, Cushing's syndrome, growth hormone deficiency).<sup>[5]</sup>
- Infectious agent.<sup>[6][7]</sup>
- Others causes of obesity like (insufficient sleep, decreased rates of smoking, increased use of medications that can cause weight gain, pregnancy at a later age).<sup>[8]</sup>

**The Prevalence of Overweight& Obesity in all age groups in KSA<sup>[9]</sup> is:**

14 % in men, and increasing level 30.7 %.

23.6 % in women, and increasing level 28.4 %.

In a study conducted by Wellman Friedberg in USA reports: "currently, the rates of both overweight and obesity in the US are 61% and 14% in adults and children, respectively. About 14% of children and adolescents are now seriously overweight."<sup>[10]</sup>

**There're a lot of medical problems associated with obesity, including:**

**Mortality:-**

Obesity reduces life expectancy by six to seven years.<sup>[11]</sup>

**Morbidity:**

- diabetes mellitus type 2.
- hypertension.
- high blood cholesterol.
- high triglyceride levels.
- ischemic heart disease.<sup>[12]</sup>

**Beside Medical Problems, There're Also Psychological Problems Associated:-**

In a study conducted by Wellman and Friedberg they report that:

"Emotional suffering may be among the most painful aspects of obesity. American society emphasizes physical appearance and often equates attractiveness with slimness, especially for women. Such messages may be devastating to overweight people. Many think that obese individuals are gluttonous, lazy, or both, even though this is not true. As a result, obese people often face prejudice or discrimination in the job market, at school, and in social situations. Feelings of rejection, shame, or depression are common."<sup>[10]</sup>

**Low Self-Esteem<sup>[13]</sup>:-**

Obese teens have significantly lower self-esteem than teens of normal weight. Low self-esteem often appears as loneliness, nervousness and sadness. Teens with low self-esteem may also engage in risky behavior such as

experimenting with drugs, alcohol or cigarettes. Obese teens who experience low self-esteem during childhood and adolescence often carry these feelings into adulthood.

#### **Depression<sup>[13]</sup>:-**

Depression is a common psychological effect of teen obesity. An obese teen who is heavier than her peers may experience feelings of sadness or hopelessness. Signs of depression include changes in sleep patterns, withdrawal from family or friends and loss of interest in activities she previously enjoyed. MayoClinic.com reports that some teens try to hide depression and appear emotionally flat rather than sad.

#### **Anxiety<sup>[13]</sup>:-**

Most children experience anxiety for various reasons throughout adolescence. Obese teens, however, may experience severe anxiety that often results in destructive behaviors or avoidance of friends and family. Overweight teens may also have social anxiety, the result of excessive bullying or teasing. Severe anxiety often interrupts the learning process and may lead to a decline in academic performance. Being an overweight teen can also affect an individual's anxiety level as an adult. Overweight teen girls may have a higher chance of developing anxiety disorders or depression in adulthood.

#### **Poor Body Image<sup>[13]</sup>:-**

Obese teens often experience poor body image as a result of being overweight. This may keep your teen from playing sports or engaging in physical activity, spending time with friends or wearing form-fitting clothing. Poor body image is connected to a number of psychological problems, including depression, anxiety and low self-esteem. Teens with poor body image are also at risk of developing an eating disorder.

#### **Eating Disorder<sup>[13]</sup>:-**

Obese adolescents are at risk of developing disorders such as bulimia, anorexia or compulsive overeating. An eating disorder is often the result of an overweight teen's effort to lose weight through risky and unhealthy behaviors.

A study from US has conclude the following "Obesity is associated with an approximately 25% increase in odds of mood and anxiety disorders and an approximately 25% decrease in odds of substance use disorders. Variation across demographic groups suggests that social or cultural factors may moderate or mediate the association between obesity and mood disorder."<sup>[14]</sup>

**The purpose of this study is to explore the psycho-social problems in obese student in four colleges of qassim university, by doing a Cross-Sectional study:-**

#### **Research Objectives:-**

##### **Goal:-**

To get better understanding of the social and psychological problems that faced by Qassim university obese students.

##### **Objectives:-**

To determine the types of Psycho-social problems, and find the prevalence of it among Qassim University overweight and obese students.

#### **Limitations of the study:-**

1. Since the selection of the study subjects was based on non-probability sampling technique, therefore it cannot be generalized to the entire obese population of students of Qassim university.
2. The study participants consent to participate in the study was voluntary, therefore there is a possibility of overestimation or underestimation of the result.
3. Only the male obese students were included in the study.

#### **Research Methodology:-**

**Research setting:-** The study was conducted in Qassim University, Colleges of Medicine, Dentistry, Pharmacy and Applied Health Sciences.

**Sampling and sample size:-** All male obese students who agree to participate in the study were inducted in the study. Therefore, the sampling method was "convenient sampling". The sample size was 65 male obese student.

**Data collection method:-** For all obese students who agreed to participate in the study, BMI was calculated to confirm obesity. Those who do not fall in the category of obesity were excluded from the study. A self-administered questionnaire was designed and pretested. The questionnaire consisted of questions regarding age, weight, height, college, social background and the psych-social problems that they encounter. An open ended question was also given so that the study subject may identify other social problems that they encounter and were not listed in the questionnaire. The data were collected by the group members. Every 3-4 group members were assigned one college to collect the data.

**Data entry and analysis:-** Before entering the data, the data were cleaned and edited. The data were entered and analyzed in SPSS program. Frequency tables were generated. Each variable frequency was analyzed and cross tabulation.

**Expected problems and their solutions:-** The faculty members may not give the permission to conduct the study. This will be dealt by taking official permission from Deans' of respective Colleges. The students may not cooperate for fear of their names being identified. This will be assured by having the questionnaire as anonymous.

### Results:-

Question	No n (%)	Yes n (%)
1. Are you satisfied with your current weight?	58(89.2)	7(10.8)
2. Have you tried to follow a program to reduce your weight?	13(20)	52(80)
3. Do you believe the obesity is a disease?	9(13.8)	56(86.2)
4. Do any of your family members have obesity?	21(32.3)	44(67.7)
5. Do you feel mood swing?	28(43.1)	37(56.9)
6. Do you feel social pressure due to your weight?	35(53.8)	30(46.2)
7. Does your overweight prevent you from going to public places?	58(89.2)	7(10.8)
8. Does your overweight prevent you from doing sport activity?	41(63.1)	24(36.9)
9. Did you try any dangerous method to reduce your weight?	45(69.2)	20(30.8)
10. Did obesity reduce your self-esteem?	41(63.1)	24(36.9)
11. Did you face difficulty in reduce your diet?	29(44.6)	36(55.4)
12. Did you thought that the obesity will affect you in the future?	9(13.8)	56(86.2)
13. Did you take any drug to reduce your weight previously?	47(72.3)	18(27.7)
14. Did your weight affect your study?	53(81.5)	12(18.5)
15. Did your weight affect your social life?	52(80)	13(20)
16. Did your overweight affect your activity?	30(46.2)	35(53.8)
17. Did you eat as a result of anger?	56(86.2)	9(13.8)
18. Did you eat as a result of sadness?	54(83.1)	11(16.9)
19. Did you eat as a result of boredom?	28(43.1)	37(56.9)
20. Did you eat as a result of frustration?	40(61.5)	25(38.5)
21. Your life style?	11(16.9)	
Lazy,	8(12.3)	
Active,	47(70.8)	
Neutral		

In studied overweight and obese student sample, 58(89%) were unhappy about their weight and 52(80%) tried to follow weight reduction program. Fifty-six students (86.2%) considered overweight and obesity as a disease and 44(67.7%) had positive family history. Mood swing and social pressure were reported by 37(56.9%) and 30(46.2%); respectively. low self-esteem and effect on social life reported by 24(36.9%) and 13(20%); respectively. Reporting overeating due to anger, sadness and boredom was 9(13.8%), 11(16.9%) and 37(56.9%); respectively.

### Discussion:-

In our study 36(56.9%) feels mood swing and 56(86.2%) thinks their obesity will affect them in the future while a study done in USA, shows that 25% obese adults have mood and anxiety disorder<sup>[14]</sup> Another study on psychosocial

aspects of obesity suggest that in obese patients seeking treatment there is an increased prevalence (40-60%) of psychiatric morbidity, most commonly depression<sup>[15]</sup>, which is quite similar to the finding in our study.

### Conclusion and Recommendation:-

Our study showed a substantial proportion of psycho-social problems among overweight and obese students. The finding of the study cannot be generalized to all Saudi adolescent, since the sample is small and not representative of all Saudi adolescent therefore we recommend that a larger study on the topic should be undertaken to estimate more accurately the magnitude of the problem.

##### Keywords:

Radiomorphometric, edentulous patients, alveolar, panoramic radiograph

#### Abstract

**Statement of problem:** In edentulous patients, alveolar bone loss is a critical factor that affects denture retention, stability, and masticatory function.

**Purpose:** To investigate the influence of age and gender on the mandibular cortical index, panoramic mandibular index, and mandibular cortical width, as well as alveolar bone loss and bone heights in the first premolar and molar region using panoramic radiographs of edentulous patients.

**Material and methods:** Panoramic radiographs of 75 edentulous patients were assessed. In addition to gender and age, the mandibular cortical index, panoramic mandibular index, mandibular cortical width at the mental foramen region, alveolar bone loss, and bone heights of the premolar and molar regions of the mandible were recorded. Statistical comparisons were performed using chi-square and 2-way ANOVA tests.

**Results:** Of the 75 patients, 32 (42%) were men and 43 (57.3%) were women. The association between MCI and age group was not statistically significant in males ( $P > 0.05$ ). In females, the association between MCI and age group was found to be statistically significant ( $P < 0.01$ ). The difference between males and females with respect to mean MCW is found to be statistically significant ( $P < 0.001$ ) indicating that gender is a significant factor influencing MCW.

**Conclusions:** The values of mean cortical width (MCW) at the mental foramen region decreased significantly with age in women ( $P < 0.001$ ). The ratio of the thickness of the mandibular cortex to the distance between the mental foramen and the inferior mandibular cortex (PMI) was not affected by gender or age.

## Introduction:-

In many phases of prosthetic dentistry, healthy alveolar bone with normal regenerative capacity is essential for a successful treatment outcome. It is important to know the quantity and quality of bone in the jaws when planning prosthetic and pre-prosthetic surgical treatment. The residual ridge influences gingival esthetics and pontic dimensions<sup>1</sup> for fixed partial dentures; it provides support and stability for removable partial dentures and complete dentures; and the underlying bone is a prerequisite for the placement of oral implants. Resorption of residual ridges is a complex biophysical process<sup>2</sup> and is widely recognized as one of the most important factors affecting denture support, retention, stability and masticatory function in edentulous patients.<sup>3</sup>

Reduction of the residual alveolar ridges could be described as a resorptive atrophy, a physiologic reaction to loss of function and inactivity.<sup>4</sup> After dental extractions, the residual alveolar bone undergoes a period of accelerated resorption for about 10 weeks, followed by a slower, but progressive resorption thereafter.<sup>5,6</sup> Due to its progressive nature, the height of the alveolar ridge and basal bone will decrease,<sup>6,7</sup> resulting in alveolar ridge bone loss as great as 1 mm per year in complete denture wearers.<sup>8,9</sup> Loss of alveolar bone from an edentulous ridge is more pronounced in the mandible than the maxilla,<sup>10</sup> particularly in the early 3 months of post extraction period.<sup>11,12</sup>

Age related mandibular bone loss may be due to general thinning and increased porosity of the mandibular cortex. Bone loss occurs more rapidly in the premolar and molar regions of the edentulous mandible, compared to the anterior region. Therefore, bone resorption of the basal bone is more frequent in this region.<sup>13</sup> Most state that women have more advanced bone loss than men, but some have not found such a difference.<sup>14-16</sup>

Previous investigations on the effects of radiomorphometric indices and alveolar bone loss (ABL) have focused primarily on partially or completely dentate women.<sup>17-21</sup> Accordingly, it is logical to assume that a possible relationship exists among bone loss, radiomorphometric indices, and edentulism. The panoramic projection (pantomograph) is a commonly used radiographic view in all disciplines of dentistry, methods of quantifying alveolar bone loss on panoramic films is of great value, particularly in clinical studies.<sup>22</sup> Several authors have attempted to measure and quantify mandibular alveolar bone loss radiographically, most of these studies have used lateral cephalometric radiographs.<sup>23,24</sup> However, the use of lateral cephalograms for this purpose may involve a fairly large error.<sup>23</sup>

A number of qualitative and quantitative indices, including the mandibular cortical index (MCI), mandibular cortical width (MCW), or panoramic mandibular index (PMI), have been used to assess bone quality and to observe signs of resorption on panoramic radiographs.<sup>18,19</sup>

In light of these observations, the purpose of this study is to investigate the influence of age and gender on the mandibular cortical index, panoramic mandibular index, and mandibular cortical width, as well as alveolar bone loss and bone height using panoramic radiographs of edentulous patients.

## Materials and Method:-

**Source of data:** Subjects with completely edentulous maxillary and mandibular ridges in the age group of 50 to 80 years visiting the Department of Prosthodontics at M R Ambedkar Dental College & Hospital, Bengaluru.

### Method of collection of data:-

The study consists of 75 individuals in the age group of 50 to 80 years which are divided into 2 groups i.e., ≤60 and >60 years. Intraoral examination was performed for selection of study subjects.

### Inclusion criteria:-

1. Completely edentulous subjects without root stumps.
2. Subjects without any systemic illness.

### Exclusion criteria:-

1. Subjects suffering from diabetes.

2. Previous history of usage of dentures.
3. Subjects suffering from endocrine disorders.

A written consent was obtained from the subjects selected to be a part of the study and they were explained in detail about the procedure which was carried out. Each subject was made to stand comfortably and the patients maxillary and mandibular jaws were placed within the focal trough of the digital panoramic machine stably and digital panoramic radiographs were obtained. All panoramic images were made with the same digital panoramic radiography unit i.e. Kodak 8000 c digital and cephalometric system (Made in France - 2006).

Gender and age were recorded for each patient. Linear measurements on panoramic images were made using imaging software i.e., TrophyDicom at a correction for 1.27 % magnification. The total duration of study was 1 year 6 months.

The measurements for radiomorphometric indices which included mandibular cortical index (MCI), mandibular cortical width (MCW), panoramic mandibular index (PMI), as well as alveolar bone loss (ABL) and heights in the first premolar and molar region (Hp and Hm) were performed.

#### **Mandibular cortical index (MCI):-**

Mandibular cortical index (MCI) refers to the inferior mandibular cortical thickness and is categorized into the following 3 groups according to the criteria described by Klemettiet al.<sup>17</sup>:

C1: the endosteal margin of the cortex is even and sharp on both sides

C2: the endosteal margin shows semilunar defects (lacunar resorption) and/or seems to form endosteal cortical residues on one or both sides and

C3: the cortical layer forms heavy endosteal cortical residues and is clearly porous.

#### **Mandibular cortical width (MCW):-**

Mandibular cortical width is the measurement of the cortical width at the mental foramen region and is assessed according to the technique described by Ledgerton et al.<sup>38</sup> in which the mental foramen is identified and a line is traced which passes perpendicular to the tangent of the lower border of the mandible and through the center of the mental foramen. The cortical width is measured at this point.

#### **Panoramic mandibular index (PMI):-**

The Panoramic mandibular index (PMI) as described by Benson et al.<sup>29</sup> is the ratio of the thickness of the mandibular cortex to the distance between the mental foramen and the inferior mandibular cortex.

#### **Alveolar bone loss (ABL):-**

Alveolar bone loss<sup>54</sup> (ABL) of the mandible is the ratio of the radiographic mandibular total bone height to the height from the center of the mental foramen to the inferior border of the mandible. The mandibular total bone height (TBH) and basal bone height (BBH; height from the centre of the mental foramen to the inferior border of the mandible) at the site of the mental foramen were measured bilaterally. Mean TBH/BBH ratio on both sides was defined as the degree of alveolar bone loss of the mandible.

#### **Heights in the first premolar and molar region (Hp and Hm):-**

Heights in the first premolar and molar region were measured according to measurement locations described by Guleret al.<sup>46</sup> i.e., by drawing a line tangential to the most inferior points at the mandibular angle and the lower border of the mandibular body. Horizontal lengths of the mandible were measured parallel to the tangent at 10 mm above the lower border of the mandible. According to results from the dentate subjects, the first premolar and the first molar were located approximately 35 and 55%, respectively, of the length of the mandibular body from the midline. The measurements Y1 (midline), Y2 (mandibular first premolar) and Y3 (mandibular first molar) were vertical distances from the interior border of mandible to the alveolar crest.

#### **Statistical Analysis:-**

The obtained data will be calculated and subjected to relevant statistical analysis using chi-square and 2-way ANOVA tests for proportions.

### Results:-

In the present study, digital panoramic radiographs of subjects with completely edentulous maxillary and mandibular ridges in the age group of 50 to 80 years were studied to investigate the influence of age and gender on the mandibular cortical index, panoramic mandibular index, and mandibular cortical width, as well as alveolar bone loss and bone height in first premolar and molar region.

Of the 75 patients, 32 (42%) were men and 43 (57.3%) were women. Only 2 categories of MCI (C2 and C3) were detected. The association between MCI and age group was not statistically significant in males ( $P > 0.05$ ).

In females, the association between MCI and age group was found to be statistically significant ( $P < 0.01$ ). Females in  $\leq 60$  years age group were found to be more associated with C2 whereas females in  $> 60$  years age group were found to be more associated with C3. (Table No. 1 and 2)

The difference between males and females with respect to mean MCW is found to be statistically significant ( $P < 0.001$ ) indicating that gender is a significant factor influencing MCW. However, age group is not a significant factor influencing MCW ( $P > 0.05$ ) and the interaction (joint effect) of gender and age group on MCW is not statistically significant ( $P > 0.05$ ). (Table No. 3 to Table No.7)

Neither gender nor age group or the interaction of gender and age group are found to be significantly influencing PMI. (Table No. 3 to Table No.7) Statistically significant difference is observed between males and females with respect to alveolar bone loss. The difference between the two age groups is also found to be statistically significant in females but not in males. (Table No. 3 to Table No.7)

Statistically significant difference is observed between males and females with respect to mean height of premolar ( $P < 0.01$ ). The difference between the two age groups is also found to be statistically significant ( $P < 0.01$ ). But the interaction of gender and age group on height of premolar is not statistically significant ( $P > 0.05$ ). This shows that gender and age group individually influence the height of premolar. (Table No. 3 to Table No.7)

Statistically significant difference is observed between males and females with respect to mean height of molar ( $P < 0.01$ ). The difference between the two age groups is also found to be statistically significant ( $P < 0.01$ ). But the interaction of gender and age group on height of molar is not statistically significant ( $P > 0.05$ ). This shows that gender and age group individually influence the height of molar. (Table No. 3 to Table No.7)

**Discussion:-**

The present study provides new findings on the effects of age and gender on radiomorphometric indices, ABL and bone heights in the first premolar and molar region, all in a group of completely edentulous individuals. Alveolar atrophy after the removal of teeth and the presence of tooth components in both the upper and lower jaws of edentulous patients has always been topics of discussion for dentists. This study attempted to assess the diagnostic validity of panoramic radiomorphometric indices to investigate the influence of age and gender on the mandibular cortical index, panoramic mandibular index, and mandibular cortical width, as well as alveolar bone loss and bone heights in the first premolar and molar region as all these factors have implications on treatment planning, with special regard to reconstructive procedures, subsequent implant treatment, and removable complete dentures.

Previous studies showed that minor anteroposterior shifts and tilts are associated with small variations (less than 2%) in vertical measurements. In the present study, all measurements were reduced to the original size of the mandibular features, according to the magnification of the panoramic machine used i.e., at correction of 1.27% magnification. This compensation allowed for comparison with other studies, because different panoramic machines

have different magnification factors. Additionally, a study<sup>63</sup> showed that mandibular angular measurements in panoramic radiographs revealed a high degree of accuracy when proper patient positioning was achieved.

Recent studies<sup>18,41</sup> indicate that dental panoramic radiography may be one of the tools for detecting a high risk of osteoporotic fracture. In light of these observations, this study attempted to investigate the influence of age and gender on the radiomorphometric indices which included mandibular cortical index, panoramic mandibular index, and mandibular cortical width, as well as alveolar bone loss and bone height using panoramic radiographs of edentulous patients.

#### **Mandibular Cortical Index (MCI):-**

MCI is a simple, qualitative, 3-point index with fairly good reproducibility. In the present study, only C2 and C3 categories were observed in the study group of edentulous patients. This may be attributable to the fact that the group of selected patients was relatively older, in comparison to the age of <sup>30</sup>, when the first signs of bone loss start to manifest radiographically.<sup>6</sup>

The association between MCI and age group was not statistically significant in males. However in females, the association between MCI and age group was found to be statistically significant. Females in  $\leq 60$  yrs age group are found to be more associated with C2 whereas females in  $>60$  yrs age group are found to be more associated with C3. The result in the present study was found to be in accordance with the study carried out by Knezovic Z et al.<sup>39</sup> which stated that the age-related distribution of MCI showed an age-related increase in the numbers of individuals with C3 cortex appearance, and a significantly higher incidence of women who had C3 cortices in an older age group and no difference was found in the distribution of men and women between MCI categories C2 and C3.

In the study conducted by Yuzugullu B et al.<sup>54</sup> (2009) only 2 categories of MCI (C2/56.4% and C3/43.6%) were detected. There were no significant differences in C2 and C3 categories of MCI between age groups in men. Category C2 was more frequently seen in age groups of  $\leq 60$ , and category C3 was more frequently observed in age groups of  $>60$  in women. When compared to our study the MCI categories were found to be similar to the above study. However, Taguchi et al.<sup>32</sup> identified a far greater proportion of C1 cortices in their study of 124 Japanese women in a broad age band ( $33 \pm 68$  years). This may reflect ethnic differences or a difference in the interpretation of the definitions of the MCI groups.

#### **Mandibular Cortical Width (MCW):-**

In the present study, the difference between males and females with respect to mean Mandibular cortical width is found to be statistically significant ( $P < 0.001$ ) indicating that gender is a significant factor influencing MCW. It was found that mean MCW values did not change as age increased in men, the mean MCW values decreased significantly with age in women. The results in the current study for the mean values of MCW demonstrate an age-related decrease in women which was in agreement with the results reported by previous studies.<sup>38,44,54</sup>

The results by Knezovic Z et al.<sup>39</sup> suggested a general decrease of MCW for both genders until the age of 75, when the values begin to decrease sharply for women compared to men. No differences with dental status were assessed. In another study by Robert et al.<sup>59</sup> there was pattern of decrease in mandibular cortical width in women after the age of 42.5 years and in men there was slow linear decrease in MCW after age of 36 years. Only a few studies<sup>39,44,52</sup> have evaluated the changes in MCW for men. The present study revealed that men showed a stable profile concerning MCW values, irrespective of an increase in age.

#### **PMI (Panoramic Mandibular Index):-**

Horner and Devlin<sup>37</sup> have shown that the panoramic mandibular index can be used for evaluation of osteoporosis status however, he also suggested that the PMI has no significant advantage over the MCW whereas, Drozdowska et al.<sup>64</sup> concluded that the PMI might be used as an indicator of bone mineral changes when PMI values deviate markedly from the mean.

According to Benson et al.<sup>29</sup> mean panoramic mandibular index values increase in the elderly. Previous studies<sup>29,38</sup> about PMI values that have been performed primarily on women have found PMI values between 0.31 to 0.38 which are higher than the mean value of 0.27 to 0.29 found in present study. These differences may not only be due to ethnic origins, but may arise due to the inclusion of partially edentulous patients, in addition to completely edentulous individuals. The present mean PMI values for edentulous patients agree with those of Gulsahiet al.<sup>52</sup> who

reported mean PMI values of 0.30, 0.32, and 0.22 for C1, C2, and C3 categories, respectively, in a large, mixed, study population. In the present study the mean PMI values for women were found to be 0.27 to 0.29 and for men it was 0.31 which was in accordance with the studies done by Yuzugullu B et al.<sup>54</sup> and Estin et al.<sup>57</sup>

#### **Alveolar bone loss (ABL):-**

In the present study the alveolar bone loss in the edentulous mandible was more pronounced in women than in men. Ortman et al.<sup>65</sup> and Baat et al.<sup>66</sup> reported similar results. Similarly in the study done by Humphries et al.<sup>28</sup> it was found that the age of the subject had a significant effect on residual alveolar ridge resorption in women, but not in men. Some clinicians have observed that alveolar ridge reduction occurs quickly following the menopause and is accompanied by a more generalized skeletal osteoporosis. However according to study done by Yuzugullu et al.<sup>54</sup> it was found that ABL was not affected by age according to gender. This finding was in agreement with the results of Soikkonen et al.<sup>21</sup> who concluded that in both genders, ABL does not increase significantly with age but in a study done by Cagri et al.<sup>58</sup> it was found that the decrease in the height of the edentulous mandible was more pronounced in women than in men. This may be due to the reason that in postmenopausal women, deficiency of estrogen hormone accelerates skeletal bone loss and may result in rapid alveolar bone resorption.<sup>9</sup>

#### **Height in premolar and Molar region (Hp and Hm):-**

In the present study the measurement value of the mandible at first premolar and first molar regions were greater in men than women, which was in agreement with Guler et al.<sup>46</sup> and Saglam.<sup>40</sup> Residual ridge resorption is usually more rapid in the premolar and molar region than the anterior region of the mandible because of the lower position of the reversal line in the posterior region.<sup>13</sup> The reversal line on the lingual side occurs along the mylohyoid ridge, which is the limit between the resorptive alveolar field and depository field of the basal bone.<sup>13</sup>

However Yuzugullu et al.<sup>54</sup> also evaluated the heights in premolar and molar region and concluded that the heights were similar in men and women, in contrast to the findings of Guler et al.<sup>46</sup> who found that measurements of vertical height in the edentulous women were lower than that of the men which may be due to parameters such as general health, denture wearing habits, nutrition, or medication intake were not included, which may have affected the outcome related to gender. According to the results of Xie et al.<sup>35</sup> and Mercier<sup>13</sup> the most pronounced percentage reduction in total height of the mandibular body was found at the first premolar and first molar sites. In the present study, the findings related to the edentulous mandible were similar to these studies although no comparison was made between dentate and edentulous mandible.

#### **Conclusion:-**

1. Category C3 of the mandibular cortical index, in which the cortical layer forms clearly porous heavy endosteal cortical residues, was more frequently seen in women over 60 years in age whereas, Category C2 was more frequently seen in women below 60 years. However the association between MCI and age group was not statistically significant in males.
2. The values of mean cortical width (MCW) at the mental foramen region decreased significantly with age in women ( $P < 0.001$ ).
3. The ratio of the thickness of the mandibular cortex to the distance between the mental foramen and the inferior mandibular cortex (PMI), was not affected by gender or age.
4. In the present study the measurement value of the mandible at first premolar and first molar regions were greater in men than women.
5. In this study the alveolar bone loss in the edentulous mandible was more pronounced in women than in men.

#### Abstract

Application for and research on lasers in dentistry continues to expand since their introduction to the dental profession. Over time, understanding of lasers has grown among researchers and the lasers themselves have become smaller and better suited to dental tasks, eventually making them accurate and safe enough for procedural use. Lasers (an acronym for “light amplification by the stimulated emission of radiation”) deliver energy and heat in the form of light, and their uses in dentistry ranges from cleaning to removing tooth decay; Laser provides more conservative, less invasive treatment of carious lesion therefore laying the foundation for the “minimally invasive era” in today’s dentistry. Dental lasers also significantly contribute to the field of Aesthetic dentistry. A laser in dentistry has allowed dentists to give state of art treatment to their patients. Speed, comfort and ease of approach are some of the advantages of these techniques. This review is aimed to give an overview of the lasers used in dental practice.

#### Introduction:-

*“A charming smile can open doors and knock down barriers that stand between you and a fuller richer life”.*  
- DUSTE

Light has been used as a therapeutic agent for many centuries. In ancient Greece, the sun was used in heliotherapy, or the exposure of the body to the sun for restoration of health. The Chinese used the sun to treat conditions such as rickets, skin cancer, and even psychosis. The beneficial effects of the sun in the treatment of rickets became apparent in the late 1700s. This use of light for treatment of various pathologies is referred to as phototherapy.<sup>1</sup>

In today’s world, modern science and technology have undergone rapid changes over the past decade than in the previous 100 years combined. It has helped us in achieving pleasing appearances with the advent of newer treatment options, better materials and innovative procedures.

Otolaryngologists, oral surgeons, and periodontists were among the first practitioners to use medical lasers intraorally to perform a variety of soft tissue surgical application.<sup>2</sup> In May, 1990, the first laser designed specifically for general dentistry, the dLase 300 Nd:YAG laser, developed by Myers and Myers, and was cleared by the Food and Drug Administration.<sup>3</sup>

The newer treatment procedures are conservative, painless and more reliable and contribute towards better esthetic outcome. A laser in dentistry has allowed dentists to give state of art treatment to their patients. Speed, comfort and ease of approach are some of the advantages of these techniques. Thus, the clinician should learn the use of lasers in dentistry, which has been evolving at a rapid rate, leading to a significant expansion of the worldwide base of knowledge, in turn, resulting in rapid development of new ones for the betterment of the society.

### History Of Lasers:-

The experimental work into the physics of laser light production highlighted the attraction of the use of intense radiation energy, of single wavelength, in many military and communications applications. Maiman's laser used a solid ruby as an 'active medium', which was energised or 'pumped' by an electrical source.

Many other kinds of laser were invented soon after the solid ruby laser – the first uranium laser by IBM Laboratories (in November 1960), the first helium-neon laser by Bell Laboratories in 1961 and the first semiconductor laser by Robert Hall at General Electric Laboratories in 1962; the first working neodymium-doped yttrium aluminium garnet (Nd:YAG) laser and CO<sub>2</sub> laser by Bell Laboratories in 1964, argon ion laser in 1964, chemical laser in 1965 and metal vapour laser in 1966. In each case, the 'name' of the laser was annotated with regard to the active medium (source of laser photons) used.<sup>4,5</sup>

Although Maiman had exposed an extracted tooth to his ruby laser in 1960, the possibilities for laser use in dentistry did not occur until 1989, with the production of the American Dental Laser for commercial use. This laser, using an active medium of Nd:YAG, emitted pulsed light and was developed and marketed by Dr Terry Myers, an American dentist. Though low-powered and due to its emission wavelength, inappropriate for use on dental hard tissue, the availability of a dedicated laser for oral use gained popularity amongst dentists. This laser was first sold in the UK in 1990.<sup>6</sup>

### Types Of Lasers In Dentistry:-

The early 1960s witnessed the beginning of dental laser investigations, with attention devoted to developing basic laser parameters as they related to dental hard and soft tissues. Initial investigator used ruby laser to explore tissue interaction with enamel and dentin, later on other wavelengths such as CO<sub>2</sub>, Nd:YAG, argon, holmium(Ho):YAG, and Erbium(Er):YAG, were investigated. Historically the first laser marketed for the intraoral use generally were CO<sub>2</sub> lasers with otorhinolaryngologic clearance authorized by FDA.<sup>7</sup>

A varied number and variety of lasers are being put to use in dentistry today. On a broad basis, they can be classified as follows:

#### Based on the type of laser medium used:

Gas Lasers	Solid Lasers	Liquid Lasers	Electronic Lasers
Helium Cadmium	Ruby	Liquid dye	Semiconductor
Helium Neon	Rhodamine	Water vapour	Diode
Argon	Neodymium		
Nitrogen	Erbium		
Carbon Dioxide			
Krypton			
Carbon Monoxide			

#### According to the type of tissue being acted upon:-

**Hard tissue lasers** – The hard tissue lasers are used to cut precisely into bone and teeth, to prepare teeth surfaces for bonding, to remove small amounts of tooth structure, and to repair certain worn down dental restorations.

**Soft tissue lasers** – Soft tissue lasers penetrate soft tissue while sealing blood vessels and nerve endings. This is the primary reason why many people experience virtually no postoperative pain following the use of a laser. Also, soft tissue lasers allow tissues to heal faster.

#### Application Of Lasers In Dentistry:-

The uses of lasers in dentistry have revolutionized several areas of treatment in the last three and a half decades of the 20<sup>th</sup> century. Initially it was used for ablating the hard tissues for acid etch treatment. Later lasers were used for cutting,

coagulation and cauterization of the soft tissues. It is also been used for the diagnosis of carious lesions and to test pulp vitality with Doppler. Now there are more than 40 uses for laser.<sup>8</sup>

**A) Diagnosis:-**

- Detection of pulp vitality- Doppler flowmetry, Low Level Laser Therapy
- Laser fluorescence- detection of caries, bacteria and dysplastic changes in the diagnosis of cancer

Laser light can be used in the visible region (blue or red) as a tool for the detection of carious lesions. Techniques developed to date for early caries detection by laser light rely on fluorescence naturally from the tooth material or from bacterial by-products. Fluorescence techniques have been introduced clinically in Europe and show great promise for improved management of dental caries.<sup>9</sup>

Laser Doppler flowmetry (LDF), is a noninvasive, objective, painless, semi-quantitative method, has been shown to be a reliable for measuring pulpal blood flow. This technique has been successfully employed for estimating pulpal vitality in adults and children, differential diagnosis of apical radiolucencies (on the basis of pulp vitality), examining the reactions to pharmacological agents or electrical and thermal stimulation, and monitoring of pulpal responses to orthodontic procedures and traumatic injuries.<sup>10</sup>

Studies were carried out to compare LDF with conventional pulp tests, EPT (electric pulp testing) and thermal tests, in children with certain dental injuries. At the initial assessment at presentation, all tests had poor sensitivity and specificity; however at 3, 6, and 12 months, LDF was significantly better than the other tests. There was no difference between tests at the later time periods, 18 months and 2 years. It was concluded that LDF identified more vital and non-vital teeth correctly at earlier time periods following injury than conventional tests.<sup>11</sup>

**B) Hard tissue applications:-**

- Caries removal and cavity preparation
- Bone recontouring
- Endodontic root canal preparation, sterilization and apicoectomy
- Laser etching
- Root canal restoration for retrograde filling of amalgam or composite

Application of laser in endodontics was introduced by Weilcham in 1971. Studies show that the effects of laser irradiation are dependent on wavelength specificity and energy density. By varying a number of parameters (Pulse mode, irradiation time, frequency and energy outputs), several types of lasers are indicated for use in various fields of dentistry. Clinical investigations into laser, used for apicectomy began with the CO<sub>2</sub> laser. Later Nd:YAG, Er:YAG and Ho:YAG lasers were used. The most promising wavelength has been the Er:YAG at 2.94 micrometers.<sup>12</sup>

The Er,Cr:YSGG laser has several hard-tissue applications like enamel etching, caries removal, cavity preparation, in vitro bone cutting with no burning, melting or alteration of the calcium: phosphorus ratio and root canal preparation.<sup>13</sup>

Clinically, cavity preparation in enamel results in ablation craters with a white chalky appearance on the surface of the crater. In dentine, cavity margins are sharp and dentinal tubules remain open without a smear layer. In a clinical study conducted to evaluate the efficiency and safety of the Er: YAG laser for caries removal and cavity preparation in dentine and enamel, Class I, II, III, IV and V cavities were prepared for amalgam and composite restorations.<sup>14</sup>

A comparison of the desensitizing effects of an Er:YAG laser with those of a conventional desensitizing system on cervically exposed hypersensitive dentine showed that desensitizing of hypersensitive dentine with an Er:YAG laser is effective, and the maintenance of a positive result is more prolonged than with other agents.<sup>15</sup>

**C) Soft tissue applications:-**

- Laser assisted soft tissue curettage and periapical surgery
- Bacterial decontamination
- Gingivectomy and gingivoplasty

- Aesthetic contouring, frenectomy
- Gingival retraction for impressions
- Implant exposure
- Biopsy incision and excision
- Treatment of aphthous ulcers
- Hemostasis
- Tissue fusion- replacing sutures
- Laser assisted flap surgery
- Removal of granulation tissue
- Pulpcapping, pulpotomy, pulpectomy
- Operculectomy and vestibuloplasty
- Incision and drainage of abscess
- Removal of hyperplastic tissue and fibroma

Laser treatment is expected to serve as an alternative or adjunctive to conventional mechanical periodontal treatment. Currently, among the different types of lasers available Er:YAG and Er,Cr:YSGG laser possesses characteristics suitable for dental treatment, due to its dual ability to ablate soft and hard tissues with minimal damage. In addition, its bactericidal effect with elimination of lipopolysaccharide, ability to remove bacterial plaque and calculus, irradiation effect limited to an ultra-thin layer of tissue, faster bone and soft tissue repair, make it a promising tool for periodontal treatment including scaling and root surface debridement.<sup>16</sup>

Er,Cr:YSGG is capable of multiple applications because its interaction with tissues is strongly influenced by variations in the air –to water ratios in the spray. It can be used on soft tissue, enamel, dentin and bone, and its shallow interaction minimizes the risk of collateral damage. Also, the ability to be used for multiple applications improves the economic feasibility of these lasers.<sup>17</sup>

Finkbeiner has suggested the usefulness of argon laser in soft tissue welding and soldering compared to conventional tissue closure methods. Epithelial exclusion using CO<sub>2</sub> laser had been suggested to retard its downgrowth, and studies have shown effective removal of epithelium from gingival tissue without damaging the underlying connective tissue.<sup>18</sup>

Mahmood, Watkinson and Rooney in a study have stated that for clinical situations with peri-implantitis the use of the CO<sub>2</sub> laser would be a safe alternative method provided that the operator chooses the right setting and power output as suggested.<sup>19</sup>

Er:YAG laser was also proposed for the implant maintenance, taking advantage of its bactericidal or decontamination effect. Matsuyama et al. performed debridement of implant abutment surface by Er:YAG laser and reported effective removal of plaque and calculus without producing damage to the implant surface.<sup>20</sup>

#### **D) Laser induced analgesia:-**

In selected patients, using the 660nm laser probe can achieve adequate pulpal anesthesia. Success in primary molars varies from 50% to 75%. Analgesia effect may be affected by things such as pigmentation of the patient's gingival tissues, because the diode may react with the pigment in the tissue rather than be absorbed by the pulpal tissues.<sup>21</sup>

Reports of pain relief mechanisms appear to originate in stimulating oxidative phosphorylation in mitochondria and through modulating inflammatory responses. Another study examined patients receiving both Nd:YAG laser and scalpel surgical techniques: most laser treated sites evoked minimal discomfort without anesthesia, while scalpel surgery required anesthesia.<sup>22</sup>

Jovanović, Mirković&Živković have proposed that soft tissue lasers can be recommended in Herpes Simplex Labialis therapy, for its evident analgesic effects, as well as for shorter disease duration.<sup>23</sup>

#### **E) Laser activation:-**

- Bleaching agent
- Restorations using composite

The objective of laser bleaching is to achieve an effective power bleaching process using the most efficient energy source, while avoiding any adverse effects. The FDA approved standards for tooth whitening has cleared three dental laser wavelengths: argon, CO<sub>2</sub> and the most recent 980-nm GaAlAs diode.<sup>14</sup>

#### F) Others:-

- Removal of root canal restorative material and fractured instrument
- Softening gutta-percha
- Removal of moisture/ drying of canal

#### Conclusion:-

After many false starts, lasers delivering pulsed energies are at last being taken seriously as a tool in the treatment of Conservative, Endodontics and Aesthetic dentistry. We, the dentists, should balance our eagerness to apply these promising new tools with an appropriate measure of caution. These systems are of relatively higher cost and this will undoubtedly limit the extent of their implementation.

Lasers are an impressive treatment modality for a variety of clinical conditions. Hard tissue lasers are being used for a variety of purposes like preparation of enamel, dentin and cementum, and ablation of caries. Many multi-wavelength lasers are also used for polymerizing light activating materials. Laser provides more conservative, less invasive treatment of carious lesion therefore laying the foundation for the “minimally invasive era” in today’s dentistry. Dental lasers also significantly contribute to the field of Aesthetic dentistry. This technology permits us to achieve desirable gingival contour, improved psychological and physical health and tooth whitening. Laser surgery has shown better results as compared to cryosurgery and electrosurgery with faster healing, no requirement of sutures and minimal post-operative bleeding and edema. In laser surgery, the tissue damage is superficial and hence there is less thermal damage to the muscles and tissues.

In the words of Steven Hawking, “Any physical theory is always provisional, in the sense that it is only a hypothesis: you can never prove it. No matter how many times the result of the experiments agree with the theory, you can never be sure that the next time the result will not contradict the theory”.

Lasers are an impressive, potential treatment modality for a variety of clinical conditions. Some clinicians are still wary of entering this exciting field because of the size and cost of equipment. Lasers will continue to get smaller in size and less costly and affordable to every clinician in the near future. This is true of all technology consider the history of computers and pocket calculators. The original lasers were not only large but had six figure price tags. Today's dental lasers are smaller, light weight, highly portable and more reasonably priced.

Laser technology has blossomed in recent years, along with the emergence of new active media and wavelengths. With these impressive advances, potential has increased for further clinical application of lasers in surgery and medicine. Laser dentistry is futuristic in its approach. Laser applications in dentistry opens the door to the modern dentistry, with less pain, better healing, increased patient compliance and patient acceptance. Application of lasers in dentistry will surely increase in the near future.

### Abstract

Dal Lake is one of the topmost attraction of tourists in Kashmir valley and is subjected to a steadily expanding rate of eutrophication and siltation. Considering the significance of this world acclaimed water body for Kashmiri human advancement and economy, the main objectives of this study was long term assessment of water quality of the Dal Lake by using multivariate statistical tools. The period of water quality assessment was 5 years from September 2010 to August 2015. Significant spatio-temporal variability in most parameters indicated considerable spatio-temporal variations. From the principal component analysis it can be construed that the lake water quality is mainly influenced by waste water discharge and agricultural run-off in the form of proliferation of nutrients like nitrate-nitrogen, ammonium-nitrogen, phosphates and chlorides. From the spatial cluster analysis it is clear that the Central Site Nigeen, Outlet Sites of Habak and Outlet Site of Hazratbal are the most polluted sites of Dal Lake and need immediate remediation strategies. Overall, this study may contribute towards the advancement of knowledge and development of conservation strategies for the Dal Lake.

### Introduction:-

More than 70% of earth's surface is covered with water in the form of streams, lakes, rivers, and oceans. Water is most essential topographical agent that adjusts the surface morphology of the planet on an exceptionally great scale. Any aperture of extensive size in the surface of the earth that is loaded with water might be characterized as a lake. Unequivocally a lake is an assemblage of stagnant, semi stagnant or new water. Most lakes are impermanent in character. Lakes demonstrate an immense diversity in form. In size lakes may run from a couple square kilometers to a few hundred thousand square kilometers in territory. Likewise in shape lakes appear as round, semi round, half-moon shape, rectangular and triangular. Lakes assume an imperative part in the economy of an area or nation and are of colossal scholarly, societal and financial significance. They go about as characteristic water supplies and store a substantial amount of water, which can be utilized for drinking, modern, water system, stylish and different purposes including era of hydro-power.

Dal Lake, a warm monomictic lake, situated at a height of 1587m above the sea level and at 34°07'N latitude and 74°52'E longitude with a catchment area of 316 square kilometers, is one of a progression of freshwater lakes of Kashmir valley. Dal Lake is a multi-basined, bull bow kind of lake, with shallow saucer-molded bowls framed by the changing course of stream Jhelum. The principle source of water for the lake is TelbalNallah in the

**Corresponding Author:-Shah Manaana.**

Address:-Department of Environmental Engineering, Delhi Technological University, Delhi, India.

Dachigam territory, various springs emerging from the base of lake and outwash from encompassing mountains. The surge of lake happens through a weir-n-bolt framework. The greatest depth is 6.5m, while the normal/average depth is under 3m. The pH estimations of the lake fall inside the alkaline range as of not long ago.

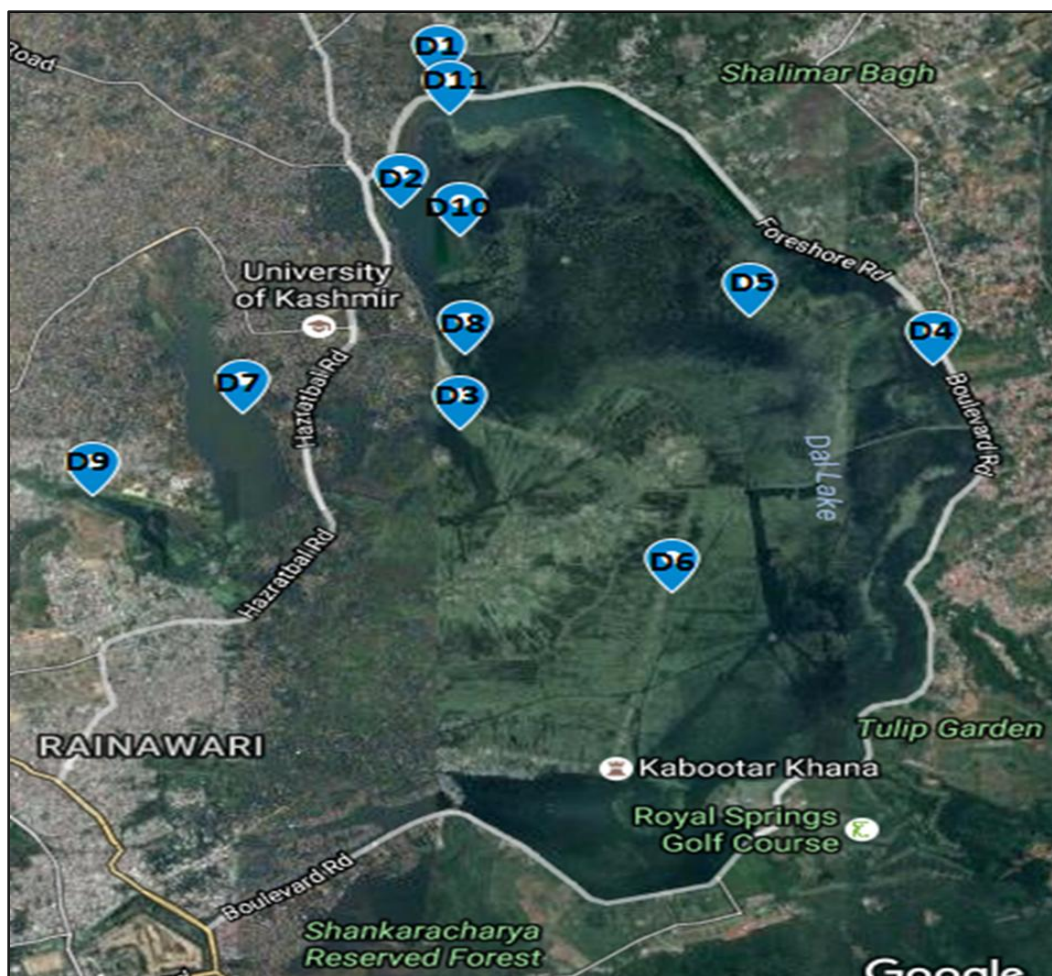

Atmosphere of Kashmir is montane valley atmosphere with a professed icy season from October to March (mean temperature 7.5 degree Celsius) and warm summers mean temperature 19.8 degree Celsius). January is the coldest month (temperature of - 2 degree Celsius to 3 degree Celsius), and July the hottest (34 degree Celsius to 35 degree Celsius). The main proportion of the precipitation is received as snow (December-February). The waters of Dal Lake bolster a changeless drifting populace of somewhere in the range of 7000 individuals, with entire towns having essentially been illicitly made in the lake. The lake underpins an enormous drifting business sector, cultivation industry, an imperative fishery and a blasting traveler industry. Weeds are collected for dairy cattle feed. The lake additionally goes about as a sump for a lot of the waste items from Srinagar. Violations of water from structures and by swelling of floating gardens and installation of lake bed materials and removing weeds on current solid land masses and obviously by transformation of floating gardens in to lasting land masses by way of accumulative weight and mass by planting of materials withdrawn from the lake. Solid waste management in the lake remains a great predicament for the following explanations that in wider terms Dal Lake is a city in itself in the interior of the city with following factors. About 2.5 lac people (source:JKLWDA) living in the surrounding areas discharge wastes which one way or the other reaches into the lake. The population living in the interior of the lake discharges their solid wastes into the lake. Resident population going to the lake, commuters and tourists also discharge their solid wastes straight into the lake.

Dal Lake, subjected to a steadily expanding rate of eutrophication and siltation, has been assessed to thoroughly vanish inside the following 50 years. Siltation has expanded essentially since various streams and rivulets which joined the lake on its western edge were dammed or filled amid the development of a roundabout street around the old city in later past. The volume of nutrients achieves a top amid the mid-year months, when more than 1700 houseboats and many inns bolster an additional 500,000 individuals for every season. Jammu and Kashmir is one of the delightful parts of this planet with rich water assets. Dal Lake is world renowned water body which should be saved. The Government of Jammu and Kashmir has authorized an agency to spare this water body from contamination called Jammu and Kashmir Lakes and Waterways Development Authority (JKLWDA). This lake has truly been the focal point of Kashmiri progress and has assumed a noteworthy part in the economy of the state through its fascination of visitors and additionally its usage as a wellspring of sustenance and water. Considering the significance of this world acclaimed water body for Kashmiri human advancement and economy, the main objectives of this study was long term assessment of water quality of the Dal Lake by using multivariate statistical tools. The period of water quality assessment was 5 years from September 2010 to August 2015.

## **Material and Methods:-**

### **Study area:-**

The study is focused on Dal Lake which is situated in Srinagar city, capital of state Jammu and Kashmir, India (Figure 1). The lake is located at an altitude of 1583m and Lat. 34° – 6' N, 74°-45' E. The main sources of feed to the lake are large perennial channel called TelbalNalawhci carries out runoff from the catchment area of about 145 km<sup>2</sup> and contributes to about 80% of the total inflow to the lake (Jellani 2006). Other streams such as PeshpawNala, Shalimar Nala, MerakhshaNala and Harshikul also contribute to the flow in the lake. These small streams feed to the lake around the shoreline along with some contribution from the groundwater. Kundangar et al. (1995) also reported presence of a number of springs within the lake basin itself acting as a permanent source of water to the lake. The division of the lake is into four basins Hazratbal, Boddal, Nageen and Gagribal. The maximum depth of the lake is approximately 6m which is in the Nageen basin and the shallowest basin is Gagribal basin with a maximum depth of 2.5m. Inside the lake there are floating gardens covering an area of 4.1m<sup>2</sup> where vegetables are cultivated and is a source of income to residents living along its shoreline. The submerged land within the lake is 1.51 km<sup>2</sup> and the marshy area is 2.25 km<sup>2</sup>.

**Figure 1:-** Google map showing the shoreline of Dal Lake and sampling sites.

#### Sample collection and analysis:-

Water quality Data was acquired from the Jammu and Kashmir Lakes and Waterways Development Authority (JKLWDA). The month wise collected data for the lake from the year 2010-11 till 2014-15 was obtained. The collected data is for the following parameters: Electrical conductivity (EC), Calcium, Magnesium, Chloride, Ortho Phosphate, Total Phosphate, Nitrate-Nitrogen, Ammonical Nitrogen, pH, Dissolved Oxygen(DO), Sulphate, Total Alkalinity and Chemical Oxygen Demand(COD). Sampling was generally done monthly from 11 locations as per the standard guidelines. Figure 1 shows the location of sampling sites and the location of sampling sites are shown in Table 1.

**Table 1:-** Location of the sampling sites and their description.

Name of the site	Description of the site
D1	Inside Lake near the entry of TelbalNallah
D2	Dhobi Ghat area
D3	Central site near Sonilank
D4	Near Nishat Pipe line bund (Culvert 1)
D5	Central site near Char Chinari
D6	Near KabootarKhana
D7	Central site Nigeen
D8	Saderabal Area
D9	Pokhribal area
D10	Outlet site of Hazratbal STP
D11	Outlet site of Habak STP

**Principal components analysis (PCA):-**

PCA converts a large dataset of variables to new, uncorrelated variables known as the principal components. These principal components are towards the directions of maximum variance. PCA helps in minimizing the variation in the data (Sarbu and Pop, 2005). It indicates the most important parameters that describe the whole data, and summarizes the statistical correlations among the constituents with minimum loss of original information (Helena et al., 2000).

**Cluster analysis (CA):-**

The CA technique is an unsupervised machine learning classification technique that measures the similarity between different objects. The clusters that are produced through this technique lead to groups or clusters that have high internal homogeneity but high external heterogeneity. The most common CA procedure is hierarchical agglomerative clustering, which provides similarities between a sample and the entire dataset. This is usually shown in a dendrogram or a tree diagram (McKenna, 2003), which provides a visual narrative of the clustering process. It shows the groups, their proximity in the original data. For simple objects, a Euclidean distance is used a similarity parameter between two samples (Otto, 1998). In this study, CA was applied to check the extent of spatial similarity in the data to group sites under the monitoring network. Hierarchical agglomerative clustering was used on the data set, normalized through Ward's method according to Kazi et al. (2009). Further, squared Euclidean distances were used as a measure of similarity.

**Data analysis:-**

Excel 2003, a part of the Microsoft Office Suite and SPSS 10 (IBM Corporation, Windows version) were used for mathematical and statistical computations. Various examiners have reported the significance of standardizing variables for multivariate analysis. Else, variables recorded at dissimilar measures do not add correspondingly for the exploration. For instance, in boundary detection, a parameter that varies from 0 to 100 will overshadow a parameter that varies from 0 to 1. Expending these parameters devoid of standardization in consequence gives the parameter with the greater range a load of 100 in the analysis. Altering the data to equivalent measures can avert this difficulty. Characteristic data standardization measures level the range. The data was therefore standardized to their corresponding z-scores by employing in the following Equation below, in order to achieve the objectives of normal distribution and homogeneity.

$$z = \frac{x - \mu}{\sigma}$$

Where x = Data and

$\mu$  = Mean

**Results and Discussion:-****Seasonal principal component analysis:-**

PCA was applied on the available data after breaking up the acquired/available data into four sets season wise i.e. Spring(March-April-May), Summer(June-July-August), Autumn(September-October-November), Winter(December-January-February). The total number of factors generated from a typical factor analysis indicates the total number of possible sources of variation in the data. Principal Components are hierarchical in order of merit. The first factor or component has the highest eigenvector sum and represents the most important source of variation in the data. The last factor is the least important process contributing to the data variation. The number of factors is determined using a scree plot. A scree plot displays the eigenvalues associated with a component or factor in descending order versus the number of the component or factor. Factor loadings on the factor loadings tables are interpreted as correlation coefficients between the variables and the factors. Factor analysis was performed using Statistical Package for the Social Sciences (SPSS 20).

Kaiser-Meyer-Olkin (KMO) is an index for comparing the magnitude of the observed correlation coefficients to the magnitude of the partial correlation coefficients. The closer the KMO measure to 1 indicates a sizeable sampling adequacy (0.8 and higher are great, 0.7 is acceptable, 0.6 is mediocre, less than 0.5 is unacceptable). Reasonably large values are needed for a good factor analysis. Small KMO values indicate that a factor analysis of the variables may not be a good idea. The measure was more than 0.8 in every season so, this indicates that the sampling size is adequate and the correlation between parameters is generally accepted.

From PCA of summer data, two principal components were obtained having eigen values greater than 1 accounting for 48.653 % of the total variance The first Principal Component PC1 accounts for about 33.644 %. Principal Component two PC2 accounts for about 15.009 % Loadings of the principal components are shown in Table 2. The first Principal Component PC1 shows a significant loading with orthophosphate, total phosphate,

ammonical nitrogen, sulphate, calcium, magnesium, COD, chloride and a negative loading with dissolved oxygen (DO). PC2 shows significant loading with, nitrate, total alkalinity and electrical conductivity. Positive loadings of COD, ammonical nitrogen, chloride and phosphates are associated with anthropogenic pollution. Negative loading of DO in PC1 with other parameters like phosphates and ammonical nitrogen occurs because high levels of dissolved organic matter consume large amounts of oxygen for decomposition. Sources of phosphates, nitrates and chloride may be traced to agricultural run-off, generation of waste water/sewage from the hospitality sector (hotels and houseboats). Calcium, magnesium and sulphates are naturally present in lakes and are representative of catchment geology and would thus exhibit noteworthy contribution to total variance in all seasons. Their proliferation may be due to the anthropogenic activities in the lake catchment.

**Table 2:- Rotated Component Matrix (summer)**

	Component	
	1	2
pH	.004	-.147
conductivity	.266	.642
DO	-.678	-.039
total alkalinity	.333	.686
chloride	.578	.539
calcium	.547	.360
magnesium	.656	.285
sulphate	.706	.327
COD	.583	.047
nitrate nitrogen	-.116	.575
ammonical nitrogen	.632	.298
orthophosphate	.822	-.119
total phosphate	.861	-.056

In winter, total numbers of significant principal components were two accounting for 56.921 % of the total variance, the first Principal Component PC1 accounts for about 31.667 %. Principal Component two PC2 accounts for about 25.254%. And their loadings on various parameters are shown in Table 3. PC1 shows a significant loading with electrical conductivity, total alkalinity, calcium, magnesium, and nitrate nitrogen. Electrical conductivity is an indicator of nutrient enrichment. Lone et al. (2014) had the same findings and has attributed it to the elevated value of total dissolved solids (TDS) in the winter season due to the decreased water levels (water levels are generally highest during summer because of melted glacial inflow) which results in increased concentration of different salts in water. PC2 shows significant loadings with chloride, sulphate, ammonical nitrogen and phosphates. Positive loadings of calcium, magnesium and sulphate relate to catchment geology. Negative loading of DO in PC2 with positive loading of other parameters like ammonical nitrogen and phosphates shows inverse relationship due to nutrient decomposition by phytoplankton.

**Table 3:- Rotated Component Matrix (winter)**

	Component	
	1	2
pH	.170	-.323
conductivity	.830	.036
DO	-.011	-.671
total alkalinity	.787	.088
chloride	.484	.658
calcium	.773	.298
magnesium	.831	.190
sulphate	.064	.801
COD	.439	.020
nitrate nitrogen	.693	.111
ammonical nitrogen	.307	.764
ortho phosphate	.409	.694
total phosphate	.563	.665

In autumn also, three principal components were derived as shown in Table 4 accounting for 63.830% of the total variance. The PC1 accounts for about 32.497%, PC2 accounts for about 16.406% and PC3 accounts for 14.927%. PC1 shows a significant loading with electrical conductivity, total alkalinity, chloride, calcium, magnesium, chemical oxygen demand (COD) and nitrate nitrogen. Electrical conductivity remains significant for the same reason as mentioned earlier for winter season. PC2 shows significant loadings with orthophosphate and total phosphate. PC3 shows positive loadings with sulphate, ammonical nitrogen and a negative loading with dissolved pH again depicting an inverse relationship. This is because of more restrained phytoplankton activity as compared to summer season leading to less consumption of ammonical nitrogen and less consumption of soluble carbon dioxide which lowers pH.

**Table 4:- Rotated Component Matrix (autumn)**

	Component		
	1	2	3
pH	-.191	-.238	.360
conductivity	.729	.148	.034
DO	-.041	-.023	-.758
total alkalinity	.770	.196	.006
chloride	.713	.123	.508
calcium	.793	.113	.238
magnesium	.802	.124	.129
sulphate	.444	.186	.695
COD	.638	-.281	.056
nitrate nitrogen	.667	.200	.059
ammonical nitrogen	.448	.284	.634
ortho phosphate	.095	.929	.066
total phosphate	.160	.935	.089

In spring, four principal components were derived as shown in Table 5 accounting for 68.535% of the total variance. The PC1 accounts for 19.12%, PC2 for 17.38%, PC3 for 16.34% and PC4 for 15.69%. PC1 shows a significant loading with chloride, calcium and magnesium. PC2 shows significant loadings with conductivity and nitrate nitrogen. Also conductivity was observed more in this season which may be caused by high concentration of dissolved solids at lower water levels. PC3 shows positive loadings with sulphate, ammonical nitrogen and a negative loading with dissolved oxygen and pH. This can again be attributed to the opposite relationship between phytoplankton proliferation and availability of dissolved oxygen. More phytoplankton activity means lesser available ammonical nitrogen and vice versa. Thus when dissolved oxygen decreases ammonical nitrogen content increases. PC4 has a significant loading with COD and the phosphate derivatives.

**Table 5:- Rotated Component Matrix (spring)**

	Component			
	1	2	3	4
pH	-.345	.403	-.447	-.075
conductivity	.075	.729	.136	.154
DO	.026	-.157	-.810	-.178
total alkalinity	.133	.801	.204	.124
chloride	.583	.084	.437	.179
calcium	.814	.334	.100	.131
magnesium	.856	-.040	.137	.087
sulphate	.505	.216	.526	.220
COD	.335	-.431	-.014	.574
nitrate nitrogen	.327	.609	-.281	.311
ammonical nitrogen	.336	.021	.763	-.017
ortho phosphate	.083	.232	.177	.859
total phosphate	.119	.350	.143	.833

### Spatial cluster analysis:-

Cluster Analysis is an unsupervised learning statistical methodology. Cluster analysis is used to organise groups of cases of which the alignment is not known beforehand. Since it is unsupervised it does not make any difference between response and explanatory parameters. The many cluster analysis methods that SPSS 20 provides resources to entertain binary, nominal, ordinal, and scale (interval or ratio) data.

Hierarchical cluster analysis (HCA) was applied to the data after breaking up the data, season wise and also location wise with regards to the sampling locations. Hierarchical cluster analysis is one of the more popular methods of cluster analysis. It divides datasets into hierarchies based on similarity or dissimilarities in the field. In this study HCA grouped seasons and sampling locations into clusters. The method used for clustering was Wards Linkage which is based on a minimum variance criteria.

A hierarchical cluster analysis using Ward Linkage was performed to highlight the spatial inter-relationships and similarities as per the hydrochemical data hydrochemistry between the sampling locations considered in the lake study based on the 5 year average data from September 2010 to August 2015. The Dendrogram shows that the sampling locations have been clustered into four groups as shown in Figure 2. The sites D7, D10 and D11 corresponding to sampling locations near Central site Nigeen, Outlet site of Hazratbal STP, and Outlet site of Habak STP respectively have been grouped together. These are the sites with the highest nutrient and pollution levels due to the anthropogenic nutrient proliferation from the various houseboats at Nigeen and the sewage disposal from STPs at Habak and Hazratbal. The second cluster pertains to sites D2, D8 and D9 which represents sampling locations near Dhobi Ghat area, Saderabal Area and Pokhribal area respectively. All three areas are proximate to high density population centres and thus receive nutrient rich effluents from the same. The third group includes sites D3, D4, D5 and D6 referring to locations around Sona lank, Nishat Pipe line bund, Char Chinari and Kabootar Khana. Sonalank and Char Chinari are tiny islands within the lake which attract lots of tourists and consequent nutrient enrichment. The other two sites (Nishat Pipe line bund and Kabootar Khana) are peripheral sites near the shore of the lake.

**Figure 2:-**Dendrogram showing clustering of sampling sites

### Seasonal cluster analysis:-

Another hierarchical cluster analysis using Ward Linkage was conducted to depict the temporal relationship and similarities as per the hydro-chemical data between the four weather seasons prevailing in the region based on the 5 year average data from year 2010-11 to 2014-15. Figure 3 shows the seasonal dendrogram. The dendrogram indicates that the hydro-chemical behavior of lake is most similar during spring and winter perhaps because of the comparable metrological conditions followed by autumn but the dissimilarity in autumn was much higher than that of spring and winter. Summer is most dissimilar to all other seasons because of the high anthropological activities and consequent nutrient loadings and also high biological activity of phytoplankton due to elevated temperatures.

**Figure 3:-**Seasonal dendrogram showing clustering of similar seasonal data

### Conclusions:-

The study was conducted to evaluate the water quality of Dal Lake. The outcome of the study was that Dal Lake suffers steady eutrophic deterioration. There is significant spatio-temporal variability as most parameters indicated considerable spatio-temporal variations. From the principal component analysis it can be construed that the lake water quality is mainly influenced by waste water discharge and agricultural run-off in the form of proliferation of nutrients like nitrate-nitrogen, ammonium-nitrogen, phosphates and chlorides. From the spatial cluster analysis it is clear that the Central Site Nigeen, Outlet Sites of Habak and Outlet Site of Hazratbal are the most polluted sites of Dal Lake and need immediate remediation strategies. From the temporal cluster analysis it is clear that spring and winter are the most hydro-chemically similar seasons of the year followed by autumn. Summer is significantly varied in hydro chemical behavior to all other seasons.

On the basis of this study there are some recommendations that may improve the status of the Dal Lake. Gradual dislodgement of houseboats and hotels, and rehabilitation of respective proprietors at a more appropriate locality. Setting up of STPs at all entry channels and immediate up gradation of existing STPs. For instance the STPs at Habak and Hazratbal are the major causes of eutrophic acceleration in the proximate lake area. Systematically regulated application of chemical pesticides by the cultivators in the lake catchment. Strategies to develop biological pest control measures to mitigate pest problem should be encouraged. Systematically regulated application of chemical fertilisers by the cultivators in the lake catchment. Methodologies should be developed to reduce the necessity of chemical fertilisers for agricultural soils near and around the Dal Lake. Overall, this study will contribute towards the advancement of knowledge and development of conservation strategies for the Dal Lake by the authorities of J&K state.

### Abstract

**Background:** Tuberculosis is among the major causes of illness and death worldwide especially in Asia. Smoking is associated with recurrent tuberculosis and its related mortality. Also, it could affect clinical manifestations, bacteriological conversion and outcome of treatment. This study aimed to evaluate the pattern of tobacco smoking, history of previous quit attempts and attitude towards quitting in tuberculosis patients.

**Materials and Methods:** It was a cross-sectional study done amongst tuberculosis patients coming to DOTS corner of Jahurul Islam Medical College Hospital. 630 patients were included in the study over the period of two years. Data was collected according to the standard questionnaires of smoking pattern.

**Results:** Sixty one percent (61%) patients (n=384) were smoker before the diagnosis of tuberculosis. 50.8% were current smokers at the time of interview and were continuing smoking after the diagnosis of tuberculosis. Only 10.2% discontinued smoking after diagnosis. 68.2% smokes less than 10 cigarettes per day. 53.1% was between 31-50 age group. 21-30 is the commonest age group (62%) to start smoking. To reduce stress was the most common cause to continue smoking (48.9%). 71.9% smokers showed keen interest to stop smoking.

**Conclusion:** Considering the prevalence of smoking in tuberculosis patients, evaluation of tobacco smoking status in these group of patients and motivating them to quit smoking could be considered as important steps in their treatment process.

### Introduction:-

Tuberculosis is amongst the most common causes of morbidity and mortality in the world especially in Asia. In 2006, 9.2 million new tuberculosis cases and 1.7 million deaths due to tuberculosis were reported globally.<sup>1</sup> On the other hand, cigarette smoking is amongst the most preventable causes of mortality and the second cause of death worldwide. At present, smoking is the cause of one out of every 10 deaths that occur. According to the WHO

**Corresponding Author:- Dr. Abu Khalid Muhammad Maruf Raza.**

Address:- Assistant Professor of Pathology, Jahurul Islam Medical College, Kishoregonj, Bangladesh.

estimates, the rate of morbidity and mortality due to tobacco consumption will reach 8 million by the year 2030.<sup>2</sup> However, the growing trend of tobacco consumption among adolescents and the youth has been worrisome.

A correlation between tobacco smoking and tuberculosis was suggested and confirmed by multiple studies and has become the center of attention during the recent years.<sup>3</sup> Current studies have highlighted several correlations between cigarette smoking and tuberculosis infection.<sup>4</sup> Tobacco consumption is directly correlated with recurrence and disability due to tuberculosis. Also, cigarette smoking impacts clinical manifestations, bacteriologic conversion and treatment outcome of disease.<sup>5</sup> In other words, one of every 5 deaths due to tuberculosis could have been prevented if the patient was not a smoker.<sup>6</sup> That is why tuberculosis patients should be a target of smoking cessation programs. Disease recurrence is one of the most important challenges encountered during the course of treatment in tuberculosis patients. Treatment compliance is another important factor for successful treatment of tuberculosis. Absence from work in smoker tuberculosis patients may be due to their nicotine addiction. So, By Collecting information regarding the pattern of tobacco smoking and prevalence of smoking, our knowledge can be enhanced in order to prevent and control cigarette smoking.

### Materials and Method:-

This was a cross-sectional study conducted over a period of two years time from July 2014 to June 2016. All patients presented to the DOTS Corner of Jahurul Islam Medical College Hospital during this time period entered the study. Data were collected by trained technicians through face to face interview with patients. Only patients who were fully alert and conscious were included in the study after obtaining a written informed consent from them. Data regarding age of initiation of smoking, pattern of smoking, the first experience of cigarette offering, quit attempts and number of cigarettes they smoked per day was collected and entered the questionnaires.

### Statistical analysis:-

Survey data were analyzed using the Statistical Package for Social Sciences (SPSS Inc, Chicago, IL, USA). The numbers of cigarettes smoked were numerically added together to obtain an aggregate score of the quantity smoked daily. Descriptive statistical analyses were performed by using Microsoft Excell 2007 software.

### Results:-

Among the 630 tuberculosis patients coming to DOTS corner for taking drugs, 384 patients (61%) found as smoker before diagnosis of tuberculosis. Despite of diagnosis of tuberculosis almost half of the patients (50.8%) were continuing smoking. Only a few numbers of patients (10.2 %) discontinued smoking after diagnosis of tuberculosis. 246 tuberculosis patients were found non smoker (Table 1).

**Table1:-** Current smokers among tuberculosis patients (n=630).

Current smoking status	Number	Percentage
Continuing smoking	320	50.8%
Discontinuing smoking	64	10.2%
Non smoker	246	39%
Total	630	100%

Among the 384 tuberculosis patients who were smoker before diagnosis of Tuberculosis, 68.2% (n=262) smoked less than 10 cigarettes per day. Other 21.4% smoked more than 10 cigarettes and 10.4% (n=40) smoked more than 20 cigarettes per day (Table 2).

**Table 2:-** Distribution of smokers based on number of cigarettes smoked per day.

Number of Cigarettes	Number of Patients	Percentage
<10	262	68.2%
10-20	82	21.4%
>20	40	10.4%
Total	384	100%

We found that, younger age group are the most vulnerable for smoking in tuberculosis. More than half (53.1%) were in the age group 31-50 years. Older age people (>50 years) had less smoking (10.9%) compared to younger age group (Table 3).

**Table 3:-** Age wise distribution of number of smoker in Tuberculosis.

Age group	Number	Percentage
<30	138	36%
31-50	204	53.1%
>50	42	10.9%
Total	384	100%

Younger age groups are more prone to start smoking habit. 21-30 years age group were the commonest group to start smoking in tuberculosis patients. 28.1% started smoking before the age of 20. Only 14 tuberculosis started smoking after the age 40 (Table 4).

**Table 4:-** Age distribution of smokers based on initiation of smoking.

Starting Age Group	Number	Percentage
<20	108	28.1%
21-30	238	62%
31-40	24	6.3%
>40	14	3.6%
Total	384	100%

Among the 384 tuberculosis patients who were smoker before diagnosis of Tuberculosis, most of the patients smoked for a long period of time before diagnosis of tuberculosis. 66.1% smoked for at least 10 years. 118 patients smoked around 10-20 years. Only 12 patients smoked for more than 20 years (Table 5).

**Table 5:-** Distribution of smokers based on number of years smoked.

Years smoked	Number	Percentage
<10	254	66.1%
10-20	118	30.8%
>20	12	3.1%
Total	384	100%

This study also explored the reasons of continuing smoking after the diagnosis of tuberculosis. Patients said multiple reasons for the smoking. To reduce stress (48.9%) were the commonest cause to continue smoking. 156 patients smoked only to get pleasure. People's influences, self confidence, enhance work performance were the other common causes (Table 6).

**Table 6:-** Reason to continuing Smoking after tuberculosis diagnosis.

Reasons	Number	Percentage
Reduce stress	188	48.9%
To get pleasure	156	40.6%
Peer pressure	108	28.1%
Self confidence	66	17.2%
Enhance work performance	62	16.1%

\*Allowed to answer multiple reasons.

Among the tuberculosis patients who are smoker or continue smoking came to DOTS corner for taking drugs, a good number of patients (71.9%) showed interest to quit smoking after diagnosis of Tuberculosis. 66 (17.2%) patients showed good will to quit smoking in recent days. Only few patients (10.9%) showed no confidence to quit smoking (Table 7).

**Table 7:-** Smokers future plan to quit smoking.

Future plan to quit	Number	Percentage
Interest to quit	276	71.9%
Will attempt to quit	66	17.2%
Not confident	42	10.9%
Total	384	100%

**Discussion:-**

Apart from HIV/AIDS, tobacco smoking is the only major cause of death that is increasing rapidly. It is estimated that smoking will cause about 10 million adult deaths from all causes in 2030 and most of the increased tobacco-related deaths will take place in Asia, Africa and South America.<sup>7</sup> Long term inhalation of tobacco smoke alters a wide range of immunological functions, resulting in significantly increased risk of heart disease, lung cancer, microbial infections and delayed recovery from these diseases.<sup>8</sup> Though the underlying biological mechanism is unclear, strong associations between tobacco smoking and TB have been proved in several areas.<sup>5</sup>

Our study results revealed the fact that many of tuberculosis patients are active or occasional smokers. And they keep continuing smoking even after diagnosis of TB. In a study conducted by Gullón Blanco and colleagues on the impact of smoking on sputum smear of tuberculosis patients, 64% of patients were smokers.<sup>4</sup> In our study 70% of the patients are smoker and 50.8% of them continue smoking after diagnosis of TB under treatment. As a significant number of patients continue smoking, smoking cessation interventions by the medical staff implementing the DOTS seems necessary. In a study conducted in Indonesia it was shown that 72% of tuberculosis patients had tobacco consumption. By using smoking cessation interventions, this rate decreased to 11% at the time of next visit.<sup>6</sup>

The younger age group are the most vulnerable for smoking in tuberculosis in this study. 36% patients are less than 30 years age group with more than half (53.1%) are in the age group of 31-50 years. Younger age groups are more prone to start smoking habit. 21-30 years age group were the commonest group to start smoking in tuberculosis patients. This study also explored the reasons of continuing smoking after the diagnosis of tuberculosis. To reduce stress (48.9%) were the commonest cause to continue smoking. This stress factor may be the cause for starting smoking in the early age group patients as this group is more vulnerable for educational, personal and employment issues. It should be noticed that behavior of tobacco use is very difficult to change, even with medicinal aids for cessation. Only a small proportion of smokers stop smoking successfully on their own.<sup>9</sup> In this study, the patients who are smoker or continue smoking came to DOTS corner for taking drugs, a good number of patients (71.9%) showed interest to quit smoking after diagnosis of Tuberculosis. 66 (17.2%) patients showed good will to quit smoking in recent days.

Considering the prevalence of tobacco consumption among tuberculosis patients, evaluation of the cigarette smoking status and encouraging them to quit play an important role in control and treatment of tuberculosis.<sup>10</sup> Adding behavioral studies and nicotine replacement therapies to the DOTS can result in faster recovery, shorter infectious period and prevent treatment failure.<sup>11</sup> Prevention of tobacco consumption and encouraging people to stop smoking can decrease the incidence of clinical cases of tuberculosis and related deaths.<sup>12</sup>

**Conclusion:-**

Tuberculosis and tobacco smoking epidemics are continuing their growing trend in developing countries. In this respect, merging the two systems suggested by the WHO namely DOTS for tuberculosis and MPOWER<sup>2</sup> for tobacco control and enhancing each one by the other can be a great strategy for controlling these obstacles. By promoting smoking cessation in TB patients, we can increase patients compliance to treatment, improve their interpersonal and social communications, decrease their stress and control their risky behaviors.

### Abstract

The symbolism of religion in the Sierra Leonean collectivist society is encouraged to promote increased interdependency and social bonding among families that share similar belief systems. This belief is further accentuated and translated at the dinner table when interacting socially at mealtimes. The concept of religion is very topical in the everyday lives of Sierra Leonean consumers/families, which largely determines their food purchase and consumption behaviour. This study critically evaluates the impact religion has on families and how it affects the way they interact socially at mealtimes. As a consequence, the paper elaborates and highlights the degree of influence Islam and Christianity have on the meal social interaction behaviour of families in Sierra Leone, which is considered as one of the prime factors responsible for the increased drive for collectivism. The authors evaluated the scope of the influence of religion on families' meal consumption behaviour and provided a comparative analysis of its influence on different gender groups.

### Introduction:-

Religion is predominantly a key influencer of most Sierra Leonean families' food consumption behaviour, especially those inclined to practice the Islamic faith. Despite the symbolism attached to religion by different social groups, it has evidently over the years been influenced by families' cultural values and traditional practices. As a consequence, the mixing up of families' spiritual practices with cultural and/or traditional practices have made it increasingly difficult for Sierra Leoneans, irrespective of their religious faith and conviction, to discern or draw a dividing line between the two (cultural values/traditional practices and spiritual belief). Religion has principally been advanced by many theorists, for example, Cohen and Varnum (2016); and Kassim and Zain (2016), as one of the key influencers of collectivism, as most individuals in such societies are heavily reliant on others or their community in shaping their own identity. Rozman (2014) argued that religion is promulgated in most collectivist societies to foster interdependence and promote group-orientation, which can be used to strengthen new and existing bond between and among people. Ji et al (2016) concluded that religion is one of the most important factors of collectivism, as it can be used to pacify and build harmonious relationship between and among individuals. It is evident from these perspectives and the findings of this study that religion in the Sierra Leonean context is used mainly for building social relationship between and among individuals, as a forum for learning and sharing ideas, a platform for enhancing interdependence, a domain for social integration and an avenue for fostering unity within communities.

This fundamentally influences their meal social interaction behaviour. Sierra Leoneans are surrounded by lots of religious practices such as making sacrifices for ancestral spirits, God's influence of everything in their daily lives and livelihoods, and prayers, which affects their food consumption behaviour as it conveys meaning that are significant to them and which are interpreted based on their understanding. This view was supported by Horta et al (2013); Judd et al (2014); and De Backer et al (2015), who stated that food tastes are shaped by family religious norms and socialisation processes, emphasising that natural tastes are founded on social constructions which have been elaborated over generations. Koenig (2013); Beagan et al (2014); and Delaney and McCarthy (2014), on the other hand, attributed food taste of working class individuals to "a taste of necessity", arising from the lack of choice and enjoyment of the sensation of feeling full. Koenig (2013) suggested that the idea of taste itself is a middle-class concept since it presupposes freedom of choice, whereas the disadvantaged classes can only have a taste for what they are anyway condemned to . . . This argument is glaring in the Sierra Leonean collectivistic culture, where, as a result of religious restrictions certain groups of people refrained from consuming certain type of food products.

It is profoundly important to acknowledge that many of the factors that influence Sierra Leonean families' meal consumption behaviour are largely shaped by their religious and/or cultural beliefs, which fundamentally define their food choice. Consequently, these religious differences provides the driving force for not only families' food choices, but fundamentally influence the degree of socialisation, food ethics and boundaries observed by individuals of different age group at mealtimes. Fisher et al (2016) defined family meal as a forum for promoting positive social interaction with other members of the family as well as contributing to better nutritional well-being of the family. However, family meal consumption in this study was defined as the traditional evening meals shared or consumed together by households as family units, but excludes foods taken away from home by household members or those consumed in restaurants or on the streets. This is because most Sierra Leonean families are less inclined to eat together outdoors with their family as a socialisation practice.

This paper discusses the influence of religion on Sierra Leonean families' meal social interaction behaviour as an arbiter of the increased collectivism experienced by most households and provides the opportunity to mirror the same argument across other parts of Africa. As a consequence, the paper further critically analysed the influence of religious factors such as: spiritual beliefs, cultural values, traditional practices and social bonding have on families' meal social interaction behaviour. This was significant as it helps outline clearly the religious factors stakeholders perceived as influencing families' meal consumption behaviour in the Sierra Leonean context. Perry-Jenkins (2013); and Perez (2014) argued that there is little or no empirical evidence, models or frameworks to explain the influence of religion on family meal social interaction behaviour in the African context. Therefore, this research attempts to bring empirical data that provides evidence on the conceptualisation of religion and its corresponding effect on family social interaction patterns at mealtimes in Sierra Leone. It is against the backdrop of the issues raised that the researchers critically evaluated the influence of religion on family meal consumption behaviour in the Sierra Leonean society. The researchers analysed the information and data obtained from the fieldwork to develop appropriate conclusions.

## **Theoretical Underpinning:-**

### **Definitions of Culture:-**

The answers to these questions vary dramatically from individual to individual as there is no universally accepted definition of culture and it is unlikely that we will be able to progress towards one soon (Hanson, 2013). Culture has been defined in so many ways over the years, but none has been sacrosanct. Usunier and Lee (2009); Du Gay et al (2013) argued that culture is the transmission, creation and patterns of values, beliefs, ideas and symbols that shape human behaviour and the artefacts produced through those behaviours. De Mooij (2013, p. 26) defined "culture as the glue that binds groups together, emphasising that without cultural patterns (organised systems of significant symbols) people would have difficulty living together". Hofstede (2001, p. 9) in an earlier study defined culture as "...the collective programming of the mind, which distinguishes the members of one human group from another". In line with this definition, De Mooij (2013) reiterated that culture is what defines a human community, its individuals and social organisations, which is a set of controlled mechanisms (plans, recipes, rules, instructions, i.e. what computer engineers' call "programmes") for the governing of behaviour. Presenting a similar argument, Helliwell et al., (2014) defined culture as the shared learned behaviour, which is transmitted from one generation to another for purposes of individual and societal growth, adjustment, and adaptation. He suggested that culture is represented externally as artefacts, roles and institutions, and it is represented internally as values, beliefs, attitudes, epistemology, consciousness, and biological functioning. Individuals therefore can be clustered into cultural

groupings based on a number of shared constructs and experiences including schemas (for example, a collectivistic orientation), beliefs (for example, attitudes toward mental health), socialisation practices (for example, controlling parenting), immigration, and language among others (De Mooij, 2013). From these definitions, it is clear that the various theorists (Hofstede, 2001; De Mooij, 2013; and Helliwell et al, 2014) views culture in a similar way, as not only the characteristic of individuals, but rather as one that encompasses a number of people who have been conditioned by the same education and life experience. Hence, they believed that people are conditioned by their socio-cultural environment to act in a certain manner (De Mooij, 2013), and that culture cannot be separated from the individual. They emphasised that culture is learned and reflects what is in the mind of the individual. Consequently, they distinguished two types of cultures – those that are visible such as symbols, rituals and heroes, on the one hand, and classified values as the invisible aspect of culture, and therefore view culture as specific to a particular group, which falls in line with the ‘emic’ perspective.

Supporting this view, Goodenough (1971) defined culture as a set of beliefs or standards, shared by a group of people, which help the individual decide what is, what can be, how to feel, what to do and how to go about doing it. In addition, Côté and Levine (2014) posited that culture is composed of psychological structures which individuals or groups of individuals use to guide their behaviour; and reiterated that culture consists of whatever it is that one has to know or believe in order to operate in a manner acceptable to its members. In a similar manner, Gerson (2013); and Herman (2014) defined culture as controlled human behaviours, suggesting that the totality of human activities, and of their accumulated products is subsumed under culture; noting that artefacts, intangibles such as language, norms and values, rituals, literature, music, science, as well as social and political institutions may be largely culture-oriented. From the perspectives of Goodenough (1971); Gerson (2013); Côté and Levine (2014); and Herman (2014), it is evident they believe that there is no reason for culture to be equated with the whole of one particular society. Goodenough (1971) posited that people switch into the culture that is operational within a given group, which assumes that the individual can choose the culture in which to interact at any given moment or in any given situation, subject to the overriding condition that the culture has been correctly internalised from past experiences, and therefore view culture from the ‘etic’ (universal) perspective.

#### **The effect of religion on culture:-**

Religion is a difficult concept to define (Ferré, 2013; Firth, 2013; and Wulff, 2014), which has resulted in many definitions (McLeod, 2013; and Timothy, 2013). Nevertheless, many researchers described religion as the external or outward expression of the inward spiritual system (Dobratz, 2013; Ivtzan, 2013; and Pompper, 2014). Johnson (2014) provided a contrary perspective to the argument by suggesting that religion is concerned with addressing the crises of human existence. He argues that religion is integral to humanity, as it addresses essential dimensions of life and its circumstances, offering resolutions that will always be in excess of any other rationalistic orientation. Kapferer et al (2009) defined religion as the construct worlds for life that are to be lived in and conditioned by ontological-cosmological ground.

In collectivistic cultures (for example, Hindu India and several East Asian countries), certain religious cultures view social connectivity as an integral part of religious life, and group affiliations are seen as important as they define religious identity (Wald and Calhoun-Brown, 2014). In addition, they noted that in collectivistic religious cultures, people are seen as fundamentally connected with each other and their communities, and pointed out that under such circumstances, people’s religious and spiritual behaviour are tightly regulated through ritual and spirituality. Jiang et al (2016) defined rituals as the verbal language that confers identity, with emphasis placed on how communities are created. Arsel and Thompson (2011) reiterated that the identity of individuals depend in large measure on their feeling of belonging, highlighting that the social experiences of everyday life in the distinctive values of a particular group and in the process, a group acquires a distinctive identity, separate from others. The emphasis placed on rituals, set religion as an obligatory instrument among groups of collectivist religious cultures. This argument was also reinforced by Dörnyei and Ushioda (2013) that collectivism is often seen as relying on obligation and on overcoming one’s internal desires for the good of the collective. Paine (2013) referenced the Jewish religion as one that emphasises the performance of religious duties even when the individual is not intrinsically motivated as it is often seen as praiseworthy to place the religious requirement above one’s own private desire. Cleveland et al (2016) offered a political dimension to the argument by purporting that the Singaporean Government’s approach towards religion is pragmatic, where religious values are seen mainly as instruments to promote national unity and maintain national identity. The view that religion is set as an obligatory instrument among certain social groups is very much opinionated as people’s commitment to religion is dying very fast in most societies and a number of people from certain social groups/settings are hardly ardent followers of religion and/or religious practices, let alone promote

ritualistic tendencies (Niebuhr, 2013). Therefore, these professed claims by the various theorists, for example, Paine (2013); and Wald and Calhoun-Brown (2014) needs a critical review to make the argument concrete and convincing as there are no empirical data to substantiate their proposition.

Reeve (2004); and Cohen and Hill (2007) developed a theoretical framework that distinguishes intrinsic and extrinsic religious values in collectivist cultures and defined 'intrinsic religion' as one that is matured, while referring to 'extrinsic religion' as immature. They further stressed that the use of extrinsic religion as one designed for instrumental purposes, including social integration. Jenkins et al (2013) noted that groups of people that share religious identity can be meaningfully viewed as sharing cultural values. This view was also purported by Han et al (2013); and Miller et al (2014) that the core element of collectivism is the assumption that groups bind and mutually obligate individuals. With so many domains of collectivism, Cohen and Hill (2007) admonished that it is vital to discern in which sense the discussion of collectivism can be viewed as they have tremendous impact on religious and spiritual identity, and motivation. Cleveland et al (2016) referenced a case of two Chinese non-Muslim youths who were convicted in court for posting inflammatory remarks against Muslims and claimed that the two men were jailed for spewing vulgarities at the Muslim Malay community. Cleveland et al emphasised that the incident led to the introduction of the Religious Harmony Declaration to remind all people of their religious obligation and reiterated that harmony is vital for peace, progress and prosperity. This indicates that religion alone cannot be used as an instrument to integrate people (Chang et al, 2013), and therefore undertaking a study that reviews the collectivist religious integration perspective is germane. Furthermore, the notion that people sharing the same religious beliefs have similar cultural values is parochial as most people in collectivist societies share similar religious beliefs, but have different cultural orientations or values (Moran, 2014).

Pirutinsky (2009) stated that the influence of religion on the functioning of humans is not monolithic and tends to fluctuate depending on the attitudes, beliefs, and behaviours promoted by the belief of the individual. A number of theorists, for example, Cohen (2009); and Moran et al (2014) suggest that religion is best understood as a source of cultural influence with a diverse and varied impact on the way family interact with each other and with society, and it is therefore important to examine the importance of religion in the meal social interaction behaviours of certain groups or families, since generalisation may prove inaccurate. On the other hand, it is evident as noted by Cohen (2009); and Moran et al (2014) that even within the broader religious categories such as Muslims, Christians and Jews, there may be within group differences in terms of belief and culture that might alter the importance of religion in the way collectivist families interact at the dinner table. Barrett (2013) noted that it is not all types of religious groups appear to be equally adaptive. For example, Protestants and Catholics place emphasis on different intrinsic and extrinsic religious values, particularly on social aspects of religious motivation (Cohen, 2009).

Cohen and Hill (2007); and Ferraro and Brody (2015) suggested that collectivistic cultures such as those of the Hindu Indians and several East Asian Countries, place greater emphasis on religious cultural values and social connectedness as an integral element of religious life, and proclaimed that under such circumstances group affiliations are seen as important in defining parts of religious identity. This argument was further reinforced by Johnson and Cohen (2013), who concluded that collectivistic religious cultures pay greater credence to connectedness among people and communities. Kitayama and Markus (2014) noted that in a collectivist religious setting individuals are more likely to see themselves as part of an encompassing social network and to act in accordance with what one perceives to be the feelings, thoughts, and actions of the others. Hofstede (2003); and Collar (2013) stressed that schisms within religious communities in collectivist societies are not encouraged, but if they do occur, they are absorbed within the context of the larger religious community. Hofstede (2003) reiterated that human beings' images of God or the gods reflect the values of human society, and professed that polytheist religions are symptomatic of collectivist societies. A number of research studies, for example, Hayton and Cacciotti (2014); Posthuma and Guerrero (2013); and Thornhill and Fincher (2014) conclude that traditional religiosity is positively associated with types of values characteristic of collectivism. It may be that because collectivism emphasises the relation to the in-group, the collectivist person would find more value in benefiting someone closer to her or him. The notion of the theorists, for example, Hofstede (2003); and Collar (2013), that schisms is not encouraged in religion can be viewed as too extreme as people of the same faith/belief may belong to different religious sects, which in itself breeds conflict and antagonism and most times a source of religious tensions (Krishnamurti, 2013).

Wald and Calboun (2014) referenced the distinction between Orthodox (i.e. the premise of acceptance of a divinely originated Torah (Hebrew bible) and adherence to the 613 biblical commandments, as interpreted in the "Talmud")

and applied to all aspects of daily life) and non-Orthodox Judaism (which does not require strict adherence to laws and beliefs, but instead emphasises interpersonal ethics and social action and communal participation). Cohen and Hill (2007); and Kvande (2014) argued that non-orthodox Judaism represents a collectivist religion, which focuses on the expression of religiosity through social interrelation. Pirutinsky (2009); and Argyle and Beit-Hallahmi (2014) reiterated that the Orthodox Jewish doctrine and culture are explicitly centred on religious mental states such as belief in an afterlife; and a personal relationship with God founded upon faith and trust (Rosmarin et al, 2009; and Barrett, 2013). In family social interaction at meal times, most religions view the provision of the food for the family as God given, which can lead to spiritual and religious growth (Burton and Clements, 2013). Rosmarin et al (2009); and Feinson and Meir (2014) posited that despite the paucity of research on Orthodox Jews, religious mental states such as belief in God's benevolence and the utilisation of religious coping strategies are strongly linked with a better mental state, whilst research on non-Orthodox Jews found no relationship between religion, belief and mental health (Feinson and Meir, 2014).

A number of studies, for example, Sussman et al (2013); and Scales et al. (2014), have pointed to the mediating pathways through which intrinsic religiosity exerts these effects, indicating that the mechanisms are not fully known and vary across religious affiliations. A key possibility noted by Bhushan (2014) is that intrinsic religiosity acts as psychological resource that encourages protective mental states. Other researchers have suggested that beyond these mental processes, religious individuals have better social contacts (Argyle and Beit-Hallahmi, 2013; and Pargament and Lomax, 2013). Giddens (2013); and Figley and Kiser (2013) suggested that social support serves as a protection against the way families interact at the dinner table. Consequently, intrinsic religiosity may help to unify the family and influence their degree of closeness through increased social support (Wang et al., 2014). Hovey et al. (2014) posited that although extrinsic religiosity provides increased social contact, intrinsic religiosity provides a more effective social support. This implies that religion is used for instrumental purposes such as social integration as well as for community affiliation, social relationship, tradition and rituals (Cohen, 2009). Ai et al (2014); and Ledbetter and Beck (2014) supported this argument by stating that relationships formed in the context of a shared religious worldview are particularly accessible and protective when families are interacting socially at the dinner table. Consequently, there are chances of potential variation in the spiritual effects of religious beliefs across religious groups or sects and the paucity of research on the impact of religion on family meal interaction behaviour justifies the essence of conducting research on such a topical issue (Koenig, 2013; and Pressman et al, 2014).

