Carpal tunnel syndrome,
Ammukkarachooranam, pinder oil,
Likert scale

Abstract

Carpal tunnel syndrome (CTS) is characterized by pain, numbness and tingling sensation in the hand caused by compression of median nerve at the wrist. Ammukkarachooranam(AMC), as internal drug and Pinder oil(PT) as external drug along with thokkamam(massage) were included in this combined strategy of therapy. The Aim of study is to evaluate reduction of signs and symptoms of CTS as per 5 point- Likert scale. The study was conducted at Teaching Hospital of Siddha medicine, Konesapuri, Trincomalee, the period of study was two years and four months. The Hospital drug is given for the CTS patients who were selected for the documentation of this research study. A patient should receive the drugs for three months. The base line and follow up symptoms were recorded with the global assessment of five point likert scale. The evaluation made to observe the reduction of significant symptoms such as pain, numbness and tingling. Amukurachooranam(AMC) 1 gram twice a day given orally with warm water and Pinder oil(PT) applied externally to the affected area. The clinical trial showed remarkable reduction of symptoms of pain and numbness. Because experimental phase shows the trial drugs have reducing effect in pain, numbness and tingling sensation from "always"(5) and "often"(4) to "never"(1) as per Likert scale. This was correlated with SPSS version 16, T Test paired sample statistics, trial combined drug showed significant reduction of symptoms of pain and numbness and tingling sensation compared to base line symptoms, because mean value of pain in base line 3.72 ± 0.54 , final visit 1.24 ± 0.52 ; mean value of numbness in base line 4.12 ± 0.6 , final visit 1.4 ± 0.64 , mean value of tingling sensation in base line 3.32 ± 0.62 , final visit 1.04 ± 0.2 with. It has been concluded that the strategy of this combination of therapy of tested drugs along with thokkanam is effective in the management of Carpal tunnel syndrome.

Introduction:-

The carpal tunnel is located at the middle third of the base of the palm, is a narrow rigid passage way along in the wrist, about an inch wide. The floor and sides of the tunnel are formed by small carpal bones namely scaphoid tubercle and trapezoid, the roof of the tunnel is a strong band of connective tissue called the transverse carpal

ligament. Nine tendons joint together called as flexor retinaculum, which bend the fingers and thump also travel through the carpal tunnel. The median nerve is the one of the main nerve in the hand. It originates as group of nerve root in neck. The roots come together and form a single nerve in the arm. The median nerve goes down the arm and forearm, passes through the carpal tunnel at the wrist and goes to the hand. The nerve provide sensation in the thump, index, middle and ring finger and also controls muscle around the base of the thump as well as impulses to some small muscles in the hand for the movements of fingers. Sometimes thickening from irritated tendons or other swellings narrows the tunnel and causes compression of the median nerve as it runs deep to the transverse carpal ligament causes atrophy of the thenar eminence, weakness of the flexor pollicis, abductor pollicisbrevis as well as sensory lost in the digits supported by the Median nerve. Carpal tunnel syndrome is neurological condition commonly occurs in female, they are three times more likely than men. It is characterized by pain, numbness or tingling sensation in the wrist. Symptoms most often occur in thump, index finger, middle finger and half of the ring finger.

The patient with Carpal Tunnel Syndrome is frequent burning sensation, tingling, itching, and numbness in the palm of the hand and the fingers, especially in thumb, index and middle finger. These Symptoms usually start gradually. The symptoms often first appear in one or both hands during the night .As symptoms worsen, patient may feel tingling during the day. Decreased grip strength .Muscle wasting noticed in the base of the thump in chronic patients.

Aim and objective:-

The feedback of some of the CTS patients regarding this therapeutic effect made me to document this therapy as a research study. At the same time, no previous studies were conducted to focus the scientific view for this type of condition with combined drug therapy. Therefore the aim of the researcher is to design this study to explore the combined efficacy of AMC and PT oil along with Thokkanam on carpal tunnel syndrome.

Materials and Methods:-

The study was conducted at Teaching Hospital of Siddha medicine, Konesapuri, Trincomalee. The Hospital drug is given for CTS patients and randomly selected for the documentation of this research study. A patient should receive the drugs for three months. The period of study was two years and four months since this type of patients rare to attend hospital. All the patients were screened after history taking and physical examination along with differential diagnosis. The consent was obtained while the patients were made to aware this therapy will be documented and used for research purposes. Among 32 only 25 patients (15 female and 10 male) records were selected for this research paper. Other 07 were excluded because they were Pregnant, lactating mothers and some of them having Diabetes mellitus, Hypertension, Asthma etc .The base line and the follow up symptoms were correlated with the global assessment of five point Likert scale. The evaluation made to observe the reduction of significant symptoms such as pain, numbness and tingling. The treatment given in OPD and advice guideline also was given to patients to follow strictly. The internal drug AMC1 gm three times daily with warm water was given , the PT oil and thokkanam (massage therapy) given to apply externally in the affected area for ninety days.

The diagnosis of the CTS is initially suspected based on symptoms supported by history and physical examination and also confirmed by following nerve conduction testing.

Tinel's sign test:-

It is performed by gently tapping skin over the flexor retinaculum to elicit a tingling sensation or "pins and needles".

Phalen's sign test:-

It is performed by flexing the wrist gently as far as possible, then holding this position for up to 60 sec, positive results is feeling of numbness along median nerve distribution.

Two point discrimination:-

Ask the patient to close the eye and then use small tips of opened paper clips, to touch two points nearly 0.5 cm apart on patient's hand or finger. The positive test is patient can't able to feel difference between the two touches in severe CTS, so it may feel as though only one place is being touched.

Results and Discussion:-

The results showed remarkable reduction of symptoms of pain , numbness and tingling sensation compared to base line symptoms, because mean value of pain in base line 3.72 ± 0.54 final visit 1.24 ± 0.52 ,mean value of numbness in base line 4.12 ± 0.6 final visit 1.4 ± 0.64 ,mean value of tingling sensation in base line 3.32 ± 0.62 , final visit 1.04 ± 0.2 with SPSS version 16, T Test paired sample statistics .

As per the siddha medical reputed literatures, the root of Amukira can be taken internally with warm water, honey, milk or ghee. It enhances the function of nervous system and improves memory and promotes the functions of reproductive system. Amukira root has been used as a Rejuvenator, tonic, and aphrodisiac, narcotic. Anti-inflammatory, analgesic, diuretic anthelmintic, astringent and stimulant. It is commonly used in children for emaciation; in adults for improve sexual function, in elders' debility, rheumatism, nerves damage, and insomnia. as well as the pinda oil also mentioned in siddha pharmacopeia and siddha pharmaceutical text for rheumatic or traumatic conditions as 'pain killer'. This present study shows positive results in the management of CTS since the Amukirachooram and Pinda oil having analgesic, anti-inflammatory and soothing effect.

The various phytochemicals isolated from *Withaniasomnifera*(Amukira/Aswakantha) such as Alkaloids-Isopelletierine, anaferine, cuseohygrine, anahygrine ,Steroidal lactone, thanolides, withaferins. Saponins-Sitaindosides and acylsterylglucosidesSitaindosides vii-x and The aerial part of withaniasomnifera yielded 5-dehydroxywithanolite -R , withasomniferin- A (Rahman et al 1991) (Mishra .et al 2000)

Withaferin A and 3-b- hydroxyl-2, 3-dihydro withanolide isolated from withaniasomnifera show antibacterial, antitumourimmune modulating and anti-inflammatory properties (Budhiraja and Sudhired al., 1987). Withaferine found to be effective in anti-stress activity (Bhattacharya et al., 1989) Many constituents show immune modulatory actions (Ghosal et al., 1989). *Withaniasomnifera*(Amukira) improves the body's defense against diseases by improving the cell mediated immunity and also possesses potent antioxidant properties that protect against cellular damage caused by free radicals.

The scientific researchers were reported the findings of the ingredients of this trial drugs as follows; Amukra 1000 mg/kg oral produced significant analgesic activity for a rat experiencing heat analgesia induced by hot plate method. (Mazen et al., 1990). Amukira is an analgesic that soothing nervous system from pain response (Twair et al., 1989). The powerful anti-arthritis properties of Amukira are now widely accepted and documented by several researchers. Ethanolic extract of *Withaniasomnifera* elicited significant dose dependent acute anti-inflammatory activity in

carrageen an induced paw edema comparable to hydrocortisone and also elicited significant chronic anti-inflammatory activity is found adjuvant induced arthritis conferrable to hydrocortisone. (KiranGiri et al., 2015). Withaferin has remarkable analgesic and antipyretic properties accompanied with absence of significant gastric damage. (Sabina et al 2008)

The external medicine Pinder oil consist of Commiphoramukul (Guggul), Hemidesmusindicus (Nanari or Indian sarsaparilla), Rubiacordifolia (manjisti), beeswax, Sesamumindicum (Gingelly oil). Pider oil known as Sivappukkukilennai endorsed in siddha literature for pain reliever and anti-rheumatic healer as external application.

Guggul plant consists of number of phytochemicals such as terpenoids, steroids, flavanoids, guggultertols, lignans, and aminoacids. Guggulsterones are chief constituents. It has anti-inflammatory and analgesic activity, and also has hypoglycemic and hypolipidaemic effect on type II diabetic patients. (PrernaSarup et al 2015). Commiphora .mukul showed significant decrease in volume thickness in paw edema in rats, and also produces significant analgesic activity as measured by hot plate and writhing test in mice; moreover the thermal hot plate method was more sensitive than chemical writhing. (Shalaby, Hammouda et al., 2014)

Root of Indian sarsaparilla has various phytoconstituents like essential oil, glycosides, resins saponin steroids and tannins which all endowed with many pharmacological activities. Root of the plant exhibits significant anti-inflammatory activity in both acute and sub-acute condition in experimental rats.

The *Rubiocordifolia* showed significant Neuroprotective activity and reduce memory dysfunction. (Joy, Nair CKF et al 2008.) Anthroquinones rich fraction of ethanol extract and aqueous root extract showed significant anti-inflammatory activity in edema inhibition induced arthritic model in experimental rat (Jaijesh et al; Sirinivasan et al., 2008)..

Sesame oil used as food supplement and also in medicinal preparations. It is highly nutritious oil and enriching with protein, essential vitamin like, E, D K, B, and Niacin complex and mineral such calcium, phosphorus, Manganese, Magnesium etc. This oil has high viscosity, lubricating and penetrating power. Thus, helps in quick penetration, thereby regulating and enhancing blood circulation of affected area. Sesame oil is rich in essential fatty acids like linoleic acid and palmitic acids. Linoleic acid shows anti-bacterial and anti-inflammatory properties. The oil also rich in anti-oxidants, hence they nourish the deep tissues and improve the blood circulation. Beeswax used as surface protector of the skin and glazing agent. The previous research findings indicated the typical pharmacological activity such as anti-inflammatory, analgesic, Neuro-protective and soothing activity present in the research dugs AMC and PT oil. The thokkanam (massage) therapy enhance further quick relieve from Carpal tunnel syndrome. This study shows the trial drugs have reducing effect in pain, numbness and tingling sensation from “always”(5) and “often”(4), sometimes(3) rarely(2) to “never”(1) as per 5 point Likert scale concordance with statistical analysis.

Conclusion:-

It is concluded that statistical analysis with SPSS Version 16, T-test paired sample showed significant reduction of symptoms like pain, tingling and numbness of CTS, trial combined drug showed significant reduction of symptoms of pain and numbness and tingling sensation compared to base line symptoms, because mean value of pain in base line 3.72 ± 0.54 , final visit 1.24 ± 0.52 ; mean value of numbness in base line 4.12 ± 0.6 final visit 1.4 ± 0.64 , mean value of tingling sensation in base line 3.32 ± 0.62 , final visit 1.04 ± 0.2 . The therapeutic strategy of this combination of tested drugs along with thokkanam is effective in the management of Carpal tunnel syndrome with Amuukirachooram (AMC) as internal and Pinder oil (PT) as external application along with thokkanam as enhancer.

Key words:-

sub gingival irrigation, Chlorhexidine, octenidol, scaling, oral hygiene methods.

Abstract

Background: To evaluate the efficacy of octenidol and Chlorhexidine in periodontal pockets and the practicability of patient self therapy by using sub gingival irrigation.

Methodology: 40 subjects with periodontal pockets (4-6mm) were enrolled and 30 were responded to treatment, divided randomly into 2 groups (Group 1 octenidol & Group 2 Chlorhexidine). Prior to scaling all clinical parameters (SBI, PI, PD & CAL) were recorded. Sub gingival irrigation done in both groups at 0,7,14 days on premolars and molars. Data were analyzed by SPSS (p<0.05).

Results: A significant reduction in periodontal inflammation and clinical parameters from base line to 14days were observed and maintained for 21 days without irrigation. When intergroup comparisons were made no statistical significance was observed in all clinical parameters except for sulcus bleeding index (SBI) showed highly significant difference in octenidol group.

Conclusion: sub gingival irrigation with octenidol and Chlorhexidine are effective in reducing periodontal inflammation and in controlling sub gingival plaque. Intermittent treatment of this kind by the patient at home might reduce to more manageable levels, the frequency of hygiene visits and the need for rigorous interdental oral hygiene.

Introduction:-

The primary etiological factor for inflammatory periodontal disease is bacterial plaque. So the principal goal in the prevention of inflammatory periodontal disease is removal of bacterial plaque.¹ Various Mechanical and chemical

Corresponding Author:- Dr. RUPASREE GUNDALA

Address:- Reader, Department of Periodontics, Lenora Institute Of Dental Sciences, Rajahmundry, Andhrapradesh, India.

methods are available presently for treating periodontal diseases. However, antibiotics appear to reduce the severity of gingivitis and may be useful in managing some form of periodontitis. Based on potential problems associated with the prolonged use of systemic antibiotics for controlling plaque, a wide variety of studies have been directed to topical or sub gingival debridement of antimicrobial agents. These agents can control colonization of the teeth by oral microorganisms which will prevent the development of gingivitis and further progression of periodontitis.²

Chlorhexidine has long been used as an antiplaque agent on the basis of the non-specific plaque hypothesis.³ Sub gingival application of Chlorhexidine may lead to changes in the sub gingival flora which selectively decreases the re-establishment of a pathogenic flora.⁴ So that Chlorhexidine may be used as a chemical agent adjunct to mechanical therapy.

Octenidine (N,N'-(1,10-Decanediyldi-1 (4H)- pyridinyl-4-ylidene) bis-[1-octanamine] dihydrochloride), a new bispyridine compound developed by the Sterling-Winthrop Research Institute.² It appears to possess substantial antiplaque activity. In monkeys, daily topical administration of octenidine resulted in a significant reduction of plaque accumulation over a seven day period (**Emilson et al 1980**).⁵ Octenidol is a highly effective bactericide against the leading germ group of infectious diseases of the periodontitis and gingivitis types, otherwise known as odontogenic infections. It is used for the regeneration of inflammatory diseases in the oral cavity and for daily application at home with restricted oral hygiene capacity. With its active ingredient Octenidine, it inhibits bacteria rapidly and persistently, prevents them from forming again and ensures healthy oral flora.⁶

Octenidol is superior over Chlorhexidine in Supportive treatment of Multi-resistant *Staphylococcus aureus* (**MRSA**). It does not discolor the teeth and it is alcohol free. So the present study is undertaken to evaluate the efficacy of sub gingival irrigation with octenidol and Chlorhexidine on periodontal inflammation.⁷

Methodology:-

A total sample of 30 patients with periodontal pockets (4-6mm) was selected from the Out patients, Department of Periodontics, Lenora institute of dental sciences, Rajahmundry, Andhrapradesh. The sample of the study was randomly divided into 2 groups, one of which received octenidol and other received Chlorhexidine. All of them were instructed to brush their teeth once daily and none had received any instructions in interdental cleaning aids. The study was approved by Ethical Committee, Lenora Institute of Dental Sciences.

Prior to scaling all clinical parameters including: Sulcus bleeding Index (SBI) (Muhlemann & Son 1971), Pocket depth (PD), Plaque Index (PI) (Silness & Loe 1964) and Clinical attachment level (CAL) were recorded. Test sites were in relation to approximal surfaces of premolars and molars. The present study was based on the following inclusion and exclusion criteria after obtaining informed consent from the patients.

Inclusion criteria:-

- Patients with age group of 20-50 years.
- Patients with at least 26 natural teeth with diagnosis of chronic gingivitis with localised periodontitis are enrolled in the study.
- Patients with pocket depth 4-6mm in premolars and molars were included in this study.

Exclusion criteria:-

- Patients with systemic diseases and orthodontic bands.
- Patients who were sensitivity to mouth wash.
- Patients who were receiving systemic antibiotics in last six months.

The irrigation device consisted of 10ml disposable plastic syringe and blunt plastic tips as showed in figure 1. The irrigation solution used is either 0.2% Chlorhexidine gluconate solution or 0.1% octenidol solution. These were supplied in identical bottles, distinguishable only by a random code number. The key to the code remained unbroken until all the data had been collected. Irrigation device

The teeth to be treated were shown and periodontal pocketing explained briefly to the patient. They were shown how to assemble and use the irrigation device. With 10ml of solution in the syringe, the investigator inserted the needle gently into the pocket until resistance was felt, without causing discomfort to the patient. About 1ml of solution was deposited into each pocket by the patient themselves without any injury to the tissues⁸ as shown in figure 2. An

individual irrigation technique was checked on day 7 and if any fault should be corrected. Except on days 0 and 7, pockets were irrigated by the patient once only at night for 14 days. At day 21, irrigation devices and solutions were taken from the patient. Clinical parameters were assessed at 0,7,14 and 21 days.

Analyses were performed using commercially available software (SPSS). Mann Whitney U test were carried out for inter group comparisons⁷ and Paired t test used for analyzing intra group comparisons⁷. The null hypothesis was rejected at the 0.05 level of significance.

Figure 1:- Irrigation Devices and Blunt Plastic Tips for Sub gingival irrigation.

Figure 2:- Technique of Sub Gingival Irrigation

Results:-

The study was conducted with a sample of 40 patients, in that 30 were responded to treatment. The study sample was randomly divided into two Groups for sub gingival irrigation (Group1- octenidol and Group 2- Chlorhexidine).

When comparison of means of Sulcus Bleeding Index (SBI) in both Groups: Octenidol group has higher reduction of mean SBI than Chlorhexidine group and continued until day 21 ($P=0.000$) as shown in (Table 1). When comparing means of SBI within the groups, there was significant reduction from baseline to 7 days and this reduction was greatest by day 21 ($P<0.001$) as shown in (Table 1a&1b).

When comparison of means of Plaque Index (PII) in both Groups: octenidol group showed significant improvement by day 7 ($P<0.001$). However, day 14 and 21 no significant difference was observed in both the groups as shown in

(Table 2). When comparing means of PII within the groups, there was significant reduction in PII scores were observed by day 21 ($P < 0.001$) as shown in (Table 2a & 2b).

When mean Probing depth (PD) values were compared in between the groups there was no significant difference was observed as shown in (Table 3). When mean PD was compared within the groups, both groups showed significant PD reduction from baseline to 21 days ($P < 0.001$) as shown in (Table 3a & 3b).

When comparison of means of Clinical attachment levels (CAL) in between the groups there was no significant difference was observed by day 7 and day 21, but the difference was significant by day 14 in octenidol group as shown in (Table 4). When Comparing means of CAL within the groups: highly significant difference was observed from day 0 to day 21 ($P < 0.001$) as shown in (Table 4a & 4b).

Discussion:-

Sub gingival plaque control and removal is a fundamental objective of periodontal therapy. Conventional close debridement of sub gingival plaque from root surfaces can be effective, but is time consuming and technically demanding. It has been shown that the chance of failing to remove all of the sub gingival plaque increases in pocket depths greater than 4 mm. As sub gingival plaque accumulates and matures, periodontal breakdown can occur. Therefore, professional maintenance therapy may not always achieve complete or adequate debridement. This has led to the adjunctive use of antibacterial agents, usually in the form of irrigants or systemic antibiotics, to overcome the limited efficacy of the conventional treatment. The primary purpose of irrigation is to non-specifically reduce the bacteria and their by-products which prevent the initiation or progression of periodontal diseases.

In any case, insertion of an identical irrigation needle 3 mm inside a deep periodontal pocket is sufficient to irrigate the apical plaque border (**Hardy et al. 1982**).⁹ In Our study patients were advised to carry out the irrigation procedure once daily at night for 14days. Blunt irrigation tips were given to prevent the injury and supervising the patients until they were able to irrigate the involved pockets without problems.

The results of the present study showed that sub gingival irrigation with octenidol and Chlorhexidine are effective in reducing periodontal inflammation and in controlling sub gingival plaque. A significant reduction in periodontal inflammation and clinical parameters from base line to 14days were observed and maintained for 21 days without irrigation.

On evaluation of mean sulcus bleeding index between the two groups were done Octenidol group has significant reduction of mean SBI than Chlorhexidine group. This reduction in clinical parameter up to 21st day in octenidol

group may be attributed to well known antimicrobial effects of octenidol and resolution of gingival inflammation. This reduction in bleeding and improvement in gingival health of patients using 0.1% octenidine formulation was suggested by decreased gingival fluid. These results were in accordance with **Patters M R et al (1983)**² stated that Octenidol is a highly effective bactericide against the ten tested representatives in the leading germ group of infectious diseases of the periodontitis and gingivitis types.

When comparison of means of Plaque Index (PII) in both Groups: octenidol group showed significant improvement by day 7 than Chlorhexidine group. This is due to antiplaque activity of octenidol. At a 0.1% concentration, Octenidine appeared to completely inhibit plaque formation over a 7 day period. These results were in accordance with **Patters M R (1983)**² and **Emilson et al (1980)**⁵. However by day 14 and 21 no significant difference was observed in both the groups.

When mean probing depths and clinical attachment levels were compared in between the groups there was no significant differences was observed, where as when compared within the groups both groups had showed significant pocket depth reduction and clinical attachment level gain. This may be due to reduction in tissue inflammation by the decrease in plaque and sulcus bleeding index scores. This result goes in concurrence with **David L et al (1990)**.¹⁰

Limitations of the present study include: short sample size, short duration. Microbiological evaluation after sub gingival irrigation was not considered.

Conclusion:-

0.1% octenidol and 0.2% Chlorhexidine applied directly to periodontal pockets reduces periodontal inflammation, even in the absence of effective interdental aids. The level of inflammation is maintained below baseline values for 3 weeks after the two week irrigation period in both the groups. In the light of our results it was stated that sub gingival irrigation with octenidol and Chlorhexidine are effective in reducing periodontal inflammation and in controlling sub gingival plaque. There was no difference found in all the parameters with both groups except for SBI which showed slightly superior effect for octenidol than Chlorhexidine, yet long term studies are to be conducted to know the efficacy and Substantivity of octenidol mouth rinse.

In the Alternative Dispute Resolution,
Living Law, and Justice

Abstract

The Alternative Dispute Resolution (ADR) In Indonesia Legal System, is a model of dispute resolution which based on living law in Indonesia society. This model is often used other than the settlement of dispute through the court by Indonesia people. Whereas, the settlement of dispute through the court can guarantee legal certainty, because as guided by the statutory law. Based on that statement, this research describes essence of justice for the living law In the ADR In Indonesia Legal System. This research uses the type of normative legal research. It based on conceptual and regulation approach. This research is analysed with qualitative descriptive in using. The result of research shows that essence of justice which based on the living law in ADR, in principle, it focuses on the substantive justice for the sake of harmonization and peacefulness which based on cohesive living value in existence. It still appreciates the procedure of applicable in the Indonesia Society, such as colloquy based on kinship. So that, it yields for society's legitimated justice.

Introduction:-

Dispute sometimes comes up in our life as a consequence of social relations between individuals or groups to each other. Folberg and Taylor (I Made Widnyana, 2007), argue that there are two types of disputes, among others: (1). intrapersonal conflict or conflict within the individual; and (2) interpersonal conflict or intergroup conflict. According to Folberg and Taylor's opinion, the second type can be considered as a conflict in the scope of legal object. The dispute contains conflict of law in relationship between community members, basically, it could lead disharmony because there are those whose neglected rights. The injured party, usually, will express dissatisfaction to the other. Since, they feel to get in loss. Based on that, in Indonesia society context, there is alternative legal instrument and legal mechanism which can be used as an attempt to resolve the dispute in order to restore such rights, namely the the settlement of disputes through the courts (litigation) and the the settlement of disputes through the outside court (non litigation).

Settlement of dispute by using a model of ADR, is also an integral part of the effort to implement progressive law as conceived by Professor Satjipto Rahardjo. It is more accommodating legal values which lives in Indonesian society context, which accentuates the legal sense for Indonesian people than the statutory law which emphasizes the ruling class' political will. This is often not accordance with the values of justice Indonesian society itself (Muhammad Jufri and Deity Yuningsih, 2016).

Corresponding Author:- By Dr Deity Yuningsih.

Address:- Faculty of Law, Halu Oleo University, Southeast Sulawesi, Indonesia.

In Indonesia, Legal effort through the court (litigation) is usually taken by people. But this effort does always depletes vigor, long time, and high cost. However, it requires the ability of law proceeding in the court. Settling of dispute through the court would produce a legal certainty since the judge's decision in winner and loser. The winner will take all of the loser, while the loser will feel dissapointed. For the people of Indonesia, it can terminate relationship and it will cause the new conflict.

There legal effort which does performance in Indonesia's legal system, namely the Alternative Dispute Resolution (ADR). The parties in dispute can choose it. This is an alternative dispute which not through the court. It is set out in Regulation of Number of 12 of 1999 on Arbitration and the Alternative Dispute Resolution. The ADR is one of the institutions for dispute resolution which is agreed by the parties in conflict. It is done which not involved the court by performance of negotiation, consultation, mediation, conciliation, or the involvement of legal expert (see Indonesia Regulation of Number of 12 of 1999).

The ADR, in principle, especially in consultation, negotiation, and mediation. It is recognized by Indonesia people as a form of dispute resolution in outside court through deliberation. This is known as a living law in Indonesia people since old time. In this context, the author does to research on ADR of Indonesia people as a living law in an effort to obtain justice. Actually, the living law in the context of Indonesia people, has been integrating into customary law as it is known as *adat* law. It is an unwritten law which does accommodate the values of justice in the legal sense of Indonesia people. Court decision, vice versa, it will be guided by statutory law which does glorify legal certainty.

Method of Research and Materials:-

This research uses normative legal research which is to examine basic norms in Indonesia's positive legal (Johny Ibrahim, 2008). This research, also uses regulation and conceptual approach (Peter Mahmud Marzuki, 2007). Regulation conceptual is useful for Indonesia regulation which concerned with legal issues of ADR, while the conceptual approach is used to analyze ADR in living law based Indonesia's legal system. Therefore, the conceptual approach is based on jurists' opinion and legal experts' view. This research uses written legal materials as analysis instrument, containing primer legal materials such as Indonesia Regulations on ADR, and secondary legal materials such as text books, law journal, law article, and scientific paper on law. Author analyses this topic research using interpretation of legal material substance based on legal theory and legal principle, in order to explain the nature of justice for ADR in Indonesia Living Law.

Result and Discussion:-

The result of research shows that living law in the Indonesia society of context, it becomes the main runway as a guidelines for dispute resolution of outside the court. The living law usually does include customary law (*adat* law). In Indonesia, dispute resolution of outside the court or ADR, it can be held if the parties in quarrel to choose it. There is a reason that dispute resolution of outside the court is preferable than through court. Because the settlement of dispute through the court has long procedure and convoluted. For example, Sasak Tribe located in Lombok, Nusa Tenggara Barat, is one of provinces of Indonesia. Sasak Tribe usually uses ADR to resolve disputes occurring among each other. Sasak people argue that settlement of dispute in ADR using, is preferred. ADR accommodates legal value contained in customary law (*adat* law). In Sasa Tribe, there is an institution in charge of maintaining the *adat* law. It is known as "Krama". It seems that this institutotion performing the role for dispute resolution of outside the court such as ADR. "Krama" has authority to hear the case based on *adat* law, and it imposes sanction of *adat* law. This institution is unique. It resolve disputes in Sasak Tribe not to issue a decision in lose or win, but its win-win solution. The leaders of "Kara" who act as judge attempts to give advice for parties in obedience of *adat* law as the living law. They suggest to their people for improving the quality of understanding on *adat* law values based on local wisdom. It is intended to achive a harmonious common life in worthy and well becoming (Syapruddin, 2014).

According to Hadikusuma (2003), dispute resolution of outside the court, in Sasak Tribe, among heirs is resolved based on five of *adat* law's principles. Those include in Indonesia tribes, as follows:

- a. Principle of divine and principle of self-control (*betel leq reden neneq* in Sasak Language);
- b. Principle of equal rihts and togetherness (*doe sopog, bareng ngepe* in Sasak Language);
- c. Principle of harmony and kinship (*awak sopog, saling peririq, saling angkat, saling ajinin, saling sedok* in Sasak Language);
- d. Principle of deliberation and consensus (*Soloh*);

e. Principle of Justice and *Parimirma* (*endeq naraq bine kire, tarik nyacap*)

Another example, Tolaki Tribe, is one of tribes living in Southeast Province of Indonesia. Rahmat Saini (2015) wrote that dispute on family law, such as inheritance problem, divorce, and quarrel. It was solved by using of Tolaki's *Adat* Law. Parties in dispute would complain to the chairman of village, known as *Kepala Desa*. In Rahmat Saini's writing that *Kepala Desa* with along prominent leaders of *Adat* Law, would do summoning for parties, they collected evidences and informations for unpleasantness among the parties. It would be resolved according to Tolakinese of *Adat* Law.

Until now, Tolakinese views that Tolaki's *Adat* Law still in keeping of justice, peacefulness, and welfare. Decision of Tolaki's *Adat* Law ties up Tolaki Tribe without differentiating of social status. Everyone who breaks *Adat* Law, it does consider as a person in saucy deed, so that he or she will be ostracized.

The ADR concept, it does provide creation for a good relationship among disputed parties. In author's view, basically, it is one way for dispute solution or alternative solution in settlement dispute without court procedure. In society's Indonesia legal culture, especially, legal conflict is solved through amicable way based on values in harmony and recognition of living law. However, the ADR concept, it does accomodate the living law as values recognized by society itself. The ADR concept does consider dynamic dispute resolution. This is very simpel because it can be done through co-operative solution. Also, it can be the model of dispute resolution which generates win-win solution.

In Von Benda Beckman's view that dispute resolution or dispute of legal conflict in simple condition of society where kinship or relationship is still very tight, it is usually there institution as a choice which settles conflict based on folk institution. This institution is the traditional institution which acts as guard regularity and magical balance in society itself (Sahnan, 2010).

Indonesia Legal System admits two kinds of legal format, as follows: Written Legal such as statutory law and Unwritten Legal such as customary law and *adat* law. Later, there are legal values which do provide living law as legal obeyed by Indonesia people. *Adat* Law contains them. *Adat* Law, actually, is unwritten legal which does not require a specific procedure. Unlike the written legal which requires a specific procedure. *Adat* law and customary law for Indonesia people is an actual law. Since it usually obeyed duly by Indonesia people.

In Professor Soepomo's view that *adat* law in Indonesia is living law since it is the embodiment of real legal sense of Indonesia people. *Adat* law will continue which follows headway of society itself. This opinion, also, is followed by Frederich Carl Von Savigny (1779-1861). He said that there was a legal embodied into people's soul (*volkgeist*) where law would flourish to expand with society itself. This opinion is known as Historical Jurisprudence. One of schools of law is followed by scholars of *adat* law in Indonesia, including Dr Guswan Hakim and Dr Ruliah, both lectures of Law Faculty, Halu Oleo University, located in Southeast Sulawesi Province of Indonesia (Jufrina Rizal, 2008).

There is same opinion expressed by Eugen Erlich. He is one of the pioneers of sociology of law. He said that Savigny's view on *volkgeist* was fact of law as a living law in the society. It was a living law of the people. Eugen Erlich said that the centre of gravity of legal development was not placed in legislation nor in juristic science, nor in judicial decision, but in society itself. Eugen Erlich, actually, is the first who used the term of "living law" in his popular book titled *Grundlegung der Sociologie des Recht*. This book has been translated into English "*Fundamental Principles of Sociology of Law*".

Professor Satjipto Rahardjo is one of Indonesia experts for sociology of law. He also agrees towards existence of *adat* law as a living law which reflects legal idea and legal sense of Indonesia people. On the other hand, Professor Djojodiguno explains *adat* law as the living law which in human creation on legal values. It can be flourished in evolution with its elasticity, so it provides different dispute resolution for the case in different legal event. Especially, the problem of rights and obligations in dispute (Deity Yuningsih, 2016).

The scholars of *adat* law in Indonesia have argument that *adat* law is simple and dynamic. It is not rigid which will receive the change and be responsive towards values in Indonesia society. Changing values is realistic in society. *Adat* law, in principle, stresses on substantive justice in order to reflect harmony and peacefulness based on compact

values in existence. This reason why *adat* law in frame work of dispute resolution, it based on living law. To reflect realistic substantive justice, then *adat* law has self-mechanism for dispute resolution. This mechanism does use deliberation in kinship which provides realistic justice as values legitimated by society itself.

In view of Robert Seidman, in his theory on “the law of the non transferability of law”, says that law could not be transferred away from society to another. Because law does not always permanently attached in a particular community. Also, not to be considered as traditional law in legal retardation (Deity Yuningsih, 2011). It means that different law can be effective for such society, since it can guarantee legal certainty and justice. However, such legal can provide justice in accordance with the needs of law for society itself.

According to author’s point, law as living values, it should be kept in order to guarantee social justice. In the Indonesia legal system context, *adat* law still does provide legal justice in accordance with legal awareness of Indonesia people. Therefore, effort to be positive legal in statutory law whereas legal values containing in it, not in accordance with needs of law for society itself. It will effect new conflict in society, including rejection of society.

Closing:-

Living law is a main principle used as the guidance in dispute resolution for Indonesia people, it does resolve disputes in outside court. ADR, basically, it can become a solution in dispute without the court. In Indonesia society context, ADR is very important because it accommodates the living law based on kinship in legitimated harmony. ADR for dynamic or simple people is suitable since it prioritizes co-operative solution and win-win solution.

The nature of justice in ADR based on living law, in principle, it more emphasizes on substantive justice in order to reflect harmonization and justice in compact legal values. The meaning of living law in this context, it based on *adat* law which recognizes exist procedure, such as colloquy in kinship. So that, it can achieve the justice as societal expectations in legitimacy. However, enforcement for living law depends on the professionalism of traditional leaders. Based on that, it is very important to give legal understanding and legal training on legal procedure, scope, including legal force in ADR based on living law in Indonesia society context.

Introduction:-

Lung cancer is one of the leading causes of mortality and morbidity worldwide. In view of high morbidity and symptom burden, quality of life (QOL) is an important parameter to measure. Incorporation of the assessment of QOL as part of daily oncology practice may enhance current treatment strategies for cancer patients [1]. In addition, enhanced understanding of the common QOL of patients enables to improve the clinical care of patients [2]. We in this study have tried to analyse and compare the quality of life in patients of advanced stage lung cancer undergoing two different modalities of treatment.

Material and Method:-

Data of 78 patients of advanced staged (stage III A & B) carcinoma lung was collected and was randomised according to the treatment received followed by QOL scoring using Quality of life Questionnaire Core 30 (QLQC30) and Lung Cancer Module (LC13), version 3.0. Results were subsequently analysed statistically using SPSS software version 20. Flow chart illustrating the work flow is shown in Fig-1.

Fig-1.Flow chart depicting work flow.

**Result:-****Table 1:-** Baseline characteristics of 78 lung cancer patients.

Characteristic	Categories	Number	Percent

Diarrhea	1.003	0.999 to 1.006	0.16

Discussion:-

In our study we tried to evaluate and compare the effect on QOL in patients receiving either modality of treatment i.e NACT→CRT or CRT alone in patients of advanced stage carcinoma lung and found that QOL is better off in patients receiving CRT alone, this probably could be due to more toxicity profile with chemotherapy received by patients in both neoadjuvant as well as in concurrent setting in group A. Study done by J. A. Langendijk et al showed chemoradiation was superior to chemotherapy alone with respect to survival and HRQoL at the expense of more hospital admissions due to toxicity[4]. In another study done by Shintaro Traumani et al, they found that pulmonary rehabilitation program for patients with non-small cell lung cancer undergoing induction chemoradiotherapy seems to improve respiratory function. It is particularly recommended for smokers and patients with respiratory impairment [5]. In a study done by Bottomley A, radical radiotherapy offers palliation of respiratory symptoms and improved QoL in a substantial proportion of patients with NSCLC who have relatively good prognostic features [6].

Conclusion:-

Quality of life is better off with single modality treatment when compared to double modality of treatment.

Abstract

In most of the third world countries like the Indian cities, informal economic livelihood activities have grown immensely over the past decade due to lack of employment opportunities in formal sectors of the urban areas in the spaces like-Kolkata, West Bengal. Specifically the urban 'poor' through such activities have gained employment and provide low cost services to a large section of the middle class residents of the area under study.

Several studies have already shown that street vendors are one of the most 'marginalised' and 'vulnerable' sections of the urban and sub-urban Indian context. To perceive the meaning, strategies, livelihood, and other dimensions of this sector, the present authors purposively selects "street vendors" including both perishable and non-perishable commodity sellers of the area under present research.

The mode and approach of one year long research is grounded on the ethnographic approach and methods from designing, framing, collection of data, triangulation, transcription, data analysis and interpretation of the findings. The data were collected through semi structured and in-depth interviews and intensive case studies.

The current effort reflects a detailed understanding of the processes and networking of informal sector that could provide an open scope for future research and innovative regulatory programmes, rather than opposing the informal workers, in part of the Government, initiatives should take into consideration in the process of implementing policies for the hawkers. The reflection of the present and in-depth ethnographic study represents a particular section of informal earning groups, but the present authors expects the research as a case and instance for better policy and actions of the area under study.

Introduction:-

Street vending or selling goods, commodities, and services in the public space is one of the most common, accessible, and momentous occupational categories in the context of globalized informal economy, extending its

Corresponding Author:- Mr. Kaustav Das.

Address:- Guest Lecturer, Department of Anthropology, Narasinha Dutt College, Howrah-711101 West Bengal. Email: kaustavanthro@gmail.com

horizons in the developing countries due to limited scope of employment in the 'organized' and/or 'formal' sectors; concurrently stimulates the opportunities among the academicians, researchers, socio-developmental activists, administrative personnel, and policy makers for conducting in-depth and effective researches in the domain of informal sectors (Vargas and Urinboyev, 2015; Saha, 2011; Timalisina, 2011; ILO, 2004). The concept of informal sector was first introduced by Hart in 1971 (Bekkers and Stoffers, 1995), but the essence of the field is embedded with the earlier impression of 'unorganised sector' that indicates 'small' size production units (Kabra, 1995). The 'unorganised' and 'domestic' nature of informal economy may also be a part of 'non-monetary' sector (GOI, 1951). Kabra (1995) indicates that the terminological diversities (including the term-'survival sector', 'non-structured sector', 'transitional activities' and so on) and debates to contextualise and localise the practices of informal economy in classical and contemporary researches, reflects the dynamic and complex nature of the issues concerned. Thus came, the priorities, angles and frames of research in informal economic practices are multilayered and manifold, is undergoing through major shifts and changes in its discussion and interpretation of living in informal mode of economy as a phenomenon, types of labour employed, productivity and contribution of the agencies associated to Gross Domestic Product, and the issues of policy intervention (Williams and Tumusiime-Mutebile, 1978; Tokman, 1990; ILO, 1972; Kabra, 1995; Charmes, 1990; Arye, 1981; Bromley, 1978).

Street vending as a significant manifestation of informal economy varies in terms of scale, timing, location, remuneration, workforce, types of goods sold and services provided, and it can be a full-time occupation, a part-time occupation, seasonal, and/or occasional dealings (Rosales, 2013; Bhowmik, 2005). The process of 'global-restructuring' instigates, accelerates, and expands the scope for individuals to incline towards street vending as a profession to serve the specialized classes in the global cities (DeLuca, 2012; Stoller, 2002). The profession of street vending can be carried out by one person but can also be a franchise of a larger street business. It can be a survival strategy or part of a big business. The incomes of street vendors consequently vary widely (Ray and Mishra, 2011).

In urban India, street vending is the largest informal sector serving mainly the 'urban poor' faces great difficulties and challenges since the era of 'economic reform' in this country (Srivastava et al. 2012; Ray and Mishra, 2011). The 'old Indian cities' are going through the rapid pace of globalization and urbanization that promotes the restructuring of the cities with different developmental strategies, including the formation of new markets, but, these reforming strategies does not effectively attempts to develop the 'old' markets, and/or rarely implements any strategy related to the alternative space for the street vendors, even in the context of a rapid increasing of participation in street vending among the immigrant population (Avigna AS, 2010). Moreover, because they sell cheaper products, the street vendors often cater for the urban poor (Ray and Mishra, 2011). There are no labour standards at the international level dealing directly with street vendors. The manner in which street vending is approached at the domestic level varies dramatically from one country to another. Many countries specifically regulate this activity, providing a clear legal framework and jurisdictional mandates, while others have an overlapping jurisdictional mandate, which creates confusion and conflict, and in others still, street hawking is simply considered illegal (Ray and Mishra, 2011).

The Objectives:-

The Present study is set to explore-

- a) The perception and lived experiences of hawking and street vending and the crisis associated with the profession from an insider's perspective.
- b) The meaning, strategies and other related dimensions of street vending to find out the meaningful alternatives for better policy and action.

Methodology:-

The current study has been conducted in the Sealdah region of Kolkata, West Bengal. The area has been selected for study due to three major reasons- i) the area is surrounded by almost two hundred (200) hawkers and multiple kinds of perishable and non perishable commodities; ii) the consumers are frequent to the region and they are from both urban and suburban premises of the state, and iii) the authors are well aware of the concerned market place and their communication with the principal agency (the hawkers) of the research were convenient to the area.

Fifty (50) respondents were selected through a primary informative schedule that included name, age, sex, the migratory information, location of the stall, selling time and duration, types of items or commodities, and perception about target consumers. After having the baseline data from the schedule, the researchers have gone through the data minutely and prioritized twenty five (25) respondents for depth interviews.

The core nature of the research is inclined to ethnographic approach and methods. The data related to the issues of socio-economic details, the process of vending, interactive pattern with the consumers, the crisis of the profession, emotional orientations towards the space, the maintenance of the local network, and the broker and mediator issues have been collected by using semi-structured and depth interviews. Field notes were collected during and after the fieldwork that facilitated data analysis and to endorse meaningful insights to the findings.

The collected data have been transcribed verbatim to include the insider's perspective of the issues concerned. After the phase of transcription, the data have been sorted out and significant findings have been marked to proceed the data to the next stage of analysis. The primary data have been analyzed by using narrative data analysis method. After analysing the data, the findings were contextualised with the research frame and question, and interpreted accordingly.

The Findings:-

A) "Street Vending"- getting into the Profession:-

The degree of choices of the participants to the street vending as profession varies from independent selection to situational inconveniences. Smt. Pratima Basak has opined that- *after my husband's sudden death there was a single option left to me i.e. to continue my husband's occupation...before his death I was a house-wife and we have no child...at the very outset the profession seemed to me very difficult...I had no idea how to manage the consumers....but gradually things became habituated...one of his friends (is a fruit seller like my husband) helped me a lot....now I can estimate who will buy and who not...how to behave with a regular customer and how to handle those who is just bargaining.*

Mr. Bhola Baidya (a vegetable seller) chose his profession independently. He is from a family who depends on cultivation as their main earning source. He opined that- *I have chosen the profession independently...we have our own land for cultivation....at first I used to sell vegetables at my local area...I am here for last six years...the consumers here are of different kinds-some are almost regular and known to me very well who buy on the way return from their offices...sometimes they ordered many vegetables which I am not used to sell...but I bring that for them...after all they are my fixed customers...*

B) Communicating with the Consumers and dealing with the Chaos:-

Street market gives a larger section of the urban people specially the middle class fresh products and traditional food in relatively lower price in compare to the super markets or malls. As a profession street vending always needs several strategies to gain profit in such a congested crowded place competing with others by sensing consumer's mentality from their choices and preferences of items and sometimes influences the shopping behaviour of the customers. Md. Sipahi, aged 40 years, fruit seller in the road side stated- *I have some fixed customers who visited everyday evening while returning from office.... I generally prefer to make them wait for few minutes if there is rush... I sell them fresh fruits in low rate... even I sense the mentality of a unknown customer by seeing his/her face that whether he/she came to buy or just to check and compare rates with other shops. Sometimes they also give intra-personal signals to their known customers in presence of others to not to take fruits or vegetables if they are not in good condition but they sell them with smiling face to others. To earn profit I need to sell fruits in higher rates and even the rotten ones from unsold stock of previous day to unknown customers... ummm... if my fixed customers are there at that time I just simply "blinking my eye" to signal them to keep quiet and wait....soon after the customer left off I come out with fresh fruits to the known ones....sometimes I also give credit if the wont have change – as said by another fruit seller Mr. Sambhunath Saha.*

C) The Problems, Crisis, and the Major Challenges of Street Vending:-

A number of daily felt problems were reported by the hawkers which are presented here categorically -

i) Lack of Drinking water and Toilet facilities:-

The place is devoid of facilities like drinking water as well as toilets. To respond to the nature's call they even have to walk for more than five minutes. In voice of Gorabini Seal (50yrs), 'vegetable seller' - *there is neither toilet nearby nor any drinking water...we have to walk to either Sealdha station or to Shradhananda Park... According to Nirapada Bhounik, a 'readymade garment seller', 50 yrs old - the principal trouble is felt by all hawkers that only toilet is there at Sradhananda Park...a walking distance of five minutes from hawking spot...which is not convenient when there is a pressure of customers.*

ii) Threats and Troubles from the Local Mediators/Brokers:-

In response to the commonly felt need to organize them from within, initiatives were taken long time back in the 70s and soon after it was termed as 'Kolkata Street Hawkers Union', affiliated to a political party. But problems arose when it comes to the issue of money lending and the lenders were the local political party leaders as well as the members of the union. Mr. Dharmendar Prasad, a 40 yrs middle aged 'jhal-mudi-wala' stated that - *problem is mainly financial...there is no saving, but the family is large...if any member of the family is sick then we have to borrow the money from our union leaders...the amount of interest is 10% monthly which is quite high for me...due to the fear of losing selling-space, we become silent....our struggle for social security purposes.* Mr. Mujafar Khan (54 yrs old), a 'vegetable seller' for the last 25 years, stated that - *the rate of interest for hawkers like us (perishable commodities) is much higher than other kind of hawkers of these place...even 20% per month...* As they are not recognized formally by the Government so they have no other alternatives but to borrow money from these private money lenders at a very high rate of interest which varies depends on their selling commodities.

iii) The Crisis and troubles associated with the Space:-

Very common problems faced by most of the hawkers are space they occupied for selling their commodities. The local union fixed 5'×3' for every hawker but sometimes it become 3'×3'. According to Mr. Chandan Mallik, who is regular in this place as 'sandal wood- rudraksha seller' for last 30 yrs stated that - *the space demarked by the union is not equal for all...in most cases, they are allotted accordance to personal choices of the union leaders...it is problematic for me to display all variety of items within this little place of merely 3'×3'.* In addition to that, according to Mr. Tapan Seal, 'cup-dish seller'...*we are always in a fear that if any day I will absent due to any reason, I may lose my selling place, there is always an additional pressure of some other hawkers who have no fixed place allotted by the local union.* Usually they occupy the space when a union recognized hawker is absent.

iv) Scarcity of Storage:-

There is no arrangement of preservation of fruits or vegetables, so unsold items become rotten, for which the prices are fixed after taking into consideration of all cost. According to 55 yrs old 'fruit seller' Mr. Swapan Roy - *I can't sell all the fruits which I purchase daily...I have to sell 3 kgs of mangoes at the price equal to the price of 5 kgs of mangoes...in this way I try to raise the purchasing price...if all fruits are not selling out daily...it is hard to earn profit.* Mr. Sadanada Sil (43 yrs of age), a regular 'vegetable seller' opined that - *the major problems for perishable commodity sellers like us is the absentee of storage room...apart from the burden of not sold vegetables storage...we also faced seasonal problems like coping with rain.*

v) Lack of Organized policies and Schemes:-

As there is no as such particular policy or scheme for legalising street vending in almost all cities of our country, corruption, in the form of bribery and extortion from all possible means as well as from police, eats the earnings of these people and reduces their income further. Mr. Krishna Das, a boot polisher was there for almost long 40 yrs said- *well my equipment values a small amount of Rs. 500/ but for doing business even in this foot path with this little amount I need to pay bribe to the local political leaders to sustain here... even police also did the same.... I won't tell you the amount... we all (indicating other vendors) are living in anxiety and struggling for long.* If Government will take initiatives then this gives a lever to the municipal authorities to earn more through license fees and street vending can also be regulated.

The Interpretation of the Findings: A Brief Overview:-

Each state government may have own planning and policies for development of its undertaken cities like- allocating space for hospitals, parks, markets, bus and rail terminuses etc. The present study intends to mirror that instead of implementing any comprehensive plans, they could take into account the alternative livelihood for hawkers for the successful and actual development of the city.

The present research are purposively restricted to portray in street vending to unearth a detailed account on the life, living and crises of the concerned respondents in the studied area. The qualitative parameters and themes developed on the basis of the narrative data analysis method from the findings of the study clearly suggests the perception, living the profession, the crises of the profession, and an hazardous and/or hectic situations to sustain the profession for a long period of time.

The present authors through their analytical findings with a very brief interpretation further instigates to intensive future and detailed research and recommendations to the governmental and other non-governmental agencies to

avoid these limitations on the multiple and different informal market oriented spaces and settings of the concerned city, as well as on the other cities in India for the issues of wellbeing and sustainable living of informal sectors professionals.

bassin de Mechraa Ben Abbou, Rehamna, Maroc, viséen supérieur, roches magmatiques basiques, altération hydrothermale.

Abstract

Le bassin de Mechraa Ben Abbou (MBA) (Rehamna-Maroc) a connu au Viséen supérieur une intense activité magmatique basique.

L'analyse structurale par des coupes réalisées sur le terrain a montré que ces roches se mettent en place sous forme de sills. Ces sills suivent en concordance les ondulations dessinées par le plissement principal cartographique du synclinal de la Gada Jennabia. La minéralogie des différents facies identifiés reste comparable avec les minéraux principaux, plagioclases et clinopyroxènes. Ce sont des gabbros à texture grenue, des dolérites à textures optique, sub optique ou intersertale et des basaltes à texture microlitique porphyrique vacuolaire.

Dans ces roches l'altération se manifeste à l'échelle de l'affleurement par des fillonnets de calcite ou de quartz et au niveau des lames minces par des processus de séricitisation, de chloritisation, de carbonatation, de silicification, d'ouraltisation et d'oxydation. Ces processus d'altération peuvent être liés à la circulation de fluides hydrothermaux syn ou post-magmatique.

Les diagrammes géochimiques en éléments majeurs en fonction des pertes au feu ont permis de qualifier et de quantifier les effets de l'altération. La confrontation des données de terrain de point de vue structural avec les données microscopiques et géochimiques permettent de caler dans le temps les phénomènes d'altérations observés qui correspondent aux phases tectoniques hercyniennes.

Introduction:-

Le magmatisme lié à l'orogénèse hercynienne au niveau de la Meseta marocaine a fait l'objet de plusieurs travaux de recherche (Jenny, 1974 ; Huvelin, 1977 ; Lagarde, 1987 ; Kharbouch, 1982 ; Kharbouch, 1994 ; Aarab, 1995 ; Essaifi et al., 1995 ; Mrini et al., 1992 ; Remmal, 2000 ; Remmal et al., 1997 ; Roddaz, 2000 ; Ben Abbou, 2001 ; Ben Abbou et al., 2001 ; Kholaiq et al., 2015b). Ce magmatisme est associé aux séries sédimentaires et métamorphiques du Carbonifère terminal.

Dans le massif des Rehamna septentrionaux, le magmatisme préorogénique est impliqué dans le plissement hercynien d'âge Namuro- Westphalien selon Gigout, (1951). Il s'agit de dolérites et de gabbros sous forme de sills dans la série viséenne et de dykes dans la série du Dévonien inférieur.

Jenny, (1974) et Michard, (1976), signalent l'existence d'ophites et de dolérites en sills et dykes à Mechraa Ben Abbou. C'est ainsi que Jenny, (1974) à travers une coupe réalisée à Bled El Mekrech reprise par Saber, (1989) montre l'existence de sills de puissance métrique séparés par des minces couches métriques de sédiments sur le flanc Est de la Gada Jennabia d'âge Viséen supérieur.

Kharbouch, (1994) a distingué dans les Rehamna septentrionaux deux ensembles magmatiques :

- Un ensemble préorogénique formé par des roches hypovolcaniques et volcaniques ;
- Un ensemble post orogénique formé par des coulées et par des filons microdioritiques.

Elle conclue que les laves sont basiques et que les sills sont constitués de gabbros et de dolérites et que les intrusions sont plus importantes que les faciès effusifs. Les seuls pyroxènes analysés dans l'ensemble magmatique de barrage El Massira révèlent une tendance alcaline. Alors que Remmal et al., (1997) attribuent un caractère tholéitique continental au magmatisme des Rehamna occidentales. Ils signalent que les roches magmatiques sont surtout des dolérites et des gabbros sous forme de laccolites ou de filons sous-marins présentant des pillow-lavas.

Pour El Kamel, (2002) à Mechraa Ben Abbou les intrusions magmatiques sont effusives et intrusives de types alcalin à tholéitique dont leur mise en place est régie par une tectonique distensive attestée par la présence de failles normales syn-sédimentaires.

Les travaux récents Kholaiq et al, (2015b) distiguent au niveau du synclinal de la Gada Janabia des gabbros, des dolérites et de laves basaltiques dont les analyses géochimiques les attribuent à une série tholeitique orogénique continentale (Kholaiq et al., 2016).

Cadre géographique et géologique:-

Le massif hercynien des Rehamna se situe à 80 Km au Nord de Marrakech et à environ 150km au Sud de Casablanca (fig.1). Le bassin de Mechraa Ben Abbou (MBA), objet de notre étude, constitue la partie septentrionale de ce massif.

Fig. 1:- Situation du massif des Rehamna dans la Meseta occidentale marocaine (Ntarmouchant et al., 2016).

Le bassin de Mechraa Ben Abou montre des terrains paléozoïques allant du Dévonien inférieur au Viséen supérieur. Ces terrains présentent une diversification des faciès allant des détritiques, aux carbonatés et aux pélagiques, contemporains de la mise en place des roches magmatiques basiques (gabbros, dolérites et basaltes).

L'ensemble est structuré par la phase paroxysmale hercynienne sous forme d'un synclinal (Fig.2) (synclinal de la Gada Jennabia).

Les secteurs de Bled El Mekrech (coupe AB) et Cheikh El Basri (coupe CD) situés sur le flanc Est, le secteur de Lala El Gara (coupe EF) qui constitue la terminaison péri-synclinal et le secteur de Leffaid (coupe GH) situé sur le flanc Ouest, sont les quatre sites qui permettront d'approcher le magmatisme dans le bassin (Fig.2).

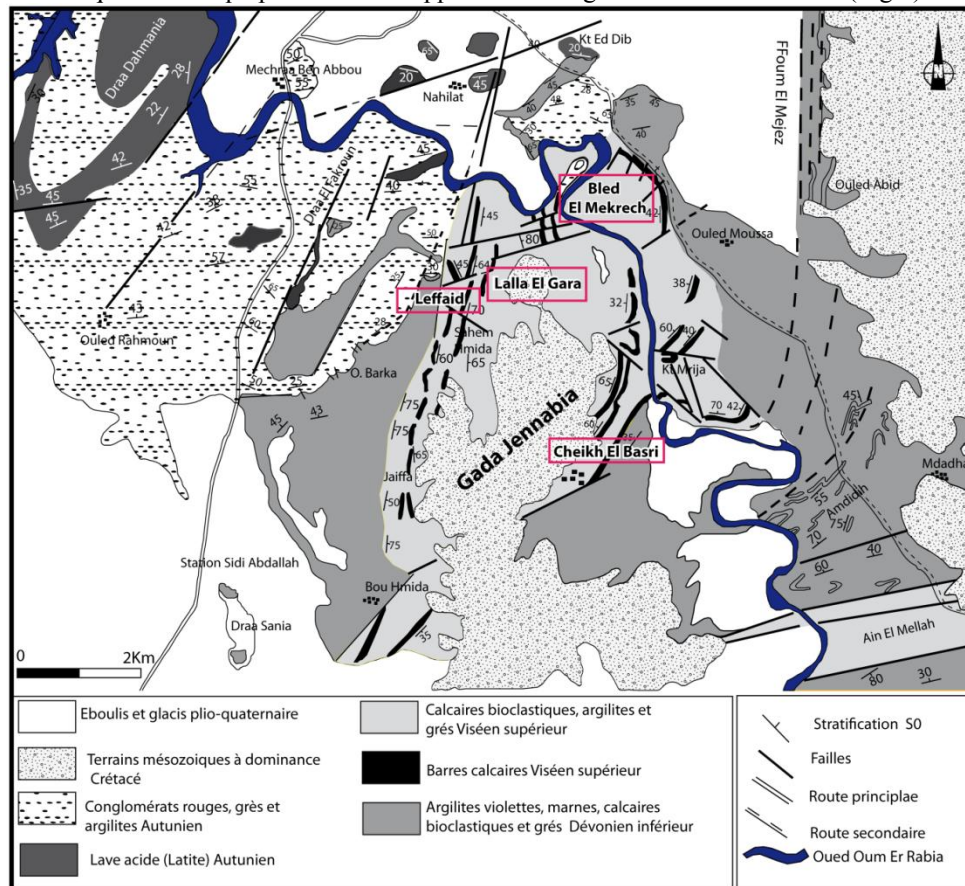

Fig. 2:- Répartition des affleurements de roches magmatiques basiques dans le synclinal de la Gada Jennabia (Kholaiq et al, 2015a)

Caractérisation structurale et pétrographique des roches magmatiques:-

Les données pétrographiques ont été obtenues à partir de l'étude d'une vingtaine d'échantillons considérés comme représentatifs. Des lames minces ont été observées au microscope pour déterminer les textures et les associations minéralogiques de ces roches. De point de vue mode de gisement, l'ensemble des roches magmatiques forment des sills et les coulées de laves parallèles à l'encaissant immédiat d'âge Viséen supérieur probable. Ainsi, leurs caractères relativement résistant à l'érosion et à l'altération mettent les gabbros et les dolérites en relief au sein des schistes. Les roches sont généralement de couleur vert olive quand elles sont fraîches, et prennent une couleur sombre par altération.

Mais avant d'étudier ses roches, et pour mieux cerner le mode de la mise en place des roches magmatiques nous avons réalisé plusieurs coupes sur le terrain.

Coupe de Bled el Mekrech:-**Relation roche magmatique – encaissant:-**

Une coupe réalisée sur le flanc Est de la Gada Jennabia, orientée ESE-WNW (fig.3), révèle la présence des plis dans les terrains d'âge Dévonien inférieur. Ces plis de taille métriques sont tous de type isopaques dont l'orientation des axes varie de N90 à N125 avec un prolongement axial de 25° à 30° vers l'Ouest.

Fig.3:- Coupe géologique dans les terrains Dévono-Viséens de Bled El Mekrech.

Sur le flanc Sud, la direction des couches varie de N100 à N105 avec un pendage de 45° à 40° vers le Sud. Sur l'autre flanc la direction est de N75 avec un pendage de 25° vers le Nord. Au niveau de la charnière la stratification est orientée N145 avec un pendage de 30° vers l'Ouest. La schistosité est surtout visible dans les bancs incompetents schisteux. Elle est sub-verticale avec une orientation N15 à N20. Cette schistosité parfois subit des virgations illustrant des zones de cisaillement à l'échelle de l'affleurement orientées N120-N130 senestres.

La deuxième barre calcaire d'âge Viséen supérieur montre une stratification orientée N160 avec un pendage de 30° dans laquelle on observe des plis SE. Au niveau de la surface structurale de cette barre on rencontre des fentes de tension remplis par la calcite de direction N55 et N160 et un pendage de 55° vers l'Est parfois en échelons matérialisant des zones de cisaillement.

La barre de Viséen supérieur est suivie par une alternance de schistes et grès dont l'orientation est la même que la barre calcaire de Viséen supérieur avec un pendage de 55° vers l'Ouest.

Dans les gabbros et les dolérites, on trouve des miroirs de failles N170 55° vers l'Est ainsi que des cassures de même direction remplis par la calcite. Ces cassures sont parfois plissées. On trouve aussi des filons pluri-métriques N 130 sub-verticaux, remplis par du quartz. Le contact encaissant - gabbros et dolérites est souvent accompagné d'une schistosité de fracture sub verticale N110 à N120. (Fig. 4). Par endroits ce contact prend un aspect bréchifié. Plus on se dirige vers l'Oued c'est-à-dire vers le cœur du synclinal le pendage des couches devient de plus en plus faible pour atteindre des valeurs très faibles (20° vers l'Ouest).

Fig. 4:- Photos de terrain montrant la relation entre les dolérites et les roches encaissantes

Pétrographie:-

L'étude microscopique des roches magmatiques à Bled El Mekrech (Fig.5), nous a permis de mettre en évidence un faciès gabbroïque. Les gabbros de couleur vert clair à vert foncé développent une variété de textures, grenue, microgrenue, et doléritique. Dans les gabbros à texture grenue, les associations minéralogiques montrent un gabbro à pyroxène et un gabbro ordinaire sans pyroxène. Les gabbros à pyroxène (Fig.5,A) montrent une composition minéralogique à plagioclases (30 à 40%), de type labrador ou les macles polysynthétiques sont assez fréquentes. La taille des lattes est comprise entre 2 et 5 mm. Ces cristaux développent une altération en calcite et en chlorite. Le clinopyroxène 40 à 50%, est le minéral le plus abondant après le plagioclase, et forme des plages xénomorphes très fissurées. Il montre des transformations en granules d'oxydes noirâtres, en chlorite, et/ou en calcite.

Vers les bordures figées et à l'approche du contact avec l'encaissant, les gabbros ordinaires (Fig.5, B) montrent une texture microgrenue ou les phénocristaux sont représentés par des plagioclases millimétriques et des transformations surtout en calcite. Dans le faciès à texture doléritique (Fig.5, C et D), les plagioclases et les clinopyroxènes constituent la paragenèse primaire (60% à 70%) et la calcite, la chlorite et les oxydes de fer constituent la paragenèse secondaire. Le plagioclase de type labrador, cristallise en lattes maclées sub-tabulaires de 0,4 à 4mm de long. Ces dernières sont en association intersertale triangulaire renfermant des clinopyroxènes. Parfois, les plagioclases se présentent sous forme de baguettes à l'intérieur des clinopyroxènes, conférant à la roche une texture ophitique.

Coupe de Cheikh El Basri :**Relation roches magmatique – encaissant:-**

C'est une coupe E-W réalisée dans les terrains géologiques de Cheikh El Basri (fig.6), les formations détritiques et carbonatées recoupées par des sills des roches magmatiques basiques d'âge Viséen supérieur, forment une structure monoclinale à pendage vers l'Ouest. Cette structure est surmontée par une couverture tabulaire d'âge Mésozoïque en discordance angulaire.

A la base, on trouve des schistes caractérisés par une schistosité de fracture. Ces schistes sont intercalés par des bancs gréseux, l'ensemble est orienté N40 avec un pendage vers l'Ouest. Les filons gabbroïques sont intercalés d'une façon concordante avec une barre calcaire orientée N50 avec un pendage de 70° vers le Nord. Au dessus de cette barre on trouve un deuxième affleurement gabbroïque qui a toujours la même direction que l'encaissant. Par endroit, le contact immédiat est souvent caché par des éboulis qui rendent difficile de toucher et préciser la nature de la limite encaissant- gabbro. Les schistes qui viennent après sont perturbés (aspect chaotique) assimilables à des brèches tectoniques, ce qui confirme un passage de faille. Le haut de ces schistes est caractérisé par des passés gréseux de couleur grisâtre à noirâtres dite cornés orienté N40 avec un pendage vers l'Ouest.

Sur les schistes un filon gabbroïque est de couleur rougeâtre parfaitement parallèle avec la stratification témoigne une autre fois une mise en place sous forme de sill stratiforme.

Sur ces gabbros repose une barre calcaire N50 avec un pendage de 70 à 60° vers l'Ouest. Avec cette barre s'affine le Viséen supérieur et commence le continentale intercalaire. Il est formé essentiellement par des grès, calcaires et des argiles rouges dont la stratification est orientée N40. Dans la partie sommitale, on trouve une alternance des barres calcaires et des marnes jaunâtres constituent une couverture sub-tabulaire.

Fig. 6:-Coupe géologique E-W à travers les terrains Viséens supérieurs à Cheikh El Basri

Pétrographie:-

Ce massif constitue l'un des principaux corps magmatiques des Rehamna septentrionaux. Dans les travaux antérieurs, il n'a jamais fait l'objet d'étude pétrographique. Il s'agit de dolérite de couleur rouge surpatine et sur cassure fraîche. Au microscope la texture est intersertale ± ophitique et/ou sub-ophitique (Fig.7). La composition minéralogique est marquée par une proportion en plagioclase quasi égale à celle des minéraux ferromagnésiens représentés par des clinopyroxènes. Le plagioclase en phénocristaux cristallise en premier. Il est de type labrador avec des macles polysynthétiques. Il est fréquemment fracturé mais rarement altéré. Le clinopyroxène qui cristallise en plages xénomorphes dans une texture de type ophitique à sub-ophitique où les lattes de plagioclases sont incluses totalement ou partiellement dans les plages de clinopyroxène.

La coupe de lala El Gara:-

Relation roches magmatique – encaissant:-

La coupe W-E réalisée au niveau de la terminaison périsynclinale de la Gada Jennabia (Lala El Gara) révèle (fig.8) : Une série schisto- gréseuse où s'intercale des gabbros sous forme de sills. La stratification aux limites des gabbros est orienté N150 avec un pendage de 70° vers le Nord.

Dans cette formation on a pu mettre en évidence des plis dont le cœur présente une schistosité de plan axial N20 - N30 sub- vertical donnant un aspect en frites aux schistes lorsqu'elle coupe la stratification.

En allant vers l'Ouest, les sills stratiformes suivent le plissement des schistes pour former des synclinaux et des anticlinaux de direction N20 - N30, le pendage sur les flancs est généralement de l'ordre de 50° vers l'Est et de 30° vers l'Ouest. Ces plis apparaissent dans des couloirs limités par des failles verticales.

Le plissement des sills suivant les ondulations observées surtout au niveau de la terminaison périsynclinale de Lala El Gara confirme une mise en place syn phase paroxysmale (fig 9 et 10).

Lala El Gara au sommet présente une structure synclinale dont les pendages aux flancs sont faibles, soit vers l'Est ou soit vers l'Ouest. Elle est bien marquée par les coulées basaltiques interstratifiées dans une formation schisteuse.

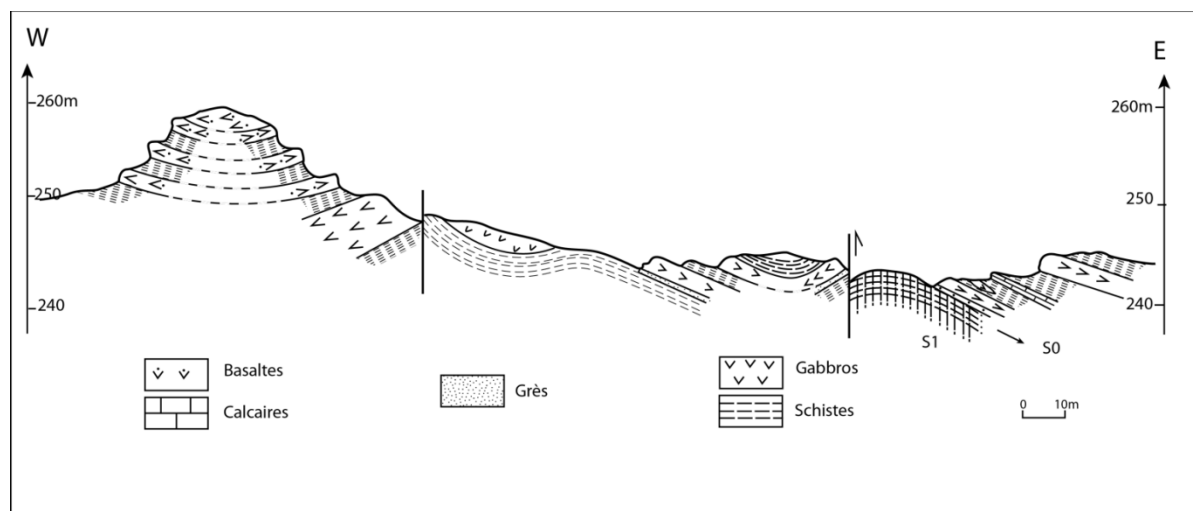

Fig.8:- Coupe géologique dans les terrains Viséens de Lala El Gara.

Fig.9:-

Fig.10:-

Fig.9:- Photo montrant un débit schisteux dans les roches magmatiques basiques.

Fig.10:- Photo montrant le plissement des veines calcitiques au sein des gabbros.

Pétrographie:-

L'étude pétrographique des roches magmatiques de Lala El Gara montre qu'il s'agit de deux ensembles : un ensemble doléritique et un ensemble basaltique. L'ensemble doléritique (Fig.11, A et B) a une composition minéralogique semblable à celle de Bled El Mekrech et de Cheikh El Basri, mais s'en diffère par l'abondance des plagioclases. Le plagioclase constitue le minéral cardinal, de type labrador sous forme des cristaux automorphes avec des macles polysynthétiques. Le clinopyroxène cristallise en plages qui peuvent englober totalement ou partiellement des cristaux de plagioclases formant une texture ophitique à sub-ophitique.

L'ensemble basaltique est reconnaissable grâce à la présence de vacuoles centimétriques, la roche est de couleur grise à verte olive. A l'échelle de la lame mince, la roche a une texture microlitique porphyrique vacuolaire (Fig.11, C et D). La paragenèse primaire est constituée essentiellement par des cristaux de plagioclases de type labrador, sous forme de baguettes allongées de taille variant de 0,05 à 4mm, qui constituent 60% à 70% du volume total de la roche. La macle polysynthétique est bien distincte. Ces cristaux sont emballés dans un fond vitreux (mésostase), qui représente 30% à 40% de la roche. Celle-ci renferme des vacuoles à remplissage calcitique, dont certaines montrent un remplissage séquentiel avec de la chlorite au centre et la calcite en bordures. Ce caractère traduit, soit la présence de deux phases d'hydrothermalisme liées respectivement à deux phases orogéniques, soit l'existence de deux stades d'hydrothermalisme tardi à post-magmatiques d'une même phase tectonique dont l'un est précoce et l'autre est tardif. Les vacuoles peuvent être isolées ou communicantes avec deux ou plusieurs individus.

A Leffaid:-

Relation roches magmatique – encaissant:-

Il s'agit d'une coupe E-W (Fig. 12), réalisée dans les terrains viséens de Leffaid (flanc Ouest du synclinal de la Gada Jennabia. En se basant sur les relations entre les différents faciès, une succession lithostratigraphique a pu être reconstituée, cette dernière comprend de bas en haut (de l'Ouest à l'Est) :

Des schistes grisâtres orientés N30 avec un pendage de 40 à 30° vers l'Est, suivi par une barre calcaire orientée N160 avec un pendage de 40° vers l'Est. Au niveau de la surface structurale on trouve des gradins matérialisés par des failles N80 portant des stries à aspect boueux, cette barre est suivie par une alternance de schistes et de grès dont l'orientation est N30 avec un pendage de 30° vers Est.

Après une deuxième barre calcaire un peu pentée que la première mais qui garde la même direction et qui est toujours vers l'Est, des filons gabbroïques sont intercalés d'une façon concordante avec des schistes et des grès (fig 13), sur ces roches magmatiques on remarque un débit orienté N30 et des fractures orientées N80 remplies de calcites et de quart. Une alternance de coulées basaltiques et des schistes coiffent la série viséenne.

Les terrains du Viséen supérieur sont couverts en partie par une série tabulaire d'âge mésozoïque sur lesquels elle repose en discordance.

Fig. 12:- Coupe géologique à travers les terrains Viséens supérieurs de Laffaid

Fig. 13:- Photo montrant la relation entre les dolérites et les roches encaissantes

Pétrographie:-

L'étude microscopique des roches magmatiques dans la région de Laffaid nous a permis de mettre en évidence deux ensembles : un ensemble doléritique (Fig 14, A et B) et un autre basaltique (Fig 14, C et D).

L'ensemble doléritique est caractérisé par une couleur vert olive sous forme de sills. Il montre à l'oeil nu des plagioclases et des clinopyroxènes. Microscopiquement, les épontes de ces sill sont caractérisées par une texture microcristalline. Vers le coeur, la texture évolue et devient intersertale, ophitique et/ou sub-ophitique. La paragenèse minérale est constituée essentiellement par des plagioclases, des clinopyroxènes, des opaques et accessoirement de la calcite, de la séricite et de la chlorite.

Le plagioclase est en général séricitisé. Il représente 40% à 50% des minéraux de la roche. Il s'agit en général de labrador sous forme des cristaux automorphes avec des macles polysynthétiques. Le clinopyroxène, le plus souvent transformé en chlorite et/ou en calcite, représente 30% à 50% des minéraux de la roche. Il est de type clinopyroxène formant avec les plagioclases une texture doléritique de type ophitique et sub-ophitique. Le clinopyroxène cristallise sous forme des plages xéno-morphes très fissuré où on observe des oxydes de fer.

Les transformations secondaires sont, en plus de la chlorite, les oxydes de fer et la calcite. Les minéraux opaques sont souvent automorphes et abondants dans les roches.

Fig 14:- A, B : Dolérites à texture inter tale, ophitique et sub-ohitique. : Dolérite à texture intertale et sub-ophitique.
C et D : Basaltes porphyriques microlitiques vacuolaire.
Pl : *Plagioclase*. Cpx : *Clinopyroxène*. Ce : *Séricite*, Ca : *Calcite*. Op : *Opaque* (Gr*100)

Il paraît que les roches magmatiques des quatre affleurements (Bled El Mekrech, Cheikh El Basri, Lala El Gara, et Leffaid), présentent des minéralogies comparables (Tableau I) a paragenèse primaire des gabrros et des dolérites est caractérisée par une abondance du plagioclase suivi par le clinopyroxène formant des textures ophitiques, sub-ophitiques et intersertales dont la paragenèse secondaire est surtout représentée par des minéraux d'altérations tels que la calcite, la chlorite, et les oxydes de fer.

Les basaltes microlitiques porphyriques vacuolaires de Lala El Gara et Leffaid sont caractérisés par des plagioclases. Les minéraux d'altération sont représentés par la Calcite, la Chlorite et la Séricite. Concernant l'ordre de cristallisation et d'après la relation mutuelle entre les minéraux, on constate la cristallisation d'abord d'opagues, de plagioclase, puis de clinopyroxène (Fig.15).

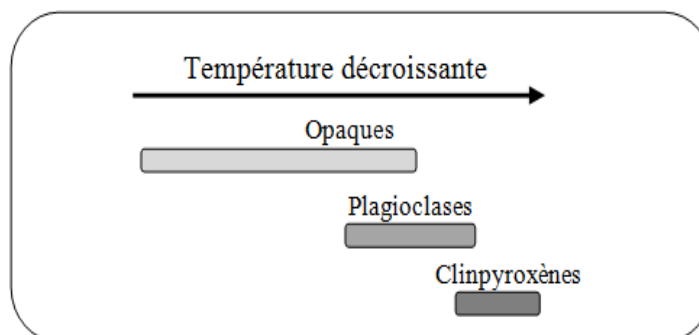

Fig.15:- Schématisation de l'ordre de cristallisation

Altération des roches magmatiques étudiées:-

A l'échelle d'affleurement et du banc, Les phénomènes d'altération sont manifestés par des filons de calcites et de quartz. En effet, les roches magmatiques sont affectées par une fracturation plus ou moins intense. Les fractures (0,5 à 4 cm d'ouverture) sont remplies selon les cas de calcite ou d'ankérite.

A Bled El Mekrech, les roches magmatiques sont affectées par deux familles de fractures remplies par la calcite. La première famille est sub verticale orientée N140, alors que la deuxième famille tardive orientée N20. Parfois, l'aspect réticulé rend difficile l'établissement d'une chronologie relative de leur apparition. Par endroit, les fractures deviennent très serrées et sont remplies par la calcite, qui illustre des amygdales de cisaillement.

Parfois, ces fractures sont plissées indiquant un remplissage anté-déformation. Certaines fractures montrent un remplissage polyphasé (séquentiel), avec cristallisation de la calcite au centre et de l'ankérite en bordures. (fig.16).

Fig.16:- fractures montrent un remplissage polyphasé

A **cheikh El Bassri**, les roches magmatiques sont traversées par des fractures N 70 remplies aussi par la calcite, alors que à **Lala El Gara**, les roches sont affectées par deux familles de fractures, dont la première est orientée N150 sub- verticale, et la deuxième famille est orientée N90 avec un pendage de 50° vers le Nord.

Microscopiquement, les roches magmatiques des trois zones d'études montrent des transformations en calcites, chlorites, opaques et en quartz rarement au centre des sills très intensément aux bordures figées.

Calcitisation:-

La calcite présente en quantité appréciable dans la majorité des échantillons. Elle représente un produit de transformation et d'altération des minéraux primaires. Elle se rencontre presque dans les roches altérées qui se situent aux bordures des sills. Ainsi Certaines roches sont complètement transformées en calcite. Cette dernière cristallise soit en petites plages, soit sous forme des paillettes et / ou des petites veines qui recoupent les lattes de plagioclases (fig.18.a). Elle cristallise dans les cassures des cristaux de clinopyroxènes et de plagioclases aussi bien qu'à la limite plagioclase-clinopyroxène. Dans les gabbros de Cheikh El Basri, la calcite est associée à l'ankérite ou au chlorite. (fig.17et 18.b).

fig. 17:-Altération polyphasée dans les gabbros de Cheikh El Basri

Ak : Ankérite, **Cl** : Chlorite, **Ca** : Calcite, **Pg** : Plagioclase

Chloritisation :-

La chlorite est un minéral secondaire qui se développe aussi bien dans gabbros que les dolérites. Elle cristallise en petits amas qui se développent aux dépens du clinopyroxène et du plagioclase. Grâce à sa couleur verdâtre, elle se reconnaît facilement en lame mince. Elle se rencontre associée à d'autres produits de transformation telle que la calcite (fig.18.c).

Oxydation :-

L'oxyde de fer fait partie des produits d'altération les plus répandus dans toutes les lames altérées. Il se développe au dépend des fractures des minéraux surtout les pyroxènes (fig.18.d).

Ouralitisation:-

Ouralitisation des pyroxènes est la formation d'amphibole (Trimolites ?) qui cristallise en amas et en plage au dépend des pyroxènes (fig.18.e).

Approche géochimique des effets de l'altération:-

Les compositions chimiques des roches analysées peuvent être affectées par une altération post-magmatique. En effet, elles montrent des transformations hydrothermales liées aux événements tectono-métamorphiques hercyniens. D'après une lecture directe des compositions chimiques et en particulier les pertes au feu qui traduisent le plus souvent la transformation des phases minéralogiques primaires en phases secondaires hydratées. L'examen des analyses chimiques (tableau) montre que les roches étudiées présentent des pertes au feu variable, de 4,16 à 9,84%. Les valeurs élevées traduisent une altération importante des minéraux primaires.

Dans ce cas, le diagramme (K_2O+Na_2O) en fonction de $K_2O/(K_2O+Na_2O)$ de Hughers (1973) (Fig19) nous semble très important du fait qu'il définit le champ des roches de composition magmatique initiale, le champ des roches enrichies en potassium et celui des roches enrichies en sodium

L'examen de ce diagramme montre que les points représentatifs des quatre affleurements du bassin de MBA gardent l'empreinte des caractères magmatiques originaux comme l'indique leur emplacement dans le spectre des roches ignées

Donc même avec des valeurs élevées des pertes au feu, les roches étudiées gardent leur caractère initiale, on peut dire donc qu'elles ont subi une altération post formation

Fig 19:- projection des roches magmatiques basiques étudiées dans le diagramme de Hughes (1973) montrant que ces roches ont une composition magmatique originelle comparable

Diagrammes oxydes pertes au feu:-

A partir de la lecture des analyses chimiques brutes des roches magmatiques, nous constatons que les pertes au feu sont relativement élevées, les roches magmatiques peuvent en contenir jusqu'à 9,84%

Les fluctuations des pertes au feu des roches étudiées semblent être liées à la proportion des minéraux hydratés (chlorites, séricites) et la néoformation de la calcite et le quartz dans les cassures, les veines et les vacuoles dans les basaltes. Il est évident que les teneurs en pertes au feu soient proportionnelles au degré d'hydratation que le magma et les minéraux peuvent subir. Ce phénomène qui traduit évidemment l'effet conjugué de l'altération phylliteuse et carbonatée, peut s'accompagner d'un apport ou d'un lessivage d'éléments chimiques.

Ainsi, les variations des principaux oxydes en fonctions des pertes au feu (fig 20) permettent de rendre compte du comportement des éléments chimiques au cours de l'altération. Dans ce sens, le diagramme SiO₂-PF montre une diminution des teneurs en SiO₂ corrélativement à l'augmentation de celle de pertes au feu, cette distribution des points représentatifs des échantillons analysés est sans doute une conséquence d'un hydrothermalisme responsable de la mobilité de la silice comme en témoigne la présence de filons, veines, et vacuoles remplis de quartz secondaire.

Le diagramme CaO – PF montre une corrélation négative marqué par une augmentation des teneurs en CaO pour des pertes au feu de plus en plus élevées, ceci peut être expliqué par la mobilité du calcium comme témoigne d'une part la calcitisation des plagioclases et de la mésostase et d'autre part, le remplissage des vacuoles, des veines et des filons de la calcite

Dans le diagramme de Fe₂O₃- PF une légère corrélation négative indique un lessivage du fer, comme le laisse prévoir l'oxydation des microfractures, l'hématisation et l'oxyde de fer dans cassures et le clivage dans les clinopyroxènes

Le diagramme de MgO- PF met en évidence une corrélation positive des représentatifs des roches basiques qui traduit un apport du magnésium, comme l'atteste la formation de la chlorite magnésienne au dépend des minéraux ferromagnésiens (chloritisation des clinopyroxène, dans les vacuoles et dans la mésostase

Le diagramme de K₂O vs PF met en évidence une corrélation négative qui indique que les phénomènes d'altération s'accompagnent d'un lessivage de K₂O.

Le Na₂O vs PF présente une très faible corrélation positive et pourrait s'expliquer par une contribution du Na marquée par l'albitisation des plagioclases calciques.

En consultant le diagramme $K_2O - Na_2O$ nous constatons que ces deux éléments sont liés par une corrélation négative si bien que les échantillons les plus potassiques étant les plus sodiques

Certes, cette évolution ne peut trouver une explication que dans les processus de différenciation magmatique, nous envisageons une métasomatose potassique couplée à un lessivage de la soude pour interpréter le comportement des alcalins dans roches magmatiques basiques du bassin de MBA

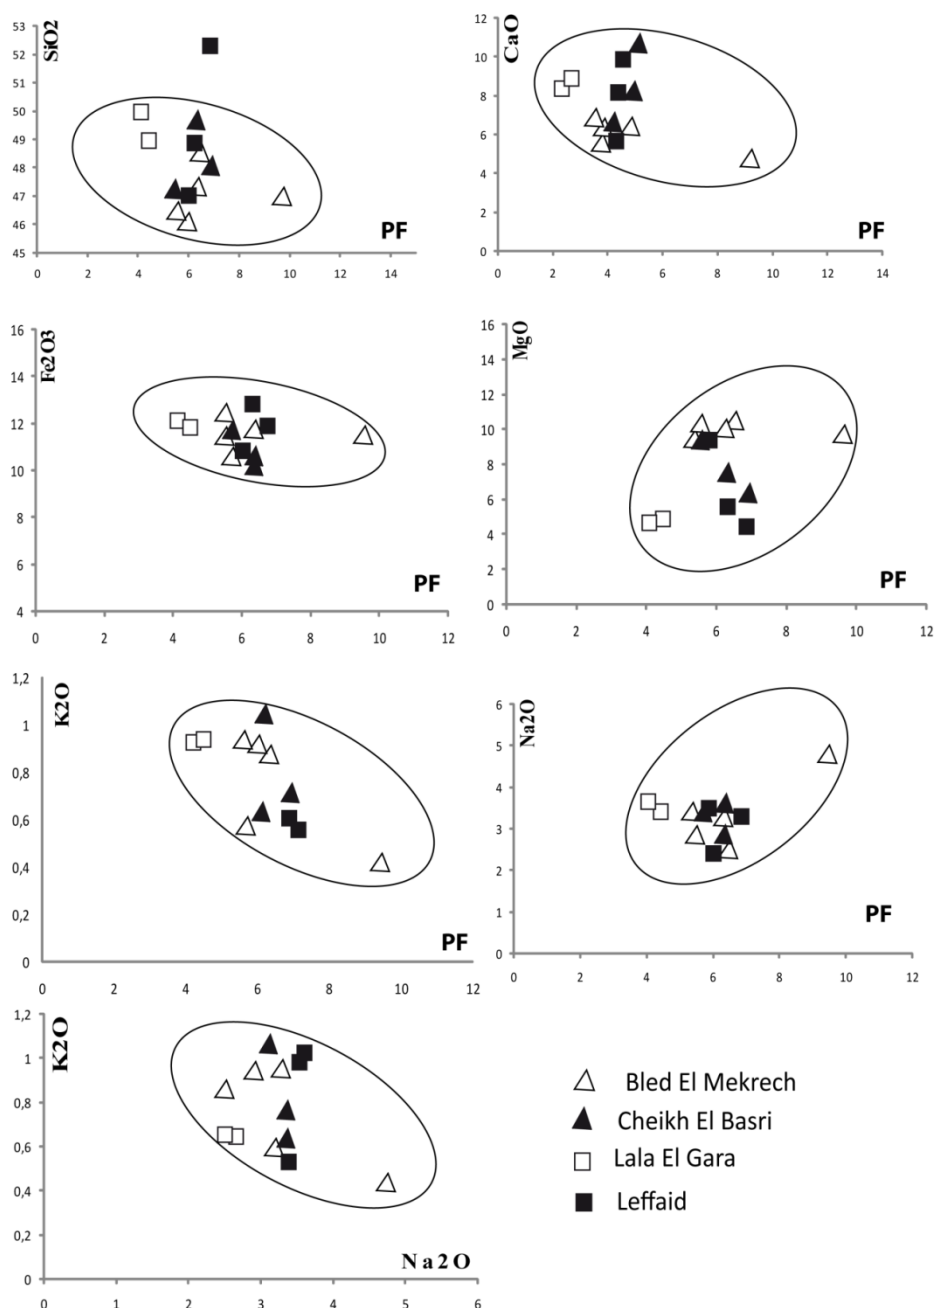

Fig. 20:- Variation de la composition chimique des éléments majeurs en fonction de la perte au feu

Conclusion générale:-

Dans le but d'approcher les phénomènes d'altération dans les roches magmatiques basiques de Mechraa Ben Abbou nous étions amenés à suivre une démarche multiple structurale, pétrographique et géochimique. Ainsi, l'analyse structurale de quatre affleurements représentatifs a permis à travers des coupes réalisées sur le terrain que les contacts entre les différentes roches magmatiques et l'encaissant immédiat sont toujours parallèles à la stratification ce qui témoigne d'une mise en place de ces roches sous forme de sills.

L'étude pétrographique des roches magmatiques des quatre affleurements (Bled El Mekrech, Cheikh El Basri, Lala El Gara et Leffaid) a permis de remarquer que ces roches présentent des minéralogies comparables dominées par une paragenèse primaire constituée par une abondance de plagioclase suivie par le clinopyroxène et une paragenèse secondaire qui est surtout représentée par des minéraux d'altérations tels que la calcite, la chlorite, l'amphibole, et l'oxyde de fer.

Ces phénomènes d'altérations qui peuvent être liés aux circulations des fluides hydrothermaux se manifestent à l'échelle de l'affleurement et du banc par des filons de calcites, de quartz et d'ankérite et à l'échelle de la lame mince les roches magmatiques des quatre zones d'études montrent des transformations en calcites, en chlorites, en oxydes de fer et en quartz rarement au centre des sills, mais très intensément aux bordures figées. Les altérations se développent, aussi bien au niveau de la mésostase qui inclut localement des vacuoles millimétriques colmatées par la calcite et la chlorite.

Les analyses géochimiques montrent que les altérations se traduisent par un changement dans le comportement des éléments chimiques qui témoigne de l'interaction entre les fluides hydrothermaux et les roches magmatiques étudiées. Ainsi, les diagrammes de variation des oxydes en fonction des pertes au feu indiquent un lessivage de SiO_2 , CaO , Fe_2O_3 et de K_2O et d'un apport en MgO et en Na_2O .

La combinaison des données structurales (filons plissés et filons cassés), la nature du remplissage minéral séquentiel avec la cristallisation de la chlorite (haute T°) et tardive de la calcite (basse T°) plaident pour deux phases d'altérations hydrothermales concordantes avec les deux phases tectoniques hercyniennes paroxysmale et tardive :

- Une phase I, caractérisée par un plissement P1 à l'échelle cartographique dont l'axe est orienté N20– N 30 avec un plongement de 10 à 20° vers le Sud. C'est le synclinal plurikilométrique dit de la Gada Jennabia ;
- Une phase II, caractérisée par un plissement P2 détectable à l'échelle de l'affleurement métrique à décimétrique accompagnant les failles transverses N60-N80.

Nature of science, scientific concepts, science teaching.

Abstract

This study sheds some light on the commonly held views of senior secondary students about the nature of science. The study is framed around the philosophical positions on the nature of science and elaborate treatment of its various aspects as given by Lederman (2002). The study is purely qualitative and emergent and has been conducted in the Indian context. Samples of the study are school children who have opted science and the college students who are in the first year of graduation course with chemistry as one of their major subjects. In this study, we have tried to describe how students perceive science to be and how it works along with trying to present an emerging relationship between their understanding of the nature of science and their interest in and appreciation of science. Furthermore, taking insights from many studies (Mc Comas, Almazora and Clough (1998)) that chemistry textbooks have an important role in shaping ideas and understanding of concepts in science and the nature of science, we reviewed the NCERT chemistry textbook looking for representation of some aspects of the nature of science. This book is chosen because of been relied upon heavily by students and teachers as the main source of information in Indian schools. Also, looking at the current trend worldwide (Nuffield Projects, PISA documents) there was a felt need how NCERT textbook fare on the yardstick of parameters set to decipher the effectiveness of chemistry concepts taught to the children. We also have used in this study the Niaz and Fernandez (2008) framework to review a chapter on 'structure of atom' looking for the representation of Historical and Philosophical treatment of the chapter.

Major findings reveal that college and school students had almost the same views about the nature of science. Textbook writing needs to incorporate the style of presentation which doesn't distort the real science, its nature and how it develops. The textbook reviewed for the chapter 'structure of atom' was not written as per the historical and philosophical framework. Students didn't appreciate the need to study older theories. Several such findings are enlisted in this study. Thus, this study presents how actually this study was conceptualized, took its course and finally manifested in the form of results, findings and discussions which we would like to share with you.

Introduction:-

Understanding the Nature of Science:-

Science is so much part of our everyday life that we find it impossible to stand back and examine its social context. Our policy documents NCF 2005 and Position Paper on the teaching of science (NCERT, 2006) talk about the development of 'scientific literacy' in all citizens. 'Scientific literacy' means the ability to use scientific knowledge to make informed personal and societal decisions. This further implies that people need to be able to distinguish between good science, bad science and non-science and make critical judgments about what to believe in. They also need to be critical consumers of science. For example, in order to understand and evaluate the scientific advice on food safety, an adult would need to not only know some basic facts about the composition of nutrients, but also to be able to apply that information. The term "literacy" is used to encapsulate this broader conception of knowledge and skills (OECD/PISA, 2003; Ramanna, 1981).

There are different researches which emphasize on different dimensions of scientific literacy or some even look at it under the rubric of public understanding of science. However, an adequate understanding of the nature of science is underlined as a central component of scientific literacy (AAAS, 1993).

The nature of science is characteristic of science. It reflects the values and assumptions that demarcate scientific knowledge and science from other disciplines. It is referred to as knowledge about science. The nature of science is directly related to the epistemology of science as distinct from scientific process and scientific content. The phrase 'nature of science' is used to describe the intersection of issues addressed by the philosophy, psychology, sociology and history of science.

Despite the acknowledged importance of the nature of science, a number of studies document students' misconceptions concerning the nature of science (Lederman, 1992; Meyling, 1997;) on some aspects which include tentativeness of scientific knowledge, social and cultural aspects

of scientific knowledge, and the theory-laden nature of observation. Textbooks on which a majority of students depend for their understanding of scientific knowledge are often devoid of presentation of issues dealing with the nature of science. Despite the advocacy at the policy level, they continue to present scientific knowledge as final, in a 'rhetoric of conclusion' (Schwab, 1962).

In continuation of our interest to explore the understanding about the nature of science (Dabas, 2010; Rampal, 1993; 1992) and to relate to the readings undertaken as part of the master's course in science education, this study was carried out to assess students understanding about the nature of science at school and college levels.

Philosophical Positions on the Nature of Science:-

The construct of the nature of science has a history of more than sixty years, which has been influenced by various philosophical debates. There are different philosophical positions on the nature of science, such as, positivism, inductivism, hypothetico-deductivism, contextualism and relativism. It often becomes difficult and complex for people working in the area of science education to define it. However, the way NOS is viewed by McComas, Clough and Almozroa, (1998, p.4) presents a comprehensive perspective "A fertile hybrid arena, which blends aspects of various social studies of science, including the history, sociology, and philosophy of science combined with research from the cognitive sciences such as psychology into a rich description of what science is, how it works, how scientists operate as a social group and how society itself both directs and reacts to scientific endeavors".

However, according to Lederman (1992) the nature of science typically has been used to refer to the epistemology of science, science as a way of knowing, or the values and beliefs inherent in the development and validation of scientific knowledge cited in abed-El-Khalick et al. (2008, p. 837). These philosophical positions on the NOS generally cannot provide a simple framework within which school science could look at issues related to the nature of science.

In the 1960s the nature of science used to be viewed mainly as observing, hypothesizing, interpreting data and designing experiments i.e. primarily science as process skills. It was believed that accurate observations lead to scientific knowledge and thus a good observer was taken as 'objective' and 'theory free'. In school, students were expected to spend more time in the laboratory making observations, even if they were not necessarily constructing knowledge. Objective observations coupled with inductive reasoning gave a greater focus to the so called "scientific method" (Dabas, 2010).

As with the shift in the trend from positivism to constructivism, educationists too made a shift from a 'science centered' to 'student centered' view of school science. The humanistic perspective in science was promoted by Aikenhead (1987) and intended to prepare students to critically and rationally assess science and technology. Stress on the STS approach began to increase because science was no longer seen as happening in isolation. Thus, the nature of science, its social aspects and its human character were sought to be described through the study of the history, philosophy and sociology of science.

Osborne et.al (2003) conducted an empirical study on experts drawn from among science educators, scientists, historians, philosophers and sociologists, as well as science teachers and then determined the aspects of the nature of science which must be featured in the school science curriculum. These themes, which emerged from the study and from the themes identified by McComas and Olson created a framework of the essential components of the nature of science to be included in school science curricula. Also, it was highlighted that these ideas and aspects of the nature of science have to be taught in an integrated manner and not in isolation and should be fully contextualized. It was also emphasized that the nature of science should be the core of science education and should not be merely confined to margins.

The Nature of Science and ‘Models’ of the Atom:-

The developments in the area like structure of the atom have immense scope to develop aspects of the nature of science in students. Students in an attempt to understand the models of microscopic entities like ‘atom’ which cannot be observed directly, need to know the nature and role of observations and inference in reaching out to these conceptions.

They may acknowledge the role of unique ideas which initiated the development of the atomic models in earlier times if the historical/developmental aspect of the nature of science could be developed in them. The structure of the atom traces the history from Thomson to quantum mechanical model; enabling the students to understand the tentative nature of science, the existence of rival theories, creativity of scientists and science as a socio-cultural human enterprise.

These aspects of the nature of science like- tentativeness in science, social and cultural association of scientific knowledge, personal beliefs and theory laden nature of observation if developed in students may lead them to have a more informed understanding about the use of ‘models’, such as, for the structure of the atom. Moreover, what is observed today, especially in the context of the microscopic world, will change tomorrow due to advancement in technology and knowledge as it has changed since Robert Hooke discovered the cell. So, students might not develop an absolutist view about science, i.e. scientific knowledge is final and that atomic models are exact replica of the ‘atom’ if these aspects of the nature of science are developed in them.

Science relies on inference and interpretation as all phenomena are not directly observable; for example, inference is used to establish the existence and properties of atoms. The stage at which this concept is introduced, students are normally expected to have developed critical ability to understand the epistemological status of facts, theory, model, and the law that they encounter in science (NCF, 2005). By not properly incorporating the aspects of nature of science, either in teaching learning processes or in the textbooks explicitly, may lead to alternative conceptions among students which gradually keep on being entrenched in their minds. This may create doubt with them about the relevance of the so called ‘redundant’ theories or models in the syllabus. As was seen during FGD and through the questionnaires, there are students who question the inclusion of Thomson’s and Rutherford’s models in the syllabus. They might appreciate their work when an understanding about the tentative nature of scientific knowledge is developed among them. They must also appreciate that scientific progress is an evolutionary process and

that earlier theories pave way for the newer researches, and that very often new theories might build upon the earlier ones, unless there is a paradigm shift.

Rationale to include the NOS in the Textbook:-

Several scholars had (Driver, 1988; West and Pines, 1985) stressed that until now, attention has mainly focused on traditional science content, though in the last decade content related to the nature of science received attention because of interest in teaching science through the history and philosophy of science (Aikenhead and Ryan, 1992, p.881).

Driver et al (1996) suggested some additional arguments supporting the inclusion of the nature of science as a goal of science education. The arguments include the utilitarian view that “an understanding of the nature of science is necessary if people are to make sense of science and manage the technological processes and objects they encounter...” (p.16).

Theoretical Framework:-

This section will lay out the framework of Lederman et al. (2002), used in the current study to understand the students' views on the nature of science.

Study of Students' Views on the Nature of Science

The present study makes use of the framework developed by Lederman using characteristics about the nature of science to analyze the views of high school and undergraduate students and subsequently reviews the chemistry textbook to see how these aspects are dealt with.

The dimensions of the nature of science in Lederman's theoretical framework are defined as:

The tentative nature of scientific knowledge:-

Scientific knowledge, including facts, theories, and law changes as new evidences are collected or gathered through advances in thinking and technology. It is reinterpreted in the light of new theoretical advances (inferential and creative), or changes in the social and cultural spheres. Contrary to common belief, scientific hypotheses, theories and laws can never be absolutely proven irrespective of the amount of the supporting empirical evidence (Popper, 1959). To be proven, a law should account for every instance of the phenomenon it purports to describe. It can logically be argued that one such future instance, of which we have no knowledge whatsoever, may behave in a manner contrary to what the law states. Thus, laws and theories can never acquire an absolutely proven status. Thus, scientific knowledge, although reliable and durable, is never absolute and certain and always tentative.

The empirical nature of scientific knowledge:-

The empirical nature of scientific knowledge addresses that science is at least partially based on observations of the natural world, and sooner or later, the validity, scientific claims is settled by referring to observations of phenomena (AAAS, 1990, P4). However, scientists do not have direct access to most natural phenomena and observations of nature are always filtered through our perceptions and interpreted from within elaborate theoretical frameworks.

The theory laden nature of scientific knowledge:-

Scientific knowledge is theory laden because it is governed by various factors associated with scientists' theoretical and disciplinary commitments, beliefs, prior knowledge, training,

experiences and expectations actually influence their work and what they investigate, how they conduct their investigation, how they interpret their observations. Observations are always guided and acquire meaning in reference to questions or problems, which are derived from certain theoretical perspectives.

The creativity and imaginative nature of scientific knowledge:-

Science, contrary to common beliefs is not entirely rational and orderly activity. Ernest Rutherford conducted an experiment of scattering of alpha particles by gold foil, in 1911. He established the nuclear model of an atom. After he has done an experiment every laboratory assistant could understand it and repeat it. To quote Hospers (1988) “when one reads his work one is always saying, ‘why did not someone else think of that?’ ” cited in Dabas (2010, p.13). It is the imagination of Rutherford which had led him to the gold foil experiment. Thus, science involves the invention of explanations and theoretical entities, which require a great deal of creativity on the part of scientists.

The social and cultural embeddedness of scientific knowledge:-

In an attempt to answer the question- ‘whether we should grow crops like corn or jatropha to produce biofuels, we need to know the social and cultural context. Developed countries depend on their industry will favor fuel, whereas developing countries will favor food. Thus, scientific knowledge is socially and culturally embedded.

Observation, Inference, and theoretical entities in science:-

Observations are different from inferences. Observations are directly accessible to the senses or extension of the senses, for example, objects released above ground level tend to fall to the ground. An inference drawn from this can be: ‘objects tend to fall to the ground because of gravity’. The notion of gravity is inferential as it cannot be accessed or measured only manifested through its effects.

Myth of the scientific method:-

Discussion on students’ responses from the questionnaire shows that they believe ‘experiments are the chief route to scientific knowledge’. Of course, experimentation is a useful tool in science, but it is not the sole route to knowledge. Many scientists had used non-experimental techniques to advance knowledge. In a number of situations, true experimentation was not possible because of inability to control variables. Discovery in astronomy is based on extensive observations rather than experiment. For instance, Copernicus theory and Kepler laws used evidence derived from lengthy and detailed observations. Charles Darwin in his discoveries used qualitative techniques, recorded his observations, speculations and thoughts and then reached at conclusions. Sometimes, theoretical advance can also suggest what to look for in an experiment for instance; the concept of antiparticle was first introduced theoretically by Paul Dirac in 1930 and confirmed two years later by the experimental discovery of positron by Carl Anderson (Ejlin, 1999). Scientific knowledge is gained in a variety of ways, including observation, analysis, speculation, library investigation and experimentation.

Scientific theories and laws:-

Within the given framework, the laws are seen as empirical propositions, which describe certain uniformities that exist in the universe, for instance Kepler's laws of planetary motion describe motion of planets. Laws can be verified by experimentation based on observations or based on inferences (Newton's laws). However, in some cases, laws describe what would happen under ideal conditions such as Boyle's, Charles's law for ideal gases, Galileo's laws of falling bodies describe the velocities with which the bodies would fall in a vacuum. Generally, laws are descriptive and discovered.

Theories are inferred explanation for observable phenomena and are tested by experimentation. Scientific theories are well established, highly sustained, internally consistent systems of explanations. A good theory makes predictions, which can be tested for its validity. However, some theories in natural sciences cannot have definite predictions, for example, Darwin's theory of natural selection and survival of the fittest which is a probabilistic theory. Scientific theories are human constructions, but have passed the guessing stage: they have substantive evidence that supports them, but it doesn't become the law, even if very strong support is there to substantiate the theory as many students tend to believe (Meyling, 1997; Ryan and Aikenhead, 1992), but it becomes a more credible theory. Once a theory become established, a large amount of disconfirming evidence is required before it can be challenged. Also, as seen from the students' responses from VOSTS and VOSE questionnaire, the majority of the students held the misconceptions about scientific theories and laws.

Students seemed to have a simplistic, hierarchal view of the relationship between theories and laws whereby theories become laws depending upon supporting evidence. Laws have higher status than theories.

Students' Views about 'Models' of the Atom:-

The framework remained the same as above for understanding students' conceptions of the structure of the atom and atomic models as part of the nature of science. The major emphasis was on the historical as it indicates evolution of scientific truths, philosophical as it emphasizes the importance of a blend of imaginative and logical thinking in the generation of new ideas and epistemological dimensions of the nature of science which is implicit in the knowledge about the structure of the atom and hence possess wide scope to develop these aspects in students.

Review of the NCERT Textbook:-

In this study, a brief analysis of the chapter "structure of the atom" present in the NCERT textbook in India is discussed on the basis of the framework developed by Niaz (1998) and Niaz et al. (2008). A slight modification was done as per the requirement of my research –An additional criterion related to use of thought experiments (Heisenberg's microscope) in understanding the quantum mechanical model was incorporated which already has been used in the study by Malhotra (2013).

The framework is based on the understanding that history, philosophy and epistemology are must to be included in the chemistry textbook particularly in the chosen chapter i.e. structure of the atom. The analysis looks if the NCERT textbook involves these aspects and to what extent. For this analysis, Niaz(1998, p541-542) developed a framework based on the rational

recommendations of developments that led to the formulation of atomic models suggesting that the framework will help teachers develop insight as to how a theory or model develops.

The framework was developed by analyzing primary sources like original papers of Thomson, Rutherford, Bohr and some secondary sources. This framework consists of two criteria to evaluate Thomson's model and three criteria to evaluate the Rutherford's and Bohr's models. In addition, five criteria developed by Niaz and Fernandez (2008, p881-883) to evaluate quantum mechanical model were added to the framework. The criteria are discussed in brief:

1. Thomson conducted his cathode ray experiment in the background of controversy against ethereal theory. His experiment aimed at finding out whether the cathode rays were charged particles or waves. The experiment was conducted to find out the mass by charge ratio to investigate whether the cathode rays were fundamental charged particles or ions.
2. Rutherford and his colleagues while working on radioactivity observed something extraordinary which diverted them from their original work towards the study of atom. They had observed that on bombarding the gold foil with alpha particles; 1 in 2000 rays deflected back through large angles and to explain this they proposed a nuclear model of atom. This model had to compete to already existing Thomson's model. Both Rutherford and Thomson tried to defend their theories by giving possible explanations for the results of alpha particle scattering experiment.
3. Bohr's mathematical calculations proved that Rutherford's model was unstable and Bohr decided to address the problem. Bohr thus, proposed a new model of the atom. His main objective was to tackle the instability of the Rutherford's atom. His proposed model was able to explain the line spectrum of the Hydrogen atom, but Bohr himself was unaware of this line spectrum when he proposed his model. The beauty of his model was that it could incorporate Planck's quantum mechanical theory and Maxwell's electromagnetic theory, which are two rival frameworks. Bohr used these two theories to formulate his model and the salient features of his model were quantization of energy and angular momentum.
4. The developments that led to the quantum mechanical model were Planck's and Einstein's contributions to which quantum mechanics provided a better answer. The comparison of the classical and quantum mechanics addresses many misconceptions about the structure of the atom. The quantum mechanical model is analyzed on the basis of success to address a major obstacle for students between orbital and electron density. The last criterion for evaluation of quantum mechanics is related to the concept of quantum numbers, how these are introduced in the textbooks, what is the basis of the formulation of quantum numbers.

On the basis of this framework, many chemistry and physics textbooks have been analyzed.

The above-mentioned studies illustrate that most of the textbooks emphasize on experimental details and observations. There is a dearth of mentioning about how the scientists make decisions, solve problem creatively with incomplete information, propose many hypotheses and judge which fits best and use mental formulation to create theories. The curtailed historical and philosophical aspects in the textbook might give rise to the misconceptions students may possess.

The suggested influence of historical treatment in the topic structure of the atom on the students' understanding of the topic prompted the researcher to look into the NCERT textbook which is accessed by a large number of students.

The Nature of the Study and Methodology:-

The present study has a qualitative research model and requires an understanding of the processes, events and relationships in the context of the social & the cultural situation (Creswell, 2012).

In this study, we wanted to explore how students understand the nature and process of science viz. how science progress, how scientists work as a social group and not in isolation. How the NCERT book (which is the major course book in science curriculum in Delhi) developing essential components of the nature of science in students?

Essential themes of the nature of science in 'structure of the atom' were selected which include historical, epistemological and philosophical aspects of science, tentativeness of theory, observation and inference (conception of atomic models), theoretical embeddedness of scientific knowledge and personal values of scientists affecting their research. The sample size of 30 senior secondary students and 15 undergraduate students were taken and their views were deciphered with the help of a questionnaire. The questionnaire had two sections A and B. Through Section A, we intended to elicit the general understanding about the NOS amongst 11th grade and college students. Whereas the section B was theme specific through which understanding of 'structure of the atom' was probed because it further helped in analyzing students' understanding of the nature of science. The questions were purposefully drawn and modified from VOSTS questionnaire to suit social and cognitive contexts of our learners.

This was followed up by a teaching module which students were asked to read and jot down those points which made better understanding of the topic in them and wanted to be in the chapter 'structure of the atom' in the NCERT. They were also encouraged to write down about those topics which they do not understand by giving reasons (could be pedagogic reasons or language of the book, not interesting illustrations etc.).

The next step was to deeply probe them for what they had answered in questionnaires through FGD (Focus Group Discussion).

Data Analysis:-

Analysis of items in the questionnaire (adapted from VOSE and VOSTS) are done using the frameworks adopted by their developers.

Section A (I) consisted of VOSE items. The framework for analysis is based on a suggestion in the VOSE questionnaire (Chen, 2006). Analysis of the VOSE items is done using a convention that except few statements in the items, the rest of the NOS items may be considered acceptable as diverse views among students and these are not wrong or naive. This convention implies that NOS is not fixed set of beliefs and so students need not conform to certain views. All students cannot have similar views about the nature of science and may perceive science differently and hence its major aspects like nature of science, process, development, scientific activities may be comprehended differently by them.

Thus, students are permitted to have diverse viewpoints about the nature of science. The developers of the test suggest that emphasis should be not on making students possess particular

views about the nature of science, but rather urge that provision should be given to students' justifications they give in support of the stance they choose for their views and beliefs about science. The need is pointed towards allowing students to develop their own conception of the nature of science with the scope of discussion in the classroom so that if there is misperceived or alternative conception about science, then that should be brought to an informed level by proper discussion and arguments which should fully satisfy students' curiosity and area of confusion. There is mention that legitimate/ official and accepted knowledge of 'Scientists' and philosophers' should be made known to students, but not taught in a way as to stamp it as if there could be no other valid knowledge than those which are documented in the texts.

The given below are those items which the developers of the questionnaire considered as the partial or incomplete views about the nature of science and considered these views as naïve (immature, raw, inexperienced) views. The items written here are from the questionnaire used for this present study. The numeral and alphabet denotes the item number and option arrangement in the item respectively.

6A, 6B, 6F- Concern with universal scientific method.

6A: The scientific method ensures valid, clear, logical and accurate results. Thus, most scientists follow the universal method in research.

6B: Most scientists use the scientific method because it is a logical procedure.

6F: No matter how the results obtained, scientists use the scientific method to verify it.

9A, 9B- Laws are more certain than theories

9A: Yes, theories are not as definite as laws.

9B: Yes, if a theory stands up too many tests it will eventually become a law; therefore a law has more supporting evidence.

2C, 2D, 2E- Using no imagination in science

2C: No, imagination is not consistent with the logical principles of science.

2D: No, imagination may become a means for a scientist to prove his point at all costs.

2E: No, imagination lacks reliability.

4C, 4D- No influence of socio-cultural milieu on the scientific investigations.

4C: No, scientists with good training will remain value free when carrying out research.

4D: No, because science requires objectivity, which is contrary to the subjective socio-cultural values.

5C, 5D-Highlight no influence of personal beliefs on scientific investigation and observations are considered to be independent of theories.

5C: Observations will be same, because through scientific training scientists can keep aside personal values to conduct objective observations.

5D: Observations will be the same, because observations are exactly what we see and nothing more. Facts are facts. Interpretations may be different from one person to another, but observations should be the same.

We present here, the pattern of responses to VOSE items.

The tabular details of students' responses to all VOSE items are given in Appendix 4. In the parenthesis, I have kept the total number of responses for particular stance i.e. strongly disagree(SD), disagree(D), neutral(U), agree(A) and strongly agree(SA) against the given options and in another line the respective breakup of responses are given for college (C) and

school(S) students. As I have explained in detail in chapter 3 about the sample size of both the groups which is: College students =15(F; 7: M; 8) initially and FGD was done with 7 college students (F; 4: M; 3). School students = 30(F; 12: M; 18) initially and FGD was done with 10 school students (F; 4: M; 6).

The following is the analysis of VOSE items:

Item no.1 ‘when two different theories arise to explain the same phenomenon, scientists will accept the two theories at the same time.’ deals with the progress of scientific knowledge which is often characterized by competition between rival theories. Textbooks do not include examples of such nature where controversies and conflicts between theories are shown. The product aspect of science is presented in the textbook as if some theory, model, law, discovery etc. in science is made without actually understanding the kind of situations these scientists had to undergo i.e. no mention about their ecstasy on finding something, fear of financial uncertainty, frenzied stages in the process of discovering something etc. in the textbook which makes science appear smooth and struggle free. So, students might not develop the understanding about science in the making.

The observations which the researcher has made fall on similar lines. The majority of the college (53%) and school (63%) students have similar views on this aspect when they think that two theories which come up to explain the same phenomenon or concept at the same time are accepted tentatively because scientists cannot objectively tell which one is better. 73% college and 92% school students agree with the position that the two theories are accepted because they explain the phenomena with different perspectives, no one being right or wrong.

For another position in this item where, options imply that only that theory is accepted with which the scientists are more familiar and that scientists tend to accept the simpler theories and avoid complex theory; substantial section of students (66% college and around 70% of school students) disagreed with these stances. 26% of college students and 50% of school students strongly disagree with this position that academic status of the person who proposed the theory will influence other scientists’ acceptance of the theory. Very few students (13% college and 6% school students) take up the stance in favor of it. This might reflect the view of science they have. They might perceive science as secluded, objective, free from human subjective interferences and therefore, they take up those options where science is seen as unaffected by power, prestige and other influences.

There are an equal proportion of sample students who agree and disagree towards the position which says that the theory which deviate less from the current core scientific theory is accepted and the one with more deviation is not accepted.

30% of school students and 26% of college students strongly agree with the position that there is only one truth, and scientists will not accept any theory before distinguishing which is best. This position taken up by the students points towards the general notion that truth is objective and is independent of subject which comes from the strong positivist framework of scientific method. The dichotomy between how science is actually practiced and depicted shows the need to teach science as actually practiced for a better understanding of the dynamics of scientific progress (Niaz, 2011, p.7).

Item no. 2 deals with the importance of imagination in scientific research. It requires creativity to imagine a pattern to fit into the existing framework or go beyond to explain the problem. It helps in solving the big jigsaw puzzle. The findings reveal that majority of students (54% college and 84% school) acknowledges the use of imagination in the scientific research.

But there are substantial numbers of (53%) school students who think that imagination lacks reliability, whereas only 13% of college students think so. Also, there is ambiguity in the thought of school students as they take the position that imagination is the main source of innovation and is used more or less in scientific research and also agree with the position that imagination might become the tool for scientists to prove his point at all costs and also it lacks reliability (S9, S5; FGD). As per the suggestion to infer the views as explained above; these students possess naïve views about the role of imagination. The students were followed up in FGD.