### **Individualism/Collectivism:-**

Martin and Manns (2014); and Yolles and Fink (2014) suggest that individualism-collectivism should be theorised along a cultural continuum rather than establishing a cultural divide as there is a tendency for both to exist in the same culture. In an earlier study, Chui and Kwok (2008) concluded that more life insurance policies are sold in individualistic cultures than in collectivistic ones, emphasising that in the former, should one die, one cannot rely on family members to support the dependents. Lu et al (2013); and Roberts (2015) noted that people with strong individualistic values emphasise autonomy, independence, and individual initiative; and the right to privacy, pleasure seeking, financial security, the need for specific friendships, and universalism, whereas individuals with strong collectivistic values tend to favour group solidarity, obligations, security, obedience, duty and personalised relationship; and promotes collective identity, emotional independence, sharing, need for stable and predetermined friendships, group decisions and particularism (Yassine-Hamdan and Pearson, 2014). The individualism-collectivism literature mainly focuses on the differences between the Western cultural values, the Middle Eastern cultural values or the Far Eastern cultural values (De Mooij, 2013; Naor et al, 2013; and Vaiman and Brewster, 2014), and it is assumed that African cultures are also collectivist (Greenfield and Cocking, 2014), which signifies that the African continent has been neglected over the years with no meaningful research conducted to verify the assertions of collectivism (McEwan et al, 2015). Therefore, the notion that collectivist cultures promote collective identity, stability, obligations and group decisions is questionable as there is evidence of the inability of families to hold things together when having social discourse at the dinner table; and Roopnarine and Hossain (2013) noted that a number of homes in Africa are built on nuclear orientation rather than extended families. Also, most collectivist homes in Africa, decisions are not made in collective rather the head of the family is the decision-maker (Kavanaugh et al, 2014).

Oh et al (2014); and Pandey and Joseph (2014) suggested that concern for belongingness leads to a tendency towards collectivism, which is expressed by an individual's identification with the collective goal of his or her group; and Parks et al (2013) recommended that priority should be given to the group as a whole, and referenced the

Chinese cultural values as one that gives credence, importance and continuity to the kinship group (Berger et al, 2014). Slater and Tonkiss (2013); Zhao (2014); and Lee (2015) buttressed this argument by commenting that the primary concern of the majority of Chinese was how to protect and enhance their private kinship interests; and that individual sacrifices may be required in order to gain the benefits that accrue to the group. The concept of collectivism has also been shown to have significant impact on creativity and innovativeness as it has been shown to extinguish the creative spark necessary for innovation (Usunier and Lee, 2009; Anderson, 2014; Kumar, 2014). The concern for belongingness should not be seen as the primary arbiter for collectivism as most family members in Africa are afraid of being ostracised by their kinship network and as a result drives them to embrace collectivistic tendencies (Gaines, 2014). Therefore, such generalisation of collectivism needs to be re-examined in order to determine whether there are discrepancies in the argument purported by the various theorists.

#### **Family meal social interaction behavior:-**

Family meal social interaction behaviour is the meal shared by a family as a social event, which has important cultural meaning in the organisation of the family's social life with culturally specific rhythms, norms, rights, and responsibilities (Conklin et al, 2014). Neumark-Sztainer et al (2008); McIntosh (2013); and Lull (2013) reported the existence of a positive family social discourse atmosphere, when families make mealtimes a priority, and the family structure during meals protect children from disordered eating behaviours. Windram-Geddes (2013) pointed out that lack of genuine concern and disengagement during the meal times has also been associated with overweight conditions in children, as families who interact socially with their children in a direct and clear manner during mealtimes are less likely to have children with internalising symptoms. The notion that family meal social interaction behaviour reduces disorderliness and internalised symptoms is subjective as many families in certain social groups hardly sit together to have a meal, but at the same time have children whose social behaviours are orderly and responsible (Chapman, 2013; Cohen, 2013; and Firth, 2013). As a result, conducting a study to address these shortcomings is essential and significant.

Family mealtime social interaction behaviours are characterised by responsiveness to children's questions, role assignment, and that when behaviour is well regulated, the child adaptations such as enriched language development and academic achievement can be enhanced (John et al, 2013; and Seifer et al, 2014). The parenting style, generally accounts for differences in eating and family meal social intercourse behaviours, particularly when considering outcomes associated with younger children who spend more time overall eating at home with one or more parents (Fraser et al, 2014). Philips et al (2014) noted family meal social interaction behaviour is characterised by over-controlling and restrictive attitudes and behaviours towards food, which can be associated with overweight status in children. A number of research findings, for example, Berge et al (2013); and Drotar (2014), showed that more frequent family meal social interactions are associated with better outcomes among children and adolescents. The notion by the theorists that over-controlling and restrictiveness to children's attitude and behaviour at meal times leads to obesity is questionable as many researchers have pointed to the type of food consumed by the family as the main contributors to obesity (Betoko et al, 2013; Pearce and Langley-Evans, 2013; and Pimpin et al, 2013).

#### **Methodology:-**

This research adopted the constructionist approach as its epistemological perspective, which is reliably linked with the 'lived experiences of families as it is considered an appropriate way for determining how humans make sense of their surroundings. As a consequence, this research used semi-structured face to face interviews, observation, field notes, and archival analysis as the data collection methods. The interviewees were drawn from 20 different Sierra Leonean families (husbands and wives) with differing ethnic and cultural backgrounds, with a sample size of 40. The research was conducted in the four provincial headquarter towns of Bo, Freetown, Kenema and Makeni. The data was collected using snowballing, experiential and convenience sampling techniques. The researcher used qualitative research in explaining the behaviours of families at mealtimes using inductive approach. A pilot study was conducted on four families of differing backgrounds to determine the appropriateness of the semi-structured interview protocols. The initial data collected from the four families were analysed to identify their appropriateness for the study. The initial data obtained during the pilot study were coded and analysed to determine whether the research questions and objectives have been met. This was eventually followed by the primary data collection. All the families were recruited on a voluntary basis by emphasising to them the freedom to withdraw from the research process at any time. Critical attention was given to the religious and marital backgrounds of the interviewees to ensure a fair representation of the sample obtained from the differing social groups. This was done in order to ensure equal proportional representation of the two religious groups (Christians and Muslims), and ensure that the couples interviewed were married in order to achieve the objectives of the research. The data collection process lasted for

about two months (8 weeks). NVIVO 10 was used in transcribing the data obtained from the field as it gave the researcher the ability to forward and rewind the audio recorder. The data was analysed thematically by identifying the frequency at which certain issues or themes appeared in the primary data.

### Results and findings:-

This section of the research discusses how religion as a doctrine affects the families' meal social interaction behaviour by outlining the various antecedents that families view as critical when having social discourse at mealtimes. Spiritual beliefs, cultural values, traditional practices and social bonding were identified as the sub-themes from the data as the main issues affecting religion of the Sierra Leonean families at mealtimes. A detailed discussion of each of the sub-theme is held in the subsequent sections.

#### Spiritual beliefs:-

Spiritual belief in this study involves: the religious beliefs; food ethics; respect and affection; gender distinction; hierarchical credence; socialisation and education espoused by families in their meal behaviours.

<b>Q.1</b>	<b>In what ways does this spiritual belief influence the way your family interact at the dinner table?</b>
	<b>Muslim Females:</b> Themes in common were: prayer; respect; provider; food ethics; food type; gratification; religious beliefs Differences were reflected in the following areas: protection; family unity; gender distinction; obedience; God's presence; fasting; kneeling down; posture; dress code; boundaries
	<b>Christian Females:</b> Themes in common were: prayer; provider; respect; gratification; food ethics; religious beliefs; family unity Differences were reflected in the areas of humility; success; responsibility; direction; God's presence; religious faith; fearing God; way of life; food wastage; relationship building; harmony; love; sharing
	<b>Muslim Males:</b> Themes in common were: prayers; provider; respect; gratification; food type; religious beliefs Differences were reflected in the following areas: truthfulness; cultural beliefs/values; humility; food ethics; religious beliefs; God's presence; love
	<b>Christian Males:</b> Themes in common were: prayer; provider; gratification; religious beliefs; blessing Differences were reflected in the following domain: respect; humility; saviour; responsibility; family cohesion/unity; God's presence; moral beliefs; fasting; fearing God; love; bonding
<b>Observational data</b>	A number of the interviewees observed silence at mealtimes. It was also observed that some of the interviewees said 'bismillahi' or the Lord's prayer in silence before eating. The members of some family used spoons when eating. The children thanked both the mother and father and any elder present after eating
<b>Comparative summary of the findings</b>	<p>In comparing the food religious behaviours of Muslim and Christian females, the results show that commonalities existed in the areas of prayers, God is the provider, respect, food ethics, gratifying God and family religious beliefs as reflected in the views of the 7<sup>th</sup>, 17<sup>th</sup>, 19<sup>th</sup>, 21<sup>st</sup>, 25<sup>th</sup>, 31<sup>st</sup>, 35<sup>th</sup>, 37<sup>th</sup>, and 39<sup>th</sup> interviewees for Muslim females and 1<sup>st</sup>, 3<sup>rd</sup>, 5<sup>th</sup>, 9<sup>th</sup>, 11<sup>th</sup>, 13<sup>th</sup>, 15<sup>th</sup>, 23<sup>rd</sup>, 27<sup>th</sup> and 29<sup>th</sup> interviewees for Christian females. For example:</p> <p><i>"Well, I teach my children to pray before their meal, I also teach them to pray after their meal and ask God to provide for us and also ask him to provide for the breadwinner. We also ask God to promote my business, and I believe that God is making that provision as it is evident in everything we are currently doing...when we are at the dinner table we expect everybody to be silent and behave appropriately- no talking is allowed during dinner. After praying we sit down quietly and eat..."</i></p> <p>Interviewee 9, Female, Christian</p> <p>Despite the overwhelming similarities shared by Muslim and Christian females, there were marked differences in terms of the type of food consumed by each sect as the Christian females</p>

	<p>were more pragmatic and open to the consumption of all kinds of foodstuffs, whilst the Muslim females were selective and restrictive in their food choice. This is reflected in the following statements:</p> <p><i>“Well, we normal say bismillahi before we start eating. For us as Muslims we believe God is the provider of anything we have in this world. We also believe that without him you will not be able to secure your daily bread and whatever you want in the world without the blessings of the almighty Allah. Also, as Muslims we are not allowed to eat anything uncleaned such as pork, monkey or other bush animals that have not been properly killed with the name of God pronounced on it. so that affects the way we interact at the dinner table”</i></p> <p>Interviewee 21, Female, Muslim</p> <p>Juxtaposing the food religious values of Muslim and Christian males, it was evident that they broadly shared a number of common values such as prayer, God is the provider, gratification and religious beliefs as espoused in the statements of 8<sup>th</sup>, 18<sup>th</sup>, 20<sup>th</sup>, 22<sup>nd</sup>, 34<sup>th</sup>, 36<sup>th</sup>, 38<sup>th</sup> and 40<sup>th</sup> interviewees for Muslim males; and the 2<sup>nd</sup>, 4<sup>th</sup>, 6<sup>th</sup>, 10<sup>th</sup>, 12<sup>th</sup>, 14<sup>th</sup>, 16<sup>th</sup>, 24<sup>th</sup>, 28<sup>th</sup> and 30<sup>th</sup> interviewees in the case of the Christian males. For example:</p> <p><i>“I believe prayer has a great influence in everything we do, particularly before taking your meal. Calling upon the lord means we are thankful to God for having that meal. The belief we have as a family is that God and Christ has provided for the family because there is a saying in the bible – “provide us with our daily bread” and if that daily bread is provided to you, you have to say thanks and praise to God for what has been given to you”.</i></p> <p>Interviewee 6, Male, Christian</p> <p>Despite the shared similarities, there were marked differences in terms of the type of food consumed as the Christian males just as the Christian females, were more open to variety in their food choices; Muslim males, just as their female counterparts, were more restrictive in the type of food consumed. This is reflected in the following statements:</p> <p><i>“Spiritually, religiously and of course I am a Muslim and as Muslims we have certain believe that there are certain foods we should abstain from such as chimpanzees, monkeys, even though they are delicious and proteinous foods, but we do go away from them, pigs inclusive, we do not take alcohol and even our mode of dressing. If you see your girl child dressed in short shirts in Africa, not only Africa, but more in terms of our religion, we do frown at those sorts of behaviours. So I think it has some effect on the way we interact at the dinner table”.</i></p> <p>Interviewee 22, Male, Muslim</p>
--	--

### Cultural values:-

Cultural values in this study are the generally accepted standard of behaviour expected from each member of a family at mealtimes, including: food ethics; reverence for each other; hierarchy; gender differentiation; affection; and religious beliefs.

<b>Q.2</b>	<b>What cultural values influence your family’s meal social interaction behaviour at the dinner table?</b>
	<p><b>Muslim Females:</b> Themes in common were: respect; gratification; prayer; food ethics; gender distinction Differences were reflected in the following domains: food type; unity; politeness; sense of responsibility; hierarchy; anti-social behaviour; kneeling down; Meal sharing; comportment; lion share; authority</p>
	<p><b>Christian Females:</b> Themes in common were: respect; prayer; food ethics; task distinction; gratification Differences were reflected in the following domains: hierarchy; politeness; obedience; sympathy; meal sharing; peace; greetings; love; lion share; self-identity; spiritual growth; blessing food</p>
	<p><b>Muslim Males:</b> Themes in common were: respect; prayers; authority/control; food ethics; meal sharing</p>

	<p>Differences were reflected in the following areas: sympathy; unity; family image; sense of responsibility; values; love; gratification</p> <p><b>Christian Males:</b>  Themes in common were: food ethics; respect; family unity; meal sharing; prayers  Differences were reflected in the following domain: boundaries; sense of responsibility; obedience; values; hierarchy; gratification; love; comportment; understanding; cordiality; friendliness; spiritual growth; blessing food; revered God</p>
<b>Observational data</b>	<p>Silence was observed at mealtimes by a majority of families. Prayer was also observed by a majority of families. The children of most families thanked their parents after the meal. However, it was observed that a few families do not attach credence to thanking them, as their children did not do so after meal.</p>
<b>Comparative summary of the findings</b>	<p>Comparatively, there was overwhelming commonality in terms of the cultural values shared by each sect on issues such as respect, gratifying God and parents, prayer and food ethics as reflected in the views of the 7<sup>th</sup>, 17<sup>th</sup>, 19<sup>th</sup>, 21<sup>st</sup>, 25<sup>th</sup>, 31<sup>st</sup>, 33<sup>rd</sup>, 37<sup>th</sup> and 39<sup>th</sup> interviewees for Muslim females; and the 1<sup>st</sup>, 3<sup>rd</sup>, 5<sup>th</sup>, 9<sup>th</sup>, 11<sup>th</sup>, 13<sup>th</sup>, 23<sup>rd</sup>, 27<sup>th</sup> and 29<sup>th</sup> interviewees for the Christian females. For example:</p> <p><i>“Well, culturally we believe in silence during dinner, we expect people to say bismillahi before eating, we expect the children to wash their hands before eating, expect them to say thank you to both parents or any elder present thank you after eating, especially if the elder is contributing to the provision or cooking of the food, we expect everybody to be respectful to each other through the dinner, and we expect women to eat separately from men”.</i></p> <p>Interviewee 33, Female, Muslim  Despite the overwhelming shared commonalities, there were differences in terms of gender distinction and task distinction. The Muslim females (17<sup>th</sup>, 21<sup>st</sup>, 33<sup>rd</sup>, 37<sup>th</sup>, 39<sup>th</sup> interviewees) were emphatic in their views about the separation of males from females at mealtimes, whilst the Christian females (3<sup>rd</sup>, 9<sup>th</sup>, 11<sup>th</sup>, 13<sup>th</sup>, 27<sup>th</sup> interviewees) highlighted task distinction as critical in their food behaviours. This is reflected in the following statement:</p> <p><i>“As Muslims, we are exempted from eating things that the Quran proclaimed that they are forbidden as part of the food or drink we take in such as alcohol or wine at dinner, pork meat, dog meat, cat meat or bush meat. These are seen in Islam as forbidden and uncleaned and anybody that eats it will not see the corridors of heaven. We also expect people to be quiet when taking their meals, to wash their hands before joining the dinner table, though in our family we mostly use spoon at the dinner table, men eat together from a common bowl, while women eat together from a common bowl separate from the men, we expect everybody to say bismillahi when eating”.</i></p> <p>Interviewee 37, Female, Muslim  In comparing the cultural values of Muslim and Christian males, it was evident that respect, prayers and meal sharing were cultural values both denominations shared as reflected in the views of the 18<sup>th</sup>, 20<sup>th</sup>, 26<sup>th</sup>, 32<sup>nd</sup>, 36<sup>th</sup>, 38<sup>th</sup> and 40<sup>th</sup> interviewees for the Muslim husbands; and 2<sup>nd</sup>, 4<sup>th</sup>, 10<sup>th</sup>, 12<sup>th</sup>, 14<sup>th</sup>, 16<sup>th</sup>, 24<sup>th</sup> and 28<sup>th</sup> interviewees for the Christian males. This is reflected in the following statements:</p> <p><i>“The main cultural values in my family are respect for elders. As a result, after dinner the children are expected to say thank you to the giver and preparer of the meal. Secondly, they must say thanks and praise to God for what they have eaten on a specific day. Respect for elders, eating together, no talking when eating and cleanliness at the dinner table – clean hands”.</i></p> <p>Interviewee 6, Male, Christian  Despite the shared commonalities between the two sects, it is evident that a majority of the Muslim males were inclined to emphasise authority/control as a predominant cultural value in their families’ meal behaviour, whilst a majority of the Christian males placed emphasis on family unity as a predominant cultural value in their families’ meal behaviour. This is reflected in the following statement:</p>

	<p><i>“Well, as Muslims the way we eat together is that they dish in a very big bowl where all of us will put our hands together as men and during the process the oldest one among you will control whatever meat or whatever condiments is on top of that food. So you don’t have to reach for that particular meat until it is being divided among you all equally. But you have to respect the rules and regulations of the elders while eating”.</i></p> <p>Interviewee 18, Male, Muslim</p>
--	---

### Traditional practices:-

Traditional practices in this study refer to the customary practices of families that are influenced by their culture or sub-culture and/or their social group or cultural settings/environment, including: food ethics; affection; modernity; respect; family religious values; hierarchy; and gender distinction.

<b>Q.3</b>	<b>What traditional practices influence your family’s meal social interaction pattern at the dinner table?</b>
	<p><b>Muslim Females:</b> Themes in common were: food ethics; gratification; prayer; sense of responsibility; sympathy Differences were reflected in the following domain: family unity; respect; obedience; politeness; gender distinction; peace; kneeling down; Islamic values</p>
	<p><b>Christian Females:</b> Themes in common were: prayers Differences were reflected in the following domains: respect; food ethics; hierarchy; humility; responsibility; kneeling down</p>
	<p><b>Muslim Males:</b> Themes in common were: prayers; food ethics; respect; gratification Differences were reflected in the following areas: control; family unity; provider; truthfulness; togetherness; responsibility; cooperation; fearing God; Islamic values; God provider</p>
	<p><b>Christian Males:</b> Themes in common were: food ethics; respect; control; prayers Differences were reflected in the following domain: sense of responsibility; modernity; sympathy; sharing; family unity; togetherness; appreciation; witchcraft</p>
<b>Observational data</b>	In a majority of families, it was observed that females ate separately from males. Members of the family washed their hands from a common bowl. The families said prayers before eating and silence was observed throughout the dinner. The females were observed bringing food to the dinner table for the males. The children thanked the parents after dinner. Females cleaned and cleared the table of dishes after eating.
<b>Comparative summary of the findings</b>	<p>Comparing the traditional practices of Muslim and Christian females, the findings show that they share commonality only in prayers as most Christian females (1<sup>st</sup>, 3<sup>rd</sup>, 5<sup>th</sup>, 9<sup>th</sup>, 13<sup>th</sup>, 27<sup>th</sup> and 29<sup>th</sup> interviewees) indicated that traditional practices do not influence their families’ meal behaviour, whilst Muslim females (7<sup>th</sup>, 17<sup>th</sup>, 19<sup>th</sup>, 21<sup>st</sup>, 25<sup>th</sup>, 31<sup>st</sup>, 33<sup>rd</sup>, 35<sup>th</sup> and 39<sup>th</sup> interviewees) commonly shared food ethics, gratifying parents, prayers, sense of responsibility and sympathy as being central in their traditional practices. For example:</p> <p><i>“Just as I said, the younger ones fetch water to the dinner table before meal, the children say thank you after meal, prayers before eating, quietness is expected from everybody when eating, sympathy and politeness at the dinner table”.</i></p> <p>Interviewee 1, Female, Christian</p> <p>A majority of the Muslim and Christian males share commonalities in the area of prayers, respect and food ethics as reflected in the views of the 18<sup>th</sup>, 22<sup>nd</sup>, 26<sup>th</sup>, 32<sup>nd</sup>, 34<sup>th</sup>, 36<sup>th</sup>, 38<sup>th</sup> and 40<sup>th</sup> interviewees for Muslim males and the 2<sup>nd</sup>, 4<sup>th</sup>, 6<sup>th</sup>, 10, 12<sup>th</sup>, 14<sup>th</sup>, 24<sup>th</sup> and 28<sup>th</sup> interviewees for the Christian males. This is reflected in the following statement:</p> <p><i>“Well, before eating, we expect everybody to wash their hands, we expect everybody to be silent when eating, we expect everybody to respect each other and particularly elders, and we expect everybody to say bismillahi before putting the food in his/her mouth”.</i></p>

	<p>Interviewee 36, Male, Muslim</p> <p>However, there are marked differences between the two denominations (Christian and Muslim males) in the area of control and parental gratification as a majority of Muslim males are more inclined to expect gratification from their children after a meal, whilst the Christian males are inclined to implement control at mealtimes. For example:</p> <p><i>“I am a Muslim, so we strictly follow Islamic norms. Before eating you have to pray and before you do anything you have to pray first. After eating you say thanks to the almighty God”.</i></p> <p>Interviewee 26, Male, Muslim</p>
--	--

### Social bonding:-

Social bonding in this study is the degree of closeness established by each family either internally within the family or externally with others in their natural settings, including: socialisation; reverence; affection; education; food ethics; and family religious values.

<b>Q.4</b>	<b>In what ways does social bonding influence your family’s social interaction pattern at meal times?</b>
	<p><b>Muslim Females:</b></p> <p>Themes in common were: food ethics; moral education; control</p> <p>Differences were reflected in the following domains: respect; advice source; family image; prayer; participation; happiness; training; preaching; learning; sharing ideas; modern approaches; direction; food type</p>
	<p><b>Christian Females:</b></p> <p>Themes in common were: family unity; respect; affection; prayer</p> <p>Differences were reflected in the following domains: meal sharing; compatibility; sympathy; sense of responsibility; social bonding; love</p>
	<p><b>Muslim Males:</b></p> <p>Themes in common were: cultural values; sharing; family unity; togetherness; prayer</p> <p>Differences were reflected in the following areas: respect; control; family image; social group; understanding; peace; success; food type</p>
	<p><b>Christian Males:</b></p> <p>Themes in common were: family unity; sharing; togetherness; prayer</p> <p>Differences were reflected in the following domain: obedience; values; sense of belonging; social event; community gathering; oneness; cordiality; raising awareness; communication</p>
<b>Observational data</b>	In one of the families, a pastor was observed joining the family at mealtimes. Lengthy prayer before eating was observed. The male child was asked to eat separately from his dad. The pastor and dad ate together and silence was observed throughout the dinner. After dinner a lengthy discussion was held. The wife cleared the table after meal.
<b>Comparative summary of the findings</b>	<p>A majority of the Muslim females (17<sup>th</sup>, 21<sup>st</sup>, 25<sup>th</sup>, 31<sup>st</sup>, 33<sup>rd</sup>, 35<sup>th</sup>, 37<sup>th</sup> and 39<sup>th</sup>) highlighted food ethics, moral education and control as the main ingredients of social bonding, which is contrary to the views of a majority of Christian females (1<sup>st</sup>, 3<sup>rd</sup>, 5<sup>th</sup>, 11<sup>th</sup>, 13<sup>th</sup>, 15<sup>th</sup>, 23<sup>rd</sup> and 27<sup>th</sup>), who emphasised family unity, respect, affection and prayers as being central to their families’ meal behaviour. For example:</p> <p><i>“Just as I have said, we are Christians and we expect our children to respect elders, we expect them to pray before taking their meal, to ensure that if there is food, it should be shared among every member of the family as a unit, and the religious aspects of our lives has also been transferred into our family”.</i></p> <p>Interviewee 15, Female, Christian</p> <p><i>“... It normally educates you, which you can transfer to your family at the dinner table. It teaches us what to do and what not to do at the dinner table. Through social bonding we are able to establish control and reinforce religious beliefs at the dinner table. When you associate with people ...you will learn a lot of new things... it is educative and you will learn about what is right</i></p>

	<p><i>and what is wrong and the right way to behave”.</i></p> <p>Interviewee 39, Female, Muslim Family unity, prayer, togetherness and meal sharing are commonalities emphasised by a majority of the Muslim (8<sup>th</sup>, 20<sup>th</sup>, 22<sup>nd</sup>, 36<sup>th</sup>, 38<sup>th</sup> and 40<sup>th</sup> interviewees) and Christian (2<sup>nd</sup>, 6<sup>th</sup>, 12<sup>th</sup>, 16<sup>th</sup> and 24<sup>th</sup> interviewees) males as influencers of their families’ food behaviour. This is reflected in the following statement:</p> <p><i>“...we believe in sharing, because we believe in give and take...it brings us together and gives us the opportunity to interact with other people in the community”</i></p> <p>Interviewee 24, Male, Christian However, there are differences in terms of cultural values as a majority of the Muslim males see social bonding as a way of sharing their values with others as reflected in the following statement:</p> <p><i>“...social bonding plays a great role in shaping the behaviour of the children and it is also a way of teaching the children our cultural values”.</i></p> <p>Interviewee 40, Male, Muslim</p>
--	--

### Discussions:-

Discussion of the impact of religion on families and businesses is sub-categorised into spiritual beliefs, cultural values, traditional practices and social bonding, each of which are discussed in detailed below:

#### The impact of spiritual beliefs:-

Under the perspective of religion, the results show that spiritual beliefs is ingrained in families across Sierra Leone as a majority of interviewees (Muslim and Christian females, and Muslim and Christian males) emphasised that their families have religious values that guide their behaviour; their families held prayers before eating as they believe that God is responsible for providing food for their families; and that God must be respected and thanked at all times (before and after meal) for the food provided for their families. Despite the similarities, a majority of Muslim and Christian females emphasised food ethics such as silence at mealtimes, washing of hands before eating, and the non-wastage of food as fundamental aspects of their families’ spiritual beliefs; a factor less emphasised by a majority of the Muslim and Christian husbands. This may be due to their gender responsibility and the keen attention they pay to the proper functioning of the family as a whole. It is also evident from the results that a majority of the Muslim females and males were more selective in their families’ food choices due to their religious beliefs, whereas the Christian females and males were more pragmatic and open to all kinds of foods. The results also show that even within the same religion and gender classification, for example, Muslim females, differences emerged including: God protects the family; family unity; gender distinction; obedience; God’s presence; fasting; kneeling down; posture at mealtimes; dress code; and food boundaries. Other issues raised by a significant number of the interviewees as spiritually influencing their families’ meal behaviour include: humility; success; responsibility; direction; observing God’s presence; demonstrating the fear of God; building relationship with others; harmony; love; sharing; truthfulness; respect; and God is the saviour. This implies that a majority of the interviewees embraced family religious values; prayers; God makes provision for the family; and respecting and gratifying God as fundamental to their families’ way of life. This further implies that despite the religious divide between the Muslim and Christian families, there are shared commonalities between them, and that the so called ‘division/schism’ between the two sects is man-made or at least blurring; may be due to acculturation. The fundamental role of prayers in families’ meal behaviour emphasised in this study reflects those of Burton and Clements (2013); Dobratz (2013); and Ivtzan (2013), that prayer at family mealtimes brings unity and that difference in the type of food eaten by families are largely influenced by spiritual beliefs. The aspect of family religious values were also emphasised by Cohen and Hill (2007); Reeve (2004); and Cleveland et al (2016) as instruments to promote national unity and maintain national identity. However, this study brings a new dimension to the argument by highlighting specific issues such as gratifying God at mealtimes; food ethics; God protecting the family from social ills; God is the provider of the food eaten by the family; and gender distinction at mealtimes as fundamental factors affecting families’ meal behaviour as well as businesses. This implies that spiritual beliefs largely influence the kind of food families eat and/or drink, which sometimes influences the kind of people they associate with. These

were the gaps the study identified in the literature such as: the generalisation of the impact of spiritual beliefs on families and businesses, as lacking sufficient evidence and argument, and which it sought to fill.

#### **The impact of cultural values:-**

On the issue of cultural value as a religious domain, a majority of the interviewees (Muslim and Christian females, and Muslim and Christian males) emphasised respect for elders, food ethics and prayers before eating as fundamental to their families' meal behaviour. Despite the avowed similarities, a majority of the Muslim and Christian females emphasised the need for gratifying God and parents, and observing food ethics at mealtimes as being symbolic in their families' meal behaviour. In comparison, a majority of the Muslim and Christian males emphasised sharing meals with others as fundamental to their families' religious cultural values. Furthermore, the results showed that a majority of Christian males were emphatic about family unity as a significant cultural value; a majority of Muslim males were emphatic about the symbolism of authority/control as fundamental cultural values; a majority of the Christian females were emphatic about the significance of task distinction as symbolic cultural values; and a majority of Muslim females were more emphatic about gender distinction as fundamental cultural values. It was also evident from the results of this study that even within the same religion and gender group, there were minor differences in cultural values, including: hierarchy; politeness; obedience; sympathy; meal sharing; peace; greetings; love; husband getting the lion share; self-identity; spiritual growth; and blessing of the food. Other issues identified by a minority of all interviewees in relation to cultural values include: food type; unity; sense of responsibility; anti-social behaviour; kneeling down; comportment; authority; family image; family values; gratification; boundaries; obedience; understanding; cordiality; friendliness; and revered God, which they emphasised are important cultural values in their families at mealtimes. This suggests that a majority of the interviewees see respect for elders, food ethics and prayers as essential cultural values in their families' meal behaviour, and that the Muslim and Christian females attached higher importance to the gratification of God than those of their male counterparts (Muslim and Christian males). This argument reflects those of Ferraro, G., & Brody (2013); Cohen and Hill (2007); and Jenkins et al. (2013), who emphasised that cultural values and social connectedness are an integral element of societal religious life. Despite the similarities shared with Ferraro, G., & Brody (2013); Cohen and Hill (2007); and Jenkins et al. (2013) about cultural values which is largely generic, this study was able to specify respect, family religious values, prayers, gratification of God and parents, and food ethics as fundamental cultural values affecting families. This implies that cultural values are becoming an important overlap of religious values, as it is difficult to discern between religion and cultural values in most Sierra Leonean family. The generic description of cultural values by previous studies led the researcher to believe that there were gaps in their findings, which this study helped to address.

#### **The impact of traditional practices:-**

In emphasising the impact of traditional practices as a religious domain, a majority of the interviewees (Muslim and Christian females, and Muslim and Christian males) emphasised prayer as a predominant factor in their families' meal behaviour. Despite the shared similarity, a majority of the Christian females suggested that traditional practices do not influence their families' meal behaviour, which was contrary to the views of Muslim females, a majority of whom posited additional factors, including: food ethics; gratifying parents; sense of responsibility; authority/control and sympathy as major influencers of their families' meal behaviour. This is consistent with the views of a majority of the Muslim and Christian males, who reiterated respect and food ethics as fundamental in their families' meal behaviour. In addition, a majority of Muslim males emphasised gratification of God and parents as symbolic traditional practices, whilst Christian males were emphatic about authority/control as fundamental traditional practices. This suggests that a majority of interviewees were inclined to use traditional practices at mealtimes, and that traditional practices are not predominantly embraced by most Christian females due to acculturation and/or other factors such as urbanisation, though their male counterparts (Christian males) are more inclined to use them. This is consistent with the views of Guerrero (2013); and Thornhill and Fincher (2014), who identified traditional practices as influencers of the behaviour of collectivist societies and proclaimed that, they are positively associated with people's religiosity. It is evident from the findings of this study that the views of Guerrero (2013); and Thornhill and Fincher (2014) are too generic and broad to be meaningful to future researchers as they failed to identify specifically the traditional practices that influenced people's behaviour. As a consequence, this study provides detailed and specific traditional practices that influenced families' meal behaviour, including: prayers; respect and food ethics; sympathy; sense of responsibility; and gratifying parents as symbolic traditional practices shared by a majority of families in Sierra Leone. This implies that despite a majority of Muslim families (males and females) still embrace traditional practices as part of their social interaction at mealtimes, the findings of this study showed that there is a gradual deviation from these practices, and presumably, there are greater tendencies for such deviations to increase

in the future. These were the gaps identified by the researcher as being too broad to be meaningful to future researchers, which are succinctly fulfilled by this study.

#### **The impact of social bonding:-**

In analysing the impact of social bonding as a religious factor on families' meal behaviour, a majority of Muslim females purported food ethics, moral education and authority/control as fundamental in their families' meal behaviour, which is contrary to the views of a majority of Christian females, who emphasised family unity, respect, affection and prayer as intrinsic in their families' meal behaviour. However, a majority of Muslim and Christian males emphasised family unity, prayer, togetherness and meal sharing as essential to the way their families behaved at mealtimes. This indicates that family unity and prayer are central to the family religious values of Christian females, Muslim males and Christian males, but offers distinct set of values/beliefs to the Muslim females, and the way people socialise in society may vary from one group to the other due to cultural, gender, age, regional or religious differences. As a consequence, even within the same family, sometimes bonding is limited to people of the same age group or gender. This implies that a majority of the interviewees view social bonding as a fundamental influencer of their families' meal behaviour. The results also showed that even within the same gender and religious domain of families, a minority of the interviewees demonstrated significant social differences in the way they relate with others, including: advice source; family image; participation; happiness; training; preaching; sharing ideas; direction; social group; understanding; peace; success; compatibility; sympathy; sense of responsibility; love; obedience; values; social event; community gathering; oneness; cordiality; raising awareness; and communication. The same argument was advanced by Arsel and Thompson (2011) that the identity of individuals depend in large measure on their feeling of acceptance, highlighting that the social experiences of everyday life is the distinct values of a particular group, emphasising that in the process, the group acquires a distinct identity, separate from others. This argument was further reinforced by Kitayama and Markus (2014), who noted that, individuals are more likely to see themselves as part of an encompassing social network and to act in accordance with what one perceives to be the feelings, thoughts, and actions of the others. Despite these similarities, this study is the first to specify the various components of social bonding and its impact on families in Sierra Leone, including: food ethics; moral education; control; family unity; respect; affection; prayer; togetherness; neighbours; and meal sharing as fundamental to the way Sierra Leonean families interact at mealtimes. This suggests that irrespective of the commonalities shared about social bonding by families, differing perspectives are bound to emerge either due to their lack of awareness of its symbolism, the upbringing of individuals or the type of social groups they interact with over the years. These gaps were what led the researcher to question the validity of the broad concept of social bonding used by earlier theorists such as: the generalisation of the view that individuals and businesses act in accordance with the feelings, thoughts, and actions of the others, which has been sufficiently filled by this study.

#### **Conclusion:-**

It is evident from the findings of this study that religion transcends the concept of spiritual beliefs and that in fact it is ingrained in the cultural, educational, traditional, ethical and social construct of families, which help fosters a healthy environment and raises children's awareness about the symbolism of God. This profoundly increases humility, respect and obedience among family members at mealtimes, and teaches children moral ethics, prevents families from experiencing health hazards and imbibes sense of responsibility in children. In retrospect, the study highlights religion as a fundamental influencer of the type of food purchased and/or consumed by families as Christians were more pragmatic and open to consuming all types of food unlike their Muslim counterparts. Another fundamental influence of religion is that it promotes the increased drive for gender differentiation and role distinction at families' mealtimes, which is used to showcase male dominance and female subservience. Consequently, this limits the association between males and females at mealtimes, which is increasingly used to define responsibility at the dinner table. The implications of this conclusion are that religion can have both positive and negative influence on families' meal behaviour. This is because it can be used for building the public image of the family, shaping the character of the children for the future good of society and by bringing them closer to God. Contrarily, religion adversely affects families as it can be used to restrict social interaction and connectivity between and among family members due to gender and age differences, which significantly promote biasness at mealtimes.

#### Abstract

This paper recommends appropriate strategies for harnessing the benefits and mitigating the pitfalls of wireless technologies in a form of strategies. Therefore, these strategies will guide government and policymakers to harness the positive social impact and mitigate the negative social impact.

#### Key words:-

Mobile, Society, Impact, strategies.

#### Introduction:-

Wireless technologies particular mobile phone has been revolutionizing the way people communicate and managing their personal as well as social lives. This can be seen through the exponential growth in the penetration rate of mobile phone throughout all Middle East countries including Iraq. In Iraq alone, the penetration rate has reached 110 percent as of second quarter of 2016 (Iraqi Ministry of Communication (2016)). The penetration rate of over 100 percent can occur because of multiple subscriptions. This means the total number of subscriptions has outnumbered the total number of population. Given the widespread use of the mobile phone technology across all user groups, understanding the adoption and appropriation pattern of mobile phone is gaining much interest among researchers in the mobile technology communities (Biljon and Kotze (2007)), (Kim (2008)), (Wirth et al (2008)). While technology adoption (Yi et al (2005)) and acceptance model (Davis (1989) ) has been highly cited in research in this pursuit, newly found model such as technology appropriation model of mobile phone use is also gaining acceptance in explaining the mobile phone use phenomena(Wirth et al (2008)). The ubiquitous use of mobile phone in the society may have also resulted in certain benefits and threats to the society at large (Kushchu (2007)), (Mihalic and Tscheligi (2006)). In this regard, understanding use and users of mobile phone technologies in Iraq is important in guiding strategies, policy developments and regulations concerning wireless technology use. This research has made an attempt to provide knowledge and guidance through a national wide survey based on the impact framework of the work of Keating and Kushchu (Kushchu (2007)) in understanding the impact of mobile phone on the Iraqi society.

#### Impact of Mobile Phone:-

The impact has been categorized into positive and negative impact on the society. Positive contributions of mobile phones to society have been described in a report by Kushu (Kushchu (2007)). He categorized the dimensions of positive social impact as contributions to personal and primary relations, contributions to the society in general and contributions to the economies. Contributions to personal and primary relations encompass connection for communication and accessibility, convenience bringing efficiency especially to daily lives, charisma reflecting influence on identity and empowerment of individuals, companionship for helping individuals have fun, care providing safety and care for others, and the establishment of a culture of its own. Contributions to the society in general include the establishment of informative society, connected society, culturally innovative society, participative society and converging society. Contributions to the economies explains the mobile phone's role on

Address:- Lecturer at the Computer Science Dep., Cihan University –Sulaimanyia Campus, Iraq.

infrastructure development, better business practices, improvements in the public sector (mobile government) and collective welfare of the individuals via social responsibility (Mihalic and Tscheligi (2006)).

On the opposite end of the spectrum, Keating (Kushchu (2007)) discussed societal problems arising from the integration of mobile phone communication into daily social life. These include the disruptions of established patterns of communication and behaviour, stress on social relationships due to these disruptions and new challenges managing antisocial behaviours. She also highlighted the conflict between “liberation” in mobility and “control” in terms of expectations to be available. The ubiquity of mobile phone contributes to a new dependence on technological connections via cell phone. As a result, new issues emerged such as the management of simultaneous contexts and spaces with different expectations and behaviours, new private vs public boundary issues and problems with the camera phone and the unauthorized transmission of visual information (Bar et al (2007)), (Aoki et al (2003)).

Based on the work of these two authors, the research conceptualize the framework of the impact study into positive impact which comprised of five dimensions and negative impact, which comprised of also five dimension. The dimensions identified as negative impact are informative society, connected society, culturally innovative society, participative society and productive society. Whereas the dimension categorized as negative impact are as follows:

- Socially Disintegrated Society: Individualistic Society, (versus caring society), Socially alienated Society, Social Relationship breakdown: illicit affair via WT, divorce through sms, Backstabbing society
- Technology Addicted Society: Excessively Dependent on Technology
- Security Threatened and Criminal Prone Society: Terrorism, Smuggling, Less Privacy, Threats, Slander, Harassment, Blackmail etc.
- Rude or Less Polite Society: Degradation of Communication Etiquette and Degeneration of language
- Threat to Iraqi Values (gambling, porno sites)

### **Qualitative Methodology:-**

The following processes are followed in the conduct of the qualitative research:

#### **Framework Development:-**

1. Identify Criteria - Brainstorming Workshop - Draft F/work.
2. Interviews: Structured Interviews using analysis template based on Conceptual Framework.
3. Respondents: Fixed Workplace Workers - Mobile Workers - students - Senior Citizens - Housewives - Non-Adopters.
4. Focus Groups: Interactive group discussions on mobile phone adoption, appropriation and impact.
5. Groupings: Academicians - Pre-Teens - Teenagers - University Students - Support Staff - Mobile Workers - Professionals - Analysis - Interviews & focus groups transcribed.

#### **Quantitative Methodology:-**

Due to the decision to apply the Computer Telephone Interview (CATI) technique in the conduct of this research, the restrictions in the procedure has led to the design of two separate surveys: one for adoption and appropriation of mobile phone survey, and the other one for the impact of mobile phone survey. Although CATI provides the benefit of randomization of samples drawn from the population to produce accuracy in prediction and generalizability in the results, the procedures do not allow for lengthy type of survey commonly administered using the Internet or paper-based survey. This issue has led to the breakdown of the survey into two, which were run concurrently during the administration process.

**Survey design:** Computer Assisted Telephone Interview (CATI ) technique by trained interviewers.

**Population:** Users of wireless phone as of May 2016, aged 13 years old and above, and able to understand Arabic or Kurdish language.

**Sample:** 2000 samples were drawn to provide national estimate, 1708 has been successfully acquired and usable for analysis.

**Instrument:** Questions were derived from the conceptualization of Kushu and Keating's work on positive and negative impact of mobile phone.

**Analysis :** Data analysis was conducted using descriptive statistics to chart and tabulate the information about the adoption and appropriation patterns and criteria of the samples. Analysis was also conducted to tabulate the different adoption and appropriation criteria according different cohorts. These cohorts are age, gender, marital status, employment status, ethnicity, and income. However the focus given in this report is given on age and gender: The following are the strategies adopted:

- Descriptive profile of respondents
- Descriptive report on adoption and appropriation criteria
- Analysis of differences on categorical variables for relationships
- Chi-square analysis with significant difference of 95% confidence level
- Cross tabulation between cohort groups and adoption criteria
- Cross tabulation between cohort groups and appropriation criteria

#### **Positive Impact of Mobile Phone to Society:-**

One dimension of impact being conceptualized is POSITIVE IMPACT. The draft instrument used comprised of 26 questions with the following concepts: Informative Society- Connected Society- Culturally Innovative Society - Participative Society- Productive Society.

The table indicates the factor loading of the items which emerged into six different factors. Most of the factors are conceptualized accordingly as: PI2 – connected society; PI1 – informative society; PI4 – participative society; PI5 – productive society; and PI3 – culturally innovative society. All of the factors are found reliable with reliability test of  $\alpha$  greater than 0.7 (Hair et.al., 1998). Factor six is considered unreliable and therefore not considered as measurement of any known concept. Findings from the analysis allows for the refinement of the positive impact dimension to be used further in the actual survey. Table 1 shows the descriptive statistics on positive impact of mobile phone.

**Table 1:-** Descriptive statistics - positive impact of mobile phone.

<b>PI2 - (Connected) <math>\alpha = .762</math></b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
My mobile phone has improved my overall social connectivity/relationship	1	5	4.42	0.79
My mobile phone has allowed me to keep track and get involved with family and friends' activities	3	5	4.35	0.66
My mobile phone has given me more social freedom than before (I can mix with anybody I like).	2	5	3.66	0.81
I am comfortable with the new cultures, values and behaviours brought by the use of mobile phones.	1	5	3.60	0.84
My social network and social circle have expanded through the use of mobile phones	1	5	3.92	0.78
<b>Average (aggregate value)</b>			<b>3.99</b>	<b>0.78</b>
<b>PI1 - (Informative) <math>\alpha = .788</math></b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
My mobile phone has improved my ability to access latest social/daily life information	1	5	3.31	1.15
My mobile phone has given me quick access to public information services	1	5	3.52	0.90
My mobile phone keeps me up to date with current issues and information.	1	5	3.48	0.92
My mobile phone has given me convenient access to online information resources	1	5	3.46	1.01
<b>Average (aggregate value)</b>			<b>3.44</b>	<b>0.99</b>

**Table 1:-** Descriptive statistics - positive impact of mobile phone (continued)

<b>PI4 - (Participative) <math>\alpha = .746</math></b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
I have used my mobile phone to give opinions on social issues	1	5	2.74	0.84
I have used my mobile phone to participate in TV/radio programmes	1	5	2.56	1.11
Through mobile phones I have participated in social/political activities involving the public and groups	1	5	2.73	0.98
The convenient access to various government and business services through my mobile phone makes my work more efficient and productive.	1	5	3.23	0.89
<b>Average (aggregate value)</b>			<b>2.82</b>	<b>0.95</b>
<b>PI5 - (Productive) <math>\alpha = .738</math></b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
My work performance has improved because of my mobile phone.	1	5	3.18	0.90
My mobile phone has allowed me to become more creative and to do things that I may not be able to do before.	1	5	3.30	0.87
My mobile phone has enabled me to generate more income.	1	5	2.84	1.03
My mobile phone provides me with functions and features that allow me to manage my social and daily life more effectively	1	5	3.61	0.94
<b>Average (aggregate value)</b>			<b>3.23</b>	<b>0.93</b>
<b>PI3 - (Innovative culture) <math>\alpha = .731</math></b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
I have used 3G/SMS/MMS to be more creative in my communication and activities	1	5	3.74	1.16
I have used unique grammar and expressions (smiley) in text messages	1	5	3.85	0.91
I use my mobile phone to socially connect with my friends and family through sharing of jokes/advice/MMS, etc.	1	5	4.02	0.94
With the use of my mobile phone, time and distance is not an issue for me to make friends and socialise with people	1	5	4.01	0.85
<b>Average (aggregate value)</b>			<b>3.91</b>	<b>0.97</b>

**Negative Impact of Mobile Phone to Society:-**

Negative impact to society was originally measured with 21 questions and conceptualized as follows:

- NI1: Socially Disintegrated Society: Individualistic Society, (versus caring society), Socially alienated Society, Social Relationship breakdown: illicit affair via WT, divorce through sms, Backstabbing society
- NI2: Technology Addicted Society: Excessively Dependent on Technology
- NI3: Security Threatened and Criminal Prone Society: Terrorism, Smuggling, Less Privacy, Threats, Slander, Harassment, Blackmail etc.
- NI4: Rude or Less Polite Society: Degradation of Communication Etiquette and Degeneration of language
- NI5: Threat to Iraqi Values (gambling, porno sites)

Six factors emerged from the principle component analysis. The table indicates how we conceptualize factor 1, 2, 3, and 4 with the corresponding reliability test  $\alpha$  above 0.7. Factor five and six are considered unknown and unreliable. Eventually, the refinement in the concept has been made which is quite different from the original dimensions. There were 16 items retained which can be used for further exploratory descriptive analysis and actual conduct of the survey. Table 2 shows the descriptive statistics on negative impact of mobile phone.

**Table 2:-** Descriptive statistics - negative impact of mobile phone

<b>ANTI-SOCIAL AND CRIMINAL PRONE SOCIETY (NI1)</b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
To my knowledge, mobile phone is being used for making threats, harassment, blackmail, slander in Iraq	1	5	2.82	1.16
To my knowledge, mobile phone is being used for activities that undermine the law in Iraq.	1	5	2.90	1.04
To my knowledge, mobile phone is being used as a threat to social integration in Iraq (e.g., spread rumours, to instigate racial/religious unrest, etc.).	1	5	3.06	1.02
To my knowledge, mobile phone is used as a means of anti-social services such as gambling, prostitution, etc.	1	5	2.85	1.06
<b>Average (aggregate value)</b>			<b>2.91</b>	<b>1.07</b>
<b>UNCONSCIENTIOUS AND LESS POLITE SOCIETY (NI2)</b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
I have experienced disturbing others or have been disturbed by other through the use of mobile phones in socially inappropriate places (e.g., places of worship, lecture halls, libraries, cinemas, etc.).	1	5	3.11	1.09
I have experienced being interrupted or disturbed from inappropriate use of mobile phones	1	5	3.66	1.01
On many occasions, events I attended (e.g., meetings, lectures, shows, etc.) have been disrupted by the use of mobile phones (either my phone or others).	1	5	3.45	0.96
Iraqis written communication skills have deteriorated due to abbreviation and other new forms of text messaging.	1	5	3.49	0.95
Iraqis have become a less polite society because of mobile phones.	1	5	3.16	1.16
<b>Average (aggregate value)</b>			<b>3.37</b>	<b>1.03</b>

**Table 2:-** Descriptive statistics - negative impact of mobile phone (continued)

<b>ADDICTION AND DISINTEGRATION IN SOCIETY (NI3)</b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
I spend a great deal of time speaking on the mobile phone at the expense of those around me.	1	5	2.86	0.99
I have experienced threats to personal relationships through mobile phones.	1	5	3.08	1.04
I find myself occupied on my mobile phone when I should be doing other things.	1	5	2.94	0.85
My life is considered miserable if I don't have my mobile phone with me at all times.	1	5	3.56	1.01
Nothing in my life and my work can be done without my mobile phone with me.	1	5	3.02	1.07
<b>Average (aggregate value)</b>			<b>3.09</b>	<b>0.99</b>
<b>ADDICTION AND DISINTEGRATION IN SOCIETY (NI4)</b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std Dev</b>
I have experienced spending more than my allocated budget for the mobile phone bills.	1	5	3.20	1.13
I have experienced financial problems as a result of over spending on my mobile phone.	1	5	2.89	1.20
<b>Average (aggregate value)</b>			<b>3.04</b>	<b>1.16</b>

### The CATI Survey:-

- Gender: Majority of the respondents (56.4%) are male. 43.6% of the respondents are female.
- Age Range: Majority of the respondent (39.3%) aged between 20 to 30 years old. This is followed by respondents aged 31-40 years old (20.2%). Respondents aged more than 55 are the least (6.3%).
- Marital Status: Single respondent is slightly higher (52.6%) than the married people (47.4%).
- Income Distribution: (13.6%) they earn more than 2000\$, majority of the respondents (50.7%) earn 1000\$ to 2000\$, followed by those who earn less than 1000\$ (31.1%).
- Employment Status: Majority of the respondents (29.1%) are support staff, followed by students (20.9%) and self-employed people (18.9%). (15.1%) were unemployed, (11.9%) were professionals, and the retirees are only 4.1% of total respondent.

### Dimensions of Positive and Negative Impact:-

13 positive impact variables and 13 negative impact variables are included in the CATI survey questionnaire. Analysis of the factors using factor analysis identifies the eight dimensions of social impact of mobile phone. Four dimensions are positive impact and another four are negative impact. The positive impact dimensions conform to the dimensions identified by Kushchu (2007). The negative impact dimensions conform to the dimensions identified by Keating (2005). Figure 1 shows the positive and impact dimensions as a result of factor analysis.

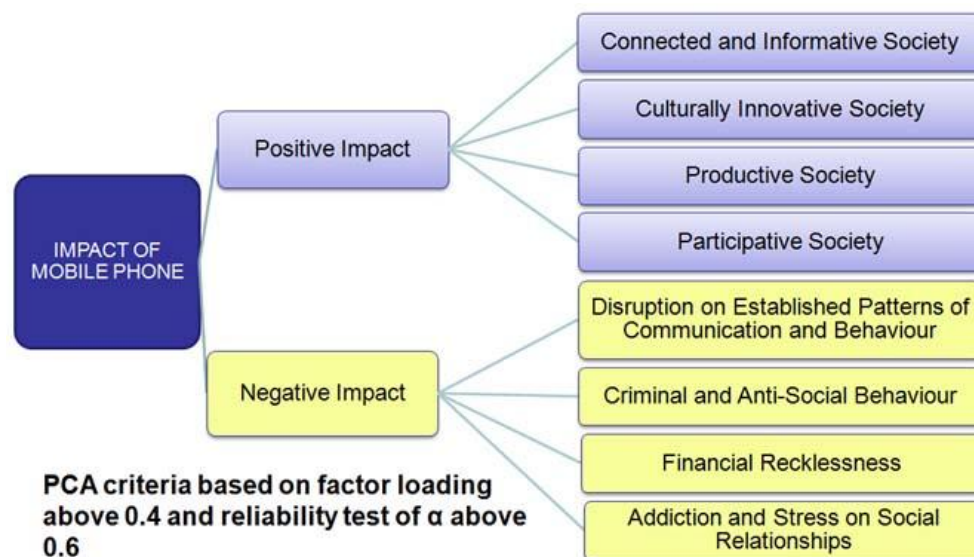

Figure 1:- Positive and negative impact dimensions

### Overall Positive Impact Measured:-

The percentage of agreement for individual indicators suggests that mobile phone gives the biggest positive impact towards contributing to a connected and informative society. This is followed by culturally innovative society, productive society and participative society. Figure 2 shows the positive impact findings highlights.

Figure 2:- Positive impact findings highlights.

Analysis on the data set according to mean responses suggests a similar outcome namely contribution to a connected and informative society, followed by culturally innovative society, productive society and participative society. Table 3 shows the aggregated mean based on dimensions.

Table 3:- Aggregated mean based on positive impact dimensions

Positive Impact Dimension	N	Min	Max	Mean	Std. Dev
Connected & Informative Society	1705	1	5	3.7	0.585
Culturally Innovative Society	1707	1	5	3.6	0.735
Productive society	1708	1	5	3.2	0.895
Participative Society	1708	1	5	2.7	0.842

### Overall Negative Impact Measured:-

The percentage of agreement for individual indicators suggests that mobile phone gives the biggest negative impact to the society in relation to the disruption on established patterns of communication and behaviour. This is followed by criminal and anti-social behaviour, financial recklessness and addiction and stress on social relationships. Figure 6.8 shows the negative impact findings highlights.

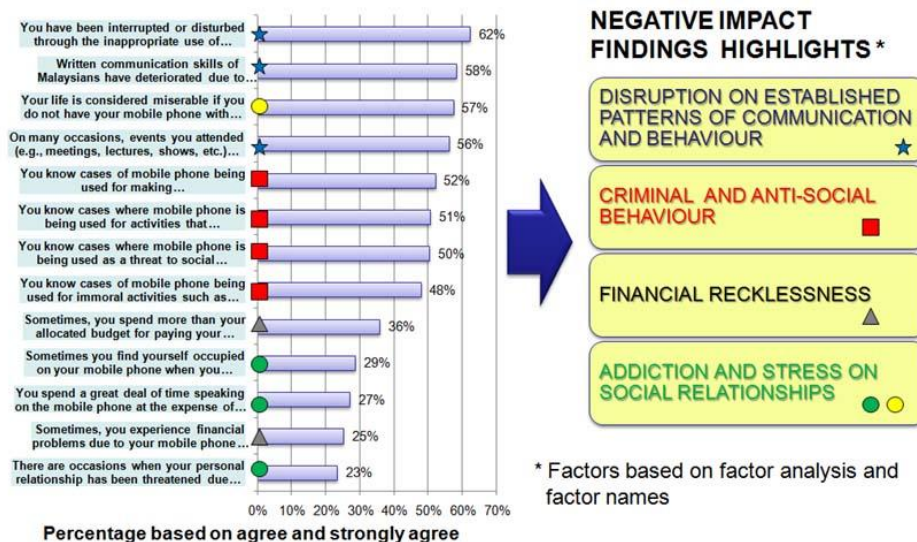

Figure 3:- Negative impact findings highlights

Analysis on the data set according to mean responses suggests a somewhat different outcome namely impact related to the disruption on established patterns of communication and behaviour, followed by financial recklessness, addiction and stress on social relationships, and criminal and anti-social behaviour. Table 4 shows the aggregated mean based on dimensions. Table 4 shows the negative impact findings details based on mean.

**Table 4: - Aggregated mean based on negative impact dimensions**

<b>Negative Impact Dimension</b>	<b>N</b>	<b>Min</b>	<b>Max</b>	<b>Mean</b>	<b>Std. Dev</b>
Criminal and Anti-Social Behaviour	1708	1	4	2.54	0.78
Addiction and Stress on Social Relationships	1708	1	5	2.62	0.79
Financial Recklessness	1708	1	5	2.72	0.92
Disruption on Established Patterns of Communication and Behaviour	1708	1	5	3.40	0.80

### **Conclusion:-**

The variables in the connected society and the informative society dimensions were found to be highly correlated with each other. As a result, the two dimensions were combined. The most significant positive impact of mobile phone is its contribution towards a connected society and informative society. This includes keeping track and involvement with family and friends, expansion of social network, increase in communication social freedom, keeping up-to-date with current issues and communication, and convenient access to online information resources. It also contributes towards a culturally innovative society through the use of unique grammar to communicate and the establishment of new identity, culture and values brought about by mobile phone. To a varying degree, there are differences on how mobile phone impacts the different cohorts in the Iraqi society. In relation to gender, male benefits more than female especially in the use of mobile phone to increase productivity. This is also true for connected and informative society, and participative society. As for age group, the working age of 31-40 is the biggest beneficiary of mobile phone contribution towards a productive society. The 20-30 and 13-19 age groups are more inclined towards a culturally innovative society.

In terms of marital status, the married are more likely to be productive from the use of mobile phone compared to the single group. In contrast, the singles are more likely to be culturally innovative. Regarding employment status, the professional and retiree are the biggest beneficiaries of the mobile phone contribution towards a connected and informative society. The self-employed used the most to participate in society and to be productive. Students are most likely to be culturally innovative. As for income group, productivity using mobile phone increases as income grows. On the contrary, the mobile phone contribution towards a participative society decreases as income grows.

In contrast to the positive impact of mobile phone on society, the percentage of agreement amongst the respondents on negative impact variables is generally lower compared to the positive impact variables. This reflects the general view of the Iraqi society that the positive aspects of mobile phone outweigh the negative. Factor analysis on the survey data suggests four negative impact dimensions, namely disruption on established patterns of communication and behaviour, criminal and anti-social behaviour, financial recklessness and addiction and stress on social relationships. The highest concern amongst the society related to mobile phone is in its use that disrupts established patterns of communication and behaviour, such as interruption through its inappropriate use at certain events and places. The deterioration of written communication skills and overly dependence on mobile phone were also a concern. About half of the respondents perceived that mobile phone is used to aid criminal and anti-social behaviour. Such activities include making threats, harassment, blackmail and slander, undermining the law, spreading rumours and instigating unrest, and aiding immoral activities such as gambling and prostitution. To some extent, mobile phone can also be considered a cause of financial recklessness through overspending more than the allocated budget. About a quarter of the respondents agreed that mobile phone causes addiction and stress on social relationship.

Similar to positive impact, there are differences on how mobile phone impacts the different cohorts in the Iraqi society in relation to negative impact. In relation to gender, there are no significant differences between male and female with regard to any of the dimensions. As for age group, the elderly 55 years and above age group is the least prone to the disruption on established patterns of communication and behaviour caused by mobile phone. The 13-19 age groups are more prone to addiction and stress on social relationships and financial recklessness. In terms of marital status, the singles are more prone to addiction and stress on social relationships, and financial recklessness caused by the use of mobile phone. Regarding employment status, the professional are most likely to be concerned

on criminal and anti-social behaviour caused by mobile phone. The same group are also most likely to experience disruption on established patterns of communication and behaviour. With regard to addiction and stress on social relationships and financial recklessness, students are more likely to experience them. As for income group, the more than 2000\$ income group are most likely to concern on the criminal and anti-social behaviour. With regard to the disruption on established patterns of communication and behaviour, the perception of the negative impact grows as income grows. The 1000\$-2000\$ group are more prone to addiction and stress on social relationships. Finally, the less than 1000\$ income groups are more likely to experience financial recklessness due to mobile phone.

In the strategic view of Iraqi objective, following statements are represented by the following eight values of the Iraqi Vision: Perseverance, Culture of Excellence, Acceptance, Loyalty, Education, Humility, Integrity, Meritocracy. The project which was initially proposed as a single study utilizing the computer assisted telephone interview (CATI) technique, in order to ensure high representation of the information generated from the sample to the population. The accuracy derived from the sample has been calculated with a predetermined type B error of 0.01 or 1 percent. This high accuracy in the sample in representing the population allows for the findings to be used and depended on by the funding agency as well as the government in the formulation of policies and guidelines concerning the users of mobile phone as well as the Iraqi society at large.

#### **Abstract**

Discovery of genes that are responsible for various diseases, becomes an important task. Since the genes are related with many diseases, the gene-disease association should be discovered. To obtain this gene-disease association from available biomedical literature, the relation type between the gene and disease is extracted from the biomedical literature. So, this becomes more and more important to deal with the extraction problem from the biomedical texts in an automatic way. Then the gene-disease association is visualized by network construction and association score matrix is constructed to calculate the gene-disease association score. The gene-disease relation type is identified and then the association score is calculated by integrating disease similarity network and protein-protein interaction network. The candidate genes for the particular disease and the novel genes for various diseases can also be found by calculating the association score and visualizing the dataset network.

#### **Introduction:-**

Determining gene-disease associations will enhance the development of new techniques for prevention, diagnosis and treatment of the diseases. Given that the amount of biomedical literature regarding the identification of disease genes is increasing rapidly. One of the challenges that scientists in this domain face is that most of the relevant information remains hidden in the unstructured text of the published papers. Hence there is an urgent need for a text mining system that extracts both known and novel GDA (Gene Disease Association) and visualization. A new text mining system with network association capability for the visualization of gene disease association is proposed. Recent studies have proposed several approaches to investigating the relationships between genes and diseases. Some previous studies use protein-protein interactions to predict gene-disease relationships. Some researchers compute the similarity values between genes and diseases based on Gene Ontology (GO) or Disease Ontology (DO) terms. Other controlled vocabularies such as MeSH (Medical Subject Headings) have already been utilized for linking proteins to disease terminologies. Some other information like gene expressions, protein/genome sequences and positional information are also served as the important evidences to relating genes and diseases. For gene-disease association discovery from the biomedical literature using biomedical text mining, the first step is Named Entity Recognition (NER) that is the annotation of gene and disease terms by highlighting the gene and disease terms in the biomedical literature. Then the sentences with gene and disease terms have to be extracted by excluding other sentences in that biomedical literature. After extracting the sentences the relationship between the gene and disease has to be identified. The relationship is identified between the gene and disease based on the semantic

analysis using relation type dictionary are further included in the network construction phase for identifying the association between them.

Although many approaches have been developed for prioritizing candidate disease-causing genes based on exploiting the protein-protein interaction network and phenotype similarities, most of which deal with the disease-gene association score based on the association between the diseases similar to the query disease and their involved genes independently. In this work, the modular nature of the genetic diseases and the consistency between the disease phenotypic overlap and genetic overlap are fully exploited. For this purpose, the disease similarity network and the protein-protein interaction network are incorporated systematically and comprehensively in a simple and compact manner to formulate the computation of the prioritization scores. As for a single disease gene association score function, both the similar diseases in the disease similarity network and neighboring genes in the protein-protein interaction network are considered because of the modular nature of the genetic diseases. All the association scores between the similar diseases and neighboring genes would be integrated into the iterative computation of this single disease gene association score. And also this system deals with the relation type identification task from the biomedical literature. For constructing disease similarity network, the large-scale disease similarity information is exploited. The disease similarity network and the protein-protein interaction network are coupled in a comprehensive and systematic way for the definition of the disease-gene association score function, and this is well in accord with the consistency between disease phenotypic overlap and genetic overlap. The definition of disease-gene association score makes full use of the information implicated in both disease similarities and neighboring genes comprehensively. On the other hand, not only the noise in the disease similarity information but also the self-loop in the protein-protein interaction network are considered in the computation of the disease-gene association scores. An iterative algorithm is designed for the computation of the disease-gene association score matrix for all the diseases and all the candidate genes in the protein-protein interaction network.

As most of the gene-disease association discovery part depends upon the datasets such as disease similarity network, protein-protein interaction network and the already discovered association dataset from OMIM. Thus the accuracy of the result depends upon the completeness of the datasets. While the calculation of association scores, the correlation between the two networks is calculated. When a candidate gene is prioritized for a disease, the correlation of the two subnetworks are considered separately induced by the neighbors of the gene in the protein-protein interaction network and the neighbors of the disease in the disease similarity network. That is, a single association between a gene and a disease is formulated iteratively by the correlation of the two subnetworks. This constraint can also be described as the fact that a gene is likely to be involved in a disease if the gene's neighbors are associated with the similar diseases. In our method, the association score between disease 'd' and gene 'g' is formulated iteratively as the weighted sum of all the existing association scores between the neighbors of gene 'g' and the diseases similar to disease 'd'. While this calculation, if the dataset does not contain sufficient information then the association score will result in less accurate one. The work is defining about the procedure of finding the association score between gene and disease and also predicting the novel gene for various diseases. And the network construction and visualization using three types of datasets namely disease similarity network, protein-protein interaction network and gene-disease association from OMIM database.

#### **Related work:-**

In PRINCE [11], a novel network-based approach for predicting causal genes and protein complexes that are involved in a disease of interest. The method, which is called PRINCE (PRIoritization and Complex Elucidation), generalizes the network-based approaches by both considering the network signal in a global manner and going beyond single genes to the modules that are affected in a given disease. It receives as input a disease-disease similarity measure and a network of protein-protein interactions. It uses a propagation based algorithm, to infer a strength-of-association scoring function that is smooth over the network (i.e., adjacent nodes are assigned similar values) and exploits the prior information on causal genes for the same disease or similar ones. This scoring is then used in combination with a PPI network to infer protein complexes that are involved in the given disease.

In other network related work they used a plethora of network-based approaches to investigate the underlying molecular mechanisms of various human diseases. They perform a bipartite, topological and clustering graph analysis in order to gain a better understanding of the relationships between human genetic diseases and the relationships between the genes that are implicated in them. For this purpose, disease-disease and gene-gene networks were constructed from combined gene-disease association networks. Collecting and integrating data from three diverse resources, each one with different content covering from rare monogenic disorders to common

complex diseases. Identifying important topological properties of the biological networks and uncover noticeable disease-disease and gene-gene associations. In particular, based on the topological analysis of networks, it is provided that numeric evidence on the assumption that many genes can be causative for a human disease.

A multi-level network model that integrates drugs, diseases and genes together, called a drug–disease–gene network (DrDiGeN)[6]. The network consists of three sub networks, a drug–drug network (DrDrN), a disease–disease network (DiDiN) and a gene–gene network (GeGeN). The statistic characteristics show that node degree in most of the sub networks approximately follows a power-law distribution. The results also indicate that if genes in the GeGeN occupy important topological positions, then their associated drugs and diseases always hold critical roles in the DrDrN and the DiDiN respectively. In addition, most drug target genes and disease-causing genes are always different and nonessential, and the both show a lower likelihood to encode hub proteins in human protein–protein interaction (PPI) network, while a little higher tendency is observed in the GeGeN. Gene modules extracted from the GeGeN are highly enriched in Gene Ontology (GO) terms, but poor co expressed in human tissues compared with that of the PPI network. Furthermore, diseases (or drugs) associated with similar genes highly interact with each other such that tightly related drugs, diseases and genes can easily form co-modules, in which they share a similar pattern. The conserved structures are helpful for the understanding of the interaction mechanisms of drug–disease–gene as well as drug applications and disease treatments in a network-based level.

A work on ‘Text mining and manual curation of chemical-gene-disease networks for the Comparative Toxicogenomics Database (CTD)’[2]. The Comparative Toxicogenomics Database (CTD) is a publicly available resource that promotes understanding about the etiology of environmental diseases. It provides manually curated chemical-gene/protein interactions and chemical- and gene-disease relationships from the peer-reviewed, published literature. Journal articles are prioritized for curation by chemicals of interest. They are identified by querying titles and abstracts from MEDLINE using PubMed and controlled chemical terms and synonyms from the National Library of Medicine's Medical Subject Headings (MeSH). Documents are ranked in date order (the default order from PubMed). Bio curators read abstracts and full-text articles from which they capture chemical-gene/protein interactions and disease relationships. All curated interactions and relationships are captured using controlled vocabularies and ontologies to maximize consistency among biocurators, ensure reproducible data retrieval by users, and enable integration of CTD data with other databases. The CTD chemical vocabulary derives from a modified subset of the chemicals and supplementary concepts in the "Drugs and Chemicals" category of MeSH. For genes and proteins, CTD uses official gene symbols and names from the National Center for Biotechnology Information's (NCBI) Entrez-Gene database. Where possible Entrez Gene entries representing orthologs are merged into a single, cross-species gene entity in CTD. Curators use these cross-species genes in CTD to capture chemical interactions and disease relationships. The CTD disease vocabulary uses terms from MeSH and OMIM. CTD interaction types are described using terms from a hierarchical vocabulary of 50 diverse relational terms (e.g., "binding," "phosphorylation") developed by CTD curators. Organisms in which chemical-gene interactions are curated are specified using terms from the Eumetazoa portion (vertebrates and invertebrates) of the NCBI Taxonomy database.

A hybrid named entity tagger for tagging human proteins/genes [7] that do analysis of scientific literature is the extraction of gene/protein names in biomedical texts. Which includes three processing steps: Conditional random fields (CRF) for initial learning and labelling, rule based tagging to improve the performance of initial tagging process by checking the specific patterns related to human proteins and genes, and a two stage abbreviation identification algorithm which resolves both short form and long form abbreviations. An integrated approach for human proteins and protein kinases normalization [8]. The task of recognizing and normalizing protein name mentions in biomedical literature is a challenging task and important for text mining applications such as protein–protein interactions, pathway reconstruction and many more. In Homo sapiens, a greater number of biological processes are regulated by a large human gene family called protein kinases by post translational phosphorylation. Recognition and normalization of human protein kinases (HPKs) is considered to be important for the extraction of the underlying information on its regulatory mechanism from biomedical literature. ProNormz distinguishes HPKs from other HPs besides tagging and normalization. ProNormz is the first normalization system available to distinguish HPKs from other HPs in addition to gene normalization task. ProNormz incorporates a specialized synonyms dictionary for human proteins and protein kinases, a set of 15 string matching rules and a disambiguation module to achieve the normalization.

## Methodology:-

The system consists of the main modules (i) gene name identification (ii) relation type identification and the other one is (iii) gene-disease association extraction. Fig. 1 depicts the detailed architecture of the system. The initial input of the system is PubMed biomedical abstracts. Because the system is mainly deals with extracting the relation type and association between gene and disease from the biomedical abstracts. Most of the biomedical information's can be extracted for various research purposes to uncover the hidden information's about the gene and disease. Such biomedical abstracts contain various gene names, human proteins and human protein kinases. The first task of this system is identifying the human genes and human protein kinases in the biomedical document .once the gene names are identified further tasks such as relation identification becomes easier. For the gene name and protein name identification task a tool called Pronormz is used. This tool has an in build tool called NAGGNER for performing the named entity recognition task that is highlighting the gene and protein names in the biomedical abstract. The tool Pronormz consists of four major functional components for the recognition of human gene/protein mentions and mapping them to their corresponding EntrezGene unique identifier, A set of string matching rules to compare the tagged entity with all entries in the dictionary, A disambiguation method if tagged entity maps more than one gene in the dictionary.

The next major task of this system is identification of the relation type between the identified gene and the disease mentioned in the biomedical document. The relation type recognition is further helpful to find the association between the particular gene and disease identified in the document abstract. For the relation identification, the dictionary [10] is classified as four categories namely altered expression, genetic variation, and regulatory modification and unrelated. The relation identification in the biomedical abstract is done using the Stanford parser. The abstract is read and parsed. The parsed sentences are compared with the dictionary that is stored in the hash map. If match occurs with the dictionary while matching, then the relation type is tagged in the corresponding sentence.

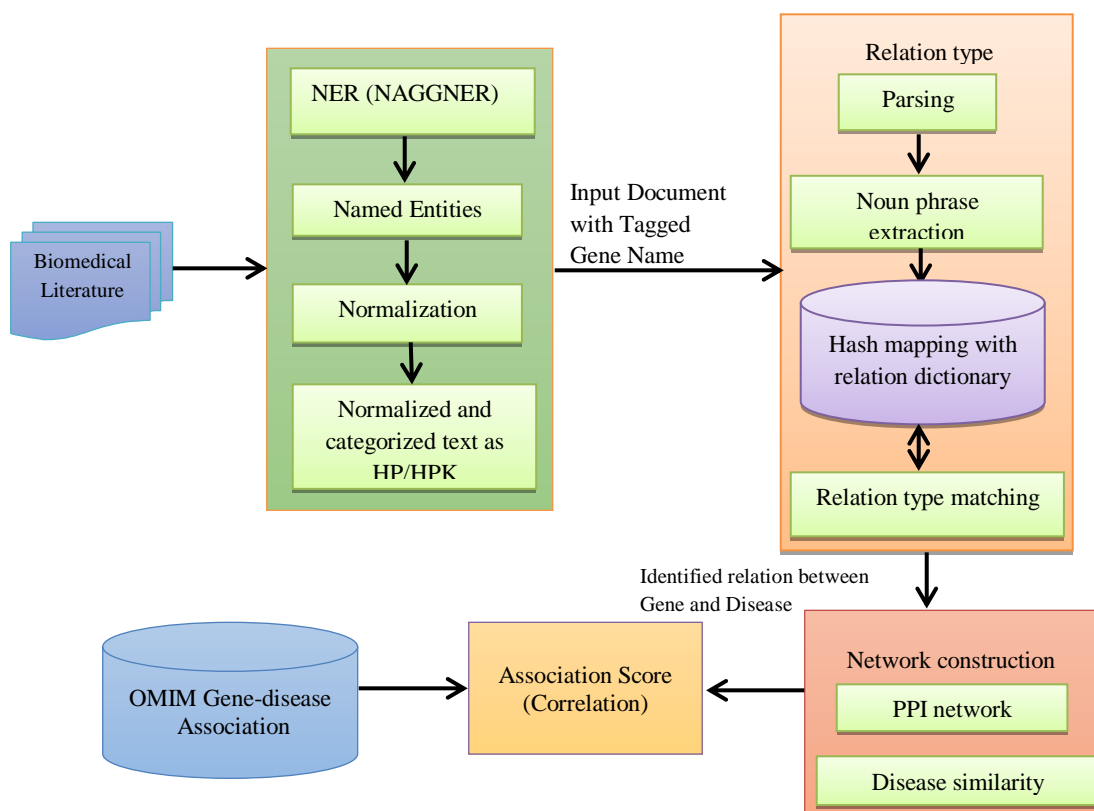

Figure 1 Work flow of the proposed Model

The final major task of the system is association score calculation. After the relation type identification, the association score is calculated between the gene and the disease that is mentioned in the abstract. The major input for the association score module is disease similarity dataset and the protein-protein interaction network. The gene

disease association dataset that contains already found association between gene and disease from OMIM [4]. The association score is calculated in form of matrix using an iterative algorithm. For association score calculation the neighboring genes and the diseases related or similar diseases are also considered. These related genes and diseases are visualized using the software called Cytoscape 3.4.0 that is used for biomedical network construction tasks.

### Gene Name Identification:-

The database of biomedical abstracts contains scientific knowledge about thousands of interacting genes and proteins. Automated text processing can aid in the comprehension and synthesis of this valuable information. The fundamental task of identifying gene and protein names is a necessary first step towards making full use of the information encoded in biomedical text. This remains a challenging task due to the irregularities and ambiguities in gene and protein nomenclature. The task of recognizing and normalizing protein name mentions in biomedical literature is a challenging task and important for text mining applications such as protein-protein interactions, pathway reconstruction and many more. so, a tool called ProNormz is used, an integrated approach for human proteins (HPs) tagging and normalization. In Homo sapiens, a greater number of biological processes are regulated by a large human gene family called protein kinases by post translational phosphorylation. Recognition and normalization of human protein kinases (HPKs) is considered to be important for the extraction of the underlying information on its regulatory mechanism from biomedical literature. ProNormz distinguishes HPKs from other HPs besides tagging and normalization. ProNormz incorporates a specialized synonyms dictionary for human proteins and protein kinases, a set of 15 string matching rules and a disambiguation module to achieve the normalization.

For the gene name tagging module the input is a bio medical literature documents. ProNormz is different from other GN systems in two different ways. First, it is specific system to normalize human proteins and also distinguishes human protein kinases. Second, ProNormz has two in built named entity taggers, NAGGNER and BANNER for GM task. So, it can process and normalize text with pre-tagged protein/gene mentions (GM text) as well as raw text.

**Input:** Biomedical abstracts (PubMed)

### Steps:-

1. Named Entity Recognition (NER) using in build tool Naggner
2. Applying dictionary rules and entity rules on NER text
3. Disambiguation task on NER text
4. NER text is normalized using the specialized synonyms dictionary for human protein (HP) and human protein kinases (HPK)

**Output:** The normalized biomedical abstract with highlighted gene and proteins

### Relation Type Recognition:-

Current biomedical research needs to leverage and exploit the large amount of information reported in scientific publications. Automated text mining approaches, in particular those aimed at finding relationships between entities, are key for identification of actionable knowledge from free text repositories. The relationship identification is mainly based on identifying relationships between biomedical entities with a special focus on genes and their associated diseases. The relation type is identified using the relation type dictionary, in which the relation type is categorized as four types namely altered expression, genetic variation, regulatory modification and unrelated which is given in Table 1. Biomedical text relation type keywords occur as noun phrases but in special cases they occur as verb phrases. The relation type recognition is performed using Stanford parser.

**Table 1:-**Relation Type Dictionary Feature

Relation Type	Feature
Regulatory Modification	Dephosphorylation, Demethylation, Epigenetic, Methylation, Hyper methylation, Hypo methylation, Phosphorylation, Hyper phosphorylation.
Genetic Variation	Allele, Alteration, Autosomal, Biallelic, Amino Acid, Carriers Of, Exchanges, Frameshift, Genotypes, Genotype-Phenotype, Duplication etc.,
Altered Expression	Activation Of, Alternative Splice, Co-Expression, Cross-Regulation, Differentially Expressed, Down-Regulate, Co-Regulate, Expressions, Immunoexpression, Inactivate, MRNA etc.,
Unrelated	But not, No, Neither, Nor, Independently, Not likely, Unlikely that, Unrelated, Does not etc.,

**Input:** Biomedical document (PubMed abstracts)

**Steps:**

1. Loading the relation dictionary using hash map
2. Hash Map <String, String>relation\_dict = load Relation()
3. Read the input document
4. String content = new Scanner(new File(filename))
5. Load the Stanford parser model
6. Lexicalized Parser lp = Lexicalized Parser .load Model(parser Model)
7. Load Treebank Language Pack tlp = lp. Treebank Language Pack()
8. Parsing tree to insert relation id

**Output:** sentences of abstracts with relation id tagged in it

### Gene-Disease Association Extraction:-

A disease-gene association matrix in favor of computing and storing the association scores. The disease similarity network and the protein-protein interaction network are also constructed and incorporated into the formulation of the disease gene association matrix in a simple and compact manner of matrix multiplication. As a result, an iterative algorithm is designed for the computation of the disease-gene association matrix. The disease similarity network and the protein-protein interaction network are coupled in a comprehensive and systematic way for the definition of the disease-gene association score function. Third, an iterative algorithm was designed for the computation of the disease-gene association score matrix for all the diseases and all the candidate genes in the protein-protein interaction network

**Input:-** Identified gene-disease relationship

**Steps:-**

1. Construct matrix  $psim[i, j]$ , the disease similarity network
2. Construct matrix  $G[i, j]$ , the protein-protein interaction network
3. Calculate  $adg$ , where  $Adg = psim * adg^0 * G$

for ( $k - th$  iteration)

$$adg^k = (1 - \alpha) \times psim \times adg^{k-1} \times G + \alpha \times adg^0.$$

where  $\alpha \in (0, 1)$

for ( $k + 1 - th$  iteration)

$$adg[i, j]^{k+1} = \sum_{l=1}^G \left( \sum_{k=1}^{|psim|} psim[i, k] \times adg[k, l^k] \right) \times G[l, j]$$

**Output:** The association score between the gene and disease

### Knowledge Discovery:-

Knowledge discovery is the task of determining whether the discovered association between the gene and disease is new, inferred or already known association. This is determined by the visualization of the network which is constructed by integrating the disease similarity network and protein-protein interaction network. The association type can be visualized using the network construction software Cytoscape 3.4.0. The network contains direct link between the gene (4049) and the disease (607507), this network is constructed from the already available dataset. So the association already exist, thus this belongs to known association. If the associations are not exists in databases but inferred by network analysis of first neighborhood association between genes/diseases and newly retrieved from the literature, then that type of association is called inferred association. If there is no direct or inferred association from the network, then that type of associations are called novel association that are newly retrieved from the literature.

### Experimental Results:-

Two disease related vocabulary resources: Online Mendelian Inheritance in Man (OMIM) and Comparative Toxicogenomics Database (CTD). An OMIM based human disease synonyms dictionary is incorporated. The

relation type dictionary developed by Bundschuh et al is used for relation type identification. (i) Human Disease-Disease similarities (D2D) from MimMiner ii) Protein-Protein interactions (PPI) from Human Protein Reference Database (HPRD) and iii) Gene-Disease associations (G2D) from OMIM morbid map.

**Table 2:-** Datasets Description.

Dataset	Description	Number Of Items
Relation type dictionary	Four types of relations namely altered expression, genetic variation, regulatory modification and unrelated.	197
Disease similarity	Similarity score between two disease	27092
Protein-protein interaction	Two genes that interacts with each other	39142
Gene-disease association	Already found association between gene and disease	4456

### Disease Similarity Network:-

The disease similarity network is introduced, where the node in the network represents a disease, the edge connecting two nodes indicates that the two diseases are similar, and the weight of the edge indicates to what extent the two diseases are similar. A disease similarity matrix  $Psim$  to model this network, in which  $Psim[i, j]$  is the similarity score between disease  $i$  and disease  $j$ . Table 3 defines about the similarity score ranges.

**Table 3:-** Disease Similarity Dataset Feature.

Disease Similarity	Similarity Score Range
Most similarity	0.9 - 1.0
Moderate similarity	0.6 - 0.8
Least similarity	0 - 0.5

Fig. 2. Represents the matrix for disease similarity dataset, in which both column and row represents same set of diseases and each cell value represents the similarity score of the two set of diseases in the respective row and column. In fig.2. Column A and row 1 both represents the same disease.

	A	B	C	D	E	F	G	H	I

**Figure 2:-** Matrix for Disease Similarity Dataset

### Protein-Protein Interaction Network:-

The protein-protein interaction network is modelled as matrix  $G$  fig. 3. In which the value of  $G[i, j]$  indicates whether the interaction between proteins  $i$  and  $j$  exists. The value “1” denotes that the interaction exists, and “0” denotes that the interaction does not exist. In this method, with regard to the association between disease ‘ $d$ ’ and gene ‘ $g$ ’, the associations between the diseases similar to ‘ $d$ ’ and the neighbors of ‘ $g$ ’, the associations between the diseases similar to ‘ $d$ ’ and the neighbors of ‘ $g$ ’, and the associations between ‘ $d$ ’ and the neighbors of ‘ $g$ ’ all need to be considered. So, the protein-protein interaction network is extended by adding the self-interactions of all the proteins into the interaction network. In fig. 8 each row defines the two types of genes that interact with each other in the protein-protein interaction network. Column A and C defines the gene name or symbol, column B and D defines the genes id.

	A	B	C	D	E	F	G	H	I
1	1	0	0	0	1	0	0	0	0
2	0	1	1	0	1	0	0	0	0

5	1	1	1	1	1	1	1	1	1
6	0	0	1	0	1	1	0	0	0
7	0	0	0	1	1	0	1	0	0
8	0	0	0	0	1	0	0	1	0
9	0	0	0	0	1	0	0	0	1

**Figure 3:-Protein-protein Interaction Network as a Matrix Model**

#### Disease-Gene Association Network:-

The gene disease association dataset consists of already discovered gene-disease association data from OMIM. The disease-gene association network is constructed such as the one where the node in the network can be either a disease or a gene and the weighted edge connecting a disease and a gene indicates to what extent the gene is involved in the disease. This network can also be regarded as a bipartite graph. In this method the disease-gene association network is expressed by a disease-gene association matrix  $Adg$ , in which the element  $Adg[i, j]$  stores the association score of gene 'j' and disease 'i' indicating the association strength between the gene and the disease. The gene-disease association dataset consists of gene name or symbol, gene id and the disease OMIM ID that is associated with the respective gene.

#### Gene Name Tagging:-

The gene name tagging module involves named entity recognition of gene/protein in the text which is accomplished by tools NAGGNER for gene mention (GM) task and Pronormz for gene normalization (GN) task. For Pronormz, PubMed biomedical abstract is given as input and the correct gene name tagging is compared with other tools. Precision, recall and F-score are used as evaluation metrics. TP denotes numbers of true positives, FP denotes the number of false positives and FN denotes the numbers of false negatives. The F-score is the harmonic mean of recall and precision.

**Table 4:- Gene Normalization Task Evaluation of PRONORMZ**

Gene Normalization Task	Precision%	Recall%	F-Score%
PRONORMZ	86.66	80.25	83.33
BANNER	65.14	74.52	69.52
NAGGNER	66.19	71.33	68.66

The evaluation of pronormz and its in build tools namely BANNER and NAGGNER for gene normalization task are shown in Table 4. The evaluation of the pronormz and its in build tools are done using the test set of BioCreAtIvE-II Gene Normalization. Pronormz shows comparatively higher precision and recall value than other tools namely BANNER and NAGGNER. Table 5 shows the comparison of Pronormz tool with other tagging tool, in which pronormz shows comparatively better precision and recall value.

**Table 5:- comparison of PRONORMZ with other tools.**

Tool Name	Precision	Recall	F-Score
Hybrid Named Entity Tagger	80.47	71.60	75.77
Abner	86.93	51.49	64.68
Ling Pipe	76.61	83.64	79.97
Memm(Mallet)	84.12	81.75	82.91
Pronormz	86.66	80.25	83.33

#### Relation Type Identification:-

The relation type is tagged in the biomedical abstract using the relation type dictionary using the Stanford parser packages. To identify the relation keyword between the gene and disease. We have used the relation type dictionary

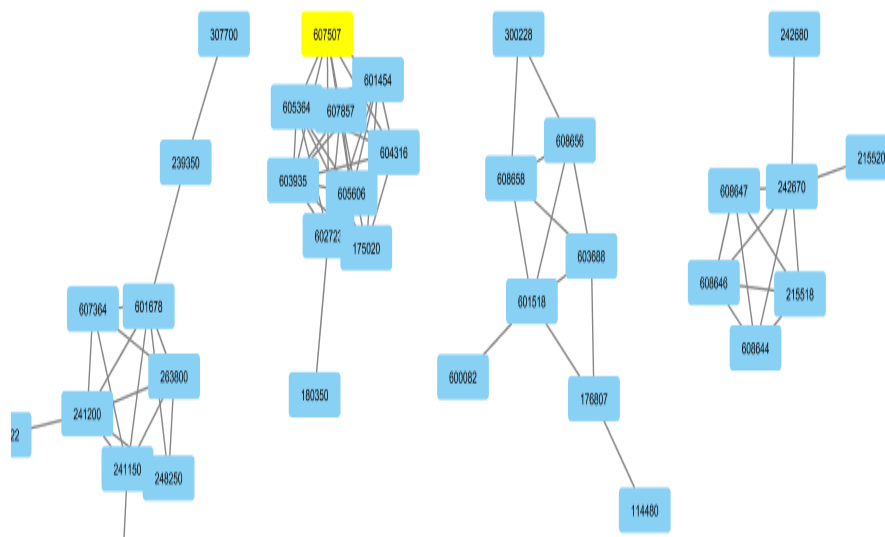

developed by Bundschus [10]. The relation dictionary synonyms are grouped into four relation types namely altered expression, genetic variation, and regulatory modification and unrelated. Table 6 shows the evaluation for relation type identification module.

**Table 6:-** Relation Type Identification Evaluation.

Evaluation Metrics	Relation Type Identification
Precision (%)	94.32
Recall (%)	66.83
F-score (%)	78.23

#### Association Score:-

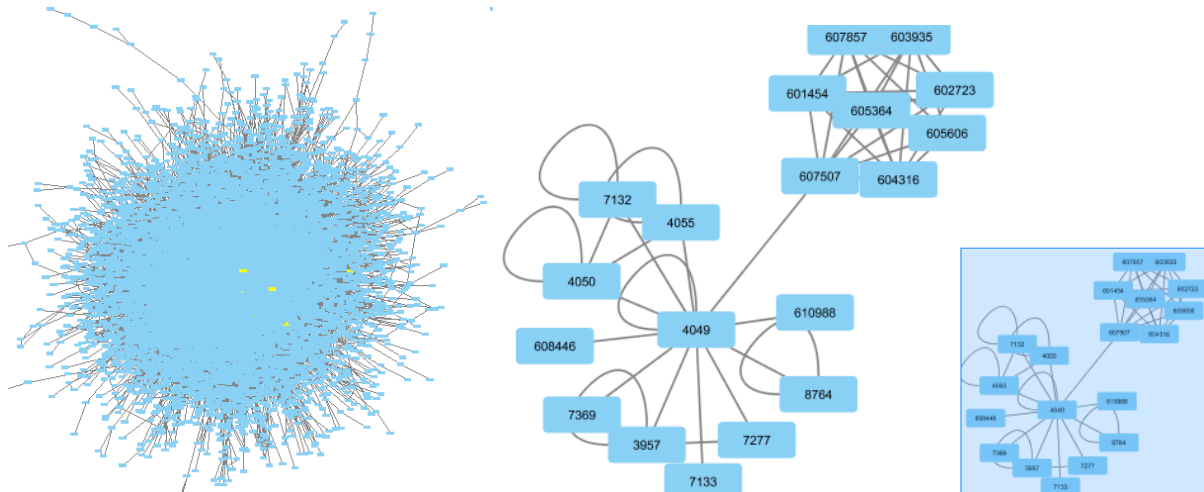

The association score is calculated as a matrix by giving the disease similarity matrix and protein-protein interaction matrix as input. The association score is calculated using the iterative algorithm which defines the correlation between the disease similarity network and protein-protein interaction network. In fig.4, the disease similarity network for psoriasis disease is constructed in the form of matrix. In disease similarity network each cell represents the similarity score between two diseases. The disease that are similar to the disease psoriasis are discovered from the network visualization in Cytoscape 3.4.0 which is depicted in fig. 4 and the disease similarity matrix is constructed. The matrix row and column both contains the disease names that are similar to the disease psoriasis. The matrix cells contain values of only “0” and “1”. “0” represents that there is no interaction between two genes and “1” represents that interaction exist between two gene. The row and column both contains genes that are responsible for disease psoriasis and the genes that interact with the gene LTA. The association score is calculated using an iterative algorithm by including the disease similarity network for psoriasis and the protein-protein interaction network for the gene LTA. Each matrix cell represents the association score between the gene and disease in which the row contains diseases and column contains genes. The association score value defines the association strength between the corresponding gene and disease.

**Figure 4:-** Disease similarity network visualization

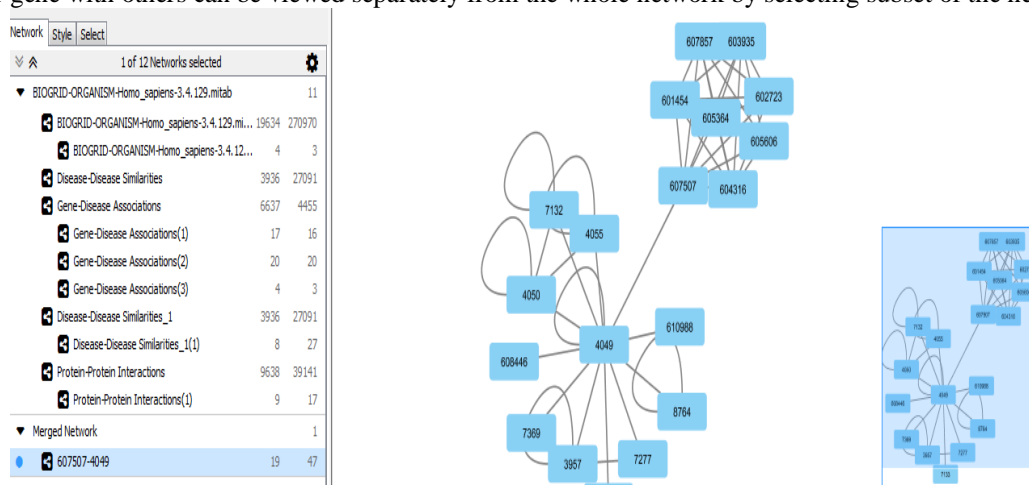

#### Network Construction:-

The network construction is visualized using Cytoscape 3.4.0 software which is a software used for biomedical network construction tasks. The network is constructed by giving the disease similarity network and protein-protein interaction network as input. It will merge the two networks and give the visualization of combined network for the given dataset. From that we can select the subset of network. Fig.5 depicts the Cytoscape network visualization of the disease similarity network which is constructed from the disease similarity dataset. The information provided in the dataset of disease similarity network is constructed as the network by converting the various diseases as nodes and the similarity score information as edges. From this network the subset of the network can be selected for any particular disease.

**Figure 5:-** Protein-protein interaction network visualization

Fig. 6 defines the network construction task of the protein-protein interaction dataset. The network nodes represents the various genes in the dataset and the edges represents the interaction between the two genes. The interaction of a particular gene with others can be viewed separately from the whole network by selecting subset of the network.

**Figure 6:-** Network Construction for protein-protein interaction

### Precision:-

Precision is the fraction of retrieved instances that are relevant. In this system the precision value is calculated for namely three tasks gene identification, relation type identification and association extraction which is plotted as bar chart in fig. 7. The precision value for gene identification task is calculated as the number of genes correctly highlighted in the given input abstract by the tool Pronormz. For the relation type identification task the precision value defines the correctly tagged relation types in the paragraph of abstract.

$$\text{Precision} = \frac{TP}{(TP + FP)}$$

(1)

True Positive (TP) measures the proportion of positives that are correctly identified as such. A False Positive (FP) is an error in some evaluation process in which a condition tested for is mistakenly found to have been detected.

Figure 7:- Precision

**Recall:-**

Recall is the fraction of relevant instances that are retrieved. In fig. 8 the recall value is plotted for gene tagging, relation type identification and association extraction module. Both precision and recall value depends upon the datasets used for this system namely relation dictionary, disease similarity network and protein interaction network. It is the ratio of the number of relevant records retrieved to the total number of relevant records in the database.

$$Recall = TP / (TP + FN)$$

(2)

True Positive (TP) measures the proportion of positives that are correctly identified as such. False Negative (FN) is result that appears negative when it should not.

Figure 8:- Recall

**F-score:-**

F-score is a measure of a test's accuracy, interpreted as a weighted average of the precision and recall

$$F = 2 \times (precision \cdot recall) / (precision + recall)$$

(3)

Fig. 9 defines the F-score value, which is the calculated mean value of both precision and recall. F-score is a measure of a test's accuracy. It considers both the precision P and the recall R of the test to compute the score. P is the number of correct positive results divided by the number of all positive results, and r is the number of correct positive results divided by the number of positive results that should have been returned. The F-score can be interpreted as a weighted average of the precision and recall, where an F- score reaches its best value at 1 and worst at 0.

Figure 9:- F – Score

**Conclusion:-**

The proposed system deals with the gene-disease association extraction along with gene and disease name tagging in the biomedical literature and also the relationship identification between the disease and gene also discovered from the biomedical literature. The gene name tagging and normalization is done using a tool called Pronormz which has an in build tool Naggner for gene name tagging. For association discovery, the disease similarity network and the protein-protein interaction network are coupled together. The association score is calculated using a neighborhood iterative algorithm by constructing three matrices namely disease similarity matrix, protein-protein interaction matrix and the gene-disease association matrix. The definition of disease-gene association score makes full use of the information implicated in both disease similarities and neighboring genes comprehensively. The self-loop in the protein-protein interaction network are considered in the computation of the disease-gene association scores. Advantages of this method are, the prioritization score for candidate genes can give some suggestions for further investigation. Second, the prioritization score can be exploited to identify disease-causing protein sub networks, which are valuable for the study of the multifactorial diseases. In future, the system is going to constructed in such a way that predicting more number of novel genes and also the identification of gene and disease along with the drugs and identifying gene to drug relation and the link prediction concept can also be included in the future work.

#### Abstract

The purpose of this study is to explore the various definitions and descriptions of Corporate Social Responsibility (CSR); elaborate upon development of CSR in India; study the theoretical concepts expounded by various researchers and study the deployment of current CSR practices in India. This paper examines how India's top companies view, and conduct their CSR, identifies key CSR practices and maps these against Global Reporting Initiative standards. The study is divided into various sections: After giving a genesis and background of the subject, the next section gives a review of literature covering various facets and areas, which are touched upon by corporate social responsibility, including the arguments put forward both for and against CSR. Further sections deal with the methodology adopted for the study. The fourth section talks about the Indian experience in the area. The fifth section presents the main findings of the study, collected through the questionnaires sent to all the companies and collated by the research team. The last section enumerates the concluding observation and lessons for future.

#### Introduction:-

The role of business in society has been debated in economic literature for a long time. By the term 'Corporate Social Responsibility' (CSR), what is generally understood is that business has an obligation to society that extends beyond its narrow obligation to its owners or shareholders. This idea has been discussed throughout the twentieth century, but it was Howard R. Bowen's book on "Social Responsibilities of Businessman" published in 1953, which was the origin of the modern debate on the subject. Bowen reasoned that there would be general social and economic benefits that would accrue to society, if business recognized broader social goals in its decisions.

Corporate Social Responsibility is nothing but what an organization does to positively influence the society in which it exists. It could take the form of community relationship, volunteer assistance programmes, healthcare initiatives, special education / training programmes and scholarships, preservation of cultural heritage and beautification of cities. The philosophy is, basically to give back to the society, what it (business) has taken from it, in the course of its quest for creation of wealth.

On the one hand experts have argued that shareholders put their risk capital in a Joint Stock Company (or business) and therefore, companies should be managed in the interest of the owners or the shareholders. This primacy of

**Corresponding Author:- Vikrant Vikram Singh.**

**Address:-** Assistant Professor, Amity Business School, Amity University Madhya Pradesh.

treatment given to the shareholders is being justified on the grounds of ownership and shareholding. It is felt that maximisation of profits or the bottom line should be the ultimate objective of the management. On the other hand, a number of experts will not agree with this position. For example, in Japan employees are treated as family. It is felt that an employee who devotes his or her life to the company has a bigger stake in it as compared to a shareholder. Germany is another nation where stakeholder recognition is high. Prominent among the experts who has taken a broader view is Minks who has argued that any company with a short term view, only maximizing profits for the shareholders, will destroy value in the medium to long run.

It is felt that the moot point here is the time frame. And that in the long run, the sustainability of the enterprise will be of paramount importance. In the long run, interests of both the stakeholders and the shareholders are not only likely to converge, but also have to be balanced.

The more the concepts of CSR are fostered and integrated into the business process, the easier it will be to benefit from alternative thinking and perhaps handle the occasional problems that for certain will occur. The more integrated the business process within the value chain, the more opportunity there will be for organizations to influence the approaches of others on whom they depend. The concept of CSR includes the openness or transparency of companies as well as taking into consideration the will and expectations of their stakeholders.

Social responsibility means a doctrine that claims that an entity whether it is government, Private Corporation or public organization has a responsibility to society. CSR is a concept that reduces costs and risks, increases the brand value and reputation, effectiveness and the efficiency of employees, improves transparency, and clarity in the working environment of the business house.

The main drivers for CSR have been the shrinking role of government, demands for greater disclosure, increased customer interest, growing investor pressure, competitive labor markets, and supplier relations. The companies enjoy several benefits like improved financial performance, lower operating costs, enhanced brand image and reputation, increased sales and customer loyalty, product safety, material recyclability, and greater use of renewable resources etc.

## **CSR in India:-**

### **CSR History:-**

India has a long rich history of close business involvement in social causes for national development. In India, CSR is known from ancient time as social duty or charity, which through different ages is changing its nature in broader aspect, now generally known as CSR. From the origin of business, which leads towards excess wealth, social and environmental issues have deep roots in the history of business. India has had a long tradition of corporate philanthropy and industrial welfare has been put to practice since late 1800s. Historically, the philanthropy of business people in India has resembled western philanthropy in being rooted in religious belief.

Business practices in the 1900s that could be termed socially responsible took different forms: philanthropic donations to charity, service to the community, enhancing employee welfare and promoting religious conduct. Corporations may give funds to charitable or educational institutions and may argue for them as great humanitarian deeds, when in fact they are simply trying to buy community good will. The ideology of CSR in the 1950s was primarily based on an assumption of the obligation of business to society.

In initial years there was little documentation of social responsibility initiatives in India. Since then there is a growing realization towards contribution to social activities globally with a desire to improve the immediate environment (Shinde, 2005). It has also been found that to a growing degree companies that pay genuine attention to the principles of socially responsible behavior are also favored by the public and preferred for their goods and services. This has given rise to the concept of CSR.

After Independence, JRD Tata who always laid a great deal of emphasis to go beyond conducting themselves as honest citizens pointed out that there were many ways in which industrial and business enterprises can contribute to public welfare beyond the scope of their normal activities. He advised that apart from the obvious one of donating funds to good causes which has been their normal practice for years; they could have used their own financial, managerial and human resources to provide task forces for undertaking direct relief and reconstruction measures. Slowly, it began to be accepted, at least in theory that business had to share a part of the social overhead

costs of. Traditionally, it had discharged its responsibility to society through benefactions for education, medical facilities, and scientific research among other objects. The important change at that time was that industry accepted social responsibility

### Review of Literature:-

**Tulsi Jayakumar (2013)** considered whether CSR correspondence issues are diverse in rising economies rather than Western created economies, requiring an alternate worldview of CSR Communication. An inside and out investigation of an Indian MNC auxiliary Hindustan Unilever Ltd. also, an Indian multinational, ICICI, uncovers that both organizations have been rehearsing CSR for quite a while and utilizing an Endorsed system of correspondence instead of the Expert Communication favored by Western standards. This is by virtue of the complex socio social milieu of such EDE resembles India which posture particular imperatives on the Communication procedure. All things considered, they either don't take after/are late participants into the field of corporate reporting utilizing GRI/UNGC standards.

**M Indira & Siddaraju V G (2009)** analyzed the CSR of TVS Motor organization by taking after a contextual analysis strategy. TVS Motor organization is situated at Nanjanagud, Mysore locale of Karnataka. The organization's revelations propose that it is taking up a few activities to enhance the states of the underprivileged in the general public and have a constructive outcome in their lives. Notwithstanding the group activities, TVS Company has been working with the NGOs, nearby powers and organizations, and neighborhood pioneers and government offices. They examined the CSR goals of TVS Company, their ability to recognize social issues, usage of methodologies and changes in the techniques after globalization, social pertinence of the issues tended to by the organization, and the state of mind of the chiefs in the organization towards CSR.

**V Ashotosh et al (2014)** studied the expenditure pattern of corporates towards CSR activities in the period of voluntary spending and based on the results, evaluated whether insertion of such a provision in the Act was necessary or not. They took sample consists of thirty companies included in BSE Sensex from 2001 to 2012. The analysis was done on the basis of number of companies spending on CSR, details of CSR expenditure, amount of CSR spending as percentage of sales and profits for each year and on an overall basis. The analysis showed that the CSR spending has been very low as percentage of revenue and profits during the phase of voluntary spending. The results also suggested that spending on environment and pollution control is not on the priority list of companies. Though, impact of CSR activities cannot always be evaluated in terms of fund allocations, still it is one of the most important indicators of the engagement of companies with society. Therefore, based on the findings, they concluded that insertion of this provision was an appropriate step by the regulators to make corporates socially more responsible.

**B Prema (2009)** analyzed the impact analysis of microfinance programme which was undertaken a decade ago by Forbes Marshall India Ltd, Pune. The analysis was based on primary data collection of 217 SHG members of SHGs formed by the company through the interview technique.

Study suggested that the microfinance has resulted in increasing the economic empowerment of SHG members belonging to weaker socio economic class. The paper also concluded that the level of economic empowerment of SHG members increases with the number of years of association with the SHG. At the end some suggestions were incorporated to give new directions to microfinance programme to fulfill new aspirations of SHG members.

**J Tulsi (2013)** analysed the CSR practices followed by HUL in its unit in DoomDooma, Assam in the period 2001-2004, a period which was one of the most tumultuous periods in the history of HUL operation in India. The largest personal care products factory set up in DoomDooma to take advantage of the government's concessions to encourage the region's development, witnessed serious challenges in the form of local bandhs (closures) and followed by an attack by the militant group, ULFA. Yet, the productivity contribution of the Assam factory was one of the highest and in fact was responsible for the company's top line growth.

She suggested that the financial performance was due in no small measure, to the corporate responsibility measures undertaken internally and externally by the company. The former consisted of the measures undertaken vis à vis the key stakeholders, viz. employees, consumers, ecosystem, and business partners while the external CR measures were with respect to the specific CSR initiatives undertaken keeping in mind the needs and expectations of the local community. Thus, the company's CR initiatives helped in sustainable growth.

She investigated whether firms operating in conflict zones can survive and sustain profitable business operations in the midst of a conflict using the tool of CSR. The objective was to see if an MNC can, through the employment of CSR, gain acceptability of a community which is confronted with social challenges and conflict, and in turn, can use such legitimacy for enhancing the value of its stakeholders. It does so by carrying out an in depth study of one of the oldest MNCs and the largest Fast Moving Consumer Goods (FMCG) company operating in India – Hindustan Unilever Limited (HUL), following the case study method of analysis. The case pertained to the CSR initiatives undertaken by HUL in its unit in Doom Dooma, Assam in the period 2001-2004.

**C Barnali & G Neeran (2013)** examined the CSR initiative of Coca Cola India through public private partnership method for contribution towards Water Management in Kaladera region by involving the government and the local community. They concluded that Setting up the plant in Kaladera resulted in strong resistance and protests of local residents. The company transformed the resistance into enormous popularity through its CSR activities and by involving the stakeholders in the execution and implementation of its plan. Coca Cola – India now enjoys local favor as it succeeded in translating the issues of the local community of Kaladera. The action plans had done wonders for boosting up the confidence level of the villagers and changing the perception about the company. Initially skeptical, the villager's apathy gradually gave way to mutual trust and cooperation.

**W Philippa et al (2013)** tried to explore the matter of whether such directors are influencing corporates in their sustainability and CSR policies. Within a framework shaped by Institutional theory, and via an examination of the publicly available published reports and other documented information on the Top 50 companies on the New Zealand Exchange (the NZX), they explored this question. The initial findings from this examination suggested that the reporting and performance record for these New Zealand corporates was both disappointing and limited. The finding was all the more interesting in light of the country's global "100% pure" marketing mantra and the environmentally responsible image and reputation the country seeks to cultivate internationally.

**Sumona Ghosh (2015)** investigated the pattern of communication of CSR information among the private sector companies in India, she pointed out that as reflected in the corporate websites taking absolute profit as the parameter and show that the corporate sector in India is yet to fully recognize the value of open communication about CSR practices to meet the needs of an increasingly transparent marketplace and to help build corporate reputation.

They concluded that companies belonging to higher deciles reported more substantial information about their CSR activities, than those belonging to the lower deciles, but the companies preferred to report more on pursuit of CSR activities with/through the help of foundations/ trusts/NGOs/government partnerships than crucial issues like disclosure of financial information on CSR activities. Thus, *richness of the content* with respect to disclosure of the number of beneficiaries that were benefitting from their CSR activities and the disclosure of financial information on CSR activities in the official websites was very shallow.

**N.K.Nair & J.S. Sodhi (2012)** analyzed the major findings of five case studies on the best CSR practices by Indian SMEs prepared by a team of researchers from Shri Ram Centre for Industrial Relations & Human Resources, New Delhi. They recommended that a lead institution may be nominated in each district to serve as a mediator. They also pointed out that supply chain pressures/opportunities to induce increasing number of SMEs to resort to CSR initiatives have been found missing. Finally they suggested that all the case examples presented in their study bear testimony to the need for the local community's involvement /support, directly or indirectly, to the full/partial success of SMEs' CSR initiatives. The least that could be done by the Ministry of Micro, Small & Medium Enterprises (MSME) is to recognize the CSR initiatives by SMEs through a suitably designed scheme of national awards.

### **Objectives of the Study:-**

1. To study the CSR Initiatives of leading companies in India.
2. To analyze and comparison of CSR practices and Ethics of various companies in India.
3. To study and explore the various areas of CSR activities done by Indian Companies.

### **Research Methodology:-**

The present study is based on data / information collected from large sized Indian companies, more specifically from those companies that were included in the National Stock Exchange's broad based index - S&P CNX NIFTY, during

January 2014-15. This represents fifty companies, with issued capital of Rs. 96,108 million and market capitalisation of Rs. 3,024,720 million.

A structured questionnaire was sent to all the companies through post, explaining the background and objectives for undertaking the study.

Despite close, rigorous follow-up, spread across two months, through e-mail, letters, telephone calls and even personal visits, response was received from only 19 companies. Two of the companies responded by saying the information was confidential and regretted their inability to share it with us. This was despite our assurance in writing that data would be consolidated and companies' names would not be revealed. Data for an additional 11 companies was culled out from other published sources as detailed in section on the main findings of the study later.

The purpose of the documentation is to bring out the similarities and differences of social responsibility initiatives, their decision making process, implementation modes and review mechanisms.

The review of literature as also the section on Indian experience is an attempt to put the entire gamut of discussions, developments on the CSR front in a perspective against which our own data is analysed and interpreted.

#### **IV Indian Experience:-**

There has been very little systematic documentation of Social Responsibility initiatives of corporates in India in the past, other than the brochures and publicity material brought out by the companies themselves. But in the last 3-4 years, 2 important surveys have been conducted, which have some significant macro level conclusions about India Incorporated and their journey on the social responsibility front.

Serious and committed approach to corporate responsibility practices is increasing its reach, but there is a vast ground yet to be covered. Corporate sector is slowly realising the positive aspects of corporate responsibility practices (good for business is good business). There is growing collaborative work between NGOs and companies. All stakeholders are increasingly becoming aware of the diverse facets of corporate responsibility practices. Due to various internal and external pressures, the climate is conducive for the growth of corporate responsibility practices in India.

Although many companies, NGOs and trade unions were aware of corporate responsibility practices, the study findings suggest that the concepts have yet to become part of core business strategy in most companies in India. Almost all companies, irrespective of size and sector had some awareness of corporate responsibility and its potential benefits. While most companies also had policies in place related to labour issues, community relations and environmental practices, they were for the most part not backed up by comprehensive implementation and monitoring systems.

Community programmes or social development initiatives, in most cases, were philanthropic and/or ad hoc in nature and not integrated into core business activities such as marketing and brand management.

#### **Analysis & Findings of the Study:-**

A structured questionnaire, specially designed for the study, was sent to all the fifty companies included in the NSE NIFTY Index.

It is appropriate to mention here that despite rigorous, consistent and close follow up with the companies through courier, telephone, e-mail and at times through personal visits, the response to the questionnaire has not been encouraging at all. Out of the 50 companies, only 19 companies have responded to the questionnaire. To make the sample more representative, we have been able to extract some / most of the information pertaining to the subject for an additional 11 companies from a) the published annual reports, b) director's reports, c) brochures published by the companies from time to time and d) other articles etc published about the CSR initiatives of these companies in reputed journal and financial dailies and weeklies. Thus, the total number of companies for which the data is available is 30, which is 60 % of the companies selected for the analysis. Considering the response to some of the earlier attempts made to document / study the area, by Chambers of Commerce, along with some multilateral agencies, the response may be considered reasonable.

The following table gives the sector wise composition of the NIFTY companies and similar analysis for the responding companies:

Sector	Composition of	
	All NIFTY Cos	*Responding Cos
Private Sector Indian Cos	72 %	89.5 %
Multi National Cos	12 %	3.5 %
Public Sector Cos	16 %	7 %
Total	100 %	100 %

\*Refers to only those companies that responded to the questionnaire.

The following are some general observations on the responding companies, which may be useful to keep in view while analysing the response:

- None of the computer software / hardware companies have responded to the questionnaire, with just one exception.
- Only two public sector undertakings have responded to our questionnaire. This is despite the well-known fact that many of them are active in the social responsibility areas.
- Out of the seven Tata Group companies included in the NIFTY list, as many as five have responded.
- Responses have come from different departments and offices within the companies, like the Office of the Company Secretary, Human Resource Department, and Department of Corporate Communications and in couple of cases from Ethics Counselors and specially created Department for Social Initiatives.

**The important findings of the study are discussed in the following paragraphs:-**

I) About 57 % of companies in the sample have a formally adopted ethics code. The nomenclature for these codes varies from company to company: Some companies call it 'Code of Conduct', others 'Core Statement of Values' and still others by some other name.

All these companies are treated, for the purpose of our analysis as having an Ethics Code.

One third of the companies do not have a formally adopted code, while for 10 % of the companies the information is not available.

About the process through which the code has been evolved, most companies have chosen to remain silent. Few companies have offered the following information and comments:

- Historically evolved
- Before adoption discussed among senior management and board of directors
- Before adoption discussed with present as well as past employees
- Studied & attempted to incorporate international standards and best practices
- Democratically evolved

Just one third of the companies have an Ethics Officer or an Ethics Counselor. Another 40 % of the companies do not have a specifically designated officer, but many of these companies have indicated that other departments and/or offices look after this function. 27 % of the companies have not given any information.

	Cos having one		Cos Not having one		Information NA	
	Number	%	Number	%	Number	%
Formal Ethics Code	17	57	10	33	03	10
Ethics Officer / Ethics Counselor	10	33	12	40	08	27

II) As far as the areas of interventions or content of the social responsibility initiatives is concerned, these have been classified into seven major areas as listed in Table below. Most companies are active in more than one area and therefore, the total does not add up to 100 per cent, but is more than that.

Sr.	Area of CSR Interventions	Number of Cos	No Percentage of Cos @
1	Education / Training	24	80
2	Health Care	20	66
3	Environment	18	60
4	Religious / Spiritual	Nil	Nil
5	Welfare of Under privileged Sections	17	57
6	Rural Development	7	23
7	Natural & Other Calamities	14	46
8	Any Other	12	40

Areas in which large proportions of the sample companies are active are Education & training ( 80 % ), Healthcare ( 66 % ), Environment ( 60 % ), Welfare of under privileged sections of the society ( 57 % ) and Rural development ( 23 % ).

There are two surprising results, which emerge out of the above analysis –

Firstly, none of the companies have said that they are doing anything actively in the area of religion and spiritual development. While it is well known that a number of companies, some of them belonging to some particular industrial groups, are doing a lot in this area. One probable reason for this could be that these activities are being undertaken by trusts formed specifically for the purpose, though under the umbrella of the group.

Second, surprising finding is that less than half (more specifically only 46 %) of the companies in the sample have mentioned natural & other calamities as part of the area in which they are active. One would have probably expected all companies to be doing their bit in this area.

##### Key words:-

Nearly quasi prime submodules, quasi prime submodules, prime submodules, pseudo – primesubmodules, nearly primesubmodules.

#### Abstract

Let  $R$  be a commutative ring with identity and  $M$  be a unitary of  $R$ -module. A proper submodule  $N$  of  $M$  is called a quasi-prime if whenever  $bx \in N$ ;  $a, b \in R, x \in M$ , implies that either  $ax \in N$  or  $bx \in N$ . In this paper we say that  $N$  is a nearly quasi prime, if whenever  $abx \in N$ ;  $a, b \in R, x \in M$ , implies that either  $ax \in N + J(M)$  or  $bx \in N + J(M)$ , where  $J(M)$  is the Jacobson radical of  $M$ . Some of the properties of this concept will be investigated. Some characterizations of nearly quasi prime submodules will be given, and we show that under some assumptions quasi prime submodules and nearly quasi prime submodules are coincide.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

A submodule of an  $R$ -module  $M$  which Birkenmeier [1] was named prime submodules that they are generalized of prime ideals, which get big importance at last years, many studies and searches are published about prime submodules by many people who care with the subject of commutative algebra and some of them are C.P .Lu, P.F .Smith, J .Dauns. The definition comes in [1] as following we say that a proper submodule  $N$  of  $M$  is called prime if whenever  $r \in R, m \in M, rm \in N$  implies either  $m \in N$  or  $r \in [N:M]$  where  $[N:M] = \{r \in R : rM \subseteq N\}$ . Many generalizations of primesubmodules were studied such a nearly prime, weakly prime, quasi prime, pseudo – prime and on almost prime, see [2, 3, 4, 5]. In this article, we give another generalization of prime submodule it is nearly quasi prime submodule if  $abm \in N$  for  $a, b \in R$  and  $m \in M$ , then either  $am \in N + J(M)$  or  $bm \in N + J(M)$ . We give some characterizations for this concept. Also, we look for the relationships between nearly prime submodules and other well knowssubmodules.

#### Basic PropretiesOf Nearly Quasi Prime Submodules:-

In this section we introduce the concept of nearly quasi prime submodule as a generalization of a prime submodule.

##### Definition(2. 1):-

A proper submodule  $N$  of an  $R$  – module  $M$  is said to be a nearly quasi prime submodule if whenever  $r_1.r_2x \in N$  for  $r_1, r_2 \in R$  and  $x \in M$ , then either  $r_1x \in N + J(M)$  or  $r_2x \in N + J(M)$ . Equivalently, a proper submodule  $N$  of an  $R$  – module  $M$  is said to be a nearly quasi prime if and only if  $[N + J(M):Rx]$  is a prime ideal of  $R$ , for each  $x \in M$ .

**Remarks and Examples (2.2):-**

Let  $M$  be the  $Z$  – module  $Z \oplus Z$  and  $K = 6Z \oplus \langle 0 \rangle$ . Then  $K$  is not nearly quasi prime submodule of  $M$ , since  $2.3(1,0) \in K$  but  $2(1,0) \notin K + J(M)$ ,  $3(1,0) \notin K + J(M)$ .

Let  $N, K$  be two submodules of an  $R$  – module  $M$  and  $N \subseteq K$ . If  $N$  is a nearly quasi prime submodule of  $M$  and  $J(M) \subseteq J(K)$ , then  $N$  is nearly quasi prime submodule of  $K$ .

**Proof:** Let  $a, b \in R, m \in K$  such that  $a.bm \in N$ . Since  $N$  is nearly quasi prime submodule of  $M$ , so either  $am \in N + J(M)$  or  $bm \in N + J(M)$ . But  $J(M) \subseteq J(K)$ , so either  $am \in N + J(K)$  or  $bm \in N + J(K)$ . Therefore  $N$  is nearly quasi prime submodule of  $K$ .

A submodule of a nearly quasi submodule need not be a nearly quasi prime submodule : For instance,  $N = \langle \bar{3} \rangle$  is a  $Z$  – submodule of the  $Z$  – module  $Z_{12}$ . It is clear that  $N$  is a nearly quasi prime of  $Z_{12}$ , but  $K = \langle \bar{6} \rangle$  is not a nearly quasi prime submodule of  $M$  since  $[K + J(M) : (\bar{1})] = [\langle \bar{6} \rangle + \langle \bar{6} \rangle : (\bar{1})] = 6Z$ , which is not a prime ideal of  $Z$ .

It is clear that every quasi prime submodule is a nearly quasi prime, but the converse is not true in general for examples:

The submodule  $Z$  of the  $Z$ - module  $Q$  is a nearly quasi prime submodule since for each  $m \in Q$ ,  $[Z + J(Q) : (m)] = [Z + Q : (m)] = [Q : (m)] = Z$ , which is a prime ideal of  $Z$ . But it is not quasi prime submodule of  $M$  by [3, remark (2.1.2,(4))].

The submodule  $Z \oplus \langle \bar{4} \rangle$  of the  $Z$  – module  $Z \oplus Z_8$  is a nearly quasi submodule since for each  $m \in Z \oplus Z_8$ ,  $[Z \oplus \langle \bar{4} \rangle + J(Z \oplus Z_8) : (m)] = [Z \oplus \langle \bar{4} \rangle + J(Z) \oplus J(Z_8) : (m)] = [Q : (m)] = Z$ , which is a prime ideal of  $Z$ . But it is not quasi prime submodule by [3, Rem.2.1.2, (5)].

Consider the  $Z$  – module  $M = Z \oplus Z_2$  and the  $Z$  –submodule  $N = (0) \oplus (0)$ . Then, for any  $x \in M$  implies  $[N + J(M) : (x)] = [(0) \oplus (0) + J(Z \oplus Z_2) : (x)] = [(0) + Z_2 : (x)] = 2Z$ , which is a prime ideal of  $Z$ . Therefore,  $N$  is a nearly quasi prime submodule of  $M$ .

It is clear that every prime submodule is a nearly quasi prime submodule.

**Proof:** Let  $N$  be a prime submodule of an  $R$  – module  $M$ . Then  $N$  is a quasi prime submodule of  $M$  by [3,remark(1)]. Therefore  $N$  is a nearly quasi prime submodule of  $M$ .

But, the converse is not true in general for example  $(0) \oplus (0)$  is not prime submodule of  $Z \oplus Z_2$ , see [3, remark(1.1.3,(8))], but  $(0) \oplus (0)$  is a nearly quasi prime submodule of  $Z \oplus Z_2$ , by (2.2,(5)).

An ideal  $I$  is a nearly quasi prime ideal of  $R$  if and only if  $I$  is a nearly quasi prime  $R$  – submodule of  $R$  –module.

Consider the  $Z$  – module,  $= Z \oplus Z$ . The submodule  $N = 2Z \oplus \langle 0 \rangle$  is a nearly quasi prime submodule of  $M$  since for any  $m \in M$ ,  $[N + J(M) : (m)] = [2Z \oplus \langle 0 \rangle + (0) \oplus (0) : (m)] = \langle 0 \rangle$ , which is a prime ideal of  $Z$ .

1. It is clear that every maximal submodule is a nearly quasi prime submodule. But the converse is not true in general for example. Let  $M = ZP \oplus Z$  as  $Z$  – module,  $N = ZP \oplus \{0\}$  is a nearly quasi prime submodule (since  $N$  is a prime). But  $N$  is not maximal by [19,example (2), chapter].
2. If  $M$  is a simple  $R$  – module, then the zero submodule is a nearly quasi prime submodule of  $M$ . Hence  $\langle \bar{0} \rangle$  is the only nearly prime submodule of  $Z_p$  ( $p$  is prime number).
3. Let  $N$  and  $W$  be two submodules of an  $R$  – module  $M$  such that  $N \cong W$ . If  $N$  is a  $N$  – prime submodule, then it is not necessary that  $W$  is a nearly Prime submodule as the following example explains this :

Consider the  $Z$  – module  $Z$ , the submodule  $2Z$  is a nearly quasi prime submodule of  $Z$  and  $2Z \cong 30Z$ . But  $30Z$  is not a nearly quasi prime submodule of  $Z$ . Since  $6.5(1) \in 30Z$ , but  $5(1) = 5 \notin 30Z + J(Z) = 30Z + 0 = 30Z$  and  $6(1) = 6 \notin 30Z + J(Z) = 30Z + 0 = 30Z$ .

Consider the  $Z$  – module  $M = Z \oplus Z$ . The submodule  $N = 8Z \oplus 9Z$  is not nearly quasi prime since  $2.4(1,9) = (8, 72) \in 8Z \oplus 9Z$ ,  $2(1,9) \notin 8Z \oplus 9Z + J(Z \oplus Z) = 8Z \oplus 9Z$  and  $4.(1,9) \notin 8Z \oplus 9Z + J(Z \oplus Z) = 8Z \oplus 9Z$ .

The following theorem gives some characterizations for nearly quasi prime submodule

**Theorem (2.3):-**

Let  $N$  be a proper submodule of an  $R$  – module. Then the following are equivalent:

1.  $N$  is a nearly quasi prime submodule of  $M$ .
2.  $[N + J(M): K]$  is a prime ideal of  $R$ , for each submodule  $K$  of  $M$ .
3.  $[N + J(M): (rx)] = [N + J(M): (x)]$ , for each  $x \in M, r \in R$  and  $r \notin [N + J(M): (x)]$ .

**Proof:**

(1)  $\rightarrow$  (2): Let  $N$  be a nearly quasi prime submodule of  $M$ . Then  $[N + J(M):_R (x)]$  is a prime ideal of  $R$  for each  $x \in M$ . So  $[N + J(M):_R (x)]$  is a prime ideal of  $R$  for each  $x \in K$ . And by [3, lemma(1.2.5)],  $[N + J(M): K]$  is a prime ideal of  $R$ .

(2)  $\rightarrow$  (3) It is clear that  $[N + J(M): (x)] \subseteq [N + J(M): (rx)]$ . Let  $m \in [N + J(M): (rx)]$  for  $r \notin [N + J(M): (x)]$  and  $x \in M$ . Hence,  $m(rx) \subseteq N + J(M)$ . It follows that  $mr \in [N + J(M): (x)]$ , which is a prime ideal by (2). But  $r \notin [N + J(M): (x)]$  so  $m \in [N + J(M): (x)]$ . Thus,  $[N + J(M): (rx)] \subseteq [N + J(M): (x)]$ . Therefore,  $[N + J(M): (rx)] = [N + J(M): (x)]$ .

(3)  $\rightarrow$  (1): Let  $x \in M$  and  $a, b \in R$  such that  $ab \in [N + J(M): (x)]$ , suppose  $b \notin [N + J(M): (x)]$ , hence by (3),  $[N + J(M): (bx)] = [N + J(M): (x)]$ . But  $a \in [N + J(M): (bx)]$ , so  $a \in [N + J(M): (x)]$  and hence  $N$  is a nearly quasi prime submodule of  $M$ .

The following is an immediate consequence of (2.3.).

**Corollary (2.4):-**

Let  $N$  be a submodule of an  $R$  – module  $M$ . If  $N$  is a nearly quasi prime submodule of  $M$ , then  $[N + J(M): M]$  is a prime ideal of  $R$ .

The converse of corollary (2.4) is not true in general for example: Let  $M = Z \oplus Z$  as a  $Z$  – module and  $N = 6Z \oplus 0$ , then  $[6Z \oplus 0 + J(Z \oplus Z): Z \oplus Z] = (0)$  is a prime ideal of  $Z$ . But  $N$  is not a nearly quasi prime submodule of  $M$  see (Rem.2.2,(1)).

**Corollary (2.5):-**

Let  $N$  be a submodule of an  $R$  – module  $M$ . If  $N$  is a nearly quasi prime submodule of  $M$ , then  $[N + J(M): rM] = [N + J(M): M]$ ,  $\forall r \notin [N + J(M): M]$ .

**Proof:-**

Let  $a \in [N + J(M): rM]$  so  $arM \subseteq N + J(M)$  which means that  $ar \in [N + J(M): M]$ . But  $N$  is a nearly quasi prime submodule of  $M$ , so by corollary (2.4),  $[N + J(M): M]$  is a prime ideal of  $R$ . Hence either  $a \in [N + J(M): M]$  or  $r \in [N + J(M): M]$ , but  $r \notin [N + J(M): M]$ . So  $a \in [N + J(M): M]$ , thus  $[N + J(M): rM] \subseteq [N + J(M): M]$ . But it is clear that  $[N + J(M): M] \subseteq [N + J(M): rM]$ , so we obtain the result.

The converse of corollary (2.5) is not true for instance: Let  $M = Z$  as a  $Z$  – module, let  $N = 8Z, r = 5, 5 \notin [8Z + J(Z): Z] = [8Z + (0): Z] = 8Z$  and  $[8Z + J(Z): 5Z] = 8Z$  so  $[N + J(M): rM] = [N + J(M): M] = 8Z$ . But  $N = 8Z$  is not nearly quasi prime submodule of  $Z$ .

Let  $R$  be any ring. A subset  $S$  of  $R$  is called multiplicatively closed if  $1 \in S$  and  $ab \in S$  for every  $a, b \in S$ . We know that every proper ideal  $P$  in  $R$  is prime if and only if  $R - P$  is a multiplicatively closed subset of  $R$ , [7, p.42]. And if  $N$  a submodule of an  $R$  – module  $M$  and  $S$  be a multiplicatively closed subset of  $R$ , then  $N(S) = \{x \in M : \exists t \in S, \text{ such that } tx \in N\}$  be a submodule of  $M$  and  $N \subseteq N(S)$ .

However, the following proposition gives a partial converse of corollary (2.4).

**Proposition(2.6):-**

Let  $N$  be a proper submodule of an  $R$  – module  $M$ . If  $P = [N + J(M): M]$  is a prime ideal of  $R$  and  $N(S) = N + J(M)$  (where  $S = R - P$ ), then  $N$  is a nearly quasi prime submodule of  $M$ .

**Proof:-**

Since  $P$  is a prime ideal, so  $R - P$  is a multiplicatively closed subset, see[7,p.42]. Let  $a, b \in R, m \in M$  such that  $abm \in N$ . Suppose that  $am \notin N + J(M)$  so  $a \notin [N + J(M): R(m)]$ , hence  $a \notin [N + J(M): RM] = P$ , then  $a \in S$ . Similarly  $b \in S$ . So  $bm \in N + J(M)$  which mean that  $N$  is a nearly quasi prime submodule of  $M$ .

**Proposition(2.7):-**

Let  $K$  and  $N$  be two submodules of an  $R$  – module  $M$ . Then  $N$  is a nearly quasi prime submodule of  $M$  if and only if  $abK \subseteq N$  implies either  $aK \subseteq N + J(M)$  or  $bK \subseteq N + J(M)$ .

**Proof:-**

Let  $abK \subseteq N$  and suppose  $aK \not\subseteq N + J(M), bK \not\subseteq N + J(M)$ . So there exists  $m_1, m_2 \in K$  such that  $am_1 \notin N + J(M)$  and  $bm_2 \notin N + J(M)$ . Since  $N$  is nearly quasi prime and  $abm_1 \in N$  and  $am_1 \notin N + J(M)$ , so  $bm_1 \in N + J(M)$ . Also  $abm_2 \in N$  and  $bm_2 \notin N + J(M)$  so  $m_2 \in N + J(M)$ .

The converse is clear.

The intersection of any collection of nearly quasi prime submodules of an  $R$  – module not necessarily nearly quasi prime submodules,  $N_1 = \langle 2 \rangle$  and  $N_2 = \langle 3 \rangle$  are nearly quasi prime submodules of  $Z_{12}$  as a  $Z$  - module. But  $N_1 \cap N_2 = \langle 6 \rangle$  is not nearly quasi prime submodule of  $Z_{12}$ , since  $2 \cdot 3 \cdot 1 = 6 \in N_1 \cap N_2 = \langle 6 \rangle$  but  $2 \cdot 1 \notin \langle 6 \rangle + J(Z_{12}) = \langle 6 \rangle$  and  $3 \cdot 1 \notin \langle 6 \rangle + J(Z_{12}) = \langle 6 \rangle$ .

Recall that a ring  $R$  is said to be a good ring if  $J(M) = J(R)M$  for each  $R$  – module  $M$ , equivalently,  $R$  is a good ring if and only if  $J(N) = J(M) \cap N$  for each submodule  $N$  of an  $R$  – module  $M$ , [8, p.236]. And a ring  $R$  is called a regular ring if each of its elements is regular, where an element  $a \in R$  is said to be regular if  $\exists x \in R$  such that  $axa = a$ , [8,p.184]. It is known that if  $R/J(R)$  is a regular ring, then  $R$  is a good ring.

Hence, we have the following Result:-

**Proposition(2.8):-**

Let  $R$  be a good ring. If  $N$  is a nearly quasi prime submodule of an  $R$ - module  $M$  and  $K$  be a submodule of  $M$  such that  $J(M) \subseteq K$  and  $K$  is not contained in  $N$ , then  $K \cap N$  is a nearly quasi prime submodule of  $K$ .

**Proof:-**

Since  $K \not\subseteq N$ , then  $K \cap N$  is a proper submodule of  $K$ . Let  $r_1, r_2 \in R$  and  $x \in K$  such that  $r_1 r_2 x \in K \cap N$ , so  $r_1 r_2 x \in N$ . But  $N$  is a nearly quasi prime submodule of  $M$  so either  $r_1 x \in N + J(M)$  or  $r_2 x \in N + J(M)$ . Since  $x \in K$  implies that either  $r_1 x \in (N + J(M)) \cap K$  or  $r_2 x \in (N + J(M)) \cap K$ . Since  $J(M) \subseteq K$  implies that either  $r_1 x \in (N \cap K) + (J(M) \cap K)$  or  $r_2 x \in (N \cap K) + (J(M) \cap K)$  by [8]. But  $R$  is a good ring, so either  $r_1 x \in (N \cap K) + J(K)$  or  $r_2 x \in (N \cap K) + J(K)$  by [24]. Therefore  $K \cap N$  is a nearly quasi prime submodule of  $K$ .

**Corollary(2.9):-**

Let  $R$  be a good ring. If  $N$  is a nearly quasi prime submodule of an  $R$ - module  $M$  and  $K$  is a maximal submodule of  $M$  is not contained in  $N$ , then  $N \cap K$  is a nearly quasi prime submodule of  $K$ .

**Proof:-**

Since  $K$  is a maximal submodule of  $M$ , so  $J(M) \subseteq K$ . Hence the result follows by proposition(2.8).

**Corollary(2.10):-**

Let  $R/J(R)$  is a regular ring. If  $N$  is a nearly quasi prime submodule of  $M$  and  $K$  is a maximal submodule of  $M$  is not contained in  $N$ , then  $N \cap K$  is a nearly quasi prime submodule of  $K$ .

**Proposition (2.11):-**

Let  $N, K$  be two nearly quasi prime submodules of an  $R$  – module  $M$ . If  $J(M) \subseteq K$  or  $J(M) \subseteq N$ , then  $N \cap K$  is a nearly quasi prime submodule of  $M$ .

**Proof:-**

Let  $r_1, r_2 \in R$  and  $m \in M$  such that  $r_1 r_2 m \in N \cap K$ , so  $r_1 r_2 m \in N$  and  $r_1 r_2 m \in K$ . But  $N, K$  are nearly quasi prime submodules of  $M$ , so either  $r_1 m \in N + J(M)$  or  $r_2 m \in N + J(M)$  and either  $r_1 m \in K + J(M)$  or  $r_2 m \in K + J(M)$ . Thus either  $r_1 m \in (N + J(M)) \cap (K + J(M))$  or  $r_2 m \in (N + J(M)) \cap (K + J(M))$ . If  $(M) \subseteq K$ , then either  $r_1 m \in (N + J(M)) \cap K = (N \cap K) + J(M)$  by [8]. If  $J(M) \subseteq N$ , then  $r_2 m \in (K + J(M)) \cap N = (N \cap K) + J(M)$  by [8]. Therefore  $K \cap N$  is a nearly quasi prime submodule of  $M$ .

**Proposition (2.12):-**

Let  $M$  and  $M'$  are  $R$ -modules and  $f: M \rightarrow M'$  is an epimorphism such that  $\text{Ker } f \ll M$ . If  $N$  is a nearly quasi prime submodule of  $M'$ , then  $f^{-1}(N)$  is also a nearly quasi prime submodule of  $M$ .

**Proof:-**

Let  $r_1, r_2 \in R$  and  $m \in M$  such that  $r_1 r_2 m \in f^{-1}(N)$  so  $r_1 r_2 f(m) \in N$ . But  $N$  is a nearly quasi prime submodule of  $M'$  so either  $r_1 f(m) \in N + J(M')$  or  $r_2 f(m) \in N + J(M')$ . Thus, either  $r_1 m \in f^{-1}(N + J(M'))$  or  $r_2 m \in f^{-1}(N + J(M'))$  and this implies that either  $r_1 m \in f^{-1}(N) + f^{-1}(J(M'))$  or  $r_2 m \in f^{-1}(N) + f^{-1}(J(M'))$ . But  $\text{Ker } f \ll M$ , so either  $r_1 m \in f^{-1}(N) + J(M)$  or  $r_2 m \in f^{-1}(N) + J(M)$ , [8]. Therefore  $f^{-1}(N)$  is a nearly quasi prime submodule of  $M$ .

**Proposition (2.13):-**

Let  $\phi: M \rightarrow M'$  be an  $R$ -epimorphism. If  $N$  is a nearly quasi prime submodule of an  $R$ -module  $M$  containing  $\text{Ker } \phi$  and  $\text{Ker } \phi \ll M$ , then  $\phi(N)$  is a nearly quasi prime submodule of  $M'$ .

**Proof:-**

$\phi(N)$  is a proper submodule of  $M'$ . If not suppose  $\phi(N) = M'$ , let  $m \in M$  such that  $\phi(m) \in M' = \phi(N)$ ,  $\exists n \in N$  such that  $\phi(n) = \phi(m)$  hence  $\phi(n - m) = 0$ , then  $n - m \in \text{Ker } \phi \subseteq N$ , then  $m \in N$ , hence  $N = M$  (contradiction), since  $N \subsetneq M$ . Let  $r_1, r_2 \in R, m' \in M'$  such that  $r_1 r_2 m' \in \phi(N)$ , we want to show that either  $r_1 m' \in \phi(N) + J(M')$  or  $r_2 m' \in \phi(N) + J(M')$ . Since  $\phi$  is an epimorphism and  $m' \in M'$ , then there exists  $n \in N$  such that  $\phi(n) = r_1 r_2 m'$ . But  $m' = \phi(m)$  for some  $m \in M$ , so  $r_1 r_2 \phi(m) = \phi(n)$  which implies that  $r_1 r_2 m - n \in \text{Ker } \phi$ . But  $\text{Ker } \phi \subseteq N$  so that  $r_1 r_2 m - n = n_1$  for  $n_1 \in N$ . Hence,  $r_1 r_2 m \in N$ . But  $N$  is a nearly quasi prime submodule in  $M$ , so either  $r_1 m \in N + J(M)$  or  $r_2 m \in N + J(M)$ . Thus, either  $r_1 m' \in \phi(N) + J(M')$  or  $r_2 m' \in \phi(N) + J(M')$ . Since,  $r_2 \phi(m) \in \phi(N) + \phi(J(M))$ . But  $\text{Ker } \phi \ll M$  and  $\phi$  is an epimorphism, so either  $r_1 m' \in \phi(N) + J(M')$  or  $r_2 m' \in \phi(N) + J(M')$ , [8]. Therefore,  $\phi(N)$  is nearly quasi prime submodule of  $M'$ .

Recall that a submodule  $K$  of an  $R$ -module is called small in  $M$ , if every submodule  $L$  of  $M$  with  $K + L = M$  implies  $L = M$  notationally  $K \ll M$  [8, p.106].

An  $R$ -epimorphism  $\phi: M \rightarrow M'$  is called small epimorphism if  $\text{Ker } \phi \ll M$ , [8].

By using these concept, we have the following:

Let  $\phi: M \rightarrow M'$  is small epimorphism. If  $N$  is a nearly quasi prime submodule of an  $R$ -module  $M$  containing  $\text{Ker } \phi$ , then  $\phi(N)$  is a nearly quasi prime submodule of  $M'$ .

Recall that an  $R$ -module  $M$  is called hollow module if and only if every submodule in  $M$  is small [9].

**Corollary (2.15):-**

Let  $M$  be a hollow  $R$ -module and  $\phi: M \rightarrow M'$  be an epimorphism. If  $N$  is a nearly quasi prime submodule of an  $R$ -module  $M$  containing  $\text{Ker } \phi$ , then  $\phi(N)$  is a nearly quasi prime submodule of  $M'$ .

Recall that an  $R$ -module  $M$  is called local if  $M$  has unique maximal submodule, [10].

**Corollary (2.16):-**

Let  $M$  is a local  $R$ -module and  $\phi: M \rightarrow M'$  be an epimorphism. If  $N$  is a nearly quasi prime submodule of an  $R$ -module  $M$  containing  $\text{Ker } \phi$ , then  $\phi(N)$  is a  $N$ -prime submodule of  $M'$ .

**Proof:-**

Since  $M$  is local  $R$ - module, so  $M$  is hollow  $R$ - module by [11 ,Th.2.6], then the result follows from corollary(2.15).

**Corollary (2.17):-**

Let  $N$  be a submodule of an  $R$ - module  $M$  and  $K$  be a small submodule of  $M$  contained in  $N$ . Then  $N / K$  is a nearly quasi prime submodule of  $M / K$  if  $N$  is nearly quasi prime submodule of  $M$ .

**Proof:-**

Let  $\pi: M \rightarrow M / K$  be the natural epimorphism, then the result follows from proposition (2.13).

**The Relation Between Nearly Quasi Prime Submodules And Other Submodules:-**

We study in this section the relationships between nearly quasi prime submodules and other submodules such as quasi prime submodules,  $N$  –semiprime, prime submodules.

As we have mentioned in section one, that quasi prime submodule is nearly quasi prime submodule and the converse need not be true in general.

In the following proposition, we give a condition under which the converse is true.

**Proposition (3.1):-**

If  $N$  is a nearly quasi prime submodule of an  $R$  – module  $M$  and  $J(M) \subseteq N$ , then  $N$  is quasi prime submodule of  $M$ .

**Proof:-**

It is clear.

Recall that an  $R$  – module  $M$  is called fully semiprime if for each proper submodule is semiprime. And  $M$  is called an almost fully semiprime if each nonzero proper submodule is semiprime, [12].

**Proposition (3.2):-**

Let  $M$  is an almost fully semiprime  $R$ -module which is not fully semiprime. If  $N$  is a nearly quasi prime submodule, then  $N$  is a quasi prime submodule of  $M$ .

**Proof:-**

Let  $M$  is an almost fully semiprime module and not fully semiprime. Then by [12, lemma (2.10), p.312],  $J(M) \subseteq N$ . Hence  $N$  is a quasi prime submodule of  $M$  by proposition (3.1).

Recall that an  $R$  – module  $M$  is called co – semisimple if each proper submodule of  $M$  is an intersection of maximal submodules, [12].

**Proposition (3.3):-**

Let  $M$  is an almost fully semiprime  $R$ - module which is not co-semisimple. If  $N$  is nearly quasi prime submodule of  $M$ , then  $N$  is a quasi prime submodule of  $M$ .

**Proof:-**

Let  $M$  is an almost fully semiprime  $R$ - module and not co- semisimple. Then by [12, lemma (2.10), p.312],  $J(M) \subseteq N$ . Hence  $N$  is a quasi prime submodule of  $M$  by proposition (3.1).

**Proposition (3.4):-**

If  $N$  is nearly quasi prime submodule of an  $R$  – module  $M$  and  $J(M) = 0$ , then  $N$  is quasi prime submodule of  $M$ .

**Proof:-**

It is clear.

Recall that a ring  $R$  is called a  $V$  – ring if every simple  $R$  – module is injective, [13].

**Corollary (3.5):-**

If  $N$  is nearly quasi prime submodule of an  $R$  – module  $M$  and  $R$  is a  $V$  – ring, then  $N$  is quasi prime submodule of  $M$ .

**Proof:-**

Since  $R$  is a  $V$ -ring, so  $J(M) = 0$  by [13, Theorem. (VILLAMAYOR), p.236]. Hence the result follows by proposition (3.4).

Next, an  $R$ -module  $M$  is said to be  $F$ -regular if each submodule of  $M$  is pure, [13].

By using this concept, we have the following:

**Corollary (3.6):-**

If  $N$  is a nearly quasi primesubmodule of  $F$ -regular  $R$ -module  $M$ , then  $N$  is a quasi prime submodule of  $M$ .

**Proof:-**

Since  $M$  is a  $F$ -regular  $R$ -module, then  $J(M) = 0$ , [15]. Hence the result follows by proposition (3.4).

**Corollary (3.7):-**

If  $N$  is nearly quasi prime submodule of an  $R$ -module  $M$  and  $R/ann(x)$  is a regular ring for every  $0 \neq x \in M$ , then  $N$  is quasi prime submodule of  $M$ .

**Proof:-**

Since  $R/ann(x)$  is a regular ring for every  $0 \neq x \in M$ , then  $M$  is a  $F$ -regular  $R$ -module by [16, Theorem. (2.2), p. 196]. Hence the result follows by Corollary (3.6).

Recall that an  $R$ -module  $M$  is called  $Z$ -regular if  $\forall m \in M, \exists f \in M^* = Hom(M, R)$  such that  $m = f(m) \cdot m$ , [15].

**Corollary (3.8):-**

If  $N$  is a nearly quasi prime submodule of  $Z$ -regular  $R$ -module  $M$ , then  $N$  is a quasi primesubmodule of  $M$ .

**Proof:-**

Since  $M$  is a  $Z$ -regular  $R$ -module, then  $M$  is a  $F$ -regular  $R$ -module by [17, proposition (2.3), p. 158]. Hence the result follows by Corollary (3.6).

Now, because of the fact that if  $M$  is semi-simple  $R$ -module, so  $J(M) = 0$  by [8, theorem 9.2.1, p.218], then the following is a consequence of proposition (3.4), where an  $R$ -module  $M$  is called semi-simple if and if only every submodule of  $M$  is a direct summand of  $M$ , [8].

**Corollary (3.9):-**

If  $N$  is a nearly quasi prime submodule of a semi-simple  $R$ -module  $M$ , then  $N$  is a quasi prime submodule of  $M$ .

Now, because of the fact that if  $R$  is semisimple then every right and left  $R$ -module is semi-simple by [8, corollary (8.2.2), p.196], then the following is a consequence of corollary (3.9).

**Corollary (3.10):-**

If  $N$  is nearly quasi prime submodule of an  $R$ -module  $M$  and  $R$  is a semi-simple ring, then  $N$  is quasi prime submodule of  $M$ .

Now, because of the fact that if  $M$  is a pseudo regular  $R$ -module, so  $J(M) = 0$  by [17, proposition 11, p.4], then the following is a consequence of proposition (3.4), where an  $R$ -module  $M$  is called pseudo regular if and if only every finitely generated submodule of  $M$  is a direct submodule, [17].

**Corollary (3.11):-**

If  $N$  is a nearly quasi prime submodule of a pseudo regular  $R$ -module  $M$ , then  $N$  is quasi prime submodule of  $M$ .

In the following result, we give another condition for which a nearly quasi Prime submodule be a quasi-primesubmodule

**Corollary (3.12):-**

If  $N$  is a nearly quasi prime submodule of an  $R$  – module  $M$  and  $J(N) = J(M) \cap N$  for each  $N$  submodule of  $M$ , then  $N$  is quasi prime submodule of  $M$ .

**Proof:-**

Since  $J(N) = J(M) \cap N$ , so  $J(M) = 0$  by [25, proposition(33-1),p.22]. Hence the result follows by proposition (3.4).

Now, because of the fact  $R$  is a good ring if and only if  $J(N) = J(M) \cap N$  for each submodule  $N$  of an  $R$  – module  $M$ , then the following is a consequence of proposition (3.4).

As another consequence of proposition (3.4), we have the following result:

**Corollary (3.13):-**

If  $N$  is a nearly quasi prime submodule of an  $R$  – module  $M$  and  $R$  is a good ring, then  $N$  is quasi prime submodule of  $M$ .

**Proof:-**

Since  $R$  is a good ring, then  $J(N) = J(M) \cap N$  for each submodule  $N$  of  $M$  by [8]. Therefore,  $J(M) = 0$  by [25] and hence  $N$  is a prime submodule of  $M$ .

Now, we can give the following:-

**Corollary (3.14):-**

If  $N$  is a nearly quasi prime submodule of an  $R$  – module  $M$  and  $R/J(R)$  is a regular ring, then  $N$  is quasi prime submodule of  $M$ .

**Proof:-**

Since  $(M) = J(R)M$ , then  $R$  is a good ring. Hence the result follows by corollary (3.13).

Recall that an  $R$  – module  $M$  is called divisible if and only if  $rM = M$ ,  $\forall 0 \neq r \in R$ , [8].

By using this concept, we have the following:

**Proposition (3.15):-**

Let  $R$  is PID and  $M$  is a divisible  $R$  – module such that  $J(M) \neq M$ . If  $N$  is a nearly quasi prime submodule, then  $N$  is a quasi prime submodule of  $M$ .

**Proof:-**

Since  $M$  is a divisible  $R$  – module and  $J(M) \neq M$ , so  $J(M) = 0$  by [25, prop.(1-4), p.12]. Hence the result follows immediately from proposition (3.4).

**Corollary (3.16):-**

Let  $M$  be an injective  $R$ - module and  $J(M) \neq M$ . If  $N$  is a nearly quasi prime submodule, then  $N$  is a quasi prime submodule of  $M$ .

**Proof:-**

Since  $M$  is an injective  $R$  – module, so  $M$  is a divisible  $R$  – module by [8]. But  $J(M) \neq M$ , so  $J(M) = 0$  by [25, prop.(1-4), p.12]. Hence the result follows immediately from proposition (3.4).

Now, we can give another consequences of proposition (3.4). But first we need the following definition: Let  $M$  and  $N$  be two modules.  $M$  is said to be essentially pseudo –  $N$  – injective if for any essentially submodule  $A$  of  $N$ , any monomorphism  $f : A \rightarrow M$  can be extended to some  $g \in \text{Hom}(N, M)$ .  $M$  is called essentially pseudo – injective if  $M$  is essentially pseudo –  $M$  – injective, [18].

**Corollary (3.17):-**

Let  $M$  be an essential pseudo –  $A$  – injective for any cyclic module  $A$  and  $J(M) \neq M$ . If  $N$  is a nearly quasi- prime submodule, then  $N$  is a quasi-prime submodule of  $M$ .

**Proof:-**

Since  $M$  be a essential pseudo –  $A$  – injective for any cyclic module  $A$ , so  $M$  is an injective by [18, corollary 1, p.4] and so  $M$  is a divisible  $R$  – module and  $J(M) \neq M$ , so  $J(M) = 0$  by [25, prop.(1-4), p.12]. Hence the result follows immediately from proposition (3.4).

Now, we can give another consequences of proposition (3.4). But first we need the following definition: Recall that an  $R$  – module  $M$  is direct injective, if given any direct summand  $A$  of  $M$ , an injection:  $i: A \rightarrow M$  and every  $R$  – monomorphism  $f: A \rightarrow M$ , there is an  $R$  – endomorphism  $g$  of  $M$  such that  $g \circ f = iA$  [19].

**Corollary (3.18):-**

Let  $M$  be a direct injective  $R$  – module and  $J(M) \neq M$ . If  $N$  is nearly a quasi-prime submodule, then  $N$  is a quasi-prime submodule of  $M$ .

**Proof:-**

Since  $M$  be a direct injective  $R$  – module, so  $M$  is a divisible  $R$  – module by [25]. Hence the result follows immediately from proposition (3.4).

Recall that an  $R$  – module  $M$  is called ic – pseudo – injective, if it is ic – pseudo –  $M$  – injective. Where an  $R$  – module  $M$  is said to be ic – (pseudo)-  $N$  – injective, if for each ic – submodule  $A$  of  $N$ , every  $R$  – homomorphism ( $R$  – monomorphism) from  $A$  to  $M$  can be extended to an  $R$  – homomorphism from  $N$  into  $M$ . And a submodule  $N$  of  $M$  is called ic – submodule, if  $N$  is isomorphic to a closed submodule of  $M$ , [21].

**Corollary (3.19):-**

Let  $M$  is an ic – pseudo – injective  $R$  – module and  $J(M) \neq M$ . If  $N$  is nearly quasi prime submodule, then  $N$  is quasi prime submodule of  $M$ .

**Proof:-**

Since  $M$  is an ic – pseudo – injective  $R$  – module, so  $M$  is a divisible  $R$  – module by [21, proposition (2.11), p.259]. Hence the result follows immediately from proposition (3.4).

Now, we study the relation between  $N$  – prime submodules and  $N$  – semi prime submodules. But first we need the following definition:

Recall that a submodule  $N$  of an  $R$  – module  $M$  is said to be  $N$  – semi prime, if whenever  $r^n \cdot x \in N$ ,  $r \in R$ ,  $x \in M$ ,  $n \in \mathbb{Z}^+$ , implies  $rx \in N + J(M)$ , [22].

**Remark (3.20):-**

Every nearly quasi prime submodule is  $N$  – semi prime submodule.

**Proof:-**

Suppose  $N$  is nearly quasi prime submodule of an  $R$  – module  $M$ . If  $r^2x \in N$  for  $r \in R$  and  $x \in M$ , then by definition of nearly quasi prime submodule implies that  $rx \in N + J(M)$ . Hence,  $N$  is  $N$  – semi prime submodule of  $M$ .

The converse is not true for example: Let  $M = Z$  as a  $Z$  – module and  $N = 6Z$ .  $6Z$  is nearly semi prime submodule of  $Z$  (since  $N$  is a semi prime). But  $6Z$  is not nearly quasi prime submodule of  $Z$ , since  $2 \cdot 3 \cdot 1 \in 6Z$ . But  $2 \cdot 1 = 2 \notin 6Z + J(Z) = 6Z$  and  $3 \cdot 1 = 3 \notin 6Z + J(Z) = 6Z$ .

In the following proposition, we give a condition under which the two concepts are equivalent. But first we need the following definition:

Recall that a submodule  $N$  of an  $R$  – module  $M$  is called irreducible if for each submodules  $L_1, L_2$  of  $M$  such that  $L_1 \cap L_2 = N$ , then either  $L_1 = N$  or  $L_2 = N$ , [23].

**Proposition (3.21):-**

Let  $N$  is an irreducible submodule of an  $R$  – module  $M$  and  $J(M) \subseteq N$ . If  $N$  is a  $N$  – Semi prime, then  $N$  is a nearly quasi prime submodule of  $M$

**Proof:-**

Since  $J(M) \subseteq N$  and  $N$  is  $N$ - semi prime submodule, then  $N$  is a semi- prime submodule by [22]. But  $N$  is an irreducible submodule of  $M$ , so by [ 26 ]  $N$  is a prime submodule of  $M$  and hence  $N$  is quasi prime submodule of  $M$ . Therefore  $N$  is nearly quasi prime submodule of  $M$ .

In the following proposition, we give other conditions under which the two concept are equivalent. But first we need the following definitions:

A non – zero  $R$  – module  $M$  is called secondary module provided that for every element  $r \in R$ , the endomorphism  $m \rightarrow rm$  is either surjective or nilpotent, [4].

Recall that a submodule  $N$  of an  $R$  – module  $M$  is said to be  $N$  – prime, if whenever  $x \in N, r \in R, x \in M$ , implies that either  $x \in N + J(M)$  or  $r \in [N + J(M) : M]$ , [24].

**Proposition (3.22):-**

Let  $N$  be a submodule of a secondary  $R$  – module  $M$  and  $J(M) \subseteq N$ . If  $N$  is a  $N$  – semi prime, then  $N$  is a nearly quasi prime submodule of  $M$ .

**Proof:-**

Let  $r \in R, m \in M$  such that  $rm \in N$ . Since  $M$  is a secondary module, then either  $rM = M$  or  $r^n M = 0$ , then  $r^n M \subseteq N$ , but  $N$  is a  $N$  – semi prime submodule of  $M$ , hence  $rM \subseteq N + J(M)$ . If  $rM = M$ , then  $m = ry$  for some  $y \in M$ . Thus,  $r^2 y = rm \in N$  and hence  $y \in N + J(M)$ . This implies that  $m \in N + J(M)$  and therefore  $N$  is a  $N$  – prime submodule of  $M$ . But  $J(M) \subseteq N$  so  $N$  is a prime submodule of  $M$  by [24] and hence  $N$  is a nearly quasi prime.

As we have mentioned in section one that prime submodule is nearly quasi prime submodule and the converse need not be true in general.

In the following proposition, we give a condition under which the converse is true.

**Proposition (3.23):-**

Let  $N$  is an irreducible submodule of an  $R$  – module  $M$  and  $J(M) \subseteq N$ . If  $N$  is a nearly quasi prime submodule of  $M$ , then  $N$  is a prime submodule of  $M$ .

**Proof:-**

Since  $J(M) \subseteq N$  and  $N$  is a nearly prime submodule, then  $N$  is a quasi prime submodule and so  $N$  is a semiprime submodule of  $M$  by [3, remark (2.1.2, 7)]. Hence  $N$  is a prime submodule of  $M$  by [26, prop.1.10, Ch.2].

#### Abstract

*Rubia cordifolia* L. (common name-Indian Madder, Majith, Manjistha) from the family Rubiaceae is commonly known as is widely dispersed throughout the lower hills of India. The plant is famous drug in the Ayurvedic treatments. Extracts of this plant have shown many important medicinal properties. In this study, we quantified the amount of rubiadin in both roots and aerial part of the plant. The amount of the active principle is affected by the geographical areas. So, we also compared the amount of rubiadin in different accessions of the *R. cordifolia* Linn. that have been collected from different geographical areas of the India.

#### Introduction:-

*Rubia cordifolia* L. (common name-Indian Madder, Majith, Manjistha) from the family Rubiaceae is commonly known as is widely dispersed throughout the lower hills of Indian Himalayas (Shekhar et al., 2010; Radha et al., 2011). The plant is important and famous drug in the Ayurvedic treatments. Extracts of this plant have shown hepatoprotective, antineoplastic properties and is also useful in the disintegration and elimination of urinary stones (Gilani and Janbaz, 1995; Divakar et al., 2010). Anti-inflammatory, anti-ulcer and anti-dysenteric activities are also found in the roots of *Rubia cordifolia* Linn. (Deoda et al., 2011). It is also used in the treatment of diuretic, liver complaints, joint pains, uterine pains, in rheumatoid arthritis (Shekhar et al., 2010).

The major compounds of this plant are anthraquinones, alizarin, purpurin and their derivatives. It also contains ruberythric acid (alizarin-primeveroside), pseudopurpurin and lucidinprimeveroside, rubiadin(1,3-Dihydroxy-2-methylantracene-9,10-dione), munjistin, quinizarin, lucidin and 1,8-dihydroxyanthraquinone (Banyal et al., 2006).

Rubiadin(1,3-Dihydroxy-2-methylantracene-9,10-dione), a dihydroxy anthraquinone, possesses effective antioxidant property and prevents lipid peroxidation (Tripathi et al., 1997). It also has hepatoprotective and anti-bacterial activity (Rao et al., 2006; Comini et al., 2011). For estimation of specific compounds in a sample HPLC is one of the several chromatographic techniques that are being generously utilized in laboratories all over the world (Mythili et al., 2011).

Although, HPLC method for determination of rubiadin in the roots of *Rubia cordifolia* Linn. has been reported in literature. But quantitative determination of rubiadin in different accessions of the plant has not been reported yet. Further we also quantified rubiadin in both roots and aerial parts of *Rubia cordifolia* Linn. which has also not been reported yet. Present study deals with the quantitative determination of rubiadin by RP-HPLC in methanolic extracts of root and aerial parts of the different accessions of the plant. Briefly, in this study we verified the RP-HPLC method for the quantification of the rubiadin in different accessions of the plant.

## Material and Methods:-

### Plant material:-

Six different accessions of *Rubia cordifolia* Linn. were used in this study. Roots and aerial parts of plant were collected from six different geographical areas (Table. 1) of India. These samples were identified by Prof. M. P. Sharma, Head, Dept. of Botany, Jamia Hamdard. Voucher specimen is deposited at the herbarium of Department of Botany, Jamia Hamdard, New Delhi.

### Extraction of Plant material:-

The plant samples were air dried and ground into a fine powder using a grinder. Then, the plant material was extracted using different solvent system in a soxhlet apparatus and by other methods as well. 20g dried plant material was extracted using 200 ml of each solvent system of increasing polarity like petroleum ether, chloroform, acetone, ethanol (80%), methanol ethyl acetate, n-butanol and water respectively in a soxhlet assembly for 12 h. Each extract was concentrated by distilling off the solvent and then evaporating to dryness on water bath or using Rotary evaporator. Extracts were also used directly for various tests. Extracts were collected and used for different phytochemical tests (Results in Table. 2)

### HPLC chemicals and reagents:-

HPLC grade standard compound rubiadin was purchased from Natural Remedies (India). All the solvents and reagents used in the experiments were of HPLC grade. HPLC grade methanol and water were purchased from Merck, India. HPLC analysis was carried out on a Waters HPLC system (Binary Pump 600 controller), Waters PDA detector (996) and an auto sampler (2707). Empower 2 software was used to control the system and for monitoring and analysis of results. For chromatographic separation  $R_pC_{18}$  column (250×4.6 mm, particle size 5  $\mu$ m) was used. Further, a sonicator, rotary evaporator (R-200/205/V (Buchi), a pH meter and hot air oven were also used.

### Preparation of sample solution for HPLC analysis:-

Powdered samples of *R. cordifolia* (roots and aerial part), plant sample (1g, accurately weighed) were extracted with methanol (2×25mL) for 24h at room temperature in sonicator. The combined extracts were filtered through Whatman Filter paper No 42. Extracts obtained were concentrated on rotary evaporator (R-200/205/V (Buchi) ) in vacuum to 10mL.

### Preparation of Standard Solutions:-

A stock solution of rubiadin (1000  $\mu$ g/mL) was prepared by dissolving 2.0 mg of standard rubiadin accurately weighed in 2 mL methanol in an eppendorf tube. Standard solution of 200  $\mu$ g /mL was prepared from the stock solution by transferring 200  $\mu$ L of stock solution, and diluting to volume with methanol (800  $\mu$ L). Appropriate quantities of this standard solution was injected to obtain rubiadin in the range of 200-1000 ng.

### HPLC Conditions:-

Chromatography was performed using Waters system (Miford, MA, USA), 616 pump and 996 PDA detector. The volume injected was 20 $\mu$ L. Quantitative determination of rubiadin was performed at 295nm on a  $R_pC_{18}$  column (250×4.6 mm, 5  $\mu$ m). The mobile phase consisted of methanol: water (80:20, v/v) (Khodke et al, 2010) . The flow-

rate was 1 mL/min. The solvent was filtered through a nylon membrane (0.45µm) and degassed by sonication before use. UV spectra was recorded from 210-400nm at a rate of 1.00 spectrum/sec and a resolution of 1.2 nm.

#### Calibration:-

Standard solutions of 10-200 µg/mL of rubiadin were prepared in methanol from the stock solution of 1 mg/mL and were used for the preparation of calibration graph. 20 µL of each of the standard solution was injected by the auto sampler with concentrations mentioned above and the linearity of response for rubiadin was determined. Calibration curve was drawn by plotting the peak areas rubiadin against the corresponding concentration.

#### Results & Discussion:-

The separation of rubiadin by RP-HPLC was carried out under optimized conditions. Optimization of mobile phase was carried out using various concentrations of methanol and water. Three different compositions of methanol and water were used, 75:25, 85:15 and 80:20. The optimum mobile phase was found to be Methanol: Water (HPLC grade) in the ratio of 80:20 it is the same as reported in the Khodke et al, 2010 method. Retention time of rubiadin was found to be 7.920 min as shown in Fig.1. A linear relationship between peak areas and concentrations was obtained in the range of 10-50µg/ml. This shows that method is linear. Repeatability studies show %RSD to be less than 2%. This shows that method is precise. %RSD for inter-day precision was higher than that of intra-day precision. Excellent recoveries were obtained at each level of added concentration as the mean recovery found to be within 98% to 102% for rubiadin. The limit of detection and limit of Quantitation of method was found to be 55.75ng/ml and 200ng/ml (Table.3). As it was found that rubiadin peak gets well resolved from peaks of other chemical constituents, hence we conclude that method is selective. Further, the quantification of rubiadin in different samples of *R. cordifolia* was also successfully done (Fig. 2; Table. 4)

Quantification of rubiadin in roots of *R. cordifolia* has been reported in the previous study (Khodke et al., 2010). This analysis showed that rubiadin is present in roots only but in our study we quantified the rubiadin in both roots and aerial parts of this plant. This study not only supports the previous study that roots are good source of rubiadin but also revealed that significant amount of rubiadin is also present in the aerial part of this plant. Thus, the whole plant can be utilized to extract rubiadin. Further, we also quantified the rubiadin in aerial and roots of the *R. cordifolia* collected from different geographical areas which has not been reported earlier. Among all the six accession that has been used in the study the accession no.5 has the higher amount of rubiadin in its roots.

**Table 1:-** List of Plant materials (*Rubia cordifolia* Linn.) used in this study.

Plant name	Explant	Sample	Locality
<i>Rubia cordifolia</i> Linn.	Aerial part	Rb-1	IHBT(Palampur)
	Aerial part	Rb-2	Indus nursery (Bangalore)
	Root	Rb-3	Chopta forest (Himalyas)
	Root	Rb-4	University of Kashmir (Srinagar)
	Root	Rb-5	Chamba (Himachal Pradesh)
	Root	Rb-6	Hamdard laboratory (Ghaziabad)

**Table 2:-** Phytochemical screening of *Rubia cordifolia* Linn.

Constituent	ME	PF	CF	EAF	WF
Anthraquinones	+	+	+	+	+
Glycosides	+	-	+	+	+
Tannins	+	-	-	-	-
Saponins	+	+	+	+	+
Triterpenoids	+	+	+	-	-
Alkaloids	-	-	-	-	-

ME: Methanol Extracts, PF: Petroleum ether fraction, CF: chloroform fraction

EAF: Ethyl acetate fraction and WF: Water fraction: + = present, - = absent

Anthraquinone and glycosides are present in almost all fractions of *Rubia cordifolia* Linn. and roots are rich in anthraquinones but alkaloids were not present.

**Table 3:-** Calibration data

Parameter (Units)	Rubiadin
Regression equation	$Y=8580X + 26481$
Linearity range ( $\mu\text{g/mL}$ )	10-200
$r^2 \pm \text{SD}$	$0.993781 \pm 0.0005$

**Table 4:-** Quantitative estimation of rubiadin in methanolic extracts of *Rubia cordifolia* Linn.

Accession no.	Plant part	Content of rubiadin (% w/w) of sample Mean $\pm$ SD
1	Aerial part	$0.12 \pm 0.091$
2	Aerial part	$0.15 \pm 0.091$
3	Root	$0.48 \pm 0.070$
4	Root	$0.27 \pm 0.073$
5	Root	$0.54 \pm 0.071$
6	Root	$0.38 \pm 0.070$

### Conclusion:-

In our study, we compared the amount of rubiadin in different samples of the *R. cordifolia* plant that have been collected from the different geographical areas.

### Conflict of interest:-

The authors have no conflict of interest.

### Acknowledgment:-

The authors are grateful to University Grants Commission (UGC) for financial assistance of the study.

#### Abstract

Cardiovascular disease incidence is increased in patients suffering rheuma-toid arthritis, The latter is a risk factor so important as the diabetes. In a prospective study, 40 patients with RA were compared with age- and sex-matched controls

**Results:-** The intima-media thickness was significantly higher in patients with RA higher than control patients (0.759 mm vs 0.558 mm;  $P < 0.001$ ). We found a higher TR, in patients with RA. But, C-HDL and C-LDL were are not significantly different between the both groups

**Conclusion:-** Increased attention to cardiovascular risk in RA will be necessary to reduce the excess CV mortality and morbidity in RA patients. It appears that the excess risk that is observed in the RA population can be explained, in part, by promotion of CV disease through increased systemic inflammation associated with RA.

#### Introduction:-

La mortalité dans la polyarthrite rhumatoïde (PR) est multipliée par deux par rapport à la population générale, cette surmortalité s'expliquant dans la moitié des cas par des événements cardiovasculaires (CV). Récemment, une surmortalité a été associée à la PR avec une espérance de vie réduite de cinq à dix ans (1). Plusieurs travaux ont mis l'accent sur la place prépondérante des événements cardiovasculaires qui expliqueraient en moyenne 50 % de cette surmortalité liée à la PR (2); Les facteurs de risque CV traditionnels n'expliquent pas seuls la majoration du risque CV, même si le tabagisme et les modifications du profil lipidique semblent impliqués. Le risque CV dans la PR est essentiellement lié à l'état inflammatoire chronique qui entraîne de nombreuses modifications métaboliques. D'autres paramètres comme les traitements utilisés jouent également un rôle. Le but de notre étude est de rechercher chez les patients atteints de PR les facteurs prédictifs pour développer un accident cardiovasculaire et cela de façon indépendante des autres facteurs de risque cardiovasculaires classiques.

#### Patients et Methodes:-

Nous avons mené une étude prospective, incluant 80 patients dont 40 sont atteints de PR (groupe PR) et 40 témoins (groupe des témoins). La durée totale de l'étude est de 24 mois allant de janvier 2013 au mois de janvier 2015. Afin d'obtenir une population la plus homogène possible, nous avons inclus dans l'étude

**Corresponding Author:-H. Jallal.**

Address:-Service de cardiologie Hopital militaire Avicenne; CHU Mohammed VI Marrakech.

les patients dont l'âge est supérieur à 20 ans présentant une PR répondant aux critères de l'ACR sans antécédents cardio-vasculaires cliniques. Nous avons exclu de l'étude les patients ayant déjà présenté une complication cardiovasculaire : cardiopathie ischémique (angor ou infarctus du myocarde [IDM], accident vasculaire cérébral [AVC] transitoire ou constitué), artériopathie oblitérante des membres inférieurs, les patients présentant les facteurs de risque cardiovasculaire classiques et les pathologies associées suivantes : pathologie hépatique, syndrome néphrotique, dysthyroïdie, et alcoolisme. Les patients atteints de PR ont été comparés à 40 témoins appariés par l'âge et le sexe. Les sujets témoins ont été soumis aux mêmes critères d'exclusion que les sujets PR. Ces témoins ont été recrutés dans la consultation du service de traumatologie de l'Hopital militaire de Laayoun. Ils sont atteints de lombosciatalgies commune ou arthrose indemnes de toute pathologie inflammatoire, infectieuse ou tumorale. Un questionnaire (HAQ) a été rempli et le DAS28 a été calculé. Tous les patients ont bénéficié d'un bilan biologique comportant : le dosage de la glycémie à jeun et HbA1c, l'acide urique et la créatinine sanguine, de la C-réactive protéine (CRP), la vitesse de sédimentation (VS) ainsi qu'un bilan lipidique réalisé après un jeun de 12 heures comportant : le cholestérol total (CT), triglycérides (TG), cholestérol-HDL (C-HDL), Tous les patients ont bénéficié en outre d'une recherche échographique des plaques d'athérome avec mesure de l'épaisseur intima media (EIM) des carotides communes et d'une échocardiographie transthoracique et enfin d'une mesure de l'IPS au niveau des membres inférieures.

### Analyse Statistique:-

Les différentes données ont été analysées par le logiciel SPSS. L'analyse a comporté deux volets

#### Un volet Descriptif:-

Cette analyse a comporté un calcul des moyennes et des écarts-types pour les variables quantitatives et un calcul des fréquences pour des variables qualitatives. Le seuil de signification a été fixé à 0,05. Une différence est dite significative si p est compris entre 0,05 et 0,01. La différence est très significative si p est compris entre 0,01 et 0,001. La différence est hautement significative si  $p < 0,001$ .

#### Un volet analytique:-

Cette analyse a consisté à étudier des corrélations entre les variables

### Resultats:-

Nous avons recueilli l'âge actuel, le sexe, l'IMC ainsi que l'ancienneté de la PR par rapport au début de notre étude. L'activité de la maladie rhumatoïde a été évaluée grâce au calcul des indices fonctionnels : DAS 28 et le HAQ (Tableau 1). Concernant le bilan inflammatoire dans le groupe PR, nous nous sommes basés sur l'étude de la VS et de la CRP afin de refléter l'activité de la PR (tableau 2). Concernant les traitements symptomatiques, nous nous sommes intéressés essentiellement à la prise ou non de corticoïdes. 90% des patients étaient sous corticothérapie. Quant aux traitements de fond, la majorité des patients (36 patients, soit 90 % des cas) ont bénéficié d'un traitement de fond à base de méthotrexate (MTX) et 10% sous salazopyrine

**Tableau 1:-** Caracteristiques épidémiocliniques du groupe polyarthrite rhumatoïde (PR)

	Groupe PR (40)
Age moyen (mois)	52.7±19.4
Sexe ratio (F/H)	3
IMC (kg/m <sup>2</sup> )	25,42 ± 4,27
Durée moyen d'évolution de la PR (mois)	91,2 ± 84,72 [10 mois–25 ans]
DAS (28)	2.9±1.6
HAQ	0.92±0.94

**Tableau 2:** Parametres biologique dansle groupe PR.

	Moyennes	Valeurs normales
Cholestérol Total	4,9± 1,1 [2,89 – 8,2]	5,2 à 6,4 mmol/L
LDL	3,3± 0,9 [1,61 – 5,20]	< 3,3
HDL	1,4± 0,3 [0,91 – 2,64]	1,0 à 1,65 mmol/L
Triglycérides	1,3± 0,4 [0,59 – 2,77]	0,6 à 1,7 mmol/L

Glycémie	5,7± 0,9 [4,3 – 8,29]	4,5 – 6, 2mmol/l
HbA1c	5,3±0,8 [4,5 – 8,5]	6%
CRPus	13,3± 19,9 [1 - 95]	<6mg/l
Acide urique	276,1± 70,5 [149 - 415]	200 et 415 µmol/

Dans le groupe PR La durée moyenne de l'évolution de la PR : 7.6±7.06 ans (42% des cas ont une durée< 5 ans), Les patients de sexe féminin ont une atteinte athérosclérotique significativement plus importante par rapport hommes. Le taux moyen des TG est significativement plus élevé chez les patients ayant un EIM ≥ 0.7mm (tableau 3). Concernant le traitement : L'étude de l'EIM en fonction de la dose administrée n'a pas montré de différence significative et la présence des plaques n'est pas corrélée à la prise de fortes doses de corticothérapie

**Tableau 3:** Correlation enter les parameters lipidiques et l'EIM dans le groupe PR.

	EIM ≥ 0.7mm	EIM < 0.7 mm	P
CT (mmol/l )	4.98	4.87	0.798
HDL-c ( mmol/l)	1.30	1.54	0.561
LDL-c ( mmol/l)	3.01	2.95	0.565
TG ( mmol/L)	1.64	1.02	0.015

Il n'existe pas de différence statistiquement significative de l'âge, du sexe, de la masse corporelle entre les deux groupes. Seule la pression artérielle et systolique et diastolique est significativement plus élevée dans le groupe PR (tableau 4). Concernant les marqueurs biologiques de l'inflammation, la VS ainsi que la CRP sont significativement plus élevées dans le groupe présentant une PR par rapport aux témoins (Tableau 4 )

**Tableau 4:-** Comparaison des caracteristiques epidemiocliniques et biologiques enter le groupe polyarthrite rhumatoide (PR) et la population temoin.

	Groupe PR (40)	Groupe témoin (40)	P
Age	52.7±19.4	51 .8±18.3	0.665
Sexe ratio (H/F)	3	2.5	0.570
PAS (mmhg)	145.82	141.22	0.007
PAD (mmhg)	79.26	74.55	0.006
IMC (Kg/m2)	25,42 ± 4,27	26,42 ± 5,30	0.445
VS (mm/h)	40.18	10.76	0.000
CRP (mg)	13.31	2.60	0.001
Glycemie a jeun( mmol/l)	5,7± 0,9 [4,3 – 8,29]	5,1± 0,7 [3,2 – 7,29]	0.992
HbA1c %	5,3±0,8 [4,5 – 8,5]	5,2±0,3 [4,5 – 7,01]	0.998
Ac urique (µmol/)	276,1± 70,5 [149 - 415]	270,1± 60.2 [138 - 460]	0.774

L'EIM est plus élevée dans le groupe PR que dans le groupe témoin : 1,1 mm vs 0,558 mm (p < 0,01) (Tableau 5), l'EIM est corrélée avec la durée de l'évolution de la PR et non pas avec l'âge de son début (figure 1). La comparaison des moyennes des paramètres lipidiques a montré une augmentation significative des taux triglycérides dans le groupe PR, le taux du CT ainsi que le C-LDL et de C-HDL n'ont pas montré de variation significative (Tableau5).

**Tableau 5:-** Comparaison des different parameters du profil lipidique ainsi que l'épaisseur Intima media (EIM) entre le groupe polyarthrite rhumatoide (PR) et la population temoin.

### Discussion:-

L'augmentation de la mortalité des patients ayant une PR par rapport à la population générale est bien établie(3). La pathologie cardiovasculaire rend compte d'une augmentation d'environ 50% de la mortalité au cours de la PR par un accroissement du risque de mortalité cardiaque et neurologique (4). Une analyse du registre des médecins généralistes anglais a montré une mortalité globale supérieure de 60 % dans le groupe PR par rapport aux patients ayant une arthrose ou n'ayant aucune affection ostéo-articulaire. La mortalité liée à la pathologie cardiovasculaire est supérieure de 30 à 60 % par rapport aux deux groupes témoins (5). Les facteurs de risque classiques y contribuent certes mais il semble aussi que des éléments propres à la PR notamment l'existence d'une inflammation systémique, y participent (6). En outre, les lymphocytes T impliqués dans la pathogenèse de la PR joueraient également un rôle important dans les syndromes coronariens aigus et dans l'instabilité de la plaque d'athérome (7).

La morbidité cardiovasculaire est également augmentée, avec un sur-risque attribuable à la PR aussi important que celui du diabète (3,8). L'étude la plus démonstrative est celle réalisée à partir de la population générale danoise (8). Plus de 4 millions de personnes ont été suivies (4 311 022 personnes) de 1997 à 2006 : 10 447 ont développé une PR et 130 215 un diabète. Le risque d'IDM est de 1,7 [1,5-6,9] chez les patients atteints de PR, similaire à celui des diabétiques : 1,7 [1,6-1,8] ( $p = 0,64$ ) (3,9). Le risque d'IDM au cours de la PR est similaire à celui de sujets normaux, mais plus âgés de 10 ans (8). L'augmentation du risque d'IDM par rapport à l'évolution de la PR est controversée : elle pourrait précéder le diagnostic, apparaître dès le diagnostic, dans l'année suivante ou seulement 7 ans après (9). L'atteinte coronaire, plus souvent asymptomatique, est également plus grave que dans la population générale, puisqu'elle est plus couramment multitrunculaire avec un risque augmenté de récurrence et de décès après un premier IDM (3). De nombreuses études concernant des marqueurs précoces et infracliniques ont été réalisées dans la PR (10). L'altération de la fonction endothéliale et l'augmentation de la rigidité artérielle et de l'épaisseur intima-média, qui sont des facteurs prédictifs d'accident cardiovasculaire, ont été retrouvées chez les patients ayant une PR par rapport aux sujets contrôles dans des études transversales ou longitudinales (10). Il existe également une augmentation de la morbi-mortalité cardiovasculaire dans le rhumatisme psoriasique et la spondylarthrite ankylosante (SPA), du même ordre que celle observée dans la PR (11, 12).

La maladie athéromateuse peut rester plusieurs années silencieuse avant l'apparition de symptômes cliniques. Actuellement, grâce au développement de nouvelles méthodes d'évaluation comme l'ultrasonographie en mode B à haute résolution en particulier au niveau de l'artère carotide, l'athérosclérose peut être dépistée très précocement et cela en mesurant l'EIM. Cette mesure échographique de l'EIM constitue un nouveau marqueur du risque cardiovasculaire ayant une valeur prédictive positive. Nos résultats concernant l'EIM sont concordants avec ceux d'autres études qui ont comparé l'EIM des patients atteints de PR à celle de témoins et ont retrouvé une EIM plus élevée chez les patients PR que chez les sujets témoins. Dans l'étude de Park et al. (13) concernant 53 femmes souffrant de PR n'ayant aucun antécédent cardiovasculaire et 53 témoins appariés par l'âge, il existe une augmentation significative de l'EIM dans le groupe PR. Dans cette même étude, l'augmentation de l'EIM est positivement corrélée à la durée d'évolution de la maladie. En effet, les PR de moins d'une année d'évolution sont associées à une moindre augmentation de l'EIM.

Dans l'étude de Kumeda et al. (14) qui a porté sur 138 PR et 94 témoins matchés par l'âge, le sexe et les facteurs de risque cardiovasculaires, l'EIM est significativement plus élevée dans le groupe PR. La durée d'évolution de la maladie ainsi que sa sévérité sont positivement corrélées à l'EIM. Mary et al. (13) ont étudié de façon prospective 98 patients souffrant de PR et ne présentant aucune maladie cardiovasculaire ni autres facteurs de risques vasculaires classiques. Ils ont été comparés à 98 témoins appariés par l'âge, le sexe et l'ethnie et obéissant aux mêmes critères d'exclusion que les patients atteints de PR. Ils ont retrouvé une prévalence significativement plus élevée des plaques d'athérome dans le groupe PR par rapport au groupe témoin (44 % vs 15 % ;  $p < 0,001$ )

La dyslipidémie observée dans la PR illustre les intrications entre l'inflammation et les facteurs de risque traditionnels. Lorsque la PR est actif, le cholestérol total et le LDL-C sont diminués, alors que contrairement à la population générale, le risque de mortalité CV est augmenté (3). Cela traduit un processus inflammatoire non contrôlé malgré le traitement. Toutefois, même si le cholestérol total est diminué, il existe dans la PR une dyslipidémie caractérisée par une réduction encore plus importante du HDL avec une augmentation de l'indice athérogène (15). En outre, le taux du C-HDL est plus élevé chez les patients en rémission que chez ceux ayant une maladie rhumatoïde active. Dans notre étude, nous n'avons pas noté une baisse significative du taux du C-HDL dans le groupe PR par rapport aux sujets témoins. Quant au LDL-C, son rôle prédictif vis-à-vis de la mortalité et des événements coronariens a été très bien documenté dans plusieurs études dans la population générale (17). Dans la PR, les études sont controversées : dans certaines le taux de LDL-C est élevé et corrélé à l'activité de la maladie [18] contrairement à d'autres où la concentration de C-LDL est plutôt vers la baisse. Nos résultats ont retrouvé une légère augmentation du taux du C-LDL dans le groupe PR par rapport aux sujets témoins mais sans atteindre le seuil significatif (2,96 mmol/L vs 2,86 mmol/L ;  $p = 0,562$ ). La triglycéridémie est très variable. Souvent elle évolue sur le versant athérogène [18] et d'autrefois elle est de concentration normale ou même abaissée (17). Dans notre étude, la triglycéridémie est légèrement plus élevée dans le groupe PR par rapport à la population témoin (1,32 mmol/L vs 1,04 mmol/L) de façon significative, de même dans le groupe PR il ressort une corrélation statistiquement significative entre l'augmentation de l'EIM et l'hypertriglycéridémie. Au cours de la PR, la CRP est non seulement un outil précis pour le suivi de la maladie mais elle est devenue maintenant un facteur de risque cardiovasculaire à prendre en compte. En effet, la CRP constitue un dénominateur commun entre la PR et l'athérosclérose. Quant à son action sur le profil lipidique au cours de la PR, de nombreuses études ont retrouvé que l'élévation de la CRP était associée à une diminution des facteurs protecteurs notamment l'ApoA1 et le C-HDL (19) d'une part, et d'autre part à une élévation des facteurs athérogènes. L'influence des traitements de la PR sur le système artériel est très importante à considérer. Certaines études ont pointé le doigt sur la corticothérapie en l'associant à une augmentation de la prévalence des maladies cardiovasculaires et ainsi à une surmortalité cardiovasculaire (20). En effet, les corticoïdes pourraient favoriser l'athérome en raison de leur effet délétère sur le métabolisme lipidique, glucidique et la tension artérielle, d'une part, et d'autre part, la prise de corticoïdes pourrait traduire également l'existence d'une maladie plus sévère aux risques cardiovasculaires plus importants. L'étude de Del Rincon (21) réalisée chez 647 patients ayant une PR, a consisté en une étude échographique de l'artère carotide. Après appariement sur les facteurs de risque cardiovasculaires, les PR ayant reçu une corticothérapie supérieure à 16,4 g avaient plus souvent des plaques carotidiennes et des artères incompressibles que les PR n'ayant jamais reçu de corticothérapie.

Un meilleur contrôle de l'activité de la PR par les traitements de fond, notamment le MTX, permet de réduire la mortalité cardiovasculaire. Choi et al. (2) ont étudié 191 patients décédés sur une cohorte de 1240 patients suivis en ambulatoire pour une PR. Dans cette étude, les décès par maladie cardiovasculaire sont réduits à 70 % sous MTX comparés aux patients qui n'étaient pas sous MTX. Cette réduction de maladie cardiovasculaire résulte probablement de l'amélioration de la mobilité et du contrôle du processus inflammatoire. Actuellement, plusieurs études ont démontré qu'un traitement par les statines permettrait de réduire la morbidité et la mortalité cardiovasculaires tant en prévention primaire que secondaire et cela par le biais non seulement de leur effet hypocholestérolémiant mais aussi leur effet anti-inflammatoire puisque les statines diminuent la synthèse de la CRP de 15 à 25 % (23). Le risque de récurrences d'infarctus du myocarde est ainsi moins important chez les patients qui ont à la fois une diminution du C-LDL et de la CRP lors du traitement par statines.

### Conclusion:-

La PR est une maladie systémique responsable d'une augmentation de la mortalité essentiellement d'origine CV. Les événements CV sont en effet plus fréquents mais également plus graves au cours de la PR comparé à la population générale. L'augmentation du risque CV ne peut pas être expliquée que par les facteurs de risque CV traditionnels, elle est essentiellement liée à l'état inflammatoire chronique qui entraîne de nombreuses modifications métaboliques. Ces constatations nous ont amenés à nous pencher sur l'étude des facteurs prédictives de l'atteinte cardiovasculaire au cours de la PR à travers une comparaison du profil lipidique et de la mesure échographique de l'EIM de l'artère carotide avec des sujets témoins appariés par l'âge et le sexe. Nos résultats ont montré en accord avec la littérature une augmentation significative de l'EIM chez les sujets atteints de PR par rapport à la population témoin, les perturbations lipidiques dans la PR rapportées dans la littérature et l'augmentation de l'EIM justifient un contrôle strict de l'activité de la maladie et la réalisation périodique d'un bilan lipidique ainsi que la prescription des statines selon les recommandations en vigueur en considérant la PR comme un facteur de risque cardiovasculaire à part entière.