The larger number of college students, recognizing the importance of imagination in science may come because of longer exposure to science and scientific practices as they study similar topics like atomic models, rules and principles to explain the nature of electron in much detail in graduation than in class XI. But this needs to be explored because even at this level majority of students think that imagination cannot be used in science; “it is the thing to be used in literature” (C6, C5: FGD). Around (26%) students are going for uncertain and neutral stance. This might reveal that they do not know the topic well and hence, playing safe by not being on either side of extremes to avoid being asked further. However, the researcher could not follow this pattern up afterwards to elicit the reasons from these students for being uncertain in many items due to time constraint.

Item no.3 deals with the tentative nature of scientific knowledge and starts with the statement- ‘Even if the scientific investigations are carried out correctly, the theory proposed can still be disproved in the future.’ There are 66% of college students, who disagree with the position that scientific research will face revolutionary change, and the old theory will be replaced; whereas 50% of school students agree with this position. Though the response cannot be considered naïve in either case; but it may point toward college students looking at the scientific progress as building up on the earlier theories and thus, looks in terms of evolutionary nature of scientific progress whereas school students seem to look at them as sudden fall of a ‘well established theory’ because of some anomalies and rise of a new theory to substitute the earlier one. Substantial section of college and school students goes for the position which talks about cumulative nature of scientific advances and hence the old theory is preserved. There are 53% of college and 56% of school students who think that with the accumulation of research data and information, the theory will evolve, finding additional and useful piece and clue about the problem and thus explaining it even better. The responses of students show that they have the idea about the tentative nature of scientific knowledge as in their textbook; they find the representation of various discoveries and scientific advances in a chronological manner, giving them the idea that scientific research does not remain static but constantly undergo certain changes and thus are tentative in nature. However, linkages among various theories and history of its development are not presented in the textbook (Chapter 3, section 3.1.2).

Item no.4 concerns with socio-cultural embeddedness of scientific knowledge and the statement is- Scientific investigations are influenced by socio-cultural beliefs and values present at a given

time. The response of both the sample students indicates that they have held naïve views about this aspect which has significant role to play in the scientific knowledge. 60% of college students disagree and 33% of school students strongly disagree with the position that socio-cultural values influence the direction and topics of scientific investigations. They possess similar ideas for the position which says scientists are influenced by socio-cultural values and they disagree with this stance. 40% college and 33% school students strongly agree with the option that scientists with good training remain value free and thus do not get influenced by socio-cultural values and hence carry out neutral and objective research. 26% college and 72% school students think that science is an objective sphere and is contrary to the subjective socio-cultural values; so in scientific research, socio-cultural values and beliefs have no role to play. These are clearly the naïve views students have upheld. Only 6% of college and school students acknowledge that even scientists are social beings and that they cannot be context free and subjectivity will come into place while carrying out research. The root to these notions was required to be elicited from the students to know why and how they think about scientific activities, so the theme of the item (socio-cultural beliefs and values influence scientific investigations) was kept for FGD.

Item no.5 deals with theory laden nature of scientific knowledge and the statement is- Scientists' observations are influenced by their personal beliefs therefore; they may not make the same observations for the same experiment. 40% of college students disagree with the position that 'observations' will be different, because different beliefs lead to different expectations influencing the observation', however, only 16% of school students think the same. There are 63% of school students and only 26% of college students who agree with this position. This may appear that college students are more steeped into the thinking about science as objective reality only and no scope of any context and subjectivity remains on the part of scientists but good number of school students has informed view on this position. Again, this difference in the opinion of two groups needed to be explored so was kept for FGD with both the groups separately. 46% college and 33% school students hold naïve views in the position which says that observations will be the same, because scientists with training can keep aside personal values to conduct objective observations. 40% college and 57% school students have naïve views for the position as they agree with it which implies that observations are considered to be independent from theories. Also, Karl Popper puts it "all observations have a frame of reference and horizon of expectations" with necessary selectivity.

Item no. 6 deals with the myth of 'scientific method'. 53% of college students and 93% of school students hold naïve views as they agree with the position which states that the scientific method ensures valid, clear, logical and accurate results. Thus, most scientists follow the universal method in research. Again, 80% of college students and 93% of school students have naïve views as they think that most scientists use scientific method because it is a logical procedure; as if undermining other methods of research too as logical procedure. 57% school and 26% college students hold the naïve views as they think that the only method to verify the obtained results is scientific method.

Item no. 7 and 8 are not discussed here because we could not get consistent responses of students for these items. These items are related to the epistemological status of scientific knowledge. The items intended to understand students' position for invention and discovery and what they think of laws and theories in terms of these.

Item no. 9 deals with the understanding about law and theory amongst students. 66% school students and 20% college students hold the naïve view as they agree with this statement that theories are not as definite as laws. However, 40% of college students have informed views in relation to 20% of school students. Substantial section of the sample students hold naïve views about the law and theory where they look upon a theory which can become laws on more supporting evidence and after standing to many tests. There were 93% of school students and 60% of college school students who think in this manner. Understanding about theory and laws in students was followed up in FGD.

The findings from VOSE are summarized in the following table:

Dimensions of NOS	Likert scale	Strongly Disagree	Disagree	% of disagreement	Neutral	Agree	Strongly Agree	% of Agree.
Tentativeness of scientific theory	2	4	13	5	25	9	76	
Observation is theory laden	14	15	64	4	4	8	27	
Diverse scientific methods	1	8	20	15	16	5	47	
Theories and laws are invented	3	11	31	9	20	3	51	
Theories and laws are different ideas	2	17	42	14	5	7	27	
Use of imagination in science	2	4	13	11	12	16	62	
Empirical evidences validate scientific knowledge	3	4	16	7	20	11	69	
Subjectivity in science	4	11	33	4	6	20	61	

The table reflects the thought profile of the sample group (combined college and school students). As indicated, majority of students (seventy six percent) recognized the tentativeness of scientific knowledge. However, few students (twenty seven percent) opted for theory laden nature of observation and hence influence in the research. Considerable number of students (sixty two percent) appreciates the use of imagination in scientific research. Forty six percent of students chose for the positions of diverse scientific methods.

Around twenty six percent held the position of laws and theories as different ideas and majority of them look at these as related hierarchically. Around half of the students think that theory and laws are invented. From the findings, it appears that some aspects of nature of science like tentativeness in science, imagination in science, need of diverse scientific methods in science are known to most of the students. But the aspects like subjectivity, theory laden nature of observation are not understood to them as appeared from their responses. They lay more emphasis on the empirical method of gaining scientific knowledge and thus undermining other means of generating scientific knowledge like observation, thought experiments. It was found in

the NCERT that there is dearth of mention about the varied methods of scientific investigations used by different scientists to give various atomic models.

Students' Conception about 'Model' of the Atom:-

This part (Section B) of the questionnaire had used the concept of 'structure of the atom' to focus on the tentative, inferential, and developmental nature of the scientific knowledge.

The items in this section of the questionnaire were adapted from the teaching module developed by Dabas (2010) in her thesis to develop understanding about the NOS in the students who are studying these topics. The items in this section provided an opportunity to understand the students' conception of the atom which reflects their understanding about the nature of science. The ten item questionnaire (open-ended) helped elicit their intuitive ideas which showed that:

- About thirty three percent of school students believed that atoms were solid particles in response to item no-1. They listed different reasons like- atoms are always depicted as sphere and circles, having perfect shape in the science textbooks; they say "if they were not solid then how this structure would have been maintained and matter would have been compressible then how orbits and orbital electrons would remain in the atom" (S1: FGD). Another group of students was saying that everything in the universe is made up of atoms and these are building blocks of everything; if the atoms were not solid, then how the matter around us would have got fixed shape. One student wrote very differently that "light passes through liquids and gases, but we see that at a shortest and smallest place which is negligible the light cannot pass through which depicts its solid nature" (S6: FGD). What the student meant by this was followed up with and is discussed in section (4.3). Others gave reasons like-atoms have definite mass and occupy space; atoms are made up of neutron, proton, and electron with a nucleus at the centre so it should be solid. Ben-Zvi et al (cited in Driver et al (1994)) working with Israeli children found that pupils often regard atoms as 'small bits of solid' and it is widely accepted that this misconception persists even when they go to University. Around 20% college students held the similar notions that atom were solid particles because everything ultimately is solid and that is why after some extent they are incompressible and cannot be broken further.
- About forty six percent school students said that atoms were not solid particles as a liquid, and gases also have atoms. These students tend to think that 'solid particles' related only to the solid state of the matter. Some had the views like atoms appear like cloud which is not solid and it has lots of spaces in it. One student wrote, "Combination of atoms can be judged into solid, liquid and gases. A single atom cannot be judged into solid, liquid and gas. So, the classification of this sort is baseless" (S2: FGD). Similar types of views in students are reported in the research of Dabas (2010) like students think that if atoms were solid, then they could not have existed freely in the nature. Clearly, there is much more that needs to be understood about students' conception related to atoms and states of matter.
- 70% of college students say they do not agree with atoms as solid particles and they also listed the similar reasons as that of school students for explaining why they think so. Some say, because we see penetrable material around us which means atoms are not only solid particles. Again, what do they understand about the nature of constituents of solid, liquid and gas need to be understood. One student wrote "atoms appear wavelike so they must be made up of wave like things" (C4: FGD). This view might have come from the representation they find in the books without explaining in an engaging manner.

- Scientists now have a complete understanding of the atom (statement 2). 28% of school students held the view that we have complete understanding of the atom as we have well developed quantum mechanical models which explain most of the properties, when probed further, they could not explain what type of properties are those which earlier theories could not explain but the quantum mechanical model can explain. It appears that they may have crammed what heard from teachers and read in the books only as information without understanding it. But most of the students disagree with it and give reasons like, what we know today changes tomorrow with advancement in technology, researches are still going on to know more about the atom and its structure. Still conclusively we cannot say that we know accurately and completely about atoms. Many said that we still doubt whether entity called atom exists or not. We know more than our earlier times but should not become complacent about it. College students also had similar views to share, but the difference in the reasons they were giving like- one student said “we have complete understanding about the atom because then only we are able to study the properties of elements as they are made up of atoms so we have to know them before” (C1: FGD). Another group of college students says that knowledge construction and development is an ongoing and dynamic process.
- Atoms are mainly composed of empty spaces. Around 45% school students agreed with this statement. They related this to the Rutherford’s experiment which showed lots of alpha rays passing through gold foil straight. Some also related this to Bohr model which talks about discrete orbits and shells like-K, L, M, N etc. and the rest being the empty spaces in between. College students also believed that atoms have empty spaces and gave reasons because we know about the Rutherford’s alpha scattering experiment.
- In the response to the question where they were asked to draw the structure of the atom; most of the school students (80 percent) used the analogy to the solar system and drew accordingly nucleus at centre and electrons revolving around it as they understood of Rutherford’s nuclear model. In spite of having studied more advanced models to elucidate the structure of atom viz. Quantum mechanical model; they were using this model. On probing further, it was found that students could retain it because of its simple appearance and easiness. However, most of the college students tried to depict the atom according to the quantum model which gives a probabilistic picture of finding the electrons.
- In response to item no.5 which says that since scientists cannot see inside of an atom, it is not possible to believe any of these models. About 45% of school and 30% of college students indicated that scientists had seen the inside of the atom. Some thought that with the help of modern technology like STM (Scanning Tunneling Microscope) etc. we can see the interior of the atoms. They had no clue that the models need not be always representing the physical reality, but could also be based on interpretations. They also had no idea about the difference between inference and observation though they use these terms in their practical classes. Some were not sure about imagination explaining the real phenomena. Similar types of views have also been expressed in other researches (Bent, 1984; Dabas, 2010).

Such students appeared to possess a naïve epistemological view of scientific knowledge (Nadeau and Desautels, 1984). They viewed the structure of the atom as copy of reality, rather than as the constructed representations that embodied certain theoretical perspectives. The most common rationale for students’ explanations of the change in science was attributed to better equipment or technology.

When asked about examples of a model; about seventy percent listed the models like that of a heart, skeleton, windmill, eye, etc. Majority of the students were having the idea about models as a working model as they are in the habit of using the term without knowing the difference between mental and physical models. All these examples indicated that students had understood model as a three dimensional picture and a proven fact (Lederman and O' Malley, 1990).

Discussion:-

The primary aim of this study was to understand the students' views on the nature of science and the role played by the NCERT chemistry textbook in developing this understanding in them. In this study, it was attempted to understand what are students' understandings and perception towards the nature of science and science processes.

Scientific content, processes and the nature of science overlap and interact in significant ways and all are important for students to learn. For example, observing and inferring is a scientific process. On the other hand, an understanding that observations are constrained by our perceptions and are inherently theory-laden is part of an understanding of the nature of science. The tentativeness of scientific knowledge is not limited to the recognition that scientific knowledge has changed through history. Rather, science draws its tentative and revisionary characteristics of the development of theories and the limitations imposed on ways of knowing. We present the conclusions of the current research in this section as follows:

The review of the NCERT chemistry textbook reflects that historical and philosophical treatment which is required for better understanding of the topic 'structure of the atom' is not included in the text (Appendix 1 and section 3.2.2). Also this affects students' content knowledge of the topic as was found in this study that majority of participants had weak content knowledge.

Students' views on various dimensions of the nature of science were identified using the VOSTS and VOSE questionnaires. Also, students' understanding about models of the 'structure of the atom' was probed as part of the nature of science by using the teaching module designed by Dabas (2010).

Over one third of the students held the naïve view that scientific knowledge, including theories and laws does not change but is final and fixed and static as seen from the VOSE questionnaire (Item no.3). The FGD with college and school students revealed that they understood that the scientific concept like the 'structure of the atom' changes in the light of new experiments. About two thirds of students recognized that scientific knowledge is not absolute and final but tentative in nature. It was also observed that an understanding of the role of imagination in science blend of inference and observation required to reach a scientific concept could be developed in students provided the scope for discussion with them is there. As was seen in this study during focus group discussions the students who earlier said that scientific knowledge is more reliable if it is proven empirically later on came to the point that the role of inference in scientific results are also very important because not everything in the universe can be seen or observed. We have to do thought experiments and infer on the basis of some premises (Thomson's plum pudding model) as in the case of the 'structure of the atom'. This modification in their perception came about after the 'tricky track activity' developed by Lederman was performed with students.

Students could make out that some events are explained on the basis of inference because there may be the possibility that no one was present at the time when the event had happened.

Students had some understanding about the tentative nature of scientific knowledge as they gave reasons like better equipment lead to improved observations which may modify or add to the existing knowledge thus scientific knowledge is never final. Fifty five percent of school and thirty percent of college students held the naïve view about 'atom and its structure'. As they seemed to believe that for scientists to know and be sure about the structure of the atom they have to see them. Scientists cannot be certain unless they 'see' the atoms or anything else they want to investigate.

Concerning the cultural and social aspects of scientific knowledge students initially felt that scientists and their research remain uninfluenced by this aspect, but during FGD they could understand that same phenomena like that of biofuels or GM foods can be investigated differently by different scientists belonging to different social and cultural contexts. They recognized that research priorities are determined by the need of the country so developed and developing countries would look upon the problems differently.

In the VOSTS over fifty percent of college and sixty percent of school students held the naïve view that models are copies of reality (section 4.3 statement 1). While discussing with students during FGD this was revealed that students could recognize that models which explain 'structure of the atom' are the mental representation and a guess based on experimental results (Section 5.2; FGD). However, in the theme of 'scientific method' there were very few students at both the levels who think that scientific knowledge not necessarily develop by following 'scientific method' only but it may arise by chance imagination etc. also. Others thought that in any situation scientific knowledge to develop; firstly, they have to encounter the problem and then other steps have to be followed which we call scientific method. They seem to undermine the role of creativity, imagination and the open mindedness of scientists. This persistence may be attributed to the strong influence of school textbooks and other materials which conjecture events of chance and serendipity as part of the process of discovery.

Students at both the levels held misconceptions about theories, laws and hypotheses. For them all three concepts are related hierarchically on the basis of supporting evidence in a progressive manner, i.e. hypothesis becomes theory and theory becomes law on accumulation of more supporting evidence.

It was observed during interaction with students of grade 11 that those students who had availed congenial environment at home i.e. where discussion about science content about scientists, etc. (with the help of family members like parents, elder brother etc.) takes place had comparatively better understanding about the nature of science. These students held informed views on certain dimensions of nature of science pertaining to theory laden nature of the observation role of imagination in science, social and cultural embeddedness of scientific knowledge tentativeness in science and so on in comparison with other students who had no one at home or outside to discuss with about such issues.

During FGD it was observed that students were able to better relate to the discovery of atom various events which had taken place in explaining about the structure of atom on being provided with a teaching module (Dabas 2010) to read. This step was not the primary focus of the research, but was done in a cursory way to understand how some enriching sources could help them develop a better understanding of the nature of science. Positive remarks from students at both the levels came. They found it interesting because the development of 'atom and its structure' was written with the mention about the contexts in which the theories or models were given with links among various discoveries in this particular area. The narrative was written with the inclusion of history and philosophy of science which got students interested in understanding the journey 'atom' travelled to come in its present form.

Then school students were asked to express how they would want this topic 'structure of the atom' to be written in the NCERT chemistry textbook many had written language that should be made simpler and commonly used. In a way, their writings implied that technical and jargonized language in the textbook complicates the flow of understanding of the scientific concepts. However, we did not analyse the textbook on these lines. This step was taken up as a suggestion from those for whom we want the textbooks to be written. They had also pointed that coherence should be there throughout the chapter because new topic starts without any link with the earlier topics which create confusion and understanding is not built and we are forced to cram this information to pass examination.

Implications:-

The science education and scientific researches call for special attention on science education right from earlier classes. So, that students may be able to relate to scientific concepts better in its entirety from beginning. The textbook has a great role to play because students and teachers use it as the main book and rely on them heavily. Bodies like the NCERT could make an effort to write the science textbook at senior secondary level in such a way that students better relate to the concepts taught. It may help them to develop interests to continue further in scientific research. This could be possible only when their understanding about the NOS is strong. FGD gives a ray of hope that if discussion in the classroom includes the aspects of the nature of science may enhance knowledge of the science and about the science.

Science education aims at preparing individuals to have a better understanding of the world. This may enable them to take responsible decisions to appreciate the natural world help in its protection and respond towards changing technology sensibly. This may also encourage them to learn the science processes to understand and analyze situations. Therefore, it is necessary to design textbooks with more explicit representation of aspects which develop understanding about the nature of science in students. This study also recommends the need to design textbook according to the frameworks of HPS for 'structure of the atom' and Lederman pertaining to the NOS in the whole textbook.

It is noteworthy that the NCERT could aid in the proper incorporation of the nature of science in curriculum. It could also train the teachers to support pedagogical methods where they provide learners to engage in actual processes of science. The understanding of the nature of science is important in creating and reviving interest in science in addition to the work of scientists. Since

knowing about the ways the theories are developed may better help them understand process of science.

The relevant and fruitful activities and situations should be provided to students to allow them to challenge their conception about various aspects of the nature of science. Projects and home assignments may be given to students, which require the use of aspects of the nature of science and science processes. For example, types of questions that are raised in the teaching modules developed by Dabas (2010) such as - Controversies in science and the media over genetically modified food Is there one scientific method scientists and the language they use, etc. If students are exposed to these types of debates requiring their own explanation and ideas may likely improve their understanding about science.

The topic 'structure of the atom' has wide scope to convey the philosophical, historical epistemological and psychological aspects of the nature of science to the students. The curriculum designers and textbook writers could think about incorporating chance and serendipity. These could be emphasized as one of the processes of discovery of scientific knowledge with more elaboration. It has been seen that one or two brief examples in the textbooks may not be effective in steering the naïve views about discovery in students away. As other researches also claim that the change in students' views on the nature of science is a difficult process and take place gradually and progressively (Driver et al 1996).

Conclusion:-

This study is exploratory in nature and has found that there is a need to develop interesting and engaging reading materials for better content development of students as well as for developing an understanding about the nature of science in them. Also, the current examination system may need a redress to revisit what it purports to test amongst students. What does it emphasize on (understanding about the process of science, nature of science or merely seeking/ justifying mugging up some concepts to pass the exam)? Is the current practice of examination system able to create scientifically literate citizens? All these questions arise because they serve a better guide to those who are science educationists, policy makers, researchers so that immediate and collective steps may be raised with the collective benefit of our young learners of science, to make our citizens scientifically literate and most of it can be achieved when there is an emphasis from all sources of education to develop an understanding of the nature of science amongst students.

Annexure 1

Criteria Chosen for a Review of the NCERT textbook

Thomson Model

T1- cathode rays are charged particles or waves in the ether.

T2- Determination of m/e ratio to decide whether the cathode rays were ions or a universal charged particle.

Rutherford Model

R1- Nuclear atom

R2- Probability of large deflections is exceedingly small, as the atom is the seat of an intense electric field.

R3- single/ compound scattering of alpha particles.

Bohr's Model

B1- Paradoxical stability of the Rutherford model of the atom.

B2- explanation of the hydrogen line spectrum

B3- Deep philosophical chasm. Bohr's incorporation of Planck's 'quantum of action' to the classical electrodynamics of Maxwell represented a strange 'mixture' for many of Bohr's contemporaries and philosophers of science. This episode illustrates how scientists, when faced with difficulties, often resort to such contradictory 'grafts.'

Quantum Mechanical Model

Q- Heisenberg's gamma ray microscope: It emphasizes on the significance of thought experiment in scientific research in situations where laboratory setup is not feasible. This criteria was developed by Malhotra (2010).

Q1- Origin of the quantum hypothesis

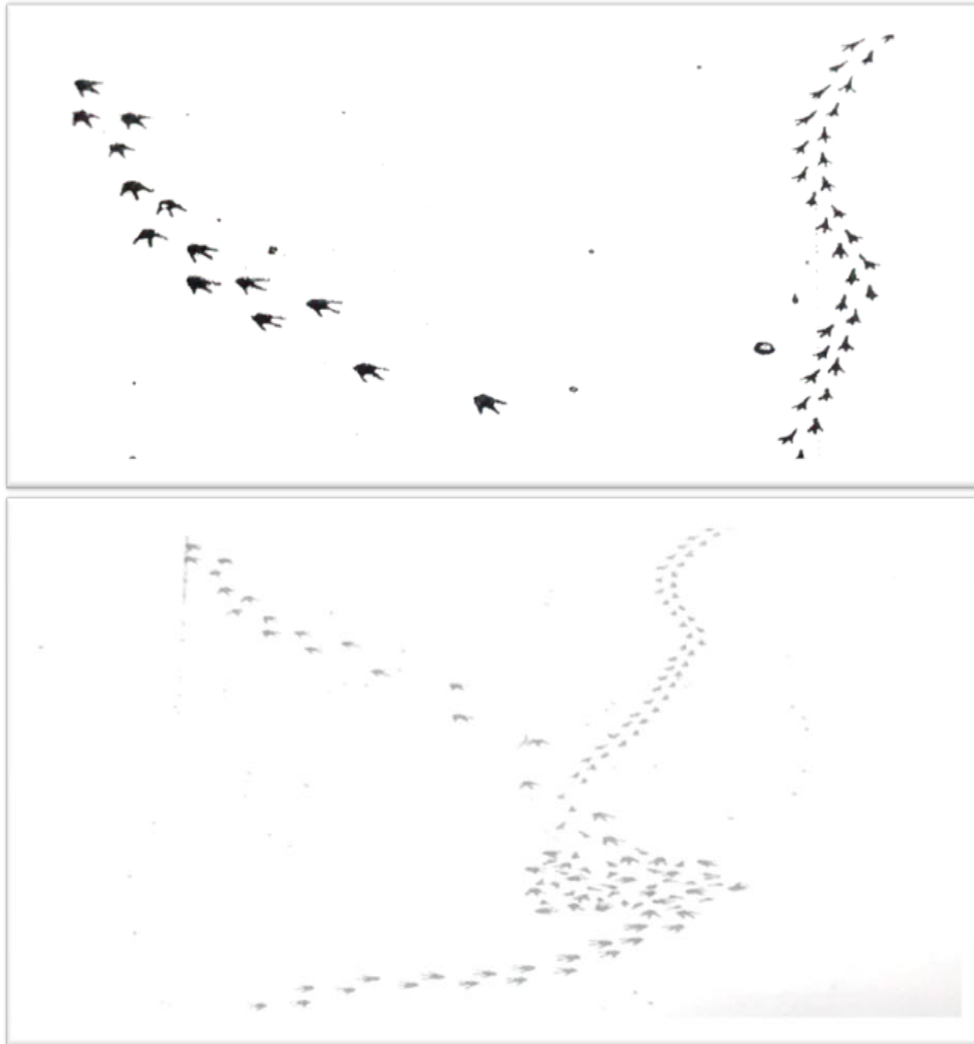

Q3- Differentiation between an orbital & electron density.

Q4- differentiation and comparison between classical and quantum mechanics.

Q5- Introduction of quantum numbers based on electron density.

Annexure 2

Annexure 3

Questionnaire used for Understanding Students' Views on the Nature of Science

Section–A (I)

Instructions to participants: Each item of this questionnaire starts with a statement about the nature of science. You may strongly agree (SA) with it, strongly disagree (SD) with it, or have other thoughts about it. Each statement is followed by several responses. Please read all the responses first, then circle your opinion on the right side (SD, D, U, A, SA) of each response according to *your* knowledge of how scientists work and science develops. There is no right or wrong answer. Thank you.

Note:

SD= Strongly Disagree

D = Disagree

U = Uncertain or No Comment

A = Agree

SA= Strongly Agree

1. When two different theories arise to explain the same phenomenon (e.g. the nature of electron), scientists will accept the two theories at the same time.

A. Yes, because scientists still cannot objectively tell which one is better; therefore, they will accept both tentatively.

SD D U A SA

B. Yes, because the two theories may provide explanations from different perspectives, there is no right or wrong.

SD D U A SA

C. No, because scientists tend to accept the theory they are more familiar with. SD D

U A SA

D. No, because scientists tend to accept the simpler theories and avoid complex theories. SD D

U A SA

E. No, the academic status of the person who proposed the theory will influence other scientists' acceptance of the theory. SD D

U A SA

F. No, scientists tend to accept new theories which deviate less from the current core scientific theory.

SD

D U A SA

G. No, scientists use intuition to make judgments. SD D

U A SA

H. No, because there is only one truth, scientists will not accept any theory before distinguishing which is best.

SD D U A SA

2. While scientists are conducting scientific research, they also use their imagination.

A. Yes, imagination is the main source of innovation. SD D

U A SA

B. Yes, scientists use their imagination more or less in scientific research. SD D

U A SA

C. No, imagination is not consistent with the logical principles of science. SD

D U A SA

D. No, imagination may become a means for a scientist to prove his point at all costs. SD D

U A SA

E. No, imagination lacks reliability. SD

D U A SA

3. Even if the scientific investigations are carried out correctly, the theory proposed can still be disproved in the future.

A. Scientific research will face revolutionary change, and the old theory will be replaced. SD D

U A SA

B. Scientific advances cannot be made in a short time. It is through a cumulative process; therefore, the old theory is preserved.

SD D U A SA

C. With the accumulation of research data and information, the theory will evolve more accurately and completely, not being disproved.

SD D U A SA

4. Scientific investigations are influenced by socio-cultural beliefs and values present at a given time (e.g., religious beliefs, social bias about gender, caste, class etc.).

A. Yes, socio-cultural values influence the direction and topics of scientific investigations. SD D U A SA

B. Yes, because scientists participating in scientific investigations are influenced by socio-cultural values.

SD

D U A SA

C. No, scientists with good training will remain value-free (neutral) when carrying out research.

SD

D U A SA

D. No, because science requires objectivity, which is contrary to the subjective socio-cultural values.

SD D U A SA

5. Scientists' observations are influenced by their personal beliefs (e.g., personal experiences, presumptions) therefore; they may not make the same observations for the same experiment.

A. Observations will be different, because different beliefs lead to different expectations influencing the observation.

SD D U A SA

B. Observations will be the same, because the scientists trained in the same field hold similar ideas.

SD

D U A SA

C. Observations will be the same, because through scientific training scientists can keep aside personal values to conduct objective observations.

SD D U A SA

D. Observations will be the same, because observations are exactly what we see and nothing more. Facts are facts. Interpretations may be different from one person to another, but observations should be the same.

SD D U A SA

E. Observations will be the same. Although subjectivity cannot be completely avoided in observation, scientists use different methods to verify the results and improve objectivity.

SD D U A SA

6. Most scientists follow the universal scientific method, step-by-step, to do their research (i.e., state a hypothesis, design an experiment, collect data, and draw conclusions).

A. The scientific method ensures valid, clear, logical and accurate results. Thus, most scientists follow the universal method in research.

SD D U A SA

B. Most scientists use the scientific method because it is a logical procedure. SD D
U A SA

C. The scientific method is useful in most instances, but it does not ensure results; therefore, scientists invent new methods.

SD D U A SA

D. There is no so-called the scientific method. Scientists use any methods to obtain results. SD D
U A SA

E. There is no fixed scientific method; scientific knowledge could be accidentally discovered.

SD

D U A SA

F. No matter how the results are obtained, scientists use the scientific method to verify it. SD D
U A SA

7. Is scientific theory (e.g. atomic theory) “discovered” or “invented” by scientists from the natural world?

A. Discovered, because the idea was there all the time to be uncovered. SD

D U A SA

B. Discovered, because it is based on experimental facts. SD D
U A SA

C. Some scientists discover a theory accidentally, but other scientists may invent a theory from their known facts.

SD D U A SA

D. Invented, because a theory is an interpretation of experimental facts, and experimental facts are discovered by scientists.

SD D U A SA

E. Invented, because a theory is created or worked out by scientists. SD D

U A SA

F. Invented, because a theory can be disproved.

SD D U A SA

8. Is scientific law (e.g., gravitational law) “discovered” or “invented” by scientists from the natural world?

A. Discovered, because scientific laws are out there in nature, and scientists just have to find them.

SD

D U A SA

B. Discovered, because scientific laws are based on experimental facts. SD D
U A SA

C. Some scientists discover a law accidentally, but other scientists may invent a law from their known facts.

SD D U A SA

D. Invented, because scientists invent scientific laws to interpret discovered experimental facts.

SD

D U A SA

E. Invented, since there are no absolutes in nature, therefore, the law is invented by scientists.

SD

D U A SA

9. In comparison to laws, theories have less evidence to support them.

A. Yes, theories are not as definite as laws.

SD D

U A SA

B. Yes, if a theory stands up to many tests it will eventually become a law; therefore a law has more supporting evidence.

SD D U A SA

C. Not quite, some theories have more supporting evidence than some laws.

SD D

U A SA

D. No, theories and laws are different types of ideas. They cannot be compared.

SD D

U A SA

Section-A (II)

Instruction to participants:

Read the statement carefully-Think to yourself whether you agree or disagree with the statement or can't make up your mind. Then read the list of different positions on the topic. Pick the one that comes closest to your own positions.

Every statement ends with the same three positions. Here is how you can use them if you wish:

X. "I don't understand." This choice is included in case there is a key word or phrase that you just don't understand.

Y. "I don't know enough about this subject to make a choice".

Z. "None of these choices fit my basic viewpoint." This choice can be used when none of the other positions comes close to your own belief, or when you want to combine two or more choices into one position.

There are no "right" answers; this is not a test. We simply want to understand what your view or position is on a number of issues about science and how scientists work. Thank You.

1. Many scientific models used in research laboratories (such as the model of heat, the neuron, DNA, or the atom) are copies of reality.

Your position basically is :(**Please read from A to J, and then choose one.**)

Scientific models ARE copies of reality:

A. Because scientists say they are true, so they must be true.

B. Because much scientific evidence has proven them true.

C. Because they are true to life. Their purpose is to show us reality or teach us something about it.

D. Scientific models come close to being copies of reality, because they are based on scientific observations and research.

Scientific models are NOT copies of reality:

E. Because they are simply helpful for learning and explaining, within their limitations.

F. Because they change with time and with the state of our knowledge, like theories do.

- G. Because these models must be ideas or educated guesses, since you can't actually see the real thing.
- H. I don't understand.
- I. I don't know enough about this subject to make a choice.
- J. None of these choices fits my basic viewpoint.

2. When scientists classify something (for example, a plant according to its species, an element according to the periodic table, energy according to its source, or a star according to its size), scientists are classifying nature according to the way nature really is; any other way would simply be wrong.

Your position basically is. **(Please read from A to I, and then choose one.)**

- A. Classifications match the way nature really is, since scientists have proven them over many years of work.
- B. Classifications match the way nature really is, since scientists use observable characteristics when they classify.
- C. Scientists classify nature in the most simple and logical way, but their way isn't necessarily the only way.
- D. There are many ways to classify nature, but agreeing on one universal system allows scientists to avoid confusion in their work.
- E. There could be other correct ways to classify nature, because science is liable to change and new discoveries may lead to different classifications.
- F. Nobody knows the way nature really is. Scientists classify nature according to their perceptions or theories. Science is never exact, and nature is so diverse. Thus, scientists could correctly use more than one classification scheme.
- G. I don't understand.
- H. I don't know enough about this subject to make a choice.
- I. None of these choices fits my basic viewpoint.

3. When developing new theories or laws, scientists need to make certain assumptions about nature (for example, matter is made up of atoms). These assumptions must be true in order for science to progress properly.

Your position basically is: **(Please read from A to I, and then choose one.)**

Assumptions MUST be true in order for science to progress:

- A. Because correct assumptions are needed for correct theories and laws. Otherwise scientists would waste a lot of time and effort using wrong theories and laws.
- B. Otherwise society would have serious problems, such as inadequate technology and dangerous chemicals.
- C. Because scientists do research to prove their assumptions true before going on with their work.
- D. It depends. Sometimes science needs true assumptions in order to progress. But sometimes history has shown that great discoveries have been made by disproving a theory and learning from its false assumptions.

- E. It doesn't matter. Scientists have to make assumptions, true or not, in order to get started on a project.
- F. Scientists do not make assumptions. They research an idea to find out if the idea is true. They don't assume it is true.
- G. I don't understand.
- H. I don't know enough about this subject to make a choice.
- I. None of these choices fits my basic viewpoint.

4. When scientists investigate, it is said that they follow the scientific method. The scientific method is:

Your position basically is: **(Please read from A to M, and then choose one.)**

- A. The lab procedures or techniques; often written in a book or journal, and usually by a scientist.
- B. Recording your results carefully.
- C. Controlling experimental variables carefully, leaving no room for interpretation.
- D. Getting facts, theories or hypotheses efficiently.
- E. Testing and retesting proving something true or false in a valid way.
- F. Postulating a theory then creating an experiment to prove it.
- G. Questioning, hypothesizing, collecting data and concluding.
- H. A logical and widely accepted approach to problem solving.
- I. An attitude that guides scientists in their work.
- J. Considering what scientists actually do, there really is no such thing as the scientific method.
- K. I don't understand.
- L. I don't know enough about this subject to make a choice.
- M. None of these choices fits my basic viewpoint.

5. The best scientists are those who follow the steps of the scientific method.

Your position basically is: **(Please read from A to H, and then choose one.)**

- A. The scientific method ensures valid, clear, logical and accurate results. Thus, most scientists will follow the steps of the scientific method.
- B. The scientific method should work well for most scientists; based on what we learned in school.
- C. The scientific method is useful in many instances, but it does not ensure results. Thus, the best scientists will also use originality and creativity.
- D. The best scientists are those who use any method that might get favorable results (including the method of imagination and creativity).
- E. Many scientific discoveries were made by accident, and not by sticking to the scientific method.
- F. I don't understand.
- G. I don't know enough about this subject to make a choice.
- H. None of these choices fits my basic viewpoint.

6. Scientific discoveries occur as a result of a series of investigations, each one building on an earlier one, and each one leading logically to the next one, until the discovery is made.

Your position basically is: **(Please read from A to J, and then choose one.)**

Scientific discoveries result from a logical series of investigations:

- A. Because experiments (for example, the experiments that led to the model of the atom, or discoveries about cancer) are like laying bricks onto a wall.
- B. Because research begins by checking the results of an earlier experiment to see if it is true. A new experiment will be checked by the people who come afterwards.
- C. Usually scientific discoveries result from a logical series of investigations. But science is not completely logical. There is an element of trial and error, hit and miss, in the process.
- D. Some scientific discoveries are accidental, or they are the unpredicted product of the actual intention of the scientist. However, more discoveries result from a series of investigations building logically one upon the other.
- E. Most scientific discoveries are accidental, or they are the unpredicted product of the actual intention of the scientist. Some discoveries result from a series of investigations building logically one upon the other.

Scientific discoveries do not occur as a result of a logical series of investigations:

- F. Because discoveries often result from the piecing together of previously unrelated bits of information.
- G. Because discoveries occur as a result of a wide variety of studies which originally had nothing to do with each other, but which turned out to relate to each other in unpredictable ways.
- H. I don't understand.
- I. I don't know enough about this subject to make a choice.
- J. None of these choices fits my basic viewpoint.

7. Scientists publish the results of their work in scientific journals. When scientists write an article for a journal, they organize their report in a very logical orderly way. However, scientists actually do the work in a much less logical way.

Your position basically is : **(Please read from A to J, and then choose one.)**

Articles are written in a more logical way than the actual work:

- A. Because scientists can think and work without following a set plan. Consequently, if you read the actual order of their thoughts and procedures, it would be confusing. Therefore, scientists write logically so other scientists will understand the results.
- B. Because scientific hypotheses are personal views or guesses and thus are not logical. Scientists, therefore, write logically so other scientists will understand the results.
- C. Scientists usually don't want to give away "the recipe" but they do want to tell the world about their results. So they write it up logically but in a way that does not reveal how it was actually done.
- D. It depends. Sometimes scientific discoveries happen by accident. But other times discoveries happen in a logical orderly way, just like the articles are written.

Articles are written in a logical way showing how the actual work was done:

- E. Because a scientist's work is conducted logically; otherwise, it would not be useful to science and technology.

- F. Because scientists do work in a logical way so that their published report will be easier to write in a logical way.
- G. Articles are not necessarily written in a logical way. They're written the way the work was done. This can be complicated or straightforward.
- H. I don't understand.
- I. I don't know enough about this subject to make a choice.
- J. None of these choices fits my basic viewpoint.

8. Scientists should NOT make errors in their work because these errors slow the advance of science.

Your position basically is :(**Please read from A to H, and then choose one.**)

- A. Errors slow the advance of science. Misleading information can lead to false conclusions. If scientists don't immediately correct the errors in their results, then science is not advancing.
- B. Errors slow the advance of science. New technology and equipment reduce errors by improving accuracy and so science will advance faster.

Errors CANNOT be avoided:

- C. So scientists reduce errors by checking each others' results until agreement is reached.
- D. Some errors can slow the advance of science, but other errors can lead to a new discovery or breakthrough. If scientists learn from their errors and correct them, science will advance.
- E. Errors most often help the advance of science. Science advances by detecting and correcting the errors of the past.
- F. I don't understand.
- G. I don't know enough about this subject to make a choice.
- H. None of these choices fits my basic viewpoint.

9. Even when making predictions based on accurate knowledge, scientists can tell us only what probably might happen. They cannot tell what will happen for certain.

Your position basically is: (**Please read from A to H, and then choose one.**)

Predictions are NEVER certain:

- A. Because there is always room for error and unforeseen events which will affect a result. No one can predict the future for certain.
- B. Because accurate knowledge changes as new discoveries are made, and therefore predictions will always change.
- C. Because a prediction is not a statement of fact. It is an educated guess.
- D. Because scientists never have all the facts. Some data are always missing.
- E. It depends. Predictions are certain, only as long as there is accurate knowledge and enough information.
- F. I don't understand.
- G. I don't know enough about this subject to make a choice.
- H. None of these choices fits my basic viewpoint.

10. Scientists in different fields look at the same thing from very different points of view (for example, H^+ causes chemists to think of acidity and physicists to think of protons). This makes it difficult for scientists in different fields to understand each others' work.

Your position basically is: **(Please read from A to H, and then choose one.)**

It is difficult for scientists in different fields to understand each other:

- A. Because scientific ideas depend on the scientist's viewpoint or on what the scientist is used to.
- B. Because scientists must make an effort to understand the language of other fields which overlap with their own field. It is fairly easy for scientists in different fields to understand each other:
- C. Because scientists are intelligent and so they can find ways to learn the different languages and points of view of another field.
- D. Because they have likely studied the various fields at one time.
- E. Because scientific ideas overlap from field to field. Facts are facts no matter what the scientific field is.
- F. I don't understand.
- G. I don't know enough about this topic to make a choice.
- H. None of these choices fits my basic viewpoint

Section-B

Guidelines for students: There are statements given about the structure of the atom. Please go through these statements carefully and give your response. Remember, this is to know about your views and understanding; **it is not a test.**

Do you agree or disagree with the following statements (1-3, 5-6). Explain giving reasons why you think so.

1. Atoms are solid particles.

2. Scientists now have a complete understanding of the atom.

3. Atoms are composed mainly of empty space.

4. You have heard about different scientists giving a model of the atomic structure. What do you think a model is?

5. Since scientists cannot actually see inside the atom, it is not possible to believe any model of the atom that has been given.

6. Early models of the atom were useless theories, which were eventually discarded.

7. What does an atom look like? Describe in your words.

The atoms looks like_____

8. How do you know that atoms look like what you have described?

Because, _____

9. Why do you need to study different models of atomic structure?

10. Which model according to you can best explain the structure of the atom? Why do you think so?

Annexure 4

Responses of Students (College and School) on the Nature of Science Questionnaire: VOSE
Represented in a tabular form separately for Both the Participating Groups

Item no. 1

1. When two different theories arise to explain the same phenomenon (e.g. the nature of electron), scientists will accept the two theories at the same time.					
A. Yes, because scientists still cannot objectively tell which one is better; therefore, they will accept both tentatively.	SD (5)	D (9)	U (4)	A (22)	SA (5)
	C S 1 4	C S 4 5	C S 2 2	C S 6 16	C S 2 3
B. Yes, because the two theories may provide explanations from different perspectives, there is no right or wrong.	SD (4)	D (4)	U (3)	A (31)	SA (3)
	C S 1 3	C S 1 3	C S 1 2	C S 10 21	C S 1 2
C. No, because scientists tend to accept the theory they are more familiar with.	SD (19)	D (12)	U (8)	A (4)	SA (2)
	C S 6 13	C S 4 8	C S 1 7	C S 2 2	C S 2 0
D. No, because scientists tend to accept the simpler theories and avoid complex theories	SD (21)	D (13)	U (5)	A (4)	SA (2)
	C S 10 11	C S 1 12	C S 2 3	C S 2 2	C S 0 2
E. No, the academic status of the person who proposed the theory will influence other scientists' acceptance of the theory.	SD (19)	D (15)	U (5)	A (4)	SA (2)
	C S 4 15	C S 6 9	C S 2 3	C S 2 2	C S 1 1
F. No, scientists tend to accept new theories which deviate less from the current core scientific theory.	SD (5)	D (13)	U (11)	A (12)	SA (4)
	C S 2 3	C S 2 11	C S 4 7	C S 2 10	C S 4 0
G. No, scientists use intuition to make judgments.	SD (6)	D (14)	U (11)	A (9)	SA (5)
	C S 2 4	C S 4 10	C S 3 8	C S 2 7	C S 4 1
H. No, because there is only one truth, scientists will not accept any theory before distinguishing which is best.	SD (7)	D (7)	U (4)	A (14)	SA (13)
	C S 3 4	C S 2 5	C S 2 2	C S 4 10	C S 4 9

Item no. 2

2. While scientists are conducting scientific research, they also use their imagination.					
A. Yes, imagination is the main source of innovation.	SD (0)	D (1)	U (3)	S (16)	SA (25)
	C S 0 0	C S 0 1	C S 3 0	C S 8 8	C S 4 21

B. Yes, scientists use their imagination more or less in scientific research.	SD (2) C S 0 2	D (4) C S 0 4	U (11) C S 3 8	S (13) C S 1 12	SA (6) C S 2 4
C. No, imagination is not consistent with the logical principles of science.	SD (2) C S 1 1	D (13) C S 2 11	U (12) C S 3 9	S (6) C S 0 6	SA (3) C S 0 3
D. No, imagination may become a means for a scientist to prove his point at all costs.	SD (13) C S 10 3	D (11) C S 1 10	U (6) C S 2 4	S (15) C S 2 13	SA (0) C S 0 0
E. No, imagination lacks reliability.	SD (8) C S 6 2	D (7) C S 1 6	U (12) C S 6 6	S (16) C S 2 14	SA (2) C S 0 2

Item no. 3

3. Even if the scientific investigations are carried out correctly, the theory proposed can still be disproved in the future.					
A. Scientific research will face revolutionary change, and the old theory will be replaced.	SD (3) C S 1 2	D (14) C S 10 4	U (7) C S 6 1	S (17) C S 2 15	SA (4) C S 2 2
B. Scientific advances cannot be made in a short time. It is through a cumulative process; therefore, the old theory is preserved	SD (4) C S 2 2	D (4) C S 1 3	U (12) C S 4 8	S (19) C S 2 17	SA (6) C S 2 4
C. With the accumulation of research data and information, the theory will evolve more accurately and completely, not being disproved.	SD (2) C S 1 1	D (4) C S 2 2	U (5) C S 2 3	S (25) C S 8 17	SA (9) C S 2 7

Item no. 4

4. Scientific investigations are influenced by socio-cultural beliefs and values present at a given time (e.g. religious beliefs, social bias about gender, caste, class etc.).					
A. Yes, socio-cultural values influence the direction and topics of scientific investigations.	SD (14) C S 4 10	D (15) C S 9 6	U (4) C S 2 2	S (4) C S 2 2	SA (8) C S 1 7
B. Yes, because scientists participating in scientific investigations are influenced by socio-cultural values.	SD (11) C S 6 5	D (18) C S 4 14	U (8) C S 2 6	S (5) C S 2 3	SA (3) C S 1 2
C. No, scientists with good training will remain value free (neutral) when carrying out research.	SD (2) C S 1 1	D (6) C S 2 4	U (6) C S 2 4	S (15) C S 4 11	SA (16) C S 6 10
D. No, because science requires objectivity, which is contrary to the subjective socio-cultural values.	SD (1) C S 1 0	D (4) C S 2 2	U (14) C S 8 6	S (22) C S 4 18	SA (4) C S 0 4

Item no. 5

5. Scientists' observations are influenced by their personal beliefs (e.g. personal experiences, presumptions) therefore; they may not make the same observations for the same experiment.						
A. Observations will be different, because different beliefs lead to different expectations influencing the observation	SD	(4)	D	(11)	U	(4)
	A					
	(23)					
B. Observations will be the same, because the scientists trained in the same field hold similar ideas.	SD	(5)	D	(23)	U	(8)
	A					
	(8)					
C. Observations will be the same, because through scientific training scientists can keep aside personal values to conduct objective observations	SD	(4)	D	(12)	U	(12)
	A					
	(12)					
D. Observations will be the same, because observations are exactly what we see and nothing more. Facts are facts. Interpretations may be different from one person to another, but observations should be the same.	SD	(3)	D	(4)	U	(15)
	A					
	(19)					
E. Observations will be the same. Although subjectivity cannot be completely avoided in observation, scientists use different methods to verify the results and improve objectivity.	SD	(2)	D	(4)	U	(5)
	A					
	(23)					

Item no. 6

6. Most scientists follow the universal scientific method, step by step, to do their research (i.e., state a hypothesis, design an experiment, collect data, and draw conclusions).						
A. The scientific method ensures valid, clear, logical and accurate results. Thus, most scientists follow the universal method in research.	SD	(1)	D	(4)	U	(4)
	A					
	(26)					
B. Most scientists use the scientific method because it is a logical procedure.	SD	(0)	D	(1)	U	(4)
	A					
	(32)					
C. The scientific method is useful in most instances, but it does not ensure results; therefore, scientists invent new methods.	SD	(1)	D	(8)	U	(15)
	A					
	(16)					

D. There is no so-called the scientific method. Scientists use any methods to obtain results.	SD (5) C S 1 4	D (12) C S 8 4	U (8) C S 2 6	A (15) C S 2 13	SA (5) C S 2 3
E. There is no fixed scientific method; scientific knowledge could be accidentally discovered.	SD (0) C S 0 0	D (6) C S 6 0	U (3) C S 2 1	A (29) C S 6 23	SA (7) C S 1 6
F. No matter how the results obtained, scientists use the scientific method to verify it.	SD (3) C S 2 1	D (10) C S 4 6	U (9) C S 3 6	A (17) C S 2 15	SA (4) C S 2 2

Item no. 7

7. Is scientific theory (e.g. atomic theory) “discovered” or “invented” by scientists from the natural world?					
A. Discovered, because the idea was there all the time to be uncovered.	SD (3) C S 2 1	D (13) C S 4 9	U (7) C S 3 4	A (20) C S 4 16	SA (2) C S 2 0
B. Discovered, because it is based on experimental facts.	SD (3) C S 3 0	D (8) C S 2 6	U (5) C S 2 3	A (26) C S 6 20	SA (2) C S 1 1
C. Some scientists discover a theory accidentally, but other scientists may invent a theory from their known facts.	SD (2) C S 1 1	D (3) C S 2 1	U (4) C S 2 2	A (28) C S 8 20	SA (6) C S 2 4
D. Invented, because a theory is an interpretation of experimental facts, and experimental facts are discovered by scientists.	SD (2) C S 2 0	D (9) C S 2 7	U (8) C S 5 3	A (18) C S 2 16	SA (5) C S 4 1
E. Invented, because a theory is created or worked out by scientists.	SD (3) C S 1 2	D (8) C S 2 6	U (16) C S 6 10	A (17) C S 4 13	SA (4) C S 2 2
F. Invented, because a theory can be disproved.	SD (1) C S 1 0	D (5) C S 4 1	U (15) C S 6 9	A (15) C S 2 13	SA (9) C S 2 7

Item no. 8

8. Is scientific law (e.g. gravitational law) “discovered” or “invented” by scientists from the natural world?					
A. Discovered, because scientific laws are out there in nature, and scientists just have to find them.	SD (1) C S 1 0	D (6) C S 2 4	U (5) C S 2 3	A (20) C S 6 14	SA (13) C S 4 9
B. Discovered, because scientific laws are based on experimental facts.	SD (1) C S 0 1	D (6) C S 1 4	U (5) C S 2 3	A (29) C S 10 19	SA (4) C S 2 2

C. Some scientists discover a law accidentally, but other scientists may invent a law from their known facts.	SD (1) C S 1 0	D (5) C S 4 1	U (15) C S 2 13	A (18) C S 6 12	SA (6) C S 2 4
D. Invented, because scientists invent scientific laws to interpret discovered experimental facts.	SD (0) C S 0 0	D (17) C S 2 15	U (8) C S 3 5	A (18) C S 10 8	SA (2) C S 0 2
E. Invented, since there are no absolutes in nature, therefore, the law is invented by scientists.	SD (2) C S 0 2	D (24) C S 6 18	U (6) C S 4 2	A (9) C S 2 7	SA (4) C S 3 1

Item no. 9

9. In comparison to laws, theories have less evidence to support them.						
A. Yes, theories are not as definite as laws.	SD (3) C S 2 1	D (9) C S 4	U (10) C S 6	A (20) C S 2	SA (3) C S 1	
B. Yes, if a theory stands up to many tests it will eventually become a law; therefore a law has more supporting evidence.	SD (2) C S 2 0	D (3) C S 2 1	U (3) C S 2 1	A (24) C S 4 20	SA (13) C S 5 8	
C. Not quite, some theories have more supporting evidence than some laws.	SD (0) C S 0 0	D (11) C S 4 7	U (11) C S 6 5	A (19) C S 2 17	SA (4) C S 3 1	
D. No, theories and laws are different types of ideas. They cannot be compared	SD (4) C S 0 4	D (15) C S 6 9	U (14) C S 6 8	A (5) C S 2 3	SA (4) C S 1 3

Key words:-

Sustainable forest ecosystem; integrated land-use management; sustainable productive environment; agroforestry; and biodiversity conservation.

Abstract

Forest ecosystems play a pivotal role in socio-economic development and ecological stability. Critical role played by forests ecosystem cannot be over-emphasized noting the current commitment by UN Member States under COP 21 of 2015 on climate change adaptation and mitigation. Forests provide a pool of genetic resources, timber, fruits, medicine, fodder, regulating services such as flood and climate regulation; cultural services, aesthetic, recreational values; and supporting services including primary production, carbon sequestration, nutrient cycling, soil formation and biodiversity conservation. They are critical in provision of renewable energy that majority of African households still depend on. Trees are important in integrated soil, water and biodiversity conservation and in mitigating climate change and variability. Forestry and agroforestry management principles are inherently geared towards harnessing the benefits of natural resources and biodiversity for livelihoods and sustainable productive environment. The study presents results of the existing challenges and opportunities facing forests ecosystem management, agricultural production and biodiversity conservation owing to human pressure on land-use and natural resources in E. Africa. It is concentrated on the analysis of three major pathways for sustainable forests ecosystem: (i) reducing pressure on natural forests; (ii) providing habitat for native plant and animal species; and (iii) forests and agroforestry systems for integrated land use management and fragmented landscapes. The review proposes a paradigm shift to accelerate the current low investment in these resources while promoting strategies that facilitate the mainstreaming of forestry and agroforestry management, including biodiversity conservation in the sub-region's development agenda. It identified the following action plans to be fast-tracked in the sub-region: Design, develop and disseminate improved technologies and innovations, management plans for sustainable and equitable management of forests and agroforestry resources; Enhance productivity and conservation of agro-ecosystems using trees and agroforestry practices /technologies for socio-economic benefits and environmental services; Facilitate the development of policy options and institutional innovations for enhanced investment in forestry and agroforestry and allied natural resources based enterprises; Strengthen the capacity and governance framework for effective and sustainable

management of forestry and agroforestry resources; and Promote awareness and access to knowledge and information for improved and adaptive management and innovations, including utilization.

..... **Introduction:-**

The General Assembly of the United Nations adopted the definition of Sustainable Forest Management in December 2007 as a dynamic and evolving concept aims to maintain and enhance the economic, social and environmental value of all types of forests, for the benefit of present and future generations. It is characterized by seven elements, including: (i) extent of forest resources; (ii) forest biological diversity; (iii) forest health and vitality; (iv) productive functions of forest resources; (v) protective functions of forest resources; (vi) socio-economic functions of forests; and (vii) legal, policy and institutional framework (International Union for Conservation of Nature, 2012).

Developments in forest management over the past decades have focused on progress towards Sustainable Forest Management (SFM), an approach that balances environmental, socio-cultural and economic objectives of management in line with the "Forest Principles" adopted at the United Nations Conference on Environment and Development (UNCED) in 1992.

Parallel efforts in environmental conservation, particularly within the framework of the Conservation on Biodiversity, have led to the development of the Ecosystem Approach (EA) as a framework and holistic approach for the conservation and sustainable use of biological diversity and its components in all types of ecosystems (Metteet *al.*, 2003).

Africa as a continent is rich in natural resources. Its land, water, and forests underpin the sustained productivity of food crops and livestock on which millions of Africans depend directly for their livelihood and survival (Global Environment Facility, 2011). These resources are major assets on which most countries depend for economic growth and sustainable development (GEF, 2011).

Undoubtedly, the risk of expanding land degradation and desertification, increased deforestation, and water scarcity threatens to hasten a major global environmental crisis. In Kenya, it is not an entirely surprising statistic that about 12 % of the land areas which was originally covered by closed canopy forests has been reduced to a mere 1.7% of its original size. This is attributed to population pressure for settlements, infra-structure, demand for wood products and conversion to agriculture Government of Kenya (GOK, 2013).

Forests harbour two thirds of all terrestrial animal and plant species (IUCN, 2012). They provide food, oxygen, shelter, recreation, and spiritual sustenance. They are the source for over 5,000 commercially-traded products, ranging from pharmaceuticals to timber and clothing. The biodiversity of forests, variety of genes, species, and forest ecosystems underpins these goods and services, and is the basis for long-term forest health and stability. The Convention on Biological Diversity (CBD) addresses the conservation and sustainable use of forest biodiversity through a comprehensive programme of work, adopted in 2002 and revised in 2008. Many of the activities of the programme of work promote poverty reduction and creation of sustainable livelihoods (IUCN, 2012).

Despite the major roles played by forests such as provision of goods and ecological services, waste assimilation and aestheticism, it is threatened by habitat modification and fragmentation, a reduction in vegetation cover and species diversity, and over-exploitation and competition from invasive species, mainly as a consequence of human population growth. The high level of deforestation is attributed to the need for woodfuel for home consumption but more so for commercial purposes where the charcoal is sold to urban dwellers in major towns. Further, there is limited information and knowledge on appropriate management regimes of the forests and also non-availability of suitable germplasm for propagation of biological species (GEF, 2011). This scenario is compounded by limited focus and priority on the forests by implementing agencies both in the government and NGO sector. Community participation is also limited in the management and utilization of such resources.

The review involved identification and assembling of relevant documents; assessment of the documents using review checklist developed in line with the emphasis on the sustainable forest management and focus areas. Past GIS database was also reviewed and key sites of major environmental significance identified.

Challenges facing forest ecosystem:-

It is widely acknowledged that forests are faced with a myriad of political, socio-economic, and environmental challenges with profound implications for their sustainable management and development. Forests and associated biodiversity, which underpins the livelihoods of the majority of the rural poor, is being destroyed irreversibly by human activities. The situation is exacerbated by climate variability and change, whose effects are already being witnessed in the region in the form of variable water supplies, lengths of growing season, extreme weather events (floods, droughts), and changing habitats. How to deal with these trends and challenges to sustainably manage these resources so as to conserve, utilize and improve livelihoods and the environment in East African forest ecosystems remains a great question.

The review findings reveal that degradation and loss of forests and associated habitats and the species that they support is a result of a wide range of natural and man-made causes interacting at different levels and intensities on the forest ecosystems. The Millennium Ecosystem Assessment (MEA) report (2005) for instance asserted that an estimated 70% of natural habitats in the Mara River Basin have been converted over time to farmland and other forms of settlement. Table (1) shows the areas in Kenya and rate of change in forest cover from 1990 to 2010

Table 1:- Areas of Forest in Kenya and Rate of Change since 1990.

Category of forest resource (using FAO definitions)	Area ('000 Ha)				Annual change 1990 to 2010 ('000 Ha)
	1990	2000	2005	2010	
Indigenous closed Canopy Forest	1240	1190	1,165	1,140	-5
Indigenous Mangroves	80	80	80	80	0
Open woodlands	2150	2100	2075	2,050	-5
Open woodlands	170	134	119	107	-3.15
Private Plantation forests	68	78	83	90	+1.1
<i>Sub-total Forest land (total of above categories)</i>	3708	3582	2357	3, 467	-12.05
Bush-land	24800	24635	24570	24, 510	-14.5
Farms with Trees	9420	10020	10320	10, 385	+48.25
Total Area of Kenya	58037	58037	58037	58, 037	0

Source: (GoK, 2013).

Over the past three decades, large areas of forest reserves have been officially “de-gazetted” and unofficially converted to other uses, mainly agriculture, and the remaining protected indigenous forests managed by for example Kenya Forest Service (KFS) in Kenya. The review established that logging, both legal and illegal, of valuable timber trees results in reduced carbon stocks and degraded biodiversity values. Forests on community trust lands under the control of local authorities continue to be degraded and destroyed through over-exploitation for timber, poles, charcoal and fuel wood, and through unregulated grazing and clearance for agriculture; depicting what the previous studies termed as “tragedy of the commons”.

Matiet *et al.*, 2005 asserted that significant changes on land cover have taken place. According to their study, it is clear that forests, shrub land, grassland, and savannah reduced by 32%, 34%, 45%, and 26% respectively as shown in table 2. Despite efforts made to protect forest biodiversity in the region pressure on forest resources is still on the rise due to population increase and hence need for more land for settlement and farming.

Table 2:- Extent of land use/cover changes in the Mara river basin between 1973 and 2000

Land cover type	1973 (km ²)	1986 (km ²)	2000 (km ²)	Change	
				Km ²	%
Forest	1008	893	689	-319	-32
Tea/ open forest	621	1073	1948	+1327	+214
Agricultural land	826	1617	2504	+1678	+203
Shrubland	5361	5105	3546	-1815	-34
Grassland	2465	1621	1345	-1120	-45
Savannah	3163	2867	2354	-809	-26

Key challenges to forest ecosystems:-

Expanding agriculture: The review established general soil fertility of forest ecosystems which has attracted settled agriculture, including commercial food and horticultural plantations. It is noted that the soils in upland and lowland Riverine forests patches are more fertile than those of surrounding farmlands and woodlands and hence face pressure to be converted for agriculture.

Charcoal production and firewood harvesting: Although not well quantified, the business of charcoal production has heavily impacted the forests ecosystems. Away from towns and roads this threat is much less important as local people use firewood for cooking. Most firewood is collected from trees and bushes outside the protected forest areas.

Uncontrolled fires: Widespread pastoralism for example in Mara River Basin forests ecosystem particularly with Maasai community in both Kenya and Tanzania threaten woodland and shrub land forest vegetation of being cleared for pastures. Although forest fires are a natural phenomenon, majority that occur are started by pastoralists and people who use the fire to clear farmland, drive animals for hunting, collect honey, and remove tsetse flies from an area. Some other fires are started accidentally, for example from cigarettes thrown from passing vehicles or by pedestrians. These occasional fires destroy forest and other biodiversity. Over time and with frequent and intense burning it is believed that lowland forests ecosystems and thicket vegetation is converted to more fire-adapted vegetation types. This results in a loss of the narrowly endemic forests ecosystem species and their replacement by wide-ranging invasive species.

Illegal and unsustainable logging: The commercial logging of forests ecosystem tree species occurs mainly for example in Mau Forest, Kenya and in the middle and lower Riverine forests of the Mara river Basin (MRB) forests ecosystem. Logging using pit-sawing techniques occurs in forests ecosystem where timber trees remain. Many forests have already been logged to exhaustion, particularly heavy exploitation for round wood. Logging of the valuable trees is often the first major disturbance to a forest, which then progresses to fire wood collection and charcoal burning, and in the worse cases to clearance for agricultural use.

Unplanned settlement: Over much of forests ecosystem the expansion of settlements is only partly planned. For example, in the Mau forests, illegal settlers have interfered with the catchment vegetation which is the main sources of water to the Mara River. In some of the protected forests ecosystem of Kenya and Tanzania (both Forest Reserves and traditionally protected forest areas), settlements have been established within the boundaries of the reserve. When this happens, farming activities also start and there can be much damage to the habitats. Similarly, the expansion of tourism facilities into some forests ecosystem is also an issue for concern.

Minor threats: Some threats, such as invasive species, are considered to be relatively minor. However these threats need to be carefully monitored to ensure that action is taken so that they do not become more significant.

Causes of Forest Biodiversity loss:-

Limited alternative economic activities: A significant proportion of the population in Kenya and Tanzania, particularly the communities relying on agriculture and pastoralism for their livelihoods. Direct threats from agricultural expansion and associated fires, in particular, are linked to poverty and limited alternative economic activities in rural areas. As subsistence agriculture is the primary livelihood strategy for most people in rural areas, the need for land puts negative pressure on forests, even though many forest products are used and valued by local people. A high level of direct reliance on forest products to sustain livelihoods contributes to their overuse in some areas. The lack of affordable energy alternatives also drives the urban demand for charcoal.

Demographic changes: Demographic changes combined with uncontrolled settlement increases overall direct pressures on land, timber and non-timber forest resources. Demand for additional farmland for subsistence agriculture also rises. Population increases are also linked to habitat degradation associated with increased demand for firewood, charcoal, timber, building materials and bush meat.

Declining respect for traditional forest protection systems: Small areas of forests have traditionally been conserved as sacred sites. These areas have been protected by community elders but are now threatened and some cases being destroyed by recent migrants who do not necessarily owe allegiance to traditional authorities. A decline

in the respect for elders among other members of the local population is causing further pressures to convert these forests to farmland.

Limited institutional capacities and financial support: While decentralization efforts are focusing more attention and responsibilities at local levels, the local natural resource management agencies are often understaffed, poorly funded, and have limited capacity to adopt new management approaches such as 'participatory forest management'. Financial support for capacity building and management activities, including management of protected areas, and enforcement of regulations on commercial resource extraction, is also limited.

Limited Consideration of Environmental Impacts of Economic Development Policies: National and Local Governments tend to give priority to economic development activities and will permit the clearance of natural habitats to establish mining, tourism facilities, roads, and agricultural projects. Given the poverty levels in Kenya and Tanzania, such a development focus is understandable. However, there remains considerable scope for undertaking development that is less environmentally damaging through enhanced integration of conservation objectives in development planning and consideration of environmental impacts.

Inadequate Capacity to Enforce Regulations on Commercial Extraction: Forest ecosystems suffers inadequate capacity to enforce forest rules and regulations, such as those on charcoal and timber production. For instance, the MRB Ecoregion Illegal activities are both depleting natural resources and limiting the economic value of these activities that is captured by the national economies.

Legal Issues and Land Tenure: The existence of different land tenure systems in East Africa contributes to loss of forest biodiversity. In Kenya for example, the current land tenure system leaves a large percentage of rural population without secure title, especially those on the Trust Lands that make up a majority of the land in the country. This limits incentives for people's long-term stewardship of these lands. In Tanzania, recent changes in the Land Law (1999) mean that it is now possible for villages to gain title deeds for their village lands, and also for individuals to obtain deeds for land. This is a change from the past system where land was controlled by the government, and may offer better possibilities for the management of forest resources at the village level.

Inadequate Institutional Coordination and Integration of Sectoral Policies: At the national level, conflicting objectives and policies among government ministries and departments have also contributed to the loss of habitats across the region. In both Tanzania and Kenya there are over 20 sectoral policies that either directly or indirectly affect forest management and conservation practices, with no clear mechanism for ensuring linkages between these different policies and Acts. However, the governments of Kenya and Tanzania have started putting mechanisms in place to address this issue.

Sustainability Management Issues:-

Despite the abundance and huge potential of the sub-region's forest and tree resources for sustainable development and provision of environmental services, the Partner States have not invested adequately in these resources in pursuit of effective and sustainable management to bring about the required transformation for improvement in livelihoods. To change this trend, there is a urgent need to increase investment in strategies to facilitate the mainstreaming of forestry and agroforestry management, including biodiversity conservation in the sub-region's development agenda. Unprecedented degradation pressure arising from human activities and climate change and variability put forests and agroforestry systems at risk. Principal threats identified include: land use and land cover changes, mainly through conversion of natural forest ecosystems to agricultural land and settlement and loss of flora due to adverse effects of climate change and variability. It is also feared that with increasing population pressure, land clearing and deforestation will continue which is a threat to genetic diversity due to loss of species.

Conclusion:-

The importance accruing from forest ecosystems cannot be over-emphasized. The riparian communities appreciate what forest ecosystems do to them. The only challenge is sustainable management of this natural resource. There is therefore need to collectively strive by partner states to ensure that their utilization, activities and management of the forest resources are geared toward sustainability.

Recommendations for sustainable forest management:-

- Designing, developing and disseminating improved technologies and innovations, management plans for sustainable and equitable management of forests and agroforestry resources;

- Enhancing productivity and conservation of agro-ecosystems using trees and agroforestry practices / technologies for socio-economic benefits and environmental services;
- Facilitating the development of policy options and institutional innovations for enhanced investment in forestry and agroforestry and allied natural resources based enterprises;
- Strengthening the capacity and governance framework for effective and sustainable management of forestry and agroforestry resources; and
- Promoting awareness and access to knowledge and information for improved and adaptive management and innovations, including utilization;

Abstract

Car drifting is a serious problem as it may lead to damage of the body, loss of some organs, loss of public and private materials as well suffering borne by the parents of drifters, as they suffer because of the bad reputation of their son actions. Causes of popularity of this phenomenon are the desire to be famous, weak control of parents, media, websites and weakness of religious faith

The purpose of this study was to analyze road traffic accident data from drifters, investigate the lifestyle of drifters, and suggest lowering the risk of accidents caused by drifting. We will also recommend lifestyle modifications in drifting to improve quality of life and may suggest safe practices.

Our main finding in this study was that the majority of drifters are teenager students and they learned it and started it at an early age, with their friends being the most encouraging factor and their family the most discouraging factor. Most of them damaged cars and many knew a friend who was injured or killed by drifting. Camry & Hilux users seemed to have more dangerous behaviours compared to other car users.

Drifting has a negative effect on the socioeconomic and health state of the country. We think it is difficult to stop, but recommend it should be regulated so it is a legal activity in special areas, so to keep drifters busy but in a safe environment. This will save lives and reduce the socioeconomic and health cost burden.

Introduction:-

Drifting requires skill, and is growing in popularity. There is potential for harm if the driver loses control of the car. While it wasn't up until recently that drifting became as popular as it is today, the history of drifting dates back to many years ago. Drivers have been using this technique as early as the 1930's in Grand Prix races. People didn't call it drifting back then, but throughout the 20th century it started as a racing technique used in motorsports.

Drifting which better known locally as “hajwalah” or “tafheet”, where the car is intentionally spun several times at speed of 180 kph or more, this form of reckless stunt-driving is strongly condemned in the Kingdom of Saudi Arabia, with strict sentences for drivers involved in fatal accidents.

Car drifting is a serious problem which may lead to damage of the body, loss of some organs, and loss of public and private property. It also affects the parents of the persons who drift; they suffer if their child is injured or killed and

also due to the bad reputation of their child's actions. Causes of popularity of this phenomenon are the desire to be famous, weak control of parents, media and websites popularizing this and weakness of religious faith.

A published definition is "Drifting refers to a specific driving technique, as well as a type of motor sport based on that technique. It occurs when the wheels are pointing in a different direction to the direction the car is sliding overall. Drifting requires skill, and is growing in popularity. There is potential for harm if the driver loses control of the car." [1]

In the process, racers often drive dangerously close to traffic, barriers and spectators, who are watching from the sides without any protection. Drifters usually drive and damage local rental vehicles. "Tafheet" practice and events occur with little to no concern for any vehicle occupants, other drivers or any spectator safety.

In videos posted to YouTube, large crowds are seen gathering by the side of the road to watch drivers skid their cars – often typical family sedans like Honda Accords and Hyundai Sonatas – through traffic at high speeds, sometimes heading in the wrong direction. These uploaded video give drivers' kudos within the culture even after vehicle damage, major injury or fatality and naturally after successful high speed skill displays. Tragically it terrorizes other highway users who are unaware of the event until they are in the middle of it and at risk of death or major injury. Several of the clips show out of control cars crashing into spectators causing serious injury, or even death. One particularly graphic video that surfaced in the internet in May 2013 showed a car that rolled through a crowd as several passengers were thrown from vehicle. A middle-aged man in Saudi Arabia was been sentenced to execution by public beheading after killing two people while 'drifting' his car.

Causes of Drifting:-

Drifting is gaining popularity as it spreads all over the internet via social networking sites like MySpace and YouTube. There is a cult following for many drifters, who have earned such titles as 'The Drift King' or 'Drift Master' from their outrageous drifting antics. However, despite all the glory from enthusiasts, drifting is quickly becoming a public safety hazard and a nuisance for Saudi authorities.

"The driving problems are with young people," Ali Abdul-Rahman Al-Mazyad, a Saudi columnist in Riyadh told The Media Line. "There are very little outlets for young people to enjoy themselves and kids basically do what they want."

"There is also not such great education in schools about driving and respecting the road," he said. "Drug use is also a contributing factor. These are the central problems." [2]

During a New York Times investigation, their reported found that between drag races and the "drifting" shown in the videos, the Saudi streets came to resemble a cross between the movies *Death Race* and *The Fast and The Furious*. It seems that a great national boredom, or "tufush," has seized the young men of Saudi, and with no public entertainment and few jobs, an underground car culture has flourished. Wealthier and middle-class men drag race Corvettes and Imprezas all night, but for the poorer, more desperately in need of excitement, only drifting cars through and around traffic will do. And the scene has created one crazy melting pot of young, angry desperation. "The idea behind drifting is, the economy and society don't need you," says Pascal Ménoret, an anthropologist with four years of field work in Riyadh. "They are mostly young Bedouins who recently moved to the city, and whose lives are marked by suffering and self-destructive behavior." [3]

Literature Review

Drifting is gaining popularity as it spreads all over the internet via social networking sites like MySpace and YouTube. There is a cult following for many drifters, who have earned such titles as 'The Drift King' or 'Drift Master' from their outrageous drifting antics. However, despite all the glory from enthusiasts, drifting is quickly becoming a public safety hazard and a nuisance for Saudi authorities.

There have been several drifting accidents which have resulted in fatalities over the years. The most infamous 'Abu Kab' drifting accident occurred in Riyadh in 2005 when a Navy officer decided to try his hand at performing the Arab Drift. He rented a Honda Accord and allowed 4 young boys to ride with him at a speed of 120 kph. The officer crashed and 3 of his passengers were killed. He was found guilty of negligence and sentenced to death by a Jeddah court. [4]

The Saudi government adopted the tougher law this past spring to deter Arab drifting and joyriding. Previously, fatalities would have been classified as “accidental” but now they are classified as “criminal negligence” which carries a much heavier punishment than the prior. Government officials hope that such a serious punishment will deter future Arab drifters from setting foot, or tire for that matter, on Saudi roads with the intention of performing daredevil stunts.

Jeddah's traffic department has recorded a whopping 2,000 cases of motorists running red lights over a two-week period. Lt. Col. Zaid Al-Hamzi, spokesman of the city's traffic department, said 60 percent of the violators were detected by the Saher system and the rest by security patrols. He said teenagers were responsible for most of the violations. A total of 200 violators were arrested, detained for 48 hours and fined SR500 each. Al-Hamzi said that during the same period, about 1,500 offenses were detected for drifting, passenger overloading, hiding of license plates, driving without seat belts, speeding, and talking on mobile phones while driving. Al-Hamzi urged motorists to abide by the country's traffic laws for the safety of all road users. [5].

The World Health Organization found Saudi Arabia to have the world's highest number of deaths from road accidents, which now make up the country's principal cause of death in adult males aged 16 to 36. First reported by the Saudi daily Arab News, the study found that 6,485 people had died and more than 36,000 were injured in over 485,000 traffic accidents during 2008 and 2009. [2].

An average of 19 Saudi Arabian residents die on the country's roads each day, a report by the Kingdom's General Directorate of Traffic has revealed. [7] In an interview with *Arab News* in September, the associate vice president and transportation systems director of Middle East Operations at traffic management consultancy Iteris Inc., Glenn N. Havinovski, said infrastructure wasn't an issue, but "when you see people turning left out of the far right lane and traffic cutting through parking lots and frontage roads, there are clearly some issues with discipline." [6]

Study Aim and Objectives:-

There are very few publications on the drifting and none were found in the on the Middle Eastern population. The aim of the study is to document and analyze road traffic accident data from drifters.

Objectives:-

- Analyze road traffic accident data from drifters.
- Investigate the lifestyle of drifters.
- Suggest lowering the risk of accidents caused by drifting.
- Recommend designated areas for drifting and attracting drifters to these areas.
- Suggest safe practices for drifting.
- Investigate risk factors for drifting.
- Suggest lifestyle modifications in drifting to improve quality of life and better future.
- The benefit of this work is that this research will help in raising the level of awareness the society by explaining the side effects and harms of drifting.

Methods:-

1. Study design: Random, cross-sectional study
 2. Study population and sample size: This will be a random cross-sectional study of 100 male subjects, aged 16 to 40 years, who will be recruited by personal contacts and online forums of the drifting community. Exclusion criteria will be subjects who do not drift. All subjects will complete a questionnaire.
 3. Data collection: A questionnaire has been prepared and will be validated to make sure it is reliable. It will pilot tested in AGU before being made available to drifters via an online questionnaire.
- Variables: The research is based on questionnaire (see Appendix) results recording age, marital status, occupation, educational level. Other questions are age of drifting initiation, what factors encourage you to drift, what factors discourage you to drift, car model, presence or absence of a driving license, drift frequency, seat belt use, frequency of car damage, frequency of being caught or arrested by police, whether any friends died or were injured by drifting and which areas do you prefer to drift.

Data Analysis:-

Method of analysis: All data will be presented as mean \pm standard deviation unless otherwise stated. Package used: IBM SPSS Statistics 19. Statistical tests used: Paired t-test, linear and multiple regression analyses.

The data will be analysed by SPSS version 19. The results will be expressed as means (\pm SD). Odds ratios (OR) with 95% confidence intervals (CI) will be calculated.

The Pearson's Chi squared (χ^2) and Fisher's exact tests were used to determine statistically significant associations of categorical variables. For quantitative variables, an unpaired t-test was used.

Results:-**A. Descriptive results**

All 105 subjects in this study were male and all were from the Kingdom of Saudi Arabia.

The mean age (\pm SD) of all our subjects was 18.44 ± 3.33 years. Their age range was 14 – 36 years. Their age of initiation i.e. the age they started drifting, was 15.10 ± 1.86 years. Their age of initiation range was 12 – 26 years. The mean number of times they drifted in one week was 2.63 ± 1.77 times.

B. Frequency

94 % of the drifters in this study were single (Figure 1). The remaining 6 % of drifters were equally either married or divorced. In terms of age, most subjects in our study were young. 54 % of drifters were aged 14 to 17 years, 29 % were aged 18 to 21 years and only 17 % were aged 22 years and above (Figure 2).

In terms of occupation, 71.4 % of the drifters in this study were students, while 21.9 % were unemployed and only 7 % were other i.e. employed (Figure 3). 91.4 % of our drifters started at a young age (12 – 17 years), 8.5 started from 18 to 21 and only 1 % of people started to drift after 22 years of age (Figure 4).

In our population, friends and free time were considered as the major encouraging factors for drifting with percentages of 35.2 % and 23.8 %, respectively (Figure 5). The remaining 41 % of encouraging factors included after exams, after football matches, stress and other factors. The greatest factors which helped discourage drifters in our study to drift were family (34.3 %). Other discouraging factors included police, religion, teachers, fear and other factors (Figure 6).

69.5 % of drifters in our study revealed that there was damage to their own vehicle or to others vehicles during the time they were drifting (Figure 7). A minority of only 30.5 % reported that there no car damage during the time they were drifting. 38.1 % of our drifters admitted they had been arrested for drifting on at least on one occasion (Figure 8). The majority were not arrested.

72.4 % of our drifters would participate in drifting 1-3 time/week, while only 27.6 % would get involved 4-7 times per week.

Figure 1:- Bar chart showing the frequency of marital status of drifters in our study (n=105).

Figure 2:- Bar chart showing the frequency of various ages of drifters in our study (n=105).

Figure 3:- Bar chart showing the frequency of various occupations of drifters in our study (n=105).

Figure 4:- Bar chart showing the frequency of various ages of initiating in drifters in our study (n=105).**Figure 5:-** Bar chart showing the frequency of various factors which encouraged our subjects to drift (n=105).

Figure 6:- Bar chart showing the frequency of various factors which discouraged our subjects to drift (n=105).**Figure 7:-** Bar chart showing the frequency of total vehicle damage (own and others vehicles) during drifting (n=105).

Figure 8:- Bar chart showing the frequency of whether our study participants were ever arrested during drifting or not (n=105).

Chi-square analysis

I. Effect of age on results state ...

- ❖ Age did not have a significant effect on whether drifters were arrested or not ($\chi^2 = 0.288$, $p = 0.591$). See Table 1.
- ❖ There were also no significant effect of the age on whether police caught drifters or not ($\chi^2 = 0.338$, $p = 0.561$).
- ❖ All the following relationships were not significant when relating age to the following:
 1. death of friend during drifting ($\chi^2 = 2.627$, $p = 0.105$)
 2. frequency of drifting ($\chi^2 = 0.450$, $p = 0.502$)
 3. injury of friend during drifting ($\chi^2 = 2.702$, $p = 0.100$)
 4. seatbelt use during drifting ($\chi^2 = 0.586$, $p = 0.444$)
 5. total damage to the car ($\chi^2 = 2.794$, $p = 0.095$)
- ❖ There was also no significant effect of the age category on the frequency of drifting (Table 2; $\chi^2 = 0.338$, $p = 0.561$).

Table 1:- χ^2 analysis showing relationship between arrest and age of drifters (n=105).

		Arrest		Total
		Yes	No	
agecategory	14-17 years of age	20	36	56
	=/>18 years of age	20	29	49
Total		40	65	105

Table 2:- χ^2 analysis showing relationship between frequency of drifting and their age category (n=105).**agecategory * Driftfreqcateg Crosstabulation**

Count		Driftfreqcateg		Total
		1-3 times/week	4-7 times/week	
agecategory	14-17 years of age	39	17	56
	=/ > 18 years of age	37	12	49
Total		76	29	105

II. Age of initiation of drifting:

There were no significant effects of age of drifting initiation on the following:

- ❖ Death ($\chi^2 = 0.861$, $p = 0.353$).
- ❖ Injury ($\chi^2 = 0.047$, $p = 0.674$).
- ❖ Seat belt use ($\chi^2 = 0.008$, $p = 0.927$).
- ❖ Total vehicle damage ($\chi^2 = 0.585$, $p = 0.444$).

III. Occupation:

Unemployed drifters had significantly higher prevalence of injuries of a friend during drifting than students drifters ($\chi^2 = 8.111$, $p = 0.004$). See Table 3.

Table 3:- χ^2 analysis showing relationship between injury and occupation of drifters (n=105).

		Injury		Total
		Yes	No	
Occupation	Student	30	45	75
	Unemployed	17	6	23
Total		47	51	98

There were no significant effects of occupation of drifters on:

- ❖ Death ($\chi^2 = 3.099$, $p = 0.078$).
- ❖ Seatbelt use ($\chi^2 = 1.527$, $p = 0.217$).
- ❖ Total vehicle damage ($\chi^2 = 2.473$, $p = 0.116$).
- ❖ Arrest during drifting ($\chi^2 = 0.074$, $p = 0.785$).
- ❖ Police catching drifters ($\chi^2 = 0.008$, $p = 0.767$).

Car model vs. seatbelt

Users of Camry and Hilux drifting vehicles had significantly lower prevalence of seat belt use during drifting (Table 4). As the χ^2 analysis had an expected count lower than 5, Fisher's Exact Test was used. This showed that when Camry cars were compared with Other cars, Camry users had significantly lower prevalence of seat belt use during drifting ($p=0.05$). Similarly, when Hilux and Other cars were compared, Hilux users had significantly lower prevalence of seat belt use during drifting ($p=0.04$).

Lastly, using a χ^2 analysis Camry and Hilux was combined and compared to Others cars. Results showed Camry + Hilux users had significantly lower prevalence of seat belt use during drifting ($\chi^2 = 5.13$, $p=0.023$). The odds ratio of wearing a seatbelt during drifting (to not of wearing a seatbelt during drifting) in Camry + Hilux users, compared to Other car users was 0.286 (95 % CI, 0.091 - 0.864).

Table 4:- χ^2 analysis and results showing the relationship between seat belt use and car model used by drifters (n=105).

		Seatbeltuse		Total
		Yes	No	
Car model	Camry	4	24	28
	Hilux	2	18	20
	Other	19	38	57
Total		25	80	105

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	6.353 ^a	2	.042
Likelihood Ratio	6.731	2	.035
Linear-by-Linear Association	4.647	1	.031
N of Valid Cases	105		

a. 1 cells (16.7%) have expected count less than 5. The minimum expected count is 4.76.

Discussion:-

Our main finding in this study was that the majority of drifters are teenager students and they learned it and started it at an early age, with their friends being the most encouraging factor and their family the most discouraging factor. Most of them damaged cars and many knew a friend who was injured or killed by drifting. Camry & Hilux users seemed to have more dangerous behaviours (not using their seatbelts) compared to other car users.

There are no deeper reasons apart from excitement and fun making that makes people in Saudi Arabia take part in drifting. In truth, drifting is mostly a reflection of other social issues including drug abuse, selfishness and deviance. Many people who attempt or actually drift their cars might be under the influence of drugs. What moves one to drifting is purely a selfish desire to satisfy one's curiosity without put into considerations other road users and relatives. The fact that drifting is illegal in Saudi Arabia, participating in it is an outward show of the levels of deviance among Saudi drivers. It is expected that once the government declares an act illegal people should desist from it.

Major concerns noted in our study were that the average age of 105 drifters was 18 years of age and some were as young as 14 years. Also, we found that the most of them initiated drifting at a very young average age of only 15 years, and some had started by even 12 years of age. It is difficult to imagine how the parents of these children allow this, but it is happening. At the time of injuries or death, parents have called for the death penalty of the responsible drifting drivers, but parents shoulder the full responsibility of their children's actions and should know where they are and what they are doing. In assessing factors encouraging our drifters, we noticed that friends and free time were considered the most important numerically, while their family was one of several factors discouraging them from drifting the most. In order to limit the level of drifting we have to deal with the most discouraging factor starting with their family. The family and parents should make their relationship stronger with their children, talk to them, let them know that they are an important member in their family, that they love them and that they are afraid from losing them. This can be exploited where by the Ministry of the Interior and Transport Departments can advertise on television and through brochures/pamphlets and target drifters and their families. Information can be given to them about the dangers of drifting with statistics to prove their point.

The majority of drifters in our study had either damaged their car or other cars while drifting. This is a large amount. If these figures were only halved, lots of resources including court, police, hospital, car insurance and other costs will be saved. No one has estimated the financial burden of drifting in Saudi Arabia, but an intelligent guess would put it in the billions of Riyals annually.

Approximately one third of our drifters' claim they had been arrested by the police. Video footage of drifters often shows they are ready and planning to escape. They choose a specific area e.g. empty space out of the city; this gives them the opportunity to escape easily. It was interesting to note that drivers who used a Camry or Hilux to drift had significantly less seatbelt usage than other car drifters. Therefore, it seems these two brands were popular and maybe drivers of these cars had more dangerous behaviours compared to other car users. The number of drifters who knew someone who had died or was injured during drifting was almost equal. It is unclear whether the factors

discouraging them from drifting would be different between these two groups, but we did not analyse this data as our sample size was only 105 and we had several discouraging factors.

With regard to the age and gender of the drifters, all are male and most are young. They are at a sensitive age with their hormones changes, in which their testosterone levels are increasing. They have a greater desire to try new things and get involved in different activities. If they are not given opportunities for outings, sports, etc then they might be attracted to drifting and other dangerous behaviours such as substance abuse. We noticed that their friends are the most common factor for them encouraging them to drift.

We had no way to compare our data with other GCC countries, such as Kuwait, Qatar, Bahrain or the UAE, as we could not find any published data on this topic. However, anecdotal evidence suggests this problem is not very common in these other neighbouring countries. One possible reason for this could be that in these other GCC countries, their governments have provided avenues for young men to release their energy, be it by providing special spaces for these activities, other sports activities, competitions, greater opportunities for higher education, allowing them drift or drag race during competitions, so to allow it in a legal way. One such example is the Bahrain International Circuit (Formula1 Track), where people can drift or drag legally and safely using their own cars and also they have opportunities to use go-karts.

In coming to the outcome, every year the government loses billion of riyals to treat the drifters and the people who get injured from drifting. A large proportion of hospital beds have patients paralyzed by road traffic accidents including drifters or their spectators. In addition to all of that they waste the time of policemen who try to stop and catch them. It's a very serious issue which has also reached the social media. A famous Saudi television programme called 'Al Tamanna with Dawood Shriya', contacted some drifters for one of their episodes. They revealed two shocking facts: firstly, some of drifters steal others cars in order to use it in drifting and then they burn it after they have finished drifting. Secondly: they hide their faces and refuse giving their real name, but use nicknames in their activity. This is obviously so they cannot be identified by the authorities.

A limitation of our study was that data was only collected from one GCC country.

Drifting has a negative effect on the socioeconomic and health state of the country. We think it is difficult to stop, but recommend it should be regulated so it is a legal activity in special areas, so to keep drifters busy but in a safe environment. This will save lives and reduce the socioeconomic and health cost burden. They harm themselves and they should be aware of what Allah says in the Quran (وَلَا تُلْقُوا بِأَيْدِيكُمْ إِلَى التَّهْلُكَةِ) 'do not throw [yourselves] with your [own] hands into destruction' البقرة آية 195

Conclusion and Recommendation:-

There is no doubt that drifting is a now major problem in Saudi Arabia. The fact that road accidents have been rated the number one killer shows how a menace drifting is. What makes it more problematic is that fact that many commercial organizations have funded advertisements for drifting or dangerous driving in order to make their products acceptable and popular among the youths. In addition, the increase in internet access as seen by the availability of free drifting videos in YouTube has continued to encourage many youths to take part in the act. The best way to decrease its frequency should be stripping away the participants driving licenses' besides charging them in a court of law. In this case they will be unwilling to participate since their freedom to drive will be taken away from them once their driving licenses are impounded.

It is really unfortunate that commercial enterprises have found a platform to advertise their commodities in such a social menace as drifting. Youth subcultures especially dangerous sports like drifting should be discouraged by all stakeholders. The idea of commercial enterprises to fund dangerous behaviours is very frustrating and in bad faith. Such firms include manufacturers of cars, tires and soft drinks. They are contributing to a course that will see many youths engage in dangerous driving hence high speed road accident cases and ultimately raising death tolls. This is the case where commercial enterprises run product adverts that show product acceptance among street youth gangs that are suspected of perpetuating crime and other social evils.

We don't want to have our youth living fast and dying young but rather living the normal pace and fully completing the metamorphosis of phases that life has laid before them. Until next time, please slow the pace down. From this it is obvious that to discourage drifting, ministries of health, interior, sports, culture and education need to work together to rid ourselves of this evil.

Acknowledgments:-

We are grateful to every person who supported us while conducting this research, including our subjects, without whom this work would not be possible. Special thanks would go to those who provided us with continuous positive and negative feedback throughout our work and our Supervisor Dr. Feisal Subhan.

Abstract

Statistical tools and features of the Design Expert software (7.0.0 Trial version) were used in experimental design and analyses of bioethanol production process from corn stover. The Box-Behnken design (BBD) was used in the design of the experiments and it yielded a total of 54 experimental runs. The response variable, Bioethanol (mg/l) was represented with Y, while the six independent variables; Sulphuric acid concentration, Hydrolysis time, Fermentation time, Concentration of yeast, Fermentation temperature and pH of Hydrolysate samples were represented by A, B, C, D, E & F respectively. A model equation was developed from the experimental results using the analysis of variance (ANOVA) feature of the Design Expert software. From the analyses of variance, only the terms A, F, AF, CD, A² were significant model terms (having P-value ≤ 0.05), which resulted in a reduced Model Equation (i.e. Adjusted) in terms of actual factors, as follows:

$$Y = 552.60398 - 0.31052*A + 3.87830*F - 5.76556*A*F - 0.26625*C*D + 5.38883*A^2.$$

The optimum process parameters for the predicted optimum bioethanol yield of 149.41 mg/l were 1.08%, 3.32hrs, 14.32hrs, 6.43g/l, 39.34°C and 7.64 for A, B, C, D, E & F respectively. However, an experimental bioethanol yield of 143.15 mg/l was obtained from three experimental replicates with the optimum process parameters. The experimental bioethanol yield obtained was 95.81% close to the predicted optimum bioethanol yield. The values of R, R², adjusted R² and Adeq Precision were 0.8747, 0.7651, 0.5212 and 8.309 respectively. The value of R² indicates a good degree of correlation between the experimental and predicted bioethanol yields. The model is adjudged to be adequate since the "Adeq Precision" is greater than 4.

Introduction:-

The bioethanol production from a lignocellulosic material, corn-stover using the separate hydrolysis and fermentation (SHF) process where hydrolysis (saccharification) of the cellulose to glucose occurs first, separate

Address:- Department of Chemical Engineering, Federal University of Petroleum Resources, Effurun, Delta State, Nigeria.

2006

from the fermentation of the resulting glucose and other sugars (from the pretreatment of hemicellulose,) to ethanol. The separate saccharification step enables operation of the saccharification step at an elevated temperature. For fermentation, the *Saccharomyces cerevisiae* is used as the biocatalyst which will ferment glucose and other sugars to ethanol. Some important factors that affect the performance of separate hydrolysis and fermentation (SHF) and thus bioethanol yield are: concentration of the hydrolysis solution, hydrolysis time, pH of hydrolysate, concentration of yeast, fermentation temperature and time. The feasibility of these two operations is determined by the effects of each factor as well as the interactions between factors at varying values of all the factors.

Thus to design the experiment involving multivariable factors, a statistical software package like the Design-Expert, that is specifically dedicated to performing comparative tests, screening, characterization, optimization, robust parameter design, mixture designs and combined designs is highly recommended (Tanco *et al.*, 2008). Design-Expert offers test matrices for screening up to 50 factors. To keep pace with this, therefore, a power calculator which helps to establish the number of test runs needed is required. Statistical significance of these factors is established with analysis of variance (ANOVA). Based on the validated predictive models, a numerical optimizer helps the user to determine the ideal values for each of the factors in the experiment. Graphical tools help identify the impact of each factor on the desired outcomes and reveal abnormalities in the data (Cornley, 2009). Design-Expert provides 11 graphs in addition to text output to analyze the residuals (Plant, 2013). The software determines the main effects of each factor as well as the interactions between factors by varying the values of all factors in parallel (Black, 2013). Design-Expert provides the user with a broad range of possible response transformations. The appropriate choice depends on subject matter and/or statistical considerations. The software provides extensive diagnostic capabilities to validate statistical assumptions. This feature of the Design-Expert offers a helpful plot, called the Box-Cox, which recommends the appropriate power transformation (including the no transformation option). Design-Expert also has an option of plotting the responses in terms of the original response data by calculating the surface matrix of data points and then applying the inverse transform before making the plot.

In the present study, the application of statistical tools of the design expert software to determine statistical significance of the various process factors in bioethanol production from corn-stover is presented as a case study. The impact of these factors on the response (i.e. bioethanol yield), diagnostic capacities to validate statistical assumptions, possible response transformations and the criteria for the choices of transformation were clarified.

Materials and Methods:-

2.1 Design of Experiment:-

Box-Behnken design (BBD), a statistical tool, was used in the design of the experiment in this study. In BBD, the six independent variables; sulphuric acid concentration X_1 (A), hydrolysis time X_2 (B), fermentation time X_3 (C), concentration of yeast X_4 (D), fermentation temperature X_5 (E), and pH of hydrolysate X_6 (F), were all set at three levels; minimum (-1), centre (0) and maximum (1). The BBD was used to determine the number of runs or sets of experiments that were needed to be carried out. Each experiment was carried out in triplicates and the mean values outcome, taken as response, Y, which is bioethanol yield (mg/l).

For statistical calculations, the variables $X_1, X_2, X_3, \dots, X_n$ were coded as $x_1, x_2, x_3, \dots, x_n$ respectively, according to Equation 1 Nuran (2007):

$$x_i = \frac{(X_i - \bar{x}_i)}{\Delta x_i} \quad i = 1, 2, 3, \dots, n \quad (1)$$

Where x_i is a dimensionless value of the independent variable, \bar{x}_i is the mean value of the independent variable at the center point and Δx_i is the step change.

The design matrix used for the six independent variables showing the real values of the variables in terms of the three levels is presented in Table 1.

Table 1:- Design matrix employed for the six independent variables

Factors	Code	Range		
		-1	0	+1
Sulphuric Acid Concentration (%)	A	1.00	2.50	4.00
Hydrolysis Time (Hrs)	B	2.00	4.00	6.00
Fermentation Time (Hrs)	C	12.00	30.00	48.00
Concentration of Yeast (g/l)	D	3.00	6.00	9.00
Fermentation Temperature (°C)	E	30.00	35.00	40.00
pH of Hydrolysate	F	5.00	6.50	8.00

The outcome of the BBD experimental design of the process (Separate Hydrolysis and Fermentation, SHF) using the Design Expert software, resulted in a total of 54 experimental runs as sets of coded variables.

Pretreatment, Hydrolysis and Fermentation of corn stover:-

The pretreatment, hydrolysis and fermentation of the corn stover were carried out in line with standard procedure (Ohimor *et al.*, 2016). The milled corn stover was alkaline pretreated with dilute sodium hydroxide (2% w/w NaOH) summing to a solid to liquid weight ratio of 1:8. The hydrolysis of the alkaline pretreated corn stover was with dilute-acid (H₂SO₄) of varying concentrations (1, 2.5 and 4%), such that a solid to liquid ratio of 1:10 is maintained in a 250ml round bottom flask and then refluxed. Hydrolysate samples were retained at intervals of 2, 4, and 6 hours for subsequent fermentation. The hydrolysate sample for fermentation was adjusted to the various pH of 5, 6.5 and 8 by adding concentrated sulphuric acid and 2N sodium hydroxide as may be appropriate.

Varying quantities of yeast (*Saccharomyces cerevisiae*) equivalent to 3, 6 and 9 g/l respectively where added to each hydrolysate samples contained in 250 ml Erlenmeyer flask, then incubated at various temperatures (30, 35 and 40 °C) for fermentation. The bioethanol content was determined by gas chromatography at various fermentation times of 12, 30, and 48 hours.

Statistical Analyses:-

Upon completion of the laboratory analyses, the results (bioethanol yield) of all 54 experimental runs were entered into a table in the file already created in the Design Expert software for subsequent analysis. The results were statistically analyzed in order to have an understanding of the interactions between variables and the bioethanol yield. These results were also used for the optimization of the process.

A second order polynomial model, similar to that of Dasgupta *et al.* (2013), was obtained from the Design Expert software indicating linear, interaction and quadratic effect of variables on the response variable (Y).

$$Y = b_0 + b_1X_1 + b_2X_2 + b_3X_3 + b_{11}X_1 + b_{22}X_2 + b_{33}X_3 + b_{12}X_1X_2 + b_{23}X_2X_3 + b_{13}X_1X_3 \quad (2.2)$$

Where Y is the predicted response; X_1, X_2, X_3 are the independent variables; b_0 is the offset term; b_1, b_2, b_3 are the linear effects; b_{11}, b_{22}, b_{33} are the square effects; and b_{12}, b_{23}, b_{13} are the cross effects of the interaction terms.

Using regression analysis, the significance of the coefficients of the terms in the model equation was determined by computing the standard errors, T-values and P-values. Analysis of variance (ANOVA) was also used to determine the level of confidence (α) as well as linear, interaction and quadratic effects. The quality of fit of the BBD model was estimated by comparing the variance (R^2) of the adjusted model and that of the predicted Model.

Finally, the experiment was repeated in triplicate using the variables that gave the optimum bioethanol yield and the average of the results was compared to the optimum value. The validity of the model was adjudged to be good since the result is comparable to the optimum bioethanol yield to an extent. Point Prediction was carried out which allows the entering of each factor or component into the current model at different levels. The software then calculates the expected responses and associated confidence intervals based on the model equation that is shown in the ANOVA output. The predicted values are updated as the levels are changed. The **95%** confidence interval (CI) is the range in which the process average is expected to fall into 95% of the time. The 95% prediction interval (PI) is the range in which any individual value is expected to fall into 95% of the time. The prediction interval will normally have a wider spread than the confidence interval because of the random nature of the individual values when compared to the averages.

Results and Discussion:-

Experimental Design of the Bioethanol Production Process and Bioethanol Yield:-

The results of the design of experiments and experimental bioethanol yields (mg/l) for each runs are presented in Table 2; it shows the experimental design of the six (6) independent variables for the bioethanol production process in terms of their coded levels (i.e. -1, 0, +1).

Table 2:- Experimental design and bioethanol yield

Run Order	Coded Variables						Experimental	Std

54	0	+1	+1	0	+1	0	91.45	16

The analytical experiments were then carried out according to the assignment of variables in Table 2. The experimental runs were performed randomly to avoid systemic error.

Transformation Equation:-

The response (i.e Bioethanol Yield) ranged from 28.62 mg/l to 147.64 mg/l. The ratio of the maximum to minimum response determines whether a transformation equation is needed or not for the statistical analysis. A ratio greater than 10 usually indicates a transformation is required. For ratios less than 3, the power transform will have little effect. For ratios ranging from 3 to 10, a transform is not required.

Transformation types can either be Square Root, Natural Logarithm, Base 10 Logarithm, Inverse Square Root, Inverse, Power, Arcsin Square Root or None.

From the experimental results, the ratio of maximum to minimum bioethanol response is 1 : 5.15863, hence a transform was not required before we proceeded with the statistical analysis.

Model type selection:-

From the statistical analysis using Design Expert, the information on *Sequential Model Sum of Squares [Type I]* and *Lack of Fit Tests*, shown in Tables 3 and 4 respectively, were obtained.

Table 3:- Sequential model sum of squares [Type I]

Source	Sum of Squares	df	Mean Square	F- Value	p-value Prob > F	Comment
Mean vs Total	2.844E+005	1	2.844E+005			
Linear vs Mean	15434.74	6	2572.46	6.82	< 0.0001	Suggested
2FI vs Linear	6864.30	15	457.62	1.35	0.2321	
Quadratic vs 2FI	3074.07	6	512.35	1.71	0.1584	
Cubic vs Quadratic	6223.58	18	345.75	1.77	0.2080	Aliased
Residual	1565.33	8	195.67			
Total	3.175E+005	54	5880.54			

Table 4:- Lack of fit tests

Source	Sum of Squares	Df	Mean Square	F- Value	p-value Prob > F	Comment
Linear	17206.59	42	409.68	3.93	0.0647	Suggested
2FI	10342.29	27	383.05	3.68	0.0755	
Quadratic	7268.22	21	346.11	3.32	0.0932	
Cubic	1044.64	3	348.21	3.34	0.1134	Aliased
Pure Error	520.69	5	104.14			

For the "Sequential Model Sum of Squares [Type I]", it is expected that the model equation that was not aliased is to be selected provided the model is shown to be significant in terms of its "Model F-value". In this case the Cubic vs Quadratic Model was aliased, meaning that the Cubic Model cannot be resolved. The test suggested Linear vs Mean, meaning that a Linear Model is preferred compared to a Mean. Nevertheless, the Quadratic Model was preferred over 2FI (i.e two – factor interaction) because it was not Aliased. The choice of the Quadratic Model was to account for interactions between two or more variables.

For the "Lack of Fit Tests", the selected model is to have an insignificant lack-of-fit, which is a "P-value " that is > 0.05. In this case the software suggested Linear, however, the Quadratic model is preferable in as much as it was not aliased, with a P-value of 0.0932. The choice of the quadratic over linear model is to be able to account for interactions between two or more variables.

The "Lack of Fit F-value" of 3.32 implies there is a 3.32% chance that a "Lack of Fit F- value" as much as this could occur due to noise. Lack of fit is bad -- we want the model to fit. This relatively low probabiity (<10%) is worrisome. What this means is that there are many insignificant model terms and as such, there is need to consider model reduction in order to improve the model.

Regression analysis:-

The result of the regression analysis is shown in Table 5 below. If the T-value is above threshold and P-value is lower than 0.05 for any given term, then that term is said to have a meaningful contribution to bioethanol production. Terms that have no contribution were removed from the predicted model and a new model referred to as adjusted model was obtained.

Table 5:- Regression analysis

Source	Coefficient Estimate	Sum of Squares	DF	Mean Square	F-value	P-value (Prob. >F)

Model summary statistics:-

The summary of the statistical analyses are shown in Tables 6 and 7 below.

Table 6:- Model summary statistics

Source	Std. Dev.	R-Squared	Adjusted R-Squared	Predicted R-Squared	PRESS	
Linear	19.42	0.4654	0.3972	0.2770	23975.89	Suggested
2FI	18.42	0.6724	0.4575	-0.0657	35340.10	
Quadratic	17.31	0.7651	0.5212	-0.1677	38722.52	
Cubic	13.99	0.9528	0.6873	-7.0869	2.682×10^5	Aliased

From Table 6, the choice of model was based on the Predicted R-Squared value. A positive value of Predicted R-Squared is more preferable to a negative term, hence the Cubic model was aliased (i.e ruled out) while the Linear model was suggested. However, the Two-Factor Interaction (2FI) and Quadratic models were not aliased because their Predicted R-Squared values were not too negative, hence the Quadratic model was selected.

Table 7:- Adeq Precision and various R– Squared values for quadratic model

Std. Dev.	17.31	R-Squared	0.7651
Mean	72.57	Adj R-Squared	0.5212
C.V. %	23.85	Pred R-Squared	-0.1677
PRESS	38722.52	Adeq Precision	8.309

The adequate precision and various R–Squared values for the quadratic model are given in Table 8. The "Adeq Precision" is a measure of the signal to noise ratio and a ratio greater than 4 is desirable. For the quadratic model, the "Adeq Precision" is 8.309. Since it is greater than 4, the model can be used to navigate the design space, but there is need for improvement, through the removal of insignificant model terms.

Confidence interval:-

The confidence interval (CI) depicted in Table 8 is another statistical data that can be used to determine whether a model term has effect (i.e. significant) or not on the model). Hence, the terms in the columns “**95% CI Low and 95% CI High**” represent the range that the true coefficient should be found in 95% of the time. If the range spans zero (i.e. one limit is positive and the other negative) then the coefficient would not be true, indicating that the corresponding term or factor has no effect. However, if the range does not span zero (i.e. both limits having the same sign, either positive or negative) then the coefficient would be true, meaning that the corresponding term or factor has effect. For example, the term B has a confidence interval which spans 0 since it is between -6.80 and 7.72, hence term B has no effect. Whereas term A has a confidence interval which does not span 0 since it is between -30.48 and -15.96, as such it has significant effect on the model equation. Similarly, the confidence intervals of the following terms A, F, AF, CD, A^2 as well as the intercept do not span 0 and therefore have significant effects on the model equation.

Table 8:- Confidence interval, degree of freedom and variance inflation factor

Factor	Coefficient Estimate	Degree of Freedom	Standard Error	95% CI Low	95% CI High	VIF

VIF: Variance Inflation Factor in Table 8, measures how much the variance of the model is inflated by the lack of orthogonality in the design. If the factor is orthogonal to all other factors in the model, the VIF is one. Values greater than 10 indicate that the factors are too correlated together (they are not independent.). Thus, since the values of Variance Inflation Factors range from 1.00 to 1.30, it indicates that the factors or terms are independent.

Standard Error: The Standard Error in Table 8 is associated with the calculation of the mean. It comes from the standard deviation of the data divided by the square root of the number of repetitions in a sample. The larger the value of the Standard Error of a term the more insignificant is the term.

Diagnostics Case Statistics:-

The actual value, predicted value of bioethanol and their residuals are given in Table 9, which informed the plots in Figures 1-5.

Table 9:- Internally and Externally Studentized Residual and Influence on Fitted Value

* Exceeds limits

Diagnostic plots:-

Important statistical plots derived from the analyses of the data are shown in Figures 1-5 below:

Figure 1:- Normal probability plot of the studentized residuals.

The normal probability plot of the studentized residuals in Figure 1, follows a linear pattern, which indicates a normal distribution of the residuals, hence a transformation is not required. This is in line with Hothorn, and Everitt (2014), who reported that a non-linear pattern indicates that the residuals did not follow a normal distribution, in which case a transformation of the response may provide a better analysis.

Figure 2:- Studentized residuals versus predicted values plot.

The studentized residuals versus predicted values plot, Figure 2, is a plot of the residuals versus the ascending predicted response values. It tests the assumption of constant variance. A random scatter (constant range of residuals across the graph.) is acceptable while an expanding variance ("megaphone pattern <") indicates the need for a transformation (Engle and Sheppard 2001). Since the plot showed a random scatter, it indicates that there was no assumption of a constant variance, thus, transformation is not required in the data so analyzed.

Figure 3:- Internally studentized residuals versus run number

The internally studentized residuals versus run plot, Figure 3, show that there were no lurking variables that may have influenced the bioethanol responses, since it followed a random scatter. According to Engle and Sheppard (2001), internally studentized residuals versus run plot which results in a trend will normally indicate the presence of lurking variables which may have influenced the responses and as such a transformation would be required.

Figure 4:- Predicted bioethanol yield versus actual bioethanol yield plot.

The predicted bioethanol yield versus actual bioethanol yield plot, Figure 4, shows points clustering along a linear graph which indicates that there are no values that would not be easily predicted by the model. A predicted response versus actual response plot helps detect a value, or group of values, that are not easily predictable by a model. Thus, the clustering of the points around a line indicates parity between the predicted and actual data being analyzed; hence the model can easily be used to predict a value of a response when the actual value is known (Cao *et al.*, 2009).

Figure 5:- Box-Cox plot for power transformations.

The Box Cox Plot, Figure 5, gave the best lambda value of 0.39 corresponding to the minimum point of the curve generated by the natural log of the sum of squares of the residuals. It was also observed that the 95% confidence interval around this best lambda value, includes 1, therefore no specific transformation is recommended for the data that was analyzed, based on the recommended transformation list in Box and Cox, (1964).

Conclusion:-

The Design Expert software and its several statistical tools are dedicated to designing experiments involving multivariable factors and analyzing the main effects of each factor as well as the interactions between factors. Thus in this paper it has been employed to determine statistical significance of the various process factors in bioethanol production from corn-stover, their impact on the response variable (bioethanol yield), diagnostic capacities to validate statistical assumptions, models and possible response transformations.

Abstract

Solar cells are the devices, which convert the solar radiation into the electrical energy without effecting the environment. To predict the real behavior of solar cells like changes in maximum power, short circuit current and open circuit voltage by changing the temperature and irradiance can be studied by using the MATLAB (simulation model). In this paper, a single diode MATLAB model is used to study the changes in solar PV module by varying temperature (100C, 200C, 300C) and by varying the irradiance (400W/m², 600W/m², 800W/m²). To study the changes in electrical parameters of a solar PV modules KD330GX-LFB and KD325GX-LFB experimental data sheet are taken and the results are discussed in the conclusion.

Introduction:-

The continuous use of fossil fuels for industrial purpose leads to huge damage to eco system and living conditions. To sustain our earth, the mankind has to decrease the green house gases like CO₂, Methane.., by choosing alternatives to fossil fuels. In order to conserve natural living spaces and not to harm the next generation utilization of renewable energy should increase. Among all the renewable energy sources, solar energy is having the large potential and small amount of it is utilizing for various purposes. Photovoltaic Effect converts solar energy to the electrical energy. Widely used applications of PV system are water heaters, street lights, electric vehicles, military and space applications(1,2). Solar panels and modules are works on the principle of Photo voltaic effect, and generates the electric power. These PV modules and panels are largely effected by different weather conditions. In this paper, mainly modeling parameters are explained. By changing the temperature of a simulink PV module, the changes in output parameters are observed. The simulated results are compared with the KD330GX-LFB, KD325GX-LFB experimental results.

State of Art: Swapnil Dubey.et.al, investigated the temperature Effect on the solar panel. they concluded that numerical parameters or equations are material dependent and also system dependent (3). Ike and C.U. investigated the effect of ambient temperature on performance. They observed the behavior of solar PV system under dry and rainy season in the year 2013. Conclusions came out as, the installation conditions shows the effect on the performance of PV panel(4). Khaled Matter, Hala.J.E-Khozondar.et.al. studied the shading effects on the maximum power point and remarkable reduction in efficiency of the solar PV system. Conclusions are there is a reduction in the maximum power point, by increasing temperature. To study the shading effects on the performance, they used the KC200GT panel(5).

Tarak Salmi , Mounir Bouzguend, Adel Gastli, Ahmed Masmoudi developed solar PV module using basic semiconductor equations and they studied the performance of solar PV module under various atmospheric conditions(6). Jay Patel and Gaurang Sharma studied the characteristics of a module, they observed the solar cell performance under various temperature and irradiance conditions(7).

Characteristic I-V equation:- The I-V equation of a solar cell, which represents the output of a solar cell is described by few researchers from past four decades(8). The solar cells is generally represented by the single diode due to its simplicity in computational time. The Single diode solar cell can be modeled using the electrical components current source, parallel resistor, series resistor.

The single diode photovoltaic I-V equation (8):

$$I = I_{ph} - I_0 \left\{ \exp \left(\frac{q(V + IR_s)}{A.K.T_c} \right) \right\}$$

$$I_{ph} = G [I_{sc} + K_1 (T_c + T_{ref})]$$

Where

I_{ph} =Photo current

I_0 =Saturation Current

R_s =Series resistance

A =Ideality factor

$K=1.38 \times 10^{-23} \text{ W/m}^2 \cdot \text{K}$ (or) $8.617 \times 10^{-5} \text{ eV/K}$.

I_{sc} =Short circuit current.

Photo current (I_{ph}): The photo current is the electricity generated by the solar radiation and I_{ph} , explicitly depends upon cell temperature(T). Habbati. Bellia.et.al. Presented the detailed I_{ph} equation as (9).

$$I_{ph} = \frac{G}{G_{ref}} [I_{ph} + \mu_{sc} \cdot \Delta T].$$

$$\Delta T = T_c - T_{c,ref}$$

Here,

G = Irradiance(W/m^2)

G_{ref} =Irradiance at STC =1000w/m²

$T_{c,ref}$ = cell temperature at STC:25+273

μ_{sc} =Coefficient of temperature of short circuit current (A/K).

Reverse Saturation Current: In solar cell, the reverse saturation current is produced due to the diffusion of charges from n-side to p-side and p-side to n-side. The equation for I_0 is given from the literature as

$$I_0 = DT_c 3 \exp \left(\frac{-q\epsilon_g}{A.K} \right)$$

T_c = Standard temperature.

Ideality factor: The ideality factor gives us how closely the diode follows the ideal diode equation, the ideality factor is material dependent Some of the researchers like Bashahu and Nkunbabakura(12) used different methods to identify, ideality factor and suggested that it lies between 1.26 to 1.5 and 'n' is assumed to be independent of temperature and solar radiation(10).

Series Resistance(R_s):The movement of charges through the emitter and base, the contact resistances are the main reason for series resistance.

Series resistance is defined as:

$$R_s = -\left(\frac{dv}{di}\right) - \frac{1}{X}$$

Shunt Resistance: Manufacturing defects and poor solar cell design are the main reason for shunt resistance (R_{sho}), leads to power losses by flowing the light generated current in an alternative path. The deviation of current flow through the junction leads to decrease in the voltage of the cell.

The shunt resistance is defined as :

$$R_s = R_{sho}$$

$$R_{sho} = -\left(\frac{dv}{di}\right) \quad (13,14)$$

Simulink single diode model: To understand the effect of atmospheric variations on the performance of solar PV module, we need a computer based model. For this purpose, by using the semi conductor basic equations, a simulated single diode model is developed. By using that model, and changing the input parameters those are temperature and irradiance, we can observe the changes in the like P_{max} , V_{mp} , I_{mp} , V_{oc} , I_{sc} from I-V, P-V graphs and the following observations are tabulated.

Single Diode Model: Simulink model consists of few subsystems inter connected and the output is linked to the multi plot graphs (I-V and P-V graphs). The following figure represents the generalized model of PV module can be compared with the any practical device.