### Abstract

Atrial fibrillation (AF) is the most common arrhythmia. In certain cases he can expose to systemic thrombo-embolic complications. Antithrombotic treatment, with anticoagulant or antiplatelet agents is guided by the evaluation of the ischaemic and haemorrhagic risk based on validated clinical risk scores. However, these scores have limitations and their diagnostic performances are variable, which limit their use in daily practice; Many biomarkers and morphologic markers have been studied to refine the stratification of thrombo-embolic risk, and should be able to predict a more focused and more rational prescription of anticoagulant treatment.

### Introduction:-

La fibrillation auriculaire est l'arythmie la plus fréquente en pratique clinique associée à une augmentation significative de la morbi-mortalité cardiovasculaire. Son incidence et sa prévalence augmentent avec l'âge, faisant de cette pathologie une véritable épidémie avec un fort impact économique. Il existe au cours de la FA un état prothrombotique, se caractérisant par un taux sanguin élevé de différentes protéines procoagulantes, mais également pouvant être marqués par des marqueurs morphologiques à l'échocardiographie. Les scores cliniques CHADS2 et CHA2DS2-VASc sont simples et pratiques en utilisation quotidienne, et la question se pose de savoir si l'on peut améliorer cette approche par la prise en compte de ces biomarqueurs ou de données échographiques (« échomarqueurs »).

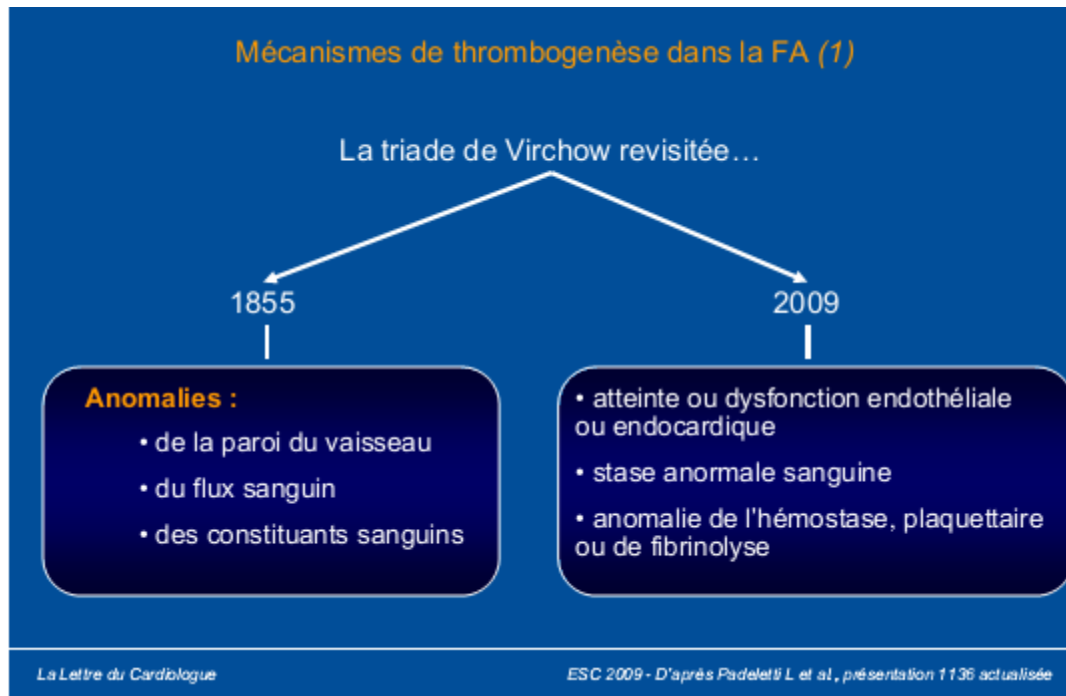

### Mécanisme de la thrombogénèse dans la fa:-

La pathogénie de la thrombose au cours de la FA ne relève pas seulement de la stase sanguine au niveau de l'auricule gauche. La FA serait en elle-même un état d'hypercoagulabilité et obéirait à la triade de Virchow : stase sanguine (perte de la systole auriculaire), altérations de la paroi vasculaire (documentées notamment par des études en microscopie électronique des parois auriculaires) et anomalies de la crase sanguine. Un état d'hypercoagulabilité correspondant à cette troisième composante a été identifié dans l'HTA, la pathologie coronaire, vasculaire cérébrale et le diabète. Plusieurs études ont suggéré le rôle d'une composante inflammatoire dans l'initiation et la pérennisation de la FA, d'autres travaux ont permis de soupçonner un lien entre l'inflammation et la thrombose.

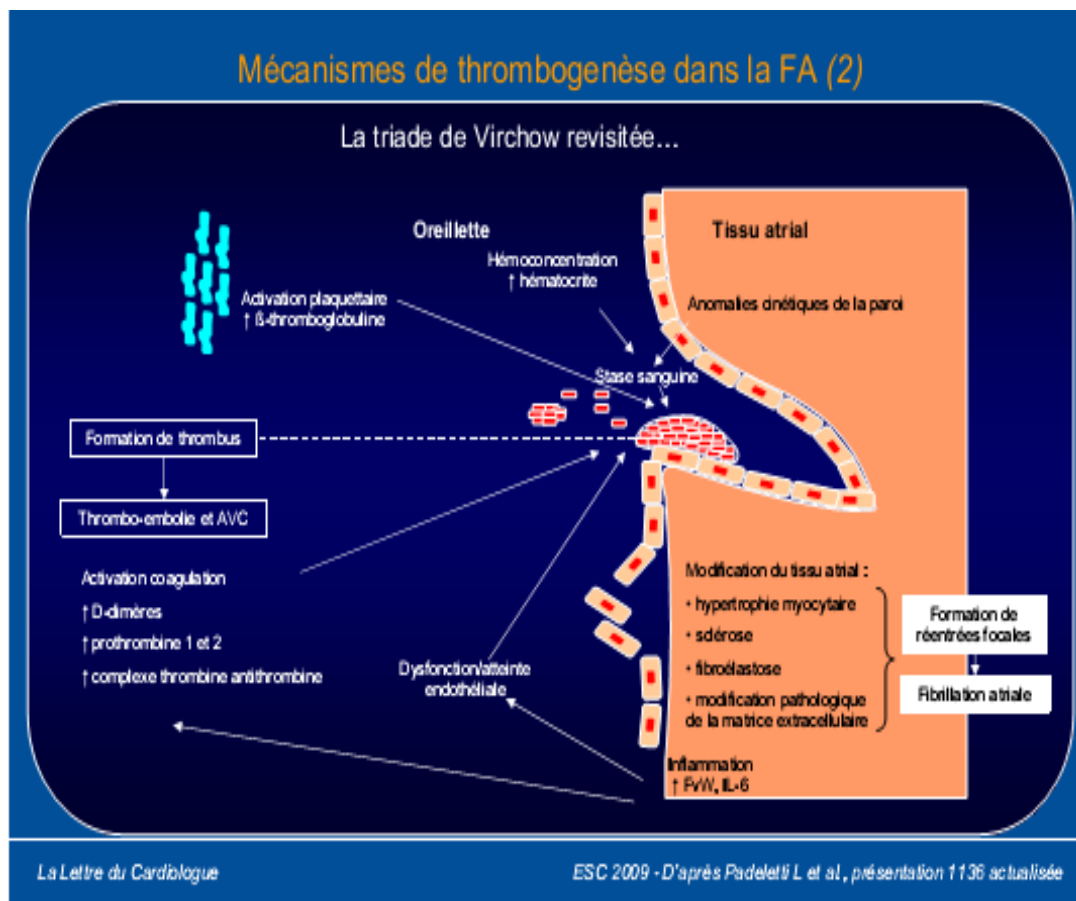

Les mécanismes physiopathologiques ont évolué depuis la classique triade de Virchow décrite en 1855 ce qui a amené à une révision de cette dernière comme le montre ce schéma ci-dessous :

**Corresponding Author:- H. Jallal.**

**Address:-** Service de cardiologie Hopital Militaire Avicenne. CHU Mohammed VI marrakech.

L'ensemble des mécanismes possiblement impliqués dans le développement de la fibrillation atriale sont illustrés dans le schéma suivant :

### Score de risque et risque embolique artériel dans la fa:-

De nombreuses approches ont successivement été proposées au cours des 20 dernières années, basées sur des études épidémiologiques ou des revues de la littérature, ayant intégré plusieurs facteurs de risque, mais à des degrés variables : âge, sexe féminin, antécédent d'infarctus cérébral ou AIT, hypertension artérielle, insuffisance cardiaque, diabète et pathologie vasculaire, cette dernière dernièrement intégrée dans le score CHA2DS2-VASc.

Cependant, ces scores sont imparfaits car issus de cohortes évaluant certes le risque embolique lié à ces facteurs, mais moins de 10 % des patients triés et éligibles ont été inclus dans les essais, qui ont par ailleurs exclu de nombreux patients ayant une contre-indication au traitement anticoagulant, ce qui explique que certains facteurs de risque n'ont pas été pris en considération. Ainsi, l'extrapolation de ces données est difficile à envisager dans le monde réel.

Faut-il calculer le score C-statistique pour déterminer le meilleur score, prédicteur des événements ischémiques, ou faut-il au contraire proposer une reclassification des patients, puisqu'il a été indiqué que le score C-statistique validé dans une étude ne peut être comparé à une autre étude, du fait de l'hétérogénéité des populations incluses et du profil de risque embolique particulier [1]. De plus, la prescription d'un traitement anticoagulant oral, basé sur des recommandations consensuelles, ne correspond pas à ce qui est réellement observé, puisque la proportion de patients sous anticoagulant est souvent indépendante de la stratification du risque en faible, intermédiaire ou élevé [2]. Ces différentes considérations doivent également être mises en perspective avec d'autres observations telles que, en particulier, la diminution du taux de prescription de l'aspirine chez les patients en FA.

Les scores cliniques CHADS2 et CHA2DS2-VASc sont simples et pratiques en utilisation quotidienne, et la question se pose de savoir si l'on peut améliorer cette approche par la prise en compte des biomarqueurs ou de données échographiques (« échomarqueurs »).

### Marqueurs biologiques de l'hémostase:-

Le dosage de marqueurs plasmatiques explore spécifiquement chacune des étapes de l'hémostase. Un état d'hypercoagulabilité peut concerner l'hémostase primaire (lésion ou dysfonction endothéliale, activation plaquettaire augmentée), la cascade de la coagulation (activité thrombine, fibrinogenèse augmentées) ou la fibrinolyse (hypofibrinolyse) (tableau 1).

**Tableau 1:-** Marqueurs de la coagulation (dosages, abréviations, métabolisme)

	Marqueurs (unités de dosage)	Abréviations	Métabolisme
Plaquettes	Facteur plaquettaire 4 (ng/mL)	PF4	Chimiokine stockée dans les granules alpha
	Bêta-thromboglobuline (U/mL)	BTG	Chimiokine stockée dans les granules alpha
	P-sélectine soluble (ng/mL)	sP-Sel	Protéine transmembranaire des granules plaquettaires (et endothéliaux)
	et membranaire (CD 62P) (% /plaquette)	mP-Sel	Expression sur la membrane cytosolique, interactions avec leucocytes et c. endothéliales
	Glycoprotéine V soluble (ng/mL)	sGPV	Protéine transmembranaire cytosolique
Endothélium	Facteur von Willebrand (U/dL)	Wb	Fragment soluble libéré après hydrolyse par la thrombine
			Glycoprotéine stockée dans les granules endothéliaux (et plaquettaires)
			Liaison au sous-endothélium et à la GPIb
			Liaison plasmatique au VIII
Activité thrombine	Thrombomoduline (ng/mL)	STM	Protéine transmembranaire cytosolique
			Liaison à la thrombine pour activer la protéine C
	Fragments 1 et 2 de la prothrombine (nmol/L)	P 1 + 2	Sous-unités de la prothrombine libérées lors de son hydrolyse en thrombine
	Complexes thrombine-antithrombine III (ng/mL)	TAT III	Complexes formés par la liaison de la thrombine à son inhibiteur, l'AT III
Fibrinogenèse	Fibrinopeptide A (ng/mL)	FpA	Peptide issu du clivage du fibrinogène par la thrombine
	Fibrinogène (g/l)	Fb	Précurseur de la fibrine
	D-dimères (ng/mL)	Ddi	Produits de dégradation de la fibrine stabilisée par le facteur XIII
Fibrinolyse			Reflet du turn over de la fibrine
	t-PA (ng/mL)	-	Protéine circulante sécrétée par les cellules endothéliales
			Clive le plasminogène en plasmine
	PAI-1 (U/dL)	-	Inhibiteur du t-PA
	Complexes plasminogène-alpha2-antiplasmin (ng/mL)	PAP	Complexes formés par la liaison de la plasminogène à son inhibiteur

Plusieurs études ont montré l'intérêt de ces biomarqueurs pour confirmer les scores cliniques [3-4]. Il s'agit de marqueurs d'hypercoagulation, d'inflammation, d'activation plaquettaire ou endothéliale, de facteur Willebrand, d'index d'atteinte endothéliale. Les plaquettes sont également activées dans la FA, mais l'activation plaquettaire pourrait ne refléter que l'association entre comorbidité et FA (par exemple, HTA et pathologie vasculaire) plutôt qu'être liée à l'état prothrombotique dans la FA [5]. Les concentrations du facteur Willebrand plasmatique constituent un facteur de risque indépendant d'événements cardiovasculaires, incluant la mortalité et le saignement majeur chez des patients sous anticoagulants du fait d'une FA permanente [5]. L'élévation des D-dimères est associée à un excès de risque chez les patients en FA, Plusieurs travaux [6-7] se sont intéressés à l'évaluation de la valeur prédictive des d-dimères sur le risque de survenue d'un événement thromboembolique. Nozawa et al. [6] ont constaté que le risque thromboembolique chez les patients à faible risque clinique d'accident thromboembolique était faible quand le taux de d-dimères était inférieur à 150 ng/mL (0,7 %/an). Ce risque n'était plus négligeable lorsque le taux de d-dimères était supérieur à 150 ng/mL (3,8 %/an).

L'élévation de la CRP est associée à un excès de risque de décès, mais pas à un risque accru d'infarctus cérébral chez des patients en FA, confirmant l'intérêt de la CRP chez des patients ayant une pathologie vasculaire. Lip (8) a montré que le facteur Willebrand plasmatique permettait d'améliorer la prédiction du score CHADS2 en ce qui concerne celle du risque d'AIC et d'AVC chez les patients en FA inclus dans l'étude SPAF-III. Plus récemment, la troponine et le BNP ont été validés comme associés à un surrisque d'événements dans la population RE-LY traitée par anticoagulants [9].

La fonction rénale, la clairance de la créatinine, la protéinurie, le débit de filtration glomérulaire ont également été considérés comme associés à un excès de risque d'événement cardiovasculaire, L'insuffisance rénale est associée au risque d'insuffisance cardiaque et d'HTA, augmente avec l'âge, la présence d'un diabète ou la pathologie vasculaire, tous composants des scores CHADS2 et CHA2DS2-VASc. En attendant des validations, le score CHA2DS2-VASc pourrait être implémenté par la prise en compte de un ou deux points supplémentaires en cas d'insuffisance rénale. Deux publications récentes ont permis de montrer qu'un score R2-CHADS2 ou R-CHA2DS2-VASc [10] pouvait améliorer la prédiction des événements cardiovasculaires chez ces patients.

#### **Marqueurs morphologiques ou echomarqueurs:-**

L'échocardiographie est une technique largement utilisée et versatile et qui peut apporter des informations complémentaires dans la stratification du risque des patients en FA, Cependant, la préconisation de la réalisation de cet examen chez tous les patients en FA pourrait accroître la complexité d'évaluation du risque thromboembolique.

#### **'échographie transthoracique:-**

Une fraction d'éjection ventriculaire gauche (FEVG) normale est associée à l'absence de formation de thrombus dans l'auricule gauche [11]. L'évaluation de la FEVG améliore la capacité de discrimination dans l'utilisation des scores CHADS2 et CHA2DS2-VASc en ce qui concerne la détection d'un thrombus atrial gauche [12] et d'autres marqueurs de la stase atriale gauche.

La masse VG indexée aurait une valeur discriminante intéressante pour prédire les thrombi dans l'auricule gauche avec un score C-statistique à 0,98, bien plus élevé que pour le contraste spontané (0,73-0,75) [13]. Dans l'étude SPAF [14], la taille de l'OG mesurée en mode M était un prédicteur indépendant du risque thromboembolique et améliorerait la valeur discriminante de la seule approche clinique, La surface atriale gauche et la FEVG augmentent la capacité de discrimination des scores CHADS et CHADS-VASc en ce qui concerne la détection des thrombi dans l'auricule gauche, le contraste spontané intense et les basses vitesses auriculaires gauches mais La combinaison de la taille de l'OG et de la FEVG a été proposée comme approche ayant une bonne capacité de discrimination des patients sans thrombus auriculaire gauche à l'ETO. Un rapport FEVG/volume atrial gauche indexé supérieur à 1,5 exclut la présence d'un thrombus dans l'auricule gauche chez les patients en FA, candidats à une ablation ou à une cardioversion [12].

Le strain longitudinal pourrait constituer une information indépendamment du volume de l'oreillette gauche indexée. Le volume atrial gauche est une mesure statique, alors que le strain longitudinal est un paramètre dynamique qui reflète les variations de dimension de l'oreillette gauche en phase de remplissage. Ce caractère dynamique des variations de dimensions de l'oreillette gauche pourrait influencer la stase atriale gauche, le temps de transit sanguin sur la surface endocardique, et donc la plus ou moins grande propension à thromboser. Une réduction

du strain longitudinal atrial gauche a été associée à la présence d'une fibrose myocardique [90], et ainsi la fibrose atriale gauche, détectée par IRM, a été associée au risque d'infarctus cérébral chez les patients en FA [91].

#### **'échographie transoesophagienne:-**

La plupart des études qui se sont intéressées aux données d'échocardiographie transoesophagienne (ETO) montrent que la présence d'un contraste spontané, de basses vitesses auriculaires gauches, d'un thrombus atrial gauche ou l'existence d'athérome aortique complexe de l'aorte descendante seraient des prédicteurs indépendants du risque embolique artériel. Dans l'étude de Zabalgoitia M [16], l'âge, les vitesses auriculaires gauches, le diamètre atrial gauche mesuré en mode M, la présence d'un athérome aortique et le taux de fibrinogène plasmatique sont associés de façon indépendante à la présence d'un contraste spontané atrial gauche, tandis que des vitesses auriculaires gauches antérogrades, < 20 cm/s, et des facteurs de risque clinique sont associés de façon indépendante à la présence d'un thrombus atrial ou auriculaire gauche [95]. Une étude ayant inclus 500 patients avec infarctus cérébral en rythme sinusal ou en FA [96] a montré que le risque de thrombose dans l'auricule gauche, avec présence de contraste spontané, augmentait de façon significative lorsque la vitesse auriculaire gauche était inférieure à 57 cm/s. Lorsqu'elle est  $\geq 55$  cm/s, le risque de thrombose atrial gauche est minime, de même que le risque de contraste spontané est très faible avec une valeur prédictive négative respectivement de 99 et 100 %. En analyse multivariée, la vitesse auriculaire gauche est le meilleur prédicteur de l'apparition d'un thrombus ou d'un contraste spontané.

#### **corrélation entre les marqueurs biologiques et morphologiques:-**

Heppellet al. [17] et Pongratzet al. [18] ont trouvé des marqueurs d'activation plaquettaire (BTG, P-sélectine et PF4) significativement plus élevés en présence de contraste spontané ou d'un thrombus et Heppellet al. un facteur de Willebrand plus élevé en présence d'un thrombus. Pour les marqueurs de la coagulation, les résultats sont divergents, sans explication claire : en présence d'un thrombus, complexes TAT III et D-dimères plus élevés pour Heppellet al. [17], non significativement élevés pour Pongratzet al.[36]. Un travail préliminaire de Somloiet al. [19] chez 73 patients bénéficiant d'une ETO avant cardioversion, a rapporté une valeur prédictive négative des D-dimères de 98 %, pour éliminer la présence d'un thrombus auriculaire gauche. Nakagawa et al.[20] ont trouvé, en présence d'un contraste spontané aortique, des D-dimères, des complexes TAT III et complexes plasmine-a2-antiplasmine (PAP) significativement plus élevés. On ne dispose pas de recherche de corrélation entre les marqueurs biologiques et l'athérome aortique

Les données échographiques pourraient donc apporter une précision supplémentaire pour évaluer le risque thromboembolique artériel, une perspective d'intégration de ces échomarqueurs en plus des biomarqueurs serait intéressante à envisager dans le contexte de la FA (Fig. 1).

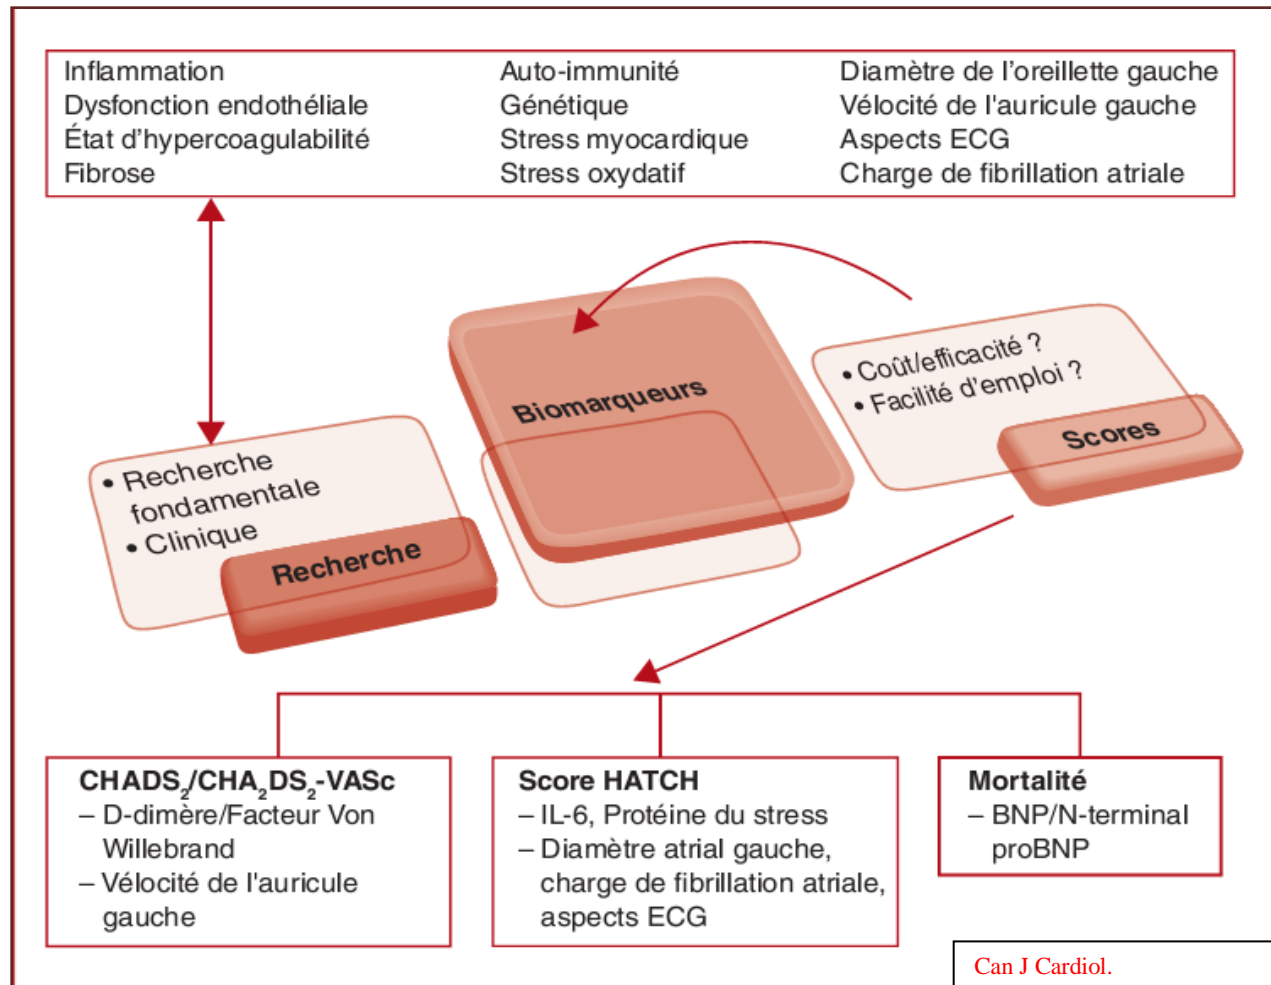

Schéma intégrant les différentes approches clinique, biologique et morphologique

**Conclusion:-**

La prise en charge thérapeutique de la FA s'avère souvent difficile. Cependant, les dernières années ont été marquées par un progrès dans l'évaluation du risque embolique artériel et hémorragique, ainsi que les possibilités thérapeutiques des antivitaminés K et des anticoagulants oraux directs (anti-IIa et anti-Xa), ce progrès a permis d'améliorer la prévention du risque d'infarctus cérébral, en particulier chez les patients ayant au moins un facteur de risque. Les approches complémentaires morphologiques et biologiques demandent à être validées afin de contribuer à une meilleure stratification du risque et peut-être aboutir à une aide au traitement, surtout chez les patients jugés à faible risque ou ceux ayant un risque hémorragique accru.

##### Key words:-

*Wrightia tinctoria*, Rutin, Catechol, flavonoids.

#### Abstract

*Wrightia tinctoria* have been studied for their chemical constituents. The powder of fruit of *W. tinctoria* was subjected to hot extraction with methanol, petroleum ether and ethyl acetate and subjected to chromatography. The flavonoids in form of Rutin and Catechol were isolated from fruit extract of *W. tinctoria*. The results revealed that, methanol fruit extracts of *W. tinctoria* contains maximum amount of flavonoids as 90 mg/g of Rutin equivalent and the phenolic content as 3.0 mg/g of Catechol equivalents. While, fruit extract of ethanol and petroleum ether has been found minimum, whereas, fruit extract of *W. tinctoria* was found highest presence of catechol equivalents.

#### Introduction:-

India. (Kirtikar and Basu, 1994; Naik 1998, Wadood Khan 1985, Zate B. R. 1983, S. R. Shinde 2008).

The whole plant and its specific parts such as, bark, leaf, seed fruits, roots are known to have high medicinal properties have a back history of use indigenous communities in India. (Nadkarni K. M., 1976).

The medicinal value of *W. tinctoria* for the treatment of a large number common ailments of human being which were reported in Ayurveda, Siddha, Unani and folk medicine (Kirtikar and Basu 1975, Warriar et.al. 1996) and screening of scientific data revealed that a large number of various drugs of indigenous drug have been investigated (Khare C. P. 2007 and Niir board 2008).

Apart from that, *W. tinctoria* also provide comprehensive information on the traditional use of mankind. Such as, ethnopharmacology, phytochemistry and pharmacological study. Present study helpful to determination and quantity content of flavonoids and phenolic compounds such compounds is useful for producing safer drugs for the treatment of common various ailments of human beings (Bharat N. S. 2015).

#### Materials and Methods:-

##### Determination of flavonoids from fruits extracts of *Wrightia tinctoria R.Br.*:-

Rutin was used as standard flavonoid. Different concentrations (20 to 100 µg/ml) of rutin were analyzed at 510 nm and a calibration curve was plotted as absorbance versus concentration. 10 µg/ml of each test substance (Extracts of *Wrightia tinctoria R.Br.* was analyzed by using the similar procedure and quantity of flavonoids in mg per gram of rutin equivalent was determined for each extract.

Address:- Botany Research Centre, Department of Botany, Maharashtra Mahavidyalaya, Nilanga. Dist. Latur (M.S.) India.

**Procedure:-**

- Known volume of samples was pipetted out in series of test tubes and volume was made up to 0.5 ml with distilled water.
- Sodium nitrite (5%; 0.03 ml) was added to each tube and incubated for 5 minutes at room temperature.
- Aluminum chloride solution (10%; 0.6 ml) was added and incubated for 5 minutes at room temperature.
- Sodium hydroxide solution (1 M; 0.2 ml) was added and total volume was made up to 1 ml with distilled water.
- Absorbance was measured at 510 nm against a reagent blank.
- Standard curve using different concentrations of rutin was prepared.
- From the standard curve, concentration of flavonoids in the test samples was determined and expressed as  $\mu\text{g}$  of rutin equivalent.

**Determination of Phenolic compounds from fruit extracts of *Wrightia tinctoria* R.Br:-**

Catechol was used as standard phenolic compound. Different concentrations (0.5 to 2.5  $\mu\text{g/ml}$ ) of catechol were analyzed at 650 nm and a calibration curve was plotted as absorbance versus concentration. 1  $\mu\text{g/ml}$  of each test substance (extracts of *Wrightia tinctoria* R.Br. were analyzed by using the similar procedure and quantity of phenolic compounds in mg per gram of catechol equivalent was determined for each extract.

**Procedure:-**

- Aliquot of each sample was pipette out in series of test tubes and volume was made up to 3 ml with distilled water.
- Folin-Ciocalteu Reagent (0.5 ml) was added to each tube and incubated for 3 minutes at room temperature.
- Sodium carbonate (20%; 2 ml) solution was added, mixed thoroughly and the tubes were incubated for 1 minute in boiling water bath.
- Absorbance was measured at 650 nm against a reagent blank.
- Standard curve using different concentrations of standard phenolic catechol was prepared.
- From the standard curve, concentration of phenols in the test samples was determined and expressed as  $\mu\text{g}$  of catechol equivalent.

**Results and Discussion:-****Determination of flavonoids:-**

In order to investigate quantity of flavonoids by using absorbance of different concentrations (20 to 100  $\mu\text{g/ml}$ ) of Rutin and the results are summarized in the table- 1. A calibration curve shows linear correlation at measured concentrations. Table- 2 represents the quantity of flavonoids in mg per gram of Rutin equivalent determined for test extract. The results indicate that methanol fruit extracts of *W. tinctoria* R.Br was contain maximum amounts of flavonoids as 90 mg/g and 88 mg/g of Rutin equivalents while minimum amount of flavonoids was in extract of petroleum ether.

**Table 1:-** Absorbance table for different concentrations of rutin

Sl. No.	Concentration of Rutin (in $\mu\text{g}$ )	Optical Density (at 510nm)
1	Blank	0
2	20	0.19
3	40	0.35
4	60	0.56
5	80	0.74
6	100	0.91

Sl. No.	Test Sample	mg/g of Rutin equivalents
1	Methanolic extract of <i>W. tinctoria R.Br</i>	90 mg/g
2	Petroleum ether extract of <i>W. tinctoria R.Br</i>	14 mg/g
3	Ethyl acetate extract of <i>W. tinctoria R.Br</i>	22 mg/g

**Determination of phenolic compounds:-**

In order to determine the quantity (quantity) of phenolic compounds by using the absorbance of different concentrations (0.5 to 2.5 µg/ml) of Catechol and the results are given in the table- 3. A calibration curve shows linear correlation at measured concentrations. Table- 4 represents the quantity of phenolic compounds in mg per gram of Catechol equivalent determined from the tested extracts. The results indicate that, ethyl acetate fruit extracts of *W. tinctoria R.Br* contain maximum amounts of phenolic compounds as 3.0 mg/g and catechol equivalents. While, other tested extracts were found to be minimum. Among the tested samples ethyl acetate extracts of *W. tinctoria R.Br* was found to be highest count of Catechol equivalents.

#### Abstract

**Background:** About 3 million Americans have dental implants, and this number is growing at 500,000 every year. In this context, the microorganisms that reside on the surfaces of the implants and their prosthetic components are considered the main etiological factor for the peri-implantite.

**Objective:** was to do a brief literary review, pointing out the main predictors of peri-implantite and treatments. **Methods:** This study is in the literature review focusing on the main predictors and treatments of peri-implantite. To this end, a survey was conducted in scientific articles in PubMed, Medline, Scielo, Lilacs and books.

**Discussion:** Several uncertainties remain regarding peri-implant disease. Long-term follow-up of consecutively treated cases appears to be a realistic path for accumulating more information. The current clinical recommendations are that there is no consensus on the protocol for the treatment of mucositis or peri-implantitis due to the heterogeneous characteristics of different implant systems, implant position and other factors related to the patient. Thus, there is no individual treatment option. **Conclusion:** In the implant, if plaque accumulation is allowed for longer periods and the patient is at risk, peri-implant mucositis can progress to lesions with peri-implantite alveolar bone loss. The most important treatment of peri-implantitis is to interrupt progressive bone loss by plaque control, even restoring the bone lost through regenerative surgical procedures.

#### Introduction:-

About 3 million Americans have dental implants, and this number is growing at 500,000 every year. In addition, the number of biological complications is also increasing. Among them, peri-implant disease is considered the most common cause of implant loss after osseointegration. In this context, the microorganisms that reside on the surfaces of the implants and their prosthetic components are considered the main etiological factor for peri-implantite [1,2].

Periodontal and peri-implant soft tissues have many characteristics in both clinical and histological [1-3]. For proper control and maintenance of these tissues, a better understanding of the differences and similarities that exist between

**Corresponding Author:- Edmiane Fernanda Batista Monteiro de Carvalho.**

**Address:-** University Center North Paulista (Unorp) - Sao Jose do Rio Preto – SP, Brazil.

them is needed. Thus, biofilms are formed on all adherent surfaces in a fluid system, both in teeth and in oral implants. As a result of bacterial presence, the host responds by developing a defense mechanism that will lead to soft tissue inflammation [3,4]. In the dento-gingival unit, the results are gingivitis lesions [3].

Furthermore, experimental research has shown that mucositis can progress to peri-implantitis, depending on the factors and risk indicators, affecting the peri-implantar support bone circumferentially [5,6]. Although the supporting bone is lost coronally, the implant will still remain integrated bone and therefore clinically stable. This is the reason why mobility represents a diagnostic characteristic of peri-implantitis that is not sensitive but more specific [6].

More sensitive and reliable parameters of the development and presence of peri-implant infections are bleeding probing, depth of probing and radiographic interpretations of radiographs, aiming to detect the peri-implant lesions as early as possible, thus enabling the treatment, which in this review is described as a cumulative procedure, starting with simpler procedures until the most advanced, aiming to paralyze and prevent the progression of these lesions, which would inevitably result in failure of the implant [5,6].

In this context, most publications from 2011 to 2015 evaluated the effect of implant surface roughness on long-term bone loss as a substitute for peri-implantitis risk. 87 of the 2,566 studies reported average bone loss after at least 5 years. The prevalence of implants with bone loss ranging from 1.0 to 3.0 mm was estimated. Bone loss was used as a surrogate parameter for peri-implantitis, since the prevalence of peri-implantitis was not reported in most studies or when reported, the diagnostic criteria were unclear or of doubtful quality [1- 6].

Peri-implant bone loss around minimally harsh implant systems was statistically less significant compared to moderately rough and rough implant systems [2]. There was no statistically significant difference between moderately rough and rough implant systems [2]. Studies comparing implants with comparable design and different surface roughness, showed lower peri-implantar mean bone loss around the less rough surfaces in the meta-analysis. In addition, when considering 3.0 mm of bone loss after at least 5 years to represent the presence of "peri-implantite", less than 5.0% of the implants were affected. Still, periodontal history and smoking habits were the most important predictors of bone loss [4].

Therefore, the present work aimed to make a brief literary review, pointing out the main predictors of peri-implantitis and treatments.

#### **Methods:-**

This study is in a literature review focusing on principal predictors and treatments of peri-implantitis. To this end, a survey was conducted in scientific articles in the databases PubMed, Medline, Scielo, Lilacs and books. The key words used were Peri-implantitis, Osteointegration, Mucositis and Implants, which are registered in the Health Sciences Descriptors. Selected papers passed criteria for inclusion and exclusion.

#### **Main Predictors Continuous or Categorical:-**

The main predictors are periodontal history, smoking habits, osteoporosis, diabetes mellitus.

#### **Main Predictors Answer:-**

The main predictor of response was peri-implantitis.

#### **Literature Review:-**

The peri-implantitis is developed from mucositis lesions, while others remain resistant and present only mucositis in response to the accumulation of plaque microorganisms [1-3]. The term peri-implantitis is used because of clinical, histological and microbiological similarities with periodontitis. Several studies suggest that destruction of peri-implant tissues is caused by a bacterial infection and that the concomitant inflammation observed is similar to periodontal disease [7,8]. Peri-implantitis is defined as an inflammatory process that affects the tissues around an osseointegrated implant as a result of the progressive loss of peri-implant bone support accompanied by inflammatory soft tissue disease [6-9].

As the tissues around teeth and implants have many characteristics in common it is inevitable that the host bacterium interaction also plays a potential role in peri-implant complications, as well as in periodontitis [6]. Gualini and

Berglundh (2003) [9] investigated the histochemical characteristics of the peri-implant tissues during mucositis and periimplantar disease. In order to do so, they selected two groups of studies: in group A (mucositis) ten patients partially treated with branemark implants as a function of +/- five years. In group B (periimplantite) six patients partially restored also with branemark type implants in use at +/- eleven years. In each group at sites with peri-implant disease, biopsies (4 / mm of soft tissue) were performed and analyzed. Before the biopsies, patients were not on any periodontal treatment program.

In addition, restorations supported by dental implants have been added substantially to the clinical treatment options presented to patients [3]. However, complications with these treatment options also arise due to inadequate patient selection and inadequate planning of treatment combined with poor follow-up care [4]. Complications related to the presence of inflammation include perimucositis, peri-implant bone loss, and peri-implantitis. The prevalence rates of these complications were reported to be as high as 56.0% [4]. Treatment options that have been reported include non-surgical therapy, the use of antibiotics administered locally and systematically, and surgical protocols aimed at regenerating lost bone and soft tissue around implants [5].

In another study Esposito et al. (1997) [10], studied the peri-implant soft tissues of implants lost after being in use for a certain period. They described the cellular composition of soft tissues that were around implants, which lost osseointegration (they were soft) and were removed the stable and healthy implants were used as control. In the research the lost implants were divided into two groups: those that were lost with infection and those without infection. The group with infection (periimplantite) were characterized by an intense inflammatory and immunological response [10].

The connective tissue had an inflammatory infiltrate containing a large number of plasma cells (predominant cells) and mono-nuclear cells (B and T lymphocytes, monocytes and macrophages). There was migration of the sulcular epithelium and in its interior the presence of neutrophils PMNs and in some cases the apical migration of the epithelium circumvented every implant [4,11]. Because of these characteristics, the authors suggest that peri-implant soft tissues react to bacterial invasion with similarity to periodontal tissues. The presence and distribution of soft tissue macrophages around lost implants were similar to those found in the control group of healthy implants [12-15].

Thus, the presence of macrophages around the tissues of the implant is a phenomenon related to the presence of a biomaterial. The macrophage is the most common cell type detected on the implant surface, regardless of the type of material, and has been suggested that it plays a key role during the inflammatory and repair phase after implantation [3,7]. According to Liljenberg et al. (1994) [11] the presence of a large number of macrophages seems to be different in periodontal disease active or inactive in humans as well as experimentally in animals.

Experimental evidence has shown us that failed implants do not appear to be distributed randomly in the population, but concentrated in a small percentage of the population. Weyant and Burt (1993) [13] studied the survival of dental implants in a group of five hundred and ninety-eight consecutive patients from the U.S. dental implant veterinary administration file, totaling two thousand ninety-eight implants. Their results indicate that, of all the group, a total of eighty-one implants of forty-five individuals were removed between five and a half years.

Smoking that alter immune functions and tissue repair or endogenous or intrinsic factors such as genetic predisposition for a hyper cytokine production, low antibody production or a decrease in the number of neutrophils can cause large changes in the disease process [14]. These factors that can modify the host response, alter the susceptibility of the individual to infection by the periodontal microorganisms are the risk factors.

## **Main Predictors:-**

### **Smoking:-**

Smoking alters the balance between the microbial load on the implants and the host response, negatively impacting the longevity of oral implants [2]. The mechanisms by which smoking affects peri-implant tissues are immunosuppressive effects in the host. Smokers also have low levels of neutrophils [14]. Pathogenic periodontii may now escape the specific and nonspecific mechanisms of immune cleansing, allowing them to establish themselves as peri-implant subgingival inhabitants. Thus, the alteration in the subgingival physical environment and the decreased oxygen tension will allow the growth of an anaerobic microbiota. In addition, smoking increases

bacterial adhesion to epithelial cells. However, it is not surprising that smokers in general have higher levels of periodontopathogens and may be considered microbiologically compromised [15].

Thus, in an effort to evaluate possible risk factors that would contribute to implant failure, Bain and Moy (1993) [16] conducted a retrospective evaluation on two thousand ninety-four Branemark implants, installed by a surgeon between one thousand Nine hundred and eighty-four and one thousand nine hundred and ninety-one. Values considered included length, location, diabetes, medication with steroids age and sex, time placed along the "learning curve" and use of cigarette. It soon became clear that of all factors considered, smoking took the most significant part in the high failure rate of implants. Their results showed an overall failure rate of 4.76% in nonsmokers versus 11.3% in smokers.

In addition, when only the maxilla was considered, there was a failure of 17.90% in smokers and only 7.3% in nonsmokers. The difference in the mandible was lower, with 4.64% of failure in smokers and 2.4% in non-smokers, with significant difference only in the anterior mandible [16]. The failure rates of implants decreased with their increased length, but in the maxilla there was a more significant failure rate in smokers of up to 15 mm [17]. Haas et al. (1996) [18] evaluated the maxillary gingival bleeding index, a periimplantar probing rate and peri-implantar inflammation, as well as mesial and distal bone loss, higher in smokers than in nonsmokers.

Moreover, Lindquist et al (1997) [17] found that the marginal loss was higher in smokers than in nonsmokers and correlated with the amount of cigarette consumption. Smokers with poor oral hygiene showed greater marginal loss around lower implants than those with good oral hygiene.

#### **Oral hygiene:-**

The oral hygiene of the patient has an important significance in the stability of the marginal bone around osseointegrated implants. A higher prevalence of peri-implant problems has been reported in patients with low oral hygiene index. Even in fully edentulous patients with dental implants, ineffective oral hygiene has been linked to increased peri-implant bone loss especially in smokers [18].

#### **Susceptibility to periodontitis:-**

Implants can be affected by periodontal conditions comes from two evidences: similarity in the microflora that colonizes teeth and implants in partially edentulous patients and identification of a hyperinflammatory phenotype in partially edentulous patients with peri-implant lesions [3]. Fardal et al. (1999) [19] described an unsuccessful therapy with implants in a partially edentulous patient suffering from aggressive periodontitis. However, authors try to prove the opposite and point out that some implant and surface configurations may be even more resistant to "insertion" loss than teeth. Thus installed implants, especially those with rough surfaces, in patients prone to aggressive periodontitis may lead to a high risk of implant loss [20].

#### **Osteoporosis:-**

Osteoporosis may be a risk factor for oral bone loss, including the alveolar process associated with periodontal infection [5]. Wowren et al. (1994) [21] showed a relationship between periodontal disease and osteoporosis, comparing twelve women with fractures due to osteoporosis with fourteen normal women, and found more loss of periodontal insertion in women with osteoporosis than in those without osteoporosis.

Although some studies Wactawski et al. (1996) [22] point to the possibility of osteoporosis without a risk factor for periodontal disease and peri-implantar disease and other studies are needed especially those on a large scale where multiple risk factors affect both osteoporosis and periodontal disease.

#### **Diabetes:-**

It is well established that diabetic patients are more prone to healing complications even in clean wounds [2,3]. There is a number of evidences supporting the association between diabetes mellitus and periodontal disease. Taylor et al. (1998) [23] in a longitudinal study showed that type II diabetes was a significant risk factor for periodontal disease.

**Table 1:-** Main considerations regarding the treatment of peri-implantitis [6].

1.	Non-surgical treatment appears to be more effective for the treatment of mucositis than peri-implantitis.
2.	Peri-implantite treated with non-surgical therapy results mainly in decreased bleeding probing and depth of probing (usually less than 1 mm).
3.	Personal hygiene care or the professional maintenance program have a positive effect on the prevention of peri-implant mucositis that begins in peri-implantitis.
4.	The implant of non-regenerative surgical therapy should be established based on the diagnosis and risk profile.

**Table 2:-** Prediction of improvement of clinical parameters that apply peri-implantite regenerative surgical treatment [6].

1.	The evaluation of the systemic and local factors of the patients affected by the perimplantite should be taken into consideration in the application of the regenerative surgical treatment.
2.	Regenerative surgical treatment may be chosen for the reconstruction of intra-auricular defects, while the non-regenerative approach and implantoplasty of the implant component are recommended.
3.	Adequate maintenance phases of pre and post-surgical hygiene and effective decontamination of the implant surface are required for the successful surgical procedure.
4.	There is no fundamental advantage of using the membrane to cover the bone graft in the final result of the regeneration of peri-implant defects.
5.	Immersion of the implants during the healing period does not appear to influence the final outcome of the regenerative treatment.

### Discussion:-

Several uncertainties remain regarding peri-implant disease. Long-term follow-up of consecutively treated cases appears to be a realistic path for accumulating more information [1]. This can be useful in establishing the magnitude and stability presitivity on the improvements that can be made. Although not generally reported, it appears that bandage-induced defects are scintillating and funnel-shaped [2].

The current clinical recommendations are that there is no consensus on the protocol for the treatment of mucositis or peri-implantite due to the heterogeneous characteristics of different implant systems, implant position and other factors related to the patient 3. Thus, there is no individual treatment option. Table 1 lists the main considerations regarding peri-implantite treatment [6].

There is still no consensus on a particular protocol or biomaterial selection in the peri-implantite regenerative surgical treatment due to the high heterogeneity and bias among the investigated studies. However, several clinical recommendations can be elaborated according to the data available in the current literature. A predictable improvement of the clinical parameters that apply to the peri-implantite regenerative surgical treatment can be predicted, as shown in table 2 [6]. In light of the peri-implant microbial etiology, the motivation and instruction of the patient together with the surgical therapy envelope are an integral part of the peri-implantite treatment. No specific clinical recommendation can be made as to which specific method of non-regenerative surgical therapy is to be implemented [6].

The formation of new bone in the apical part of the defects may have occurred against a surface that was not contaminated prior to treatment [24]. However, the magnitude of the new bone formation obtained in some studies suggests that new bone can be formed in direct contact with a previously contaminated implant surface [25,26]. There is a consensus that correct oral hygiene should be established and that occlusal forces should be assessed and corrected by occlusal adjustment when deeply traumatic [26].

### Conclusion:-

In the implant, if plaque accumulation is allowed for longer periods and the patient is at risk, peri-implant mucositis can progress to lesions that extend more apically, with associated alveolar bone loss (peri-implantite). Due to the infectious nature of mucositis and peri-implantitis, preventive procedures should be performed in a control program and reassessed to ensure adequate supportive therapy for a lifetime. The most important treatment of peri-implantitis is to stop progressive bone loss by plaque control and purging, even restoring the bone lost through regenerative surgical procedures.

**Competing Interests:-**

The authors declare que they have no competing interests.

### Abstract

Green synthesis is environmentally friendly technique for synthesis of metal Oxide nanoparticles. In this present work, synthesis of ZnO nanoparticles were prepared by Green Synthesis method. Here Leaf extract of Alternanthera Sessile can be used as reducing and capping agent for synthesis of stabilized ZnO nanoparticles. ZnO nanoparticles were characterized by X-ray diffraction (XRD), Scanning Electron Microscope (SEM), Energy dispersive analysis of X-rays (EDAX) and Fourier transform infrared spectroscopy (FTIR). From X-ray diffraction studies it is observed that (101) phase obtained at  $36.68^\circ$  2theta value. The size of the nanoparticle is 22nm at this peak. It was observed that the shape of the ZnO particles is agglomerated spherical by SEM attached with EDS analysis. From FTIR analysis, it was observed that Alkenes and Nitriles functional groups in this leaf extract used as reducing agent for synthesis of ZnO nanoparticles. It was proved by peaks were obtained at wave numbers  $809\text{cm}^{-1}$ ,  $909\text{cm}^{-1}$ ,  $2331\text{cm}^{-1}$  and  $2361\text{cm}^{-1}$ .

### Introduction:-

ZnO is one of the most promising materials for analyse optical and electrical properties. The superiority of ZnO photocatalytic activity and semiconductor property because it is direct band gap semiconductor of, bandgap of 3.37 eV. ZnO has a wide range of applications in optoelectronic devices such as light-emitting diodes, photodetectors, and p-n homojunctions lasers. ZnO has higher luminescence efficiency of the emitted light even at room temperature. Many techniques including chemical vapor deposition, pulsed laser deposition, molecular beam epitaxy, sputtering, hydrothermal synthesis, and oxidation of metallic zinc powder have been used to prepare ZnO in different forms and structures for various applications. Nanoparticulate form enhances the catalytic activity due to its large surface area and the presence of vacancies and uncoordinated atoms at corners and edges. The photocatalytic activity is also improved by bandgap engineering, as a result of the quantum confinement effect. A well-controlled synthesis process at room temperature is needed for the economical use of ZnO in catalytic applications such as water treatment and other environmental applications. Plant crude contains novel secondary metabolites such as phenolic acid, flavonoids, alkaloids and terpenoids in which these compounds are mainly responsible for the reduction of ionic into bulk Metallic nanoparticles formation. Plant metabolites involved in the bioreduction i.e Amine, Nitrile, Carboxyl and Alkene group in the Leaf extract of Alternanthera Sessile which one responsible for reducing ionic compounds into Metal oxide nanoparticles. Nano particles synthesised by green synthesis method, can be used for Anti oxidant

and antimicrobial activity. From biological approach using leaf extract of *Alternanthera Sessile* has been used for the first time as a reducing material as well as surface stabilizing agent for the synthesis of spherical-shaped ZnO-NPs. The structure, phase, and morphology of synthesized product were investigated by the standard characterization techniques.

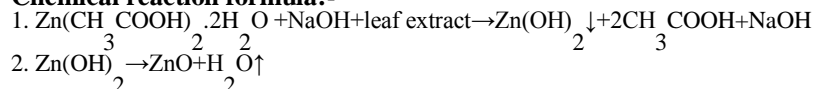

### Experimental:-

#### Synthesis of ZnO-NPs:-

Zinc acetate dihydrate and glassware was purchased from Indian scientific company, tirupati. All glassware was washed with sterile distilled water and dried in an oven before use.

ZnO NPs can be synthesized by using the leaves extract of plant *Alternanthera sessile*. In this procedure, 600 ml of distilled water is taken and aqueous zinc acetate dihydrate is added into it under constant stirring and make it 0.1M solution. Then after 10 min stirring the aqueous leaf extract of *Alternanthera sessile* is introduced into the above solution. 2M NaOH is also added to make pH 12 resulting in a pale white aqueous solution. It is then placed in a magnetic stirrer for 2 hrs. After stirring, pale white precipitate is centrifuged and washed many times with distilled water followed by ethanol to make it free from impurities. Then after drying in vacuum oven overnight, a pale white powder of ZnO nanoparticles will be obtained at 100°C temperature.

#### Chemical reaction formula:-

### Result and Discussions:-

From X-Ray Diffraction (XRD) Analysis of The ZnONp powdered sample was examined by a CuKα1- X Ray Diffractometer for confirming the presence of ZnO and its structure. Main peaks corresponding to 2θ values of 32.14°, 34.83°, 36.68°, 47.98°, 56.91°, 63.32°, 68.38°, 69.58°, 77.40°, 90.07° and 95.86° in the multi-plot have observed from the graph as shown in Fig . The observed peaks of the graph are in good agreement with the JCPDS data card no:36-1451, proved that ZnO NPs has Wurtzite structure. Peaks was compared to standard literature values and the presence of zinc oxide particles was confirmed. The average size of the particles was calculated as 22nm using Debye-Scherrer's formula:

$$D = \frac{k \times \lambda}{\beta_{hkl} \times \cos \theta}$$

where k is Scherer constant=0.9.

the wave length of the source  $\lambda = 15.406\text{nm}$ .

Lattice parameters are calculated from the following equations  $a = \frac{\lambda}{\sqrt{3} \sin \theta_{100}}$

$$c = \frac{\lambda}{\sin \theta_{002}}$$

$$V = \frac{\sqrt{3}a^2c}{2}$$

$$\text{Interplanar spacing } d_{hkl} = \frac{1}{\sqrt{\frac{4(h^2+k^2+hk)}{a^2} + \frac{l^2}{c^2}}}$$

**Fig 1:-** XRD graph of Alternanthera Sessile leaves ZnO nanoparticles

**Table 1:-** The structural parameters of Alternanthera Sessile leaves ZnO nanoparticles

data	2θ	hkl	$d_{hkl}$ (Å)	Structure	Lattice parameters(Å)	$V$ (Å <sup>3</sup> )
sample	32.14 34.83	(100) (002)	2.783 2.582	Hexagonal	$a=3.213$ $c=5.152$ $c/a=1.6035$	46.05
Jcpds(36-1451)	31.770 34.422	(100) (002)	2.814 2.603	Hexagonal	$a=3.250$ $c=5.207$ $c/a=1.6021$	47.63

#### SEM &EDAX analysis:

From the SEM analysis observed that ZnO nanoparticles were agglomerated spherical in shape. In reported journal they have stated that agglomerated spherical shape ZnO nanoparticles formed by Green synthesis method. The particle size roughly estimated as 15-30nm from SEM analysis.

**Fig 2:-** SEM image of Alternanthera Sessile leaves-ZnO nanoparticles

**EDAX:** The sample contains only Zinc and Oxygen and no other impurity are present in the sample. This was conformed by the EDAX study.

**Fig 3:-** EDAX graph of ZnO nanoparticles of Alternanthera Sessile leaves

**Table-2:** Atomic Weight percentage of Alternanthera Sessile leaves ZnO nanoparticles from EDAX graph

tnemeIE	egatnecrep thgieW	egatnecrep cimotA

Total	100	100

#### Fourier Transform Infrared Spectroscopy (FTIR):-

The FTIR spectrum of ZnO nanoparticles is shown in Figure . For the IR spectra of unannealed samples (Fig-4), a series of transmission peaks from 500 to 4000 $\text{cm}^{-1}$  can be found, corresponding to the carboxylate and hydroxyl impurities in materials. The O-H stretching mode of hydroxyl group has confirmed by peaks observing at 3501 and 1206  $\text{cm}^{-1}$  wave numbers due to water adsorption by ZnO nanoparticles. The peaks assigned at 1630 and 1384  $\text{cm}^{-1}$  are due to the asymmetrical and symmetrical stretching of the zinc carboxylate, respectively. As the size of the nanoparticles increases, the content of the carboxylate ( $\text{COO}^-$ ) and hydroxyl ( $-\text{OH}$ ) groups in the samples decreased. The hygroscopic nature of ZnO causes to form zinc carboxylate and zinc hydroxide .

The fundamental mode of vibration at 1647 $\text{cm}^{-1}$  which correspond to the  $\text{C}=\text{O}$  stretching vibration, 3396  $\text{cm}^{-1}$  which correspond to the N-H bend, 1556  $\text{cm}^{-1}$  which corresponds to  $\text{N}=\text{O}$  stretching vibration were confirmed Amide group present in Alternanthera Sessile leaves. Peaks at 909 and 809 $\text{cm}^{-1}$  which correspond to O-H bend, 2331 and 2361 $\text{cm}^{-1}$  which correspond to  $\text{C}\equiv\text{N}$  stretch were conformed that carboxylic acid ,Alkenes and Nitriles present in the Alternanthera Sessile leaves. Amides , carboxylic acid, Alkenes and Nitriles groups in this leaves serves as the reducing agents for minimal of particle size becomes few nano meters.

**Fig 4:-** FTIR graph of ZnO nanoparticles of Alternanthera Sessile leaves.

### Conclusions:-

The Green synthesis of zinc oxide nanoparticles using leaf extract of *Alternanthera Sessile* provides an environmental friendly, easy and effective route for synthesis of nanoparticles. From the use of plant extracts eliminates bad effects from the usage of harmful and toxic reducing and stabilizing agents. The nano crystallites of ZnO are in the range of 18-30nm. The operating temperature and  $P^H$  of the solution will affect the stability of nano particle and agglomerates are formed. The Green synthesis of ZnO nano particles is still in its Research progress for focusing in the fields of pharma, optical energy conversion and spintronics by tuning its size over few nanometers.

#### Abstract

**Background:** Infectious keratitis (corneal ulcer) is defined as a corneal characterized as a corneal inflammatory process connected with an overlying epithelial damage and it's a vision-threatening medical condition displaying in all age population and either sex that changes in morbidity rate through worldwide, its caused by bacteria, fungi, protozoa or viruses, and presents with pain, photophobia and redness. If left untreated, apart from scar formation, it can lead to endophthalmitis and even corneal perforation and blindness.

**Objectives:** The aims of this corneal ulceration study was therefore to establish the incidence of different types infectious corneal ulcers and to discuss the evidence based treatment that were approved in different world wide studies.

**Methodology:** we conducted a systematic review study that performed through Comprehensive literature search was performed in MEDLINE/PubMed and Cochrane Central Register of Controlled Trials using combinations of the following search terms: "corneal diseases, corneal keratitis" or "corneal ulcer. Epidemiology, Etiology, treatment" our search was ended on 14th of July 2016.

**Conclusion:** Corneal Keratitis is an important cause of ophthalmic disorders worldwide. Most common causes of corneal ulceration include including the infectious keratitis which is caused by bacterial, fungal, viral, and protozoan, the diagnosis of which is made on clinical examination aided by microbiological demonstration in smears or cultures from corneal tissues.

#### Introduction: -

Corneal ulceration is defined as a corneal infiltrate associated with an overlying epithelial defect and it's a vision-threatening medical condition presenting in all age groups and either sex that varies in morbidity worldwide. It might resolve with no medical intervention, advancement to aperture and its resultant outcomes, or leave behind an opacity which if focal may prompt loss of vision. Variety in occurrence of infectious keratitis is a multi-factorial issue that includes a tight mix of different factors, for example, geological and other area related elements<sup>(1)</sup>, degree of development of the country concerned, the predominant predisposing factors and the type of infection commonly present in this community<sup>(2)</sup>. However, varieties in frequency of corneal keratitis have been accounted for in various keratitis trails in various nations despite the fact that these were comparative in the level of development, topographical area, and the most common sort of corneal contamination and related inclining components. Also, within the same nation, France for instance, varieties have been accounted for in the rate of serious types of irresistible keratitis that required healing facility confirmation<sup>(3-5)</sup>.

According to some studies it is generally acknowledged that bacterial and fungal keratitis have far higher rate in the developing world than that in the developed world <sup>(22,23)</sup>. Also it is thought that viral keratitis is more prevalent in developed countries, such as the United States where Herpes Simplex Keratitis (HSK) is considered the leading cause of corneal blindness <sup>(24,25)</sup>. However, predominance of bacterial <sup>(3)</sup> and fungal <sup>(26,27,28)</sup> keratitis in developed countries has been reported.

#### **Objectives: -**

The aims of this corneal ulceration study was therefore to establish the incidence of different types infectious corneal ulcers and to discuss the evidence based treatment that were approved in different world wide studies. And to highlight the most common causes of corneal ulcers in different populations. In contrast this review was aimed to give the chance for healthcare professional and patients to understand the epidemiology, predisposing factors, etiology and the outcome of management of corneal ulcers.

#### **Methodology: -**

We conducted a systemic review study that performed through Comprehensive literature search was performed in MEDLINE/PubMed and Cochrane Central Register of Controlled Trials according to the validated methods of the Preferred Reporting Items for Systematic Reviews (RRISR) <sup>(40)</sup> (using combinations of the following search terms: "corneal diseases, corneal keratitis, Corneal Infiltrate, Corneal Inflammations, Microbial Keratitis" or "corneal ulcer. Epidemiology, Etiology, treatment" our search was ended on 14th of July 2016. Extracted data from individual studies were summarized according to the main objects that our study is concerning about Epidemiology and Etiology of corneal ulcer.

This search was limited to English languages studies, we excluded all case reports, comments, reports, and we included reviews, cross sectional studies and all randomized control studies which met the criteria of our search which are every study discussing the incidence and causes of corneal ulcers from different populations worldwide published in English language.

#### **Data collection: -**

Using a structured data abstraction form, different authors extracted the data from the included studies, and another independent author checked the extracted data. Disagreements were resolved through discussion and if necessary by involving another independent author.

#### **Results and Discussion: -**

Our search identified 89 studies concerning the corneal ulceration and we have and included only 12 studies for the epidemiology concerning corneal ulceration, and 19 studies included in the Etiology of corneal ulcer.

#### **Epidemiology of corneal ulceration: -**

Corneal ulceration was not considered as imperative reason for corneal visual deficiency. Both injury and ulceration are normally monocular and influenced people, consequently, not portrayed as thoroughly visual impairment but rather just as outwardly incapacitated. Nonetheless, as general health programs have turned out to be more compelling in lessening the predominance of conventional reasons for corneal visual impairment, for example, corneal ulceration have turned out to be moderately more critical. In 1992, Thylefors et al, attracted regard for the way that injury is regularly the most imperative reason for corneal ulcer and one-sided loss of vision in creating nations and that up to 5% of all respective visual deficiency after corneal ulcer is an immediate consequence of injury <sup>(6)</sup>. The implication is that well over half a million people in the world are blind as a result of eye injuries <sup>(7)</sup>. A careful analysis of the world literature by Negrel & Thylefors in 1998 brought to light a global epidemic of ocular trauma with some 55 million eye injuries occurring annually, of which 750 000 cases required hospitalization and 200 000 were open-globe injuries <sup>(8)</sup>. They further estimated that approximately 1.6 million people were blind from their injuries, 2.3 million had bilateral low vision, and 19 million were unilaterally blind or had low vision. Even though ocular trauma is a global problem, the burden of blindness from eye injuries falls most heavily on developing countries, especially those where war and civic unrest have left a legacy of eye trauma from weapons such as land mines <sup>(9)</sup>. A country-wide population-based survey in Nepal a country with a peaceful history reported that trauma was responsible for 7.7% of all monocular blindness <sup>(10)</sup>. A more recent population-based prospective study in Bhaktapur District in Kathmandu valley, Nepal, revealed that the annual incidence of ocular injury is 1788 per 100 000 people, with 789 of the injuries due to corneal abrasions <sup>(11)</sup>. In other words, 1.8% of the residents of Bhaktapur

District experience some form of ocular injury every year. In Nepal and other developing countries, injuries are usually associated with agricultural work, but a much higher rate of ocular trauma can occur in specialized situations, such as foundries: an 11% eye-injury rate was reported in foundry workers in Saudi Arabia <sup>(12)</sup>. Corneal ulceration in developing countries has only recently been recognized as a “silent epidemic” <sup>(13)</sup>. Gonzales et al. found that the annual incidence of corneal ulceration in Madurai District in South India was 113 per 100 000 people, see figure 1 <sup>(14)</sup>, 10 times the annual incidence of 11 per 100 000 reported from Olmsted County, Minnesota, in the United States of America <sup>(15)</sup>. By applying the 1993 corneal ulcer incidence rate in Madurai District to all of India, there are an estimated 840 000 people a year in the country who develop an ulcer. This figure is 30 times the number of corneal ulcers seen in the United States <sup>(14)</sup>. Extrapolating the Indian estimates further to the rest of Africa and Asia, the number of corneal ulcers occurring annually in the developing world quickly approaches 1.5–2 million, and the actual number is probably greater. Invariably corneal blindness is the end result in the majority of these infections; outcomes may be even more disastrous such as corneal perforation, endophthalmitis, or phthisis. In a prospective population-based study by Upadhyay et al.2001 in Bhaktapur District, Nepal, the annual incidence of corneal ulceration was found to be 799 per 100 000 people <sup>(11)</sup>.

Glynn RJ et al 1992, in his study showed that the annualized incidence of ulcerative keratitis among aphakic persons using contact lenses was estimated to be 52 cases per 10,000 aphakic contact lens wearers (95% confidence interval (CI), 31.1 to 86.9). The risk of ulcerative keratitis varied substantially by lens use, with extended wear having an estimated sevenfold greater risk relative to daily wear (95% CI, 1.6 to 30.2) <sup>(16)</sup>.

**Figure1:** -Age and sex distribution of patients with corneal ulceration in south India.

A recent trial that was targeting population of 1 093 210 patients in Northern California performed by (Jeng BH et al. 2010), found that out of this large population number 302 developed ulcerative keratitis. The incidence of ulcerative keratitis was 27.6 per 100 000 person-years (95% confidence interval, 24.6-30.9). The incidence of corneal ulceration in contact lens wearers was 130.4 per 100 000 person-years (95% confidence interval, 111.3-151.7), with an adjusted relative risk of 9.31 (7.42-11.7;  $P < .001$ ) compared with non-contact lens wearers, who had an incidence of ulcerative keratitis of 14.0 per 100 000 person-years (11.7-16.6). Seven of 2944 people known to be infected with human immunodeficiency virus developed ulcerative keratitis, with 5 being contact lens wearers. The incidence of ulcerative keratitis in human immunodeficiency virus-positive patients was 238.1 per 100 000 person-years. <sup>(18)</sup>

**Etiology: -**

The regular danger variables for corneal keratitis incorporate visual injury, contact lens wear, recent visual surgery, previous visual surface disease, dry eyes, lid deformity, corneal sensation impairment, chronic use of topical steroids and systemic immunosuppression<sup>(32,33,24)</sup>.

**Microbial keratitis (infectious corneal ulceration): -**

Microbial keratitis is an infection of the cornea that is associated with a risk of permanent visual impairment<sup>(3,24,25,27,29)</sup>. It can be caused by bacteria, virus, fungus, protozoa and parasites.

Wong et al. (2003)<sup>(29)</sup> stated that infective keratitis represented about 2% of annual ophthalmic services in Auckland, New Zealand. In the Hong Kong study<sup>(30)</sup> 223 patients with different types on infectious keratitis were recruited in a 17-month period, giving an average of 157 patients per year.

A study that was conducted by T Bourcier et al, 2003 in Quinze-Vingts National Center of Ophthalmology, Paris, France included 300 cases, showed that in 207 eyes (68.2%), bacteria were identified from the corneal cultures. the hospital culture grew an identifiable organism in 58% of cases. Gram positive bacteria were predominant (83% of all positive cultures), mainly coagulase negative *Staphylococcus* species; Gram negative bacteria (17%) were mostly *Pseudomonas* and *Serratia* species. Polybacterial infection was noted in six cases (2%). Twenty-eight per cent of culture positive isolates were detected on smears<sup>(17)</sup>.

In contact Lenses wearers group, 63.3% of the corneal scrapings were positive. Thirty per cent of isolated bacteria were Gram negative, mostly *Pseudomonas aeruginosa*. Contact lens and/or storage cases cultures were performed in 67 cases (Table 1). An organism was identified in 83.6% (56) of cases. Ninety-seven per cent of the organisms were Gram negative bacteria. The bacteria isolated were similar to the organism recovered by corneal scraping in 14 cases<sup>(17)</sup>.

Total	104

The spectrum of micro-organisms responsible for corneal ulceration varies according to geographical location. a very old reports from the northern parts of the United States of America show predominantly Gram-positive organisms<sup>(19)</sup>. While the southern parts show a striking number of fungal and Gram-negative isolates<sup>(20)</sup>. A study from London in 1989 also showed predominantly Gram-positive isolates. Variations such as these are probably worldwide.

Over the period of 7 years (Ibrahim YW et al 2012) have conducted retrospective study that detected linear trend pathogens causing corneal ulcers which was mainly related to the bacterial rather than viral ulcers. The rate of bacterial ulcers showed gradual increase over the period between 1997 and 2003 compared with viral keratitis that showed an initial increase between 1997 and 2000 followed by progressive decline till 2003. In 2006 the overall rate of infectious keratitis was lower than that in the retrospective study due to the significant decrease in viral keratitis (p=0.0003) as it shows in Table 2<sup>(21)</sup>.

 \* Incidence is given per 100,000 persons of population in every given year  
 \*\* Some of these values are not pure (mixed with other micro-organisms)  
 \*\* Average population in 7 years

(Keshav et al. 2008) performed his study among 188 patients treated for corneal ulcers in Sur regional hospital in Oman through duration of 6 years. When microbiological isolation was evaluated it was found that in 76 patients (43.18%) bacteria/fungi. Among the isolates, 9 cases (11.84%) were fungi and the rest (88.26%) were bacteria. Of the bacterial isolates, pseudomonas was found in 35 cases (53.84%), staphylococci were found in 13 cases (20%), streptococcus pneumonia was found in 12 cases (18.46%), streptococci were found in 2 cases (3%) and klebsiella was found in 5 patients (7.69%) <sup>(31)</sup>. figure 2

**Figure 2:** - Shows the proportion of patients with specific microbial isolates in positive cultures (Keshav et al. 2008) <sup>(31)</sup>

(Shojaet al, 2004) conducted a trail in Shahid Sadoughi Hospital, School of Medicine, Yazd, Iran, identified 80 cases of microbial keratitis from March 1999 to March 2001. And they found 32 patients (40%) had positive cultures, 22 of which were gram-positive. The most common strains were Staphylococcus epidermidis, Staphylococcus aureus and Streptococcus pneumonia and in the gram-negative group, pseudomonas was the most common isolate. In 21% of gram-negative and 13% of gram-positive cultures, the patients had used one or more topical antibiotics before admission. Keratitis caused by pseudomonas strain (10 cases) had the largest diameter, the highest mean number of days of hospital stay, and the poorest final VA. Two of the 5 patients with fungal keratitis, developed corneal perforation <sup>(35)</sup>. Table 3

**Table 3:** -Distribution of the patients according to age and predisposing factors (Shoja et al, 2004) <sup>(35)</sup>

Age groups	Predisposing factors					Total
	Trauma	Ocular disease	Previous ocular surgery	Contact lens	Systemic disease	
0-20	12 (66.7)	3 (16.7)	1 (5.5)	2 (11.1)	0 (-)	18
20-50	11 (40.8)	7 (25.9)	3 (11.1)	6 (22.2)	0 (-)	27
50-80	9 (25.7)	18 (51.5)	4 (11.4)	0 (-)	4 (11.4)	35

Data are given as number (percentage)

*Non infectious corneal ulcer (Idiopathic keratitis)***Peripheral ulcerative keratitis:-**

according to (Mondino BJ et al, 1988) Noninfectious/inflammatory keratitis can be subdivided into micro-ulcerative and macro-ulcerative. Micro-ulcerative peripheral keratitis includes marginal catarrhal ulcer, phlyctenulosis and peripheral rosacea keratitis. Macro-ulcerative peripheral keratitis is generally a manifestation of systemic, immune-mediated disease. Peripheral ulcerative keratitis has been associated with nearly all connective tissue diseases or vasculitis. However, the most common entities associated with are rheumatoid arthritis, Wegener's granulomatosis and polyarthritidenodosa. When associated with systemic disease, Peripheral ulcerative keratitis represents a local vasculitis affecting the limbal arcades. Circulating immune complexes deposit in the limbal vessels inciting local inflammation, which include diffusion of immune complexes, components of complement system, and inflammatory cells into the peripheral cornea. Loss of stromal collagen leading to descemetocoele formation has been reported <sup>(36)</sup>.

**Corneal ulcer following the use of non-steroidal anti-inflammatory agents: -**

Topical non-steroidal anti-inflammatory drugs have been reported to be the cause of corneal melting and perforation <sup>(37)</sup>. Impairment of wound healing, neurotrophic effect and activation of matrix metalloproteinase are responsible for the melting. (Gokhale *et al.* 2010), have reported a case of diclofenac-induced acute corneal melt after collagen cross linking <sup>(38)</sup>. The surrounding cornea of perforation showed regenerative changes with large epithelial cells. The adjacent stroma showed edema, keratocyte loss, myofibroblastic transformation of keratocytes, and few neutrophils and round cell infiltrate this was according to study by (O'Brien et al, 2001) <sup>(39)</sup>.

**Conclusion:-**

Corneal Keratitis is an important reason for ocular morbidity worldwide. A substantial part of the standard etiology for corneal keratitis integrate bacterial, fungal, viral, and protozoan, the analysis which is made on scientific assessment supported by microbiological presentation in smears or cultures from corneal tissues. Non-infectious keratitis can likewise be seen in a number of conditions where swelling happens in the cornea due to other etiologies, causing corneal vascularization, scarring and visual loss.

#### Abstract

**Background:**unexplained/nonspecific abdominal pain makes up a high percentage of surgical admissions to hospitals, both in emergency department, and as elective admissions,with a substantial diagnostic dilemma.

**Objective:** The aim of this study was to determine if laparoscopy has any significant role in the diagnosis and management of unexplained/nonspecific abdominal pain.

**PatientsandMethods:** All patients who presented to the hospital with abdominal pain with no identifiable etiology and after clinical examination, assessment and investigations were labeled as unexplained/nonspecific abdominal pain, and after that underwent diagnostic laparoscopyto reach a definitive diagnosis were included in the study.

**Results:**127 patients were included in the study. Females accounted for 67% (n=85) and males33% (n=42). The mean age was 28 years (ranged from18-58 years).Out-patient department was the commonest mode of admission,99 (78.4%) patients. Patients who presented with unexplained/nonspecific abdominal pain in the lower part of abdomen accounted for 29% (n=37), followed by 25% (n=32) with right lower abdominal pain, and 22% (n=28) with periumbilical pain radiating to right lower abdomen. Diagnosis was established in 85%(n=108) of patients. In 15% (n=19) no pathology was found. The most common diagnosis was pathology of appendix in 33% (n=42) of patients followed by pelvic pathology in 20% (n=25), and abdominal tuberculosis in 16% (n=20) of patients. Most of the patients (42%, n=53) stayed in the hospital for 24 h. There were no major postoperative complications and no readmissions.

**Conclusion:** Laparoscopy has a definitive role in the diagnostic dilemma associated with unexplained/nonspecific abdominal pain. It has at the same time a role in treatment, decreasing mortality, morbidity, cost, hospital stay, and improving quality of life relative to observation; hence laparoscopy is an effective diagnostic and therapeutic modality in the management of patients with unexplained/nonspecific abdominal pain.

**Introduction:-**

Abdominal pain is a common complaint both in general practice and in hospitals, with which patients present to emergency department. <sup>(1)</sup>Nonspecific abdominal pain (NSAP), is generally defined as acute abdominal pain of under 7 days' duration, and for which there is no diagnosis after examination and baseline investigations, is a common cause of emergency surgical hospitalization. <sup>(1)</sup>Nearly 25% of patients have nonspecific abdominal pain. <sup>(2)</sup>More than 38% of the patients with chronic abdominal pain have no specific etiological diagnosis made at the end of the diagnostic workup. <sup>(3), (4)</sup> Many organic and functional diseases can cause abdominal pain. The most common organic conditions include intestinal adhesions, <sup>(5), (6)</sup> biliary causes, <sup>(7), (8)</sup> and appendicular causes, <sup>(9)</sup> while functional conditions include irritable bowel disease, <sup>(10)</sup> functional dyspepsia, <sup>(11)</sup> and various motility disorders. Many of patients have ongoing symptoms and cannot be discharged, undergo multiple, often expensive, unneeded investigations and have repeated readmissions. A lot of cases of NSAP are mimicking acute or chronic appendicitis. Most patients with NSAP are referred as possible cases of acute appendicitis, frequently with periumbilical pain and tenderness that radiates to right iliac fossa (RIF). A number of these may erroneously undergo operation for suspected appendicitis, some are put on anti-tuberculosis therapy, while females mostly end up taking anti-androgens. <sup>(12)</sup> One study showed that, NSAP was diagnosed in 30% of 135 patients who are undergoing appendectomy operations. <sup>(1)</sup>Patients may undergo unnecessary appendectomy operations and may reiterate with symptoms even after surgery. A definite diagnosis is not always achievable, however, with noninvasive imaging modalities including contrast radiology, computed tomography (CT), magnetic resonance imaging (MRI), and ultrasonography. <sup>(13)</sup> In addition, minimally invasive procedures like paracentesis, endoscopy fail to reach a diagnosis as well at times. Laparoscopy is a minimally invasive surgical procedure in which the peritoneal cavity and intrabdominal organs can be visualized in order to detect pathology. It has both a diagnostic as well as a therapeutic potential and it is especially useful in patients with equivocal signs and those who are hemodynamically stable not requiring urgent surgical intervention. It is a safe and effective tool and can establish the etiology and allows for appropriate interventions in such cases. <sup>(14)</sup>After giving symptomatic treatment to patients, normal diagnostic laparoscopy may allow the surgeon to discharge patients early from hospital. This study was conducted to highlight the role of laparoscopy in unexplained/nonspecific abdominal pain.

**Materials and Methods:-**

This study was conducted out in Department of Surgery, King Khalid University Hospital (KKUH), Riyadh, Saudi Arabia for a period of 3 years, from July 2011 to June 2014. All patients of either sex and age, who were admitted through emergency department or as an elective through outpatient department and presented with acute or chronic nonspecific abdominal pain which was of unclear etiology, in whom medical history, clinical assessment, routine laboratory investigations and radiological evaluations failed to make a definite diagnosis, were included. After acquiring detailed history and clinical examination, relevant blood investigations taken, X-ray abdomen, ultrasound, and CT scan were performed when indicated. Laparoscopy was performed, after completion of all the necessary hematological, biochemical, radiological, and ascetic fluid analysis, endoscopic evaluation, imaging techniques, and Tuberculin sensitivity test, in any chronic abdominal condition in which the etiology was unknown. Depending on the underlying pathology, therapeutic intervention was performed with either open laparotomy or laparoscopic technique. A form was used to keep a record of all the patients' data in terms of medical history, clinical examination, laboratory investigations and laparoscopic findings. The time for hospital stay was defined as time from moment of admission until patient discharge. A single antibiotic for prophylaxis was given preoperatively. Patients informed-consent form approved by our Institution's Ethics Committee was taken before operation. Also, patients were informed about the possibility of conversion of laparoscopic surgery to an open procedure depending on preoperative findings. Pneumoperitoneum was established using veress needle in periumbilical region. After establishment of the pneumoperitoneum, a standard three-trocar technique was used (10-mm optic via periumbilical trocar and two 5-mm lateral trocars), followed by insertion of additional ports where therapeutic intervention was required. The findings and results of laparoscopy were recorded. Biopsy specimens were sent for histopathology to confirm the diagnosis. Outcome measures included diagnosis made, duration of surgery, duration of hospital stay and postoperative complications. Data were analyzed using Statistical Package for the Social Sciences Version 20.0 (SPSS Inc., Chicago, IL, USA) and Microsoft Excel 2010. Categorical data was presented as frequency and percentage, and numerical data as means and standard deviations.

**Results:-**

The common mode of admission to hospital was through outpatient department ( $n = 99$ , 78.4%). The common clinical presentations were as follow: nonspecific abdominal pain in the lower part abdomen in 29% ( $n=37$ ) patients, with right lower abdominal pain in 25% ( $n=32$ ) and 22% ( $n=28$ ) with periumbilical pain radiating to right lower abdomen.(detailed in **Table 1**).

**Table 1:-Clinical presentations**

Site of abdominal pain	Number of patients (N)	Percentage (%)
Pain in lower abdomen (RIF, hypogastrium, LIF)	36	28.4
Pain in RIF	30	24
Pain in periumbilical/central abdomen	28	22
Pain in hypogastrium	9	6.8
Pain in LIF	9	6.8
Pain in right lumbar region	7	5.6
Pain in RIF and hypogastrium	4	3.4
Pain in left lumbar region	3	2.5
Total	127	100

In 43% ( $n=55$ )of patient's abdominal ultrasound was normal. A common finding that was noted on abdominal and pelvic ultrasound, was distended bowel loops in right iliac fossa. Benign prostatic hypertrophy was reported in three patients. Pelvic ultrasound in 81 of 85 females was normal. In the remaining patients, minimal free fluid in cul-de-sac was reported. All subjects underwent CT scanning, out of which, 52.5% ( $n=66$ ) patients had a change in findings when compared with the findings on ultrasonography. The CT scan was better able to show retroperitoneal/mesenteric lymphadenopathy and dilatation of gut loops. Thirty-four subjects out of 127 cases (27.2%) had altogether new findings, while 92 (72.7%) cases had findings similar to the radiological means. Thirty-six out of these 64 had new findings along with the previous findings. Therefore, 70 out of the 127 subjects had new findings. After diagnostic laparoscopy, tissue diagnosis was achieved in 108 of the 127 subjects (85%).Laparoscopic results showed inflamed appendix, appendicular faecaliths, mesenteric lymphadenitis,enlarged mesenteric lymph nodes, salpingitis, omentum at deep inguinal ring, adhesions in peritoneal cavity and pelvis, fluid in cul-de-sac and ovarian cysts, diverticulitis(as indicated in **Table 2**).

**Table 2:-Laparoscopic findings**

Laparoscopic findings	Number of patients (N)	Percentage (%)
Inflamed appendix	22	17
Adhesions/bands (postoperative/cong.)	16	12.5
Appendicular faecaliths	12	10.2
Enlarged mesenteric lymph nodes	12	10
Salpingitis with fluid in cul-de-sac	10	7.5
Ovarian cysts	9	6.8
Caesating mesenteric nodes with ileal adhesions	9	6.8
Fibrous/kinked appendix	7	5.6
Strictured terminal ileum with lymph nodes	4	3.4
Omentum/viscus in deep ring	4	3
Meckel's diverticulitis	1	1.1
Fimbrial cyst	1	1.1
Worm in appendix	1	1.1
No pathology found	19	15
Total	127	100

Final diagnosis was made in 108 (85.2%) patients. In 19 patients (14.7%) diagnosis could not be established. All laparoscopic findings were confirmed by histopathology. Inflamed appendix was the most common diagnosis made in 22 (17%) patients with rest of diagnoses detailed in **Table 3**.

**Table 3:-** Final diagnosis

Final diagnosis	Number of patients (N)	Percentage (%)
Appendicular pathology	42	33
Pelvic pathology	26	20.4
Abdominal tuberculosis	20	16
Mesentericadenitis	6	4.5
Postoperative adhesions	4	3.4
Early inguinal hernia	4	3.4
Congenital bands	3	2.2
Lymphoma	1	1
Meckel's diverticulitis	1	1

The average length of the operative time was 58.7 minutes and the maximum duration was 96minutes. Among the postoperative complications 10 (8%) patients developed wound inflammation/infection, 8 (6.8%) had post-operative fever and chest infection, 6 (4.5%) with post-operative fever alone. Follow-up was done weekly for 1 month, then seen once monthly for 3 months. No major complications were reported and seven patients came back with complaints of recurrent pain who were subjected to further investigations and imaging modalities like CT, MRI, MRCP (magnetic resonance cholangiopancreatography) to reach a definite diagnosis.

### Discussion:-

Unexplained/nonspecific abdominal pain still remains a diagnostic dilemma. In many cases, despite all the routine laboratory investigations and imaging modalities, a diagnosis could not be achieved. The challenge posed by patients with NSAP is extensive and noticeable. It accounts for an estimated 15-40% of all emergency-department surgical admissions.<sup>(1)</sup> The abdominal disease is complicated, and patients usually undergo a lot of costly investigations and even exploratory laparotomy for definite diagnosis. In such conditions, diagnostic laparoscopy is a better choice for the patient. It can directly give a high-field visualization of the abdominal cavity, provide adequate tissue sample for histopathological assessment, and in expert hands is an excellent therapeutic tool with cosmetic acceptable scars. When reviewing the literature, it reveals various outcomes of diagnostic laparoscopy in patients of undiagnosed abdominal pain to support its use in recurrent nonspecific abdominal pain. Some studies clearly support diagnostic laparoscopy role in such challenging situations and have shown a good accuracy in reaching a diagnosis in NSAPs.<sup>(15), (16)</sup> Some other studies were not as supportive.<sup>(17)</sup> In our study, the overall success was 88% which supports use of this diagnostic modality. A study done by Lippert *et al.* showed that diagnostic difficulties are more experienced in young females with lower abdominal pain and inconsistent features of appendicitis.<sup>(18)</sup> It seems to be a better option to evaluate nonspecific lower abdominal pain in this gender class by diagnostic laparoscopy. This is similar to the study carried by Ou and Rowbotham in which diagnostic laparoscopy provided a definitive diagnosis in 76 of the 77 cases (99%).<sup>(19)</sup> In our study, more than half (85 out of 127) of patients were females. This strengthens the observation that nonspecific abdominal pain was common diagnostic problem in this group. Diagnostic laparoscopy provided a definitive diagnosis in 73 (86.4%) out of 85 female patients in our study. In a similar study appendicular pathology was found in 75% cases, whereas in another study it was found in 40% patients.<sup>(20), (21)</sup> These numbers were higher in our study in which appendicular pathology was found in 33% (n = 42) of patients. In majority of cases in our study, the appendicular pathology was inflamed appendix with pelvic appendix as a common position, along with subserosal and retrocecal appendix. Females with findings of pelvic pathology and pelvic inflammatory disease (PID) were the second most common diagnosis reached with 26 (20.4%), and abdominal tuberculosis was found in 20 (16%) patients in a study which is similar to our results.<sup>(22)</sup> Five male patients in the present study presented with a complaint of right groin pain that radiated to right iliac fossa. On diagnostic laparoscopy, findings were protrusion of omentum into deep inguinal ring in two patients and small bowel along with omentum in three others. Transabdominal preperitoneal repair was done in all the five patients with no postoperative complications. Our results were in concordance to a study revealing similar results.<sup>(4)</sup> Early laparoscopy also has the benefit that a number of therapeutic options were available.<sup>(23)</sup> In this study, diagnostic laparoscopy has become therapeutic in many cases. Ovarian cysts could be drained and treated with immediate relief of symptoms.<sup>(24)</sup> Purulent fluid collections secondary to pelvic inflammatory disease or diverticulitis could be drained. Early recognition of PID is crucial and enables early treatment that was important if

complications such as infertility were to be minimized. Patients with an inflamed appendix can be dissected safely and effectively laparoscopically. Laparoscopic adhesiolysis was possible. <sup>(25)</sup>In our study, there were some minor postoperative complications noted including wound inflammation/infection and post-operative fever, while the laparoscopy failed to make any diagnosis in 17 patients, which were put on follow-up for further assessment to reach a diagnosis. Seven were females (unmarried) of child bearing age, five were males <12 years of age, whereas the other females had a history of cesarean section with normal imaging studies. All of these patients attended the follow-up clinic for 8 weeks and then were being evaluated with other modalities during follow-up.

### Conclusion:-

In conclusion, laparoscopy has an effective diagnostic role in evaluating patients with acute unexplained/nonspecific abdominal pain, in whom conventional methods of investigations have failed to reach a definitive cause. The therapeutic value of laparoscopy is also accepted and appreciated.

#### Abstract

**Aim of the Research:-** The purpose of this research was to study the effect of drinking boiled olive leaves extracts on blood sugar level among adults with type-2 diabetes (both males and females) in Al-Madinah Al-munawarah, KSA. The following research questions guided the study:

- Is there a relationship between olives leaves consumption and blood sugar level?
- Can olive leaves reduce high blood glucose level?

**Materials and Methods:-** Seventy-three participants (29 males & 44 females) were chosen from 120 applicants according to the inclusion and exclusion criteria. Each patient was given a box that contains (3 disposable cups, 3 packs containing 5 gram grounded olive leaves, 18 lancets & strips for measuring blood glucose, follow-up card & instruction card and diabetes education book). Participants were asked to measure blood glucose level for 6 days (Before the main meal, after 1 hour of eating and after 3 hours of eating). The last three days they added drinking boiled olive leaves powder immediately after the main meal. Comparison of blood glucose levels in the three reading times before and after olive leave powder consumption.

**Results:-** Reduction in mean blood glucose level after drinking boiled olive leave extracts was found in all measurements during the 3 days of consumption but the only significant reduction in blood glucose was found on the third day one hour after meal.

**Conclusion:-** Hypoglycemic effect of olive leaves was found in the study with minor side effects. Further studies are recommended to identify the ideal dose, duration, preparation and timing of consumption to produce the maximum impact on blood glucose.

#### Introduction:-

Diabetes mellitus (DM) is one of the major ailments globally.<sup>1</sup> "DM is a chronic metabolic disease that occurs when the pancreas is not able to produce enough of the hormone insulin or when the body cannot effectively use the

**Corresponding Author:-** Raneem A Almutairi.

Address:- Graduate students of clinical nutrition department, faculty of applied medical sciences, Taibah University.

insulin it produces.”<sup>2</sup>

Globally Saudi Arabia has the seventh highest rate of DM and the second highest rate in the Middle East according to the World Health Organization (WHO).<sup>3</sup>

Diabetes has become an epidemic health problem in several economically developing countries.<sup>4</sup> By 2015 it was estimated that 3.4 million people in Saudi Arabia were diagnosed with DM.<sup>5</sup> This prevalence of diabetes in Saudi Arabia might be due to various influences but most researches speculate that obesity and lack of exercise are very prominent factors.<sup>1</sup> Proportion of people diagnosed with type 2 diabetes accounts for 90% of all the diagnosed cases of DM.<sup>6</sup>

The number of people diagnosed with diabetes around the world is 336 million, which is expected to reach 550 million people by the year 2030. Almost five million people die of diabetes each year corresponding to one victim every 7 seconds. Diabetes is one of the major 10 causes of disability.<sup>2</sup>

For countless years, human beings have used the curative power of nature to live healthier lives. Conventional medicines and herbal remedies are woven through every nation and society. In specific Olive plant leaves have been used for eras all over the world. Several researchers have been investigating for the subproducts of olive leaves that might have positive outcome on human health.

Complementary and alternative medicine (CAM) refers to a wide range of clinical therapies outside of conventional medicine, the term “complementary” refers to therapies that are used in conjunction with conventional medicine, whereas “alternative” medicine includes therapies that are used in place of conventional medicine.<sup>7</sup>

One of the commonly used CAM herbs in Saudi Arabia is olive leaf. However, until recent time, the use of olive leaf as a potential diabetes treatment had not been appropriately examined.

Olive leaf plus olive leaf extracts (OLE), are currently promoted as anti-aging, immunostimulator, antioxidant, anti-inflammatory and antibiotic agents.<sup>8</sup>

The antioxidants oleuropein and hydroxytyrosol are assumed to be the main functional composites in unprocessed olive leaf, along with a number of other polyphenols and flavonoids, including oleocanthal.<sup>9</sup> Oleuropein the primarily active component is highly bioavailable, comprising nearly 60-90mg/g (6-9%) of the leaf dry weight.<sup>10</sup>

“Studies on olive leaf extract have failed to notice any significant side-effects when doses up to 1000mg daily for 8 weeks<sup>11</sup> or lower doses.<sup>12</sup>” Overall, olive leaf extracts in supplemental dosages are not associated with any major side effects.<sup>13</sup>

The purpose of this research was to study the effect of olives leaves on blood sugar level among type-2 diabetic adults (both male and female) in Al-Madinah Al-munawarah. The following research questions guided the study:

1. Is there a relationship between olives leaves consumption and blood sugar level?
2. Can olive leaves drink reduce high blood glucose level?

The general objective is to examine the short-term safety and efficacy of drinking boiled olive leaves on glycemic control among adults with type-2 diabetes living in Al-Madinah Al-munawarah. Furthermore the specific objectives were to assess blood glucose level before and after consumption of olive leaves among diabetic adults and to determine acceptability and immediate side effects of consumption of olive leaves (diarrhea, hyperacidity ...etc.).

The hypothesis was that the Consumption of olive leaves drink can reduce elevated BG level (to a normal range).

### **Methodology:-**

The study Design was a clinical trial conducted to achieve the research objectives; furthermore the setting was in Taibah University and community in Almadinah Almunawarah.

This study was conducted on 73 diabetic adults (29 males & 44 females) with type 2 diabetes who were enrolled according to the inclusion and exclusion criteria

**Inclusion Criteria:-**

- Agree to participate.
- Having type 2 diabetes.
- Able to measure BG using home device and accurately record results.
- Living in Al-Madinah Al-Munawarah

**Exclusion Criteria:-**

- Pregnancy and lactation.
- Blood glucose  $\leq 70$
- Using Insulin treatment.
- Presence of diabetic complication or poor metabolic compensation.
- Following a diet to change weight or lifestyle during the trial days.
- Changing medical therapy during the trial days.

Subjects were recruited by advertisements at the University female section, flyers, Internet survey and face-to-face promotion of the study. Signing written consent was a pre-requisite to enrollment.

The active preparation was a commercial olive leaves powder; they were packed in empty bags for tea.

An Internet questionnaire was distributed, One hundred and twenty diabetic patients responded but upon phone calling them, we found that only 80 fulfill the inclusion criteria and were enrolled in the study. Another 7 subjects did not complete all the required measurements and were excluded from the study. 73 participants were enrolled according to the inclusion and exclusion criteria.

Each patient was given a box that contains (3 cups, 3 olive leaves bags, 18 lancets & strips for measuring BG, follow-up card, instruction card and Diabetes education book from the ministry of health).

Instructions to the patients were given to drink olive leaves immediately after the main meals. Measuring blood glucose level was done according to the following schedule:

1. Immediately before the main meal and drinking the olive leaves powder.
2. After 1 hour of eating.
3. After 3 hours of eating.

The patients were asked to complete a symptom questionnaire including any possible unexpected side effects e.g. GIT troubles.

In this study, the control group was of utmost importance. Due to the great variability of glycemic control among patients, patients were used as their own control so every patient repeated the test for 3 days under the same conditions but without using olive leave drink. Patients started with the 3 days with no olive leave drink and after that they added the drink for 3 more days.

The techniques, tools and equipment's were forms designed to record participants' information such as; personal data of the patient, medical history, treatment history and usual BG level, to ensure that the participants were suitable for the study, home monitoring BG measuring devices (freestyle optimum), follow up cards used to assess participants' BG level throughout the trial and finally questionnaires used to review the participants' side effects, tolerability and acceptance.

Pre-testing was done before the start of the study on 20 participants and the following problems were encountered:

1. Long fasting period
2. No compliance with the exact described methodology due to patients having to eat CHO (20 gram CHO biscuit).

**So methodology was changed from:-**

**Measuring blood glucose level after at least 2 hours fasting according to the following schedule:-**

- Before the study
- 1/2 hr after eating a biscuit containing 20g carbohydrates and drinking the olive leaves powder.
- Two hours after eating a biscuit containing 20g carbohydrates and drinking the olive leaves powder.

**If blood glucose level is >140 the participant will drink olive leaves powder alone:-**

If blood glucose level is <140 the participant will eat 20g biscuits then drink olive leaves powder.

To the current described method.

Ethical permission to conduct the current study was obtained from the Vice-Dean at the faculty of Applied Medical Sciences. Also permission was sought from The Medical directory of Taibah University (female section). Consent was obtained from all participants prior to the start of the study. The research explained to the participants in simple language, all data was kept confidential and patients were free to withdraw from the study.

Statistical Analysis was done by entering the encoded answers into Microsoft Excel and coping it to SPSS program. Descriptive analysis was done using statistical package for social sciences (SPSS17) and the comparative outcomes of results were analyzed by using T-test for paired samples for continuous data. The minimal level of significance was set at  $P < 0.05$ .

## Results:-

The study included 73 subjects suffering from type 2 diabetes, the majority were females (60.3%,  $n=44$ ), males represented 39.7% of the subjects ( $n=29$ ), and Mean age was 49 years with range from 19-65.

Mean level of BMI was  $30.46 \pm 5.548$ . Distribution of BMI category among the studied group is presented in figure 1.

Blood glucose level was compared time by time (before meal, 1 & 3 hours after meals) between the control days (no intake of boiled olive leaves) and after the intake of olive leaves. Results showed that there is reduction in mean level of blood sugar three hours after consumption of boiled olive leaves. The third day showed borderline significance. However, the only significant reduction in BG was found on the third day of consuming olive leaves 1 hour after meal. Results are shown in table 1.

**Table 1:-** Statistical comparisons in mean blood sugar level (mg/dl) between patients before and after olive leave intake (n=73):

Measurements	Timing	Mean blood sugar level (mg/dl) $\pm$ SD		P value
		Before olive leave intake (Control days)	After olive leave intake (Therapy days)	
First day	Before meal	180.52 $\pm$ 70.44	189.67 $\pm$ 75.48	.450
	1 hour after meal	238.63 $\pm$ 77.165	239.25 $\pm$ 85.448	.964
	3 hours after meal	207.84 $\pm$ 71.518	193.96 $\pm$ 66.588	.227
Second day	Before meal	186.44 $\pm$ 67.044	191.6 $\pm$ 70.816	.649
	1 hour after meal	236.88 $\pm$ 74.857	231.45 $\pm$ 70.858	.654
	3 hours after meal	206.90 $\pm$ 73.660	199.41 $\pm$ 74.417	.542
Third day	Before meal	189.97 $\pm$ 74.119	177.60 $\pm$ 72.205	.309
	1 hour after meal	242.16 $\pm$ 79.757	216.00 $\pm$ 68.302	.035*
	3 hours after meal	210.74 $\pm$ 79.617	188.99 $\pm$ 59.739	.064

\*Significant difference

The side effects experienced by the studied group during trial were: Hyperacidity and GIT disturbances reported by only 19 subjects (26%) and diarrhea among 13 subjects (17.8%). Diarrhea was reported by 13 subjects (17%) and constipation was reported by only 2 subjects (2.7%) of the studied group.

Although olive leaves drink has a very bitter taste, yet the majority of participants 58.9% (n=43) reported that they could accept its taste, 21.9% (n=16) of participants reported that the taste was good and bad taste was reported by only 14 subjects (19.2%), Figure 2.

However, only 9 subjects (12.3%) stated that they would not continue to use it after the end of the trial, figure 3.

### Discussion:-

Up until today there's no known cure for DM.<sup>14</sup> Management concentrates on keeping blood sugar levels as close to normal as possible, which can be achieved through eating a healthy diet, being physically active, having a normal BMI and using diabetic medications.

One of the commonly used complementary and alternative medicine herbs in Saudi Arabia is olive leaves, few human studies were available about the hypoglycemic effect of drinking boiled olive leaf therefore, this study was aimed to examine its effect.

In our study and with using 5 gram OLE dose once per day for three days which were preceded with three control days, the blood glucose level started to show significant reduction at the third day and that effect was significant one hour after the meal. We believe that drinking olive leaf extracts was responsible for reduction of blood glucose from mean level of  $242.16 \pm 79.757$  mg/dl to  $216.00 \pm 68.302$  mg/dl one hour after meal ( $P=0.035$ ), and from  $210.74 \pm 79.617$  mg/dl to  $188.99 \pm 59.739$ , three hours after meal ( $P=0.064$ ).

**Pre-testing was done before the start of the study on 20 participants and the following problems were encountered:-**

1. Long fasting period
2. No compliance with the exact described methodology due to patients having to eat CHO (21gram CHO biscuit)

**So methodology was changed from:-**

**Measuring blood glucose level after at least 2 hours fasting according to the following schedule:-**

- Before the study
- 1/2 hr after eating a biscuit containing 20 g carbohydrates and drinking the olive leaves powder.
- Two hours after eating a biscuit containing 20 g carbohydrates and drinking the olive leaves powder.

If blood glucose level is  $>140$  the participant will drink olive leaves powder alone.

If blood glucose level is  $<140$  the participant will eat 20 gm biscuits then drink olive leaves powder.

To the current method.

The results from this study were supported by the results from previous studies. Results of improved blood glucose level of (79 middle aged, overweight men with type 2 diabetes) were shown after conducting human studies on hypoglycemic effect of consumption of olive leaf and during a longer period with higher concentrations<sup>15</sup>

A controlled clinical trial was conducted in New Zealand, 46 participants were given olive leaf polyphenols supplements for 12 weeks results revealed significant enhancement in insulin sensitivity by 15% ( $p=0.02$ ) in comparison to placebo furthermore pancreatic  $\beta$ -cell secretory capacity improved by 28% ( $p=0.01$ ) in overweight

middle-aged men who were at risk of developing the metabolic syndrome.<sup>12</sup>

An experimental study in Al-Mustansiriyah University, Baghdad where oleuropein was given to diabetic rabbits for a period of 16 weeks with a dose of 20 mg/kg body weight found that it inhibit hyperglycemia and oxidative stress induced by diabetes and propose that oleuropein might be useful in the prevention of diabetic complications associated with oxidative stress.<sup>16</sup>

The University of Grenada researchers conducted a study In rats with alloxan-induced diabetes, doses of 16 and 32 mg/kg had a significant hypoglycemic effect and an increased peripheral glucose uptake depending on the dose given.<sup>17</sup>

The majority of the participants in our study were females 60.3% (n=44), males represented 39.7% of the subjects (n=29). Mean age was 49 years with a range from 19-65. Mean level of BMI was  $30.46 \pm 5.548$ .

Descriptive analysis was done using statistical package for social sciences (SPSS17), mean and standard deviation of BG levels among studied group of each measurement each day before and after consuming olive leaves were determined, statistical significant difference between BG level before and after olive leaves intake was found on the third day of consuming olive leaves 1 hour after the meal ( $216.00 \pm 68.302$ ) (where P value =0.035) where in the control days Mean blood sugar level (mg/dl) in the third day 1 hour after meal was  $242.16 \pm 79.757$ . And the measurement in the third day 3 hours after the meal were  $210.74 \pm 79.617$  for the control day and Mean blood sugar level (mg/dl) after olive leaf intake  $188.99 \pm 59.739$  (where P value =0.064).

Previous literature suggests that blood glucose may be lowered by two mechanisms: (1) enhanced insulin release, and (2) amplified glucose uptake.<sup>18</sup>, and some animal studies showed that reducing starch digestion and absorption might facilitate the hypoglycemic effect of olive leaf extract.<sup>15</sup>

The potential health promoting effect of Olive leaf appear to be related to its antioxidant activity, which was found in previous literature to be beneficial in the prevention of diabetic complications associated with oxidative stress.

Our result was independent of lifestyle factors (such as dietary intakes and physical activity levels). Hence, the result of our study may have been stronger if we have instructed the participants to engage in regular physical activity and to consume a healthy diet.

At the end of the study the participants were asked to complete a symptom questionnaire regarding any unexpected side effects, the amount of olive leaves taken and if they were going to continue taking olive leaf.

There was no significant side effect to taking olive leaf; with only minority reporting hyperacidity 26% (n=19), diarrhea 14% (n=12), constipation 2.7% (n=2).

Other studies conducted even at higher concentration and when taken for longer periods showed also no side effects.<sup>15</sup>

Only 5% (n=4) of the participants didn't drink the whole cup with olive leaf while others took the whole 100ml amount with a 5 mg of olive leaf.

Despite these reported side effects and even though olive leaf had a very bitter taste yet the majority of participants (87.7%) reported that they would continue to drink olive leaves.

### **Conclusion and Recommendations:-**

Olive leaf extract may represent an effective therapy that normalizes glucose homeostasis in individuals with diabetes. Hypoglycemic effect of olive leaves was approved in the third day of use and minor side effects were reported, and the majority accepts this therapy.

Pharmaceuticals and drug companies should separate and investigate the impact of individual ingredients of olive leaves on blood glucose level with the objective of finding a safe, effective and cheap cure for diabetes. This could be a milestone in modern medicine.

However, more research into the possible hypoglycemic effects of olive leaf extract is needed before it can be recommended for use as a natural safe treatment. This could be a millstone in modern medicine.

### **Dedication and Acknowledgment:-**

To our caring, loving, and supporting Dr. Sahar Ali, our deepest and sincerest gratitude for her continuous support, for her patience, motivations, and immense knowledge. Without her guidance and consistent help, this research would not have been completed, our heartfelt thanks.

Our genuine gratefulness and warmest regard to our families, and our friends we would not be who we are today without your constant love and support. We are sincerely thankful for the encouragement and help you have given us throughout our life to succeed and make our dreams come true. We have been blessed to have you.

Finally, a special feeling of gratitude to our study participants whose words of encouragement and prayers for us has pushed us to do our best.

### Abstract

Coronary Artery Disease (CAD), is a significant contributor morbidity and mortality in Rheumatoid Arthritis (RA).<sup>1</sup> Familiarity with the pathophysiology of coronary atherosclerosis will have important practical implications for patient care. Insights into the mechanisms of thrombosis will give further insight into the concomitant therapy used during acute revascularization.<sup>2</sup> The purpose of this review is thorough understanding of the connection between atherosclerosis and RA and stress in accurate risk stratification in RA patients and timely intervention to improve outcomes. The review also highlights comprehensive collaboration between Rheumatologist and cardiologist to help in prevention of cardiovascular diseases in RA patients and improve patient care in a total spectrum.

### Introduction:-

Rheumatoid Arthritis (RA), is the most common autoimmune articular disease with systemic manifestations. It affects 2.1 million Americans and 1.5 million women. It is more common in females. The reduced life span of RA patients is possibly explained by the cardiovascular diseases.<sup>3</sup>

Coronary Artery Disease (CAD), is a significant contributor morbidity and mortality in RA.<sup>4</sup> Rheumatoid arthritis patients have increased risk of Myocardial Infarction. Hence aggressive interventional prevention strategies are implicated in RA patients with cardiovascular diseases.

There is a deep connection between CAD and RA. Thorough understanding of this connection will help in accurate risk stratification in RA patients and timely intervention will improve outcomes. Comprehensive collaboration between Rheumatologist and cardiologist will help in prevention of cardiovascular diseases in RA patients and will improve patient care in a total spectrum.

Atherosclerosis has inflammatory origin.<sup>5</sup> Similarity has been observed between pathology mechanism underlying in the synovium of joints of RA patients and endothelium of arteries in atherosclerosis. In both atherosclerosis and RA, there is infiltration of inflammatory cells, dysfunctioning of endothelial cells and synovial cells, smooth cell proliferation. The hallmark mechanism underlying both diseases is Inflammation.<sup>6</sup>

Chief contributors of atherosclerosis in RA are Endothelial dysfunction caused by immune complexes, antibody-mediated, cytokine-mediated, Autoantibodies, hypercoagulability, dyslipidemia. Other traditional

risk factors of consideration are hypertension ,diabetes,raised body mass index ,hyperhomocystinemia. There is also association of the HLA-DRB1 gene with premature death, particularly from cardiovascular disease, in patients with rheumatoid arthritis.<sup>7</sup>

Previously,our understanding of atherosclerosis was different as it is today .Earlier it was considered a cholesterol storage disease ,but now our understanding about its pathophysiology has remarkably evolved and now its considered an inflammatory disease .CAD causes stenosis hence need of revascularization to relieve ischemia..Besides treatment of stenosis through revascularization ,aggressive management of modifiable risk factors is also important .Disrupted plaques are the stimulus for thrombosis .Its a solid state stimulus .Changes in levels of circulating prothrombotic or antifibrinolytic mediators in blood predispose to acute coronary syndrome .Widespread inflammation and multiple high risk plaques predispose to ACS ,ACS is no more a localized or segmental disease .The goal of treatment should be treating early lesions and stabilizing other plaques to prevent recurrent events in the future .Treatment of stenosis should include mechanical revascularization and further preventive interventions to prevent future events.<sup>8-10</sup>

## Discussion:-

### Pathophysiology of chronic cad:-

Atherogenesis is a complex interaction of risk factors ,cells of the arterial wall and inflammatory mediators and proinflammatory cytokines .Inflammation plays role in all stages of atherosclerosis<sup>1</sup>

Inflammation also plays role in blood vessel ,cardiac and systemic complications of atherosclerosis .

The chief key players involved in the pathomechanisms are circulating cytokines,tissue necrosis factor alpha.,INFgamma,interleukin 1 ,interleukin 6,hyperhomocysteinemia,ESR,CRP .

Endothelial dysfunction first marks the first step of atherosclerosis.<sup>11</sup>It is the earliest event that signals the beginning of atherosclerosis.Exposure of arterial endothelium to proinflammatory cytokines derived from excess adipose tissue ,products of glycooxidation associated with hyperglycemia ,vasoconstrictor hormones in hypertension,dyslipidemia and bacterial products ,leads to expression of adhesion molecules .<sup>12</sup>These adhesion molecules allow blood leukocytes to stick to the inner surface of the arterial wall .Next step is the transmigration of the adherent leukocytes .The leukocytes reside in the intima and communicate with the endothelial cells and smooth muscle cells .<sup>12</sup>Mediators of inflammation that are involved in this process are prostanoids ,leukotrienes ,histamine cytokines,protein mediators and complement components .<sup>14,16</sup>As a next sequel ,SMC s migrate from the tunica media to the intima .These secrete extracellular matrix .,SMC ,endothelial cells and monocytes secrete MMP in response to hemodynamic stresses .MMP s play vital role in regulating functions of vascular cells ,angiogenesis,healing ,destruction of extracellular matrix of arteries.Proteoglycans of extracellular matrix binds to lipoproteins ,prolong their residence in the intima ,render them susceptible to glycation and oxidative modifications .Lipoprotein modification gives products such as oxidized phospholipids and advanced glycation end products .They propagate inflammatory response .Next step of progression is the calcification and the bone formation .<sup>15</sup>There is both proliferation and death of lipid laden macrophages .The extracellular lipid coalesce in the intima and form lipid rich necrotic core of atherosclerotic plaque .

The atherosclerotic lesion grows outward rather than inward .Thus stenosis is the last stage of atherosclerosis .By the time stenosis is diagnosed and treated ,atherosclerosis already had a widespread and diffuse distribution .Thus the prevalence of atherosclerosis is still underscored and underdiagnosed specially in adolescent and young adult Americans .<sup>17</sup>

Complications in plaques like disruption of plaque, superficial erosion ,intraplaque hemorrhage and erosion of calcified nodule account for all acute coronary thromboses.Disrupted plaques lead to thrombosis .When the plaque disrupts ,collagen is exposed and this exposed collagen in the extracellular matrix triggers platelet activation .Smooth muscle cells and macrophages secrete TF and it activates the coagulation cascade .Thus disrupted plaque is a stimulus to both thrombosis and coagulation .Thrombin amplifies platelet activation .Fibrinogen is converted to fibrin .Activated platelets release vWF.vWF helps in the formation of white arterial thrombus which is a dense mesh of fibrin network in which platelets are entrapped.This is the solid state of the disrupted plaque .In addition to this we have the fluid phase also which predisposes to coronary thrombosis .Raised levels of plasminogen activator

inhibitor -1, specially in diabetes, obesity and hypertensive patients is responsible for fluid phase changes. Disrupted plaque secrete particulate TF which increase thrombogenicity of blood.<sup>18-19</sup>

Plaques with thin fibrous cap and a large lipid core with numerous inflammatory cells and few SMCs are prone to rupture. These are high risk plaques. Patients with high risk plaques and wide spread inflammation are prone to acute coronary syndrome. Plaques with outward remodeling lead to hidden lesions that lack angiographic detection but harbor a substantial burden of atherosclerosis. They do not cause symptoms nor do they cause ischemia. Myeloperoxidase is a marker of inflammation and is raised in ischemia. Diffuse arterial inflammation is responsible for focal lesions and clinical presentations

### Signs and symptoms:-

The key clinical manifestations of CAD are stable angina pectoris, unstable angina pectoris, MI. Chest discomfort is the first symptomatic episode.<sup>20</sup> Sometimes the first coronary artery diagnostic presentation is acute plaque rupture or acute myocardial infarction. Cardiac dysrhythmias represent underlying electrical instability. Angina pectoris is a cardinal symptom developed due to inadequate oxygen supply to the myocardium. Cardinal angina symptoms are discomfort in arm, throat, jaw, exertional fatigue, shortness of breath, heartburn. Angina Pectoris is said to be stable when its pattern of duration, intensity, frequency are not changed over time. Administration of sublingual nitroglycerin can help to differentiate stable and accelerating pattern.

Accelerating Angina shows a change in pattern of stable Angina. Easy provocation, more prolonged episodes, more intensity, longer recovery and more often use of nitroglycerin. It's a transitioning stage from stable to unstable angina. Transition from Stable Angina to accelerating pattern warrants medical attention.

Unstable Angina, pattern of chest discomfort changes abruptly. Chest pain at rest, increase in frequency, discomfort with minimal activity. Unstable Angina occurs when there is sudden rupture of atherosclerotic plaque or abnormal occlusion of coronary artery. MI follows as a sequelae of unstable angina. Immediate medical attention is warranted.

Clinical symptoms pertaining to metabolic syndrome should also be evaluated and be a part of work up plan.<sup>21</sup>

### Diagnosis:-

Key diagnostic approach is detail patient history, through physical examination, EKG, laboratory blood tests, stress test and cardiac catheterization. Imaging methods help to assess the regional myocardial perfusion and function. New imaging technologies that provide risk of progression and further cardiovascular events are optical coherence tomography, thermography, Infrared spectroscopy, electron beam computed tomography, MRI.<sup>22</sup>

### Treatment:-

The aim of treatment is to reduce myocardial oxygen requirements and increase the myocardial blood flow. Medications that reduce oxygen requirements are nitroglycerin, nitrates, Beta blockers and calcium channel blockers. Revascularization procedures thrive on the concept of restoring forward coronary artery blood flow. New procedures of revascularization include arteriogenesis stimulation by cells, protein and gene. Besides treatment of flow limiting lesions, non obstructive plaques should also be addressed. Angiography helps to assess the severity of lesions. Ischemia is the end result of dynamic obstruction superimposed on fixed stenosis. Sudden rapid progression of the lesion leads to poor prognosis. Fixed stenosis progress in sudden spurts.<sup>23</sup> There is discontinuous progression of plaques. Sudden increase in the severity of the obstruction is due to episodes plaque disruption, thrombosis and healing. Revascularization procedures relieve ischemia but do not protect against future acute thrombotic events. Modification of risk factors delay disease progression. Thus for atherosclerotic patients combination of treatment strategies are used, revascularization procedures, lifestyle modifications and pharmacological measures. Modification of risk factors include –reduction in blood pressure, reduction in LDL, smoking cessation. Diabetes Mellitus, Metabolic syndrome lead to adverse lipid profile and dyslipidemia leading to CVD events.<sup>24</sup>

Primary prevention of cardiovascular disease is lifestyle modification. The heart protection study promotes the use of statins in individuals with total cholesterol >135 mg/dl and with traditional risk factors. The physician's health study, showed aspirin significantly reduces MI in men aged 40-80 yrs.<sup>20</sup> EUROPA study showed that ACE inhibitor significantly reduce CVS events. Besides pharmacological therapies, lifestyle modification carry equal importance. Biomarkers linked to inflammation have been studied and it was found that they predict coronary events better than traditional risk factors.<sup>24</sup> These markers include acute phase reactants, cytokines, MMPs. Patients with elevated CRP

at baseline are benefited most by aspirin and statin therapy in primary prevention trials .They reduce CRP and other markers of inflammation .This supports the beneficial use of anti-inflammatory in atherosclerosis.<sup>25</sup>

Bypass surgery and percutaneous revascularization treat localized segmental disease .The goal of treatment should be to restrict thrombosis and embolism both ,maintain perfusion and limit loss of cardiomyocytes..Severe ischemia leads to ST-T segment abnormalities and release of troponin T or I .These are signs of poor prognosis .Aggressive management should include platelet inhibition ,inhibition of thrombin generation revascularization of culprit lesions .This approach will improve outcome in high risk patients.Best combination recommended for high risk patients is oral aspirin ,clopidogrel and intravenous glycoproteinIIb/IIIa during angioplasty during angioplasty .<sup>26</sup>

Through understanding of pathophysiology of ACS will help to reduce plaque atherogenicity ,achieve rapid control of disease process,prevent future recurrences.Use of statins helps to prevent recurrences of ACS in the future by reducing cholesterol levels and by anti-inflammatory actions.COX-2 inhibitors also retard atherosclerosis

Management of ACS should aim to stabilize lesions .Stabilization of lesions reduce recurrent events .Systemic factors that cause plaque disruption should be adequately controlled ..Statins by affecting the biology of the plaque reduce recurrent coronary events.<sup>55</sup>Inflammation underlies the mechanism of plaque formation hence anti inflammatory will have beneficial effects <sup>56</sup>.Statins reduce CRP levels ,hence improve outcomes in ACS .

Prime aim of treatment should be to stabilize lesions and control all systemic factors adequately that leads thrombotic complications of atherosclerosis .Both size of the plaque and composition of the plaque decides future complications .Larger plaques cause stenosis and ischemia .Smaller plaques could grow oblong towards the outer wall and can be silent killers and cannot be detected on the angiogram. Sturdier extracellular matrix skeleton are less likely to rupture and less likely to trigger clot formation .

### Conclusions:-

Our understanding about CAD has significantly changes in the last few decades .Now atherosclerosis is not merely just a cholesterol storage disease but its more of an inflammatory disease .Familiarity with the pathophysiology of coronary atherosclerosis will have important practical implications for patient care .Insights in to the mechanisms of thrombosis will give further insight into the concomitant therapy used during acute revascularization .Therapies should be individualized based on patient's specific characteristics..Preventive therapy should be emphasized in more efficient and cost effective manner.LDL should be targetized to reduce risk of atherosclerotic complications.Lifestyle modifications with drug treatments should be used patients with obesity,metabolic syndrome and diabetes.

### Abstract

Rheumatoid Arthritis (RA), is a inflammatory joint disease of chronic nature with predominant articular symptoms of pain ,swelling and stiffness. The most common extraarticular manifestation is cardiovascular disease which accounts for 50 % mortality in RA patients . Complex interplay between traditional CVD risk factors ,systemic inflammation and vascular function in RA are the reasons behind the scene worse outcome in RA patients .5

The MCC of mortality in Rheumatoid Arthritis patients is cardiovascular disease .1,2 Endothelial dysfunction is directly related to RA associated systemic inflammation

The aim of the review is to discuss Endothelium ,its morphology and normal physiology ,consider endothelial dysfunction (ED ) in RA patients and relate endothelial dysfunction to systemic inflammation and traditional CVD risk factors and also consider the effect of drugs on vascular function.

## Discussion:-

### Endothelium and its role:-

Endothelium is a dynamic organ that lines the entire blood vessel system and acts as a barrier between blood and vessel wall. <sup>11</sup> Endothelium responds to hormones, neurotransmitters and vasoactive factors. It controls vascular functions like vasomotion, thrombosis, platelet aggregation and inflammation, fibrinolysis, coagulation, vascular growth, vasoregulation, vasoprotection. Vasoactive factors balance is important for atheroprotection. Damaged endothelium disrupts this balance. This imbalance causes endothelial dysfunction which is a precursor for atherosclerosis. <sup>12</sup>

Endothelial cells line the inner wall of the vessels and are located in the intima. Endothelial cells in arteries and veins are more thicker and continuous while in capillaries they are thinner and fenestrated to allow exchange of gases and metabolites. <sup>14</sup> Endothelial cells responses are varied in different vascular beds and different sections of the same vascular bed. Endothelial dysfunction marks the start of atherosclerosis.

Blood vessels are the main link between the heart and tissues. The vascular wall has three layers-tunica intima, media and externa. Intima is the inner layer made of endothelial cells and is responsive to hormones and vasoactive factors. The tunica media is a thick layer made of smooth muscle cells, collagen, elastic tissue. This layer is responsible for vasoconstriction and vasi dilation and gives vessel structural integrity. Tunica externa made up of loose connective tissue which adheres vessels to the surrounding organs.

Endothelium releases vasoactive factors. Vasodilators such as nitric oxide (NO), Prostacyclin (PGI<sub>2</sub>) and endothelium derived hyperpolarizing factor (EDHF). Vasoconstrictors such as thromboxane (TXA<sub>2</sub>) and endothelin-1 (ET-1).

### Vasodilator (NO) and underlying mechanism of vasodilation:-

Nitric Oxide (NO) is released by the endothelial cells and causes vasodilation of the smooth muscle cells of the tunica media. It was first identified by Furchgott and Zawadzki <sup>15</sup>. It also plays role in maintaining the basal vasodilator tone of the blood vessels <sup>16</sup>. L arginine, amino acid is converted to NO by the nitric oxide synthase (NOS). NOS exists in 3 isoforms –Neuronal isoform (n-NOS) acts as a neuronal messenger regulates synaptic neurotransmitter release. Inducible isoform only expressed in cells exposed to injurious stimuli. Endothelial NOS e-NOS produces nitric oxide in the vasculature. Blood vessel dialation is more dependent on e-NOS. Inactive eNOS is located in small invaginations in the cell membrane called caveolae. The inactive form is bound to protein caveolin. <sup>17</sup>

NO Agonists like bradykinin, acetylcholine, ATP, ADP, Acetylcholine, substance P, thrombin, <sup>18</sup>. NO agonists release Ca<sup>2+</sup> from the endoplasmic reticulum. When intracellular levels of Ca<sup>2+</sup> increase, eNOS detaches from caveolin and is activated. Once intracellular calcium is depleted, a signal sent to membrane receptors open Ca<sup>2+</sup> channels allowing extracellular calcium into the cell. This process is called capacitative Ca<sup>2+</sup> entry. Ca<sup>2+</sup> attaches to protein calmodulin in the cytoplasm of the cell, it undergoes structural changes and bind to eNOS and then eNOS convert L arginine to NO. Hence its well evident that NO production is dependent on intracellular Ca<sup>2+</sup> sores and extracellular calcium. When Ca<sup>2+</sup> levels decrease it causes calcium-calmodulin complex to dissociate from eNOS, which in turn binds with caveolin and becomes inactivated again. Release of NO relies on intracellular Ca<sup>2+</sup>.

Shear stress, by the action of protein kinases causes eNOS phosphorylation and increases NO production. Shear stress allow transfer of blood borne agonists to attach to endothelial cell receptors and stimulate them and increase intracellular Ca<sup>2+</sup>. Shear stress also activates specialized Ca<sup>2+</sup> activated K<sup>+</sup> channels on the endothelial cell surface causing K<sup>+</sup> efflux and Ca<sup>2+</sup> influx into the cells. Duration of shear stress determines the proportion of contribution from Ca<sup>2+</sup> and eNOS phosphorylation to NO production. NO production in short duration shear stress depends on intracellular Ca<sup>2+</sup> and in long duration shear stress, it depends on eNOS phosphorylation.

Once NO is synthesized in the endothelial cells, it diffuses across the endothelial cell into the adjacent smooth muscle cells and bind to the enzyme soluble guanylyl cyclase. This activated enzyme convert GTP to CGMP. This decreases smooth muscle contraction and also CGMP reduces Ca<sup>2+</sup> release from sarcoplasmic reticulum. Both these actions reduce smooth muscle contraction. NO is responsible for resting vasodilator tone.

Other functions of NO are –prevent platelet activation, leukocyte activation and also prevent adhesion to the vessel wall. Endothelial damage initiates inflammatory cascade. It begins with recruitment of leukocytes at the damaged site.

#### **Role of PGI-2 and TXA<sub>2</sub> in regulation of vascular function:-**

PGI-2 and TXA<sub>2</sub> regulate vascular function. They are produced by COX enzymes. COX-1 is expressed in endothelial cells and COX-2 is expressed when endothelium gets damaged and is exposed to inflammatory cytokines.

Arachidonic acid is converted to PGH<sub>2</sub> by COX-2, which is converted to PGI<sub>2</sub> by prostacyclin synthase. PGI<sub>2</sub> binds to prostacyclin receptors located on platelets and vascular smooth muscle cells. Activation of platelet IP receptors lead to inhibition of platelet aggregation. PGI<sub>2</sub> binds to prostacyclin receptors on vascular smooth muscle cells activate adenylate cyclase and induce synthesis of cAMP. cAMP then activates protein kinase A and causes smooth muscle relaxation. Thus both NO and PGI<sub>2</sub> are responsible for dilation of blood vessel.

TXA<sub>2</sub> is responsible for platelet aggregation and vasoconstriction. Arachidonic acid is converted to PGH<sub>2</sub> by COX-1, after which TXA<sub>2</sub> is formed by thromboxane synthase. TXA<sub>2</sub> acts on thromboxane –prostanoid receptors located on platelets and cause their activation and cause platelet aggregation. TXA<sub>2</sub> acts on thromboxane –prostanoid receptors located on vascular smooth muscle cells, activate phospholipase C. This causes increase in intracellular Ca<sup>2+</sup> levels in the smooth muscle cells causing vasoconstriction. Balance in levels of PGI<sub>2</sub> and TXA<sub>2</sub> maintain homeostasis in the healthy vessel.

Endothelial dysfunction (ED) marks the initial stage in atherosclerosis. It's a good prognostic marker of future cardiac events in patients with CVD. Drugs used in CVD diseases such as anti hypertensives and statins have beneficial effect on endothelial function by decreasing oxidative stress and lipid accumulation.

Endothelium is atheroprotective and ED leads to atherosclerotic lesion formation and subsequently to cardiac events.

#### **Techniques to assess endothelial function:-**

Endothelial function are most commonly assessed in the peripheral circulation and it helps in assessing the endothelial function in the coronary arteries. Patients who have established CVD or at risk of CVD assessment of endothelial function is a good predictor of future cardiac events. Assessment involves measurement of dilation in response to stimulus. Impaired vasodilation is indicative of poor endothelial function. Assessments of microvascular endothelial function can be done with LDI with iontophoresis, and assessments of macrovascular endothelial function using FMD with Doppler Ultrasound [19,20-22].

**Iontophoresis**–The assessment of NO bioavailability in the microvasculature is conducted using Iontophoresis.

**Forearm blood flow and venous occlusion Plethysmography** –Assesses Endothelial function of the forearm resistance vessels

**Nailfoldcapillaroscopy**– helps to assess capillary morphology. It helps to diagnose changes in size of capillaries, changes in numbers and also structural impairments.

**Flow Mediated Dilatation (FMD)** –FMD, checks NO bioavailability, it quantifies dilation.

**Strain gauge plethysmography**–Another method to quantify dilation.

**Pulse wave analysis and Pulse wave velocity** –evaluate coronary microvascular endothelial function. It also assesses arterial stiffness from the peripheral circulation. PWA is the single measurement of radial artery pressure waveforms.

**Carotid intima –media thickness** –Carotid intima –media thickness is assessed by B mode ultrasound. It detects thickening of the medial layer of the vascular wall. It helps to predict cardiac events in patients of early atherosclerosis and also restenosis in patients who undergone PCI.

Overall IMT is increased in RA patients as compared to the healthy controls . Longitudinal assessment of ESR and CRP revealed CRP was related to IMT ,but not to ESR .Hence more research is needed to determine why CRP is related to IMT and not ESR.

#### **Endothelial dysfunction in ra:-**

Endothelium plays vital role in homeostasis and prevention of atherosclerosis .Turbulence leads to ED and if left untreated leads to atherosclerosis and cardiac sequele.

There is substantial evidence to support the fact that there is ED in RA ,a precursor to cause atherosclerosis as a sequele. 23,24Therefore assessment of ED in RA patients with traditional risk factors is vital to identify vascular abnormalities and plan strategies to improvise endothelial function and lower CVD risk 61

*Cardiovascular diseases contribute a major cause of mortality in Rheumatoid Arthritis patients.* 1,2.Inflammation and severity of RA are the major determinants of ED in RA patients. 27 There is also evidence that high grade inflammation associated with RA induces accelerated atherosclerosis 28,30

.As compared to healthy control group ,RA patients have poorer endothelial function in both the microvasculature and the macrovasculature 31-35.Anti-inflammatory agents improve endothelial function in different vascular beds 32, highlighting the role of inflammation on the vasculature in RA .

The pathogenesis mechanisms behind articular inflammatory process in RA and the inflammatory process in blood vessels of atherosclerotic CVD are similar.Also raised levels of inflammatory mediators ( CRP,IL-6,TNF –ALPHA ) are seen in both the conditions ,so it has been speculated that RA disease related inflammation might contribute to accelerated atherosclerosis.28These proinflammatory molecules promote endothelial dysfunction (ED). In RA both microvascular and macrovascular endothelial functions are affected Adequate control of disease activity and inflammation in RA patients can lead to improvements of CVD outcomes in RA patients.36.Non invasive assessments of vascular function and structure in RA patients will help in screening these patients at an earlier stage and plan a management .

.Inflammation is evaluated by measuring CRP ,ESR . CRP is directly linked to arterial stiffness and vascular dysfunction .37,38 The acute phase response is attributed to TNF-ALPHA and IL-6.

There is a noted trend for an association between microvascular endothelial-dependent function and CRP. Continuous long-term high levels of inflammation play vital role in ED in RA.CRP duration is a better predictor of ED in RA than current CRP and ESR levels .ESR/CRP duration affect arterial stiffness39-40 and so is for cIMT41-43

Disease activity and x ray scores are used to assess disease state and response to treatment .Hingori et al 44proved direct proportionality between high levels of disease-relatedinflammation at the time of the assessments may have contributed to the impairments in endothelial function. acute inflammation can result intransient impairments in endothelial function 44.Disease duration has a lesser influence on endothelial function than current disease-related inflammation.45,46.The link between inflammation and vascular function was demonstrated in RA patients without established CVD disease ,47.Vascular function is progressively affected in course of RA .Patients with long disease duration of RA have significantly impaired endothelial function .Long term inflammatory burden associated with vascular function 49 In the context of RA, various disease related parameters may exert differential effects in different sized vessels .In RA ,systemic inflammation has significant impact on the vasculature and is a significant contributor of atherosclerosis.

Both of RA disease duration and greater frequency of inflammatory fluctuations which could impact on endothelial function. It is possible that cyclical fluctuations of high and low disease activity which could acutely impact on the vasculature 50 could be more critical than disease duration on impacting endothelial function.

However, cIMT has been reported to be associated with disease duration 52 and represents a later stage of atherosclerosis .There is evidence that structural defects in the vessel as determined by carotid intima-media thickness are present in patients newly diagnosed with RA 51

Radiographic damage using sharp score is a marker of inflammatory activity in the joints was found related to arterial stiffness. They provide better reflection of burden of RA

CVD risk factors such as ageing, smoking, hypertension, dyslipidemia cause arterial stiffness. CVD risk factors are known to impair endothelial function in the general population. Their contribution to impairments in endothelial function in RA is worth exploration. Global CVD risk was greater in the RA patients. Role of traditional risk factors in the context of systemic inflammation as key players of impairing endothelial function in RA requires further exploration. Inflammation has been reported to independently contribute to CVD [13].

Stiffening is caused due to a reduction in NO production from endothelial cells, loss of smooth muscle tone, degeneration of elastin fibres, increased collagen deposition in the vascular wall. Morphological changes in the vasculature cause arterial stiffness and affects the function of the blood vessels.

Arterial stiffness is increased in RA compared to control group. Inflammatory burden, ESR, joint assessment and physician global assessment are predictive of arterial stiffness. [39] Further, ESR was only found to associate with cIMT in the presence of classical CVD risk factors.

Further analysis revealed that age was the main contributor for these associations, and most likely accounted for the higher FRS and TC SCORE in RA patients relative to healthy controls. A limitation of global CVD risk is that they only incorporate classical CVD risk factors. It should include inflammation as a factor also. [13]. It has also been suggested that incorporating coronary artery calcification into the FRS algorithm would increase the accuracy of estimating future risk of CVD, as high FRS score independently associates with coronary artery calcification in RA [53].

Microvessels because of their widespread area and large proportion have greater exposure to injurious stimuli. Small changes in global CVD risk could have a greater effect on microvascular endothelial-dependent function. Microvascular dysfunction is common in diabetes and hypertension and may even contribute to the development of macrovascular disease [54]. Hence assessments which examine both vascular beds may provide more meaningful clinical information on vascular risk in RA.

High disease-related inflammation and inflammatory fluctuations both have significant affect on microvascular and macrovascular endothelial function in patients with RA. ED is also dependent on FRS, metabolic syndrome, parameters of insulin resistance, SBP, presence of high cholesterol and hypertension as well as the total number of CVD risk factors. CVD risk factors may differentially affect endothelial cell and smooth muscle function. [56, 57] and cause smooth muscle dysfunction. [74, 75]

In RA patients which reported that components of the metabolic syndrome such as insulin resistance, were strongly associated with cIMT. These metabolic parameters cause ED and lead to carotid atherosclerosis subsequently Carotis atherosclerosis is calibrated by measurement of cIMT.

Besides disease-related inflammation and individual classical CVD risk factors, other RA specific factors such as physical inactivity [58], rheumatoid cachexia [59] and genes [60] that may also affect endothelial function in RA. Hence further research is needed to identify other RA specific factors

#### **Targeting Different Inflammatory Pathways:-**

Treatment of RA with disease-modifying anti-rheumatic agents (DMARDs) such as methotrexate exert beneficial effects both in terms of RA disease progression as well as CVD risk factors, endothelial function and eventual CVD outcome [61, 62]

However, in patients who are DMARDs non responders, biologic agents such as the anti-TNF- $\alpha$ , anti-IL6 receptor, anti-CD20 and selective co-stimulation modulators are often used. These agents target different pathways of inflammation, and hence improvements are seen in RA symptoms and endothelial. [63-65] These medications by affecting inflammatory pathways, thus effect the CVD outcomes in RA patients.

#### **Conclusion:-**

Rheumatoid Arthritis patients have impaired vascular function and structure. A correlation between RA and accelerated atherosclerosis has been well established [24]

A number of studies have reported impaired microvascular endothelial function in the coronary circulation of RA patients 66-68 which can be reversed with anti-inflammatory therapy 66,67

In RA patients, both RA disease-related inflammation and classical CVD risk factors have a greater impact than on the vasculature. High grade inflammation in RA is the cause of accelerated atherosclerosis 30. This fact become more evident with a number of studies that have reported impaired microvascular endothelial function in the coronary circulation of RA patients 67,68, which can be reversed with anti-inflammatory therapy 66,67

There is differential impact on microvascular and macrovascular endothelial function. Several studies in patients suspected of CVD and those with established CVD report that poor microvascular and macrovascular endothelial function at baseline are good predictors of atherosclerotic progression and future cardiac events 70,71

Assessment of endothelial dysfunction in Rheumatoid Arthritis patients with CVD risk patients will help to identify vascular abnormalities and help to plan a management with strategies and interventions that can improve endothelial function and cut down CVD risk.

More research is needed to confirm whether CVD risk factors affect vascular function and to determine parameters to predict long-term CV outcomes in RA.

#### **Future Research:-**

Few studies have analyzed the effect of traditional CVD risk factors on endothelial function in RA 72,73. More research is required to explore the interplay of traditional risk factors and endothelial function in RA patients. We have ample evidence for ED in RA patients but its correlation to disease activity and synergist role of traditional CVD risk factors still has to be explored further.

Longitudinal studies are required to examine the concept of accelerated atherosclerosis. Studies are needed to assess the effect of fluctuations in disease activity on vascular changes over time. High levels of IMT are predictive of cardiac events in RA. Vascular functions are predictive for cardiovascular events but detailed longitudinal studies are further required. Once the causes of ED are clear, interventions can be developed to improve vascular function and structure in RA.

#### Abstract

The handout 'Men wanted to sell fried- ground nuts, monthly salary Rs.10,000, boarding free' advertised by a budding, not the Hovered educated Entrepreneur down in the streets of T.Nagar, a busy bazaar in Chennai with its round the clock hustle and bustle is graphical enough to display the amount of unexplored Entrepreneur Potential that remains latent in TamilNadu, and by extension the cities, villages across the nation as a whole. one can't deny the fact that an engineering graduate after spending his or her Capitation fee that runs into few lakhs, has to settle down for a paltry 'package' as it were Rs.8000 odd amount, should think twice before pursuing higher studies any more if this is what his exacting educational destiny prepares him or her to be. The wisdom of practical experience as it is encapsulated in the Tamil adage 'Kai tholil ondrai Katrukol Kavalai Unakillai Othukol' the translation of which is 'Learn a Craft( vocational training in entrepreneurial parlance) and bother no more' serves it right for the tens and thousands of the so called 'Engineering' folks to not only aspire big in life but also expand the horizon of professional advancement, economic prosperity, and contributions to the national Development and growth as responsible citizens. The present paper undertakes to study the untapped entrepreneurial potency that our nation has in terms of its educated youth, especially among the engineering students, the unemployability crisis that the country wrestles with and finally the hitherto unexplored domains of entrepreneurial excellence that the country needs to zero in on. This paper also endeavors to demystify the concept of Entrepreneurship, the need and scope of entrepreneurship in India, and finally unearths some of the potential domains which could be capitalized with proper leverage.

#### Introduction:-

A professional body builder with bulging muscles saw an advertisement that read 'Trainers wanted at circus' and went to meet the owner of the circus. To his utter dismay the owner told that there was no vacancy in the circus and that they needed someone to impersonate a monkey since the chimpanzee in the circus was dead. He also added that a lot of school children were going to visit the circus the next day. If he desperately wanted a job, all that he could do is to slip in to the outfit of a monkey, swing between branches, and eat bananas and pee-nuts whenever they were fed to him. As the bodybuilder was down and out, in the hopes of getting over his financial crisis, he succumbed to his words and played the part of a monkey. He displayed a masterful dexterity in all the said skills for few hours but

**Corresponding Author:- Mr. M. Ramesh Kumar.**

Address:- Asst. Prof of English, Agni college of Technology, Chennai.

a little later the bananas got the better of him. He felt nauseated and while swinging over to another branch slipped and fell into the lion's den. As the lion came closer, he shouted for help, 'help'. The lion leaned over and said 'shut up your mouth you fool else both of us will be caught'

Later, the man learnt most of the animals found in the circus were university rank holders and that out of jobs, were forced to take up what they were offered. Since he was an average student, he was offered a monkey's role as against the university topper that was offered to play the lion king.

This may be gag joke, but calls for both scrutiny and diligence while pondering over the employability status of Indian students especially 1.5 million the engineering graduates that go out from different colleges across the Indian sub-continent which is reckoned to be the second youngest country in the world. As per the recent survey of NASSCOM, over 80% of engineering graduates are 'unemployable' in terms of the "skill set" that the industry demands. It's evident from this fact our education system and the academia does not prepare our students to be 'industry-ready' rather mechanically prepares them to be 'marks- producing- engines'. This abysmal state of affairs need a radical revamp, a clean revamp in the way education, career, and life has been perceived by our policy makers, parents, and the educational enthusiasts down the ages.

In a country that is bulging with 1.2 billion people and 64% of whom are well educated, where cut-throat competition thrives, getting a placement for every student largely of whom lack the required 'basic skill set' leave alone the much hyped "people skill" and 'Domain expertise' is a Herculean job. Be that as it may, the abounding Entrepreneur potential that the country is demographically vested with should not be ignored. By the way India ranks third in terms of the Entrepreneurial potential and dividend it has in the world. With stable and sustainable economic growth, that too direct foreign investments, Make in India, India has opened a chapter in its gallant march to words becoming 'the supreme power' by 2020. Fresh ground has been made in the efforts of bridging the alarming gap that exists between industry and academic institutions and by extension, converting the untapped potentials hitherto into national assets.

#### **Defining entrepreneurship:-**

Defining what it means to be an entrepreneur is no easy task. The term 'Entrepreneur' originally is derived from the combination of two words 'entre' to swim and 'prendes', to grasp, understand or capture. It was coined and popularized by French-Irish Economist Jean-Baptiste Say. The Business dictionary.com defines Entrepreneurship as 'the capacity and willingness to Develop, Organize and manage a business venture along with any of its risks in order to make a profit'. A recent World Economic Forum report into entrepreneurship education defines an entrepreneur as 'someone who is creative, innovative and risk taking, and has an ability to translate 'ideas into action' (Volkman et al 2009, p. 18).

Dana (2001, p. 405) maintains the fact that 'there is no universally-accepted definition of Entrepreneurs or of Entrepreneurship' in the literature. This evident lack of a comprehensive and widely accepted definition does not detract from the reality that entrepreneurship possesses distinctive features including 'a capacity for innovation' (Bruni, Gherardi & Poggio 2004, p. 258). By and large, it is quite evident from the above said definitions that 'Entrepreneurship' or 'Entrepreneur' is characterized by a spirit of organizing, managing, innovating and risk taking in any area of business enterprise and is an integral part of national development in an ever changing and increasingly competitive global marketplace.

#### **The Need and Scope Of Entrepreneurship:-**

It is universally acknowledged that India has an enormous demographic dividend. By 2026, nearly 65% of our population will be between 15-64 years (with 35% being below 35). Given that, the country is poised to become the world's single destination for skilled human resources, the home truth that 25% of India's graduates, less than 10% of India's MBA graduates and 17% of Engineering graduates are employable (i.e., they have the necessary skill set to be employed by industries across sectors) is less palatable for a nation bestowed with such an astounding Demographic Dividend. Moreover, a vast majority of our population works in the informal sector, with little quantifiable skills. This needs serious attention. India needs to aggressively invest in providing skills to its youth to capitalize on this untapped potential. On demand side, a skill gap study has been conducted by National Skill development Cooperation in 2014, which indicates that there is an additional net requirement of 11.92 crore skilled manpower in twenty four key sectors by 2022.

The analysis based on results of 66th and 68th round of NSSO, Appendix-I observes that the total workforce in the country today is estimated at 48.74 crore, of which approximately 51% is in the non-farm sector. Of these 24.9 crore non-farm workers, a maximum of 10% would be formally trained and skilled (4.69% is based on 2011-12 NSSO survey and is including both farm & nonfarm). Approximately 22.4 crore would be either skilled through non formal channels or unskilled. Out of these, it is estimated that approximately, 15.7 crore would be in the age group 15-45 years. This workforce will need to be mapped with recognition of existing skills and then provided with necessary up-skilling or re-skilling for increasing productivity and providing a livelihood pathway. Similarly, in farm sector, this figure works out to be 15 crore. Given this context, the need and the scope of Entrepreneurship in India is very bountiful.

#### **Tourism:-**

Tourism is certainly a blooming and booming industry in India. With the number of domestic and international tourists visiting the country steadily on the rise every year, Tourism is one lucrative sector entrepreneurs must focus on. India with its diverse culture and rich heritage could be a mine of wealth for the foreign tourists to explore and excavate in terms of cross cultural learning. India with its Beaches, hill stations, caves, heritage sites, wildlife, rural life, peculiar religious dogmas and practices, the Mother India has everything that captivates, gravitates the attention of tourists from all over the world. The lack of trained professionals in the tourism and hospitality sectors raises alarm that this potential field could possibly be a prey of perpetual neglect.

Moreover, any business in this sector will thrive in the long run as the demand continues to grow every year. The arrival of Foreign tourists during January-March were estimated to be over 15.63 lakh with a growth rate of 12.8 percent, compared to 13.86 lakh during the first three months last year. This is a standing testimony that tourism development is the Order of the day so far as the expansion of entrepreneurial development is concerned in India.

#### **Automobile:-**

India is now a hot spot for automobiles and auto-components. A cost-effective hub for auto components sourcing for global auto makers, the automotive sector is potential sector for entrepreneurs. The automobile industry recorded a 26 per cent growth in domestic sales in 2009-10.

The strong sales have made India the second fastest growing market after China. India being one of the world's largest manufacturers of small cars with a strong engineering base and expertise, there are many segments that entrepreneurs can focus on in India's automobile and auto components sector. In addition, international automobile giants like Ford, Mercedes, Audi, Volvo and other potential counterparts pitching in the Indian Market establishing their manufacturing units in different parts of the country is also evident of the impending surge the automobile gamut has.

#### **Education and Training:-**

Education is the back bone of any country and is undoubtedly the visa to growth and economical prosperity. In an educationally young country like India There has never been a dearth for educational and online tutorial services. With good facilities at competitive rates, India can attract more students from abroad. Unique teaching methods, educational portals and tools can be used effectively to make the sector useful and interesting.

#### **Food processing:-**

India's mainstay is agriculture. Entrepreneurs can explore many options in the food grain cultivation and marketing segments. Inefficient management, lack of infrastructure, proper storage facilities leads to huge losses of food grains and fresh produce in India. Entrepreneurs can add value with proper management and marketing initiatives. The processed food market opens a great potential for entrepreneurs be it fast food, packaged food or organic food. Fresh fruits and vegetables too have a good demand abroad. A good network of food processing units can help potential exporters build a good business.

#### **Ayurveda and organic farming:-**

India is well known for its herbal and Ayurvedic products. With increasing awareness about the ill-effects of allopathic medicines, there will be a huge demand for cosmetics, natural medicines and remedies. Together with this, organic farming has been in India since a long time. The importance of organic farming will grow at a fast pace, especially with many foreigners preferring only organic products. Entrepreneurs can focus on business opportunities in this sector. There are many small-time farmers who have adopted organic farming but the demand is

still unmet, offering many opportunities for those who can promote organic farming on a large scale. Organic farming has gone well in the downtown of Chennai with people experimenting the same on terraces, roof top gardens, and private yards etc.

#### **Floriculture and Energy solutions:-**

India's floriculture segment is small and unorganized. There is a lot to be done in this lucrative sector. The global trade in floriculture products is worth \$9.4 billion. With 8 per cent growth, it is expected to grow to \$16 billion by 2010. India's share in world trade is just 0.18 per cent. This is a huge market to be tapped considering the rising demand for fresh flowers. More awareness and better farming and infrastructure can boost exports.

In a power starved nation, the need to develop cost effective and power saving devices is gaining more significance. There is a huge demand for low-cost sustainable energy saving devices as well. The government has already unveiled the National Solar Mission which has set a target of 20,000 MW of solar generating capacity by the end of the 13th Five Year Plan. The Prime Minister, Mr.Narendra Modi too has been urging the industries in and overseas to zero in on the huge business opportunities in India and set up 'Solar Vallies' on the lines of the Silicon Vallies. This scheme is very well implemented in the state of Gujarat with astounding success. Such solar valleys can become hubs for solar science, solar engineering and solar research, fabrication and manufacturing. So there is a big opportunity for entrepreneurs in this sector as well.

#### **Conclusion:-**

It is squarely evident that, India has been recording a steadfast economic growth ever since the advent of Globalization and been making fresh inroads in various fields of economic stability. The growth is very encouraging even in the face of Global Economic Meltdown which had a punctuated blow in the western economy. However, the issues of unemployment, underemployment, low educational levels, high rates of drop outs, lack of proper vocational training and more importantly, the shortage of skilled work force shackle India's valiant march in the global economic arena. Such areas which demands instant remedy, if addressed foresightedly could prove to be a world of wealth to the nation. It's highly unlikely that India will capitalize on its demographic dividend (more than 50% of population below the age group of 25) if the current state of only 10% of youth population being trained in vocational training and skill development continues. The fact that the 11<sup>th</sup> five year plan identified India as the potentially emerging global player in Skill Development sector is in itself an illustrious testimony that the Indian subcontinent can make significant strides in Entrepreneurial development. According to NASSCOM India is the 3<sup>rd</sup> largest base for start-ups in the world at present with over 3,000 startups present in India and over 800 setting up annually. By 2020, India is expected to be a home of 11,500 start-ups employing over 250,000 people.

Creation of Mass awareness among school children and educating engineering graduates in specific, by highlighting positive aspects of entrepreneurship as a career option using ICT, folk, traditional and electronic media, would empower the young minds to fearlessly give birth to the budding entrepreneurs in them. Inception of Consortium (of entrepreneurs below 30 years of age) at all levels (district, state and national levels) to promote entrepreneurship in their areas by organizing various events around the theme of entrepreneurship and development work would make a world of difference in providing entrepreneurial facilitation and guidance to youth.

Above all inception of Awards for young achievers (for both men and women entrepreneurs separately) at all levels viz., district, state and national levels to recognize the achievements of entrepreneurs below the age of 30 years would establish an Entrepreneurial eco-system in India, so that the Grand Dream of 1.2 billion people of India to be the supreme economic power that it once was, will be gloriously realized and retained.

### Abstract

Accidental hypothermia increases mortality and morbidity in trauma patients. Various methods for insulating and wrapping hypothermic patients are used worldwide. Prevention and early correction of cold exposure is important because hypothermia is an independent predictor of increased morbidity and mortality in injured patients. Systematic review was conducted evidence based studies were searched in Pubmed, Embase, Cochrane central database, all to July, 2016. Every type of studies including reviews, prospective studies and retrospective studies with prospective collected data were included. Qualities of included studies were assessed by a standardised scale previously reported for observational studies. It is difficult to determine whether admission hypothermia occurs because of prolonged patient exposure to ambient temperatures, heat loss from open body cavities, or because of aggressive fluid resuscitation with room temperature IV. Passive re-warming strategies and an effective first step on slowing the rate of deterioration, although these measures used in isolation are often insufficient to prevent hypothermia in severely injured patients.

### Introduction:-

Major or severe trauma is the primary cause of death in up to 10 % of all deaths worldwide. It is defined as having an Injury Severity Score (ISS) of 15 or greater<sup>(1)</sup>. Inadvertent injuries are the sixth leading cause of death and the fifth leading cause of severe disability internationally<sup>(1)</sup>. It is also the commonest cause of death for persons aged from 18-44 years<sup>(2)</sup>. In the developed countries, injury constitutes the leading causes of death among people aged 15-44 years and is increasingly a leading cause of death in the low-and middle-income countries, where death due to infection is also high<sup>(3)</sup>.

Trauma victims often suffer from hypothermia on arrival at hospital and, even when the hypothermia is moderate; it can be associated with a poorer prognosis and an increase in mortality rate<sup>(4-11)</sup>. Hypothermia is commonly found in injured victims and occurs in about 57% trauma admission in Accident & Emergency Department<sup>(16)</sup>. The definition of hypothermia is core temperature below 36 °C in healthy subjects, or heat loss exceeds the heat production ability; but it is defined as temperature less than 36.5 °C in injured victims<sup>(16)</sup>.

Early diagnosis of hypothermia is thus essential<sup>(4)</sup>. However, although the mechanisms of the deleterious effects of hypothermia are well known, its causes are not clear. Most published data on hypothermia victims are hospital registry data or data from retrospective studies<sup>(6-13)</sup>.

A possible cause of hypothermia is the severity of the injury<sup>(4,6-11,14)</sup>. Both severe head injury and hypovolemic shock affect body temperature regulation. Although protecting the victim from the cold or warming them, whether passively or actively, might have a positive effect on body temperature, treatment such as vascular filling might impact negatively<sup>(15)</sup>.

Hypothermia is felt to be primarily a secondary event, that is, due to the injury itself. Animal models have shown a decrease in core body temperature correlating with blood pressure and not the level of resuscitation<sup>(18)</sup>. Human studies, while observational in nature, give a more mixed picture<sup>(19,20,21,22)</sup>. Physiology and injury severity seem to be the primary predictors of hypothermia, and these findings often correlate with the volume of resuscitation. In the studies to date, the majority of risk factors discussed appear to be secondary to the injury itself and the underlying changes to physiology. Factors commonly cited for hypothermia in trauma patients include extremes of age, environmental stresses, impaired neurological state or mobility, and subsequent care by health services<sup>(23)</sup>.

Hypothermia following traumatic injury, on the other hand, represents a failure of the body's compensatory mechanisms for thermoregulation. The body responds to heat loss by shivering, which increases oxygen consumption in skeletal muscles by 40% to 400%. This high metabolic demand places some organs at risk of developing ischemia. By the time hypothermia develops, the energy reserves of the body are depleted and the system is showing signs of exhaustion. Hypothermia interferes with the clotting mechanisms of the blood by disrupting platelet function, slowing the chemical reactions that ultimately produce the protein strands necessary to build blood clots and by suppressing the immune system. A drop in body temperature of 1 degree Celsius results in a 6% to 7% decrease in cerebral blood flow, which could be dangerous for patients with traumatic brain injury<sup>(22,23)</sup>.

In trauma, several retrospective studies have found an association between higher death rate and an increasing degree of hypothermia, even accounting for differences in the severity of injury<sup>(7,11)</sup>. Jurkovich et al<sup>(7)</sup> found that no trauma patient whose core temperature fell below 32 °C survived, and they regarded this as the critical temperature for survival. Hypothermia is recognized as one pillar of a "lethal triad" (hypothermia, acidosis and coagulopathy) of homeostatic failure that is believed to mark the limits of ongoing intervention, and necessitates an "abbreviated" laparotomy<sup>(26-30)</sup>.

Routine monitoring of temperature in severely injured patients is considered basic, but most techniques have not been validated in trauma patients. The most reliable core monitoring sites include the pulmonary artery, distal esophagus, nasopharynx, and tympanic membrane.

Swan and Ganz introduced the pulmonary artery catheter (PAC) in 1971 for measuring cardiac pressures. The PAC is the most accurate monitor and correlates to within 0.1 °C of core temperature<sup>(17, 24)</sup>. However, its routine use is often precluded in trauma patients because it is technically cumbersome to insert and is associated with its own complications, including arrhythmias, perforation, and pericardial tamponade<sup>(41)</sup>. The PAC has not been shown to improve clinical outcomes and has fallen out of favor for routine use in most noncardiac intensive care situations<sup>(42)</sup>.

The oral temperature probe has existed since 1805 and has since gone through multiple iterations including the electronic clinical thermometer in 1954<sup>(43,44)</sup>. The oral probe is sensitive when placed correctly into the sublingual pouch next to the sublingual artery<sup>(45)</sup>. It can be altered by salivation, previous intake of hot or cold food, smoking, and rapid breathing<sup>(45)</sup>. Giuliano et al.<sup>(46)</sup> evaluated the Welch-Allyn oral thermometer (model 670; Welch Allyn, Inc., San Diego, CA, USA) in 72 ICU patients and found a significantly lower variability in temperature values compared with the tympanic probe. They concluded that oral monitoring should be considered a first-choice device if a PAC is not warranted.

The tympanic infrared probe should be considered next since it is easily accessed from two identical sites and optimally located 3.5 cm from the hypothalamus. However, the temperature of the tympanic membrane, and not the brain, can be influenced by convective air currents generated during resuscitation efforts<sup>(47)</sup>. Tympanic temperatures should only be considered for monitoring when oral temperature is not feasible.

A noninvasive, disposable, medical thermometer, based on zero-heat-flux thermometry technology (3 M, St. Paul, MN, USA) is now available in North America. The probe's temperature is controlled to perfectly insulate the skin under the probe, which allows the warmer core tissue to warm the adjacent skin. In a study by Eshraghi et al.<sup>(48)</sup>, the

zero-heat-flux thermometry technology matched the PAC within 0.2 °C during cardiac surgery. This device has not been studied in trauma and requires further evaluation.

Cork et al. <sup>(49)</sup> evaluated the use of seven temperature monitors during anesthesia and compared their accuracy with tympanic measurements. Esophageal and nasopharyngeal temperatures were the most accurate while axillary temperatures were consistently 1.5–1.9 °C below tympanic temperatures. Precision of measurements using the nasopharynx, esophagus, and bladder was found to be superior to those obtained in the axilla, forehead, or rectum.

Rectal, bladder, and axillary measurement techniques are each less accurate than the methods already discussed <sup>(50)</sup>. Rectal values have been shown to lag behind core temperature in cardiopulmonary bypass (CPB). As such, using the rectal temperature is considered an “intermediate” measuring technique because it is not representative of the true core temperature <sup>(50,51)</sup>. Bladder probes and axillary measurements are even less consistent, up to almost 1 °C in variability <sup>(52)</sup>. Each technique can be disturbed by external temperatures, local blood flow, and incorrect placement <sup>(53)</sup>. Many measurements are considered insensitive and therefore the most practical technique with the best precision should be applied.

### **We demonstrate here some of the physiological effects of hypothermia on human body systems.**

#### **Cardiovascular effects:-**

Mild hypothermia (<36 °C) causes increased sympathetic tone, heart rate, blood pressure, and cardiac output while moderate hypothermia will depress cardiac activity <sup>(52,55)</sup>. At 34 °C, hypothermia impairs diastolic relaxation. By 28 °C, bradycardia develops with a prolonged PR interval, Osborne waves, and T-wave inversions followed by ventricular fibrillation at 25 °C <sup>(55)</sup>.

#### **Respiratory effects:-**

Mild hypothermia can increase the respiratory rate, causing a decrease in the partial pressure of carbon dioxide ( $P_aCO_2$ ). At moderate levels, airway reflexes are reduced, predisposing a patient to aspiration. At 32 °C, the medullary center becomes depressed, leading to a decrease in minute ventilation, increased secretions, and atelectasis <sup>(52,57)</sup>. Gas exchange is not affected, but there is an increase in pulmonary vascular resistance and ventilation–perfusion mismatch.

#### **Renal effects:-**

The initial increase in cardiac output, peripheral vascular resistance, and mean arterial pressure can lead to an increase in renal blood flow and cold-induced diuresis <sup>(57)</sup>. With further heat loss the glomerular filtration rate decreases, reaching 50 % of normal at approximately 30 °C. Urine output does not decrease until 20 °C <sup>(57)</sup>.

#### **Hematological effects:-**

Clotting factor enzymes and platelets work optimally at 37 °C. Hypothermia impairs platelet function between 33 and 37 °C and the activity of clotting factors and fibrinogen synthesis below 33 °C <sup>(58)</sup>. Rohrer and Natale investigated the effects of temperature on coagulation. Partial thromboplastin time levels increased from 36.0 s at 37 °C to 39.4, 46.1, and 57.2 s at 34 °C, 31 °C, and 28 °C, respectively <sup>(59)</sup>. Temperatures below 33 °C also inhibit thrombin, glycoprotein Ib–IX complex, platelet aggregation, and thromboxane B2 production. One study investigated the reversibility of these effects in whole blood flow cytometric analysis and the complications were shown to resolve with rewarming back to 37 °C <sup>(60)</sup>.

#### **Hypothermia and trauma-induced coagulopathy:-**

Trauma-induced coagulopathy (TIC) is present in one-quarter of all severely injured patients and carries a 46 % mortality rate <sup>(61)</sup>. Several important processes, including the release of heparanoids from the endothelial glycocalyx, protein C activation, tissue plasminogen activator, hyperfibrinolysis, and platelet dysfunction, have been implicated <sup>(61)</sup>. The concept of early TIC is a new model that has not yet been entirely elucidated. However, several recent trials have identified a prolonged prothrombin time and therefore coagulopathy in the early time period after initial trauma in 25 % of patients <sup>(62)</sup>. There are seven mechanisms involved in its development: shock, tissue trauma, inflammation, acidemia, hemodilution, massive transfusion, and hypothermia <sup>(61)</sup>. Bukur et al. <sup>(63)</sup> retrospectively reviewed 21,023 trauma patients and found 44.6 % of prehospital patients had significant hypothermia, which can exacerbate all other mechanisms.

While shock is thought to be the primary driver of coagulopathy, tissue injury is still required for its initiation. Hypoperfusion causes tissues to become hypoxic and leads to lactic acidosis, which along with hypothermia decreases the activity of the coagulation cascade and increases fibrinolysis<sup>(64)</sup>. Sustained hypoperfusion increases thrombomodulin, which can increase thrombomodulin-bound thrombin that activates protein C, a systemic anticoagulant<sup>(64,65)</sup>.

### **Objective:-**

Physicians commonly ignore hypothermia and its relation with mortality in trauma patients, in general due to its prevalence and belief that it is secondary to the injury itself (secondary hypothermia). Over the past several decades, hypothermia in trauma has been studied concerning its effects on mortality; however, very little has been done to identify the beneficial effect of preventing hypothermia among adult traumatic patients, and the different procedures and strategies. Thus this study aimed to systematically review the evidence of prevention hypothermia in traumatic patients and its beneficial effect on their health.

### **Methodology:-**

#### **Study design:-**

Systematic review of literature.

#### **Search strategy:-**

Systematic review was conducted evidence based studies were searched in we searched three electronic databases (Pubmed, EMBASE and ISI Web of Science) using the following search strategy: (hypothermia OR temperature) AND (trauma OR accident OR injury), Search was to July, 2016. Every type of studies including reviews, prospective studies and retrospective studies with prospective collected data were included. Qualities of included studies were assessed by a standardised scale previously reported for observational studies. The effects of individual studies were combined with the study quality score using a previously reported model of best-evidence synthesis. The hazard ratios of strong evidence predictors were combined only by high quality studies. The inclusion and exclusion criteria are identified after a systematic research of six electronic databases. Among these articles, four of them are randomized controlled trials while the remaining one is quasi-experimental design with prospective randomized assignment. The quality of these identified articles is evaluated with the methodology checklist for randomized controlled trials which is developed by Scottish Intercollegiate Guideline Network (SIGN). All studies of medium and high quality would be considered as sufficient evidence to support the proposed innovation in preventing hypothermia for trauma patients in Accident.

### **Results:-**

Trauma patients are at great risk of accidental hypothermia (body temperature [BT] < 36 degrees C). Hypothermia influences the functioning of all organ systems and can lead to pathological changes, which in turn additionally complicate the trauma. Furthermore, hypothermia can, e.g., by influencing blood coagulation (reduction of thrombocyte aggregation, increased fibrinolysis) have a markedly unfavourable impact upon the in-hospital surgical treatment of the trauma patient. If the patient begins to shiver, it means that hypothermia is beginning to occur. Shivering increases oxygen consumption by the muscle cells by as much as 400 percent.

Therefore, the goal of prehospital care is to avoid the onset of shivering. Basic passive heating measures such as covering the patient and turning on the patient compartment heater until it is uncomfortably warm can slow down the loss rate.

#### **Different risk factor associated with hypothermia in traumatic patients:-**

The prevalence of hypothermia in trauma victims on arrival at hospital was high (14%) and was associated with several risk factors as it was stated in Danzl et al<sup>(13)</sup>. The most significant factor was the severity of the injury as given by the RTS. The relationship between hypothermia and severity of injury is known<sup>(13)</sup>. Different study by Luna et al showed that not only blood loss and spine or head injury impair body temperature regulation, even if not always immediately. Intubation was also a significant risk factor. It was no doubt a sign of the severity of the injury<sup>(11)</sup>. Head injury, RTS, and intubation were all three, severity criteria independently associated with hypothermia<sup>(11)</sup>.

However some other studies have showed that the infusion fluid temperature was noticed, for the first time, to be a significant risk factor for the onset of hypothermia<sup>(33,34)</sup>. The temperature of the fluid infused on resuscitation of

75% of the patients with hypothermia on arrival at hospital was below 21°C and close to air temperature. Infusion temperature was a more important risk factor than infusion volume, maybe partly because of the small infusion volumes used. Another significant factor was mobile unit temperature. In order to minimize hypothermia in trauma victims, therefore some studies have recommend that infusion fluid temperature be controlled, that small infusion volumes be used for resuscitation, that the mobile unit be heated, and that trauma victims preferably remain clothed (33,34,35).

We identified observational study<sup>(35)</sup> carried out by the mobile EMS of eight French hospitals between 1 January 2004 and 10 November 2007, that included Body temperature measurements on arrival at hospital were available for 448 patients. The distribution is shown in **Figure 1**. Hypothermia (body temperature <35°C) was present in 64 of these 448 patients (14%). and therefore they for patients safety they recommended that Optimal patient management could contribute to limit heat loss or even to increase the patient's temperature when required. Undressing patients should be avoided. Mobile unit temperature and fluid infusion temperature were independently associated with hypothermia. They should be routinely measured. Adapted tools are available.

**Figure 1:-** Temperature distribution in the 448 trauma victims on arrival at hospital<sup>(35)</sup>.

#### **Hypothermia Prevention among adults traumatic patients:-**

We identified five <sup>(36,37,38,39,40)</sup> clinical randomized trials, the sample size of two studies were 100 participants<sup>(37)</sup> and 298 patients<sup>(36)</sup>. The other two studies had sample sizes of 30 patients<sup>(38)</sup> and 48 patients<sup>(40)</sup>. One study was within subject design and had sample sizes of 10 <sup>(39)</sup>. three out of those studies included patients which were all minor to medium level trauma with abdominal trauma, fractures, contusion, hematoma and injury severity scored <sup>(36,37,38)</sup>. One of the studies<sup>(39)</sup> recruited patients who suffer burn accidents with total burn surface area greater than 20% (ranged from 20% to 87%). The other article was patients with blunt trauma who were under cold stress <sup>(40)</sup>. The age of the subjects were from 20 to 78 with mean age of 38-58 in the four articles except one of them failed to provide the age of subjects <sup>(36)</sup>.

Two studies<sup>(37,38)</sup> of the previous mentioned investigated the effect of carbon fiber heating blanket with temperature set to 42°C when compared to the control group which was same carbon fiber heating blanket without switching on the electricity and the duration of warming devices applied was about one hour in both studies<sup>(37,38)</sup>. The device was portable and easy to implement which contained batteries of 0.5 kg and could last for 30-40 minutes.

One of the five articles<sup>(36)</sup> investigated and compared the thermal efficiency among reflective blanket, prewarmed cotton blanket and forced-air inflatable blanket without specifying the control groups<sup>(36)</sup>. Another one article investigated the effect of using large chemical heat pad 16 applied to upper torso and passive warming blankets when compared to passive warming blankets only as control group, the mean of warming duration was 35 +/- 26 minutes<sup>(40)</sup>. The remaining one compared the effect among temperature regulating water circulating mattress + infusion heater, temperature regulating air circulating mattress + infusion heater, and conventional heating which were radiator ceilings, bed warmers and infusion heater<sup>(39)</sup>.

Three articles used aural probe which was gently placed in aural canal and occluded with cotton as measuring tool for continuous core temperature measurement (Kober et al, 2001; Scheck et al, 2004; Ludgren et al, 2011)<sup>(37,38,40)</sup>. In Cohen et al (2002)<sup>(36)</sup>, electronic 17 thermometer either orally or rectally were used as measuring tool for core temperature measurement if urinary catheter thermistor was not feasible. In the article (Kjellman et al, 2011)<sup>(39)</sup>, an indwelling (bladder) thermistor was used as a tool to measure core temperature.

Our review included a cohort study<sup>(41)</sup> that involved 2848 Adults traumatic patients; 18% were hypothermic (temperature < 36 degrees C). Hypothermia was significantly ( $P < .05$ ) correlated with admission Glasgow Coma Scale (GCS), tachycardia, hypotension, lower hematocrit, and acidosis. Hypothermic patients had a significantly higher blood product and factor VIIa requirement. Hypothermia was an independent predictor of operative management of injuries, and overall mortality ( $P < .05$ ). This study stated that Combat trauma patients have a high percentage of penetrating injuries with variable evacuation times. Hypothermia was a pre-hospital physiologic marker, and independent contributor to overall mortality. Concluded that the prevention of hypothermia could reduce resource utilization and improve survival in the combat setting<sup>(41)</sup>.

In concern with the prevention of hypothermia in adult patients we identified a prospective, randomized study<sup>(25)</sup>. Mentioned study involved 61 physical status of adults undergoing major surgery and general anesthesia with isoflurane which consider a type of intention traumatic procedures. Patients were divided into two groups the temperatures measured showed, Lowest and final intraoperative distal esophageal temperatures were higher ( $p < 0.05$ ) in Group 1 (mean +/- SEM: 35.8 +/- 0.1 degrees C and 36.6 +/- 0.1 degrees C) versus Group 2 (35.4 +/- 0.1 degrees C and 36.1 +/- 0.1 degrees C, respectively). Compared with Group 1, more Group 2 patients were hypothermic at the end of anesthesia (10 of 26 patients, or 38.5% vs. 4 of 30 patients, or 13%;  $p < 0.05$ ). And the results showed After 30 minutes in the recovery room, there were no differences in temperature between groups (36.7 +/- 0.1 degrees C and 36.5 +/- 0.1 degrees C in Groups 1 and 2, respectively). Intraoperative cessation of convective warming because of core temperature greater than 37 degrees C was required in 33% of Group 1 patients (vs. 11.5% in Group 2;  $p = 0.052$ ). All patients received convective warming. Group 1 patients received warmed fluids (setpoint 42 degrees C). Group 2 patients received room temperature fluids (approximately 21 degrees C). Therefore this study showed the combination of convective and fluid warming was associated with a decreased likelihood of patients leaving the operating room hypothermic. However, average final temperatures were greater than 36 degrees C in both groups, and intergroup differences were small. Care must be taken to avoid overheating the patient when both warming modalities are employed together<sup>(25)</sup>.

Another retrospective trail<sup>(8)</sup> was identified which was analysis of data total of 2182 patients from the Queensland Trauma Registry, Australia, and included all patients admitted to hospital during 2003 and 2004 with an injury severity score (ISS)>15. Demographic, injury, environmental, care and clinical status factors were considered. 124 (5.7%) of patients had hypothermia on admission to the definitive care hospital, while a further 156 (7.1%) developed hypothermia during hospitalisation. Factors associated with hypothermia on admission included winter, direct admission to a definitive care hospital, an ISS> or =40, a Glasgow Coma Scale of 3 or ventilated and sedated, and hypotension on admission. Hypothermia on admission to the definitive care hospital was an independent predictor of mortality. Hypothermia during definitive care hospitalisation was independently associated with mortality (OR=2.52; 95% CI 1.52-4.17), intensive care admission (OR=1.73; 95% CI 1.20-2.93) and hospital length of stay (IRR=1.18; 95% CI 1.02-1.36). This study has stated that Trauma patients in a predominantly sub-tropical

climate are at risk of accidental and endogenous hypothermia, with associated higher mortality and care requirements, the study highlighted that prevention of hypothermia is important for all severely injured patients<sup>(8)</sup>.

The last study<sup>(31)</sup> which was included to our study was aimed determined the efficacy of three hypothermia prevention strategies: the ChillBuster warming blanket, ChillBuster with a reflective blanket, and two wool blankets. A quasi-experimental design was used to compare changes in core temperature. Following resuscitation from hypovolemic shock, 20 swine were assigned to one of the three interventions, placed in an environmental chamber set to reproduce in-flight conditions onboard a military cargo aircraft (50 degrees F/airspeed 0.2 m/s), and monitored for 6 hours. A repeated measures analysis of variance and least-squared difference post hoc were performed. The ChillBuster/reflective blanket group was significantly warmer than the ChillBuster only group and the wool blanket group ( $p < 0.01$ ). After 6 hours of cold exposure, the ChillBuster/reflective blanket group remained warm while the ChillBuster only and wool blanket groups developed mild hypothermia. Combined use of a warming blanket and reflective blanket was effective in preventing hypothermia over 6 hours and is feasible in a deployed military environment<sup>(7,39)</sup>.

#### **Important differences in rewarming techniques:-**

Because patients remain threatened for as long as they're hypothermic, rapid and efficient rewarming is crucial. A variety of methods are used to gain normothermia in the trauma patient. They are generally divided into three groups: passive external rewarming, active external rewarming, and active internal rewarming. The patient's temperature and condition, and your hospital's resources, govern which maneuver to use. For more severe hypothermia, more aggressive rewarming techniques are warranted<sup>(39)</sup>.

Passive external rewarming is used when there's minimal heat loss. Heat is regained by means of the body's intrinsic ability to generate heat. Examples of passive external rewarming include bringing the patient indoors and providing him with warm blankets and hats.

Active external rewarming is used when there's moderate heat loss. Radiant rewarmers, fluid-filled blankets, and convection warming units are among the devices used. Monitor the patient's core temperature closely, as he can continue to lose heat or fail to rewarm despite active external devices if he is significantly cold at the onset of therapy<sup>(66)</sup>.

Fluid-circulating blankets make contact with only 20% – 30% of the body surface area, which can hamper their efficiency. They should always be placed on top of the patient to prevent tissue necrosis and further heat loss<sup>(66)</sup>.

Convection blankets circulate air at 109.4° F (43° C) at a flow rate of 400 cubic feet per minute. But air has very little thermal energy, which means these blankets are able to prevent further heat loss but are slow in active rewarming. They're best augmented by covering the patient's head<sup>(66)</sup>. Active internal rewarming is indicated for patients with moderate to severe hypothermia. The use of entrained warmed gas into the endotracheal tube is the least invasive internal maneuver. Oxygen can be warmed to 107.6° – 114.8° F (42° – 46° C) without damage to the pulmonary parenchyma<sup>(66)</sup>.

Another method of active internal rewarming is the use of rapid infuser fluid warmers, which have been the mainstay of resuscitation of hypothermic trauma patients. Fluids and blood can be warmed to 104° F (40° C) and infused at a rate of about one liter per minute. These devices maintain a steady state with rate and temperature regulation. Unlike rapid infuser fluid warmers, standard fluid warming devices have been found to be ineffective in keeping fluid temperatures warm, as they pass through coils of tubing at a rate of 125 ml/hour or less<sup>(66)</sup>.

Irrigation of body cavities with warmed fluids is another method of active internal rewarming. The amount of heat transfer depends on the difference between the inlet and outlet of water temperatures. The pleural cavity and peritoneal cavity are equally effective for rewarming. These cavities first need to be checked carefully to make sure they're intact. Diagnostic studies should be performed to rule out pneumothorax or diaphragmatic injury before beginning fluid administration. This technique can increase body temperature 1° – 2° C per hour<sup>(66)</sup>.

Cardiopulmonary bypass (CPB), which diverts the flow of blood via a pump oxygenator and heat exchanger to avoid both the heart and lungs, is considered to be the "gold standard" therapy for a hypothermic patient with cardiovascular instability. CPB is usually reserved for those with a body temperature lower than 82.4° F (28° C) and

can increase body temperature at a rate of 10° – 12° C per hour. In addition to rewarming, CPB can help oxygenate and perfuse organs despite ventricular fibrillation or asystole<sup>(5,39, 66)</sup>.

### Conclusion:-

Normal human body temperature is 35.6–37.8 degrees C with hypothermia being defined as a core temperature < 35 degrees C. In many of our reviewed study, it was found that almost half of EMS-transported trauma patients had a temperature < 36 degrees C on arrival to the ED. Important to note is that there was no association between season of the year and frequency of hypothermia. At highest risk were those patients older than 65 and those who had been entrapped. In addition, hypothermia in trauma has been associated with a significantly increased mortality compared to patients with the same body temperature from environmental exposure alone. Most of these studies trauma victims, a core temperature < 32 degrees C was associated with 100% mortality independent of the presence of shock, injury severity or volume of fluid resuscitation. Because hypothermia in a trauma patient predicts such a poor outcome, the traditional classification system of hypothermia has been revised for use in this vulnerable patient population. It is difficult to determine whether admission hypothermia occurs because of prolonged patient exposure to ambient temperatures, heat loss from open body cavities, or because of aggressive fluid resuscitation with room temperature IV. Medics often disrobe trauma patients early in the assessment, thereby enhancing radiant heat loss that occurs when there is a significant temperature gradient between the environment and the patient's skin. Reversing hypothermia is an effective strategy for improving outcome. However, once hypothermia develops, it is not resolved quickly or easily.

One of the easiest ways to begin combating the harmful effects of hypothermia is to undertake passive warming strategies such as removing the trauma patient from the cold environment as quickly as possible, raising the temperature in the back of the ambulance, and covering the patient with a blanket. Although passive interventions are effective for mild hypothermia if the patient's thermoregulatory mechanisms are intact, this strategy will still allow trauma patients to cool.

##### Key words:-

Religious conversion - Reason -  
Emotion - Fear - Desire - Vengeance -  
Violence - Peace.

#### Abstract

The man uses the reason to distinguish the truly of the forgery. Yet, he is identified again like an emotional being. Besides, psychoanalysts and psychologists revealed that the emotion is the basis of the human existence. It releases by the fear and the desire of vengeance that push to the religious conversion. One knows that the fear is a violent fear facing a reality and that the desire is tension toward an object, source of satisfaction. In this sense, the role of the imagination is not to demonstrate anymore. Of the cruel gods to a merciful God, of the capricious gods to a God who frees, of idols to a God-mind, the convert leaves from these representations to encourage himself and to satisfy his desires.

#### Introduction:-

La religion est un effort pour maintenir la paix au sein de l'humanité. On sait qu'étymologiquement, le mot religion dérive du latin « *religare* » qui veut dire « *respecter* » et que par extension, il désigne le fait de vouer un culte. Dans le même ordre d'idées, il vient du verbe latin « *religare* » qui signifie « *relier* », pour exprimer le lien qui unit l'homme à Dieu le créateur ou à d'autres divinités, qu'il s'agisse de « *religions du livre* » ou de « *religions de la coutume* » pour reprendre les expressions d'Edmond Ortigues. De cette définition, il ressort que la conversion religieuse désigne l'adoption d'une nouvelle religion. Elle est souvent marquée par l'entrée dans un groupe de croyants et est accompagnée d'un acte symbolique comme par exemple, le baptême chez les Chrétiens, la profession de foi chez les Musulmans, l'initiation, suivie de la profession de foi dans les religions traditionnelles. Autrement dit, la conversion religieuse est le processus par lequel l'individu s'évertue à suivre une nouvelle voie en décidant d'abandonner les mauvaises pratiques ou les idées jugées fausses qu'il avait autrefois reçues. En se convertissant donc, l'individu passe par la foi pour rejoindre une communauté religieuse réputée dans la pratique et la transmission des valeurs préférées. Bien qu'étant une œuvre de la foi, même si quelquefois la raison peut intervenir dans les limites qu'on lui reconnaît, toutes les conversions religieuses se caractérisent par l'émotion. D'ailleurs, les recherches en psychologie et en psychanalyse ont révélé que l'émotion est la base même de la vie humaine. Elle est un phénomène psychologique qui pousse l'organisme à réagir face à une situation agréable ou désagréable.

Dans le présent article, nous voulons attirer l'attention du lecteur sur la peur et le désir de vengeance, deux émotions inconscientes et nocives pour la conversion religieuse. Il s'agit alors de mettre l'accent sur la connaissance et la maîtrise de soi pour que cesse la violence au sein des religions et que la paix soit une réalité, surtout dans les pays d'Afrique où le **Boko Haram** dicte sa loi. Car, la peur et le désir de vengeance suscitent chez les convertis, l'agressivité qui, à son tour, conduit à la violence ou à la guerre des religions.

## A- La peur à l'origine de la conversion religieuse:-

### La peur des phénomènes naturels:-

Dès son apparition dans le monde, l'homme a eu peur des phénomènes naturels. Alors, il s'est posé la question que se pose Leibniz dans *Principes de la nature et de la grâce fondés en raison* : Pourquoi il y a eu quelque chose plutôt que rien ? Pour Leibniz en effet, le rien serait plus facile à comprendre que quelque chose. C'est ce dernier qui met en œuvre la raison pour aider l'homme d'une manière ou d'une autre à comprendre et à expliquer tout ce qui existe. C'est alors qu'il aurait compris que les phénomènes naturels ont leur cause dans l'existence d'une autre chose dont ils sont l'effet. On comprend dès lors qu'à ses débuts, l'humanité ne pouvait pas conceptualiser directement et rationnellement l'idée de Dieu. Cela veut dire qu'en fait, la peur des phénomènes naturels serait à l'origine de la conception de Dieu et par conséquent, aurait conduit à la conversion religieuse. Ainsi, au départ, les hommes savaient qu'il y avait une vie et qu'ils en faisaient partie ; mais ils ne comprenaient pas les phénomènes naturels. C'est donc la peur de ces derniers qui poussait spontanément les premiers hommes à l'animisme. Ces phénomènes qu'ils ne comprenaient pas étaient entre autres : le soleil, le vent, les eaux, les plantes, les animaux, le feu, la foudre, les éruptions volcaniques, le tonnerre etc.

En marge de ces phénomènes, nous pouvons parler de la mort qui constitue pour l'homme une source d'angoisse. La peur liée à la mort provient de l'événement lui-même et des conséquences qui peuvent en découler. Pour un individu qui meurt, on sent la souffrance et la solitude chez les membres de sa famille. Après la mort, la question se pose encore de savoir si l'individu peut jouir d'une vie éternelle, en allant au Paradis. De plus, chacun se demande si après sa mort, quelqu'un pourrait s'occuper de sa famille et de ses biens. Blaise Pascal l'a bien compris quand il montre dans son œuvre *Pensées*, la peur qui nous anime au sujet de la mort. Dans le monde, tout se passe comme si les hommes sont enchaînés et condamnés à la mort. Certains étant chaque jour égorgés à la vue des autres, ceux qui restent, c'est-à-dire les vivants, voient leur propre condition dans celle de leurs semblables. En attendant leur tour, ils ont peur et se regardent avec douleur et sans espérance. S'inspirant de cette image de la condition humaine, Freud nous apprend la même chose quand, parlant de la mort des hommes, il affirme : « *Leur mort fait naître la conscience douloureuse.* »<sup>1</sup> De ces points de vue, la mort apparaît comme un phénomène qui pousse à réfléchir, en ce sens qu'elle conduit à la conversion religieuse à travers la peur qu'elle suscite.

Cela se comprend dans la mesure où l'homme est le seul animal qui sache qu'il doit mourir. De tous les êtres vivants, il possède de manière privilégiée la conscience ; une faculté qui le renseigne sur sa propre mort à partir de la mort d'autrui. Ainsi, il se plaint toujours d'avoir été créé mortel. C'est pourquoi, pour notre part, il ne serait pas exagéré de dire que l'homme est devenu religieux quand il a commencé par enterrer ses morts. Toutefois, il faut reconnaître que la mort ne doit pas être une source de peur, en ce sens qu'elle est un phénomène biologique. Elle n'est donc ni un accident, ni une réalité contingente ; mais une partie intégrante du système vivant. Dans *La logique du vivant*, François Jacob fait d'ailleurs remarquer que la mort est inhérente au monde animal et à son évolution. Elle est une nécessité inéluctable et une exigence de la vie.

La même idée se retrouve chez Heidegger qui, dans *Introduction à la métaphysique* soutient que l'homme est un être-pour-la-mort. Si tel est le cas, il serait stérile et vain de passer le temps à penser à notre finitude. L'essentiel pour le converti et pour tout homme est de bien agir pour améliorer ses conditions de vie. En fait, la saisie de notre finitude et de notre mort n'aura de sens que si elle nous pousse à de bonnes actions. Car, s'il est vrai que la mort est considérée comme la destruction du corps, il faut néanmoins reconnaître que quelque chose résiste à cette destruction. Il s'agit des œuvres que nous avons accomplies au cours de notre existence. C'est là notre revanche sur la mort et en même temps, l'espoir de toutes les victimes de la méchanceté humaine. Même si la vie ici-bas est éphémère, le fait de la vivre est à notre avis, un fait éternel.

Par ailleurs, ne pouvant pas comprendre pourquoi la nature pouvait se déchaîner dans des orages, des ouragans, des sécheresses et des inondations qui pouvaient tout détruire, l'homme est obligé de chercher une protection auprès de l'être suprême. En outre, dans une existence harassante où l'homme est confronté à des difficultés, la recherche de Dieu serait pour lui la solution adéquate. A l'instar de l'homme « primitif », l'homme des sociétés modernes croit en Dieu pour lutter contre la peur des phénomènes naturels et pour obtenir un bon niveau de vie. D'ailleurs, le fait d'observer la nature, de voir le jour, la nuit et les saisons se succéder ; de voir les fleurs s'épanouir périodiquement et les plantes se débarrasser de vieilles feuilles pour porter de nouvelles a amené les hommes à concevoir une force animée ; mieux, un esprit dans chacun des phénomènes de la nature. On comprend dès lors que c'est la peur des

<sup>1</sup> Sigmund FREUD, *Essai de psychanalyse*, Paris, Payot, 1972, p.215

phénomènes naturels qui a poussé les hommes à imaginer un dieu de la pluie, de la terre, des cieux, du soleil, de l'air, du feu, de l'eau, etc.

Contrairement à ce que nous dit Placide Tempels dans *La philosophie bantoue*, la raison n'est pas à l'origine de la conversion religieuse. Pour notre part, la peur des phénomènes naturels pousse les hommes à se tourner vers Dieu pour l'adorer. Il s'agit là d'une réalité qui ne laisse aucun peuple indifférent. Qu'il s'agisse de « *peuples civilisés* » ou de « *non-civilisés* », les réalités sont les mêmes. C'est pourquoi, bien que Raoul Allier ait montré que la conversion religieuse relève de l'émotion, nous ne sommes pas d'accord quand il nous parle seulement des « *peuples indigènes* », des « *peuples primitifs* » ou des « *peuples non-civilisés* ».

Dans le paganisme comme dans les religions révélées, la peur des phénomènes naturels pousse les hommes à penser qu'ils peuvent influencer sur les humeurs des dieux, des esprits ou des génies afin de leur plaire pour qu'ils deviennent favorables. Dans le même ordre d'idées, ils pensent que ces dieux, ces esprits et ces génies doivent agir selon leurs humeurs et leurs caprices. Ils ont très tôt compris qu'il fallait les écouter et les respecter pour se faire exaucer et pour se faire libérer de la peur des phénomènes naturels. Nous pouvons dès lors comprendre l'apparition des rituels de toutes sortes pour invoquer les puissances célestes. Par les rituelles, les hommes, de toute société, de toute langue et de toute culture apaisent les phénomènes naturels, en honorant les dieux et en les amenant à satisfaire à leur demande. On comprend alors le sens des rituels de naissance, d'initiation, de réconciliation, de protection, de mort qui s'observent à travers toutes les religions.

### **La peur des malédictions ancestrales:-**

Dans les sociétés africaines modernes, la conversion religieuse se justifie de plus en plus par la peur des malédictions ancestrales. En effet, pour la plupart des personnes qui se convertissent, les ancêtres sont désormais identifiés comme la source de toutes malédictions, ou de toutes difficultés. Autrement dit, pour ceux qui se convertissent, il faut rompre le lien avec les ancêtres pour échapper aux difficultés de l'existence. De ce point de vue, le converti se fait une conception persécutrice du mal qui se transmet à travers les liens de sang et à travers les générations. Les nombreuses conversions enregistrées depuis plusieurs années dans les religions monothéistes comme le Christianisme et l'Islam s'expliquent par la peur des malédictions ancestrales. Les difficultés de l'existence étant souvent attribuées à la sorcellerie ou aux esprits ancestraux, l'individu se convertit pour rompre avec le passé.

Dans les sociétés traditionnelles, pour échapper à l'échec, à la maladie et à la mort, il faut fréquemment apaiser les puissances persécutrices en choisissant les rites propitiatoires les plus appropriés afin de resserrer les liens avec les ancêtres du lignage et les ascendants immédiats. Mais dans les religions du livre (L'Islam et le Christianisme), les personnes converties rompent le lien avec les esprits ancestraux pour se libérer de la peur des malédictions ancestrales et se laisser conduire par le Dieu créateur. C'est justement ce que nous apprend le couple Ortigues par l'affirmation suivante : « *Dans l'islamisme ou le christianisme on exorcise, on expulse la puissance du mal qui vous possède.* »<sup>2</sup>

Il s'agit le plus souvent d'une rupture qui pousse à briser les liens familiaux. Car le converti pense que le démon œuvre à travers les liens de sang et que le Dieu créateur du ciel et de la terre est capable de rompre ces liens pour lui permettre de jouir du bonheur à travers sa bénédiction. Pour lui, la conversion garantit la protection contre le pouvoir maléfique des ancêtres. Depuis quelques décennies, la multiplication des Eglises Evangéliques et Pentecôtistes sur le continent africain donne la preuve de l'intention de rompre avec le lien ancestrale chez la plupart des personnes converties. De tels exemples nous donnent la preuve que la conversion religieuse en Afrique relève de l'émotion comme le souligne Raoul Allier dans *La psychologie de la conversion chez les peuples non-civilisés*. De plus en plus, on constate que les pratiques relatives aux religions traditionnelles sont abandonnées au profit de celles qui s'observent dans les religions monothéistes. Il n'est pas rare de voir les Eglises Evangéliques et Pentecôtistes lutter jour et nuit contre la sorcellerie, le démon et surtout contre les malédictions ancestrales ; car les génies, les esprits des morts anciens et nouveaux qui peuplent les maisons, les forêts, les rivières, les arbres sont désormais identifiés comme les causes de tout blocage chez l'individu qui aspire à la conversion religieuse.