By varying the temperature: One of the input parameter Temperature change shows the major influence on the Performance of the module. The effect of temperature on KYOCERA KD330GX-LFB is observed by varying the temperature from 10°C to 30°C , by an increment of 10°C . The corresponding changes are tabulated and compared with the practical values. The resistances are identified for the simulink model by the Newton_Raphson numerical method. The resistances are $R_s=0.2500\text{ohm}$ and $R_p=493.206\text{ohm}$

Isc=8.69(A)	8.65	8.68	8.70

Table-4:- Change of Efficiency with Temperature:

Temperature ($^\circ\text{C}$)	Fill Factor(%)	Efficiency (%)
T=10	77.46	17.33
T=20	75.02	15.05
T=30	74.52	14.75

The temperature change of KYOCERA KD330GX-LFB is observed for the temperatures 10°C , 20°C , 30°C and the changes in P_{max} , V_{mp} , I_{mp} , V_{oc} , I_{sc} are taken from the I-V, P-V graphs and those values are tabulated. The resistances for KD330GX-LFB simulink model are identified using the Newton_Rapshon method those values are $R_p=493.206\ \Omega$ and $R_s=0.2500$.

By Varying Irradiance: Solar module efficiency depends upon the input variable irradiance, as the irradiance is changed from 400W/m^2 to 800W/m^2 the output efficiency of a module changes. To study the changes in the performance of a solar PV module, KD330GX-LFB and KD325GX-LFB are studied and the results are tabulated.

Constant Parameters used for Simulation:

Ideality factor (a)=1.3

Number of cells(Ns)=80

Boltzmann constant(K)= 1.38×10^{-23} W/m².K

Energy gap(E.g.)=1.12.

Electron charge(q)= 1.602×10^{-19} C**Conclusion:-**

From Table-1, Table-3 as the temperature increases maximum power, open circuit voltage decreases and short circuit current increases ultimately efficiency decreases. Table -2 and Table-4 represents the change in efficiency and fill factor, from those we can conclude that as the temperature increases the efficiency decreases, this is because of increased intrinsic recombination. By the increase of heat energy, band gap of semi conductor decreases the open circuit voltage which is a function of band gap, decreases faster than the increase in the short circuit current so it leads to the decrease in the efficiency. The negative temperature coefficient of Silicon material reveals that as the temperature increases, the maximum power output decreases. The Table-5 and Table-7 represents the changes in the parameters of solar cell with the change in the irradiance. The Table-6 and Table-8 represents the changes in the efficiency and fill factor with the changes in the irradiance. As the irradiance increases, the number of photons incidenting on the module produces maximum power and leads to increase in the efficiency. This generalized simulink model is used to study the changes in the output parameters of any photovoltaic module by using Newton-Raphson numerical method to identify the suitable resistances.

Abstract

The precise role of bacterial infection in the course of exacerbation COPD has been a source of controversy for decades. Chronic bacterial colonization of the lower airways contributes to airway inflammation; The course of COPD is characterized by intermittent exacerbations of the disease. Approximately 40-50% acute exacerbations are caused by bacteria, by viruses in 25%, and both viruses and bacteria in another 25%. Airway inflammation is increased during the exacerbation resulting in increased hyperinflation, reduced expiratory air flow and decreased gas exchange. Expectored sputum is the most commonly used sample for diagnosis of lower respiratory tract infections (LRTI), which can be obtained easily and non-invasively.

The bacteria are very common in the lower respiratory tract of patients with COPD and cause inflammation. We have shown that among microorganisms causing acute exacerbations of COPD in our patients prevailed gram negative Enterobacteriaceae family and comparatively high resistance against cephalosporins and fluoroquinolones related to wide usage of antibiotics of this group for chemoprophylaxis.

Introduction:-

Chronic obstructive pulmonary disease (COPD) is a major cause of chronic morbidity and mortality worldwide. The World Health Organization predicts that COPD will become the third leading cause of death worldwide by 2030. (1,2). Exacerbation of COPD is redefined as a sustained worsening of a patient's condition from a stable state. The precise role of bacterial infection in the course of exacerbation COPD has been a source of controversy for decades. Chronic bacterial colonization of the lower airways contributes to airway inflammation; The course of COPD is characterized by intermittent exacerbations of the disease. Approximately 40-50% acute exacerbations are caused by bacteria, by viruses in 25%, and both viruses and bacteria in another 25%. Airway inflammation is increased during the exacerbation resulting in increased hyperinflation, reduced expiratory air flow and decreased gas exchange. (3,4,5).

Bacteria have established niches in the human body where they exist in symbiosis with their host. The term microbiome is used to refer to complex communities of microorganisms, termed the microbiota, that inhabit the body surfaces in symbiosis with the host. The most clearly defined microbiome occurs in the gastrointestinal tract in

which there are far more bacterial cells than in the whole human body (as bacteria are much smaller than human cells). Bacteria which form part of the normal flora of the microbiome, are tolerated by the local mucosal immune response with minimal activation of inflammatory cells, in particular T cells. The lower respiratory tract is directly connected to the upper respiratory tract with frequent micro-aspiration of secretions.(5,6,7).

Expectorated sputum is the most commonly used sample for diagnosis of lower respiratory tract infections(LRTI),which can be obtained easily and non-invasively.However, sputum may show a heavy growth of commensal organisms because of the necessity to traverse a highly contaminated oropharynx which may prevent the determination of true epidemiologic agent. A potentially-photogenic microorganism(PPM) had to grow in significant counts to be considered a potential causative agent of an exacerbation. (8,9)

Major challenges remain in accurately defining the potential role of bacteria in the inflammatory process and how best to optimize the use of antibiotics without the overuse of this limited resource. The thresholds for positive cultures used in most of the recently published studies are as follows: $\geq 10^2$ or $\geq 10^5$ colony-forming units/millilitre (CFU/ml) for sputum, $\geq 10^2$ CFU/ml for bronchial lavage (BL) and $\geq 10^2$ or $\geq 10^3$ CFU/ml for bronchoscopic protected specimen brush (PSB) and bronchoalveolar lavage (BAL) samples. Considering bacterial exacerbations, Gram-negative bacteria such as *P. aeruginosa*, *Stenotrophomonas maltophilia* and members of the *Enterobacteriaceae* family are more often present in patients with a greater degree of functional impairment, recent antibiotic or systemic steroid therapy, and in those with severe exacerbations. The rates of positive cultures in COPD vary depending on the sampling technique .(10)

The aim of the study was the bacteriological examination of expectorated sputum taken from COPD patients during exacerbation, identification of microbes and studying their sensitivity to antibiotics for the purpose of optimization of antibiotic therapy.

Material and Methods:-

We retrospectively have studied the medical records of the 17 patients of the University Clinic at TSMU Department of Therapy and Cardiology from 2015 - until September 2016. Acute exacerbation was defined as the presence of an increase in at least two of the three following symptoms: dyspnea, cough and sputum production. At least one sample of spontaneously expectorated sputum for microbiological evaluation was obtained from all patients during admission for aerobic gram-positive and gram-negative bacteria. An early morning sample was preferred. Specimens were collected according to standard guidelines(Baron and Thomas, 2012). Sputum samples were plated on 5% Sheep blood agar, Chocolate agar, Endo agar and Sabouraud dextrose agar and incubated at 37 °C for both 24 h and 48 h. All microorganisms isolated were identified through standard laboratory methods : isolation of pure culture, identifying microbes with rapid identification system(API20E, APIStaph, API haemo, API Strep, API 20NE, biomérieux). Sensitivity of microorganisms to antibiotics was defined with disc-diffusion method using standard discs(EUCAST guidelines).Rapid tests for identification of oxidase and catalase.

Results:-

In 12 patients monomicrobial growth has been documented by bacteriological investigation, among which gram-negative bacteria prevailed, namely *Klebsiella pneumoniae* $\geq 10^5$ colony-forming units/millilitre (CFU/ml) in 5 patients, *Escherichia coli* $\geq 10^5$ colony-forming units/millilitre (CFU/ml)– 2, *Proteus mirabilis* 10^8 CFU/ml-1. Among gram positive bacteria *Enterococcus* spp $\geq 10^5$ colony-forming units/millilitre (CFU/ml) was in 2 patients, *Staphylococcus aureus* -1, *Streptococcus pneumoniae* -1. Polymicrobial growth were observed in 5 cases: *Klebsiella pneumoniae* 10^5 CFU/ml and *Candida albicans* 10^8 CFU/ml-3, *Escherichia coli* 10^4 CFU/ml and *Enterococcus* spp 10^7 CFU/ml-1, *Staphylococcus aureus* 10^8 CFU/ml and *Enterococcus* spp 10^7 CFU/ml-1. By defining sensitivity on local antibiotics on strains isolate by us only 12% of gram-negative bacteria was resistant on quinolones, 19% to the third generation of cephalosporins, and among gram-positive bacteria methicillin-resistant *Staphylococcus aureus* and vancomycin-resistant *Enterococci* was not found. Comparatively high resistance against cephalosporins and quinolones related to wide usage of antibiotics of this group for chemoprophylaxis .

Conclusion:-

The bacteria are very common in the lower respiratory tract of patients with COPD and cause inflammation. We have shown that among microorganisms causing acute exacerbations of COPD in our patients prevailed gram

negative Enterobacteriaceae family and comparatively high resistance against cephalosporins and fluoroquinolones related to wide usage of antibiotics of this group for chemoprophylaxis.

Abstract

The study of hemocytes in arthropoda is the most fascinating area of research. The hemocytes are having similarity with that of blood cells in vertebrates. The study of hemocytes is mostly concentrated around insects and the scorpion hemocytes are having limited attention by scientists. In the present investigation granulocytes (GRs) of five different scorpions- *Mesobuthus tamulus tamulus*, *Mesobuthus tamulus concanensis*, *Orthochirus bicolor*, *Heterometrus xanthopus* and *Heterometrus phipsoni*, were studied qualitatively as well as quantitatively.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

The scorpions are the arachnids with open type of circulatory system with hemocoel filled by hemolymph. The hemolymph consists of plasma in which numerous blood cells- hemocytes are suspended and playing vital role in maintains of immunity against various pathogens (Bauchau, 1981). The defense role played by hemocytes is through phagocytosis, encapsulation and by lyses of foreign cells (Soderhall and Cerenius, 1992). The hemocytes are also important for transport of nutrients and hormones at the site of growth and wound healing (Lavine and Strand, 2002). According to Al-Robai et al. (2002), there are three well defined types of hemocytes in arthropoda- prohemocyte (PRs), plasmocytes (PLs) and granulocytes (GRs). Some more types of hemocytes are recorded in arthropods are- coagulocytes (COs), spherulocytes (SPs), adipohemocytes (ADs) and oenocytes (OEs). In the present investigation the GRs are studied in scorpions- *Mesobuthus tumulus tumulus*, *Mesobuthus tumulus concanensis*, *Orthochirus bicolor*, *Herterometrus xanthopus* and *Heterometrus phipsoni*.

Material And Methods:-

All five species of scorpions were collected from their natural habitat from different localities of Maharashtra (India). These are placed in perforated jars containing hibiscus leaves, water and cockroaches as their food. The males and females were identified according to sexual dimorphic characters as described by Tikader and Bastawade (1983) and placed in separate jars.

- Collection of hemolymph: The hemolymph was collected from the live animals as explained by Padmanabha (1967). It is collected by aspiration through arthroidal membrane at the third joint of one of the pedipalp. 1 to 3 ml of hemolymph was collected from single animal.
- Techniques employed to study hemocytes: The hemocytes were studied qualitatively and quantitatively. The methods used to study hemocytes were same that was followed to study vertebrate blood cells. For qualitative study none of the single method was satisfactory, hence combination of different methods were employed. For qualitative study different staining methods used are- Sudan Black B, Giemsa, Janus Green B and Leishman's stain. The hemocytes were observed under light as well phase contrast microscope. The transmission electron

microscopic (TEM) observation was made for only one sample of *H. xanthopus*. For identifying the granulocytes qualitative methods employed are differential hemocyte count (DHC) and total hemocyte count (THC). For THC Neubauer's hemocytometer was used (Witting, 1966).

Result and Discussion:-

During the present investigation Jones's classification (Jones, 1962) method was used. According to this method seven types of hemocytes- PRs, PLs, GRs, Ads, OEs and COs are present in the scorpions. These are also reported by Shah and Patil have studied the hemocytes in *M. tumulus tumulus* (2011) and in *O. bicolor* (2013).

The GRs are characterized by presence of cytoplasmic granules in it, which are stainable by different stains like Sudan Black B, Giemsa and Leishman's stain. These are generally round to oval in shape. The shapes of the GRs are round in *O. bicolor*, oval in *H. xanthopus*, round/ oval in *M. tumulus tumulus*. The size of GRs is smallest in *H. concanesis* (6- 12 μm), while largest in *H. phipsoni* (11-15 μm) in diameter. In *M. tumulus tumulus* the cell is 9- 15 μm , 7- 14 μm in *O. bicolor* while it is 10- 15 μm in diameter in *H. xanthopus*.

The nucleus of all GRs in above five types of scorpions is round in shape. The size of the nucleus is minimum in *M. concanesis* (3- 5 μm) while largest in *H. xanthopus* and *H. phipsoni* (5- 8 μm) in diameter. The size of the nucleus is 4- 6 μm in *M. tumulus tumulus*. The nucleocytoplasmic ratio was ranging from 30-70%. In all the GRs the nucleus was mostly central in position. The cytoplasm and nucleus of all above five GRs are basophilic in nature.

An attempt has been made to study ultra structure of one of the scorpions- *H. xanthopus*, in which the GRs are with following characteristics-

1. The GRs are almost spherical in shape.
2. The plasma membrane appears smooth.
3. The nucleus is eccentric in position due to presence of granules. The chromatin is scattered with dense clumps. The nucleolus with two zones.
4. The cytoplasmic granules are concentrated near nucleus and measures about 1- 3 μm in diameter and are of three types- structure less and electron dense, structure less and with small tiny granules, structured granules.
5. The nuclear envelope is perforated by nuclear pores.

According to Gupta (1985) the structured granules by gradual transformed into structure less during maturation and discharged the contents in the hemolymph. In the present investigation during TEM study both types of granules were observed. The microtubules were associated with granules, which were also reported by Akai and Sato (1973) but there are no such structural microtubules are observed. The structured granules become structure less during discharge of its contents in hemolymph as shown in the Plate II. The same findings are reported by Gupta (1985). The chemical nature of the granules was identified by PAS (McManus, 1946) and Sudan Black B (Humason, 1979) methods. These granules are with mucopolysaccharides and lipid in it.

GRs are reported almost in all arthropoda including onychopora (Gupta, 1985a), hence are plesiomorphic hemocytes. Many researchers have reported phagocytic role of GRs (Gupta, 1985a). In the present investigation there were no any pseudopodia like structures are notified. The same findings were reported by Silva et al (2000) in GRs of larva *Anastrepha oblique*. There is conflicting views about the origin of GRs in arthropoda. Arnold (1974) has suggested that these arise from PRs and PLs. It was also supported by Takada and Kitano (1971). According to Gupta and Sutherland (1966) GRs are capable of giving rise to SPs, Ads and Cos. Arnold (1974) has suggested that "the GRs, might be considered as basic unit from which more precisely structural and functional classes of cells have been developed."

THC was performed in both male and female (Pregnant and non-pregnant) scorpions. The values of THC are lowest in male *H. xanthopus* (9750 per mm^3) and highest in *H. concanesis* (46850 per mm^3). The values of others are reported in the Table 1. The same findings were observed in females. The number of GRs are more in pregnant than non-pregnant females. The % of GRs was performed by DHC. Higher % of GRs was reported in *M. tamulus concanesis* (15%) while minimum (10%) in *H. xanthopus*. The granules of *M. tamulus tamulus*, *M. tamulus concanesis* and *O. bicolor* are smaller in size and number of GRs are more while the granules are larger in size in *H. xanthopus* and *H. concanesis* and number of GRs are less in number. It indicates that there is inverse relation between size of granules and number of GRs.

The hematology of scorpion can be done with ease as large volume of hemolymph can be obtained from single animal. Although Gupta (1986) has pointed out several functional analogies between arthropod immunocytes and vertebrate B- and T- lymphocytes, there is great scope to study it in future. In general the hemocytes of scorpions are similar to those in other arthropods. There are few reports about the study of hemocytes in scorpions. *M. tamulus concanensis* is one of the most venomous species found in India, whose poison fatal especially in children. Whether this venomous nature is related to high THC or to number of GRs is the matter of further research.

Abstract

Atypical clubfoot is a clinical type of idiopathic clubfoot that requires early detection and modification in the Ponseti treatment. The goal of treatment is to reduce or eliminate its 4 components so that the patient has a near functional foot and lives a normal life: We had 20 patients with 20 idiopathic atypical clubfoot deformity. Clinically, atypical clubfeet is defined as having rigid equinus, severe plantar flexion of all metatarsals, a deep crease above the heel, a transverse crease in the sole of the foot, short foot and a short and hyperextended first toe. Correction was achieved in all patients by modifying the Ponseti manipulation and casting technique. The mean number of casts that were applied to obtain correction was 8 (range four to nine casts). Tenotomy was done in all feet. Finally all the feet were considered clinically cured. Modified Ponseti method is an effective treatment for congenital idiopathic atypical clubfoot and reduces the need for corrective surgery.

Introduction:-

During the course of treatment of idiopathic clubfoot by ponseti technique all feet show resistance to treatment. These feet have typical features like short foot, smaller great toe, deep planter crease. These feet are not usually identified initially but over the course of treatment these features become more prominent. Turco (1994) advised against surgery in these feet. He classified them as atypical clubfeet. Ponseti et al.(2006) advised about change in his standard protocol in these feet. We performed these modified Ponseti technique of manipulations and casting to see if this modified treatment would result in correction and maintenance of the correction for these atypical clubfeet.

Materials and methods:-

20 patients with 20 clubfeet were chosen. They were atypical clubfeet as they showed resistance to standard casting technique and had following features: feet were short and stubby, deep crease present over sole of foot, deep crease above the heel, severe equinus and supination, forefoot in adduction and planterflexion of all metatarsals.(figure 1)

There were 9 boys and 7 girls. Average age of patients was 3 months (range 1- 5 months). Treatment had been started in our hospital and from outside by applying plaster casts. We excluded syndromic clubfoot & clubfoot associated with neuromuscular disorders. The average follow-up was for 1 & half years (range 1 to 3 years). In all these patients plaster casts were applied . In all these cases standard ponseti technique was modified. Correct identification of talar head is essential. It is done by moving index finger and thumb down lateral malleoli and then grasping the head of talus. With the other hand forefoot is abducted which causes movement at Talo-calcaneo-navicular joint and thus in the correct identification of talar head.

Abduction is done by putting thumb on lateral aspect of head of talus. Index finger of same hand is put behind lateral malleolus. Using thumb and index finger of other hand abduction is done.(figure 2)

Abduction is done upto 40 degrees only. Standard abduction of 70 degrees is not done. Abduction is always kept less than 40 degrees. Abduction beyond 40 leads to abduction at tarsometatarsal joints and thus disruption of this joint. While abduction is being done , the foot usually come s into alignment with the long axis of the leg. This usually leads to slipping of cast which may cause foot edema and skin excoriation. To prevent this we applied the cast with the knee bent to 110 degrees . To prevent excessive cast behind the knee, we applied slab of cast anteriorly on the knee to strengthen the cast. A similar slab was applied behind ankle. When desired abduction was obtained , the metatarsals were still severely planterflexed. Here another modification was performed. Thumbs of both hands were placed under the heads of 1st and 5th metatarsals. Index fingers of both hands were placed dorsally over the talar head and dorsiflexion of metatarsals and ankle was performed. (Figure 3) Tenotomy was performed in all cases.

(Figure 4)

Post tenotomy dorsiflexion of 10 degrees was usually obtained. Post tenotomy cast was applied for 3 weeks. If ankle dorsiflexion of less than 5 degrees was obtained post tenotomy then cast was applied for 1 week only and a new cast was applied weekly with increasing dorsiflexion till 10 degrees of dorsiflexion was obtained. Following cast removal Dennis Brown splint was applied. (Figure 5) Feet were kept at 40 degree abduction on both normal and affected sides unlike standard Ponsetti technique, where feet are kept at 70 degree abduction on affected side and 40 degree abduction on normal side.

Brace was applied for 23 hours for first 3 months. Following initial 3 months in brace, weaning from brace was done with 2 hours of bracing time reduced every month until night time bracing (12 hours) was started and was advised to be kept for 3-4 years.

Results:-

The average age of the patients at the start of treatment was 3 months (range, 1-5 months). All the twenty patients had unilateral clubfoot. The mean number of casts that were applied to obtain correction was 8 (range four to nine casts). Percutaneous tendo Achilles tenotomy to correct the residual equinus deformity was done in all patients. The average follow-up was for 1 and half years (range 1 to 3 years). Finally, all feet were corrected (figure 5) with mean ankle dorsiflexion of 15° (range, 10°–20°).

Discussion:-

Orthopaedicians have been treating clubfoot successfully using Ponseti technique (Chotel et al., 2002; Colburn and Williams, 2003). However there is a small group of clubfoot which does not correct or shows resistance to correction by standard Ponseti method. These feet are short and stubby. The hindfoot is in severe equinus and varus. The calf muscles are small and the tendo achilles is long, wide, and tight. The forefoot is adducted and all metatarsals are in severe plantar flexion. There is a deep crease across the sole of the foot and another above the heel. The great toe is short and in dorsiflexion. Applying casts by standard Ponseti methods leads to complex deformities in these cases. There develops hyperabduction of forefoot at tarso-metatarsal joint but cavus and equinus do not get corrected. There occurs slippage of cast causing sores over bony prominences and edema of the foot. This type of clubfoot is difficult to treat and requires modified Ponseti technique. Adduction of forefeet should not be corrected beyond 40 degrees to prevent hyperabduction at tarso-metatarsal joint. Adduction should be corrected by keeping thumb on lateral aspect of talar head and index finger of same hand behind lateral malleolus. This also corrects heel varus. Once the heel varus is corrected, the planter-flexed forefoot and the equinus are corrected simultaneously by forcefully dorsiflexing the metatarsals with both thumbs while keeping index fingers of both thumbs on dorsal aspect of talar head. The cast is strengthened by applying a posterior slab behind the ankle. To prevent the cast from slipping, knee is immobilized at 110 degrees of flexion and it is strengthened with a slab applied anteriorly over the knee. A tenotomy is performed before applying the last plaster cast to facilitate correction of any unyielding equinus.

Thus our study shows that an orthopaedic surgeon needs to be careful enough to identify an atypical clubfoot. There is need of modified Ponseti technique in case of atypical clubfeet. This modification corrects the deformity thus decreasing the need for surgery in most children. Once an atypical clubfoot is treated adequately, the foot develops normally.

Abstract

The growing impact of the Internet in all walks of human life has also introduced us to newer problems related to security and hence the increasing demands to address such threats that prevail. The Future Internet (FI) being a confluence of various technologies, and the cloud being one such component technology in the FI that provides storage as a prominent service amongst the other services offered by it, it follows that the public cloud cannot be trusted at all times and therefore cannot be completely relied upon to regulate access to the stored sensitive data that it contains. This creates an avenue for collusion attack by the cloud and a malicious user. This has been addressed in our proposed system by the separation of access policy and access structure. Further considering the insecure communications and the vulnerability of the transmitted data, a mutual identity establishment scheme has been proposed to secure the channel and therefore the contents in transit. A recurrence relation for the established scheme has been derived to calculate its time complexity and the time taken to achieve mutual authentication has been administered for repeated iterations and the values thus obtained have been plotted and verified under the normal distribution bell curve to suggest the model's consistency and adaptability.

Introduction:-

Internet has become an essential technology that impacts billions of people in every aspect of our lives today. Internet of today has billions of connected devices which are still predicted to evolve/increase over the years to come. It is facing multidimensional challenges ranging from attacks to performance issues, while at the same time should never cease upon its responsibility of maintaining organizations' and personal integrity and privacy. Hence there are ever increasing research activities in progress on having the Future Internet (FI) to address its current shortcomings. The future Internet being a confluence of devices, technologies and areas, and access management being one such area of concern in association with its component technology the FI, an attempt has been made in this paper to address a few security issues namely, collusion attack, replay attack resistance, mutual authentication establishment and content integrity.

Motivation:-

The evolution of Internet and its advancements that press towards the establishment of a futuristic era that involves a confluence of various devices/things intermittently connected online to exchange data/information and provide

Corresponding Author:- Nancy Ambritta P.

services, has led to the growth of demands in terms of security, privacy and trust which are the basic elements that need to be satisfied from an end user's point of view. The lack of a proper authentication mechanism and secured ways of exchanging data makes it easier for an intruder to steal/sniff data illegally thereby affecting the security and privacy of the users. Also, considering the usage of a public cloud, the cloud cannot be trusted all the time, and hence is capable of exposing sensitive data maliciously (collusion attack). This necessitates us to develop suitable architectures and algorithms that helps address the security, authentication (for secure channel establishment) and content integrity issues that occur in a communication between participating entities.

Related work and evaluation:-

Table 1:- Related work and Evaluation

Paper No	Mutual Authentication	Content Integrity	Forward Secrecy maintenance	Trust
[4]	No-one way	Not addressed	Not addressed	One way (server is assured trust on the requesting device)

[10]	No-one way	Yes , OAuth	Not addressed	Pre-requisite for authentication

The need to regulate access to critical and sensitive information has led to the proposal of numerous access control schemes like the Dynamic broadcast encryption technique [1], role based access control (RBAC) [2] and Attribute based encryption (ABE) [3] which have addressed the issues such as scalability and anonymity. However, the assumption that the cloud is honest (trusted) but curious, does not hold good at all times since the cloud, controlled by the cloud service provider (CSP) may not belong within the trusted domain of the involved association/group thereby providing greater avenue for the cloud to expose the access policy (rules that regulate access to the sensitive data and provides protection) to malicious attackers and collude with them posing threat to the stored sensitive data.

Even though SLAs address this as a legal issue, preventing such attacks by providing technical solutions makes the system resilient and more reliable. Also, several schemes have been introduced to address the security issues that prevail in the various areas that make up the Future Internet. A few solutions include the challenge-response protocol coupled with a novel two factor authentication protocol [4], Kurento and Nubomedia [5], a Shared Authority based Privacy Preserving Authentication protocol (SAPA) to address the privacy issues using the Attribute based Access Control (ABAC) and proxy re-encryption scheme [6], a HTTP/CoAP (Constrained Application Protocol) service based architecture to provide an authorization framework [7], an aggregated proof based Hierarchical Authorization scheme in U2IoT [8], a novel privacy preserving authenticated Access Control scheme [9] and an optimization work on the OAuth 2.0 protocol [10] to solve the associated performance challenges while still ensuring privacy of user sensitive credentials.

However in all such cases the necessity to establish a trusted communication channel via mutual authentication and ensuring the integrity of the user sensitive data that is exchanged between devices has not been considered. Also, forward secrecy, a phenomenon wherein an attacker should be incapable of tracing back to the data transmitted previously with the information that he has managed to fetch at that instance is not considered in most cases. Table 1

summarizes the above discussions and provides a comparative analysis of a few security issues discussed in this section.

Proposed Architecture:-

Fig 1 shows the proposed architecture [11] that addresses the security issues such as maintaining user privacy (by providing a user controlled environment) and collusion attack caused due to the exposure of access policy that contains the sensitive user information to the cloud. The sequence of steps that occur in the system are labeled [1-10] in the figure below. As shown in fig 1. The system consists of three entities namely the Attribute Authority ((AA) owner of the data), the public cloud that provides services in terms of storage and processing power, and the users/devices with their sensors. The communication between the entities follows a model wherein the access policy lies with the sole owner AA and the AAs within the trusted domain of the owner.

The AA requires that the cloud and the devices register themselves initially depicted as channel 1 in fig 1. The AA provides certificates to the entities upon registration, which is to be used later to prove their identities to establish trust amongst the participating entities. The AA uploads the encrypted data and documents along with the access structure to the public cloud. The cloud only possesses the access structure (contains key and ID of values in the access policy) that facilitates it to map the user/device attribute values by matching the associated IDs of attributes. The cloud is therefore left unclear about the actual attribute values that facilitate access to the data. Its job is therefore limited to storing the data and collecting the required attributes, and forwarding it to the appropriate AA which ultimately makes the decision about allowing/denying access after comparison with the respective access policy. The cloud is thereby prevented from participating and executing a collusion attack.

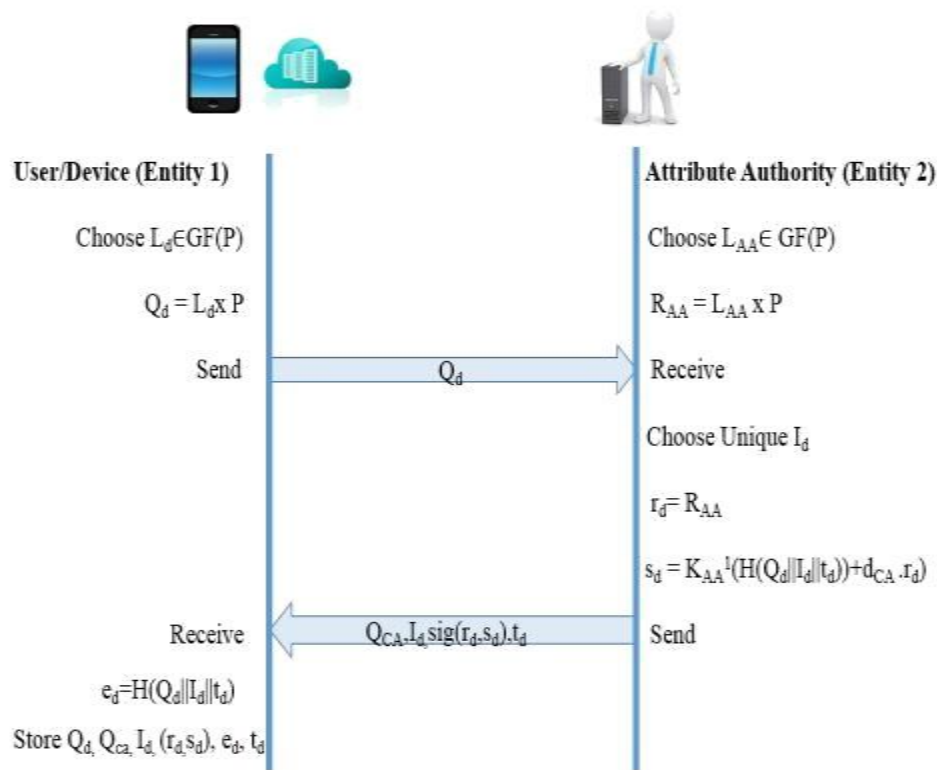

Fig 1:- Proposed Architecture

Algorithmic Details:-**Fig2:-** Certificate Distribution.

The communication between the entities namely the AA, user/device and cloud are classified into three parts namely,

1. AA (server) \rightarrow User/device/cloud (client) [user/devices register with the AA and obtain keys] represented as channel 1a and 1b in fig 2.
2. Cloud (server) \leftrightarrow user/device (client) [user/devices request access to data on the cloud] represented as channel 2 in fig 2.
3. AA (server) \leftrightarrow Cloud (client) [cloud sends the collected and mapped data for verification to the AA] represented as channel 3 in fig 2 [12][13].

In all the above cases the proposed mutual identity establishment scheme is executed in order to ensure the establishment of a secure communication channel and integrity of transmitted message. This scheme adopts the ECCDH (Elliptical curve diffie Hellman) mechanism for the establishment of a shared secret key (Q_{sk}) between the participating entities shown in fig 2. The execution of the scheme is threefold. First, as mentioned earlier, the AA issues certificates to the devices and cloud shown in fig 2. This certificate consists of a unique temporary ID (I_d) chosen by the AA for the cloud/device which in turn performs a hash on the chosen Identity and the certificate expiration time, signs it and passes it over to the cloud/device which is then utilized for authentication.

Fig 3:- Mutual authentication

Further, in order to ensure the establishment of a secure channel for exchange of data, mutual authentication has been implemented via exchange of the participating entities' certificates and a random number g that is appended to the certificate and encrypted with the shared secret key obtained via ECCDH to maintain the freshness of the exchanged information. The certificates are then verified on either side following the ECCDSA's (Elliptical curve Cryptography Digital Signature Algorithm) verification mechanism. This establishment of mutual authentication provides a secured communication channel to ensure trust, and prevents the privacy theft/tampering of the exchanged information (user attributes/requests and request approval from AA).

Fig 4:- Content Integrity

Also, the integrity of the transmitted message is achieved by computing a HMAC of the encrypted message (ME, encrypted by using the shared secret key (Qsk)) and the attribute structure is flushed off from the cloud by using the session management techniques, transported to the other side where the encrypted value of timestamp is decrypted and verified against a predefined threshold time (TH) thereby enabling the detection of replay attack. A session key Ksk is generated by adding the random number g with the shared secret key to help maintain sessions by which we can ensure that the mapped attributes are not retained at the cloud after transfer to the AA. This shared secret key is used to compute the HMAC of the encrypted message ME.

The computed HMAC, encrypted time-stamp (using shared secret key (Qsk)) and encrypted message (ME) are transmitted to receiver (Entity2) and any attacks/tampering of data is identified by verifying the received HMAC against the recomputed HMAC' on the receiver (Entity2) side. If any discrepancy is detected the received content is discarded, otherwise accepted for further processing. Fig 3 shows the mutual authentication establishment scheme for the communication between a device and the cloud and fig 4 shows the content integrity maintenance scheme in the communication between a device and the cloud.

A similar scheme that follows the same sequence of operations is defined for the communication between the cloud (client) and the AA (server) to achieve mutual authentication and content integrity.

Time Complexity Analysis and Performance Evaluation of the System:-

A recurrence relation for the proposed mutual identity establishment scheme presented in the previous section is given below as

$T(n) = aT(n/a) + 3n$ Where, n represents the number of requests that are incident at the cloud/AA/server via any device/user (client).

a, represents the number of domain attribute authorities(AA) which in the proposed system amounts to three AAs . Here the requests that arrive at the cloud are assigned to the appropriate attribute authorities which is given by n/a or $n/3$ and is handled by each of the AAs individually at each domain, therefore multiplied by the total number of attribute authorities i.e., $aT(n/a)$ or $3T(n/3)$.

$3n$, is a summation of the time required to distribute certificates for n entities that register with the AA (n units of time), time required to establish mutual authentication for n entities/devices and their associated requests (n units of time) Upon solving the recurrence relation by master's theorem to obtain the running time complexity we get,

Iteration frequency	2	1	2	3	4	1	1	2	1	1	1	2	2	1	2	1	1	1	1
MA in ms	4	4	4	4	4	4	4	4	4	4	4	4	4	4	4	4	4	4	4
	1	2	5	7	4	2	6	5	3	5	4	2	4	4	3	3	3	6	8
	0	2	0	0	0	3	7	5	4	0	7	0	5	2	0	2	3	0	3

Table 2:- Mutual Authentication (MA) Time Dataset in Milliseconds.

$T(n) = O(n \log n)$ [since $=n$ and $f(n) = 3n \approx n$ upon ignoring the constant term associated with n] and time required for integrity check of the transmitted contents (n units of time).

Fig 4:- Content Integrity

Further, the implementation of the proposed algorithm in the system has been verified against 30 iterations and the amount of time taken to mutually authenticate the devices was noted. For the data given in table 2 we calculate the average to be 443.1667ms and standard Deviation 18.41753. In statistics, the so-called 68–95–99.7 rule indicates the percentage of values that lie within a band around the mean in a normal distribution with a width of one, two and three standard deviations, respectively. With our data set of 30 samples we find that all the values fall within the width of three standard deviations i.e. 99.73% as depicted in the bell curve in fig 5, which suggests that the proposed model is predictable with no outliers and ideal for use.

Conclusion and Future Work

This paper has established the need for Future Internet to address privacy and integrity of exchanges/transmitted data that will determine its successful adoption universally. It has provided an insight into the proposed system and its resistance to collusion attack. Also, the reader has been introduced to the mutual identity establishment scheme that ensures secure transfer of data through the establishment of a secure channel via mutual authentication establishment and assurance of content integrity. We have successfully derived a recurrence relation for the proposed scheme and calculated the running time complexity for the same. Also, a plot (normal distribution bell curve) of the different times taken for mutual authentication for numerous iterations has revealed the system's consistency in performance and its adaptability. In future we propose to extend the scheme to implement the auto-delegation mechanism along with the interoperability of the devised protocol with the existing ones.

Abstract

Biological control has been found efficient eco-friendly approach for the management of several fungal diseases caused by pathogenic fungi. Therefore, present study was carried out to evaluate the *in vitro* efficacy of some *Trichoderma* isolates against the pathogenic fungi, *Alternaria alternata* (Fr.) Keissl, *Penicillium* sp and *Aspergillus niger* Van Tiegh known to infect tomato fruits in Kashmir. It was observed from the results that all the *Trichoderma* isolates brought about significant inhibition in the mycelial growth. The inhibition in mycelial growth of *Alternaria alternata*, by PPT3 isolate of *Trichoderma* was 26.79%, followed by isolate PPT1 (19.47%) and isolate PPT2 (14.64%) of *Trichoderma* respectively. Likewise, the highest inhibition in mycelial growth of *Penicillium* sp. was shown by isolate PPT3 (34.36%) followed by isolate PPT2 (23.44%) and by isolate PPT1 (9.37%) respectively. In case of *Aspergillus niger*, the inhibition in mycelial growth was highest by isolate PPT3 (42.5%) followed by isolate PPT1 (36.67%) and by isolate PPT2 (31.67) respectively. The results indicate that different local isolates of *Trichoderma* proved effective against the tested pathogenic fungi and can be evaluated further for their antifungal activity against other fungi.

Introduction:-

Tomato (*Lycopersicon esculentum* Mill.) is a member of the family Solanaceae which comprises short-lived perennial herbaceous plants. It is one of the most popular vegetable crops widely grown for its edible fruits, high nutritive values and also for its diversified uses (Afroz *et al.*, 2008; Ewulo *et al.*, 2008). They are important source of vitamins and important cash crop for both small holders and medium scale commercial farmers (Ana *et al.*, 2003). The fruit also contains plenty of antioxidant carotenoid lycopene that has recently attracted interest because of its role in preventing cancer heart disease and muscular degeneration (Wener, 2008). Several pathogenic fungi are known to cause damage to tomato especially under storage conditions and also on the aerial parts of the plants. The main postharvest disease of tomato caused by various pathogenic fungi are *Rhizopus stolonifer* (Stevens *et al.*, 1997; Schena *et al.*, 1999), *Botrytis cinerea* (Lee *et al.*, 2006) and *Alternaria alternata* (Feng and Zheng, 2007). *A. alternata* is a saprophytic pathogen of tomato causing postharvest black rot at high frequency (Akhtar *et al.* 1994). Harvested fruits and vegetables decay due to fungal infestation is the main cause of major losses in food production. Postharvest decay of fruits and vegetables can be traced to infections, occur either between flowering and fruit maturity or during harvesting and subsequent handling and storage (Eckert and Ogawa 1988). The loss resulting

Address:- Section of Mycology and Plant Pathology, Department of Botany, University of Kashmir, Hazratbal, Srinagar, Kashmir.

from these infections have been reduced primarily by applying fungicides in the field or after harvest (Eckert and Ogawa 1988).

Trichoderma spp. is the most widely studied biocontrol agents (BCAs) against plant pathogens because of their ability to reduce the population of soil borne plant pathogens (Papavizas, 1985). They are soil borne fungi and show significant activity against a wide range of plant pathogenic fungi (Elad *et al.*, 1982). Mechanism used by *Trichoderma* spp. for control of plant pathogen includes competition, mycoparasitism, antibiosis and induced resistance of the plant host (Chet, 1987; Schirmböck *et al.*, 1994).

Trichoderma is one of the common fungal biocontrol agent is being used worldwide for suitable management of various foliar and soil borne plant pathogens. (Dominguesa *et al.*, 2000). Therefore, the objective of the present investigation was to assess the efficacy of local isolates of *Trichoderma* under in vitro condition against some fungal pathogens isolated from tomato fruits.

Materials and Methods:-

Tomato (*Lycopersicon esculentum* Mill.) fruits were obtained from different vegetable local markets of Kashmir Valley. Samples of infected fruits were brought to the laboratory in clean polythene bags and these samples were either used immediately or stored at 10°C in the laboratory for different pathological studies. Small portions of rotted tissues were isolated aseptically from the diseased tomato fruits and transferred to Potato Dextrose Agar (PDA) medium. Pure colony cultures were obtained by sub-culturing the isolated fungi such as *Alternaria alternata* (Fr.) Keissl., *Penicillium* sp and *Aspergillus niger* Van Tiegh, in separate Petri plates containing the same medium. The pathogen was identified by their morphological, reproductive and cultural characteristics (Ellis, 1971; Barnett and Hunter, 1972; Watanabe, 2002; Gilman, 2008). For pathogenicity, pathogens were re-inoculated after isolation onto the healthy pear fruits (Tomkin and Trout, 1931). Then all the fruits were kept in clean polythene bags and incubated at 25±2°C for ten days. These pathogenicity tests were used for the identification of plant pathogens and to confirm the detection of a particular disease. Identification of the disease and the pathogen was done following Koch's postulates.

Isolates of *Trichoderma* were isolated from rhizospheric soil of the tomato plant following serial dilution method (Brown 2004). These isolates were identified on the basis of morphological and cultural characteristics and named as PPT1, PPT2 and PPT3. The antimycotic effect of these pure local isolates of *Trichoderma* against isolated fungi such as *Alternaria alternata* (Fr.) Keissl., *Penicillium* sp and *Aspergillus niger* Van Tiegh was assessed by dual culture method (Bashar and Rai 1994, Prince *et al.* 2011). To assess the effect of *Trichoderma* isolates against fungi, known quantity of mycelia of both was inoculated onto petriplates containing PDA. Then the inhibition in mycelial growth of fungi such as *Alternaria alternata* (Fr.) Keissl., *Penicillium* sp and *Aspergillus niger* Van Tiegh by isolates of *Trichoderma* was observed after incubation. The percent inhibition in mycelial growth of tested fungal pathogens in presence of *Trichoderma* isolates was calculated as per the formula given by Skidmore and Dickinson 1976.

$$\text{Mycelial growth inhibition (\%)} = \frac{dc - dt}{dc} \times 100$$

Where dc = average diameter of fungal colony in control, and dt= average diameter of fungal colony in treatment group.

Results:-

It was observed from the results (Table 1) that isolate PPT-3 of *Trichoderma* inhibited the mycelial growth of *Alternaria alternata* to an extent of 26.79 per cent. This was followed by *Trichoderma* isolates PPT-1 (19.47%) and PPT-2 (14.64%) respectively. Likewise, growth inhibition of *Penicillium* sp by *Trichoderma* isolates PPT-1 was 9.37%, by PPT-2 was 23.44% and by PPT-3 was 34.36% respectively and inhibition in mycelial growth of *Aspergillus niger* due to *Trichoderma* isolates, PPT1, PPT2 and PPT3 were 36.67%, 31.67% and 42.5% respectively.

The maximum growth inhibition of *Alternaria alternata* and *Aspergillus niger* was due to *Trichoderma* isolate, PPT3 followed by isolate PPT1 and isolate PPT2 respectively. Whereas, isolate PPT3 caused maximum growth inhibition of *Penicillium* sp. However, the least inhibition in mycelial growth of pathogenic fungi was observed by *Trichoderma* isolate, PPT1.

Table 1:- Effect of *Trichoderma* isolates on the mycelial growth of fungi causing rot disease of tomato by dual culture plate method

Treatment	Mycelial growth (mm)		
	<i>Alternaria alternata</i>	<i>Penicillium sp</i>	<i>Aspergillus niger</i>
PPT1	11.00±1.00 (19.47%)	19.33±1.15 (9.37%)	25.33±1.52 (36.67%)
PPT2	11.66±1.52 (14.64%)	16.33±1.52 (23.44%)	27.33±2.08 (31.67%)
PPT3	10.00±1.00 (26.79%)	14.00±1.00 (34.36%)	23.00± 2.00 (42.5%)
Control	13.66 ± 1.52	21.33± 1.52	40.00±1.00

Each value is mean of 3 replicates ± SD

Figures in parenthesis is the mycelial growth inhibition (%)

Discussion:-

It is clear from the above results that different local isolates of *Trichoderma* caused significant inhibition in mycelial growth of *Alternaria alternata* (Fr.) Keissl., *Penicillium* sps and *Aspergillus niger* van Tiegh.

In a similar studies, the antagonistic activities of *Trichoderma harzianum* against several pathogenic fungi have been reported by many workers (Henis and Chet, (1975); Backman and Rodrigues-Kabana, 1974; Hadar *et al.*, 1979 and Elad *et al.*, 1980). Kakde and Chavan (2011) studied the antagonistic activity of *Trichoderma viride* and *Trichoderma harzianum* against storage fungi and found that growth of *Curvularia lunata*, *Rhizopus stolonifer*, *Fusarium oxysporum*, *Macrophomina phaseolina* and *Penicillium chrysogenum* was retarded due to *Trichoderma* species. Dharmaputra *et al.* (1994) also tested two isolates of *T. harzianum* and one isolates of *T. viride* against *Ganoderma* and found that all isolates inhibited the mycelial growth of the pathogen, but *T. harzianum* (isolates B 10-1) showed the best performance. Etabarrian (2006) reported that *T. viridi* (MO) reduced the colony area of *Macrophomina phaseoli* by 19.2 and 34.9% using the dual culture and cellophane methods, respectively. Intana *et al.* (2007) reported the efficacy of three mutant and two wild type strains of *T. harzianum* against *Colletotrichum capsicis*, causal agent of anthracnose of chili. The present study suggests that *Trichoderma* sp. effectively inhibits the growth of fungi causing rot of tomato, hence can be used as a biocontrol agent against rot diseases of vegetables. Bashar and Rai (1994) studied the three isolates of *Trichoderma* viz., *Trichoderma harzianum* Refai, *Trichoderma hamatum* and *T. viride* Pers. were selected to test their antagonistic potential against the pathogens following dual culture technique. However, further investigation is needed for the efficacy of these local isolates of *Trichoderma* against fungal pathogens.

Abstract

A new taxaon, *Phyllanthus vasukii* sp. nov., is described from the Southern Eastern Ghats. A detailed description, Phenology, Anatomical Characters, Micromorphology of seeds, Distribution and Ecology notes and IUCN status are provided for easy identification.

Key words:-

Phyllanthus vasukii, New species,
Namakkal, Southern Eastern Ghats.

Introduction:-

Phyllanthaceae is the second largest segregate of Euphorbiaceae *sensu lato*, comprising c. 2000 species in 49 genera. Phyllanthaceae includes two subfamilies, Phyllanthoideae and Antidesmatoideae. Phyllanthoideae consists of four tribes and *Phyllanthus* belongs to the tribe Phyllanthae. Members of Phyllanthaceae are pantropical and include trees, shrubs, phyllocladous taxa, semi – succulents, annual herbs, and even a free floating species. The recent classification of angiosperms recognises five lineages of *Euphorbiaceae sensulato* at family rank: *Euphorbiaceae sensu stricto*, *Pandaceae* Engl. & Gilg, *Phyllanthaceae* Martynov, *Picrodendraceae* Small and *Putranjivaceae* (APG III, 2009).

Most Phyllanthaceae, are uniform with pinnate venation, entire margins and simple indumentums. Flowers are small and actinomorphic but display great diversity in shape, size and number of floral organs (Hoffmann *et al.*, 2006; Kathriarachchi *et al.*, 2006). The genus *Phyllanthus* L. was first described by Linnaeus in 1753 and consists of ca.833 species (Govaerts *et al.*, 2000) in the world and is chiefly distributed in moist humid tropics. In India, it is represented by ca. 40 species (Henry & Santapau, 1973), although Hooker f. (1887) has recorded 56 species from the then British India. In total, 12 species of herbaceous *Phyllanthus* have been identified in India.

Webster (1955, 1956a, b, 1957, 1958, 1967, 1970 and 1994; Webster and AiryShaw, 1971) has worked exhaustively on *Phyllanthus* and has provided detailed taxonomy. In course of botanical exploration of local region of Southern Eastern Ghats some exciting specimens of *Phyllanthus* were collected. After critical examination and perusal of literature, these specimens were determined as belong to a distinct new taxon of the genus *Phyllanthus*, which is being described here.

Materials and Method:-

The plant specimens for collected from various parts of South India and the variations among these two plants were studied using fresh materials as well as herbarium specimens. The morphological and anatomical characters were recorded by examining several specimens of each species with the help of stereomicroscope and inverted phase-contrast microscope, respectively. Details about the distribution, habitat, local name and uses were taken from literature, herbarium data bank and field studies. Anatomical studies were conducted by hand sectioning and stained with safranin stain and glycerine.

Morphological study:-

The morphological characteristics of the specimens described herein as *Phyllanthus vasugii* sp.nov. were compared with those of the allied species, *P. urinaria* L.

Table.1:- The difference between of *Phyllanthus vasukii* sp. nov. and *Phyllanthus urinaria*.

Attributes	<i>Phyllanthus vasukii</i> sp. nov.	<i>Phyllanthus urinaria</i> L.
Habitat	Shrub	Herb
Leaf size and shape	5-20m long, 2-7mm broad, linear to oblong, When touched, the leaves not fold.	6-15m long, 3-15mm, broad oblong, When touched, the leaves fold in automatically.
Leaf apex	Mucronate	Mucronate
Stem colour and form	Dark green, round, not smooth, Branches and branchlets are stout and erect, tetra gon, very rarely branched, glabrous and woody at base.	Reddish-green, not round, smooth, Branches and branchlets are mostly weak and drooping, pentagonal, branched, glabrous and woody at base.
Fruit and flower colour	Greenish fruits and whitish green tepals. 6-capillary fruit. 6 dehiscent cocci each fruit.	Reddish fruits and reddish green tepals. 3-carpellary fruit. 3 dehiscent cocci each fruit.
Number of tepals	Hexatepalous (6)	Hexatepalous (6)
Nature of stipules	Greenish and closely attached	Reddish and laterally free
Plant height	Up to 150 cm high	Up to 60 cm high

Micromorphology study:-

Table.2:- Difference between anatomical Characters of the *Phyllanthus urinaria* and *Phyllanthus vasukii* species (Fig.2.).

Part of the plant species	Characters	<i>Phyllanthus urinaria</i>	<i>Phyllanthus vasukii</i>
LEAF	Number of palisade parenchyma in the mesophyll.	2 layer thick	1 layer thick
	Nature of intercellular spaces	Large	Small
	Nature of xylem cells within the mid rib	Clustered cells 2 layers thick	Clustered cells 3 layers thick
STEM	Epidermal circumference	Regular angular	Irregular angular
	Ridges and Furrows	Present	Present
	Hypodermis (Collenchyma)	Rectangular 2-5 layers thick on ridges 1-2 layers thick on furrows	Rectangular 2-4 layers thick on ridges 2 layers thick on furrows
	Oil ducts	Absent	Present
	Cortex (Parenchyma)	Oval & Polygonal 2-5 layers thick	Polygonal 1-9 layers thick
	Pericycle (Sclerenchyma)	2-4 layers thick	3 layers thick

ROOT	Xylem	2-5 elongated cells	2-8 elongated cells
	Phloem	3-5 elongated cells	2-8 elongated cells
	Ground tissue	Small	Very large
	Cork cells	8-11 cell thick	2-7 cell thick
	Cortex	2-4 cell thick	6-9 cell thick
	Xylem	11-43µm	8-25 µm
	Phloem	4-8 cell thick	8-11 cell thick

To distinguish *Phyllanthus vasukii* and *Phyllanthus urinaria* between lateral, dorsal and ventral ornamentation of the seed surfaces was analyzed by microscopy. Three types of surface ornamentation patterns were presented in the Table-3.

Table.3:- Micromorphology of seeds of features between of *Phyllanthus vasukii* and *Phyllanthus urinaria*.

Taxa Seed ornamentation <i>Phyllanthus L.</i>	Seed ornamentation		
	Dorsal	lateral	Ventral
<i>Phyllanthus vasukii</i>	Transversal ribs, aligned on a irregular microverrucose on ribs, with valleys	Stellate verrucose regular concentric C-shape alignment, with crusts	Regular or irregular concentric C-shape ribs, regular longitudinal finger-shape rodlets
<i>Phyllanthus urinaria.</i>	Transversal ribs, microverrucose on ribs, crusts on valleys	Asymmetrical longitudinal ribs valleys, microverrucose on ribs, crusts on valleys	Asymmetrical longitudinal ribs, microverrucose on ribs sometimes branched ribs, crusts on valleys

***Phyllanthus vasukii* parthipan et al., sp. nov.**

Shrub woody, erect, up to 150 cm high. Leaf sessile, bipinnate, opposite, entire, leaf let linear to oblong, pale green, 5-20 x 2-7 m, mucronate apex, the base slightly oblique, unequal; stipules linear, very finely puberulous on lower sides leaf margin; lateral veins in 3–5 pairs; reticulation inconspicuous on both sides. Stem green, suffrutescent, sticky angled, rarely branched, glabrous herb, 50-120 cm high, Stem diameter 2.0 – 2.9 mm. Rarely branchlets up to 35 cm long, with up to 50 leaves, Flowers, mostly bisexual fascicles, 6 petals, very small, 6-merous, axillary, ca. 1 mm in diameter. Higher leaf axils bear only solitary male flowers no paired, with female flowers in the lower axils zig- zag arrangement, single or sometimes paired. Male flowers : Pedicels 0.2–0.5 mm long; sepals 6, ovate or elliptic, 0.2–0.5 by 0.5–0.3 mm, white transparent green middle strip; disc glands 6, star-shaped or orbicular; stamens 3, staminal column 0.1–0.2 mm long, anthers 0.1–0.2 mm long. Female flowers : pedicels 1.0 – 1.5 mm long; sepals 6, obovate-oblong or lanceolate, 0.5–0.9 by 0.3–0.6 mm, glabrous, apex acute with broad red pinkish scarious margin with greenish sepals in the middle; disc glands 6; ovary covered with scurfy-tuberculate ; styles 0.2–0.9 mm long; stigma c. 0.5 mm long. Fruit green, pedicel 1.0–1.5 mm long, 0.5–1.5 mm diam, capsular, depressed globose, densely verrucous, cocci 3 , not spiny. Seeds are transversely ribbed on the back, and sides. Seed 2 in each cocci, 0.8–1.9 by c. 1 mm wide, 2-angled, curved on dorsal side, smooth sand in colour. (**Fig.1.**)

Flr. & Fr.: Throughout the year.

Etymology: The new species is named in honour of **DR.A.VASUKI**, Secretary, Kongunadu Arts & Sciences College, Coimbatore for her significant contribution in the field of Science.

Distribution: Endemic to Tamil Nadu part of South India.

Habitat and ecology: Growing along the cultivated land, especially wetland field, in moist grassy wetland. Namakal District (11°14'N 78°10'E / 11.23°N 78.17°E), Tamil Nadu, India.

Conservation measures:

The significance of field research is the detection of novel additions to a floristic region, which subsequently improve our understanding of plant biogeography, species diversity. This species is extremely very rare and known only from type locality with limited population density. This should be included in the Red Data Book of Indian plants. The known localities have already covered by Eastern Ghats. However, the new plant should be propagated by using biotechnology method and also to conserve under *ex-situ* conditions.

Conclusion:-

In present study, we observed that *Phyllanthus urinaria* differ from *Phyllanthus vasukii* and by their height, and leaves numbers, stem, When touched, the leaves not in fold in automatically, Six capillary fruit. 6 dehiscent cocci in each fruit. Anatomical studies also confirmed the new species *Phyllanthus vasukii* by Nature of intercellular spaces large in leaf, Epidermal circumference in regular angular stem and oil ducts present in stem. Entirely different of number of root arrangement cells, *etc.* Micromorphology of seeds of features very different between of *Phyllanthus vasukii* and *Phyllanthus urinaria*. By this, we confirmed that *Phyllanthus vasukii* can be treated as a new species due to the presence of variation in both morphological, Micromorphology of seeds and anatomical characteristic features.

Acknowledgement:

We extend our sincere thanks to Professor and Head, Dept. of Botany, Bharathiar University, Coimbatore.

learning style preference, participating, reflecting, searching, experimenting, intelligent learning systems, genetic algorithm approach, Factor Analysis

Abstract

The research thesis of this study is that matching students' learning style preferences with the complementary course syllabus and instruction improved academic achievement and student attitudes toward learning based on the research work of Kurt Lewin, David Kolb, John Dewey, Jean Piaget. The composition of this study method is both descriptive and exploratory. In the first part of the study, the qualitative research method was used to overview the literature background of the study. In the empirical part of the study, the factor analysis, using the Principle Axes Factoring method – PAF, was used to extract learning styles.

This study has four aspects. First, it outlines the literature review, summarizing learning styles taxonomy. Then it covers research framework and methodology, including data collection, sample characteristics, variables description and data analysis and tests the learning styles theories using factor analysis. Finally, it discusses the results by recognizing some limitations and by providing pedagogical implications and further research.

This article explains the cyclical learning styles like participating, reflecting, structuring and experimenting, based on the combined research work of many notable researchers. The concept of learning styles is embedded in different academic literature and researched from different approaches, including intelligent learning systems (Laureano-Cruces et al., 2006), a genetic algorithm approach to students' learning styles (Yannibelli et al., 2006), a web-based education perspective on learning styles (Garcia et al., 2007), learning about and through aesthetic experience (Welsh et al., 2007), use of business case studies in the learning process (Duff et al., 2008), problem-solving strategies within learning styles (Metallidou & Platsidou, 2008), preferred learning styles (Peters et al., 2008) and an adaptive learning system perspective of learning styles (Tseng et al., 2008).

Introduction:-

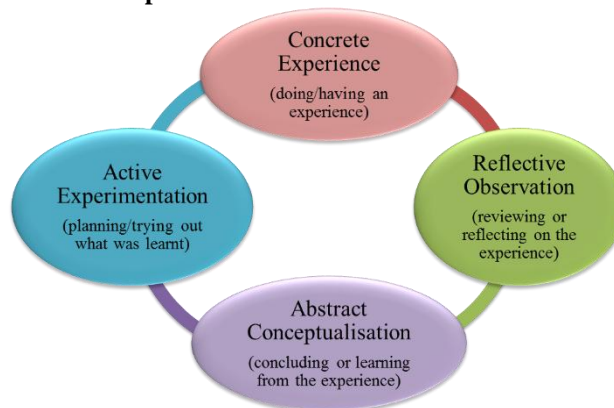

David Kolb.

Born 1939, he is an American educational theorist. He is the founder-chairman of Experience Based Learning Systems, Inc. (EBLS) whose interests and publications focus on:

- experiential learning,
- the individual and social change, career development
- executive and professional education

David Kolb (1984) said that (deeper) learning runs through a cycle of **concrete experience, reflective observation, abstract conceptualization** and **active experimentation**.

Applying lessons learned into future actions provides the basis for another cycle of learning.

Kolb's Learning Cycle:-

- The left side of the vertical arrow represents **doing tasks**, the right side **observing tasks**.
- The upper half represents **feeling** (being creative and emotional), the bottom (logical) **thinking**.

- People usually have their own preferences in one of the four learning styles: they are more **exploring**, **analyzing**, **decision-making** or **acting** types.

A well-balanced team consists of people with different learning styles.

Kurt Lewin

Kurt Lewin, whom many consider to be the **father of modern social psychology** and the **study of organisational behaviour**, developed a four-stage model of action-research.

This model has been adapted by many others, the most notable of whom is David Kolb. The cycle starts when an individual encounters a problem within the environment. Then,

1. **Reflect** on what they know about situations like this.
2. **Plan** how they intend to proceed.
3. **Act** out their plan.
4. **Observe** the results their actions bring.

Jean Piaget

Swiss biologist and psychologist **Jean Piaget (1896-1980)** is renowned for constructing a highly influential model of child development and learning.

The concept of **cognitive structure** is central to his theory. Cognitive structures are patterns of physical or mental action that underlie specific acts of **intelligence** and correspond to stages of child development. There are 4 **primary cognitive structures** (i.e., development stages) according to Piaget:

John Dewey

John Dewey (October 20, 1859 – June 1, 1952) was an American philosopher, psychologist and educational reformer whose ideas have been influential in education and social reform.

Dewey was an important early developer of the philosophy of pragmatism and one of the **founders of functional psychology**. He proposed that education be designed on the basis of a TOE - **theory of experience**.

Central Tenets Of Dewey's Theory:-

Dewey's theory of experience rested on two central tenets:-

Continuity refers to the notion that humans are sensitive to (or are affected by) experience.

Humans survive more by learning from experience after they are born than do many other animals who rely primarily on pre-wired instinct.

Interaction builds upon the notion of continuity and explains how past experience interacts with the present situation, to create one's present experience.

Cyclical Learning Styles:-

Learning Is Cyclical In Nature - Kurt Lewin, David Kolb, John Dewey, Jean Piaget:-

Learners are **actively involved** (participating) in some form of learning event. They **reflect** back on the activity - either alone or in consultation with others, to develop an understanding of what they've **experienced**. They understand based on their **Participation** and **Reflection**. This helps them develop a generalized set of theories or rules (**Structuring**) of how things should work.

They **experiment** the theories to assess their validity that may help identify the **most practical approach** to achieving the desired results. Now, learners **participate** in a new learning 'event', repeating the experiential learning cycle once again.

The learning styles literature has had a revival during the past years, especially in the first decade of the 21st century (Alban & Metcalfe 2002; Duff & Duffy, 2002; Dunn & Griggs, 2003; Loo, 2004). Since 2007 and 2008, there has been an increasing interest in the potential of experiential learning (Reynolds & Vince, 2007; Argyris, 2007; Welsh

et al., 2007; Hornyak et al., 2007; Herbert & Stenfors, 2007; Hyde, 2007; Kayes, 2007 and Armstrong & Mahmud, 2008).

The Learning Style Questionnaire (PRSE) has been proposed as an alternative for Kolb's Experiential Learning Style Model (ELM). The PRSE is designed to probe the relative strengths of four different learning styles: Participator, Reflector, Structure and Experimenter. The authors' intention is that learners should become proficient in all four stages of the learning cycle. The authors are keen to emphasize that 'no single style has an overwhelming advantage over any other. Each has strengths and weaknesses, but the strengths may be especially important in one situation, but not in another'. These four styles correspond approximately to those suggested by Kolb's (1999) Experiential Learning Model (ELM): active experimentation (Participator), reflective observation (Reflector), abstract conceptualization (Structure), and concrete experience (Experimenter).

Participators involve themselves fully and without bias in new experiences. They are open-minded, not skeptical, and this tends to make them enthusiastic about anything new. Their philosophy is "I'll try anything once". They tend to act first and consider the consequences afterwards. Their days are filled with action. They tackle problems by brainstorming. As soon as the excitement from one action has died down, they are busy looking for the next. They tend to thrive on the challenge of new experiences but are bored with implementation and longer term consolidation.

- Flexible
- Gets bored with consolidation
- Happy to give things a try
- Open-minded
- Optimistic about change
- Rushes into action without preparation
- Takes immediate obvious action
- Takes unnecessary risks

Reflectors like to stand back to ponder experiences and observe them from many different perspectives. They collect data, both first hand and from others, and prefer to think about it thoroughly before coming to any conclusion. The thorough collection and analysis of data about experiences and events is what counts so they tend to postpone reaching definitive conclusions for as long as possible. Their philosophy is to be cautious. They are thoughtful people who like to consider all possible angles and implications before making a move.

- Careful
- Good listener
- Holds back from participation
- Methodical
- Does not jump to conclusions
- Slow to decide
- Thorough and thoughtful

Structures adapt and integrate observations into complex but logically sound theories. They think problems through in a vertical, step-by-step logical way. They assimilate disparate facts into coherent theories. They tend to be perfectionists who won't rest easy until things are tidy and fit into a rational scheme. They like to analyze and synthesize. They are keen on basic assumptions, principles, theories models and systems thinking. Their philosophy poses rationality and logic. "If it's logical, it's good". Questions they frequently ask are: "Does it make sense?" "How does this fit with that?" "What are the basic assumptions?" They tend to be analytical.

- Disciplined
- Intolerant of subjective, intuitive ideas
- Logical
- Low tolerance of uncertainty, ambiguity
- Objective
- Parental in approach
- Rational

Experimenters are keen on trying out ideas, theories and techniques to see if they work in practice. They positively search out new ideas and take the first opportunity to experiment with applications. They are the sort of people who come back from learning experiences brimming with new ideas that they want to try out in practice. They like to get on with things and act quickly and confidently on ideas that attract them. They are essentially practical, down-to-earth people who like making practical decisions and solving problems.

- Business-like – gets to the point
- Does not like theory
- Impatient with waffle
- Keen to test things out in practice
- Practical, down to earth, realistic
- Rejects ideas without clear application
- Task and technique focused

Research Methodology:-

In this research, data were analyzed using the Statistical Package for the Social Sciences (SPSS 16.0). An alpha level of 0.05 was used as a margin of statistical significance (Coakes & Steed, 2003). The factor analysis using the Principle Axes Factoring method - PAF was used to extract learning approaches (Miller et al., 2002; Coakes & Steed, 2003). The essential purpose of factor analysis is to describe the variation among many variables in terms of a few underlying, but unobservable, random variables called factors. The underlying assumption of factor analysis is that there exists a number of unobserved latent variables (or "factors") that account for the correlations among observed variables, such that if the latent variables are partially out or held constant, the partial correlations among observed variables all become zero. In other words, the latent factors determine the values of the observed variables. One of the most frequently used techniques for factor extraction is the Principal Factor Method, where factors are extracted in such a way that each factor accounts for the maximum possible amount of the variance contained in the set of variables being factored (Miller et al., 2002).

Nature Of The Items:-

All the items in the questionnaire belong to the content domain which facilitate in assessing an individual's personality type. The 20 items in the questionnaire describe multiple situations in which an individual is most likely to respond in various environments through which his personality characteristics are displayed. The items are repetitive in a way so as to track the individual's response to a certain-stimuli which best predicts his personality type across situations. The items are standardized as they are the same for every respondent with respect to the content, form and order

Data Collection And Sample Characteristics:-

The study sample included 527 students chosen by random sampling. Students were anonymously interviewed using online questionnaires. This was to a certain level an exploratory research, setting a base for further research in this field.

Data Analysis – Factor Analysis:-

The applicability of factor analysis was tested using the Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO measure) and Bartlett's Test of Sphericity. The KMO measures the sampling adequacy which should be greater than 0.5 for a satisfactory factor analysis to proceed. The applicability criteria were the KMO measure being > 0.6 and χ^2 test statistically significant (Miller et al., 2002). Another indicator of the strength of the relationship among variables is Bartlett's test of sphericity. Bartlett's test of sphericity is used to test the null hypothesis that the variables in the population correlation matrix are uncorrelated. The observed significance level is .0000. It is small enough to reject the hypothesis. It is concluded that the strength of the relationship among variables is strong.

Kmo And Bartlett's Test:-

Measure of factor analysis applicability PRSE learning style theory:-

Kaiser-Meyer-Olkin measure of sampling adequacy	0.675
Approx. Chi- Square (Bartlett's test of sphericity)	259,572
Df - (Bartlett's test of sphericity)	78000
Sig. (Bartlett's test of sphericity)	0.000

Analyses And Findings:-

The factors extracted from the group of variables were labeled reflectors (best explaining four variables Vs3, Vs6, Vs11,17), Structure (best explaining five variables Vs10, Vs4, Vs1, Vs16, Vs18), Participators (best explaining four variables Vs5, Vs9, Vs19, Vs20), and pragmatists (best explaining five variables Vs7, Vs12, Vs13, Vs14, Vs15), confirming the applicability of PRSE Learning style questionnaire.

	Raw Factors					Rescaled Factors			
	1	2	3	4		Participator	Reflector	Structure	Experimenter
Vs3	.053	.766	-.078	-.227		.053	.773	-.079	-.229
Vs6	-.193	.621	.073	.060		-.200	.645	.076	.063
Vs11	.136	.694	.110	.126		.143	.732	.116	.133
Vs10	.242	.162	.510	.072		.260	.174	.548	.077
Vs4	.087	.029	.737	.299		.080	.027	.677	.274
Vs1	.271	.145	.306	.258		.346	-.185	.390	.329
Vs5	.816	-.067	.272	.069		.806	.066	.268	.068
Vs9	.673	.117	.029	.031		.632	.110	.027	.029
Vs7	.415	-.120	.200	.296		.430	-.124	.208	.307
Vs12	.102	-.180	.011	.592		.113	-.200	.012	.636
Vs13	.336	-.054	.185	.545		.394	-.063	.217	.640
Vs15	.020	.069	.218	.611		.022	.077	.245	.686
Vs14	-.012	.195	.131	.542		.014	.223	.149	.616
Vs19	.241	.127	.031	.214		.765	.114	.291	.331
Vs17	.132	.068	.263	.365		.047	.625	.034	.035
Vs20	.085	.172	.521	.431		.753	-.052	.231	.627
Vs18	.339	-.062	.035	.131		.357	.123	.612	.271
Vs16	.427	.165	.343	.071		.211	.043	.614	.072

This rule of thumb is cited in Schneider (2003). He indicated that factor loadings greater than 0.30 or less than -0.30 are considered significant, loadings greater than 0.40 or less than -0.40 are considered more important and loadings greater than 0.50 or less than -0.50 are considered very significant.

In order to assess the reliability of compound scales (the extracted factors) measuring applied learning styles concepts, the Cronbach Alpha Coefficient was calculated for the sample as a whole.

<u>Factors</u>	<u>Cronbach Alpha</u>
Participator	0.688
Reflector	0.743
Structure	0.630
Experimenter	0.744

Cronbach's Alpha measures how well a set of items (or variables) measures a single unidimensional latent construct. Cronbach's Alpha is not a statistical test, rather it is a coefficient of reliability (or consistency) the reliability coefficient α of 0.7 or higher is considered "acceptable" in most social science research situations (Coakes & Steed, 2003). As indicated, the results of factor analyses are close to satisfactory: Factors for the analysis have Cronbach Alpha values from 0.630 to 0.744. These results indicate that the extracted factors appropriately characterize the dimensionality of the data.

The aim of this study is to explore the widely used cyclical learning styles theory in Participator, Reflector, Structure, and Experimenter among the teenage student population. By analyzing the teenage student's learning approaches, typical patterns have been discovered. The research confirmed the results through qualitative meta-analysis and quantitative factor analysis. The study resulted in a clear extraction of four theoretically expected learning styles dimensions (factors – Participators, Reflectors, Structures, and Experimenters).

Recent thinking in this area suggests that unlike cognitive personality styles, learning styles can be modified to a degree through learning and training strategies. Instead of matching training to the styles of the learners, it could be

more rewarding to expose learners to a mismatched learning environment in order to help them develop a wider repertoire of coping behaviours and learning strategies. Those that can learn to use a variety of problem-solving and learning strategies, and apply them in situations that do not match with their natural learning style, may be more able to perform effectively across a wider range of situations than those who have limited stylistic versatility (Hayes & Allinson, 1996).

According to the research thesis of this study, we can summarize that matching students' learning-style preferences with the complementary course syllabus and instruction improved academic achievement and student attitudes toward learning. The mission of education is to create and disseminate knowledge to enable students' successful entry into the adult world. Teaching community need an awareness of the learning style preferences of students in order to develop and utilize effective and efficient teaching and pedagogical strategies and methods.

A significant number of researchers (Honey & Mumford, 1992; Armstrong & Mahmud, 2008) have argued that learning styles are not determined by inherited characteristics, but are developed through experience. Styles are therefore not necessarily fixed, but can change over time, even from one situation to the next. The implications regarding the learning strategies implementation in education suggest that students who are aware of a range of learning strategies are more likely to select the correct one for a particular task. The approach of the flexible learning style strategy is best suited to the case-study method of teaching. For the educators in educational institution, the challenge is to provide meta-cognitive support for students, enabling them to reflect not just on what they learn but also how and why.

The development of these new skills and knowledge requires a variety of teaching methods and learning strategies in order to match students' learning style preferences. Therefore, teachers/lecturers need an awareness of the learning style preferences of students in order to develop and utilize effective and efficient teaching and pedagogical strategies and methods. Recognizing students' learning styles allows educators to effectively lecture to a diverse population of students with different learning style preferences. Being an effective teacher implies matching individual learning style preferences among students with a collective course syllabus in teaching strategies.

Limitations:-

The most prominent deficiency of the research is that it does not recognize the dimension of time. Namely, the concept of this research is inherently static. Therefore, further analysis should focus on determining those developments - styles are not necessarily fixed, but can change over time. As well, from the methodological perspective of the research process, regarding the employment of the construct reliability, the average variance extracted and composite reliability index should be engaged too.

Conclusions:-

Researchers have pointed out that students learn effectively in a harmonic environment and by using teaching aids which match the students' learning style preferences (Li et al., 2008). The concept of the learning style has a broad meaning. In this research, it is proposed and defined as an individual's preferential focus on different types of information, the different ways of perceiving the information, and understanding the information (Li et al., 2008). The learning styles literature has had a revival during the past years, especially in the first decade of the 21st century (Alban & Metcalfe 2002; Duff & Duffy, 2002; Dunn & Griggs, 2003; Loo, 2004). Upon reviewing the literature on learning styles, the intense rate and growing interest is involved.

The implications for pedagogy indicate that instead of fixed learning styles strategies, adapting content to the learner, educators should rather implement flexible learning strategies. The implications regarding the learning strategies implementation in education suggests that students who are aware of a range of learning strategies are more likely to select the correct one for a particular task. The ultimate goal for the educators in educational institution is to provide meta-cognitive support for students, enabling them to reflect not just on what they learn but also how and why, thereby helping them to 'learn how to learn'.

The logic of lifelong learning suggests that students will become more motivated to learn by knowing more about their own strengths and weaknesses as learners. Consequently, if teachers can respond to individuals' learning style preferences, then the achievement rate is likely to rise and "learning to learn" skills of students may provide the foundation for the lifelong learning concept.

Sample Report:-

PRSE - Participating, Reflecting, Structuring and Experimenting: PRSE assesses the approach (Participating, Reflecting, Structuring and Experimenting) an individual takes to organize and internalize information. The individual's scores provide an objective analysis to understand the means by which he/she organizes new learning.

Sample Report Of "A":-**Analysis:-**

- Being naturally intuitive, the subject tends to form connections between concepts easily. This allows him/her to form ideas and enhances his/her ability to address problems effectively
- The subject tends to enjoy a non-restrictive learning environment that nurtures his/her creativity and gives the opportunity to express his/her ideas/opinions/views without bias
- Often, he/she tends to use fantasy and imagination as a ready resource to facilitate learning
- Taking a holistic approach, he/she likes to gather information from various sources and seek a well- rounded understanding of a topic
- Being people oriented, he/she would work well in a team; and would benefit from learning from or teaching others. Hence, he/she would tend to reflect on his/her learning alongside others
- Seeking intellectual stimulation, he/she may tend to ask lots of 'why' questions in order to gain better clarity on the topic
- Placing importance on practical application of his/her ideas, he/she also tend to focus on honing his/her technical skills
- Being energetic and enthusiastic, he/she would be open to volunteering in an activity and learning by doing
- The use of examples would trigger his/her ability to visualize the concept and connect it with his/her previous experiences. Hence, he/she would benefit greatly with real or hypothetical examples
- He/she prefers relating learning to a personal and emotional experience, thereby, enjoy personalized attention and emotional support during a learning event
- With a need to personally experience things, he/he may enjoy learning things through self-discovery
- He/she comes across as a person who is open to new ideas, and would reflect on the same through open discussions, debates and brainstorming sessions
- He/she would be willing to take risks in order to achieve objectives and complete tasks
- He/she seeks to understand "why" things happen the way they do; hence, he/she is likely to benefit by asking questions and seeking additional information
- Driven by his/her emotions and relationships with others, he/she would be influenced by his/her teacher to a large extent. Hence, he/she would exhibit a particular interest in subjects that are taught by his/her favorite teachers

Pressure

Abstract

In this study the magnitude of reduction in total active earth pressure, overturning moments at the bottom of the wall and its distribution due to the response of a relief shelf in a retaining wall is presented with cantilever type retaining wall on cohesionless soils with increase of additional resisting moments at the bottom of the wall. Retaining wall is considered as cantilever beam-like, multi-rows and stepwise reinforced concrete, multi-shelves on vertical wall and elastic foundation. A numerical study is conducted to investigate the effect of the number of shelves; shelf and wall stem rigidity and shelf horizontal location on the resulted lateral earth pressure distribution. Pressure quantity, the maximum acting bending moment and shear force on the wall are also discussed to perform the retaining design. Currently, numerical analysis is one of the easiest and the fastest method to examine the effect of each factor on the dynamic behavior of a retaining wall. According to the analysis it was found that the shelves have a significant effect on the distribution of the earth pressure. The numerical results indicate that the presence of a relief shelf behind the wall would result in a reduction of the earth pressure and also results show that shelf inclusions have positive role as pressure detractive for cantilever retaining walls in earthquake areas.

Introduction:-

A retaining wall will be subjected to an additional load under the seismic and wave conditions and caused not only by the dynamic lateral earth pressure and wave force but also by the inertial force due to the structural mass reduced by pressure relief shelves. The lateral force acting between the retaining structure and the backfill mass is termed as lateral earth pressure. Cantilever retaining walls with pressure relief shelves are considered one special subset of retaining walls (Farouk,2015). The concept of providing pressure relief shelves towards the active soil mass side of a retaining wall reduces the total earth pressure on the wall, which results in reducing the thickness of the wall and ultimately to get an economic design by use of less reinforcement on wall horizontal cross section on the level of contraction joints (Farouk,2015). Over the decades, several types of methods have been developed to calculate the complex dynamic soil interactions between a retaining wall and retained earth mass. These methods can be categorized into limit state analyses, closed form solutions, numerical analyses, and experimental methods (Padhye,2011). Jumikis (1964) presented the provision of one or more relief shelves to increase the stability of retaining wall. The relief shelves have an advantage of decreasing the overall lateral earth pressure on the structure.

An economical design is reached because of less material use in construction mechanism as compared to massive structure of cantilever retaining walls without shelves (Jumukis,1964). Chaudhury (1973) proposed Coulomb's theory for earth pressure computation for cohesionless soil. He presented the charts for various locations and widths of relief shelf. and compared cantilever and counterfort type retaining wall in reinforced concrete with and without relief shelf to show the economy in providing a relief shelf (Chaudhury,1964). According to Phatak (1975) the effect of relief shelves can increase the stability of retaining wall by using the Rankine's theory to evaluate the lateral pressures (Phatak,1975). He presented experimental study on flexible cantilever wall with relief shelf to show substantial reduction in earth pressure (Phatak,1975). In order to facilitate the reduction of earth pressure and increase stability against sliding and overturning, construction of relief shelves behind retaining wall was used (Banerjee,1977). Padhye and Ullagaddi (2011) presented the procurement of one or more relief shelves to increase and to provide the stability of retaining wall. They considerably applied Coulomb's theory for analysis and design of cantilever type of wall for cohesionless soil (Padhye,2011).

In this study, RC retaining wall to provide both of lower overturning moments caused by decreasing lateral active earth pressure forces and lower opposing bending moments originated from gravity weights of shelves are analytically analyzed on elastic foundation. Special retaining wall is designed and analyzed holistically under the conditions such as cantilever beamlike vertical section, doubly reinforced rectangular base section on elastic foundations and vertical wall with multi-shelf, stepwise and three-rows reinforcement.

Methodology:-

The retaining wall is designed against sliding and overturning using Rankin's earth pressure theory based on stress equilibrium of a soil mass element. The method of Rankine is still the most widely used to compute earth active thrusts on walls. For the wall geometry and ground conditions considered on this study, wall movements are reduced more effectively by providing multiple relief shelf than increasing the wall's base slab, at least if the wall's bending moment and stability remains unchanged. This paper deals mainly with seismic considerations. The stability of retaining wall checked to ensure that it is capable of supporting the design lateral forces. The stability regulations require that the selected retaining wall cast on the case study satisfy requirements for sliding, overturning and bearing capacity. The relationship between principal stresses when the soil reaches a state of plastic equilibrium can be derived from Mohr circle with a failure plane at an angle of $45 + \phi'/2$.

The active pressure coefficient is has been proposed by Rankine's theory as (Kip et al.1999)

$$K_a = \cos\alpha \frac{\cos\alpha - \sqrt{\cos^2\alpha - \cos^2\phi'}}{\cos\alpha + \sqrt{\cos^2\alpha - \cos^2\phi'}} \quad (1)$$

Where α is an inclination angle with the horizontal surface and ϕ' is internal friction angle of soil. The horizontal stress for the above condition is defined as Rankine's active pressure (P_a):

$$P_a = K_a \gamma z - 2c'\sqrt{K_a} \quad (2)$$

Here, c' is the cohesion. A reinforcement computation and arrangement is designed to satisfy the bending moment values and shear force magnitude of the system. The comparison of the calculated bending moments with the required moments is carried out to prove the accuracy of the reinforcement. Length of the reinforcement is adjusted in order to satisfy the stability of the junction points of the shelf configuration. To prevent failure at the joints of shelves, stability of reinforced concrete demand an assessment of the process that control the behavior of the shear forces and bending moments. The retaining wall is an important part of the transportation and geotechnical systems. The damages of retaining wall in an earthquake create difficulties to the traffic flow with huge economic loss of rescue work (Li et al,2011).

Case Study:-

This study deals with the application of a new retaining system in order to reduce the weight of soil layers on the shelves more than a single shelf. A novel approach to providing external stability on retaining wall had come into existence to minimize earth pressure with the multiple pressure relief shelves. An application of multiple shelves is performed to eliminate the necessity of enlargement of the stem cross section. Instead of construct vertical wall

terracing, the integrity of the retaining system was conserved and the problems due to the geometric constraints were eliminated.

A reinforced concrete cantilever wall with relief shelves is designed to retain fill to a height of 14.3 meters. The backfill behind the retaining wall has a dry unit weight of about 18 kN/m^3 and shear strength parameters of $c' = 5$ and $\phi' = 40^\circ$. Additional features, such as the ground water height H_w and surcharge load q are shown in Figure 1 as a typical cross-section with the maximum design wall height. A surcharge load of 17 kN/m^2 was applied for traffic loading.

Fig. 1:- Retaining wall with multiple shelves.

The calculations of forces (total horizontal forces, R_H , total vertical forces, R_V) and moments (overturning moment, M_H , restoring moment, M_V) are set out in Table 1.

Table 1 Factors of safety against sliding and overturning with forces and moments.

Forces (t)		Moments (tm)	
R_H	21.75	M_H	109.39
R_V	59.72	M_V	226.48
Factor of safety			
Sliding	2.30		
Overturning	2.07		
Eccentricity	1.04		

The required number of stem reinforcement until the first shelf was 3 whereas number of stem reinforcement was 2 for second shelf above the base slab. Figure 2 shows the elevation and bending moments of retaining wall divisions with shear forces.

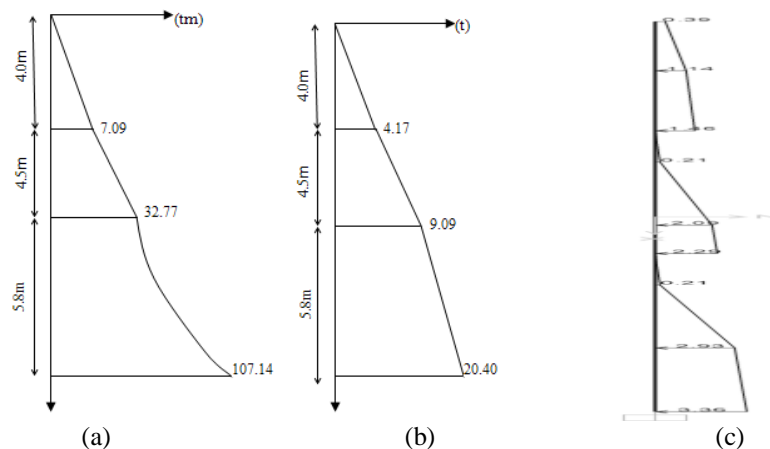

Fig. 2:- (a) Bending moments, (b) shear forces, (c) lateral pressures of stem part of wall

The cross sections and reinforcement details of wall are summarized in Figure 3a, 3b and 3c. Within three vertical sections of wall (base section-5.8m long, middle section-4.5m and top section-4.0m), the steel bars are placed in stepwise and three rows. Accordingly, number of steel bars and rows for unit-width wall (100cm) are indicated as in Fig.3.

Fig. 3:- (a) Reinforcement of base section at 5.80 m-long, (b) Reinforcement of middle section at 10.30 m, (c) Reinforcement of top section at 14.30 m-long

First row reinforcement continues through the entire retaining wall. In each transfer region of reinforcement was taken as a quarter of reinforcement length. Figure 4 summarizes the theory of beam on elastic foundation.

Fig. 4:- (a) Beam on elastic foundation, (b) Unit-concentrated loading on elastic foundation (c) Unit-bending moment loading on elastic foundation

Winkler assumes that reaction forces of the foundation are proportional at every point to the deflection of the beam at this point under applied external loads (Winkler, 1876). The elasticity of the foundation which follows the Hooke's law characterized by the force called the modulus of the foundation K_0 . Winkler's constant, K which includes the effect of the width of the beam and the characteristic of the system, λ are described by the following equations:

$$K = K_0 B \quad (3)$$

$$\lambda = \sqrt[4]{\frac{K}{4EI}} \quad (4)$$

The equations of shear force and moment in accordance with particular integral of beam on elastic foundation equations of concentrated moment and concentrated load can be expressed respectively as in Equations 5-8 (Kameswara Rao, 2011):

$$M(x)_M = -M \delta_{MM}^{(x)} \quad (5)$$

$$Q(x)_M = -\lambda \beta_{QM}^{(x)} = -\frac{\lambda l}{l} M \beta_{QM}^{(x)} = -M \delta_{QM}^{(x)} \quad (6)$$

$$M(x)_P = PL \frac{1}{\lambda l} \beta_{MP}^{(x)} = Pl \delta_{MP}^{(x)} \quad (7)$$

$$Q(x)_P = P \beta_{QP}^{(x)} = P \delta_{QP}^{(x)} \quad (8)$$

Here, $\delta_{MM}^{(x)}$, $\delta_{QM}^{(x)}$, $\delta_{MP}^{(x)}$, $\delta_{QP}^{(x)}$ values can be taken from charts and tables in practice (Kameswara Rao, 2011). For using easy-use of functions and integral terms including complex terms, the influence lines are generally generated as seen in Figure 4b and 4c. Figure 5 depicted the beam on elastic foundation mechanism in this study.

Fig. 5:- Beam on elastic foundation system of the retaining wall.

The computational model of a beam on an elastic foundation is often used to describe a lot of engineering problems and has application in geotechnics. In this study, an analytical solution of the problem of beam on elastic foundation was investigated bending moments and shear diagram were shown in Figure 6 and Figure 7. P_0 and P_2 represent respectively the water and water-soil concentrated loads on both cantilever parts of concrete base. P_1 is denoted as concentrated load originated from vertical part of concrete wall. M_0 is the bending moment at fixed support of the vertical part of RC wall which is assumed as cantilever beam and exposed to lateral active earth pressure. Sectional bending moments and shear forces of concrete base considered as beam on elastic soil are calculated by superposition of concentrated loads spaced at base and bending moment of vertical wall support placed at central point of base. Therefore, the bending moment and shear force diagrams required especially in RC design are plotted for both sides of concrete base of the vertical wall. RC design is carried out in accordance with Turkish Standards on Reinforced Concrete Design of Building (Turkish Standards-500,2000).

Fig. 6:- Shear and moment diagram of retaining wall as beam on elastic foundation.

In Figure 6, Section 1 considered as doubly reinforced rectangular section covers the 40cm-spaced steel bars 3#24 with the 600cm-long for the 100cm-width of base. In order to respond the maximum bending moment, the additional steel bars (more 3#24 with the 270cm-long) are placed only at Section 2. At the intersection length of base, the steel bars to be applied are 6#24. Base section where the support of vertical wall is located is therefore strengthened.

Conclusion:-

In this study, it is aimed that the lateral active earth pressure forces and their overturning moments can be decreased, the weight of double shelves and their protective moments can be increased, double reinforced rectangular section of base on elastic foundation can be equipped well and vertical steel bars in vertical retaining wall designed as cantilever can be placed by stepped and multiple rows reinforcement. Under these conditions, the required earth pressures, the overturning-protective moments and shear forces they causes, effect of elastic soil basement and reinforcement of vertical and horizontal rectangular wall sections are achieved. Results show that the proposed method can capture the displacements and bending moments of retaining wall more accurately than the retaining wall with single shelf. In this study, efforts were made to develop a multiple shelves system of retaining wall to satisfy successfully external and internal stability of the wall. The proposed method on special-designed RC retaining wall maximizes the friction capacity of the retaining system in presence of the multiple shelves. The purpose of this study is therefore realized by demonstrating the usage of multiple and elevated shelf on an elastically-founded retaining system with high backfill mass.

Abstract

Bioactive compounds of endophytic fungi exhibit antimicrobial, antioxidant, anticancerous, antiviral and insecticidal properties. They harbor inter or intra-cellular in the plants epidermal layer. They are the most potent microorganisms in establishing interrelationship with plant without harming them or asymptotically. They have the mechanism which enables them to establish association with the plant and produce similar bioactive compound as plant produce. This research paper focused on the isolation, production, screening and separation of exploitable bioactive compounds from the plants Tulsi and Aloe vera. Total 5 fungi were isolated from segments of the plants. And the organisms taken for the study are both Gram-positive and Gram-negative bacteria i.e. *Staphylococcus aureus*, *Streptococcus pyogenes*, *Escherichia coli*, *Pseudomonas aeruginosa* respectively which were isolated from the clinical samples (like wound, blood and urine) and the results of antibacterial screening showed that (BCEF-01*), (BCEF-02*), (BCEF-03*), (BCEF-04*) and (BCEF-05*) inhibited all the test organisms. The inhibitory effect was promising to all the test organisms showing sufficient zone of inhibition with respect to all the fungal extracts.

Introduction:-

Endophytic fungi are ubiquitous fungi that reside inter or intracellular in plant parts for at least a portion of their lives without causing apparent symptoms of infection and represent a large portion of fungal species (Petrini, 1991^[1]). Endophyte by definition is one which in the tissue beneath the epidermal cell layers and causes no apparent harm to the host. Endophytic fungi can be biotrophic, mutualists, benign commensals, decomposers or latent pathogens. According to Rodriguez *et al.*, (2009)^[2], all plants in the natural environment can shelter endophytic fungi, including algae, mosses, ferns, conifers and angiosperms. This fungal group appears to significantly influence the lifestyle of its host. Taxonomically most of the endophytic fungi belong to the phylum Ascomycota and its associated anamorphs, while some species belong to the phyla Basidiomycota and Zygomycota (Huang *et al.*, 2001 and 2008^[3, 4]). Dreyfuss & Chapela (1994)^[5] have estimated that approximately 1.3 million species of endophytic fungi remain to be discovered. This diverse fungal group could impact the ecology, fitness and shape of plant communities, conferring resistance to abiotic (temperature, pH, osmotic pressure) and biotic (bacteria, fungi, nematodes and insects) stresses. Endophytic fungi are an important source of bioactive molecules. These bioactive metabolites have a broad range of biological activities and could be the starting materials for

Corresponding Author: - Prof. K. P. J. Hemalatha

Address: Department of Microbiology, Andhra University, Visakhapatnam-530003.

pharmaceuticals or lead structures for the development of pharmaceutical or agrochemical products. These endophytes protect their hosts from infectious agents and adverse conditions by secreting bioactive secondary metabolites (Carroll and Carroll, 1978^[6]; Azevedo *et al.*, 2000^[7]; Strobel, 2003^[8]). The substances produced by endophytic fungi originate from different biosynthetic pathways, including isoprenoid, polyketide and amino acid and belong to diverse structural groups, such as terpenoids, steroids, xanthenes, quinones, phenols, isocoumarins, benzopyranones, tetralones, cytochalasins and enniatins (Schulz *et al.*, 2002^[9]). Indeed, these bioactive molecules represent a chemical reservoir for discovering new compounds, such as antibiotic, antioxidant, immunomodulating, anticancer, antiparasitic and antidiabetic compounds, for use in the pharmaceutical and agrochemical industries.

Ocimum species belongs to the family Lamiaceae are very important for their therapeutic potentials. Tulsi leaves contain bright yellow volatile oil reported to possess the antimicrobial properties and also act as insecticide. Tulsi is a fragrant bushy perennial growing up to 1.5 m in height with profusions of white blooms and slightly purple tinted foliage. This herb has been known from as early as the Vedic period and is held sacred by the Hindus and is often planted around temples and used in rosaries. It is native to India, reached Western Europe in 16th century. Tulsi leaves are traditionally used for getting relief from common cold, bronchitis, cough, mild indigestion, diminished appetite and malaise. *Ocimum* (tulsi) are also known for its antimicrobial, immunomodulatory, anti-inflammatory, anti-pyretic, anti-asthmatic, hypoglycemic, hypotensive and analgesic activities. The only side effect reported is constipation.

Aloe vera is a perennial, drought-resisting, succulent plant belonging to the Asphodelaceae family. The name, aloe, is derived from the Arabic "alloe" or Hebrew "halal" meaning bitter shiny substance. It has a vast traditional role in indigenous system of medicine like ayurveda, siddha, Unani and homoeopathy. *Aloe barbadensis* miller or *Aloe vera*, a semi tropical plant is one of the 250 species of Aloe. There are more than 200 compounds found in *Aloe barbadensis*, about 75 of which have biological activity, *Aloe vera* leaves contain a diverse array of compounds, including anthraquinones (e.g. aloe-emodin), anthrones and their glycosides (e.g. 10-(1, 5'' anhydroglucosyl)-aloeemodin- 9-anthrone, also known as aloin A and B), chromones, carbohydrates, proteins, glycoproteins, amino acids, organic acids, lipids, sugars, vitamins, minerals. Various studies have revealed that *Aloe vera* leaf possesses many pharmaceutical activities, including antimicrobial, anticancer, antioxidant, antidiabetic, antiulcer, hepatoprotective, immunomodulatory and many more activities. Many of the health benefits associated with *Aloe vera* have been attributed to the polysaccharides contained in the gel of the leaves.

Research on endophytes dates back to over one hundred years. During this period, several aspects of endophyte biology were thoroughly studied, including the diversity, taxonomy, reproduction, host ecology and effects on the host. Because natural selection favors the evolution of beneficial endophytic strains, several endophytes were found to secrete secondary metabolites that protect plants against insect pests, pathogenetic organisms as well as herbivores, thus, endophytes represent a promising source of novel, biologically active metabolites for pharmacological and agricultural applications. Biochemical research revealed that a wide variety of natural products can be obtained from endophytic microbes. Natural products from endophytic fungi were observed to inhibit many pathogenetic organisms including bacteria, fungi, and viruses.

Materials and Methods:-

Sample collection:-

Healthy (showing no visual disease symptom) and mature plants were carefully chosen for sampling. Fresh plant materials (branches, leaves and roots) were collected from ten different sites at Bhoopsandra area, Bangalore, India. The plant material was brought to the laboratory in sterile bags and processed within few hours after sampling. Fresh plant materials were used for the isolation work to reduce the chance of contamination.

Glassware, Chemicals and Media:-

The glassware used were made up of borosilicate glass obtained from M/s Borosil India Limited. The chemicals used were of analytical grade obtained from M/s Himedia Laboratories Pvt. Limited & M/s Sigma-Aldrich Pvt. Limited, Mumbai, India. The Media used for the experiments were obtained from M/s Himedia Laboratories Pvt. Limited, Mumbai, India.

Sample Processing:-

For Tulsi:-

Isolation of endophytic fungi from *Ocimum sanctum* was carried out by using the protocol described by strobel *et*

al., (2003) ^[8] with slight modification. The plant was washed under running tap water for 10 minutes to remove dust and debris. Highly sterile conditions were maintained for the isolation of endophytes. Before surface sterilization, the leaves, branches and roots were cut into small pieces of about 1cm long and sterilized in series with 70% ethanol for 1min, 1% mercuric chloride for 1 min and further cleaned by passing through two sets of sterile distilled water. All of work needs to be performed in the laminar air flow using sterile glassware and mechanical instruments. The sterile samples were placed on plate containing potato dextrose agar (PDA) media with 200mg/L concentration of streptomycin to suppress the bacterial contamination. The parafilm wrapped petridishes were incubated at 25-27°C till the mycelia start growing from the samples. The endophytic fungi was transferred into new agar slant and stored at 4°C for further studies.

For Aloe vera:-

The plant was washed under running tap water for 10 minutes to remove dust and debris. Before surface sterilization plant material was cut into small pieces of about 1cm long and sterilized in a series of 70% ethanol for 1-3 minutes, 4% mercuric chloride for 3-5 minutes, and rinse with 70% ethanol for 2-10 seconds further cleansed by passing through two sets of sterile distilled water. All of work needs to be performed in the laminar air flow using sterile glassware and mechanical instruments. The sterile samples were placed on plate containing potato dextrose agar (PDA) with 200mg/L of streptomycin to suppress the bacterial contamination. The parafilm wrapped petridishes were incubated at 25-27°C till the mycelia start growing from the samples. The endophytic fungi was transferred into new agar slant and stored at 4°C for further studies.

Media preparation:-

Potato Dextrose Agar (PDA) was used for isolation and purification of endophytic fungi. Antibiotic, streptomycin (200mg/L) was added to suppress bacterial growth. The media and antibiotics were purchased from Himedia, India.

Endophyte Fungal identification:-

The identification procedure of endophytic fungi was based on morphology. The five isolated species were described according to their macroscopic features (i.e. the color, shape and growth of cultured colonies) as well as microscopic characteristics (i.e. the structure of hyphae, conidia and conidiophores). The morphology of fungal culture colony or hyphae and the characteristics of the spore were identified by temporary mounts using lacto phenol cotton blue (LPCB) and viewed under the microscope at 40X. Obtained data were then compared with the descriptions of endophytic fungi species from standard identification manuals and matches were recorded. Analysis of the antibacterial activity was carried out on all species identified.

Preliminary antibacterial assay:-

Antibacterial activity of isolated endophytic fungi was tested based on the protocol of Zhang *et al.*, (2009) ^[10] with slight modification. The Petridish containing respective media for growth of bacteria were prepared and the test organism was spreaded on the surface of agar with the help of sterile cotton swab. Nine millimeter diameter of actively growing fungal culture disc from PDA plates were cut using sterile cork borer and placed on the surface of respective agar media seeded with the test bacteria. The plates were sealed with parafilm and kept in refrigerator at 4°C for 6 hours for the complete diffusion of the antimicrobial compounds if any, they were incubated at room temperature for next 12 hours for all bacterial cultures. After incubation the diameter of zone of inhibition was measured in millimeter by using scale.

Secondary metabolite extraction:-

Secondary metabolite extraction was carried out by using the protocol Radji *et al.*, (2011) ^[11]. Positive endophytic fungal isolate was inoculated into 1000 ml conical flask containing 500 ml potato dextrose broth and incubated at room temperature for 21 days under stationary condition with intermittent shaking. The broth culture was filtered to separate the mycelia and filtrate. To the filtrate equal volume of ethyl acetate was added, mixed well for 10 min, keep for 5min, till the two clear immiscible layers are formed. The upper layer of ethyl acetate containing extracted compound was separated using separating funnel. The mycelium was grinded properly in pestle and mortar using ethyl acetate as solvent and then it was filtered using cheese cloth. Both mycelia and culture filtrate were pooled together and evaporated to dryness using water bath. The extracted residue was dissolved in dimethyl sulfoxide (DMSO) and stored at 4°C to be used as stock solution for antibacterial assay.

Preparation of test organism:-

Endophytic fungal extracts isolated from Tulsi and Aloe vera were evaluated for their antibacterial potential against both Gram-positive and Gram-negative bacteria. *Staphylococcus aureus*, *Escherichia coli*, *Streptococcus pyogenes*, *Pseudomonas aeruginosa* were isolated from the clinical samples (like wound, blood and urine) obtained from patients attending KIIMS Hospital, K.R market, Bangalore, India and M. S. Ramaiah Memorial Hospital, New Bell road, Bangalore, India. These bacteria were identified on the basis of biochemical tests, by observation of the morphological structure microscopically and colony characters visually. The isolated organisms were stained with Gram's stain and viewed under microscope at 100X. The organisms were isolated in nutrient agar medium and selectively cultured at 37°C for 24 hrs. These bacterial cultures were maintained in nutrient agar slants at 37°C and were stored at 4°C for further study. Each of the bacteria was reactivated prior to susceptibility testing by transferring them into a separate test tube containing nutrient broth and incubated overnight at 37°C.

Secondary metabolite antibacterial assay:-

Antibacterial activities of secondary metabolites were tested by agar diffusion method. The bacteria used for antimicrobial assay are the pathogenic *Pseudomonas aeruginosa*, *E.coli*, *Staphylococcus aureus*, *Streptococcus pyogenes* which were isolated from urine, blood and wound samples. Muller Hinton agar was used for the antimicrobial assay. The sterile growth media plate specific for test organism were prepared and inoculated with the test organism. Twenty microliters of crude extract was added on to sterile 6mm paper disc using a micropipette and allowed to dry. Disc containing compounds were placed on the surface of the medium. In another plate 6mm diameter wells were made using a sterile cork borer and 20 microlitres of sample was added to each well. The plates were incubated at 24-48 hours at 37°C. The diameter for zone of inhibition was measured.

Determination of Minimum inhibitory concentration [MIC]:-

Minimum inhibitory concentration was carried out using broth dilution as previously reported by Lennette *et al.*, (1974)^[12]. Dilutions of different concentrations of extract and fractions that exhibited sensitivity against the test organisms were prepared using test tubes containing 9 ml of double strength broth. The test tubes were inoculated with (0.2 ml) suspension of the standardized inocula and incubated at 37°C for 24h. MIC's were recorded as the lowest concentration of extract showing no visible growth of the broth.

TLC Screening:-

About 1 mg of each extract was used for chromatography. A solvent system of dichloromethane: ethyl acetate 7:3 was prepared and placed in a tank and the lid was replaced. The fungal extracts were spotted, each one on separate origin on the plate. Chromatographic separations were carried out using silica gel (E. Merck, type 60), pre-coated silica gel GF254. The plates were placed carefully into the tank and covered with the lid. After development, the plate was removed and the solvent front was marked with pencil and allowed to dry. TLC plates were viewed under UV light at 254 nm for fluorescence spots and at 366nm for fluorescent spots. The metabolites from all the bands obtained were extracted by centrifugation of silica containing band in ethyl acetate at 10,000 rpm for 10 minutes. The supernatant was used for the antibacterial activity against all the clinical pathogens.

Results:-

Medicinal plants have been the main source for drugs over many centuries in many countries, in both developed and developing countries. Traditional medicine products are not officially recognized in many countries, and the European Union presently developing regulatory laws for quality traditional medicines. It is estimated that at least 25% of all modern medicines are derived either directly or indirectly from medicinal plants. Traditional medicines play important role in world health treating millions of people. The medicinal property of herbs is due to the presence of different complex chemical substances as secondary metabolites, which are exclusively accumulated in different parts of the plant. The need for new antimicrobial agent, in general, comes from increasing rate of resistance to existing antibiotics. This problem extends beyond the clinical application of antimicrobial drugs, such as agricultural microorganisms are also known to have acquired resistance to commonly used antimicrobial chemicals. In the present study, a total of 5 endophytic fungi (Table 1) were isolated from two medicinal plants (tulsi, aloe vera). All the isolated endophytic fungi showed preliminary antibacterial activity against the clinical pathogen. BCEF-01* showed maximum activity against *E.coli* and *Streptococcus pyogenes* while BCEF-04* and BCEF-05* showed maximum activity against *Streptococcus pyogenes* (Fig.1, Table 2). All the isolated endophytic fungi were cultivated in stationary condition (Fig.2) and the secondary metabolites produced by them are used for the antibacterial activity in different concentrations by agar as well as broth dilution methods. In agar dilution method, the results of antibacterial screening showed that BCEF-01*, BCEF-02*, BCEF-03*, BCEF-04* and

BCEF-05* inhibited all the test organisms. BCEF-01*, showed resistance at concentration of 2.1mg/ml against *P. aeruginosa* while other all test organisms are susceptible at various concentrations of fungal extract. *Staphylococcus aureus* shows maximum zone of inhibition of 15mm at extract concentration 2.6mg/ml (Table 3). For BCEF-02*, all the test organisms were found to be susceptible to the fungal extracts at various concentrations. The maximum zone of inhibition was found to be 17mm for *E. coli* at extract concentration of 2.0 mg/ml (Table 4). For BCEF-03*, *E. coli* was found to be resistant at concentration of 2.1 mg/ml while at rest of the concentrations all the test organisms are susceptible to the fungal extracts (Table 5). For BCEF-04*, *E. coli* is resistant at concentration 1.5mg/ml and 1.6mg/ml and *S. Pyogens* is resistant up to concentration of 1.8mg/ml while *S. aureus* and *P. aeruginosa* are resistant till the concentration of 2.0mg/ml. Rest of the test organisms are susceptible at various concentrations (Table 6). For BCEF-05*, *Pseudomonas aeruginosa* is resistant at concentration 1.5mg/ml while at other concentrations all test organisms are susceptible to the fungal extract (Table 7). The inhibitory effect was promising to all the test organisms showing sufficient zone of inhibition with respect to all the fungal extracts. The summary for which is given in the Table 8. The secondary metabolites of the endophytic fungi were further determined for Minimum Inhibitory concentration (MIC) against all the clinical pathogens by broth dilution method. The MIC of BCEF-02*, extract for all test organisms was found to be 1.42mg/ml (Fig.3).

For BCEF-05*, MIC was found to be 1.5mg/ml for *S. aureus* and *S. pyogens*, while for *E. coli* and *P. aeruginosa* the MIC were found to be 1.54mg/ml and 1.56mg/ml respectively (Fig.4). For BCEF-03*, MIC value obtained for *S. aureus*, *S. pyogens* and *P. aeruginosa* was found to be 2.02mg/ml while for that of *E. coli* MIC value obtained was 2.06mg/ml (Fig.5). For BCEF-01*, MIC value obtained for *E. coli* and *S. pyogens* was found to be 2.04mg/ml while for *S. aureus* and *P. aeruginosa* the MIC values obtained were 2.02mg/ml and 2.06mg/ml respectively (Fig.6). For BCEF-04*, MIC value for *S. aureus* and *S. pyogens* was found to be 2.02mg/ml and for that of *E.coli* and *P. aeruginosa* the MIC value obtained was 2.06mg/ml (Fig.7). Further the secondary metabolites produced by endophytic fungi were subjected to TLC and the bands obtained were used for antibacterial activity (Fig.8).

Separation of the metabolites by preparative TLC:-

The fungal extracts were subjected to preparative Thin Layer Chromatography. The spots on the plates were developed by mobile phase (dichloromethane: ethylacetate) in the ratio 7:3 and observed under UV illuminator. Bands obtained were used to check antibacterial activity. And all the fungal extract shows promising antibacterial activity.

Fig 8:- Antibacterial activity of TLC extracts of different fungal extracts.

Hence the bioactive compounds need to be identified in order to find out which functional group is active against the given pathogens. As for *S. aureus* and *S. pyogenes* the novel compound may be used as a potent bioactive chemical

for topical applications against skin diseases and wounds. For identification of the functional group the study recommends the use of HPLC and GCMS. Still the potential for the same promising novel compound needs to be evaluated before it becomes a potential candidate for treatment. Hence, it may be concluded that these endophytic extracts could be used in the treatment of human diseases which have demonstrated potential values.

Discussion:-

Endophytes colonize inside healthy plant tissues to get nutrition and shelter from the host, and in response produce many functional metabolites, which may enhance the host fitness, and have anti-feedant activity and provide resistance against various biotic and abiotic stresses as well. Endophytic fungi have been recognized as a repository of novel secondary metabolites, some of which have beneficial biological activities (Bills and Polishook, 1991^[13], Strobel and Daisy, 2003^[14]). The results of the present study agree with these earlier findings. The result shows that the fermentation broth of endophytic fungi of *Aspergillus* sp. (BCEF-01*), *Penicillium* sp. (BCEF-02*), *Cladosporium* sp. (BCEF-03*), *Nigrospora* sp. (BCEF-04*) and *Gliocladium roseum* (BCEF-05*) has broad-spectrum of antimicrobial activity against both Gram-positive and Gram-negative pathogenic bacteria like *Staphylococcus aureus*, *Streptococcus pyogenes*, *Pseudomonas aeruginosa*, and *E.coli*.

Siqueira *et al.*, (2011)^[15] reported that 16 out of 203 endophytic isolates showed antimicrobial activity with a wider action spectrum inhibiting Gram-positive and Gram-negative bacteria and fungi. Most of the bioactive metabolite compounds from endophytic fungi reported were more effective against Gram-positive bacteria than Gram-negative bacteria and pathogenic fungi (Chareprasert *et al.*, 2006^[16]). These findings were in agreement with observations by Cos *et al.*, (2006)^[17] that the Gram-negative bacteria are much more resistant than Gram-positive bacteria. It has been stated that the possible mechanism behind the sensitivity of Gram-positive bacteria may lie in the significant differences in the outer layers of Gram-negative and Gram-positive bacteria. Gram-negative bacteria possess an outer membrane and a unique periplasmic space (Duffy and Power, 2001^[18]) whereas the Gram-positive bacteria found to be much more susceptible since they have only an outer peptidoglycan layer which is not an effective permeability barrier (Scherrer and Gerhardt, 1971^[19]).

Since in microbial-plant relationship endophytes contribute with substances that possess various types of bioactivity (Radu and Kqueen 2000^[20]), researchers had been conducting screening for bioactive metabolites and endophytic fungus antimicrobial activity, as was previously revealed (Pela'ez *et al.*, 2000^[21], Radu and Kqueen 2000^[20], Ezra *et al.*, 2004^[22]). Five different endophytic fungi were isolated from the medicinal plant tulsi and aloe vera and all belong to phylum Ascomycota. These results were correlated with the previous findings of Pavithra *et al.*, (2012)^[23]. In the preliminary antibacterial assay the endophytic fungi *Gliocladium roseum* and *Nigrospora* sp. showed the maximum zone of inhibition of 25mm and 26mm against *Streptococcus pyogenes* while *Aspergillus* sp. showed the maximum zone of inhibition of 25mm against *E.coli* and *Streptococcus pyogenes*.

The antibacterial activity of 5 extracts of liquid culture of endophytic fungi were evaluated by diffusion agar assay against Gram-positive and Gram-negative bacteria. The activity of the extracts was estimated from growth inhibition (in mm) as follows: <8mm: Inactive; 8–12 mm: weak activity; 13–15 mm: moderate activity; >15 mm: strong activity (Becerra *et al.* 2002^[24]). Almost all the endophytic fungi showed the antimicrobial activity against the test bacteria but the endophytic fungi *Penicillium* sp. showed the zone of inhibition of 15mm, 16mm, 17mm and 11mm at the concentration of 2mg/ml against *S.aureus*, *E.coli*, *S.pyogens*, and *P.aeruginosa* respectively. Hence the bioactive compound produced by these fungi can be used for the treatment of disease caused by such organism. Although *Cladosporium* sp. showed less antibacterial activity in this experiment, while in a recent study, Zhang *et al.*, (2011)^[25] reported the production of an alkaloid, huperzine A, used in treating the Alzheimer's disease.

The minimal inhibitory concentration (MIC) was defined as the lowest extract concentration resulting in no visible growth after the incubation time. Aligiannis *et al.*, (2001)^[26] proposed a classification for plant materials, based at MIC results as: strong inhibitors: MIC up to 0.5 mg/ml; moderate inhibitors: MIC between 0.6 and 1.5 mg/ml and weak inhibitors: MIC above 1.6 mg/ml. In the present study, we have established MIC from 1.42mg/ml to 2.06mg/ml for all the 5 endophytic fungal extracts. *Penicillium* sp. and *Gliocladium roseum* extracts possess moderate MIC.

Besides the antimicrobial and other bioactivities, endophytic fungi *Gliocladium roseum* reported to produce biodiesel (Strobel *et al.*, 2008^[27]), which may be the future hot cake for endophytic study. Interestingly, the findings of this study provide a strong platform for the isolation and purification of novel natural antimicrobial agents from

endophytic fungi of Tulsi and Aloe vera.

Conclusion and Future Targets:-

Since Stierle *et al.* (1993)^[28] discovered a taxol producing endophyte: *Pestalotiopsis microspore*, there have been an increasing interest in bioactive metabolites isolated from endophytes. Many studies proved that endophytes produce novel secondary metabolites as a resistance mechanism to overcome pathogenic invasion (Tan and Zou, 2001^[29]). Research on endophytes has been carried out and a great amount of antimicrobial natural products were found. So far, a great number of antimicrobial compounds have been found in a handful of the one million different endophyte species (Petrini, 1991^[1]); It is believed that searching for natural products synthesized by endophytes could be a promising way to solve the problem that bacteria are becoming resistant to some commonly used drugs according to WHO and meet the emergency demand of discovering highly effective, low toxicity, and no environmental impacted antibiotics to fight against resistant bacteria species.

The ultimate purpose of endophytes research is to find new antibiotics or pesticides, thus the following aspects should be intensively studied:

1. To find better bioactive antimicrobial substances without any side effect to human, plant and environment.
2. To enhance the antimicrobial activity or decrease the side effects of known metabolites from endophytes by modifying their structures in order to improve the efficacy and specificity to microbes.
3. To optimize conditions of endophyte fermentation that has been found to show bioactivity in order to enhance the yield of active substances synthesized by endophyte.
4. To search for the regulatory gene in synthesis path of antimicrobial compound, and use genetic engineering technology to increase the production of antibacterial substances.

As so many antimicrobial compounds were isolated from endophytes which only occupied a small portion of total endophyte species, it is obviously that there is a great opportunity to find reliable and novel antimicrobial natural products in endophytes, which may be used as clinically effective antibiotics in future.

Key words:-

Literature, Management, Wisdom,
Workforce.

Abstract

Management of organization is the management of its staff in real terms because the work is executed by them and it ultimately runs organization. Every employee has its own customs to solve the problems of life. Literature studies not only enhance the knowledge, but also provide solutions to the life issues. Reading motivational and inspirational stories fills us with a new insight. For this study, employees have been asked that an interesting proverb or saying written on notices can ever encourage them. They admit that fictional writings can be used a new technique to get clarifications of their glitches. The aim of this study is to develop new criteria of literature and management, so that we get to know our culture, traditions and history. The modern management studies can be enriched with literature studies and organization can have better people with more alertness and improved work efficiency.

Introduction:-

Literature is the base of any culture. One can easily identify the richness of culture by studying it. It demonstrates the traditions, rituals, styles, habits and beliefs of the various present and earliest civilizations. These practices are available in the form of stories, sayings, teachings, poems and proverbs. It constitutes a folk wisdom through creative literature. Some sayings are most popular and become a part of everyday life. 'Folk psychology is a unique kind of narrative practice and that viewing it as such is the best way to account for its ultimate origins and everyday applications. Many of our routine encounters with others take place in situations in which the social roles and rules are well established, so much so that unless we behave in deviant manner we typically have no need to understand one another by means of the belief or desire schema'. 'Folk psychological narratives work to regulate our actions, as such they are instruments of culture, and they summarize not simply how things are but (often implicitly) how they should be (Hutto 2012)'.