<sup>2</sup> M.C.- E. ORTIGUES, *Œdipe africain*, Paris, L'Harmattan, 1966, p. 129

Précisons avec intérêt que la peur des malédictions ancestrales et le désir de rompre les liens avec les ancêtres s'expliquent par le fait que les conséquences des péchés commis par ces derniers retombent selon les convertis, sur les générations présentes et futures. Les effets de la malédiction ancestrale sur une personne se traduisent par des maladies chroniques, des psychopathologies (névroses et psychoses), des excès émotifs, des pertes financières répétées, une succession de morts non naturelles dans l'entourage de la personne, des troubles de comportement, des problèmes de stérilité et d'impuissance sexuelle, des divorces répétés, des excès de colère etc.

Ces aléas de la vie quotidienne sont souvent interprétés comme des conséquences ou comme des effets de la malédiction ancestrale. Autrement dit, ils sont considérés comme les plans de l'ennemi ou du diable pour éprouver les individus et les détourner du salut de Dieu. C'est pourquoi, dans *Sorcellerie et prière de délivrance*, Meinrad Hebga nous donne son point de vue sur la question du rapport entre l'individu et les ancêtres : « *De toute façon, les mânes des ancêtres ont chez nous un statut spécial, unique ; nous leur vouons un culte religieux si important que la religion traditionnelle africaine a pu être appelée parfois ancestralisme. Mais un théologien comme Boladji Idowu, d'Ibadan, conteste une telle appellation. Selon lui, c'est finalement au dieu suprême que l'on offre sacrifice et libations.* »<sup>3</sup>

Les différents blocages de la vie des chrétiens ou des musulmans sont attribués à une maladie spirituelle qui affecte directement ou indirectement leur relation à Dieu. Car, bien qu'étant convertis, les fidèles peuvent encore être poursuivis et tourmentés par les esprits ancestraux. Mais précisons au passage que tous les esprits ancestraux ne poursuivent pas et ne tourmentent pas. Chez les Mossi comme chez beaucoup d'Africains, un ancêtre bienveillant peut apparaître dans le rêve afin de prévenir d'un danger imminent. Cela veut dire que les ancêtres peuvent se révéler bienveillants ou persécuteurs, selon les circonstances. A ce sujet, voici encore ce que nous apprend Hebga : « *Ne devraient être regardés comme bons et bienveillants que ceux qui, véritables anges tutélaires nous témoigneraient leur sollicitude sans nous réduire en esclavage, et sans nous imposer des conditions qui blessent notre conscience morale et notre foi religieuse.* »<sup>4</sup>

### La peur des ennemis:-

Une autre raison qui conduit à la conversion religieuse est la peur des ennemis. Pour la plupart des personnes converties, l'ennemi représente un individu asocial et mauvais, en ce sens qu'il veut le mal des autres. Autrement dit, l'ennemi est un persécuteur qui fait peur au converti et à sa famille. Sa seule présence peut être considérée comme une source de peur et de blocage. Il s'agit de la peur psychologique et de blocage dans la réussite des affaires : maladies, dépérissement, réduction de l'énergie vitale, échec, stérilité, mort etc. qui sont attribués à l'action malveillante des ennemis, surtout dans les sociétés africaines.

D'ailleurs dans *Edipe africain*, Marie-Cécile et Edmond Ortigues ont montré que ces maux et d'autres encore sont souvent l'objet des délires de persécution dans les sociétés africaines. Ils nous donnent l'exemple de Fari, un jeune lycéen originaire de Dakar. Fari est un musulman et candidat au baccalauréat technique. Il souffre d'insomnie et de céphalées violentes. Il faisait les pires rêves qui le poussaient à la folie. Son père avait décidé d'inscrire à l'école un de ses cadets. Mais puisque ce dernier était trop jeune et que Fari était plus âgé, il est entré à l'école à la place du cadet. Pour Fari en effet, son frère cadet serait à l'origine de sa maladie, en ce sens qu'il lui avait ravi la position qui devait être la sienne. Alors, la réussite scolaire pour Fari consiste à tuer son frère cadet. Ainsi, il ne souffrirait plus d'aucune maladie et il réussirait brillamment ses études. Dans le cas d'espèce, le sentiment de culpabilité est externe et l'agressivité s'exprime principalement sous la forme de réactions persécutives. Dans les cultures africaines, les rapports interpersonnels sont colorés par le fait que chacun se perçoit facilement comme persécuté par l'autre. Cela se comprend dans la mesure où l'individu qui souffre d'un mal, accuse le plus souvent un ennemi au sein ou en dehors de sa famille. Il est donc trop facile d'attribuer à l'action de l'ennemi, tous les maux dont on souffre.

A partir de ce constat, il serait intéressant de relever au passage une analogie entre la conversion dans les religions traditionnelles et celle qui s'observe dans les religions monothéistes. Dans *La philosophie bantoue*, Placide Tempels

<sup>3</sup> Meinrad HEBGA, *Sorcellerie et prière de délivrance : réflexion sur une expérience*, Paris, Présence Africaine, 1982, p. 134

<sup>4</sup> Ibidem, pp. 136 - 137

a fait remarquer que la peur de l'ennemi fait retourner les Bantous superficiellement convertis au Christianisme, à la religion de leurs ancêtres. Car dans les sociétés africaines traditionnelles, l'ennemi est le plus souvent considéré comme l'auteur du malheur ou plus précisément celui qui réduit l'énergie vitale, en ce sens qu'il est capable de conduire à la mort. La même conception se retrouve chez les personnes converties au monothéisme (Christianisme et Islam). Pour ces derniers en effet, la conversion religieuse apparaît comme la solution à la peur de l'ennemi. Nombreuses sont d'ailleurs les chansons religieuses qui véhiculent une telle idée. Dieu apparaît dès lors comme le vainqueur de l'ennemi. Quiconque se convertit au Christianisme ou à l'Islam n'a plus rien à craindre.

Dans le psychisme des personnes converties aux religions bibliques, tout se passe comme si l'ennemi n'était à leurs yeux qu'un monstre mythique qu'il faut nécessairement abattre pour avoir la paix. Son action destructrice a, selon eux, une nature spirituelle. Pourtant, dans les Evangiles, le Seigneur Jésus nous invite à étendre son commandement d'amour jusqu'aux ennemis. Dans l'*Evangile selon Saint Matthieu*, nous avons les propos suivants : « *Vous avez entendu qu'il a été dit : tu aimeras ton prochain et tu haïras ton ennemi. Eh bien ! Moi je vous dis : aimez vos ennemis et priez pour vos persécuteurs, afin de devenir fils de votre Père qui est aux cieux, car il fait lever son soleil sur les méchants et sur les bons, et tomber la pluie sur les justes et les injustes. Car si vous aimez ceux qui vous aiment, quelle récompense aurez-vous ? Les publicains eux-mêmes n'en font-ils pas autant ? Et si vous réservez vos saluts à vos frères, que faites vous d'extraordinaire ? Les païens eux-mêmes n'en font-ils pas autant ? Vous donc, vous serez parfaits comme votre Père céleste est parfait.* »<sup>5</sup>

En fait, Jésus nous donne comme leçon d'aimer le pécheur ou l'ennemi, tout en détestant le péché. Autrement dit, nous devons agir comme un médecin qui combat la maladie en aimant le malade qui a besoin de guérison. En d'autres termes, nous devons lutter contre le mal que commettent nos ennemis tout en manifestant à leur égard, une immense charité. On peut dans cet ordre d'idées se référer au conseil de l'apôtre Paul dans l'*Epître aux Romains* : si nous aimons nos ennemis, nous serons vainqueurs du mal par le bien.

### La peur des punitions ici-bas:-

Dans l'*Evangile selon Saint Matthieu*, Jésus nous met en garde contre la recherche effrénée du bonheur et du bien-être à travers les moyens non recommandables : « *Cherchez avant tout le royaume de Dieu et sa justice, et le reste vous sera accordé par surcroît.* »<sup>6</sup> En s'inspirant de ce propos de Jésus, saint Paul, dans la *Deuxième Epître aux Corinthiens* souligne que la recherche du bonheur, sous toutes ses formes ne doit pas être la première préoccupation du converti ou de l'homme en situation dans le monde. L'essentiel est de connaître Dieu, de l'adorer et de faire sa volonté. C'est pourquoi, pour l'apôtre Paul en effet, la souffrance doit être acceptée par le converti, comme une participation à celle de Jésus. En d'autres termes, le converti doit être capable de boire avec Jésus, à la coupe d'amertume. Il doit être capable de souffrir et de mourir avec Jésus pour ainsi entrer avec lui dans son royaume. De ce point de vue, la souffrance ne doit plus être vue comme une punition ici-bas. Cela veut dire qu'en réalité, le converti ne doit plus avoir peur de quoi que ce soit. Tout ce qu'il vit en bien ou en mal doit être vécu en Dieu, pour Dieu et avec Dieu.

A partir de cette considération, une question pourrait venir à l'esprit du lecteur averti : doit-on accepter la souffrance sans rien faire pour y échapper ? A notre avis, la réponse à cette question doit être négative. Pour notre part, Dieu n'est pas injuste et ne cautionne jamais l'injustice. De plus, il n'a jamais voulu le mal, mais toujours le bien de l'humanité. C'est d'ailleurs pourquoi il nous a dotés des facultés intellectuelles telles que : la conscience, la volonté, la liberté, la responsabilité, la raison, l'intelligence, la mémoire, l'imagination, pour ne citer que celles-là, afin de bien penser pour bien agir en faisant des choix libres et responsables pour notre bonheur et pour notre bien-être. Cela veut dire qu'en réalité, notre bonheur peut dépendre de nous-mêmes, si nous œuvrons vraiment dans ce sens et si nous agissons de façon responsable dans la société. Restons dans la même logique pour dire que le malheur peut dépendre de nous si nous n'exerçons pas bien nos facultés intellectuelles pour opérer des choix en vue d'une existence heureuse.

En résumé, si le bonheur peut dépendre de nos choix, le malheur peut en dépendre aussi. Nous n'ignorons certes pas la question du déterminisme, mais nous voulons souligner avec rigueur qu'il est inutile que les convertis se réfugient dans les églises, dans les mosquées et dans les religions traditionnelles pour échapper aux punitions ici-bas. En fait, Dieu reste égal à lui-même et n'est jamais responsable du mal de l'homme. Tant que l'homme ne changera pas de mentalité et de comportement ; tant qu'il ne va pas travailler avec une bonne conscience pour améliorer sa condition

<sup>5</sup> Mt 5, 43- 48

<sup>6</sup> Mt 6, 33 - 34

de vie et celle des autres, il ne peut échapper aux punitions ici-bas. Cela signifie qu'en réalité, Dieu ne met pas fin aux punitions ou à la souffrance de l'homme après son adhésion à une religion. Ce qui importe pour Dieu et qui passe par-dessus tout, c'est la recherche de son royaume et de sa justice à travers le respect des commandements. Si cela est compris et bien compris, nous pouvons prétendre échapper aux punitions ici-bas. Toutes les personnes converties qui n'auront pas compris cette leçon prendront la vie comme un fardeau dont il faut se débarrasser en passant d'une religion à une autre ou de certaines religions à d'autres.

Ainsi, à l'instar du tradithérapeute qui soumet son client à de nombreux interdits, Dieu lui aussi nous soumet à des interdits. Chez le tradithérapeute, enfreindre les interdits, c'est s'exposer à ne pas guérir du mal dont on souffre et de mourir par conséquent, de sa maladie. Dans la même logique, chez le croyant, l'ataraxie (absence de trouble ou tranquillité de l'âme) comporte elle aussi des exigences, c'est-à-dire des interdits qui se retrouvent dans les commandements de Dieu, du moins, sous leur forme prohibitive. Par exemple, si le converti comprend qu'il doit aimer son prochain comme lui-même, il peut éviter la violence et les conflits sociaux en favorisant ainsi la paix en lui et autour de lui. S'il comprend qu'il ne doit pas corrompre ou se faire corrompre, qu'il ne doit pas voler ou détourner le bien public, il doit travailler avec une bonne conscience pour satisfaire ses besoins fondamentaux (se nourrir, se soigner, s'instruire, se loger, et se vêtir), pour rendre service à la société et pour développer son pays. Cela ferait d'ailleurs de lui un patriote et un modèle à suivre. S'il sait qu'il doit s'occuper de ses enfants et bien les éduquer, il aura une famille heureuse, épanouie et contribuera ainsi à la formation de bons citoyens pour son pays. En agissant de la sorte, le converti n'aura plus peur des punitions ici-bas. Il saura que pour lui, le Paradis de Dieu commence déjà ici-bas, parce qu'il est devenu un bon converti. Dans ce sens, nous pouvons nous référer à cette formule de Ludwig Feuerbach : « *Exister veut dire être sujet.* »<sup>7</sup>

Dans le même ordre d'idées, nous pouvons nous référer à ce que nous dit Lucrèce (philosophe latin, 98 à 55 avant Jésus Christ), dans *De la nature* : si, en sentant sur leur cœur le poids qui les accable, les hommes pouvaient aussi connaître l'origine de leur mal et d'où vient leur lourd fardeau de misère, ils ne vivraient pas comme ils vivent trop souvent, en ignorant ce qu'ils veulent, cherchant toujours une place nouvelle comme pour se libérer de leur charge.

### **La peur des punitions dans l'au-delà:-**

Jusqu'ici, nous avons constaté que toute religion propose à ses adeptes, le système de la carotte et du bâton : punition divine, en cas de mauvaises actions et récompense, en cas de bonnes actions. En habituant les hommes à une telle logique il est clair que leur conversion religieuse ne peut relever que de l'émotion et non de la raison. Plus on médite cette idée, plus on en sent la vérité. Plus on la conteste, plus on donne l'occasion de l'établir encore par de nouvelles preuves.

En effet, dans les religions traditionnelles, le rapport existant entre la morale, la religion et la manière dont les jugements se font sur terre amènent les hommes à se faire une idée du jugement dans l'au-delà. En d'autres termes, l'homme se fait une conception de l'autre vie, c'est-à-dire de l'au-delà qu'il se représente généralement comme une continuation de la vie terrestre. Dans l'imaginaire collectif, le pays des morts est fort semblable au pays des vivants, en ce sens que l'on pense que les bons seront récompensés, tandis que les mauvais seront punis ou châtiés, exactement comme cela se fait dans le monde ici-bas. On pense que dans l'au-delà, se trouvent les mêmes habitudes, les mêmes usages, le même genre de vie. Dès lors, le traitement réservé à ceux qui ne sont plus de ce monde et qui vont dans l'au-delà dépend du genre de vie qu'ils ont mené sur cette terre, c'est-à-dire dans ce monde. Autrement dit, selon la logique humaine, le jugement et le traitement réservés à l'individu dans l'au-delà relèvent du rang qu'il occupait dans sa famille, dans sa tribu. Cela dépend aussi de sa situation sociale, de sa richesse, de sa puissance magique, de son intelligence, de sa vigueur, de sa capacité à faire le bien ou le mal. La même idée est exposée dans *La psychologie de la conversion chez les peuples non-civilisés* où Raoul Allier montre que, selon la logique des « *peuples primitifs* » ou « *peuples indigènes* », le roi demeure roi, au pays des morts, l'esclave demeure esclave, celui qui a été malade ou malheureux voit se poursuivre sa maladie et sa misère, tandis que le bonheur suit au-delà du tombeau, l'homme qui en a joui sur cette terre. A notre avis, la peur des punitions dans l'au-delà serait encore à l'origine de la conversion religieuse.

<sup>7</sup> Ludwig FEUERBACH, *Principes de la Philosophie de l'avenir*, Paris, P.U.F., 1842, p. 220

Dans les religions traditionnelles par exemple, on pense que les dieux châtent les malfaiteurs qui ont agi sur terre contre leurs serviteurs dévoués ou contre leurs adorateurs fidèles. Autrement dit, les dieux doivent punir dans l'au-delà, ceux qui agissent mal sur terre après leur mort. De ce point de vue, les dieux qui habitent le pays des morts apparaissent dans les religions traditionnelles comme des juges qui étendent leur juridiction sur tous les actes des hommes, qu'ils agissent en bien ou en mal. Mentionnons avec intérêt que dans les religions traditionnelles, les dieux n'ont pas seulement pour rôle de juger les morts et de les châtier. Ils sont aussi pourvoyeurs de récompenses. Ils sont considérés encore comme des réparateurs des injustices commises dans le monde ici-bas. Car, on pense que ceux qui subissent l'injustice de la part des ennemis ou des plus forts de ce monde sont aussi consolés.

S'agissant des religions révélées (l'Islam et le Christianisme), la peur des punitions dans l'au-delà ou plus précisément, la peur de l'Enfer serait aussi l'une des raisons pouvant pousser les individus à se convertir. D'ailleurs, le discours sur la peur de l'Enfer est assez présent dans l'histoire des religions monothéistes. Tout porte donc à croire que ceux qui se convertissent craignent le jugement de Dieu et l'entrée en Enfer pour se conduire droitement. La figure de l'Enfer est bien l'image de la sanction des fautes. Les Saintes Ecritures, témoignent que Dieu jette dans l'Enfer ceux qui, sur cette terre, se sont éloignés de la justice pour choisir les voies tortueuses du mal. On se rappelle à juste titre du sermon de Jésus sur la montagne exposé dans l'*Evangile selon saint Matthieu*. Ici, Jésus nous parle de la géhenne de feu qui détruira le malfaiteur qui aura librement choisi de mener une existence en désaccord avec la loi de Dieu.

La même idée se retrouve dans le *Coran* : « *Ceux qui font le mal et qui se font cerner par leurs péchés, ceux là sont les gens du feu où ils demeureront éternellement.* »<sup>8</sup> Une telle idée entraîne chez l'homme, la peur des sanctions dans l'au-delà. Dans le même sens, elle amène l'homme le plus mauvais à se convertir pour chercher refuge dans la foi en Dieu, dans l'espoir d'être sauvé de ses fautes. Cela veut dire qu'en réalité, dans les religions monothéistes, la peur de l'Enfer tient en respect un nombre important de personnes converties. En craignant le jugement de Dieu et l'Enfer après la mort, le converti est obligé de vivre selon les préceptes de la foi ; car, il sait que là haut, c'est-à-dire dans l'au-delà, les comptes seront faits et que son âme sera jugée si, ici-bas, il s'est livré au péché.

L'idée de la peur de l'Enfer est encore développée dans *Gorgias* de Platon où Socrate tente longuement de faire entendre à Calliclès qu'il vaut mieux être tempérant et intègre ici-bas, au lieu de prendre le parti de l'intempérance et de l'immoralisme. Mais, puisque Calliclès ne voulait pas entendre la voix de la raison, Socrate tire sa dernière cartouche et emploie un langage religieux en tenant un discours menaçant relatif à la sanction des âmes après la mort. Pour Socrate en effet, la peur de l'Enfer doit nous obliger à bien agir ici-bas.

Mais, mentionnons que pour le converti, la peur de l'Enfer n'est qu'une erreur en ce sens qu'elle relève de l'imagination. Déjà, dans l'antiquité, des voix se sont élevées contre la religion, notamment dans l'épicurisme. En effet, si beaucoup de religions pensent détenir la vérité au sujet de la peur de l'Enfer qui pousse le converti à vivre selon les règles morales ici-bas, afin d'entrer dans le Paradis, tel n'est pas le cas chez Epicure qui nie totalement l'existence d'un au-delà après la mort. Si tel est le cas, pourquoi le converti doit-il encore avoir peur de l'Enfer ? Car, pour Epicure, la mort est la privation totale de la sensibilité. Celui qui meurt n'a plus conscience de rien. Il ne connaît ni joie, ni peine, ni Enfer, ni Paradis. C'est pourquoi, dans sa *Lettre à Ménécée sur la morale*, Epicure nous apprend que personne ne peut expérimenter la mort. Tant que nous existons, elle ne nous concerne en rien et pendant qu'elle est là, nous n'existons plus.

La peur de l'Enfer est encore rejetée par Nietzsche qui refuse toute tentative de faire de Dieu un bourreau et de considérer l'Enfer comme le lieu du châtement et de la faute. En battant en brèche la thèse de Schopenhauer selon laquelle le salut de l'homme consiste à s'affranchir du « *vouloir vivre* » et donc de la douleur qui en est l'expression, Nietzsche condamne aussi la morale du péché pour faire l'éloge de l'instinct. Pour lui, cette peur que prônent les religions conduit à la fuite de responsabilité face à l'existence. Cela se comprend dans la mesure où la religion relève de la « *mentalité du troupeau* » ; puisqu'elle fait diminuer la force des instincts naturels qui sont refoulés dans l'inconscient et qui finalement se transforment en cruauté et en rancune souvent difficiles à oublier. Dans *Généalogie de la morale*, Nietzsche prend le converti qui a peur de l'Enfer et qui considère Dieu comme un

<sup>8</sup> *Coran*, Al-Madinah Al-Munawwarah, Complexe Roi Fahd pour l'impression du Noble Coran 1410,

bourreau pour une bête triste et folle. Dans cet ordre d'idées, il refuse d'inventer une autre vie ; une vie différente de celle dans laquelle nous sommes. Dans *Le gai savoir*, il nous apprend que l'homme doit aimer la vie et œuvrer pour le bonheur. Il faut donc cesser d'être un fabricant de dieu et de projeter en lui toutes ses intentions. Il doit plutôt devenir un « *surhomme* », c'est-à-dire un être supérieur, grâce à la « *volonté de puissance* ». La peur de l'Enfer ne stimule donc pas notre « *volonté de puissance* », mais la diminue. De ce point de vue, Nietzsche a voulu obliger ses lecteurs à s'interroger sur eux-mêmes et sur leur foi.

## **B- Le désir de vengeance à l'origine de la conversion religieuse.**

### **Vengeance contre le diable:-**

En affirmant que Dieu existe, les hommes ne disent pas la même chose et ils ne sont pas nécessairement du même avis. En fait, le mot « *Dieu* » peut renvoyer à des idées très différentes. Chez certains convertis, Dieu peut être appelé au secours pour se venger contre le diable, parce qu'il est considéré comme un être tout puissant, c'est-à-dire, celui qui possède la force par lui-même et qui est capable de tout. C'est justement ce qui fait l'objet de notre réflexion dans la présente section.

En effet, les Saintes Ecritures nous enseignent que parmi les anges que Dieu a créés pour qu'ils soient près de lui et contemplent sa gloire, certains, à la suite du premier d'entre eux que l'on nomme le diable se sont rebellés contre lui. Cela signifie qu'ils ne peuvent plus rester près de Dieu et qu'ils sont rejetés dans l'Enfer préparé pour le diable et ses anges. C'est justement ce que nous apprend Jésus dans l'*Evangile selon Saint Matthieu* : « *Alors il dira encore à ceux de gauche : allez loin de moi, maudits, dans le feu éternel qui a été préparé pour le diable et ses anges.* »<sup>9</sup> Dès lors, les convertis pensent que le diable et ses anges viennent dans le monde des hommes pour apporter le mal ; qu'ils détournent les hommes de Dieu et les entraînent au péché. Sachant alors que le diable peut être la source du mal, mais qu'il n'est pas puissant et que seul Dieu est capable de tout, les personnes converties appellent Dieu au secours pour se venger contre le diable. Cela veut dire qu'en fait, les hommes seraient perdus si Dieu ne les aimait et ne les protégeait pas. D'ailleurs, selon la *Sainte Bible*, le diable est identifié comme le contradicteur de Dieu. Plusieurs noms lui sont attribués pour exprimer ses mauvaises actions. Selon les circonstances, il est appelé Satan ou Belzébuth. C'est le prince des ténèbres, le père du mensonge, le prince de ce monde.

Dans l'intention de nous montrer que seul, Dieu est capable de venger le converti contre le diable, l'apôtre Pierre, dans sa première épître, nous montre la nécessité de résister au diable par la foi en Dieu : « *Soyez sobres, veillez. Votre partie adverse, le diable, comme un lion rugissant, rôde, cherchant qui dévorer. Résistez lui, fermes dans la foi.* »<sup>10</sup> Alors, nous comprenons que Dieu n'abandonne pas le converti qui croit en lui. Il le garde, le gouverne avec sa divine providence et constitue en même temps celui qui le rend fort contre le diable et ses anges. Autrement dit, en Dieu, se trouve la confiance inébranlable qui lui permet de résister au diable ou de se venger contre lui.

Mais, à notre humble avis, une telle compréhension des Saintes Ecritures ne doit pas nous faire perdre de vue la réalité. L'homme peut lui-même choisir d'avoir le statut du diable, s'il décide de penser et d'agir contre la volonté de Dieu. Bien qu'étant converti à une religion, il est toujours libre. Par ses actes, il peut ressembler à Dieu ou au diable. S'il ressemble à Dieu, il écouterait sa parole et collaborerait avec lui comme un fils bien aimé. S'il ressemble au diable, il deviendrait son partenaire et ferait le mal pour lui-même et pour autrui. Car, bien que la loi de Dieu soit exigeante, elle laisse néanmoins à chaque homme, la liberté de faire ce qu'il veut. Dans certaines circonstances, il peut faire ce qu'il veut, ce qui lui plaît ou ce qu'il juge bon. Il peut dès lors ressembler à Dieu s'il veut ou ressembler au diable. Cela veut dire qu'en réalité, Dieu ne peut pas venger le converti contre le diable s'il décide lui-même, par ses actes, de ressembler au diable. Jean-Paul Sartre l'a bien compris quand il dit : « *L'homme est responsable de ce qu'il est.* »<sup>11</sup> Chaque converti, par ses actes, propose donc des valeurs. De ce point de vue, il peut prendre l'apparence de Dieu ou du diable, selon les circonstances. Cela veut dire qu'en réalité, le diable n'est pas nécessairement en dehors de l'homme. D'ailleurs, personne ne l'a jamais vu. C'est l'homme qui, selon les circonstances, prend l'apparence du diable par ses actes ou par ses comportements. Si les hommes pouvaient changer de mentalité et s'aimer entre eux, l'on ne parlerait plus de diable et l'on ne se vengerait plus contre lui.

<sup>9</sup> Mt 26, 41

### Vengeance contre l'ennemi:-

Il est clair que l'homme partage avec l'animal, l'instinct d'agressivité. C'est une tendance à déployer sa puissance qui peut impliquer la neutralisation de tout obstacle, y compris l'être humain, qui, d'une manière ou d'une autre, peut être considéré comme un ennemi. Dans ce sens, on comprend que l'agressivité est naturelle chez l'homme, quelle que soit la morale ou la religion et qu'il serait illusoire de la supprimer, mais de l'atténuer. C'est pourquoi le Coran recommande que la lutte soit engagée contre l'ennemi : « *Combattez dans le sentier d'Allah ceux qui vous combattent, et ne transgressez pas. Certes, Allah n'aime pas les transgresseurs !* »<sup>12</sup> D'ailleurs, philosophes et penseurs d'horizons les plus divers n'avaient pas attendu les travaux de Freud avant de montrer que la violence en général et le désir de vengeance contre l'ennemi, en particulier, est chez l'homme une tendance naturelle. Par exemple, dans *Le citoyen ou les fondements de la politique*, Thomas Hobbes nous apprend que l'homme porte en lui le désir de recourir aux moyens les plus extrêmes pour se venger contre son ennemi, en vue de sa propre conservation. De ce point de vue, il n'est pas étonnant que la religion soit pour le croyant un moyen pour se venger contre l'ennemi. Voilà ce que nous apprend Hobbes en ces termes : « *Il s'en suit que, puisque chacun a droit de travailler à sa conservation, il a pareillement droit d'user de tous les moyens et de faire toutes les choses sans lesquelles il ne se pourrait point conserver.* »<sup>13</sup>

Partout et toujours, on voit donc l'homme exercer la violence contre ses semblables, en se vengeant contre ses ennemis. Cela veut dire qu'en ayant peur des phénomènes naturels comme nous l'avons montré dans la première section du chapitre précédent, les hommes ont encore peur d'eux-mêmes, quelle que soit leur confession religieuse. La crainte réciproque que les fidèles d'une même religion ou de religions différentes éprouvent vis-à-vis de l'autre, conditionne le rapport de chaque homme ou de chaque croyant envers son semblable et s'explique par le désir de vengeance contre l'ennemi. C'est pourquoi, dans *Léviathan*, Hobbes justifie l'existence d'une « *crainte réciproque et une défiance universelle parmi les hommes.* »<sup>14</sup> Même dans les religions, il n'est pas rare de voir des convertis agir pour détruire ou pour dominer leurs prochains, considérés comme leurs ennemis, afin que ceux-ci ne puissent en aucun cas empêcher la réalisation de leurs désirs.

S'inscrivant dans la même logique, Sigmund Freud a révélé, grâce à la psychanalyse (science de l'inconscient), l'existence de l'agressivité, une pulsion destructrice chez l'homme. A travers *Malaise dans la civilisation*, le père de la psychanalyse soutient : « *L'homme est, en effet, tenté de satisfaire son besoin d'agression aux dépens de son prochain, d'exploiter son travail sans dédommagements, de l'utiliser sexuellement sans son contentement, de s'approprier ses biens, de l'humilier, de lui infliger des souffrances, de le martyriser et de le tuer.* »<sup>15</sup>

En parlant de la vengeance contre l'ennemi, nous pouvons encore nous référer à ce que nous dit René Girard dans *La violence et le sacré*. Pour cet auteur en effet, le sacré est l'organisation de la violence inhérente à la nature humaine. Autrement dit, loin de supprimer la violence primitive, le sacré la transforme en moyen de cohésion du groupe. Dans tous les cas, nous constatons que la violence et le sacrifice sont toujours mêlés dans l'acte fondateur des religions. Pour justifier sa thèse, Girard se fonde sur la notion de « *victime émissaire* » qui permet à une société ou à une religion de se décharger de son agressivité sur l'être toujours choisi comme un bouc émissaire que l'on sacralise afin de détourner la culpabilité provoquée par le meurtre rituel. Dès lors, nous pouvons parler de la religion en tant qu'un ensemble d'individus formant une communauté qui se réconcilie en Dieu ou en une autre divinité, aux dépens de la « *victime émissaire* ». Pour René Girard, la violence est une caractéristique religieuse propre à toute société. Cela se traduit par la formule suivante : « *Le religieux est tout entier orienté vers la paix mais les moyens de cette paix ne sont jamais dénués de violence sacrificielle.* »<sup>16</sup>

A analyser de près, nous ne pouvons pas ne pas donner raison à Hobbes, à Freud ou à Girard. Dans *La philosophie bantoue*, Placide Tempels a reconnu le totémisme comme un fondement de la religion chez les peuples primitifs. Une telle pratique met en relief l'idée du bouc émissaire ou de la victime émissaire dont nous parle René Girard dans *La violence et le sacré*. Dans le même ordre d'idées, nous pouvons justifier ces différentes thèses par ce que nous apprend Raoul Allier dans *La psychologie de la conversion chez les peuples non-civilisés* où il nous parle abondamment des pratiques relatives au sacrifice humain dans le paganisme. Ces pratiques étaient faites pour se

<sup>12</sup> Coran, op. cit, S. 2, V. 190

<sup>13</sup> Thomas HOBBS, *Le citoyen ou les fondements de la politique*, Paris, Ed Sirey, 1981, p. 84

<sup>14</sup> Thomas HOBBS, *Léviathan*, Paris, Ed Sirey, 1971, p.122

<sup>15</sup> Sigmund FREUD, *Malaise dans la civilisation*, Paris, P.U.F., 1930 p.64

<sup>16</sup> René GIRARD, *La violence et le sacré*, Paris, Grasset, 1972, p. 41

venger contre les ennemis et pour protéger les peuples afin de détourner d'eux, les fléaux. Marc Augé s'est lui aussi intéressé à la question de la vengeance contre l'ennemi quand il parle de « *la guerre des frères ennemis à la mort du roi régnant*. »<sup>17</sup> Tous ces phénomènes nous donnent la preuve que la conversion religieuse relève de l'émotion et non de la raison.

Mais, loin d'encourager la violence à travers le fait religieux, nous voudrions par ces différentes considérations attirer l'attention de toute personne convertie sur la recherche d'une paix véritable à travers la conversion religieuse. Car, puisque Dieu est unique, tous les membres d'une même religion ou de différentes confessions religieuses doivent s'unir et s'aimer comme des frères pour faire échec à la violence ou du moins, pour l'atténuer.

Ainsi, dans la *Catéchèse bantoue*, un des premiers écrits pastoraux de Tempels, il a eu le mérite de souligner l'universalité du Christ. Pour l'auteur en effet, le Christ est venu sauver les hommes de toute race, de toute langue et de toute culture. Cela veut dire qu'en fait, le Christ n'est pas seulement venu pour la race blanche ou pour les peuples occidentaux. Que l'on soit un Africain ou un Européen, un Américain ou un Asiatique, on est appelé à aimer Dieu et son prochain comme soi-même pour bâtir un monde plus humain et mériter l'entrée au Paradis. A vrai dire, la foi en Dieu n'est pas une affaire de race, de culture de langue ou de classe sociale. Que l'on soit pauvre ou riche, jeune, adulte ou vieillard, on doit bien agir pour vivre en Dieu. Dans ce sens, le respect des commandements doit être une obligation et une réalité, conformément à la logique de Tempels. Dans le même ordre d'idées, il faut dire que l'appartenance à une religion ou à une autre ne garantit pas le salut de Dieu. Ce qui importe, c'est d'accomplir sa volonté. Dans ce sens, nous disons ici et maintenant que la guerre des religions n'est qu'une barbarie ; puisqu'en réalité, nul ne peut se servir de la violence pour justifier la foi. Le Dalaï Lama a donc raison quand il affirme qu'il croit fermement aux valeurs de la non-violence.

### **Vengeance contre le plus fort:-**

La présente section nous oriente vers la question du plus fort ; une question qui, depuis l'Antiquité Grecque, est au centre de la réflexion philosophique en général et de la philosophie morale et politique en particulier. En effet, le plus fort désigne un individu qui possède une puissance d'action physique ou symbolique résultant d'une pluralité de sources. Chez le plus fort, la force peut se manifester par des techniques d'exploitation des plus faibles à travers l'agression physique ou la mise en œuvre des moyens rationnels pouvant permettre la destruction d'un homme ou d'un groupe d'hommes. Autrement dit, le plus fort a le pouvoir d'exercer une action sur quelqu'un pour l'amener à faire quelque chose, indépendamment de sa volonté. Depuis Calliclès, il est clair que le plus fort attaque le plus faible pour avoir tous les droits. D'ailleurs, l'histoire nous révèle que le droit du plus fort est le plus constant de tous les droits. Dans *Le loup et l'agneau*, La Fontaine souligne que le plus fort a toujours raison, en ce sens qu'il a le pouvoir d'exploiter le plus faible et d'obtenir de lui tout ce qu'il veut, quand il veut et où il veut.

Par contre, dans *Du contrat social*, Jean-Jacques Rousseau a mis en relief la contradiction inhérente au prétendu droit du plus fort. Pour Rousseau en effet, la force ne doit en aucun cas faire le droit. Car, selon les circonstances, elle peut s'affaiblir pour faire place à une autre force supérieure. Nous pouvons nous référer à la formule suivante : « *Le plus fort n'est jamais assez fort pour être toujours le maître*. »<sup>18</sup> Aussi longtemps qu'un individu est le plus fort, c'est cette force qui est la source de son pouvoir. Si quelqu'un lui obéit, c'est parce qu'il est plus faible que lui et qu'il le craint, en ce sens qu'il ne peut faire autrement. Dieu est l'être puissant qui a la force par lui-même. C'est encore lui qui donne sa force à celui qui en a et qui domine les autres. Mais, pour l'auteur de : *Du contrat social*, la force peut prendre fin et redevenir faible en face d'une force supérieure. Car, seul Dieu est le plus fort ; tandis que la force humaine est limitée.

Dans cet ordre d'idées, nous pouvons comprendre comment la religion peut permettre aux plus faibles de se venger contre le plus fort. Dans la première partie de notre thèse, nous avons défini la religion, conformément à la formule de Durkheim. Dans la religion, les plus faibles se mettent ensemble pour former une communauté qui s'enracine dans une histoire commune et qui repose sur un patrimoine commun. De ce point de vue, toute religion engendre

<sup>17</sup> Marc AUGÉ, *Pouvoirs de vie, pouvoirs de mort : introduction à une anthropologie de la répression*, Paris, Flammarion, 1977, p. 129

<sup>18</sup> Jean-Jacques ROUSSEAU, *Du contrat social*, Paris, Garnier-Flammarion, 2001, p.44

entre ses membres ou entre ses adeptes, un sentiment naturel de solidarité. Il s'agit d'une solidarité à travers laquelle les faibles se réunissent ou s'assemblent pour se venger contre le plus fort.

Dans la religion, l'intérêt particulier et l'intérêt général semblent être confondus. En tout cas, on constate que leur rapport est immédiatement senti. Quiconque attaque un membre a affaire à toute la communauté. Dans ce sens, nous pouvons paraphraser Rousseau pour dire que la religion constitue une forme d'association dont le but est de défendre et de protéger la personne et les biens de chaque associé. Car, les membres d'une religion se considèrent le plus souvent comme des fils et filles d'un même père. C'est pourquoi, ils se vengent contre leurs ennemis en croyant puiser dans la force de Dieu pour agir. Dieu a un pouvoir qui permet à ses fidèles de briser toutes les résistances que l'ennemi leur oppose. Il est lui-même la force suprême à laquelle aucune autre ne peut résister.

### **Vengeance contre l'incrédule:-**

Dans l'imaginaire collectif, tout se passe comme si les convertis ont un important compte en banque, en ce sens qu'ils se croient plus aimés de Dieu par rapport à l'incrédule. Autrement dit, la foi en Dieu apparaît comme un synonyme de garantie ou d'assurance. Elle est la manifestation de la confiance absolue en Dieu, une confiance fondée sur des témoignages dont la raison ne saurait totalement garantir la valeur. Ainsi, pour Gérard Durozoi et André Roussel, « la foi désigne alors une croyance ferme, une certitude qui ne s'appuie pas sur des preuves rationnelles. »<sup>19</sup> En d'autres termes, elle est l'adhésion aux dogmes qui sont considérés comme des vérités révélées.

Toutefois, on note chez le converti un certain sentiment de vengeance à l'égard de l'incrédule, c'est-à-dire, à l'égard de celui qui ne croit pas en Dieu. Pourtant, à travers les Saintes Ecritures, on constate que Dieu s'est révélé aux hommes de toute race, de toute culture et de toute langue, de manière progressive et pédagogique. S'il est vrai qu'au départ, il s'est choisi et façonné un petit groupe, c'est-à-dire le peuple d'Israël, pour contracter une alliance avec lui, il faut néanmoins reconnaître qu'à travers ce peuple, ce sont en même temps tous les peuples de la terre qui doivent bénéficier de son salut. Autrement dit, Dieu n'accorde pas seulement ses bienfaits à ceux qui appartiennent à une religion particulière, mais à tous les hommes. Que l'on soit un fidèle ou un adepte d'une religion ou non, il est avec nous et exauce nos prières comme celles des autres. Cela veut dire qu'en réalité, le salut de Dieu s'étend à toute l'humanité. L'essentiel n'est pas d'appartenir à une religion pour prétendre être sauvé. Pour notre part, ce qui est important dans la question du salut de Dieu, c'est de bien penser pour bien agir, conformément aux lois morales de la société ; une société qui tient son existence de Dieu.

Si vraiment l'individu s'évertue à respecter avec une bonne conscience les lois justes de la société, il est déjà en accord avec Dieu et il peut jouir de son salut, au même titre que le fidèle ou l'adepte d'une religion. Cela veut dire qu'en réalité, il y a un rapport très étroit entre les commandements de Dieu et les lois de la société. Voilà ce que nous apprend Durkheim dans ce sens : « *D'une manière générale, il n'est pas douteux qu'une société a tout ce qu'il faut pour éveiller dans les esprits, par la seule action qu'elle exerce sur eux, la sensation du divin ; car elle est à ses membres ce qu'un Dieu est à ses fidèles.* »<sup>20</sup> De ce point de vue, nous comprenons dès lors que la société revêt un pouvoir important. On pourrait même dire qu'il s'agit d'un pouvoir qui vient de Dieu, en ce sens qu'elle nous aide à prendre conscience de nous-mêmes et des règles morales adéquates à respecter pour être de bons citoyens. Or, à dire toute pensée, le bon citoyen est déjà un bon converti ; tandis que le mauvais citoyen n'est qu'un mauvais converti. Car, l'influence que la société exerce sur nos consciences tient beaucoup de l'autorité morale dont elle est investie. En obéissant aux lois de la société par l'accomplissement de nos devoirs, nous aimons déjà le prochain et nous aimons déjà Dieu. Ainsi, nous ne sommes plus des incrédules, mais plutôt des vrais convertis. Pour ceux qui nous reprochent d'égaliser Dieu à la société, nous contestons par l'affirmation suivante : Nous ne posons pas l'équation selon laquelle la société représente Dieu ou que Dieu est égal à la société. Au contraire, nous invitons les hommes de toute race, de toute culture et de toute langue à mieux connaître Dieu pour mieux l'adorer.

<sup>19</sup> Gérard DUROZOI - André ROUSSEL, *Dictionnaire de philosophie*, Paris, Nathan, 2002, p.153

<sup>20</sup> Emile DURKHEIM, *Les formes élémentaires de la vie religieuse : le système totémique en Australie*, Paris, P.U.F., 1998, p.295

**Vengeance contre le pécheur:-**

Chez les personnes converties, l'émotion consiste encore à se venger contre les pécheurs, c'est-à-dire, ceux qui font du mal et qui refusent de se convertir. Pourtant, dans l'Evangile, saint Jean nous parle des Scribes et des Pharisiens qui amènent une femme adultère à Jésus en lui disant : « *Maître, cette femme a été surprise en flagrant délit d'adultère. Or, dans la loi, Moïse nous a prescrit de lapider ces femmes-là. Toi donc, que dis tu ?* »<sup>21</sup> Puisque ces Scribes et Pharisiens persistaient pour connaître la réponse de Jésus sur cette question, il leur a répondu en ces termes : « *Que celui d'entre vous qui est sans péché lui jette le premier une pierre !* »<sup>22</sup> Après avoir entendu et compris la réponse de Jésus, les accusateurs s'en allaient, l'un après l'autre, à commencer par les plus anciens. S'étant finalement retrouvé seul avec la femme, Jésus lui demande où sont passés ses accusateurs. Ensuite, il lui demande si personne ne l'avait condamnée. Alors, la femme répond en disant que personne parmi ses accusateurs ne l'avait condamnée. C'est alors que Jésus lui dit : « *Moi non plus, je ne te condamne pas. Vas, désormais ne pèche plus.* »<sup>23</sup>

Cette rencontre de Jésus avec la femme adultère nous donne la preuve que Dieu ne veut pas que l'on se venge contre le pécheur et qu'il ne veut pas non plus sa mort. A vrai dire, la souffrance éternelle est quelque chose que personne ne doit jamais souhaiter, même à son pire ennemi. C'est un malheur inimaginable qui, en réalité, ne doit pas être pensé, quelles que soient les circonstances. Même si le fidèle sent un désir de vengeance dans les propos des chefs religieux (prêtres, pasteurs, imams ou chefs religieux traditionnels), il doit lui-même se poser des questions. Car, tant que l'on arrive à croire simplement à ce que dit son chef religieux sans se poser de question, tout va bien. Mais lorsqu'on commence à réfléchir par soi-même, surtout au sujet de la vengeance contre l'ennemi ou contre le pécheur, on a de la matière à passer des nuits blanches. Jésus ne condamne pas et n'évite pas non plus le pécheur. Les Saintes Ecritures révèlent qu'il va même au-devant d'eux pour les amener à la conversion. Plusieurs fois, il a fréquenté les pécheurs et a mangé avec eux. L'exemple de Matthieu le Publicain, l'illustre mieux. Mais, reconnaissons que Jésus ne cautionne pas le péché. Il veut plutôt que le pécheur se convertisse pour devenir un homme nouveau.

En d'autres termes, Dieu n'enfoncé jamais le clou de la culpabilité. Par sa miséricorde, il soulage de leur fardeau, ceux que le poids du péché a fait tomber à terre, afin qu'ils se redressent pour continuer à vivre. Autrement dit, Dieu ne veut pas que le pécheur soit puni, mais qu'il revive tout en reconnaissant son œuvre dans sa vie. A notre avis, si nous évitons de nous venger contre le pécheur en lui montrant ce qu'il doit faire et comment y parvenir, il mènera une vie plus juste. Car la bonté et le pardon de Dieu sont sans limite. Soulignons que la vengeance contre le pécheur ne peut en aucun cas permettre au converti d'avoir la paix. Comme nous l'apprend saint Augustin, pour avoir la paix, il faut aimer. D'ailleurs, il serait impossible d'identifier au sein de l'humanité, les pécheurs de ceux qui ne pêchent pas. Alain a donc raison quand il dit que, ce sont les mêmes hommes qui font la guerre qui aiment encore la paix. Pour notre part, il vaut mieux travailler pour sa propre sainteté et contribuer à celle des autres que de penser à l'existence d'un Dieu vengeur qui doit torturer dans l'Enfer, ceux qui pêchent ici-bas.

**Conclusion:-**

La promotion de la paix au sein des religions doit nécessairement passer par la maîtrise des émotions chez les personnes converties. On sait qu'il y a des émotions nocives, c'est-à-dire négatives et des émotions positives. En fait, la religion devrait délivrer le converti des émotions négatives telles que la peur et le désir de vengeance. Elle devrait donner au converti, la joie de se sentir membre d'une communauté de fidèles qui doivent véritablement aimer Dieu et leurs prochains comme eux-mêmes. Puisque l'homme est un être ambivalent, c'est-à-dire capable du meilleur et du pire, la paix doit dépendre de l'homme véritablement transformé par la Parole de Dieu ; un homme prêt à lutter contre la peur et le désir de vengeance pour aimer ses semblables. En réalité, il serait illusoire de croire que, pour être un bon converti, on doit devenir l'ennemi des incrédules ou des fidèles d'autres religions. Etre un bon converti, c'est lutter contre la peur et le désir de vengeance en souhaitant par la raison le bien pour autrui et pour soi-même. Si tel n'est pas le cas, le converti doit se poser des questions sur sa foi. Car, bien que le rôle de la raison dans la conversion religieuse soit limité, elle doit néanmoins permettre de distinguer le vrai du faux, voire le bien du mal. Autrement dit, la raison doit permettre au converti de savoir s'il est en accord ou en désaccord avec la Parole de Dieu.

#### Abstract

In this work, we focus on the design of a rectangular patch antenna for use in Ultra Wide Band ( UWB ) in breast cancer detection. After modeling and validation of the base antenna, we perform the parametric study on the choice of the dielectric substrate, the height of the ground plane, the transition between the patch and the microstrip line. This is in order to optimize these parameters to meet the standards set by the Federal Communications Commission (FCC) for UWB communications in terms of bandwidth, standing wave ratio (SWR ) and antenna input impedance.

#### Introduction:-

With the development of wireless communications, Ultra Wide Band (UWB) systems has recently attracted attention of scientists because of the benefits they offer. Thanks to a much wider bandwidth, this new technology is very robust in complex environments. Furthermore, the transmission power being of the same level as the noise, the technique can coexist with narrowband systems<sup>(1)</sup>.

The Federal Communications Commission (FCC) has established in February 2002, Terms of use the frequency spectrum between 3.1 and 10.6 GHz and emission power limits allocated to the various UWB applications<sup>(2)</sup>. Given its characteristics (low power, narrow pulses) even noticed, we begin to realize the benefits of UWB technology in many areas of research. These include medical microwave imagery that has generated considerable interest in recent years. This technique could be a very effective means for detection of malignant tumors including breast cancer<sup>(3)</sup>.

We propose in this work to perform parametric study and design of a planar antenna patch for application on Ultra Wide Band UWB. After modeling and validation of the base antenna, there follows the parametric study consisting on the choice of dielectric substrate, height of the ground plane, form of transition between the patch and the microstrip line. This is in order to optimize these parameters to meet the standards set by the Federal Communications Commission FCC for UWB communications in terms of bandwidth and SWR standing wave ratio.

#### Theorecal study:-

The transmission-line model representing the microstrip antenna is defined by two slots, separated by a low impedance ZC transmission line of length L. Since the dimensions of the patch are finite along the length and width, field lines suffer the edge effects on both sides of the patch. These effects are a function of the patch dimensions and the height h of the substrate<sup>(4)</sup>.

The signal transmission is not dispersive if the mode of propagation is TEM (Transverse Electro- Magnetic). This is possible if the electromagnetic field that propagates through the line meets one type of material. For the microstrip line of Figure 1, which the field lines are shown in Figure 2. A portion of the electric field lines are reflected in the substrate and a part in the air <sup>(5)</sup>. Many studies have shown that such a transmission line is the seat of a wave propagating in quasi-TEM mode. We must therefore consider not only the dielectric constant of the substrate but rather  $\epsilon_{\text{eff}}$  workforce.

Fig 1:- Microstrip Line

Fig 2:- Electric field lines

A good approximation was proposed by EO Hammerstad in <sup>(6)</sup> and <sup>(7)</sup> giving the values of the effective dielectric constant  $\epsilon_{\text{eff}}$  and characteristic impedance  $Z_c$  for a microstrip line that the width is  $W$  and the height of the substrate is  $h$ . For calculation, we adopt the approximation given in equations (1), (2), (3) and (4).

In the case of  $W/h \leq 1$  :

$$\epsilon_{\text{reff}} = \frac{\epsilon_r + 1}{2} + \frac{\epsilon_r - 1}{2} \left[ \left( 1 + 12 \frac{h}{W} \right)^{-\frac{1}{2}} + 0.04 \left( 1 - \frac{h}{W} \right)^2 \right] \quad (1)$$

$$Z_c = \frac{60}{\sqrt{\epsilon_{\text{reff}}}} \ln \left[ \frac{8h}{W} + \frac{W}{4h} \right] \quad (2)$$

In the case of  $W/h \geq 1$  :

$$\epsilon_{\text{reff}} = \frac{\epsilon_r + 1}{2} + \frac{\epsilon_r - 1}{2} \left[ 1 + 12 \frac{h}{W} \right]^{-\frac{1}{2}} \quad (3)$$

$$Z_c = \frac{120\pi}{\sqrt{\epsilon_{\text{reff}}}} \left[ \frac{W}{h} + 1.393 + 0.667 \ln \left( \frac{W}{h} + 1.444 \right) \right]^{-1} \quad (4)$$

#### Modeling antenna base:-

The structure of the antenna considered as a first step will be DM sheen antenna's mentioned by P. Wang in <sup>(8)</sup>. It is a rectangular planar antenna made up of a ground plane, a dielectric substrate of permittivity  $\epsilon_r$  value of 2.2 and a rectangular patch showed. respectively, in Figures 3 and 4 and whose dimensions are showed in Table 1.

**Fig 3:-** Front face of the planar rectangular antenna base (Substrate and patch)

**Fig 4:-** Back face of the planar rectangular antenna base ( ground plane )

**Table 1:-** base antennadimensions

Greatness	Value in (mm)
L	30
W	30
$L_p$	16
$W_p$	12,45
$L_f$	4,00
$W_f$	2,46
h	0,795

The patch with dimensions  $W_p \times L_p$  is fed by a microstrip line whose dimensions are  $L_f$  and  $W_f$  selected in order to have a value of 50 Ohm for input impedance. We had choose CST MWS (Computer Simulation Technology - Microwave Studio ), as a simulation tool based on the Finite Integration Method FIT. Other methods exist , we have used in a previous work <sup>(9)</sup>, the Finite Difference Time Domain FDTD for modeling a planar antenna microstrip.

**Fig 5:-** Simulated and measured return loss  $S_{11}$  versus frequency for planar base antenna.

Figure 5 illustrates the return loss versus frequency of this antenna. Simulation results on red color are compared with measurements results referred to P. Wang <sup>(8)</sup> drawn on blue points. We find good agreement between the two results including first and second resonant frequencies of 7.6 GHz and 10 GHz. For higher frequency beyond 18 GHz a slight difference was remarked but no effect since the frequency range of the ultra wide band UWB is between 3.1 and 10.6 GHz. We can confirm and validate the method used for this study. This antenna will be improved through a parametric study to satisfy the ULB requirements set by the Federal Communications Commission FCC.

## Parametric study:-

### A. Substrate choice:-

We use a substrate with relative permittivity value of 4.6. On the other hand in <sup>(5)</sup>, for microstrip technology the characteristic impedance  $Z_c$  of a microstrip line, with  $w$  for lying on a substrate with a height  $h$ , varies versus ratio value of  $w/h$  as illustrated in Figure 6. To have a characteristic impedance matched at 50 Ohms and a substrate relative permittivity of value 4.6, the  $w/h$  ratio must be taken equal to value 1.85. So for the most common and inexpensive substrate with value height of  $h = 1.5$  mm, width microstrip line must have a value of  $w_f = 2.8$  mm which we will use for the microstrip line to feed the patch of the microstrip antenna.

**Fig 6:-** Impedance characteristic versus ratio  $w/h$  in microstrip technology for relative permittivity value 4.6

### Effect of ground plane size:-

The choice has been set for an FR-4 substrate with relative permittivity 4.6 and 1.5 mm for substrate height.

The patch of microstrip antenna has dimensions values of  $14.5 \times 15 \text{ mm}^2$  and the starting area ground plane is  $30 \times 30 \text{ mm}^2$  as mentioned in Table 2.

**Table 2:-** Starting planar microstrip antenna dimensions

Greatness	Value in (mm)
L	30
W	30
$L_p$	14,5
$W_p$	15
$L_f$	12,5
$W_f$	2,8
h	1,6

We simulate this first structure. After we change the ground plane size on reducing its length  $L_{pm}$ , as shown in Figure 7.

**Fig 7:-** Reducing the length  $L_{pm}$  of planar microstrip antenna ground plane

**Fig 8:-** Return loss  $S_{11}$  versus frequency After Reducing the length  $L_{pm}$  of planar microstrip antenna ground plane

Figure 8 shows the return loss versus frequency for four structures of planar microstrip antennas identical but whose height ground plane is different. The red curve represents return loss  $S_{11}$  versus frequency for the starting antenna with a full ground plane  $30 \times 30 \text{ mm}^2$ . The bandwidth at -10 dB in this case is [ 9,1Ghz ; 10,4Ghz ] with a width of 1.3 Ghz. The others curves show the effect of the reduction the length of the ground plane on the frequency bandwidth for planar microstrip antenna. The results are summarized in Table 3. We see that the reduction of the ground plane allows the increase of the width of bandwidth for planarmicrostrip antennas studied.

**Table 3:-** Bandwidths versus length ground plane of the planar microstrip anntenna

Ground plane width	Ground plane length $L_{pm}$	Bandwidth at -10 dB
30 mm	30 mm	1,30 Ghz
30 mm	15 mm	1,44 Ghz
30 mm	12,5 mm	3,30 Ghz
30 mm	11,8 mm	4,2Ghz and 3 Ghz
30 mm	10,8 mm	4,30 Ghz
30 mm	10,5 mm	4,25 Ghz
30 mm	10 mm	4,20 Ghz

Other hand, we see in case of ground plane length value  $L_{pm} = 11.8$  mm, Figure 9, the antenna can operate on two frequency bands . The first [3,4 GHz ; 7.6 GHz ] with width 4.2 GHz band and the second [ 8.4 GHz ; 11.4 GHz ] with width 3 GHz. In this case, this antenna can be regarded as ultra wide band UWB antenna operating in two bands of frequencies and that return loss reaches a maximum absolute value respectively 14.6 dB and 23 dB . Furthermore, this antenna has a rejection band [ 7.6 GHz ; 8.4 GHz ] .

**Fig. 9:-** Return loss  $S_{11}$  versus frequency for the length  $L_{pm}$  of planar microstrip antenna ground plane.

So reducing the length of ground plane for rectangular planar microstrip antenna, has allows us to expand bandwidth from an initial value of 1.3 GHz to 7.2 GHz. This last value is divided into two width 4,2 GHz and 3 GHz corresponding onto two operating bands .

#### Effect of the transition between the patch and themicrostrip feed line:-

In order to improve the frequency band and increase the absolute value of return loss, we modify the transition between the patch and the microstrip feed line. The passage of the rectangular shape of the patch to the linear shape of the microstrip feed line, instead of brute, will be done progressively as it is shown in figure 10.

**Fig 10:-** Shape of the planar microstrip antenna according to modification of the transition between the rectangular patch and themicrostrip feed line.

Therefore, the rectangular planar microstrip antenna having two frequency bandwidths respectively width of 4.2 GHz and 3 GHz, and with the transition between the patch and the microstrip feed line was brute, can be improved by adopting a gradual transition staircase from the patch to the microstrip feed line. In Figure 11, red curve shows the improvement in the bandwidth that becomes [ 3,1 GHz ; 18.7 GHz ], which gives a best width value of 15.6 GHz for bandwidth.

### Results:-

Comparing the return loss  $S_{11}$  versus frequency of the three structures of planar microstrip antennas shown in Figure 11, we notice a large improvement of bandwidth for final structure designed antenna on red curve.

**Fig. 11:-** Return loss  $S_{11}$  versus frequency for three antennas : starting antenna, without and with gradual transition between planar patch and microstrip feed line.

Indeed the blue curve of base antenna with area ground plane of  $30 \times 30 \text{ mm}^2$  has a width bandwidth of 1.3 GHz which increases to 7.2 GHz divided into two bands of 4.2 GHz and 3 GHz on the green curve for reducing the ground plane to  $30 \times 11.8 \text{ mm}^2$ . While the red curve shows a clear improvement in the bandwidth of the final structure of planar microstrip antenna modified by adopting a gradual transition between the microstrip line feed and the rectangular patch, which gave us a bandwidth [ 3,1GHz ; 18.7 GHz ] and a width of 15.6 GHz. On the other hand, return loss is also enhanced in maximum absolute value from 25 dB to 45 dB. This result meets the standards set by the Federal Communications Commission FCC for Ultra Wide Band UWB communications with the frequency band is [ 3.1 GHz ; 10.6 GHz ].

Other hand, Figure 12 allows comparison of antenna input impedance versus frequency for base antenna on red curve and final structure of microstrip antenna adopted on green curve. The first varied between  $12 \Omega$  and  $60 \Omega$  and the second is between  $27 \Omega$  and  $43 \Omega$  over the entire bandwidth of the antenna [3.1 GHz ; 18.7 GHz]. This stable result is obtained after reducing area ground plan and adopting a gradual transition between the microstrip line feed and the rectangular patch of final antenna.

**Fig 12:-** Antenna input impedance versus frequency for two cases, with total ground plan and second with reducing height ground plan at 11,8mm and gradual transition.

Standing Wave Ratio SWR can also allow to characterize the impedance mismatch. The ideal value of this ratio must be less than or equal to 2 over the entire antenna frequency band.

For the base antenna with area ground plane  $30 \times 30 \text{ mm}^2$ , the standing wave ratio, Figure 13, have very large values for the low frequencies and reaches a value of 15 at frequency 6.8 GHz and a value of 4 at both frequency of 4.7 GHz and 12 GHz.

**Fig. 13:-** Standing Wave Ratio SWR versus frequency for starting antenna with total ground plan dimensions  $30 \times 30 \text{ mm}^2$

**Fig. 14:-** Standing Wave Ratio SWR versus frequency for three antennas : starting antenna, without and with gradual transition between planar patch and microstrip feed line.

Figure 14, shows an improvement of the Standing Wave Ratio SWR for the final structure of the planar microstrip antenna. Indeed, the green curve shows that SWR factor remains below a value 2 over the entire frequency band [3,1GHz ; 18.7 GHz ].

**Fig. 15:-** Three-dimensional radiation diagram at the 7.8 GHz frequency of the ULB planar antenna designed

The chosen final structure of the planar antenna chosen for use in Ultra Large Band has a radiation pattern which is represented in FIG. 15 in three dimensions. At the frequency 7.8 GHz, a maximum gain of 4.6 dBi is obtained with respect to an isotropic antenna.

In FIG. 16, we represent the same two-dimensional radiation pattern in the plane E. The angle of opening of this half-power antenna ( $-3$  dB of the maximum power) is equal to 107.2 deg.

**Fig. 16:-** Two-dimensional radiation diagram of the ULB planar antenna at the 7.8 Ghz frequency in E plane (variable theta and constant phi).

### Conclusion:-

The parametric study allows us to explore the effects of reducing ground plane area and the gradual transition between the microstrip line feed and rectangular patch. This enabled us to design a rectangular planar microstrip antenna meets the requirements of the Ultra Wide Band UWB set by The Federal Communications Commission FCC. This final structure antenna can be used for breast cancer detection. For future work, performance of this antenna can be improved in matters of gain by networking this structure.

fabrication technology.

#### Abstract

Mostly Bangladesh is a flat land with average wind speed of around 3.5 m/s. However in the coastal areas wind speed reaches up to 7-9 m/s. The potential of deploying low speed wind turbines is promising. With these view, a low speed vertical axis wind turbine together with a wind generator have been designed which can work at low speed of wind available in Bangladesh. The wind turbine and wind generator have been fabricated using locally available materials and fabrication technology. The output of the generator should be 250 W and usable watts should be at least 200 W at low cost. The generator will produce power at 450 rpm. A pulley system power drive is used to rotate the generator.

*Copy Right, IJAR, 2016., All rights reserved.*

#### Introduction:-

The civilization is dependent on electric power. There is a relationship between GDP growth rate and electricity growth rate in a country [1]. It will therefore, be necessary to tap all sources of renewable energy and to use these in an efficient converted form for benefit of the people of Bangladesh. Primarily this will be done in remote inaccessible un-electrified area in a standalone system which is environment friendly and also save cost of grid expansion. This type of energy conversion will reduce pressure on the national power supply system. Generation of electricity through wind turbine, using available low speed of wind in Bangladesh is very much effective to provide electricity to the rural people. Because only 10% of these users have electricity connection and there are some parts of Bangladesh which will not get connected to the national grid within next 30 years [2]. Bangladesh Centre for Advance Studies (BCAS) and Local Government Engineering Department (LGED) with assistance from Overseas Development Administration (ODA) of UK launched the Wind Energy Study Project (WEST) Project in 1995 at seven places in Bangladesh [3]. These sites are Potenga, Cox's Bazar, Tecknaf, Noakhali, Charfassion, Kuakata and Kutudia. It was found that average annual mean wind speed in meter per second are 3.95, 3.34, 2.94, 2.96, 2.96, 4.07, 4.52 and 4.21 respectively. Later on LGED and BUET jointly studied the wind speed at 15 different places in Bangladesh. Their findings were not so satisfactory for high power wind generation. Since wind speed in Bangladesh is low, therefore low wind speed generator might be feasible. During the months starting from late October to February wind speed remains either calm or too low. This period is called lull period. The remaining seven months wind speed is quite good [4, 5] for this type of low speed wind generator. The peak wind speed occurs during the months of May, June and July. It will be an efficient way to generate electricity by using a newly designed wind generator for a low speed vertical axis wind turbine which can work at the available low speed of wind in Bangladesh. To meet the situation, a wind generator have been designed, fabricated and operated with capacity 100W- 200 W at low cost.

### Theory of wind Turbine:-

To estimate performance of a particular wind turbine [6], one should theoretically asses the matter as bellow. For total production of energy from a turbine in one year-

$$AEO = 1.64 d^2 V^3$$

Where,

AEO =Annual energy output, KW/year,

d =Rotor diameter, meters and

V =Annual average wind speed, m/s

If it is required to reduce the cost of the turbine for an energy efficient one, it is necessary to reduce the size of peak demand electrical loads.

To design a wind generator, let us consider the elementary two pole dc machine in the figure2 (A).

The polarity of the induced emf for clockwise rotation, follow Lenz's law, figure 2(b).When angle  $\theta$  (angle between magnetic axis of the stator and rotor) is zero or  $\pi$ , the voltage induced in the armature coil is zero. It is assumed that, for polarities of the field poles and direction of rotation, brush b1 always positive and brush b2 always negative.

A full pitch armature coil of one or more turns is one that spans a pole pitch. In a two pole machine a full pitch coil spans the diameter and in a P-pole machine it spans a chord that subtends an angle of  $2\pi/P$  on the armature periphery.

**Figure 2 A:-** Elementary two-pole dc machine. (a) Partial view (b) Simplified view

**Figure 2 (B):-** (a) Flux-density space wave (b) Rectified no-load voltage in a full-pitch coil.

Figure 2(B) shows the approximate flux density distribution curve for a dc machine at no load with the effect of the armature slots neglected. The armature current is zero and the flux is entirely due to the field current. Average voltage induced in the coil of a generator is given by-

$$E_{(coil)avg} = (2PN_{coil} / d n) / 60$$

Where  $E_{(coil)avg}$  = Average voltage induced in the coil

P = Number of poles in a machine

$N_{coil}$  = Number of coils

d = Flux per pole

n = Speed in rpm

### Design of wind generator:-

To generate 200 W , different parameters of wind generator have been calculated. The vertical axis wind rotor diameter is about 2M. Five to seven half circle or NACA -0018(NACA-National Advisory Committee for Aeronautics) profile, curved thin aluminum blades are being fixed vertically at the outmost diameter of the wind rotor. The rotor rotates around the vertical axis shaft which is fitted at 20 to 30 feet height. The rotor shaft is extended to the ground platform where two gears or pulleys are arranged to increase rotor RPM at 600 from 30 -40 RPM. Sixteen poles consisting of 32 permanent magnets size of Ø28mm x 6mm are used to generate 100W- 200W power. For each magnet 100 turns, 15 gauge copper wire is used around each core material. Main components of wind generator and their measurements are given in the table below-

**Table:-** Main components of wind generator and their specification.

Sl. No.	Name of the components	Diameter (mm)	Thickness/ Length(mm)	Material	Quantity (Pieces)
1	Permanent magnet	28	3	Ferro-magnet	2x16
2	Disc for permanent magnet	300	10	Nylon fiber	2
3	Disc for copper coil	382	15	Nylon fiber	1
4	Flange bush	108	30	Nylon fiber	2
5	SS shaft	20	350	SS	1
6	Copper wire for coil	16 gauge	-	Copper	-
7	Screw	6	12.7	SS	10
		6	254.4	SS	4
8	Cover	400	20 gauge	SS	Body area

### Construction of wind generator:-

A wind generator is constructed to extract energy by a vertical axis low speed wind turbine using low speed of the wind. The steps of construction are as bellow-

- The principle to construct a wind generator is, in an electrical generator, conductor cuts magnetic flux which induced e.m.f. in it.
- In the present design two discs used for permanent magnet which are rotating and one stationary disc for copper coil or winding.
- Copper coil disc is placed between two permanent magnets.
- There is flange bush in the centre of the magnet disc through which the shaft will pass. The diameter of the flange bush is 108 mm in one side and 32 mm in another side and thickness is 30 mm. It is attached to magnet disc by screw. Instead of flange bush, one can use 30 mm thick magnet disc which is costly and make the disc heavy. Another reason to use this flange bush is that, in case of any damage of the disc due to rotation, we need to change the flange bush only. Magnet disc also fixed with shaft by flange bush using screw.
- There is one coil disc between two magnet discs which contains the winding. Shaft is passed through the center of the disc but they do not touch each other. This disc is attached with cover and makes it stationery.
- The SS shaft is passed through the center of the discs. Magnet disc rotate on this axis. This shaft is coupled with the wind turbine to rotate the disc and make electricity.
- Whole arranged component system is surrounded by a cover case made of SS sheet.

### The matching procedure:-

The matching procedure of the wind rotor to the wind generator implies that the following three conditions should be satisfied-

- Field energy or cut in energy is produced at  $V = V_{\text{cut-in}}$
- Tip speed ratio remain close to  $\lambda_0$  for  $V_{\text{cut-in}} < V < V_{\text{rated}}$
- Rotor start turning at  $V_{\text{start}} < V_{\text{cut-in}}$

For the first case, when required data of the generator and the transmission are known and even for the maximum power co-efficient of the rotor (matching procedure ensures that at  $V = V_{\text{cut-in}}$  the rotor operates at  $C_{p\text{max}}$ ) this expression gives a value for  $V_{\text{cut-in}}$ . If this calculated value turns out to be higher than the value chosen in the calculation, the generator choice was wrong. We need to repeat the procedure. The simplest solution of this problem is to increase the area  $A$  of the rotor, in that case  $P_{\text{rated}}$  also increased and it should not exceed maximum power of the generator. If to increase  $A$  is not possible, higher value for  $V_{\text{cut-in}}$  has to be accepted, implying number of operating hours per hour.

In practical case for our country,

Wind velocity at which wind generator starts its maximum power output,  $V_{\text{start}} = 2.5$  m/s,

Wind velocity at which wind generator starts producing net electricity,  $V_{\text{cut-in}} = 3.0$  m/s,

Average wind velocity is defined as  $V_{\text{cut-in}}/0.7$  i.e.  $V_{\text{avg}} = 3/0.7 = 4.28$  m/s,

Wind speed at which wind generator obtained its maximum power output,  $V_{\text{rated}} = 1.5 \times 4.28 = 6.4$  m/s

To calculate area  $A$  of turbine for power  $P_a = 250$  W and  $V = V_{\text{rated}} = 6.4$  m/s using the equation of power  $P_a = 0.1AV^3$ , we get  $A = 9.53\text{m}^2$  and radius of the turbine is  $R = 1.75$  m.

So to generate 250 W power the radius of the turbine blade should be 1.75 m. The starting torque of the generator depends on the pressure of the brushes on the commutator (or on the slip rings) and on the value of the field current. It can easily be measured by means of a spring balance and a rope wound the shaft of the generator.

### Results and Discussion:-

Discussion on results obtained from the present research work is described in this section. The total result obtained from this work is aiming to provide electricity to the needy families who live in the remote corners of Bangladesh without any touch of modern development and far away from the reach of national grid. By using this generator, this group of people can turn on light to increase brightness in their daily life.

- A wind generator for a vertical axis wind turbine of 250 W generation capacity has been designed.
- This designed generator has been fabricated with the locally available low cost raw materials.

- C. The wind generator which works at low speed of wind like our country (where average wind speed is 3.5 m/s) is costly and these generators are imported. So this development of wind generator is very much helpful for local operation and production of wind turbines.
- D. This generator is suitable for producing electricity in remote areas of Bangladesh and capable to Provide electricity to full fill the demand of five to six families.

### Conclusion:-

Under this circumstances one can draw the following conclusion regarding the present research work.

- a. Life is directly depending on use of electricity and energy crisis is a threat for economical development of Bangladesh. This type of wind turbine and wind generator may be a solution of these power crisis by connecting it to the grid or using it separately in the remote areas where grid connected supply is not possible.
- b. Production cost of solar energy is 4 to 5 times greater than the production cost of wind energy. So wind energy is suitable to produce, economically viable for people of low earning group and it is also environment friendly.
- c. Unit cost of electricity produced by wind turbine is comparatively low when it is produced at a capacity of over 650 MW. As a result, in the remote areas of Bangladesh, multiple number of family can make a group for producing and dissemination of this type of energy.
- d. To give a magical touch of modernization to the people of remote areas of Bangladesh, use of renewable energy like wind energy may be a viable option.
- e. So Government and private sectors should give emphasis on wind power generation as a effective solution of power crisis in the perspective of Bangladesh.

### RESEARCH ARTICLE

#### DEFINING DRY SURFACE AREA OF RAZZAH LAKE BY USING GIS.

**Prof Zuhair Abdul Wahab Al jawahery.**

College of Engineering, University of Karbala Dec 2016

#### Manuscript Info

##### Manuscript History

Received: 15 November 2016

Final Accepted: 17 December 2016

Published: January 2017

#### Abstract

Razzah Lake is considered the second largest water depression in Iraq and Euphrates is considered the main feeder through Warar Barrage which connects it to Habaniya Lake which receives water directly from Euphrates. The drop in Euphrates water level has led to a continuous drop in Razzah Lake water level. The research involves specifying the water surface area of the lake for the period 2007, 2010, 2013 using aerial photos of the lake which lies within the administrative boundaries of Karbala Province. A GPS model has been used to locate the dry areas during these periods, It was found that the lake dry surface area during the period 2007-2010 was 175,901 sq km while the dry area between 2010 and 2013 was 53,147 sq km, that is three times more.

#### Introduction:-

Razzah Lake, is located almost in the center of Iraq as shown in Figure (1). It is within the administrative boundaries of Karbala and Anbar, it is fed with water from Habaniya Lake through Warar Barrage. Both receive water from Euphrates. Its northern part lies in Anbar Province and southern part within Karbala Province. Figure illustrates the Lake shape

**Figure 1:-** Razzah Lake relative to Iraq

Source: Internet

**Figure 2:-** Razzah Lake shape

**Source:** Internet

The surface area of Razzah Lake varies with water level. When the water level increases, the surface area increases and vice versa. Table (1) shows the surface area of Razzah Lake and the quantity of water stored on the whole Lake water level. It is noted the lowest point in the lake is 17 m at sea level and the highest level is 40m

**Table 1:-** shows storage capacity and surface area of Razzah Lake based water based on water level

1	elevation	area(km)	capacity-مليار متر مكعب

23	38	1740	22.12
24	39	1770	23.75
25	40	1810	25.75

Razzah Lake was characterized by the large number of tourist facilities (homes, tourist restaurants and complexes. tourist recreation centers)n but because water was available in large quantity. But the drop in water level led to the deterioration of these facilities

#### **Research aim:-**

The research aims to achieve the following:

- Building a model of Razzah Lake for the recent years
- Specifying the areas that suffered water recession during the three periods

### Research problem

The research problem is represented by the continuous drop in Razzah Lake water level because it is no longer receiving water from Euphrates Research procedure, The researcher relied on aerial photos for the years 2007, 2010, 2013 Of the study area, Razzah Lake as well as ARC MAP, ARC CATALOG to build area definition model.

### Research Methodology:-

The researcher adopted two methods. The first one is theoretical in which main data on GIS are given as well as giving conclusions and recommendations

#### The first Part:involves the importance of the data in GIS:-

Data are considered the backbone of GPS .A researcher described it as the blood of GIS and it represents the huge demount of data and information, Its resources are numerous and demand on it increases, there has been an increase in data entry to databases. The data lose their importance when they are old or inaccurate because they then have a negative impact on analysis results therefore GIS data and information should be given equal attention to that given to equipment and programs

Aerial photographic instruments are considered one of the main factors in the development and spread of GPS because with them we can get accurate digital images of various areas .The drawing of features can be done in two ways

#### Vector model:-

Data are represented in this model by structures of basic components called simple special components , they are (point, line and area ). They are defined digitally and the relations between them are called special or topological relations . Figure (3) illustrates patterns of these features .

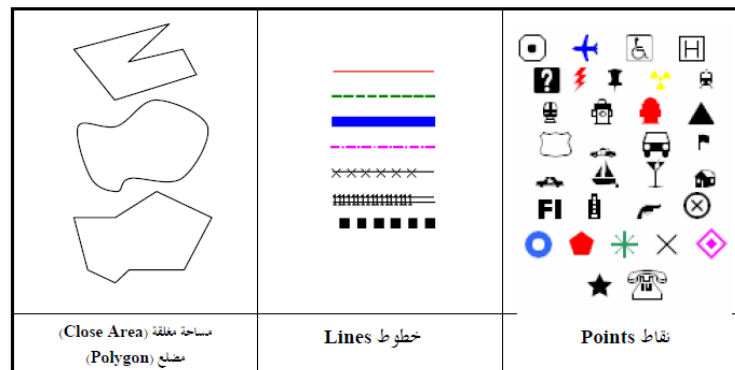

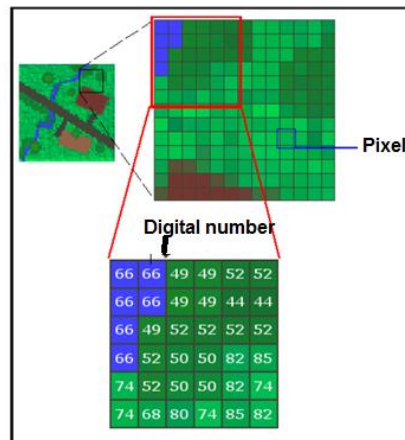

Figure 3:- Pattern of features. (point, line and area)

#### Rastor model:-

Data are represented in this model in the form of net or two dimensional matrix consisting of small cells called pixel .Each pixel has a value reflecting feature type and nature of the clarity because the pixel is the average of lighting or absorption measured electronically .The less the digital value of the pixel , the clearer the image. For example, an image with (0.5) m pixel value (the researcher has adopted this type) is which the pixel value is greater than an image in which the pixel value is 3 or 4 . Figure (4) illustrates this

**Figure 4:-** illustrates the pixel

Programs on GPS are numerous, they cover Surface, GlobalMapper, Arc. Gis which deal with spatial digital data in terms of collection, storage, analysis and exposition depending on geographical location. The researcher has adopted Arc and Gis in this research

The data sources used by GPS are of two types

1. Spatial data which cover radar data aerial images (which the researcher has adopted) as well as maps
2. Non spatial data which cover descriptive data such as tables and statistical

#### **The second part:- Building Razzah Lake model**

The researcher has used the southern part of the lake which lies within the administrative boundaries of Karbala province because aerial2020r photos are available for the years (3007.2010, 2013)

#### **Steps in building a model of study area:-**

There are several methods for building the model. Below are the steps of building the model according to one method

- 1-The photos of Razzah Lake part in Karbala province for the three years were retrieved from Arc Map, they are shown in Figure (5)

**Figure 5:-** Aerial views of Razzah Lake for years (3007. 2010, 2013)

**Sources:** The researcher

- 2- Drawing the boundaries if the water surface for each year using Arc Map as well as drawing the islands.

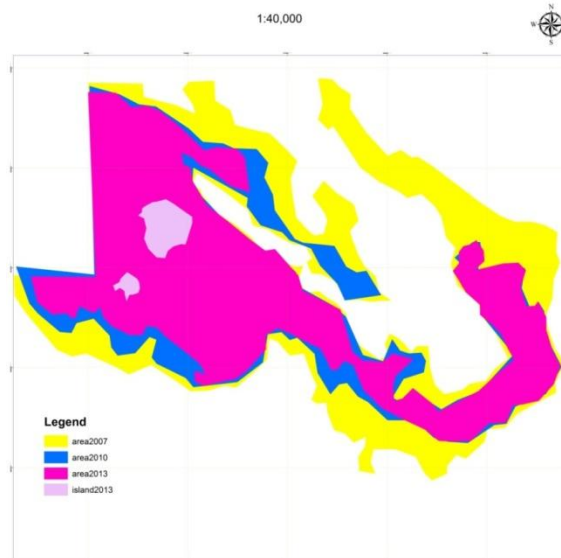

In the lake in the form of polygon. Figure (6) illustrates this where each color represents the area of water surface for each year adopted in the research

**Figure 6:-** illustrates Razzah Lake surface area for the three years

**Source :** The researcher

3-When these layers are assembled, they appear as in Figure (7) which shows the structure of these areas and the areas from which water has ebbed

**Figure 7:-** shows the structure of these areas

**Source :** The researcher

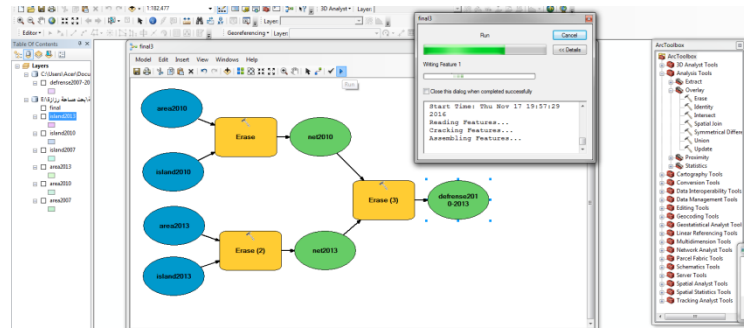

4-Stages for building water surface model .Arc toolbox was opened and a model was built for each year .This model contains the water surface and te islands in it as shown in Figure (8).The goal of this process is defining the pure area of the lake after deducting the island area from the lake total area

**Figure 8:-** shows how Razzah Lake model works

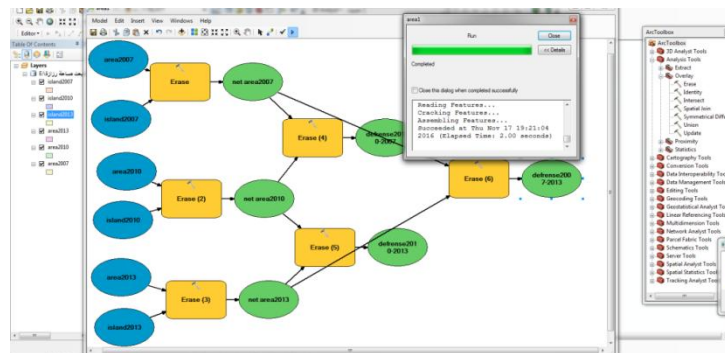

**Source :** The researcher

5-Another model was made which connects the pure areas for the years (2007, 2010, 2013) to find out the areas which suffered from water ebb as shown in Figure (9)

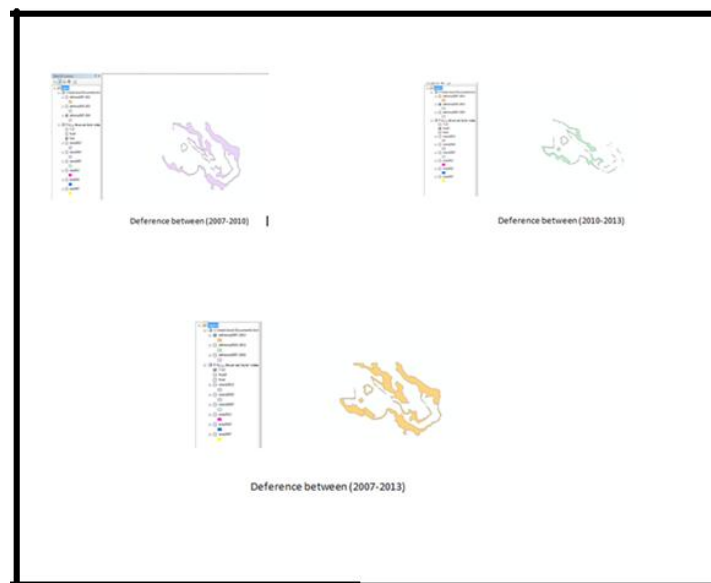

**Figure 9:-** shows how Razzah Lake model works to define the areas which suffered from water ebb  
Source : The researcher

6-After the model was run, the areas which suffered water ebb between 2007 and 2013 were calculated as shown in Figure (10) while Figure (11) shows the pure areas between each two periods

**Figure 10:-** shows how the model works between the years (2007, 2013)

**Figure 11:-** shows the pure areas from which water receded between each two periods  
Source : The researcher

7-From the data base built for model , the lake area lying within the administrative boundaries of Karbala was found for, the three years as well as the areas from which water receded as shown in Table c.

**Table 2:-** The areas from which water recede during the three years and their circumference

Area(km <sup>2</sup> )	Deference between years	Area(km <sup>2</sup> )	year
171.839	2007-2010	500.944	2007
53.137	2010-2013	329.105	2010
224.976	2007-2013	275.968	2013

Boundary(km)	year
235.866	2007
183.586	2010
156.924	2013

**Source :** The researcher

### **Third part:** Conclusions and recommendations

#### **Conclusions:-**

1. The lake surface area dropped by 35% during 2010 compared with 2007 that is 171,839 sq km
2. lake The surface area dropped by about 17% during 2013 from that of 2010. That is 53.137 sq km
3. lake The surface area dropped by about 45% during 2013 from that of 2007. That is 224,976sq km
4. The lake surface area diameter in 2007 was 235,866 km
5. The lake surface area diameter in 2010 was 183,586 km that is a drop of 23% from 2007
6. surface area The lake diameter in 2013 was 156,924,km 2010 that is a drop of 15% from 2010 that is a drop of 34% from 2007
7. After 2013, the lake surface area dropped less than in the previous years because the water quantity was low
8. Most areas which suffered water recession lie in the northern east and southern west which that these two areas have higher topography than other areas of the lake
9. Most sandstorms over Karbala are because it lie west part s in southern east of the lake
10. Recreation facilities stopped

#### **Recommendations:-**

1. It is necessary to feed the lake with water from Euphrates through Warar Barrage to improve Karbala climate and fish life and thus improve tourism
2. It is necessary that the related government bodies should provide aerial photos and specialized spatial data

Published: January 2017

#### Abstract

**Background:-** Upper respiratory tract infections (URTIs) occur most commonly among children and most of these infections are self-limiting with a very low risk of complications and its management consist of self-care and symptomatic treatment.

**Objectives:-** To examine assess parental knowledge about the antibiotic use in the treatment of childhood upper respiratory tract infections (URTIs), Saudi Arabia.

**Methods:-** A Pre-formed Self-administered questionnaire was conducted among the parents of children with URTIs of Jeddah City.

**Results:-** A total of 385 parents from Jeddah City were included, of them 325 were females. Overall, 69 members of all interviewed parents had satisfactory knowledge on antibiotic use but 316 parents which represents the majority of subjects had poor knowledge. Univariate analysis showed that female was found to be the only variable that associated with satisfactory knowledge.

**Conclusion:-** The knowledge of Parents in this study showed a poor knowledge on antibiotic use, which is significantly dependent on female gender.

#### Background:-

Antibiotics have been used for the last 70 years to treat patients who have infectious diseases<sup>(1)</sup>. Antibiotics are targeted to kill or inhibit the growth of bacteria and have no effect on viral agents. Antibiotics are among the most commonly prescribed drugs used in human medicine and can be lifesaving drugs. 50% of the antibiotics prescribed is not even necessary and it is not needed<sup>(2)</sup>.

Unfortunately, they are often inappropriately used to treat viral infections such as upper respiratory tract infections (URTIs). URTIs are usually self-limiting and resolve in the same amount of time regardless of antibiotic consumption<sup>(3)</sup>. Thus, using antibiotics to treat these viral infections is considered a misuse of antibiotics. URTIs prevalence is high between children so they are usually the group which use antibiotics the most. It is currently considered to be one of the major worldwide public health issues<sup>(4)</sup>.

The bacterial drug resistance seems to be the main problem antibiotics misuse has caused. Antimicrobial resistance is the ability of microbes to resist the effects of drugs – that is, the germs are not killed, and their growth is not stopped. The threat is real and needs serious actions from the communities and governments<sup>(1)</sup>. This misuse may be due to reasons related to: patients, parents or guardians, or the medical practitioner. Several studies have discussed

the reasons associated with antibiotics overuse. These include: attitudes, beliefs, knowledge of antibiotic use<sup>(5, 6)</sup>, behaviors (e.g. over-the-counter medication and self-medication)<sup>(7)</sup>. Patients' perceptions regarding patient-doctor interaction, patient satisfaction, and patients' experience with antibiotics<sup>(7)</sup>. It is important to assess the situation in order to solve the problem. In this paper our goal is to assess the parent's role in antibiotics misuse in children with URTIs in Jeddah city which is a big city in the WEST of Saudi Arabia. Measuring the parent's knowledge, attitudes, behaviors, and beliefs about antibiotics will help in the assessment of the situation burdens are attributable.

The overall aim of the present work was to study the parents' knowledge about the dangerous effect of excessive use of antibiotics on children with URTIs in Jeddah City.

### **Rational:-**

The intervention of antibiotics has marked an important milestone in the history of medicine. The role of antibiotics in reducing the mortality and morbidity of diseases caused by bacteria is beyond any doubt. The challenge to the medical community is to maintain the effectiveness of antibiotics. When used inappropriately, antibiotics may lose its healing power as bacteria develop resistance.

### **Objectives:-**

#### **General objectives:**

- 1- To decrease the overuse of antibiotics in Jeddah city
- 2- To decrease the incidence of super-infections in Jeddah city
- 3- To decrease the incidence of hospital Acquired infections in Jeddah city

#### **Specific objective:**

- 1- To assess the parent's knowledge, attitudes, behaviors, and beliefs about antibiotics in Jeddah.

### **Methods:-**

#### **Study design:-**

It is community based, descriptive study.

#### **Setting and data collection:-**

This survey analysis among community population was conducted in Jeddah city. A pre-formed self-administered questionnaire was distributed to Parents of children with UTRIs.

#### **Sample size:-**

Subjects were chosen according to geographical and sex distribution. Sample size was calculated based on web-site calculator, taking the total size of Jeddah population (3,976,000), confidence level (95%) and margin error (5%) to be 385<sup>(8)</sup>.

#### **Study population:-**

Parents in Jeddah city and their children had URTIs were included.

#### **Study tools:-**

The tool used was Pre-formed Self-administered questionnaire that requires information about.

- 1- Demographics including age, gender, education level.
- 2- Self-administrated questionnaire:

To assess the knowledge of parents regarding antibiotic use, including the basic concepts of antibiotics and indications for their use, methods of administration, and side effects.

**In the questionnaire patients' knowledge of anti-biotic abuse was assessed using 12 questions relating to the prescriber, course, and need of use. Then scored by assigning one point for each correct response. The anti-biotic abuse knowledge score was calculated as a continuous variable by summing the participant's number with a maximum obtainable correct score of 12 for each respondent.**

#### **Limitation of the study:-**

- This study was carried out on only 385 parents, and limitations to generalizability are inevitable.
- Samples readiness in participating.

#### **Ethical considerations:-**

Informed consent was obtained from all the participating parents in the study. Participants were made aware that they could withdraw at any time.

#### **Statistical analysis:-**

Data were entered into the Statistical Package for Social Sciences (SPSS, version 24, SPSS, Chicago, IL, U.S.A.) and descriptive analysis conducted. The results were reported as percentage (95% confidence interval). The internal consistency was assessed using Cronbach's  $\alpha$  test.

Association of respondents' characteristics with about anti-biotic abuse anti-biotic abuse hazard, was evaluated using univariate logistic regression. Results were reported showing odds ratio (OR) and 95% confidence interval. Statistical significance was accepted at  $p < 0.05$ . The dependent variables: knowledge of anti-biotic abuse risk (1 = Poor knowledge and 0 = good knowledge). The following independent variables were included: (1) age:  $\leq 30$  years, [31–30 years] and [31 $\geq$ 41 years] (2) gender: males and females; (3) level of education: Collage, High School and Middle and Elementary School.

#### **Results:-**

##### **Demographics of the studied subjects:-**

The socio-demographic characteristics were shown in Table. 1.

**Table 1. Socio-Demographic Characteristics of Respondents**

	No.	Percentage (%)
<b><math>\leq 20.00</math></b>	24	6.4
<b>21.00 - 30.00</b>	181	48.1
<b>31.00 - 40.00</b>	113	30.1
<b>41.00 - 50.00</b>	46	12.2
<b>51.00+</b>	12	3.2
<b>Mean<math>\pm</math>SD (Min.-Max.)</b>	31 $\pm$ 9 (12-60)	
<b>Female</b>	325	85.5%
<b>Male</b>	55	14.5%
<b>Collage</b>	287	75.5%
<b>High School</b>	73	19.2%
<b>Middle School</b>	14	3.7%
<b>Elementary School</b>	6	1.6%

This study included total of 385 subjects who approved to answer the questionnaire. The range of age was from 12 to 60 years with a mean 31 years old. About 6.4% of subjects were less than 20 years old, 48.1% of participants were from 21-30 years old, 30.1% were from 31-40% years old, 12.2% ranged from 41-50 years old and 3.2% were more than 51 years old.

This study included 85.5% females and only 14.5% were males.

The study population represents a highly educated group of people, with 75.5% have completed college, 19.2% completed high school, 3.7% completed middle school and 1.6% have been to elementary school.