Insight Through Narratives:-

"Each narrative text is a singular unit and needs to be seen as such. The characters in the stories are identified by their caste, and when the stories are interpreted collectively, the social fabric of attitudes towards each caste emerges. This adds variety to the folktales. The narration of the oral tales undergoes constant innovation and renewal. For this reason, the narratives of late nineteenth century contain many direct references to contemporary social reality (Naithani 2006)". 'Stories are a way of understanding the underlying operating principles behind organizational communication and learning. Organizations need to be their own unique, customized processes and tools to implement the push - to - pull -to - push strategy. Stories are giving employees a greater sense of alignment between their job responsibilities, the business objectives they need to execute, and the organization's mission'. The majority of management literature on stories places emphasis on characterizing stories as vehicle of communication.

'The communicating power of stories lies in their role as a tool for listening and reflecting. Stories also demystify the way in which our mind synthesizes information in order to produce new insights and learning (Gargiulo 2014)'. The wisdom loving person is the one who searches for the timeless and unchanging truths, never contend with the shifting phenomenon of the material world (Sternberg 1990). "Folk wisdom has been to explore sources of wisdom that have stood the test of time and culture and that might serve to help individuals cope with challenges of life (Lopez 2011)".

Importance Of Vasudhaive Kutumbakam To Entrepreneurs:-

'The most important message that one can extract from the study of Indian literature is *Vasudhaive Kutumbakam*. This word has its own significance and it gives the message of unity being a family. This word has been used by many scholars in their speeches and writings. We are trying to relate this with the practices of management studies in the organization, because the organization is not a single entity. It's a group of people in which people work for their mutual benefits and for the organization itself. So the theory of *Vasudhaive Kutumbakam* can be best applied in the organization which can help the organization to bring the change in the performance of employees by having a feeling of unity among them and can work for each other's benefit rather than having individualistic approach. Everyone has their own worldview which is quite often different from person to person. *Vasudhaive Kutumbakam* means respecting this difference. Contrary to single worldview, *Vasudhaive Kutumbakam* says animals, birds, plants, trees and other organisms in the ecosystem have Atma they are part of our family (Nanuk 2012)'. "*Vasudhaive Kutumbakam* occurs in the *Hitopadesha* or 'Beneficial Instruction' a collection of fables that was intended to be a manual for teaching young princes how to get ahead in the world. One of the fables concern the machinations of hungry jackal. As the larger narrative frames provide the best context for interpreting the verse in question, I shall paraphrase loosely from the *hitopadesha* and find in each case the end in mind is a dastardly one. 'The cat wants to devour the birds, and the jackal has his eyes on the deer. Both make hypocritical appeals to what sounds like accepted moral rules in order to attain their ends. Thus, both play upon the conscience of their prey, turning it to their own evil purpose. The one difference between the verses cited by these two scoundrels is that while the cat's epigram suggests the possible fate that might befall a consistently dutiful host, the jackal cites a verse that has no shadow side'. It seems merely to exhort one to a higher level of humanity (overlooking the character's animal personas) (Hatcher 1994)".

"Far away in Behar there is a forest called Champak-Grove, and in it had long lived in much affection a Deer and a Crow. The Deer, roaming unrestrained, happy and fat of the carcase, was one day described by a Jackal. 'Ho! Ho!' thought the Jackal on observing him, 'if I could but get this soft meat for a meal! It might be—if I can only win his confidence.' Thus reflecting he approached, and saluted him. 'Health be to thee, friend Deer!' 'Who art thou?' said the Deer. 'I'm Small-wit, the Jackal,' replied the other. 'I live in the wood here, as the dead do, without a friend; but now that I have met with such a friend as thou, I feel as if I were beginning life again with plenty of relations. Consider me your faithful servant.' 'Very well,' said the Deer; and then, as the glorious King of Day, whose diadem is the light, had withdrawn himself, the two went together to the residence of the Deer. In that same spot, on a branch of Champak, dwelt the Crow Sharp-sense, an old friend of the Deer. Seeing them approach together, the Crow said, 'Who is this number two, friend Deer?' 'It is a Jackal,' answered the Deer, 'that desires our acquaintance.' 'You should not become friendly to a stranger without reason,' Said Sharp-sense. 'Don't you know?' 'To folks by no one known house-room deny:-

The Vulture housed the Cat, and thence did die." 'No! How was that?' said both.

'In this wise,' answered the Crow. "On the banks of the Ganges there is a cliff called Vulture-Crag, and thereupon grew a great fig-tree. It was hollow, and within its shelter lived an old Vulture, named Grey-pate, whose hard fortune it was to have lost both eyes and talons. The birds that roosted in the tree made subscriptions from their own store, out of sheer pity for the poor fellow, and by that means he managed to live. One day, when the old birds were gone, Longear, the Cat, came there to get a meal of the nestlings; and they, alarmed at perceiving him, set up a chirruping that roused Greypate. 'Who comes there?' croaked Grey-pate.

"Now Long-ear, on spying the Vulture, thought himself undone; but as flight was impossible, he resolved to trust his destiny and approach. 'My lord,' said he, 'I have the honor to salute them.' 'Who is it?' said the Vulture. 'I am a Cat.' 'Be off, Cat, or I shall slay thee,' said the Vulture. 'I am ready to die if I deserve death,' answered the Cat; 'but let what I have to say be heard.' 'Wherefore, then, comest thou?' said the Vulture. 'I live,' began Long-ear, 'on the Ganges, bathing, and eating no flesh, practicing the moon-penance, like a Bramacharya. The birds that resort thither constantly praise your worship to me as one wholly given to the study of morality, and worthy of all trust; and so I

came here to learn law from the, Sir, who art so deep gone into learning and in years. Dost thou, then, so read the law of strangers as to be ready to slay a guest? What say the books about the householder?-

*'Bar thy door not to the stranger, be he friend or be he foe,
For the tree will shade the Woodman while his axe doth lay it low.'*

And if means fail, what there is should be given with kind words, as-'Greeting fair and room to rest in; fire, and water from the well-Simple gifts-are given freely in the house were good. Men dwell,- and without respect of person-'Young, or bent with many winters; rich, or poor, whate'er thy guest, Honor him for thine own honor-better is he than the best,'

Else comes the rebuke-'Pity them that ask thy pity: who art thou to stint thy hoard, When the holy moon shines equal on the leper and the lord!' And that other, too, 'When thy gate is roughly fastened, and the asker turns away, Thence he bears thy good deeds with him, and his sins on thee doth lay.' For verily, 'In the house the husband ruleth, men the Brahmins "master" call; Agni is the Twice-born Master-but the guest is lord of all.' "To these weighty words Grey-pate answered, 'Yes! But cats like meat, and there are young birds here, and therefore I said, go.' 'Sir,' said the Cat (and as he spoke, he touched the ground, and then his two ears, and called on Krishna to witness to his words), 'I that have overcome passion, and practiced the moonpenance, know the Scriptures; and howsoever they contend, in this primal duty of abstaining from injury they are unanimous. Which of them sayeth not-'He who does and thinks no wrong-He who suffers, being strong-He whose harmlessness men know-Unto Swerga such doth go.' "And so, winning the old Vulture's confidence, Long-ear, the Cat, entered the hollow tree and lived there. And day after day he stole away some of the nestlings, and brought them down to the hollow to devour. Meantime the parent birds, whose little ones were being eaten, made an inquiry after them in all quarters; and the Cat, discovering this fact, slipped out from the hollow, and made his escape. Afterwards, when the birds came to look closely, they found the bones of their young ones in the hollow of the tree where Grey-pate lived; and the birds at once concluded that their nestlings had been killed and eaten by the old Vulture, whom they accordingly executed. That is my story, and why I warned you against unknown acquaintances." (Edwin 1861)

Literature Review:-

"Wisdom consists of proverbial sentence or instruction, debate, intellectual reflection; thematically wisdom comprises self-evident intuitions about mastering life for human betterment, groping after life secrets with regard to innocent suffering, grappling with finitude, and quest for truth concealed in the created order and manifested in Dame Wisdom. When a marriage between form and content exists, there is wisdom literature". 'Wisdom literature is not dry-as-dust academic work, but strongly poetic in character (Weeks 2010)'. 'Wisdom is a comprehensive grasp of knowledge that is characterized by both breadth and depth of understanding. It is one of the cardinal virtues and thus transcends the realm of the merely cognitive. The great philosophers of the wisdom are Socrates (469- 399 B.C.), Plato, Aristotle (384-322 B.C.), Lucretius (99-55B.C.), and Zeno of Citium (336- 265 B.C.) (Sternberg 1990)'. "Panchatantra have become part of common Indian folklore transmitted orally from parents to children down the centuries. The literary sources of the Panchatantra therefore, are twofold: the expert tradition of political science and the folk and literary traditions of storytelling (Olivelle 2009)". "Proverbs are the excellent source of wisdom". 'Proverbs have been classified in to three types: synonymous, antithetic, and synthetic. Another classification includes Aussagewort (Statement) and the Mahnwort (warning or admonition) (Whybray 1995)'. 'Ancient authors sought to capture wisdom in collection of proverbs and fables. Language and Literacy are generally regarded as two of the foundation stones of human civilization (Curnow 2015)'. "In Vasudhaive Kutumbakam, the relationship between individuals, families, institutions, communities and nations and between men and nature should be cemented on the basis of equity, mutuality and respect" (Shah 2013). "Folk wisdom also contain a treasure itself of positive psychology- a psychology that was not just about suffering, trauma, depression ,victims, irrationality, madness and crime" (Lopez 2011).

Research Methodology:-

Hypothesis- Proverbs and Literary writings has its significant place in the modern world and ethical and working knowledge can be imparted to employees through these works.

Data analysis:-

We have done survey and interviewed about 200 people professions. Questions were divided on different issues related to our problem. The sample was taken randomly from the Institute, itself. The respondents are divided in to

the different categories. Almost 200 respondents filled the questionnaire very well. Survey was done in very short duration of time of one week due to busy schedule of the respondents. We have asked the respondents about their interest in literature, the concept of Vasudhaiva Kutumbakam and the moral lessons in the proverbs. Two tables are drawn of the response; one table has answers of the questions. And other table is drawn on the basis of the grouping of the respondents according to their profession. The response that we get is described here in the form of charts and tables.

Table 1:- Response From The Employees.

Issue	Reply –Yes	Reply –No
Issue 1	185	15
Issue 2	190	10
Issue 3	160	40
Issue 4	180	20
Issue 5	195	5
Issue 6	170	30
Issue 7	175	25

Figure 1:-

Findings:-

After interviewing them, we have found that all the respondents like reading literature. One of the important achievement of the survey is that all the respondents believe that that literature reading definitely helpful to come out of the problematic situations. It will energizes them and helpful in character building. All the respondents were educated persons and they also suggest their colleagues to read literature because it just not entertaining them, but also helps them in building Good moral character. Most of them read literary writings for entertainment but after this survey they read finest literary writing to improve the moral of their employees and set up a good mechanism of management based on literature. Reading literature is not a leisure activity, but it guides and shows the right path. Some entrepreneurs admitted that the business should be run on the basis of the Vasudhaiva kutumbakam. All the respondents gave their wonderful feedback. They agreed that by introducing literature in management studies because one can learn the lessons of good management through their own culture and literary writings. They are very good response about the proverbs because proverbs can be a source of quick learning.

Lessons From The Proverbs:-

'Proverbs expresses what a fundamental truth is apparently; - that is a truism in homely language often adorned, however, with alliteration and rhyme. It is usually short, but need not be; it is usually true, but need not be'. "A proverb must be venerable; it must bear the sign of antiquity, and, since such signs may be counterfeited by a clever literary man, it should be attested in different places at different times". This last requirement we must often waive in dealing with very early literature, where the material at our disposal is incomplete". (Whiting 1932) For example "Do not work under an irrational boss. If it is fate accomplice, try to get rid of him soon" (Dadhich 2014). 'Some proverbs contain a truth of general application which holds good for all time and stands its ground in the phase of social change and political or economic revolution. Such proverbs are based on universal experience and embody the common sense of mankind. Some proverbs have a more limited range. They express a truth rooted in experience, but the experience is that of a particular people, or of a particular nation, and the saying in which it is summed up are colored by the spirit of the time when they were coined and of the nation which produced them. They hold well for their birth place, but not for the entire world' (Risley 1999).

"For example:-

1. A little wit will serve a fortunate man. It means that fortune is nourished by intelligence.
2. A man must plough with such oxen as he hath. It means one should not wait for great efforts and must start with the efforts which he has.
3. Both together do best of all. Appreciation of togetherness.
4. Do not put all your eggs in one basket. One should not risk everything he has in a single venture.
5. Every tub must stand on its own bottom. Hard work is a foundation of mend person.
6. First think and then speak. What will be the effects of speaking? Think it first. First think and then start the work.
7. Go not for every grief to the physician, for every quarrel to the lawyer, nor for every thirst to the pot. Bearness, balance of mind and watchful thirst are the best options of them respectively.
8. Health is wealth. It is true because health earns wealth.
9. Honesty keeps the crown of the cause away. Honesty never is questionable.
10. In to a shut mouth flies fly not. The person who is satisfied never be with ill work. Satisfaction keeps away all the evil things".
11. "Kindness like grain, increase by sowing. Grain increase by sowing so the kindness by doing kind things.
12. Opportunity hardly comes twice. It comes once in a while manner.
13. Punctuality is the soul of business. Most Important merit of business.
14. Religion is the rule of life. It is a chief source of life.
15. Second thoughts are best. Second thoughts are the wise and correct thinking.
16. The greatest wealth is contentment with a little. Gratification is also a great wealth.
17. The morning hour has gold in its mouth. Good hours for effective working as well as good for your health too.
18. There is a good time coming. One should hope for the best.
19. Think before doing. One should think before doing.
20. Truth fears no colours. Truth always is a ferules thing. Whatever the authority is.
21. Union is strength. Untidiness is a sign of power.
22. Virtue has all things in itself. Moral goodness is a perfect thing.
23. We much not lie down and cry, God help us. God helps those who help themselves so it is essential that we should help ourselves first.
24. You may know by a handful the whole sack. Little quantity is sufficient to know the whole sack or if you want to know a person completely then his few specialties are sufficient enough.
25. Zeal without knowledge is fire without light. Enthusiasm without cognition is like a body without soul" (Sharma 2015).

Famous proverbs in the world:-

1. 'By preserving the egg walk on legs. Patience enables one to scucced.to succeeds in any endeavour we have to be patient and preserve till our effort comes to fruition.
2. When the bag tears, the shoulders get a rest. When plans run in to problems, one does not have to become overly frustrated. Frustrating our plans may be god's gracious way of giving.

3. One who bathes willingly with cold water doesn't feel the cold. It expresses the positive benefit of choosing one's fate and accepting circumstances'.
4. 'If you refuse the elder's advice you will walk the whole day.
5. A person who is not disciplined cannot be cautioned
6. Say only a little but say it well.
7. A man a smiling face must not open shop.
8. Experience is a comb which nature gives us when we are bald' (Sawhney 2004).

Conclusion:-

Literature is the medium to learn and explore new things. Ancient literary writings and proverbs are full of wisdom and helpful in transforming personalities of people. People of the modern world always looking for an extra pathway to tackle with the problems of today's demanding life and solution should be quick and easy. In that case proverbs play a better role to show them a true direction and empower them with strength of positivity. We are concluding this paper by significantly remarking that narratives in literature are the best source of wisdom to an ordinary man, and to an entrepreneur.

Pore texture, Methylene blue.

Abstract

Resorcinol-formaldehyde organic xerogels (OXs) were synthesized by the polycondensation of resorcinol (R) and formaldehyde (F) using two different techniques [microwave (MW) - induced synthesis and conventional (C) synthesis methods]. For the MW-induced synthesis of OXs, five samples variable in their R-F solutions pH values [in the range 3.0-7.2] were synthesized. These samples were pyrolyzed at 750 °C under N₂ flow to give five carbon xerogel (CX) samples. To study the effect of the carbonization temperature, the OX sample prepared at R-F solution pH value of 6.5 was selected and carbonized at different temperatures in the range 600 - 800°C, to produce four CX samples. To investigate the effect of the synthesis method on the CX characteristics, another OX sample was prepared by the conventional method at R-F solution pH value of 6.5 and was carbonized at 750°C under N₂ flow to give the last CX sample. The effect of the synthesis conditions on the physicochemical and surface chemistry characteristics of the products was performed using different techniques, such as elemental analysis, determination of the surface acidic and basic active sites by the Boehm method, identification of surface functional groups by FTIR, XRD analysis, SEM and TEM investigations. Pore texture characteristics were evaluated by analysis of the respective N₂/77K adsorption-desorption isotherms. The methylene blue (MB) number (X_m (mg/g)) and surface areas accessible to MB (S_{MB}) were calculated using the Langmuir and Freundlich adsorption isotherm equations. The Langmuir adsorption isotherm model gives better fit as compared to Freundlich model. Ratios of methylene blue surface area to nitrogen surface area (S_{MB} / S_{N₂}) were evaluated and discussed. Removal of MB from aqueous solution is governed by the chemical nature of the CX surface as well as the diffusion through the intricate internal porosity.

Introduction:-

Carbon gels are a class of porous carbon materials that have received considerable attention due to their potential applications in fuel cells (Alegre et al., 2012), adsorption (Álvarez and Ribeiro, 2015), bio-sensing (Li et al., 2016), catalysis (Moreno-Castilla and Maldonado-Hódar, 2005), energy storage (Ordeñana-Martínez and Rincón, 2016), and supercapacitors (Lufrano et al., 2011; Zapata-Benabith et al., 2016). They can be obtained by sol-gel synthesis

via polymerization reaction between hydroxylated benzenes (such as resorcinol (R)) and formaldehyde (F) (Al-Muhtaseb and Ritter, 2003; Job et al., 2004). After sol-gel polymerization, the solvents used as the reaction media can be removed in three different drying methods; subcritical, supercritical or freezing drying, resulting in xerogels, aerogels and cryogels, respectively (Job et al., 2005). The cheapest and easiest drying method is subcritical drying, which is based on removing the solvent from the gel structure by drying conventionally (at ambient pressure and temperatures of around 100-150 °C) to obtain organic gels with high surface areas and pore volumes (Al-Muhtaseb and Ritter, 2003). Pyrolysis of an organic gel under inert atmosphere allows the removal of labile oxygen and hydrogen surface groups, resulting in thermally stable nano structured porous carbon gel. By varying the synthesis conditions, it is possible to obtain carbon gels with different properties (Zubizarreta et al., 2008). Among the parameters that have a great influence on the final gel properties is the R-F solutions pH values (Zanto et al., 2002a). During the pyrolysis process, the carbonization temperature (CT) is the most important parameter that has a significant influence on the pore structure of carbon gels (Al-Muhtaseb and Ritter, 2003).

Carbon xerogels (CXs) have very interesting features such as three-dimensional nanosized network (Kakunuri et al., 2015), high porosity and surface area, the possibility of designing their porous texture, outstanding electrical, thermal and mechanical properties and simple manufacturing on a laboratory scale (Calvo et al., 2011). However the main problem of CXs synthesis is the too long time in the conventional preparation method. During the last few years, microwave (MW) radiation has become an accepted heating source for chemical synthesis due to numerous advantages it offers. These include a reduction in synthesis time, an easy and safe method, direct heating of molecules and the avoidance of secondary reactions, giving rise to cleaner products with a higher yield (Gedye, 2002). Therefore, MW radiation has been used to produce carbon gels with a considerable saving of time and energy (Kang et al., 2008).

There are a quite large number of studies regarding the production of OXs, as precursors of CXs, using the conventional synthesis method (Naseri I., et al. 2014). In comparison, there is a great lack in the synthesis of OXs using MW radiation as a heating source and the effect of the synthesis conditions on the OXs produced, and as a result on the CXs characteristics. In addition, a large shortage in the studies regarding the surface chemistry and texture characteristics of MW assisted synthesized CXs was observed, although these features determine their behavior towards various applications. A comparative study between the characteristics of CXs produced under the same condition but with these two different techniques (i.e. MW assisted synthesis and conventional synthesis methods) was not given suitable attention (Calvo et al., 2011).

The object of the present investigation is to examine the influence of the R-F solution pH value, as well as the CT on the physicochemical, surface chemistry and pore texture of the MW assisted synthesized CXs, in an attempt to find out the best conditions for preparing high quality CXs by this method. Also, to correlate their surface and textural characteristics with their adsorption capacity for removal of MB (as a standard medium-size organic dyestuff) from aqueous solution. The study was extended, also, to compare the effect of the synthesis method (the MW assisted synthesis and the conventional synthesis methods) on the CX surface chemistry and pore texture characteristics. The results confirmed that there is no need for using the very long conventional synthesis method for CX synthesis, not only because MW assisted method save a lot of time (5 hours compared with 7 days for the conventional method), but also because it produces higher yield, higher carbon content, more surface functional groups, higher surface area, wider pore volume, and more developed mesoporosity.

Experimental:-

Synthesis of Organic and Carbon Xerogels:-

Resorcinol-formaldehyde (R-F) organic xerogels (OXs) were synthesized using two different techniques (microwave-induced synthesis and conventional synthesis methods).

Microwave - induced synthesis Method:-

For the MW-induced synthesis of OXs, the precursor solutions were prepared by the polycondensation of resorcinol and formaldehyde using deionized water as solvent. Resorcinol (Alfa easer, 99%) was first dissolved in deionized water. Then, formaldehyde (Aldrich, 37 wt. % in water, stabilized by 10.7 wt. % methanol) was added under magnetic stirring until obtaining a homogenous solution. The (R/F) molar ratio was (0.5) and the dilution ratio (i.e. total solvent/ reactant molar ratio) was fixed at (5.70). The dilution ratio includes the added deionized water and the water and methanol contained in the formaldehyde in the case of “total solvent”, while “reactant” refers to the resorcinol and formaldehyde. NaOH (1M) and HNO₃ (1M) were added to adjust the pH of the R-F solutions to the

required pH values. The precursor solutions were placed in unsealed glass bottles transparent to MW, and these were then introduced into a multimode microwave oven [MILSTONE START SYNTH 1200 W/ 2450 MHZ]. First, the temperature was kept at 85°C for ~ 3 h for gelation and permitting part of the curing stage to take place. Then, the microwave device was allowed to operate at power (750 Watt) until synthesis had been completed. The total synthesis time of the OX was around 5h. Five OX samples variable in their R-F solutions pH values (between 3.0 and 7.2) were synthesized. These samples were designated as OX3.0(MW), OX5.0(MW), OX6.0(MW), OX6.5(MW) and OX7.2(MW), where the letters OX refer to the organic xerogel and the numbers indicate the R-F solution pH value, whereas (MW) indicates the use of MW-induced synthesis method. Pictures of the OX6.5(MW) sample obtained by the MW induced synthesis method are given in Figure 1(a).

Fig. 1:- Photos of the OX6.5(MW) sample prepared by the MW assisted synthesis method (a), and of the steps of the conventional synthesis method of the OX6.5(C) sample (b).

To study the effect of the R-F solutions pH values on the carbon xerogels characteristics, the OX samples were pyrolyzed at a fixed temperature (750°C) under nitrogen flow in a vertical tubular quartz reactor for 2h. with a heating rate of 50 °C. min⁻¹ to give CXs. These samples were designated as CX3.0(MW)750, CX5.0(MW)750, CX6.0(MW)750, CX6.5(MW)750 and CX7.2(MW)750, where the last number indicates the carbonization temperature. For studying the effect of the carbonization temperature, the OX6.5(MW) sample was selected and pyrolyzed, as described above, at different temperatures in the range 600–800 °C, to produce four CXs variable in their CT. These samples were designated as CX6.5(MW)600, CX6.5(MW)700, CX6.5(MW)750, and CX6.5(MW)800.

Conventional synthesis Method:-

To study the effect of synthesis method on the CX characteristics, another OX sample was prepared by the conventional method at R-F solution pH value of 6.5 and CT of 750 °C to give the last CX sample. These conditions were found to be the best effective ones on the characteristics of the CXs prepared by the MW-induced synthesis method. To synthesize the OX sample by the conventional method, the pH was adjusted to the required value (6.5) using NaOH and HNO₃. The solution was placed in a stopper bottle, which was then introduced in an electrical oven at 85 °C for 72 h. to undergo gelation and curing stages. Afterwards, the bottle was opened and the oven temperature was set at 100 °C for 4 days with the purpose of drying the organic gel via evaporation of the solvent until the process of drying of the organic gel was ended. This sample was designated as OX6.5(C), where (C) indicates the synthesis using the conventional method. Pictures of the steps of the conventional synthesis method of the OX6.5(C) sample are given in Figure 1(b). Finally, the OX6.5(C) sample was pyrolyzed at 750°C under nitrogen flow. This sample was designated as CX6.5(C)750.

Physicochemical and Surface Chemistry Studies:-

Determination of the pH of the Investigated Carbon Xerogels:-

For measuring the pH values of aqueous suspensions of the CX samples, 1.0 gram portions of finely powdered carbon were mixed with 20 cm³ distilled water in 50 cm³ capacity stopper Pyrex bottles. The suspensions were

shaken mechanically for 48 h. at 25°C, following which their pH values were determined using a Jenway 3510 pH meter.

Elemental Analysis:-

The carbon, hydrogen and oxygen contents of the samples were analyzed using Elementary Analyzing-System GmbH, Vario EL V2.3.07 July 1998, CHNS Mode. For the sake of quality assurance and quality control, duplicated analysis was conducted on all samples.

Determination of Active Sites:-

The acidic and basic active sites were determined according to the method of Boehm (Boehm, 2002). 0.2 g of CX sample was placed in 25 ml of the following (0.1N) solutions: sodium hydroxide, sodium carbonate, sodium bicarbonate and hydrochloric acid. The vials were sealed and shaken for 24 h. and then 5 ml of each filtrate was pipetted and the excess of base and acid was titrated with standard HCl and NaOH, respectively. The numbers of acidic sites of various types were calculated under the assumption that NaOH neutralizes carboxyl, phenolic and lactonic groups, while Na_2CO_3 neutralizes carboxyl and lactonic groups, and NaHCO_3 neutralizes only carboxyl groups. The number of surface basic sites was calculated from the amount of HCl which reacted with the CX.

FTIR Analysis:-

The FTIR spectra of the CX samples were recorded using the KBr disc technique in the range $4000\text{--}400\text{ cm}^{-1}$ at the resolution of a Genesis-II Fourier transform infrared spectrophotometer, Shimadzu (Japan), model (Nicolet 6700). About 10 mg of the finally powdered sample was mixed well with 200 mg of KBr powder (spectroscopically pure) in mortar. The mixture was then pressed in a special disc under vacuum at about 8 ton/cm^2 by means of a hydraulic press. The disc produced was 1.2 cm in diameter and about 0.7 mm thickness.

XRD Analysis:-

XRD patterns for the CX samples were recorded using a Philips type Diffractometer (Model PW 2103/00) using Ni-filtered $\text{Cu K}\alpha$ radiation at $\lambda=1.5418\text{ \AA}$. The powders were mounted on silicon monocrystal sample holders. Data acquisition was realized in the range ($4\text{--}80^\circ$) with scan step size of 0.04° . The average particle size of each sample was calculated from Scherrer formula (Khetre et al., 2011) ($t = K \lambda / \beta \cos \theta$, where t is the average size of the particles, assuming particles are spherical, $K=0.9$, λ is the wave length of X-ray radiation, β is the full width at half maximum of the diffracted peak and θ is the angle of diffraction).

Scanning Electron Microscope (SEM) Investigations:-

Scanning electron micrographs of the CX6.5(MW)750 sample were obtained using a JEOL Scanning Microscope, Model JSM-5400 LV (Jeol, Tokyo, Japan). The sample was prepared by the gold sputtering technique (Girgis, 1993), by sprinkling the powder lightly onto a double-sides adhesive tape, which was mounted on a SEM specimen stub. The edge of the double-sided tape was coated with silver paint to minimize charging. Finally, the sample was sputter-coated with gold. Micrographs were obtained in a secondary electron imaging mode using a potential difference of 25 kV.

Transmission Electron Microscope (TEM) Investigations:-

TEM micrographs of the CX6.5(MW)750 sample were recorded using High Resolution Transmission Electron Microscope (HRTEM) TECANI G^2 spirit TWIN. The sample was prepared by mixing the powder with ethanol, and then subjected to sonication for 10 min., and placing a drop onto former-backed carbon coated copper grid. Transmission micrographs were obtained using accelerating voltage 120 kV, conducted by VELETA camera.

Pore Texture Studies:-

To evaluate the textural parameters of the xerogel samples under investigation, the adsorption / desorption isotherms of nitrogen at 77 K were constructed using NOVA 3000 Multi-Station High Speed Gas Sorption Analyzer (Quanta-Chrome Corporation), Version 6.07. Approximately (0.1- 0.2) grams of sample were originally out gassed at 523 K for about 5 h. under a vacuum of about 1.3×10^{-5} KPa. After cooling, the samples were kept in a N_2 atmosphere and later evacuated with a drag pump. The results were expressed in relation to unit mass of out gassed CX. The true adsorption equilibrium checked at regular intervals, following it during long periods. The adsorption isotherms were analyzed to get various porous parameters: i) The BET-equation parameters (Brunauer et al., 1938): S_{BET} (BET-surface area, $\text{m}^2.\text{g}^{-1}$), C_{BET} (the constant C of the BET equation) and $V_{\text{P(total)}}$ (total pore volume, cc.g^{-1}), and ii) The

α_S -plot parameters (Sellés-Pérez and Martín-Martínez, 1991): s_t^α (total surface area, $\text{m}^2.\text{g}^{-1}$), s_n^α (non-microporous surface area, $\text{m}^2.\text{g}^{-1}$), s_{mic}^α (microporous surface area, $\text{m}^2.\text{g}^{-1}$), v_o^α (micropore volume, $\text{cc}.\text{g}^{-1}$), \bar{r} (mean pore radius, Å) and V_{meso} (mesopore volume, $\text{cc}.\text{g}^{-1}$).

Methylene Blue Adsorption Studies:-

A stock aqueous solution of MB (1000 ppm) was prepared. Other solutions of MB were prepared from this solution by dilution to the required concentration. The adsorption of MB was made by placing 50 mg of each of powdered CX, which was dried in an oven at 110°C for 2 h, in a stopper Pyrex bottles containing a 50 ml of dye solution. The bottles with their contents were shaken occasionally for 72 h. at 25°C . Preliminary experiments established that equilibrium times of 48h. were needed to determine solution adsorption isotherms for CXs. The supernatant liquid was removed and analyzed spectrophotometrically using a double beam computerized UV/Visible Scanning Spectrophotometer [type Shimadzu (UV-2101 PC)] and $\lambda_{max} = 662.5 \text{ nm}$. The amount adsorbed was calculated from the difference between the initial and the equilibrium concentrations of MB in the aqueous solution (Girgis and El-Hendawy, 2002). The experimental error was about 5%. Reproducibility was ensured by repeating the experiment under the same conditions.

Results and Discussion:-

Physicochemical and Surface Chemistry Characteristics:-

Yield of Carbon Xerogel:-

Carbonization of the prepared OXs causes removal of the captured solvent, release of volatile matter including residual organic components and non cross linked organic chains, and volatilization of labile oxygen and hydrogen leading to an additional weight loss. This results in the formation of thermally stable nanostructured material formed mainly by carbon. The results of the % yield (expressed as the ratio between the mass of CX and the mass of OX under different conditions) are summarized in Table (1). The results indicate the following: 1) The CX yield depends largely on the R-F solution pH values. It increases continuously with increasing the pH value from 3.0 (46.6 %) up to 6.5 (66.0 %) then declines at pH 7.2 (54.8 %). 2) The CX yield depends also on the CT. As expected, as the CT was increased the yield was reduced. It decreases continuously from 72.0 to 60.0 wt % by increasing the CT from 600 to 800°C , which can be attributed to more and more release of oxygen and hydrogen, as well as a decrease in carbon content, with raising the CT. 3) The synthesis method largely affects the yield. MW induced synthesis method promotes the yield of CX by 10 % compared to the conventional method (66.0 and 56.0 %, respectively). The higher CX yield of the microwave assisted method is a very important factor favors it over the conventional method.

Elemental Analysis:-

The results of elemental analysis of the CXs investigated are presented in Table (1). It can be observed that the content of elemental carbon, hydrogen and oxygen depends on the preparation conditions, as follows: 1) The content of carbon depends on the original R-F solution pH value. It decreases very slightly with the increase of the pH value from 3.0 (94.19 %) to 5.0 (94.11 %), then continuously up to pH 7.2 (87.24 %). 2) The content of carbon, also, depends on the CT. As the CT was increased the content of carbon was decreased. It decreases linearly from 91.45 % to 81.45 % by raising the CT from 600 to 800°C . 3) Carbon content depends, also, on the synthesis method. The MW induced synthesis method shows a higher content of carbon compared to the conventional method (88.71% and 83.37 %, respectively).

Slurry pH of the Investigated CXs Surfaces:-

The pH value of a carbon surface represents the average effect of species of various strength and number, i.e. the average effect of both acidic and basic groups existing on the surface. As an indication of pH of the CX surface, the slurry pH of a CX suspension was measured. All values were obtained at the same conditions. The pH values of the investigated CXs surfaces are given in Table (2). As deduced from the pH values, the chemical nature of the CX surfaces is different. 1) The surface pH value depends largely on of the original R-F solution pH value. It increases linearly with increasing the pH value from 3.0 up to 7.2. 2) The surface pH value is influenced also with the CT. As the CT was increased, the surface pH value was increased. It increases continuously from 6.04 to 7.02 by raising the CT from 600 to 800°C . The acidic functional groups are easily decomposed with raising the CT (Bansal and Goyal, 2005) leading to a decrease of the acidity of the prepared CXs and, as a result, an increase of the pH value. 3) The chemical nature of the CX surfaces depends on the synthesis method. The MW induced synthesis method shows slightly acidic character compared to the conventional method (pH= 6.70 and 7.21, respectively).

Table 1:- Yield (wt.%), elemental analysis and average particle size of the investigated CX samples.

Sample Notation	% Yield	Elemental analysis						Average particle size* (nm)
		wt.% of the element			Atomic content			
		C	H	O	C _{at}	H _{at}	O _{at}	
Effect of Initial pH								
CX3.0(MW)750	46.6	94.19	2.28	3.53	7.85	2.28	0.22	9.0

*Calculated by Scherrer formula .

Surface acidic and basic active sites:-

The chemical properties of the investigated CXs surfaces were assessed by neutralization with bases of various strengths (NaHCO₃, Na₂CO₃ and NaOH) and HCl. According to Boehm (Boehm, 2002), the bases consumption can be described in the presence of surface acidic groups with various strength while the acid uptake characterizing the carbon surface basicity. Only the strong acidic groups (carboxyl) can be neutralized by NaHCO₃ (pK_a= 6.37), whereas Na₂CO₃ (pK_a= 10.25) titrates carboxyl and lactones. NaOH (pK_a= 15.74) neutralizes carboxyl, lactones and phenolic (hydroxyl) groups. The results of the acid-base titration to determine the surface acidic and basic active sites by the Boehm method are shown in Table (2). Total surface acidic sites included phenolic, lactonic and carboxylic sites, whereas basic sites may include chromene-, pyrone-, and quinone-type structures (Boehm, 2002). The most distinguishing feature of these CXs is the co-existence of the acidic and basic sites; i.e. the representation of all types of surface functional groups. Thus, these CXs are amphoteric in nature. The concentration of the surface acidic and basic active sites depends on the CX synthesis conditions. The analysis of the data given in Table (2) provided the following: 1) The surface acidic and basic active sites depend largely on the original R-F solution pH value. The total surface acidic sites decrease linearly from 2.37 to 1.00 meq.g⁻¹, whereas the total surface basic sites increase continuously from 0.50 to 1.25 meq.g⁻¹ with raising the pH value from 3.0 up to 7.2. Thus, increasing the initial pH from 3.0 to 7.2 (i.e. increasing the amount of basic catalyst) results in a decrease in the acidic function groups and an increase in the basic function groups. 2) The surface acidic and basic active sites depend largely on the CT. The total surface acidic sites decrease from 1.30 to 0.85 meq.g⁻¹, whereas the total surface basic sites increase from 0.60 to 1.22 meq.g⁻¹ by raising the CT from 600 to 800 °C. The decrease in the surface acidic groups by increasing the CT indicates that these groups are thermally unstable, whereas the surface basic groups are stable up to 800°C, as reported by Bansal and Goyal (Bansal and Goyal, 2005). 3) The surface acidic and basic active sites depend on the synthesis method. The MW induced synthesis method shows more total surface acidic and basic sites compared to the conventional method. It is possible that, during the microwave synthesis, some secondary reactions take place producing a higher cross linked organic gel with more stable oxygen functional groups (Caddick, 1995; Le Van and Gourdenne, 1987). These oxygen groups will remain after the carbonization process in a higher extent than in the CXs prepared conventionally. So, to develop more functional groups on the CX surface, it is advisable to use MW assisted synthesis method.

Table 2:- pH values of the investigated CXs surfaces, and number of surface species (meq.g⁻¹) obtained from Boehm titration.

Sample notation	pH	Carboxylic sites	Lactonic sites	Phenolic sites	Total Acidic sites	Basic sites	Total surface coverage
Effect of pH							
CX3.0(MW)750	2.65	0.51	0.44	1.42	2.37	0.50	2.87
CX5.0(MW)750	4.76	0.32	0.30	1.13	1.75	0.80	2.55

Identification of surface functional groups by FTIR:-

This study provides qualitative information on the chemical structure of the investigated CX surface. Figure (2) displays the FTIR absorption spectra obtained for the CX samples prepared under different conditions. It is clear that these samples have nearly the same absorption peaks, which ensures the fact that most porous carbon materials are characterized by the presence of carboxylic, phenolic hydroxyl, carbonyl and lactone groups (Shafeeyan et al., 2010). However the difference in the relative intensities of the respective bands indicate that some differences are present in the chemical structure of these samples due to the different preparation methods and conditions. Analysis of the absorption bands for the CX6.5(MW)750 sample, for example [c.f. Figure (2 (a))], shows the following: 1) The absorptions displayed in the range 3688-3082 cm⁻¹ as broad band with maximum absorption centered at 3400 cm⁻¹ is ascribed to O-H stretching vibrations [$\nu(\text{O-H})$] due to the existence of surface hydroxyl groups, with participation of adsorbed water. The asymmetry of this band at lower wave number indicates the presence of strong hydrogen bonds (O'reilly and Mosher, 1983). 2) The weak absorptions displayed in the range 2997-2750 cm⁻¹ as broad band centered at 2918 cm⁻¹ are ascribed to C-H symmetric and asymmetric stretching of some aliphatic species on the sample, i.e. methyl and methylene groups (Li et al., 2013). 3) The absorptions displayed in the range 1360-1138 cm⁻¹ with a maximum centered at 1200 cm⁻¹ can be assigned to C-O stretching in alcohols, phenols, ethers and esters (Figueiredo et al., 1999). 4) The absorption bands displayed in the range 1695-1397 cm⁻¹ with maximum absorptions centered at 1600 and 1460 cm⁻¹ can be attributed to the stretching vibrations of the C=O moieties in carboxylic and lactone systems, overlapping the C=C stretching vibrations of aromatic rings of quinone and keto-enol groups (Figueiredo et al., 1999). The results obtained in the present FTIR absorption studies are in agreement with those obtained by the Boehm-titration method.

Fig. 2:- FTIR spectra of the CX samples obtained under different conditions: (a) different R-F solutions pH values, (b) different CTs and (c) different synthesis methods.

XRD Analysis:-

The X-ray diffraction patterns of the CX samples obtained under different conditions are given in Fig.3 (a-c), whereas those of the OX samples are represented in Fig.3 (d). The peak located at 25.3 can be assigned to the maximum diffraction of graphitic carbon (002) plane (Yoon et al., 2005). Thus, the XRD results indicate that all CX samples are crystalline in nature and consists of a single phase with a graphite structure, as reported also by Oyedoh et al. (Oyedoh et al., 2013). On the other hand, the OX samples are semi crystalline in nature, as shown in figure 3(d). The average crystallite size of the CX samples obtained under different conditions are given in Table (1). It can be observed that the average crystallite size is in the nanoscale range between 5.9 and 9.7 nm.

Fig. 3:- XRD patterns recorded for the CX samples obtained under different conditions: (a) different R-F solutions pH values, (b) different CTs and (c) different synthesis methods, also for the OX samples prepared with different methods (d).

Scanning Electron Microscope (SEM) Observations:-

The surface features of a selected sample [CX6.5(MW)750] was examined by SEM for structure, degree of uniformity and the development of porosity. The SEM results at high magnification, Figure (4(b)), confirm the fine and nanostructured nature of the CX under consideration with fine nanosized grains, wide interparticle voids, interconnected particles with irregular shapes. A uniform pore distribution all over the surface was also observed.

Fig. 4:- SEM micrographs of the CX6.5(MW)750 sample at two different magnifications.

Transmission Electron Microscope (TEM) Investigations:-

The TEM micrographs in Figure (5) at two different magnifications confirms the fine and nanostructured nature of the CX sample. They show distinctly beads of pearl nature of the very fine particles (< 50 nm) and the pores which are originated by the interconnection of CX particles.

Fig. 5:- TEM micrographs of the CX6.5(MW)750 sample at two different magnifications.

Pore Texture characteristics:-

The sorption isotherms of N_2 at 77 K for the CX samples synthesized at different initial R-F solutions pH values are given in Fig. (6 (a)),

Fig. 6:- Nitrogen sorption isotherms at 77K for the CXs obtained under different conditions: (a) different R-F solutions pH values, (b) different CTs and (c) different synthesis methods.

whereas their α_s -plots are shown in Fig. (7 (a)). As shown in Fig. (6 (a)), the type of the isotherm depends largely on the R-F pH value. The adsorption isotherm of the CX3.0(MW)750 sample exhibits type I feature in the BDDT classification (Brunauer et al., 1940) with very sharp "knee" at the low pressures end ($P/P_0 < 0.02$) and very little of the type II features at relative higher pressures. This indicates a developed microporosity with some mesoporosity and capillary condensation (Pradhan and Sandle, 1999). The type II features increase with raising the R-F pH value. The isotherm of the CX6.5(MW)750 sample exhibits type II feature which indicates the more development of mesoporosity, i.e. the presence of mixed micro- and mesoporosity.

Fig. 7:- α_s -Plots for the CXs obtained under different conditions: (a) different R-F solutions pH values, (b) different CTs and (c) different synthesis methods.

The α_s -plots complement the observations obtained from the sorption isotherms, as these plots exhibit features of the type (f) of the α_s -plots classification (Sellés-Pérez and Martín-Martínez, 1991). The α_s plot in (f) is derived from a Type I isotherm or composite of Type I and II isotherms; here micropore filling is followed by multilayer adsorption on a small external surface (Carrott et al., 1987). The evaluated texture characteristics obtained from the BET-equation and α_s -plots are summarized in Table (3). A comparative representation of the data for total surface area (s_t^a), micropore surface area (s_{mic}^a) and non microporous surface area (s_n^a) obtained from the α_s -plots for these CX samples, prepared at different initial R-F solution pH values, are given in Fig. (8 (a)). The following can be observed: 1) The evaluated texture parameters of the CXs prepared under different R-F pH values indicate that these CXs are in general microporous (s_{mic}^a / s_t^a in the range 72.0- 97.0 %) with some mesoporosity (s_n^a / s_t^a in the range 3.0-28.0 %). 2) As the pH increased from 3.0 to 6.5, the surface area increased from 484 to 622 $\text{m}^2 \cdot \text{g}^{-1}$, then decreased sharply to 412 at pH 7.2. Increasing the pH value from 3.0 to 6.0 leads to a greater cross-linking of the already formed clusters due to lower concentration of protons in the media which resulted in a more porous polymeric structure (Zanto et al., 2002b). On the other hand, increasing the pH up to 7.2 causes the condensation reaction to be hindered leading to less cross-linking of the structures and resulting in a much weaker porous structure than at lower pH value. 3) The CX6.5(MW)750 sample possesses the highest total and micropore surface area parameters. It has mixed micro- and mesoporosity. The mesopore volume for this sample is ~ 43 % of the total pore volume.

The sorption isotherms of N_2 at 77 K for the CX samples synthesized at fixed R-F pH value (pH = 6.5) and different CTs are given in Fig.(6 (b)), whereas their α_s -plots are shown in Fig.(7 (b)). These isotherms exhibit type II features in the BDDT classification with sharp "knee" at the low pressures end, which indicates carbons with mixed micro- and mesoporosity. The evaluated texture characteristics are also summarized in Table (3). A comparative representation of the data for s_t^a , s_{mic}^a and s_n^a obtained from the α_s -plots for these samples are given in Fig. (8 (b)). The following can be observed: 1) The texture parameters of the CX samples prepared at fixed R-F pH value (pH = 6.5) and different CTs reflect that raising the CT is accompanied by a continuous development in the total surface area (s_t^a) with a maximum value at 750°C. 2) The micropore surface area (s_{mic}^a) increases continuously with raising the CT up to 800°C. The s_{mic}^a / s_t^a value increases from 17.7% to 98.2 % by raising the CT from 600°C up to 800°C. Also, the V_{mic} / V_p (total) value increases continuously from 5.1 % to 93.6 %. 3) The non-microporous surface area (s_n^a) decreases sharply with raising the CT up to 800°C. 4) When the pyrolysis temperature increases, the micropore volume first increases (due to the opening of the closed pores and a widening of the narrowest micropores already present), then passes through a maximum ($0.212 \text{ cm}^3 \cdot \text{g}^{-1}$) at 750 °C and finally decreases to reach ($0.203 \text{ cm}^3 \cdot \text{g}^{-1}$) at 800 °C.

Fig. 8:- A comparative representation of the data for total surface area (S_t^α); microporous surface area (S_{mic}^α); and non-microporous surface area (S_n^α); obtained from the α_s -plots for the CXs obtained under different conditions: (a) different R-F solutions pH values, (b) different CTs and (c) different synthesis methods.

The sorption isotherms of N_2 at 77 K for the OX and CX samples synthesized by the two different methods are given in Fig. (6 (c)), whereas their α_s -plots are shown in Fig. (7 (c)). As shown in Fig. (6 (c)), the type of the isotherm of the organic or carbon xerogel depends on the synthesis methods. The adsorption isotherm of the OX6.5(C) and CX6.5(C)750 samples exhibits type I feature in the BDDT classification with sharp "knee" at the low pressures end and very little of the type II features at relative higher pressures ($> 0.65 P/P^0$). This indicates a developed microporosity with some mesoporosity and capillary condensation. On the other hand, the isotherm of the OX6.5(MW) sample exhibits type II feature which indicates the presence of mixed micro- and mesoporosity. The isotherm of the CX6.5(MW)750 sample preserves the type II feature with sharp "knee" at the low pressures end ($P/P^0 < 0.05$) indicating also a carbon with micro- and mesoporous structure.

Table 3:- Porous characteristics of the organic and carbon xerogels under different synthesis conditions

The α_s -plots complement the observation obtained from the sorption isotherms. For the OX6.5(C) and CX6.5(C)750 samples, these plots exhibit features of the type (f) of the α_s -plots classification, where the micropore filling is followed by multilayer adsorption on a small external surface. On the other hand, the OX6.5(MW) and CX6.5(MW)750 samples exhibit features of the α -2 type of the α_s plots classification, indicating developed carbon microporosity with some mesoporosity.

The evaluated texture characteristics obtained from the BET-equation and α_s -plots are summarized also in Table (3), which reflects that the organic and carbon xerogels pore texture depends on the synthesis method. A comparative representation of the data for S_t^α , S_{mic}^α and S_n^α obtained from the α_s -plots for the organic and carbon xerogels under conventional and MW synthesis methods are given in Fig.(8 (c)).The following can be observed: 1) Comparing the texture parameters of the OXs [OX6.5(C) and OX6.5(MW) samples] with those of the corresponding CXs [CX6.5(C)750 and CX6.5(MW)750 samples, respectively], reflect that the carbonization process is accompanied by a drastic development in these parameters. 2) The texture parameters of the OX6.5(C) and OX6.5 (MW) samples show that an OX with slightly more developed total surface area and lower microporosity is obtained by the MW induced synthesis method. The OX6.5(MW) sample has predominantly non-microporous character. The non-microporous surface area (S_n^α) is more than 64.0 % of the total surface area (S_t^α) for this sample. This percentage decreases sharply from 64.0 to ~ 17.8 % by carbonization at 750 °C. 3) The texture parameters of the CX6.5(C)750 and CX6.5(MW)750 samples reflect that a CX with more developed porosity (17.8 %) is obtained by the MW induced synthesis method rather than by the conventional synthesis one (4.2 %). 4) The texture parameters of the CX6.5(C)750 sample reflect that the conventional synthesis method produces essentially microporous carbon with wide microporosity (95.8 %) and containing some mesopores (4.2 %). On the other hand, the parameters of the CX6.5(MW)750 sample indicate that the MW induced synthesis method produces, also, microporous carbon (82.2 %) but with slight shift to mesoporosity (17.8 %).

Adsorption of Methylene Blue:-

Fig. (9 (a)) shows the adsorption isotherms of MB on the CX samples synthesized at different R-F pH values and fixed CT of 750°C in nitrogen atmosphere. The graphs are plotted in the form of the amount of MB adsorbed (X) per unit mass of carbon, against the concentration of MB remaining in solution, C_{eq} . The adsorption isotherms show type-H according to the Giles classification (Giles et al., 1960) . They show very steep behavior with various degrees of sharpness or roundness at the low concentration values, tending to a plateau parallel to the C_{eq} -axis. Type-H indicates high affinity isotherm with strong preferential adsorption of the solute (Giles et al., 1960). The results of the Langmuir and Freundlich plots show satisfactory straight lines, which indicate that both of these

adsorption models are applicable. The Langmuir plots are represented in Fig. (10 (a)), whereas the Freundlich plots are illustrated in Fig. (11 (a)).

Fig. 9:- The adsorption isotherms of MB on the CXs obtained under different conditions: (a) different R-F solutions pH values and (b) different CTs.

Table (4) summarizes the adsorption parameters (X_m , K_L , n_F and K_F) derived from both adsorption models. The following can be observed: i) Application of the Langmuir equation is more satisfactory as evident from their higher correlation coefficients (R^2) compared to those of the Freundlich equation. ii) The dye adsorption capacity increases with the increase of the R-F solution pH value up to pH=6.5 then declines. The adsorption capacity increases continuously from 102 to 128 mg. g⁻¹ with increasing the initial pH value from 3.0 to 6.5, respectively. This can be ascribed to the increased adsorption space on the CX surface, due to the increase in the surface area and number of pores accessible to MB molecules with raising the R-F solution pH value up to pH=6.5. The sample prepared at pH= 7.2 has a lower surface area, lower pore volume, and, as a result, lower uptake of MB.

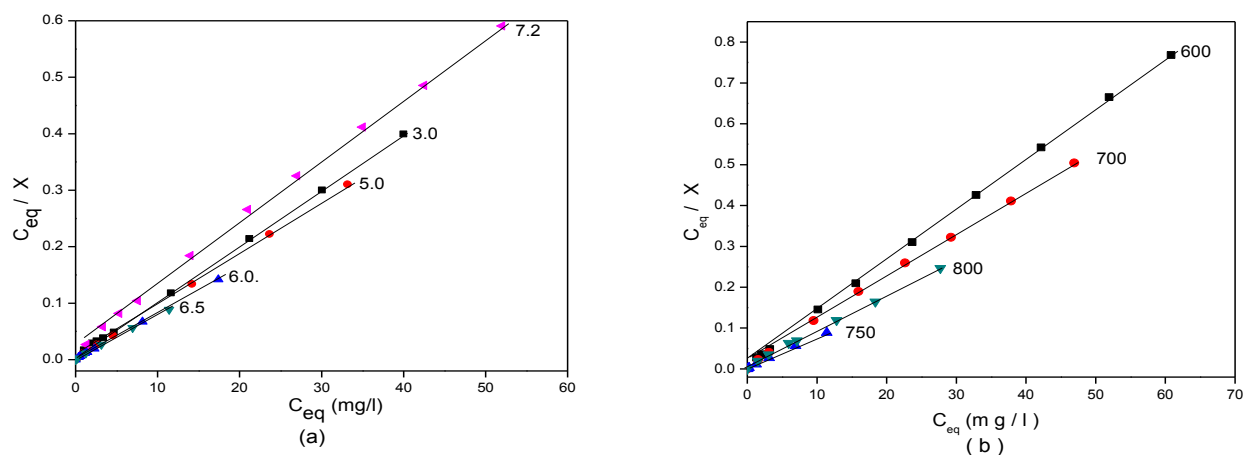

Fig. 10:- Langmuir plots of MB by the CXs obtained under different conditions: (a) different R-F solutions pH values, and (b) different CTs.

Fig. 11:- Freundlich plots of MB by the CXs obtained under different conditions: (a) different R-F solutions pH values, and (b) different CTs.

Table 4:- Equilibrium values of MB adsorption, surface area accessible to M.B and ratio to nitrogen surface area for the investigated CXs.

The adsorption capacity of CXs depends not only on their textural characteristics, but also on their surface chemistry, i.e. the nature of the CX surface, c.f. Table (5) and Fig. (12 (a, b)). The pH of the dye solutions was not adjusted, so that the pH of the CX surface becomes an important determining factor. The pH determines the surface charge of the carbon material, and therefore the electrostatic interaction (attractive or repulsive) between the dye molecules and the adsorbent (Moreno-Castilla and Rivera-Utrilla, 2001). The maximum adsorptivity belongs to the CX6.5 sample. At lower pH values, excessive protonation of the carbon surface occurs which enhances the electrostatic repulsion between the CX surface and MB cations (positively charged), resulting in lower adsorption capacity. At a higher pH value, although the surface of the adsorbent is negatively charged which could favor the adsorption of positively charged MB, the low porosity and surface area decrease this effect. In this case the net synergistic effect of texture properties and surface chemistry of CX7.2 is to reduce the adsorptivity towards MB.

Fig. 12:- Adsorption amounts X_m of MB vs. surface basic (a) and acidic (b) sites obtained from Boehm titration for the CXs obtained at different R-F solutions pH values.

Table 5:- Adsorption amounts X_m ($\mu\text{mol/m}^2$) of MB, total acidic and basic sites (meq/m^2) obtained from Boehm titration for the investigated carbons

Sample notation	X_m (mg.g^{-1})	Total acidic sites (meq.g^{-1})	Basic sites (meq.g^{-1})
Effect of pH			
CX3.0(MW)750	102	2.37	0.5

CX6.5(MW)750	128	1.21	1.20
CX7.2(MW)750	91	1.00	1.25
Effect of CT			
CX6.5(MW)600	80	1.30	0.60
CX6.5(MW)700	93	1.27	1.00
CX6.5(MW)750	128	1.21	1.20
CX7.2(MW)800	113	0.85	1.22

Taking the evaluated X_m and the value of cross-sectional area covered by an adsorbed MB molecule as 120 \AA^2 (Giles, 1969), the surface areas accessible to MB (S_{MB}) were determined. The estimated S_{MB} values are given in Table (4) along with the (S_{MB} / S_t^a) ratios. A comparative representation of the data for total surface area (S_t^a) obtained from N_2 sorption isotherms and surface area accessible to methylene blue (S_{MB}) for the CX samples are given in Fig. (13 (a)). The CX6.5 sample has higher S_{MB} value ($S_{MB} = 499 \text{ m}^2.\text{g}^{-1}$) compared to that for the CX6.0 sample ($S_{MB} = 483 \text{ m}^2.\text{g}^{-1}$), which can be correlated to the less surface acidic nature of this sample (acidic sites = $1.21 \times 10^{-3} \text{ (meq.g}^{-1})$) compared to that of the CX6.0 sample (acidic sites = $1.25 \times 10^{-3} \text{ (meq.g}^{-1})$) [c.f. Table (5)]. However the $S_{MB} / S_{N_2}^a$ value for the CX6.5 sample is lower than that for the CX6.0 sample (i.e. 0.713 and 0.799, respectively) which can be attributed to the development of micro pores inaccessible to MB in the CX6.5 sample. The ability of these CXs for adsorption of MB is reduced by surface acidic groups and enhanced by surface basic sites.

Fig.(9 (b)) shows the adsorption isotherms of MB on the CXs prepared at different CTs in N_2 atmosphere and fixed R-F pH value of 6.5. The isotherms show also type-H according to the Giles classification (Giles et al., 1960). The results of the Langmuir and Freundlich plots show satisfactory straight lines. The Langmuir plots are represented in Fig. (10 (b)), whereas the Freundlich plots are illustrated in Fig.(11 (b)). The Langmuir parameters (X_m and K_L) and Freundlich constants (K_F and n_F) are given also in Table (4). It can be observed that the dye adsorption capacity increases continuously with the increase of the carbonization temperature up to 750°C then declines, the highest value is observed for the CX750 sample. A comparative representation of the data for the CXs obtained at different CTs are given in Table (4) along with the (S_{MB} / S_t^a) ratios, and are represented graphically in Fig. (13 (b)). Table (4) reflects a gradual decrease in the MB accessible surface area ratio (i.e. S_{MB} / S_t^a) with the increase of the CT up to

750°C. The effect of raising the CT was found to increase the porosity up to 750 °C, as indicated previously from the calculated values of S_t^a , S_n^a , and S_{mic}^a , c.f. Fig.(8 (b)). Also, the non-microporous surface area is 82.3 % of the total surface area for the CX600 sample. It decreases sharply to 1.8 % by raising the CT up to 800 °C (i.e. the CX800 sample), [c.f. Table (3)]. It should be remembered here that MB, due to its bulky size, measures only the surface area within pores of diameter $\geq 15 \text{ \AA}$ (Girgis and El-Hendawy, 2002).

Fig. 13:- A comparative representation of the data for total surface area (S_t^a) obtained from N_2 sorption isotherms and surface area accessible to methylene blue (S_{MB}) for the CXs obtained under different conditions: (a) different R-F solutions pH values, and (b) different CTs.

The results obtained from Fig. (14) are in agreement with those observed in Fig. (12), i.e. the ability of these CXs for adsorption of MB is reduced by surface acidic groups and enhanced by surface basic ones.

Fig. 14:- Adsorption amounts X_m of MB vs. surface basic (a) and acidic (b) sites obtained from Boehm titration for the CXs obtained at different CTs.

Conclusions:-

1. The MW induced synthesis method of CXs confirmed the following: a) By varying synthesis conditions such as initial solution pH and calcinations temperature, it is possible to obtain nanostructured porous carbons with different physicochemical properties. The chemical nature of the CXs surfaces depends strongly on the synthesis conditions. b) The texture characteristics obtained from the BET-equation and α_s - plots indicate developed carbon microporosity with some mesoporosity, which depends on the preparation conditions. c) The removal capacity of MB is governed by the chemical structure of the CX surface (i.e. the acidic and basic nature) as well as the diffusion through the intricate internal porosity. d) The best conditions for producing CXs by the MW induced synthesis method is at initial solution pH value of 6.5 and CT of 750°C. These conditions

favor higher yield and carbon content, more surface function groups, higher surface area, wider pore volume and more developed mesoporosity.

2. The effect of the synthesis method confirmed that the MW assisted method has a lot of advantages over the conventional method. The main advantage is the saving of time, resulting in a reduction in the energy consumed, also the prepared CXs have higher surface area, more developed porosity, higher carbon content and more yield than those obtained by the conventional synthesis method.

Nuclear Binding Energy, Origin.

Abstract

On 13 June 1936, Paul Kazuo Kuroda noticed confusion about terms used in Aston's lecture on nuclear energy that would later isolate humanity from reality (God). In 1945, Kuroda secretly retained a personal copy of Japan's design for atomic bombs to finesse post-WWII standard scientific models that obscured Aston's 1922 finding of "powers beyond the dreams of scientific fiction" in rest masses (m) of atoms. Precise nuclear and space age measurements later revealed neutron repulsion as the source of energy (E) in cores of heavy elements like uranium, planets like Jupiter, the Sun, and galaxies that maintain the dynamic, cyclic, now-expanding universe through reversible transitions between two forms of one fundamental particle: Neutrons (compacted electron-proton pairs) and hydrogen (expanded electron-proton pairs), with nuclear charge densities of $Z/A = 0$ and $Z/A = 1$ and reversibly, different rest masses, are the alpha and omega of the cosmos and other all atomic matter with nuclear charge densities of $0 < Z/A < 1.0$. Weizsäcker had mistakenly assumed in 1935 that differences in rest masses of free neutrons and hydrogen atoms remained unchanged when these combine to produce atoms of heavier elements, and thus obtained misleading values of "nuclear binding energy" that obscured neutron repulsion as an important force in the origin and evolution of the cosmos and life in the solar system.

Introduction:-

Kuroda was born on 1 April 1917 and died on 16 April 2001 (Manuel 2001a,b). Kuroda noticed on 13 June 1936, and reported a serious misunderstanding of nuclear energy in his autobiography (Kuroda, 1992, page 6). BBC News (2002) reported that Kuroda had secretly retained a personal copy of Japan's design for atomic bombs, since "just before Japan's surrender in 1945."

The author does not know, but will explain why he believes, Kuroda retained the copy to show others a misunderstanding of Aston's (1922) "packing fraction" might block public acceptance of his conclusion "the beginning of the world may have been just like" Hiroshima's destruction on 6 Aug 1945 (Kuroda, 1982, page 2). Many discoveries subsequently made on the origin and early history of the solar system in fact pointed to the powerful nuclear force in the Sun that was obscured by this 1936 misunderstanding of nuclear energy (Manuel 2016a).

The author and five students finally discovered neutron repulsion in atomic rest mass data, aka Aston's "nuclear packing fractions," (Manuel et al., 2000) and reported this as the source of solar energy at the 32nd Lunar & Planetary Science Conference (Manuel et al., 2001). A copy of the "Cradle of the Nuclides" from the LPSC abstract was sent to Kuroda, beneath the title of this paper as an encrypted message of hope, indelibly recorded in the rest masses of atoms.

This paper celebrates the centennial of Kuroda's birth on 1 April 1917 and his contributions, as a nuclear, geo-, cosmo-chemist at the University of Tokyo (1936-1949) and later at the University of Arkansas (1952-2001), to dating the geo-chronology of hot springs (e.g., Kuroda, et al., 1954), "fall-out" particles from atmospheric nuclear weapons testing (e.g., Clark et al., 1967), and the solar system's origin and chronology at the "beginning of the world" (Kuroda, 1982, page 2).

Kuroda published about 400 scholarly research papers and supervised the research of ~70 PhD students and several postdoctoral research associates (W.A. Myers, University of Arkansas, personal communication, 2002). Two of his papers were cited as Benchmark Papers in Nuclear Chemistry (Seaborg and Loveland, 1982). Rowe (1988), Braun (2013) and Manuel (2016a) summarized Kuroda's major research contributions, and the author nominated Kuroda for posthumous recognition (Manuel, 2017a). The title and first figure of this paper are from the author's last message to Kuroda in 2001.

An outline of this paper was written to confirm recent reports (Manuel 2016a, 2016b, 2016c) of "An Error in Calculated Nuclear Energy" (Manuel, 2017b), posted for public comments, corrected, expanded and retitled, "The Universe Is In Good Hands," aka "There Is A God," to convey a more appropriate message for the centennial celebration of Kuroda's birth - a message of hope for today's distressed society.

Through the throes, violence and racial nationalism in Japan during WWII, and in the United States after WWII, Kuroda developed a magnificent obsession for truth as the ultimate salvation for his own life and for society as a whole (Kuroda, 1982, 1992). Kuroda's obsession was contagiously passed to his students, who learned that rigorous adherence to basic principles of the scientific method and their own creativity and logic could also provide them meaningful lives of continuous discovery. Since Kuroda encouraged students to think for themselves, the author is therefore solely responsible for any errors in the conclusions of this paper. Kuroda did not endorse them, although many are based on Kuroda's scholarly research publications, especially those cited above and in his book, *The Origin of the Chemical Elements and the Oklo Phenomenon* (Kuroda, 1982), in his autobiography, *My Early Days at the Imperial University of Tokyo* (Kuroda, 1992), and in his summary paper with Myers published in *Proceedings of the American Chemical Society symposium on Origin of Elements in the Solar System*, "Xenology, FUN Anomalies and the Plutonium-244 Story" (Kuroda and Myers, 2000).

The conclusions of this paper are simply the author's own interpretation of Kuroda's actions and published reports, in view of his status as an immigrant from a former enemy nation that secretly retained a personal copy of Japan's successful design for atomic bombs (BBC News, 2002).

1. Kuroda noticed on 13 June 1936 and reported publicly in his autobiography (Kuroda, 1992, p.7) that someone "who appeared to be a physicist in his 30's" did not grasp the meaning of Aston's "packing fraction." The goal of this paper and Kuroda's nomination for posthumous recognition (Manuel, 2017a,b) is public awareness of the misunderstanding of nuclear energy that Kuroda noticed in 1936 (Kuroda, 1992, p. 7) and its long-term impact on modern science and public perception of our place in the universe.
2. While standing in the ruins of Hiroshima one day in August 1945, Kuroda was "overwhelmed by the power of nuclear energy. The sight before my eyes was just like the end of the world, but I also felt that the beginning of the world may have been just like this" (Kuroda, 1982, p. 2).
3. As a research mentor, Kuroda demonstrated and taught his students to appreciate the scientific method as the design for a meaningful life of continuous discovery.
4. In a series of papers with W.A. Myers in the 1990s, Kuroda dated the geo-chronology of the early solar system's formation from a supernova explosion, like fallout particles from a nuclear weapons explosion, using a combination of ^{26}Al , ^{238}U and ^{244}Pu age dating to show that refractory silicon carbide (SiC) and graphite/diamond (C) grains in primitive meteorites formed ~1-10 Ma after a supernova explosion (Kuroda and Myers, 1996) made the solar system's actinide elements ~5.1 Ga ago (Kuroda and Myers, 1994).

In 1961 the author independently noticed the error in Weizsäcker's concept of "nuclear binding energy" (Weizsäcker, 1935) and reported the error at the 1966 Annual Meeting of the American Physical Society (Manuel, 1966). Kuroda did not identify the name of the physicist who misunderstood Aston's talk on "nuclear packing fractions" at the Imperial University of Tokyo on 13 June 1936, except by approximate age. Three possible candidates, whose research achievements also reflected a misunderstanding of Aston's (1922) "nuclear packing fractions," are:

- Hideka Yukawa (born 1907) received the 1949 Nobel Prize in Physics for a model of the nucleus that overlooks neutron repulsion (Yukawa, 1949);
- Hans Bethe (born 1906) received the 1967 Nobel Prize in Physics for a solar model based on hydrogen-fusion, rather than neutron repulsion, as the primary source of energy production in stars (Bethe, 1967).
- Carl von Weizsäcker (born 1912) received the 1957 Max Planck Medal for extra-ordinary achievements in theoretical physics. Noting that modern science "has given us the power of Greek gods" (Drieschner, 2014, page 173), Weizsäcker established the Carl Friedrich von Weizsäcker Society in 1994 to promote "wissen und verant-wirtung," aka "knowledge and responsibility," in the areas of "Physics, philosophy, theology, economics and altered awareness" (Drieschner, 2014, page 173-174).

Publication of Weizsacker's (July 1935) neutron-proton model of the nucleus may have influenced Chadwick's (Dec 1935) Nobel Lecture, or visa versa. Chadwick (1935) assumed the validity of the "scheme of quantum mechanics" as reason to alter his earlier conclusion the neutron consists of "a proton and an electron in close combination" (Chadwick, 1932, pages 697 and 708), as had been suggested earlier in Rutherford's Bakerian Lecture (Rutherford, 1920).

Scientists more qualified than the author to evaluate quantum mechanics (Weinberg, 2017, Weinberg et al, 2017) continue to express doubts about the validity of quantum mechanics, but there is no reasonable doubt calculated values of "nuclear binding energy" (Weizsacker, 1935) consistently disagree with observed values of beta-decay by 0.782 MeV (Manuel, 1966) - the exact rest mass difference between the free neutron and the hydrogen atom - and obscure the powerful force of neutron repulsion in ordinary atoms (Manuel et al., 2000), in the Sun (Manuel et al., 2001), in changing Earth's climate (Manuel, et al., 2002), and in the cosmos (Manuel, 2011, 2012, 2016a,b,c, 2017b, and reference cited therein).

Adherence to theoretical models of reality, over experimental measurements of reality, may also explain current unrest over government-funded science in Washington, DC, with the US NAS supporting ScienceDebate.org (2017), a private 501c3 organization calling for a public "March for Science" in Washington, DC next month in response to President Trump concerns about the validity of scientific evidence for human-induced global warming (AGW).

Publication of this paper – as first outlined and posted for public comment as "An error in calculated nuclear energy" (Manuel, 2017b) – will offer "March for Science" promoters an opportunity to consider first evidence the error in calculated nuclear energy (Manuel, 2017b) has altered awareness of evidence the Sun made our elements (Manuel and Sabu, 1975; Sabu and Manuel, 1976a; Manuel et al., 1977; Toth, 1977; Manuel, 1978; Manuel et al., 1979; Sabu and Manuel, 1980; Manuel and Hwaung, 1983), birthed the solar system in a supernova explosion ~5.1 Ga ago (Kuroda and Myers, 1994), controls Earth's climate (Manuel et al., 2002), now holds Earth in continuous harmonic vibration with the Sun (Thomson et al., 2007) and has sustained the origin and evolution of life on Earth for ~4 Ga ago (Michaelian and Manuel, 2011).

The author first met Kuroda in May 1960, two years after Kuroda returned to the University of Arkansas from a personally challenging and professionally unsuccessful year (1957-1958) at Argonne National Laboratory studying radioactive fallout from a series of "nuclear weapons tests being recklessly conducted in the South Pacific" (Kuroda, 1996, p. 64) - a study that "has remained unpublished in scientific journals up to the present time" (Kuroda, 1996, p. 65).

Four years earlier, Kuroda's suggestion of natural, self-sustaining nuclear fission reactors in the early Earth (Kuroda, 1956) had been criticized as impossible at the 1956 National Meeting of the American Geophysical Union (AGU). The author was nevertheless convinced of Kuroda's genius and intellectual integrity and gratefully accepted Kuroda's PhD research assignment on the "Origin of the solar system and its elements" after discussing these recent findings with him:

- Reynolds' (1960a) discovery that the Richardton meteorite contained excess radiogenic ^{129}Xe from in situ decay

- of extinct, 17-Ma year ^{129}I , synthesized just before the meteorite formed;
- Reynolds' (1960b) report that the overall abundance pattern of all nine stable isotopes of primordial xenon in meteorites is distinct from that in air; and
- Kuroda's (1960) suggestion that spontaneous fission of extinct 82-Ma year ^{244}Pu , made just before the Earth formed, generated excess heavy xenon isotopes (^{131}Xe - ^{136}Xe) in air.

These 1960 discoveries were all later confirmed, the last in 1972 by observing an anomalous mix of xenon isotopes (xenon-X) released from primitive carbonaceous meteorites at $\sim 800^\circ\text{C}$ (Manuel et al., 1972) that would cause the overall isotopic abundance pattern of primordial xenon in meteorites to be distinct from that in air (Reynolds, 1960b).

Xenon-X had properties expected in fresh supernova debris, with "the greatest enrichment in the lighter isotopes, $^{124,126}\text{Xe}$, and the heavier isotopes, $^{134,136}\text{Xe}$, relative to ^{130}Xe . These are the isotopes expected to be produced in supernova explosions," (Burbidge et al., 1957) "the $^{124,126}\text{Xe}$ isotopes by the p-process and the $^{134,136}\text{Xe}$ by the r-process" (Manuel et al., 1972, page 100). It was therefore concluded that "no known nuclear or physical process is capable of producing both anomalies in situ" (Manuel et al., 1972, p. 101), within the meteorite itself.

Scientists at the University of Chicago separated mineral fractions of the Allende carbonaceous meteorite, better isolating the fraction containing "strange xenon" (Lewis et al., 1975), or xenon-X (Manuel et al., 1972), and concluded in situ fission of an unknown super-heavy element made "strange xenon" ("xenon-X") inside the meteorite itself.

However the University of Chicago analysis revealed that essentially all primordial helium and neon in the meteorite was trapped in the mineral fraction that trapped "strange xenon," whereas mineral fractions of the Allende meteorite that trapped "normal xenon" had little or no primordial helium or neon (Manuel et al., 1975).

This observation of primordial He and Ne – trapped only in mineral fractions of the primitive Allende meteorite that trapped "strange xenon" (aka, "xenon-X"), and not in the mineral fractions that trapped xenon of "normal" isotopic composition (Lewis et al., 1975) – matched the prediction by Burbidge et al. (1957) that fusion reactions would have depleted light elements from the interior of a star that evolved to the terminal supernova stage, when r- and p-processes of explosive nucleosynthesis might produce "strange xenon," aka "xenon-X" in outer layers of the exploding star - where light elements like hydrogen, helium, carbon and neon remained.

Being convinced that linked, elemental and isotopic anomalies in the Allende meteorite (Lewis et al., 1975) were nucleogenetic, D.D. Sabu and the author wrote and submitted three papers saying a single, local supernova explosion at the birth of the solar system made strange "xenon-X" (Manuel et al., 1972), primordial helium and neon, ^{244}Pu and perhaps some other isotopic anomalies and decay products of short-lived radioactive isotopes that had been observed in meteorites (Sabu and Manuel, 1976a, Sabu and Manuel, 1976b, Manuel and Sabu, 1975) – before going to the 1976 Annual Spring Meeting of the American Geophysical Union to present the first paper.

A protracted discussion of events that occurred there and in other open discussions of the supernova beginning of the solar system in 1976-77 would only distract from the central purpose of this paper and its outline (Manuel, 2017b):

1. Identification of the logical error in Weizsäcker's (1935) definition of "nuclear binding energy" that isolated humanity from reality after WWII (Manuel, 2017b);
2. Celebration of the centennial of Kuroda's birth on 1 April 1917; and
3. Gratitude that we were anyway able to confirm Aston's report of "powers beyond the dreams of scientific fiction" in atoms (Aston, 1922, page 20): Neutron repulsion - indelibly recorded in rest masses of atoms (Manuel et al., 2000, 2001, 2016a,b,c) – powers the Sun, the cosmos and offers humanity a rational scientific explanation for the simple, logical sequence of events that:
 - Made our elements and birthed the solar system in a supernova explosion (Sabu and Manuel, 1976a,b; Manuel and Sabu, 1975; Manuel et al., 1977; Ballard et al., 1979).
 - Condensed highly refractory "fallout" grains of silicon carbide (SiC) and graphite- diamond (C) within the first 1-10 Ma (Kuroda and Myers, 1996) after the supernova exploded, ~ 5.1 Ga ago (Kuroda and Myers, 1994).
 - Accreted terrestrial planets in layers from heterogeneous supernova debris, beginning with formation of iron

cores from Fe-rich debris near the pulsar (Manuel and Sabu 1981).

- Separated d- and l-forms of amino acids (that would later become precursors to life) in primitive carbonaceous chondrites with CP-circularly polarized light from the pulsar (Cronin and Pizzarello, 1997), before a
- Gravitationally trapped photosphere of waste products, mostly H and He (Manuel, 2012), accumulated over the pulsar and moderated the energy of solar radiation to allow the origin and evolution of life to begin on Earth, ~4 Ga ago, when intense UV radiation from the evolving Sun were first absorbed by primitive molecules of life, like RNA or DNA (Michaelian and Manuel, 2011).
- Sustained the evolution of life into humans, with incredible talents, ~79 year life spans, and inalienable rights to self-governance on the water-covered planet orbiting only 1 AU (one astronomical unit) from the supernova pulsar remnant that birthed the solar system.

Results and Discussion:-

Before considering the figures posted below, readers are encouraged to **read carefully** and **consider thoughtfully** two figures in the outline (Manuel, 2017b) showing

- The consistent error, and
- The way it was obscured

In values of nuclear binding energy Weizsacker (1935) calculated for the neutron-proton model of a nucleus composed of two, always distinguishable forms of nucleons: Neutrons and Protons.

The consistent discrepancy between real nuclear stability observed in the ordinary β -decay of isobars – as measured by Aston’s “nuclear packing fractions” (Aston, 1922) and always calculated incorrectly, by exactly 0.782 MeV (the difference in rest masses of the neutron and the hydrogen atom), in Weizsacker’s values of “nuclear binding energies” – shows neutrons and hydrogen atoms simply become two, reversibly interchangeable forms of one fundamental particle when combined to make heavier atoms with mass number, $A > 1$ (Manuel, 2011).

Widespread adoption of Weizsacker’s (1935) flawed model of the nucleus after WWII blocked serious consideration of Kuroda’s realization, standing in the ruins of Hiroshima in August 1945, “the beginning of the world may have been just like this” nuclear explosion (Kuroda, 1982, p. 2).

Kuroda probably retained a personal copy of Japan’s atomic bomb design after WWII (BBC News, 2002) to show others that the same source of energy that destroyed Hiroshima made our elements, birthed the solar system and began a measurable geochronology for the formation of the solar system, its elements and the beginning of the world (e.g., Kuroda, 1982; Kuroda, 1992; Kuroda and Myers, 1994; Kuroda and Myers, 1996; Manuel et al., 2000; Manuel et al., 2001).

Figure 1 shows the message the author sent shortly before Kuroda died in April 2001, a message of hope, indelibly recorded in rest masses of the ~2,850 distinct types of atoms that comprised all known matter in 2000 (Manuel et al., 2000). The author had just returned from the 32nd Lunar and Planetary Science Conference in March (Manuel et al., 2001) where the “Cradle of the Nuclides” was presented to show that neutron repulsion powered the giant nuclear explosion that triggered the formation of the solar system and sustained the current operation of the Sun:

“The Universe Is In Good Hands”

Each dot represents one of the 2,850 nuclides listed in *Nuclear Wallet Cards*, 6th edition (2000) National Nuclear Data Center, Brookhaven National Laboratory, 74 pp.

Figure 1:- The above message of hope for humanity was sent to Kuroda in April 2001. This “Cradle of the Nuclides” had been published in research papers. It was published on the front cover and inserted in the front flyer pages of the Proceedings of the 1999 ACS Symposium on the Origin of Elements in the Solar System as it was going to press (Manuel, 2000). Combined U/Pb, Pu/Xe and Al/Mg age dating of primitive meteorites and their refractory inclusions by Kuroda and Myers (1994, 1996) showed that a supernova exploded shortly before the oldest meteorites formed, about five billion years (~5.1 Ga or ~5,100 My) ago. Five students enrolled in a graduate course, Special Topics in Nuclear Chemistry, at the University of Missouri-Rolla in the spring semester of 2000 helped the author use computer-assisted 3-D images of atomic rest masses to identify neutron repulsion there (Manuel et al, 2000)

Figure 2 shows how the discovery and confirmation of decay products from 82 My ^{244}Pu in the Earth, in meteorites and in man-made ^{244}Pu (Kuroda, 1960; Rowe and Kuroda, 1965; Alexander et al., 1971) was used to determine and illustrate the geo-chronology and early history of the solar system’s formation.

Figure 2:- Combined U/Pb and Pu/Xe age dating of primitive meteorites, dated back from the present by Kuroda and Myers (1994), show the geochronology of primitive meteorites in the early solar system after a supernova explosion birthed the solar system, shortly before the oldest meteorites formed about five billion years (~5.1 Ga or ~5,100 My) ago.

Figure 3 shows how Kuroda and Myers (1996) used the discovery of excess ^{26}Mg from the decay of extinct ^{26}Al in the Allende meteorite (Gray and Compston, 1974) to demonstrate the geo-chronology of formation of silicon carbide and graphite-diamond refractory grains in primitive meteorites with the physical properties of single fallout particles after nuclear detonation (Clark et al., 1967).

Figure 3:- $^{26}\text{Al}/^{26}\text{Mg}$ age dating of refractory meteorite inclusions of silicon carbide and graphite (diamond) show their formation within the first 1-10 My after the supernova, with physical properties like those of "fall-out" particles from nuclear explosions (Kuroda and Myers, 1996). Grains that formed first grew larger and trapped higher levels of radioactive ^{26}Al ($t_{1/2} = 740,000$ yr or 0.74 My), like the fractionation of fission products in single fallout particles after a nuclear detonation (Clark et al, 1967).

We cannot see the Sun's core, but it may be indistinguishable from this Chandra x-ray image of the pulsar formed in 1054 AD by the supernova explosion that produced the Crab Nebula.

Fig. 4:- The creator, destroyer and sustainer of every atom, life and planet in the solar system is a pulsar like the one above that birthed the Crab Nebula in 1054 AD. Toth (1977) proposed a solar pulsar, Kotov (1996) measured and confirmed the 160 minute solar pulse Toth (1977) had noted earlier as the forth of regular, 40-minute pulses, Manuel et al. (2002) noted the implications for solar eruptions and Earth's climate, Thomson et al. (2007) demonstrated the effects of solar vib-rations on engineering and scientific systems, interplanetary magnetic fields,

atmospheric pressure, induced voltages on ocean cables, and terrestrial seismic data, and Karoff et al. (2016), Clery (2016), Persson (2016) note abrupt solar eruptions may periodically reset civilization.

Conclusion and Acknowledgements:-

The author is honored to write this manuscript to celebrate the centennial of the birth of Paul Kazuo Kuroda on April 1, 1917. Kuroda risked his life and the wrath of united world governments after WWII so humanity might know the simple sequence of geo-, cosmo- chrono-logical events that produced life from highly radioactive debris of a supernova that exploded here five billion years (~5.1 Ga) ago, sustained the origin and evolution of life into humans, and endowed them with remarkable talents and inalienable rights to self-governance on a water-covered planet orbiting ~1 AU (one astronomical unit) from the pulsar remnant that was, and still is, powered mostly by neutron repulsion, the mysterious source of energy Aston discovered and reported as “powers beyond the dreams of scientific fiction” in “nuclear packing fractions” of ordinary atoms (Aston, 1922).

This paper is meant to be suggestive only. We are at the beginning of a new awakening to reality and know only a little. More will be revealed if we selflessly practice the basic principles of science for the benefit of humanity, as exemplified by the life and career of Paul Kazuo Kuroda.

Numerous friends, anonymous scientists and bloggers encouraged publication of this summary of the heroic efforts of the late Professor Paul Kazuo Kuroda (1917-2001) to prevent the misuse of nuclear secrets to isolate humanity from reality, including two well-known geo-ethicists, Drs. Nils-Axel Möerner and VáclavNěmec .

Ratio Analysis, CMIE, GLS Method,
Textile Industry and Profitability.

Abstract

The financial performance of the textile industry in Tamil Nadu had been analyzed with the help of the financial ratios. The financial structure of a company can show its capacity to generate the funds needed to undertake the desired expansion. The financial performance assessment together with other efficiency criteria, will give an idea of the total efficiency and industry performance. The success of the company ultimately depends upon its future growth and development. The company's future can never be predicted with accuracy without having precise information related to its present financial position and its past earnings. In addition, the present study analyzed the impact of the performance of liquidity, solvency and efficiency on the profitability of the textile industry using CMIE data. The study found the impact of financial ratios, such as return on capital employed and net profit ratio, on the profitability of textile industry in Tamil Nadu, was meticulously studied. From the Generalized Least Square method it was found that absolute liquidity ratio had the highest impact among the financial ratios on the return on net profit ratio as well as creditors' turnover ratio is highest impact on return on capital employed during the study period with statistical significance.

Introduction:-

It presents a detailed analysis of the determinants of financial performance of textile industry in Tamil Nadu using financial ratios. The financial structure of a company can show its capacity to generate the funds needed to undertake the desired expansion. The financial performance assessment together with other efficiency criteria, will give an idea of the total efficiency and industry performance. The success of the company ultimately depends upon its future growth and development. The company's future can never be predicted with accuracy without having precise information related to its present financial position and its past earnings. Ratio Analysis is an age-old technique of financial analysis. The financial position of the textile industry in Tamil Nadu is analyzed with the help of the financial facts and ratios such as: liquidity, solvency, efficiency and profitability. In addition, the present study analyzed the impact of the performance of liquidity, solvency and efficiency on the profitability of the textile industry. Liquidity and profitability are the two desired goals of financial management and they are directly affected by the working capital management. With increase in working capital size beyond the adequacy level, liquidity improves and profitability declines, and vice versa. **Ratio Analysis:** This is an age-old technique of financial analysis. It provides the financial statements in an absolute, historical and static form. It is also designed to show

Corresponding Author:-Dr. Marimuthu KN.

Address:-Assistant Professor, Department of Management Studies, Manonmaniam Sundaranar University, Tirunelveli – 627 012.

how one number is related to another and the meaning of such relationships. A ratio is worked out by dividing one number by another number.

Objectives of the Study:-

- To study the financial performance of the textile industry in Tamil Nadu
- To find out the impact of financial ratios (liquidity, solvency and activity) on the textile industry of profitability ratio

Hypothesis of the Study:-

H1 There is a significant impact of Liquidity, Solvency and Activity ratios on ROCE

H1 There is a significant impact of Liquidity, Solvency and Activity ratio's on the Net Profit Ratio

Research Methodology:-

The study sought to measure the financial performance of textile companies, registered under CMIE list. These industries are spread over the state of Tamil Nadu in India. 234 companies were listed under CMIE and 18 companies were listed under NSE/BSE as well as the availability of data for the last ten years (2005 to 2014), which was chosen for the study.

Review of Literature:-

The SINET report (2007) has briefly discussed about the Indian cotton textile industry and its contribution to our country's export, economy, production and employment. It has also analysed the industry's financial indicators of return on capital employed (ROCE), operating and net margins and also earning stability, etc. Anupkumar&Subhash (2011) measured the level of technical efficiency of firms in the Indian textile industry and identified the factors that account for efficiency variation across firms, using the data envelopment analysis (DEA) in non-parametric methodology. Kunal and Lokinder (2009) sought to understand the impact of liberalisation on the Indian textile industry, by comparing the performance of firms incorporated before and after the liberalisation period. Kataria (1996) analysed the financial position of some selected units of the cotton textile industry of Malwa region to judge their profitability and financial strength. Noel, John and Scott (1990) determinants of industry, firm and business financial performance can be used as measures of individual relationships in models linking various hypothesized causal variables of various performance indicators. Mansur (2003) assessed the financial performance of textile industry, using ratio analysis, to determine the financial and operational efficiency. Ram and Mayank (2002) extend the prior work done on the relation of Indian firm characteristics and their financial performance. Alovsat&Abdulmecit (2001) focused on the profitability margin of the export-oriented textile industry of Turkey in the post crisis period. Manasranjan, et. al, (2005) examined the causal relationship between the three variables, the study used granger causality and co-integration test for the period of 1970-2004. Waqas, et.al, (2013) analyzed the factors affecting firm performance in the textile and food sector of Pakistan, using panel/longitudinal data of companies (non-financial) listed in KSE for the years 2005 to 2010.

Analysis and Interpretations:-

Liquidity Ratios: -

Liquidity ratios measure the capacity of the business to meet its short term financial commitments as and when these become due. Investors regularly take a close look at liquidity ratios when performing fundamental analysis on a company. Since a company consistently having trouble meeting its short-term debt, it is at a higher risk of bankruptcy, liquidity ratios are a good measure of whether the firm will be able to comfortably continue as a going concern (Walker, 2011: Ukessays, 2013: Saravanan&Abarina, 2014).

Current Ratio:-

Current Ratio expresses the precise relation between current assets and current liabilities. It indicates the availability of current assets in rupees for every one rupee of current liabilities. A high current ratio indicates high liquidity; while a low current ratio indicates low liquidity. It is sometimes difficult to decide what should be the satisfactory current ratio of any company. Generally, the manufacturing industry ratio of 2:1 is traditionally considered as a benchmark of adequate liquidity, and, in India, as 1.33:1 (Prasanna Chandra, 2004). The current ratio is a very important tool to the outsiders, as well as to the management. It is a measure of the firm's ability to meet its short-term liabilities to the outsiders. From the management side, this ratio discloses the magnitude of the current assets that the firm carries, in relation to its current liabilities. For an outsider, the larger the ratio, the higher is the liquidity

of the company. A very high ratio means that the firm is having idle assets and, hence, there could be some inefficiency in management of its short term funds. Nevertheless, the current ratio is a quick measure of the company's liquidity, as it tests only the quantity - and not the quality. The constraint of this ratio indicator lies due to size, type of the investor and the quality of the receivables of the enterprise.

Table-1 reveals that the average current ratio of the sample companies varied between 0.90:1 and 4.76:1 during the study period. The current ratio was 1.47:1 in 2005, which increased to 1.66:1 in 2006 and then decreased to 1.42:1 in 2008. Thereafter, it marginally declined to 1.39:1 in 2009. Thereafter, it gradually increased to 1.80:1 and reached the level of 1.42:1 in 2014. The analysis shows that the average ratio was lower than the standard, which indicates that sample companies had maintained a sufficient level of liquidity during the study period since the current ratio was above the benchmark of 1.33:1. This indicates that most of the sample companies have maintained the current ratio, as compared to the benchmark of 1.33:1

An in-depth analysis of Table-1 reveals that the companies VTML, BASL and SCL had a very high current ratio. In contrast, companies SSL, KSML and KGDL had a very low current ratio. SSL, KSML & KGDL are likely to have difficulties in meeting their short term obligations, because most of their current assets consist of inventory. VTML, BASL and SCL are likely to meet their current obligations as and when these become due, because a large portion of their current assets consists of cash and accounts receivables. Normally, accounts receivable are highly liquid and can be converted into cash quickly. The standard deviation is universally used to measure the confidence level in statistical conclusions. Usually, the standard deviation close to zero indicates that the data points tend to be very close to the average/mean of the set, although a high standard deviation indicates that the data points are spread over a wider range of values. In this study, when the standard deviation was high, it indicated that the firm has more deviation from the mean/average. It explains that firms (KGDL, KSML SSML and SSL) had not maintained consistent current assets to meet their obligations.

Quick Ratio:-

Table-2 shows the quick ratios of the sample companies. Quick ratio indicates the direct liquidity of current assets that are easily convertible into cash. Recognising that inventory might not be very liquid, this ratio takes into account the quickly realisable assets and measures these against the current liabilities. This is a more refined and conservative estimate of the company's liquidity than the current ratio, since it establishes a relation between liquid assets and current liabilities. Conventionally, a quick ratio of 1:1 is considered to be a more satisfactory measure of the liquidity position of a concern. While this ratio does not entirely supplement the current ratio and, when used in conjunction with it, tends to give a better picture of the company's ability to meet its claims out of the quick assets.

It is evident from Table-2 that the overall average of the quick ratio was 0.62:1 during the period under study. The quick ratio showed a downward trend throughout the period of ten years. It was 0.58:1 in 2005, which gradually decreased and reached lowest level of 0.70:1 in 2013. It is evident from the Table that the overall quick ratio of the sample companies, taken together, was more than unity. The trend clearly reveals that the sample companies had not improved their overall liquidity position over a period of time. In this study, when the standard deviation was found to be high, it indicated that the firm has more deviation from the mean/average. It explains that firms, VTML and NEPCTL, had not maintained consistent liquid assets to repay their creditors. The coefficient of variation of the sample companies was 35.08%, which shows a lesser variation among the units, indicating that they had followed a uniform policy for quick ratio during the period under study. The coefficient of correlation of the quick assets and current liabilities was +0.99. This reveals that there had been a perfect positive correlation between quick assets and current liabilities. This leads to the conclusion that an increase in current liabilities can trigger an increase in quick assets in the same proportion. An in-depth analysis of Table-2 reveals that companies, VTML and NEPCTL, had very high quick ratios, while companies, ACML and KSML, had very low quick ratios.

Absolute Liquidity Ratio: Cash to Current Liabilities:-

This ratio is also known as cash position ratio. Though current ratio and acid-test ratio are important tools to measure the liquidity position of the company of a going concern, this ratio is appropriate to measure the absolute liquidity of the concern. As it indicates the availability of cash to meet the current obligations immediately. If the firm begins with a shortage of absolute cash in meeting its current obligations and if this trend mounts up to heavy burden on the finances of the company, this may even cause cash insolvency of the business. Early detection of this kind of situation by the management is a sine-qua-non for the continuity of the business. Table-3 exhibits the ratio of cash to current liabilities.

Among the companies, the proportion of cash to current liabilities reveals that this was in the range of 0.96% to 0.02%. The average of all the sample companies was 0.12% in 2005, which decreased to 0.11% in 2008 and then marginally increased to 0.20% in 2010. Thereafter, it decreased to 0.06% in 2011 and reached 0.10% in 2014. Most of the companies were not in a position to meet their current liabilities from their cash balances. The study reveals that, during the study period, on an average, the sample companies had 0.16% of cash against their current liabilities. The acceptable specific norm for this ratio is 0.25:1 or 1:4, i.e., Rs.1 worth of cash is considered adequate to pay Rs. 4 worth of current liabilities in time, as all the creditors are not expected to demand at the same time. The company's cash may also be realised from receivables and inventories. As the selected companies had almost equivalent amounts to the specific norm, it indicates their sound cash position. The overall average of total cash to total current liabilities of the selected companies was 0.16% during the study period. The coefficient of variation of the selected companies was very high, i.e., 73.35%. It clearly indicates that they had not followed a uniform policy of maintaining cash during the period under study. In this study, when the standard deviation was high (VTXIL & BASL), it indicated that the firm has more deviation from the mean/average. It explains that firms were not maintaining a sufficient liquid assets position to meet their quick obligations. A deeper analysis of the Table reveals that the companies, VTML, BASL and STL, had exceptionally high cash balance, whereas companies, RML and SSL, had an exceptionally low cash balance of current liabilities. In addition, absolute liquid assets, such as marketable securities and cash in bank, were found to be high, whereas the current liabilities, such as bank overdraft, sundry creditors, bills payable and creditors for outstanding expenses, were found to be low. High ratio reflects that absolute liquid assets worth one half of the value of current liabilities was sufficient for satisfactory liquidity position of the companies.

Solvency Ratios:-

Solvency ratios throw light on the long-term solvency of a firm, while the liquidity ratios, on the short-term solvency. These measure the long term financial viability of a business and its ability to pay off its long-term obligations such as bank loans and bonds payable. It is critical for banks, government, employees, institutional investors, bond holders, owners, etc. (Obaidullah, 2011). Solvency ratios include: debt-to-equity ratio, fixed charge coverage ratio, debt-to capital ratio, times interest earned ratio, and debt-to assets ratio.

Debt-Equity Ratio:-

Table-4 shows the Debt-Equity ratio, the ratio of total liabilities of a business to its shareholders' equity. It is a leverage ratio and measures the degree to which the assets of the business are financed by the debts and the shareholders' equity in a business. Lower values of the debt-equity ratio are favourable and indicate less risk. A higher debt-equity ratio is unfavourable, because it means that the business relies more on external factors. Thus, it is at higher risk, especially at higher interest rates. A debt-equity ratio of 1.00:1 means that half of the assets of a business are financed by debts and the rest by the shareholders' equity. A value higher than 1.00 means that more assets are financed by debt than by the money of shareholders.

It is evident from Table-4 that the overall average of debt-equity ratio was 2.42:1 during the period under study. The debt-equity ratio showed an upward trend throughout the period of ten years. It was 0.12:1 in 2005, which gradually increased and reached a peak level of 0.25:1 in 2006. It is evident from the Table that the overall debt-equity ratio of the sample companies, taken together, was more than unity, suggesting thereby that the companies were investing more funds from outside, compared with shareholders' funds. If it is more than the ideal ratio, it should meet more obligations from outside with high risk. However, less than the ideal ratio means that the company is utilising own funds with its structure, by avoiding the risk.

The standard deviation close to zero indicates that this data points tend to be very close to the average/mean of the companies, although a high standard deviation indicates that the data points are spread out line over a wider range of values. In this study, when the standard deviation was high (CFL & VTML), it indicated that the firms had more deviation from the mean/average. It explains that the firms were borrowing more funds from the outsiders, rather than utilising their own assets effectively. An in-depth analysis of the Table reveals that companies, SSIL, KPRML and VTML, had a very high debt-equity ratio, while companies, LMCL and GTL, had a very low debt-equity ratio.

Interest Coverage Ratio:-

This ratio measures the debt servicing of a firm, in so far as fixed interest on long term loan is concerned. It is determined by dividing the Net Profit before Interest and Tax by the fixed interest charges. It is also known as "time-interest-earned ratio," or debt service ratio, or net income to debt service ratio, or coverage ratio, or fixed

charges over. The lower the interest coverage ratio, the higher would be the company's debt burden, and greater the possibility of bankruptcy, or default. A lower ICR means less earnings are available to meet interest payments and that the business is more vulnerable to an increase in interest rates. When a company's interest coverage ratio is only 1.5, or lower, its ability to meet interest expenses may be questionable. An interest coverage ratio below 1.0:1 indicates that the business is having difficulties in generating the cash necessary to pay its interest obligations, i.e., the interest payments exceed its earnings (EBIT).

It is evident from Table-5 that the overall average of the interest coverage ratio was 2.08 during the period under study. Interest coverage ratio showed an upward trend throughout the period of ten years. It was 2.83 in 2005, which gradually increased to 3.14:1 in 2006. Thereafter, it decreased to 1.56:1 in 2008, and went up to 2.59 in 2011. It reached 1.77 in 2014. There was an impact of the global meltdown on textile companies during 2008 to 2009. The interest coverage ratio indicates the capacity of an organisation to meet its interest obligations. An interest cover ratio of 2 implies that the entity has sufficient profitability to bear twice the amount of its current financial costs. On the whole, the standard deviation close to zero indicates that this data points tend to be very close to the average/mean of the companies, although a high standard deviation indicates that the data points are spread over a wider range of values. In this study, when the standard deviation was high (as in the case of VTXL & CFL), it indicated that the firms had more deviation from mean/average. It explains that the firms were not capitalising on the relatively cheaper source of finance (debt). Also, in such instances, an increase in gearing ratio may actually add value to the company. The company expected the least financial risk (low debt financing) and high interest coverage ratio. It explains that the company preferred equity financing through venture capital institutions, rather than loan financing due to the high level of risk. An in-depth analysis of the Table reveals that the VTML and KPRML companies had a very high ICR, while LMCL and GTL companies had a very low ICR.

Any company tries to control its borrowings, to avoid more interest repayment. Due to the impact of a weak ratio, a company may have to face difficulties in raising funds for its operations. Companies operating in plants that are exposed to a high level of business risk and uncertainty would generally prefer to maintain lower levels of financial risk (lower debt financing) and higher interest coverage ratios. Many start-up companies prefer equity financing through venture capital institutions, rather than loan financing, due to the high level of risk involved and such companies would tend to have very high interest ratios. Some industries tend to have higher interest coverage ratios than others, and cyclical companies, in particular, can experience significant swings in their interest coverage ratios (especially during downturns). Thus, comparison of interest coverage ratios is generally most meaningful among companies within the same industry, and the definition of a "high" or "low" ratio should be made within this context.

Activity Ratios:-

Activity ratios are concerned with measuring the efficiency in asset management. It measures the efficiency with which a business utilises its assets, such as accounts receivable, inventories, and fixed assets. The common operating ratios are: the average collection period ratio, the inventory turnover ratio, days of inventory ratio, the fixed asset turnover ratio, and the total asset turnover ratio. The success or failure of the concern too depends much upon proper and judicious use of the resources. This ratio may be defined as a test of the relationship between sales and the various assets of a firm.

Debtors' Turnover Ratio:-

The debtors' turnover ratio indicates the efficiency achieved by using the funds invested in debtors. A high debtors' turnover ratio indicates quick collections and enables the firm to transact a larger volume of business, without an increase in the investment of receivables. As per Spiller and Gosman, the analysis of the receivables turnover ratio supplements the information regarding the liquidity of the receivables. Table-6 shows the debtors' turnover ratio during 2005 to 2014. The overall average turnover ratio of the sample companies registered a fluctuating trend throughout the period under study and was 12.03 times in 2005, which decreased to 9.26 times in 2006 and then showed an upward trend and fell to 11.67 times in 2010 and finally it marginally increased to 32.23 times in 2014. It is evident from Table-6 that the overall average of the debtor's turnover ratio was 18.28 times during the period under study. This shows that the selected companies had efficient management of receivables, as compared to the overall average ratios. The coefficient of variation of 72.71% of the sample companies indicates that they had followed a uniform policy with regard to debtors during the period under study. Out of the eighteen selected textile companies, eight of them were found to have a turnover rate higher than the overall average of 18.28 times, while 10 had a lower overall average debtor's turnover ratio. An in-depth analysis of the Table reveals that companies,

VTML and GTL, had a very high turnover ratio, while companies, VTXIL, KGDL and CTL, had a low turnover ratio.

Inventory Turnover Ratio:-

Inventory Turnover Ratio is one of the efficiency ratios and measures the number of times, on an average, that the inventory is sold and replaced during the fiscal year. It measures a company's efficiency in turning its inventory into sales. Its purpose is to measure the liquidity of the inventory. Inventory Turnover Ratio is figured as "turnover times". Average inventory should be used for inventory level, to minimise the effect of seasonality. Table-7 shows the inventory turnover ratio during 2005 to 2014. The overall average turnover ratio of the sample companies registered a fluctuating trend throughout the period under study and was 4.46 times in 2005; which increased to 4.54 times in 2009, and then showed a downward trend and fell to 3.71 times in 2011. Finally, it marginally increased to 5.29 times in 2014.

It is evident from Table-7 that the overall average Inventory Turnover Ratio was 4.39 times during the period under study. It reflects that the selected companies had an efficient inventory management system, as compared to the overall average ratios. The coefficient of variation of the sample companies is 34.17%, which indicates that they had followed a uniform policy with regard to inventory during the period under study. Out of the eighteen selected textile companies, seven companies had a turnover rate higher than the overall average of 4.39 times, while 11 had a lower overall average inventory turnover ratio. The high variation of coefficient of ACML and BSSL reflects that these companies had not followed the inventories accounting methods properly, which are indicated by: "last in first out (LIFO)" method, which shows higher costs of goods sold and lower inventories than companies using "first in first out (FIFO)" Method. In addition, high variation shows that special promotions, new product introductions can suddenly and somewhat artificially change the company's inventory ratio. An in-depth analysis of the Table reveals that NEPCTIL and KSML companies had a very high turnover ratio, while ACML, VTXIL and STL companies had a low turnover ratio.

Creditors' Turnover Ratio:-

This ratio is calculated by taking the total purchases made and dividing it by the average accounts payable during the period. It is used to measure the rate at which a firm pays off its suppliers. It's also known as an Accounts Payable Turnover Ratio, or Creditors' Velocity. Accounts payables turnover trends can help a company to assess its cash situation. Just as accounts receivable ratios can be used to judge a company's incoming cash situation, this figure can demonstrate how a business handles its outgoing payments. The higher ratio should indicate that the payments are made promptly. Table-5.8 shows the creditors' turnover ratios during 2005 to 2014. The overall average turnover ratio of the sample companies registered a fluctuating trend throughout the period under study and was 20.10 times in 2005, which increased to 25.14 times in 2007 and then showed a downward trend and fell to 13.44 times in 2009 and finally marginally increased to 39.78 times in 2014. It is evident from Table-8 that the overall average of the creditor's turnover ratio was 25.57 times during the period under study. The average payment period was less than the standard. It shows that the payments are made earlier. This may be due to better liquid resources and working capital. The coefficient of variation of 71.11% of the sample companies indicates that they had followed a uniform policy with regard to the creditors' collections during the period under study. A high ratio (prompt payment) is desirable, but a company should always avail the credit facility allowed by the suppliers.

Out of the eighteen selected textile companies, six were found to have a creditors' turnover ratio higher than the overall average creditors turnover ratio of 19.80, while 12 had a lower than the overall average creditors' turnover ratio. The high standard deviation of CFL, GTL and KGDL shows that data sets of the companies were not close to the mean/average. It explains that suppliers and creditors of the companies were not paying the bills in the right time period. It also suggests that new vendors were being paid back very slow. An in-depth analysis of the table reveals that ACML and NEPCTL companies had a very high creditors' turnover ratio, while VTXIL, SCL and VTML companies had low creditors' turnover ratios.

Profitability Ratios:-

Profits are the measure of the overall efficiency of a business. Profitability is an indication of the efficiency with which the operations of the business are carried on. Poor operational performance indicates poor sales and poor profit. The higher the profits, the more efficient the business is. A lower profitability may arise due to lack of control over the expenses. It must be remembered that profit is an absolute measure of the earning capacity, and profitability is the relative measure of the earning capacity. Important profitability ratios are: return on capital employed ratio,

gross profit margin ratio, net profit margin ratio, operating profit margin ratio, return on assets ratio and return on equity ratio. It highlights how effectively the profitability of a company is being managed.

Return on Capital Employed:-

Return on capital employed is also known as rate of return. It establishes the relationship between profits and the capital employed. It also reveals the earning capacity of the capital invested in the business. It is widely used to measure the overall profitability and efficiency of the business concern. The main objective of making investments in any business is to obtain a satisfactory return on capital invested in the business. It measures the profitability of a company, by expressing its operating profit, as a percentage of its capital employed. Capital employed is the sum of the stockholders' equity and long-term finance. Alternatively, the capital employed can be calculated as the difference between total assets and current liabilities. This ratio is useful to show the efficiency of the business as a whole.

Table-9 shows the return on capital employed during the period under study and also depicts that the overall average return on capital employed was 12.74%. It was 15.92% in 2005, which increased to 16.44% in 2006. Thereafter, for the next three consecutive years, it showed a declining trend, and fell to 3.55% in 2009, but increased to 16.98% in 2014. The ROCE greater than unity indicates, that the higher efficiency of the sample companies in the utilisation of assets to generate sales. The coefficient of variation of 98.88% of the samples companies shows higher variation among the company ratios', which indicates that these companies had followed different policies for the return on capital employed during the period under study. It reveals that there was a lesser perfect positive correlation between profits and capital employed. This leads to the conclusion that increases in capital employed led to an increase in proportion of profits of the companies. An in-depth analysis of the table reveals that companies SSIL and KPRML had a very high return, while companies GTL and CFL had a very low return on capital employed.

Return on Equity:-

This ratio reveals the relationship between profits of a company and its equity shareholders' funds. Net profit after interest, tax and preference dividend is divided by the equity shareholders' funds. It is a measure of the profitability of the stockholders' investments. It shows the net income as a percentage of shareholder equity. Net income is considered for the full fiscal year, after taxes and preferred stock dividends, but before common stock dividends. Shareholders' Equity does not include preferred stocks. Return on Equity varies substantially across different industries. Therefore, it is recommended to compare returns on equity against company's previous values or return of a similar company. The ratio of return on equity of the sample companies moved in a very wide range - varying from -96.60% to 77.09% during the period under study. This ratio was 15.26 in 2005, which increased to 19.60% in 2006. It then maintained an increasing trend and reached 16.61% in 2014. The companies show the negative - 11.92% in 2009 due to the impact of global meltdown and recovered in the year 2011 and reached a peak level of 21.09. The average percentage of return on equity was 9.07% during the period under study. This shows the conservative policy adopted by the managements of the sample companies.

It is evident from Table-10 that the overall average of the return on equity ratio was 9.07% during the period under study. It is assumed that the assets, without corresponding liabilities, are the direct creation of the shareholder capital that helps the company to grow in the first place. The coefficient of variation of 460.83% of the sample companies indicates that they had not followed a uniform policy with regard to equity returns during the period under study. The high standard deviation of CFL and NEPCTL shows that the data set points were not close to the mean and were away from the mean line. An in-depth analysis of the Table reveals that the companies GTL and SSIL had very high returns on equity ratio, while companies NEPCTL and CFL had low returns on equity ratio.

Operating Profit Ratio:-

The operating profit ratio measures whatever proportion of a company's revenue is left over, after deducting direct costs and overheads, before taxes and other indirect costs, such as interest. It measures a company's pricing strategy and operating efficiency. It gives an idea of how much a company makes (before interest and taxes) on each rupee of sales. The operating margin ratio shows whether the fixed costs are too high for the production or sales volume. The operating cost is equal to the cost of goods sold, plus the operating expenses. Non-operating expenses, such as interest charges and taxes, are excluded from the computations. The operating profit ratio of the sample companies moved in a narrow range varying from 7.95% to 22.34 during the period under study. This ratio was 17.51 in 2005, which reached the peak level of 22.34% in 2006. Thereafter, it declined for the three consecutive years to 7.95% in 2009 and increased to 18.12% in 2011 and reached 20.09% in 2014. The average operating profit ratio was 15.84%

during the study period. This shows the conservative policy adopted by the managements of the sample companies to use's sales revenue to cover the cost of goods sold and operating expenses.

It is evident from Table-11 that the overall average ratio of the operating profit was 15.84% during the period under study. The coefficient of variation of 87.21% of the sample companies indicates that they had not followed a uniform policy with regard to operating profit ratio. The high standard deviation of the companies, CFL and GTL, shows that the data sets of these companies were varying too high and not very close to mean/average. It explains that, the companies were not making enough money from their ongoing operations to pay for their variable and fixed costs. An in-depth analysis of the Table reveals that the companies, ACML and RML, had a very high ratio of the operating profit, while companies, CFL, GTL and CTL, had a low ratio of the operating profit.

Net Profit Ratio:-

This ratio reveals the overall profitability of the concern. Net profit ratio establishes the relationship between net profit (after taxes) and sales. It is expressed as a percentage of sales. It indicates the efficiency of the management in manufacturing, selling, administrative and other activities of the firm. This ratio is very useful to the proprietors, because it reveals the overall profitability of the business concern. It is also called "Net Profit to Net Sales ratio". This ratio indicates the result of overall operations of the firm. The net profit ratio of the sample companies moved in a wide range, varying from -7.27 to 9.45 during the period under study. This ratio was 5.52 in 2005, which increased to the high level of 9.45 in 2006. Thereafter, it decreased for the next three consecutive years to touch -7.27 in 2009, due to the impact of the global meltdown, and recovered within a year, to reach 4.51 in 2011. Once again, it fell to -2.74% in 2012 due to low market price for the raw materials and reached 5.12 in 2014. The average percentage of the net profit ratio was 2.83 during the period 2005 to 2014. This shows the conservative policy adopted by the managements of the sample companies.

It is evident from Table-12 that the overall average ratio of the net profit was 2.83 and the coefficient of variation of the sample companies was negatively placed at 124.84%. The high standard deviation of the companies reflects that the companies were not constantly improving their profitability. Also, they were not comparing the ratio with those of the previous years, the industry's average and the budgeted net profit ratio. An in-depth analysis of the table reveals that BASL and ACML companies had a very high ratio of the net profit, while companies, GTL and CFL, had a low ratio of the net profit.

Impact of Liquidity, Solvency and Activity ratios on Return on Capital Employed using Generalised Least Square Method:-

(OLS) techniques were used due to high correlation. Before going to use OLS, one should consider the impact of independent variables on the ROCE of the profitability ratio. In order to examine the impact of both independent and dependent variables of the textile companies, ordinary least squares tests the stationarity on the variables, if it is a time series data. The study applied the unit root tests as per the augmented Dickey Fuller and Phillips-Perron (PP, 1988) method to avoid spurious regression results. If the first and second difference does not satisfy the stationarity, it would reflect that multi-collinearity, or auto correlation.

$$Y = \alpha + \beta X_i + e.$$

It has been observed that the correlation is given the multi-collinearity, to avoid more than two variable of multi-collinearity, used in the generalised linear square method.

$$\text{Generalised Least Square } Y^* = \alpha + \beta X_i^* + U_i$$

Here, Y^* = Transformed Dependent Variable (Y/σ), X_i^* = Transformed Independent Variables (X_i/σ), σ = Standard Error

The generalised Linear Square method indicated that the profitability was high, as depicted by its independent variables. It is also evident from the value of R^2 that 0.967 percent of variation in ROCE was accounted for by the joint variation in the independent variables of financial performance. The Adjusted 'R' Square (R^2) signifies that 0.935 percent of the positive variation in the ROCE is explained by the independent variables. The high standard error of the regression coefficients demonstrates that there is really a line of estimates among the variables.

H1 There is a significant impact of Liquidity, Solvency and Activity ratios on ROCE

Generalized Least Square Statistics and Hypotheses Results

	Coefficients	Standard Error	t Stat	P-value	H
Intercept	1.88	20.09	0.09	0.93	
Current Ratio	96.85	46.23	2.09	0.07	Not Accepted
Quick Ratio	-41.52**	13.20	-2.52	0.03	Accepted
Absolute Liquidity Ratio	23.99	28.09	1.02	0.33	Not Accepted
Debt Equity Ratio	-0.68	5.49	-0.12	0.90	Not Accepted
Interest Coverage Ratio	5.12**	0.81	6.33	0.00	Accepted
Debtors Turnover Ratio	13.37	6.98	1.92	0.09	Not Accepted
Creditors Turnover Ratio	-152.42	72.88	-2.09	0.07	Not Accepted
Inventory Turnover Ratio	1.29	1.87	0.69	0.51	Not Accepted

** = statistically significant at 5% level

It can be observed from the above Table that current ratio is having the high positive impact on the return on capital employed and was statistically insignificant at 5% level. It reflects that the capital employed was the sum of stockholders' equity and long term finance. The capital employed is the difference between total assets and current liabilities. Here, the assets are impacting more on the return on capital employed. On the other hand, the estimated coefficient of quick ratio shows the negative impact on the capital employed, which is statistically significant. The estimates coefficients of absolute liquidity ratio were found to be having a high negative impact on the ROCE, which was statistically insignificant. DER and ICR of the coefficients shows the positive impact on the ROCE, which was statistically insignificant by DER and significant by ICR at the level of 5%. It reflects that debt into a company's total capital provides a more comprehensive evaluation, as well as management's usage of debt and equity disposal. DTR, CTR and ITR were found to be having a positive and negative impact on the ROCE, which was statistically insignificant. During the years 2005 and 2008 to 2010, the stock turnover and the average collection period had shown adverse trends, which indicate the deteriorating level of inventory management and stock collection policy. In the year 2012 all those ratios showed high and low fluctuations. The main reason for that was the availability of raw materials at low cost and the less duty on textile products by the government. An insignificant variation in financial ratios could be the result of the composite effect adopted in the analysis, as well as many other financial ratios-related unexplained variables. Hence, we can agree with the alternative hypothesis *there is no significant impact of Liquidity, Solvency and Activity ratios on ROCE of the textile industry in Tamil Nadu*.

Impact of Liquidity, Solvency and Activity ratios on Net Profit Ratio, using the Generalised Least Squares Method:-

The strength of the relationship between the dependent variable, net profit ratio (NPR) and all the independent variables are taken together to look into the impact of independent variables on the NPR of the profitability ratio. In order to examine the impact of both independent and dependent variables of textile companies, ordinary least squares (OLS) techniques were used, due to the high degree of correlation. Before going to use OLS, one should test the stationarity on the variables, if it is time series data. The study applied the unit root tests as per the augmented Dickey Fuller and Phillips-Perron (PP, 1988) method to avoid spurious regression results. The first and second differences were not satisfying the stationarity, which reflect the multi-collinearity, or auto correlation.

$$Y = \alpha + \beta X_i + e.$$

It is observed that the correlation given the multi-collinearity, to avoid more than two variable of multi-collinearity, used in the generalized linear square method.

$$\text{Generalised Least Square } Y^* = \alpha + \beta X_i^* + U_i$$

Here, Y^* = Transformed Dependent Variable (Y/σ), X_i^* = Transformed Independent Variables (X_i/σ), σ = Standard Error

The Generalised Least Square method indicates that the profitability was high impacted by its independent variables. It is also evident from the value of R^2 that 0.99 percent of variation in NPR was accounted for by the joint variation in independent variables of financial performance. The Adjusted 'R' square (R^2) signifies that 9.97 percent of the positive variation in the NPR is explained by the independent variables. The low standard error of the regression coefficients demonstrates that there is really a line of estimates among the variables. Note that the p-values for all the coefficients, with the exception of the coefficient for profitability, are lower than 0.05. This means that we

cannot reject the hypothesis that they are zero or below 0.05 (so it can be eliminated from the model). This is also confirmed from the fact that the 0 lies in the interval between the confidence level of the lower 95% and the upper 95% for each of these coefficients.

H1 There is a significant impact of Liquidity, Solvency and Activity ratio's on the Net Profit Ratio

Generalized Least Square Statistics and Hypotheses Result.

	Coefficients	Standard Error	t Stat	P-value	Hypotheses

** = statistically significant at 5% level.

It was observed from the above Table that current ratio having the high positive impact on the net profit ratio was insignificant at 5% level. It replicates that an increase or decrease in current assets will impact the net profit ratio of the companies. The estimated coefficients of the QR and ALR were found to be having a positive and high negative impact on the net profit ratio of the textile companies, which was statistically significant at 5% level and insignificant by ALR. On the other hand, the estimated coefficient of ICR and CTR were found to be having a positive impact on the net profit ratio, which is statistically insignificant by ICR. The collection system was found to be faulty, because the debtors were enjoying a credit facility beyond the normal period. The performance of debt collection was found to be poor. It reflects that company were neglecting the increase of the credit position, as also the decreasing debt burden, while making repayment at high interest rates. Two other important indicators of efficiency, DTR and ITR, were having a low negative impact on the net profit ratio of the companies, which are statistically significant at 5% level by DTR and insignificant by ITR. Hence, we can agree with the alternative hypothesis *there is no significant impact of Liquidity, Solvency and Activity ratio's on Net Profit Ratio of the textile industry in Tamil Nadu.*

Findings, Suggestions and Conclusion:-

The financial performance of the textile industry in Tamil Nadu had been analysed with the help of the financial ratios. VTML Company performed better than the other companies throughout the period of the study in the areas of: current ratio, quick ratio and absolute liquidity ratio. As regards debt-equity ratio, CTL and RML Company scored better than the other companies. ACML Company was the best performer in the area of interest-coverage ratio. A higher debt-equity ratio was noticed in SSML. VTML Company better performed in less time to collect the receivables compared with other companies in the debtor's turnover ratio. The inventory turnover ratio of textile industry in Tamil Nadu fluctuated significantly during the period under study. NEPCTL also occupied the first place in inventory turnover ratio. The inventory management was better in KGDL. However, the age of inventory gradually declined during the period of the study. The high accounts payable turnover ratio is not always good enough in the interest of a company. LMCL Company performed better than the other companies during the study period in the area of medium creditor's turnover. The contribution made by shareholders to the capital structure was found to have gradually increased in textile industry of Tamil Nadu. ROCE is a more comprehensive test of profitability and SSIL Company performed with high return among the companies. At the same time, CFL Company's average return on equity fluctuated very badly during the period of the study. The higher operating profit ratio reveals the less net profit ratio. RML Company was found to have a high operating profit among the textile companies. However, BASL Company was earning the highest net profit among the select textile companies during the study period. The impact of financial ratios, such as return on capital employed and net profit ratio, on the profitability of textile industry in Tamil Nadu, was meticulously studied. From the Generalised Least Square method it was found that absolute liquidity ratio had the highest impact among the financial ratios on the return on net profit ratio as well as creditors' turnover ratio is highest impact on return on capital employed during the study period with statistical significance. During the course of the study, it was found that some companies were giving more attention to only liquidity and solvency aspects of the performance and taking more conservative decisions, leading to the

decline in their profitability. There is an urgent requirement to bring about changes in the approach of the management. Each company should give suitable weightage to the performance aspects of liquidity, solvency, and activity and profitability ratios. STL showed good performance in a very short span, as it was able to maintain its aggressive approach towards the working capital. Other companies also need to adopt more aggressiveness in maintaining their current ratio at 2:1 and improving their profitability. Both VTXIL and STL Company were found to be having very huge funds blocked in inventories and receivables. This could be due to the company's size of operation, and also to obviate issues like diseconomies of scale. The selected companies are advised to review their working capital frequently with tools like funds flow and cash flow statement and cash control reports. All the companies were found to have enough resources to meet their obligations over the next business cycle. At the same time, the current ratio values were varying from company to company, due to their respective demand and supply conditions and their own position in the market. However, it is suggested that all the sample companies should maintain the ratios at least equal to the benchmark level of 2:1. Meanwhile, the companies should avoid the idle assets, rather than keeping these as cash/liquidity in the business. Companies should maintain the ideal Absolute liquidity ratio in the business, which is productive and earning, and also taking care of liquidity. If the firm begins with a shortage of absolute cash in meeting its current obligations and if this trend imposes a heavy burden on the finances of the company, this may even cause cash insolvency of the business. Further it is suggested that companies should avoid the sine-qua-non for the continuity of the business. Overall debt-equity ratio of the sample companies, taken together, was more than unity, suggesting thereby that the companies were investing more funds from outside, compared with shareholders' funds. If it is more than the ideal ratio, it should meet more obligations from outside with a risk. However, less than the ideal ratio means that the company is utilizing its own funds within its structure, by avoiding the risk. Companies should maintain the average inventory level, instead of the ending the inventory level, to minimize the adverse impact of seasonal factors. Further, the companies should also solve the negative coefficients of absolute liquidity ratio, debtor's turnover ratio, as well as debt-equity ratio.

Abstract

In 2002, Germany legalised prostitution through the enactment of the Prostitution Act, thereby following one of the most liberal regulationist approaches to date. The following year, New Zealand enacted the Prostitution Reform Act 2003, which has become an often-referenced example of decriminalisation. Despite both jurisdictions following a regulationist approach, New Zealand's model has attracted much positive international attention, whereas the German approach is used as an example of the shortcomings within regulationism. Drawing on the findings of the governmental evaluations of both New Zealand's and Germany's prostitution legislation, this article argues that the significant differences between the New Zealand and German models of regulating prostitution are not to be found within the legislation, but rather in the evaluation thereof. This finding calls into question the evidence presented within the evaluation of approaches to prostitution, and suggests that there may be other societal factors which decide how the success of legislation is determined. In Germany, the evaluation of the 2002 Prostitution Act (Prostitutionsgesetz) resulted in a move towards stricter regulation of prostitution. This article examines the changes to the law that will enter into force in July 2017, which are aimed at ensuring that the rights of sex workers in Germany will not just be protected in theory, but also in practice.

Introduction:-

As a subject matter that divides people in their opinions regarding morality, best practice, society and laws, prostitution and the way it should be regulated in individual jurisdictions is a contemporary topic that regularly finds its way into governmental debates regarding the best way to regulate the issue. As will be demonstrated in the following article, there are a number of different approaches to regulating prostitution, and much debate regarding whether these approaches are appropriate to effectively deal with prostitution in relation to the desired objectives sought to be achieved by a particular government. In contemporary law reform discussions, a general practice can be found in examining other jurisdictions and the approaches taken in order to evaluate whether a particular approach would be similarly suitable in one's own jurisdiction. As will be demonstrated in the following, a country often referred to in relation to decriminalisation, is New Zealand, with their regulationist approach to prostitution. However, Germany, as one of the countries with the most liberal regulationist approach to prostitution, is rarely used as a similar role model in this sense. In order to examine why this may be the case, the following will examine the German model of regulationism in light of the upcoming changes to their legislation on prostitution, which will be

entering into force in July 2017. In particular, the focus will be on the German experience of regulationism in legal practice, what has been learnt, and how this has affected the upcoming German law reforms. In light of the German legal terminology, the words prostitutes and sex workers will be used interchangeably.

The Theoretical Approaches to Prostitution:-

There are a number of terms used in relation to the regulation of prostitution in law and policy. Many are commonly used interchangeably to describe different legal approaches, such as “criminalisation” and “prohibitionism,” in some cases “legalisation” and “decriminalisation” as well as in other cases “decriminalisation” and “abolitionism.” However, when investigating the terms, it becomes clear, that what is often used to describe a particular regulatory system in the media or certain policy documents, or even in certain journal articles, is not actually in line with the theoretical meaning of the terms, which leads to confusion. In this sense, it has to be explained that these terms fall into two fundamentally separate categories. In this sense, the Council of Europe Resolution 1579 (2007) is correct when explaining that the three predominant approaches adopted in the 47 member states of the Council of Europe are prohibitionist, regulationist and abolitionist.¹ This is because these three terms actually address and describe regulatory approaches. However, it is often found that decriminalisation is mentioned as a fourth option, often with reference made to the system in New Zealand.² However, “decriminalisation” is not an approach in itself. Instead, it is a function, or a tool used within the development of approaches, which merely describes the absence of criminalisation. In this sense, the terms “criminalisation” and “legalisation” fall into the same category of legal terminology. Accordingly, “criminalisation” describes the process of making an activity prohibited under criminal law provisions³ and “legalisation” describes the process of reform in which something, which was considered illicit, ceases to be viewed as such under the law, and instead becomes legitimate.⁴ In this sense, although these latter three terms may constitute key attributes within the regulatory approaches to prostitution, they are not the same and cannot be used interchangeably.

In terms of the different theoretical regulatory approaches to prostitution, prohibitionist approaches generally target both the sale and the purchase of these services by utilising criminalisation. Prohibitionism can also involve a categorical prohibition of certain behaviours, which are closely related to selling or purchasing sexual services, including activities like street solicitation, or running agencies or sex businesses.⁵

Abolitionist approaches involve policies, which do not unconditionally criminalize acts of prostitution or activities closely related. The defining attribute of an abolitionist approach is that it will target only one side of an interaction in an attempt to make the entire interaction obsolete. Usually the side targeted is the procurement side, which is then categorically criminalized, as it is thought that the elimination of demand will eliminate the entire transaction.⁶

Regulationism refers to a set of policies that neither criminalise the sale or purchase of prostitution services nor any other activities that are closely related. Accordingly, regulationist approaches will legalise the activity itself, however, while imposing certain restrictions, which differentiate prostitution from other transactions or businesses. Restrictions in this sense can involve, for instance, imposing age restrictions or introducing targeted health regulations.⁷ This attribute of regulationism differentiates it from full decriminalisation. Full decriminalisation may be what is meant by “decriminalisation” when used to describe a regulatory approach to prostitution. Full decriminalisation refers to a set of policies that incorporate normalisation or laissez-faire.⁸

Calls for the Decriminalisation of Prostitution:-

Over the past decades, there have been numerous calls for decriminalisation of prostitution. These calls become particularly public, when governments open discussions for potential law reforms in the area of prostitution.⁹ The ideas that are put forward in this situation usually relate to the general feminist ideas of decriminalization, which involve the objective of decriminalizing “prostitution in those places where it is still a crime to be or to visit a whore.”¹⁰ However, as the term “decriminalization” refers to the complete abolition of any laws, which seek to criminalize prostitution as well as any offences that are related to prostitution,¹¹ it is implied that prostitution activities are legitimised as a form of work.¹² Thus, decriminalisation would involve removing any penal sanctions, while avoiding to introduce any legal measures to regulate prostitution.

When looking through a number of bills and reports from governments reviewing potential changes to the laws on prostitution, New Zealand is often referred to and discussed as an example of decriminalisation in the false use of the term.¹³ New Zealand sought to decriminalise prostitution in 2003 with the implementation of the Prostitution Reform Act (PRA).¹⁴ The objectives of this piece of legislation were claimed to be to decriminalise prostitution,¹⁵ construct a legal framework to protect sex workers’ human rights and prevent them from being exploited, as well as to promote sex workers’ welfare and occupational health and safety and to “contribute to public health; and prohibit the use of prostitution of persons under 18 years of age.”¹⁶ These objectives already indicate that what is being referred to as “decriminalisation” is not what the theoretical concept of decriminalisation dictates. Instead, it appears that New Zealand’s decriminalisation approach is a form of regulationist approach. This becomes even more apparent when looking more closely at the various provisions that were implemented through the PRA, such as, for instance the provisions listed in part 2 of the Act which regulate prostitution as commercial sexual services,

including regulating an age restriction of 18 years of age or a certification regime for owners or managers of brothels.¹⁷

A point which will be interesting when looking at the German regulatory approach is that the first purpose named listed in the PRA 2003 is to “[safeguard] the human rights of sex workers and protects them from exploitation”¹⁸ and that the first regulatory provision of commercial sex in part 2 is that “No contract for the provision of, or arranging the provision of, commercial sexual services is illegal or void on public policy or other similar grounds.”¹⁹ As it is already clear from the theoretical concept of the term “decriminalisation” that the approach taken in New Zealand is regulationist rather than fully decriminalised, the question arises what makes this approach unique in relation to other regulatory approaches to prostitution.

The main reason for this can be the reported success of the approach, as promoted by the New Zealand Government. In this sense, the PRA underwent governmental evaluation in 2008 by a governmentally arranged Law Review Committee.²⁰ The main findings of this report were that the PRA had not had any significant impact on the amount of sex workers working in the sex industry; that the PRA protected the rights of children, in the sense of people under the age of 18 years; that the PRA succeeded in protecting adults’ right to refuse engagement in sex work, which included being able to refuse particular clients or sexual services, and that the PRA offered sufficient protection from exploitative and degrading employment practices.²¹ The report suggests that this protection of the sex workers’ rights was only achieved through decriminalisation, in the sense of having removed the illegality of this kind of work. This is not disputed here. The use here of decriminalisation is clearly in line with the meaning of the term as explained above. In this sense, it can be argued that New Zealand decriminalised prostitution. However, it should be emphasised that this was only one part of the overall regulatory approach taken.²²

Although the report noted that the Act had not managed to eliminate all exploitative practices in practice, there was clear evidence from their qualitative study that more sex workers felt they were likely to report any incidents of violence they had experienced to the police. Street work was still claimed to be dangerous for sex workers, who were urged to either leave the industry entirely or move their work to safer, indoor settings.²³ Tim Barnett, a New Zealand Member of Parliament, who had sponsored the Prostitution Reform Bill while it was passing through Parliament, stated that the decriminalisation of prostitution had resulted in a “massive improvement in police-sex worker cooperation” that had facilitated the solving of murders of sex workers, the exposure and conviction of corrupt and law breaking brothel owners and police, as well as the detection of traffickers of sex workers.²⁴ According to the New Zealand Prostitutes Collective, the approach to prostitution in New Zealand ensures the protection of prostitutes’ rights, health and welfare.²⁵ Furthermore, they emphasise that this not only protects sex

workers from exploitation, but also provides them with the legal opportunity to report any violence they encounter to the relevant authorities without having to fear any action being taken against them or their clients by the police.²⁶

The New Zealand model has been emphasised as an example in various governmental reports looking at the issue of the regulation of prostitution. In this sense, the UK House of Commons, for instance, examined the New Zealand model in their Third Report of Session 2016–17.²⁷

The German Approach to Regulating Prostitution:-

The German approach to prostitution is openly regulationist by nature, with many counting it not only as the most liberal approach to prostitution in Europe, but also as one of the most liberal approaches in the world.²⁸ Nevertheless, the discussions about prostitution reform tend to focus on the New Zealand model, or even the Dutch model, rather than the German approach.²⁹ One of the reasons for this could be the stark criticism Germany has received in light of the size of its sex industry.³⁰ In this sense, Germany is often referred to as the “bordello of Europe.”³¹ However, the following will look at the German model in closer detail, in order to demonstrate that this system may not be as different as the New Zealand model, which is often referred to as “decriminalisation.” In particular, the following will also address how the German criticalness of their own system may be one of the root causes of its international disrepute, rather than the disadvantages within the system itself. In order to understand the German viewpoint in the laws, a brief overview will also be provided on the legal system prior to the introduction of the Prostitutionsgesetz (Prostitution Act) (ProstG) in 2002.³²

One of the initial critiques of the former prostitution laws in Germany, as explained by Philipp S. Fischinger,³³ is that prostitution as the “world’s oldest profession” was essentially, a millennia-old set of double standards which involved a form of legal discrimination. On the one hand, there were the clients, who lived a respectable life as first

³²Germany 2002 Prostitution Act (ProstG).

³³Philipp S Fischinger and Norbert Habermann, §§ 134-138; Anh. Zu § 138: Prostg (1st edn, Sellier - de Gruyter 2011), §1 ProstG.

class citizens, whereas on the other hand, there was the sexual services providing prostitute, who was mostly regarded as a second class citizen and was exposed to social contempt. In Germany, prior to the introduction of the ProstG, this societal double standard was also implemented through the laws of the state: On the one hand, prostitutes were required to pay income and sales tax.³⁴ On the other hand, they were denied access to social security and were categorized as acting in violation of moral standards (*Sittenwidrigkeit*).³⁵

This was also found to be reflected in the German jurisprudence over several decades, starting with the equation of prostitution with ("Ausübung von Gewerbsunzucht") professional criminals in the Bundesverwaltungsgericht (BVerwG - The German Federal Administrative Court).³⁶ This had the effect that prostitution could not fall under the protection of Article 12 of the German Constitution (das Grundgesetz (GG)).³⁷ The Bundesverwaltungsgericht maintained this conception for several decades due to the perception of prostitution being a violation of moral standards and as such *contra bonos mores* and in many aspects socially repugnant.³⁸ This position was also put forward in 1981, when it was held that prostitutes could not be granted free movement rights in accordance with European Economic Community (EEC) law.³⁹ In the area of civil law, the jurisprudence of the Bundesgerichtshof (BGH – The German Federal Court) not only considered prostitution contracts as *contra bonos mores*, but also contracts such as for telephone sex⁴⁰ or for loan agreements for the purpose of financing brothels.⁴¹ In 1973, in the area of criminal law, the BGH even differentiated between whether the victim was an "unblemished woman" or a prostitute, in the determination of the culpability of a rapist.⁴² Around the turn of the millennium, a significant change became apparent in the courts' jurisprudence to a softer attitude towards prostitution. The BVerwG changed its decision regarding the free movement status by revoking its previous decision, which stated that prostitutes were not part of economic life.⁴³ Moreover, the Bundesfinanzhof (BFH – The German Federal Fiscal Court) started to think it possible to reconsider its previous decisions on the taxation of prostitution based on changes in public opinion,⁴⁴ and the BGH distanced itself from its previous decision on telephone sex.⁴⁵ In particular, a decision from the Verwaltungsgericht Berlin (Berlin administrative court) marked a significant change in the attitudes towards prostitution, as it clearly rejected the *contra bonos mores* of sex services as well as the idea of them being a violation of human dignity.⁴⁶

A significant indicator for the change of public opinion in Germany was the result of a representative study used in the rationale of this case. This study looked into the public opinion in Germany as to whether prostitution should be recognised as employment. The study revealed that almost two thirds of the questioned participants thought that prostitution was to be considered to be legal employment.⁴⁷

The significance of this decision was that prior to the ProstG entering into force, the central legal issue surrounding prostitution was the characterisation of prostitution contracts as being *contra bonos mores*.⁴⁸ This meant that even after a prostitute had fulfilled the service, he or she did not have any legally enforceable demands.⁴⁹

The Creation of the Law for the Improvement of the Legal and Social Status of Prostitutes:-

The creation of the law for the improvement of the legal and social status of prostitutes is only comprehensible on the basis of the previously described legal situation. Following calls for reform for many years,⁵⁰ the German legislature started drafting a prostitution code.⁵¹ Despite diverse ideas on how this was to be conducted, all parties of the Bundestag (the German House of Representatives) agreed that the legal status of prostitutes had to be improved.⁵² Apart from the purely legal changes, a primary goal was to send a clear signal that the social double standards were to be removed.⁵³

The German prostitution code is essentially based on three pillars: Under civil law, the prostitute should have an entitlement to the agreed remuneration after the service has been performed.⁵⁴ Secondly, the access of prostitutes to social security should be enabled or facilitated. Finally, the expungement of § 180a Abs. 1 No. 2 StGB (Strafgesetzbuch – The German criminal code) was to give prostitutes the possibility to be legally safeguarded and to voluntarily act as persons in dependent employment in brothels. The objective was to achieve an improvement of working conditions in these types of establishments.⁵⁵

The most significant part of the ProstG (Prostitution Code) is the first of three paragraphs, which states:

⁵⁴Germany 2002 Prostitution Act (ProstG) §§ 1 & 2.

⁵⁵Deutscher Bundestag, (n 51) 6.

§1 When sexual acts have been undertaken for a previously agreed fee, the agreement shall constitute a legally valid claim. The same applies if a person, especially in the context of an employment relationship, keeps the provision of such acts ready against an agreed fee for a certain period of time.⁵⁶

The *ratio legis* of the 2002 code, as evidenced by the draft justification, is solely the legal improvement of the prostitutes' status as opposed to brothel managers.⁵⁷ The two key priorities in the introduction of this provision, were to remove any barriers prostitutes may have accessing social security⁵⁸ and to create a civil claim for prostitutes against clients or brothel and club managers, when sexual acts have been performed, or have been kept ready.⁵⁹ The intention was to help prostitutes in two respects: Legally, by granting prostitutes an enforceable claim due to the repeal of the contractual finding of *contra bonos mores*, as well as factually, by reducing the dependence of prostitutes on procurers or pimps, as prostitutes no longer required the help of so-called "fist law."⁶⁰ This point is crucial in looking back at the provisions in New Zealand, as it becomes apparent that both models base their legalisation on the contractual notion of eliminating contracts for sexual services becoming void on the basis of *contra bonos mores* provisions.⁶¹

Another interesting point to be made is one of the key motivations for the German legislators to argue for the legalisation of sex services. Due to the history of human rights violations during the Third Reich period in relation to the holocaust and other atrocities which took place during the time of the Second World War, the highest legal provision on the basis of which all other laws need to be measured can be found in the first article of the German Basic Law, which essentially is the German constitution, states that human dignity shall be inviolable.⁶² The strong sense that human dignity needs to be ensured and protected at all costs is typical of a German legal philosophy. Accordingly, it is interpreted widely. As a basic human right, the protection of human dignity is a defensive tool to protect citizens from the state. In this sense, the wide understanding of the inviolability of human dignity includes preventing the state from dictating what an individual's dignity entails. Accordingly, part of the protection of dignity entails being able to decide for oneself what is and what is not in accordance with one's own dignity.⁶³ However, although the state understands that it is not able to decide whether providing sexual services is in accordance with one's own understanding of one's dignity, the German government accepts the responsibility to protect its citizens regardless of the way they perceive their own human dignity, and the life choices they make on the basis of this.⁶⁴ Thus, the German model is based mostly on ensuring the human rights' protection of prostitutes, including providing them legal protection from harm, by ensuring they are able to press charges under criminal law, as well as to make civil action claims,⁶⁵ as well as ensuring access to social security provisions. In this sense, prostitutes in Germany are entitled to the same rights as any other worker, including pension rights, holidays, sick leave, maternity

⁵⁶Translated from German: § 1 ProstG: "Sind sexuelle Handlungen gegen ein vorher vereinbartes Entgelt vorgenommen worden, begründet diese Vereinbarung eine rechtswirksame Forderung. Das Gleiche gilt, wenn sich eine Person, insbesondere im Rahmen eines Beschäftigungsverhältnisses, für die Erbringung derartiger Handlungen gegen ein vorher vereinbartes Entgelt für eine bestimmte Zeitdauer bereithält."

or parental leave and healthcare.⁶⁶ Again, this human rights emphasis mirrors the same objectives found in the New Zealand model.

The Scope of the German Prostitution Act:-

Due to the fact that the ProstG only consists of three paragraphs, in which the working has deliberately been kept as general as possible, the scope of the code and its effects in practice are far reaching. The way this works in practice will be addressed in the following, in particular, by laying out the scope of application.

In personal terms, the ProstG applies to all genders of prostitutes, including male, female, transsexual and hermaphrodites.⁶⁷ This has been the case since the date the code came into force, in other words since the 1st January 2002.⁶⁸ Due to the short and general nature of the ProstG, it is not surprising that the material scope was not clearly defined within the wording of the act, and, thus, needed to be established by legal interpretation.

According to von Galen, the material scope of the ProstG is to be interpreted narrowly. Hence, “sexual acts” in the sense of the first sentence of the first paragraph are to be understood the same way as the term would be understood in society, meaning the performance of sexual acts with or in front of a client with direct contact.⁶⁹ This interpretation would exclude practices such as telephone sex, the performance of sexual intercourse on stage in front of a public audience, peep-shows, striptease performances or webcam transmissions of a sexual nature.

However, the prevailing opinion appears to distance itself from this narrow interpretation by concentrating on the term “sexual act” in the sense of § 1 S 1 ProstG instead of “prostitution.”⁷⁰ The only counterargument to this is title of the act referring to the “legal relationship of prostitutes” as well as the fact that the legal materials and § 3 of the act consistently refer to the term “prostitution.” However, it is apparent that the drafters did not understand the term prostitution in the same narrow sense as stated above. Instead, in accordance with the draft act, prostitution is understood to mean “the commercial performance of sexual acts.”⁷¹ Furthermore, in accordance with the intentions of the drafters, the reference to “sexual act” will not only apply to sexual acts in the traditional sense between two people, commonly of different genders. It is also argued that the initial objective to protect the status of prostitutes justifies a wide interpretation. Moreover, the fluctuations⁷² in practices, pose difficulties in determining what is included within the definition or not. This difficulty in setting boundaries within the definitions is seen as a further supporting argument for a wide interpretation.⁷³

It appears that the entire scope of the ProstG relies on the term “sexual act.” This commonly refers to “every human act or acquiescence, which is directed at sexually arousing and satisfying another.”⁷⁴ This may include all forms of sexual acts, regardless whether a form of penetration has taken place. The key indicator is intention. Hypothetically, this could even include neutral acts such as gynaecological examinations or gymnastic exercises as long as the sexual intent can be subjectively established. This widens the scope of the definition of “sexual act” in the ProstG beyond the definition of the same term used in German criminal law.⁷⁵ In this sense, even acts such as telephone sex or cyber transmission could be included.⁷⁶ It is assumed, that a wide interpretation is accepted here, due to the fact

that this is a matter of civil law, and is, thus, not connected to punitive evidence.⁷⁷ This also explains the fact that the mere acquiescence is sufficient without any requirement to have actively performed something.⁷⁸ Thus, the passive participation in sexual acts is also included.

Despite these differences between the civil and criminal legal realms, it is debated whether the definition of a "sexual act" in civil law requires an element of significance, as is the case in § 184g of the German Criminal Code (hereinafter referred to as StGB).⁷⁹

It is the German view, that transferring criminal law concepts and principles in such a manner would mix two things that are unrelated.⁸⁰ On the one hand, § 184g no. 1 StGB deals with the question whether actions against a protected interest, good or right are insignificant.⁸¹ On the other hand, it is merely relevant for the scope of the ProstG to establish whether the sexual activity in question was of "some weight."⁸² Furthermore, the fact that § 184 no 1 StGB is limited to, in the words of the paragraph, "this law," strengthens this argument. The limitation of culpability can be explained by the fact that the criminal law is only *ultima ratio*, whereas the objective of the ProstG is to establish the greatest possible protection for the sexual services providers, regardless of the nature of the service provided.⁸³ Finally, as the intention of the action is to satisfy the clients' sexual desire or arousal is a highly personal and subjective matter, it is argued that this cannot be determined on the basis of objective criteria, which ultimately means that the application of the ProstG is not dependent on establishing significance of the performed service.⁸⁴

Prostitutes as Employees:-

A point that is quite different between the German and the New Zealand models of regulating prostitution relate to the employee status of prostitutes. In this sense, although New Zealand's provisions may refer to prostitutes as being employed, this refers merely to the situations in which prostitutes work within brothels, or out of brothels, in the sense, that the brothels distribute work to them. However, as in accordance to Section 16 of the PRA, brothel operators are unable to sanction workers for lateness, unprofessional conduct or other misdemeanours,⁸⁵ as well as the fact that prostitutes are required to pay a "shift fee" to the brothels, regardless of how much business comes in,⁸⁶ and apart from this are able to keep their proceeds, the working relationship would be classified as self-employed according to EU standards.⁸⁷ These practices are often criticised in the New Zealand model, as it often means that prostitutes will potentially lose money on slow nights.⁸⁸ In contrast, in Germany it is possible for prostitutes to work as employees in brothels, which means that they receive a fixed salary. In these circumstances, there is no

⁸⁸ Charles B Fields and Richter H Moore, *Comparative And International Criminal Justice* (1st edn, Waveland Press 2005) 73.

contractual relationship between the prostitute and the clients, but rather between the clients and the brothel owners.⁸⁹

The contract between the prostitute and the brothel will herein be referred to as a brothel contract. In accordance with § 1 S2 of the ProstG, the prostitute is considered to be keeping his or her services ready to provide these to clients for a particular amount of time. In return the prostitute will receive his or her “previously agreed salary.” However, it is clear from § 3 ProstG that the legislator aimed at only granting brothel owners a limited right of direction.⁹⁰ This, however, only applies to the place and time of the acts to be undertaken and not to the selection of clients and the nature of the services provided. In this sense, the prostitutes are not employed for the specific services, but rather for keeping his or her services ready for a particular time and at a particular place.⁹¹ This allows for employed prostitutes to also have the right to reject any clients without losing any claim towards the brothel owner in relation to salary.⁹² Similarly to the classification of the prostitution contract, the brothel contract will also be classified as a services contract. The only difference is that this contract is not unilateral and falls within the scope of a regular services contract. This is based on the fact that the prostitute is only contracted to keep the services ready for provision, and thus does not directly apply to the actual provision of the sexual act provisions per se.⁹³

However, the brothel owners’ right of direction, even if it is only limited, can only be explained constructively if the contractual partners have certain obligations. These obligations are seen in the keeping ready of the services. This obligation would not fall under the human dignity protection of the German constitution, as it cannot be equated to actually providing the sexual act itself.⁹⁴ This legal obligation can, however, not be enforced by the brothel owner, as a prostitute is able to terminate the contract at any point without notice.⁹⁵ Nevertheless, in order for the contractual relationship to be categorised as an employment contract, which brings with it the entitlement to social security in accordance with § 7 Abs. 1 S 1 SGB IV (Sozialgesetzbuch IV – the German Social Code: book IV), obligations need to be assumed, despite the fact that a brothel owner cannot enforce these.⁹⁶

If a brothel contract constitutes a contract for employment, the normal individual and collective employment laws apply. This includes that the contract can only be limited by § 14 TzBfG,⁹⁷ that the prostitute has holiday entitlements, an entitlement to continued payment in case of illness (sick leave), a protection against dismissal as well as the right to form a union.⁹⁸

In principle, although the brothel contract is not specifically referred to in the ProstG, it is widely accepted that it will not be considered *contra bonos mores*, similarly to prostitution contracts. However, this will only be applicable within reason, meaning that brothel contracts may, nevertheless, be considered *contra bonos mores* in exceptional circumstances, for instance, if the contract were to result in the exploitation of the prostitute.⁹⁹

A significant advantage in contrast to the New Zealand model is that under a brothel contract, prostitutes are merely contractually obliged to keep themselves ready to provide sexual acts.¹⁰⁰ This means that there is no due

performance of the actual provision of sexual acts and prostitutes will be owed remuneration, even when sexual acts have not been performed.¹⁰¹

The question that naturally follows is how brothel owners' interests can be protected from prostitutes declining to perform sexual acts persistently or at least in an unreasonably large number of cases. The answer to this question can be found in the understanding of the term "keeping ready." It is understood that to keep something ready involves an internal willingness to serve suitable clients who are willing to pay for the service.¹⁰² According to von Galen,¹⁰³ this requirement of willingness extends to the prostitutes' appearance as well, meaning that it requires prostitutes to present themselves in an externally sufficiently attractive manner. The employment nature of the work relationship between prostitutes and brothel owners also assumes instruction rights of owners or managers in relation to prostitutes' appearances and clothing.¹⁰⁴ However, this does not mean that a prostitute can be forced against her will to follow these requirements. Instead, it merely means that non-compliance will be understood as an absence of internal willingness,¹⁰⁵ which in the worst case will result in a termination of the employment contract.¹⁰⁶

Despite being regulated under German employment law, the termination of brothel contracts involves a number of exceptions due to the nature of the work. In this sense, brothel contracts may be terminated mutually by agreement, or in the event of the death of the prostitute.¹⁰⁷ Furthermore, it has been emphasised that prostitutes, as they cannot be forced into providing sexual services against their will, have the right to terminate brothel contracts at any time without giving previous notice.¹⁰⁸ However, there is no corresponding termination right for brothel owners. Thus, without a qualifying reason for an extraordinary termination,¹⁰⁹ it can be assumed that the ordinary termination provisions apply in accordance with § 620 BGB. Accordingly, a brothel owner would have to give a prostitute between 2 weeks and 7 months' notice, depending on the length of the brothel contract.¹¹⁰

Finally, a point worth mentioning in relation to the current effects of the ProstG in Germany involve the way damages are regulated. Accordingly, claims for damages in prostitution usually follow the same *culpa in contrahendo* rules as in any other contractual relationship.¹¹¹ However, an area which deserves particular attention in the issue of damages related to parties to the contract being infected with a disease by the other party. The resulting claim in such a scenario would be derived from § 280 s. 1 in conjunction with § 241 s. 2 BGB, due to a breach of the duty of care towards the other party. In the event that the prostitute infected the client, this protected interest is the client's integrity interest. As there are no specific provisions within the ProstG, the majority opinion is that prostitutes do not fall under any general limitation of liability. The reason for this is that the non-use of barrier protection, such as condoms, is regarded as negligence, unless the surrounding circumstances of the risk of infection was known to the client and he or she nevertheless requested the omission of said protective measures.¹¹²

Understanding the German move to stricter Regulationism:-

In recent years, the German government has worked towards drafting new legislation targeted as implementing further regulation of prostitution, which will enter into force on 1st July, 2017.¹¹³

In order to understand the planned changes to the current laws, it is important to understand the issues and gaps revealed from the initial Prostitution Code (ProstG).

When the ProstG was drafted, a key philosophical stance towards prostitution was that it was a given, which realistically had to be dealt with regardless of moral attitudes.¹¹⁴ Accordingly, the Act sought neither to end prostitution, nor to augment its status.¹¹⁵ Instead, a particular focus was directed towards the improvement of prostitutes' working conditions, in order to support people voluntarily earning their living through the provision of sex services.¹¹⁶

Thus, the Act sought to enhance prostitutes' legal as well as social situations, by removing the negative effects of prostitution having been classified as immoral, and as such invalid, legal transactions,¹¹⁷ as well as by facilitating access to social insurance.¹¹⁸ The idea was for the ProstG to assist in reducing prostitution-related crimes as well as making it easier for people working in prostitution to exit the industry.¹¹⁹ A crucial point, however, was that prostitution was not "job like any other," in particular, due to strict legal protection provisions related to the rights of prostitutes to sexual self-determination.¹²⁰

A key rationale here is the notion that the state is not responsible for the protection of people from their own life-choices, especially when these have been a product of free self-determination. In this context, freedom as part of the right to sexual self-determination proscribes that people should be allowed to freely choose whether, how and when to engage in sexual acts.¹²¹

The basis for this is found, in particular in the fact that, today, prostitution, as an occupation aimed at sustaining one's livelihood, is protected by Article 12 s. 1 GG.¹²² As an occupation, people working in the area need to be protected from harm in the same way as anyone else. The German government recognises the vulnerability of people working in prostitution. Thus, it has been emphasised that the state needs to combat any prostitution-related

crimes, in particular socially damaging human rights violations, such as forced prostitution, trafficking in human beings, child prostitution and other human rights violations by all available means provided by law.¹²³ These means include criminal prosecution, monitoring, preventive and repressive measures, and victim protection, including the provision of assistance to victims.¹²⁴

In line with the German gender equality framework, the Federal Government has recognised a need to take countermeasures against the gender equality issues found within prostitution.¹²⁵ This includes the high proportion of women working in the industry in contrast to men, as well as considerations of the nature of the industry, which can be “physically and psychologically demanding, risky and dangerous.”¹²⁶ Thus, while accepting the free choice of adults to work in this industry, it is understood that any threats, including poor hygiene conditions, as well as any other threats to prostitutes’ health, safety and overall wellbeing need to be addressed. In particular, it is important to ensure the voluntariness of the decision to work in prostitution. Accordingly, it needs to be ensured that the social reality of many prostitutes finding themselves in social and psychological situations, in which the ability to freely and autonomously choose to practice this occupation can be called into question, are counteracted. The social responsibility taken up by the Federal Government in this respect include providing possibilities for prostitutes to “earn their living by other means and to prevent them drifting into dependencies which make prostitution appear to be the lesser evil or an acceptable way out.”¹²⁷ These objectives are sought to be achieved through state-funded assistance programmes as well as labour market and education policy in order to offer viable alternatives.¹²⁸

Although the legal measures taken by Germany in 2002 strongly resemble the legislation introduced in New Zealand, the German Federal Government appears to have been more critical in their 5-year review of their prostitution laws. The New Zealand government undertook a four-stage research study, which, despite conducting a quantitative element by means of a survey, which was evaluated on the basis of statistical estimations, sought to avoid significant evaluation based on these statistics within their report, and instead focussed on the predominantly qualitative stages of the study. This consisted of interviews conducted with 58 voluntary participants who worked in prostitution.¹²⁹ This evaluation can be criticised on the basis, that any dark figures would not have been revealed, as it can be assumed that vulnerable prostitutes who had not been positively affected by the PRA, would not necessarily be able to take part in such studies. Moreover, New Zealand’s evaluation of the PRA, focussed more on the black letter law achievements. This means that the success of the PRA was predominantly based on the human rights protection the law provided in theory rather than in practice. In this sense, the report concludes that

“[t]he PRA has been in force for five years. During that time, the sex industry has not increased in size, and many of the social evils predicted by some who opposed the decriminalisation of the sex industry have not been experienced. On the whole, the PRA has been effective in achieving its purpose, and the Committee is confident that the vast majority of people involved in the sex industry are better off under the PRA than they were previously. However, progress in some areas has been slower than may have been hoped. Many sex workers are still vulnerable to exploitative employment conditions, and there are still reports of sex workers being forced to take clients against their will.”¹³⁰

Despite the negative findings that the PRA’s success had been slower than intended and that there still were many exploitative practices, it is significant that New Zealand found the PRA to be a success. In this sense, they justified this finding by stating that “[i]t is a truism that traditions and attitudes developed over many years cannot be

changed overnight”¹³¹ and concluded that the committee did not consider it to be necessary to undertake further reviews of the operation of the PRA at that stage.”¹³²

The optimism in the theoretical, legal application of the legislation in contrast to some of the more negative findings in practice may explain why the evaluation of the ProstG by the German government was less optimistic in its findings. In this sense, the German Federal government took a more pragmatic stance in its evaluation. It explained that despite the unreliability of statistical data, the legislators had to assume that the ProstG had only achieved its objectives to a limited extent. As previously explained, the objectives of the ProstG included to eliminate the legal immorality of prostitution, to enable prostitutes to take legal action, not only under criminal law, but also to ensure they could take civil measures, such as to enforce payment, to ensure access to social insurance, to combat prostitution-related crime, to facilitate prostitutes to exit prostitution, and to better working conditions.¹³³

Accordingly, the German government stressed that the legislation itself ensured that all the objectives were met legally, the situation in practice revealed that not all people working in prostitution were making use of these legal provisions. In particular, it was noted that there were no indications of the legislation having worsened the situation in prostitution, nor of human trafficking for the purpose of sexual exploitation as well as other prostitution related crimes having been enhanced or made more difficult to prosecute through the legalisation of prostitution, as initially feared by critics of the ProstG. However, the improvements through the legislation were still tentative, and despite some indications of improvements, these suggested that the ProstG proved rather a long-term rather than a short-term solution to the situation of prostitution in practice.¹³⁴ These final points essentially demonstrate the same kinds of findings as the report from the New Zealand Government. It appears that the most significant difference is that the New Zealand Government interpreted these findings as a success, whereas the German government interpreted their findings as an indication to take further action.

It was recognised by the Government, that the particularly liberal approach taken, which based on the mere three paragraphs, was in fact less regulated than the New Zealand model, only represented a limited approach, and as such could only be taken as a first step towards achieving the government’s objectives regarding the regulation of prostitution.¹³⁵

The Introduction of the Act on the Protection of Persons engaged in Prostitution:-

Following the evaluation of the ProstG in 2007, the Act on the Protection of Persons engaged in Prostitution (short: Prostituiertenschutzgesetz - ProstSchG) was issued as the first Article of the Law on the regulation of Prostitution and the Protection of Persons engaged in Prostitution (Gesetz zur Regulierung des Prostitutions sowie zum Schutz von in der Prostitution tätigen Personen - ProstSchGEG) on the 21st October 2016 and will enter into force on 1st July 2017.¹³⁶

The aim of the ProstSchG is to improve the situation for prostitutes by strengthening their right to self-determination as well as ensuring the protection from exploitation, coercion, violence and trafficking in human beings.¹³⁷ The legal basis also serves to improve the legal instruments relating to the monitoring of the prostitution industry in order to tackle any threats therein.¹³⁸

¹³⁸ Ibid.

The act is based on two key pillars, namely, the regulation of the prostitution industry, as well as the protection of persons engaged in prostitution.¹³⁹

The first pillar primarily involves introducing an authorization requirement within the prostitution industry for brothels and brothel-like establishments, as well as all other forms of commercial prostitution.¹⁴⁰ Accordingly, operators will need to undergo a personal reliability test. This will also apply to any persons acting as a legal agent or has been entrusted with any managerial or security related duties.¹⁴¹ In order to obtain authorisation, operators will be required to draw up an operating concept and comply with the minimum requirements for the equipment within the business premises.¹⁴² A significant milestone, according to the German Federal Ministry of Family Affairs, Senior Citizens, Women and Youth, is the newly created obligations to ensure acceptable working conditions.¹⁴³

The obligatory checks introduced by the new regulation will ensure, for instance, that people who have previously been convicted of human trafficking offences will no longer be permitted to operate brothels.¹⁴⁴ It will also ensure that there is an evaluation of reasonableness of operating concepts and business models prior to the start-up of prostitution businesses. This can be interpreted as a direct response to the consequences of capitalist market forces in Germany following the particularly liberal legalisation of prostitution, which resulted in new business models, such as “flat rate brothels” being introduced, as well as an increasing demand for harmful or dangerous sex acts, such as group sex” or “gangbangs.”¹⁴⁵ Any breaches would result in the operators being subject to sanctions, such as the loss of authorisation as well as penalties.¹⁴⁶

The second pillar, covering the protection of persons engaged in prostitution, includes the implementation of a personal notification obligation as well as health advice provisions for prostitutes, which are to be repeated at regular intervals.¹⁴⁷ The idea is to provide prostitutes with additional support and to ensure that prostitutes are actually able to exercise their rights and to work freely in a self-determined manner.¹⁴⁸

¹⁴⁸Deutscher Bundestag, Drucksache 18/8556, Entwurf eines Gesetzes zur Regulierung des Prostitutionsgewerbes sowie zum Schutz von in der Prostitution

Thus, from July 2017, prostitutes will receive a personal information and consultation session at registration, during which they will be informed about their rights and receive important information on available support,¹⁴⁹ such as the Germany-wide "Violence against women support Hotline."¹⁵⁰ The provided services and information are available in currently 17 languages,¹⁵¹ however, § 7 (3) ProstSchG indicates that the provided information should be provided in a language understood by the prostitute, which may require further languages to be made available. Moreover, prostitutes are to be given the opportunity to discuss any health-related aspects of their work in confidentially in one-to-ones.¹⁵²

It has been argued that the new stricter regulation is a step backward from the ideal decriminalised regulation of prostitution, with merely few regulatory measures, such as age-restrictions, in particular from a number of advocacy groups for prostitution, such as Hydra,¹⁵³ BesD,¹⁵⁴ BSD¹⁵⁵ and the Doña Carmen eV.¹⁵⁶ The main criticism is based on the argument that any restrictions, such as imposed by the obligatory registration and authorisation for businesses, will unreasonably interfere with and potentially limit prostitutes' right to self-determination and other basic rights protected in the German constitution. However, the German Federal government has argued that these provisions are necessary in order to ensure the self-determination of vulnerable prostitutes and the protection of victims. Accordingly, it can be argued that a balancing of these competing interests, namely the limitation of the general right to self-determination and the rights of vulnerable prostitutes and exploitation victims to be protected from harm, justifies the implementation of such measures.¹⁵⁷

Conclusion:-

It has been revealed that the supposed decriminalisation approach in New Zealand is in fact a regulationist approach much like the German one. In fact, in terms of the amount of provisions, it became apparent that the German approach was less regulated than the New Zealand model. Both approaches targeted the elimination of invalidity of contracts due to prostitution being *contra bonos mores*, as their primary provision. Moreover, both systems appear to

have prioritised the right to sexual self-determination as well as the protection of other human rights affected in the commercial sale of sex services in their choices to decriminalise the sale and procurement of sex services. Interestingly, the governmental evaluations of each model, which were conducted five years after the implementation of each approach revealed similar findings as well. However, these findings appear to have resulted in opposite conclusions. The evaluation of the New Zealand model was seen as a success, in particular due to the theoretical legal application and the way this was able to protect the rights of sex workers. It was understood that in the long-term, when society adapted, the approach would achieve the initially set objectives. The German evaluation, however, has focused on the short term application of the model, and sees a slow adaptation as something that needs addressing in order to ensure the rights of vulnerable prostitutes are protected. Thus, the German government has sought to create new legislation, which will tighten the regulation of prostitution. In particular, this move to stricter regulation will involve regulating and monitoring the industry as well as enhancing the protection of the individual sex workers by implementing mandatory registration and consultancy, as well as extending the provision of support and education, in order to ensure all voluntary sex workers are adequately protected, and any victims of exploitation or forced prostitution are helped. Consequently, what can be learnt from the German regulationism is that although decriminalisation, from a philosophical human rights perspective is desirable, in practice it appears that there are a number of other factors apart from the laws, which currently interfere with the realisation of the theoretical objectives of such a regulatory approach. Thus, in the short-term, negative practices cannot be ignored and require addressing to ensure the wellbeing of all sex workers. Only time will show whether the new German regulationist approach will be able to close any current deficiencies in the decriminalisation of prostitution.

Birth preparedness and complication readiness (BPCR), knowledge, antenatal women, competency, health care provider.

Abstract

Birth preparedness and complication readiness (BPCR) is an approach that focuses on raising awareness and creating a stronger demand for quality healthcare services. Childbirth is a crucial biological event which is socially constructed as it takes place within a cultural context and gets shaped by the perception and practices. According to the Integrated Management of Pregnancy and Childbirth (IMPAC) manual of WHO, birth preparedness would significantly increase the capacities of women, their partners and their families to remain healthy, to take appropriate steps to ensure a safe birth and to seek timely skilled care in emergencies. BPCR also reduces delays in receiving appropriate care as it requires the health care providers like nurses, doctors, community health workers to be prepared to attend births and be ready to manage or prevent complications through appropriate measures. On reviewing literature, the researcher found various studies which have shown that not only that antenatal women lack in BPCR, even the health care providers lack in knowledge and/or skills in delivering services related to BPCR.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

A positive childbirth experience is very important not only to the woman but also to the newborn's health and well-being. Childbirth is a normal physiological process for the majority of women and a process that, like all other life events, is looked upon with a mixture of anticipation and happy expectation. Studies in developed countries have shown a positive impact on pregnancy and birth outcomes when the woman feels in control of the process of pregnancy and birth; childbirth preparation has been shown to facilitate this feeling of self-control and autonomy.

In the Standards for Maternal and Neonatal Care developed by the Department of Making Pregnancy Safer, World Health Organization, a birth plan/emergency preparedness plan includes identification of the following elements: the desired place of birth; the preferred birth attendant; the location of the closest appropriate care facility; funds for birth-related and emergency expenses; a birth companion; support in looking after the home and children while the woman is away; transport to a health facility for the birth; transport in the case of an obstetric emergency; and identification of compatible blood donors in case of emergency.¹

Since pregnancy is perceived as an ordinary event, most families do not effectively prepare for an emergency. When a pregnancy complication arises, the family is unprepared and while in a hasty attempt to handle the situation precious time is lost in most of the cases. Even to have BPCR at the provider level-health care facility, the doctors, midwives, and other health care workers like ASHAs must have the knowledge and skills necessary to treat or stabilize and refer women with complications.

Hence, the researcher strongly felt the need of assessing the knowledge of antenatal women regarding BPCR after developing and administering an informational booklet and also assessing the competencies of ASHAs regarding the same. In the same context, the researcher reviewed many literatures obtained through various databases like CINAHL, MEDLINE, PubMed, Science Direct, ProQuest and Google Scholar and found out that most of the studies showed lack of BPCR among both the antenatal women and the health care providers.

Materials, Methods And Findings:-

This study is mainly headed in two areas based on the target population and they are knowledge of antenatal women regarding BPCR and competencies of ASHAs regarding the same.

A cross-sectional study was conducted to assess the Birth Preparedness and Complication Readiness of ASHAs at Koppal, Karnataka. (2013). A structured pre-tested interview schedule was used to collect data on socio-demographic and BPCR from 225 randomly selected ASHAs. The study findings showed that the proportion of ASHAs who knew key danger signs were just 1% for labor and child birth, 4.8% for postpartum period and 7.2% for pregnancy. Composite score out of 10 showed a poor score of 0-3 in 55.1%, 4-5 in 37.7%, 6-7 in 7.2%, with none scoring above 7. Score for BP/CR out of 8 showed a maximum score of 8 in 1.4%, 4-7 in 71% and 1-3 in 27.5%. However, knowledge of antenatal care components was good with $\geq 90\%$ in 50.2% of ASHAs. Thus the study concluded that the ASHAs were poorly equipped to identify obstetric complications. They had considerable potential but needed sustained support from the health system to be able to make a difference to maternal mortality and morbidity.²

A quasi-experimental study was conducted to evaluate the effectiveness of Home Based Life Saving Skills training on knowledge of danger signs, birth preparedness, complication readiness and facility delivery, among women in Rural Tanzania. (2016). A two-stage cluster sampling strategy was employed to select 700 samples each from two districts. An intervention district received training with routine care whereas the comparison district continued to receive routine antenatal care. The main findings of the study showed significant improvement of knowledge of three or more danger signs during pregnancy (15.2 % vs. 48.1 %) with a net intervention effect of 29.0 % (95 % CI: 12.8–36.2; $p < .0001$) compared to the comparison district. Birth preparedness practice improved for those who made more than three actions (20.8 vs. 35.3 %) with a net intervention effect of 10.3 % (95 % CI: 10.3–20.3; $p < .0001$) between the intervention and control district at pre-intervention and post intervention. Use of facility delivery improved in the intervention area as compared to comparison district. Thus the study concluded that a community-based intervention in delivering Home Based Life Saving Skills program improved the knowledge of mothers & families regarding preparedness for childbirth and increased deliveries at health facilities.³

A community-based study was done to assess perception and practices regarding BPCR and to identify the related factors among women in a rural community of Bankura district, West Bengal, India. (2011). Cluster sampling technique was used to select 240 women who had delivered in last 12 months with the help from ASHA & Anganwadi workers. Data collection was done using semi structured questionnaire and a set of ten indicators constructing the BPCR index. The study result showed that the proportion of women who had identified a blood donor was low 12.9% (+3.3). Around only one-sixth respondents were aware of key danger signs of pregnancy, childbirth, postpartum and neonatal period, which indicated low awareness at the individual level. BP/ CR index of the study population was 49.4 (+1.7). The study noted that women who were more vulnerable to obstetric complications showed reluctance in following BPCR practices. Thus the study concluded to emphasize the need of motivating the health workers to utilize every contact with the beneficiaries and making them equipped with the concept of 'focused antenatal care' in order to empower women and their family to take decision, plan and implement BPCR practices.⁴

A cross-sectional study was conducted by NIHFV and Department of Community Medicine, S.S. Medical College, Rewa to assess the status of BP/CR at individual, institute and community levels in Rewa district, Madhya Pradesh. (2008-09). 2022 mothers who had delivered before one year of the study and pregnant women who were in 2nd & 3rd

trimester of pregnancy were selected using cluster sampling technique and among the 9 CHCs of Rewa district, 9 medical officers and 11 peripheral health staffs like staff nurses and ANMs were included. The study findings noted that all the CHCs severely lacked manpower like an anesthetist and Ob -Gynae specialist. None of the CHCs had blood storage facilities and were not providing Comprehensive Emergency Obstetric Care like CS facility, blood transfusion, and anesthetic kit. Among the knowledge and skills of health care providers less than 50% of them were competent in diagnosing and management of complications. BP/CR index was only 47.5%. The Birth preparedness indicators like knowledge of danger signs, knowledge of transportation services, 1st trimester registration and population saved money was found to be very low like 18.6%, 18.6%, 24.1% and 44.2% respectively. Thus the study concluded the need to enhance the facilities and manpower at the CHCs through effective resource management and adequate staff training. It also stressed to encourage the mothers and community to effectively involve in BPCR activities.⁵

A descriptive study was done to assess the proportion of women with birth preparedness plans, and the socio-demographic, maternal and institutional determinants of birth preparedness among 345 systematically selected women who had delivered within two years prior to the study attending maternal and child health clinics at Tharaka, Kenya. (2014). Data collection was done using interviewer administered questionnaires, focus group discussion guide and key informant interview guide. The study noted that only 20% of the women were prepared for birth. The aspect of birth preparedness that was identified and planned for by the highest number of women was finances for delivery expenses (74%) followed by place of delivery (68%) while the least was the mode of transport to the facility (35%). The maternal determinants of birth preparedness were history of still birth and attendance of 4 or more antenatal visits. There were no institutional determinants in this study. Thus the study concluded that the level of birth preparedness among the women of Tharaka was low and thus recommended to their ministry of health to sensitize women of reproductive age on birth preparedness.⁶

A cross sectional study was conducted to assess the status of BPCR and socio-demographic factors affecting BPCR among 417 antenatal mothers attending a primary health center, Palam, New Delhi. (2012). The study revealed that the BPCR index was very low 41%. Only 42.9% women were aware about early registration of pregnancy. Only one-third 33.1% of women knew about four or more antenatal visits during pregnancy. Overall, only 27.8% women knew about any one danger sign of pregnancy. Thus the study concluded that efforts should be targeted to increase the awareness regarding components of BPCR among pregnant women and their families at the PHC as well as at the community level.⁷

A cross-sectional survey was done to assess the knowledge and practice towards BPCR among women in Northern Ghana. (2015). Systematic random sampling technique was used to select 211 pregnant women and 211 women who had given birth in the 12 months preceding the study who attended antenatal or postnatal care in health facilities within the 5 zones of the study area. A structured survey questionnaire adapted from the safe motherhood research tools by the Maternal Neonatal Programme of JHPIEGO was used for data collection. The study findings related to knowledge noted that only 3.79% respondents mentioned of knowing about arrangement for someone to cater for house and kids, 3.08% knew about making transport arrangements, 4.5% mentioned arrangement for delivery place ahead of time, 0.24% mentioned the identification of blood donor, 0.71% mentioned identification of skilled attendants and 12.09% did not know anything about BPCR. The study findings related to practices noted that only 18.01% of respondents planned ahead for a place of delivery, only 10.18% had prior arrangement for transport, only 0.95% & 0.47% had identified a potential blood donor and a skilled provider respectively. Thus the study concluded that antenatal care education should be emphasized on BPCR to improve access to skilled and emergency obstetric care.⁸

Qualitative study using focus group discussions (FGD) were conducted to explore the perception of community on BPCR at Rufiji district, Eastern Tanzania (2011). Purposively selected 65 young women and men, as well as 67 older men and women, participated in the FGDs. A pretested topic guide that included cultural and social issues surrounding birth preparedness, pregnancy, and childbirth, steps taken to prepare for pregnancy and potential complications during childbirth in the community, recognition of maternal danger signs, and the use of traditional medicine during pregnancy and childbirth was used to conduct the FGDs. The study finding noted that the community members expressed a perceived need to prepare for childbirth. They were aware of some aspects of BPCR however, certain factors like stigma on unmarried women and transportation were identified as hindrance to birth preparedness and hence utilization of skilled care. Challenges were related to the consequences of poverty they perceived difficulties due to informal user fees. Thus the study concluded to stress upon community reinforcement

for BPCR, by using insurance schemes, community health funds, and by providing information on other birth preparedness messages via community health workers.⁹

A cross-sectional study was done to assess BPCR among slum women in Indore, India. (2004-06). A pretested interview schedule was used to collect data from purposively selected 312 mothers of infants aged 2-4 months in 11 slums of Indore. The study finding noted that only 47.8% respondents were well-prepared. Factors associated with well-preparedness were maternal literacy and availing of antenatal services. Deliveries in the slum-home were high 56.4%. Among these, skilled attendance was very low 7.4%. Skilled attendance during delivery was three times higher in well-prepared mothers compared to less-prepared mothers. Thus the study concluded that antenatal outreach sessions should be used for promoting BPCR as it will be important to increase the competency of slum-based traditional birth attendants, along with promoting institutional deliveries.¹⁰

A Facility-based cross-sectional study was conducted to assess the determinants of BPCR among pregnant women attending antenatal care at Dilchora Referral Hospital, Dire Dawa City, East Ethiopia. (2015). A pre-tested structured questionnaire was used to collect data from 405 systematically selected participants. The study findings noted that the proportion of women who were well prepared for birth and ready for complications were 54.7%. Attending tertiary level education and being knowledgeable on obstetric danger signs were found to be significantly associated with BPCR. The study concluded that the proportion of women who were well prepared for birth was still low and thus improving their awareness and reinforcing counseling on obstetric danger signs was recommended to increase level of BPCR.¹¹

A community-based mixed method study was conducted to find out awareness and practices regarding BPCR among pregnant and recently delivered women in Uttar Dinajpur, West Bengal. (2011). Two-stage, 40 cluster sampling technique was used to select 360 participants. Information on socio-demographic variables as well as awareness and practices regarding BPCR were collected through semi-structured interview. In-depth interviews with one respondent per cluster were also conducted. The study findings indicated that overall BPCR index of the study population was 34.5. Proportion of women aware of at least one key danger sign each of pregnancy, labor, postpartum, and newborn ranged from 12.1% to 37.2%. Proportions of women with first ANC within 12 weeks, four or more ANCs, institutional delivery, saving money, identifying transport, and blood donor were low. Thus the study concluded that preparedness in health system, ensuring competence, and motivation of workers were needed for promotion of BPCR among the study population.¹²

Conclusion:-

Various studies have been done to assess BPCR among the antenatal women and even the health care providers. These studies showed that there is a varied range of factors that affect BPCR. In spite of various health programs for antenatal women, and training of health care providers regarding BPCR, they are found to be not effectively prepared for birth and emergencies. As knowledge of antenatal women and competence of health care providers play substantial role to reduce maternal mortality and morbidity, the researcher feels the need to assess both.

Abstract

Worldwide, hepatitis C Virus (HCV) is recognized as a major threat to global public health. Accurately predicting the patients who will respond to therapy of HCV by interferon and ribavirin is still important, for patient care and also with respect to the cost as new DAAs are not always available. Studies have shown that IL28B is strongly associated with the response to treatment of hepatitis C by interferon and ribavirin. Our patients are 200 divided into two equal groups, responders and non- responders to Interferon ribavirin treatment. They are submitted to detailed history and clinical examination including body mass index calculation, laboratory examination: CBC, PT, PC, serum Albumin, AST, ALT, Bilirubin total, viral load by PCR, abdominal ultrasound, liver biopsy, IL28B gene. We proved that IL28B is the strongest predictor of response of treatment by Peg/interferon ribavirin and CC allele has the best chance to respond to treatment. Also, BMI, ALT and ALP could be used as predictors for response.

Introduction:-

Hepatitis C virus (HCV) infection is a major cause of chronic liver disease (Berg T et al., 2003). About 2.35% of the world's population is infected with HCV (Lavanchy D, 2011).

In Egypt, hepatitis C virus (HCV) has the largest epidemic in the world. The released Egyptian Demographic Health Survey [EDHS] declared that the overall prevalence of HCV is 14.7% (El-Zanaty F and Way A, 2009). The blood borne virus, which is highly infectious, kills an estimated 40 000 Egyptians a year and at least 1 in 10 of the population aged 15 to 59 is infected (Henk B, 2014).

Studies have shown that the prevalence of antibodies to HCV (anti-HCV) specially, to a single subtype, 4a in Egypt is approximately 10-fold greater than in the United States and Europe (Strickland GT et al., 2002). Clinical trials demonstrated that type 4 response to treatment by Pegylated- Interferon (PEG- INT) and ribavirin is better than type 1 response but it is worse than type 2 and 3 response (Martinot-Peignoux M et al., 2010).

Accurately predicting the patients who will respond to therapy is becoming increasingly important, both from the point of patient care and also with respect to the healthcare cost as clinicians need to continue treatment in patients who will respond and stop treatment in patients who are unlikely to respond and use new protease inhibitors instead of Peg- interferon and ribavirin (Zeuzem S et al., 2004). Also in era of new direct antivirals, as they are not always available.

Older age, advanced stage of fibrosis, African-American ethnicity and HCV- related factors, including HCV genotype 1 and high viral load at baseline, predict poor response to anti-viral therapy. Furthermore, metabolic factors, such as high body mass index (BMI), presence and severity of liver steatosis and increasing homeostasis model assessment of insulin resistance (HOMA-IR) score have been reported as negative predictors of response (Bressler BL et al., 2003).

On the other hand, early on-treatment kinetics of HCV RNA, e.g. undetectable HCV RNA at week 4, has a high positive predictive value of SVR (Yu ML et al., 2008). Several independent studies have consistently shown that single nucleotide polymorphisms (SNPs) near IL28B, which encodes the type III interferon are strongly associated with the response to treatment of chronic hepatitis C (Ge D et al., 2009).

However, very few studies are available where all these novel pre- treatment variables are analyzed together in multivariate models.

The aim of this study was to find if there is a relation between IL28B gene single nucleotide polymorphism and the response to treatment of HCV by combination of PEG- Interferon and ribavirin. Also, to find if IL28B was a surrogate predictor of the response to HCV treatment compared to other predicting factors like age, sex, liver enzymes, liver biopsy and degree of steatosis, body mass index (BMI) and viral load.

Material and Methods:-

Study population:-

A prospective study was conducted on 200 patients, including 124 males and 76 females & the mean age was (41.93 ± 9.686) years taken from 657 patients after they took pegylated-interferon/ ribavirin. They were recruited from the outpatient clinics of the Internal Medicine department, Kasr Al Aini hospital, Cairo University, Beni-Suef Public Hospital and National liver institute from 2012 to 2014, while patients with Co- infection with HBV and were receiving immunosuppressant drugs, chemotherapy or corticosteroids concomitantly with the study were excluded. Following the response to treatment with PEG interferon and ribavirin after 48 weeks, the patients were classified into two groups, responders and non- responders each group contained 100 patients. The study protocol conformed to the ethical guidelines of 1975 the Helsinki declaration and was approved by the ethical committee of internal medicine, faculty of medicine, Cairo University. Written informed consents were obtained from participants in this study.

Blood collection and sample preparation:-

Blood (10 ml) was withdrawn by venipuncture; After analyzing cell blood counts (CBC) on aliquots of whole blood in EDTA tube (2 ml) using the (sysmex corp, Kope, Japan) automated hematology analyzer. Liver function tests (bilirubin, ALT, AST, ALP, albumin, PT, PC, & INR), urea and creatinine were measured. Viral load by PCR DNA extraction. DNA was extracted from mononuclear cell layer of whole blood sample using QIAamp kit supplied by Qiagen (USA) according to manufacturer's specifications. IL28B genotyping (rs12979860) was carried out by means of custom TaqMan Assay (Applied Biosystem, USA) designed to detect the following SNP: rs12979860. Primers and probes sequence as following; rs12979860 (5'-GCTTATCGCATACGGCTAGG-3', sense) and rs12979860 (5'-AGGCTCAGGGTCAATCACAG-3', antisense). The TaqMan minor groove binder probe sequences were VIC 5'- ACCTGCCTACCCCTT G-3', and FAM 5'- CTGCCCCACC CTTG-3'. The detection was carried out by qPCR in a StepOne thermocycler by using fluorescent probes. The amplification conditions were as follows: After a denaturation time of 10 min at 96 °C, 45 cycles of 92°C 15 sec 60°C 90 sec were carried out and fluorescence was measured at the end of every cycle and at endpoint. All samples were determined by duplicate and genotypes were assigned both, by the gene identification software (StepOne 2.0, Applied Biosystem) and by analysis of the reference cycle number for each fluorescence curve, calculated by the use of algorithm (Applied Biosystem).

Statistical analysis:-

Pre-coded data was entered into the computer program SPSS (Statistical Package for the Social Science; SPSS Inc., Chicago, IL, USA) release 15 for Microsoft Windows (2006) to be statistically analyzed. Data was summarized using mean and standard deviation for quantitative variables and frequency and percentage for qualitative ones. Comparison of numerical variables between the study groups was done using Student *t* test for independent samples while comparing categorical data was done using Chi square (χ^2) test. Exact test was used instead when the expected frequency is less than 5. Univariate and multivariate analysis models were used to test for the preferential effect of the independent variable(s) on response to treatment. *p* values less than 0.05 was considered statistically significant.

Results:-

Two hundred patients were included in our study. The demographic characteristics and laboratory results are shown in (table 1).

Table 1:- Univariate analysis. HS: highly significant S: significant N S: non- significant

Variables		Non responder	Responder	P value
Number		100	100	
Age(yrs.) (Mean \pm SD)		44.42 \pm 9.111	39.44 \pm 9.647	0.000(HS)
Sex	Male (N, %)	52(53.1%)	30(30%)	0.14(NS)
	Female (N, %)	48 (46.9%)	70(70%)	
BMI (%) (Mean \pm SD)		29.5260 \pm 5.15565	26.3260 \pm 3.39585	0.000(HS)
AST(IU/L)		64.99 \pm 41.528	27.44 \pm 16.469	0.000(HS)
ALT (IU/L)		69.71 \pm 40.743	25.46 \pm 14.206	0.000(HS)
ALP(IU/L)		120.41 \pm 62.545	156.17 \pm 52.245	0.000(HS)
Viral load (before treatment)		1,752,561.87 \pm 8,147,842.224	742,197.40 \pm 1,641,246.876	0.226(NS)
IL28b SNP	CC (N, %)	6(6%)	47(47%)	0.000(HS)
	CT (N, %)	60(60%)	47(47%)	
	TT (N, %)	34(34%)	6(6%)	
Fibrosis	0 grade (N, %)	10(10%)	4(4%)	0.29(NS)
	1 grade (N, %)	59(.59%)	76(76%)	
	2 grade (N, %)	21(21%)	14(14%)	
	3 grade (N, %)	7(7%)	6(6%)	
	4 grade (N, %)	3(3%)	0(0%)	

By using univariate analysis, the results demonstrate a highly significant relation between age, sex of the patient and the response to treatment of HCV by PEG interferon and ribavirin. The *p* value was respectively (0.00 & 0.014). Also the study shows significant relation between treatment response and elevated ALT & ALP of the patients. The study reported that a highly significant relation between IL28B subtype and the response to treatment of HCV by PEG interferon and ribavirin. CC showed more incidence to respond to treatment and TT less incidence to respond. In group of responders (CC/CT/TT) represented (47%/47%/6%) respectively. In non- responders group (CC/CT/TT) represented (6%/60%/34%) respectively. The *P* value was (0.000). However, regarding both viral load & fibrosis grades, no significant relation between those & the response to treatment of HCV by PEG interferon and ribavirin (*p* value= 0.226 & 0.092) respectively.

By multivariate analysis: The present study illustrated a significant relation between BMI and the response to treatment, the lesser the BMI is, the better response to treatment (*p*= 0.005). The *p* value for the ALT, ALP and its relation to response to treatment were (0.000, 0.028) respectively. As well as the *p* value for the IL28B subtype and its relation to response to treatment was (0.000) in multivariate analysis. These result showed highly significant relation between IL28B subtype and the response to treatment. CC subtype has more incidence to respond to treatment by PEG interferon and ribavirin. TT subtype has less incidence to respond to treatment by PEG interferon and ribavirin. The odd ratio for BMI, ALT, ALP and IL28B 0.76, 0.92, 0.01 and 8.79 respectively. On the other hand, no significant relation between the response to treatment of HCV by PEG interferon and ribavirin and each of these factors including age, sex, AST, viral load & fibrosis (*p* value = 0.405, 0.851, 0.051, 0.531 & 0.405 respectively) in multivariate analysis.

Discussion:-

Many studies were done to find predictors of treatment response to INF and ribavirin in HCV. Finding those patients who will mostly respond to treatment will help in decreasing the cost and side effects of medications. Moreover, this will help in choosing patients to use the triple therapy with direct acting antiviral drugs (Butti M, 2002). An important factor influencing treatment outcome in chronic hepatitis C has been discovered IL28B gene polymorphism that is also distributed according to ethnic and geographical areas. The CC allele polymorphism occurs in 33% of Americans of European ancestry, 14% of African Americans and 29% of Hispanic Americans (Thomas DL et al., 2009). Individuals carrying IL28B polymorphism with CC alleles have the best prognosis, with two to three times the rate of sustained virological response (SVR) with IFN-based anti-HCV therapy, while those with TT alleles have the worst SVR rates (Thompson AJ et al., 2010). Most of the initial studies of this polymorphism were conducted on genotype 1 patients. However, a study by Asselah T, et al., (2012) has shown that, in patients with HCV genotype 4, patients with CC, CT and TT genotypes have 82%, 47% and 29% SVR rates respectively.

IL28B genotype is the most important pretreatment predictor of response to peg-IFN and RBV therapy for HCV-1. Patients who carry the good response genotype (e.g. C/C at rs12979860) have reported SVR rates $\geq 70\%$, a two- to threefold increase over patients who carry one of the poor response genotypes (e.g. C/T, T/T at rs12979860) (Chen Y et al., 2012). While in genotype 2 and 3 infected patients, this association seems to be less pronounced (Scherzer TM et al., 2011).

The primary goal of the present study was to evaluate the variable predictors of treatment response (PEG interferon and ribavirin) in Egyptian patients infected with HCV subtypes 4a, mainly age, sex, BMI, fibrosis on liver biopsy, viral load, AST, ALT, ALP and IL28B SNP.

For HCV genotype 4 (HCV-4), three studies on HCV mono-infected (Stättermayer AF et al., 2011; De Nicola S et al., 2012; Asselah T et al., 2012) and two in patients coinfecting with HCV and the human immunodeficiency virus (HIV) (Pineda JA et al., 2010; Rallón NI et al., 2011) suggest that single nucleotide polymorphisms (SNP) near IL28B are strong predictors of treatment outcome.

The current study was conducted on 200 Egyptian patients infected by HCV; 124 males and 76 females. The patients were classified into two groups; responders and non-responders according to response to treatment with PEG interferon and ribavirin following 48 weeks. Univariate and multivariate analysis were used to detect the relation between different predictors and the response to treatment by c. We studied the age, sex, BMI, fibrosis on liver biopsy, viral load, AST, ALT, ALP and IL28B SNP as predictors of response. Our results showed a highly significant relation between IL28B subtype and the response to treatment of HCV by PEG interferon and ribavirin in univariate analysis. CC subtype showed more incidence to respond to treatment and TT less incidence to respond. In group of responders (CC/CT/TT) represented (47%/47%/6%) respectively. In non-responders group (CC/CT/TT) represented (6%/60%/34%) respectively. The P value was (0.000). The p value for the IL28B subtype and its relation to response to treatment was (0.000) in multivariate analysis. These results showed highly significant relation between IL28B subtype and the response to treatment. CC subtype has more incidence to respond to treatment by PEG interferon and ribavirin. TT subtype has fewer incidences to respond to treatment by PEG interferon and ribavirin. These results are in accordance with Stättermayer AF, et al., (2011); De Nicola S, et al., (2012); Asselah T et al., (2012).

In our study, we found that the age has a highly significant relation to the response to treatment of HCV by PEG interferon and ribavirin in univariate analysis. The responders mean age mean is 39.44 and the lesser the age, the better the response with a p value (0.000). However, this relation was not detected in multivariate analysis. The p value for the age and its relation to response to treatment in multivariate analysis was (0.567). These results showed no significant relation between age and the response to treatment of HCV by PEG interferon and ribavirin. The SVR was found significantly higher in patients below 40 years of age compared to those above 40 years ($P = 0.022$) in a study done by Muhammad Idrees and Sheikh Riazuddin, (2009) and this was disagreed by Gamal El Din E, et al., (2010) found no relation between age and response to treatment by Peg/ribavirin.

Strangely, in our study, the fibrosis stage did not show significant relation to SVR neither in univariate or multivariate analysis (p value =0.050 and =0.851, respectively). Only in one study by Thomas Berg et al., (2003), the stage of fibrosis was not significantly associated with SVR.

We found a better response to treatment with PEG and ribavirin in males compared to females. The p value of the sex and its relation to response to treatment was (0.014) in favor of the male sex. However, in multivariate analysis this effect disappeared. The p value of the sex and its relation to response to treatment was (0.405). These results showed no significant relation between sex and the response to treatment of HCV by PEG interferon and ribavirin. While, Hadziyannis et al., (2004) and Conjeevaram et al., (2006) found that males have a lower SVR than do females, no statistically significant correlation was found between sex and SVR by Kau A et al., (2008).

In our study, a highly significant relation was found between BMI of the patient and the response to treatment of HCV by PEG interferon and ribavirin. The P value was (0.000) in univariate analysis. The p value was (0.005) in multivariate analysis in our study. These results showed highly significant relation between BMI and the response to treatment. Bressler BL et al., (2003), reported that body fat mass, as estimated by body mass index (BMI), influenced viral eradication in response to antiviral treatment for HCV and found that obesity defined as a BMI greater than 30 was a negative predictor of response to HCV treatment. Body weight was not significantly associated with SVR in a study done by Thomas Berg et al., (2003).

Our results univariate analysis showed a highly significant relation between AST of the patient and the response to treatment of HCV by PEG interferon and ribavirin as the P value was (0.000). While the p value for the AST and its relation to response to treatment was (0.051) in multivariate analysis, which showed no relation between AST and the response to treatment of HCV by PEG interferon and ribavirin. Other studies showed mixed results. In a study done by AS Hgar H et al., (2009), they found the lesser AST was, the better the response to Peg/ribavirin. Gamal El Din E et al., (2010) found no relation between AST level and SVR.

Our results showed a highly significant relation between ALT of the patient and the response to treatment of HCV by PEG interferon and ribavirin in univariate analysis. The P value was (0.000). The p value for the ALT and its relation to response to treatment was (0.000) in multivariate analysis. These result showed highly significant relation between ALT and the response to treatment. The lesser the ALT is, the better the response to treatment. The mean for responders was 25.46. The studied baseline ALT levels, which were an indicator of liver damage, were significantly higher in responder patients than in non-responders in treatment ($p = 0.002$) (Berg T et al., 2003). Pre-treatment ALT levels had no predictive role in treatment response rate in study done by Muhammad Idrees and Sheikh Riazuddin, (2009).

Our results showed a highly significant relation between ALP of the patient and the response to treatment of HCV by PEG interferon and ribavirin in univariate analysis. The P value was (0.000). The mean for responders was 156.17units/litter. The higher the ALP is, the better the response. The p value for the ALP and its relation to response to treatment was (0.028) in multivariate analysis in our study. These results showed significant relation between ALP and the response to treatment. ALP was of no significant impact in a study done by Gamal El Din E et al., (2010). In a study done by Ekram W et al., (2015); they reported a significantly higher in alkaline phosphatase, in non-responder group than in responder group at baseline assessment ($p=0.037$).

In our study the p value for the viral load and its relation to response to treatment was (0.226) in univariate analysis. These result showed no significant relation between viral load and the response to treatment of HCV by PEG interferon and ribavirin. The p value for the viral load and its relation to response to treatment was (0.531) in multivariate analysis in our study. These result showed no significant relation between viral load and the response to treatment of HCV by PEG interferon and ribavirin. A low baseline viral load ($P= 0.04$) was independent predictor for sustained virologic response in a study done by Thomas Berg et al., (2003). The predictive effect of baseline viral load was confirmed by several studies, even in the studies of patients co-infected with HCV and HIV (Zeuzem S et al., 2012).

Conclusion:-

We concluded that IL28B is the strongest independent predictor of response of treatment by Peg/ ribavirin by the highest OR 8.79. Also, BMI, ALT and ALP could be used as predictors for response. AST, age, sex, viral load and fibrosis are not predictors for response according to our study.

Acknowledgement:-

First, and foremost, all thanks and gratitude to God, most gracious and most merciful.

I would like to express my deepest gratitude and thanks to Prof. Dr. Dina El Gendy, Professor of Internal medicine, Cairo University, for her continuous guidance and valuable advice for enriching this work. I appreciate her great support for me, which has given me a powerful push helping this study to be established.

I am extremely grateful to Dr. Ali Farag, Lecturer of Internal medicine, Cairo University, for his continuous guidance and suggestions, saving no effort or time to make this work better.

I would like to express my highest appreciation to Dr. Dina Sabry, Prof. of medical biochemistry, Cairo University, for her cooperation, and assistance during the whole work.

I am extremely grateful to Dr. Mona Amin, Prof. of Internal medicine, Cairo University, for her cooperation, and assistance during the whole work.

Awareness, Organ and Whole body donation, Medical Fraternity.

Abstract

This study is undertaken to evaluate the awareness and attitude of medical fraternity towards whole body and organ donation. A cross sectional study was conducted among undergraduates, graduates and post graduates. Total 500 participants answered the multiple choice questionnaire containing information about demographic features, awareness and attitude towards whole body and organ donation. Out of 500 participants, 44% were willing to donate organs, 47.8% were willing to donate body only for organ transplantation, while only 5.8% for dissection purpose. 16.2% and 36.4% were not willing to donate organs and body respectively. 55.4% were self motivated followed by media (27.7%). Mistrust or misconception was the major reason for unwillingness to donate followed by premature organ removal. Although there is high level of awareness about whole body and organ donation, most of the medical students did not filled the pledge form. It is suggested that there is a need for reviewing medical school curricula and focussing on organ and whole body donation so, that there will be an altruistic change in attitude of future medical professionals.

Introduction:-

Best method to deliver anatomy training to medical students is by cadaveric dissection. Voluntary whole body donation and unclaimed bodies obtained by the police is the principal means by which universities acquire bodies for dissection. In India, the rate of increase in number of medical students is not correlating with the number of whole body donors. As a result, there is a diminished opportunity for an individual student to carry out dissection of the cadaver. In Japan, cadavers for dissection were totally supplied by body donation.⁽²⁾

The idea of donating bodies to medical science was decreased significantly from 31.5% to 19.6% among medical students after exposure to dissection.⁽¹¹⁾

Replacing the organ was the only treatment for patients with end stage organ disease. There are two kinds of donors: live and cadaveric (brain dead persons). Highest rate of cadaveric donation in world occurs in Spain being 32 per

million population, in USA and UK, it is 22 and 14 per million population, where as in India, it is just 0.16 per million population ⁽¹³⁾. Only 23% knew about the concept of cadaver as brain death and 93% were able to distinguish between brain death and persistent vegetative state ⁽¹³⁾.

The medical personnel are the one who derive maximal benefit from dissection and they are also the one who will have maximum knowledge on organ and whole body donation. So, this study was undertaken to examine the awareness and attitude of medical students and doctors towards both whole body and organ donation.

Materials and Methods:-

A cross sectional study was conducted in GITAM Dental College and Hospital, Andhra Pradesh, among 500 medical students from Nov 2015 to Jan 2016 to evaluate the awareness and attitude towards whole body and organ donation. Medical students were categorized as Undergraduates, Graduates and Post graduates. Undergraduates were again categorized as third and fourth year students. For this, a multiple choice questionnaire had been given to the participants which includes information about donation.

Attitude and Awareness of Medical Fraternity towards Organ / Whole Body Donation

A.) Age (year):

B.) Sex:

C.) Religion:

- | | |
|----------------|-------------------|
| • Hinduism | • Islam |
| • Christianity | • Others(specify) |

D.) Educational Qualifications

- | | |
|--------------------------|------------|
| • Inter/Higher secondary | • Graduate |
| • Post graduate | • Other |

OPINION REGARDING ORGAN / BODY DONATION

E.) What is your idea about organ donation:

- | | |
|---|---|
| • Organ donation from living donor only | • Organ donation from living & cadaver both |
| • Organ donation from cadaver only | • No idea |

F.) What is your idea about Body Donation:

- | | |
|---|-----------|
| • For dissection purpose of medical students only | • Both |
| • For purpose of organ transplantation only | • No idea |

J.) Will your family agrees for body donation:

- Yes without any hesitation
- No absolutely not
- Yes but need persuasion
- No idea

G.) Are you willing to donate your organ after death:

- | | |
|--------------------------------|-------------|
| • Yes, with out any hesitation | • No idea |
| • Yes, but need persuasion | • For money |
| • No absolutely not | |

H.) Do you want to donate your body after death:

- | | |
|---------------------------------------|-------------|
| • Yes, only for organ transplantation | • Unwilling |
| • Yes, only for dissection purpose | • For money |
| • For both purpose | |

I.) Will your family agrees for organ donation:

- | | |
|------------------------------|----------------------|
| • Yes without any hesitation | • No, absolutely not |
| • Yes but need persuasion | • No idea |

J.) For those who are willing to donate Body or Organ only continue this; And those who are not willing to donate continue page no.4

FOR THOSE WHO ARE WILLING ONLY

K.) From where you are motivated for organ / body donation:

- By medical person / Doctor
 - By media (TV, Radio, News paper, Internet etc)
 - By family members
- L.) Have you already filled up donor card pledge form:
- Yes
 - No
- M.) Reason behind willingness to donate body / organ but not filled up pledge form till now:
- Not decided yet
 - Will do later
 - Want to know much more
 - No idea about procedure
 - Religious Barrier
 - Family not agreed
 - No benefit
- N.) What is your opinion regarding positive attitude of Body / Organ donation:
- To be live by other peoples life
 - To avoid unnecessary wastage of body by cremation
 - To save other needy people's live
 - To facilitated medical teaching process more
 - To avoid environmental pollution
 - All of above
 - Others
- O.) If willing which organ would you like to donate:
- Kidney
 - Heart
 - Liver
 - Brain
 - Whole body
- FOR THOSE WHO ARE NOT WILLING**
- P.) Reason behind willingness regarding body / organ donation:
- Organ could be wasted
 - Don't want to cut body in to pieces
 - Organ / Body could be misused / abused
 - Religious barrier
 - Prevented by family members
 - Psychological anxiety
 - No reason
 - No knowledge about this
 - Any other reason
 - No monetary benefit for family
- Q.) Do you have any Religious beliefs for not donating organ:
- Yes
 - No
- R.) Do you have any fear of premature organ removal:
- Yes
 - No
- S.) Do you have any mistrust / misconception about how the medical community treats registered organs:
- Yes
 - No
- T.) If you have monetary benefit, will you accept for donation of Body / Organ?
- Yes
 - No

[Table/Fig-1]: Questionnaire

Results:-

Questionnaires were answered by all 500 participants, out of which 273 were undergraduates, 144 were graduates and 83 were post graduates.

Majority of participants were willing to donate organ and 24% had no idea about organ donation. Responses from organ donation was close among undergraduates, graduates and post graduates with a little higher willingness among graduates and post graduates. Regarding cadaveric donation, maximum (48%) of participants were willing to donate only for organ transplantation while for dissection purpose was very poor (6%).

Majority of participants were self motivated followed by media. Very less percentage of participants were motivated by medical person / doctor. Even though, majority of participants were willing to donate, only one had filled donor card. 33% of participants had no idea about donation. Mistrust or misconception was the main reason behind unwillingness to donate organs. Reasons behind unwillingness to donate organs is shown in Table/Fig 7.

Groups		Male	Female	Both	Percent
Undergraduates	Third year	31	113	144	28.8
	Fourth year	32	97	129	25.6
	Total	63	210	273	56.4
Graduates		24	120	144	28.8
Post graduates		31	52	83	16.6

Table/Fig-4: Attitude towards body donation.

Table/Fig-5: Motivating factors for donation

Table/Fig-6: Reasons for not filled up donor card

Table/Fig-7: Causes of unwillingness to donate organs

Discussion:-

Body donation to science was first occurred in 1832, when British utilitarian philosopher, Jurist and social reformer Jeremy Bentham's body donated their body according to their will ⁽¹⁰⁾.

In India, it was first experienced in year 1956, when the body of pandurang Sridhar Apte was donated to BJ Medical college, Pune ⁽¹⁰⁾. Even though, body donation was started in 1956 there was no significant improvement in percentage of body donation. The rate of increase in medical students was not correlating with the body donors for cadaveric dissection and research purposes. And the demand for organs was also increasing as the patients with end stage organ diseases were increasing. As physicians will have maximum knowledge on organ donation process, they can play a key role in solving this problem of shortage of organs and body by eliminating the barriers for organ and body donation by creating awareness, educating and motivating others but they may fail because of lack of knowledge about donation⁽⁹⁾. So, this study is undertaken, to know the awareness and attitude among 500 medical personnel which includes undergraduates, graduates and post graduates.

In this study, we found that 44% of respondents were willing to donate organs, 47.8% were willing to donate body only for organ transplantation while for dissection purpose was very poor and females were more willing to donate than males. Very negligible members were willing to donate for money where as in Turkey, 58.4% were willing to donate their organs and the acceptance of live organ donation was higher than cadaveric donation ⁽³⁾.

Majority of students were self motivated followed by media and only 8 members were motivated by medical person / doctor and 59.3% of students said that they want to save other needy people's live. In other studies they found that print / electronic media as their major and primary source of knowledge ^(2,3,4,8).

Although, more than half of our students were willing to donate, only one student has filled up donor card and only 8 of them asked for donor cards which were similar to a study done in turkey, where only 1.2% had a organ donor card ⁽³⁾. It states that the participants who are willing to donate are not whole heartedly willing to donate and some participants did not know about the procedure. So, proper guidance and counselling of and also incorporating organ donation topics in medical curriculum thereby creating awareness about it is very much essential.

Reasons behind unwillingness to donate organ or body was not wanting cut their body into pieces because of their previous experience with dissection hall followed by mistrust or misconception, fear of premature organ removal, religious barriers and monetary benefit Very less percentage of people were prevented by their family members.

Idea of donating bodies to medical science among medical students decreases significantly from 31.5% to 19.6% but not levels reported in general population⁽¹⁰⁾.

In a study done among medical and dental members, showed that 80% believed in mistrust and are not ready to donate their bodies⁽⁶⁾ which was similar to a study done in Malaysia⁽⁷⁾.

So, in India, Anatomy act was implemented in 1949, a state act published in state government gazette, which regulates the use of unclaimed bodies for medical research and education. It states that any death occurring in the state hospital or in a public place within the prescribed zone of medical institution and there are no claimants for body provided the police declared a lapse of 48 hours, they can be used for medical education⁽¹⁰⁾.

In Pakistan, Transplantation of human tissues and organ bill was passed by Pakistan parliament in 2007 and it includes restriction of organ donation only to a closed blood relative. It also created the "Human organs transplantation authority" which established transplant registry and recognized centers for transplantation⁽²⁾⁽⁶⁾.

A similar act was established in 2004 in Libya known as Libyan organ transplantation program to initiate deceased organ transplantation activity and helps in obtaining legal approval for organ donation and also organizes educational campaigns and meetings with the religious leaders to overcome the religious beliefs⁽¹²⁾.

Awareness of brain death and its importance for organ transplantation was extremely low in India especially among villagers⁽¹⁴⁾. Brain stem death was now legal in India under the passage of legislation by the Indian parliament act 1994 and it applies only when organ transplantation was intended⁽¹⁴⁾.

Most important reason for nobody donation in Indians is lack of awareness followed by religious beliefs⁽¹⁰⁾. In Libya, lack of adequate knowledge and religious implications were the major reasons for refusal⁽⁵⁾.

So, shortage of organs was not only due to mistrust or misconception but also because of lack of awareness, thought of being dissected and religious implication.

Conclusion:-

It is emphasized that there is a need for reviewing medical school curricula and focusing on organ and whole body donation so, that there will be an altruistic change in attitude of future medical professionals towards organ and whole body donation.

Abstract

Background: Hypoglycemia is one of the most common complications of diabetes management. The over enthusiastic approach in maintaining tight blood sugar control so as to reduce the long-term complications of diabetes have resulted in increase in frequency of this complication. This situation seems to get worsened with use of combination of anti-diabetic drugs.

Objectives: To assess the level of awareness toward First Aid Related To Hypoglycemia among Population In Riyadh And Jeddah cities to identify barriers.

Methods: A cross sectional analytical questionnaire based study among the general population of Riyadh And Jeddah cities.

Results: A total of 360 subjects answered the questionnaires. The mean age were 36 years, ranged from 16 to 70 and 45.2% females and 43.7% male respondents .Of these, 67% had attended college, 5% had postgraduate degree, 23.5% had completed high school, and 3.1% had basic school. The majority of participants had high level of monthly income (38%). The majority of subjects included in the research were (59.6%) married and (51.3%) were unemployed.

Most subjects (338) had poor knowledge about risk of hypoglycemia and there was no association between the knowledge and demographics of participants except for education as the higher the levels of education, the more significant association with good knowledge.

Conclusion: The Results of the present study reveal that the knowledge about the risks of hypoglycemia and first aid of hypoglycemia was poor among the studied population. Also, education significantly impacts the knowledge of hypoglycemia thus there is a need for providing the population and patients with necessary information to improve their hypoglycemia awareness.

Background:-

Hypoglycemia is one of the most common complications of diabetes management. The over enthusiastic approach in maintaining tight blood sugar control so as to reduce the long-term complications of diabetes have resulted in increase in frequency of this complication. This situation seems to get worsened with use of combination of anti-diabetic drugs.

The American Diabetes Association defines the hypoglycemia as “any abnormally low plasma glucose concentration that exposes the subject to potential harm”, and proposes a threshold of $<70 \text{ mg\%}$ ⁽¹⁾. In subjects with type 1 diabetes, autoimmune destruction of pancreatic β -cells leads eventually to an absolute requirement for insulin replacement therapy. Insulin delivered exogenously is not subject to normal physiological feedback regulation, so it may induce hypoglycemia even in the presence of an intact counter regulatory response. The average individual with type 1 diabetes experiences about two episodes of symptomatic hypoglycemia per week, a figure that has not changed substantially in the last 20 years ⁽²⁾. This risk is increased markedly with the increasing duration of the disease and strict glycemic control. In subjects with type 2 diabetes, the increasing duration of the disease and the more widespread use of insulin therapy also increase the risk of severe hypoglycemia. This was reflected in a recent survey in Tayside, Scotland, which found the proportion of severe hypoglycemic episodes needing emergency medical assistance was similar between type 1 and insulin-treated type 2 diabetic patients ⁽³⁾. Our Study Was Designed To Examine Health Beliefs And Assessment Level OF Awareness Toward Early First Aid Related To Hypoglycemia among Population In Saudi Arabia, Riyadh And Jeddah And Applies The Health Belief Model To Determine Barriers.

Rationale:-

Diabetes mellitus is a chronic disease that constitutes a major public health problem. The worldwide prevalence of DM has risen tremendously over the past two decades. Hypoglycemia is one of the most common complications of diabetes management. The over enthusiastic approach in maintaining tight blood sugar control so as to reduce the long-term complications of diabetes have resulted in increase in frequency of this complication. This situation seems to get worsened with use of combination of anti-diabetic drugs.

Objectives:-

General objectives:-

To assess the level of awareness toward First Aid Related To Hypoglycemia among Population In Riyadh And Jeddah cities to identify barriers.

Specific objective:-

The goal of this study was to examine community health beliefs regarding hypoglycemia and their perceptions related to it and evaluate the role of demographic factors in shaping beliefs about first aid related to hypoglycemia and assess possible associations between demographic characteristics with the preventive behavior of interest.

Methods:-

Study design: cross sectional study.

Setting and data collection:-

This survey analysis was conducted among community population in Riyadh and Jeddah cities. A preformed self-administered questionnaire was distributed among the community population.

Sample:-

Subjects were chosen according to geographical and sex distribution. Sample size was calculated based on web-site calculator ⁽⁴⁾ taking the total size of Riyadh and Jeddah population (4,087,000+2,800,000) ⁽⁵⁾, confidence level (95%) and margin error (5%) to be 285. Additional 20 % was added to cover the missing data. The total sample obtained was 360.

Study population:-

The study population included were both male and female in Riyadh and Jeddah cities.

Study tool:-

Preformed Self-administered questionnaire that requires information about:

- 1- Demographic characteristics: age, gender, education level, monthly income, marital status, and employment.
- 2- Knowledge assessment including 7 questions about risk factor of hypoglycemia and first aid of hypoglycemia. A score of 1 was given to yes and 0 otherwise. For each subject, a maximum score of 7 was calculated. A scoring system was applied to measure the respondents' knowledge towards hypoglycemia impacts. The hypoglycemia knowledge score was calculated as a continuous variable by summing the participant's number

of yes answers to the questions. One point was awarded for each yes, and zero for each no or don't know, with a maximum obtainable correct score of 7 for each respondent. The knowledge score was categorized into two levels indicated by poor (0–4.5), and good (5–7).

Ethical considerations:-

An informed consent was obtained from the participants included in this research before filling the questionnaire.

Statistical analysis:-

Data were entered into the Statistical Package for Social Sciences (SPSS, version 24, SPSS, Chicago, IL, U.S.A.) and descriptive analysis conducted. The results were reported as percentage (95% confidence interval).

The internal consistency was assessed using Cronbach's α test. The test results were for the 7 statements of knowledge about hypoglycemia first aid was 0.422.

Association of respondents' characteristics with about hypoglycemia first aid, was evaluated using univariate logistic regression. Results were reported showing odds ratio (OR) and 95% confidence interval. Statistical significance was accepted at $p < 0.05$. The dependent variables: knowledge of hypoglycemia risk (1 = Poor knowledge and 0 = good knowledge). The following independent variables were included: (1) age: ≤ 20 years, [21–30 years], [31–40 years], [41–50 years], > 50 years; (2) gender: males and females; (3) level of education: low, for those who completed secondary school or less, intermediate for those who finished college degree or have bachelor degree and high for those who had postgraduate degree; (4) monthly income: low [< 3000 Saudi Riyal (SR)], middle [3000–10000 SR] and high [> 10000 SR]; (5) marital status: single and married; (6) employment: unemployed and employed.

Results:-

Demographics of the studied subjects:

The socio-demographic characteristics were shown in Table. 1.

Table 1:- Socio-Demographic Characteristics of Respondents (n = 360)

	Frequency	Percentage (%)
Age (Year)		
≤ 20.00	36	8.60%
21.00 - 30.00	125	29.70%
31.00 - 40.00	56	13.30%
41.00 - 50.00	47	11.20%
51.00+	63	15.0%
Missing	94	22.30%

Married	251	59.60%
Un Married	169	40.10%
Missing	1	0.20%
Employment		
Employed	194	46.10%
Un Employed	216	51.30%
Missing	11	2.60%

A total of 360 subjects were included in the study and answered the questionnaire. The age ranged from 16 to 70 years. The mean was 36 and about 8.6% of subjects were less than 20 years old, 29.7% of participants were from 21-30 years old, 13.3% were from 31-40 years old, 11.2% ranged from 41-50 years old, 15% were more than 51 years old and 22.3% of participants had missing data about age.

The gender distribution showed that 54.2% of participants were females, 43.7% were males and 2.1% had missing data about gender.

The study population represents a highly educated group of people, with 67% having attended university or college, 23.5% having completed high school, 5% having post-graduate degree and 3.1% completed basic school and 1.4% had missing data about education level.

The majority of participants had high level of monthly income (38%) more than 10.000 SR, followed by 21.4% of patients had monthly income less than 3000 SR then 19% had income ranged from 7000-10.000 SR, 10.95% had an income that ranged from 3000-5000 SR and 8.1% had an income ranged from 5000-7000 SR.

The marital status showed that the majority of subjects included in the research were (59.6%) married and 40.1% were un-married.

The most of subjects were unemployed (51.3%), and 46.1% were employed, however only 2.6% had missing data.

Responses to questions of knowledge assessment questionnaire (Table. 2):-

The response of participants to question 1 showed that 76.5% of patients answered that they had good knowledge about risks of hypoglycemia and hypoglycemia first aid, 58.4% of subjects answered yes to question 2 as they have knowledge about the importance of hypoglycemia assessment by doctors.

As for question 3, 50.6% of participants had no knowledge about the first aid hypoglycemia and 49.4% answered yes to this question.

Regarding to Q 4, 95% of subjects said yes to their knowledge about the treatment of diabetes have hypoglycemic effect on blood glucose. But 76.2% of participants said that the majority of doctors underestimate informing patients about the risks of diabetic therapy in Q 5.

57.2% of subjects said that doctors doesn't give them enough information about hypoglycemia and 42.8% had been given information about hypoglycemia in question 6. In question 78.9% of patients had knowledge about the complication of hypoglycemia (Figure. 1).

Table 2:- Responses to questions on assessment level of awareness toward hypoglycemia risk

	No	Yes	Don't Know
Q1: Do you think that the hypoglycemia has risks?	99(23.50%)	322(76.50 %)	0 (0.0%)
Q2: Do you think that hypoglycemia assessment by doctors are important?	129 (30.60%)	246 (58.40%)	46(10.90 %)
Q3: Do you have knowledge about the first aid of hypoglycemia?	213 (50.60%)	208 (49.40%)	0 (0.0%)
Q4: Do you think treatment of diabetes have hypoglycemic effect on blood glucose?	21 (5.00%)	400 (95.00%)	0 (0.0%)
Q5: Do doctors clarify the impacts of diabetes therapy?	321 (76.20%)	100 (23.80%)	0 (0.0%)
Q6: Do doctors provide adequate information for people to avoid hypoglycemia ?	241 (57.20%)	180 (42.80%)	0 (0.0%)
Q7: Do you think hypoglycemia leads to sever complication can cause death?	89 (21.10%)	332 (78.90%)	0 (0.0%)

hypoglycemia risks (Figure. 2).

Table 3:- Knowledge of awareness toward first aid of hypoglycemia

	Knowledge Score
Mean± SD	4.25±1.44
Min.- Max.	0-7
Good Knowledge (≥ 5.69)	83 (19.71%)
Poor knowledge (< 5.69)	338 (80.29%)

**Figure 2:-** Respondent's Knowledge about first aid of hypoglycemia

Association between knowledge and demographics of included participants:-

Univariate logistic regression to study the association between knowledge and participant's demographics showed that, neither age nor other demographic variables showed significant association with being aware of hypoglycemic risks ($P > 0.05$). However, education level achieved statistical significance ($p < 0.0001$) association with knowledge as higher education resulted in good levels of hypoglycemia first aid (Table. 4). Interestingly, it was found that respondents who have completed their college degree have had a higher likelihood to have poor knowledge about hypoglycemia risks with an OR (95% CI) of 8.07 (3.11 - 20.94) when compared with those who get higher post-graduate degree (Master of PhD). Nearly the same difference was found in respondents, who have completed either high school or lower, with % of poor knowledge about (80.4%) when compared with individuals with high post graduate degrees (Figure. 3).

Table. 4:- Univariate logistic regression model for association between hypoglycemia knowledge and socio-demographic variables:

	Good Knowledge (n=83)	Poor Knowledge (n=338)	OR (95% CI)	P-value
Age				
<= 20.00	5(13.9%)	31(86.1%)	1	0.434
21.00 - 30.00	30(24.0%)	95(76.0%)	0.51(0.18-1.43)	0.201
31.00 - 40.00	8(14.3%)	48(85.7%)	0.97 (0.29-3.23)	0.957
41.00 - 50.00	9(19.1%)	38(80.9%)	0.68 (0.21-2.24)	0.527
51.00+	10(15.9%)	53(84.1%)	0.86 (0.27-2.73)	0.791
Gender				
Female	39(17.1%)	189 (82.9%)	1	0.115
Male	43(23.4%)	141(76.6%)	0.68 (0.42-1.1)	
Education Level				
High	14 (66.7%)	7 (33.3%)	1	< 0.0001
Intermediate	56 (19.9%)	226 (80.1%)	8.07 (3.11 - 20.94)	< 0.0001
Low	22 (19.6%)	90 (80.4%)	8.18 (2.95 -22.69)	< 0.0001
Monthly Income (SR)				
> 10,000 SR	31(19.4%)	129(80.6%)	1	0.68
3000-10000 SR	34(21.3%)	126(78.8%)	0.89 (0.52-1.54)	0.677
< 3000 SR	15(16.7%)	75(83.3%)	1.2 (0.61-2.37)	0.596
Marital Status				
Married	51(20.3%)	200(79.7%)	1	0.727
Un Married	32(18.9%)	137(81.1%)	1.09(0.67-1.79)	
Employment				
Employed	42(21.6%)	152(78.4%)	1	0.429
Un Employed	40(18.5%)	176(81.5%)	1.22(0.75-1.97)	

OR: Odds ratio, CI: Confidence Interval

Figure 3:- Forest plot illustrating the odd ratios with 95% confidence intervals of the different socio-demographic predictors for Respondent's Knowledge about hypoglycemia first aid

Discussion and conclusion:-

This study has some limitations including that sample size in this research were educated group, and doesn't represent the whole population of the Riyadh And Jeddah cities thus the results can't be generalized. Also, Regardless of the sample size limitations, this study showed that there is a poor knowledge in the general population awareness about risks and first aid of hypoglycemia .

The response of participants to the questions showed that the majority had good knowledge about risks and first aid of hypoglycemia .

On the other hand the majority of doctors don't give the patients adequate information for risks nor first aid of hypoglycemia.

Thus doctors should provide patients with the necessary information to increase their awareness toward risks and first aid of hypoglycemia as it is a part of the responsibility of healthcare providers. Also, hypoglycemia significantly affected the general knowledge of the included participants.

In conclusion, the knowledge about risks of hypoglycemia and first aid of hypoglycemia was poor , thus the awareness about hypoglycemia and first aid of hypoglycemia must be increased. This study showed a poor awareness about hypoglycemia and first aid of hypoglycemia in the general population. Thus many studies should be conducted to provide the necessary information in order to increase of hypoglycemia and first aid of hypoglycemia awareness of population .

Abstract

Background: Methicillin Resistant *Staphylococcus aureus* (MRSA) since its emergence, has been a challenge for the community owing to its potential to cause life threatening events like sepsis, endocarditis and osteomyelitis.

Aims and objectives: To investigate the prevalence of MRSA in various clinical samples and to find the antibiotic resistance pattern of the MRSA isolates.

Materials and Methods: Oxacillin resistance screening agar with 5.5% NaCl and Kirby–Bauer disk diffusion method (cefoxitin 30µg disk) were used for MRSA confirmation and antibiotic resistance testing was done as per CLSI 2016 guidelines. E-test was done for testing sensitivity to Vancomycin.

Result: *Staphylococcus aureus* was isolated from 350 specimens. Out of these 350 isolates, 220 (62.86%) were methicillin sensitive and rest 130 (37.14%) isolates were MRSA. Most of the MRSA isolates were from urine samples (43.71%) followed by pus (24.0%), and putum (11.14%). MRSA isolates showed high resistance to ciprofloxacin (53.38%), and clindamycin (42.31%). linezolid resistance was seen in only 6.15% and all isolates were sensitive to vancomycin.

Conclusion: A high prevalence of MRSA (37.14%) in our institution warrants the judicious use of antibiotics in treating infections caused by *Staphylococcus aureus*. Vancomycin and linezolid are good treatment options in infections caused by MRSA isolates.

Introduction:-

The genus *Staphylococcus* is one of the most commonly encountered group of pathogens in both community-acquired as well as hospital-associated infections. Within genus *Staphylococcus*, *Staphylococcus aureus* is the most important and prevalent organism isolated in clinical specimen¹. The organism also exists as a commensal, colonizing the anterior nares of about one third of the healthy human population. Asymptomatic nasal carriers are at a high risk of subsequent *S. aureus* infection and are presumed to be an important source of strains that spread and cause infection in contacts^{2,3,4}.

This centuries-old pathogen is found in almost all the varieties of clinical specimen ranging from minor skin infections to fatal necrotizing pneumonia⁵ and still continues to be the cause of significant morbidity and mortality despite huge advances in medical care *S. aureus* resistance to methicillin was reported for the first time in 1961 in

England, and since then it continues to be the most dreadful strains of *S. aureus*. It is one of the most common pathogens that cause nosocomial infections^{6,7}

In India, a multicentric trial conducted between January 2008 to December 2009 at several healthcare centres⁸ found MRSA prevalence among specimen collected from outpatients, ward inpatients and ICU to be 28, 42 and 43 per cent, respectively in 2008 and 27, 49 and 47 per cent, respectively in 2009, thus indicating that MRSA has assumed a concerning proportion. Moreover, they stressed on the pattern of changing antibiotic susceptibility and also recommended robust antimicrobial stewardship and strengthened infection control measures to prevent spread and reduce emergence of resistance.

It must be kept in mind that current therapeutic options for MRSA are limited few expensive drugs like vancomycin, linezolid, teicoplanin, daptomycin and streptogramins. Another alarming sign is that emergence of resistance to Vancomycin, although at a low level has been reported in literature⁹, thus underlining the observations made by the multicentric study cited above.

Hence, the present study was planned with an aim to assess the prevalence and antibiotic susceptibility of Methicillin resistant *Staphylococcus aureus* at Era's Lucknow Medical College and Hospital (ELMCH)

Aims and Objectives:-

The present study was carried out with an aim to evaluate the prevalence, antibiotic susceptibility of MRSA in a tertiary care centre. This aim was fulfilled with the help of following objectives:

1. To investigate the prevalence of MRSA in various samples obtained for culture.
2. To find the antibiotic resistant pattern of MRSA isolates

Material And Methods:-

Place Of Study Study was conducted at Department of Microbiology, Era's Lucknow Medical College.

Duration:

12 months from Nov 2014 to Oct 2015

Study Population:

Part I: All patients visiting Era's Lucknow Medical College and Hospital, Lucknow.

Sampling Frame:-

Sample size: 350

Inclusion criteria:-

All patients including outpatients and admitted patients

Exclusion criteria:-

Patients who did not show cooperative attitude or refuse to provide necessary information were excluded.

Sample Collection:-

Part I: The sample collection was done at different clinical Department of Microbiology, Era's Lucknow Medical College, Lucknow using standardized sampling techniques. The specimen obtained from different sources were labeled and tagged with information

Lab Diagnosis:-

Microscopy:-

Gram staining

Culture was done on following media:

Blood agar

Mac Conkey agar

MRSA confirmation by:-**Oxacillin resistance screening agar with 5.5% NaCl:-**

Suspend 51.75 grams in 500 ml distilled water. Heat to boiling to dissolve the medium completely. Sterilize by autoclaving at 15 lbs pressure (121°C) for 15 minutes. Cool at 45-50°C and aseptically add rehydrated contents of 1 vial of Oxacillin Resistance Selective Supplement (FD191). Mix well and pour into sterile Petri plates.

Disc diffusion method [Kirby bauer (cefoxitin 30 mg disk)]¹⁰

Procedure (As per manufacturer's instructions):-

Bacterial Suspension was prepared according to 0.5 McFarland standard and results were interpreted as Resistant, Intermediate or Sensitive for each antimicrobial using CLSI guidelines.

E-TEST: Vancomycin EzyMIC strips (HiMedia) were used to test for vancomycin sensitivity over a range of MIC from 0.016-256 mcg/ml. The E Test was done and interpreted as per manufacturer's instructions. Apply the Etest strip to the agar surface with the MIC scale facing upwards. MICs were read where the edge of inhibition ellipse intersected the strips.

Statistical Tools Employed:-

The statistical analysis was done using SPSS (Statistical Package for Social Sciences) Version 15.0 statistical Analysis Software. The values of mean, standard deviation and p value were calculated and a p value of $p < 0.05$ was considered significant. Chi square test was done to differentiate between MRSA and MSSA.

Results:-

A total of 350 specimens from the patients were collected which were subjected to MRSA sensitivity.

Table 1:- Distribution of Cases according to MRSA status (n=350)

	Number of cases	Percentage
MRSA	130	37.14
MSSA	220	62.86

Out of 350 specimens, 220 (62.86%) were found to be MSSA and only 130 (37.14%) specimens were found to be MRSA. Prevalence of MRSA in our tertiary care centre was found to be 37.14.

Table 2:- Comparison of Type of specimen between MRSA and MSSA cases

	Total	MRSA (n=130)		MSSA (n=220)		Statistical significance	
		No.	%	No.	%	χ^2	p
BC	5	5	3.85	0	0.00	47.289	<0.001
Blood	15	2	1.54	13	5.91		
Body fluid	30	2	1.54	28	12.73		
Catheter tip	24	10	7.69	14	6.36		
Pus	84	51	39.23	33	15.00		
Sputum	39	11	8.46	28	12.73		
Urine	153	49	37.69	104	47.27		

Out of 350 specimens, most common specimen was Urine (n=153; 43.71%), followed by Pus (n=84; 24.0%), Sputum (n=39; 11.14%), Body fluid (n=30; 8.57%). 15 (4.29%) were blood specimens and 5 (1.43%) were from blood culture (BC).

Proportion of MRSA specimens was higher than MSSA for Blood components – Blood culture (3.85% vs. 0.0%), Catheter tip (7.69% vs. 6.36%), Pus (39.23% vs. 15.00%).

Table 3: Distribution of MRSA positive specimen according to Method of Identification (n=130)

SN	Method	No. of specimen identified	Percentage
1.	Disc diffusion method : Kirby Bauer (cefoxitin 30mg disk)	130	100
2.	Oxacillin resistance screening agar with 5.5% NaCl	90	69.2
3.	Both	90	69.2

All the MRSA samples were identified by Kirby-Baur disc diffusion method (cefoxitin 30 mg). Using Oxacillin resistance screening agar with 5.5% NaCl helped in identification of 90 (69.2%) specimen. Both the methods identified MRSA in 90 (69.2%) specimens

Difference in type of specimens between MRSA and MSSA was found to be statistically significant ($p < 0.001$).

Table 9:- Comparison of Resistance of MRSA and MSSA cases

Resistant	MRSA (n=130)		MSSA (n=220)		Statistical significance	
	No.	%	No.	%	χ^2	P
CEFOXITIN	130	100.00	0	0.00	350.00	<0.001
CIPROFLOXACIN	70	53.38	63	28.6	22.04	<0.001
DOXYCYCLINE	20	15.38	17	7.7	5.068	0.024
NORFLOXACIN	18	13.85	15	6.8	4.726	0.030
LINEZOLID	8	6.15	8	3.6	1.187	0.276
CLINDAMYCIN	55	42.31	47	21.4	17.37	<0.001
VANCOMYCIN	0	0.00	0	0	-	-
AMIKACIN	13	10.00	11	5.0	3.198	0.074

All the MRSA specimen were resistant against Cefoxitin. The resistance rate in decreasing order was Ciprofloxacin (53.38%), Clindamycin (42.31%), Doxycycline (15.38%), Norfloxacin (13.85%), Amikacin (10%) and Linezolid (6.15%). Vancomycin was sensitive against 100% of MRSA isolates.

All MSSA specimen were sensitive against Cefoxitin. The resistance rate in decreasing order was Ciprofloxacin (28.6%), Clindamycin (21.4%), Doxycycline (7.7%), Norfloxacin (6.8%), Amikacin (5%) and Linezolid (3.6%). Vancomycin was sensitive against 100% of MRSA isolates.

Discussion:-

Methicillin resistant *Staphylococcus aureus* since its emergence has been a challenge for the healthcare workers owing to its potential to cause life-threatening events like sepsis, endocarditis, and osteomyelitis. Major outbreaks of MRSA and its different phage types have also been recorded and reported in healthcare facilities¹¹. Since resistance to multiple antibiotics among MRSA isolates is very common, there is a possibility of extensive outbreaks, which may be difficult to control. MRSA is now one of the commonest nosocomial pathogens, and asymptotically colonized healthcare workers are the major sources of MRSA in the hospital environment. Early detection of MRSA and formulation of effective antibiotic policy in tertiary care hospitals is of paramount importance from the epidemiological point.

In our study a total of 350 clinical specimen positive for *Staphylococcus aureus* were obtained and assessed for methicillin resistance. Out of these 130 (37.14%) were found to be Methicillin resistant. Thus prevalence of Methicillin resistant *S. aureus* was found to be 37.14% in present study. Prevalence of MRSA has been shown to vary substantially in some contemporary clinical series from the region. Table D1 shows the prevalence of MRSA in some contemporary clinical series:

Table D1:- Prevalence of MRSA in some contemporary clinical series

SN	Author (Year)	Sample size and characteristic	MRSA prevalence rate
1.	Saikia <i>et al.</i> (2009) ¹² Dibrugarh, Assam	276 Clinical specimen	34.78
2.	Ahmad <i>et al.</i> (2009) ¹³ , Armed Forces Hospital, Saudi Arabia	106 Specimen collected from different hospital	22.3%
3.	Tiwari <i>et al.</i> (2011) ¹⁴ , Bhubaneswar, India	204 Clinical samples	55.8%
4.	Sharma <i>et al.</i> (2013) ¹⁵ , Mangalore, India	685	23.25%

SAAn overview of Table D1 above shows a wide variability in clinical prevalence rate of MRSA in different studies.

In present study, Kirby Bauer disc diffusion method (Cefoxitin 30 mg) proved to be more sensitive than Oxacillin resistance agar method for detection of MRSA. This finding is in accordance with the observations made by Datta *et al.* who also showed that Cefoxitin disc diffusion is more sensitive than Oxacillin resistance agar method in the detection of MRSA¹⁶.

In present study, pus was the most common source of MRSA (39.23%) followed by urine (37.69%), sputum (8.46%) and catheter tip (7.69%) respectively. Saikia *et al.* (2009)¹² also showed maximum isolation of MRSA from pus/wound swabs (46.67%) followed by sputum/throat swab (42.86%) while Ahmad *et al.*¹³ found source of MRSA to be 22.2% from pus, 23.8% from wound swabs, 33.3% from aspirates and 13.3% from sputum. The findings of present study are in accordance with the observations of Tiwari *et al.*¹⁴ (2011) who reported pus (45%) followed by urine (20.5%) to be the major source of MRSA in their study. With slight difference in proportions, these two sources comprise the major source of MRSA in our study too. In present study, MRSA positivity rate in pus samples was significantly higher (51/84; 60.7%) as compared to other specimen (79/266; 29.7%). This finding is in accordance with some other studies too that have also reported pus to have a higher MRSA positivity rate as compared to other specimen^{12,14,15}.