#### **Responses to questions of knowledge assessment questionnaire (Table. 2& Figure. 1):**

**Table 2:-** Responses to questions on assessment level of awareness toward excessive use of Antibiotics:

	No	Yes
<b>Q1:</b> Do you use antibiotic for your children without the advice of a doctor?	266 (70.4%)	112 (29.6%)
<b>Q2:</b> Is fever a strong motivation for the use of the antibiotic?	249 (66.2%)	127 (33.8%)
<b>Q3:</b> Do you usually complete the course (period specified for use by a physician) of antibiotic?	117 (31.0%)	260 (69.0%)
<b>Q4:</b> Have you ever heard of antibiotic resistance of bacteria?	134 (35.6%)	242 (64.4%)
<b>Q5:</b> Do you think that the bacterial resistant to antibiotics appear in the case of non-completion of the antibiotic course?	116 (31.0%)	258 (69.0%)
<b>Q6:</b> Taking the antibiotic often described by?	<b>Pharmacist</b>	58 (15.4%)
	<b>Doctor</b>	268 (71.1%)
	<b>Person Who used it before</b>	14 (3.7%)
	<b>Self</b>	37 (9.8%)
<b>Q7:</b> What are the symptoms that makes you give your children antibiotics?	<b>Fever</b>	105 (28.3%)
	<b>Diarrhea</b>	14 (3.8%)
	<b>Tonsillitis</b>	235 (63.3%)
	<b>Rhinitis</b>	17 (4.6%)
<b>Q8:</b> what do you depend on while choosing to buy a certain antibiotic?	<b>Price</b>	8 (2.1%)
	<b>Pharmacist</b>	49 (13.0%)
	<b>Doctor</b>	273 (72.2%)
	<b>Person Who used it before</b>	20 (5.3%)
	<b>Commonly Used</b>	28 (7.4%)
<b>Q9:</b> Do you see a doctor in case of treatment failure?	36 (12.0%)	265 (88.0%)
<b>Q10:</b> What is the period in which they define treatment failure?	<b>1-3 Day</b>	68 (22.4%)
	<b>4-6 Day</b>	92 (30.3%)
	<b>1 Week</b>	144 (47.4%)
<b>Q11:</b> Do you know what are the risks and complications of using antibiotics?	93 (30.9%)	208 (69.1%)
<b>Q12:</b> Do you know that antibiotics may interfere with some used drugs?	72 (23.9%)	229 (76.1%)

**Figure 1:-** Responses to questions which corresponds to (%) of patients answered correctly.

Table. 2 indicated the response of participants to the knowledge questionnaire about the use of antibiotics. Overall, 70.4% of the parents in the study didn't give their children antibiotic without advice from doctors as well as 66.2% didn't rate fever or high temperature as a motivation for using antibiotics.

Of the 385 parents responding, 69.0% of them usually complete the antibiotic course and 64.4% of parents believed that they had good knowledge on antibiotic resistance of bacteria, and 69.0% of them thought that non completion of the antibiotic course may lead to antibiotic resistance of bacteria. The main source for parents to obtain information on antibiotic use was from physicians (71.1%), and followed by pharmacy staff (15.4%), 9.8% was self-described and 3.7% take antibiotics according to person who used it before.

In addition, when parents were asked specifically about the most serious symptoms that would have to be present in order for them to buy a certain antibiotic in the case of URIs, 63.3 and 28.3 % of symptoms were tonsillitis and fever, respectively, often accompanied by other symptoms.

The majority of subjects depend on the doctor's advice (72.2%) to buy antibiotic followed by 13.0% depend on pharmacist. Price, the persons who used antibiotic before and commonly used antibiotics were the least percentages of dependence when buying antibiotics.

If treatment failed, 88.0% of participants go to seek doctor's advice. Also most of parents define the failure period to be 1 week (47.4%), followed by 30.3% of them thought that the treatment failure period was 4-6 days and 22.4% was from 1-3 days.

Only 30.9% of parents thought that antibiotics did not cause any harmful side effects, while 69.1% were certain that antibiotics might cause many harmful adverse effects and also the majority (76.1%) know about the interference of antibiotics with other drugs.

#### **Assessment of knowledge of participants regarding to the risks of excessive use of antibiotics:**

The mean knowledge score was 7.8 out of 12 for all subjects and it was considered as poor knowledge (Table. 3). Also, 316 parents which represents the majority of subjects had poor knowledge however, only 69 had good knowledge (Figure.2).

**Table 3:-** Knowledge of participants regarding to the risks of excessive use of antibiotics

	Knowledge Score
Mean $\pm$ SD	7.80 $\pm$ 2.83
Min.- Max.	0-12
Good Knowledge ( $\geq 85\%$ )	69 (17.9%)
Poor knowledge ( $\leq 84\%$ )	316 (82.1%)

**Figure 2:-** Respondent's Knowledge about Anti-biotic Abuse risk**Association between knowledge and demographics of included participants:-**

Table. 4 showed the association between knowledge and subject's demographics. This study showed that there was no significant association between neither age nor educational level with demographic variables of the participants ( $P > 0.05$ ). On the other hand, the female gender was associated with higher levels of knowledge than males and achieved statistical significance ( $p < 0.0001$ ) association. Remarkably, females had higher levels of knowledge due to their higher interaction with their children (Figure. 3).

### Discussion and Conclusion:-

The study assessed the parents knowledge that influence the use of antibiotics in children. Knowledge and beliefs of parents were assessed using a questionnaire to study the behaviors, antibiotics adherence, seeking information, and awareness about antibiotics resistance. All of these aspects were tested in this study against a set of demographic and child health-related aspects.

Antibiotics are helpful in treating bacterial infections, but have been widely used inappropriately to treat viral infections such as most Upper Respiratory Tract Infections (URTIs) otherwise known as the common cold infection, the most common infections around the world<sup>(9-12)</sup>.

This study showed that the majority of population had poor knowledge however prevalence of higher levels of education. This study was in agreement with a recent study that was conducted at Taif City, Saudi Arabia where they found that had poor parents knowledge on antibiotic use however it was significantly dependent on parents' level of education<sup>(13)</sup>.

Comparatively, other researchers reported high level of knowledge among 60% of caregivers interviewed to assess their KAP on the same topic<sup>(14)</sup>. Also, in contrast study in Saudi Arabia showed that most parents in the study show good-to-moderate awareness about antibiotic resistance<sup>(15)</sup>; similar results have been documented in other studies<sup>(16, 17)</sup>.

The parents here in this study trusted both the physician and the pharmacist as top sources of information about antibiotic use and the least were the common use and self-administered antibiotics. In consistence with these results, this was a positive finding that parents seek physician and pharmacist advice and this can be utilized for the distribution of health education in the future<sup>(13)</sup>.

Respondents in this research ranked tonsillitis and fever as the most common symptoms that enhance them to use antibiotics. In agreement with this result, the fever was the most common symptom (80.5%) that the child suffers and make them to visit the doctors<sup>(13)</sup>. Also, other researchers reported that the main symptoms considered important and would drive parents to visit the doctor were earache (84%) and fever (81%)<sup>(18)</sup>. These findings may be highly attributed to the parents' fear of the complication associated with fever beside their lack of knowledge about fever. Parents in Taif were interviewed about their knowledge about fever, which was found to be suboptimal and nearly 38% correctly determined the threshold for defining fever<sup>(19)</sup>.

There was a significant association between good knowledge and female gender also fathers in the current study appear to have lower knowledge and beliefs about the appropriate use of antibiotics in children. This result is consistent with other studies which found that males provided more incorrect information regarding the appropriate use of antibiotics than females<sup>(20, 21)</sup>. Belongia *et al.* (2002) also found that females have better knowledge and beliefs about the appropriate use of antibiotics in children<sup>(22)</sup>.

The univariate analysis showed no association between the age and knowledge score of the participants. In contrast with our findings, Belongia (2002) found that older parents have better knowledge and beliefs about antibiotics use. Which could be associated with older parents having more years of experience with antibiotics compared to younger parents, and experience leads to better knowledge and beliefs<sup>(22)</sup>.

During this study the knowledge about antibiotic resistance and complications associated with overuse of antibiotics were good despite low knowledge score achieved by the included parents. In agreement, the antibiotics resistance is currently one of the most important growing public health issues worldwide, mainly caused by antibiotics overuse<sup>(23)</sup>. Antibiotic resistance places both the community and the individual at risk<sup>(24)</sup>. Teng *et al.* (2004) assert that the inappropriate use or the overuse of antibiotics to treat viral URTIs is one of the main reasons for the development of antibiotic resistance<sup>(9)</sup>.

### In conclusion:-

providing patients and parents with this information will help doctors to give better medical treatment without prescribing unnecessarily antibiotic treatment for URTI. Further research should focus on evaluation of parents' expectations and effective ways to educate the parent about appropriate use of antibiotics in treatment for URTI.

*A. vasica*, Immobilized cell, calcium alginate, cell growth, vasicine.

### Abstract

Immobilization have been suggested as a strategy to improve the overall productivity in plant tissue culture. Two auxin and one cytokine used to manipulate the media and the effect was studies in terms of cell growth. Secondary metabolite production was analyzed by HPLC.

The calcium alginate concentration was optimized on the basis of cell viability and cell number increase was observed in immobilized condition.

Copy Right, IJAR, 2016,. All rights reserved.

### Introduction:-

Immobilized system facilitates cell viability over an extended time for secondary metabolite production. Immobilization enables reutilization of entrapped biomass, and this technique is especially suitable for slow growing plant cells. Immobilized plant cells have been employed to perform biotransformation and reported to have higher production from suspension culture cells. Enclosure in a support material exerts certain stress on plant cells leading to restricted growth, the condition normally considered as prerequisite for higher secondary metabolite production (Brodelius, 1979).

Immobilization separates cells from medium and the desired product is extracellular, simplifying down-stream processing. Manipulation of the auxin to cytokinin ratio in the medium can lead to the development of shoots, roots, or somatic embryos from which whole plants can subsequently be produced (Haigh, 1989).

Immobilized plant cells have been employed to perform biotransformations and reported to have higher production rates than freely suspended cells. For example, immobilized Capsicum cultures treated with precursors accumulated more quantities of biotransformed compounds than freely suspended cultures (Johnson et al., 1996; Rao and Ravishankar, 2000). Immobilization techniques were initially developed to immobilize enzymes for applications in the industrial production of sugars, amino acids and pharmaceutical products (Vasilev, 2014). In an immobilized system growth and production phases can be decoupled and controlled by chemical and physical stress conditions. This allows cells to be retained in the bioreactor for extended periods, with alternating rejuvenation /growth and secondary metabolite production cycles (Williams and Mavituna, 1992).

*Adhatodavasica* Nees (Vasaka) is used in various chest infections and has reputation as an expectorant in the indigenous system of medicine. The leaves, roots and flowers are extensively used for various respiratory disorders like cough, asthma, bronchitis etc. *Adhatodavasica* has been used for centuries in India as an insecticide. Its leaves have been shown to control insect pests in oil seeds, in both laboratory and warehouse conditions (Srivastava, 1965). It provides relieves in muscular spasms, cramps or convulsions. Vasicine (peganine) is a quinazoline alkaloid (Atal, 1980). It is the active compound of A. Vasica.

## Material and method:-

### Immobilization in calcium alginate-

1 ml. of cell suspension, corresponding to 1 gm of fresh weight was added to 10 ml. of 2% sodium alginate (HI-media) and mix well to achieve the uniform distribution of cells throughout the sodium alginate solution and left for sometime to remove bubbles. This mixture was then added drop wise into 3mM calcium chloride solution through sterilized syringe under aseptic condition in Laminar airflow bench. This leads to form circular beads having diameter of 2.5-3.0 mm. Formed beads are then left in  $\text{CaCl}_2$  solution for 30 minits for stabilization. The beads were then washed with sterilized water to remove the traces of  $\text{CaCl}_2$ . Washed beads were then dispersed in 50 ml. production media in Erlenmeyer flasks in shaker cum incubator.

### Optimization of calcium alginate concentration by cell viability study:-

Immobilized cells are subjected to check the viability in calcium alginate entrapped condition. For cell viability study 5 beads are placed in 5 ml. of potassium phosphate buffer (pH 6.5) to release the cells from calcium alginate. After complete dissolution of beads the obtained suspension was centrifuge at 2000 rpm for 2 min and 1 ml. of 23.9 mM TTC (Tri phenyl tertazolumchloride) was added in separated cells in micro centrifuge tubes.

### Cell Number increase study in calcium alginate immobilized cells:-

Cell number was estimated by dissolving the randomly selected 10 beads in 10 ml. of potassium phosphate buffer (pH 6.5). After ensuring the complete dissolution of beads, the cells were counted under the microscope with cytometer.

### HPLC Quantitative estimation of Vasicine:-

The Quantitative estimation of Vasicine was analyzed qualitatively was done by High Performance Liquid Chromatography (HPLC) method (Indian Herbal Pharmacopoeia, 1998). The different dilutions of known concentration of vasicine (Provided by Laila Impex, Vijaywada) was prepared by dissolving them in methanol to get the concentration range between 10-60  $\mu\text{g/ml}$ .

### Sample preparation:-

For quantitative estimation of vasicine in immobilized cell culture, 25 ml production media was taken out from four flasks and pooled together to make it 100 ml. Which is then subjected for acid-alkali method<sup>7</sup> to extract alkaloidal fraction. At the end of process a semi solid mass was remains, was further dissolved in methanol and use for HPLC estimation.

### HPLC Standard curve for Vasicine:-

Instrument: Shimadzu, Mobile phase: Methanol: water (2:3), Flow rate: 0.7 ml/min.  
Column: Resolve C18 Spherical 5 $\mu$  (3.9 mm X 15 cm), Detector: SPD-M10 Avp.  
Wavelength: 298 nm, Retention time: 3.8 min.

## Results and discussion:-

From the above results it was observed that the immobilization of A. vasica cells in calcium alginate gel is showing promising results. 2% calcium alginate was found optimum for immobilization as it maintains higher degree of cell viability. Immobilization restricted cell number increment, which stimulates secondary metabolite productions. MS media was found suitable for more vasicine production, maybe due to higher concentration of ions and nutrient supplements, which provide necessary material for de-novo synthesis of vasicine. The above study showed that MS media supplemented with 2,4-D (2 ppm), Kinetin (0.5 ppm) and + IAA(0.5 ppm) is suitable for more vasicine production.

##### Key words:-

curcumin, Ayurveda, anti-carcinogenic,  
anti-oxidant.

#### Abstract

In India from ancient time plants are consumed as source of food and also for prevention and treatment of various diseases. *Curcuma longa* is commonly known as turmeric cultivated in Asia and some tropical countries. Its medicinal usage has been reported in the traditional systems of medicine such as Ayurveda and Homeopathy. Its constituents are curcumin volatile oil and curcuminoids etc. *Curcuma longa* is known for its colour and its health-giving properties. It possesses various medicinal properties as anti-microbial, anti-oxidant, anti-inflammatory, anti-carcinogenic etc.

Copy Right, IJAR, 2016,. All rights reserved.

#### Introduction:-

*Curcuma longa* is belonging to Zingiberaceae (ginger) family and it is a perennial herb. It is cultivated in Asia including India, China and other tropical countries. It grows to 3-5 ft long having pointed and oblong leaves, funnel-shaped yellow flowers.<sup>[3]</sup> Its root system has many rhizomes which is used as a spice known as turmeric and its medicinal extract curcumin. Rhizome is used as medicine which was introduced in Homeopathy and proved by Augustine, Arya and Balachandra. In India *Curcumin longa* has different names in different languages as Halda, Haldi, Hardee, Halad, Halede, Halada, Haldar, Aneshta, Bahula, Halud, Indian saffron, Turmeric, Lidar, Mannal, Halja, Manjal, Mancal.<sup>[4]</sup> In past it is used as aromatic stimulant and carminative while currently it is used for cough, rheumatism, sinusitis diabetic wounds, biliary disorders, anorexia and hepatic disorders.<sup>[3]</sup>

#### Geographical Distribution:-

Turmeric (*Curcuma longa* Linn. Syn. *C. domestica* Valet.) is one of the important spice crops. India is a leading producer and exporter of turmeric in the world. Andhra Pradesh, Tamil Nadu, Orissa, Karnataka, West Bengal, Gujarat, Meghalaya, Maharashtra, Assam are some of the important states cultivate turmeric, of which, turmeric can be grown in diverse tropical conditions from sea level to 1500m ASL, at a temperature range of 20-35°C with an annual rainfall of 1500mm or more, under rain fed or irrigated conditions. Though it can be grown on different types of soils, it thrives best in well drained sandy or clay loam soils with a pH range of 4.5-7.5 with good organic status<sup>[1], [12]</sup>

#### Classification of *Curcuma longa*:-

Class Liliopsida	Subclass Commelinids
Order Zingiberales	Family Zingiberaceae
Genus <i>Curcuma</i>	Species <i>Curcuma longa</i>

**Corresponding Author:-Seema V. Nayak.**

### Chemical Composition Of Turmeric:-

Turmeric contains protein (6.3%), fat (5.1%), minerals (3.5%), carbohydrates (69.4%) and moisture (13.1%). The essential oil (5.8%) obtained by steam distillation of rhizomes has *a*-phellandrene (1%), sabinene (0.6%), cineol (1%), borneol (0.5%), zingiberene (25%) and Sesquiterpenes (53%)<sup>5</sup>. Curcumin (diferuloylmethane) (3–4%) is responsible for the yellow colour, and comprises curcumin I (94%), curcumin II (6%) and curcumin III (0.3%)<sup>6</sup>. Demethoxy and bisdemethoxy derivatives of curcumin have also been isolated<sup>7</sup>. Curcumin was first isolated<sup>8</sup> in 1815 and its chemical structure was determined by Roughley and Whiting<sup>9</sup> in 1973. It has a melting point at 176–177°C; forms a reddish brown salt with alkali and is soluble in ethanol, alkali, ketone, acetic acid and chloroform,<sup>[3]</sup> the high content of bisabolane derivatives distinguishes turmeric from other curcuma species.<sup>[4]</sup>

### Uses:-

1. Turmeric (*Curcuma longa* and *Curcuma aromatica* Salisb.) has been described in Ayurveda active principle called Curcumin or diferuloylmethane, a yellow pigment present in turmeric (curry powder) has been shown to exhibit numerous activities.<sup>[9]</sup>
2. It has therapeutic as well as Chemo-preventive activity, hence it is useful in different types of cancers like duodenal tumors<sup>[25]</sup>, tongue carcinoma, colon cancer, human breast cancer cells.<sup>[15]</sup> The anti-carcinogenic effects of turmeric and curcumin helping in prevention of nitrosamine formation and hepatic detoxification of mutagens.
3. The rhizome from *C. longa* L. has long been used to reduce menstrual disorders, rheumatism and traumatic diseases, and also act as antimicrobial, insecticidal repellent and anti-feeding against some stored-product insects.<sup>[7]</sup>
4. It is also used in confectionary and food industry and pharmacy, as well as in paints and varnishes as colouring agent.<sup>[2]</sup>
5. Turmeric has potential to give luster and glow to the skin as well as vigour and vitality to the entire body.<sup>[8]</sup>
6. In *Atharvaveda* (a collection of Vedas and mantras) Haridra (turmeric) was reported as a remedial drug for graying of hair, for skin disease and for curing jaundice.

7. Turmeric powder is employed in leech therapy to detach leech from the biting site.
8. In *Rasa sastra* (Alchemy) turmeric is added in group of yellow substances (*Peethavarga*) which is used in the processing of mercury.<sup>[9]</sup>
9. It has a strong antioxidant property, hence helps in protection of free radical damage.<sup>[13]</sup>
10. It acts as anti-inflammatory agent because it lowers histamine levels.<sup>[14]</sup>
11. It protects the liver from various toxic substances such as carbon tetrachloride (CCl<sub>4</sub>), galactosamine, acetaminophen (paracetamol), and *Aspergillus aflatoxin*..<sup>[15] [18]</sup>
12. It has ability to improve circulation by preventing platelets from clumping together, which may help protect against Atherosclerosis.<sup>[16]</sup>
13. Turmeric is anti-mutagenic because it inhibits new cancers caused by chemotherapy or radiation used to treat existing cancers. It is effective against metastasis (uncontrolled spread) of melanoma (skin cancer) cells and may be helpful to inactivate the carcinogens in cigarette smoke and chewing tobacco. Curcumin inhibits HIV in test tubes, though human trials but still needed to confirm its effectiveness for treating humans with this condition.<sup>[22][23]</sup>
14. Curcumin is useful for reducing pain and stiffness in the joints. Turmeric in the diet may defend against pain from bursitis, arthritis, and tendonitis.<sup>[24]</sup>
15. Turmeric increases the production of enzymes which helps in digestion of fats and sugars and also stops cholesterol from forming gallstones.<sup>[10]</sup>
16. Turmeric is effective in the treatment of some urinary disorders such as diabetes mellitus and also useful in diabetic nephropathy.<sup>[11]</sup>
17. Turmeric stimulates the secretion of bile, acts as an anti-bacterial, eases stomach pain. Turmeric extract's effect on cholesterol levels may be due to decreased cholesterol uptake in the intestines and increase conversion of cholesterol to bile acids in the liver.<sup>[5][17]</sup>
18. Paste or fresh juice of rhizome commonly used as local application as well as internally in the treatment of snake bites, leprosy, and vomiting associated with pregnancy.<sup>[19]</sup> and smallpox and chickenpox.<sup>[20], [21]</sup>
19. 1:20 proportion of Turmeric powder with alum powders are mixed and are blown into an ear that has chronic discharge or otorrhea.<sup>[10]</sup>
20. Turmeric powder can give relief from dental problems by massaging the aching teeth which eliminates pain and swelling.<sup>[5]</sup>

### Conclusion:-

Turmeric is very powerful natural medicine. It is considered as store house of tremendous medicinal potential. It is very common in our daily life. *Curcuma longa* has ability to prevent and cure various ailments like anorexia, dyspepsia, abdominal colic, constipation, laryngitis, dry cough, dysmenorrhoea, lumbago, headache, vertigo,

conjunctivitis, toothache and anxiety neurosis, atherosclerosis etc. curcuma longa is not only use in medicinal preparation but also used in cosmetics and food industry.

#### Abstract

This paper provides the results of analysis of total, sectoral-specific, and spatial-specific multipliers and flow-on effects in Sumatera Island economy. The model employed was Inter-Regional Input-Output Model (IRIOM) developed using new hybrid procedures with special attention on Island economy. Data used for model were updated Indonesian data for the year of 2015. The results show that firstly, the important sectors of Java Island economy could be based on total multipliers and flow-on effects of output, income and employment. Secondly, important economic sectors could be based on sector-specific multipliers effects; multipliers that occurred in own sector and other sectors. Thirdly, important economic sectors could be based on spatial-specific multipliers; multipliers that occurred both in own region and other regions. Fourthly, important economic sectors could be based on spatial distribution of flow-on; flow-on effects that occurred in own region as well as in other regions.

#### Introduction:-

Diabetes Mellitus (DM), the commonest endocrine disorder. Oral diseases are common in diabetics as compared to non-diabetic's individuals. Despite the global acknowledgment of the risk of Diabetes Mellitus, diabetic patients' knowledge and attitude toward their increased risk for oral health has not been fully deal with. Oral hygiene behaviour and seeking oral health care depends on a number of factors. Lack of knowledge about dental health and conforming to better oral hygiene is among the causes for non-adherence to oral hygiene practices, economical limitations, lack of services and lack of proper counselling.

Diabetes Mellitus refers to a group of common metabolic disorders that share the phenotype of sustained hyperglycaemia affecting almost all tissues in the body including those in the oral cavity. It is associated with

aberrations in carbohydrate, fat, and protein metabolism, and results of numerous chronic complications, comprising of microvascular, macrovascular, and neuropathic disorders (4).

### Aims and objectives:-

The aim of this study is to gather baseline information on knowledge, attitude, and practices of diabetic patients regarding their oral health with the view of enhancing dental health education for them, which will help in updating their knowledge about the disease and the various oral complications and to assess their attitudes and practices toward sustaining good oral health through proper oral hygiene and regular dental check-ups.

### Material and Method:-

This study was a cross-sectional Analytic of 416 diabetic patients visiting the Prince Abdulaziz Bin Majed Diabetic Centre (PABMDC). Eligible participants will be confirmed diabetes mellitus patients who can read and write.

A questionnaire will be designed to assess the knowledge, attitude, and practices of diabetic patients along with corresponding demographic variables.

Questionnaire questions were carefully selected from relevant published reports in international journals. The questionnaire questions will be related to participants' nationality, age and gender, Type and duration of diabetes, and their awareness for systemic and oral diseases as complications associated with diabetes

The questionnaire will be piloted in 416 patients to determine its validity.

### Result:-

The majority of the subjects were Saudis 99.6%, 99.8% and diagnosed with diabetes more than 6 months ago, 62.9% male and 37.1% female with mean age of 44.91 (Table 8). 31.4% of the subjects visited the dentist in the past 12 months for fillings, 2.9% for C&B, 23.1% for restorations, 48.8% for checkup, 18.5% for RCT, 18.7% for periodontal therapy, 11.6% for dental extractions and 9% for other reasons (Table 1). And the majority of them said that Tooth brushing & toothpaste is their oral hygiene method (Table 3). 7.9% of the subjects never brush their teeth (Table 4) and 46.6% said that tooth brushing is their Health promotion priority (Table 6), 18.2% of the subjects said that the reason for not visiting the dentist more often is the difficulty in scheduling an appointment, 38% said because of high cost, 24.4% said because they forgot, 23.1% because they don't like their dentist, 28.8 because of anxiety 26.4% because of transport problems and 12.1% because they can't leave work (Table 2).

Vast majority of the subjects have gingival bleeding 99.6% (Table 5). 50.8% think diabetic more prone to oral diseases (Table 7). 50.5% of the subjects have been told by their physician about the oral problems related to diabetes (Table 9), moreover 49.2% of them think that their oral problems are because of diabetes (Table 10).

**Discussion:-**

This cross sectional analytic study of 456 diabetic patients visiting Prince Abdulaziz Bin Majed Diabetic Center (PMBADC) located in Al Madinah, Saudi Arabia. Dent Hyg said that 78.7% of the subject visited a dentist for check-up in the past 12 months and 22.2% brush their teeth twice a day and 73.6% never use dental floss, 80% visited a physician in the past year and 12.6% visited a dentist (1). While Diabetes Res ClinPract. Said 42.7% of participants reported visiting a dentist for a regular check-up, and 58.6% went to see a dentist last year. Of the participants, 95.3% brushed teeth at least once a day and 61.2% brushed at least twice a day; 34.9% flossed their teeth at least once a day and 35.3% never flossed (2).

In present study 48.8% of the subject visited a dentist for check-up in the past 12 months and 35.4% brush their teeth twice a day and 79.6% never use dental floss, 12.1% visited a physician in the past year and 26.8% visited a dentist and 28.8% brushed teeth at least once a day and 20.4% flossed their teeth at least once a day.

**Limitations:-**

We acknowledge that the sample in this study is a convenience sample which may or may not represent the diabetes population. Nevertheless, it should be noted that oral health behaviors in the present study are similar to those reported in the literature (3). There are some potential limitations in this study that should be considered when interpreting the results. First, since the study was an analytical cross-sectional study, therefore, no direct relationship between variables and outcomes can be proved. A second limitation is the potential reporting bias associated with the self-administered questionnaire with the possibility that subjects tend to over-report compliance. Also, to get some participants respond was difficult especially diabetics who are not registered in (PMBADC). Another potential limitation is the use of a lot of close-ended questions (i.e. yes/no/don't know) in the oral health knowledge test may allow participants to guess the correct answer.

**Conclusion:-**

The subjects are well aware about their diabetic Bot/ADC

Conditions and the oral effects of diabetes, on the other hand, they have near to the ground attitude and practice (behavior) toward systemic and oral health.

**Recommendations:-**

Health professionals have the opportunity to educate patients with diabetes about oral manifestations (e.g., dry mouth) and complications (e.g., periodontitis and oral candidiasis) of diabetes and to promote proper oral health behaviors. They should provide appropriate special oral care information and advice concerns related to dental hygiene. In addition to the routine education of patients with diabetes about the importance of proper oral hygiene and receiving regular professional dental care, health professionals should educate patients more about oral complications related to diabetes and measures that can be taken to prevent these oral complications such as avoiding tobacco use.

### Abstract

**Introduction:** Acquired immunodeficiency syndrome (AIDS) caused by the human immunodeficiency virus (HIV) is a major health problem in many parts of the world, and is considered as a pandemic disease [1, 2].

**Aim:** To find out the knowledge, attitudes and Practice among Taibah university students toward HIV/AIDS.

**Material and Method:** A cross sectional analytic study using an online anonymous self-administered structured questionnaire was used to collect information, there were 484 respondents to the questionnaire from students of both genders from the various colleges

**Results:** From the total of 484 respondents there were 139 (28.7%) males and 345 (71.3 %) females, The majority of the respondents 442 (97.4%) have heard About HIV/AIDS, the respondents shows an average level of KAP regarding HIV/AIDS, Positive attitudes towards HIV/AIDS were observed among 53.3% of respondents, However 82.9% said they heard condoms.

**Conclusion:** It is recommended to start HIV/AIDS Prevention Programs at Taibah University giving attention to changing attitudes and practices among students...

### Introduction:-

Acquired immunodeficiency syndrome (AIDS) caused by the human immunodeficiency virus (HIV) is a major health problem in many parts of the world, and is considered as a pandemic disease [1, 2]

HIV/AIDS is one of the fastest-spreading epidemics in the world. There are 42 million people living with HIV/AIDS worldwide, and more than half of them are adolescents. [3]

Sexual contact remains the main mode of transmission of the disease worldwide followed by intravenous drug use and perinatal transmission [4]

HIV/AIDS, Its mode of transmission is known and is easily preventable, but because of the lack of knowledge and practices about HIV/AIDS in general population causes its rapid spread. So, this study was conducted to assess and compare the knowledge, attitude and practices about HIV/AIDS among the students at Taibah University [5]

**Study objectives:-**

- To find out the knowledge, attitudes and Practice among Taibah university students toward HIV/AIDS.
- WE will share the results and try to contact with the responsible members in Taibah University to explain to them the results so they can take measures to increase the student awareness toward HIV/AIDS.

**Study Design:-**

A cross sectional analytic study using an online anonymous self-administered structured questionnaire was used to collect information using google form sent to the emails and cell phones of the students at Taibah University in El-Madinah El-Munawarah through the Deanship of Student affairs.

The sample size is using the Roasoft<sup>1</sup> sample size calculator, based on the estimate that 50% of students may have enough knowledge on HIV/AIDS. Margin of error was set at 5%, 95% confidence, and an estimated 10% drop out, our expected sample size is 415 students.

Data entry and analyses of results will be done using the Statistical Package for Social Sciences (SPSS) ver 21 for Windows software<sup>2</sup>. Descriptive statistics such as mean and standard deviation (SD) for continuous variables, and frequency and percentage for categorical variables will be determined. Inferential statistics will then be followed using parametric and non-parametric test for univariate analysis followed by multivariate analysis using logistic regression. The level of significance is set at  $p < 0.05$ .

**Sample size:-**

- 70 students of each gender from the scientific colleges at Taibah University.
- 70 students of each gender from the humanities colleges at Taibah University.
- 70 students of each gender from the different health colleges at Taibah University

**Inclusion criteria:-**

The students of the different colleges (Scientific, humanities and health) at Taibah university in El-Madinah El-Munawarah

**Exclusion criteria:-**

1. Non Taibah University Students.
2. Students of Taibah University branches (outside El-Madinah El-Munawarah)

**Ethical clearance form:-**

1. Ethical clearance will be sought before the start of the study from the Taibah University College of Dentistry Research Ethics Committee (TUCD REC)
2. Data will be collected coded and locked in a password-protected computer at the principal investigator office to ensure confidentiality and privacy of patient data.

**Statistical Analysis:-**

For the statistical analysis, the data will be used for descriptive parameters in the form of frequency, percentage means and standard deviations. Chi-square and one-way ANOVA will be used to determine the significant differences in the frequency of subjects with other variables. Pearson Correlation will be used to correlate the variables using SPSS version 21<sup>3</sup> to analyse the data. The level of significance was set at  $p < 0.05$  or  $p < 0.001$ .

**Results:-**

There were 484 respondents to the questionnaire from students of both genders from the various colleges at Taibah University

From the total of 484 respondents there were 139 (28.7%) males and 345 (71.3 %) females (Table 1)

<sup>1</sup><http://www.raosoft.com/samplesize.html>

<sup>2</sup>. [www.ibm.com/software/analytics/spss/](http://www.ibm.com/software/analytics/spss/)

<sup>3</sup>IBM SPSS Statistics IBM North America, 590 Madison Avenue, New York, NY 10022. United States, E-mail: [www.ibm.com](http://www.ibm.com)

The age of the respondents ranged between 16-39 years of age. The respondents were grouped into 5 age groups. The 16-20 years formed (27.5%) and the 21-25 years of the respondents formed the largest age group comprising of 57.9%, the 26-30 years age group formed (10.8%), the 31-35 years formed the smallest age groups consisting of (1.4%). The 36-40 years age group formed (2.5%). (Table 1)

The respondents came from three types of colleges, the Health and medical colleges, the Literary & humanitarian colleges and the scientific colleges. From the Health and medical colleges there were 123 (25.5%) respondents, while from the Literary & humanitarian colleges were 205 (42.5%) respondents and from the Scientific colleges there were 154 (31.9%) respondents (Table 1)

The respondents represented the various academic years, from the 1<sup>st</sup> of college to the 6<sup>th</sup> year of college. The first academic year students comprised of 46(10.6%) of respondents were in, the 2<sup>nd</sup> academic year were 91(20.9%), 63(14.4%) were in the 3<sup>rd</sup> year, 79(18.1%) were in 4<sup>th</sup> year, 43(9.9%) were in the 5<sup>th</sup> year, and 114(26.1%) were in the 6<sup>th</sup> year (Table 1)

The respondents who have traveled outside Saudi Arabia comprised of 200(43.9%), while the majority of the respondents 256(56.1%) respondents have not traveled outside Saudi Arabia (Table 2).

The majority of the respondents 245(53.6%) rated their health as excellent, 166(36.3%) rated their health as very good, 39(8.5%) rated their health as good, 4(0.9%) rated their health as acceptable, 2(0.4%) rated their health as poor, and 1(0.2%) rated their health as very poor (Table 2)

The majority of the respondents were not smokers, comprising of 381(83.2%) while only 77(16.8%) were smokers (Table 2)

The majority of the respondents 442(97.4%) have heard About HIV/AIDS, (Figure 1).

The majority of the respondents heard of HIV/AIDS from the TV 291(60%), this is followed by 278(57.4%) respondents who heard of HIV/AIDS from Internet, 67(13.8%) heard about HIV/AIDS from Public health officials, , 212(43.8%) have heard about HIV/AIDS from their studying, while 137(28.3%) heard about HIV/AIDS from Magazines & Newspapers , 63(13%) have heard about HIV/AIDS from the radio and 4(0.8) have heard about HIV/AIDS from Friends. Table (3)

When asked about the symptoms of HIV/AIDS, the majority of the respondents 189(39%) think that persistent fever is a of the symptoms of HIV, 173(35.7%) think loss of weight and appetite is one of the symptoms of HIV, 99(20.5%) think acute diarrhea is one of the symptoms of HIV and 199(41.1%) of them don't Know. Table (4)

When asked about the organisms that causes HIV/AIDS, the majority of the respondents 279(57.6%) think it's a virus is the causative organism of HIV , 11(2.3%) think it's bacteria, 9(1.9%) think it's a fungi , 4(0.8%) think it's a parasite and 181(37.4%) don't know. (Table 5)

When asked have heard of a condom, most of the respondents 401 (82.9%) claimed to have heard of Condoms (Table 5) When asked that a Condom is a way to prevent the spread of AIDS 87(18%) of the respondents totally agree 109(22.5%) only agree with that, 83(17.1%) neither agree nor disagree, 28(5.8%) disagreed and 177(36.6%) don't know. (Table 6)

When the respondents were asked if their knowledge of AIDS is far better when they entered the college or university" 62(12.8%) totally agree 132(27.3%) agree, 206(42.6%) disagree and 84(17.4%) said that they totally disagree (Table 7).

When asked to what extent you wish to obtain additional information and education about the basic information about AIDS, 47(9.7%) of the respondents think that there is no need for them to get more knowledge, 214 (44.2%) think that there is some need, 126(26%) think that there is only a slight need and 97(20%) think that there is a great need. (Table 7)

When asked if they think their knowledge is sufficient 23(4.8%) of the respondents believe strongly that their knowledge about HIV is sufficient, 89(18.4%) thinks it's enough, 192(39.7%) don't think it's enough, 77(15.9%) don't think strongly it's enough and 103(21.3%) answer with I don't know. (Table8)

In answer to the question "does the term HIV means the term AIDS,the vast majority 308 (63.6%) don't know, 126(26%) of the respondents think that it does, and 50(10.3%) don't think so. (Table 9).

When asked if there is a cure for AIDS the majority 272(56.2%) think there is no cure for AIDS, 43(8.9%) of the respondents think there is and 169(34.9%) said they don't know. (Table 9)

In response a question whether coughing and/or sneezing transmit HIV/AIDS, the majority 215(44.4%) answered I don't know, 200(41.3%) of the respondents said no, while 69(14.3%) said yes, (Table 9).

In response a question that pregnant women with AIDS give birth to infected child, the majority 230(47.5%) don't know, 191(39.5%) said yes while only 63(13%) said no. (Table 9)

When asked if with AIDS / HIV (AIDS) look and feel healthy, the bulk of the respondents 248(51.2%) did not think so, 189(39%) did not know and 47(9.7%) of the respondents said yes (Table9)

In response to a question can infected with HIV could show no signs or symptoms for a period of five years or more, the majority 228(47.1%) of respondents don't agree, 225(46.5%) don't know while 31(6.4%) of the respondents think that the person who is infected with HIV could show no signs or symptoms for a period of five years or more, with that and. (Table 9)

Is there a vaccine to immunize adults from AIDS, the majority 291(60.1%) don't know, 152(31.4%) think there is no vaccine and 41(8.5%) of the respondents think that there is a vaccine against HIV (Table 10)

In response to a question do you think that people with AIDS can live with their families without the spread of AIDS? 182(37.6%) don't know, 169(34.9%) of the respondents believe that the people with AIDS can live with their families without spreading AIDS, and 133(27.5%) think they can't live with their families without spreading AIDS (Table 10)

In response to a question do you think that people with AIDS can continue their education and mingle with their colleagues in schools and universities? The majority 258(53.3%) of the respondents think that people with AIDS can continue their education and mingle with their colleagues while 226(46.7%) think they couldnot (Table10)

The was majority 410(84.7%) haven't been checked for HIV/AIDS while 74(15.3%) of the respondents have been checked for HIV (Table 10)

## Discussion

This is the first study on Knowledge, Attitude and Practice of HIV/AIDS in students at Taibah University in Medina, Saudi Arabia, This study reports an average level of knowledge relating to HIV/AIDS among students of Taibah University.

The majority of the respondents were female (71%), similar findings have also been reported in similar study done in South Africa. [6]

Almost All respondents had heard about HIV/AIDS (97%), similar findings have also been reported in study done in Lao People's Democratic Republic. [7]

Only 10% of the respondents differentiate between HIV and AIDS, This is lower than similar study 81.9% done in Ethiopia. [8]

Majority of respondents 272 (56.2%) knew there is no cure for AIDS and 169 (34.9%) said they don't know, While in a similar study done in Ethiopia 90.3% of respondents knew there is no cure for AIDS.[8]

Most of the students knew that the use of condoms during sexual intercourse could prevent HIV, Similar findings have also been reported in study done in Lao People's Democratic Republic. [8]

The majority of the respondents heard of HIV/AIDS from the TV 291(60%), this is followed by 278 (57.4%) respondents who heard of HIV/AIDS from Internet, 67(13.8%) heard about HIV/AIDS from Public health officials, , 212 (43.8%) have heard about HIV/AIDS from their studying, while 137 (28.3%) heard about HIV/AIDS from Magazines & Newspapers , 63(13%) have heard about HIV/AIDS from the radio and 4 (0.8) have heard about HIV/AIDS from Friends, While in a different study conducted in Lao People's Democratic Republic their findings were (61.3%) source of information was the television, followed by the radio (25.3%). Less than one-fifth of the respondents were aware about HIV/AIDS from friends (7.7%), brochures (3.7%), newspapers (1.3%) and magazines (0.7%). [8]

## Limitations:-

Because of the restricted cultures here in Saudi Arabia, it was difficult to ask the participants about their sex activates and related question to that. Also because of that most of the student will not respond to sex related questions. However, the anonymity of the questionnaires hopefully encouraged students to be honest in their responses.

## Conclusion:-

In conclusion, the surveyed university students had an average KAPs about HIV/AIDS. The students need more information about AIDS symptoms, transmittion and how to prevent its infection. It is recommended to start HIV/AIDS Prevention Programs at Taibah University giving attention to changing attitudes and practices among students. The study reveals that most of student get their information from the TV, so there should be more TV programs about AIDS.

**Recommendations:-**

It is recommended to start HIV/AIDS Prevention Programs at Taibah University giving attention to changing attitudes and practices among students.

**Acknowledgments:**

We thank the respondents for their cooperation to answer and complete the survey and special thanks to Dr. Abdulrahman Ramadan for his effort to help me with every step.

dam setup, water quality, cyanobacteria, microcystins, trophic status.

#### Abstract

This study was conducted to monitor, and to assess the water quality of the dam "Yaacoub Al Mansour" recently filled. The monitoring program concerned the evolution of physico-chemical parameters, bacteria indicating fecal contamination, trophic status and cyanobacteria biomass with their associated toxins. This reservoir is located at 65 km southeast of the city of Marrakech and was filled in May 2008. The main role of the dam is to supply Marrakech city with drinking water.

The early occurrence of *Microcystis aeruginosa* bloom and the high microcystin concentrations measured just only two years after the set up of the reservoir Yaacoub Al Mansour show the importance to consider the control of microcystins concentrations in the surveillance. So, the bacteriological control cannot be the only indicator of water quality of reservoirs which are intended for the supply of drinking water and it is necessary to consider others parameters. Indeed, management programs of drinking water should take into account the toxicity of cyanobacterial blooms from the setup of the reservoirs to protect effectively the health of humans and animals.

#### Introduction:-

Water resources are becoming increasingly scarce due to the progression of incessant demands of the people.

In order to satisfy the increasing requirements for water, a strategy of establishing a large number of dams was adopted in Morocco.

However, after the construction of a dam, stream regimes are suddenly transformed into stagnant or lake aquatic systems. Species adapted to running water will disappear or readjust to lake conditions and will establish with the newly emerging species, a complex ecosystem in terms of relationships and interactions (Dauta, 1978; Landner and Wahlagreen, 1986). Moreover, after the filling of dams, several changes of physico-chemical, biological and microbiological water quality are induced. These changes require controls of several parameters to assess water quality and to establish a management system that will help to ensure water supply.

**Corresponding Author:- Ait Hammou H.**

Address:- Laboratory of Biology and Biotechnology of Microorganisms, Faculty of Science Semlalia, University Cadi Ayyad, BP 2 390, Marrakech 40000, Maroc.

Therefore, we conducted a water quality study of the dam «Yaacoub Al Mansour» recently filled and which will be intended to supply drinking water for Marrakech city.

We performed a bimonthly sampling from February 2009 to December 2010, to study temporal variations of abiotic parameters, bacteriological parameters, cyanobacteria biomass and microcystins concentration since the filling of the dam.

## Materials and Methods:-

### Study site and sampling:-

Yaacoub Al Mansour lake ( $31^{\circ} 11'$  North  $8^{\circ} 05'$  West) is located at 65 km south-east of Marrakech city and 20 km upstream of the reservoir of Lalla Takerkoust (Fig. 1). The dam was built on Oued N'Fis (High Atlas stream) and filled in 2008. This reservoir is characterized by a total water volume of  $70 \text{ Mm}^3$  and a maximal depth of 70 m. The main role of the reservoir is to supply Marrakech city with drinking water.

**Figure 1:-** Geographical location of “Yaacoub Al Mansour” reservoir.

From February 2009 to December 2010, water samples were performed using a Van Dorn bottle (2 L), monthly in winter and spring and bimonthly in summer and autumn, at the surface of the deep station (DS) located near to the bridge.

### Analysis of Abiotic parameters:-

Water samples were collected in 1.5L bottles to measure abiotic parameters.

Temperature and conductivity were measured using the conductivity-type WTW LF 318. pH and dissolved oxygen were measured using pH meter type WTW PH 330i and oxygen probe HANNA HI 9142 successively. Transparency was measured by Secchi disk.

Total phosphorus, total nitrogen, ammonium and chlorides were analyzed using standard methods (AFNOR, 1994).

Nitrates, sulfates and oxidisability were analyzed according to standard methods of Rodier (1984). Chlorophyll a was determined using spectrophotometric method (ISO, 1992). Total Suspended Solids is obtained by filtration on Millipore filter (0,45µm).

#### **Fecal indicator bacteria:-**

From water samples (1 liter) stored in sterile glass bottles, enumeration of Total Coliform (TC), Fecal Coliform (FC), and Fecal Streptococcus (FS), was performed according to techniques described in AFNOR (1994).

#### **Cyanobacteria abundances:-**

Cyanobacteria cells count were estimated after the fixation of 250 mL of water with 10% of Lugol's solution.

The abundance of *Microcystis aeruginosa* cells was estimated after the fixation of 10mL of water with 10% of Lugol's solution. The samples were sonicated (50 KHz during 5 seconds) to disrupt *Microcystis aeruginosa* colonies and not alter the cellular integrity (Latour *et al.* 2004). Cells were counted in a Malassez cell with an optical microscope (objective x40). The results were expressed as number of cells per liter of water.

However, the counting of other cyanobacteria species was performed according to the classical method of Uthermohl (Uthermohl, 1958).

#### **Analyses of microcystins:-**

After filtration of 1 L of water on Whatman filter Grade GF/C, the microcystins (intracellular) were extracted twice by sonication (two sets of 5 baths during 15 min) of the filter in 2 ml of 75% methanol. The lysate was centrifuged at 14 000 rpm during 15 min to remove cellular debris then the supernatant was evaporated with a concentrator (Concentrator 5301, Eppendorf, Hamburg, Germany). The extract obtained was dissolved in 200 µl of methanol 20% and stored at -20°C until analysis.

The microcystin measurements were achieved by high-pressure liquid chromatography coupled with photodiode array detection (HPLC-DAD, Agilent Technologies Waghäusel-Wiesental, Germany). The sample was pushed by a mobile phase consisting of water (A) and acetonitrile (B) (each containing 0.1% formic acid). Separation was performed with a C18(2) column (250 of 4.6mm, 5Mm particle size; Phenomenex Luna) with the following gradient: 0-2 min, 98% A; 2-12 min, 98-2% A(linear); 12-13 min, 2-98% A. Quality control samples (MC-LR) and blank runs were interspersed between the samples under investigation.

### **Results and Discussions:-**

#### **Study of physicochemical and bacteriological quality:-**

For nitrogen compounds; total nitrogen, nitrates, and ammonium successively vary between 76 and 820,9 (µg/L), 35,9 and 568 (µg/L) and 15,2 and 351 (µg/L) (table 2).

During the two years of study, temperatures of reservoir waters of Yaacoub Al Mansour vary generally between 12 and 33,2 (°C) (table 2). The pH was alkaline throughout the study period and varies between 7,08 and 9 (Table 2). Concerning conductivity, values are between 165 and 420 (µg/cm). Concentrations of total phosphorus were included between 30,9 and 312,68 (g/L) (Table 2). For nitrogen compounds; total nitrogen, nitrates, and ammonium successively vary between 76 and 820,9 (µg/L), 35,9 and 568 (µg/L) and 15,2 and 351 (µg/L) (table 2).

Chlorides and sulfates are extremely low and successively vary between 14 and 77 (mg/L) and 0,1 and 2,8 (mg/L) (Table 2). However, values of suspended matter were relatively high (between 0,01 and 2,6 mg/L) (Table 2). The oxidisability varies between 0,1 and 3,8 (mg/L) (Table 2). Moreover, dissolved oxygen values were included between 2,15 and 11 (mg/L) showing then the oxygenation of reservoir waters (Table 2).

The comparison of values of the whole physico-chemical parameters measured with Moroccan standards for raw water intended to drinking water supply (Moroccan Standards, 2008), shows that the dam Yaacoub Al Mansour has a bad water quality and this water require an intensive physical and chemical treatment.

However, the number of bacteria colonies indicating water pollution (table 2) does not exceed Moroccan standards (Moroccan Standards, 2008). In this case, water requires just a simple physical treatment to be drinkable.

The bacteriological study has shown that the raw waters of the dam Yaacoub Al Mansour are good for production of drinking water and require only a simple treatment by disinfection. Nevertheless, physicochemical analysis has shown that water requires extensive treatment because some parameters exceed the Moroccan standard for raw water intended for drinking water. This treatment includes several stages: screening, sieving, desabling, settling and pre-oxidation.

**Table 2:-** Minimum and maximum value for each physico-chemical and bacteriological parameters studied.

Studied Parameters	Minimum and maximum value
Temperature	12-33,2 (°C)
pH	7,08-9
Conductivity	165-420 (µg/cm)
Total phosphorus	30,9-312,68 (µg/L)

Fecal Streptococcus	0-20 (UFC/100mL)

#### **Temporal evolution of cyanobacteria and microcystins:-**

The autumn of the year 2009 was characterized by a significant development of cyanobacteria and a manifestation of *Microcystis aeruginosa* bloom (Maximum:  $46 \cdot 10^6$  cells/L) (Fig. 2).

This bloom appeared early just at the second year after the filling of the dam. However, the year 2010 has recorded a low development of cyanobacteria in summer (maximum:  $18 \cdot 10^4$  cells/L) (Fig. 2).

According to the World Health Organization, the presence of cyanobacteria blooms in water constitutes a high health risk and it should forbid any contact with these blooms (OMS, 2003).

Concerning concentrations of intracellular Microcystins LR (MCLR), they were very high in autumn of 2009 which corresponds to the bloom period (max:  $7,5 \mu\text{g/L}$ ). However, concentrations decreased in 2010 (max:  $1,12 \mu\text{g/L}$ ) (Fig. 2).

In all cases, maximum concentrations of MCLR for the two years exceed the standard ( $1 \mu\text{g/L}$ ) established by the World Health Organization for microcystin-LR in drinking water (OMS, 2004).

**Figure 2:-** Temporal evolution of cyanobacteria and microcystin LR at the surface of the reservoir

#### Evolution of trophic Status:-

Several authors determine the trophic status of lakes based on qualitative and quantitative characteristics of the phytoplankton population. Others were based on phosphorus, nitrogen, chlorophyll a and transparency (Galvez-Cloutier and Michelle Sanchez, 2007; Vollenweider, 1968; OECD, 1982).

Based on the OECD classification (1982) and in particular on chlorophyll a, Yaacoub Al Mansour lake has been transformed from a hypereutrophic state in the first year of its filling in (2009) to a eutrophe state in 2010 (Fig. 3).

The high degree of trophy reached by this reservoir, two years after its filling, is a surprising event especially since there is no clearly visible source of pollution on the watershed. This state would probably represent a transitory state of trophic explosion, which is related to the young and unstable nature of this ecosystem.

This situation is similar to that observed in other lakes of Morocco (Loudiki, 1990; Fqih berrada, 2001). In fact, Loudiki (1990) found that the filling of dam of hassan I has promoted an early eutrophication which is due to the simple cleaning of vegetation.

Moreover, the degradation of organic matter and the geological substrate after the setup of a dam may lead to the nutrient enrichment. Like for the dam "Petit-Saut "in France, its setup resulted a mobilization and a permanent flow of dissolved elements (Richard, 1997). Other secondary contributions of nutrient can thereafter intervene by leaching waters after rainfall (Mama, 2011).

**Figure 3:-** Temporal evolution of chlorophyll a, total phosphorus and transparency at the surface of the reservoir .

### Conclusion:-

The bacteriological study shows that the reservoir Yaacoub Al Mansour has a good water quality which can be consumed just after a simple treatment. However, temporal evolution study of physico-chemical parameters, the biomass of cyanobacteria and microcystin concentrations showed that the reservoir Yaacoub Al Mansour has a bad water quality which can never be used for drinking water supply except after an intensive physical and chemical treatment.

Therefore, only the bacteriological control cannot determine the water quality of reservoirs which are intended for the supply of drinking water and it is strictly necessary to study physicochemical parameters, cyanobacteria biomass and microcystin concentrations.

Finally, the hypertrophic state and the early occurrence of *Microcystis aeruginosa* bloom in the reservoir Yaacoub Al Mansour show the importance to apply surveillance programs immediately after the setup of dam reservoirs to protect the health of humans and animals.

### Acknowledgments:-

Microcystins analysis was carried out in the Laboratory of Microorganismes: Génome et Environnement at the University Blaise Pascal, Clermont Ferrand-France under the supervision of the project French-Moroccan: Volubilis, MA/10/239.

#### Abstract

One of the important prerequisite for the success of any service organization in general and banking sector in particular is the better Service quality. In view of this fact, service organizations require employees who give job performances that are perceived to be exceeding the expectations of the customers. With growing competition and advancement in technologies, the level of expectations of the customers increase considerably leaving no option for the service organizations but to improve and upgrade with those expectations. The efforts of the organizations would be to decrease the negative gap as much as possible between customer perception and their expectations of service quality. Existing research suggests that this gap between customer perception and their expectations of service quality was identified and presented in Gaps model by Parassuraman, et al. This gap was called as customer Gap or Expected Service-Perceived Service Gap. This Gap can be measured and estimated using SERVQUAL instrument also proposed by Parassuraman, et al. The study uses the SERVQUAL instrument to measure the Expected Service-Perceived Service Gap in private and public sector banks in Jammu and Kashmir. The data was collected from 1000 customers (500 each) of private and public sector banks located across Jammu and Kashmir. Reliability and validity tests were conducted followed by basic descriptive statistics. The gap score was calculated and their significance was tested using t-test. The gap score was used to test the proposed hypotheses. The results of the study reveal that the average customer gap score is more in public sector banks as compared to the private sector banks in Jammu and Kashmir

#### Introduction:-

The banking sector in India has grown tremendously over a past decade. This growth has also been witnessed in the state of Jammu and Kashmir, as many private players have entered the state and are competing with the incumbents like Jammu and Kashmir bank and State Bank of India. After globalization, the operating environment for the banking sector has turned more dynamic and competitive. In order to search and maintain the competitive advantage, the banking industry is placing more focus on service quality as it has become an important competitive advantage in almost all industries (Albrecht and Zemke, 2001). It has been considered as the most researched

concept in the service marketing because of its relationship with various outcomes. (Baron et al., 2009). According to Crosby (1979), the service quality has is supposed to have relationship with the costs. Bolton and Drew (1991) relate service quality with customer retention whereas Cronin and Taylor (1992) highlight the relationship of service quality with customer satisfaction. Rust and Zahorik (1993) relate it with the profitability and Stodnick and Rogers (2008) with positive word-of-mouth. In market place, as the banks compete generally with undifferentiated products, service quality becomes a key competitive weapon. Banks with high quality service can possess distinct marketing edge in terms of higher revenues, increased cross-sell ratios, higher customer retention (Bennett and Higgins, 1988). This ultimately leads to expanded market share (Brown and Hedges, 1993). As traditional and non-traditional financial institutions have adopted fierce marketing strategies, this has resulted in decline of customer loyalty. (Beckett et al., 2000, Wisner and Corney, 2001, Caruana, 2002, Corelli, 2002, Estell, 2002 and Humenick, 2002). Hence, attracting new customers has become equally important as retaining existing customers (Wisner and Corney, 2001; Jones et al., 2002). As a result, it is vital and important for banks to understand the various dimensions of customers' perception of banks' service quality. Furthermore the demand for more personalized products or services compels the banking industry to be more responsive in order to meet the expectations of the customers. In order to achieve this desired service quality, the performance of the employees in general and contact employees in particular need to be effective. The employees should be enough motivated to give desired performance. Thus organizations are consistently putting efforts to match the actual perceptions of the customers with their expectations of service quality and reduce the possible negative gap if any between them. It is in this context that the present study aims to explore the perceptions and expectations of customers regarding service quality in public and private sector banks and analyse the possible gaps between perception of service quality and expectations of the service quality in the state of Jammu and Kashmir.

### Literature Review:-

Literature on the service quality reveal that many researchers have termed service quality an 'elusive' and 'indistinct' construct that is difficult to define and measure (Parasuraman et al., 1988; Bolton and Drew, 1991; Carman, 1990; Cronin and Taylor, 1992). According to Baron et al. (2009), service quality is a highly abstract construct as compared to the goods quality, where technical aspects of quality are apparent. Furthermore, Clewes (2003) claim that finding an appropriate definition of service quality an unresolved issue in area of service marketing. Researchers have made attempts to define quality as one of the earliest definitions of quality was put forward by the Crosby (1979). He defines quality as: *"the conformation to specifications."* Crosby (1979) further states that quality is often mistaken for some imprecise adjectives like "goodness, or luxury or shininess or weight". These adjectives are illustrating the indefinable nature of the construct. However, Lewis and Booms (1983) were one of the first to define quality in terms of services. They define service quality as *"a measure of how well the service level delivered matches customer's expectations."* (Gronroos, 1984) defined service quality as follows *"the perceived quality of a given service will be the outcome of an evaluation process, where the consumer compares his expectations with the service he perceives he has received, i.e. he puts the perceived service against the expected service. The result of this process will be the perceived quality of the service."*

Parasuraman et al. (1988) developed this definition and argue that *"service quality stems from a comparison of a consumer's general expectations with their actual perceptions of a firm"* Consequently, service quality can be measured by how much the service provided to consumers exceeds their expectations (Lovelock and Wirtz, 2011). For the purpose of the study, the definition put forward by the Parasuraman et al. (1988) was used and service quality was defined as *"the ability of the organization to meet or exceed customer expectation in terms of what they feel a service provider should offer rather than would offer"*

### Models and Measures of Service Quality:-

Researchers over the period of time have recognized the need to develop valid measures of service quality. This has lead to the development of many measures service development in the past few decades. In service marketing literature, different models have been developed to find the different determinants of the service quality concept. Gronroos (1984) proposed technical and functional quality model that state that customers compare their expectations to their experience of service quality in forming their judgments. Parasuraman et al., (1985) proposed GAP model that define the service quality as a difference between expectation and performance. If expectations are more than performance, a gap is formed which in turn results from other four Gaps. This exploratory research was refined with their subsequent scale named SERVQUAL for measuring customers' perceptions of service quality (Parasuraman et al., 1988). Attribute service quality model given by Haywood-Farmer (1988) focuses on meeting the expectations of the customers regularly. According to this model a service organization has "high quality" if it

meets customer preferences and expectations consistently. Cronin and Taylor, (1992) gave performance only model that the service quality with consumer satisfaction and purchase intentions. The authors suggest that the perceptions are better predictor of service quality and the expectations are difficult to conceptualize. They authors thus developed performance only measurement of service quality called SERVPERF. They maintained that Performance instead of "Performance-Expectation" determines service quality and service quality is evaluated by perceptions only without expectations. Internal service quality model proposed by Frost and Kumar, (2000) uses Gaps model of Parasuraman et al. (1985) to develop an internal service quality. The model thus identifies three internal Gaps. Internet banking model (Broderick and Vachirapornpuk, 2002): The authors tests the service quality model of internet banking. The model suggests that five key elements in the context of the internet influence the perceived service quality. These key factors are: customer expectations of the service, the image and reputation of the service organization, aspects of the service setting, the actual service encounter, and customer participation.

These were few of the service quality models and measures which has considerable acceptance in the academic circles. However, one of the most popular measures of service quality widely accepted and used by academicians and researchers is SERVQUAL, originally developed by Parasuraman et al. (1985, 1988, 1990, 1991, 1994). According to Brown and Bond (1995), the GAPS model of the Parasuraman et al. is one of the best received valuable contributions to the service marketing literature. This pioneer study of Parasuraman et al. (1985) is regarded as major driving force in developing an increased understanding of service quality (Gerrard and Cunningham, 2001). The current study has used the SERVQUAL as a measure of service quality in banking sector and thus for evaluating the Customer Perception-Customer Expectation Gap.

#### **SERVQUAL Model:-**

Among the general instruments of service quality, the most popular instrument is SERVQUAL, which has been used to measure the service quality in variety of banks in original (Dedeke, 2003; A. 28 Hassan Al-Tamimi and Al-Amiri, 2003; Furrer et al, 2000; De Ruyter et al, 1999; Cowling and Newman, 1996; Kwan and Tan, 1994) as well as adapted versions (Adlaigan and Buttle, 2002; Othman and Owen, 2001, 2002; Bahia and Nantel, 2000; Kangis and Voukelatos, 1997; Teas, 1993). ). Many researchers consider a stream of research initiated by Parasuraman et al (1985) the most comprehensive investigation in the field of service quality. According to Parasuraman et al (1985), service quality is a function of three attributes i.e. pre-purchase customer expectations, perceived process quality, and perceived output quality. The researchers propose that consumers evaluate both the process and the outcome of the service received. SERVQUAL scale consists of 22-items spread over five dimensions, each item measuring two statements:

- (i) Customers expectations of service quality, and
- (ii) Customer's perceptions of the service they actually received.

According to Parasuraman et al., the content of the 22-items making up each dimensions of SERVQUAL was assessed and following labels and brief definitions for the five dimensions were suggested:

- i. **Tangibles:** Physical facilities, equipment, and appearance of personnel.
- ii. **Reliability:** Ability to perform the promised service dependably and accurately
- iii. **Responsiveness:** Willingness to help customers and provide prompt service
- iv. **Assurance:** Knowledge and courtesy of employees and their ability to inspire trust and confidence
- v. **Empathy:** Caring, individualised attention the firm provides to its customers

Parasuraman et al, (1985 &1988) suggested that the difference between customers' expectations of a service provider's performance and their evaluation of the services they have received will determine the service quality. According to Zeithaml et al, (1993), customers' expectations are beliefs about a service. Those beliefs act as standard against which service performance is judged. Parasuraman et al. (1988) state that customers' expectations are what customers think a service provider should offer rather than an actual offer. Thus,

$$\text{Service quality} = f(\text{Perceptions} - \text{Expectations})$$

On the basis of the above equation, Parasuraman et al, developed and proposed the SERVQUAL instrument as a reliable, valid, and generalizable way to measure the service quality construct. As service quality has been defined as difference between a customer's expectations and the perception, a gap is formed if the perception falls short of the expectations. This Gap results due to size and direction of four other Gaps associated with delivery of service quality on the marketer's side (Parasuraman et al, 1988). These five Gaps visualized by the authors are as under:

- Gap-1: Difference between consumers' expectation and management's perceptions of those expectations, i.e. not knowing what consumers expect.
- Gap-2: Difference between management's perceptions of consumer's expectations and service quality specifications, i.e. improper service-quality standards.
- Gap-3: Difference between service quality specifications and service actually delivered i.e. the service performance gap.
- Gap-4: Difference between service delivery and the communications to consumers about service delivery, i.e. whether promises match delivery
- Gap-5: Difference between consumer's expectation and perceived service.

The Gap-1 is referred as Consumer Expectations-management Gap. This Gap is discrepancy between what customers expect and what management perceived that they expected. The Gap-2 is referred as the Management Perception-Service Quality Specification Gap. This Gap is the result of the difference between manager's perceptions of customers' expectations and the actual standards they set for service delivery. The Gap-3 is referred as the Service Quality Specifications-Service Delivery Gap. This Gap is due to the difference between service specifications and the actual service delivery. The Gap-4 is referred as Service Delivery-External Communications Gap. The Gap is due to the difference between what a firm promises about a service and what it delivers. These four Gaps contribute to the Gap-5 which is referred Expected Service-Perceived Service Gap. This Gap is the result of the discrepancy between customers' expectations and perceptions of service quality. The fifth Gap is the basis of the SERVQUAL instrument which is used to measure the difference between consumers' expectation and consumers' perception of the service received. Parasuraman et al. (1988), state that the magnitude of the gap between expectations and perceptions decide the level of the perceived service quality. They believe that the smaller the gap, the higher the level of perceived service quality. When expected service exceeds perceived service, quality is less than satisfactory and the level of gap is negative. When expected service equals perceived service, perceived quality is satisfactory and the level of gap is zero. When perceived service exceeds expected service then service levels are more than satisfactory and the gap is positive. This positive gap depicts that the more than satisfactory service levels is tending towards customer delight.

#### **Empirical studies on Gap Analysis and Service Quality:-**

Numerous empirical studies have been carried out on the Gap analysis and service quality by various authors. Gautam, S and Singh, A (2014) in their study entitled as 'To Identify Service Quality Gaps in Banking Sector: A Comparative Study of Public Sector Banks and Foreign Banks' examined service quality gaps in public sector and foreign banks in India. The sample size for the study was 150 and the study was carried out in NCR. The results of the study revealed that the service quality gap in public sector banks is more than private sector banks. Jain, V, Gupta, S and Jain, S (2012) studied "Customer Perception on Service Quality in Banking Sector: With Special Reference to Indian Private Banks in Moradabad Region". The authors investigated the customer perception regarding service quality and explored different dimension of service quality in banks. The study was conducted in Moradabad and sample size taken was 100. SERVQUAL instrument was used and the analysis revealed that all the dimensions of the service quality are equally important in private sector banks. Singh, SP and Khurana, S (2011) examined gender wise customer's expectations and perceptions of service quality in their study entitled as "Analysis of Service Quality Gap and Customers' Satisfaction in Private Banks. The study was conducted in Hissar District and the sample size taken was 300. The study used the quota sampling technique and SERVQUAL as an instrument was used. The study identified the difference in expectation & perception of service quality of male & female customers. The results of the study reveals that the customer's perception of service quality was below their expectations in private sector banks in Hissar. Roy, R, Vijayanathi, P and Shreenivasan K (2011) in their study entitled as 'Service Quality Gap of Foreign Banks in India using PZB Service Quality Model – an Empirical Study' investigated various factors that contribute to the customer satisfaction in Foreign Banks in India. The study was conducted in Tamil Nadu and the sample size for the study was 275 customers. The dimensions of the SERVQUAL were used to analyse and measure the 5 Gaps proposed in the Gaps Model. The results of the study revealed that only first three gaps were prominent and foreign banks should focus on bridging those gaps in order to survive in Indian setting. A. Ananth, A, Ramesh, R and Prabakaran, B (2010) in their study entitled as "A Service Gap Analysis in Private Sector Banks- an Empirical Study of Customers' Expectations vs. Perceptions" investigated the service quality in various private sector banks. The study identified the gap between customer perception and expectations of service quality. The study used the dimensions SERVQUAL along with the one more dimension namely accessibility. The results of the study revealed that empathy variable of the SERVQUAL shows wider gap between customer perception and expectation. Furthermore, the multi-regression

analysis shows that Reliability, Assurance and Empathy positively influence the service quality in banking sector. Ravi K. Dhar and Silky Vigg Kushwah (2009) in their study on 'Service Quality Expectations and Perceptions of Public and Private Sector Banks in India: A Comparative Study' investigated the difference in perception and expectations of service quality among customers of private and public sector banks. The study also identifies the factors that influence those perceptions and expectations of the customers regarding service quality. The study was conducted in Madhya Pradesh and the sample size of the respondents was 400. The results of the study revealed that there exist a significant gap between perceptions and expectations of customers regarding service quality in both private and public sector banks. Mengi, P. (2009) conducted a study on 'Customer satisfaction with service quality: An empirical study of public and private sector banks'. The study was conducted in Jammu region of the state of Jammu and Kashmir. The service quality was measured using dimensions of SERVQUAL instrument. The results of the study revealed that the customers of public sector banks perceive better service quality as compared to the private sector banks in Jammu. Chawla, S., & Singh, F. (2008) investigated and measured service quality in life insurance companies in their work entitled as 'service quality perceptions of life insurance policyholders in northern India: Pre-privatization vs. post-privatization'. The aim of the study was to identify the service quality dimensions affecting satisfaction levels of the insurance policy holders. The study was conducted on 210 policyholders located in northern India. The results of the study revealed that accessibility dimension has a higher mean satisfaction compared with mean satisfaction of reliability and assurance dimensions. The results further highlighted the comparison of overall mean satisfaction of the customers and revealed that the policyholders who had purchased insurance policies before privatisation had a higher mean score compared with the policyholders who purchased insurance policies after privatisation. Brahmabhatt, M and Panelia, D (2008) examined and measured the service quality and customer satisfaction in their study "An Assessment of Service Quality in Banks". The study investigated the service quality in private, public and foreign banks. The study was carried out in Ahmedabad and Gandhinagar and the sample size taken was 246. The result of the study revealed that the foreign banks surpass the public and private sector banks in providing the better service quality. The customer gap is less in foreign banks as compared to private and public sector banks. Rohini, R. (2006) in her study 'Service quality in Bangalore hospitals - An empirical study' analysed the service quality perception in 5 hospitals. The study was conducted in Bangalore and the sample size of the study was 500 patients and 40 management personnel. SERVQUAL was used as a measuring instrument of Gap 1 and Gap 5. The results of the study revealed that there exists a service quality gap between patients' perception and patients' expectations. Furthermore the study also revealed that there also exist a gap between managements' perception about patients' expectations and patients' expectations of service quality. Hinson, R, Mohammed, A and Mensah, R (2006) conducted a comparative analysis of service quality across three banks in their study "Determinants of Ghanaian Bank Service Quality in a Universal Banking Dispensation". The aim of the study was to identify the most important dimensions that contribute most to the service quality. The study was carried in Ghana and sample size for the study was 250. The study used the SERVQUAL model and the results revealed that all the dimensions of the model significantly contribute in predicting service quality in Ghanaian bank in Ghana. Gudep and Elango (2006) in their study on 'the service quality and customer satisfaction amongst the private, public and foreign banks in India' analysed the difference in service quality between three banking sectors in India. The results of the study suggest that the private sector banks and foreign banks are well ahead in providing better service quality then public sector banks. In the light of the above reviewed studies, it is clear that very few studies have focused on comparative analysis of service quality perception and expectation of customers of private and public sector banks in India. Further extent of research in Jammu and Kashmir is very dismal and only one study of Mengi, P. (2009) is available in the subject that has been carried out in Jammu. It is against this backdrop, the present study has been conducted with a view to investigate the comparative analysis of customer Gap between private and public sector banks in Jammu and Kashmir.

### **Research Methodology:-**

The study was conducted using convenience sampling technique. Public and private sector banks in Jammu and Kashmir were selected for the purpose of the study. The questionnaire was administered on customers of those banks.

### **Sampling Frame and Method:-**

The sampling frame consisted of the customers of the private and public sector banks in Jammu and Kashmir. The private sector banks that were the units of the study were Jammu and Kashmir Bank and HDFC Bank. As for as the public sector banks were concerned, State Bank of India and Punjab National Bank were taken as the units of the study. Data was collected from customers through the questionnaire administered personally. A cover letter was accompanied with the questionnaire, which sought consent from the respondents for participating in the study. The

letter gave an introduction of the study and the researcher, ensured confidentiality and communicated that the data would be used for academic purposes only. The questionnaires were distributed to 500 customers of public sector banks and 500 customers of private sector banks. All the distributed questionnaires were received and were usable.

#### Instruments:-

The data collection method used to collect the primary data for this study consisted of SERVQUAL instrument. The service quality instrument consisted of 22 items covering 5 dimensions. The scales were properly reviewed to make them more readable and comprehensive.

#### Pre-testing:-

A pilot test was also conducted on customers of Private and Public sector banks. The SERVQUAL questionnaire was distributed among 100 customers of those banks (50 in each sector). After giving them brief introduction of the objective of the study, the respondents were asked to respond to the questionnaire and comment on any modifications needed.

#### Pre-Analysis data screening:-

Before submitting the dataset for final statistical analysis, each collected questionnaire was individually checked for preliminary analysis to evaluate missing data, incorrect data and outliers. The data was first checked for presence of outliers. The critical value at  $p < 0.001$  for chi squared with 5 independent variables for service quality is 20.52. Hence cases with Mahalanobis distance greater than 20.52 in case of service quality would be multivariate outliers. On inspecting the results it was found that there was no case with value greater than the critical value of 20.52 for  $df=5$  in case of Service Quality, signifying that no outliers existed amongst the data collected. All the collected cases were hence fit for further statistical testing. The extreme Mahalanobis values with case numbers are presented in Table 1.

**Table 1: Table of Extreme Values of service quality**

			Public Sector Banks		Private Sector Banks	
			Case Number	Value	Case Number	Value
Mahalanobis Distance	Highest	1	12	18.34553	11	19.67554
		2	125	18.12212	122	19.60012

		3	34	3.118291	312	4.610082
		4	23	3.421211	112	5.410078
		5	311	4.219872	301	5.610933

Shapiro-Wilk's test ( $p > .05$ ) (Shapiro & Wilk, 1964 ; Razali & Wah, 2011) as shown in Table 2 was conducted on the variables of the study to test for normality. The results of the test showed that the p value of all the variables were above the critical value of 0.05 indicating that all the variables of the study were approximately normally distributed.

**Table 2: Results of Shapiro-Wilk Test (Service Quality)**

	Shapiro-Wilk Public Sector Banks			Shapiro-Wilk Private Sector Banks		
	Statistic	Df	Sig.	Statistic	Df	Sig.
Tangibility	.911	500	.305	.919	500	.576
Reliability	.932	500	.193	.925	500	.621
Responsiveness	.937	500	.442	.933	500	.451
Assurance	.952	500	.512	.941	500	.453
Empathy	.972	500	.508	.954	500	.565

The internal consistency of the instruments was also tested by Cronbach Alpha. The reliability coefficients of the constructs of the service quality were 0.908. Each construct exceeded the 0.70 benchmark recommended by Nunnally (1978). The Cronbach Alpha scores indicated that all the scales were internally consistent and the scale

items measured the constructs the way they are intended to be measured. The results of the Cronbach Alpha test is presented in Table 3

**Table 3: Cronbach Alpha Coefficients of Test Instrument**

Instrument	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	No of Items
Service Quality	.908	.908	22

Furthermore item-to-total correlation test was also applied to check the consistency of the scale. Corrected item-to-total correlations were calculated for each item of service quality construct. It was observed from the results of the test that all the correlation coefficients of the items of service quality constructs were above the benchmark level of 0.30 (Cristobal et al., 2007) and hence were consistent. The results of the test are presented in Table 4

**Table 4: Results of Item-to-total Correlations for Service Quality**

	Public Sector Banks			Private sector Banks

Employees of these firms should/will not be expected to know customer needs.	.627	.801		.710	.819	
It is unrealistic to expect these firms to have their customer's best interest as its objective.	.810	.721		.617	.699	
They should/will not be expected to have convenient business hours for all clients.	.712	.771		.521	.711	

**Objectives of the study:-**

1. To examine the customer expectations and perceptions of service quality in private sector banks
2. To examine the customer expectations and perceptions of service quality in public sector banks
3. To study the gap between the customer perception and expectation of service quality in public sector banks.
4. To study the gap between the customer perception and expectation of service quality in private sector banks.
5. To compare the service quality gap between private and public sector banks

**Hypothesis:-**

- H<sub>0</sub>1: There is no significant difference in perception of customers of private and public sector banks
- H<sub>0</sub>2: There is no significant difference in expectations of customers of private and public sector banks
- H<sub>0</sub>3: There is no significant difference between customer perception and expectations of service quality in private sector banks
- H<sub>0</sub>4: There is no significant difference between customer perception and expectations of service quality in public sector banks
- H<sub>0</sub>5: There is no significant difference in Gap-1 between private and public sector banks.

**Data Analysis:-**

It begins with presenting the demographic profile of the respondents followed by the basic descriptive analysis. Finally the difference in customer perception and expectations of service quality in private and public sector banks was evaluated to test the proposed hypotheses.

**Demographic information of the sample:-**

The detailed demographic profile of the respondents of the study is presented in Table 5.

**Table 5: Demographic Characteristics of the Sample**

Demographic Characteristics	Private sector Banks (HDFC+JK BANK)		Public sector Banks (SBI+PNB)	
	Frequency	Percentage	Frequency	Percentage
<b>Gender</b>				
Male	355	71%	340	68%
Female	145	29%	160	32%
<b>Years of association with bank</b>				
3-5 years	110	22%	50	10%
5-8 years	230	46%	140	28%
8-10 years	100	20%	115	23%
>10 years	60	12%	195	39%

**Descriptive statistics:-**

The details of the descriptive statistics are presented in the Table 6

**Table 6: Descriptive Analysis of Service Quality Factors**

It is seen from the Table 6 that the Mean score of the various items of the SERVQUAL variable Tangibility in private sector banks are close to the score of 4 whereas in case of public sector banks the value is close to 3

depicting that the perception of customers towards Tangibility is satisfactory in private sector banks as compared to the public sector banks. The mean score of the various items of the variable Reliability in private sector banks are again close to 4 as compared to public sector banks where the values are around 3.5, thus depicting the satisfactory perception of the customers regarding the Reliability of the private sector banks as compared to public sector banks. The mean score of the items of the variable Responsiveness in private sector banks are also close to 4 as compared to public sector banks where the values are either close to 3 or around 3.5. Finally, the mean score of items of Assurance and Empathy in private sector banks are also close to 4 as compared to the private sector banks where it round around 3 and 3.5. This can be further interpreted from the average mean score of all the 5 variables as presented in Table 7

**Table 7: Descriptive Statistics of SERVQUAL variables – Perception/Expectation questionnaire**

	N	Private sector banks				Public sector banks			
		Perceptions		Expectations		Perceptions		Expectations	
		Mean	Std. Deviation	Mean	Std. Deviation	Mean	Std. Deviation	Mean	Std. Deviation
Tangibility	500	3.9242	0.26102	4.6176	0.51738	3.3987	0.66877	4.4461	0.51850
Reliability	500	3.8348	0.32576	4.5166	0.76856	3.6521	0.69743	4.7291	0.70385
Responsiveness	500	3.9332	0.32934	4.5761	0.59960	3.6262	0.59324	4.6813	0.63720
Assurance	500	3.9373	0.32192	4.2981	0.57710	3.6191	0.69270	4.5662	0.63351
Empathy	500	3.8745	0.33364	4.2237	0.70204	3.6660	0.74187	4.6491	0.77752

As seen from the Table7 the average mean score of all the 5 variables in private and public sector banks reflect that the customers are less satisfactory about all the variables of the SERVQUAL in public sector banks as compared to the private sector banks meaning thereby that they feel public sector bank are less responsiveness and their physical facilities also need to be attractive and modern as compared to private sector banks where the customer perceive them more responsive to their needs and appearances of their contact employees are more appealing and their physical facilities are modern. Furthermore the customers of the public sector banks perceive those banks less dependable, less accurate, and less courteous, lacks the ability to pay individual attentions and care. Whereas the customers are somehow satisfied with the accuracy, courtesy and care in private sector banks. The perception mean score of various items of the all 5 variables in Table 6 and average Perception mean score of those variable represented in Table 7 reveal that customers have high expectations from those banks. The results of the basic descriptive analysis provide us the basic understanding of the customer perception and expectation towards various dimensions of the service quality in both types of banks. The results in no way makes us to conclude which type of bank is better in terms of the dimensions of the service quality, that can be actually inferred after evaluating the Gap between customer perception and expectation of service quality in both private and public sector banks. The lower value of perceptions mean score may not be so matter of concern if its expectations mean score is also not so high thus may not have much wider perception-expectation gap. Whereas higher value of perception mean score may be needed to get further better if the corresponding expectation score are far higher thus having much wider gap between customer perception and expectation of service quality. Thus it becomes important to evaluate the perception-expectation gap in order to conclude the performance of service quality.

#### **Hypotheses Testing using Gap analysis and T-test:-**

**Hypothesis 1:** *There is no significant difference in perception of customers of private and public sector banks*

The null hypothesis 1 that there is no significant difference in perception of customers of private and public sector banks is statistically tested. The statistical significance in difference is examined using T-statistics. If the calculated value of T-estimate is greater than 1.96 and less than 2.58, the difference in perception of customers in private and public sector banks is significant at 5% level. If the T- statistics value greater than 2.58, the difference is significant at 1%. If the T-value is significant, it means the null hypothesis is rejected and there exists a significant difference in perceptions of customers of private and public sector banks. The mean perception scores of customers of private and public sector banks along with T-values and significance level are presented in Table 8

**Table 8: Mean Perception scores, t-value and Significance level**

	ASSU03	3.9786	3.7587		
	ASSU04	3.9712	3.7956		
<b>ASSURANCE</b>		<b>3.9373</b>	<b>3.6191</b>	<b>3.392</b>	<b>.000</b>
EMPATHY	EMP01	3.9987	3.9063		
	EMP02	3.7128	3.5862		
	EMP03	3.8272	3.6125		
	EMP04	3.9712	3.5288		
	EMP05	3.8629	3.6966		
<b>EMPATHY</b>		<b>3.8745</b>	<b>3.6660</b>	<b>2.749</b>	<b>.006</b>

It is seen from the Table 8 that the mean perception scores of customers of private sector banks with regard to all the variables of service quality exceed all the mean perception scores of customers of public sector banks. The difference is significant at 1% level of significance. This reveals that the customers of private sector banks perceive better service quality compared to customers of public sector banks. The overall mean perception score of customers of private and public sector banks is presented in Table 9

**Table 9: Mean Perception scores, S.D., t-value and Significance level**

PERCEPTION	Banks	Mean	Std. Deviation	t-value	Sig.
	PRIVATE SECTOR	3.89	0.27664	<b>3.321</b>	<b>.000</b>
	PUBLIC SECTOR	3.59	0.19886		

The t-value of 3.321 as seen from the Table 9 is more than the critical value of 2.58 at 1% level of significance. Thus the null hypothesis is not accepted. Hence we can conclude that there exists a significant difference in perception of customers of private and public sector banks.

**Hypothesis 2:** *There is no significant difference in expectations of customers of private and public sector banks*

The null hypothesis 2 that there is no significant difference in expectations of customers of private and public sector banks is statistically tested. The statistical significance in difference is examined using T-statistics. If the calculated value of T-estimate is greater than 1.96 and less than 2.58, the difference in perception of customers in private and public sector banks is significant at 5% level. If the T-statistics value is greater than 2.58, the difference is significant at 1%. If the T-value is significant, it means the null hypothesis is rejected and there exists a significant difference in expectations of customers of private and public sector banks. The mean expectations of customers of private and public sector banks along with T-values and significance level are presented in Table 10

**Table 10: Mean Expectation scores, t-value and Significance level**

	EMP02	4.5887	4.2887		
	EMP03	4.6213	3.9913		
	EMP04	4.5425	4.1425		
	EMP05	4.6812	4.2812		
	<b>EMPATHY</b>	<b>4.2237</b>	<b>4.6491</b>		

It is seen from the Table 10 that the mean expectation scores of customers of Public sector banks with regard to all the variables of service quality except tangibility exceed all the mean expectations scores of customers of private sector banks. The difference is significant at 1% and 5% level. The overall mean expectations score of customers of private and public sector banks, standard deviations, T-value and significance level is presented in Table 11

**Table 11: Mean Expectations scores, S.D., t-value and Significance level**

EXPECTATION	Banks	Mean	Std. Deviation	t-value	significance
	PRIVATE	4.45	0.41314	4.513	0.000
	PUBLIC	4.61	0.29816		

The t-value of 4.513 as seen from the Table 11 is more than the critical value of 2.58 at 1% level of significance. Thus the null hypothesis is not accepted. Hence we can conclude that there exists a significant difference in expectations of customers of private and public sector banks.

**Hypothesis 3:** *There is no significant difference between perception and expectation of customers of private sector banks*

The null hypothesis 3 that there is no significant difference in perception and expectation of customers of private sector banks is statistically tested. The statistical significance in difference is examined using T-statistics. If the calculated value of T-estimate is greater than 1.96 and less than 2.58, the difference in perception of customers in private and public sector banks is significant at 5% level. If the T-statistics value greater than 2.58, the difference is significant at 1%. If the T-value is significant, it means the null hypothesis is rejected and there exists a significant difference in perceptions and expectations of customers of private sector banks. The mean perception and expectation scores of customers of private banks along with gap score, T-values and significance level are presented in Table 12

**Table 12: Perception and Expectation scores, t-value and Sig. level in Private sector banks**

It is seen from the Table 12 that the difference between customer perception and expectation of service quality in private sector banks is negative as seen from the gap scores. This difference is significant at 1% level of significance. This reveals that the customers of the private sector banks expect better service quality than what they receive from their banks. The overall mean perception and expectations score of customers of private sector banks, standard deviations, T-value and significance level is presented in Table 13

**Table 13: Mean Perception & Expectation, S.D., t-value, Sig. level in Pvt. Sector banks**

PRIVATE SECTOR BANKS		Mean	Std. Deviation	t-value	Sig.
	PERCEPTION	3.89	0.28123	4.012	0.000
	EXPECTATION	4.45	0.33213		

The t-value of 4.012 as seen from the Table 13 is more than the critical value of 2.58 at 1% level of significance. Thus the null hypothesis is not accepted. Hence we can conclude that there exists a significant difference between perceptions and expectations of customers of private sector banks.

**Hypothesis 4:** *There is no significant difference between perception and expectation of customers of Public sector banks*

The null hypothesis 4 that there is no significant difference in perception and expectation of customers of public sector banks is statistically tested. The statistical significance in difference is examined using T-statistics. If the calculated value of T-estimate is greater than 1.96 and less than 2.58, the difference in perception of customers in private and public sector banks is significant at 5% level. If the T-statistics value greater than 2.58, the difference is significant at 1%. If the T-value is significant, it means the null hypothesis is rejected and there exists a significant difference in perceptions and expectations of customers of public sector banks. The mean perception and expectation scores of customers of public sector banks along with gap score, T-values and significance level are presented in Table 14

**Table 14: Perception and Expectation scores, t-value and Sig. level in Public sector banks**

Public Sector Banks (SBI & PNB)

<b>EMPATHY</b>		<b>4.6491</b>	<b>3.6660</b>	<b>-0.9831</b>	<b>7.031</b>	<b>.000</b>

It is seen from the Table 14 that the difference between customer perception and expectation of service quality in public sector banks is negative as seen from the various gap scores. This difference is significant at 1% level of

significance. This reveals that the customers of the public sector banks expect better service quality than what they receive from their banks. The overall mean perception and expectations score of customers of public sector banks, standard deviations, T-value and significance level is presented in Table 15

**Table 15: Mean Perception & Expectation, S.D., t-value, Sig. level in Public Sector banks**

PUBLIC SECTOR BANKS		Mean	Std. Deviation	t-value	Sig.
	PERCEPTION	3.59	0.19886	7.810	0.000
	EXPECTATION	4.61	0.29816		

The t-value of 7.810 as seen from the table 15 is more than the critical value of 2.58 at 1% level of significance. Thus the null hypothesis is not accepted. Hence we can conclude that there exists a significant difference between perceptions and expectations of customers of private and public sector banks.

**Hypothesis 5:** *There is no significant difference in Gap1 between private and public sector banks*

The null hypothesis 5 that there is no significant difference in Gap1 between private and public sector banks is statistically tested. The statistical significance in difference is examined using T-statistics. If the calculated value of T-estimate is greater than 1.96 and less than 2.58, the difference in perception of customers in private and public sector banks is significant at 5% level. If the T-statistics value greater than 2.58, the difference is significant at 1%. If the T-value is significant, it means the null hypothesis is rejected and there exists a significant difference in Gap1 between private and public sector banks. The average Gap1 score in all the dimensions of service quality in private and public sector banks along with T-values and significance level are presented in Table 16

**Table 16: Gap scores, t-value and Sig. level in private and public sector banks**

Dimensions	Gap Scores		t-value	Sig.
	Public Sector Banks SBI & PNB	Private sector Banks JKBANK & HDFC		
Tangibility	-1.047	-0.693	5.425	0.000
Reliability	-1.076	-0.681	6.011	0.000
Responsiveness	-1.055	-0.642	6.917	0.000
Assurance	-0.947	-0.360	7.018	0.000
Empathy	-0.983	-0.349	7.214	0.000

It is seen from the Table 16 that the average Gap 1 score in all dimensions of service quality in public sector banks exceeds the average Gap 1 score in private sector banks. This difference is significant at 1% level of significance. This reveals that the customers perception-expectation Gap in public sector banks are more as compared to private sector banks meaning thereby that that service quality of public sector banks far away from the expectations of the customers where as in private sector banks service quality is comparatively less away from the expectations of the customers. The overall mean perception and expectations Gap, standard deviations, T-value and significance level is presented in Table 17

**Table 17: Mean Gap score, S.D., t-value, Sig. level in Public Sector banks**

GAP SCORES		Mean	Std. Deviation	t-value	Sig.
	PUBLIC SECTOR	-0.545	0.49813	7.956	0.000
	PRIVATE SECTOR	-1.021	0.65123		

The t-value of 7.956 as seen from the table 17 is more than the critical value of 2.58 at 1% level of significance. Thus the null hypothesis is not accepted. Hence we can conclude that there exists a significant difference in Gap 1 between private and public sector banks.

### Conclusion:-

The current study measured and compared the service quality gap between private and public sector banks in Jammu and Kashmir. It is clear from the preceding discussion that the service quality parameters are seriously being evaluated by the customers of private and public sector banks. The findings of the study show that the customer expectation of service quality is more in public sector banks as compared to private sector banks whereas customers perceive better service quality in private sector banks as compared to public sector banks. This necessitates the need of improvement in all the dimensions of the service quality as highlighted in the preceding discussions in public sector banks. This in no way mean that the private sector banks provide optimal service quality as the gap between perception and expectation is also significant in these banks. The significant finding in the above discussions is the that the customers expect more reliability, responsiveness, assurance and empathy from public sector banks as compare to private sector banks. This means that the customers expect public sector banks to be more reliable, responsive, courteous and empathetic as compared to private sector banks. Thus private sector banks need to develop a sense of reliability, responsiveness, courtesy and empathy among their customers. The findings reveal that both the banks have to manage all the dimensions of the perceived service quality in order to match the expected service. To keep the gap between perceived service and the expected service as low as possible; all the marketing activities including word of mouth must not be unrealistic compared to the perceived service. Both the types of banks should continually evaluate how customers perceive their service quality and what are their expectations in order to check whether they match or not.

### Abstract

**Aim:** This study aims to investigate the knowledge and attitudes towards hepatitis C virus transmission among medical interns of King Abdulaziz Medical City in Riyadh city , kingdom of Saudi Arabia. **Methods:** A cross sectional descriptive study was conducted by administering a closed ended questionnaire on a sample of 100 medical interns. **Results :** Findings of this study showed that medical interns in King Abdulaziz Medical City in Riyadh city possess a good level of knowledge regarding HCV transmission , besides to the good level of knowledge regarding the prevention of HCV infection. Moreover , medical interns have a positive attitude towards patients infected by HCV. **Conclusion :** It could be concluded that there is an accepted level of knowledge among medical interns of King Abdulaziz Medical City regarding HCV transmission , and a positive attitude towards dealing with HCV patients.

### Introduction:-

Hepatitis C is a significant global health issue due to the vast and increasing number of infections happening every year, besides to the increasing mortality rate among infected people.

Nowadays , it is estimated that there is around 170 million of infected people by HCV , as an estimated to be 3% of the world's population . high prevalence rate of hepatitis infection imposes high demand on health service providers and particularly on healthcare workers to be more close and in direct contact with HCV infected people.

Hepatitis C is a blood borne viral infection that is caused by the hepatitis C virus (HCV) (National and medical research council (NHMRC) , 1997).

Hepatitis C is still poorly understood , in part because has only recently been identified . the genome of HCV was isolated in 1988 and a serological test was developed in 1990 (Crofts et al.,1999) . The HCV has a tendency to mutate rapidly , which makes it genetically unstable. The rapid change in viral antigens makes it difficult for the immune system to clear the virus , consequently there is a high rate of chronicity.

Around 80% of HCV infected people go on to develop chronic hepatitis , up to 20% will develop cirrhosis of the liver and around 5% will develop hepatic cancer. The rapid mutation rate also means that there is no licensed , effective vaccine against HCV , and that gamma globulin is not an effective prophylactic therapy.

People with chronic Hepatitis C infection could be treated using interferon monotherapy , or with interferon and ribavirin combination therapy . Neither of both treatments is highly effective with only 15-20% of patients treated with interferon alone, and 35 – 50 % of patients treated with combination therapy showing a sustained response ( i.e. absence of viral RNA for at least six months after cessation of treatment).

Hepatitis C virus (HCV) is considered a major factor that increases the mortality rate in patients with end-stage-renal-disease (ESRD) that are treated with renal dialysis. Serological tests had indicated that there is a high prevalence rate of HCV infection among ESRD patients. Specific procedure represented by the early diagnosis and infection treatment, can help in reducing the mortality rate .Moreover,it's very important to perform blood screening to identify any available anti-HCV antibodies in the patients, or to detect Ribonucleic Acid molecules (RNA) of the HCV by hybridization screening methods. Little knowledge is known about the Saudi renal dialysis patients knowledge level about HCV infection, so that spot the light on the need for more survey and quantitative researches to explore their knowledge,attitudes, beliefs and other related aspects.

The greatest risk of transmission to healthcare workers is via a contaminated needlestick or sharp injuries . HCV is transmitted primarily by direct contact with human blood . transmission through blood transfusion that are not screened for HCV infection , through reuse of inadequately sterilized needles , syringes or other medical equipment , or through needle sharing among drug users , is well documented. Other modes of transmission through social , cultural , and behavioral practices using percutaneous procedures can occur if inadequately sterilized equipment are used. Sexual and parental transmission may also occur , although less frequently . HCV is not spread by sneezing , hugging , coughing , food or water , sharing eating utensils or casual contact , although there are household contacts with unexplained HCV infection .

Middle east countries , including Saudi Arabia , show an intermediate level of hepatitis C infection prevalence . although the disease can lead to huge burden especially in endemic areas , it is preventable. Prevention is the only safe strategy against high prevalence of viral hepatitis.

Having enough knowledge and proper attitudes towards these infections are cornerstone of preventing the spread of them . healthcare workers have the most important role in preventing the disease by improving the disease knowledge among them and the patients , because health services staff are in close with hepatitis infection patients. The present study aims mainly to determine the knowledge level and attitudes of medical interns towards the transmission and patients of HCV in Riyadh city , Saudi Arabia.

### Objectives of the study:-

Several studies had reported evidences regarding the prevention of HCV transmission to patients underlying hemodialysis. Medical interns in the hemodialysis units are supposed to possess enough knowledge regarding HCVprevention, and they have to hold enough experience and training to perform full prevention procedure. Current study aims to investigate and measure the level of knowledge among medical interns in hemodialysis units in King Abdulaziz Medical Cityin Riyadh city, KSA.

### Literature review:-

In a study conducted by Biancoet al (2013) , aimed to investigate and explore knowledge , attitudes and evidence based practices in hemodialysis units in Italy , Bianco and her colleagues had explored 37 hemodialysis units in Calabria region in Italy using a self-administered questionnaire.

Findings of the study had showed that there is a high level of knowledge regarding HCV pattern of transmission (73.7% to 99.3% ). Moreover , study results indicated that there is a positive attitude among the study participants , but it was the highest among the nurses category.

In another study performed by Kabiret al (2010) , aimed to evaluate knowledge , attitudes and behaviors of physicians concerning HBV and HCV. Researchers had distributed a semi-structured questionnaire composed of 29 items on 369 healthcare workers in Iranian hospitals.

Results showed that there is a low to moderate knowledge level among healthcare workers regarding routes of transmission of HBV and HCV and the prevalence rate, and seroconversion rates secondary to a needlestick injury.

Furthermore, results revealed that there was no significant correlation between the different specialties and: 1. Concern about HBV and HCV, 2. The understanding of needlestick injury; and 3. Correct knowledge of post-needlestick HCV infection.

Hu *et al* (2004) had investigated and compared Taiwanese dental students' knowledge of Hepatitis B virus (HBV) and Hepatitis C virus (HCV) and Human Immunodeficiency Virus (HIV), besides to explore their attitudes towards the infected patients and factors impacting their willingness to treat infected patients. They had distributed a self-administered questionnaire with closed ended questions on 1930 dental students in seven dental schools in Taiwan. Results showed that 80%, 75%, and 49% of the respondents were willing to treat HBV, HCV, and HIV patients, respectively. Moreover, it was found that students were less knowledgeable about HCV infection compared to HBV and HIV infections.

A study conducted by Ghanaei *et al* (2013) aimed to determine the knowledge level and attitudes of medical students in Guilan University towards hepatitis B and C viral infections. Study sample was composed of 424 medical students, and a standardized questionnaire was applied on the study sample. Results showed that there is a weak knowledge and attitude level of medical students, especially in the preventive methods, and in those groups of students who have less close contact with the patients. Moreover, study found that there is a positive correlation between students' knowledge and attitudes towards HBV and HCV infections.

One year later, Elkazeh *et al* (2014) had conducted a study to assess the knowledge level and attitudes towards patients with hepatitis C among nursing interns in Tanta university hospital. Descriptive correlation study was implemented on a convenient sample of 200 nursing interns. A pre-designed questionnaire was developed and applied on the study sample. Results showed that 11.5% of nursing interns had poor knowledge, 66.5% had a moderate knowledge and 28% had a good level of knowledge about patients with hepatitis C. Also, 50.5% of the nursing interns showed positive attitudes and 73.2% of them had good level of knowledge, while 49% of nursing interns had negative attitudes towards patients with hepatitis and only 26.8% of them were having a good level of knowledge.

Moreover, Shahbaz *et al* (2014) had performed a study entitled as "Hepatitis B and C: knowledge, attitudes and perception of medical students at Lahore medical and dental college, Lahore. As a descriptive cross sectional survey that involved the implementation of an evaluation questionnaire distributed over 280 medical students in different academic years. Results showed that about 80 – 90% showed a good knowledge level about transmission and prevention of these infections. Furthermore, results had indicated that medical students level of knowledge was associated with the academic grade, and the overall knowledge was found to be high, but vaccination status was low for this particular group.

Abdela *et al* (2016) had investigated and assessed the knowledge, attitudes, and practices toward prevention of hepatitis viral infection among students of medicine and health sciences in northwest Ethiopia. A cross sectional study was conducted on 246 students of healthcare professions. Results showed that majority of the study participants (more than 80%) had an adequate knowledge on risk factors of hepatitis viral infection, its mode of transmission, and preventions. About 83.3% of the respondents had positive attitudes towards following infection control guidelines, while 81.7% of the respondents believe that all healthcare workers should take hepatitis vaccinations.

#### **Justification of the study:-**

Several studies had reported that there is an increasing prevalence rate of Hepatitis C infection. Moreover, studies had showed that healthcare workers who are in direct contact with Hepatitis C patients are the most exposed category to HCV infection, which requires the healthcare workers to possess high level of knowledge and positive attitudes towards the transmission, prevention and patients of Hepatitis C viral infection.

Study setting representing the selected hospital, had reported verbally that there is an increasing rate of HCV infection among citizens and healthcare workers in the recent years. Which had motivated the researcher to perform this study.

Finally, one of the motivating factors to perform this study is the lack of the regional studies in Saudi Arabia, that examines and investigates the healthcare workers attitudes and knowledge level regarding HCV patients and transmission methods of the viral infection.

#### **Limitations of the study:-**

1. Current study has a narrow scope due to several limitations that could influence the results of the study, they are:
2. Restricted geographical spot of the study which limits the generalization of the study results to other areas.
3. Study sample is restricted to medical interns who are in direct contact with HCV patients, ignoring other healthcare workers categories, such as nurses and lab technicians.
4. Other aspects of HCV infection knowledge are not covered by this study, such as HCV treatment.
5. Limited size of the study sample could limit the validity of the results.

#### **Research design and methodology:-**

A cross sectional descriptive study, including 100 Saudi medical interns in hemodialysis units in King Abdulaziz Medical City in Riyadh city, Kingdom of Saudi Arabia.

Study population is represented by both male and female medical interns working, or previously worked in hemodialysis units in King Abdulaziz Medical City in Riyadh city, Kingdom of Saudi Arabia.

#### **Study setting:-**

The study will be conducted in the hemodialysis units in King Abdulaziz Medical City in Riyadh city, Kingdom of Saudi Arabia.

#### **Sample size, selection of sample and data collection:-**

Convenient sampling will be performed to get the study sample. Data will be collected using a semi structured questionnaire.

Socio-demographic data of the participants will be collected by another part of the study questionnaire.

Data regarding medical interns knowledge and attitudes towards Hepatitis C virus transmission will be collected using the study instrument that will be built in using available literature review.

Data analysis will be performed after coding study participants' responses using Statistical Package for Social Sciences (SPSS) software. Frequencies, percentages, means, and standard deviations will be utilized to extract the study results.

**Reliability:** Reliability of the study tool will be checked using Cronbach's Alpha coefficient.

**Validity:** The content validity of the research tool for its completeness and clarity had been maintained through literature review and consultation with concerned advisor.

#### **Ethical considerations and human subject issues**

- Formal approval will be obtained from the concerned authorities.
- Informed verbal consent will be obtained from study subjects before participating
- Confidentiality will be maintained throughout the study and will be maintained later.
- It is voluntary to participate in the study.

#### **Results and discussion:-**

This study aims to investigate and assess the knowledge of medical interns regarding hepatitis C virus transmission methods, besides to determining their attitudes towards hepatitis C virus patients.

In this chapter, we present a detailed preview of the study results based on the study participants responses to the study instrument (Appendix A)

#### **Study sample distribution according to Age variable:-**

Results presented in table (1) show that participants ranging in age between 31 to 37 were representing the highest category among the study participants and constituted 59.3%, followed by the category of the participants ranging in age between 24 to 30 years (18.5%). The third rank, was for the medical interns who were more than 37 years

old (14.8%) , and finally came the category representing the participants who were less than 24 years old , and constituted 7.4% of the total study sample.

**Table 1:-** Study sample distribution according to Age variable

Category	Frequency	Percentage
Less than 24	2	7.4%
24 – 30	5	18.5%
31 – 37	16	59.3%
More than 37	4	14.8%
Total	27	100%

**Study sample distribution according to gender variable:-**

Results shown in table (2) indicate that about two thirds (66.7%) of the study sample were males , while one third (33.3%) was of females.

**Table 2:-** study sample distribution according to gender variable

Gender	Frequency	Percentages
Male	18	66.7%
Female	9	33.3%
Total	27	100%

**Sample distribution according to profession variables:-**

Study sample distribution according to profession variable shows that the majority of the study sample is composed of nurses (70.4%) , followed by laboratory specialists category (22.2%) , and the least represented category were the physicians who constituted 7.4% of the total study sample .

**Table 3:-** study sample distribution according to profession variable

Profession	Frequency	Percentage
Nurse	19	70.4%
Physician	2	7.4%
Lab specialist	6	22.2%
Total	27	100%

### Study sample distribution according to participants years of experience

Results presented in table (4) show that the most represented category according to the number of experience years was for participants whose their experience was ranging between 6 to 10 years and constituted (63%) , while those who exceeded 10 years of experience came secondly by a percentage equals to 18.5% . moreover , participants possessing an experience period ranging between 3 to 6 years constituted 14.8% , while the least represented category was those whose their experience years were less than 3 years and constituted (3.7%) of the total study sample.

**Table 4:-** study sample distribution according to years of experience

Years of experience	Frequency	Percentage
Less than 3 years	1	3.7%
3 – 6 years	4	14.8%
6 – 10 years	17	63%
Total	27	100%

### Mean and standard deviation scores for the knowledge and attitudes scale items:-

Table (5) shows the mean and standard deviation scores of the knowledge and attitudes scale . it is clear from the previous results that there is a high level of knowledge regarding HCV transmission methods. Participants showed that they have a good knowledge level regarding HCV transmission through Saliva ( $2.89 \pm 0.75$ ) , and transmission through blood transfusion from an infected donor ( $2.74 \pm 1.03$ ) , and for the negative items , the low score means higher knowledge . for example , participants showed higher knowledge regarding that ingestion of HCV contaminated food ( $1.59 \pm 0.56$ ) is not a transmission method, as well as kissing an HCV positive individuals ( $1.93 \pm 0.39$ ) and transmission is possible via breast feeding (wrong statement) ( $1.36 \pm 0.73$ ).

Furthermore , participants had showed that they possess a good knowledge level for the positive statements stating that " sharing needles while injecting drugs is a transmission method " ( $2.86 \pm 0.71$ ) , and being born to an HCV positive mother ( $2.94 \pm 0.61$ )

Responses to questionnaire items measuring participants knowledge about HCV prevention , had showed that there is a high level of knowledge among medical interns . for example , participants showed a good level of knowledge in that using gloves is useful in preventing HCV infection ( $2.86 \pm 0.44$ ) , and avoiding renal transplantation can prevent HCV infection ( $2.54 \pm 0.64$ ).

Items designed to investigate attitudes of medical interns towards HCV patients had showed that there is a positive attitude among the study participants regarding willingness to treat people with HCV ( $2.21 \pm 0.33$ ) , and their feelings towards people who contacted HCV through a blood transfusion ( $2.76 \pm 1.01$ ) . finally , participants responded negatively to the negative items stating " I don't like treating people with HCV infection " ( $1.31 \pm 0.72$ ) which indicates to their positive attitudes towards HCV patients.

**Table 5:-** Mean and standard deviation scores for the study instrument items

Item	Mean	Standard deviation
Transmission is possible via saliva	2.89	0.75
Receiving a blood transfusion from an infected donor	2.74	1.03
Ingestion of HCV contaminated food	1.59	0.56
Sharing needles while injecting drugs	2.86	0.71
Kissing an HCV- positive individual	1.93	0.39
Being born to an HCV positive mother	2.94	0.61
Using gloves is useful in preventing HCV infection	2.86	0.44
Avoiding renal transplantation can prevent HCV infection	2.54	0.64
Transmission is possible via breast feeding	1.36	0.73
I am willing to treat people with HCV	2.21	0.33
I feel sorry for people who contracted HCV through a blood transfusion	2.76	1.01
I don't like treating people with HCV infection	1.31	0.72

**Summary:-**

Hepatitis C is a blood borne infection that is transmitted only by blood . statistics showed that there is an increasing number in HCV infections and increase in mortality rate due to its prevalence.

This study aimed to investigate the knowledge level and attitudes of medical interns in hemodialysis units regarding HCV transmission and HCV patients.

Results showed that medical interns possess a good level of knowledge regarding HCV transmission methods , besides to the good level of knowledge regarding the prevention of HCV infection.

Furthermore , results showed that medical interns have a positive attitudes towards patients infected by HCV , and dealing with them

#### Abstract

Renal cell carcinoma (RCC) represent 90% to 95% of malignant neoplasms developing from the kidney. Current advances in surgical and systemic treatments have actually significantly altered the management of RCC. Therefore, This review aimed to discuss and evaluate the most common complications and outcomes Associated with Surgical Management of Renal Cell Carcinoma, through different trails from all around the world, which are based evidence ones.

We performed a comprehensive review of the literature based on free-text search in the National Library of Medicine Database MEDLINE using the following keywords: partial-nephrectomy, nephron-sparing surgery, cytoreductive-nephrectomy and metastatic renal cell carcinoma. Filtered for human trails, articles published in English to November 2016 were included in this article.

#### Introduction:-

Renal cell carcinoma (RCC) represent 90% to 95% of malignant neoplasms developing from the kidney. Current advances in surgical and systemic treatments have actually significantly altered the management of RCC<sup>(1)</sup>. Regardless of the earlier detection of smaller sized kidney tumors, the rate of RCC-related mortality has actually increased<sup>(2,3)</sup>, recommending that recurrence and advanced disease are responsible for mortality. RCC consists of a heterogeneous group of growths with distinct genetic and metabolic defects, in addition to histopathologic and scientific functions (**Table1**)<sup>(4)</sup>. Medullary carcinomas are unusual however aggressive, and are specifically associated with sickle cell trait. Targeted treatments against the vascular endothelial development factor (VEGF) pathway have extended the lives of the patients with innovative disease significantly, with average total survival currently surpassing 2 years<sup>(1)</sup>.

With an estimated incidence of 61,560 cases and 13,040 deaths in 2015, renal cell cancer (RCC) stays a crucial and common reason for cancer death in the United States<sup>(5)</sup>. Around 25%-30% of patients have metastatic disease at the time of diagnosis<sup>(6,7,8,9,10)</sup>, which is connected with a mean survival of 1-2 years (11,12,13). Up until recently, immunotherapy, such as interleukin-2 and interferon-alpha, was the only readily available systemic treatment choices for metastatic RCC<sup>(14,15,16,17,18)</sup>; nevertheless, over the past years, treatment choices have actually increased significantly with the approval of numerous targeted treatment agents<sup>(18)</sup>. I Few studies exist examining the utility and efficiency of more aggressive surgical intervention for in your area advanced or metastatic RCC including the

liver. Furthermore, concurrent surgical resection of the liver at the time of radical nephrectomy is connected with substantial morbidity, which might exceed the benefits of surgically debulking RCC<sup>(19,20,21,22)</sup>.

Even after surgical resection for clinically localized disease, 20 to 40% of patients will regression and have a poor prognosis with respect to long-lasting survival<sup>(23,24)</sup>. Even with the brand-new targeted systemic therapies being developed and authorized in the last years, rarely do they supply long-term or complete reactions. The only possibility of long-lasting treatment and survival of RCC involve surgical interventions consisting of radical nephrectomy, partial nephrectomy (PN), ablative techniques, and, in chosen cases, metastasectomy in mix with multimodal treatment techniques<sup>(25)</sup>.

Table 1. Classification of Renal Cell Carcinoma

Histology	Frequency	Cell of Origin
Clear cell	60%-70%	Proximal tubule
Papillary	5%-15%	Proximal tubule
Chromophobic	5%-10%	Cortical collecting duct
Oncocytic	5%-10%	Cortical collecting duct
Collecting duct	<1%	Medullary collecting duct

This Review aimed to discuss and evaluate the most common complications and outcomes Associated with Surgical Management of Renal Cell Carcinoma, through different trails from all around the world, which are based evidence ones.

### Methodology:-

We performed a comprehensive review of the literature based on free-text search in the National Library of Medicine Database MEDLINE using the following keywords: *partial-nephrectomy*, *nephron-sparing surgery*, *cytoreductive-nephrectomy* and *metastatic renal cell carcinoma*. Filtered for human trails, articles published in English to November 2016 were included in this article. Based on the relevance of the content, our review consisted of several articles. Of note, the reviewed literature had a low level of evidence, constituted by case reports, small case series and reviews.

### Results and Discussion:-

#### Less Prognosis of All RCC:-

Patients with Small RCC appear to have the worst diagnosis of all RCC. Couple of patients show extended survival; those who do generally present with early-stage disease (phase I and stage II)<sup>(26)</sup>. Most of series report an average survival time of just 4-9 months after medical diagnosis<sup>(27,28,29,30,31)</sup>. Compared to other patients with top-quality RCCs, those with sRCCs still have a worse diagnosis. Numerous series have validated the presence of sarcomatoid features to be an independent predictor of bad survival<sup>(27,32,33)</sup>. The existence of sarcomatoid components might be one of the most prominent prognostic variables for patient result<sup>(28)</sup>. Numerous studies have looked at the impact of the percentage of sarcomatoid transformation on prognosis and demonstrated that greater amounts were associated with a worse result<sup>(26,27,28)</sup>.

#### Roles of surgical management methods and their complications or RCC:-

For most RCC patients who provide at a sophisticated phase with a big, large tumor, surgical treatment can be really difficult, and generally radical nephrectomy is required. Regularly, these growths are connected with an intense desmoplastic reaction and resection of surrounding organs might be needed. In a series of patients undergoing cytoreductive nephrectomy, > 25% of them had T4 disease and 33% had favorable lymph nodes<sup>(28)</sup>. As such, significant morbidity may be inevitable in innovative cases.

Lymph node dissection in the lack of medical disease has actually been omitted due to the fact that of level I evidence<sup>(34)</sup>, Blute and associates at the Mayo Clinic advised extended lymph node dissection if sarcomatoid functions are identified at the time of surgery<sup>(35)</sup>.

A) **Cytoreductive nephrectomy (CN)** is utilized in patients with RCC who initially present in a metastatic RCC (mRCC) setting. 2 prospective randomized trials showed remarkable progression-free survival and OS in patients going through CN followed by immunotherapy compared with immunotherapy alone<sup>(36,37)</sup>. In a combined analysis, patients treated with CN and immunotherapy had a survival benefit of 13.6 versus 7.8 months in patients going through immunotherapy alone<sup>(40)</sup>. This is the factor that CN for patients with mRCC

has actually been extensively embraced, although only patients with excellent overall performance status were included and some poor prognostic metastatic sites (brain) were excluded, presenting a selection predisposition. CN is substantially more complex than basic RN, with in-hospital death rates of 5%, suggesting the need for cautious patient selection <sup>(41)</sup>. In the setting of metastatic RCC, level I evidence supports the benefits of cytoreductive nephrectomy prior to prepared immunotherapy <sup>(36,37)</sup>. Although the new era of targeted therapy has demonstrated responses in the primary tumor, cytoreductive nephrectomy typically remains an integral part of therapy <sup>(38,39)</sup>. Whereas cytoreductive surgery still has a major function in the treatment of metastatic RCC, for patients with sRCC, numerous question the survival benefit of cytoreductive surgical treatment <sup>(28,29)</sup>. The aggressive nature of this disease might lead to quick disease progression with postponed initiation of systemic therapy to enable postoperative convalescence <sup>(39)</sup>. Previous experience with these patients has indicated that ~ 60% cannot proceed to systemic therapy after surgery <sup>(28)</sup>.

- B) Radical Nephrectomy (RN);** radical nephrectomy has actually been the gold standard of dealing with deadly kidney masses with a curative intent for years <sup>(42)</sup>. In contrast to previously described pericapsular nephrectomy, radical nephrectomy consisted of the en bloc resection of the entire kidney in addition to the surrounding perinephric fat, the ipsilateral adrenal gland, and the local lymph nodes <sup>(42)</sup>. This improved overall survival (OS) significantly at that time to around 65% for localized RCC <sup>(42)</sup>. In the 1990s, minimally intrusive techniques to radical nephrectomy were established, and consequently laparoscopic radical nephrectomy (LRN) has actually ended up being an extensively adopted treatment <sup>(43)</sup>. LRN is carried out by transperitoneal, retroperitoneal, and hand-assisted methods. Due to equivalent oncologic control with lower morbidity, enhanced complication profile, and faster convalescence than ORN, LRN is now considered requirement in a patient population not amenable to NSS and with growth stages approximately T1-3, N0, M0 <sup>(44,45,46,47)</sup>. Numerous studies demonstrated improved perioperative and postoperative results such as decreased blood loss, reduced personnel time, shorter hospital stay, less need for analgesia, and faster healing to normal exercise <sup>(48,49)</sup>.
- C) Partial nephrectomy or nephron-sparing surgery (NSS);** is considered the treatment of option for localized small kidney masses with oncological outcome in cases of renal cell cancer (RCC) comparable to radical nephrectomy <sup>(50)</sup>. Using NSS has the advantage of preserving kidney function with lower cardiovascular death and morbidity <sup>(51,52,53,54)</sup>. NSS is considered the treatment of choice for localized little renal masses, <sup>(50)</sup> with oncological result comparable to Registered Nurse, and benefits of maintaining renal function and lowering cardiovascular death and morbidity <sup>(51,52,53,54)</sup>. Due to the fact that chronic kidney disease (CKD, glomerular filtering rate <60 mL/min/1.73 m<sup>2</sup>) is more widespread in a RCC patient, <sup>(52,54)</sup> the benefit of NSS can be appreciated in this study from Memorial-Sloan Kettering that found the incidence of new-onset CKD in patients with normal serum creatinine and two operating kidneys, who had actually gone through NSS and RN for little renal masses, to be 17% and 69%, respectively <sup>(53)</sup>. There is installing evidence in the literature that tumor characteristics instead of surgical method figured out CSS and OS (55,56). This evidence led to the expansion of the utility of NSS in tumors larger than 4 cm and in your area advanced RCC. In a research study by Margulis et al., the oncological efficacy of NSS versus Registered Nurse in patients with in your area advanced RCC was compared. In the comparison of 34 patients going through NSS and 567 patients undergoing RN, the CSS curves demonstrated comparable result <sup>(57)</sup>.

### Conclusion:-

Surgical resection represents the requirement of take care of handling patients with kidney masses. Radical nephrectomy is the gold requirement for bigger kidney masses, whereas nephron-sparing PN is the preferred treatment modality for T1a growths. NSS, when possible, might be a feasible option for surgical debulking in metastatic RCC. For patients with primary growths open to NSS, developed prognostic factors can be utilized for patient choice. Patients more than likely to take advantage of a nephron-sparing method are those for whom Registered Nurse is not feasible due to preexisting kidney impairment and patients with restricted metastatic disease anticipated to enjoy extended survival with a mix surgical intervention and systemic treatment. The very same benefit as resection of a systemic metastasis is suggested to be real for isolated local recurrence of RCC. Also, complete and aggressive surgical resection can supply long lasting local growth control, and a multimodal technique with th combination of systemic treatment should be considered in these patients

#### Abstract

Ceramide is subsequently metabolized by ceramide kinase to generate C1P and by ceramidase to generate sphingosine, which is further phosphorylated to S1P by sphingosine kinase. Alternatively again, dephosphorylating of the metabolic derivate also occurs using specific phosphatases, such as C1P phosphatase and S1P phosphatase ceramide can also be produced from sphingosine by ceramide synthase the dynamic regulation for ceramide generation and metabolism is critical for cellular responses to extracellular stimuli, such as death receptor-mediated (TNF-and Fas), chemotherapeutic agent-mediated using in prostate cancer (zoladex , prostate car , and irradiation-mediated (UV and  $\gamma$ -irradiation) . For tumorigenesis, ceramide acts as a tumor-suppressor lipid, whereas S1P acts as a tumor-promoting lipid in BPH and PC cancer comparing with healthy men.

#### Introduction:-

The experimental work was done at The Department of Chemistry and Biochemistry, College of Medicine AL-Nahrain University, and The Ministry of Science and Technology, during the period from (January to Jun) 2016. Sixty patients from men have malignant prostate cancer and Benign Prostatic Hyperplasia, were chosen to be subjected to this study and divided into two groups. The first group (B) consists of (30) patients of men with (BPH), This group was divided into four sub-groups: two groups were serum tested, and other two groups were tissue tested each group consist of (30) samples which were divided according to doses of drugs (high and low dose). The second group (C) consist of (30) patients of men with malignant prostatic cancer. At the same manner of this groups were divided into four sub-groups: two groups were serum tested, the other two groups were tissue tested. Each group consists of (30) samples which were divided according to chemotherapy doses (high and low doses of chemotherapy). The control group was marked (A) consists of (30) samples of healthy men who were free signs and symptoms of prostate cancer, age ranged from (50- 70) years, were nonsmokers, free from Diabetic mellitus, hypertension, renal function disease, and family history of prostatic cancer. All samples were collected from Al-Imameen Al-Kademen Medical City, AL-Jawad Oncology Centre, Medical City-Hospital Martyr Ghazi Al-Hariri for Specialized Surgery, AL-Yarmok Hospital, Educational Oncology Hospital, Special Nursing Hospital, and AL-Saadon Privet Hospital.

In this study it has been developed through examination to assess the Ceramide kinase as assay to measure concentration of ceramide in Serum and Tissue into three groups (control, BPH, and PC) of patients by using Elisa Kit and this Figure (1) shows standard curve of Ceramide in serum and tissue, and The (Mean  $\pm$  SD) of Cer in serum

and tissue had shown an increase in the patient with BPH and malignant prostatic cancer in comparing to with control group as in Table (1). Membrane sphingolipid, regulators for cell growth, death, senescence, adhesion, migration, angiogenesis, inflammation, and intracellular trafficking, are bioactive metabolites including sphingosine, ceramide, sphingosine-1-phosphate (S1P), and ceramide-1-phosphate (C1P). Apoptosis or Type I programmed cell death, is essential for the maintenance of normal cellular homeostasis and is an important physiological response to many forms of cellular stress. One of the most studied roles of ceramide pertains to its function as a proapoptotic molecule. Ceramide accumulation has been found following treatment of cells with a number of apoptotic agents including ionizing radiation, UV light, TNF-alpha, and chemotherapeutic agents. (Saddoughi et al., 2008). This suggests a role for ceramide in the biological responses of all these agents. Because of its apoptosis-inducing effects in cancer cells, ceramide has been termed the tumor suppressor lipid. Several studies have attempted to define further the specific role of ceramide in the events of cell death and some evidence suggests ceramide functions upstream of the mitochondria in inducing apoptosis. It is owing to the conflicting and variable nature of studies into the role of ceramide in apoptosis, the mechanism by which this lipid regulates apoptosis remains elusive (Spiegel, S, et al, 2002).

Determination Concentration of Ceramide kinase (CERK) in Enzyme Linked Immunosorbent Assay (ELIZA) A double -antibody sandwich enzyme-linked immunosorbent one step process assay (ELISA) one stop process was used to measure Ceramide kinase (CERK) in serum and tissue samples.

#### Standard preparation:-

The Standard was diluted with Standard diluents in the method of Multiple proportion dilution and the concentrations were followed: (0, 75, 150, 300, 600, 1200 pg/ml).

#### Reagent Preparation:

20  $\times$  dilution of washing buffer: distilled water, diluted by 1:20, or 1 copy of the 20  $\times$  washing buffer plus 19 copies of the distilled water 5.

**Washing Method:-**

Manually washing method was emptied the plate by inverting it and shaking the content out, and then it was taped on the absorbent papers to dry. At least 0.35ml washing solution was added into each well, and the plate was soaked for 1~2 minutes. This process was repeated for 5 times.

**Operation Steps:-**

Fifty  $\mu$ l of standard were added to standard wells. 40  $\mu$ l of sample diluent were added to sample wells and ten  $\mu$ l of sample were added. 50  $\mu$ l of horseradish peroxidase (HRP) were added into each well, except the blank well, the plate was shaken gently and was incubated 60 min at 37 °C.

Excess liquid was discarded, the wells then dried, washed with washing solution and dried again. Chromogen solution (A) followed by 50  $\mu$ l of Chromogen solution (B) were added to each well. The plate gently shaken and incubated for 10 minutes at 37°C in dark place. Fifty  $\mu$ l of stop solution were added into each well to stop the reaction (the blue changes into yellow immediately). Measurement and standard were the blank wells were set at zero and the optical density (OD) was measured at 450 nm within 15 min after adding the stop solution

**Standard curve:-**

According to standards concentration and the corresponding OD values, the standard curve linear regression equation was calculated and then the OD values of the sample was applied on the regression equation to calculate the corresponding Figure (2.2) shows the calibration in curve concentration of samples with a rang > 0- <150 ng/ml.

**Figure 2:-** standard curve of (CERK) concentration (pg/ml) in serum and tissue

**Discussion:-**

In Iraq, people with prostate cancer, according to statistics the Iraqi Ministry of Health is % 5.06 in 2011, a very large number for that was the need to discuss ways and analyzes new reduce the incidence of this disease and it has been the use of advanced technology at a cost of good for early detection of prostate hyperplasia and malignant cancer and result was significant and detection for prostate cancer. The concentration of S1P and Ceramide were different levels with control, and high levels in patients without any drugs or chemotherapy while levels of these markers still low with patients were taken drugs or chemotherapy and level of protein in tissue were raised. Results of biochemistry analysis still normal because we take patients without any D.M., renal failure, and hypertension. Approximately of the population in Western countries suffers from chronic pain syndrome there is a major need for renewed focus on novel targets that will be effective in both neuropathic and inflammatory pain. Compelling evidence implicates Ceramide-to-sphingosine 1-phosphate (S1P) pathways as contributors to pain of diverse etiologies. S1P and its receptors are emerging as important neuronal and immune cell regulators interacting at several sites in the pain pathway. Timely and important to critically evaluate the pharmacological basis for targeting the ceramide-to-S1P pathway as an approach to pain management (BraakM, et al, 2009). (P value) between control group and all groups were significant and (P value) between also two groups (BPH with and without drugs in serum and tissue) (PCa with high and low doses chemotherapy in serum and tissue) also founded significant.

**Conclusion:-**

A significant inverse correlation between total S1P and Ceramide levels with BPH and Prostatic cancer. The study concludes that increased incidence of Prostatic cancer with BMI and age.

Increase concentration of protein in tissue with BPH and PC and as well as being a marker that distinguishes indolent prostate cancer from those at risk of lethal progression.

#### Abstract

The SONATA LINEAMENT ZONE embodies the two Quaternary basins of tectonic origin on the two margins of Satpura Crustal Block. The Satpura block traversed by enechelon system of faults and lineaments is characterized by thinner crust (33-38 km deep, basement depth >2.5 km) with series of ENE-WSW trending gravity high (viz. Sendwa, Khandwa, Chicholi, Tikaria etc.) with amplitudes of 10-35 mgal. The chain of gravity high indicates extensive magmatism and emplacement of derivatives at shallow crustal levels. The associated Narmada South (Satpura North) fault and Satpura South Fault marking the two hinges of the Satpura block are fundamental in nature and extend to Moho level. The Narmada Quaternary basin in the north and Tapti-Purna basin in the south are two Graben which formed prominent loci of sedimentation in lineament zone. The area of lineament zone studied tectonically encompasses two crustal provinces of Central India Shield, namely, the Northern Crustal Province (NCP) and the Southern Crustal Province (SCP). The two provinces are separated by a crustal level shear zone, referred as Central Indian Suture. The zone has been a major locus of episodic tectonism and Quaternary sedimentation with evidences of reactivation. The E-W to ENE-WSW trending Narmada and Tapti lineament from a prominent tectonic belt (SONATA) in midplate continental India.

The Narmada Rift valley formed a linear trench in the middle of Indian subcontinent was an ideal loci for accumulation of sediments. The rift trench is intruded by the dolerite and other mafic and siliceous dykes and sills along lineaments in different phases of tectonic deformation. The Quaternary sedimentation incepting from glacial activity, followed by fluvio-glacial, lacustrine and fluvial phase within the rifting and sinking environment, block faulting and linear displacement and dislocation, uplifting and isolated domal up- lift, Neogene rifting and Quaternary sedimentation. The rift-bound Pliocene-Pleistocene rifting and volcanic activities specifically during glacial and fluvio-glacial phase are major component of the Quaternary period and tectonic processes of the Narmada Rift System which form the base of quaternary deposits. The Narmada rift system basin platform provided a unique setting for dynamic ecosystems that were

**Corresponding Author:- Dr. A. A. Khan.**

Address:- Ex. Director, Geological Survey of India and Director, Rajeev Gandhi Proudhyogiki Mahavidyalaya, Bhopal-462042, M.P India.

characterized by Rift-related subsidence and coeval sedimentation and has also created an ideal loci of Quaternary sedimentation and environment for the accumulation of sediments volcanic fabrics sediments, burial, diagenesis, and preservation of organic remains. The present disposition of Narmada blanket of Narmada, Tapti-Purna and Son in SONATA LINEAMENT ZONE revealed that the rift occurred after widespread Quaternary sedimentation and accumulation of sediments in the linear trench by glacial activity in late Pleistocene. The Fluvio-glacial phase is represented by boulder conglomerate which has formed the persistent horizon in the valley. The Narmada has in the area under study has sculptured the alluvial tract into stepped sequence forming four alluvial terraces along its course. These are designated as NT0 to NT3, NT0 being the youngest terrace and NT-3 the oldest terrace where the sub terraces are designated NT2-A is NT2-B, NT2 B, besides NT2-C, NT3-A & NT3-B in increasing order of antiquity. These are both erosional and depositional terraces and confined at an elevation of, between 280 to 310-380, are separated by the scarp both of curvilinear and linear in nature facing towards river side. These are abandoned flood plains represent the level of former valley floor in the area, and were formed by cumulative climato-tectonic changes in the watershed of Narmada in the Quaternary times.

The Indian Plate is currently moving northeast at 5 cm/yr (2 in/yr), while the Eurasian Plate is moving northeast at only 2 cm/yr (0.8 in/yr). This is causing the Eurasian Plate to deform, and the Indian Plate to compress leading to tectonic activity along major fault zones. In tectonically active areas sedimentary basins undergo phases of both crustal extension and contraction leading to basin inversion and hence display features typical of subsidence and uplift. Geomorphic attributes and deformation in late Quaternary sediments are the indicators of active tectonic activity in any sedimentary basin. The geomorphic evolution in such reactivated basins is primarily due to complex interaction between sedimentation processes and tectonics. The peninsular India has been undergoing high compressive stresses due to the sea-floor spreading in the Indian Ocean and locking up of the Indian plate with the Eurasian plate to the north. Much of this N-S directed stresses have been accommodated by the under thrusting of the Indian plate below the Eurasian plate. A part of these compressive stresses are accumulated along the Narmada-Son Fault (NSF), a major E-W trending crustal discontinuity in the central part of Indian plate. The Quaternary tectonic activity recorded in the Narmada valley possibly, has wider ramifications when viewed in the larger perspective of the Indian plate on Quaternary sedimentation. This suggests a renewed phase of extreme compression of the Indian plate, which led to tectonic insecurity and may cause tumors and earth quake in peninsular India. The Narmada Rift valley forms a ENE-WSW lineament where Quaternary deposits are confined in a trough like basin on unstable platform which forms a prominent lineament with profound geomorphologic and geological asymmetry between the northern and southern valley walls, giving it a tectonic significance. The alluvial deposits of the Narmada valley represent the thickest Quaternary deposits in peninsular India. These sediments were deposited in faulted and sinking platform under structural riparian rift trench remained silent and unrevealed. The quaternary blanket of Narmada consists of sediments of various domains which were deposited in different environment in vertical chronology in faulted trough in time and

space. The Quaternary blanket consists of sediments of three domains viz. glacial, fluvio- glacial and fluvial, which were deposited in distinct environments during Quaternary time. The Boulder Bed (20 to 260 m.) below ground level is of glacial origin, comprised of thick pile of sediments occupied at the base of rock basin and were deposited by glacial activities in dry and cold climatic condition during early Pleistocene time. The fossiliferous bed Boulder conglomerate (260 to 278 m. above m.s.l.) is of fluvio-glacial origin and top four formations in increasing antiquity are Sohagpur, Shahganj, Hoshangabad and Janwasa ( 278 to 350m. above m.s.l.) are of fluvial origin and represent the complete sequence of Quaternary sedimentation in Narmada valley & Central India Khan & Sonakia (1992). The boulder conglomerate is a marker horizon of Quaternary sedimentation in Narmada Valley and as well in Central India, its disposition and relation with other deposits in the valley, indicates a significant change in regional climate from cold dry to warm and humid, during which the sediment were re-worked from glacial front intermittently and deposited in the valley over a very long time. The skull cap of *Homo erectus* (Narmada Man) and other fauna recorded along with calc- nodules within the boulder conglomerate; suggest that warm climatic phase prevailed for very long time.

The skull cap of *Homo erectus* (Sonakia1984) and other fauna recorded along with calc- nodules near village Hathnora (22° 52' N; 77° 52' E) in fossiliferous boulder conglomerate; named as Hathnora formation Khan & Sonakia (1992) is found to be associated with volcanic Ash bed of Quaternary age in the area around Hathnora, and upstream Khan et.al. (1991). The two levels of horizons of Ash bed identified are designated as NAB-I and NAB-II in ascending antiquity in the valley. The Ash bed NAB-I is associated lower litho units of boulder conglomerate which is well preserved and persistent where as NAB-II is associated with younger deposits. The NAB-I contains three micro layer (L-1 to -L3) and NB-II two micro layers (L-4 to L-5) in increasing antiquity. The Ash bed is associated with Hathnora formation at the depth of 78 m in Quaternary column and occurrences skull cape of *Homo erectus* at the depth of 83 m in decreasing antiquity from the top assumed that Toba eruption have taken place later than existence of *Homo erectus* which appeared and resided in the valley for long time before the fall of Toba ash. The association of Ash is NAB-I NAB-II at the depth of 72 m with the younger deposit revealed the second cyclic fall of Toba ash which certainly have had influenced on hominines and had collective and cumulative impact on *Homo erectus* (Sonakia1984) *Homo sapiens* (Thobold 1860, 81 ), in Narmada valley and Indian sub-continent. The Toba eruption was a mega event of very great magnitude and intensity, far greater than any known historical eruption, suggesting it had very devastating impact and repercussions. It has change the global climate environment and ecology. It is significant to note that the occurrences and association of two marked horizons at different levels further reveal that the cyclic eruption and settling of volcanic matrix has taken place with pause in the valley during sedimentation

The study of grain morphology of glass matrix, their relation with other minerals shape, size, and texture of fragments and sediments of pyroclastic origin suggest that sediments were brought from distant source in the form of thick cloud containing dust matrix and volcanic ash which was highly explosive and siliceous in nature and remained in atmosphere for quite long time. The height of the eruption column

appears to be considerable. It is postulated that the tephra preserved as disconnected bodies within the river valley sediments represent rapidly settled ash falls from a volcanic ash cloud which formed a canopy over a large part of river basins for longer time of Peninsular India where sedimentation was on in different river basins including Narmada valley. The discontinuity of Ash bed in Narmada valley and Indian subcontinent is attributed to be associated with column of volcanic eruption, quantum of volcanic matrix, wind direction, moisture density of air and rate of fall of matrix on oscillating platforms of sedimentation in different basin. It is significant to note that the occurrences and association of two marked horizons at different levels further reveal that the cyclic eruption and settling of volcanic matrix was with pause in the valley which perhaps related with pause in volcanic eruption

The volcanic eruption and consequential ash fall has created severe dislocation in ecology and environment and adversely affected hominines in Narmada valley and Indian subcontinent. It is witnessed by association of Ash bed NAB-I with Hathnora formation at the depth of 78 m in Quaternary column and occurrences skull cap of *Homo erectus* at the depth of 83 m in decreasing antiquity from the top assumed that Toba eruption have taken place later than existence of *Homo erectus* which appeared and resided in the valley for long time before the fall of Toba ash. The association of Ash is NAB-II at the depth of 72 m with the younger deposit revealed the second cyclic fall of Toba ash which have had influenced collective and cumulative the *Homo erectus* (Sonakia1984) *Homo sapiens* (Thobold 1860, 81), in Narmada valley and Indian sub-continent.

The study of cyclic Toba ash fall and using phytogeographic data, Oppenheimer (2003) argues that *Homo. Sapiens* occupied India before ~74 ka and may have undergone "mass extinction" as a result of the Toba eruption. The argument of Oppenheimer (2003) is in strong conformity with the present observation of authors. As sediment & Ash bed sequence of Quaternary column of Narmada (325m) and occurrences of fossil of skull cap of *Homo erectus* (Sonakia1984) at 83 m & human cranium *Homo sapiens* (Thebold 1960,1981) (transported) have rarest occurrences of human fossils in Narmada valley and subcontinent which also confirm the intensive impact of volcanic ash fall on these hominines and their consequential mass extinction caused by mega dislocation in ecology and environment by volcanic eruption

The Narmada skull cap of *Homo erectus* which is recovered from the vom of basal unit of boulder conglomerate at the depth of 83 m. (278 m. above m.s.l.) is estimated to be of upper segment of lower Pleistocene age. It is older than the *Homo erectus* of Chenjiawo, Congwangling of China which were recovered from paleo-sole and loess deposit at the depth of 38 and 26 m. The Quaternary sequence of Narmada (325 m.) as compared to Louchuan (136 m.) sections of China on unified Quaternary platform is older and represents the complete and type sequence of Quaternary sedimentation in Narmada Rift System in Central India. The occurrence of skull cap of early man at the depth of 83 m. in basal unit of boulder conglomerate of fluvio-glacial origin in Narmada Valley is one of the earliest and oldest *Homo erectus* in Asia.

The statistical analysis of sediments from these different domain in vertical column has been conducted to ascertain the environment of sedimentation and trace the breaks in climate (Khan et.al. in press). An

attempt has been made for the first time Khan et.al (2013) to correlate the various stratigraphic columns of associated hominid fossils of Narmada valley ( 325 m) India and that of Luochuan sequence,( 90-120 m) Chenjiawoe (50m ) and Congwanling sequence ( 36 m ) of China on unified Quaternary platform tied up and developed at mean sea level. The study revealed that the depth of occurrence of Narmada skull cap on unified Quaternary platform is about (83 m) as compared to with that of Chenjiawo and Gongwangling of China which occur at very shallow depth of 38 and 26 m respectively. The estimated age of Narmada Man based on these parameters is about 1.38 m.y. (+), which is greater than *Homo erectus* of Chenjiawo 0.65 m.y. and Gongwangling 1.15 m.y. of China An Zhisheng and Ho Chuan Kun (1989).

In India Narmada basin considering the one of a main loci of Quaternary sedimentation, and assuming the uniform accumulation rate of sediment in the basin in the line of Ma. et. al. (1978) Yobin Sun & Zhisheng, An (2005) and comparing the Narmada sequence of Quaternary deposit (325 m.) with those of Luochuan standard sequence of Chenjiawo and Congwangling sequence of China. The skull cap of *Homo erectus* (Narmada Man) recovered from the boulder conglomerate of fluvio-glacial origin in middle part of Quaternary column from deep level of Narmada, at the depth of 83 m. above glacial deposits, in association of ash bed, as compared to Chenjiawo Hominid from inter bedded sequence of paleo sols loess and silty loess at the depth of 38 m. and Congwangling 26 m. from paleo sols which are younger than Narmada deposits.

The Narmada skull cap of *Homo erectus* which is recovered from the vom of basal unit of boulder conglomerate at the depth of 83 m. (278 m. above m.s.l.) is estimated to be of upper segment of lower Pleistocene age. It is older than the *Homo erectus* of Chenjiawo, Congwangling of China which were recovered from paleo-sole and loess deposit at the depth of 38 and 26 m. The Quaternary sequence of Narmada (325 m.) as compared to Louchuan (136 m.) sections of China on unified Quaternary platform is older and represents the complete and type sequence of Quaternary sedimentation in Narmada Rift System in Central India. The occurrence of skull cap of early man at the depth of 83 m. in basal unit of boulder conglomerate of fluvio-glacial origin in Narmada Valley is one of the earliest and oldest *Homo erectus* in Asia. (Table No HE\_1 to \_3 & Plate No HE\_1 to 9)

The Paleo- anthropological information from these localities is remained closely associated with Quaternary sedimentary deposits boulder conglomerate and boulder bed often related to the trench Quaternary sedimentation, formation and development of rift and linear basin caused by repeated uplift, and the development of rift basins that began in the middle to late Pliocene and Pleistocene period. The unfortunate part of these deposits is that due repeated tectonic dislocation and faulting they are displaced dislocated and distorted the presently they are only exposed in limited section of meandering loop of Narmada river in valley at the base of NT2 and mostly concealed under the thick pile of sediments of present and paleo domain of Narmada of late Pleistocene and Holocene time. The disposition of boulder conglomerate and hidden its nature does not provide an adequate opportunity to researcher to study the human remain as postulated, except in limited section where they are exposed. it is difficult to disclose mysteries of human evolution in Narmada due to concealed nature of these deposits in rift system, however the

complementary part of Tapti-Purna Quaternary blanket may be potential and possessive of human remain and should be studied to trace further the

Imprints of fossil man taking in to account of SONATA LINEAMAN ZONE as single ecosystem for evolution of man in Indian subcontinent. The rift system and platforms of sedimentation bear the imprints of and evidence of the effects of tectonics on fauna and flora are distinct, however the signatures of subsidence dislocation and concealing of fossiliferous horizons are uncontrolled and ill defined in the ecosystem in the valley during the Pliocene–Pleistocene periods. The boulder conglomerate which yielded the skull cap of *Homo erectus* in Narmada rift from Hathnora Sonakia (1984) remained only discovery of hominid fossil in last two and half decade due to concealed and hidden nature of Mio-Pliocene Pleistocene deposits in rift system and inconsistency in exposure of fossiliferous horizon of Narmada rift system which is the handicapp in search of further human remains in Narmada valley after Khan et.al (2016), Khan et.al (2016), Khan et.al (2016)

The Quaternary blanket has been studied complete in three dimension and about 907 sediment were collected to study of statistical parameters heavy mineral assemblage, quartz grain morphology, quartz grain morphology of paleosol, ash bed and other aspect across the depth of about 480 m. The study revealed that their binary relations distinctly display contrasting and relative heterogeneity in sediment characteristics throughout across the Quaternary blanket in Narmada valley. The study of sediments display diagnostic characteristics of glacial, fluvio-glacial and fluvial environment at different depth and levels 000.m to 150, 150 to 350, and 350 to 550 m from glacial, fluvio-glacial fluvial, and fluvial deposit (150 samples). The critical analysis of these parameters exhibits sediment textural linkage to long evolution in glacial, fluvio-glacial and fluvial environment in time and space in increasing antiquity in the valley. The characteristics inherited by the sediments from pre-existing domain of sediments are glacial & terrestrial & environment. The diagenetic and diagnostic features; varying degrees of heterogeneity, sediment angularity roundness, degree of sorting indicate evolution and sedimentation of quaternary sediments in a high-energy turmoil glacial environment on tectonically dislocated and unstable platform. The sediments confined up to 150 m below ground level represent paleo fluvial domain of Narmada and represent multi cycle sedimentation under varying energy condition on oscillating platform. The vertical variation in increasing antiquity in textural parameters and distinct breaks at specific level identified indicate changes of environments of sedimentation in vertical columns from glacial at the bottom of valley trough subsequently followed by fluvio-glacial and further overlain by fluvial deposits which is related with change of climate and tectonic in watershed of Narmada. The binary relation of these parameters effectively used in differentiating and fencing the sediments of these domains and their environment of sedimentation in time and space Khan et.al (2015). The study of statistical parameters across the entire thickness of Quaternary deposits revealed three breaks in sedimentation at 350 -290, 190-220, 100-150 which represent glacial, Fluvio-glacial and Fluvial environment of in increasing antiquity in from bed rock in Narmada valley.

The qualitative and quantitative studies of heavy minerals of Quaternary deposits of different domain revealed five prominent heavy mineral suites viz, opaque suite; amphibole-pyroxene suite, biotite-muscovite-chlorite suite, garnet, sillimanite, kyanite, staurolite suite

and zircon, rutile, tourmaline suite.. The mineral of stable group viz. rutile, zircon and tourmaline show uniform distribution in the entire domain of terraces in the area of study. The zircon rutile, tourmaline and sphene are highly stable minerals though their abundance is common in quaternary deposit, hence considered to be very significant. The grain morphology and imprints of sedimentation these mineral bear are of immense significance in understanding the source of sediment, its nature of transportation, mode of transport, kinetics of medium and sedimentation. The zircon rutile tourmaline and sphene minerals occur as accessories mineral, mostly released from rock fabrics comprising boulder bed and were subjected to different degree of wear and tear and physical condition of weathering transport and deposition, the micro imprints acquired by different condition of sedimentation revealed the intense grounding and bed traction of sediments from the source. The striations on these minerals indicate intense glacial activity in the initial stage of sedimentation. These are generally angular to highly angular in shape and show very poor indices of sphericity and roundness typical of glacial environments. Occasionally sub-hedral partly broken prismatic crystals of tourmaline are also in these deposits. The study revealed that sediments were primarily derived from metamorphic source comprising of kyanite-paragonite, muscovite schist, gneiss, garnet mica schist, and Para-amphibolite tourmaline garnet metasedimentaries and meta-volcanic. Apart these minerals are also reworked from older Quaternary deposits from Boulder bed glacial deposit, Boulder conglomerate of fluvio-glacial deposit and fluvial terrace and higher and other older terraces of fluvial domain. These heavies were basically transported from the sources area by glacial fluvio-glacial and fluvial agencies to the present site of their occurrence. The configuration of minerals, rock clastic, ground mass, imprints and impact of tectonics revealed the intense grounding and bed traction of sediments from the source to site of sedimentation.

The Narmada before debouching into Gulf of Cambay a conspicuous quaternary blanket is encountered. This segment is about 90 km in length and forms the southern margin of the N-S extending Gujarat alluvial plains. A significant feature of the lower Narmada valley is the deposition of a huge thickness of Tertiary and Quaternary sediments in a fault controlled rift trench. To the south of the ENE-WSW-trending Narmada-Son Fault (NSF), the Tertiary rocks and basaltic flows of Deccan Trap Formation occur on the surface while to the north they lie in the subsurface and are overlain by Quaternary sediments. However, the overlying Quaternary sediments having a maximum thickness of 800 m (Maurya et al., 1995).

The tectonic uplift of the lower Narmada valley during the Early and Late Holocene suggests inversion of an earlier subsiding basin. Such inversions of the basin have been common in the Tertiary times and are well recorded in the sediments of that age (Roy, 1990). A symmetric convergence of the NT-1, NT-2 terraces, diagonal disposition of paired equivalent of terraces across the channel, divergent and linear disposition of cliff of NT-3 terrace in conformity of NSF revealed constant subsidence of basin and in response to frequent movement of geotectonic activity along the NSF.

The strongest supporting evidence for the Early Holocene tectonic uplift of the area comes from the sea-level curves of the west coast of India which suggest a tectonic component of about 40 m at this time (Rao et al., 1996). In the Lower Narmada valley the Mid-Late Holocene Quaternary valley deposits is the product of a Holocene high

sea-level-induced deposition in a deeply incised valley trench trough highly influenced by NSF. The Mid–Late which resulted in both estuarine and fluvial sedimentation in the lower reaches. A significant slowing down of tectonic uplift facilitated the encroachment of the sea into the valley and the creation of a depositional wedge, which extended up to the deep in land foothills. The 5–10-m exposed thickness of the valley-fill sediments reveals tide dominated estuarine deposition in the lower reaches and fluvial deposition upstream of the tide reach.

The pre-existing quaternary platform of NT-3 of middle Pleistocene prior to induced sedimentation of tidal transgression was strongly induced by tectonic impulses of NSF. The relative disposition of terraces (NT-2 NT-3), cliff alluvial bluff and scarp, reveals that the present mouth of the Narmada river has retained roughly the originally funnel shape of the estuary formed during the Mid–Late Holocene. However, the size of the estuary is now considerably reduced in space and time with sedimentation and compressive tectonic environment. The stepped sequence of terraces NT0 to NT2A NT2B NT2C NT3A, NT3B) their disposition, their convergence & divergence, cyclic and non cyclic nature and mutual inter relation revealed at least three mega phases and four micro phases of up rise of sea level related with tectonics of the area in late to upper pleistocene time.

The incursion and transgression of tides, present estuarine reach contains several islands, which are coeval with the terrace surface above the present tidal range. Hence, they are the products of estuarine processes of the Mid–Late Holocene and not those of the present day. Funnel shaped morphology and increasing tidal energy landward are characteristics of tide-dominated estuaries (Wright et al., 1973). Existing data suggest that the Mid–Late Holocene sea level has remained at the same level up to the present with minor fluctuations (Chappel and Shackleton, 1986; Hashimi et al., 1995). The Mid–Late Holocene sediments show tilting of 10–20 which is more pronounced in the vicinity of the NSF suggesting that the incision and uplift of the valley-fill terraces well above the present day tidal limits is related to the continued differential uplift along NSF. Evidence of tectonic uplift has been reported from the coast also in the form of raised mudflats occurring 2–4 m above present sea level (Merh, 1993). Currently, the river occupies the northern margin of the Early Holocene channel belt and is clearly more sinuous. It exhibits a narrow channel with wide meanders inside wide belts of Mid–Late Holocene terraces ( NT-3) a typical pattern of under fit streams (Dury, 1970).

### Introduction:-

The Narmada river originates from the Amarkantak plateau of Satpura Ranges in Rewa at an elevation of about 1057 m (22° 40' -81° 45') flows westerly course for about 1284 kms length across the middle of Indian subcontinent before entering Gulf of Cambay in the Arabian sea in Gujarat state.

The principal tributaries of Narmada are Hiran, Sher Shakkar, Dudhi, Tawa, Central sector where as Man, Madhumati, Heran and Orsang are in lower Narmada valley. These tributaries have developed transverse to the main axis of Narmada rifting and had deep cut across the quaternary blanket. The evolution of Narmada graben is differential and asymmetrical with rifting and sinking valley floor. These tributaries possess imprints of rifting and sinking events. These imprints are recorded in terms of manifestation and signature on landscape, drainage, land form elements, present and paleo- meandering segment, river terraces, cut of meanders, paleo channels, scars, rock cut terraces, selective channel entrenchment linear and curvilinear cliff & scarpment.

The Quaternary tract of Narmada basin covers an area of about 12950 sq. km starting from west of Jabalpur (23°07'79°53'00") to east of Harda (22° 29'; 76° 58') for a distance of about 320 km. It is found to be ideal locus of Quaternary sedimentation in Central India as witness by multi-cyclic sequence of Quaternary terraces in the valley. The general elevation of Narmada alluvial plain varies between 265.7 and 274.3 m above the sea level. The general gradient of this plain in this stretch is about 1m/Km towards West. (Plate No\_1 to 3)

### Sedimentation:-

The Quaternary blanket occurs in the central part of valley in Jabalpur –Harda section and in Gurudeshwar –Bharouche section in lower of valley; where as in the other part in Harda –Mandleshwar section thin and isolated caps and strips of quaternary sediments are noticed on rock cut terraces and rock benches of country rocks. In Mandleshwar-Barwani, Dhadgaon- Tilakwarda the quaternary deposits are shallow to moderate in thickness and thin out to wards east. The isolated loci of accumulation and sedimentation along the entire length of 1300 kms of Narmada area controlled by the tectonics and structural frame work and sinking and uplift of fault bounded blocks and lineaments. It is well illustrated by neoseismic signatures and imprints on quaternary deposits and landscapes in the valley. The critical analysis of landscape profile evolution of drainage, quaternary terraces, river morphology and analysis of bore hole data of basement configuration of rock and quaternary deposits revealed that Jabalpur-Harda section valley segment suffered mega dislocation and sink to level of about 1150 m as compared to the adjoining blocks and created and has formed open rock basin and platform of quaternary sedimentation. This section display complete record of quaternary deposits of glacial, fluvio- glacial and fluvial sediments in increasing antiquity from the base. The study of bore data of ETO, CGWB, and GSI indicates that average thickness of quaternary deposits of Narmada is about 435 m. The quaternary deposits bear well preserved imprints of neotectonism indicating that the Sonata lineament zone seismically is active and has direct bearing on quaternary landscape of rift valley. The Harda –Mandleshwar section predominantly portrays the sequence of cyclic and noncyclical rock cut terraces and rock cut platform and benches which are time equivalent to the quaternary terraces of central and lower Narmada valley Khan et.al (2014). In Mandleshwar-Barwani the quaternary sediment are of moderate to shallow in thickness which are incised along with the country rock by cyclic structural dislocation and tectonic activity along ENE WSW lineament fabrics and dynamic incision of stream. It is well documented in quaternary terraces and composite erosional terraces; rock cut terraces capped by quaternary sediments, river profile and channel morphology. The morphogenetic expression of the section revealed uplift of block. The Gurudeshwar-Bharouche embodies the thickest quaternary deposits which represents complete sequence from the base glacial fluvio-glacial fluvial, lacustrine and mud deposits.

The Narmada rift system basins provided a unique setting for dynamic ecosystems that were characterized by Rift-related subsidence and coeval sedimentation also created an ideal loci of Quaternary sedimentation and environment for the accumulation of sediments volcanic fabrics sediments, burial, diagenesis, and preservation of organic remains. Because rifts formed after widespread Quaternary sedimentation occurred and voluminous sediments in the rift basins were accumulated by glacial activity consequential upon the lowering of temperature and climatic changes in the region.

The Miocene -Pliocene–Pleistocene lake deposit of Katni on the eastern rift shoulder was created by faulting, topographic control, or isostatic depression similar to that of other Rift system. The Narmada flows along seismic tectonically active NSF which forms a fault controlled basin of a huge thickness of Tertiary and Quaternary

sediments. The thick blanket of Quaternary sediments occurs in the central part of valley in Jabalpur –Harda section and in Gurudeshwar – Bharouche section in lower of valley; where as in the other part in Harda –Mandleshwar section thin and isolated caps and strips of quaternary sediments are noticed on rock cut terraces and rock benches of country rocks. The Tilakwarda \_Bharouch section display complete record of quaternary deposits of glacial, fluvio- glacial and fluvial sediments in increasing antiquity from the base.

#### **Pleistocene Phase:-**

The Narmada Rift valley formed a linear trench in the middle of Indian subcontinent, was an ideal loci for accumulation of sediments. The rift trench is intruded by the dolerite and other mafic and siliceous dykes and sills along lineaments in different phases of tectonic deformation. The Quaternary sedimentation incepting from glacial activity, followed by fluvio-glacial, lacustrine and fluvial phase within the rinsing and sinking environment, block faulting and segmental and linear displacement and dislocation, uplifting and isolated domal up- lift, Neogene rifting and Quaternary sedimentation and rift-bound Pliocene–Pleistocene rifting and volcanic activity, specifically during glacial and fluvio-glacial phase are major component of the Quaternary period and tectonic processes of the Narmada Rift System which forms the base of quaternary deposits. The Quaternary sedimentation was triggered by tectonic activities / up lift and climatic changes. The provenance for these sediments is the weathering products of eroding pre- Cambrian, meta-sediments, sedimentary and volcanic rocks along the watershed upland, rift escarpments and shoulders; faulted and uplifted blocks, volcanic fissure zones, and plateaus within and outside the rift. The Narmada Rift System, bounded by adjacent plateaus rising 300–700 m above the rift floor, consists of number symmetrical and asymmetrical faulted blocks, escarpment, rock cut terraces, rock floors and segments of micro half grabben. Although rift-related basins started to form during the late Oligocene to early Miocene times, the Narmada Rifts were fully defined by middle to late Miocene time.

The Narmada rift system basin platform provided a unique setting for dynamic ecosystems that were characterized by Rift-related subsidence and coeval sedimentation also created linear depression for Quaternary sedimentation and environment for the accumulation of sediments volcanic fabrics sediments, burial, diagenesis, and preservation of organic remains. Because rifts formed after widespread Quaternary sedimentation occurred and voluminous sediments in the rift basins were accumulated by glacial activity consequential upon the lowering of temperature and climatic changes in the region.

The Miocene -Pliocene–Pleistocene lake deposit of Katni on the eastern rift shoulder was created by faulting, topographic control, or isostatic depression similar to that of other Rift system. The skull cap of *homo-erectus* Sonakia (1984), suggest that the Narmada Rift System created productive ecosystems during Pliocene–Pleistocene time. The volcanic rocks within the fossiliferous sediments provide temporal information for calibrating and sequencing hominid and other faunal evolution. The detailed geological sedimentological geochemical study of interbedded tephra, Quartz grain morphology of sediments of quaternary strata and paleo-sole of and geochronological studies of from the different localities for establishing accurate biostratigraphic and lithostratigraphic data, sedimentation rates, and paleoenvironmental and tectonic histories of different sediment columns in area along the rift system. Interbedded volcanic rocks allow determination of the time of rifting, the beginning of sedimentation, sedimentation rates, and the oscillation from glacial, fluvio-glacial lacustrine to fluvial environments. The cyclic environmental transitions recorded in the sedimentary sequences of the rift basins are caused by tectonic activities (uplift and subsidence), changes in relief, and climatic variations. The climatic changes in uplift, topographic and landscape features, coupled with block faulting, rinsing and sinking platform, created basins for the accumulations of thick lacustrine and fluvial sediments sequences with terrestrial and aquatic fossils. The sequential change in the sediment facies from finely bedded lacustrine deposits to fluvial sediments are commonly noted in the sedimentary sequences and reflect environmental and tectonic changes that can be temporally determined. Moreover, regional correlation based on the chemistry and geochronology of interbedded tephra has made it possible to establish accurate stratigraphic relations those are useful for pale- environment reconstruction and evolutionary studies of fossil remains in the Narmada rift valley Khan et.al. (2012). Regional tephra correlation is being used increasingly to link sites together, and has already established that similar tephra layers are known from other parts of rift valley, as well as from other basin and peninsular India Achariya, (1995), Khan (1992) Khan et.al. (2012) Tiwari (1996). There is a great potential for further correlation of tephra in the Rift System and marine sediments in the Arabian Sea. The Arabian Sea has a continuous record of deposition that extends to at least 7 million years. The Quaternary sediments interbedded with tephra within the age range of the ODP Ocean Drilling Program 721/722 stratigraphic sections of the Arabian Sea are also present within the rift floor and the western rift margin of the region. The chemical and chronological correlations of ash beds within the

rift sequences of have been made with ashes described in marine sections. Detailed correlations based on orbitally calibrated time scales of pale magnetic stratigraphy Rao (1996 ) within Quaternary sediments of rift deposits will provide ties to establish global climate changes based on the terrestrial and marine sediments of the rift system.

Moreover, because of tephra layers in sedimentary basins of different geologic periods, processes such as faulting, rifting, sedimentation and diagenesis, impact of climatic changes, age of fossils, nature and acquisition of archeological implements, and the origin, distribution, and functional significance of early hominid artifact assemblages can be deciphered. However, evidence of the effects of tectonics on fauna and flora are distinct and its signatures on dislocation and concealing of fossiliferous horizons are uncontrolled and ill defined in the ecosystem in the valley during the Pliocene–Pleistocene periods. The boulder conglomerate which yielded the skull cap of *Homo erectus* in Narmada rift from Hathnora Sonakia (1984) remained only discovery of hominid fossil in last two and half decade due inconsistency concealed nature of fossiliferous horizon due faulting, dislocation and subsidence of Quaternary blanket of Narmada rift system as such researcher and scientist failed to add any further knowledge to hominid discovery any further.

The Narmada Rift System consists of symmetrical basins that have been evolved in different stages of tectonism. The 100 -120 km-wide and 1300 km long rift bounded by Satpura in south and Vindhyan in north constitutes conspicuous ENE-WSW to E-W rift basin zone is filled with Pliocene–Pleistocene sediments, whereas some of them contain Miocene sedimentary deposits. Most of the sedimentary sequences contain faunal and floral remains including hominid species. Most of the basin-fill sediments were derived from topographically elevated rocks that are present within and outside the rift basins. Lava flows and tephra are interbedded with the fossiliferous sediments clastic sediments derived from .The provinces of sediment mostly from crystalline basement volcanic, sedimentary, meta basic and sedimentary rocks, aided in the cementation and preservation of organic remains by providing secondary minerals released during alteration in a burial environment. Quick burial minimized the effect of preburial taphonomic processes. Moreover, chemical constituents released by the alteration have provided critical temporal and spatial information without which the study of hominid evolution and paleoenvironmental reconstruction in the Rift System would have been impossible.

Moreover, because of tephra layers in sedimentary basins of different geologic periods, processes such as faulting, rifting, sedimentation and diagenesis, impact of climatic changes, age of fossils, nature and acquisition of archeological implements, and the origin, distribution, and functional significance of early hominid artifact assemblages can be deciphered. However, evidence of the effects of tectonics on fauna and flora are distinct and its signatures on dislocation and concealing of fossiliferous horizons are uncontrolled and ill defined and the ecosystem in the rift system during the Pliocene–Pleistocene periods is not clear. The boulder conglomerate which yielded the skull cap of *Homo erectus* in Narmada rift from Hathnora remained only discovery of hominid fossil in last two and half decade due inconsistency concealed nature of fossiliferous horizon in Narmada valley. Historical or modern analogs illustrate the potential of the regional and sometimes global effects of such major silicic eruptions in the geologic past of sedimentation, sedimentation rates, and the oscillation from lacustrine to fluvial environments. The cyclic environmental transitions recorded in the sedimentary sequences of the rift basins are caused by tectonic activities (uplift and subsidence), changes in relief, and climatic variations. Changes in topographic features, coupled with volcanic damming, created basins for the accumulations of thick glacial, fluvio-glacial lacustrine and fluvial sequences with terrestrial and aquatic fossils. Changes from finely bedded lacustrine deposits to fluvial sediments are commonly noted in the sedimentary sequences and reflect environmental and tectonic changes that can be temporally determined. Moreover, regional correlation based on the chemistry and geochronology of interbedded tephra has made it possible to establish accurate stratigraphic relations that are useful for pale environment reconstruction and evolutionary studies of fossil remains in the rift valleys across India sub continent Regional tephra correlation is being used increasingly to link sites together, and has already established that similar tephra layers from known area in Rift system.

The Boulder Bed and Boulder conglomerate which form the base of Quaternary sediments in Central sector of Narmada Rift Valley are not exposed in the lower Narmada valley. These deposits are concealed under the sediments of lacustrine and fluvial deposits in the valley. The presence of these deposits is confirmed by study of bore hole data and logs of State and Federal agencies drill in lower Narmada valley under various projects. The boulder bed is differentiated in Hominid locality by extensive and intensive statistical analysis of sediment collected from bore hole logs for grain size parameters heavy mineral study quartz grain morphology of sediments and palaeosol which have assisted in identifying the sedimentological breaks in increasing antiquity in vertical columns and their correlation in other sections of Narmada Rift valley.

**Early to Late Pleistocene phase:-**

In the Narmada valley the River terraces (NT-1 NT-2) which represents sediments of Bharuch and Tilakarda formation date back to the Late Pleistocene. The sedimentation commenced with the deposition of the marine basal clays during the last interglacial high sea level at 125 ka, which is presumed to be about + 7 m as revealed by the studies. Regression of this sea led to the initiation of fluvial sedimentation. The fluvial sediments were deposited in two phases of sedimentation with a sharp break marked by tectonic changes and related climatic changes. The fluvial flood plain deposit of Bharuch formation overlies the marine clays followed by the fluvial flood plain deposit of Tilakarda formation. The sequence of these two formations is exposed in the cliff section which represents different sediment facies typical of fluvial environments. The sequence of sediments displays imprints of compressive tectonic regimes of sedimentation. The southern margin of lower Narmada is marked by Narmada–Son Fault, the transformation of this geofracture in Tertiary to reverse fault in Quaternary is implicit in the seismic studies of the area (Roy, 1990). Additional evidence for prevalence of compressive stress regime in the lower Narmada basin is provided by numerous reverse faults (Fig. 2B) in the Neogene sediments exposed immediately to the south of Narmada–Son Fault (Agarwal, 1986). These evidences suggest that the sediments of both the formations were formed in a compressive tectonic environment. There are evidences of subsidence of basin which has been documented on landscape of basin which are authenticated by other studies exist from adjacent area of synsedimentary subsidence on alluvial plain sedimentation (Shuster and Steidtmann, 1987; Brown and Plint, 1994; Kraus and Middleton, 1987; Kraus, 1992; Jordan, 1981; Hagen et al., 1985).

Absence of soil profiles in the thick blanket of Quaternary sediments of the study area is indicative of synsedimentary subsidence of the basin. It is unlikely that a high sinuosity channel will produce stacked system of fluvial deposits showing these characteristics (Shuster and Steidtmann, 1987). Deformations in these sediments of the types described above are the direct manifestations of this subsidence. Strong similarity of the structural orientations of the deformation structures suggests subsidence in a thrusting environment along the NSF which is consistent with the subsurface studies. It is inferred a low sinuosity and relatively fixed river system in a slowly subsiding basin for the deposition of these sediments. Synsedimentary subsidence of the basin due to differential movement along the NSF is indicated by entrenched meander thick overbank sediments and the deformation structures. Folding and faults with reverse movement in the overbank sediments suggest a compressive stress regime along the NSF. A brief period of tectonic stability followed as suggested by the 4–5-m thick palaeosol (red soil), which is stratigraphically correlatable with the red soil exposed in the Mahi and Sabarmati river basins of Gujarat alluvial plains.

The alluvial fan in between of Tilakarda and Rajpipla within the loop of Narmada is mono illustration of morphogenetic process associated with neotectonic event. The disposition of Quaternary blanket, fan deposit and other quaternary land forms are controlled and restricted by SONATA LINEAMENT to wards north. The convergence of fan deposits and its apex is not in conformity of piedmont sedimentation, it is also devoid of torrential stream net work, which firmly rule out to be endogenetic fan deposits and appears to up lift cut & past mass of older quaternary deposits along SONATA LINEAMENT.

The physiographic set up and drainage configuration of the Narmada the area of study demonstrate strong influence of tectonic and structure on development and evolution of drainage. The Narmada enters in the area around Garudeshwar descends NW –SE direction cutting across NSA entering the quaternary tract. It further down stream of Tilakarda swing to wards west and suddenly become slow and sluggish and sinuous to meandering in channel pattern long the northern edge of upland and ultimately debouches in the Gulf of Cambay. The disposition and convergence of drainage net in conformity of disposition of quaternary landscape demonstrates is anomalous further imprints and neoseismic signatures on landscape profile revealed persistent instability of basin during sedimentation. The tectonic uplift of the lower Narmada valley during the Early and Late Holocene suggests inversion of an earlier subsiding basin. Such inversions of the basin have been common in the Tertiary times and are well recorded in the sediments of that age (Roy, 1990). A symmetric convergence of the NT-1, NT-2 terraces, diagonal disposition of paired equivalent of terraces across the channel, divergent and linear disposition of cliff of NT-3 terrace in conformity of NSF constant subsidence of basin and in response to frequent movement and geotectonic activity along the NSF. The displaced Late Pleistocene sediments across NSF in the Narmada and Orsang Heran and Madhumati & Karjan valleys, the NNW tilting of the NT-1, NT-2 sediments litho units consisting of the Late Pleistocene sequence, the anomalous topographic slope in the same direction and the incised cliffs up to 25–30 m in the streams that flow along this slope in the area between NSF and the Narmada River, indicate unsynchronized neoseismic movements along the NSF during the Early Holocene. The displacement of sediments of NT-1 surface across the NSF indicates differential movement of about 35 m along the NSF during Early Holocene. The block

between the Narmada and Karjan rivers bounded by the NSF and the two other cross-faults suffered subsidence leading to the formation of a series, linear and curvilinear cuts of on terraces and flood plains. The 5–8-m incised cliffs of the streams also suggest that this block escaped the uplift induced large scale incision going on simultaneously in other areas of the lower Narmada valley. The occurrence of ravines and association of deep gullies with the river terraces is morpho- tectonic manifestation caused by the sudden vertical movement and block adjustment due subsidence resulting to sudden collapse of water table and ground water regime in the area. The strongest supporting evidence for the Early Holocene tectonic uplift of the area comes from the sea-level curves of the west coast of India which suggest a tectonic component of about 40 m at this time (Rao et al., 1996).

#### **Middle Holocene - Recent phase:-**

In the Lower Narmada valley the Mid–Late Holocene Quaternary valley deposits is the product of a Holocene high sea-level-induced deposition in a deeply incised valley trench trough highly influenced by NSF. The Mid–Late Holocene which resulted in both estuarine and fluvial sedimentation in the lower reaches. A significant slowing down of tectonic uplift facilitated the encroachment of the sea into the valley and the creation of a depositional wedge, which extended up to the deep in land foothills. The 5–10-m exposed thickness of the valley-fill sediments reveals tide dominated estuarine deposition in the lower reaches and fluvial deposition upstream of the tide reach. The pre-existing quaternary platform of NT-3 of middle Pleistocene prior to induced sedimentation of tidal transgression was strongly induced by tectonic impulses of NSF. The relative disposition of terraces, (NT-2 NT-3 cliff alluvial bluff and scarp), reveals that the present mouth of the Narmada river has retained roughly the originally funnel shape of the estuary formed during the Mid–Late Holocene. However, the size of the estuary is now considerably reduced in space and time with sedimentation and compressive tectonic environment.

The incursion and transgression of tides, present estuarine reach contains several islands, which are coeval with the terrace surface above the present tidal range. Hence, they are the products of estuarine processes of the Mid–Late Holocene and not those of the present day. Funnel shaped morphology and increasing tidal energy landward are characteristics of tide-dominated estuaries (Wright et al., 1973). Existing data suggest that the Mid–Late Holocene sea level has remained at the same level up to the present with minor fluctuations (Chappel and Shackleton, 1986; Hashimi et al., 1995). The Mid–Late Holocene sediments show tilting of 10–20° which is more pronounced in the vicinity of the NSF suggesting that the incision and uplift of the valley-fill terraces well above the present day tidal limits is related to the continued differential uplift along NSF. Evidence of tectonic uplift has been reported from the coast also in the form of raised mudflats occurring 2–4 m above present sea level (Merh, 1993). Currently, the river occupies the northern margin of the Early Holocene channel belt and is clearly more sinuous. It exhibits a narrow channel with wide meanders inside wide belts of Mid–Late Holocene terraces (NT-3) a typical pattern of under fit streams (Dury, 1970).

In the Narmada valley the River terraces (NT-3) has occupied large area on the both bank of Narmada. It extends from Orsang river in the north east to Mahi river in the west from Baroda in the north to Bharuch –Aliabet in the southwest. In the southern bank of Narmada it is developed around Ankleshwar and Rajpipla and further south. The average elevation of this surface is about 75 m above m.s.l, separated by both linear and curvilinear scarp from NT-2. The average height of cliff is about 40 m. The sediments comprised of this terrace are exposed in the cliff section. The oldest deposit of the exposed sediment successions a highly pedogenised mottled clay horizon showing vertisolic characters like extensive fracturing giving rise to blocky aggregates, pseudo anticlines and hydro plastic slickenside along the fracture surfaces. The sediments of this terrace are associated with a rich assemblage of shallow marine foraminifers. The basal unit consisting of rock pebbles with clays is overlain by thick fluvial sediments, which comprise alluvial plain facies. The pebbly unit which contains rock fragments of quartzite, granite basalt, and limestone sandstone is about 5.5.m thick, it is a persistent horizon and exposed in the cliff section. It is marker horizon, represent distinct phase of sedimentation in the valley. In the Narmada valley the River terraces (NT-3) which represent sediments of Ankleshwar formation. The fluvial sediments indicate deposition in single phase of fluvial sedimentation with a sharp break marked by tectonic changes and related climatic changes. The sequence of this formation is exposed in the cliff section, is marked by the major break in sedimentation as witnessed by the occurrence of persist pebble horizon at the base. This formation represent different sediment facies typical of fluvial environments. The sequence of sediments display imprints of compressive tectonic regimes on sedimentation. In the lower Narmada Valley alluvial fan as identified between Tilakwarda and Rajpipla within the loop of Narmada is mono illustration of morphogenetic process and morpho tectonic manifestation associated with neotectonic event. The disposition of Quaternary blanket, fan deposit and other quaternary land forms are controlled and restricted by SONATA LINEAMENT. The convergence of fan deposits and its apex is indistinct

and not in conformity of piedmont sedimentation, further it is devoid of torrential stream net work and environment it firmly rule out to be endogenetic fan deposits. The present study of these deposits their disposition its composition indicate that these deposits are older deposits and brought to the present position by tectonic activity along SONATA LINEAMENT.

The boulder bed is diffrentiated in Hominid locality by extensive an intensive statistical analysis of sediment collected from bore hole logs for grain size parameters heavy mineral study quartz grain morphology of sediments and plaosole, which have assited in identifying the sedimentological breaks in increasing antiquity in vertical coloumns and their correlation in other sections of Narmada Rift valley.

The sediments of paleo-domain of Narmada conformably overlies the boulder conglomerate and represent the flood-plain fluvial facies of the Narmada. The sediments of the facies predominantly consist of clay silt and sand, discontinuous nodules and plates. The beds are horizontal, exhibit upward fining sequence typical of fluvial deposits. This domain may be divided into three formations based on lithology, sediment assemblage, shape and size of rock clastics, relative disposition and diagnostic sedimentary characteristics. These formations are, viz. (i) Shohagpur, (ii) Shahganj, and (iii) Hoshangabad Formations respectively. These formations represent the sediments the complete sequence of Narmada deposited in channel and flood plain environments during Upper Pleistocene time. (Plate No \_5 to \_8)

#### **Neotectonics Tectonics & sedimentation:-**

The Indian Plate is currently moving northeast at 5 cm/yr (2 in/yr), while the Eurasian Plate is moving northeast at only 2 cm/yr (0.8 in/yr). This is causing the Eurasian Plate to deform, and the Indian Plate to compress leading to tectonic activity along major fault zones. In tectonically active areas sedimentary basins undergo phases of both crustal extension and contraction leading to basin inversion and hence display features typical of subsidence and uplift. Geomorphic attributes and deformation in late Quaternary sediments are the indicators of active tectonic activity in any sedimentary basin. The geomorphic evolution in such reactivated basins is primarily due to complex interaction between sedimentation processes and tectonics. The peninsular India has been undergoing high compressive stresses due to the sea-floor spreading in the Indian Ocean and locking up of the Indian plate with the Eurasian plate to the north. Much of this N-S directed stresses have been accommodated by the under thrusting of the Indian plate below the Eurasian plate. A part of these compressive stresses are accumulated along the Narmada-Son Fault (NSF), a major E-W trending crustal discontinuity in the central part of Indian plate. The Quaternary tectonic activity recorded in the Narmada valley possibly, has wider ramifications when viewed in the larger perspective of the Indian plate. This suggests a renewed phase of extreme compression of the Indian plate, which led to tectonic insecurity and may causes tumores and earth quake in peninsular India. The manifestation of impact of compressional forces with the movement of Indian plates have resulted in reaped and frequent migration and changes in courses of Kosi, Sharda, Ghaggar, Ghagra and their tributaries in Ganga plain. The Himalayan river Ganga and Jamuna in intermontane region had unilateral chiselled fluvial terraces in western and eastern extremity of river banks which are unpaired and non cyclic in nature indicating up lift and up rising of block in between these two mighty accedental river. Besides area also possess imprints of neotectonism, hanging drainage, tilt in terraces, over stepping of alluvial fan and chopping of apex from main body of fan deposits along the fault and lineament hanging which further revealed that area is under stress and within the periphery zone of substratum and collision Of Indian and Eurasian plate. (Khan et al 2016)

In Narmada Rift system taking as single ecological unit for Quaternary sedimentation & tectonics and presence of the Katni Formation in central sector with angiosperm flora suggests that sedimentation continued during Mio-Pliocene in localized lakes. The relative disposition of such lakes and subsequent deformation and structural dislocation on oscillating valley platform clubbed with rifting and faulting during Quaternary period has shifted the site of the lakes towards the present alluvium-covered area between Harda -Jabalpur, Garudeshwar and Bharouch as presumed: where as the present study of various aspects of Quaternary blanket in SONATA LINEAMENT ZONE revealed that quaternary sedimentation was a sequential and continuous process in rift valley system from Mio-Pliocene Pleistocene time, has deposited complete sequence of glacial, fluvio-glacial lacustrine fluvial and tidal deposits with changing environments and climate in time & space. The present disposition of quaternary blankets in Son Narmada basin is due to post deposition Quaternary tectonics which is solely responsible for sedimentation, dislocation, faulting and shifting of different blocks and distorting ecology in rift system. The occurrence of Boulder bed and Boulder Conglomerate in Son Narmada Tapti and Purna with similar rock assemblages and suites of rock fabrics, heavy mineral assemblages, and quartz grain morphology in critical and

crucial sections across the SONATA LINEAMENT ZONE strongly support tearing and rifting of quaternary blanket during late Pleistocene time. The presence of thick boulder bed in Harda inliers area, such as at Chandgarh and north east of Barwaha, boulder bed in confluence are of Tapi and waghur around Khadgaon in Tapi valley Khan et.al (1984) supports this assumption.

The Narmada Rift valley formed a linear trench in the middle of Indian subcontinent was unique site for accumulation of sediments. The rift trench is intruded by the dolerite and other mafic and siliceous dykes and sills along lineaments in different phases of tectonic deformation. The Quaternary sedimentation incepting from glacial activity, followed by fluvio-glacial, lacustrine and fluvial phase within the rifting and sinking environment, block faulting and linear displacement and dislocation, uplifting and isolated domal up-lift, Neogene rifting and Quaternary sedimentation. The rift-bound Pliocene–Pleistocene rifting and volcanic activities specifically during glacial and fluvio-glacial phase are major component of the Quaternary period and tectonic processes of the Narmada Rift System which form the base of quaternary deposits. The Narmada rift system basin platform provided a unique setting for dynamic ecosystems that were characterized by Rift-related subsidence and coeval sedimentation and has also created an ideal loci of Quaternary sedimentation and environment for the accumulation of sediments volcanic fabrics sediments, burial, diagenesis, and preservation of organic remains. The present disposition of Narmada blanket of Narmada, Tapi-Purna and Son in SONATA LINEAMENT ZONE revealed that the rift occurred after widespread Quaternary sedimentation and accumulation of sediments in the linear trench by glacial activity in late Pleistocene. The Fluvio-glacial phase is represented by boulder conglomerate which has formed the persistent horizon in the valley. The Narmada has in the area under study has sculptured the alluvial tract into stepped sequence forming four alluvial terraces along its course. These are designated as NT0 to NT3, NT0 being the youngest terrace and NT-3 the oldest terrace where the sub terraces are designated NT2-A is NT2-B, NT2 B, besides NT2-C, NT3-A & NT3-B in increasing order of antiquity. These are both erosional and depositional terraces and confined at an elevation of, between 280 to 310-380, are separated by the scarp both of curvilinear and linear in nature facing towards river side. These are abandoned flood plains represent the level of former valley floor in the area, and were formed by cumulative climato-tectonic changes in the watershed of Narmada in the Quaternary times. (Khan et.al 2016).

The Quaternary landscape of Narmada comprises ( NT-1 to NT-3 ) and their correlation with rest of Narmada Rift Valley between Jabalpur-Harda and Harda - Bharuch suggest that it has evolved mainly due to tectonic activity along the SONATA LINEAMENT in a compressive stress regime. The sediments comprising these were deposited in a slowly subsiding basin during early Pleistocene middle Pleistocene and the Late Pleistocene. The Holocene period is marked by inversion, which had earlier suffered subsidence. The inversion of the basin is due to a significant increase in compressive stresses along the NSF during the Early Holocene, resulting in differential uplift of the lower Narmada valley. The continuation of the compressive stress regime due to ongoing northward movement of the Indian plate indicates that the NSF is a major candidate for future intraplate seismicity in the region. The alluvial fan in between f Tilakwarda and Rajpipla within the loop of Narmada is mono illustration of morphogenetic process associated with neotectonic event. The disposition of Quaternary blanket, fan deposit and other quaternary land forms are restricted by SONATA LINEAMENT to wards north. The convergence of fan deposits, geomorphic set up slope, impersistancy of apex and other converging points are not in ecology of piedmont sedimentation, hence it is firmly rule out to be endogenetic fan deposits; the assemblage of sediment matrix rock fabrics and rock pethology and occurrence and disposition of these deposits indicate that it is uplifted cut mass of older quaternary deposits which has moved by tectonic activity from deep level of strata and has been pasted along SONATA LINEAMENT. (Khan et.al 2016).

There are evidences of the effects of tectonics on fauna, flora and tephra layers associated with Quaternary deposits of Narmada Rift valley, have under gone faulting, rifting, and dislocation during sedimentation. The impact of structural disturbances and evidence of the effects of tectonics on fauna and flora are distinct and their signatures on dislocation and concealing of fossiliferous horizons are uncontrolled and ill defined in the ecosystem in the valley during the Pliocene–Pleistocene periods. The boulder conglomerate which yielded the skull cap of *Homo erectus* in Narmada rift from Hathnora Sonakia ( 1984 ) remained only discovery of hominid fossil in last two and half decade due inconsistency and concealed nature of fossiliferous horizon due faulting, dislocation and subsidence of Quaternary blanket of Narmada rift system as such researcher and scientist failed to add any further knowledge to hominid discovery in Narmada any further. The area is under tremendous stress due to movement of India plate to wards north east and vertical adjustment of different blocks in the Sonata lineament zone. There appear there is significant increase in compressive stresses accumulating on an intracrustal fault like the NSF can transform a

previously subsiding basin into an uplifting one. The NSF has been characterized by a compressive stress regime throughout the Quaternary and variations in the degree of compression relative to the rates of plate movement are responsible for the late Pleistocene subsidence and the Holocene tectonic inversion in the Narmada it is witnessed by manifestation on drainage net work imprints of neotectonism and shifting and tilt in terraces of Narmada and its tributaries. Khan et.al (2016).

The impact of structural disturbances and evidence of the effects of tectonics on fauna and flora are distinct and their signatures on dislocation and concealing of fossiliferous horizons are uncontrolled and ill defined in the ecosystem in the valley during the Pliocene–Pleistocene periods. The boulder conglomerate which yielded the skull cap of *Homo erectus* in Narmada rift from Hathnora Sonakia (1984) remained only discovery of hominid fossil in last two and half decade due inconsistency and concealed nature of fossiliferous horizon due faulting, dislocation and subsidence of Quaternary blanket of Narmada rift system as such researcher and scientist failed to add any further knowledge to hominid discovery in Narmada any further.

The Tapti-Purna graben is located south of Satpura which evolved as two separate basins of fluvio-lacustrine sedimentation, connected subsequently. The most conspicuous feature of the southern margin of the Satpura between longitude 74° and 78° is conspicuous ENE-WSW to E-W trend of Tapti which display local swing at places. These trends characterizing Tapti crustal block, conform to structural grain of the area reflecting the convergence of Tapti and Gavilgarh faults enechelon system traversing Satpura foot hills, with a southerly convexity. The Quaternary basin areas in Tapti Crustal block are characterized by relatively thinner crust with moho depth of 33-37 km, shallow basement (<1 km) with higher density (+0.239m) mantle derivatives emplaced at shallow level (4-5 km; Rao K.V., 1997). The present studies taking entire quaternary sedimentation of SONATA LINEAMENT ZONE as single ecological system besides the tectonics on the either side of Satpura, it revealed that the area of SONATA LINEAMENT ZONE formed a single loci of sedimentation and there was continuous and sequential deposition of sediments from Pleistocene to Upper Pleistocene time, it is witnessed by quaternary events morphogenetic expression disposition of river terraces their mutual relation, lithostratigraphic, correlation across Narmada, Tapti–Purna and Son valley Khan (in press). The Narmada and Son are two linear basins north of Satpura and Tapti-Purna in south, was a single elliptical trench which has provided a platform of Quaternary sedimentation in Central India. The present expression and configuration and fragmented disposition of quaternary blankets of Son Narmada, Tapti and Purna is due to tearing, faulting, dislocation subsidence, up rise of various blocks and reactivation of structural fabrics with in the SONATA LINEAMENT ZONE. (Khan 2016).

The Quaternary deposits of Tapti comprised of Boulder conglomerate, fluvial deposits of paleo- domain of Tapti and Fluvial deposits of present domain of Tapti. The Boulder deposits forms the base of Quaternary deposits overlying directly of basaltic rock embodied with older deposits in the basin. It revealed that inception of quaternary sedimentation occurred in the rock basin south of Satpura in Tapti which has outer rim of basin in the west and restricted by strong N-S structural trend and striking ranges in the west. It is contradictory to the opinion of earlier worker (Tiwari, 1996) and others. The quaternary deposits of Wardha upper Pleistocene-Holocene age (50 m) (Tiwari 1985) forms the eastern fringe of Tapti Basin; it is separated from Tapti-Purna basin by episodes activation of the eastern block during Quaternary period Khan (in press). The present studies within single ecology of geomorphology and in harmony of sedimentation in lineament zone in increasing antiquity revealed that Tapti-Purna was a single basin, formed a mega tectonic depression which was hospitable to sedimentation inception from Pleistocene and continued up to Upper Pleistocene–Holocene time. The present expression is due to neotectonism in the lineament zone. In Tapti basin the boulder conglomerate occurs as persistent horizon at the base of quaternary deposit which represents specific phase of sedimentation in the basin, it is time equivalent to the boulder conglomerate of Narmada and further add that the sedimentation on either edge of Satpura and in the SONATA LINEAMENT ZONE was contemporaneous and simultaneous, which further revealed quaternary deposits of Tapti are early to middle Pleistocene in age and related to the early reactivation of Tapti lineament. The association of rock cut terraces, rock cut benches, stream lines and rock cut scar in Tapti and Waghur rivers demonstrate mighty reactivation of Tapti lineament during the early stages of sedimentation. The cyclic reactivation has vertically incised and cut country rocks in to rock cut benches in stepped sequence; whereas in the Purna valley a gape was been created by reactivation of Tapti- Purna lineament it has resulted a converging point of accumulation of sediments. The sequential analysis of deposits and its relation with drainage and its evolution indicate it was a persistent locus which was hospitable to sedimentation. Khan (2016).

The Purna basin embraces hanging drainage and configuration of basin is closed which indicates that a deep gape was created by vertical and cyclic subsidence of fault bounded block south of Satpura after inception of sedimentation in Tapti in west which was hospitable to accumulate sediments. The thick pile of sediments comprised of five lithostratigraphic units viz. Ferruginised gravel and Sand, Red Silt Formation, Brown Silt Formation, Light Grey Silt Formation and Dark Grey Silt Formation where as Tapti Basin which has only three units viz. Boulder Conglomerate at the base on rock basin followed by quaternary deposits of paleodomain and present quaternary deposits of Tapti which are older deposits. The present studies within single tectonic and geomorphic ecology and in harmony of sedimentation in increasing antiquity revealed that Tapti-Purna was a single basin which formed a mega tectonic depression in the east was hospitable sedimentation from Pliocene to Upper Pleistocene –Holocene in increasing antiquity from west to east due to tectonic slope and topographic configuration south of Satpura. The quaternary deposits of Wardha upper Pleistocene-Holocene age (50 m) (Tiwari 1985) forms the eastern fringe of Tapti Basin, it is separated from Tapti-Purna basin by episodes activation of the eastern block during Quaternary period Khan (2016). (Plate No \_4).

#### **Volcanic Ash Bed & Sedimentation:-**

The Quaternary tract of Narmada basin covers an area of about 12950 sq.km starting from west of Jabalpur (23°07'790530) to east of Handia (22° 29'; 76° 58') for a distance of about 320 km. It is found to be ideal locus of Quaternary sedimentation in Central India, as witnessed by multi-cyclic sequence of Quaternary terraces in the valley. The total estimated thickness of Quaternary sediments in the central sector of Narmada is about 325 m. where the level of Ash bed occurrence has been identified at the depth between 75-83 m of Quaternary column of valley. The Quaternary blanket consists of sediments of three domains viz. glacial, fluvio- glacial and fluvial, which were deposited in distinct environments during Quaternary time. The Boulder Bed (20 to 260 m.) below ground level is of glacial origin, comprised of thick pile of sediments occupied at the base of rock basin and were deposited by glacial activities in dry and cold climatic condition during early Pleistocene time. The fossiliferous bed Boulder conglomerate (260 to 278 m. above m.s.l.) is of fluvio-glacial origin and top four formations in increasing antiquity are Sohagpur, Shahganj, Hoshangabad and Janwasa (278 to 350m. above m.s.l.) are of fluvial origin and represent the complete sequence of Quaternary sedimentation in Narmada valley & Central India Khan & Sonakia (1992).