MRSA specimens were most sensitive against Vancomycin (100.0%) and Linezolid (93.85%). Cefoxitin, Ciprofloxacin and Clindamycin showed maximum resistance (100%, 53.38% and 42.31% respectively). The antibiotic susceptibility has been reported to vary substantially in different studies. Goyal *et al.* (2013)¹⁷ showed from a study conducted in a teaching hospital at Agra that MRSA specimens were most sensitive against

Vancomycin, Teicoplanin and Linezolid (100%), Ampicillin, Erythromycin and Chloramphenicol showed maximum resistance (100%, 88%, 66.7% respectively). Another study conducted by Sharma et al (2013)¹⁸ from Mangalore, India showed most of the MRSA strains were sensitive against Linezolid (98.27%) and Ciprofloxacin (64.7%), Tetracycline (58.38%) showed maximum resistance. The findings of the present study are in accordance with Tiwari et al (2011)¹⁹ Bhubaneswar, India who showed all the isolated MRSA strains were sensitive against Vancomycin and Linezolid (100%). Vancomycin and Linezolid are most sensitive drugs with most of the studies reporting their sensitivity rates between 90% to 100%. The findings of present study also emulated the same and showed vancomycin and linezolid to be 100% and 93.85% sensitive. For other conventional antibiotics different studies have shown a high resistance pattern. A number of studies have also reported multidrug resistance. In present study too for conventional antibiotics the resistance rates were ranged from 42.31% to 100%. A number of specimens were polypersistent too.

These findings in turn indicate the need to develop an antibiotic protocol dependent on MRSA profile of the pathogen in order to reduce the unnecessary burden of antibiotics.

Conclusions:-

The present study was carried out in the Department of Microbiology, Era's Lucknow Medical College & Hospitals to evaluate the prevalence, antibiotic susceptibility and carriage rate of MRSA in a tertiary care centre

1. Out of 350 specimens during the study period, 220 (62.86%) specimens were found to be MSSA and 130 (37.14%) were MRSA. Prevalence of MRSA in our institution was 37.14%.

2- Proportion of MRSA specimens was higher than MSSA for Blood culture (3.85% vs. 0.0%), Catheter tip (7.69% vs. 6.36%), Pus (39.23% vs. 15.00%) while proportion of MSSA was higher than MRSA for body fluid (12.73% vs. 1.54%), Sputum (12.73% vs. 8.46%) and Urine (47.27% vs. 37.69%).

3-MRSA specimens were most sensitive against Vancomycin (100.0%) and Linezolid (93.85%) while least sensitive for Cefoxitin (0.0%).

4- 90 isolates were detected by oxacillin resistance screening agar and 130 isolates were detected by Kirby Bauer disk diffusion method. Thus Kirby Bauer method provided an addition of 30.8% in overall MRSA detection

The findings of present study, thus showed that MRSA was prevalent in our hospital. There is a progressive increase in MRSA positivity and multi-drug resistance in strains of *Staphylococci*. Vancomycin and linezolid were found to have absolute sensitivity.

Abstract

Evaluation of cobs-to-row progenies raised from previously selected 800 progenies for their early vigour at 30 DAS and grain yield and its components at maturity indicated the presence of high degree of variation for leaf area and leaf width compared to seedling girth and seedling height. Further median and mode values of traits related to early vigour exhibited negative skewed distribution with a platykurtic pattern indicating greater scope of selection among the progenies for improving early vigour. Among the traits studied at the time of maturity cob weight, pith weight, number of kernels per cob and grain yield per plant showed high coefficient of variability. Plant height and shelling percentage exhibited very low coefficient of variation.

Introduction:-

Maize (*Zea mays* L.; $2n = 20$) is an important cereal crop with high yield potential. The total production at world level has surpassed both sorghum and pearl millet gaining a third place after wheat and rice. The demand for maize grain is increasing every year due to its diversified use in poultry, piggery and industry. In India, about 50-55 per cent of maize production is consumed directly as food, 30-35 per cent for poultry, piggery and fishmeal and 10 to 12 per cent in wet milling industry viz., in starch and oil and about 3 per cent in dry milling for traditional requirement like *Dalia* and *Sattu*. A number of genotypes viz., single cross, three way cross, double top cross, double cross hybrids, composites, synthetic population are being cultivated by farmers.

The efficiency and success of hybrid maize breeding depends on the contribution of heterotic effects from the superior inbred lines. The superior cross combination may be exploited as commercial single cross. Usually, the hybrid development programme in maize involves development of inbred lines, evaluation of inbred lines, crossing of selected inbreds and production of hybrids. In this context, a programme on development of inbred lines was initiated by using inbreeding system utilizing yellow pool as the base population. Yellow pool is a blend of 50 elite lines received from Directorate of Maize Research (DMR), New Delhi and inter mated for four cycles at Agricultural Research Station, Arabhavi. The S_2 lines derived from this population were evaluated by line \times tester analysis involving four diverse testers in to know their performance, combining ability and nature of inheritance of different quantitative traits. The line \times tester ($L \times T$) design is basically an extension of top cross analysis involving more than one tester (Kempthorne, 1957). Thus, keeping these views in background, the proposed work was undertaken to develop hybrids suitable for *kharif* season.

***Part of the Ph.D thesis submitted to the University of Agricultural Sciences, Dharwad**

Material and methods:-

Fifty elite breeding lines (Table 1) were received from Directorate of Maize Research (DMR), IARI, New Delhi for development of full season heterotic yellow pool. These lines were raised and allowed to open pollinate for four generations (intermating) without exercising any selection. In each generation, the plants were raised in half-sib family method and at the end of fourth generation, the seeds were collected and grown as base population at College of Agriculture, Dharwad in isolation and allowed to open pollinate. Sufficient care was taken to maintain more than 10 thousand plant population. Out of this population, 150 plants were tagged in each grid by dividing entire population into 10 grids of 150 sq. mt. at the time of tassel emergence, based on vigour, standing ability, silk and tassel traits and free from disease incidence, 800 cobs were selected based on grain yield (*per se*) performance and this material formed basis for further inbreeding and isolation of inbred lines.

The experiments were laid out at Agricultural Research Station, Arabhavi and the experimental details are mentioned below under.

After thorough land preparation, hand dibbling was done with two seeds per hill and thinned out to maintain single plant per hill during second week after sowing (10-15 days after sowing). The crop was applied with recommended dose of fertilizers as per the package of practices.

Observations On Quantitative Traits:-

In these investigations, data were collected in respect of quantitative traits. Observations on quantitatively inherited traits were recorded on five competitive randomly selected plants. The average was taken as the mean of the treatment. The way in which observations were recorded is described below.

Plant height at 60 days after sowing (cm) :-

Plant height was expressed in centimetres by measuring the plant stalk from the ground level to the base of the last leaf sheath of the plant.

Ear height at 60 days after sowing (cm) :-

This observation was recorded at the same time as plant height (at harvest), measured as the height of the plant from the ground level to the uppermost ear bearing node and expressed in centimetre.

Leaf area at 60 days after sowing (cm²) :-

The average of five leaves from five different plants at 60 days after sowing was calculated by using formula $L \times B \times 0.75$ and expressed in square centimetre (Montgomery, 1911).

Ear weight (g) :-

Five ears were sun dried and weight in grams was recorded at stable moisture content.

Ear length (cm) :-

Length of the ear was measured and recorded in centimetres at the time of harvest as its total length (from the base to the tip of the ear).

Ear circumference (cm) :-

Ear circumference at one-third length from the base of the ear was measured and recorded in centimetre.

Number of kernel rows per cob:-

Number of kernel rows in each ear was counted for five cobs and mean was worked out.

Number of kernels per row:-

The number of kernels in any one of the row in each ear was counted and mean was worked out.

Number of kernels per ear:-

Total number of kernels in each ear of the selected plants was recorded.

Hundred grain weight (g) :-

One hundred randomly selected grains per cob were weighed and weight was recorded in grams.

Shelling percentage:-

The ratio of grain weight to the ear weight was expressed in percentage.

$$\text{Shelling percentage} = \frac{\text{Grain weight}}{\text{Cob weight}}$$

Pith / shank / heart weight (g) :-

The total pith / shank / heart weight from each ear was recorded and the average heart weight was expressed as heart weight per plant in grams.

Kernel yield per plant (g) :-

At the time of harvesting, fresh ear weight was recorded in grams per plant. Moisture determinations were made from shelled samples from five random ears of each plot with the help of electronic moisture meter. The fresh ear weight data was used to work out the dry weight at 15 per cent moisture grain yield in grams per plant.

Kernel yield per plot (kg/plot) :-

At the time of harvest, fresh ear weight was recorded in kilograms for each plot. This fresh ear weight was adjusted to zero per cent grain moisture and recorded as grain yield per plot. Moisture percentage was determined on universal moisture tested in a grain sample obtained from two rows of each of five ears selected at random at the time of harvest were used for genetical analysis following Combstock (1948) and Robinson (1968).

$$\text{Yield per plot (kg/plot)} = \frac{\text{Fresh ear weight} \times (100 - \text{AVM})}{100}$$

Where,

$$K = \frac{\text{Average stand/plot of the trial} \times \text{plot area} \times 0.9412}{\text{Final stand}}$$

AVM = Average moisture

100 × plot area

Kernel / grain yield per hectare (q/ha):-

Fresh dehusked ear weight per plot was recorded at the time of harvest. Moisture content of 100 grams of fresh kernels was recorded by moisture meter of each entry and the moisture percentage was calculated by using moisture conversion charts. Kernel yield per hectare was calculated using the formula given below:-

$$\text{Yield (q/ha)} = \frac{\text{Fresh ear weight} \times 100 - \text{AVM}}{100} \times K$$

Where,

$$\text{K} = \frac{\text{Final stand harvest}}{\text{Average stand of the trial} \times \text{Area (ha)} \times 0.9412}$$

Statistical Analysis:-**Analysis of variance:-**

The data were subjected to statistical analysis for randomised block design (RBD) as described by Panse and Sukhatme (1962). The mean values of the entries in each replication were used for analysis of variance (ANOVA). The significant difference among genotypes was tested by 'F' test at one per cent and five per cent levels of probability.

Genotypic and phenotypic correlation coefficients:-

Genotypic and phenotypic correlation coefficients were worked out as per the methods suggested by Johnson *et al.* (1955) to find out the relationship between yield and its contributing characters. Analysis of covariance was done similar to that of analysis of variance taking two characters at a time. The genotypic and phenotypic co-variances were derived as detailed for genotypic variance. The genotypic and phenotypic variance and co-variance components were utilized to calculate genotypic and phenotypic correlation coefficients (r) by applying the formula.

$$r = \sqrt{\frac{\text{Cov. g. 1,2}}{(\sigma^2_{g1}) \times (\sigma^2_{g2})}} \text{ and } \sqrt{\frac{\text{Cov. p. 1,2}}{(\sigma^2_{p1}) \times (\sigma^2_{p2})}}$$

Where,

Cov.g. 1:2 : Genotypic covariance between two traits (1 and 2)

Cov.p. 1:2 : Phenotypic covariance between two traits (1 and 2)

$\sigma^2_{g_1}$: Genotypic covariance for first trait

$\sigma^2_{p_1}$: Phenotypic covariance for first trait

$\sigma^2_{g_2}$: Genotypic covariance for second trait

$\sigma^2_{p_2}$: Phenotypic covariance for second trait

Referring to correlation table of Snedecor and Cochran (1967), the significance of phenotypic correlation coefficient was tested.

Results:-

Association studies in S_1 progenies:-

Among all traits, selection for seed yield is a complex phenomenon that involved interaction among different growth and yield contributing character of a genotype. In the present investigation an attempt was made to understand association of different traits at population level contributing towards yield improvement.

The phenotypic and genotypic correlation of grain yield with 16 other yield components among S_1 progenies were worked out and the same is presented in Table 2 and 3.

A general observation of the data across different characters under study revealed that seed yield exhibited significant positive correlation with few yield traits, but also exhibited significant negative association with few other traits. The results obtained on the basis of association of individual trait with grain yield are presented below.

Plant height at 60 days after sowing (cm):-

Plant height at 60 DAS showed highly significant association in positive direction with other traits under study except for shelling percentage which had non-significant association with this trait (0.086) only at genotypic level (Table 2). Whereas highly significant phenotypic association was recorded in desirable direction, except for number of kernels per rows (0.112) which expressed only significant association in positive direction (Table 3).

Ear height (cm):-

All the traits exhibited highly significant positive association with the ear height, except shelling percentage (0.072) which was non-significant at genotypic level (Table 2). A highly significant positive phenotypic association was recorded for all the traits studied, except for plant girth at 30 DAS (0.108), leaf area at 30 DAS (0.121), number of kernel rows per cob (0.110) and number of kernels per row (0.123), at five per cent level of probability (Table 3).

Leaf area at 60 days after sowing (cm²):-

The data revealed significant positive genotypic association with all traits except for number of kernel rows per cob (0.028), shelling percentage (0.082) and number of grains per cob (0.184) which recorded non-significant association (Table 2).

A highly significant positive phenotypic association was recorded for all the traits studied, except for number of kernel rows per cob (0.036) and shelling percentage (0.070) (Table 3).

Cob weight (cm) :-

All the traits exhibited highly significant association with cob weight at both genotypic and as well as phenotypic level in the desirable direction (Table 2 and 3).

Cob length (cm) :-

The trait cob length exhibited highly significant positive genotypic association with all the characters, except for number of kernel rows per cob (0.062) and shelling percentage (0.061) (Table 2). A similar association of cob length with all the characters at phenotypic level was exhibited except for plant height at 30 DAS (0.122), number of kernel rows per cob (0.068) and shelling percentage (0.053) (Table 3).

Cob girth (cm) :-

It is interesting to note that all the traits under study exhibited highly significant association in the desirable direction in both genotypic as well as phenotypic level with cob weight (Table 2 and 3).

Number of kernel rows per cob:-

Majority of the characters exhibited highly significant positive genotypic association with number of kernel rows per cob, except for the traits like, number of kernels per row (0.101), leaf area at 60 DAS (0.028) and cob length (0.062) (Table 2). Similarly, a highly significant positive phenotypic association was recorded for all the traits studied, except the characters like plant girth at 30 DAS (0.117), leaf area at 30 DAS (0.127), ear height (0.110), number of kernels per row (0.103) and shelling percentage (0.125), which recorded significance only at five per cent level of probability (Table 3). But, the traits such as leaf area at 60 DAS (0.036) and cob length (0.068) exhibited non-significant association.

Number of kernels per row:-

A highly significant positive genotypic association with number of kernels per row was observed for all the characters under study, except for number of kernel rows per cob which exhibited significance at five per cent level of probability in positive direction (0.101) (Table 2). Similarly, with phenotypic correlation, trait under study had highly significant positive association with all the characters except for plant girth at 30 DAS (0.102), plant height at 60 DAS (0.112), ear height (0.123) and number of kernel rows per cob (0.103) which exhibited only a positive significant association at five per cent level of probability (Table 3).

Pith weight (cm):-

The study revealed that the trait pith weight exhibited highly significant association at one per cent and five per cent level of probability with all the traits under study at genotypic and phenotypic levels, except with shelling percentage which had significance in negative direction (Table 2 and 3).

Hundred seed weight (g):-

From the results of present study, it is clear that all the characters exhibited highly significant association with 100-seed weight at both genotypic and phenotypic levels, except for number of kernel rows per cob (0.121) which recorded positive association with phenotypic level at five per cent level of probability (Table 2 and 3).

Shelling percentage (%):-

The character shelling percentage exhibited highly significant positive genotypic association with all the traits under study, except for plant height at 30 DAS (0.115) which recorded only significant positive association (Table 2). The characters plant girth at 30 DAS (0.039, 0.009), plant height at 60 DAS (0.086, 0.075), ear height (0.072, 0.056), leaf area at 60 DAS (0.082, 0.070) and cob length (0.061, 0.053) exhibited non-significant association, whereas pith weight (-0.450, -0.450) recorded highly significant negative association at both genotypic and phenotypic levels (Table 2 and 3). Similarly at phenotypic level, a highly significant positive association was recorded for all the traits, except for plant height at 30 DAS (0.103), leaf area at 30 DAS (0.102) and number of kernel rows per cob (0.125) at five per cent level of probability (Table 2 and 3).

Number of kernels per cob:-

Number of kernels per cob recorded highly significant positive association at both genotypic and phenotypic levels, except for leaf area at 60 DAS (0.184) which showed non-significant association at genotypic level (Table 2 and 3).

Grain yield per plant (g):-

In maize, increase in grain yield is mainly achieved by manifestation of many characters like number of kernel rows per cob, number of kernels per row, cob length, cob girth, 100-seed weight, *etc.* Therefore it is necessary to understand the nature of association existing between all characters and grain yield, particularly in early generation (S_1).

Grain yield per plant had highly significant positive association with all the characters at both genotypic and phenotypic levels, except for plant girth at 30 DAS (0.393) which showed significance only at five per cent level of probability at genotypic level (Table 2 and 3).

Discussion:-

In general genotypic correlation was higher in magnitude than that of phenotypic correlation. Similar trend of higher values of genotypic correlation coefficients than phenotypic coefficient correlation was also reported in earlier studies. Muhammad Rafique *et al.* (2004) reported higher GCV in case of grain yield per plant followed by plant height, ear height, kernels per row, 1000-kernel weight and ear length. Number of kernels per row had significant

correlation with seed yield followed by plant height, ear height, cob diameter and length of cob. Similar results were also reported by earlier worker, Khatum *et al.* (1999) and Devi *et al.* (2001).

Grain yield per plant exhibited positive association with all growth and yield parameters in the present investigation. Most of the growth and yield parameters are inter dependent as evidenced by significant and positive correlation among themselves. However, number of kernel rows per cob was not associated significantly with leaf area and cob length indicating these as independent traits. Likewise shelling percentage was also found to be independent of plant girth at 30 DAS, plant height at 30 DAS, ear height at 30 DAS, leaf area at 60 DAS and cob length as it has recorded non-significant correlation with these traits. As expected pith weight exhibited significant and negative association with shelling percentage, which are interdependent among the productivity traits. Cob weight, cob length, cob girth, grain number per cob, number of kernels per cob, 100-seed weight and shelling percentage recorded high correlation coefficient more than 0.50 indicating these are important yield contributing traits. Similar reports were also made by Kumar (1974), Bhalla and Khehra (1977) and Ramamurthy (1980).

Abstract

Myofascial pain characterized by the presence of myofascial trigger points (TP) that can cause local pain and referred pain, that is, perceived in a different location. TP is a palpable nodule and a painful point of compression, which, in addition to local pain, promotes pain. It is called referred pain when pain caused by TP also affects other regions, such as: other muscles, teeth, gums, TMJ and ears. It is of fundamental importance the anatomical knowledge of the muscles, since it facilitates the localization of the TP and palpation, as well as the functional knowledge of the muscles, since the TP can be activated when the patient makes a certain movement / gesture, this facilitates the correct diagnosis. When the procedures performed reach the TP areas, muscle pain is rapidly eliminated, restoring function and normal muscle length. One of the most widely used treatments has been dry pressing, the theory is that the needle through mechanical trauma stimulates the release of intracellular potassium, which blocks the transmission of nerve impulses temporarily. The needle also breaks the adhesions of the fibers that may exist. The objective of this work is to report two cases of myofascial pain treatment using the dry needling technique. Where, Ms D.S.R and Ms O.H.S.R. attended the UNIFEB clinic, with symptoms of muscular pain and difficulty opening the mouth and chewing, dry needling was performed and there was instant improvement of the pain picture, and improvement in movements that were previously limited.

Introduction:-

Temporomandibular Disorders (TMDs) involve a series of changes, painful or not, in the Temporomandibular Joint (TMJ) region, chewing muscles, or both [1]. TMD pains, especially those in the temporalis muscle (temples) or in the joint itself, can produce a sensation of pain in the head due to the location of these structures. It should be clear that such manifestation is not a primary headache, that is, those of neurological origin. In the case of TMD pain, a classic manifestation is the worsening of pain with the use of the jaw to speak, to feed, among others [2].

One of the most debated topics today is chronic orofacial pain that according to the World Health Organization (WHO) [1] it is estimated that this type of pain reaches 30% of the world population. According to the Brazilian Society for the Study of Pain, women feel more pain and are at greater risk of experiencing numerous painful conditions. In this way, pains in the neck and shoulders, abdomen, tension-type headaches, migraine after puberty, temporomandibular joint (TMJ) disorders are more common in women.

In men, the risk of painful manifestations of this type is lower and one of the great novelties in the research is the signaling that testosterone protects males in relation to TMJ pain, where a difference in the biological mechanisms of TMJ pain is also observed with respect to other parts of the body [3]. In Brazil, it is estimated that 50 million people feel this type of pain, and that at some point 15 to 25% of people will suffer from chronic pain, and in individuals over 65 this rate can increase to 50% .

Myofascial pain syndrome is the most common musculoskeletal dysfunction (6), this is common in clinical practice where about 10% of the population has one or more disorders of the musculoskeletal system [4,5,6,7]. This syndrome is characterized by localized or referred muscle pain that is originated in a myofascial trigger point [9]. The term trigger point (TP) describes a nodule in the musculature located mainly at the end of the muscle insertion, where a hypersensitive and painful area is formed [8,10]. However, the mechanisms of TP formation are hardly evident. It is known that local muscle pain is related to the activation of muscle nociceptors for a variety of endogenous substances including neuropeptides, arachidonic acid derivatives, inflammatory mediators and others.

The therapeutic approach of myofascial pain syndrome is extremely difficult due to the difficulty of diagnosis, which occurs in only 15% of cases [12]. The treatment for myofascial pain syndrome is broad and has many techniques, most commonly used: ischemic pressure (IP), dry needling (DN), wet needling, passive stretching, stretching and spraying, TENS, massage [12], ultrasound and laser [8, 14, 15]. In these techniques DN and IP appear to be very effective in the treatment of myofascial pain syndrome [15,16,17].

The DN, a technique similar to acupuncture, is an effective treatment for pain relief. This technique may increase pain threshold and range of motion on return of pain. Hsieh et al. [16] provided evidence that acute dry-needle inactivation of a primary TPs inhibits activity in satellite TPs located in their pain reference zone.

Thus, this study compares the efficacy of dry needling in the treatment of myofascial pain in addition to reducing pain and analyzing the influence on quality of life. The present study is justified aiming at the effectiveness of dry needling therapy when applied in cases of myofascial pain. Therefore, the present study aimed to report clinical cases of myofascial pain treatment with the dry needling technique, to demonstrate the importance of the dental surgeon in the diagnosis of temporomandibular disorders.

Case Reports:-

The present work has a descriptive character as object of study the clinical cases and the bibliographic survey, through a systematized review of scientific materials as articles found in databases available in electronic medium, such as: Scielo, Bireme and Google academic.

Cases:-

1. Ms. O. H. S. R., melanoderma, attended the UNIFEB clinic, with symptoms of muscular pain and difficulties to open the mouth and chew, performing dry needling with instant improvement of the condition. Patient reported constant headache and limited movement (Figure 1).
2. Ms. D.S.R., leucoderma, attended the clinic of UNIFEB, with symptoms of muscle pain and difficulties to open the mouth and chew, performing dry needling with instant improvement of pain. Patient still reported going through emotional problems and making use of medication for treatment (Figure 2).

The materials used were: fine monofilament sterile needles; Pen for marking trigger points; 70% alcohol and sterile gauze for site asepsis;

Ethics:-

The current resolutions of the National Health Council - Ministry of Health (CNS / MS), which regulate human research standards (Resolution CNS 196/96), were followed. Before the beginning of the study, the protocol will be submitted to the Research Ethics Committee of the University Center of the Teaching Foundation of Barretos.

Discussion:-

According to Schmidt et al. [1], temporomandibular dysfunction (TMD) is a type of orofacial pathology arising from disorders of the masticatory system as well as in its underlying structures, which may present with muscular or articular characteristics. This, in turn, is located near the ear and is responsible for the connection between the jaw and the skull. It presents functions such as chewing movements, facial expression and speech.

The etiology of TMD is complex and multifactorial in relation to its predispositions, involving emotions, traumas, postures and muscular hyperactivity. It presents an evolutionary course varying in days, months and years, aggravating itself with parafunctional habits, characterized by not presenting normal functions of the masticatory system [3].

The main symptoms of TMD are related to otalgia, headache, dizziness, pain in the face and / or TMJ region, tinnitus, TMJ noises, cracking and crackling, and movement-related disorders. Patients may still present inappetence, fatigue, sleep disturbance, labor difficulties and loss of quality of life [3,4].

Pain is an unfeasible experience and its importance is recognized by exerting biological function, manifesting protection to the organism. Patients who present chronic pain, because they report pain in long periods and complain of therapeutic failures, result in the presence of signs of depression and behavioral changes. They cease to be understood as warning signs and are observed as a biopsychosocial process that affects daily life in general [3,5].

Dry needling is a relatively new method in the arsenal of painkillers. Its widespread use began after Lewit's publication more than 30 years ago [6-9]. Since the beginning of the 21st century, serious scientific attention has been given to this method [10,11]. The dry needling technique emerged empirically, in different schools and conceptual models, were developed including the radiculopathy model which is a form of deep dry needling and the myofascial trigger point model is a form of superficial needling [12-14]. Patients with cardiovascular problems and bleeding or those who are taking drugs for the blood thinner will not be allowed to use the dry needling technique [15-17].

Conclusion:-

Needle treatment has been shown to be very effective for immediate pain relief, requiring follow-up for TMD treatment.

Conflict of Interest:-

The authors declare no conflict of interest.

Abstract

Aim- to review about the colour changing and fluoride releasing pit and fissure sealants.

Background- dental caries is the most important and the most common intra oral disease that is seen both in children and adults. This being the era of preventive dentistry, the main aim of the dentist is to prevent the teeth from any carious involvement. Earlier, two main methods prophylactic restoration and prophylactic odontotomy were used in the management of pit and fissure caries. It is even possible to establish a caries free dentition in childhood with the increasing advancements in pit and fissure sealants. This article mainly aims to review the recent advancements in pit and fissure sealants like color changing sealants, fluoride releasing sealants and resin based sealants.

Reason- to understand more about the colour changing and fluoride releasing pit and fissure sealants.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Dental sealants are preventive dental treatment where pit and fissure of primary or permanent molar and premolar are filled with material thereby preventing caries [1]. Aim of pit and fissure sealant is to prevent developing caries which is achieved by blocking the surface and prevents bacteria from getting attached to it [2]. Deep pits and fissures favor food retention and are difficult to clean by routine brushing. It provides a favorable environment for the oral microorganisms to thrive and convert the carbohydrates to acids, leading to demineralization of the enamel. [3]

Previously, during the early 1920s two main procedures were done for the management of pit and fissure caries, they are prophylactic restoration and prophylactic odontotomy. Which was later followed by Kline and Knutson who discovered treatment of pit and fissure caries with ammoniacal silver nitrate and Bowen RL et al who discovered Bis-GMA (Bisphenol A - Glycidyl Methacrylate) a resin sealant material. Thus, resin sealant methods were born [4].

Sealants are the most effective clinical technique to prevent pit and fissure caries. The cost effectiveness of sealants, naturally, is based upon sealant retention. While the rates of sealant retention on occlusal surfaces are relatively high at five years, [5-8] sealant retention for buccal and lingual pits and fissures of molars is considerably lower [9].

A recent, significant development with resin based sealants is the development of moisture-tolerant chemistry. In the past, isolation and exclusion of moisture with resin-based sealants was required. A moisture tolerant, resin-based sealant does not require an additional bonding agent [10-12].

Discussion:-

Indications and Contraindications of Pit and Fissure sealants

The main indications of application of pit and fissure sealants are deep retentive pit and fissures and stained pit and fissures. Patients which have a very poor plaque control and patients undergoing orthodontic treatment. Other indications of application are no evidence of proximal caries[13].

The contraindications are mainly partially erupted teeth without any adequate moisture control and in teeth where isolation is not possible[14].

Generations of pit and fissure sealants

FIRST GENERATION	UV cured pit and fissure sealants
SECOND GENERATION	Chemically cured pit and fissure sealants
THIRD GENERATION	Visible light cured pit and fissure sealants
FOURTH GENERATION	Fluoride releasing sealants

Fluoride releasing pit and fissure sealants:-

The primary approach in prevention of dental caries comprises of use of pit and fissure sealants. Fluoride from the sealants reduces demineralization and enhances remineralization, thus helping to the prevent initiation and progression of caries[15]. Fluoride releasing sealants are commonly used in dental treatment as a primary preventive measure against caries[16]. The focus of most sealant studies is the occlusal surface of permanent teeth. Permanent molars have been selected as teeth most at risk for occlusal caries and thus, the teeth that most benefit from sealants. This perspective comes from population data. It reflects the realities of “normal” tooth anatomy and thus average susceptibility to caries. It does not account for individual differences among patients and among teeth[17].

Fluoride is incorporated into resins by two ways-

the first utilizes a soluble fluoride salt which, after application, dissolves releasing fluoride ions, which may compromise the integrity of the resin[18]. This method has been questioned, because fluoride release resulting from the dissolution of a soluble salt might weaken the sealant and thereby might reduce its usefulness as a preventive agent[19]. The other system uses an organic fluoride that is subsequently released by an exchange with other ions in the system[20]. In this method (anion exchange systems), fluoride constitutes only a small amount of the total structure, and is replaced rather than lost. Thus, there should not be any significant decrease in the strength of the sealant[19]. The addition of fluoride to pit and fissure sealants was considered more than 25 years ago[20,21] but did not prove that they reduce caries as they were poorly retained on the tooth surface.

The properties of a fluoride containing sealant that the conventional sealants did not have are better retention rates when compared to the conventional, constant fluoride release for a prolonged period of time and the ability to function as a reservoir of fluoride ion for enamel and to promote fluorapatite formation in enamel[22].

Colour Changing Sealants:-

In March of 1977, the first colored sealant (3M's Concise White Sealant) was introduced to the market. The advantages to a color as long as it is esthetically acceptable. It is easier to see the sealant during application, and it is much retention. Faster and easier to assess with a white sealant than with a clear sealant at later time intervals.[23] While a Helioclear material, which changes color from clear to green when exposed to a visible light has some clinical utility, particularly on subsequent follow-up examinations when clear sealant is very hard to see, it is hard to understand any benefit to dentist or patient of the Clinpro material that changes color from pink to white on polymerization. The combined identification error rate for opaque resin was only 1%, while for clear resin it was 23%. Significant differences were also found in the accuracy with which the 3 dentists identified each type of resin. The most common error was to identify the presence of clear resin on an untreated tooth.[24] This study raises questions about the accuracy of studies done with clear resin.

Conclusion:-

Of all the surfaces of the tooth pit and fissures are very much susceptible to caries and hence pit and fissure sealants help mainly to prevent caries and also are cost effective. Fluorides in the pit and fissure sealants reduce enamel solubility and stimulate remineralization thereby reversing the course of caries in the early stages itself.

Abstract

Study on population build up of rice leaf folder *Cnaphalocrocis medinalis* (Guenee) was carried out at NARP Farm, Navsari Agricultural University, Navsari during Kharif 2012 and 2013. The observation on per cent damaged leaves was recorded immediately after transplanting up to the harvest of the crop. Results shows that maximum 21.9 per cent damaged leaves were observed during fourth week of July (30th SMW) and that of minimum (0.2 per cent) were in fourth week of October (43rd SMW). In the present investigation, per cent damage leaves showed significant and positive correlation with morning relative humidity, evening relative humidity, average relative humidity and rainfall but significant negative correlation with maximum temperature, sunshine hours and evaporation rate.

Introduction:-

Rice (*Oryza sativa*, Linnaeus.) is a staple food of Southeast Asian population. (FAO, 2004; Kumar, et al, 2009). Global rice production must increase by 36% by 2025 to feed estimated 4 billion rice consumers (Anderson et al., 1997). But the rice production is limited by both biotic and abiotic stresses of which insect pests alone caused about 25 % losses amounting to Rs.240,138 million (Dhaliwal et al., 2007). Bautista et al., (1984) have clearly shown that loss in yield, due to the rice leaf folder, is positively related to the percentage of damaged leaves. Weather factors are the major regulating causes for the insect pest populations under field circumstances. Certain limits support and other disfavour their multiplication and movement; therefore, it results in serious outbreaks of different insect pests (Hyslops, 1941). Insects are mostly dependent on the environmental temperature for the maintenance of their activity.

Materials and Methods:-

In order to study the influence of weather parameters on population build up of rice leaf folder *Cnaphalocrocis medinalis* Guenee experiment was carried out at N.A.R.P. Farm, N.A.U., Navsari during Kharif 2012 and 2013 in 1000 m² area in GR 11 rice variety was transplanted with 20 x 15 cm² spacing. All the post sowing recommended agronomical practices were followed. The experimental area was kept free from insecticide spray throughout the crop season in order to record incidence of rice leaf folder *C. medinalis*. The observations on per cent damaged leaves caused by rice leaf folder *C. medinalis* were recorded at weekly interval in each standard meteorological week immediately after transplanting up to the harvest of the crop. The leaf folder incidence was assessed by calculating per cent damaged leaves per 10 hills.

Results and Discussion:-

The data on incidence of rice leaf folder in terms of per cent damaged leaves (DL) per ten hills during kharif-2012, 2013 and pooled were found significant. During Kharif 2012, data recorded on per cent damaged leaves indicated that infestation was ranged from 1.04 to 20.72 per cent. the average infestation started appearing just after establishment of transplanted paddy seedlings i.e. from third week of July [30th SMW] and continued up to the second week of October (41th SMW). The maximum infestation 20.72 per cent DL was found in first week of September (36th SMW).

During Kharif 2013, infestation commences from fourth week of July (31st SMW) and continued up to the fourth week of October (43rd SMW). The maximum infestation (35.96 per cent DL) was found in second week of July. In 4th week of September 39th STW sudden increase in per cent leaf folder damage thereafter started declining up to 4th week of November (42nd SMW) which noticed minimum 1.44 per cent (DL) and no incidence in next SMW.

Results on pooled data of (Kharif 2012-2013), indicated that in both the years (Table 1). Maximum infestation 21.9 per cent (DL) was observed in fourth week of July (30th SMW). Minimum infestation of leaf folder 0.2.0 per cent (DL) was noticed during fourth week of October (43rd SMW).

The results on correlation of per cent leaf damaged of rice leaf folder, *C. medinalis* during Kharif-2012 -2013 and pooled were worked out with weather parameters indicated that during first year morning relative humidity (X4) ($r = 0.5749$), evening relative humidity (X5) ($r = 0.5409$) and average relative humidity (X6) ($r = 0.5651$) had highly significant positive correlation and rain fall (X9) ($r = 0.04847$) had significant positive relationship with per cent damage leaves (Y1). The maximum temperature (X1) ($r = -0.7230$), sunshine hours (X8) ($r = -0.5495$) and evaporation rate (X10) ($r = -0.7986$) had highly significant negative correlation with per cent damage leaves. The minimum temperature (X2) ($r = 0.3426$) showed non-significant positive correlation but wind speed (X7) ($r = -0.0571$) showed non-significant negatively correlation with per cent damage leaves (Table 2).

Likewise, in the subsequent year (Kharif 2013), per cent damage leaves indicated highly significant positive correlation with wind speed (X7) ($r = 0.5758$) and rain fall (X9) ($r = 0.5455$). However, the maximum temperature (X1) ($r = -0.6317$) and evaporation rate (X10) ($r = -0.6416$) exhibited highly significant negative correlation with damage of leaves. The evening relative humidity (X5) ($r = 0.4266$) and average relative humidity (X6) ($r = 0.4234$) showed significant positive correlation but Average temperature (X3) ($r = -0.4265$) and sunshine (X8) ($r = -0.4525$) showed non-significant negative correlation while minimum temperature (X3) ($r = 0.2928$) and morning relative humidity (X4) ($r = 0.3832$) had non-significant positive correlation with per cent damage leaves (Table 6.1).

In pooled analysis, overall per cent damaged leaves (Y1) showed significant positive correlation with morning relative humidity (X4) ($r = 0.5170$), evening relative humidity (X5) ($r = 0.5083$), average relative humidity (X6) ($r = 0.5114$) and rainfall (X9) ($r = 0.4554$). The maximum temperature (X1) ($r = -0.7130$), sunshine hours (X8) ($r = -0.5626$) and evaporation rate (X10) ($r = -0.6416$) exhibited highly significant negative correlation, whereas morning relative humidity (X4) ($r = 0.5170$), evening relative humidity (X5) (5083), average relative humidity (X6) (0.5154) and rain fall (X9) ($r = 0.454$) had significant positive correlation. But, average temperature (X3) ($r = -0.2294$) had non-significant negative correlation with per cent damage leaves. Whereas minimum temperature (X2) ($r = 0.3934$) and wind speed had non-significant positive correlation (Table 2).

It is revealed from the forgoing discussion that, per cent damage leaves showed significant and positive correlation with morning relative humidity, evening relative humidity, average relative humidity and rainfall but significant negative correlation was observed with maximum temperature, sunshine hours and evaporation rate. Earlier, Balasubramanian et al. (2005) depicted that a significant positive correlation was found between pest incidence and morning relative humidity, evening relative humidity, total rainfall and total number of rainy days. A significant negative correlation was observed between pest incidence and hours of sunshine and maximum temperature.

Abstract

This study examined the effects of the use of Platform Switching in rehabilitation implantossuportadas. It is a technique that consists in fitting a prosthetic component of smaller diameter the platform of implant with larger diameter, so that there is no combination in the size of both, as in conventional manner. The results showed that the benefits and the indication of the use of this technique is due to reason that the same initial reduces the reabsorption of bone Christian peri-deploy and maintain this level bone in the course of time, as well as reduces the forces on the bone tissue adjacent to the cervical region of the implant. Although there are possible disadvantages in the use of Platform Switching, which may cause an increase of tensions in the region of the screw and prosthetic component, its adaptation in rehabilitation implantossuportadas has been very attractive.

Introduction:-

Dentistry was favored by the discovery of osseointegration, which became of its importance in the treatment of partially and totally edentulous patients. Initially, osseointegration was only used to treat fully edentulous patients in the maxilla and mandible, through a single type of implant, prosthetic abutment and rehabilitation protocol [1,2]. Surgeons, as soon as they began to use osseointegration, sought only to obtain and maintain the anchorage of the implants, without caring much about aesthetics. However, this has been gradually changed and is now established as a reality, thanks to the longevity of the treatments and to the functional and aesthetic results obtained [2].

Over time, the basic principle of osseointegration has been proven, so as to allow its application in the most varied clinical situations of tooth failure, both unitary and partial. It is necessary that new concepts, principles and technologies be discovered and improved [3]. However, as the applications of osseointegration have evolved, complications have also increased, which have become more numerous and are no longer the result of surgical and mechanical problems of the components of a single care protocol, requiring more research, studies and Care [3].

Among the most varied concerns that prosthodontists experience, peri-implant bone loss is found because a treatment with implants will only have satisfactory results if the soft and hard tissues are maintained in the long term around the implant [2,3] . This led to a reassessment and questioning of the traditional protocols, resulting in new approaches to implantology, among which, the concept of Switching Platform, considered as the use of a prosthetic

component smaller than the implant platform , In order to reduce reabsorption of vertical bone crest levels around the implants over time [2,3].

Once the prosthesis is definitively installed on the implants, an expected peri-implant bone loss occurs, which is called saucerization [3,4]. This is due to the reestablishment of biological distances. Thus, the application of prosthetic components smaller than the implant platform creates a difference in horizontal adaptation circumference size, limiting bone crest resorption and preserving bone levels around implants [3].

Therefore, Platform Switching consists of a technique adopted to preserve the bone, through the prosthetic connection of a smaller diameter than that of the implant, in order to transfer the existing slit to an innermost position horizontally. Its concept has presented satisfactory results, by reducing peri-implant bone loss through the internalization of the junction between the implant and the prosthetic connection [1-3].

The objective of the present study was to evaluate the effects of the use of the Switching Platform in implant - supported rehabilitations. It is a technique that consists of connecting a smaller diameter prosthetic component to the larger diameter implant platform, so that there is no combination in size of both, as in the conventional form.

Methods:-

For the identification of studies in this review study, carried out a detailed search strategy for Medline, Pubmed, in the years 1986 - 2016. They were used as descriptors: Switching Platform; Regular Platform; Implantology; Implant Supports Rehabilitations. Analyzed studies systematic review, meta-analysis, randomized controlled cases, nonrandomized clinical cases and opinion articles that addressed the term atraumatic surgery. The data are analyzed, correlated to the discussion of the results highlighted in the literature, as shown in figure 1.

Continuous Predictors:-

The continuous predictors were Switching Platform Implant.

Response Predictor:-

The response predictor were increased tensions in the region of the prosthetic component and retention screw, which could lead to loosening and maladjustment and even fracture.

Literature revision:-

Implant concept and Osseointegration:-

The implant is performed when a titanium screw, which can be of various shapes, is inserted into the bone, by means of various surgical techniques. This screw will support a prosthetic crown, which can be cemented or screwed, which will restore the functions of the natural tooth crown [40].

When analyzing the blood microcirculation in rabbit tibia in the 1960s, Branemark verified that there was a perfect integration of the bone with the titanium used in the research, which led to the appearance of the term osseointegration, that is, structural and functional junction that occurs Between the living, ordered bone and the surface of the implant submitted to the functional load [6].

In this context, it is not only the osseointegration that Branemark discovered that it is enough for an implant to be successful, also needing other factors, among them, a correct occlusion, that is, a harmonic relationship between the upper and lower arches without nothing interfering. If there is no such occlusal harmony, occlusal trauma or premature contact may occur, which may lead to changes in the functioning of the masticatory apparatus, significantly altering the position of the teeth, gingival recessions, bone resorption, as well as interfering with the implants installed, generating undesired results. Patient and the surgeon [43].

Bone Loss:-

In implants where the heights of the structures are greater than 180 μm , even if there was no inflammation in the peri-implant tissue, an increase in bone resorption may occur due to occlusal overload [35]. This is because bone resorption is generated where there is an inflammatory reaction or a prolonged excessive stimulus [6,16].

However, in the first implants performed, there was correspondence between the prosthetic components, observing the occurrence of an apical remodeling of the bone crest of about 1.5 to 2.0 mm of the implant implant pillar or at the level of the first thread, the Which altered the successful results of implant maintenance [5,27].

This bone loss was defined as saucerization, which consists of a process that affects all types of osseointegrated implants, regardless of even the general conditions of the patient. It is a mechanism of adaptation of the organism in the establishment of the physiological dimensions of the periodontium, that is, of the periodontal biological space. This process of saucerization occurs mainly around external hexagon type implants [1,2].

The Peri-implant junctional epithelium is shown to have more layers of cells, assuming a conformation very similar to the junctional epithelium of the natural teeth, which approximates the Peri-implant junctional epithelium of the osseointegrated surface, increasing the concentration of Gingival connective tissue at the site, represented by the arrows and, consequently, accelerating bone resorption, beginning the saucerization [2].

In conventional implants, the apical remodeling of the bone crest occurred when exposed to the buccal medium after a healing was performed or the second stage surgery performed. This is due to the fact that an inflammatory infiltrate arises in the implant interface pillar implant or the attempt of the soft tissue to create a barrier, in order to seal the environment of the implant platform [11,16]. However, bone resorption can also be induced by stress concentrations in the coronal region of the implant [16,19].

Many factors may lead to loss of bone crest around conventional implants, among which the most common are: surgical trauma, recovery of biological space, occlusal overload, peri-implantite, gaps [23], as well as manipulations Tissues [11]. Some consequences can be caused by the resorption of the bone crest around dental implants, especially in relation to aesthetics, because the soft tissues change in the proximal faces, which can be seen in the papillae and, on the vestibular face, through the Presence of recessions [16,23].

Keeping the level of the bone crest in the ridge of implants was only possible when, occasionally, a radiographic study was able to make this observation. This is due to the fact that the Implantodontics company, called Innovations 3i, has introduced wide-diameter platform implants (5.0 mm and 6.0 mm), which should be used in cases of implants failure Standard and poor bone region [2,3]. Above all, because there were no prosthetic components corresponding to these implants, they were restored with 4.1 mm abutments, so that a step of 0.45 mm occurred and, radiographically, a variation of 0.45 mm at 0.95 mm [32].

After 13 years of follow-up, by means of radiographs, these restored restorations with smaller diameter pillars than the platform, it was possible to verify that the levels of bone crest were maintained with minimal marginal bone loss, thus raising the concept Of Platform Switching [16].

Platform Switching:-

The concept of Switching Platform used in rehabilitation with osseointegrated implants has been increasingly used, both in the literature and in implant clinics, because it presents satisfactory results, both aesthetic and functional. This is a concept created by Lazzara and Porter (2006) [32], which consists of the use of a smaller diameter prosthetic component connected to the platform of a larger diameter implant, in order to create a "step" of 90 Between the implant and the prosthetic component.

Although a number of factors influence bone resorption, many studies show that implants with a Switching Platform system are more advantageous in relation to implants in which there is a combination of the standard prosthetic component with the type of implant, to maintain the crest level Because it improves the results of peri-implant soft and hard tissues, maintenance of the position of the interdental papilla and marginal gingiva, in addition, when using a prosthetic component of smaller size, the concentration of force area on the implant occurs of the marginal bone crest area. [8,37].

The Switching Platform has been considered a very significant form of treatment to maintain soft and hard peri-implant tissues, not only in two-stage implants, but also in immediate-loading immediate implant protocols. This system removes the concentration of stresses from the peri-implant bone margin and reduces its effect on marginal bone resorption [30]. There is a chain of theorists who affirm that the occurrence of change in the prosthetic-implant

component connection contributes to the maintenance of the biological space, thus reducing bone loss of the marginal ridge [32,37].

Based on Maeda et al. (2007) [34] verified the biomechanical advantages of the Switching Platform, analyzing three-dimensional finite elements, through the use of an external hexagon-type implant model (4.0 mm x 15 mm), on which two types of implants were performed: One with a prosthetic component of 4.0 mm in diameter and the other with a prosthetic component of 3.25 mm, using the Switching Platform configuration.

According to Canullo et al. (2010) [18] developed a study to evaluate changes in bone level in implants with Switching Platform system, making use of various combinations between implant / prosthetic component. After 90 days, they verified that the connection of the prosthetic components of 3.8 mm to the implants occurred, and the restorations were definitively installed. The bone was measured by radiographs performed at implant placement (control), and after 9, 15, 21 and 33 months. After 21 months, all implants were clinically osseointegrated in all 31 patients studied. However, according to the radiographs, the authors verified the occurrence of bone loss of 0.99 mm (± 0.42 mm) for Second experimental group; 0.82 mm (± 0.36 mm) for the third experimental group and 0.56 mm (± 0.31 mm) for the fourth experimental group. However, these values were lower in comparison with the control group (1.49 mm ± 0.54 mm). After 33 months, no difference was found compared to the 21-month results, with the exception of the third experimental group (0.87 mm) and the fourth experimental group (0.64 mm), leading to the conclusion that the existing relationship is Inverse relationship between size / extent of implant-prosthetic component decompensation and amount of bone loss, with the maintenance of better bone margins levels using the Switching Platform configuration.

The study by Calvo-Guirado et al. (2009) [17] evaluated the survival rate of implants made in the maxilla, anterior and premolar areas and restored with single crowns after one year and also loss of bone crest. In this study, implants were fixed in the alveoli, after tooth extraction, with an immediate temporary restoration, and the definitive implant was placed after 15 days, through the Switching Platform concept.

Still in the same year of 2009, Schrotenboer et al. (2009) [42], studying the interaction of the platform in the transcortical section of the adjacent bone of an osseointegrated dental implant, developed a two-dimensional model to analyze finite elements in order to observe the bone-implant interactions under mastication forces. They simulated, together with a 5.0 mm diameter implant, two prosthetic components, one of 4.5 mm in diameter, to represent the switching platform and the other 5.0 mm, to represent a standard diameter platform, Applying static forces of 100 N, vertically (90°) and obliquely (15°) on the pillars. The results revealed that with the standard platform model, the maximum von Mises stress pressure on the bone crest was 28 MPa under oblique load and 6,977 MPa under vertical load.

Hsu et al. (2009) [29] when checking the bone tension and micro-movement at the bone-implant interface for switching platform, simulated finite elements and analysis by extensometry with different diameters of a single implant with immediate loading. They created four models, 5.0 mm diameter implants with prosthetic components 5.0 mm and 4.0 mm in diameter, cemented (late loading) and screwed (immediate loading), and a model with implant of 3.75 Mm diameter, in which vertical and lateral loads of 130 N were applied, which resulted in the following: bone forces were reduced by up to 10% with the use of the switching platform.

Another evaluation of bone crest alterations was made by Vigolo et al. (2009) [47], who did so for a long period of five years, after implanting external hexagon type 5.0 mm diameter restoration with components of the same diameter or switching platform. One group had mean bone resorption values of 0.9 mm (± 0.3 mm), while the other group had 0.6 mm (± 0.2 mm). In consecutive years no marginal bone resorption was observed, leading to the conclusion that restored implants with prosthetic components of standard diameters had greater bone loss than those restored with a switching platform.

Cocchetto et al. (2010) [22] sought to verify that the change of the junction to a more interior region of the implant platform may result in less resorption of the bone crest, with an increase in the discrepancy between the implant platform and the prosthetic component diameter. This study was performed with 10 patients who needed restoration with mandibular or maxillary implants. Fifteen 5.0 mm diameter implants with a switching platform with a diameter of 5.8 mm in the collar were used, and 5.0 mm prosthetic surfaces were attached, which were connected to healing wounds of 4.1 Mm for eight weeks, following single-stage protocol. The results showed a peri-implant bone loss averaging 0.30 mm.

Bilhan et al. (2010) [13] performed a study with 51 patients to compare bone preservation around regular implants and switching platform that supported overdentures. A total of 126 implants were performed, with follow-up for 6, 12, 24 and 36 months after the installation of the prostheses. Through a series of radiographs they were able to show that, with the use of the switching platform, there were lower bone and distal bone losses in 36 months, although there were differences in mesial and distal surface loss in both groups. They verified, therefore, that the smaller bone losses in implants that support overdentures occur with the use of platform switching.

Chang et al. (2010) [21] performed an analysis and comparison of tensions at the bone-implant interface with protein elements of standard diameters and diameters according to the concept of switching platform in the posterior maxilla region, using finite elements. They created two finite element models, one of a first maxillary molar section, with an osseointegrated implant of 4.1 mm x 10.0 mm, with the simulation of a prosthetic component of 4.1 mm in diameter and another model with a little narrower component, that is, with 3.4 mm, simulating the switching platform.

Fickl et al. (2010) [24] studied the influence of the use of the switching platform at the height of the bone crest around dental implants in 89 dental implants and 36 patients. For this, these authors observed implants made in healthy bone, which did not require an increase of ridge. In this way, they created the following: Group 1, with the placement of wide diameter implants in the region below the bony crest and the connection of regular diameter scars; Group 2, placement of regular diameter implants on the ridge line and connection of regular diameter scars. The results showed that, with the use of the switching platform system (n = 75), bone loss was significantly lower at the moment of definitive insertion of the prosthesis (0.30 ± 0.07 mm, versus 0.68 ± 0.17 mm; $p < 0.05$), and in one year (0.39 ± 0.07 mm versus 1.00 ± 0.22 mm, $p < 0.01$), compared with conventional implants (n = 14), leading them to conclude that implants With switching platform limit bone crest remodeling.

Discussion:-

For Lazzara and Porter (2006) [32] the term Switching Platform has been extensively studied in Implantology today, which means that the base of the restorative abutment is smaller than the head of the implant where it is embedded. An implant performed according to the Switching Platform concept presents, around the cervical region, a greater quantity of soft tissues and maintenance of more bone, because of the reduction of the remodeling generated by the establishment of the biological space.

The ideal for the success of an implant would be minimal or no bone loss, however, there is always some bone loss, especially after one year of masticatory function [28]. Several biological and mechanical factors influence this resorption around the implant, such as bacterial microleakage, localization of inflammatory connective tissue area, concentration of stresses in the cervical region of the implant, location of the implant / abutment junction and micro-movements [38].

The maintenance of the bone / implant interface, whether biomechanically, in the induction of stresses, or biological, depends on the type of connection that can allow bacterial infiltration at the interface, which directly influences the success of the rehabilitation. [14,20,46]. This fact is evidenced, especially, in the alteration of the height of the bone crest, as a consequence of the concentration of tension in the cervical region of the implant [21]. Thus, the implant system must be designed to better dissipate the load in the peri-implant bone, so that it can support restoration in function and maintaining osseointegration [48]. In view of this, some studies have shown that resorption of bone crest can be reduced by the use of the Switching Platform technique [32,38].

The rehabilitations that make use of the concept of Switching Platform have been much studied, aiming to verify their real advantages and disadvantages in the short and long term. Among the advantages, the literature points to the reduction of reabsorption of the peri-implant bone crest, as verified by the following authors: Calvo-Guirado et al. (2009) [17], which evidenced a reduction in bone loss in osseointegrated implants with the use of the Platform Switching concept; Canullo et al. (2010) [18] who, in an evaluation of sixty implants, observed the occurrence of an inverse relationship between the extent of implant-prosthetic component decompensation with amount of bone loss, so that the greater the discrepancy, the lower the loss Bone at the peri-implant crest, still acting on the longitudinal maintenance of this bone level. Also Cocchetto et al. (2010) [22] and Bilhan et al. (2010) [13], have concluded that increased discrepancy between implant and prosthetic component reduces subsequent bone loss.

In relation to the distribution of forces under occlusal loads, Schrotenboer et al. (2009) [42] observed that the Switching Platform system for the Von Mises test, on cortical bone crest, had a measurable but minimal effect. Hsu et al. (2009) [29], when using finite elements in their studies, concluded that there is a 10% reduction in forces exerted on bone when there is the use of the Switching Platform concept in relation to conventional implants and that the increase of implant diameter (Extended platform) led to an expressive reduction of the stress in the surrounding bone to the implant, leading to understand that not only the Switching Platform system, but the increased implant diameter reduces stress in the bone tissue. Still in the same study, they stated that none of the settings used. However, regarding micromovements to improve the stability of the implant, no differences were identified when comparing with those presenting conventional implants.

In relation to stress concentration, Chang et al. (2010) [21], found that the Switching Platform system led to a reduction of stress concentration in areas of compact bone but transferred this concentration to areas of spongy bone. Also Tabata et al. (2011) [45] have shown that implants with Switching Platform are advantageous in terms of improving biomechanical stress distributions in peri-implant bone tissue.

However, Maeda et al. (2007) [34] concluded that although the Switching Platform system shifts to more distal from the cervical stress area concentration, which has been considered as important for maintaining the peri-implant bone crest, it generates an increase in stress on the component Prosthetic and retaining screw, which may lead to maladjustment, fracture or loosening of the screw. In addition, according to Vigolo and Givani (2009) [47], the 85 implants from his work in which wide platform components were used showed greater bone loss than the 97 implants in which the switching platform was used in the components.

Through statistical analysis of 850 implants with switching platform and the evaluation of radiographic changes of marginal bone levels and their amount of loss compared to implants without switching platform. The results showed that the implants with switching platform lost less marginal bone in relation to the rehabilitated ones without platform switching, except for the study of Kielbassa et al. [50] where decreasing the size of the component relative to the platform resulted in a loss of 0.8mm. This bone loss was greater than the conventional rehabilitated implants, where a loss of 0.63 mm was detected.

Figure 1:-

Figure 2:-

Conclusion:-

The biological advantages and the clinical performance of the Switching Platform technique in the implant-supported rehabilitations were evaluated, reducing the bone resorption at the marginal ridge adjacent to the implant with the maintenance of the implant, as well as a reduction of about 10% in the forces on the bone tissue. However, the use of this technique can increase tensions in the region of the prosthetic component and retention screw, which can lead to loosening and maladjustment or even fracture.

Abstract

Baanganga, the riverine wetland lies between Hastinapur Wildlife Sanctuary in Uttar Pradesh and Jhilmil Jheel Conservation Reserve, in Uttarakhand is considered a major habitat for wintering waterfowl. The habitat, known for swamp deer and hog deer and also for aquatic and semi aquatic fauna, is deteriorating as revealed by the analysis of physico-chemical properties of water. The present study recorded the occurrence of four species of freshwater turtles, marsh crocodile, three amphibians and 18 species of fishes in the Baanganga wetland. Freshwater turtle, *Morenia petersi* recorded from the area is a new record for the State. We suggest measures for conservation of these wetlands.

Introduction:-

Wetlands harbor variety of fauna that inhabit terrestrial-semi-aquatic and aquatic environments. Baanganga wetland, Indrishpur village in Haridwar district lies between Hastinapur Wildlife Sanctuary in Uttar Pradesh and Jhilmil Jheel Conservation Reserve in Uttarakhand. It represents riverine wetland ecosystem (Fig.1). The construction of a dam across river Ganga, near Baanganga and other anthropogenic activities have led to the conversion of channel into isolated water bodies. These wetlands are still considered as major habitat for wintering waterfowl, though they are surrounded by large agricultural fields and human settlements (Adhikari 2008). The Indo-Gangetic plain and the Terai region have diverse Chelonian fauna with 20 species of freshwater turtles (Das 2002, Rao 1990). The present study describes the occurrence freshwater turtles, amphibians and fishes based on collection and sightings in and around Baanganga. Water quality of the area and suitability for aquatic fauna is also described.

Material And Methods:-

Study area: Baanganga wetland (78°2'43"E to 78°2'15" E and 29°44'5" N to 29°36'01"N) is located 60 km. south-west of Haridwar on Laksar-Purkaji road, and it has about 10 km² water spread area. Land use and land cover include; water bodies (55 %), marsh (4 %), islands (15 %), moist shores (8 %) and upland (18 %) (Adhikari, 2008, Fig 2-4).

Monthly surveys were conducted along the Baanganga River covering seven localities (Table 1) during May –Sep 2008 to 2010. The wetland was divided into five land use categories: water bodies, marshy area, islands, moist

Address:- Northern Regional Centre, Zoological Survey of India, 218, Kaulagarh Road, DehraDun, Uttarakhand 248195.

shores and upland (Adhikari 2008) and surveyed randomly for freshwater turtles, amphibian and fishes. Enquiries were also made on the occurrence of taxa studied.

A minimum of 10 water samples were collected from each (eight) water bodies for analysis (Table 6, 7). The ambient temperature of the atmosphere and of surface water was taken by using digital thermometer. Dissolved oxygen of water was calculated following/ NIH (1987-1988) and electrical conductivity was determined following method given by Jackson (1962). The levels of calcium, magnesium, chloride and bicarbonate were assessed titrimetrically (Jackson 1962a, b, c, d).

Mollusca were collected qualitatively together with other fauna using a plastic hand-net of 1 mm mesh size and hand picking method directly from the habitat. Larger specimens of the samples were pre-identified in the field and preserved in 15% ethyl alcohol to avoid hardening and contraction, later they were transferred into 70% ethyl alcohol. The material is deposited in the Zoological Survey of India, Northern Regional Centre, Dehradun. Identification was done with the help of Preston (1915), Subba Rao (1989) and Ramakrishna & Dey (2007).

Results and Discussion:-

Fauna: Molluscs, fishes and amphibia are known to be the major food for many freshwater turtles (Tikader and Sharma 1985). The aquatic Mollusca fauna associated with the investigated habitats comprise 8 snails (Class Gastropoda) and 6 shells (Class Pelecypoda or Bivalvia). All records are relatively large-sized species of riverine and wetland or lake habitats. These are the most frequently found and common mollusks of the Gangetic Plains including the Himalayan foothills and the Kumaon Lakes (Prashad, 1922; Neemann *et al.*, 2003-2007) (Table 2).

The family Viviparidae is represented with two species. The most common snail in different types of running and stagnant water bodies was *Bellamya bengalensis* with fifteen localities during the present field studies. The second much smaller Viviparidae *Idiopoma dissimilis* was found in three localities and this species was limited on stagnant water bodies. Among the air-breathing snails, the two species *Lymnaea acuminata* with seven localities and *Indoplanorbis exustus* with five localities were distributed in all types of water bodies with shallow zones and presence of submerged aquatic macrophytes including paddy fields as well as the shorelines of lakes and reservoirs in the Himalayan middle mountains (Table 2).

The freshwater mussels were found in two rivers with six widely distributed species of the Indian subcontinent, e.g. *Parreysia favidens*, *Radiatula* and the clam shell *Corbicula striatella*. The Unionidae were identified with results of Neemann *et. al* (2003) and the updated species catalogue of Haas (1969), Graf and Cummings (2007). The presence of a number of large bivalves species always indicates stable ecological conditions with fairly good sediment quality. The larvae or glochidia need different host fishes to complete metamorphosis into a young freshwater mussel.

The pollution tolerant Physidae *Haitia mexicana* is a true invasive species or neozoan that reached the northern Indian subcontinent by introduction to the capitals as the main centers of aquarium trade with plants and substrate. *Haitia mexicana* started rapid spreading from Delhi after 1994 (Surya Rao *et al.* 1997), reaching Allahabad in the year 1998 and Patna in the year 2000 (Sinha *et al.* 2003). It simultaneously colonized the Bagmati Kosi River system starting from Kathmandu after 1994. Nowadays *Haitia mexicana* is a widespread species of various polluted and degraded water bodies. The species remains absent from most natural habitats which have developed a rich diversified native fauna. Thus *H. mexicana* is always an indicator for direct anthropogenic impact. However in the present study there was no record of this species in any of the water body studied indicating that the area is still suitable for aquatic and semi aquatic fauna but small measures can be taken to improve the quality of the habitat.

Eighteen species of fishes belonging to 14 genera, 9 families and 3 orders were observed during this study (Table3). The heterogeneity of the wetlands could be one of the reasons for the observed diversity (Kumar, 2007).

Three species of anurans, *Fejervarya sahydrensis* (Annandale); Syhadra frog, *Euphlyctis cyanophlyctis* (Schneider) and Indian bull frog, *Hoplobatrachu stigerinus* (Daudin) were collected during this study (Table 4). The cricket frog has been reported to be available in small hill streams and water logged areas near paddy fields. The population of the species is denser in eastern parts of the district Dehradun (Ray 1998). *Zakerana* were split off from *Fejervarya* in 2011. This was the culmination of recognizing that *Fejervarya* (as known before) was paraphyletic and consisted of two different groups; this recognition had already developing some years before. The sister taxon of *Zakerana* is

Sphaerotheca (Frost 2014, Howalder 2011). *Fejervarya*, as currently defined, has a more eastern distribution than the southern Asiatic *Zakerana*, from eastern India eastwards. (Frost 2014). They are sometimes known as the South Asian cricket frogs.

Euphlyctis cyanophlyctis was the most common anuran recorded from the area. It can tolerate considerable amount of contamination and organic pollution in temporary water pools (Ray1998), (Table 4).

Four species of freshwater turtles; *Lissemys punctata andersonii* (Webb), *Pangshura tecta* (Gray), *Pangshura tentoria circumdata* (Gray) and *Morenia petersi* (Anderson) were observed (Table 4, Fig. 8, 9). *Lissemys punctata andersonii* and *Pangshura tecta* are listed under Schedule- I of the Wildlife (Protection) Act, 1972, and *Pangshura tentorian circumdata* and *Morenia petersi* are new distributional records for Uttarakhand state (Bahuguna 2009, Bahuguna 2010) (Figs 6-9). Rawat and Pandav (2006) also reported three species; *Geoclemys hamiltonii*, *Kachuga kachuga* and *Lissemys punctata* from these wetlands and all are listed in Scheduled I of the IWPA (Table 5).

Marsh crocodile (*Crocodylus palustris* Lesson) was observed during this study and also reported in the past (Rawat and Pandav 2006, Rashtriya Sahara 2009). The crocodiles were reported to often enter the human settlements near Laksar in Ajitpur area. The distribution of crocodiles in Uttarakhand is restricted to Corbett Tiger Reserve and Baanganga wetlands.

Physico- Chemical Parameters:-

Temperature: Mean surface temperature of the various water bodies ranged from 25° to 30° C during May - September 2008 and 2009 (at 1200hrs- 1230 hrs). The highest ambient temperature (39° C) was recorded during May and June.

The increase in temperature in water leads to speeding up of chemical reactions and reduced solubility of gases (Hem 1989, NIH 1987-1988). Continuous depletion of ground water reservoirs and deterioration of quality in Haridwar is reported by Rao & Kumar (2002). The increase in temperature in the area must be due to recent spate of urbanization, increased vehicular pollution, regular incoming of pilgrims to Haridwar and ever increasing population in Haridwar. This increase in temperature can deteriorate the conditions of some of the water bodies (2-3 meters depth, Nainpur) harboring the important aquatic, semi aquatic fauna and water birds (Figs 6, 7).

pH and electrical conductivity : The pH recorded in the present study (Table 6) varied from 7.02 to 8.14 (in Lalpur near to Stone crusher unit). The range of pH for freshwater was within the permissible limit of BIS 10500 (1991). Electrical conductivity of water corresponds to the total concentration of dissolved compounds (electrolyte). It was noted to be varying from 0.191 to 0.588 ds/m. Highest has been noted to be in water bodies near to human settlements

Dissolved oxygen: Dissolved oxygen varied from 3 to 4 ppm in the present study. DO for healthy water has been recommended to be >6 ppm by BIS 1991 (Table 5).

Calcium: In the present study, Calcium concentration from all localities ranged from 24-76 ppm, highest Nainpur i.e. 64 ppm, whereas for Lalpur it was 48 ppm (Table 7). Calcium concentrations in natural waters are typically less than 15 mg l⁻¹ (NIH 1987-88). For waters associated with carbonate rich rocks, level may reach 30-100mg l⁻¹. Cremation sites near Nainpur (Fig 4) and stone crusher facility in Lalpur area (Fig 2) and intense human activities near Shahpur might have led to increased level of calcium in the water sample. It has been reported that acidic rainwater can increase the leaching of calcium from soil (Hem 1989, NIH. 1987-1988).

Magnesium: As noted, the magnesium concentration ranged from 12.0 ppm to 48 ppm, which is within the range of natural conditions. Natural levels of magnesium in freshwater may range from 1 to 100 mg l⁻¹. Magnesium occurs in many organometallic compounds and in organic matter since it is an essential element for living organisms. Although magnesium is used in many industrial processes these contribute relatively little to the total magnesium in surface waters (EIFAC 1964-90, ISO 1984, Hem 1989, WHO 1984a, 1984b).

Carbonate: Carbonate concentration in water ranged from 6 to 18 mg l⁻¹, it was noted to be nil at Nainpur and Tada Bhagmal localities (Table 6). Carbonate is uncommon in natural surface waters because they rarely exceed pH 9, whereas the groundwater can be more alkaline and may have concentrations of carbonate up to 10 mg per liter.

Bicarbonate concentration in surface water is usually less than 500 mg l⁻¹ (WHO 1984a, 1984b). In the present study, it was noted to be within the range and was the dominating anion present in surface water (Table 7).

Chloride: In the present observations it was noted to be very high i.e. of the 56.8 to 78.1 ppm. In freshwater, chloride concentrations are usually lower than 10 mg l⁻¹ and sometimes less than 2 mg l⁻¹ (APHA 1989, Hem 1989). Higher concentrations can occur near sewage and other waste outlets, irrigation drains, salt water intrusions, in arid areas and in wet coastal lines. In the present study, it seemed to be mainly through irrigation drains and waste outlets. As chloride is frequently associated with sewage, it is often incorporated into assessments as an indication of possible faecal contamination or as a measure of the extent of the dispersion of sewage discharge in water bodies (APHA 1989; Bestemyanov and Krotov, 1985; CEC 1976).

The physicochemical parameters recorded depicted that for the fishes pH was optimum. The value of dissolved oxygen in the present study varied from 3 to 4 mg /l. Oxygen plays a vital role to regulate the metabolic processes and is indicator of aquatic productivity. For average, good productivity dissolved oxygen should have concentration >5 mg/l (Banerjee 1967) and thus the D.O. recorded is less for the survival of the fish. The chloride level (56.8 to 78.1 mg/l) was noted to be too high depicting that the water might be leading towards eutrophication (CEC 1976, Jairam 1999).

Human activities around and in the area like cleaning cattle's, taking bath and discharge of remains of human cremation in small water bodies were affecting the health of the water as revealed by physical and chemical analysis of water (Tables 6,7). Agriculture practices around the area were also affecting the water level in remnant habitats as the drainage through water pumps were done and still going on to increase the land area and for irrigation purpose. The upland and moist shores of the study area were noted to be utilized for agriculture. The area was also exploited to collect stone for stone crusher unit present in the area. The local enquiries revealed the presence of channel full of water till 1980 in the same locality meeting Ganga, thus called Baanganga, but the construction of barrages/ dam on Ganga led to decrease in the water level in the channel, thus produced different land categories (Adhikari, 2008). Rao (1998) extensively surveyed from Rishikesh to Kanpur and reported 12 species of freshwater turtles. Localities near Baanganga (Haridwar) were surveyed by Adhikari (2008) and Kumar (2007) for the study of vegetation types and fish fauna. They reported that the study area harbored many islands, varying in shape and size, which remained underwater during the rainy season and provided a good habitat to various plant taxa, birds (resident as well as migratory) and animals mainly Swamp deer, *Cervus duvauceli duvauceli* Cuvier, a critically endangered species and Hog deer, *Axis porcinus* (Zimmermann).

Activities like sand mining, agriculture, reclamation of wetlands and riparian areas, alternation of rivers for irrigation and generation of hydroelectric power, pollution, siltation, eutrophication and intensive fishing have been reported to cause the killing of turtles, affecting their nesting (Bhupathy and Chaudhury 1995, Sharma 1998, Rao 1998). Surveys to the present study area since May 2008-September 2010 unfolded the deteriorating situation of the habitat for aquatic and semi-aquatic fauna. Main factors, which have affected the habitat, are: barrage/dam construction nearest to habitat, increase in human activities including agriculture, use of open water bodies for cattle and human bath, cremation ground including weed proliferation in many water bodies. The increase in ambient atmospheric temperature that resulted in the low level of water in many small water bodies causing death of fishes and other aquatic fauna as observed during the surveys.

Rao (1998) undertook extensive survey in Ganga River (645 km) at a stretch between Rishikesh to Kanpur to know the status of freshwater turtles and reported 12 species of freshwater turtles under seven genera. He observed that all the way from Rishikesh to Kanpur most of the Ganga Ghats have religious importance. Large numbers of the pilgrims take holy bath, do cremation and post cremation activities and thus become a major source of pollution to the river; large number of factories like IDPL, BHEL, sugar, chemicals, fertilizers, engineering, cotton and tanneries are situated on the bank of the river. The natural flow of the Ganga River has been checked due to construction of hydro-power barrages up-stream at Rishikesh, Haridwar, Bijnor and Narora. Two barrages have been constructed at Haridwar and Bijnor for irrigation purpose through Upper Ganga canal and Madhya Ganga Canal, respectively (Rao 1985). The present study although limited to a small area of 8-10 km has significant importance as the area still has freshwater turtle species in various water bodies and they need conservation and protection, as lowering the water levels and scarcity of the food might increase the mortality rate besides exposing them to the danger of illegal trade. Local people were though aware of the legal protection of the freshwater turtles were not

able to differentiate Scheduled and unscheduled species. Local enquiry revealed that the people from outside were coming to the area and asking for particular species of freshwater turtles for medicine.

Illegal trade of freshwater turtles is a global problem, involving many of the developing countries. There is a demand of turtles in China, Singapore and Hong Kong markets. In India, the illegal trade of turtles is going on and the most common routes are from Kanpur to Kolkata market. Uttarakhand State earlier rich in biodiversity of turtles but recently the population of turtles has now been found to be restricted (Husain and Ray 1995), thus indicating threats to the population of turtles and tortoises in the State. There is an urgent need for the management to conserve the habitat and the species.

Conclusion:-

Water bodies in Baanganga wetlands of Haridwar, Uttarakhand are not in healthy conditions. This river is also passing through the conservation area Jhilmil Jheel, thus needs special attention for habitat management. Available oxygen, adequate nutrients and absence of toxic chemicals are essential factors for growth and reproduction for aquatic and semi-aquatic fauna. In the present study increasing atmospheric temperature, increased pH in some water bodies, low oxygen in water, high level of chloride ions were noted to be harmful for the habitat of aquatic and semi aquatic fauna still thriving in the area. Many scheduled (under IWPA) species were found to be present in the area including turtles, crocodile and mammals, indicating the importance of the area. Low level of water during summer and increased pressure due to anthropogenic activities were noted to be increasing the threat to their survival and make them easy target of poaching.

Management plan for the area:

1. The water body in Nainpur locality can be a good habitat for aquatic and semi aquatic fauna after implementation of some management measures like: removal of weeds, pumping air, shifting cremation ground and involvement of local people for management of habitat, reintroduction of aquatic-semi aquatic fauna from deteriorating habitat to habitat in Nainpur.
2. Afforestation programmes around the area should be initiated to improve the habitat and to control the rising temperature.
3. Strong actions are required to conserve the threatened and endangered species as some of them may reach the threshold of critical endangerment.
4. Involvement of local people: generate awareness among local community about the importance of fauna residing in the area; involve them in reintroduction programmes, afforestation programme. Local people and turtle trappers should be involved in various surveys to get information of illegal trade.

Table 1:- Land types present

S.No.	Localities	Land types
1	Shahpur	Small water bodies 20%, upland, agriculture area covering 60 % of the area, human settlements 20 %
2	TandaBhagmal	Few water bodies 10%, agriculture area 55 % and human settlement 20 %
3	Lalpur	Open water bodies 30 %, Agriculture 50 %, rest other types
4	Nainpur	Open water bodies 50%, marshy area 20%,upland10%,agriculture 10%,human settlements 10%
5	Indreshpur	Open water bodies 10%, agriculture 55%, rest human settlements
6	Ranjitpur	Open water body 75% (near to Ganga bank), agriculture 25%, rest human settlement
7	Bhikampur	Open water body 25%,agriculture area 50%, human settlements 25%

Image attributes, Face recognition, Templates, Compression, Content analysis, Video content extraction, Image processing, Temporal segmentation, Scene segmentation.

Abstract

Image detection to identify the targeted image and extract its contents in any of the live videos which are being streamed. Every particular image of a layman contains several unique attributes for Example, the space between the eyebrows or a different type of nose. The proposed project looks into recognizing this special features and detecting them through the videos being processed in of the environment. This was attributed to the ability of artificial intelligence management, as a computer technology, to generate, process, and analyze large volume of data at a time, compared to when humans are used, to help managers in quick decision making because results of the analysis are available in time.

Introduction:-

With the advancement in technology and more and more invention being done in the field of computer technology, the risk of theft and destruction has been increased to vast levels. A security system for the protection of all kinds of destructive things round the world has become one of the major necessity. This kind of a system would be creating help to not only the field of technology but also in vehicle monitoring, theft and illegal activity investigation. The approach can also be used in detecting murders and crimes happening around.

A self-recognizing system that detects image in live video streaming is being studied. Every human face is different, every face is gifted with certain attributes that is one's own identity and this makes each face different from other. This personal identity can be used as a tool to detect and verify different people round the ground. The basic requirement for the work are: Images, for representing the frame data, a numerical matrix whose values can be colours, colour map entries, etc. Colour Maps, which map entries into a colour space, allowing an additional indexation level. Image Display Converters and Image IO Handlers, that convert images in the specific formats of the platforms and vice-versa

The approach seeks to store the unique feature of the image in its database. Further, the extraction of this feature is verified through Eigen- Face algorithm. Here whenever the system detects an image, it crops the unique feature from the face and creates a similar possible and identical image of the face in its image dataset. So the next time the same face occurs in front of the face it detects the image and extracts the contents about the image from the video streaming. This indirectly detects and monitors

Related work:-

The idea for extracting the content of information is the Accessibility Problem. A problem that is even more relevant for dynamic multimedia data, which also have to be searched and retrieved. While content extraction techniques are

Corresponding Author:- Yashraj Manshani.

Address:- D.Y. Patil College of Engineering, Akurdi, Pune.

reasonably developed for text, video data still is essentially opaque. Its richness and complexity suggests that there is a long way to go in extracting video features, and the implementation of more suitable and Effective processing procedures are an important goal to be achieved [1]. The increase in the diversity and availability of electronic information led to additional processing requirements, in order to retrieve relevant and useful data: the accessibility problem. This problem is even more relevant for audio visual information, where huge amounts of data have to be searched, indexed and processed. Most of the solutions for this type of problems point towards a common need: to extract relevant information features for a given content domain [2]. A process which underlies two difficult tasks: deciding what is relevant and extracting it. In fact, while content extraction techniques are reasonably developed for text, video data still is essentially opaque. Despite its obvious advantages as a communication medium, the lack of suitable processing and communication supporting platforms has delayed its introduction in a generalized way. This situation is changing and new video based applications are being developed. In our research group, we are tools for indexing video archives for later reuse, a system for content analysis of TV news, and hyper video systems where hyperlinks are established based on content identification in different video streams. These applications greatly rely on efficient computational support, combining powerful image analysis and processing [3]. Each of these concepts is represented by a (C++) class and integrated in a systematic hierarchy. Tools for data processing are applied to the described data modelling classes, and also modelled as a hierarchy of classes [4]: The Image OPs, these operators represent functions which are applied to image regions and extract "single-image" or sequential content features. A shot object is a discrete sequence of images with a set of temporal attributes such as frame rate and duration and represents a video segment [5]. A shot sequence object groups several shots using some semantic criteria. Views, are used to visualize and browse shots and shot sequences.

The approach in this study is to construct dynamic templates in a bottom-up fashion using information on problem types and associated discourse structure [6]. The classification algorithm uses different cropping styles to detect the 3D image in the video streaming.

Face recognition has been a tough problem of biometrics and it has a variety of applications in modern life. The problems of face recognition attract researchers working in biometrics, pattern- recognition and computer vision. Several face recognition algorithms are also used in many different applications apart from biometrics, such as video compressions, indexing's etc. [7]. They can also be used to classify multimedia content, to allow fast and efficient searching for material that is of interest to the user. An efficient face recognition system can be of great help in forensic sciences, identification for law enforcement, surveillance authentication for banking and security system, and giving preferential access to authorised users i.e. access control for secured areas etc. [8]. The problem of face recognition has gained even more importance after the recent increase in the terrorism related incidents.

Background: Image Detection:-

This section introduces image detection and presents a list of common performance objectives and the techniques used to achieve them. Moreover, a brief overview of the evolution of image processing until the appearance of the PCE-based architecture is included. Finally, the limitations of current solutions are described, in order to identify how system can be future improved.

A. In this paper, it proposes to improve MPW with the aim of sampling a smaller number of PWs without any loss in detection rate and false positive rate. In addition, we solve the problem of determining the number of PWs in each stage. We call the proposed algorithm iPW does not need to generate a large number of PWs at the initial iteration (stage), which greatly reduces the detection time. Even if the initial PWs do not contain any object, iPW can detect the objects at next stages. 2) MPW unnecessarily draws too many PWs around the positive windows whereas iPW avoids generating these redundant PWs by using the information of both rejected and accepted PWs. 3) To use MPW, one has to empirically set the number of PWs in each stage whereas this is not a problem because iPW generates a single PW in each iteration (stage). 4) IPW fully makes use of the information of rejected negative PWs while MPW almost completely depends on the accepted positive PWs. Rejected negative PWs are used to directly suppress the PD around these windows and at the same time indirectly enhance the PD beyond the windows. In this sense, iPW is rejection-oriented while MPW is acceptance-oriented. 5) In MPW, the uniform distribution is used in the initialization and plays an unimportant role in the later stages so that it can be omitted. In iPW, a dense uniform distribution is used to play an important role for sampling useful PWs by rejecting background. IPW fully makes use of the information of rejected negative PWs while MPW almost completely depends on the accepted positive PWs. Rejected negative PWs are used to directly suppress the PD around these windows and at the same time indirectly enhance the PD beyond the windows. In this sense, iPW is rejection-oriented while MPW is acceptance-oriented. 5)

In MPW, the uniform distribution is used in the initialization stage and play unimportant role in theater stages so that it can be omitted. In iPW, a dented uniform distribution is used to play an important role for sampling useful PWs by rejecting background(i.e., no object) regions.6) iPW utilizes dented Gaussian distribution while MPWutilizes full Gaussian distribution for sampling PWs. Byusing dented Gaussian distribution, iPW avoids drawingmany unnecessary PWs around the object and object-likeregions.7)

B. It provides a comprehensive review on the recent advances in face anti-spoofing. While most previous works on face spoofing detection are based on analyzing only the luminance (i.e. gray-scale) information of the face images, we introduce a novel and appealing approach using color texture analysis and demonstrate that the Chroma component can be very useful in discriminating fake faces from genuine ones. We exploit the joint color-texture information from theluminance and the chrominance channels by computinglow-level features using different descriptors extractedfrom different colorspace. We investigate how welldifferentcolor spaces and descriptors can be used for describing the intrinsic disparities in the color texture between genuine faces andfake ones. We also perform afusion study to analyze the complementarity of the different descriptors and different colorspace. We conduct extensive experimental analysis on the three latest and most challenging spoofing databases using their pre-defined publicly well-defined experimental evaluation protocols ensuring the reproducibility of the results and a fair comparison against the state of the art. We provide an extensive comparative analysis againstthe state-of-the-art face spoofing detection techniques andshow that our proposed approach outperforms all existingmethods on two databases and achieves very competitiveperformance on the third databaseUnlike most of the methods proposed in the literature, our proposed approach is able to achieve stable performance across all the three benchmark datasets. Furthermore, in our inter-database evaluation, the facial color texture representation showed promising generalization capabilities,thus suggesting that color texture can be more stable in unknown conditions compared to its gray-scale counterparts.

Research onnon-intrusive software-based face spoofingdetection has mainly been focusing on analyzing gray-scaleimages and hence discarding the color information whichcan be a vital visual cue for discriminating fake faces fromgenuine ones. In a very recent work, Wen et al. [6] proposedcolor quality based features that describe the chromaticdegradation and the lack of color diversity of recaptured faceimages. However, the actual local variations in color textureinformation was not exploited for face spoofing detection

There are many ways to perform face scrambling. Forexample, scrambling can be done simply by masking orcartooning. However, this kind of scrambling will simplylose the facial information, and hence subsequent facerecognition or verification becomes unsuccessful in this case.Especially for security reasons, it is obviously not a goodchoice to really erase human faces from surveillance videos.In comparison, the Arnold transform as a basic step in many encryption algorithms, is a kind of recoverable scrambling method. Scrambled faces can be unscrambledby several manual tries.

C.Moving object detection plays an important rolein many video processing applications, such asobject tracking, categorization, identification, and videocondensation. It often serves as pre-processing for higher levelvideo analyses and its performance directly affects the performance of the subsequent applications. For object tracking, if moving object is detected as two or two moving objects are detected as one, the tracking result may be incorrect. For object categorization, incomplete or adhesive detection of moving objects may lead to wrong categorization, and it is the same case for object identification. For video condensation, object tracking is also an indispensable part. It's not the desired result if the head and legs of one person appear at different time in the condensed video. Ideally, a detection method should detect each moving object separately without breaking. Backgroundmodelling is indispensable for moving object detection in many cases and many works have been done in this research area. In early works, the background model was constructed for each pixel independently. In , a single Gaussian model was used to model the value variations of each pixel, and the parameters of the Gaussian model were updated recursively with an adaptive filter. It is robust in modelling the static background, but is sensitive to dynamic background variations. To address these problems, the mixture of Gaussian models (Moggs) was proposed in . In addition, a series of variants were proposed to improve the performance of background modelling. However, the Gaussian model-based methods are all based on the assumption that the pixel intensity follows a Gaussian distribution, which is not always correct. In contrast, a nonparametric method was proposed in , where each pixel is directly modelled with a probability density function without any assumption on the distribution of the pixel values. Since all the possible pixel values are modelled into the probability density function, dynamic background modelling problem can be handled and illumination change can be adapted progressively. In [6], a Bayesian decision rule for

background and foreground classification was constructed based on different feature selections for static and moving backgrounds, and is able to deal with dynamic background problems better than MoG. In [7] and [8], background pixel values are quantized into a set of codebooks to form the background model which is efficient in memory and speed.

D. Given a training dataset, faces are forwarded to the training procedure. The offline procedure then learns its semantic salience map. Following this, the database is scrambled and the feature space is reconstructed by multiplying salient feature according to their semantic salience weights. Random sampling is then applied to select features sparsely to construct as many kernels as is allowed, and discriminant analysis is used to learn a kernel subspace for each kernel. After a scrambled facial image is input as a test, the input is projected into each kernel subspace, and the distance to each training sample is computed. The decision procedure is based on the combination of all kernel subspaces. It is noted that we can have unscrambled images (mainly for statistic salience learning) in the offline training because offline training is carried out centrally with authorities'/business supervisors' permission and will not undermine users' privacy. Privacy protection is mainly an issue with distribution over the internet. In this scheme, the training procedure can be carried out offline. The online verification then becomes purely a data-driven process. In the test procedure, all test images, we have identified a new challenge in scrambled face recognition originated from the need for biometric verification in emerging IoT applications, and developed a salience-aware face recognition scheme that can work with chaotic patterns in the scrambled domain. In our method, we conjectured that scrambled facial recognition could generate a new problem in which "many manifolds" need to be discovered for discriminating these chaotic signals, and we proposed a new ensemble approach – Many-Kernel Random Discriminant Analysis (MK-RDA) for scrambled face recognition. We also incorporated a salience-aware strategy into the proposed ensemble method to handle chaotic facial patterns in the scrambled domain, where random selection of features is biased towards semantic components via salience modelling. In our experiments, the proposed MK-RDA was tested rigorously on three standard human face datasets. The experimental results successfully validated that the proposed scheme can effectively handle chaotic signals and drastically improve the recognition accuracy, making our method a promising candidate for emerging IoT applications. One of the most important tasks for video analysis is to specify a unit set, in which the video temporal sequence may be organized.

The different video transitions are important for video content identification and for the definition of the semantics of the video language, making their detection one of the primary goals to be achieved. The basic assumption of the transition detection procedures is that the video segments are spatially and temporally continuous, and thus the boundary images must suffer significant content changes. Changes, which depend on the transition type and can be measured. The original problem is reduced to the search of suitable difference quantification metrics, whose maximums identify, with great probability, the transition temporal locations

Goals:-

Once installed, test whether or not it works by firing up a python session. If there are no any errors then, move further. Next step is the cascading the image (the cascade is just a Xml file that contains the data to detect faces. Read the image and convert it to greyscale. Many operations in Open Cv are done in grayscale. This is detection of the face that comes in front of camera. Once the face detection is done, next part to be done is its recognition in such a way that it stores the value of each faces, so that the next time the face appears on the screen it is able to name and retrieve data by its own. For this Eigen-face Algorithm is used, the Eigen values of each face is stored under the database. Prepare a training set of face images. The pictures constituting the training set should have been taken under the same lighting conditions, and must be normalized to have the eyes and mouths aligned across all images. Subtract the mean. The average image \bar{a} has to be calculated and then subtracted from each original image. Calculate the eigenvectors and eigenvalues of the covariance matrix S . Choose the principal components. Sort the eigenvalues in descending order and arrange eigenvectors accordingly. The number of principal components k is determined arbitrarily by setting a threshold ϵ on the total variance. These Eigen faces can now be used to represent both existing and new faces.

Identified Challenges:-

Extensive experiments on the three latest and most challenging spoofing databases (the CASIA FASD, the Replay-Attack Database and MSU MFSD) showed excellent results. On the CASIA FASD and the MSU MFSD, the proposed facial colour texture representation based on the combination CoLBP and LPQ features computed over HSV and YCbCr colour spaces outperformed the state of the art, while very competitive results were achieved on the Replay-Attack Database. More importantly, the proposed approach was able to achieve stable performance

across all three benchmark datasets unlike most of the methods proposed in the literature. Furthermore, in our inter-database evaluation, the facial colour texture representation showed promising generalization capabilities, thus suggesting that colour texture seems to be more stable in unknown conditions compared to its gray-scale counterparts. To be consistent with many previous studies, it is worth noting that face normalization or the limits of the face bounding box were not optimized in our experiments.

Identified Analysis:-

The system contains four modules:

Image detection, Image recognition, Image classification and content extraction. Image detection is the basic step towards identification of the image here the face in front of the screen is identified and a cropping structure (dialog box) appears over the detected area. The next step is to recognize the unique feature of the face the system recognized the basic pixels and creates the base feature of the face. Further a similar possible image of the face is created using this base feature and the image is classified under various folders. The live streaming data of the previously stored is compared and the contents from the image is detected and conclusions are made.

Experimental Setup:-

Following explain the basic experimental setup of the system:

Accept the image from the live video streams

Classify it and crop appropriate features

Identify function using Eigen-face algorithm

Generate equations (with the help of Eigen values)

Solve Equations

Display Content

Summary:-

present a multi-stage investigation system that can be used in various fields of cyber security systems. The crimes and various threats can be easily solved through recognizing images in the pictures as well as live video streams ensuring a safety towards a destructive world.

Introduction:-

Pulmonary alveolar microlithiasis (PAM) is a rare and slowly progressive diffuse chronic lung disease characterized by deposition of small calcium phosphate spherules within the alveolar cavity.(1) The etiology of the disease is still unknown and is supposed to be due to defect in the inherited local enzyme that is responsible for calcium deposition.(2)The disease is usually seen from birth up to 40 years of age.(1,3) Clinically, the disease course is different. Most of the patients are asymptomatic or having very mild symptoms and majority of patients either having normal or restrictive pulmonary function tests. (1,3)

Case:-

We report a case of 44-year-old male, tailor by occupation who presented with breathlessness on exertion for 3 years. Initially, grade I MMRC dyspnea progressed to grade II MMRC on presentation, over 3 years. Associated with mild cough and scanty expectoration which was gradually progressive, non-foul smelling, non-blood tinged. No history of fever/chest pain.

Personal history-Smoker for 10 years,1-2 cigarettes/day, stopped 5years back. Also, had a history of cement dust exposure from a nearby cement factory for 25-30 years. No significant family history.

On general examination vitals, stable, clubbing grade 2 observed. No pallor, icterus, cyanosis, lymphadenopathy or edema. Systemic examination: Upper respiratory tract normal.

On inspection, chest bilaterally symmetrical, trachea sign negative. No scars, sinuses or dilated veins seen, movements bilaterally equal. Palpation: Inspectory findings confirmed, no local rise of temperature or tenderness, tactile vocal fremitus equal on both sides. Percussion: Resonant note all over lung fields. On auscultation: Late fine inspiratory crepitations heard over interscapular, infrascapular and infraaxillary areas. Vocal fremitus: equal on both sides. Rest of the systems are normal.

On chest x-ray (Fig-1) diffuse, dense, large calcifications noted in bilateral lung fields. HRCT chest (Fig-2,3) revealed dense, large parenchymal calcifications in apico-posterior and anterior segments of bilateral upper lobes, thick septal calcifications in rest of the lung fields, predominantly in the basal segments of the bilateral lower lobes. Spirometry showed restrictive pattern. Bronchoscopy showed fibrosis in the secondary bronchi Bronchoscopic guided lung biopsy was done.

Corresponding Author:- Dr. Tushar Sahasrabudhe.

Address:- Department of Pulmonary medicine, Dr. D.Y.Patil Medical college and Research institute, Pimpri, Pune.

Histopathological examination (Fig-4) of the lung section revealed calcified microlith in the intra-alveolar spaces. Special stain -Von kossa stain (Fig-5) positive confirmatory of pulmonary alveolar microlithiasis.

Treatment:-

Treatment with corticosteroids and symptomatic treatment was given and on follow up visits, patient improved symptomatically.

Discussion:-

PAM is a rare chronic parenchymal lung disease often diagnosed incidentally in asymptomatic patients or become symptomatic between 3rd and 4th decades(1,3,4,5). Basically characterized by numerous small calculi (denominated calciferites, calcospherites or microlites) within air spaces.(5) Calculi are round or ovoid in shape and range from 0.01 to 2.8mm.(2) Studies confirmed that the disease is caused by autosomal recessive inheritance of a mutation in the gene (SCL34A2 gene) on chromosome 4, that produces the protein that is the only known sodium-dependent phosphate transporter in the lungs.(4,6) As a result of this mutation, the protein is unable to transport phosphorus ions from the alveolar space into type II pneumocytes, and this failure leads to the development of calcospherites in the alveolar space.(6) At clinical presentation patients usually demonstrate a lung disorder with restrictive pattern as seen in our case. Adult patients commonly show progressive deterioration of the pulmonary function and death usually occurs in mid-life because of respiratory failure associated with cor pulmonale.(5)

Plain chest x-ray usually shows diffuse bilateral symmetric micronodular calcification (sandstorm) mainly in middle and lower zones; apical bullae and black pleural lines. HRCT thorax remains the imaging technique of choice to diagnose PAM. Findings include ground glass opacity (most common), sub-pleural calcification, confluent and diffuse calcified nodules and dense consolidation. Septal thickening, 'black pleura' sign due to sub-pleural cyst and crazy paving pattern have also been described. (4,5) Although the imaging can help in diagnosing the disease but the lung biopsy is the best for definitive diagnosis.(4) Measurement of surfactant protein A (SP-A) and surfactant protein D (SP-D) can be considered as an alternative in monitoring disease activity.(4,5) Differential considerations include sarcoidosis, pneumoconiosis, pulmonary hemosiderosis, amyloidosis, miliary tuberculosis, and metastatic pulmonary calcifications associated with chronic renal failure.(6) There is no effective treatment for PAM. Use of disodium etidronate in the treatment of PAM is associated with mixed results. Lung transplantation is the only hope for end-stage PAM. (4)

Abstract

Stock market prediction is considered as one of the classic problems of time series prediction due to high volatility of the financial market. Stock prices tend to be dependent on various factors like historical values of the company stock, P/E ratio of the company, news articles related to the company and public opinion which includes faith in the company and rumours related to the activities of the company. The system tries to predict the opening price of stock market for few particular companies based on the company's past performance and information available from various news sources.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

A stock is a type of security that represents a claim on part of the corporation's assets and earning and thus signifies ownership [1]. Companies raise funds by allowing customers to buy the company's shares at an agreed price. Stock Market thus, in turn, affects the economy of a country. Buying and selling (the right) stocks lead to profits. Act of trying to determine the future value of company stock traded on an exchange is Stock Market Prediction. Stock markets have gained speed since the use of internet increased. Trading market analysis aims to predict the market fluctuations and the rise or fall of market in future.

It involves an assumption that the fundamental information that is publicly available in the past is somehow predictively related to the future stock returns. The objective of this study is to extract fundamental information from relevant news sources and use them in analysing or forecasting the stock market from any common investor's viewpoint. Researchers have developed a lot of interest in this area due to its dynamic and unpredictable nature. Since stock prices are dependent on various parameters there exists no clean equation to determine the movement of the stock price.

Predicting stock market is difficult, since relationship between stock prices and the financial economic variables is not linear. Therefore, nonlinear models could produce more reliable and correct predictions of share prices. Machine learning techniques like Artificial neural networks (ANN) has ability to map nonlinear nature and hence can be used much effectively. This paper investigates systematic usage of neural network to predict stock market prices in future.

Literature survey:-

A lot of work had been done previously in the field of stock market prediction. Stock market prices are mostly dependent on the principle of demand-and-supply. Demand of a particular company share varies depending on various factors mentioned below:

1. Historical Prices of the company share which includes the opening prices, closing prices, highest prices and lowest prices for a time span varying from a month to an year.[3]
2. Financial status of the company, Dividends and balance sheets, Volatility of the stock[5]
3. Overseas markets that close around the same time when the concerned stock market opens up.[2]
4. Prices of oil, interest rates, inflation, GDP[4]
5. P/E ratio, general index, Volume traded[5]
6. Tweets made by people regarding the company
7. News articles related to the company.[8]

Various methodologies were used to predict the values of the stock. Decision trees were used in-order to determine whether the market will rise or fall. Linear regression approach was used to predict the trading volume of the stocks. Use of Support vector machines has also been done for predicting the rates of NASDAQ market.[2] But, a lot of previous work has proved that use of Artificial neural network is the best choice for predicting the stock markets because:

1. Ability to implicitly detect complex nonlinear relationships between dependent and independent variables.[4][5]
2. ANN is nonlinear model that is easy to use and understand compared to statistical methods.

Background: stock market prediction:-

There are few factors that help to analyse and predict its movement. These forces come under three categories:

1. Fundamental Factors
2. Technical Factors
3. Market Sentiments

Fundamental Factors:-

Stock prices would be determined primarily in an efficient market by these fundamentals, which, at some point, refer to a combination of two things:[5]

1. Earnings base (earnings per share (EPS))
2. Valuation multiple (a P/E ratio).

The level of earning base, the expected growth in the earning base, the discount rate, which is itself a function of inflation and the perceived risk of the stock are the key fundamental factors. EPS means the profit that a particular company has made per share and that too on the last quarter.

An owner of a common stock has a claim on earnings, and earnings per share (EPS) are the owner's return on his or her investment. Whenever a stock is been purchased, a proportional share of an entire future stream of earnings is purchased. That's the reason for the valuation multiple: it is the price one is willing to pay for future earnings stream. Part of these earnings might be distributed as dividends, while the remainder would be retained by the company for purpose of reinvestment.

Technical Factors:-

There are certain technical factors that helps to predict the bumpy ride of stock market, some them are Expected moving average (EMA), Rate of change indicator, Moving average (MA), Relative strength index (RSI), On Balance Volume etc.

Market Sentiment:-

It refers to the psychology of market participants, individually and collectively. Market sentiment is often subjective, biased and obstinate that helps to make a judgement about a stock's future growth prospects.

The psychology of market participants is hugely dependent on the news and hence, news is another factor that affects the share price. When there is good news about a particular stock or a company which might result in a good future of the company and increase in profits, people try to invest all their money in that particular company. This leads to increase in the interest of buying the stock whereas there exists a contrary situation too, where news could bring a negative effect where it could ruin the prospect of the particular stock.

Thus, investors depend on various different factors. Short term traders usually prioritize the technical factors of trading and hence incorporate them. While the long-term investors recognize that technical factors play a major role they also prioritize the fundamentals of trading. At the most fundamental level, supply and demand in the market determines stock price. Price times the number of shares outstanding (market capitalization) is the value of a company. It's meaningless to compare just the share values of two companies. Theoretically what affects the investor's valuation of a company is Earning, but along with this there are certain other indicators also that can be used to predict the stock hence it is investor's sentiments, attitude and expectations play an equally important role in determining the prices of the stock market

Trading analysis can be of following types-

1. Fundamental analysis:-

It mainly focuses on statistical data of the company. The goal of fundamental analysis is to find a stock's intrinsic value. It basically means what a stock is really worth as opposed to the value at which it is being traded in the market. Fundamental analysis may involve examination of financial data, management, business concept and competition. It also includes quarterly balance sheets, daily news and rumours related to the company, return on investments etc. It finds intrinsic value of a stock and if the current value of stock is below intrinsic value, it generates a buy signal and is helpful for long term trading.

2. Technical analysis:-

The Fundamental analysts examine earnings, dividends, assets, quality, ratio, new products, research and the like[11]. Technicians employ many methods, tools and techniques as well, one of which is the use of charts. Using charts, technical analysts seek to identify price patterns and market trends in financial markets and attempt to exploit those patterns.

Technicians using charts search for archetypal price chart patterns, such as the well-known head and shoulders or double top/bottom reversal patterns, study technical indicators, moving averages, and look for forms such as lines of support, resistance, channels, and more obscure formations such as flags, pennants, balance days and cup and handle patterns.[9]

Technical analysis is done considering various market indicators, some of which include price transformations, up and down volume, all time high and low etc. This factor helps to know whether the asset is trending and also its direction of growth in near days. Technical analysis also considers relationships between price/volume indices and market indicators such as moving average, relative strength, and price/volume index.

Goals:-

The system first analyses the past prices of the stock market and news related to the company to predict the opening value of that particular stock. The information from news is scraped from a variety of web sources, the open source selenium web driver is a good choice for accomplishing this task. The system scrapes the financial information like news articles, prices in history, volume of stocks sold etc. The scraped data is then processed to obtain only the data that is useful to us. The system then tries to combine sentiment analysis on this processed data along with fundamental and technical analysis.. This data is then passed through "neural network" in order to forecast the opening value of a particular stock. Output will be the approximate Prediction of highest value or the lowest value for a particular share for the given day.

The system's input consists of the news, public opinion (for rumours and people's faith in the company), volume traded, and public shareholding, stability of the share and various technical parameters of the stock market trading system. Stability of the stock's price of a particular company plays a major role in predicting the future value of a share. It depicts the performance of the share over past time and how the share has recovered from market falls. Thus it provides a measure of how good the stock is likely to be in its present position.

Identified analysis:-

Following are the modules in the system:

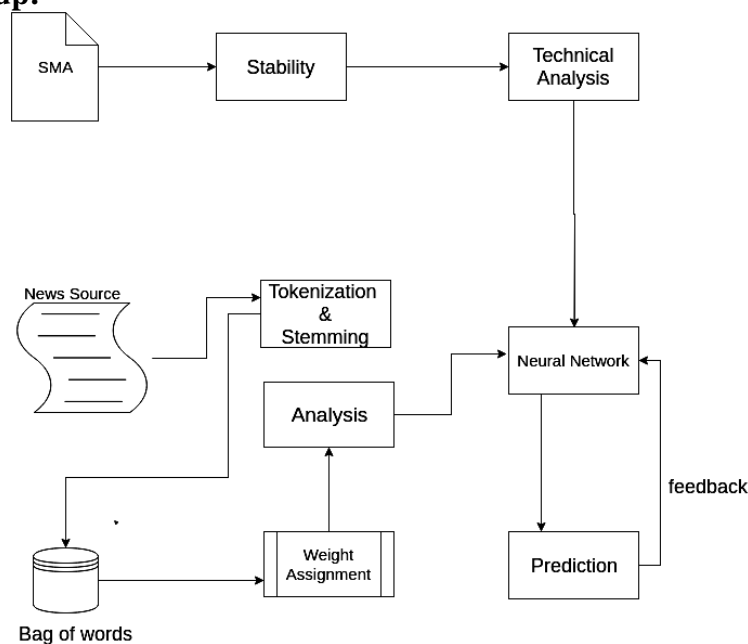

1. Scraper:
 - a. There are three scrapers in the system as follows:
 - i. First, the scraper that scrapes the values of the company stock like:
 1. Highest price
 2. Lowest price
 3. Opening price
 4. Closing price.

The prices scraped are over an interval of one-month
 - ii. Second, the scraper that scrapes the news articles related to a particular company.
 - iii. Third, the scraper that extracts tweets from the twitter related to a particular company.
2. Sentiment analyser
 - a. News related to a particular company are passed through the analyser which vectorizes the news articles and also the tweets.
 - b. The overall sentiment of the news articles and tweets is analysed using bag of words.
 - c. This is done using 'gensim' library of python which help in the Doc2Vec conversion.
3. Neural Network:
 - a. The results from the scraper and the sentiment analyser are passed as input the neural network.
 - b. Expected results are also fed to the network so as to train it.
 - c. Error values are back-propagated to update the weights.
 - d. 'Tensorflow' and 'keras' modules of python are used to implement the neural network

Information gathering:-

Scraper extracts the news articles regarding the recent company activities and the analyser shows how it will affect its share value. It extracts highest value and the lowest value of a share from the given company so as to get its stability that will help in predicting its future value. The news information will be scrapped from a collection of financial websites. BeautifulSoup[10] is a Python library which is used for scraping the live data and it converts incoming documents to Unicode and outgoing documents to UTF-8. Along with beautiful soup the open source Selenium web driver is used so as to continuously fetch the information as it is visible to a visitor on the webpage. The scrapping would be constrained only to gather information about a particular company or a set of companies.

The process of sentimental analysis comes into picture that will show how the collected news affects the sentiments of people which in turn affects the trading of the stock. We also consider Sentiment analysis on twitter feeds which is performed on the tweets extracted from the Twitter feed. This is done using 'tweepy' library. The system then uses a set of technical analysis methods, variables such as public shareholding which means equity shares of the company held by public. Such Parameters aid in the technical analysis of the trading market so as to minimize the market risk. This parameter along with various other parameters like all-time high, all time low, average returns in the form of numerical value will be input for an artificial neural network.

Experimental setup:-

The basic experimental setup of the system is as follows:

1. Scrape the news information, tweets related to the company and other stock related information from the web.
 - a. The news articles are scraped from reliable news sources like reuterindia.com
 - b. Historical prices of the company shares along with its volatility is scraped from nseindia.com
 - c. Tweets related to the company are extracted from twitter using 'tweepy' library
2. The news articles are passed through the sentiment analyser which returns the overall sentiment of the news. The same process is performed on the tweets to quantify the public opinion about the company
3. The values are passed to the neural network where number of nodes, activation function and number of hidden nodes are decided based on the accuracy of the system. After a right amount of training, the neural network is passed test values to check for its accuracy.

Summary:-

The system tries to predict the opening price of the share of a particular company by analysing news related to the company for the next trading day. The system also considers the stability of the stock price of the particular company. Sentimental analysis is used for vectorizing the news, along with technical and fundamental analysis. Artificial neural networks are used as they hold good for pattern recognition, classification and forecasting of the market so as to model nonlinear process without any prior assumptions. The nature of this process helps in obtaining accurate results.

Various stakeholders attempt to have such a system as a strategy that aims towards solving the financial situations as well as improving the efficiency and efficacy of financial risk management. Such proposed model can be a helpful tool for the investors for taking the right decision in regards to their stocks in order to extract any predictive information from that given data. The system will also display a graph of "Stock price" vs. "Date" in which the predicted values and real values in the past are plotted.

Hence it can be concluded that hybridized parameters like combination of technical and fundamental variable gives better prediction accuracy over application of standalone parameters and news being a vital factor that affects investor sentiments can be used to predict the drive of the market.

Abstract

Background: Rhinoplasty is one of the most popular cosmetic procedures in the developed countries with Plethora of techniques available to successfully complete the Rhinoplasty. Rib cartilage graft is used as an alternative to septum cartilage, with the advantage of providing sufficient amount of cartilage even for large or revision Rhinoplasty.

In this study, we will use rib cartilage graft in primary and revision Rhinoplasty cases. The rib cartilage graft will be obtained from different anatomical sites, depending on patient gender while using different techniques. The patient nasal angles and lines will be measured before and after the operation with recording the patient satisfaction in functional and cosmetic manners.

Methodology: Reconstruction Rhinoplasty cases performed from 2012 to 2016 were chosen from the King Abdullah Medical Center KAMC in Saudi Arabia. A total of 18 patients (10 females and 8 male) were selected from ENT clinic, with the age above 18 years and all of which must presented with nasal deformity and nasal obstruction. Both primary and revision Rhinoplasty cases were constituted. Patients presented with normal nose shape had been excluded from research along with the cosmetic cases. Rib cartilages were used in all patients as the graft of choice for the Rhinoplasty procedure and different technique were used as well.

Results: A total of 18 cases; 8 (44.4%) male patients, 10 (55.6%) female patients, most of them are Saudis (88.9%). They are presented with different nose presentation, majority of them had dorsal irregularity (77.8%) and deviated nose (66.7%), and they are complaining of poor breathing and Aesthetic look.

Regarding the nasal angles (Nasofrontal, Nasolipial angle, and Tip deviation) have been measured pre and post-operative as well. And for all the angles, their P Values are significant statically.

Pre-op Nasofrontal angle, Mean \pm SD (144.4 \pm 7.9). Post-op Nasofrontal angle, Mean \pm SD (135 \pm 7.8). P value is < 0.001 which is significant. Pre-op Nasolipial angle, Mean \pm SD (86.4 \pm 9.5). Post-op Nasolipial angle, Mean \pm SD (97.9 \pm 7.7). P value is < 0.001 which is significant. Pre-op tip deviation, Mean \pm SD (1.9 \pm 2.3). Post-op tip deviation, Mean \pm SD (0.47 \pm 0.73).

Conclusion: We conclude that autogenous rib cartilage grafts are an outstanding material in septorhinoplasty when structural, functional, and aesthetic problems are present.

Autogenous rib cartilage grafts are the gold standard for nasal reconstruction in patients with cartilage depletion and when large amount of tissue are needed.

Introduction:-

Rhinoplasty is one of the most popular cosmetic procedures in the developed countries with Plethora of techniques available to successfully complete the Rhinoplasty. However, nowadays autografts is preferred, mainly due to less complication when compared to other types of grafts.

Cartilage grafts usually obtained from conceal, septum and costal cartilage. The size of the required graft and the type of the procedure (either primary or revision Rhinoplasty) usually determine the site of where the graft is taken. In small graft, the septum cartilage is considered the graft of choice. But in large reconstruction or revision procedures, the use of septum cartilage is limited because it is either too small or it because it damaged (1,2,6).

Rib cartilage graft is used as an alternative to septum cartilage, with the advantage of providing sufficient amount of cartilage even for large or revision Rhinoplasty. complains about the rib graft has been introduced and different techniques have been suggested to improve rib graft(2-4).

Autologous or homologous tissues grafts can be used in Septorhinoplasty. Comparing different types of graft, autologous tissue graft has the most advantages than the other types. Autologous graft can be obtained from septum, rib, or auricular concha [2].

The 5th or 9th rib cartilage is the graft of choice in female or male respectively in dorsal augmentation and reconstructive support in general. Specially in secondary Rhinoplasty because there is not sufficient septal cartilage [1,2].

Numbers of Factors make Secondary Rhinoplasty more difficult than the primary operation; different surgeons, sufficient septal cartilage, thickening of the skin, etc. Rhinoplasty considered one of the most challenging surgery, and it has a revision rate of 21% [3].

In this study, we will use rib cartilage graft in primary and revision Rhinoplasty cases. The rib cartilage graft will be obtained from different anatomical sites, depending on patient gender while using different techniques. The patient nasal angles and lines will be measured before and after the operation with recording the patient satisfaction in functional and cosmetic manners.

Methodology:-

The cases presented from January 2011 to December 2016 were chosen from the ENT department at King Abdullah Medical City, Makkah, Saudi Arabia. A total of 18 patients fro 250 septorhinoplasty cases (10 females and 8 male) were selected from ENT clinic retrospectively with consent obtained before starting ,and IRB approval was tekened .

Inclusion criteria:-

The age above 18 years, and presented with nasal deformity and obstruction. Both primary and revision Septo-Rhinoplasty cases were included.

All patients have been examined before and after the operation, and all the complains were documented as well. The measurements of the Nasal lines and angles were obtained from patients pictures. The patient's satisfactions from breathing and aesthetic point of view pre and post operative estimated by using a scale from 1 to 5 (1=not satisfied) and (5 =completely satisfied).

Post operatively the patients observed for complication and recorded if existed, then the follow up continued until one year at least after the procedure and all the measurements and data were repeated again.

Costal cartilage is the graft of choice when there is no preserved septal or conchal cartilage in the Septo-Rhinoplasty in both revision and primary severely depressed and saddled nose. Costal cartilage harvested from the 6th rib in male patients while in female patients was taken from the 5th rib just above the inframammary fold to obscure the appearance of the scar.

Two techniques have been applied to the harvested costal cartilage:

1st is the core of the rib was used as a spreader and strong strut graft and the outer part of the cartilage is diced and wrapped with either rectus fascia or temporalis fascia (16 cases),

2nd technique slanting incision was done to form straight slices which used as spreader and strut graft and the remnant was diced and wrapped in rectus fascia (2 cases).

Diced Rib Cartilage Graft Wrapped in Rectus Fascia:-

After the cartilage extracted from the rib, the surgeon isolate and separate the graft from any remnant fat or muscles, then the outer part of the rib cartilage was taken and diced into small cubes (0.7mm-1mm). In the same time, the rectus muscle fascia is taken and compressed to be more thinner, Then the diced cartilage was wrapped by the rectus fascia. This combination of the diced cartilage and fascia gives the graft its unique characteristics; Strong, smooth, camouflage effect, long standing, and the natural look.

Remnants of the sliced rib cartilage graft wrapped in rectus fascia:-

This technique is similar to the diced cartilage in rectus fascia

Dr. Mohamed Saad- notice that by slicing the cartilage, it will lose its strength, and it is weaker than the core of the cartilage when used as spreader and strut graft.

Results:-

In this study 18 cases have been included, 8 (44.4%) male patients and 10 (55.6%) female patients. Most of them are Saudi (88.9%).

They are presented with different nose presentation, majority of them had dorsal irregularity (77.8%) and deviated nose (66.7%). Other presentation includes saddle nose, radix depression.

Pre and post-operative nasal lines have been measured, Intra pupillary line has been fixed at 30mm, and then all other nasal lines (Basal, Dorsal, and Interdomal line) have been measured pre and post-operative, and they all show a significant P values.

Pre-operative basal line, Mean \pm SD (12.6 \pm 2.7). And post-operative measurements are Mean \pm SD (11.4 \pm 2.7), the p value is 0.004 which is statically significant. Pre-op Dorsal line, Mean \pm SD (5.8 \pm 1.4). And Post-op Dorsal line, Mean \pm SD (5 \pm 1.2), p value is 0.001 which is statically significant. Pre-op interdomal line, Mean \pm SD (7.8 \pm 1.4). Post-op interdomal line, Mean \pm SD (7.1 \pm 1.3), the P value is 0.009 which is statically significant. table 4.

Regarding the nasal angles (Nasofrontal, Nasolipial angle, and Tip deviation) have been measured pre and post-operative as well. And for all the angles, their P Values are significant statically.

Pre-op Nasofrontal angle, Mean \pm SD (144.4 \pm 7.9). Post-op Nasofrontal angle, Mean \pm SD (135 \pm 7.8). P value is < 0.001 which is significant. Pre-op Nasolipial angle, Mean \pm SD (86.4 \pm 9.5). Post-op Nasolipial angle, Mean \pm SD (97.9 \pm 7.7). P value is < 0.001 which is significant. Pre-op tip deviation, Mean \pm SD (1.9 \pm 2.3). Post-op tip deviation, Mean \pm SD (0.47 \pm 0.73).

table 6.

The patients satisfactions regarding breathing and Aesthetic look have been included in the study. There were dramatically improvement in both breathing and cosmetic appearance. Breathing and Aesthetic P values are less than 0.001 which are statically significant.

Table 5

None of the patients had Diabetes, Hypertension, or other co-morbidities.

All patient removed their sutures after 7 days of surgery, and they all received oral antibiotics and analgesics after surgery. The follow-up of all 18 cases have been done 12 months post-operative.

The rib cartilage used as a graft of choice. Two techniques were used; cucumber and take core techniques. 16 (88.9%) cases have been done with take core technique, 2 (11.1%) cases with cucumber technique.

Discussion:-

The main goal of septorhinoplasty is to achieve the optimal functional and aesthetic results, regarding the patient and surgeon prevalence. Autogenous costal cartilage graft is the graft of choice in revision septorhinoplasty [1,2]. costal cartilage graft provide the adequate amount of tissue needed to reconstruct the defected cartilages, and has low rate of infection[2].Some complications have been noted, and to avoid those complications multiple techniques are used[5]. Knowing which method is better is mandatory as the use of costal cartilage graft become the standard of care in revision septorhinoplasty [2,5].The costal cartilage graft has been used in deferent techniques. 16 out of 18 cases have been done by taking the core of the cartilage graft, then diced and wrapped in rectus (8 cases), and temporalis (7 cases) fascia. The other two cases have been done by taking the costal cartilage in a slices technique,this used for spread and strut graft, and then the remnants diced and wrapped in rectus fascia. One case has been done using the core of the outer part of the cartilage alone, and this has the lowest results of them all. The best technique was the diced core in rectus fascia, it is the strongest,has smooth contour, and doesn't develop the wrapping effect. In the other hand, slices technique is much weaker.

the result depends on three main factors, patient satisfaction, nasal measurements (angels and lines), and post operative complication.

Patient satisfactions in function (breathing) and aesthetic look were taken pre and one year post operative. All the patient are satisfied with the result.

Regarding the nasal measurements, the goal was to reduce theNasofrontal angel to the range between 115-135 degree. And to increase the nasolapial angel to the range between 90-95 in males, and 95-105 in females. Both angels have significant P value.

Non of the patients developed significant post operative complication, except slices technique, we did for him augmentation of the lower lateral cartilage with chonchal cartilage graft.

Advantages of our research:-

18 cases were obtained from jan2011 to 2016 from KAMC center with an inclusion criteria involved only revision septorhinoplasty. All patients complain of function and structural defect, Cosmetic cases were excluded from the research. Adult patient were only selected with 10 female and 8 male patients. Rib cartilage graft used in all patients with different techniques involved: Core cartilage, slices and diced cartilage wrapped in either temporal or rectus abdominal fascia. Objective and subjective measurement were done for the patients before and after operation with follow up duration post operatively for one year and complication documented if present.

The difficulties we faced in our research which include cases were obtained from KAMC only and that reflected the low number of cases. Some of the techniques were added lately in the research, which caused unequal distribution of cases per technique. In future research we will include multiple centers to increase the number of data involved to get more accurate results.

Conclusion:-

We conclude that autogenous rib cartilage grafts are an outstanding material in septorhinoplasty when structural, functional, and aesthetic problems are present.

Autogenous rib cartilage grafts are the gold standard for nasal reconstruction in patients with cartilage depletion and when large amount of tissue are needed.

Autogenous costal cartilage grafting offers strength for nasal support to replace or augment missing tissue.

Abstract

Background: Orofacial clefts are common congenital birth defects that are influenced by genetic and environmental factors. Affected babies and their families suffer from burdensome consequences emotionally, socially and economically. The association of orofacial clefts with maternal intake of folic acid still unclear.

Objective: This study was conducted to collectively examine evidences released regarding the possible protective effect of maternal use of folic acid against orofacial clefts of any type.

Methods: We conducted a meta analysis and searched bibliographic databases for potential prospective and retrospective studies that report the association between folic acid and orofacial clefts. Our search was limited to human studies published in English in the last five years. Results revealed by included studies were combined using the random effect model. Q test and I^2 statistics were used to examine heterogeneity and further investigation made by subgroup analysis and meta regression. The publication bias assessed visually by funnel plot and statistically by Begg's test and Egger's test.

Results: The combined odds ratio revealed by analyzing 6 case-control studies was 0.387 (95% CI: 0.263, 0.567; $p < 0.001$). Significant heterogeneity between studies was noted ($Q = 12.4$, $p = .003$, $I^2 = 59.7$).

Conclusions: Our meta analysis supported the hypothesis of the preventive role of folic acid to orofacial clefts but more attention has to be paid for examining this association using prospective and interventional study designs.

Introduction:-

Orofacial clefts are considered as common congenital birth defects with a prevalence of 1.47 per 1000 live births globally [1]. Structurally, they can be categorized as either isolated, in forms of isolated cleft lip (CL) and isolated cleft palate (CP), or combined cleft lip and plate (CLP) [2]. As it needs a multidisciplinary approach with several steps, the treatment process could be intolerable and burdensome [3].

Folic acid, also known as vitamin B₉, is an essential amino acid that must be supplemented exogenously to humans since they can't synthesize it de novo [4]. It has a critical role in cell division, DNA synthesis, methylation and repair, particularly in infancy and pregnancy periods that has rapid growth and multiple cell divisions [5].

It is thought that non-syndromic orofacial clefts (NSCLP) are developed under the influence of genetic and environmental factors' interactions [6]. In the light of the fact that the neural tube is the embryological origin of facial and oral tissues via its neural crest cells in which folate receptors are expressed extremely high [7] and since maternal intake of folic acid supplementation during the preconception period had been demonstrated by experimental studies' findings to reduce the risk of neural tube birth defects (NTDs) [8], many studies were conducted hypothesizing that similar effect of folic acid might exist for reduction of orofacial clefts risk. In addition, some evidences showed that epileptic mothers who are taking anti-epileptic drugs that interfere with folate metabolism are more prone to have babies with orofacial defects [9].

Conflicting results came out from the observational studies examining the potential protective role of folic acid's intake against orofacial clefts in human. These mixed evidences might be explained by the difficulty in investigating the folic acid role in reducing the risk of orofacial clefts independent from the effects of other multivitamins supplementations taken by mothers in the same time [10]. Other factors that might contribute to this contradiction include variations in study designs, sample sizes, populations and different analytical approaches for potential confounders [8].

In 2006, the World Health Organization recommended Mandatory wheat flour fortification with folic acid programs to be implemented as a national law [11]. Reduction of orofacial clefts risk following mandatory fortification of food was observed by several studies. This inverse association was statistically significant in some of these researches [12,13,14] and insignificant in others [15,16,17].

Since the evidences still controversial and not conclusive, we conducted this meta analysis to combine the results of different studies on the possible protective role of maternal use of folic acid supplementation during the period of preconception and the first trimester against the risk of orofacial clefts of any type.

Methodology:-

Search Strategy:-

We conducted our systematic review with the guidance of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses Statement [18] as relevant and required. Our search started in 15th of December 2015 using bibliographic databases including the PUBMED interface to MEDLINE, SCOPUS and COCHRANE databases to identify potentially eligible citations by using the mesh terms for [folic acid] and [clefts]. The search was limited to human studies published in English in the last 5 years. We communicated with experts in the field of Obstetrics and Gynecology as well as the field of Pediatrics Surgery for further identifications of potential eligible studies. Our search was repeated every two weeks and the electronic automated PUBMED alert system was used monthly to identify any newly published studies up to the end of February 2016. The reference lists of all included studies as well as those of relevant systematic review articles were scanned to enhance our search deductibility for further potentially eligible articles.

Inclusion and Exclusion Criteria:-

Studies included in our systematic review had to meet the following inclusion criteria: 1- is designed as a randomized controlled trial, cohort, case-control, or cross-sectional study. 2- Provide sufficient data for estimations on the association between maternal folic acid intake in preconception period and first trimester and non syndromic orofacial clefts of any type. Studies that reported the folic acid intake to general population and studies that included syndromic orofacial clefts were excluded.

Data extraction:-

The following elements were extracted from each study: citation, study design, study place, study time, the amount of folic acid supplemented, folic acid supplementation timing in relation to conception and antenatal period, sample size, crude and adjusted estimations with 95% CI, p-values and standard errors. After the four investigators extracted data from each study independently, they cross-checked the extracted data and met to resolve any discrepancies.

Statistical methods:-

We used Comprehensive Meta-Analysis Software version 3 with were *p* values of 0.05 or less and a confidence intervals of 95 %, considered statistically significant for all statistical analyses performed in our review. All studies included in Meta analysis were of case control study design, since there was only one eligible cohort study met our inclusion criteria. As the included studies brought out results from different populations, we used the random effect

model for combined effect estimation. The heterogeneity was tested using Q statistics calculations in which statistically significant values different from 0 indicates presence of heterogeneity. Further evaluation of heterogeneity made by I^2 statistics which evaluated the percentage of variation between studies that cannot be attributed to within-study variation. The value of $I^2 > 50\%$ was considered significant for heterogeneity. In order to explore the source of heterogeneity, we used the subgroup analysis and further investigation of heterogeneity made using meta regression for selected variables and study characteristics.

The National Heart, Lung, and Blood Institute (NHLBI) quality assessment tool was used to assess the studies qualities. This tool rates the study quality as good, fair or poor. The good quality study is considered to be of a least risk of bias and valid results, while the fair and poor studies are considered to be susceptible to some risk of bias and indicate a significant risk of bias, respectively[19]. All investigators assessed the quality of each eligible study and they met to make a consensus on their study quality assessment ratings. Only studies rated as of good quality were included in our review and meta analysis.

Graphical assessment of publication bias was made by funnel plot that assessed asymmetry visually, while Begg's test and Egger's test were chosen for statistical assessment.

Results:-

Data search results:-

Our search in electronic databases initially revealed 112 citations; in which 43 articles were duplicated. The titles and abstracts of the remaining 69 articles were scanned and the full texts of 20 of them were retrieved since they were identified as potential articles to be included in our review. After in detail review of their full texts, 13 articles were excluded for not fitting with the inclusion criteria, leaving 7 articles for final inclusion in the systematic review and meta analysis.

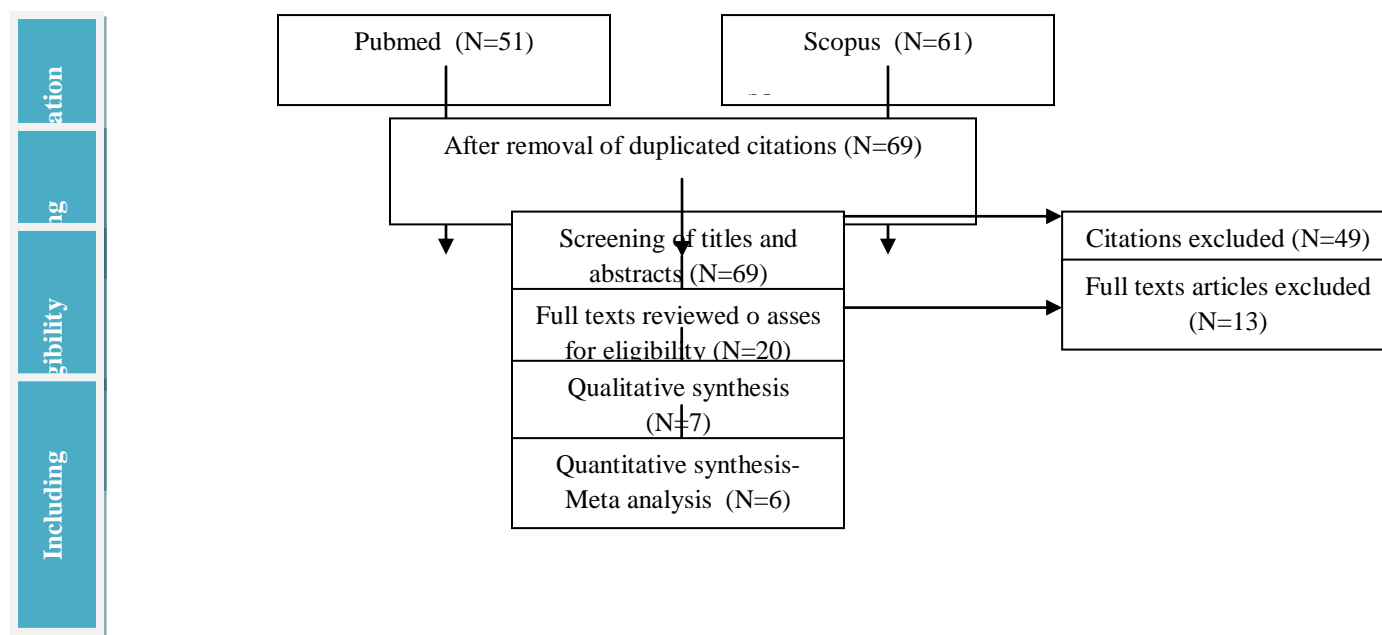

Figure1. Flow Chart for Studies Selection

Characteristics of studies included in the systematic review:-

One prospective cohort (Li Song,2012) and six retrospective case-control (Li Fang,2015; Lin,Yu, 2014; McKinney,2013; Hao,2015; Jia,2011; Figueiredo,2015) studies met the inclusion criteria. The cohort study showed a statistically significant association between maternal folic acid supplementation and orofacial clefts (aRR= 0.69; 95% confidence interval = 0.55– 0.87) suggesting that daily maternal intake of 0.4mg of folic acid, started during the period of preconception and in early pregnancy , was associated with a reduced risk of orofacial clefts in offspring born in a highly prevalent region of China [20].

Five retrospective case control studies demonstrated a statistically significant association between maternal folic acid supplementation and orofacial clefts of any types. Four of these studies (Li Fang, Xu, 2015; Lin, Yu, 2014; Hao, 2015; Jia, 2011) were conducted in China. Xu Li Fang showed that folic acid intake in first trimester confers a reduced risk of having babies with orofacial clefts (aOR= 0.23; 95% confidence interval = 0.10–0.55) [21]. Similarly, a significant relationship between folic acid supplementations during pregnancy and having offspring with orofacial clefts was established using multiple logistic regression analyses of different environmental factors in Yu Lin's study, indicating a possible preventive role of folic acid to orofacial clefts (aOR= 0.36; 95% confidence interval = 0.274–0.473) [22].

Plausible associations between preconceptional and 1st trimester use of recommended dose of folic acid and risk of orofacial clefts was evident among Chinese population as revealed by Yanru Hao (aOR= 0.43; 95% confidence interval = 0.210–0.880) [23]. Furthermore, the protective role of folic acid against orofacial clefts was emphasized in Z-L Jia's assessment of the risk of orofacial clefts and its relation to exposures to different environmental factors and nutritional supplements intake as demonstrated by multiple logistic regression analyses (aOR= 0.67; 95% confidence interval = 0.44–1.00) [24].

According to RF Figueiredo, women in Brazil who took a daily dose of 0.40 mg of folic acid in 1st trimester were significantly 0.14 times as likely to have an affected child with orofacial clefts than those who did not [25]. The relationship between micronutrients and orofacial clefts was examined by C.M. McKinney among the Thai population and women who reported taking a folic acid supplement in the preconception period were 0.51 times as likely to have an affected child than those who did not, although this finding was not statistically significant (P= 0.12) [26]. All included studies characteristics are listed in table 1.

A Case-control Study of Environmental Risk Factors for Nonsyndromic Cleft of the Lip and/or Palate in Xuzhou, China*	Li Fang, 2015	527	China	case-control study	OR = 0.18; 95% CI= 0.19-0.26	OR= 0.23; 95% CI= 0.10–0.55	family history, pesticide exposure, indoor decoration pollution, multivitamins.	First trimester of pregnancy.
The role of the folic acid to the prevention of orofacial cleft: an epidemiological study	Figueiredo, Rf, 2015	80	Brazil	case-control study	OR= 0.14 95% CI= 0.049 – 0.401	Not adjusted	No adjustment	Preconception and first trimester.
Micronutrients and oral clefts: a case-control study.	McKinney, C M, 2013	342	Thailand	case-control study	OR= 0.68 95% CI= 0.32, 1.45	OR= 0.51 95% CI= 0.22, 1.19	Diabetes, history of cold, vitamin A intake, Liver intake, Menstrual cycle regulation supplements	Preconception and first trimester

Using the random effect model, the combined data of six case-control studies yielded a combined odds ratio of 0.387 (95% CI: 0.263, 0.567; $p < 0.001$) suggesting a statically significant role of maternal intake of folic acid supplementation in reducing the risk of orofacial clefts in offspring (Figure 2).

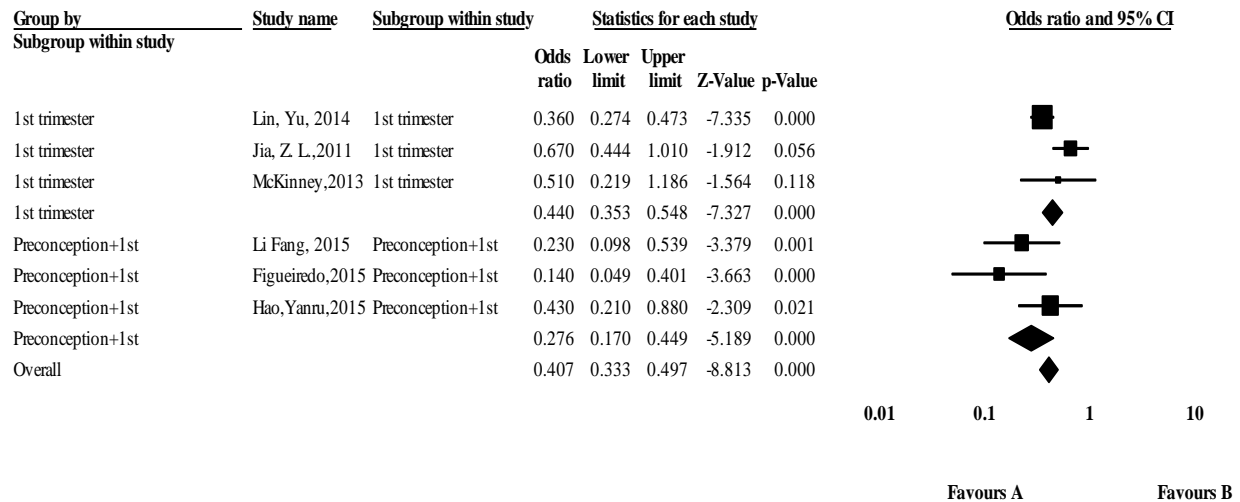

Figure 2. Meta Analysis of Case-Control Studies

The Q test and I^2 statistics showed a significant moderate heterogeneity between the analyzed studies ($Q=12.4, p=.003, I^2=59.7$). In order to estimate the effect of folic acid supplementation maternal intake timing, a subgroup analysis was performed based on the folic acid intake timing relative to conception and antenatal period. Half of the included case-control studies confined the time of maternal intake of folic acid to the first trimester (Lin, Yu, 2014; Jia, Z. L., 2011 and McKinney, 2013). Combining the odd ratios of these studies revealed a combined OR of 0.440 (95% CI: 0.353, 0.548; $p<0.001$) and the tests for heterogeneity were significant ($Q=12, I^2=59.7, P=0.03$) while the combined odd ratios of the remaining three studies that include the preconceptional intake to their analyses (Li Fang, 2015, Figueiredo, 2015 and Hao, Yanru, 2015) was 0.276 (95% CI: 0.170, 0.449; $p<0.001$) and the tests for heterogeneity were not significant ($Q=3.01, I^2=26.7, P=0.9$). Thus, the subgroup analysis showed a folic acid intake role in reducing the risk of orofacial clefts to be statistically significant in both subgroups and adding the analysis of preconceptional use of folic acid reduced the dispersion to insignificant level statistically (figure 3).

All studies (Random Effect Model)

Figure 3. Subgroup Analysis Results.

Further investigation of possible sources of heterogeneity was made using the meta regression. Neither the sample size ($Q=2.1, P=0.146$) nor the study location ($Q=3.05, P=0.217$) were found to show statistically significant relation to heterogeneity (figure 4)

Figure 4. Regression of Log Odds Ratios on Sample SIZE

By using the funnel plots, the visual check for publication bias did not appear to be asymmetrical, and the Begg's test for publication bias was not significant ($p=0.18$). Moreover, Egger's Test, that has the better statistical power to discover publication bias, was also not significant ($p=0.6$).

Figure 5. Funnel Plot of standard Error by Log Odds Ratios

Discussion:-**Outcome:-**

Our systematic review and meta analysis advocated the hypothesis of the protective role of maternal intake of folic acid's supplements against orofacial clefts in offspring. The point estimates yielded from the meta analysis of included case-control studies revealed that folic acid intake by mothers during the preconception period and first trimester reduced the risk of orofacial clefts in their offspring by 38,7 %.

A Similar significant effect was reflected by combining estimations using a subgroup analysis of the studies restricted the time of maternal intake to the first trimester only and those studies that included the use in the preconception period. Mothers who took the folic acid supplements in 1st trimester only were 44% less likely to have babies with orofacial clefts than mothers who did not. Similar effect was shown in the preconception period and 1st trimester subgroup, but with less effect size.

A previous meta analysis showed results that indicate an inverse relationship between folic acid and orofacial clefts of any type, but yielded a positive relationship for cleft palate among the prospective studies [27]. Another meta analysis among the populations in the United States and Canada concluded that the evidence of folic acid association with orofacial clefts is not strong, however, it suggested a possible beneficial effect of the use of multivitamins supplements in early pregnancy in preventing the occurrence of orofacial clefts and have shown that a reduction of about 7% of cleft lip and palate [28].

The results of a recent individual participant data (IPD) meta-analysis for the studies that examined the interaction between genetic and environmental etiological factors, focusing mainly on the folic acid and MTHFR C677T genotype interaction, showed reduced risk of cleft lip and palate with maternal folic acid use ($p=0.008$; OR=0.70, 95% CI: 0.65–0.94) and with supplements containing folic acid ($p=0.028$, OR=0.80, 95% CI: 0.65–0.94) suggesting a protective influence of folic acid against orofacial clefts[29]. A meta-analysis of studies that examined the association of fortification with orofacial clefts among the populations in United States and Canada have shown a reduction of about 7% of cleft lip and palate[30].

A randomized control trial found no difference in the recurrence rates of orofacial clefts among two groups of women assigned to high dose (4mg) and low dose (0.4mg) of folic acid intake, suggesting that potential ineffectiveness of the higher dose was possibly ineffective in further reducing recurrence of orofacial clefts relative to the lower dose [30].

Limitations:-

Our results were limited by relatively few number of studies included in the meta analysis (6 studies) which might affect the statistical power for estimating the combined effect.

All included studies in our meta analysis were of retrospective case-control design making our results vulnerable to recall bias. Maternal consumptions of different vitamins and trace elements supplements that have potential contribution to the risk of orofacial clefts were difficult to be examined independently among included studies, creating a bias of non random selection of supplements use.

Another main limitation in our review was the lack of randomized clinical trials which experimentally test the folic acid role in protecting offspring against orofacial clefts. Since the protective role of folic acid supplements against neural tube defect has been well established, conducting a randomized control trial with low dose folic acid against the control of placebo will interfere with the concept of nonmaleficence, thereby, considered unethical.

The potential confounders, such as intake of other supplements, family history, age, gender, were analyzed differently among the included studies and one study did not show the results of analytical manipulation to control for potential confounding factors.

Significant moderate heterogeneity observed between included studies is another source of limitation to our findings. Aside from narrowing the time window of exposure in the first trimester, no factor was identified to explain the significant heterogeneity.

The concern of publication bias is considered in any meta analysis. The results of our analysis did not show this bias to be evident.

Conclusion:-

Our results supported the hypothesis that taking folic acid-containing supplements during pregnancy may protect against oral clefts. However, more prospective studies conduction in different populations with different ethnicities would be beneficial in expressing a causal association. Moreover, it is essential for future retrospective observational studies consider careful analysis of suspected confounders and improve the statistical power by enhancing the representativeness of the sampling techniques and sample sizes. Enhancing the Implementation of Mandatory fortification programs with close monitoring, might be beneficial in reducing the risk of orofacial clefts in offspring.

Abstract

In-vitro comparative study to evaluate the efficacy of antimicrobial activity of Thymol(A), Chlorhexidine(B), Chlorhexidine plus triclosan (C), Cetylpyridinium chloride (D), Belleric myrobalan (E), Povidone iodine (F) mouthwashes against Staphylococcus aureus and Streptococcus mutans with distilled water as a control group was undertaken. The mouthwashes were tested at four different concentrations 1:4(25%), 1:1(50%), 3:4(75%) and full strength (100%). The antimicrobial activity was determined by using agar well diffusion method. The plates were allowed to incubated at 37°C for 24hr, 48hr and 72hr. Chlorhexidine plus triclosan emerged as the most effective mouthwash against Staphylococcus aureus (30mm to 35.33mm) and Streptococcus mutans (19mm to 27.5mm) followed by Cetylpyridinium chloride, Chlorhexidine, Thymol, Belleric myrobalan. Povidone iodine and distilled water had no antimicrobial activity. It was concluded that the Chlorhexidine plus triclosan shows excellent antimicrobial activity but povidone iodine has no antimicrobial activity.

Introduction:-

Prevention of oral diseases is easier than cure¹. Oral hygiene is an important aspect in our daily life for maintaining a healthy life style. The oral cavity contains more than 500 types of pathogenic and non-pathogenic bacteria, out of which 22 types are dominant. Improvement of oral health can influence the quality of life. Scientific research has shown that the use of mouthwashes (antimicrobial solutions) plays a vital role in the reduction of oral microbial load in the oral cavity.

Antimicrobial solutions are used for cleaning food remnants, decreasing oral malodour, prevention of plaque accumulation on tooth and gingival surfaces, used prior to and after oral surgical procedures in order to prevent oral pathogenic infections. Within the oral cavity, the most common microorganisms are staphylococcus aureus

(formerly also called staphylococcus pyogenes) and Streptococcus mutans. Staphylococcus aureus is a gram positive, non motile, non spore forming, catalase positive cocci that occur in grape like clusters, it is a major human pathogen, responsible for a number of hospital-acquired infections, initially colonizes several locations in the human body, but the oral cavity and hands are the main reservoirs for propagation of this pathogen in the hospital environment¹. Streptococcus mutans is a gram positive, non motile, non spore forming, catalase negative, facultative anaerobic cocci arranged in chains or pairs and commonly found in the oral cavity and has a major role in tooth decay formation and sore throat. S.mutans metabolise sucrose to lactic acid causes tooth decay.

There are 25 species of oral streptococci in human oral cavity². Each of them develops specialised properties for colonisation in oral sites and constantly changes conditions to fight competing bacteria. Oral diseases can be initiated by imbalances in the microbial flora. In specific conditions, streptococci can change to opportunistic pathogen that can initiate the disease and damage the host. Oral streptococci is mentioned both as harmless and harmful bacteria.

To decrease infections in the Oral cavity different antimicrobial mouthwashes are used. So an in vitro study was under taken to know the antibacterial effectiveness of various mouthwashes such as A – Thymol, B – Chlorhexidine, C – Chlorhexidine gluconate with triclosan, D - Cetylpyridinium chloride, E - Belleric myrobalan, F - Povidone iodine on Staphylococcus aureus and Streptococcus mutans.

Aims and objectives of the study:-

The aim of this invitro study is to evaluate efficiency of antimicrobial activity of different mouth washes such as Thymol, Chlorhexidine, Chlorhexidine plus triclosan, Cetylpyridinium chloride, Belleric myrobalan, Povidone iodine mouthwashes in different concentrations against staphylococcus aureus and Streptococcus mutans, by using culture media such as Nutrient agar and Blood agar respectively, compared with distilled water as a control group.

Materials and Methods:-

Six commonly used mouthwash products (Table 1) were evaluated for their antimicrobial activity compared with a control group (distilled water) in Department of Oral and Maxillofacial Surgery, GITAM Dental College and Hospital, Visakhapatnam, Andhra Pradesh.

Microorganisms:-

The test microorganisms Staphylococcus aureus, Streptococcus mutans were subcultured on specific media such as Nutrient Agar broth and Brain Heart Infusion Agar respectively incubated aerobically at 37°C. The identification of all the microbes was confirmed by standard staining and biochemical methods.

Identification of pathogen:-

The oral specimens are plated on BHI agar, blood agar, and BHI broth for the isolation of the pathogenic strains in both aerobic and anaerobic conditions. The isolated strains were identified to the genus level by staining, microscopy, and biochemical tests. The agar slants of brain heart infusion agar are used for maintaining the identified culture. The culture slants were stored at 4°C in the refrigerator.

Staining Characteristics:-

The isolated colonies were stained by Grams staining procedure. The prepared smear was air-dried and heat fixed. Crystal violet was flooded over the smear for 1 min and drained. After washing, Gram's iodine was added and left for 1 min. The smear was then washed in 95% (v/v) ethanol for 30 sec. It was counterstained with Safranin for 2 min. After air drying, the smear was examined under oil immersion objective in a light microscope.

Biochemical Characteristics:-

The isolated strains were subcultured on BHI, blood agar and BHI broth. These Plates were incubated at 37°C overnight and cultural characteristics of the colonies were studied after incubation. Biochemical tests such as indole production test, methyl red test, citrate utilization test, catalase, indole, nitrate reduction, carbohydrate fermentation test, starch hydrolysis, urease test, hydrogen sulfide test, gelatin hydrolysis were performed.

Methods:-

Antimicrobial effectiveness of various mouthwashes was assessed by using Agar well diffusion method:

Agar well Diffusion Method:-

The mouthwashes were tested at four different concentrations: 1:4(25%), 1:1(50%), 3:4(75%) and full strength (100%), taking sterile distilled water as the diluent, using agar well diffusion method or cup plate method. In this method, pure isolate of each microbe was subcultured on the recommended specific media for each microorganism at 37°C for 24hrs. From each inoculated agar plate, a minimum of four colonies were touched with a sterile loop and transferred into a tube containing normal saline (0.85%). A 100µl volume of each mouthwash concentration (full strength, 3:4, 1:1, 1:4) and the control was propelled directly into the wells of the inoculated specific medias nutrient agar petri plates for *Staphylococcus aureus* and blood agar petri plates for *Streptococcus mutans*. The petri plates were allowed to stand for ten minutes for diffusion of the mouthwash to take place and incubated at 37°C for 24hr, 48hr and 72hr. The antimicrobial activity, indicated by an inhibition zone surrounding the well containing the mouthwash measures in mm. The inhibition zone for different mouthwashes are measured and noted.

Observations and Results:

In the present study the antimicrobial activity of the six mouthwashes was evaluated against *Staphylococcus aureus* and *Streptococcus mutans*. It was determined by agar well diffusion method, was measuring growth of inhibition zone in millimeters (mm) including the diameter of well (6mm). The inhibition zone diameters were measured accordingly with dilutions of 1:4, 1:2, 3:4 and full strength, during the respective time intervals of 24hrs, 48hrs, 72hrs

Based on the mean diameter of the zones of microbial inhibition produced by the six mouth washes in agar well diffusion method, against *Staphylococcus aureus* and *Streptococcus mutans*, the mouthwash 'C' emerged as the most effective antimicrobial activity followed by mouthwash 'D' that showed excellent level of antimicrobial activity. Following which mouthwash 'B' and 'A' showed good antimicrobial activity and finally, displaying very little antimicrobial activity was mouthwash 'E'. No antimicrobial activity against *Staphylococcus aureus* and *Streptococcus mutans* was elicited when tested with mouthwash F and distilled water.

Table 1:- Ingredients of six mouthwashes tested for antimicrobial potential.

Mouthwash	Ingredients	Active ingredients
A	Purified water, sorbitol, alcohol, poloxamer 407, benzoic acid, sodium saccharin, eucalyptol, flavour, methyl salicylate, thymol, sodium benzoate, menthol	Thymol Eucalyptol Methyl salicylate Menthol
B	Chlorhexidine gluconate 0.2% w/v in a pleasantly flavoured aqueous base.	Chlorhexidine gluconate
C	Chlorhexidine gluconate 0.2% w/v, triclosan USP 0.05% w/v, sodium monoflourophosphate USP 0.07% w/v in a pleasantly flavoured aqueous base.	Chlorhexidine gluconate Triclosan
D	Water, glycerine, propylene glycol, sorbitol, poloxamer 407, cetylpyridinium chloride, potassium sorbate, sodium fluoride, sodium saccharin, menthal, citric acid	Cetylpyridinium chloride, Sodium fluoride
E	Belleric myrobalan (Bibhitaki) 10mg, Betel (Nagavalli) 10mg, Pilu 5mg powders, Peppermint satva 0.4mg oils, Gandhayva taila 1.2mg, Ela , other ingredients Sodium benzoate IP, Bronopol IP, Potassium sorbate	Belleric myrobalan (Bibhitaki)
F	Povidone iodine IP 2% w/v, absolute alcohol content 8.38% v/v in a mint flavour aqueous base.	Povidone iodine

Table 2:- Antimicrobial activity of mouthwashes against *Staphylococcus aureus* and *Streptococcus mutans* determined by agar well diffusion method by measuring diameter of growth of inhibition zones (mm)

Discussion:-

P.K. Sreenivasan .et.al³ (2013) stated that the human oral cavity and its various ecological niches (i.e. dorsal tongue, buccal mucosa, subgingival spaces, etc.) harbour substantial numbers of Gram-positive and Gram-negative bacteria. Dental plaque is one of the most thoroughly investigated types of microbial biofilms with clinical studies clearly. The oral cavity is a major gateway to the human body. The microorganisms colonizing one area of the oral cavity have a significant probability of spreading on contiguous epithelial surfaces to neighbouring sites. Microorganisms from the oral cavity have been shown to cause a number of oral infectious diseases, including caries (tooth decay), periodontitis (gum disease), endodontic (root canal) infections, alveolar osteitis (dry socket), and tonsillitis. Evidence is accumulating which links oral bacteria to a number of systemic diseases, including cardiovascular disease, stroke, and pneumonia.

In the present study determination of the antimicrobial activity of six mouthwashes, and its effectiveness of active ingredients was done. The antimicrobial activity of the mouthwashes were assessed where statistical ranking procedures were used to place the six different mouthwashes following the order of antimicrobial effectiveness. The results revealed variations in their effectiveness against the two tested microorganisms. Based on the mean diameter of the zones of microbial inhibition produced by the mouthwashes in agar well diffusion method, tested against *staphylococcus aureus* and *streptococcus mutans*, chlorhexidine gluconate with triclosan showed best results where as Cetylpyridinium chloride also emerged as a mouthwash with the excellent antimicrobial activity. Chlorhexidine

gluconate and Thymol (essential oils) showed good antimicrobial activity and finally, displaying very little antimicrobial activity was Belleric myrobalan while povidone iodine had no antimicrobial activity.

The mouthwash 'A' contains active ingredients such as four phenol-related essential oils (thymol, eucalyptol, menthol and methyl salicylate) which claim to penetrate the plaque biofilm and thus kill micro-organisms that causes gingivitis. Furgang D .et.al⁴ (2005) stated that the mouthwashes display broad spectrum antimicrobial activity, prevent bacterial aggregation, slow bacterial multiplication, retard plaque maturation and decrease plaque mass and pathogenicity.

The mouthwashes 'B' and 'C' contains active ingredients. They are Chlorhexidine gluconate is a cationic biguanide with broad spectrum antimicrobial activity. It is most effective mouthwash for reducing plaque and gingivitis. Arweiler NB .et.al⁵ (2001) stated that the Chlorhexidine has an important feature of substantivity, that helps in prolonged adherence of the antiseptic to the oral surfaces (mucosa & teeth) & its slow release at effective doses that guarantees the persistence of its microbial activity. Kamal Raj Current recommendations are for twice-daily i.e. chlorhexidine to be used only as a short-term adjunct, or as an aid in disinfection of surgical sites, to improve wound healing, or as a short-term treatment of halitosis. It is not recommended for long-term use due to its numerous adverse effects. These include tooth and restoration staining, soft tissue staining, increased calculus deposition, unpleasant taste, taste alteration, burning sensation, desquamation and mucosal irritation. Chlorhexidine may also potentiate oral discomfort in patients with chemotherapy-induced mucositis, xerostomia or ulcerative oral mucosal conditions.

The mouthwash 'C' contains active ingredients, Chlorhexidine gluconate and Triclosan. Triclosan is synthetic non-ionic chlorinated phenolic agent with antiseptic qualities. Witt J.et.al^{6,7} (2005) stated that broad-spectrum efficacy on Gram-positive and most Gram-negative bacteria. It is also effective against mycobacterium, anaerobic bacteria, the spores and fungi of the Candida species. The mechanism of its antiseptic action is by acting on the microbial cytoplasmic membrane, inducing leakage of cellular constituents and thereby causing lysis of the micro-organisms.

The mouthwash 'D' contains active ingredients, they are Cetylpyridinium chloride is a quaternary ammonium compound with antiseptic and antimicrobial properties. Narinder Pahwa .et.al⁸ (2011) stated that the cationic and binds to bacterial surfaces causing disruption of the cell membrane, leakage of intracellular components and disruption of metabolism. Mouthwashes containing cetylpyridinium chloride inhibit and reduce plaque build-up. Hadi Darvishikhezri et al³ (2013), investigated that the mouthwashes containing cetylpyridinium chloride with alcohol and cetylpyridinium chloride without alcohol were most effective antimicrobial activity against supragingival plaque microorganism.

The mouthwash 'E' contains active ingredients such as Belleric myrobalan. Rupali Mahajan .et.al⁹ (2016) stated that the antimicrobial properties, analgesic and antioxidant properties.

The mouthwash 'F' contains active ingredients such as Povidone iodine, an iodophore in which iodine is linked to povidone that displays an affinity for the cell membrane there by delivering free iodine directly to the bacterial cell surface. Adamietz I.A.et.al¹⁰ (1998) stated that the broad spectrum of activity against bacteria, fungi, protozoa and viruses. The mouthwash has been shown to be effective in reducing plaque and gingivitis and may be a useful adjunct to routine oral hygiene. It also reduces the incidence, severity and duration of radiation mucositis. Absorption of excess iodine has been postulated to result in metabolic complications, however this is not of concern in patients without pre-existing thyroid disease and if the patient spits out the solution.

Chlorhexidine gluconate with triclosan has shown most effective antimicrobial activity at full strength concentration against Staphylococcus aureus and Streptococcus mutans, which causes dental caries and oral infections respectively in comparison with the other five mouthwashes (i.e Thymol, Chlorhexidine, Cetylpyridinium chloride, Belleric myrobalan and Povidone iodine).

Conclusion:-

According to this study, Chlorhexidine gluconate with triclosan has shown most effective antimicrobial activity at full strength concentration against Staphylococcus aureus and Streptococcus mutans which causes dental caries and oral infections respectively in comparison with the other five mouthwashes (i.e Thymol, Chlorhexidine, Cetylpyridinium chloride, Belleric myrobalan and Povidone iodine).

ER physicians, sleep quality, daytime sleepiness, depression.

Abstract

Objectives: To assess the prevalence of daytime sleepiness, poor sleep quality and depression among (emergency room) ER physicians in comparison to family medicine physicians.

Methods: We compared 68 ER physicians with 69 family medicine physicians in an observational case control study. A self-administered questionnaire composed of the Epworth Sleepiness Scale (ESS), the Pittsburgh Sleep Quality Index (PSQI) and the Beck Depression Inventory Scale (BDI).

Results: The mean total ESS score of ER physicians was significantly higher than the score of family medicine physicians as 41.2% of ER physicians scored ≥ 10 , while only 14.5% of family medicine physicians scored ≥ 10 . Moreover, ER physicians had a higher on the PSQI (indicating poorer sleep quality), and 83.8% of them had poor sleep quality (≥ 5) in comparison to 50.7% of family medicine physicians. The BDI scores of the ER and family medicine physicians indicated that 41% and 22% suffered from some level of mood disturbance, respectively. Pearson correlation showed a positive and significant relationship between sleep quality and depression among ER physicians ($P < 0.001$, $r = 0.437$).

Conclusion: Our study demonstrated that daytime sleepiness, poor sleep quality and depression are prevalent among ER physicians. Moreover, there was a strong correlation between poor sleep quality and depression.

Introduction:-

Night shift work is a well-known risk factor for disturbed circadian rhythm¹, leading to significant drawbacks in quality of sleep and sleep efficiency²⁻⁴. Therefore, night shift workers, such as emergency room physicians, have a significant liability to develop poor sleep quality. A fair number of studies have focused on the effects of shift work on the general health, and have found a link between shift work and cardiovascular diseases⁶⁻¹², diabetes mellitus type 2¹³⁻¹⁷, breast cancer²¹, metabolic syndrome²²⁻²³, memory loss²⁴ and obesity²⁵⁻²⁶. In contrast, fewer studies have addressed the relation between shift work and its effect on sleep quality and its negative consequences on sleep patterns and mood. Shift work schedule has numerous effects on the quality of sleep and wakefulness of workers^{25, 27}. Some studies mentioned that the irregular work hours seem to exert acute effects on sleep and alertness of individuals similar to those witnessed in clinical insomnia, which could be responsible for major negative human

Address:- King Saud University, College of Medicine, Department of Family & Community Medicine, CMED 305 course 2015 – 2016.

and economic impacts due to fatigue related accidents and diminished productivity²⁵. There is a definite association between low sleep quality and shift work^{27, 28}. A previous study done in Kingdom of Saudi Arabia revealed that the quality of sleep of shift-workers was significantly affected in comparison to those without shift work²⁹. Sleepiness and stress are among the risk factors for worsening sleep quality among shift workers³⁰. Poor sleep quality was associated with increased work injury³⁰. Low sleep quality was reported to correlate with a poor quality of life among nurses working rotating shifts²⁸. Insomnia among shift workers plays a role in experiencing sleep difficulties³¹. Regarding poor sleep quality and depression, one study was done on multiple sclerosis patient had found a link between poor sleep quality and depression³². One studies suggested that the increase in depressive symptoms across adolescence is partially mediated by sleep-related developmental changes³³. Increasing depression among sleep apnea patients was associated with poor sleep quality, as well³⁴.

No study has assessed the effect of shift work on ER physicians on sleep and mood in Saudi Arabia; therefore, we conducted this study to estimate the prevalence of poor sleep quality, daytime sleepiness, and depression among ER physicians.

Methods:-

This is an observational case control study that was conducted between November 2015 and April 2016. The cases were randomly chosen and comprised of 68 emergency medicine physicians from 8 major Riyadh hospitals (King Khalid University Hospital, King Faisal Specialist Hospital and Research Center, King Fahad Medical City, National Guard Hospital, Prince Sultan Military Medical City, King Saud Medical Complex, Imam Abdulrahman bin Faisal Hospital, King Salman Hospital) who have worked regular shifts for at least 3 months. The controls comprised of 69 family physicians randomly chosen from 5 major Riyadh Hospitals (King Khalid University Hospital, King Fahad Medical City, National Guard Hospital, Prince Mohammed bin Abdulaziz Hospital, King Saud Medical Complex). The project was approved by the Ethics Committee and informed consent was obtained from participants.

Data collection and Questionnaire:-

As medicine is taught in English in Saudi Arabia, a self-administered questionnaire in the English language was distributed to all participating physicians. The questionnaire used in this study was composed of four sections: Demographic information, position, previous diagnosis of either depression or a sleeping disorder, and medications.

The Epworth Sleepiness Scale (ESS): This is a validated questionnaire that is used to assess daytime sleepiness. It contains 8 items that assess the likelihood of dozing in a variety of daily living situations. The highest score is 24, and a score ≥ 10 indicates sleepiness³⁶.

The Pittsburgh Sleep Quality Index questionnaire: This is an instrument used to measure the quality and patterns of sleep in adults. It differentiates “poor” from “good” sleep quality by measuring seven areas (components): subjective sleep quality, sleep latency, sleep duration, habitual sleep efficiency, sleep disturbances, use of sleeping medications, and daytime dysfunction over the last month. A total score of 5 or higher is indicative of poor sleep quality³⁵.

The Beck Depression Inventory: This is a validated questionnaire to assess depression. It is composed of items relating to symptoms of depression. It contains 21 questions; each answer being scored on a scale value of 0 to 3. Higher total scores indicate more severe depressive symptoms. A score of 11-16 indicates mild mood disturbance, 17-20 indicates borderline clinical depression, 21-30 indicates moderate depression, 31-40 indicates severe depression, and a score of over 40 indicates extreme depression³⁷.

Data Analysis:-

Data were expressed as mean \pm SD for continuous data. Categorical data were expressed as n (%). Student t-test or Mann-Whitney U-test (depending on normality) and chi-square test were used to compare numerical or categorical data, respectively. One way ANOVA or Kruskal Wallis test (if normality assumption violated) were used to compare BDI groups. The results were considered statistically significant if $P \leq 0.05$. Pearson correlation or Spearman rank-order correlation (if normality assumption violated) were used to assess correlation between ESS, PSQI and BDI scores. Statistical Package for Social Sciences (SPSS), IBM version 22 (SPSS Inc., Chicago, IL, USA) software was used for data analysis and management.

Results:-

The study included 68 ER physicians and 69 family medicine physicians. Table 1 shows that the two groups were similar in all parameters except for age; the mean age for ER physicians was 35.2 years (SD: 8.6), and mean age of 40.4 (SD:10.5) in family medicine physicians. There was a difference in the position parameter, as well. There were a higher proportion of male physicians in both groups; 70.6% of ER physicians were males, and 58% were males in family medicine physicians group. One subject of ER physicians reported being diagnosed with a sleeping disorder, and two from the control group, one of them specified being diagnosed with obstructive sleep apnea. In addition, 8.8% of ER physicians are diagnosed with depression; almost the same percentages, 8.7%, of family medicine physicians are diagnosed with depression as well. Three subjects of the ER physicians reported being on Selective Serotonin Reuptake Inhibitors, and one reported being on beta-adrenergic blocking agents. Only one subject of family medicine physicians is on beta-adrenergic blocking agents.

The mean total ESS score of ER physicians was significantly higher than the score of family medicine physicians. Furthermore, 41.2% of ER physicians scored ≥ 10 , while only 14.5% of family medicine physicians scored ≥ 10 [Table 2]. ER physicians also scored higher on the PSQI, 83.8% of them were having poor sleep quality (≥ 5) in comparison to 50.7% of family medicine physicians [Table 2]. Finally, a strong correlation was observed between sleep quality and depression among ER physicians, Pearson correlation shows a positive and significant relation ($P < 0.001$, $r = 0.437$) [Figure, Table 3]. The results of Pearson correlation between ESS score and BDI score represents that daytime sleepiness has a weak correlation with depression in ER physicians ($r = 0.172$) [Figure, Table 3]. Pearson correlation between sleep quality and daytime sleepiness has a weak correlation ($r = 0.178$), as well. [figure, Table 3].

Table I:- Characteristics; comparison between ER physicians and family medicine physicians.

Variable	Mean \pm SD		P-Value
	ER physicians n=68	Family medicine n=69	
Age	35.2 \pm 8.6	40.4 \pm 10.5	0.003
Gender			
Female	20 (29.4)	29 (42)	0.123
Male	48 (70.6)	40 (58)	
Marital Status			
Single	17 (25)	12 (17.4)	0.276
Married/Divorced/Widower/Widow	51 (75)	57 (82.6)	
Position			
Consultant	13 (19.1)	26 (38.2)	0.014

ESS: Epworth Sleepiness Scale

PSQI: Pittsburgh Sleep Quality Index

BDI: The Beck Depression Inventory

Table III:- Correlations between ESS, PSQI and BDI scores in ER physicians.

Variable	n=68	r	p-Value
ESS Score Vs Global PSQI Score		0.178	0.146
ESS Score Vs BDI Score		0.172	0.161
BDI Score Vs Global PSQI Score		0.437	< 0.001

**Figure:-** Scatter plot between ESS, PSQI and BDI scores in ER physicians.**Discussion:-**

This study was conducted to assess the prevalence of daytime sleepiness, poor sleep quality and depression among emergency room physicians with a control group of family physicians in Riyadh referral hospitals.

The results of this study showed by using the PSQI³⁵ that poor sleep quality was prevalent among emergency room physicians with a prevalence of 84% compared to 51% in family medicine physicians. Moreover, we found that falling asleep during daily activities is more prevalent among ER physicians with a prevalence of 41% compared to 14% reported in family medicine physicians. In addition, by using Becks Depression Inventory (BDI)³⁷ it was found to be statically significant and indicating that 41% of emergency room physicians room physicians were depressed

compared to 22% of family medicine physicians who were found to be depressed. Moreover, we found that poor sleep quality in emergency room physicians is strongly associated with depression.

A previous study conducted on male factory workers in Aseer, Saudi Arabia²⁸ showed that poor sleep quality among shift workers was reported to be around 67.6% compared to only 20.3% in non-shift workers. Furthermore, another study was conducted on ER physicians in Pittsburgh³⁸, reported that a percentage of almost 31% suffered from poor sleep quality. In comparison, the percentage of shift workers and ER physicians suffering from poor sleep quality are much less than what was reported in ER physicians in our recent study. Both studies focused on the effect of shift work on the sleep quality of the shift workers. It is possible that doctors in our study do more shifts than ER physicians in the American study.

Limitations:-

A limitation of this study was the relatively small sample size. However, the number of emergency room physicians in Riyadh is relatively small. Another limitations were that a higher proportion of the participants in this study were males.

Conclusion:-

Our study demonstrated that daytime sleepiness, poor sleep quality and depression are prevalent among emergency room physicians. Moreover, there was a strong correlation between poor sleep quality and depression. Efforts are needed to investigate the causes of these problems among emergency room physicians and to propose practical solutions.

Abstract

This research addressed the effect of distance learning courses on regular courses. Distance Learning Courses are very popular now days and persons are much interested in distance learning courses because this is cheaper than the regular courses but we found that some they do not believe in this system because they think this will not help in grooming the personality of the executive. So that some people were satisfied with distance Learning System but still some people believe in regular studies. Regular class attendance keeps students on track with their course work in classroom courses. Distance learning courses do not have regular class meetings, so students must be self-disciplined enough to keep up with their studies. Distance learning has opened doors for many students, especially for those who cannot afford to pay for the high fees of full-time courses. Although online distance learning courses have many advantages over on-campus degree courses, many factors come into play in order to make this a success for students.

Introduction:-

Mukhopadhyay (1998) described distance education as “Distance education is a mode of delivery and not an educational system; open education is a system-distance education is often the delivery mode of open education”. The first three Open Learning Institutes were set up in Australia, Canada and New Zealand in 1916, 1919 and 1922, respectively. The success of Delhi University’s endeavor in distance education motivated other universities to introduce several kinds of programmes through correspondence courses.

As distance learning has evolved, various terms have been used to describe the particular technique being utilized. Moreover, distance learning techniques have become more widely diffuse across educational and organizational settings, spawning even more unique terms and definitions. Distance learning is training that takes place largely synchronously; that is, the material is delivered to all participants at the same time even though participants are separated by geographical distance. The US Distance Learning Association defines distance learning as “the delivery of education or training through electronically mediated instruction including satellite, video, audio, audiographic computer, multimedia technology etc.

Literature Review:-

Mr. Wei Yuan Zhang at all from the open University of Hong Kong SAR, given their views on “A Preliminary study of current states of distance Education research in India”. They suggested that, In India, higher education through the distance mode was first offered by the School of Correspondence and Continuing Education, the University of Delhi, in 1962. At present there are 10 open universities and 62 conventional universities offering correspondence courses, little literature is available on the current state of distance education research in India. This study surveys 29 experts in 14 distance education institutions in India and examines their foci in tertiary distance education research. The data for each expert include gender, administrative positions, electronic mail address and homepage, research areas, recent research projects, and proposed future studies.

Mr. M.M Ansari from *Distance Education Council, IGNOU, New Delhi, India* wrote on “Best Practices in Open and Distance Learning Systems in India: An Assessment” The success of Open Distance Learning institutions has contributed to increased credibility and acceptance of distance learning systems as an effective mode of teaching and learning. This genre of education has made significant contributions to human resource development. At least 40 per cent of incremental students population at post-secondary level, of the total of about 0.5 million students per year, prefer to study through distance mode. They opt for different types and levels of degree/diploma programmes that are offered by the QOL institutions.

Mr. Satya Sundar SETHY from Staff Training and Research Institute of Distance Education Indira Gandhi National Open University Maidangarhi, New Delhi, India On “Distance Education In The Age Of Globalization: An Overwhelming Desire towards Blended Learning The aim of this paper is to discuss the nature and status of distance education in the age of globalization, i.e. how best it fits for the present educational scenario.

Dr. Ashok Kumar Gaba, Senior Research Officer, Staff Training and Research Institute of Distance Education Indira Gandhi National Open University given his view on “The Role of Distance Education in the Human Resource Development of India. The objective of this paper is to analyze the role of distance education in the human resource development (HRD) of India. The paper has been divided into three parts. First, part discusses the relationship between distance education and human resource development in general and conceptual context in particular. Indian rank in HRD corresponding to other countries has also been highlighted in this part. Second part highlighted how distance education helped to learners to bring changes economically in their personal life after getting degree from distance education institution. The third and last part discusses the futuristic model of distance training for on the job learners.

Research Objectives:-

The main aim of this study is to analyze effect of Distance education on regular courses. This research is an endeavor towards to analyze the attitude of the students towards distance education. Today number of distance institutions has crossed a number of 850 which offer more than 16,000 courses to over 15 million learners all around the world. During this research we conducted a survey among the youth of Uttar Pradesh in order to verify the roll and impact of distance education on regular courses.

Area of Research:-

For our convenience we have selected many area of *district of Uttar Pradesh (East)* as a research area that includes Faizabad, Lucknow, Gonda, Ambedkarnagar, Barabanki, Sultanpur for the research project.

Sample Unit:-

My sampling units were students of different *district of Uttar Pradesh (East)*. I have taken 150 respondents for my study.

Hypothesis-Let us take the hypothesis that Distance education having no effect on regular courses.

I have used the conclusive Research Method in this study. As our project deals with the study of distance learning education so we need to meet the student. Our primary aim is to find the psychology of student for what they think about the distance learning education. We had interacted with students of different areas and came out with some conclusions, for that we had framed questions.

Finding/Interpretation:-

For two degree of freedom at 5% level of significance, the table value of $\chi^2=5.991$. The calculated of χ^2 is much greater than the table value and hence our hypothesis stands rejected. We, therefore conclude that Distance education having effect on regular courses.

The above diagram shows that exactly half of the percentage in yes and half in no that means students think that distance learning has effect on regular courses are equal in number as thinkers who think that it has no effect on regular courses. It happens generally as government give priority to regular courses in comparison of distance learning. Distance students can save costs because people do not have to travel to campus to attend classes on regular scheduled basis, nor live on campus, nor leave their current professional commitments, although they will have to pay for tuition fees and expenses for the purchase of learning materials. This relatively much lower cost of distance education on the parts of the students compared to the face-to-face mode of education should improve participation and expand greater opportunities for those socially and economically less advantaged groups of the society, particularly women to have access to quality education higher education at affordable costs. Those who thought that distance education was passé are in for a surprise as close to one-fourth of the country's students are getting educated through the distance mode. The Open Distance Learning (ODL) system, also known as Distance Education (DE) system, has evolved as one of the effective modes of education and training as the overall annual growth. In fact, the enrollment in distance education has been increasing approximately at the rate of more than 10% in last two decades. Enrollment in Open Universities (OUs) and Distance Education Institutions (DEI) has increased steadily at a higher pace than in conventional programmes. According to the report of a seven-member committee headed by NR Madhava Menon, the share of distance education increased

from 2.6% in 1975-76 to 8.9% in 1985-86 and further improved to 10.7% in 1990-91 and to 20.56% in 2008-09. "At present, close to 24% of all enrollments are in the ODL system and growing fast because of the reach of this mode and the opportunities it gives to those who are already employed and seek to enhance their qualifications.

Conclusion:-

Distance Education plays a vital role in the development and access to education. It is less expensive than the conventional system though the cost per student differs among the distance education institutions. The cost variations are due to the expenditure pattern and the enrolment trend. The fixed cost for the Open University is high because it has to create physical infrastructure and appoint teaching and administrative staff. But the CCIs utilize the physical infrastructure of the concerned university and hire the services of the resource persons from the formal system. Hence, the fixed cost is comparatively low in the correspondence course institutions. As far as the variable cost is concerned, where the enrolment is more, the per capita cost tends to reduce. This is due to large scale production of learning materials, and other expenditures like remuneration to lesson writers, payment to resource persons, rent and other expenditures to conduct PCPs. Hence, the per head cost is low in the institutions where the enrolment is high. To determine the cost in any distance education system following four factors need to be considered:

- ❖ Compare the cost per student in distance education system with the cost per student in the formal system.
- ❖ Quality of equipment/material used.
- ❖ Number of students enrolled in each system.
- ❖ Students' private costs.

Distance education has opened a new window of opportunities for those who craved for further studies. In a way it has helped numerous professionals, dropouts (school & college), housewives, etc to accomplish their unfinished dreams.

Abstract

In 2014, the world crude steel production reached 1665 million tonnes (mt) and showed a growth of 1% over 2013. China remained the world's largest crude steel producer in 2014 (823 mt) followed by Japan (110.7 mt), the USA (88.2 mt) and India (86.5 mt) at the 4th position. WSA has projected Indian steel demand to grow by 6.2% in 2015 and by 7.3% in 2016 as compared to global steel use growth of 0.5% and 1.4% respectively (Ministry of Steel, Government of India 2016).

Established in 1907 as Asia's first integrated private sector steel company, Tata Steel Group is among the top-ten global steel companies with an annual crude steel capacity of over 29 million tonnes per annum. It is now the world's second-most geographically-diversified steel producer, with operations in 26 countries and a commercial presence in over 50 countries. The Tata Steel Group, with a turnover of Rs. 1, 48,614 crores in FY 14, has over 80,000 employees across five continents and is a Fortune 500 company (Tata Steel 2016).

All research used for this paper will be secondary information. Secondary information was taken from Tatasteel.com. The method of analysis is through ratios. The study concentrates on profitability ratios and concentrates on company's two-year growth.

Liquidity ratios affect profitability as they have a positive direct relationship. If liquidity is low, profitability will be affected negatively. If Liquidity is high, profitability will be affected positively. Tata Steel, one of the largest players in the Indian despite this, their economic activity had decreased in 2015 compared to 2014.

Introduction:-

Tata Steel Limited is an Indian multinational steel-making company headquartered in Mumbai, Maharashtra, India. A subsidiary of the Tata Group, it has a total number of 79,657 employees (2015) and incurs revenues of US\$ 20 billion or 135,278 Crore rupees. Tata Steel's larger production facilities comprise those in India, the UK, the Netherlands, Thailand, Singapore, China and Australia. Operating companies within the Group include Tata Steel Limited (India), Tata Steel Europe Limited (formerly Corus), Tata Steel Singapore and Tata Steel Thailand. Tata Steel's competitors consist of JSW steel, SAIL and Jindal industries, all major contributors in the steel industry.

Address:- Assistant Professor, Sydenham Institute of Management Studies, Research and Entrepreneurship Education, Mumbai, India.

The Tata Steel Group's vision is to be the world's steel industry benchmarks in "Value Creation" and "Corporate Citizenship" through the excellence of its people, its innovative approach and overall conduct. Underpinning this vision is a performance culture committed to aspiration targets, safety and social responsibility, continuous improvement, openness and transparency. In 2008, Tata Steel India became the first integrated steel plant in the world, outside Japan, to be awarded the Deming Application Prize 2008 for excellence in Total Quality Management. In 2012, Tata Steel became the first integrated steel company in the world, outside Japan, to win the Deming Grand Prize 2012 instituted by the Japanese Union of Scientists and Engineers (Tata Steel 2016).

Literature review

The ratio data has been taken from Moneycontrol.com, a reputed and sought after source of information related to finance and business in India. However, this paper is not being analytical about the steel industry in India and is only considering one big player (Tata Steel). Our study of the company is also limited as we only consider data from the most recent 3 years of the company's activities. All definitions of ratio's as well as their interpretation have been taken from the book Introduction to Managerial Accounting (Brewer, Garrison and Noreen 2016).

As said by Florenz Tugas, most financial statement analyses focus on firms belonging to industries that either contributes significantly to economic figures or post it in a highly competitive business environment. Whatever the motivation may be, financial statement analysis should be made available to all industries for reasons of comparability and benchmarking (Tugas 2012). In addition, empirical results of a financial statement can be used to adequately signal business failure in the context of normal economic circumstances (Tuvadaratragool 2013). According to Savchuk, liquidity is one of the most essential factors for assessing the company's position (Savchuk 2014).

Limitations of research:-

- The paper analyzes only one company from the steel industry.
- Restricted study from year 2014 to year 2015.
- Secondary information from online resources.

Research methodology:-

All research used for this paper will be secondary information. A trusted Indian online source, Moneycontrol.com (Money Control 2016), used by seasoned professionals as well as stock brokers is the source of the secondary research and information employed in this paper. Secondary information was also used from Tatasteel.com. The method of analysis is through ratios. The study concentrates on profitability ratios and concentrates on company's two-year growth (Kothari and Garg 2015).

Data Analysis & Findings:-

Liquidity Ratios:-

H₍₀₎: There is no significant difference in the liquidity ratios in year 2014 and 2015

H₍₁₎: There is significant difference in the liquidity ratios in year 2014 and 2015

Table (1):- Descriptive Statistics

Liquidity Ratios	Mar'15	Mar'14	Industry Standard
Current Ratio	0.52	0.62	2:1
Quick Ratio	0.32	0.27	1:1

Current Ratio:-

H₍₀₎ a: There is no significant difference in the liquidity ratios in year 2014 and 2015

H₍₁₎ a: There is significant difference in the liquidity ratios in year 2014 and 2015

In the table above, the industry standard is mentioned. However when we look at Tata Steel's ratios, we see that their current ratio is lower than the standard. A relatively low current ratio represents that the liquidity position of the firm is not good and the firm shall not be able to pay its current liabilities in time without facing difficulties.

As we can see, the current ratio should be 2, where as Tata's is 0.62 in March 2014 and decreases to 0.52 in March 2015. The decrease will affect Tata negatively. This could be due to many reasons, some being insufficient funds to pay off liabilities or the business trading beyond its capacity. In the case of Tata's current ratio, hypotheses H₍₁₎ a, proves to be applicable as there is significant difference in the liquidity ratios in year 2014 and 2015.

B) Quick Ratio

H₍₀₎ b: There is no significant difference in the liquidity ratios in year 2014 and 2015

H₍₁₎ b: There is significant difference in the liquidity ratios in year 2014 and 2015

On the other hand, Quick ratio should be 1. Tata's quick ratio is low at a 0.27 in March 2014 and 0.32 in March 2015, however there is an increase when year 2014 is compared to year 2015. This increase will have a positive affect on the overall function and business activity of Tata. This could be because Tata is meeting its short-term obligations in time because of its very efficient inventory management. In the case of Tata's quick ratio, hypotheses H₍₁₎ b proves to be applicable as there is significant difference in the liquidity ratios in year 2014 and 2015.

After looking at the balance sheets of Tata we can make some assumptions for why this effect might have occurred. Cash and bank Balances reduced from 961.16 crore rupees in 2014 to 478.59 crore rupees in 2015. Their cash flow has been affected and reduced; this might have an effect on the liquidity ratio as 'liquidity' of the company has reduced. A step toward improving the ratios could be that of increase liquidity or the inflow and outflow of cash. In the case of Tata's Liquidity ratios, hypotheses H₍₁₎ proves to be applicable as there is significant difference in the liquidity ratios in year 2014 and 2015.

Profitability Ratios:-

H₍₀₎ : There is no significant difference in the liquidity ratios in year 2014 and 2015

H₍₁₎ : There is significant difference in the liquidity ratios in year 2014 and 2015

Table (2):- Descriptive Statistics

Profitability Ratios	Mar'15	Mar'14
Operating Profit Margin (%)	18.87	23.95
Gross Profit Margin (%)	13.81	19.17
Net Profit Margin (%)	12.82	15.41
Return On Capital Employed (%)	9.03	9.25

Gross Profit Ratio:-

H₍₀₎ a: There is no significant difference in the liquidity ratios in year 2014 and 2015

H₍₁₎ a: There is significant difference in the liquidity ratios in year 2014 and 2015

Gross profit is very important for any business. It should be sufficient to cover all expenses and provide for profit. There is no norm or standard to interpret gross profit ratio. Generally, a higher ratio is considered better. To judge whether the ratio is satisfactory or not, it should be compared with its own past ratios.

A consistent improvement in gross profit ratio over the past years is the indication of continuous improvement. However as we see above, Tata's gross profit has fallen from 19.17% in 2014 to 13.81% in 2015. This could have occurred due to a decrease in overall sales volume caused by a decrease in units sold or decreased selling prices or due to an increase in purchasing costs that is not offset by an increase in selling prices. For Tata's gross profit, hypotheses H₍₁₎ b is applicable as there is a negative change.

Operating Ratio:-

H₍₀₎ b: There is no significant difference in the liquidity ratios in year 2014 and 2015

H₍₁₎ b: There is significant difference in the liquidity ratios in year 2014 and 2015

This ratio is used to measure the operational efficiency of the management. It shows whether the cost component in the sales figure is within normal range. A low operating ratio means high net profit ratio i.e., more operating profit. To judge whether the ratio is satisfactory or not, it should be compared with its own past ratios.

As shown above, Tata's operating ratio has fallen from 23.95% in 2014 to 18.87% in 2015. This reduction could be due to either a decrease in sales or an increase in expenses.

Net Profit Ratio:-

H₍₀₎ c: There is no significant difference in the Net Profit Ratio in year 2014 and 2015

H₍₁₎ c: There is significant difference in the Net Profit Ratio in year 2014 and 2015

For the purpose of this ratio, net profit is equal to gross profit minus operating expenses and income tax. All non-operating revenues and expenses are not taken into account because the purpose of this ratio is to evaluate the profitability of the business from its primary operations. To judge whether the ratio is satisfactory or not, it should be compared with its own past ratios.

As shown above, Tata's operating ratio has fallen from 23.95% in 2014 to 18.87% in 2015. This reduction could be due to either a decrease in sales or an increase in expenses.

Return on Capital Employed/ Return on Investment:-

H₍₀₎d: There is no significant difference in the Return on Capital Employed in year 2014 and 2015

H₍₁₎d: There is significant difference in the Return on Capital Employed in year 2014 and 2015

Return on capital employed ratio measures the efficiency with which the investment made by shareholders and creditors is used in the business. Managers use this ratio for various financial decisions. It is a ratio of overall profitability and a higher ratio is, therefore, better.

As shown above, Tata's Return On Capital Employed has fallen from 9.25% in 2014 to 9.03% in 2015. For this case, hypotheses H₍₀₎d is applicable as there is no significant difference in the Return On Capital Employed. This is a positive sign as their return on investment has not changed much. This keeps all stakeholders feeling secure and confident.

Conclusion:-

As shown in the analysis above, Tata Steel, one of the largest players in the Indian steel market has suffered some fallbacks. However, the company has made an effort to maintain their stance in the market and have been successful in doing so. Despite this, their economic activity had decreased in 2015 compared to 2014. This could be due to a few reasons, as mentioned above. Tata needs to take some steps in moving forward as their growth slows down and is hampered. Tata Steel exports 67% of their revenue and should work on the untapped domestic market by being more competitive. Though Tata Steel's revenues from the domestic market are 32%, this figure can be increased, leading to higher sales revenue and eventually higher profits. Tata also needs to concentrate on reducing their expenses and seen above and in their other financial statements, as expenses eat away at the company's profits quite largely.

loyalty

Abstract

The present study has great scope in the modern Educational system. We are living in a world which never considers values. Values can change the behavior and attitudes of every one. Value education is important for our students. And Bible always remains us about values. We can see the different teaching methods and techniques used by Jesus Christ and we can also understand that many of them have great relevance today. There are also guiding principles to teachers, parents and students. Bible strongly advocates the need for discipline and it is also helpful for our educational system.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

“The Bible is no Mere a book, but a living creature, with a power that conquers all that opposite it” “NAPOLEON BONAPARTE(1769-1821)

Bible is like a software, it enters in your life, scan your problems, edit your tension, download solutions, delete your worries and saves you.

A child gets his first education from his family (proverbs 17:6)” Children are the crown of old men and the glory of children in their father”. Little children are Humble, dependent, harmless, godly and deserve to be cherished by parents. Each family believes in certain religion. So there is an interconnection between education and religion believes imparted from the family. Each religion has its own norms and principle and these are conveying through religious books. The thoughts and ideas of bible great related to values.

Bible and values:-

Philippians 23:4, “don’t be Selfish; don’t live to make a good impression on others. Be humble, thinking of others as better than yourself. Don’t think only about your own affairs, but be interested in others too, and what they are doing .The implies the morality and good character that showed be promoted by a family and educational system on their children. Bible does not teach what method to use, but it does teach what character to build. One of the main aims of Bible is to inculcate virtues among individuals. If the teacher in any setting loves children and promotes Christ like conduct by example, the school conforms to the bible. This does not mean that the child will only learn to love the lord, but that he will also learn to diligent at work, competent in labour, kind in relationships, forgiving in conflict and gracious in judgement.

Corresponding Author:- Dr. J. E. Merlin sasikala.

Address:- Asst. Prof in Education, Alagappa University College of Education, Alagappaa University, Karaikudi.

Compassion:-

The definition of "Compassion" simply says that " it is the sympathetic consciousness of others distress along with a desire to alleviate it"

The parable of the good Samaritan (Luke 10: 25-37) is a best example for compassion. There are more than to specific references to compassion in the bible. Most old testament version refer to the lord's compassion toward his people and most new testament version refer to Jesus compassion in need.

"Lord will always have compassion on us" (2 kings 13:23, Psalm 103:13, Isaiah 54:8)

"Jesus felt compassion on those in need" (Matt 9:36, 14:14, Mark 6:34, 8:2, 15:20)

"Compassion fulfill the law of Christ" (Galatians 6:3)

Loyalty:-

The world loyalty means unswerving in allegiance as faithful to one's sovereign or government, faithful to a private person to whom fidelity in due faithful to a cause, ideal or custom. Bible has to say about loyalty and being loyal.

"Loyalty is unwavering in good times and bad" (Proverb 17:7)

"Loyalty is what you do, not what you say (Matt 26:33-35)

Loyalty is in your heart. It is willing and not Reluctant (Psalm 78:8)

Forgiveness:-

Bible says you should forgive seventy seven times. The benefits of forgiveness are

It is necessary for our own forgiveness:-

1. Jesus said. "But you are Praying, first forgives any one are holding a grudge against, so that your father in heaven will forgive your sins too" (Mark 11:25, 26)
2. Spiritual cleaning
3. James says that the elders of the church should pray over those who are and lord will make them well, adding "and *Anyone who has committed sins will be forgiven*" (James 5:15-16)

Integrity:-

Integrity means firm adherence to a code of moral values, ie, incorruptible, honor;

Bible says about integrity are "Integrity means treating people fairly and honest"(Deut 25:15, Proverbs 16:11-13)"Integrity is giving your word and keeping it.(Exodus 8:28-32)

"Lord hates lies and lack of integrity (Zachariah 8:16-17)

Moral values:-

Moral values refer to those values that are related to an individual's character and personality conforming to what is right and virtuous. They reveal a person's self control. Some of the moral values envisaged in bible are as follows.

Leadership value and Bible:-

Maintaining one's values can cost a leader dearly. So how do we decide what matters most when we are weighing the bottom line costs against our bottom line conviction. The first step in effective leadership is defining core values. Until that is done, the ship the leader is trying to steer has no rudder. Vision, mission, strategy and outcomes are difficult-if not impossible to define until values are clear. Jesus knew that. Early in the process of developing his team of disciples, he forced them to confront this foundational issue.

Jesus told his disciples that the core value, the driving value, the internal value is this "Does what I am doing please God" Every other value is second to that one. When that value is in place all other values line up. Matthew 6 is among the most definitive chapters in the bible for shaping a leader's philosophy of life and leadership. Jesus urged his disciples to focus their values on things that would bear an eternal return. But how, while making a living on earth, while responsibly leading an enterprise on earth, while providing jobs, product, service and profit on earth, do we build treasure in heaven.

Matthew records Jesus' primer on values in Matthew 6:1. Jesus focused his lesson in verses 19-21. Do not store up for yourselves treasures on earth, where moth and rust destroy, and where thieves break in and steal. But store up for

yourselves treasures in heaven, where moth and rust do not destroy, and where thieves do not break in and steal. For where your treasure is there your heart will be also.

Bibles quotes about family values:-

Psalms 127:35 "Children are a heritage from the lord the fruit of womb is a reward, like arrows in the land of a warrior, so are the children of one's youth. Happy is the man who has quiver full of them". **Proverbs 17:6** "Children are the crown of old man and the glory of children is their father"

Ephesians 6:14:-

'Children obey your parents in the lord, for there is the right, honor your father and mother, which is the first commandment with promise. That it may be well with you and you may live long on the earth. And you father's, do not provoke your children to wrath, but bring them up in the training and dominations of the lord', Titus 2:4 "they admonish the young women to love their husbands, to their children.

Bible And Discipline:-

Discipline is essential and important for the development of children. As a matter of fact, it is discipline which makes an individual a dynamic, co-operative, sympathetic and tolerant citizen include with social ideas of service and sacrifice at the cost of his own self-interest. Only this sense of discipline creates such conditions in a school which promotes desirable development of a child. In ancient times, too much importance was given to discipline that it was regarded as an end in itself instead of a means only.

For a well adjured life, development of human and moral qualities are essential, because this qualities make a child cultured and civilized for the purpose of leading one's life happily and also contributing to the welfare of society. To achieve this great aim, discipline is very essential. According to Nunn, "discipline is involved in the control of emotions and powers and it in through that we get the ability to work. The aim of discipline is the creation of virtues and development of personality".

Bible also gave importance to discipline. God uses discipline as a last resort. If all god needed to justify mankind to himself was a bigger cattle-prod, then Christ died for nothing. No, god's plan for the earth is love first, discipline last. To get us to listen and repent, he will use deep conviction, the rebuke of friends, coincident sermons, the quickening of scripture, and every other means before discipline us. But if we resist God's spirit of light and mercy. We are promised the rod of correction. When god disciplines, the punishment fits the crime.

Quotes from Bible about discipline:-

Prov. 3: 11-12 :- "May son, do not despise the Lord's discipline and do not resent his rebuke, because the Lord disciplines those he loves as a father the son he delights in".

Prov: 15: 5:-" A fool spurns his father's discipline but who ever heads correction shows prudence".

Job 5: 17-18:-"Blessed is the man whom God corrects so do not despise the discipline of almighty for he wounds, but he also binds up, he injured but his hands also heal"

1 Cor 11:32:-"But when God does judge us, the disciplines us as his own sons, that we may not be involved in the general condemnation of the world".

Prov: 20 : 30:-"Blows and wounds cleanse away evil and beatings purge the innermost being".

Rev: 3 : 19:-"Those whom I love I rebuke and discipline. So be earnest and repent".

Child discipline :-"He that loveth his son, frequently chastiseth him, that he may rejoice in his latter end, and not grope after the doors of his neighbours" (**Ecc 30:1**)

"A horse not broken becometh stubborn and a child left to himself will become head strong" (**Ecc. 30:8**)

"Give him not liberty in his fourth, and wink not at his devices bow down his neck while he is young, and beat his sides while he is a child, lest he grow stubborn, and regard thee not and so be a sorrow of heart to thee" (**Ecc. 30: 11-12**)

"He who spareth the rod hateth his son; but he that loveth him correcteth him betimes" (**Proverbs 13:24**)

"With hold not correction from a child: for is thou striketh him with a rod he shall not die. Thou shall beat him with a rod, and deliver his soul hell".(Prov. 23: 13-14)

1 Pet 4: 17-19:- "The time has evidently arrived for God's judgment to begin, and it is beginning at his own household. And if it starts with us, what is it going to mean for those who refuse to obey the gospel of God? If even the good man is only just saved, what will be the fate of the wicked and the sinner?... Therefore those who suffer according to god's will can safely commit their souls to their wonderful creator, and go on bound up in the heart of a child, but the rod of discipline will drive it far from him".

Prov. 22: 15:- "Foolishness is bound up in the heart of a child, but the rod of discipline will drive it far from him".

Proverbs 13:24 -- "He who spares the rod hates his son, but he who loves him disciplines him promptly."

Proverbs 19:18 - "Discipline your children while they are young enough to learn. If you don't you are helping them destroy themselves".

Proverbs 21:15 - "Children will naturally do silly, careless things, but a good spanking will teach them how to behave"

Proverbs 23:13 - "Don't hesitate to discipline children. A good spanking won't kill them. As a matter of fact it may save their lives"

Proverbs 23:22 - "Listen to your father. Without him you would not exist. When your mother is old, show her your appreciation"

Proverbs 29:15 - "Correction and discipline are good for children" "Foolishness is bound in the heart of a child; but the rod of correction shall drive it far from him" (**Proverbs 22:15**)

Withhold not correction from the child: for if thou beatest him with the rod, he shall not die. Thou shalt beat him with the rod, and shalt deliver his soul from hell (**Proverbs 23:13-14**).

"Correct thy son and he shall give thee rest; yea, he shall give delight unto thy soul "(**Proverbs 29:17**).

Physical discipline in Bible:-

The bible is replete with exhortations about discipline and examples of stiff disciplines allowed or brought by the Lord, in both Old and New Testaments. Some examples;

"Folly is bound up in the heart of a boy, but the rod of discipline drives it far away" (Prov. 22:12)

"Do not withhold discipline from your children, if you beat them with a rod, they will not die. If beat them with a rod, you will save their lives from sheol" (Prov. 23: 14-15)

"The rod and reproof give wisdom" (Prov. 29:15) Discipline your children and they will give you rest, they will give delight to your heart" (Prov. 29 : 17)

"On the lips of one who has understanding wisdom is found, but the rod is for the back of one who lacks sense" (Prov. 10: 27)

"Those who spare the rod hate their children, but those who love them are diligent to discipline them" (Prov. 13: 24).

"The Lord disciplines those whom he loves, and scourges every child whom he accepts" (Hebrews 12:6)

Discipline believes that good behaviour is a teachable skill, not unlike math or reading. Because of this, it makes use of the tools that a good teacher would use. Tools like: good relationship/ rapport building, teaching stories following through with logical consequences, real life examples, personal sharing, redirecting, practice, and giving information in respectful, repeated and varied ways. People who use discipline correctly, do not necessary differ in the number of limits they establish.

Conclusion:-

Values can change the behavior and attitude of every one. Value education is important for our children. And Bible always remains us about values. We can see the different teaching methods and techniques used by Jesus Christ and we can also understand that many of them have great relevance today. There are also some guiding principles to teachers, parents & students. Bible strongly advocates the need for discipline and it is also helpful for our educational system.

Diversity, Quality of Work Life.

Abstract

This study aimed at Identifying the impact of the case of functional diversity on the quality of work in the surveyed organization system, and the impact of diversity by gender, diversity by age, Diversity by specialization, and diversity, according to the functional level the stuff on the quality of work in surveyed organization. The study concluded that there is high impact for these variables on the quality of work. It recommends that the bank strategy should take in consideration the unity and balance of the organization, and carry out the requirements of its integration.

Introduction:-

All organizations, of all kinds, whether governmental organizations or business organizations or civil society organizations, in different sectors of work, if it is agricultural organizations, industrial or service ...it is working hard to be a unified and balanced organizations, so that it meets all components of each organization, and interact together to form a (system)to be integrated and balanced, so it looked like a human body that if one part was suffering all body will be suffering and felt the pain too . The human element is the base for this Organization unity, it is the only vital element in the organization, which gives it's a vitality and governs it's movement, in it the organization life cycle begins to take shape, and finishes when it's finish. Thus, it should develop an integrated strategy for the management of human resources, to effectively manage the organization to achieve balance and united desired. Multiple components that play in any integrated strategy, but the demand to manage the diversity of human resources and the understanding of its effects on the unity of the organization and the elements of its balance, is one of the key components of this strategy. It demands to build a system for the quality of working life and is a major part in it. And that this study will revolve around these two variables, with a focus on the impact of the case of functional diversity on the quality of working life in the Jordan Islamic Bank.

He problem of the study:-

Contemporary organizations concerned with the requirement to build an advanced system to improve the quality of life work, has also become interested in the phenomenon of functional diversity as one of the main variables that affect the lives of organizations, and that the problem of this study centered on the search this matter to answer the following question:

Corresponding Author:- Aysar khashman.

Address:- Department of Management, Faculty of Finance and Business Administration, the World Islamic Sciences & Education University, Jordan.

Is the case of functional diversity affect the quality of working life of the system in the Jordan Islamic Bank.

The importance of the study:-

The importance of the study from a scientific point that it's working on a research influential relationship between two variables and they are considered the most important variables that are keen various of the organizations on their management to manage it effectively, due to their uncertain role in preserving the unity, integrity and balance of organizations. They also have practical importance where the results of it will help the specialized departments, in particular, the human resources management in the surveyed organization to develop strategies in a more rational and effective.

Objectives of the study:-

The main objective in the study is the impact of the case of functional diversity on the quality of work in the surveyed organization system. The ramifications of the following sub-goals:

- Knowledge of the impact of diversity by gender on the quality of work in surveyed organization.
- Knowledge of the impact of diversity by age on the quality of work in the surveyed organization.
- Knowledge of the effect of diversity, according to specialization on the quality of work in surveyed organization.
- Knowledge the effect of diversity, according to the functional level the stuff on the quality of work in surveyed organization.

Study model: based on two variables:-

The independent variable: the diversity of human resources, and the ramifications of several sub-variants, have been some of the sub variables is appropriate exception to the case of the Islamic bank because there is no diversity of this kind, and that as a variable of race or nationality or values, emphasis was placed on four variables are: (diversity by gender, by age, according to the categories of staff (administrators and executives) and according to the functional level (senior management, central and lower). The dependent variable: the quality of working life of the system, and the ramifications sub-variables (working conditions, labor problems, and the system of security and public safety). Source: prepared by the researcher, based on (Sail & Alavi, 2010), (Sing, 2011), (Dessler, 2004) (Assaf, 2012).

Hypotheses:-

The main hypothesis (H01):-

No effect is statistically significant at a moral level ($P \leq 0.05$) for the cases of diversity in human resources in terms of its scopes (gender, age and categories of employees, career level), the quality of work life of the system in terms of its scopes (the conditions of the physical work and the problems of work and the system of security and safety) in the Jordan Islamic Bank.

Sub-hypotheses:-

- The first hypothesis (H01-1): No effect is statistically significant at a moral level ($P \leq 0.05$) for diversity by gender, the quality of work life of the system in terms of its scopes (physical working conditions and labor problems and the system of security and safety) in the Jordan Islamic Bank.
- The second hypothesis (H01-2): No effect is statistically significant at a moral level ($P \leq 0.05$) for diversity by age, the quality of work life of the system in terms of its scopes (physical working conditions and labor problems and the system of security and safety) in the Jordan Islamic Bank.
- The third hypothesis (H01-3): No effect is statistically significant at moral level ($P \leq 0.05$) diversity, according to specialization, the quality of work life of the system in terms of its scopes (physical working conditions and labor problems and the system of security and safety) in the Jordan Islamic Bank.
- hypothesis fourth (H01-4): No effect is statistically significant at a moral level ($P \leq 0.05$) diversity, according to the functional level, the quality of work life of the system in terms of its scopes (the conditions of the physical work and the problems of work and the system of security and safety) in the Jordan Islamic Bank.

Methodology of the study:-

- The study relies on two approaches descriptive and analytical, a case study of the Jordan Islamic Bank. The study includes managers of the bank's branches in Amman community, which is numbering 30 branches, and the study included a survey of all levels of society.
- Questionnaire was designed for the purposes of this study, it has been distributed to all members of the sample, and 24 forms were obtained from the numbers, which was 80%. Also Likert scale has been used; it was an appropriate statistical analysis to test the hypotheses of the study.

Literature:-

Managing the diversity in human Resources:-

All organizations, of whatever type, is working hard to be a unified and balanced organizations, to integrate all the components of each organization, and interact together to form both the (system) integrated and balanced. (Kehinde,2012) .The human element in any organization considered the single vital element which gives it vitality and governs its movement. As the human resources by nature is characterized by diversity and difference, its presence within any organization will ask an important question about the impact of this diversity or differences on the unity of the organization and the elements of balance, and the performance and effectiveness levels, and this is what forces the organizations to take the necessary degree of attention, and to include it within their strategies. (Noori,2013). Have multiple definitions offered by scholars of the concept of diversity despite the clarity of the concept which is inherently in it, it does not provoke any controversy around the researchers to try to clarify the truth, diversity is the variety and differences in the types of human resources, and its degree, according to each organization and what are the sources that they get their human resources, and we do not have to define the axioms. The distinct and more voluminous organizations and geographical spread, especially cross-border and multi-national organizations, the more diversity is more apparent, it has helped the phenomenon of globalization, and the phenomenon of complexity and entanglement in international economic and political relations, the proliferation of such organizations. (Richard,2008) (Nasyira,Othman,&Gazali,H ,2014).

Cases of the diversity of human Resources:-

First, the diversity of gender ; this has become a source of the most common causes of diversity in various organizations, without exception, even the military and security ones, as a result of the expansion of the entry of women into the work field, and markedly and growing, due mostly to: (Polk,2011,167),(Suhasini&, Naresh, 2013).

- The growth of public awareness of the heads of families in different communities, especially in Arab societies, as a result of the spread of education among them, the need to give girls opportunities in education, in response to the imperatives of social life on the one hand, and the evolution of consciousness and religious understanding, which focuses on the importance of girls' education.
- The general sense of the growth of the necessity of equality between men and women, especially in front of education and employment opportunities, has become the general legislation in most states which imposed it. International pressure operated global trend organizations which they have supported it.
- The pressure of economic life, and the weight of the economic burden on many families, prompting the woman to go and female heads of households and their daughters to enter the practical life to help men to provide the growing needs of the family members.

There is no doubt that the differences are organic and differences between males and females are differences (Congenital), are present at the origin of the creation of all of them and that it has direct effects and remark on their behavior in public life and working life, and that is necessary for each organization to put these differences into account, and what is most important can be referred to as: (Zikmund,2000,54),(Ichi, , &Arthur, 1984,68-74)

- distinguish between jobs that require physical efforts and capabilities, and guide the male workers to it because they are characterized as having high capabilities more than females in this area.
- recognize the high degree of emotional transparency among females than males, and by taking into account the situation of women and not to put her in a decision-making positions, which are constantly under pressure from the centers of power in the organization or community. If it is necessary to put women in certain positions of leadership, it is important to have a number of male advisers who are able to support in any situation like this.
- Note some of the characteristics that can be characterized by the female often, that they do things in details, and have ordinal and protocol capabilities, and so on, so you can take advantage of the functions or activities that they do.

Second, the diversity of culture; where is the culture in the organization is the most important factors that affect the unity and balance of the organization, if the organization has a clear and unified culture, and workers with different functional levels stick to it, and to be organized at their best, then it will be cohesion and balanced. But if there were cultural differences among workers, and is rooted in their consciousness, and visible in practice, this is one of the most dangerous things that can be faced by the organization, and inevitably leads to disagreements and conflicts that threaten the unity of the organization and perhaps its existence as well. (Chuai, 2008) .The concept of the culture is important, which needs to clarify and be determined, when we follow up on the most important definitions provided,

we can offer an integrated definition which defines culture as the outcome of three basic systems of interaction : (Assaf, 2012,265):

- System prevailing values
- System prevailing public knowledge
- The skills and expertise which include customs, traditions and tools, rituals and symbols and techniques and means. that prevail in the life of the community or organization system.

Cultural diversity challenge in most international organizations has become a reality case, where these organizations are spread and have hundreds of branches around the world, and attracts thousands upon thousands of workers from different cultures, and this is what is in fact the most important factors that should be on the public authorities of any such organization, be taken into account, and that the design is suitable to make a bigger deal of cultural integration, and the development of the spirit of citizenship functional strategies, and without it threatening the unity of the organization, and more likely failures. (Drucker, 1998,165-172).

Third, the diversity of nationalities; due to global openness among many regional organizations or cross-border, as well as the many local organizations in some countries that rely on imported labor from abroad, as in the case of the Gulf countries, and some other oil states like Libya and Algeria. As it happens for most major industrial countries, which amounted to the degree of expansion of their organizations to import manpower from abroad. The diversity of nationalities represents one of the main sources of cultural diversity in many cases; in addition to that it may represent a source of some of the conflicts that may arise as a result of the existence of political sensitivities, economic or ... between some of the countries to which it belongs. The organizations that are monitoring these cases and practices, and put suitable strategies to manage this diversity and overcome the disadvantages, and take advantage of it to greater vitality to its life and operations.

Fourth:- The diversity of races and colors; in turn its reflected in the cultural diversity on the one hand, it also represents one of the major factors of difference and disagreement, and perhaps conflict within organizations, especially if it has been associated with the multiplicity of nationalities, or social and political sensitivities. That the organizations be aware of the truth of this matter, and take him into consideration which put its strategies to build a united and balance.

Fifth:- The religious and sectarian diversity; and it is considered the most dangerous sources and the most important events in the cultural diversity, and it set on the flame of the rivalry between the workers and to the degree it may sometimes be devastating. It is true that organizations can paint a functional policy which abolish the status of religions and sects, but it is important to give it a constant attention, and concern for the lack of full openness to diverse sources of religiously and ideologically as much as possible, because in the case where the religious and sectarian rivalry, if happened it will become out of control, and difficult to be contained, and it threatens the life of organizations actually.

Sixth:- The diversity of ages; the wide gap between the ages of workers in any organization lead undoubtedly to the disparity in scores of experience, and functional and professional expertise, as reflected in the form of variations in the level of general wisdom, and in the degree of flexibility and personal capabilities to bring about mutual understanding and interaction between workers of all levels horizontally and vertically, may lead to a kind of generational conflict within organizations. The organizations that took this issue a keen interest and designed work strategies, any organization is undoubtedly in desperate need for the elderly and their experience and wisdom, as it is in definite need for new generations and their knowledge, skills and enthusiasm, and thus become a required to paint scenarios needed to bring about integration and knowledge among all workers which have different ages.

Seventh:- Functional diversity itself; any organization has had the category of administrative or white collar stuff, also has executives and normal class workers or blue collar workers, there is no doubt that there is a significant gap or legal and psychological between these two categories, and should not be ignored, and the development of appropriate formalities, and appropriate guidance, to reduce its size and to avoid effects. (Wilson, 2014,68-74). Also up in the functional diversity among the category of managerial and professional category within organizations, and it's important to the organizations authorities realize the truth of that and its importance, and put all the formalities needed to bring interactive and complementary relationships between these groups and guidance. Administrators should realize the importance of technicians for the life of the organization, and they're part of an integral part, and they are the most important elements of the organization's success in its operations and to achieve its objectives.

Technicians also must understand the role stature and importance of administrators who do all administrative arrangements that help technicians on their success, and that they (professionals). And do not aspire to administrative positions that if they have succeeded access to it, leading to disruption of artistic energies on the one hand, and they are not expected to succeed in their administrative roles because of the elements of personal and technical skills that they have differ from the administrative personal elements. (Worrel & Cary, 2012.76-77) .As well as functional diversity among the category of managers and the category of experts and advisers, and the possibility of escalation of the conflict between them sometimes, this is reflected on the organization negatively. The organization responsible authority required to put the necessary regulatory scenarios for the development of each category in the proper context, so as to convince the advisers and experts that the work of administrative differs in terms of success on their work, and therefore, on these experts and consultants to focus on the tasks required of them in all honesty (consultant is - intimate), and does not aspire to management positions that may fail miserably if it were transferred to them. Well it is necessary to convince managers that they need the expertise of experts and advisers who are without their advice, and knowledge and experience; they may not be able to make decisions effectively.

Finally, functional diversity and differences between the Central upper levels of management and administrative levels and lower levels, this diversity may result in many organizations to the outbreak of the manifestations of hatred and personal intrigues, and manifestations of espionage and absent ... etc. Especially if there was a large and spacious gaps between the levels of compensation that workers get in each level of them.

The power authority in the organization should take care of this matter, and to estimated the severity of it, and put administrative and financial formalities necessary to minimize the negative effects and containment.

8-2 the quality of work life:-

It is not considered modern in the quality of work life or new in the management thought, and administrative practice, as some researchers may think, but it is due in fact to the model liberal-west in the mid-thirties of the last century with the surfacing of human relations school , and the escalation of this attention with the rise of behaviorism school in the fifties of the last century, which grows until it reached the limits of its peak following the emergence of Total quality management School at the beginning of the eighties of the last century, until now.

The concept of quality of work life:-

Regardless of any definitions may be presented by some scholars here or there, it could be argued that this concept of sufficient clarity that does not require to make hardship in order to identify the vocabulary of it, and if it was necessary to enter into this subject, it should be recognized that determining this concept needs to consider the following: (Wilson, 2014.86-87).

- overview of all work life so that it is taking into account all the components of life, whether these components related to the internal environment of the organization, or affecting the external environment.
- focus on quality necessary to improve all environmental components related to the life of the organization requirements, as a prerequisite to improve human resources in the organization, and make it truly the real capital in it.

Thus, the quality of life can be defined as the work situation which reflects the improvement or development of all elements of the organization and the foundations of all environments to ensure the provision to adapt the necessary atmosphere for human resources and resettlement in the organization, and to enable them to be the true capital of it.

Core areas of working life:-

Varied and multiple attention should be paid out to improve the lives of work in different organizations elements of the environment, and the most important thing that should be taken care of and focused on:

Improve basic working conditions:-

The basis for the improvement of the various working conditions on the demand aims at adapting the material elements of work with the needs of workers and material and moral circumstances and not vice versa. Dealing with the working conditions and development is supposed not to rely on the fact that workers are characterized by flexibility and speed of adaptation. But we must make the other elements are flexible and compatible with the requirements and expectations of employees and not inconsistent with them, and the most important conditions that must be observed.

- a. light intensity; It has been proved experimentally that the increase of light does not lead to increased productivity, and that there is a critical lighting degree of increase then stop point, this with the need to take into account individual differences among workers, some of whom needs severity of high illumination to works effectively, and some of them needs the intensity of lighting to be moderate, and so on ..., but the normal situation is that there are a critical lighting one minimum and the other is high point, and that productivity negatively affected if the degree of intensity of illumination less than the minimum, and it is fixed if above the maximum, it has been adversely affected in some exceptional cases. (Assaf, 2012,265-272)
- b. Days and hours of work; (William Martar) conducting an experiment on the number of hours of work and its impact on productivity he found that the reduction of working hours has led to increased productivity and gave workers important opportunities for reflection and self-development and development of other work items. But reducing the number of weekly working days effect was present, but less degree of reduced working hours. (Assaf, 2012,267-274)
- c. periods of daily comfort; experiments on the effects of rest periods has shown the importance of human relation during work, and the necessity of having breaks during work, it reactivates workers, whether their work that they carry out heavy and stressful, or boring and stressful psychologically. The breaks should not be multiple which leads to cutting business continuity and preparations for its implementation, and long breaks leads to inaction and lack of enthusiasm to return to work. (Morshal, 2012,56-65)
- d. Ventilation, temperature, humidity and cold conditions noise and dust ... etc. All the factors that affect the impact, stressing the sense of working comfort and satisfaction, and it is a must for any organization that is keen to ensure the safety of its facilities and arrangements to have all this, in an effort to provide a good working environment as a requirement on one hand, and the demand for motivating employees and raise their performance levels on the other hand.

Overcoming the problems:-

Studies suggest that problems of work have a prominent role in the increase of accidents at work, says one study, 95% of work-related accidents were caused by human error, and 5% were by machines, as was proven by the study that there is a relationship between the state of mental and physical of the worker and accidents before they happen. (Assaf, 2013), and the most important problems that can be referred to:

- a. The problem of fatigue or stress; an experience shows that the patterns of social and psychological characteristics that could lead to stress and fatigue as the physical fatigue, studies have indicated that the cases of physical exhaustion less common in modern organizations than the psychological exhaustion. Some scholars say that the solution to fatigue problems do not have to remove fatigue completely by rest periods or other procedures within the organization, but to take the necessary steps to keep the fatigue at minimum before it happens, and this requires accurate studies, and the creation of appropriate working conditions.
- b. the problem of boredom; some scholars believed that boredom is not as a result of physical causes, but rather is the result of psychological reasons, and occur as a result of fragmentation detailed work, which makes the worker feels futility and irrelevance, and leads him to boredom and then the physical and psychological stress.
- c. To address the cases of boredom can change the work type of the employee from time to time, and develop a sense of the importance to the workers who do simple jobs and repetitive it is their roles that they do that make the organization to continue and elevate (Great job), as well as the development of the case of job stability, and granting appropriate wages, and to provide appropriate break periods, etc.
- d. The problem of absenteeism and turnover work; highlights the absences as a problem when repeated markedly, and when top managers have doubts that absences did not have compelling excuse, but rather the negative feeling towards the business or organization.
- e. One study has shown that rates of 25-33% of absences due to neurotic diseases may be already exist among workers, and appeared while working out in unsuitable conditions, or as a result of the organization's policies concerning them. (Assaf, 2012,266-274)
- f. The problem of incompatibility or functional adaptation; adaptation intended to find a balanced and acceptable relationship between workers and their work environment with all its components. The consensus is that each of the organization and employee convergence between each other to achieve a balance between their needs and objectives. It was the technological developments and its accelerated entry into the life of organizations, especially the computer revolution and related technical developments and administrative, which has a big impact and made a wide gap in the relations between workers and organizations, and vice versa, thereby exacerbating adjustment and functional compatibility issues needed and it is the most important thing to be

recommended to provide an adequate amount of the balance of working and supporting the case of functional adaptation: (Parakash, 2015), (Wilson, 2014,112-116)

- The development of the organization's preparations for compatibility with the interests of workers and their goals, and to highlight that in the rules and regulations prescribed by the management of their employees, and to develop policies and practices that actually confirms it.
- Promote the spirit of social and collective solidarity with the workers through cultural and educational programs, and through some of the practices that are programmed for this purpose.
- The design of technical programs for the use of computer systems and related support systems, skills, and educational and behavioral programs to promote new systems of relations between the workers themselves, and between them and the organization, in line with the imposed technological developments of relations.
- Pursue advanced career and objective methods for selecting and directing careers, for the person who is chosen to work to be psychologically and professionally appropriate to the requirements of the work that he will exercise when his appointed.
- Take into account individual differences among workers, and try to deal with all of them in accordance with the nature of his personality, and the system needs.

Security management and occupational safety:-

There is no disagreement about the concept of occupational safety and security, and it is known as expressing some most important areas which are looking at the ways to protect workers in the organizations in which they work for, from the effects resulting from all existing environment elements of each organization of risk factors mechanisms, and lead to health effects, directly or indirectly on the safety of workers and their health. This is in addition to the protection of the property of the various organizations, facilities, reputation and position in the market and society. (George & Weimerskirch, 1998). It was the industrial revolution which caused the emergence of this issue to take its place and its importance, especially in the industrial organizations, which have many risks in the workplace, mechanical, electrical, chemical and physical, etc., which cannot be ignored by any organization or neglected, and it must manage it to ensure the provision of safe and healthy working environment. It is sufficient demonstration of the importance of this subject to the annual Statistics of the International Labor Organization (ILO) show that there are about 115 million workers in the world are exposed annually to accidents and injuries, of which about a variety of work (180000) injury leading to death. (AlAkailah, 2011,17-24). It was the first established law by the nations to protect the employees from the dangers of the environment of work is in Britain in (1802). The interest increased with the founding of the International Labor Organization at the end of the First World War, which became to take care of this matter. Then the formation of the Arab Labor Organization as one of the Arab League specialized organizations, issued Convention No. (7) of the occupational safety and health, and put obligations on the Arab countries in order to achieve protection for workers from exposure to any injuries of work or occupational diseases, as stipulated by the Convention No. 13; the need to improve the working conditions of physical, chemical and biological, technical and social (AlAkailah, 2011,16-29). Security management and safety functions: The main objective of this department is the protection of persons, individuals or groups, of any risks, which revolves around the functions of the department concerned, in addition to: (Sheraz, Salid, Quresh, & Rizwan, 2014)

- Protection of buildings, facilities and equipment and various equipment from the risk of damage or theft or other threats and risks.
- Conservation and protection of raw materials during storage or use during the production process, as well as the conservation and protection of materials when processed and stored to avoid any potential risks.
- Measuring the effects of all chemical and biological, electrical and lay the foundations for preventive basics, and build a foundation for complete information about all the environment of the organization, and to benefit from all of this in a safe and disciplined work environment, according to the required standards of prevention.
- take care on the highest levels of mental health and physical and social, this requires the activation of legislation, regulations and procedures and technical and administrative arrangements in forced by the organization. And design training programs that build the skills of workers in the organization.

Organization environment risks: each organization is keen to be environment-friendly and all occupational safety and health conditions are secure, in order to avoid the most important risks: (Kakkos, 2011) (AlAkaileh, 2011,26-54)

First, the physical hazards, including noise, humidity, ventilation, heat, cold, luminescent radiation and atmospheric pressure, and others.

Second: chemical hazards, including the risk of toxic effects, and the effects of irritants or allergic or that which lead to distortions on birth or mind or otherwise.

Third: mechanical risks that come as a result of the wrong operation of machinery and equipment and various tools. Or as a result of error in carrying the loads and the method of downloading and others.

Fourth: the risks of construction, which relates to the fall of the materials or falling from scaffolding or cranes, or as a result of falling into the excavation or the result of some fires .. and so on.

Fifth: human risks, that stems from the weakness in some senses like smell or sight, or produced as a result of the psychological conditions of workers and their feelings of stress physical or moral, or the result of carelessness or negligence, and so on.

Sixth: the risks of mismatch between the employee and the work for any reason, which leads to the situations of stress and increase job errors and risks.

Seventh: biological risks: which result from the spread of harmful viruses and infectious bacteria, parasites and fungi.

Eighth: electrical hazards: caused by any errors in the use of machinery, equipment, fixtures, that uses electrical power.

The responsibility to improve security and safety conditions: the human resources management, in particular units responsible for the subject of security management and occupational safety, required to manage a system for the basic relations between all parties of the production processes in the organization in order to accomplish a number of important responsibilities, namely: (Ibrahim, 2014) (Kakkos, 2011)

1. The responsibility of the organization to develop an integrated and clear system of security and safety.
2. The responsibility of continuous coordination with the higher authorities in the organization, so as to develop the rules and regulations and issue decisions and instructions appropriate and necessary for their implementation.
3. Responsibility for coordination with suppliers, in order to determine where the source of the danger in all this, and what are the possibilities of the risks, and the preparation of evidence to show these things, and the definition of hazardous substances and their characteristics, the design of catalogs showing ways to use and contribute to the training of personnel on the use and operation. And determine what contingency plans in the event of a particular incident
4. Responsibility for coordination with the workers, so as to identify training needs of all equipment, tools and techniques used, and identify training plans aimed to explain to the workers the operating and maintenance details, and the development of operational skills, and familiarize them with the tools of prevention, systems and procedures. It is responsible for coordination with the various trade unions in order to approve the necessary protection systems for workers with all the details of that technical and procedural.
5. The responsibility of continuous coordination with the administrators of safety and security so as to ensure they are doing their duties in the best way possible, and to develop plans from their knowledge and skills.

Security and safety of workers system: There is no doubt that the protection of employees and providing good conditions for their security and safety, is one of the most important arrangements of any organization, and makes them at the head of the organizational and administrative priorities, and that their the absolute goal is to be zero accidents, because if any breaches of the cases of security or integrity happened, the results could be disastrous, notably: (Sing, 2011) (Parakash, 2015).

1. The humanitarian consequences that come as a result of injury to any of the workers with some work-related injuries that may cause him bodily harm leading to death or partial disability or permanent, which will reflect the occurrence of psychological and social effects on him or his family and relatives.
2. Social consequences for the society as a whole from some incidents of disabling some of the forces operating in it, and what consequences on their families from its effects.
3. The economic consequences of the organization as a result of any incidents that may be damaging to its assets or property or workers or the general population and the environment surrounding it.

4. Legal consequences that may result if the argument broke out between the organization and employees affected or their families about their compensation for damages for their losses as a result of exposure to accidents at work, which is reflected on the reputation of the organization and its place in society.

That the organization must design an integrated system of security and safety which is one of the most important prerequisites that must be provided, and that the human resources management in the organization must working to verify the construction of this system, and discuss the elements and the specificity with the makers of the design mode. Security and safety system may differ from one organization to another depending on the nature of the work of each organization, its size, and its technologies. There is no doubt that the greater the technical nature of the Organization, and the Organization of substantial size, advanced technology, the degree of risk in it is high, security and safety system would grow more complex and important. Add to it that whenever there was high competition between the organization and some other organizations, the more job security considerations are needed, especially those related to information security and the protection of confidentiality. Ranging safety and security system components, according to the degree of complexity, and the areas it covers, and the most important thing we must focus on:

(A): The system vocabulary and the fields, the system should cover all aspects that could be breached more or less on the state of security and safety within the organization or outside, in particular the state of safety and security for their workers, or the people in the surrounding community, and the most important thing should be covered by the system namely: (AlAkaileh, 2011,55-155) (Siddique, Fatima & Khan, 2013)

- A comprehensive statement identifies all sources of risk, ranging from the highest sources of risk down to the least dangerous.
- Build expectations of environmental risk sources, both with regard to the occurrence of earthquakes or floods, or other things that can happen and has an impact on the organization and its staff.
- Determine the degree of risk entailed in each of these sources, and determine the risk involved in this, and affected stuff.
- Identify the times that have higher degree of risk than others, and the system should identify a comprehensive disclosure list of all sources of danger and times of occurrence of each risk, and the degree of risk, according to each case, all the time.
- Identify areas of risk within the organization, and draw a clear and comprehensive map showing all that, with the identification of risks for each place, and what is the degree of the risk.
- Identify sources of external threats that are related to the organization, and determine the degree of seriousness of each of them, particularly as regards to opposition organizations, or the culture of the surrounding community and the likelihood of burglary, robbery or revenge and sabotage ... etc.

The system processes and procedures, which are carried out by the risk management within the organization and outside, and consists of two-fields: (Moshal, 2011,65-78) (ILO, 2014).

- The first part: a precaution; includes all policies and regulations, tools and procedures that must be adhered to by the employees in the organization at all levels, and the most important as follows:
- Build a comprehensive system of security and safety records include all incidents involving the organization, and what are the effects and results, to represent documentary reference which can be referred to it when necessary.
- The design of criteria that include everything related to the general structure of the organization; electrical and mechanical systems, sewage networks, computer networks and systems. It also includes all the work of the organization and operations of every detail necessary to ensure the security and integrity of the organization and its staff and procedures.
- The provision of supplies for the security and safety system, taking into account that they are consistent with the safety and security specific standards, with the need for continuous update.
- Identify all the actions that are working out in case of any emergency, and circulated to all relevant personnel, and train them to do so in an orderly and accurate way, according to specified criteria.
- Build a system for monitoring and inspection, which guarantees and ensures verification of compliance with all policies, standards and requirements and the specific arrangements and procedures.
- Review of the items of the system as necessary to keep pace with the various developments.

The second part: Therapeutic; in the event of danger for any reason, the security and safety system should include a comprehensive design and actions that must be taken to counter the threat and treatment and reduce its effects, and the most important thing must be contained in the system:

- build your own risk occurrence of expectations, and its causes and degrees of damage that result from each of them, and a system of priorities for dealing with it.
- Identify the arrangements and requirements and procedures that must be applied in every case of danger, and make sure that it is ready constantly.
- Monitor a special budget (risk budget), so the organization will not find itself unable to finance any danger that it may be exposed to.
- Conduct audits of vocabulary of the system and arrangements from time to time and again, and develop what needs to be developed, and add or delete what needs to be added or deleted.

The priorities of safety and security system; it includes priorities of following models; (Parakash, 2015).

First priority: The imminent risk, which confirms the high expectations on the probability of occurrence soon, if happened it will cause great harm to the organization or employees. And you must determine what these risks, and classifying them according to the degree of impact and the expected times of occurrence.

Second priority: large risks related to disasters and accidents that result in high-risk and negative results, determine what these risks are and classify them according to the degree of impact and the expected times of occurrence.

Third priority: the risks of non-compliance with the security standards and safety, or inputs, systems, regulations and technical and administrative specified procedures.

Fourth Priority: small risks relating to certain natural faults that are bound to occur in some of the equipment and techniques or electricity networks and various utilities.

Fourth Priority: The requirements for the system to succeed: it must provide a set of requirements that lead to the success of the system, at the corporate level or the staff level, or the surrounding environment and the surrounding community level. The most important of these requirements (Worral & Cary, 2012,67-69):

- That includes a comprehensive list of the most important reasons that could lead to an accidents or certain risk of the system, and work to develop solutions.
- All levels of the organization's management should be committed to the system and conditions.
- The training of all employees on the implementation of the system and all its standards, arrangements and procedures, and work to make the process of how to arrange of the applications in the event of any accident.
- Identify and provide all the necessary requirements in the event of any accident, and to ensure availability and made available upon request at the time, and work to check it regularly.
- To provide job security and safety nets, health insurance or social security, or the policies of job stability, and make sure they take into account the working conditions, according to each organization, and take into account the workers professional and living standards.
- Design a code of honor to work, focusing on forbidding the abuse of drugs and alcohol and similar substances, and not to violate ethical norms accepted.
- Comply with the regulations imposed by the trade unions technical and administrative.

The results of the study:-

First, it was a multiple linear correlation tests to ensure suitability of the study model, and the results were as follows:

Table 1:- multiple linear correlation test.

Sequence	variation	VIF inflation rate variables
1	diversity by gender	2.767
2	diversity by age	3.336
3	diversity, according to functional category (administrators and executives)	2.155
4	diversity, according to the functional level (senior management, middle management and lower)	1.988

As noted, the results of each variation inflation is higher than one and less than ten, underscoring according to (Gujarati, 2004,352) there is no problem between the variables of the study.

Second:- A test of autocorrelation was conducted (Deran- Watson test) to ensure the absence of data from the autocorrelation problem, and the results were as follows:

Table 2:- autocorrelation test

Hypothesis	value (D-W) d calculated	(dL) minimum	upper limits (du)	result
Ho1-1	1.803	1.758	1.779	No self link
Ho1-2	1.812	1.758	1.779	No self link
Ho1-3	1.852	1.758	1.779	No self link
Ho1-4	1.905	1.758	1.779	No self link
Ho1	1.889	1.728	1.809	No self link

As can be seen, all the values of (d) outside the limits specified in the standard values (dL), In (du), which confirms the absence of evidence of autocorrelation and validity problem in the use of the regression model.

Third:- hypotheses test; was conducted by analyzing the simple linear regression and gradual, and the results were as follows:

(1) test the first sub-hypothesis (H01-1), and the result was as follows in Table (3)

Table 3:- impact test results by age diversity on the quality of working life

Coefficient					ANOVA			Model Summery		The dependant variable
Sig t level of significance	T calculate d	standar d error	B	statement	Sig F	Df degree of freedom	F calculate d	r ²	R correlation coefficient	
0.000	14.763	0.038	0.567	polarization	0.000	1	217.945	0.479	0.692	quality of work life

As can be seen, the value of the correlation coefficient (r) between the diversity variable by gender and variable quality of work life is positive, high-value, according to the standard (Zikmund, 2000, 513) as can be seen that, the coefficient of determination (r²) has interpreted the role of the state of diversity by gender in the level of variation (47.9%), with all other variables remain constant. Also, the value of (F) has confirmed a significant gradient at the level of less than 5%, at a confidence level (Sig = 0.000), as well as the rest of the results confirm a significant coefficient at least 5%, and this leads to the rejection of the hypothesis Sub-first, and to accept the hypothesis (that there is a statistically significant effect in the abstract level of equal to or less than 5% of the state of diversity by gender on the quality of working life of the system in the Jordan Islamic Bank).

(2) The second sub-test the hypothesis (H01-2), and the result was as follows in Table (4)

Table 4:- impact test case diversity results by age on the quality of working life of the system.

Coefficient					ANOVA			Model Summery		The dependant variable
Sig t level of significance	T calculate d	standar d error	B	statement	Sig F	Df degree of freedom	F calculate d	r ²	r correlation coefficient	
0.000	16.496	0.036	0.595	resettlement	0.000	1	272.123	0.534	0.731	Quality of work life of the system

As can be seen, the value of the correlation coefficient (r) between the state of diversity variable by age and variable quality of work life is (73.1%), a positive, high-value, according to the standard (Zikmund, 2000, 513) as can be seen that the coefficient of determination (r^2) has interpreted the role of the state of diversity by age in the quality of work life standard amount of variation of 53.4%, with all other variables remain constant. Also, the value of (F) has confirmed a significant gradient at the level of less than 5%, at a confidence level (Sig = 0.000), as well as the rest of the results a significant coefficient at least 5%, and this leads to the rejection of the hypothesis sub-second, and to accept the hypothesis (that there is a statistically significant effect in the abstract level of equal to or less than 5% of the state of diversity, according to a variable-age on the quality of working life of the system in the Jordan Islamic Bank).

(3) Test the hypothesis Sub-third (H01-3), and the result was as follows in Table (5)..

Table 5:- the impact of the test case of diversity, according to the results of the functional groups on the quality of working life of the system:

Coefficient					ANOVA			Model Summery		The dependant variable
Sig t level of significance	T calculate d	standar d error	B	statement	Sig F	Df degree of freedom	F calculate d	r^2	r correlation coefficient	
0.000	15.604	0.035	0.547	Investment	0.000	1	243.485	0.507	0.712	Quality of work life system

As can be seen, the value of the correlation coefficient (r) between the state of diversity variable depending on the functional groups on the quality of work life is a system (72.1%), which is a positive, high-value, according to the standard (Zikmund, 2000,513) as can be seen that the coefficient of determination (r^2) may be interpreted the role of the state of diversity, according to categories of staff in the quality of working life system, standard amount of variation (50.7%), with all other variables remain constant. Also, the value of (F) has confirmed a significant gradient at the level of less than 5%, at a confidence level (Sig = 0.000), as well as the rest of the results confirm a significant coefficient at least 5%, and this leads to the rejection of the hypothesis Sub-third, and to accept the hypothesis (that there is a statistically significant effect in the abstract level of equal to or less than 5% of the state of diversity, according to the functional groups on the quality of working life of the system in the Jordan Islamic Bank).

(4) Test the hypothesis Sub-fourth (H01-4), and the result was as follows in Table (6).

Table 6:- the impact of the test case of diversity, according to the results of the functional level on the quality of working life of the system.

Coefficient					ANOVA			Model Summery		The dependant variable
Sig t level of significance	T calculate d	standar d error	B	statement	Sig F	Df degree of freedom	F calculated	r^2	r correlation coefficient	
0.000	17.032	0.037	0.639	preservation	0.000	1	290.087	0.550	0.742	Quality of work life system

As can be seen, the value of the correlation coefficient (r) between the state of diversity variable depending on the functional level and the variable quality of work life in a system (74.2%), which is a positive, high-value, according to the standard (Zikmund, 2000,513) as can be seen that the coefficient of determination (r^2) may be interpreted the

role of functional diversity, according to the functional level in the quality of work life of the level of \$ 55.0% variation, with all other variables remain constant. Also, the value of (F) has confirmed a significant gradient at the level of less than 5%, at a confidence level (Sig = 0.000), as well as the rest of the results confirm a significant coefficient at least 5%, and this leads to the rejection of the hypothesis Sub-fourth, and to accept the hypothesis to become (that there is a statistically significant effect in the abstract level of equal to or less than 5% of diversity, according to the functional level on the quality of working life of the system in the Jordan Islamic Bank).

(5) test the hypothesis President, and to identify any of the sub-variables most impact in the quality of life of work system, and has been so for a multi-tiered regression testing, the following table illustrates this:

Table 7:- a summary of the model to test the main hypothesis.

Model summary form				Model
coefficient of determination	standard error	The coefficient of determination	R correlation coefficient	
0.504		0.550	0.742	1
0.435		0.667	0.817	2
0.416		0.697	0.835	3
0.409		0.707	0.841	4

Table 8:- analysis of variance to test the main hypothesis.

Sig F level of significance	F calculated	D f degree of freedom	sum of squares	model	
0.000	290.087	1	73.682	Regression	1
		237	60.198	Residual	
		238	133.880	Total	
0.000	236.138	2	89.270	Regression	2
		236	44.609	Residual	
		238	133.880	Total	
0.000	179.769	3	93.247	Regression	3
		235	40.632	Residual	
		238	133.880	Total	
0.000	141.181	4	94.657	Regression	4
		234	39.222	Residual	
		238	133.880	Total	

Note that the data in Table 7 shows that the first model for gradual regression analysis shows that diversity variable is depending on the functional level and may be interpreted accounted for 55% of the total variation in the quality of work life, and become ratio 66.7 when you add diversity variable by age to diversity variable depending on the functional level, the ratio becomes 69.7 when you add diversity to a business class, for up to 70.7 by adding diversity by gender. While noting that the value of the levels (F) in all the different models within the abstract level (Sig = 0.000) as shown in Table (9) as follows:

Table 9:- the results of regression coefficient is a summary to test the main hypothesis

Sig significance level	t calculated value	Std.Error	B	quality work life	Model
0.000	17.032	0.037	0.639	diversity, according to the functional	First
0.000	9.680	0.042	0.402	diversity, according to the functional	Second
0.000	9.081	0.039	0.357	Diversity by age	
0.000	7.795	0.042	0.331	diversity, according to the	Third

				functional	Fourth
0.000	6.013	0.043	0.258	Diversity by age	
0.000	4.796	0.041	0.194	Diversity, according to the functional level	
0.000	7.020	0.043	0.302	diversity, according to the functional	
0.002	3.167	0.053	0.167	Diversity by age	
0.000	4.851	0.040	0.194	Diversity, according to the functional level	
0.004	2.900	0.048	0.140	Diversity by gender	

By observing these results, we find that the values of (B) in the two models at levels (t) is different at the significance level (Sig = 0.004) or less, and this confirms a significant regression co-efficients, which confirms that the impact of these variables in the models statistically significant. Accordingly, we reject the premise of it and accept the alternative hypothesis that (There is no impact statistically significant at a moral level $P \leq 0.05$ cases diversity of different dimensions (gender, age and job category, career level) on the quality of working life of the system in terms of its various dimensions (working conditions and labor problems and the system of Security and safety) in the Jordan Islamic Bank.

Abstract

The aim of this study is to investigate the effect of human resources information systems on the effectiveness of organizational change management, applied study on Jordanian insurance companies. The study concluded with the following results: there is a correlation relationship between the training on system and the effectiveness of organizational change management, the training on system explained 19.9% of the variation in the effectiveness of organizational change management, the availability of technical support explained 37.8% of the variation in the effectiveness of organizational change, the availability of technical support explained 55.1% of the variation in the effectiveness of organizational change, the availability of technical support explained 57.8% of the variation in the effectiveness of organizational change. The multiple regression results showed that training on the system has no significant effect on the effectiveness of organizational change, while there was a significant effect of (availability of technical support, senior management support, availability of infrastructure) on the effectiveness of organizational change. The study recommended with the following: develop the capacity of workers and trained them on human resources information systems requirements, put a fair system of incentives to encourage innovation and creativity process, develop infrastructure and technological development, and there is a need to be updated with the developments existing in the world, update software and deal with the reliable one, benefit from the experiences of other insurance companies regarding human resources information systems, management of change resistance and use scientific means.

Introduction:-

Organizational success and management of the knowledge economy is heavily dependent today on the performance of Human Resources Management (HRM) (Lippert and Swiercz, 2005; Troshani et al, 2011). The human resources management (HRM) recently changed to focus on the exchange of knowledge and strategic analysis of the workforce, and its contribution significantly developed widely in the strategic management of the organization and adaptation with the surrounding forces of change that have high impact on the management of its resources and

Address:- Department of Management, Faculty of Finance and Business Administration, the World Islamic Sciences & Education University, Jordan.

maximize the return of them (Rodriguez and Ventura, 2003; Troshani et al., 2011). Therefore, the organizations with various forms seek today to take advantage of all what possesses of resources, potential and abilities to face the developments and challenges that determine their relationship with its customers and affect its position in the market, so there is a new direction to increase the effectiveness of the management of human resources by relying on human resources information systems (Ball, 2001; Lippert and Swiercz, 2005; Troshani, et al., 2011). To do so, the Jordanian insurance companies must use human resources information systems in order to adapt with the surrounding forces of change, and to achieve and build competitive advantage, and this can provide quick access to the customer and meet his/her expectations.

Problem Statement:-

The change management in Jordanian Insurance companies is one of the most important research areas, as it is a tool that affects the reasons for its survival and development of its ability to adapt with the surrounding environmental forces that have effective impact on their ability in leading markets. The human resources information systems interest is one of the strategies that must be taken into account in this aspect, the researcher thinks that there is a lack of awareness in the role of human resources information systems in the organizational change management in the Jordanian insurance companies, so they must develop their human resources systems in line with the size of change that occurred in their environment.

Study Objectives:-

- Know the reality of human resources information systems in the Jordanian insurance companies.
- Know the reality of change management in the Jordanian insurance companies.
- Know the areas of use of human resources information systems in the Jordanian insurance companies.
- Know the effect of use of human resources information systems on the effectiveness of change management in the Jordanian insurance companies.

Study Importance:-

The importance of the study stems out from the importance of human resources information systems and their role in the development of the capacity of workers and raise their readiness for the best use of the resources, and this requires good change management and adapting with that change to achieve the goals and raise the organization ability to deal with the forces of change in the internal and external environment, and this assures that organizations must respond to rational demanding which is based on the principle of rational view to achieve the desired benefits while achieving stakeholder satisfaction. Also, the applied importance of this study stems out of the importance of the researched sector, the Jordanian Insurance companies, which employs a large number of staff and they are reliable sector to make partnership with government agencies in the development and employment and in running the economic resources sectors. The activation of the use of human resources information systems in the Jordanian insurance companies will raise their efficiency, so that the right choice for workers will raise their abilities and their knowledge and develop attitudes, and provide data and knowledge by the required ways.

Hypotheses:-

first hypothesis: There is no statistically significant effect of human resources information systems represented by (training on system, availability of technical support, senior management support, availability of infrastructure) on the effectiveness of change management (technological change, cultural change, change in the organizational structure) in Jordanian insurance companies.

The first hypothesis is divided into the following sub-hypotheses:

- First sub hypothesis: There is no statistically significant effect of (the training on system) on the effectiveness of organizational change in the Jordanian insurance companies.
- Second sub hypothesis: There is no statistically significant effect of viability of technical support on the effectiveness of organizational change in the Jordanian insurance companies.
- Third sub hypothesis: there is no statistically significant effect of senior management support on the effectiveness of organizational change in the Jordanian insurance companies.
- Fourth sub hypothesis: There is no statistically significant effect of the availability of infrastructure on the effectiveness of organizational change in the Jordanian insurance companies.

Study Model Variables

Sub-variables for human resources information systems have been identified by study of (Abu Obeilh ,2010) (Alkdah and Alkarasni, 2008), the variables of the effectiveness of change management were determined by study of (Anzi 2013).

Previous Literature:-**Human resources information systems:-**

The use of technology in the field of human resources has significantly and continuously expanded and therefore the human resources management activities changed at the senior, middle or lower management level (Mathis and Jackson, 2010).human resources information systems have evolved since 1960 (Lederer, 1984), the surveys carried out by the study of (Ball , 2001) indicated that 60% of Fortune Companies used human resources information system to support their daily operations of human resources management (Kovach et al., 2002).With the beginning of the nineties of the past century, human resource management practices have become more complex and there is great pressure to achieve corporate objectives related to improving general performance, and therefore human resources information systems (HRIS) have evolved to use expert information, which includes analytical tools to support the decision-making process in managing human capital (Ostermann, Staudinger & Staudinger, 2009).The human resource planning process makes the process of follow-up easier regarding gaps in the labor force, either quantitative or qualitative or planning to determine the needs of the labor force in the future and all that with the help of knowledge systems used by human resources (Dessler, 2005).The human resources information systems accelerate the formulation and implementation of effective human resources management activities, which include personnel management , payroll administration, and monitoring daily work attendance , skills development, medical history, performance appraisal, training and development, human resources planning, recruitment and career planning, negotiations and so on (Singh et al., 2011).Human resources information system defined as these systems which are based on the technology used for the acquisition, storage, processing, analysis, retrieval and distribution of relevant information on the human resources of the organization (Tannenbaum, 1990). Also it is defined as the integrated system used to collect, store and analyze information related to human resources in the organization by using the necessary data and computer applications and the hardware and software (Hendrickson, 2003).The Human Resources Information System (HRIS) is one of the most important management information systems that contributes to the goals and strategies of the organization related to the management of human resources and increasing their capabilities (Kavangah et al, 2002). (Pyburn, 1983) indicated that (HRIS) is becoming increasingly important for the successful implementation of the company's strategy, whilst (Tanriverdi, 2006) indicated that ((HRIS) is a strategic organizational resource.The human resources information systems have an essential and effective role in achieving the organization's objectives, and therefore they must provide a number of basic requirements interconnected and integrated with each other, and those requirements are as follows : (Almagribi, 2009, p. 352).

Administrative requirements:-

All organizations seek access to its goal and achieve the desired goals of performance, so the organization management is primarily responsible for identifying those goals and the role to be played by human resources information systems, so the organizations has to train workers on the system and to provide all the requirements relating to infrastructure. The system design requires cooperation between different organization and human resources management departments, and provision of all requirements of the multiple resources, and vigorous follow up for all its elements and its components to ensure efficiency and effectiveness in its performance, and that system must consider to the need of beneficiaries regarding information and statements.

Technological requirements:-

The success of the human resources system in the implementation of the tasks entrusted to it depends on what is owned by the organization of devices and machinery and infrastructure within the limits of their capabilities, and the ability of employees to manage and operate those machines by what is available of expertise and technical skills. The data and information provided by the system are extremely important which, therefore, must be handled with absolute secrecy, and the organization management should design an integrated system that considers to maintenance and safety, as they must be characterized by interdependence and integration to utilize them more effectively.

Economic requirements:-

The human element is the most important requirements in the success of the human resources information system, as the optimum utilization of the personnel, and training them on the system skills will contribute in achieving the desired goals, and will reduce the costs, as the time factor will effect on the preparation and design that is based on clear and sound principles.

Social requirements:-

The fact that the human resources information system depends on the amount of joint cooperation between human resources management and beneficiaries of the system on one hand, and between workers in the organization and the various departments on the other hand, as this cooperation results will provide the necessary information, and to help them to extract data necessary, and to encourage positive behavior for employees and beneficiaries of the system which makes it easy to take advantage of its results and outputs.

The effectiveness of organizational change:-

The application of the regulatory change is necessary for organizations in order to compete in the constantly changing business environment. The rapid development of information and communication technology has made many organizations to seek creating ways and ideas for new and innovative solutions to improve existing products and strategy of its operations and its technological system and all this called organizational change, which requires acceptance of its workers in the framing positive behavior, which will inevitably lead to change in the organization (Tan and Nasurdin, 2010). Change management: is a means of planning, implementation and follow-up in the processes of change at the institutional and personal level, and includes a revolutionary change in the management of new projects and developmental changes in the organization structure (Frans, 2010). Change management defined as the effective management of change that practice by executive, managers and employees by using technology and organizational resources. (Korir, Mukotive, 2012).

The areas of change in organizations:-

It is the most influential external power in the organization than the internal power because of its broad scope and difficulty of predicting their dimensions, and also because of rapid changes in the environment in which the organizations work. It turned out that there is a significant increase in competition between companies, especially after the emergence of the current globalization and the accession of many countries to the World Trade Organization (WTO)

These global changes have impacted heavily on the methods and patterns of management in the organizations, and thus they made them to move from the static central and bureaucratic systems to a more flexible system which fit with the nature of the global economic transformations system, and there is a need to change as a strategic choice (Sawalhah, et al 2015). The legal environment has also played a big role, represented by state intervention in economic and social activity and legal environment that lies in the change of laws or amended legislation as these impose restrictions or create opportunities, such as changes in fiscal and monetary government policy (Sawalhah et al, 2015). The technological environment is the most important source for change, where the latest technical development in industrialized countries made parallel change in the labor force structures, and the organizational structures moved from the traditional pyramid shape to the knowledge organizations and not routine business organizations, and consequently there is a change in training curricula and change in performance standards. The most important technological change that drives to change is the advancement in transportation and communication, which overcomes the border that was between the countries, and the aspects of accelerated technological development in digital equipment and machinery. The information revolution appears through information and communication technology (Sawalhah et al, 2015). Organizations also witnessed a dramatic change in values, attitudes and behaviors of individuals, customers and suppliers, culture surrounding environment do not only

affects the behavior of employees and their way of dealing, but this culture is reflected in the existing structure and pattern of the prevailing management and communication systems and information, and people's ways in problem-solving and decision-making, also it effects on customers' trends particularly in demand ,product design ,marketing mix and methods of dealing with customer (Sawalhah, et al 2015).

Hypotheses Testing:-

first hypothesis: There is no statistically significant effect of human resources information systems represented by (training on system, availability of technical support , senior management support, availability of infrastructure) on the effectiveness of change management (technological change, cultural change, change in the organizational structure) in Jordanian insurance companies.

The first hypothesis is divided into the following sub-hypotheses:-

First sub hypothesis: There is no statistically significant effect of (the training on system) on the effectiveness of organizational change in the Jordanian insurance companies.

Table 1:- Simple regression of the first hypothesis.

Dependent variable Effectiveness of organization change	Model Summary		ANOVA			Coefficients				
	R	R square	Adjusted R Square	DF	SIG	VAR Training on system	β	Std. Error	T	SIG
	0.478	0.199	105.756	1	0.000		0.478	0.033	11.096	0.000

The table above shows that there is a strong correlation between the training on system and the effectiveness of management of organizational change, the training on system explained 19.9% of the variation in the effectiveness of organizational change, as (F) value is statistically significant on the test.

Based on the results, we accept the alternative hypothesis:-

There is statistically significant effect of (the training on system) on the effectiveness of organizational change in the Jordanian insurance companies

Second sub hypothesis: There is no statistically significant effect of availability of technical support on the effectiveness of organizational change in the Jordanian insurance companies.

Table 2:- Simple regression of the second hypothesis.

Dependent variable Effectiveness of organization change	Model Summary		ANOVA			Coefficients				
	R	R square	Adjusted R Square	DF	SIG	VAR availability of technical support	β	Std. Error	T	SIG
	0.625	0.378	351.258	1	0.000		0.625	0.033	18.152	0.000

The table above shows that there is a strong correlation between the availability of technical support and effectiveness of organizational change management , the availability of technical support explained 37.8% of the variation in the effectiveness of organizational change, as (F) value is statistically significant on the test. Based on the results, we accept the alternative hypothesis: There is statistically significant effect of (availability of technical support) on the effectiveness of organizational change in the Jordanian insurance companies.

Third sub hypothesis: there is no statistically significant effect of senior management support on the effectiveness of organizational change in the Jordanian insurance companies.

Table 3:- Simple regression of the third hypothesis.

Dependent variable Effectiveness of organization change	Model Summary		ANOVA			Coefficients				
	R	R square	Adjusted R Square	DF	SIG	VAR Senior management support	β	Std. Error	T	SIG
	0.732	0.551	525.237	1	0.000		0.732	0.031	21.103	0.000

The table above that there is a strong correlation between the senior management support and the effectiveness of organizational change management, the technical support explained 55.1% of the variation in the effectiveness of organizational change, as (F) value is statistically significant on the test. Based on the results, we accept the alternative hypothesis: There is statistically significant effect of senior management support on the effectiveness of organizational change in the Jordanian insurance companies.

Fourth sub hypothesis: There is no statistically significant effect of the availability of infrastructure on the effectiveness of organizational change in the Jordanian insurance companies.

Table 4:- Simple regression of the fourth hypothesis

Dependent variable Effectiveness of organization change	Model Summary		ANOVA			Coefficients				
	R	R square	Adjusted R Square	DF	SIG	VAR Availability of infrastructure	β	Std. Error	T	SIG
	0.775	0.578	525.237	1	0.775		0.775	0.025	23.144	0.000

The table above shows that there is a strong correlation between the availability of infrastructure and effective management of organizational change, the technical support explained 57.8% of the variation in the effectiveness of organizational change, as (F) value is statistically significant on the test.

Based on the results, we accept the alternative hypothesis says:

There is statistically significant effect of the availability of infrastructure on the effectiveness of organizational change in the Jordanian insurance companies. To test the main first hypothesis, we used multiple regressions as follows:

Table 5:- Multiple regressions for fourth hypothesis

Dependent variable Effectiveness of organization change	Model Summary		ANOVA			Coefficients				
	R	R square	Adjusted R Square	DF	SIG	VAR	β	Std. Error	T	SIG
	0.805	0.725	175.232	4	0.000	Training on system	-0.075	0.025	0.725-	0.441
						Availability of technical support	0.169	0.047	4.425	0.000
						Senior management support	0.118	0.041	3.045	0.000
						Availability of infrastructure	0.335	0.036	6.321	0.000

The table above show that the correlation coefficient (0.805), indicating a strong correlation, and that the impact of dimensions of human resources information systems on the dependent variable (effectiveness of organizational change) is a statistically significant, according to F value, and R square, it is indicated that 72.5% of change in the effectiveness of organizational change was due to the human resources information systems. The training on the system has no statistically significant impact, while the other variables have statistically significant impact.

Results and Recommendations:-

Results:-

Based on the field study and analysis of survey data and the variables the study the following results was drawn:

1. There is a strong correlation between the training on system and the effectiveness of organizational change management the training on the system explained 19.9% of the variation in the effectiveness of organizational change, as (F) value is statistically significant on the test.
2. There is a strong correlation between the availability of technical support and effectiveness of management of organizational change, the availability of technical support explained 37.8% of the variation in the effectiveness of organizational change, as (F) value is statistically significant on the test.
3. There is a strong correlation between the support of senior management and the effectiveness of management of organizational change, the availability of technical support explained 55.1% of the variation in the effectiveness of organizational change, as (F) value is statistically significant on the test.
4. There is a strong correlation between the availability of infrastructure and effectiveness of organizational change, the availability of infrastructure explained 57.8% of the variation in the effectiveness of organizational change, as (F) value is statistically significant on the test.
5. Multiple Regression Results showed that training on the system has a statistically significant on the effectiveness of organizational change while there was a statistically significant effect of (availability of technical support, senior management support availability of infrastructure) on the effectiveness of organizational change.

Recommendations:-

1. Develop the capacity of workers and training them on human resources information systems requirements.
2. Put a fair system of incentives to encourage innovation and creativity process.
3. Develop Technological infrastructure and the to keep up with the developments in the world
4. Update software and deal with them reliably.
5. Take advantage from other insurance company's experiences with respect to human resources information systems.

Abstract

A Mathematical model has been done for the study area (Laylan sub-basin) in Kirkuk / NE of Iraq by Modflow pro software. To make a simulation for the shallow aquifer to predict a clear future imagination about the hydraulic head. The aquifer receives 23.29 mm in January, 49.44 mm February, 25.17mm in March. According to such conditions with no sinks, the model was run, after converting the water surplus to the used unit in the model m/day. The model output in the monthly flow map depends on the variation of the above package (groundwater recharge). The calculated head values for each step are noticed showing slight differences in head values. Another simulation was run with sinks for one year divided also to 12 stress period. The calculated hydraulic head after 1-year simulation with the withdrawal of groundwater estimated by -432 m³/day of 70 wells, the small difference in hydraulic heads was noticed when comparing the readings of both simulations (with or without pumping). The model was run after reloading the mentioned stresses, and with increasing 10 wells yearly (as an assumption), the result shows that there will be a decrease in the southern and northern parts toward the center of the modeled area.

Introduction:-

Groundwater Modeling is an efficient tool for groundwater management (Harbaugh AW, et al., 2000). Models are a simplification of reality to investigate certain phenomena or to predict future behavior of groundwater. Despite their efficiency, models can be complicated and produce wrong results if they are not properly designed and interpreted. Regardless of the type of model being used, similar sequences should be followed in modeling. If the conceptual model is not properly designed, all modeling processes will be a waste of time and effort. To build a proper conceptual model, hydrogeological data should be sufficient and reliable. Calibration and verification are the last steps in modeling before writing the final model report (Todd DK, and Mays LW., 2005). Groundwater management and policy decisions must be based on knowledge of the past and present behavior of the groundwater system, the likely response to future changes and the understanding of the uncertainty in those responses (Sinclair Knight Merz, 2012). The purpose of modeling can vary widely, and the approach used may depend on site-specific needs, current understanding of the hydrogeologic system, availability of input data, and expectation and use of the model results. Models are typically used to evaluate ground water movement, flow direction, velocity, and discharge rates beside:

- Evaluate the interaction between hydrogeologic systems.
- Interpolate between known measurement points.

Address:- Head of Environmental Research unit, College of Science, University of Kirkuk, Kirkuk, Iraq.

-Identify data gaps during site characterization.

-Aid in the development and management of groundwater supply systems.

Models are not a substitute for field investigations but should be used as supplementary tools. Results depend on the quality and quantity of the field data available to define input parameters and boundary conditions (Wang, H.F., and Anderson, M.P., 1982). The results should always be evaluated in context with the fundamental assumptions of the model and the adequacy of the input data. A general rule, it is prudent to continually question the results of modeling and the potential consequences of decisions based on misleading results, and consider what can be done to verify the results (U.S. EPA., 1996c).

Location of Study area:-

The study area (Laylan) located in the northeastern part of Iraq, it is a sub-basin belongs to Kirkuk province. Laylan is approximately 26 Km to the southeast of the governorate capital, Kirkuk. Geographically, the area of study lies in between latitudes ($35^{\circ} 26' 30''$ - $35^{\circ} 10' 00''$), and longitudes ($44^{\circ} 43' 30''$ - $44^{\circ} 22' 30''$), the area of study is about 256 km². These places belong to Kirkuk province. Geologically, structural boundaries for the study area from east and northeast by Kirkuk anticline, while in the west and southwest by Jambur Mountains (Anticline), and it is bounded by hydrological natural boundaries from north and northwest by ephemeral stream (intermittent stream named Shireen valley), while in the south and southwest by ephemeral stream named (Qarqacha valley) (Figure 1).

Figure (1):- Location of the study area.

General Setting of Tectonic, Geology, and Structure of the Study Area:-

Lailan sub-basin contains Mukdadyia (L. Pliocene) and Bai-Hassan (U. Pliocene) Formations with a cover of Pleistocene and Holocene Quaternary deposits. Groundwater exists abundantly in sand and gravel layers of Quaternary and Bai Hassan Formation. Lailan located within unstable shelf in the deepest part of the Foothill Zone, which called Hemrin-Makhul Subzone. The subzone was the depocentre of the Neogene molasses but has been a subsiding unit throughout the Mesozoic and Tertiary (Jassim and Goff, 2006), AL-Mamuri (2005).

Methodology:-

The research is done by using the hydrogeological field data to build a proper model for the study area (Lailan sub-basin) through the following steps:

Grid Design:-

The dimensions of the model should be selected during the formulation of the conceptual model. To minimize a variety of sources of numerical errors the model grid should be designed using the finest mesh spacing and time steps. In designing the grid, the length to width ratio (or aspect ratio) of cells or elements should be kept as close to one as possible. Long linear cells or elements can lead to numerical instabilities or errors and should be avoided, particularly if the aspect ratio is greater than about (Jacques W. Delleur, 2006). The modeled area was 256 km², this area was divided into 355 cells, the dimension of each cell is (750 m*1000 m), all these cells are active.

Boundary & Initial Conditions:-

To obtain a unique solution of a partial differential equation corresponding to a given physical process, additional information about the physical state of the process is required. This information is supplied by boundary and initial conditions. The boundary conditions include the geometry of the boundary, for groundwater model applications, the initial conditions are simply the values of the dependent variable specified everywhere inside the boundary at the start of the simulation. Normally, the initial conditions are specified to be a steady-state solution. It should be recognized that heads will change during the transient simulation, not only in response to the new pumping stress but also due to the initial conditions. Boundary conditions have great influence on the computation of flow velocities and heads within the modeled area. The boundary conditions which are used in the modeled area, specified head positive values (+1) in the I Bound array defines active cells when expressing the domain inside.

Initial Hydraulic heads:-

MODFLOW requires initial hydraulic heads at the beginning of a flow simulation. For steady state simulation, the initial heads are used as starting values. Actual, confidential head values were derived from the hydrogeologic data bank of groundwater commission. GIS, the 3D spatial analyst is used to create initial isopotential lines. The isopotential lines of the aquifer, the same values were loaded into the model as initial hydraulic heads.

Aquifer Material Properties:-

The model needs more additional properties such as top and bottom of the aquifer beside transmissivity... Etc, the values were loaded into the model. Flow packages represented by recharge (L/T) which means length unit /time unit, positive values, and wells (L³/T), negative values, will add to the model during simulation of the Transient model. Recharge is defined by assigning the data to each vertical column of cells. The model assumes that a well penetrates the full thickness of the cell. To calculate heads in each cell in finite difference grid, GMS prepares one finite difference equation for each cell. SIP (strongly implicit procedure) package is used to solve the system of a finite difference equation.

Results and Discussion:-**Steady State Simulation:-**

Flow in such simulation means the volume passing a given point per unit of time remains constant. An initial steady-state condition is required for time-dependent modeling of groundwater flow. After loading data and after running the model, hydraulic heads are the primary results of the model as a steady state simulation will appear as in (Figure 2).

Figure (2):-Steady State Simulation

Model Calibrations:-

Calibration is the process of adjusting model inputs to achieve the desired degree of correspondence between the model simulations and the natural groundwater flow system(Christoph Wels,2012). In other words, calibration methods are used until the solution matches the known (usually hydraulic heads).For this model, calibration is made for inputs to reach the matching between inputs and model simulation. Model calibration should include comparisons between model-simulated conditions and field conditions for the following data.

Transient Simulation:-

Transient simulation involves the change in hydraulic head with time. These simulations are needed to narrow the range of variability in model input data since there are numerous choices of model input data values which may result in similar steady-state simulations.

The first attempt in the transient simulation is made with an assumption without withdrawal water from the aquifer. The flow recharge package is the most important factor included in this simulation due to the difference in climatological factors, groundwater recharge as a source is an influenced factor during three months in a year according to the calculations of water surplus. The aquifer receives 23.29mm in January, 49.44 mm February, 25.17mm in March. According to such conditions with no sinks, the model was run, after converting the water surplus to the used unit in the model m/day.

Time stepping in transient simulation:-

The time for one-year simulation without sinks (wells) is divided to 12 stress periods, each stress period represents a month, while the period length of each stress period are divided into days, so the total time steps equal to 12 months, while the total simulation time equals to 3.65E+2 days. The model output in the monthly flow map depends on the variation of the above package (groundwater recharge). The calculated head values for each step are noticed showing slight differences in head values.

Another simulation was run with sinks for one year divided also to 12 stress period. The calculated hydraulic head after 1 year simulation with withdrawal of groundwater estimated by $-432 \text{ m}^3/\text{day}$ of 70 wells, Small difference in hydraulic heads was noticed when comparing the readings of both simulations (with or without pumping) (Figure 3).

Figure (3):-Transient Simulation

Predictive simulation:-

A model can be used to predict future groundwater flow conditions, such simulation estimates the hydraulic response of an aquifer, and also it can predict the pumping rate needed to monitor the hydraulic heads.

A pumping strategy (groundwater management) is a set of spatially and possibly temporary distributed rates of extracting water from the aquifer.

To predict the simulation for 5 years, the stress period were divided into 20 stress periods, each one-year simulation divides into 2-period lengths, 1 for the wet period represented by 90 days while the another one for the dry period represented by 270 days.

For utilization of 70 wells for agricultural purpose, wells flow package represented by estimated withdrawal of $(-432) \text{ m}^3/\text{day}$ during the dry period and $(-216) \text{ m}^3/\text{day}$ during wet season, recharge flow package represented by $(0.00108) \text{ m/day}$ during the wet season and (0) during the dry season. The model was run after reloading the mentioned stresses, and with increasing 10 wells yearly (as an assumption), the result shows that there will be a decrease in the southern and northern parts toward the center of the modeled area (figure 4)

figure (4):- 5 Years later Simulation

Abstract

The fully mature fresh leaves of *Tridax procumbens* L. were collected and prepared extract. *Tridax* weed, used for germination. Make different concentration of extract. This was carried on Cowpea *vigna unguiculata* (L.) Walp. The studies on the influence of extract on seed germination are highly essential and of paramount importance, considering this view, the impact of *Tridax* leaf extract has been studied by using seed germination bioassay of Cowpea in the present investigation.

Introduction:-

Cowpeas are one of the most important food legume crops in the semiarid tropics covering Asia, Africa, southern Europe, and Central and South America. A drought-tolerant and warm-weather crop, cowpeas are well-adapted to the drier regions of the tropics, where other food legumes do not perform well. It also has the useful ability to fix atmospheric nitrogen through its root nodules, and it grows well in poor soils with more than 85% sand and with less than 0.2% organic matter and low levels of phosphorus. In addition, it is shade tolerant, so is compatible as an intercrop with maize, millet, sorghum, sugarcane, and cotton. This makes cowpeas an important component of traditional intercropping systems, dried stalks of cowpea is a valuable by-product, used as animal feed.

Seed germination is one of the most basic aspects. During seed germination sequential series of physiological and biochemical event takes place in quiescent seed, resulting into seedling. It is transition period between resting and growth phases of plants and considered to be completed at the time of emergence of radical. The stimulatory or inhibitory impact of extract can be initially analysed through seed germination bioassay studies. *Tridax* leaf extract was used to study seed germination bioassay on Cowpea.

Material And Method:-

Collection of material:-

The fully mature fresh leaves were collected in polythene bags from the fixed study area and the material was brought to the laboratory in ice bags. Leaves were washed thoroughly under tap water and spread over the blotting papers under shade for drying.

Preparation of Extracts:-

Freshly collected mature leaves were cleaned and shade dried. The leaves were uniformly homogenized in 100 ml 80% ethanol and condensed in water bath to 10 ml below 60°C to avoid evaporation of volatile compounds and denaturation of active principle in it. This was filtered and filtrate was made to 100 ml final volume with sterile distilled water & stored in sterile coloured bottle in deep freezer at 0°C for further use.

Seed germination bioassay:-

This is carried out with Cowpea. Uniform seeds were washed thoroughly in water & surface sterilized with 0.5% HgCl₂ solution & again washed with distilled water. Surface sterilized seeds were germinated in different concentration of *Tridax* leaf extract observation on

- (1) Germination %
- (2) Length of plumule & radicle.
- (3) Root/shoot ratio
- (4) Fresh & dry weight of seedling
- (5) Vigor index were recorded. All the sets were triplicated under laboratory condition. Observation on the following parameter were recorded.

Germination percentage:-

Development of seedling from seeds is known germination. It is a process in which the seed sprouts for growing & developing into a plant. Germination percentage is a calculated approximately of the viability of a population at seeds. The germination rate provides a measure of the time course of seed germination.

Record for seeds germinated in each treatment from 2nd day to 9th days after sowing was noted carefully. The seeds with normal length of radicle & plumule were considered as germinated seeds. The percent germination was calculated as

$$\text{Germination percentage} = \frac{\text{Number of seed germinated}}{\text{Total number of seeds kept for germination}} \times 100$$

Length of Plumule & radicle in germinated seeds.

From each replication & each replication and each treatment ten germination seeds were randomly selected & the length of selected Plumule & radicle of these germinating seeds was recorded at 6th & 9th days.

Root/shoot ratio –

The root /shoot ratio for each germinating seeds at each treatment was calculated as follows

$$\text{Root /Shoot Ratio} = \frac{\text{Root length (cm)}}{\text{Shoot length (cm)}}$$

Seed Vigor index (VI):-

Seedling vigor index were determined by germination percentage and seedling length of the same seed lot. Seed vigor index is calculated by multiplying germination % & Seedling length.

Seed vigor index = germination % X seedling length (mm)

Table 1:-

Sr.no	Extract (%)	% germination	Shoot length (cm)	Root length (cm)	Total length (cm)	Root/shoot Ratio (cm)	Vigor Index (VI)
1	Control	60%	2.3	11.5	13.8	5.0	828
2	1%	80%	9.9	10.5	21.4	0.15	1712
3	2%	90%	10.5	12.1	21.0	1.15	1890
4	3%	100%	12.00	14.0	24.1	1.16	2410
5	4%	100%	12.8	9.9	26.8	0.77	2680
6	5%	70%	8.00	11.5	17.9	1.43	1432

Result And Discussion:-

Effects of extracts on seeds germination:-

The result recorded in table 1 indicate that the extracts had positively stimulated the seed germination percentage over control in higher concentration. While the lower conc. (1%,2% 3%) have caused low influence on seed germination. The length of root & shoot was significantly increased at 4% concentration, however at lower conc. it was reduced over control.

Root / shoot length:-

In present investigation the impact of the extracts on root & shoot length in Cowpea seedling was studied in details. For this extracts of (*Tridax*) were used. From the result it is seen that extract of the species was stimulatory enhancing the seed germination at higher conc. (4%) however lower concentration adversely affected the seed germination, root length & shoot length.

Seed vigor index (VI)-

4% *Tridax* extract seed lot showing the higher seed vigor index is considered to be more vigorous.

Conclusion:-

The early seedling growth governs its establishment through root & shoot elongation. The uptake of water & nutrients depends on the early root development & its spreading. Inhibition or stimulation of root & shoot length at seedling level will have adverse or favorable effects on the future growth of the plant.

Abstract

The present study was undertaken with a view to look for the use of Vero cell line for plaque assay of Yellow fever vaccine, over Mouse LD₅₀ method, for vaccine potency test. To establish the plaque assay the growth conditions for Vero cell line were standardized. Different parameters like cell count, dilution, inoculum size, adsorption time for virus, concentration for Methyl Cellulose (MC) in the overlay media and incubation period were standardized. And titration of Yellow fever vaccine was performed by Plaque Forming Unit (PFU) method. A cell concentration of $3-4 \times 10^5$ cells per ml, in tissue culture plate gave a complete monolayer after overnight incubation. Virus dilution of 10^{-2} was optimum for desired pfu/0.5ml. An inoculum size of 0.2 ml per well was found suitable. Maximum plaques were obtained after an adsorption time of 4 hours, at $36 \pm 1^\circ\text{C}$, by 7 days of incubation. Different concentrations of methyl cellulose, overlay media were used. 1% methyl cellulose in Minimum Essential Media (MEM) with 2% FBS gave good results. The different samples of Yellow fever 17D vaccines were titrated by Plaque Assay method along with the IRS and titre results were compared with the titre values of manufacturer's potency assay. The vaccine pass the limit of minimum requirement of potency i.e., $4.24 \log_{10}$ PFU/0.5ml dose, equivalent to titre 1000 MouseLD₅₀.

Introduction:-

Yellow fever was recognized as a clinical entity as early as in the seventeenth century and was familiar to pirates as the 'YELLOW JACK'. It is a native of Africa and was transported along the trade routes to Europe, America. The disease has been largely confined to certain areas of Africa and South and Central America. Yellow fever is a non-contagious acute infectious disease caused by the Yellow fever virus^{[1][2]}. Yellow Fever is member of family *Flaviviridae*, genus *Flavivirus*, and the virus after which the family and genus were named (*flavus*, Latin- Yellow). The virus has a small positive-sense, single stranded (ss) RNA genome. It is a spherical enveloped virus, bearing surface projections. Nucleocapsid has an icosahedral symmetry, 40-50 nm in diameter.

It is a serious health problem with clinical symptoms that may vary from mild to severe disease characterized by sudden onset of fever and jaundice. The most serious forms also include hepatorenal syndrome, bleeding, shock and eventually evolve to death^[3]. It is both Viscerotrophic, causing liver disease and Neurotrophic causing encephalitis^[4].

Among various preventive measures such as vector control, improved hygiene and sanitation and immunization; immunization currently represents the least expensive and most effective means to prevent infection and to avoid subsequent disease ^[5] ^[6]. Yellow fever is a vaccine preventable disease and can be controlled by an effective vaccination program ^[7].

Yellow fever was one of the most feared lethal diseases before the development of an effective vaccine ^[3]. The live attenuated vaccine of Yellow fever was developed in 1936 by Thieler & Smith by attenuating Yellow fever virus Asibi strain through serial passages in tissue culture and animals, originating the 17D attenuated vaccines. Another French neurotropic vaccine was developed by Sellard and Laigret in 1932; it was popular as Dakar vaccine. The serious drawbacks of this vaccine were high incidences of encephalitic reactions in children. Due to which it was stopped being recommended for children under 14 years in 1961 and manufacturing of this vaccine strain was discontinued in 1980 ^[8].

Nowadays, there are two licensed vaccines available in international market, the first vaccine uses the 17D-214 strain and the second uses the 17DD strain (in Brazil) ^[9]. Yellow fever 17D vaccine has an outstanding feature that the vaccine provide protection against other Flaviviruses.

Vaccines are essential tool in the prevention of disease, as they protect the vaccinated individual from developing a potentially serious disease and helps in the reduction of spreading of infectious diseases. Thus the manufacturers are primarily responsible for the safety and efficacy of the vaccines. However, it is country's National Control Authority (NCA) that is responsible for establishing procedures for assuring that vaccines intended for use in that country are of adequate safety and efficacy. The activities required in this concept are incorporated under the responsibility of Quality Control (QC). The NCA grants approval for marketing vaccines and certify manufacturer by monitoring production, testing procedures and processes, performing QC testing of vaccines through National Control Laboratory (NCL) ^[10].

QC tests for a vaccine are; sterility, identity, stability, toxicity, potency test etc. Potency is one of the most important parameters for the QC of vaccines. WHO requirements for potency testing of 17D vaccine are that the titre of the vaccine shall be not less than 1,000 mouse LD₅₀/dose (0.5 ml) or its equivalent PFU ^[11] ^[12]. Potency of Yellow fever is tested by two methods; LD₅₀, PFU ^[11] ^[12] ^[13].

Mouse LD₅₀ is a sensitive method but involves use of animals, with a long observation period *i.e.*, 21 days and involves large number of animals (8 for each dilution). On the other hand plaque technique is quite sensitive, accurate, less time consuming method for titration. The PFU method gives result in 7 days, and has no use of animals. Many problems of taking care of mice, their food, and breeding etc., and problems faced due to premature death, variation in animal immune status, sensitivity to particular immunological products and variability in results can be avoided. Keeping in view the guidelines of RRR (Replacement, Refinement and Reduction of animals) for use of laboratory animals, an attempt has been made to perform the potency assay *in vitro*, *i.e.*, PFU method. PFU method is equally sensitive method as mouse LD₅₀ (*in vivo* method) ^[13].

Material and Method:-

Vaccine:- The samples of the Live-attenuated, 17-D (204) Yellow fever vaccine, with diluent for suspension.

Cell lines:- Vero Cell line was revived at passage level- 126 at CDL, Kasauli.

Reference Standard:- Yellow fever International Reference Standard (IRS); 99/616 IRS

Media, Reagents And Solutions:-

Buffers and solutions:-

- Sterile water for injection (W.F.I.).
- Distilled water: - Solutions used in all procedures were dissolved in distilled water.
- Washing Buffer: Phosphate buffer saline (pH7.4), Sodium chloride (NaCl)-0.8gm, Potassium chloride (KCl)-0.020gm, Sodium Hydrogen Phosphate (Na₂HPO₄)-0.115gm, Potassium Dihydrogen Phosphate (KH₂PO₄)-0.020gm.

The above contents were mixed and solution was sterilized by autoclaving at 121°C, 15 lbs, for 20min. and stored at 2-8°C.

- 0.25% Trypsin-EDTA (1X) (Dissociation Reagent);

Staining and fixing reagents:-

- Trypan Blue (0.4% solutions):- The solution was used for cell counting.
- 0.5% Crystal Violet Solution, Crystal Violet-2.5gm, Absolute ethanol-100ml, Formaldehyde (37-41%) - 135ml, Distilled water-265ml. The above contents were mixed and filtered through filter paper. Solution is stored at room temperature. It was used for staining the plaques.
- Cell fixative, Formal saline (10%):- Normal Saline (NaCl), NaCl-0.85gm, Distilled water-100ml.
- The above contents were mixed and solution was sterilized by autoclaving at 121°C, 15 lbs, for 20min.
- Formal Saline, Formaldehyde (37-41%)-10ml, Normal Saline-90ml. The solution is stored at room temperature. The solution was used as fixative *i.e.*, for fixation of cells.

Media:-

- Foetal Bovine Serum (FBS), Sterile, gamma-irradiated, Mycoplasma tested; It was used at different concentrations in MEM. Stored at 2°C-8°C.
- Minimum Essential Medium (MEM) 1X, MEM Alpha (1X) + GlutaMAX-I [-] Ribonucleosides, [-] Deoxyribonucleosides, Stored at 2°C to 8°C.
- Penicillin-Streptomycin solution, Penicillin-[+] 5,000 units/ml, Streptomycin-[+] 5,000 µg/ml, Stored at 2°C to 8°C.
- Growth medium- MEM= 470ml, FBS-25ml, Pen/Strep (1%)-5ml.
- Maintenance medium; MEM-483ml, FBS-12ml, Pen/Strep (1%)-5ml.
- Overlay medium: Methyl Cellulose (1% Stock solution):-

Solution A:- MEM-97ml, Methyl cellulose-1gm, Vigorous shaking of solution to mix methyl cellulose properly. Autoclave the solution at 121°C, for 15 min. Solution is cooled to room temperature.

Solution B:- FBS-2ml, Penicillin/Streptomycin-1ml.

Solution B was added to solution A; Stored at 2-8°C.

Materials And Equipments:-

Tissue culture plates (Disposable, flat bottomed 6-Well-tissue-culture plates), Tissue culture bottles (Roux bottles) (25cm² and 75cm² sterile disposable cell culture bottles), Autopipettes, Disposable graduated pipette (5ml, 25ml, 100ml), Ependorff, falcon tubes, Disposable syringe and needle (5ml). Glass vials, Measuring cylinders, Glass bottles, Beakers, flasks. Disposable gloves, masks, tissue paper, vaccine vial opener, glass vial stand, vortex mixer, haemocytometer, inverted microscope, biosafety cabinet, autoclave, deep freezer and refrigerator, carbon dioxide incubator.

Method:-

Revival and Propagation of Vero cell line:-

Vero cell line was obtained from CDL, Kasauli at passage level-126 (P-126). The ampoules containing Vero cell line, were stored at -196°C in cryopreservation system (in liquid Nitrogen), were removed and transferred immediately to water bath at 36°C ± 1°C till its content was completely thawed. Then outside of the ampoule was wiped with disinfectant to reduce contamination and the ampoules were opened in Bio-safety Cabinet. The cell suspension was transferred to culture bottles containing growth media, MEM with 5%FBS. The bottles were incubated at 36°C ± 1°C for 4 hrs. The media was decanted carefully to get rid of DMSO present and fresh growth medium was added for the production of cell monolayer and incubated at 36°C ± 1°C until the cell monolayer is complete.

Maintenance of cell lines:-

Cell lines were maintained at 32°C temperature with maintenance medium MEM+2%FBS.

Tissue Culture:-

Trypsinization of Cells:-

Once the monolayer was complete, the cells were harvested using the following procedure-

- A freshly thawed trypsin was warmed to $36^{\circ}\text{C} \pm 1^{\circ}\text{C}$ in incubator.
- The tissue culture bottle was observed under the inverted microscope, for following characteristics: - Confluent monolayer, healthy and viable cells, no or little granularity, no C.P.E., or other changes in the cell growth present.
- Using a sterile pipette, whole spent medium was aspirated from tissue culture bottle.
- The cell layer was rinsed gently with 5 ml of 1X MEM.
- 0.25% trypsin solution was added to the cell monolayer, *i.e.*, 1ml to 25cm^2 tissue culture bottles and 2-3 ml to 75cm^2 tissue culture bottles.
- The tissue culture bottle was incubated in the incubator at $36^{\circ}\text{C} \pm 1^{\circ}\text{C}$ until the cells starts detaching from the surface.
- Discard the trypsin before the cell monolayer detach entirely from the surface of the tissue culture bottle.
- The growth medium was added to cell culture bottle, 10 ml to 25cm^2 culture bottles, 20 ml to 75cm^2 culture bottles. The serum in the growth medium stops the action of trypsin still present.
- The media was aspirated gently to loosen the cells from the surface of the bottles and pooled the cell suspension from each bottle into new tissue culture bottle.
- Re-suspended the cells in growth medium to desired concentration, based on cell counting. Seed fresh culture bottles or 6-well tissue culture plates.

Cell counting:-

Cell counting was done for enumeration of viable cells per ml. Accurate number of cells in a cell suspension was calculated by using haemocytometer (Neubauer chamber). Before cell counting the cells were dispersed thoroughly by pipetting in and out.

- Prepared 1:1 dilution of original cell suspension (obtained by trypsinisation) using 0.4% trypan blue as follows: 0.5ml of diluted cell suspension, 0.5ml of 0.4% trypan blue.
- The cell suspension was mixed well with pipette and immediately aspirated a sufficient volume to fill the haemocytometer.
- All viable (unstained) cells were counted in the 8 squares (1.0mm) constituting the 4 corners of each of the two haemocytometer chamber, omitting cells lying on the upper line and left line of each square. The volume of each corner square = 0.1mm^3 ($1.0 \times 1.0 \times 0.1$).
- Calculated the mean count of the cells per 0.1mm^3 .
- The number of cells in the suspension were calculated using the following formula:

$$N = m \times tb \times V \times 10^4$$

Where,

N- Total number of cells in the suspension

m- Mean of cell count in eight corners

tb- Trypan blue correction factor

V- volume of original cell suspension in ml

10^4 - conversion factor for haemocytometer

PLAQUE ASSAY ^[14]

Preparation of the Vero Cell monolayer:-

After counting cells, the cell concentration was adjusted to $3-4 \times 10^5$ Vero cells/ml of cell suspension, in MEM with 5%FBS.

- 2ml of this cell suspension was added to each well of 6-well tissue culture plate.
- Tissue culture plates were incubated at $36^{\circ}\text{C} \pm 1^{\circ}\text{C}$, at 5%CO₂, overnight for complete monolayer formation.

Reconstitution of Yellow fever vaccine:-

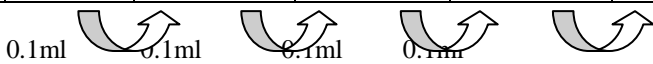

Lyophilized

vaccine (0.5ml dose) was diluted in the diluent provided with the vaccine. It was placed on ice bath till use.

Preparation of vaccine dilution:-

- The sterile glass vials were labelled as 10^{-1} , 10^{-2} , 10^{-3} , 10^{-4} and 10^{-5} .
- The reconstituted vaccine was serially diluted in chilled dilution medium (MEM with 2%FBS), in a range of 10^{-1} to 10^{-5} .
- 0.9ml of chilled dilution medium was dispensed in all 5-vials.

- The 10-fold dilutions were prepared by adding 0.1ml of reconstituted vaccine into first vial (10^{-1}), and mixed on vortex for 15-20 seconds and then transferring 0.1ml of 10^{-1} dilution to next vial making it 10^{-2} and vortex it, and similarly upto 10^{-5} dilution.

Range of dilutions used in plaque assay of Yellow fever vaccine.					
Dilution	10^{-1}	10^{-2}	10^{-3}	10^{-4}	10^{-5}
Diluent (in ml)	0.9	0.9	0.9	0.9	0.9
Vaccine (in ml)	0.1	—	—	—	—
					

Virus infection and Adsorption:-

- The media was aspirated, from the wells of tissue culture plates with confluent monolayer of Vero cell line.
- 0.2ml of each viral dilution from 10^{-1} to 10^{-5} was added to different wells, minimum 2 wells for each dilution.
- Two wells will remain as the cell-control wells, and 0.2 ml of medium (MEM+2% FBS) was added to it.
- The plates were incubated for 4 hours, for adsorption of virus to the cell-monolayer. The plates were gently shaken after every 30 minutes, for uniform distribution of the inoculum.

Addition of Overlay Medium:-

- After 4hrs of adsorption, 3ml of methyl cellulose was added to all 6 wells of the plate, to stop the viral diffusion.
- The plates were incubated for 7 days, at $36^{\circ}\text{C} \pm 1^{\circ}\text{C}$, at 5% CO_2 for the development of plaques.

Plaque Fixation and Staining:-

- On 7th day, the overlay medium was aspirated from the wells, and the plates were washed 2-times with PBS 2ml per well.
- The cells were fixed with 2ml per well 10% formal saline solution for 30 minutes.
- After fixation aspirated the fixative and the plates were washed with PBS.
- The plates were stained with 0.5% crystal violet stain solution for 30 minutes at room temperature.
- The plates were washed with PBS 2-3 times and air dried.
- After proper drying of tissue culture plates, the plates were examined to count the number of plaques, comparing with the cell control.

Calculation of results (PFU/0.5ml dose):-

The number of Plaque Forming Units (PFU), were titred per 0.5ml dose.

Formula: - $\text{PFU} = \text{P} \times \text{D} \times 2.5$

Where: - P - Average No. of plaques

D- Reciprocal of Dilution factor

Results:-

Cell count:-

The cell count of $3-4 \times 10^5$ cells/ml gave a complete monolayer when 2ml of this suspension was used per well of the 6-well tissue culture plate. (Table-1)

Table 1:- Standardization of the Cell Count.

Cell count	Incubation time	Result
2×10^5	Overnight Incubation	Incomplete Monolayer Formation
3×10^5	Overnight Incubation	Complete Monolayer Formation
4×10^5	Overnight Incubation	Complete Monolayer Formation
5×10^5	Overnight Incubation	Complete Monolayer, with overgrowth of cells at centre.

Working Dilution and Inoculum Size:-

It was observed that the dilution of 10^{-2} at the inoculum size of 0.2ml was suitable for the assay (Table-2). Therefore this dilution and inoculum size were used in the entire study.

At 10^{-1} dilution with 0.2ml of inoculum, plaque formation occurs but due to their large number, their boundaries were seen overlapping and hence plaques were difficult to count. With higher inoculum sizes 0.3ml and 0.4ml, the plaques were absent due to excessive degeneration of cells.

At 10^{-3} dilution, very less number of plaques was obtained. Even with highest inoculum size of 0.4ml, the plaque ranged from 10-20, hence was not suitable for the study. With 10^{-2} dilution of the virus, the inoculum size of 0.2ml produced a uniform distribution of plaques (Table-3). With higher inoculum sizes 0.3ml and 0.4ml, the plaques formation occurred yet counting could not be made due to excessive degeneration of cells. So, the inoculum size of 0.2 ml was selected as it gave a discrete plaque distribution with round appearance, sharp boundaries and clear margins.

Table 2:- Effect of Different Dilution on the Formation of Plaques.

Virus Dilution	Results
10^{-1}	Very high no. of plaques. Boundaries overlapping. Unable to count.
10^{-2}	Plaques were seen as uniformly distributed, discrete, with round shape.
10^{-3}	Plaque no. very less.
Cell control	Healthy.

Table 3:- Effect of Different Inoculums on the Formation of Plaques.

Inoculum size (10^{-2} dilution)	Results
0.2 ml	Discrete plaques were observed.
0.3 ml	No. of plaques was high, unable to count.
0.4ml	No plaques were seen, rounding of cells and detachment.

Image 1: - Shows 10^{-1} dilution with 0.2ml of inoculum. The plaque formation occurs but due to their large number, their boundaries were seen overlapping and hence plaques were difficult to count.

Adsorption time:-

Maximum plaques were obtained after an adsorption time of 4 hours at $36^{\circ}\text{C} \pm 1^{\circ}\text{C}$. (Table-4) At adsorption time 1 hour there was no plaque development. Therefore the adsorption time of 4 hrs was selected.

Table 4:- Effect of Different Adsorption Times on Plaque Formation.

Adsorption Time	Results
1 hour	No Plaque development.
4 hours	Good plaques development; maximum no. of plaques seen.

Image 2:-

Image 3:-

Image-2 and 3:- No plaque development due to incomplete adsorption time period of 1 hr.

Methyl cellulose Concentration:-

It was observed that maximum final concentration of 1% of Methyl cellulose (MC) in medium (MEM with 2% FBS) suited well for Vero cells as well as for the formation of plaques. (Table-5)

Low concentration of MC (0.8%) could not prevent the spreading of the virus on entire plate. The plaques were seen with diffused boundaries and were not countable.

Table 5:- Effect of Different Concentration of MC on Vero Cells and Plaque Formation.

MC Concentration	Results	
	Test	Control
0.8%	Plaques were seen but were not countable	Cells were normal.
1%	Plaque formation occurred.	Cells were normal.

Image 4:-

image 5:-

Image 4 and 5:- represents the appearance of plaques of Yellow fever virus in a 6-well tissue culture plates. The first well is inoculated with 10^{-1} dilution of the virus and clear but non countable plaques were seen. The 2nd well was inoculated with 10^{-2} dilution and 0.2 ml of inoculum after an adsorption time of 4 hours followed by 7 days of incubation at $36^{\circ}\text{C} \pm 1^{\circ}\text{C}$, and clear countable plaques were seen.

Incubation Time Period:-

Results of standardization of incubation time showed that plaque development occurred best after 7 days of incubation. (Table-6)

On 5th day of incubation the plaque development was poor as very small sized plaques were seen. On 7th day clear and distinct plaques were observed.

Table 6:- Effect of Time Period of Incubation on Plaque Development.

Incubation period	Results
5 days	Small sized plaques; poor development.
7 days	Clear distinct plaques.

After standardization of the different parameters for the establishment of the plaques assay on Vero cells, a standardized procedure was followed for the demonstration of the plaques assay. The final results were recorded and photographed. Image1 represents the appearance of plaques of Yellow fever virus in a 6-well tissue culture plates. The first well is inoculated with 10^{-1} dilution of the virus and no clear plaques were seen. The 2nd well was inoculated with 10^{-2} dilution and 0.2 ml of inoculum after an adsorption time of 4 hours followed by 7 days of incubation at $36^{\circ}\text{C} \pm 1^{\circ}\text{C}$, and clear countable plaques were seen.

Vaccine titration: The final results recorded after standardization of different parameters of Plaque assay method.

Table 7:- Vaccine titre values obtained by PFU Method.

S. No.	Titre values of test performed (Log ₁₀ PFU/0.5ML)
1.	4.50
2.	4.49
3.	4.40
4.	4.47
5.	4.46
6.	4.43
MEAN	4.45
S.D.	0.37

Test titre values obtained by PFU method are given in Table-7. The lowest and the highest titres were 4.40 log PFU/ 0.5ml and 4.50 log PFU/ 0.5ml, respectively with mean of 4.45; standard deviation (SD) of 0.037. The titres obtained from PFU method were all above the minimum requirement for Yellow fever vaccine potency *i.e.*, 4.24 log PFU/ 0.5ml.

Table 8:- Vaccine titre along with IS titre obtained by PFU Method

S. No.	Titre values of test performed (Log10 PFU/ 0.5ml)		Titre values of IS (Log10 PFU/ 0.5ml)
Batch	A	B	
1.	4.50	4.47	4.72
2.	4.49	4.46	4.67
3.	4.40	4.43	4.69

Test was performed with two different batches of vaccine, A and B respectively, along with the test of IRS with PFU method. One sample from each batch was simultaneously titrated with IRS sample. The results obtained are given in Table-8.

Table 9:- Vaccine titre and Manufacturer's titre values.

4.	4.47	4.54
5.	4.46	4.57
6.	4.43	4.56
MEAN	4.45	4.59
S.D.	0.037	0.046
CORR.	0.916	

**Graph 1:-** The different results of titration of two batches A and B compared with the titre values of manufacturer.

6 different vials of Yellow fever 17D vaccine of two different batch numbers (A and B), were titrated for potency testing and were compared with the titre values of manufacturer. The results obtained are given in Table-9 and GRAPH-1. The lowest and the highest titres were 4.40 log PFU/ 0.5ml and 4.50 logs PFU/ 0.5ml, respectively with mean of 4.45; standard deviation (SD) of 0.037; and correlation coefficient (CORR.) was 0.91. The titres obtained from PFU method were all above the minimum requirement of Yellow fever vaccine potency *i.e.*, 4.24 log PFU/ 0.5ml. The assay was found to be reproducible.

Discussion:-

Vaccine potency of Yellow fever is routinely assay by Mouse LD₅₀ method (*in-vivo* method). Modern techniques in virology have shown that cell culture techniques are useful for potency and stability tests of many viral vaccines ^[14]. The potency test carried out in mice can be replaced by an alternative cell culture technique (*in-vitro*) for Yellow fever vaccine ^[13].

However, Mouse LD₅₀ method is sensitive with a long observation period *i.e.*, 21 days and involves large number of animals (8 for each dilution). On the other hand plaque technique is quite sensitive, accurate, less time consuming method for titration. The PFU method gives result in 7 days, and has no use of animals. Many problems of taking care of mice, their food, and breeding etc., and problems faced due to premature death, variation in animal immune status, sensitivity to particular immunological products and variability in results can be avoided.

Keeping in mind the guidelines of RRR, for use of laboratory animals, an attempt has been made through this study to establish Plaque Assay method by replacing MouseLD₅₀ method for potency testing, in CRI, Kasauli. As *in-vitro* Plaque Assay is already established as equivalent method to *in vivo* MouseLD₅₀ method, by WHO and also recommended in IP ^{[11][12]}.

The manufacturers of Yellow fever vaccine across the world are presently using PFU method to establish the titre of Yellow fever vaccine. In India, the titration of Yellow fever vaccine is being done by using mouse LD₅₀ or CCID₅₀ method. So to harmonize the methodology (as per the ICH guidelines) an attempt to adapt PFU method is made.

Different parameters were standardized for the plaque assay of Yellow fever vaccine on Vero cell line. The plaque assay was carried out in 6-well tissue culture plate. The first parameter was to standardize the cell count of Vero cells to be used per well of the 6-well tissue culture plate. The cell count which gave a complete monolayer formation after overnight incubation was the criteria for the selection. For that, varying number of cells, ranging from 2×10^5 to 5×10^5 per ml, were added to the individual wells of the 6-well tissue culture plate. The plate was incubated at $36^\circ\text{C} \pm 1^\circ\text{C}$ for overnight.

The cell count of approximately $3-4 \times 10^5$ cells/ml were found suitable as the cell number lower than this could not give a complete monolayer formation while on the other hand the cell count higher than $3-4 \times 10^5$ cells/ml, produced a confluent monolayer after overnight incubation, and produced a thick cell sheet and more than 50% of the cells were found rounded.

Standardization of different parameters for establishment of plaque assay was the next step of the study, such as dilution of the virus inoculum, size of inoculum, concentration of methyl cellulose and incubation time etc.

The dilution of the virus which could give at least 4.24 log₁₀ pfu/ 0.5ml was also standardized. The dilutions from 10⁻¹ to 10⁻⁵ were tested and finally 10⁻² dilution was selected, as it gave the desired pfu/ml.

In case of 10⁻¹ there is high pfu/ml and the entire sheet was found detached due to excessive infection as shown in Image1. At 10⁻³ dilution of the virus, very less number of plaques was seen. This may be due to low number of virus particles.

After the standardization of dilution of the virus, inoculum size of the virus was also standardized. For this, three different inoculum sizes were tested; 0.2ml, 0.3ml, and 0.4ml/well. Out of these, inoculum size of 0.2ml was found to be suitable for the study. With 0.3ml inoculum no major differences was observed. However, with inoculum size of 0.4ml, no plaques were seen due to excessive degeneration of cell line. So Yellow fever virus suspension adjusted to contain 4.24 log₁₀ pfu/ 0.5ml, and the inoculum size of 0.2ml/well of a 6-well tissue culture plate were finally selected for the plaque assay.

The effect of different adsorption time on the attachment and development of plaques was also studied. Two different adsorption times were studied *i.e.*, 1 hour and 4 hours. At 1 hour, no plaque development occurred as shown in Image-2 and 3. Best results were obtained at 4 hours of adsorption time and it was selected for the present study.

In order to localize the plaques, different concentrations of methyl cellulose were incorporated in the overlay media (MEM with 2% FBS) *i.e.*; 0.8%, 1%. The final concentration of 1% was found optimum for the plaque assay, as the Vero cells did not show any abnormal behaviour at this concentration. 1% MC just maintained the semi-solid nature of the overlay media, which is quite necessary for the localization of the plaques. The incubation period for the development of plaques was also standardized, and incubation period of 7 days was found to be adequate.

After standardization of different parameters, the reproducibility of the assay was also tested and was found to be good. The plaques were seen as clear, distinct and uniformly distributed. The titration of Yellow fever vaccine was performed on 6 different vials of two different batches along with the IRS and compared with the titre values of manufacturer potency assay. The results show titre above lower limit of 4.24 log PFU/0.5ml. The range of titre results was from 4.40 to 4.50 log PFU/0.5ml with mean of 4.45; SD of 0.037; and Corr. of 0.91.

Conclusion:-

The conclusions of the present study are:-

The plaque formation of Yellow fever 17D vaccine virus is affected by the inoculum size, dilution of virus, duration of adsorption, temperature and concentration of overlay media (MC).

From present study it can be concluded that plaque assay using Vero cell line can be used for potency testing. Mouse LD₅₀ method is sensitive with a long observation period *i.e.*, 21 days and involves large number of animals (8 for each dilution). On the other hand plaque technique is quite sensitive, accurate and less time consuming method for titration.

It is also concluded that PFU method as potency assay of Yellow fever vaccine is reproducible with a mean titre of 4.45; SD of 0.037; and Corr. Coff. Was 0.91. However, further studies are required for the establishment of plaque assay method for the potency testing of Yellow fever vaccine.

Effectiveness, Structured teaching programme (STP), Knowledge, Women, Cervical cancer.

Abstract

Background: Most of the women keep struggling with cervical cancer because of barriers such as early detection and timely treatment which can be changed by adequate knowledge about the disease.

Aim: To assess effectiveness of Structured teaching programme (STP) on knowledge regarding cervical cancer among women in Sanganer district, Jaipur.

Objective: To assess pre-test and post-test knowledge regarding cervical cancer among women and find out association between knowledge regarding cervical cancer with their selected demographic variables.

Methodology: The design explains one group pre test post test design, quasi experimental design to measure the effectiveness of the structured teaching programme on knowledge regarding cervical cancer among rural women in selected area of Jaipur.

Result: Findings of study reveals that mean pre test knowledge score about cervical cancer is 9.65 and post test mean knowledge score is 17.87, structured teaching programme was found to be effective in increasing the knowledge regarding cervical cancer. No significant relationship was found between knowledge regarding cervical cancer and selected demographic variables in Pre test but in post test significant association between education and knowledge score were found. So more educated people had more knowledge score in post test.

Introduction:-

Approximately 132,000 new cases are diagnosed and 74,000 die annually in **India**, accounting to nearly 1/3rd of the global **cervical cancer deaths**. Cervical cancer, mainly caused by Human Papillomavirus infection, is the leading cancer in Indian women and the second most common cancer in women worldwide. Though there are several methods of prevention of cervical cancer, prevention by vaccination is emerging as the most effective option. Early detection and timely treatment can reduce the burden of cervical cancer in India cancer

Background of the study:-

Cervical cancer is the major and devastating death for cause to young girls and their mothers, mortality and morbidity worldwide with an estimated take control of their health and help them protect themselves against cervical cancer. But most of them keep struggling with the disease because of lack of knowledge about the disease.

Corresponding Author:- Kumari Nutan¹.

Address:- Assist. Professor Institute of Nursing KGMU Lucknow, Uttar Pradesh, India.

Need of the study:-

70% or more cases found are of stage 3 or higher at diagnosis. Establishment of baseline indicators to monitor and evaluate cancer control programs, require data on incidence, clinical stage at presentation, and survival rate which concluded that all programs will be effective if they are able to persuade women with abnormal screening tests to attend for diagnosis and treatment, and facilities for treatment. Women, living in rural community need knowledge about the cervical cancer for early detection, screening and treatment about cervical cancer. A teaching programme for the women living in rural area will help them to know about etiological risk factor, signs symptoms, diagnosis and treatment aspects of cervical cancer which will help in early diagnosis and prompt treatment.

Aim and objective:-

- To assess pretest knowledge regarding cervical cancer among women.
- To find association between knowledge regarding cervical cancer with their selected demographic variables.
- To assess post test knowledge regarding cervical cancer among women.

Material and Methods:-

One group pre test_ post test was used on a sample of 60 women aged between 25 to 45, who were resident of Mangyawas of Sanganer . Subjects were enrolled by convenient sampling and data was collected by self reporting .

Tools:-

The questionnaire consisted of two sections. Section A consists of the questionnaire on demographic information of the respondent. Section B consists of 30 questions on knowledge of women regarding cervical cancer. The reliability coefficient (Pearson's co-efficient) was $r=0.739$. Each correct item was given a score of one and incorrect response a score of zero. The maximum scoring possible was 30 and minimum was zero. The scoring was categorised as

0—10 --- Poor

11---20 --- Satisfactory

21 -- 30 --- Good

Data Collection:-

Data was collected from the women aged between 25 to 45 years and residing in locality, Mangyawas of community health center of Sanganer. The study was conducted from 13 June 2015 to 26 June 2015. Prior permission was obtained through letter from Medical Officer of C.H.C of Mangyawas. Ethical permission was granted by committee in B.M.C.H.R.C, Jaipur

Result:-

Finding of study reveals that more than half of the women had poor knowledge regarding cervical cancer in pre test but of them none had in post test, i.e. score ranging from 01-10. Data revealed that 36.66% have satisfactory knowledge regarding cervical cancer in pre test were as in post test it raised to 85%, had scoring range from 11-20. None had scoring range from 21-30 in pre test and it reached to 9 in post test.

Table I:- Pre test Post test scoring of knowledge regarding cervical cancer N=60

SL. No	Scores	Pre test		Post test	
		Frequency	Percentage	Frequency	Percentage
1	01-10	38	63.33	0	0
2	11-20	22	36.66	51	85
3	21-30	0	0	9	15

Comparison of Pre test and Post test Knowledge score of samples

Figure 1:- Bar diagram showing comparison of pre test and post test knowledge s

Table Iii:- Effect of structured teaching programme N=60

Knowledge score	Mean score	Mean difference	Standard deviation Of difference	t value
Pre test	9.63	8.21	2.53	3.239
Post test	17.85			

t = 3.239, p = 5.52628E-31

p = 5.52628E-31 < 0.05 (level of significance) thus, shows that structured teaching programme is effective in increasing the knowledge regarding cervical cancer.

Table Iv:- Association between post test knowledge score and demographic variable N=60

S.No	ITEMS		11-20	21-30	Chi square	Table value	Result
1	Age in years	a)25-30	14	4	$\chi^2=0.990008$	7.81	No association
		b)31-35	12	2			
		c)36-40	19	2			
		d)41-45	6	1			
2	Educational Status	a)Secondary	39	2	$\chi^2=6.3725$	5.99	Significant association
		b)Senior secondary	10	6			
		c)Graduate	2	1			
		d)Post Graduate	0	0			

Discussion:-

The finding on the existing knowledge regarding cervical cancer among women shows that more than half of the women have poor knowledge score none of them have good. Mean knowledge score of pre test is 9.633 \pm 1.99. The finding is comparable to study by Nwankwo. K in 2010 where Nigerian women from urban and rural area were included in the study. Only 15.5% of the respondents were aware of availability of cervical cancer screening services. Only 4.2% had ever done Pap smear test. Hindrance in the use of available cervical cancer screening services were lack of knowledge (49.8%) and the feeling that they had no medical problems (32.0%).

The study shows that there is no significant relation between knowledge regarding cervical cancer and Age groups, Educational Status, Occupational status, Marital Status, Age of first intercourse, Number of children, Use of contraceptive pills, Pattern of Menstruation and Family history of Cervical Cancer. This also supports the finding of the study by Lee EE on Korean American women. It was founded that women never undergone Pap smear in the preceding 3 years irrespective of the variables as age, marital status, income, knowledge of early detection method for cervical cancer, and perceived beliefs about benefits of and barriers to receiving Pap tests. Components were suggested for the groups of Korean American women who never undergone Pap smear and for those who have not had one in the preceding 3 years. The common intervention strategies that aim to increase knowledge and perceived benefit and to decrease perceived barriers to receiving Pap tests.

Conclusion:-

From the researcher point of view screening is the first step for fighting against this deadly disease and until and unless this knowledge is propagated in women no program will be effective in control of cervical cancer. The structured teaching programme on cervical cancer is effective tool as demographic variables show little role in post test knowledge score. Women were ignorant about their health and have less knowledge regarding cervical cancer, so awareness camp should be organised to promote screening test. 'Cervical cancer' is curable, if detected early and in terminal stages it is the quality and not the quantity of life that really matters and is possible only by education and knowledge enhancement by awareness camps.

Resistance training, explosive strength, under graduate college female students

Abstract

The present study was to find out the effect of resistance training on power parameter among under graduate students. To achieve the purpose twenty under graduate female college students ($n = 20$) were selected as subjects and their age ranged between 18 and 25 years. They were divided in to two equal groups, each group consisted of ten ($n = 10$) subjects. The group I underwent resistance training (RTG), and group II acted as a control (CG) who did not exposed any special training apart from their regular activities. The training period of this study was limited to three days in a week for eight weeks. Explosive strength was selected as a criterion variable of this study and it was measured by using vertical jump. The analysis of covariance (ANCOVA) was applied as a statistical tool. In all cases 0.05 level of confidence was fixed to test the significant, which was considered as in appropriate. It was concluded from the result of the study that there was a significant improvement ($p \leq 0.05$) on explosive strength due to resistance training compared to control group.

Introduction:-

Resistance training is a form of exercise that improves muscular strength and endurance. During a resistance training workout, you move your limbs against resistance provided by your body weight, gravity, bands, weighted bars or dumbbells. Some exercise machines can also be used for resistance training (<https://www.verywell.com/what-is-resistance-training>). Resistance training is the use of resistance to muscular contraction to build the strength, anaerobic endurance and size of skeletal muscles. Resistance training is based on the principle that muscles of the body will work to overcome a resistance force when they are required to do so. Resistance training has been general categorized into major type with different objectives: "strength type" and "hypertrophy-type". The former consists of high intensity exercises with two repetition and long rest periods between sets. This type of regimen is used for gaining strength. On the other hand, the hypertrophy type regimen consists of moderate intensity exercises with higher repetition and shorter rest periods between sets. This type of regimen has been thought to be effective in gaining muscle size (Kraemer, 2001). Recently, the use of a single particular type of regimen throughout the training period has become less common: instead, multiple training regimens are used in a periodized fashion, because it is thought that they course greater strength gains in muscles (Marx, 2001). When do the resistance training repeatedly and consistently, the muscles become fit. (<https://www.betterhealth.vic.gov.au/health/resistance-training-health-benefits>).

Power is defined as the amount of work performed per unit of time. Power is an element of skill-related fitness that is needed to excel in athletic performance. Increased strength does not always translate into increased power. For example, a strong upper body lifts a high amount of weight. However a strong upper body does not always have the ability to throw a shot put very far if enough speed cannot be generated (www.livestrong.com.Sports and Fitness). Although power is a fundamental part of human relations, little is known about power in daily life. We studied the everyday experience of power by surveying individuals multiple times over 3 d regarding their subjective feelings of power and positional power (www.hydrol-earth-syst-sci.net). Power dynamics were a common, though not constant, experience. Rather than power being concentrated among a few individuals, almost half of participants reported sometimes holding high-power positions. People's feelings of power did not always map onto the positions they held. Most variability in power was related to people's changing situations rather than their stable traits. Low power negatively affected mood and cognition. Contrary to negative stereotypes of power holders, higher power was associated with greater feelings of responsibility (Smith & Hofmann, 2016).

Materials and Methods:-

The present study effort was made to find out the effect of resistance training on explosive strength of under graduate female college students. To achieve these purpose twenty (n = 20) under graduate female students were chosen as subjects from Physical Education Department, Calicut University, Kerala and their age ranged between 18 and 25 years. They were divided into two equal groups, each group consisted of ten (n = 10) subjects. The group I underwent resistance training (RTG) and group II acted as a control (CG) who did not exposed any special training apart from their regular activities. The training period of this study was limited to three days in a week for eight weeks. Explosive strength was selected as a criterion variable and it was measured by using vertical jump. For every training programmer there would be a change in various structures and system in a human body. The experimentation was subjected to eight weeks of resistance training. The training programme was scheduled for one session per day between 6 am to 7 am. Training was given under the direct supervision of the investigator. The progression of load was followed during experimentation. The following exercises were used to resistance training and performed with progressive methods squat, power clean, front squats, bench press, overhead press, dead lift, barbell row, pendlay row. The exercises were arranged from simple to complex.

Table-I:- Percentage of Intensity, Repetition and Sets of Resistance Training

Group I	Components	Weeks			
		I & II	III & IV	V & VI	VII & VIII
Resistance	Intensity	60%	70%	80%	90%
	Repetition	8 to 10	6 to 8	4 to 6	2 to 4
	Sets	2	2	3	3

Data Analysis:-

Mean and Standard deviation were calculated for explosive strength for each training group. And the data analyzed by using analysis of covariance (ANCOVA). Statistical significance was fixed at 0.05 levels.

Results:-

Table – II:- Analysis of Covariance on Explosive Strength of Resistance Training group and the Control Group

	SD	1.6	1.8	W	53.80	18	2.9		
Post test	Mean	26.3	23.3	B	45.00	1	45.0	7.62*	
	SD	2.44	4.71	W	106.20	18	5.90		
Adjusted Post test	Mean	26.4	23.2	B	49.50	1	49.50	11.11*	
				W	74.95	17	4.40		

*Significant at 0.05 level of confidence

(The table value required for significance at 0.05 level of confidence with df 1 and 18 and 1 and 17 are 4.41 and 4.45 respectively)

Table II shows that the pretest mean values on explosive strength for the resistance training group and the control group are 21.9 and 22.1 respectively. The obtained F ratio of .067 for the pre test mean is less than the table value 4.41 for df 1 and 18 required for significance at 0.05 level. The post tests mean of resistance training and control group are 26.3 and 23.3 respectively. The obtained F ratio of 7.62 for post test mean is higher than the table value 4.41 for 1 and 18 required for significance at 0.05 level. The adjusted post test mean of resistance training group and the control group are 26.4 and 23.2 respectively. The obtained F ratio of 11.11 for adjusted post test mean is higher than the required table value 4.45 for df 1 and 17 required for significant at 0.05 level.

The result of the study indicated that there was a significant difference between the adjusted post test mean of the resistance training and the control group on explosive strength at 0.05 levels. The pre, post and adjusted post test mean values of the resistance training and the control group on explosive strength is graphically represented in the figure 1.

Figure 1:- The pre, post and adjusted post test mean values of resistance training group and the control group on explosive strength

Discussion:-

This study revealed that there was a significant improvement on explosive strength due to resistance training compared to control group. The result of this study is much related to other studies conducted before. Matavuji *et al.* (2001) conducted his study to evaluate the effects of resistance training on elite junior basketball players. The result of the study was proved that the training positively influenced the vertical jumping height of the selected subjects after the training duration. Markovic (2007) conducted his study to evaluate the effect of resistance training among the selected male subjects. The result of the study indicated that, the training was positively influenced the vertical jumping ability of the subjects as compared with the control groups. Martinez *et al.* (2011) included 40 women and 38 men medium level sprinters in their study. The resistance training was conducted for the duration of 8 weeks and reached the conclusion that the training was significantly improved the jumping ability of the both men and women subjects. Young *et al.* (1995) conducted his study to effects of resistance training on strength, power, among women. The result of the study was proved that the progressive resistance exercise can produce substantial increases in muscle strength and in power for women. Jeffrey *et al.* (2002) conducted his study to evaluate the effect of heavy- vs. light-load jump squats on the development of strength and power. The result of the study was proved that the investigation indicates that training with light-load jump squats results in increased movement velocity capabilities and those velocity-specific changes in muscle activity may play a key role in this adaptation. Moktar *et al.* (2008) conducted his study to evaluate of concurrent endurance and circuit resistance training sequence on muscular strength and power development. The result of the study was proved that the resistance circuit training alone induced strength and power improvements that were significantly greater than when resistance and endurance training were combined, irrespective of the intersession sequencing. So the present study clearly mentioned that there was a significant improvement made on explosive strength due to systematic of resistance training.

Conclusion:-

The resistance training can be improved explosive strength during the age between 18 and 25 years of under graduate female college students. The results of the study indicated that there was a significant improvement on explosive strength due to eight weeks of resistance training. From the result we recommended that the resistance training is very suitable to improve explosive strength.

Abstract

It is to note that today's world considers English as a global language because there has never been a language so widely spread or spoken by many people as English. English is one of the primary languages that is taught almost everywhere in the world. It has a lot of extended reach and influence around the world. The India has a tremendous amount of need to learn English as a second language. Every educational system has certain objectives which aim at bringing about desirable changes in pupil. In order to bring about those changes, the institutions arrange learning experience. The success of learning can be judged only in terms of the changes brought about by this experience and evaluation.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

It is significant to note that English has become a world language rather than the language of only the English speaking countries such as the UK and the USA because the number of the people who use English as a means of communication exceeds much more than the number of the people who speak it as their mother tongue. In the case of English in India, more than two centuries, India has been directly and indirectly had influence of the language, English on all the fields, such as Education, Medical Science, etc. It examines the present status of English as a second language in India. This article lists different phases of learning English, defines language and identifies the factors that affect second language learning. It also asserts that it is essential for a language teacher to understand what a student is intending to say or communicate. This understanding forms the basis for a teacher to select a proper approach, method and technique that would be useful to his or her students. This paper also discusses different problems faced by teacher and learners of English in India. It also explains the need for a teacher to be resourceful and knowledgeable to meet the grave situation and promote better standards of achievement.

Teaching English As A Second Language:-

The Council of Chief State School Officers (CCSSO), U.S., defines English language proficiency in this way: A fully English proficient student is able to use English to ask questions, to understand teachers, and reading materials, to test ideas, and to challenge what is being asked in the classroom. Four language skills contribute to proficiency as follows:

1. Reading - the ability to comprehend and interpret text at the age and grade appropriate level.
2. Listening - the ability to understand the language of the teacher and instruction, comprehend and extract information, and follow the instructional discourse through which teachers provide information.
3. Writing - the ability to produce written text with content and format fulfilling classroom assignments at the age and grade-appropriate level.

Corresponding Author:- Y. Rajasekhar.

Address:- Asst. Professor of English, Govt. Degree College for Men, Kurnool.

4. Speaking - the ability to use oral language appropriately and effectively in learning activities (such as peer tutoring, collaborative learning activities, and question/answer sessions) within the classroom and in social interactions within the school. Hence, the teacher should keep in mind while teaching English as a second language to the students.

English As A Second Language In India:-

English in India is a question of linguistic centralism while the other Indian languages lead to linguistic regionalism...A foreign languages existing so firmly and distinctly has posed a problem to the country .Yet the language problem became more complicated without any practical solution .In the process of teaching-learning ,the teacher should try to understand the student first .Then only he/she can enable the students to understand his/her teaching .Theory with practice on some of the teaching topics ,may enable the students to understand the concept easily. The growing modernization and internationalism in the world prevented us from doing away with the English language .Besides ,Indian languages are associated with tradition and are understood to be anti-modern .Therefore , a complete switchover to the Indian languages would lead to educational chaos and complete isolation from the developments on the international arena .We could not risk this because of the cultural ,social ,political and economic reasons .Hence ,this situation requires an urgent solution .

The only resolution that could be thought of was a need for coexistence of English with Indian languages .As a result, we had to define the role of English in India and its relationship with Indian languages .As a result, we had to define the role of English in India and its relationship with Indian languages .Further, the role of English was strengthened and consolidated as English was recognized and perceived as:

- The language of knowledge(science and technology)
- The language of liberal, modern thinking
- A window on the world
- The language of library

Thus, the three language formula came in to existence. This policy was proposed in 1956 by the central advisory board on education and was adopted at the Chief Ministers conference in 1961. The policy aimed at making English an integral part of the school education in India .this naturally restricted the learning and use of Hindi and the students started learning English as second language.

Common problems affecting teaching / learning english as a second language in india:-

There are so many factors that affect the teaching-learning process in India. The students in India can be categorized into two; the one is having the regional language as medium of study from the primary level and the other is having English as the medium of study. Hence, the problem of teaching English as a second language, to the Indian students starts from the pre schooling. Teaching of English in India has always been in difficult circumstances .This is so because of the large population of the country, bleak economic conditions, the cultural diversities, etc

Excess strength in class:-

With our large population we do not find any class where students number is less than 60.As the student in the class are always heterogeneous, there is hardly any time to pay attention to the weak or creative child .Even the average child do not get enough experience in the use of language .There is no scope for individual attention. This certainly, hinders the intellectual growth.

Lack of exposure:-

Most of the Indian students are exposed to their mother tongues .They do not get adequate opportunities either to listen to or speak in English .Because of the poor social and economic backgrounds ,they neither get enough exposure to English outside the classroom to improve themselves.

Lack of motivation:-

As students do not find any immediate need for English, their interest naturally lacks .Similarly, as there is no immediate reward for their achievement, the interest decreases. The poverty and the insecure sociological conditions also force them to neglect the language. Learning a foreign language is not an easy task and the much needed exposure and practice are not available to achieve fluency in the use of the language.

Lack of expert teacher:-

Good teachers of English are found in small number in India. Hence, not having a good teacher of English is common experience of all the students of English. The teachers of ENGLISH are either not trained by the teachers of English in India but not by the native speakers. Even the materials and methodology used in these training programs are outdated. As such, it is the same limited experience that is shared. There is hardly any scope to improve intuitive and spontaneous knowledge of the language. With all problems, discussed above, the standard of English in our country is deplorably low. Hence, a lot of responsibility is thrown on the shoulders of the teachers to make their classes interesting and learning of English fruitful. They have to gear up to meet the demands of the situation and successfully perform their duties.

Conclusion:-

This paper intends to bring facts that in our country about 75% of the students are from rural areas and they are coming through regional language medium schools. Keeping in mind the standards of the students and based on their background, we have to design the syllabus and adopt methods to test their English language proficiency. Therefore, it is necessary to go for a detailed discussion as to whether the existing curriculum is fulfilling the need of the hour and suitable to the students in achieving their goals. Taking into consideration of all the above points and undergoing a detailed analysis, a real solution may be found out for the betterment of the students as well as society.

Key words:-

Toxoplasmosis, Abortion, Screening,
Hail, KSA.

Abstract

Background: Toxoplasmosis is one of the most common parasitic infections with variable prevalence in different countries caused by *Toxoplasma gondii*. The importance of toxoplasma mainly due to the risk of disease transmission during pregnancy and suggested its role in abortion. Chronic toxoplasmosis causes repeated abortion especially at first trimester.

Objective: This study aims to determine the proportion of women with Toxoplasmosis who experienced recurrent abortion among 2 years 1432 and 1433 and the relationship between the incidence of Toxoplasmosis and recurrent abortion in Hail with the effect of treatment.

Subjects and method: Data was collected from Maternity and Children's Hospital in Hail as a representative case in Hail, Saudi Arabia about women who had suffered from recurrent abortion (3 or more) among 2 years 1432 and 1433 and the seroprevalence of *Toxoplasma gondii* antibodies in pregnant women.

Results: indicate that the percentage of abortion due to toxoplasmosis in relation to total abortion due to different causes among 2 years (1432 & 1433) was found to be 2.85%. High percentage was found at first trimester (62.1%) followed by second trimester (31%) and then third trimester (6.9%). There is no significant difference between percentages either in year 1432 or 1433. High percentage of abortion due to *Toxoplasma gondii* was found in participant women with age of 25-45 years old.

Conclusion: We can conclude that it is of great importance to avoid raw or undercooked meat, preventing close contact with cats and early treatment from toxoplasmosis.

Introduction:-

Toxoplasmosis is a parasitic infection caused by *Toxoplasma gondii* (*T. gondii*) with variable prevalence in different countries. Some studies have suggested its role in abortion (Ebadi et al., 2011). There are three main routes of

Corresponding Author:- Madiha Rabie Mahmoud.

toxoplasma transmission through ingestion of raw or undercooked meats, exposure to oocyst-infected cat feces, and vertical transmission. (Elmore et al., 2010).

Detection of IgM antibody in a woman who had abortion indicates the possible role of *T. gondii* in abortion phenomenon in Ahfaz, Southwest of Iran 2015 (Saki et al., 2015). The seroprevalence of *T. gondii* antibodies in pregnant women varies from the 6.1 to 75.2 % based on the geographical region (Elsheikha, 2008). This prevalence is 7.6% in India, 15-41% in Africa, 21% in Pakistan and Bangladesh, 31% in Ireland, 33% in Caribbean, 55% in France and 46% in other European countries (Remington et al., 2006). Other authors found that (53.14%) of women with recurrent abortion and (69.35%) of women with neonatal deaths tested positive IgM antibody against Toxoplasma. Although spontaneous abortion due to congenital toxoplasmosis is well known, it is yet controversial that to what extent toxoplasmosis can cause habitual abortion (Ebadi et al., 2011). Also Toxoplasma antibodies detected by positive serological tests tend to be higher with increased age and parity it seems that they have no role in habitual abortion, the study conducted between January 2000 and May 2001 at King Hussein Medical Center (Qublan et al., 2002). Toxoplasmosis can be involved in etiology of abortion and stillbirth (Ghasemi et al., 2016). The results indicate that the Type II *T. gondii* is associated with ovine abortion (Chessa et al., 2014). Other study indicates that chronic toxoplasmosis, most probably is significant cause of repeated abortion, also found that toxoplasmosis has a significant relation to abortion at first trimester (Sahwi et al., 1995). Also a higher percentage of antitoxoplasma IgG antibodies positivity in women with repeated abortion than the control group (Ebadi et al., 2011). Other study presents evidence of Toxoplasma infection in Quasseem, Saudi Arabia and directs the attention that toxoplasmosis is an important cause of repeated abortion there (El-Sebai, 1991). There is a relatively high seroprevalence of acute Toxoplasma infection in pregnant women, with the potential for transmission of the parasite to the fetuses (Al-Mohammad et al., 2010). Other study mentioned that one of every three pregnant women in Aydin was at risk of toxoplasmosis at the first trimester of their pregnancy (Ertug et al., 2005). Another study found that the seroprevalence increased significantly with age and was higher in the lower socioeconomic strata (Rossa et al., 2008).

Mwambe, et al. (2013) found that in *Mwanza, Tanzania* about 30.9% were sero-positive for *T. gondii*-specific antibodies. Infection was higher in urban than those from rural communities (41.5% versus 22.0%). Also, employed women were more likely to get infection than peasants (40.0% versus 25.9%). The risk of infection was increased by 7% yearly also with increased woman's age.

Therapies are based primarily on spiramycin because of the relative lack of toxicity and high concentration achieved in the placenta (Han et al., 1999). The effect of treatment with spiramycin on 122 women with recurrent abortions and 55 women with neonatal deaths who had tested positive for IgM antibody, 115 (94.26%) in current abortion group and 35(63.64%) in neonatal death group delivered normal babies (Zargar et al., 1999). Another study recommended that spiramycin treatment be started as soon as possible once the diagnosis of maternal Toxoplasma infection during pregnancy is proved or strongly suspected, because a prolonged time interval between onset of infection and start of treatment seems to be associated with the presence of severe fetal lesions at the time of prenatal diagnosis (Hohlfeld et al., 1989). Another study found a weak evidence for an association between early treatment and reduced risk of congenital toxoplasmosis (Leproust et al., 2007). Spiramycin may reduce the risk of materno-fetal transmission by 60%, but is in the present doses without influence on an already infected fetus. Pyrimethamine in combination with sulfonamides eradicates more effectively parasites in the placenta, and also in the fetus (Stray-Pedersen, 1992). The early start of treatment resulted in a significant reduction in the number of severely affected infant (Foulon et al., 1999).

Aim of the study:-

This study aims to determine the proportion of women with Toxoplasmosis who experienced recurrent abortion among 2 years 1432 and 1433. Also to discover whether there is a relationship between the incidence of Toxoplasmosis and recurrent abortion in Hail and the effect of treatment on this proportion.

Subjects and methods:-

Data were collected about women who had suffered from recurrent abortion among 2 years (Muharam 1432 to Dhu Al-hijah 1433) by making a survey of the medical records in Maternity and Children's Hospital. The data collected were related to the woman age, Number of pregnancies, Number of abortions, causes of abortions, exposure to treatment (duration and type).

Data were analyzed by using the SPSS software package (Chicago, IL, USA), and the chi-square test was used to compare proportions of cases in Toxoplasmosis infection. A statistically significant difference was assumed when the $p < 0.05$.

Results:-

Data was collected from Maternity and Children's Hospital in Hail as a representative case in Hail, Saudi Arabia. In table 1, the number of pregnant women among years 1432 and 1433 H was about 15319 women, about 50% in each year. The number of newborns among the same 2 years was 11252. The number of cases admitted to abortion department was 4057, and the number of abortion due to different causes was 1014 (6.62%); 7.28% in 1432 and 5.98% in 1433 in relation to the total number of pregnant women. Percentage of abortion due to toxoplasmosis in relation to total abortion due to different causes among years (1432 & 1433) was found to be 2.85% (2.90% for 1432 and 2.80% for 1433).

Table 2 showed the seropositivity of anti-toxoplasma among 2 years, for IgG (86.2%), IgM (0%) and Mixed IgG & IgM (13.8%). In year 1432, 1433 the percentage of positive IgG (93.8% & 76.9%), IgM (0%) and Mixed IgG & IgM (6.2% & 23.1%) respectively. Women with positive antibodies for toxoplasmosis have abortion at different gestational age among years (1432 & 1433 H). High percentage was found at first trimester (62.1%) followed by second trimester (31%) and then third trimester (6.9%). There is no significant difference between percentages either in year 1432 or 1433 H (Fig 1).

Table 2 showed also the frequency of abortion due to toxoplasmosis among 2 years (1432 & 1433) was found to be 69% for women that have abortion for 1-2 times and 13.8% (3-4 times) and 17.2% (≥ 5 times). These percentages have some variations among years (1432 & 1433), women with abortion 1-2 times (62.4% & 76.9%) and abortion for 3-4 times (18.8% & 7.7%) and abortion for ≥ 5 times (18.8% & 15.4%) respectively (Fig 2).

Table 3 showed that the age of participant women varies from < 16 to > 45 years old. High percentage of abortion due to toxoplasma gondii was found in participant women with age of 25 – 45 years old. From age of 25 – 34 years old was found to be (41.4%) and from 35-45 years old was found to be 44.8% among 2 years 1432 & 1433. Low percentage was found in women with age of < 16 – 24 years old (14.8%) and zero % in women with age > 45 years old (Fig 3). Causes of toxoplasmosis among years 1432 and 1433 H was found to be due to cats (3.5%) and due to other causes (96.5%) like uncooked meat, water and others (table 3). Treatment with spiramycin or pyrimethamine in combination with sulfonamides eradicates more effectively parasites in the placenta, and also in the fetus (data not shown).

Discussion:-

The importance of toxoplasma from the perspective of public health is mainly due to the risk of disease transmission during pregnancy (Elsheikha, 2008). Between 350 and 1,000 HIV-infected persons with seropositive for toxoplasmosis and have impact of congenital and AIDS-related symptomatic toxoplasmosis on morbidity and mortality in Kyrgyzstan (Minbaeva et al., 2013).

In this study, the number of abortion due to different causes was 1014 (6.62%), 7.28% in 1432 and 5.98% in 1433 in relation to the total number of pregnant women. Percentage of abortion due to toxoplasmosis in relation to total abortion due to different causes among 2 years (1432 & 1433 H) was found to be 2.85% (2.90% for 1432 and 2.80% for 1433). Elsheikha et al., (2008) said that the seroprevalence of toxoplasma antibodies in pregnant women varies from 6.1% to 75.2% based on the geographical region. In pregnant women worldwide, there are seroprevalences of toxoplasmosis from 7% to 51.3% and in women with abnormal pregnancies and abortions the seroprevalences vary from 17.5% to 52.3% (Galvan-Ramirez, et al., 1995). The prevalence of anti-Toxoplasma antibodies in Japan was 10.3%, and it was significantly higher in women aged above 35 years (Sakikawa et al., 2011), and in pregnant women in Tanzania (Mwambe, et al., 2013). In year 2012, congenital toxoplasmosis was estimated in France at 2.58 per 10,000 live; births and 204 cases of congenital toxoplasmosis were observed (Nogareda et al., 2014).

Our finding reported that, the sero-positivity of anti-toxoplasma among years (1432, 1433), for IgG (86.2%), IgM (0%) and Mixed IgG & IgM (13.8%). Our result was higher than the result of Vado-Solis et al. (2013). They found in Yucatan, Mexico that, 55.2% of the samples were positive to IgG, (3.4%) to IgM, (8.6%) to IgG and IgM. It is also higher than that reported by Ashraf et al. (2010), they found 41.90 % were seropositive for anti *T. gondii* IgG and 11.88 % for anti *T. gondii* IgM. It is also higher than that reported by Al-Harhi, et al. (2006) among pregnant

women in Makkah (Saudi Arabia) was (29.4%) for anti-Toxoplasma IgG, (5.6%) for anti-Toxoplasma IgM. Other authors reported that among pregnant women in Hebron district (Palestine) was (27.9%) for anti-IgG and (17.6%) for anti-IgM (Nijem and Al-Amleh, 2009). Other authors reported lower prevalence of Toxoplasma IgG (17.9%) and Toxoplasma IgM (12.8%) in Gaza city (Al-Hindi, 2009).

In Accra, Ghana, Seropositivity was found to be 51.2 % pregnant women for IgG anti-*T. gondii* antibodies, but 0% for mixed IgG and IgM, (Ayi, et al., 2016). The result of Murata et al., (2016) indicate that serum of pregnant women were positive for IgG (50%), and for IgM (91.9%).

This study found that high percentage of abortion was found at first trimester (62.1%) followed by second trimester (31%) and then third trimester (6.9%). This result was in agree with the result of Zargar, et al. (1998) who found that 48% of the abortions had occurred in first trimester followed by 36% and 16% in second and third trimester respectively.

In the current study, the frequency of abortion due to toxoplasmosis among years (1432 & 1433 H) was found to be 69% for women that have abortion for 1-2 times and 13.8% (3-4 times) and 17.2% (≥ 5 times).

In this study, high percentage of abortion due to toxoplasma gondi was found in participant women with age of 25 – 45 years old. From age of 25 – 34 years old was found to be (41.4%) and from 35-45 years old was found to be 44.8% among 2 years 1432 & 1433. Low percentage was found in women with age of <16 – 24 years old (14.8%) and zero % in women with age >45 years old. Our findings were in agree with the study carried out in Makkah Al-Mukarramah, the highest IgG and IgM seroprevalence were among participants aged 35 to 43 years (48.8% and 12% respectively) (Al-Harthi, et al., 2006). And also in agree with the study of Ashraf et al. (2010) in Sana'a, Yemen, participants women aged 31-40 years (45.3%), then age group 21-30 years 42.1%. found that toxoplasma antibodies detected by positive serological tests tend to be higher with increased age (Qublan et al., 2002). In Japan, the overall prevalence of anti-Toxoplasma antibodies was significantly higher in women aged above 35 years (Sakikawa et al., 2011).

Caroline Paquet, RM et al. (2013) stated that, spiramycin should be offered for fetal prophylaxis if pregnant women were infected but the infection not reached the fetus. Combined therapy of pyrimethamine, sulfadiazine, and folic acid should be started with toxoplasmosis infected women and fetus. Repeat testing should be performed within 2 to 3 weeks, if acute infection is suspected starting therapy with spiramycin immediately without waiting for the repeat test results. Moreover, treatment of pregnant women can modify the results of serological tests (Rodrigues, et al., 2014; Pomares and Montoya, 2016).

In this study, causes of toxoplasmosis among 2 years 1432 and 1433 was found to be due to cats (3.5%) and due to other causes (96.5%) like uncooked meat, water and others. On the other hand, Al-Hindi (2009) said that animal breeding was reported for 33.3% of the aborted women. A history of raw meat intake, exposure to oocyst-infected cat feces, and vertical transmission was identified to be a risk factor related to toxoplasmosis (Skariah et al., 2010; Elmore et al., 2010; Sakikawa et al., 2011).

Recommendations:-

Our study showed a moderate seroprevalence of *T. gondii* antibodies among pregnant women in Hail, KSA. Hence we recommend the implementation of health extension program among pregnant women in order to prevent primary infection during pregnancy. Screening of women for Toxoplasma antibodies before and during pregnancy and periodic surveillance of the disease among population all over the country is also recommended. It is of great importance to avoid raw or undercooked meat, handling raw meat safely and preventing close contact with cats. Also, the early start of treatment with spiramycin or pyrimethamine in combination with sulfonamides resulted in a significant reduction in the number of severely affected infant.

Acknowledgment:-

Many thanks to the manager of Maternity and Children's Hospital in Hail, KSA and the employments, Mr. Naief and Mr. Fahd, in the medical records department for their great efforts and help to collect data for this study.

Introduction:-

The contaminated hands of health care workers (HCW), play an important role in transmission of hospital infection, and is a common pattern seeing in most healthcare settings[1]. An important cause of morbidity and mortality among hospitalized patients worldwide, is Healthcare-associated infections (HCAIs), also known as nosocomial infections[2]. In developed countries, HCAs have been reported to affect 5%-15% of hospitalized patients and 9%-37% of those admitted to intensive care units (ICUs), while in developing countries , prevalence rates have been estimated to be between 14.8% and 19.1%[3]. The single most important measure to prevent cross-transmission of microorganisms and to reduce the rate of nosocomial infection is to maintain hand hygiene[4]. The landmark study carried out by Semmelweis in 1884 , demonstrated that the simple act of hand washing could save lives especially when health care workers do it routinely and thoroughly[5]. The organisms transmitted can be harmful for both patients and health-care workers ,and these organisms are sometimes resistant to antimicrobial agents (AMA) .Still, health-care workers(HCW), do not practice hand washing[6].

To reduce such infections in hospital, a targeted surveillance culture to identify asymptomatic carriers of multidrug resistant bacteria and subsequent isolation and treatment should be done. To predict possible risk of infection with multi-drug resistant bacteria in health-care settings , the sensitivity patterns of isolates should also be studied.

This study was therefore undertaken in a TERTIARY CARE HOSPITAL , LUCKNOW as part of a wide scale hospital infection control surveillance programme. It seeks to ascertain the proportion of bacterial colonization of the isolates from the hands of healthcare workers who are in regular contact with patients, and to determine multidrug resistant isolates for possible intervention.

Materials and Methods:-

This study was carried out in Era's Lucknow Medical College & Hospital, Lucknow, which is a tertiary care hospital , in the month of August 2015. Ethical clearance was taken from the Institutional Ethics Committee.

A total of 60 hand swab samples were collected from 60 healthcare workers of the Hospital. Of all the healthcare workers, 50 (83.3%) were female nurses and 10 (16.7%) were male nurses, which were choosen randomly. Sterile cotton wool swabs, which were pre- moistened in sterile normal saline, were used to swab the interdigital spaces, dorsal and ventral aspect of hands of the participants. The media used in this study were Blood Agar, MacConkey

Agar and Mueller Hinton Agar. The swabs from hands were cultured on Blood agar and MacConkey agar plates. The plates were incubated at 35°C for 24-48 hrs. The bacterial isolates were identified using bacteriological procedures, involving microscopy, morphology, and biochemical tests.

All detected bacterial isolates were tested for antimicrobial susceptibility test by the standard Kirby-Bauer disc diffusion method, according to the Clinical Laboratory Standard Institute (CLSI) guidelines. The test organism was picked up with a sterile loop, suspended in peptone water and incubated at 37°C for 2 h. The turbidity of the suspension was adjusted to 0.5 McFarland's standard. It was then spread on the surface of Mueller-Hinton Agar (MHA) plate using sterile cotton swab. After drying the plates (37°C for 30 minutes) antibiotic discs were applied by sterile forceps. *Staphylococcus aureus* ATTC 25923 and *Escherichia coli* ATTC 25922, *P. aeruginosa* ATCC 27853 were used as controls during the study.

Results:-

A total 60 hand swab sample, were collected from 60 healthcare workers of Era's Lucknow Medical College & Hospital, Lucknow, among which 50 (83.3%) were female nurses and 10(16.7%) were male nurses. Of the 60 samples analysed, 48 (80%) yielded bacterial growth, while 12 (20%) showed no bacterial growth. Out of the 48 isolates, 36 (75%) were Gram negative, and 12(25%) were Gram positive organisms. Also out of total 50(83.3 %) females nurses, 30(60 %) had Gram negative and 8 (16 %) had gram positive bacteria; while out of 10(16.7 %)male nurses, 6(60%) had Gram negative and 4 (40%) had Gram positive bacteria.(Table1)

TOTAL NO. (%)	TOTAL GRAM NEGATIVE	TOTAL GRAM POSITIVE
FEMALE NURSES- 50 (83.3)	30 (60%)	8 (16%)
MALE NURSES – 10 (16.7)	6 (60%)	4 (40%)

TABLE 1:- (Distribution of Gram negative and Gram positive bacteria among female and male nurses)

Also out of total 38 bacterial isolates in female nurses,30(78.9 %) were Gram negative and 8 (21.05 %) were gram positive bacteria ;while out of 10 bacterial isolates in male nurses, 6 (60%) were Gram negative and 4 (40%) Gram positive bacteria.(Table 2)

SOURCE		TOTAL NMBER OF ISOLATES	GRAM NEGATIVE	GRAM POSITIVE
HAND SWABS	FEMALE NURSES	38	30(78.9%)	8(21.05%)
	MALE NURSES	10	6(60%)	4(40%)

TABLE 2:- (Distribution of Bacteria among nurses, out of total bacterias isolated)

Of the 60 samples analyzed, bacterial isolates were seen in 48. Out of total 48, organisms were identified as 22(45.8%) *Escherichia coli*, 4(8.3 %) *Pseudomonas aeruginosa* ,10(20.8 %) *Klebsiella pneumoniae* and 12 as *Staphylococcus spp*, of which 8(16.6 %) were *Staphylococcus aureus* and 4 (8.3 %) were *Coagulase Negative Staphylococcus(CONS)*.(Table 3)

TOTAL BACTERIAL ISOLATES	48
<i>Escherichia coli</i>	22(45.8%)
<i>Pseudomonas aeruginosa</i>	4(8.3%)
<i>Klebsiella pneumoniae</i>	10(20.8%)
<i>Staphylococcus aureus</i>	8(16.6%)
CONS	4(8.3%)

Table 3- Different bacterias isolated in the study

Out of 22(45.8 %) *Escherichia coli* isolated, 20(90.9%)were in female nurses and 2(9.1%)were in male nurses. Out of 4(8.3 %) *Pseudomonas aeruginosa*, all the 4(100%)were in female nurses and none was found in male nurse 0(0%).

Out of 10(20.8 %) *Klebsiella pneumoniae*,6(60%)were in female nurses and 4(40%) were in male nurses.

12were *Staphylococcus spp*, of which 8(16.6 %) were *Staphylococcus aureus* and 4 (8.3 %) were CONS.

Out of 8(16.6%) *Staphylococcus aureus*, 6(75%) were in female nurse and 2(25%) in male nurses.

Out of 4 (8.3 %)CONS, 2(50%) were in female nurses and 2(50%) were in male nurses. (Table 4)

ORGANISMS	ORGANISMS FOUND IN FEMALE NURSES	ORGANISMS FOUND IN MALE NURSES
<i>ESCHERICHIA COLI</i> 22(45.8%)	20(90.9%)	2(9.1%)
<i>PSEUDOMONAS AERUGINOSA</i> 4(8.3%)	4(100%)	0(0%)
<i>KLEBSIELLA PNEUMONIAE</i> 10(20.8%)	6(60%)	4(40%)
<i>STAPHYLOCOCCUS AUREUS</i> 8(16.6%)	6(75%)	2(25%)
<i>CONS</i> 4(8.3%)	2(50%)	2(50%)

Table 4- Distribution of total Bacteria isolated among female and male nurses

Out of total 50(83.3%) female nurses, *Escherichia coli* were isolated from 20(40 %) female nurses, *Pseudomonas aeruginosa* were isolated from 4(8 %) female nurses, *Klebsiella pneumoniae* were isolated from 6(12 %) female nurses; and *Staphylococcus spp* were isolated from 8(16 %) female nurses ; of which 6(75%) were *Staphylococcus aureus* and 2(25 %) were *CONS*.

Out of total 10(16.7%) male nurses, *Escherichia coli* were isolated from 2(20 %) male nurses, *Pseudomonas aeruginosa* were isolated from 0(0%) male nurse, *Klebsiella pneumoniae* were isolated from 4(40 %) male nurses; again, *Staphylococcus spp* were isolated 4(40 %) male nurses ; of which 2(50%) was *Staphylococcus aureus* and 2(50 %) was *CONS*.(Table 5).

TOTAL FEMALE NURSES 50(83.3%)	<i>ESCHERICHIA COLI</i> 20(40%)	<i>PSEUDOMONAS AERUGINOSA</i> 4(8%)	<i>KLEBSIELLA PNEUMONIAE</i> 6(12%)	<i>STAPHYLOCOCCUS AUREUS</i> 6(75%),OUT OF 8(16%)	<i>CONS</i> 2(25%),OUT OF 8(16%)
TOTAL MALE NURSES 10(16.7%)	2(20%)	0(0%)	4(40%)	2(50%),OUT OF 4(40%)	2(50%), OUT OF 4(40%)

Table 5- Distribution of bacterial isolates among total female and male nurses

The proportion of gram negative bacteria was high 36(75%),when compared to gram positive bacteria 12(25%),out of total 48 isolates. The antibiotic sensitivity pattern were as follows:-

Escherichia coli showed 100% sensitivity to Ciprofloxacin, Doxycycline, Amikacin, Gentamycin, Levofloxacin ;but were resistant to Amoxycillin/ clavulanic acid(81.8%), Ceftriaxone(72.7%)and Co-Trimoxazole(63.6%).Total ESBL producers were 72.72%.

Pseudomonas aeruginosa showed 100% sensitivity to Ciprofloxacin, Levofloxacin, Piperacillin/Tazobactam, Imipenem; but were resistant to Ceftazidime(75%), Cefepime(50%), Gentamycin(25%), Cefotaxime(75%).

Klebsiella Pneumoniae showed 100% sensitivity to Ciprofloxacin, Doxycycline, Amikacin, Gentamycin, Levofloxacin ; but were resistant to Amoxycillin/ clavulanic acid(60%), Ceftriaxone(60%) and Co-Trimoxazole(50%).Total ESBL producers were 60%.

Staphylococcus aureus showed 100% sensitivity toAmikacin; but were resistant to Cefoxitin, Levofloxacin(12.5%),Amoxycillin/ clavulanic acid (25%),Ceftriaxone(62.5%),Clindamycin(25%),Erythromycin(50%),Ciproflaxacin(50%). Total MRSA was 12.5%. *CONS* showed 100% sensitivity to Cefoxitin, Levofloxacin, Amikacin; but were resistant to Amoxycillin/ clavulanic acid (25%),Ceftriaxone(75%),Clindamycin(25%),Erythromycin(50%),Ciproflaxacin(50%). All of the *CONS* were Methicillin susceptible.(Table 6,7,8).

Discussion:-

A total of 60 healthcare workers, which included 50 female nurses and 10 male nurses, were included in this study, which were chosen randomly. Out of the 60 hand swabs samples analysed, 48 (80%) yielded bacterial growth, while 12 (20%) showed no bacterial growth.

Out of the 48 isolates, 36 (75%) were all Gram negative, and 12 (25%) were gram positive organisms. Of 48 isolates, organisms were identified as 22 (45.8%) *Escherichia coli*, 4 (8.3%) *Pseudomonas aeruginosa*, 10 (20.8%) *Klebsiella pneumoniae* and 12 as *Staphylococcus* spp, of which 8 (16.6%) were *Staphylococcus aureus* and 4 (8.3%) were *Coagulase Negative Staphylococcus* (CONS). Among the gram negative organisms, 16 (72.72%) ESBL producers were *Escherichia coli* and 6 (60%) ESBL producers were *Klebsiella pneumoniae*. Out of 8 *S. aureus*, 1 (12.5%) was MRSA. Among CONS, all of them were Methicillin sensitive.

This can be compared to a study carried out by Maheshwari *et al.* [7], which included 70 HCWs, comprising 20 doctors, 20 nurses, 20 operation theatre (OT) technicians and 10 were laboratory technicians, from whom a total of 140 swabs were collected; and the organisms which were isolated were *S. aureus* in 13 (18.6%) and *coagulase negative staphylococcus* in 44 (63%).

Out of 13, *S. aureus* isolates 6 (46.2%) were MRSA. Gram negative bacteria (GNB) were isolated in 22 (31.5%), out of which 15 (68.2%) were ESBL producers. Among the 15 ESBL producers, 9 were *Klebsiella pneumoniae*, 5 were *Escherichia coli* and 1 was *Proteus mirabilis*.

Sarfraz *et al.* [8] conducted a similar type of study, comparing doctors and nurses of clinical department; and doctors and staff of non-clinical department. Organisms isolated were *Staphylococcus aureus*, *Acinetobacter baumannii*, *Pseudomonas aeruginosa*, *Coagulase negative Staphylococcus* spp., *Acinetobacter lwoffii*, *Escherichia coli* and *Corynebacterium* spp., from hands of clinical staff (doctors + nurses). Organisms isolated from non-clinical staff was *Acinetobacter lwoffii*, *Coagulase negative Staphylococcus* spp., *Staphylococcus aureus*, *Acinetobacter baumannii*, *Pseudomonas aeruginosa* and *Micrococcus* spp.

Survana Sande *et al.* [9], also showed in their study, a high rate of bacterial colonization in hand swab samples of HCWs, and proved the importance of hand washing, by showing very low rate of bacterial colonization in hand swab samples after hand washing. In their study, out of total 150 samples collected from Nursing staffs before hand washing, growth of microorganisms was observed in 107 (71.3%) samples and no growth in 43 (28.7%) samples. No growth was obtained in 128 (85.3%) samples and single type of growth in 22 (14.7%) samples, after hand washing.

Of the 60 samples analyzed in our study, maximum samples showed growth of *Escherichia coli*. *E. coli* is Gram-negative, aerobic and facultative anaerobic bacteria [10]. *E. coli* is an emerging nosocomial pathogen causing serious problems in health care settings [11]. This species leads to both intestinal and extraintestinal infections in humans and many animals. Currently, six major groups of intestinal pathogenic *E. coli* (IPEC) have been recognized: enteropathogenic *E. coli* (EPEC), enteroaggregative *E. coli* (EAEC), Shiga toxin-producing *E. coli* (STEC), enterotoxigenic *E. coli* (ETEC), enteroinvasive *E. coli* (EIEC), and diffusely adherent *E. coli* (DAEC).

Three types of extraintestinal pathogenic *E. coli* (ExPEC) are also recognised, including neonatal meningitis-causing *E. coli* (NMEC), sepsis-causing *E. coli* (SEPEC), and uropathogenic *E. coli* (UPEC), associated with meningitis in newborns, systemic infections, and urinary tract infections (UTIs), respectively [12].

In our study, *Escherichia coli* showed 100% sensitivity to Ciprofloxacin, Doxycycline, Amikacin, Gentamycin, Levofloxacin; but were resistant to Amoxycillin/clavulanic acid (81.8%), Ceftriaxone (72.7%) and Co-Trimoxazole (63.6%). Total ESBL producers were 72.72%.

Pseudomonas aeruginosa showed 100% sensitivity to Ciprofloxacin, Levofloxacin, Piperacillin/Tazobactam, Imipenem; but were resistant to Ceftazidime (75%), Cefepime (50%), Gentamycin (25%), Cefotaxime (75%).

Klebsiella Pneumoniae showed 100% sensitivity to Ciprofloxacin, Doxycycline, Amikacin, Gentamycin, Levofloxacin; but were resistant to Amoxycillin/clavulanic acid (60%), Ceftriaxone (60%) and Co-Trimoxazole (50%). Total ESBL producers were 60%.

Staphylococcus aureus showed 100% sensitivity to Amikacin, (87.5%) to Cefoxitin and Levofloxacin, (75%) to Amoxicillin/ clavulanic acid, (75%) to Clindamycin, (50%) to Erythromycin, (50%) Ciprofloxacin, and least sensitive to Ceftriaxone (37.5%). 1 (12.5%) was MRSA.

CONS were (100%) sensitive to Cefoxitin, Amikacin, Levofloxacin; (75%) to Amoxicillin/ clavulanic acid, Clindamycin; (50%) to Erythromycin, Ciprofloxacin, and least sensitive to Ceftriaxone (25%). All of the *CONS* were Methicillin sensitive.

In a study carried by Edem EN *et al.* [13], the antibiotic sensitivity pattern of the *Staphylococcus aureus* showed 60% to Oxacillin, 80% to Clindamycin, 43.3% to Erythromycin, 40% to Ceftriaxone, 77% to Ciprofloxacin, 23.3% to Trimethoprim Sulphamethoxazole and 73.3% to Amoxicillin clavulanic acid. 13% of the *Staphylococcus aureus* were found to be inducible clindamycin resistant. The antibiotic sensitivity pattern of *Staphylococcus epidermidis* showed 56.2%, 75%, 19%, 81.3%, 12.5% and 68.8% to Erythromycin, Clindamycin, Ceftriaxone, Ciprofloxacin, Trimethoprim Sulphamethoxazole and Amoxicillin clavulanic acid, respectively. 6.25% of the *Staphylococcus epidermidis* were found to be inducible Clindamycin resistant. *Escherichia coli* showed 100% sensitivity to Ciprofloxacin, Ceftriaxone, Gentamycin, Ceftazidime and Cefotaxime, but were resistant to Amoxicillin clavulanic acid and Cefpodoxime. It was non-ESBL producing. *Proteus mirabilis* showed 100% sensitivity to Gentamycin, Ceftriaxone, Amoxicillin clavulanic acid and Cefotaxime. It was ESBL producing.

MRSA isolates showed 0%, 50%, 91%, 33.3% and 75% sensitivity to Oxacillin, Erythromycin, Clindamycin, Ceftriaxone, Ciprofloxacin, Trimethoprim Sulphamethoxazole and Amoxicillin clavulanic acid, respectively, and 16.6% of the MRSA isolates were inducible Clindamycin resistant.

Chaka *et al.* [14], in their study took samples from dominant hands of staff nurses, pediatric residents and medical interns and their cell phones. *Staphylococcus aureus* strains isolated from hand swabs were resistant to oxacillin, vancomycin and ceftazidime in 46%, 24% and 44% respectively. The resistance pattern of *Staphylococcus aureus* from cell phone isolates were 51.6%, 14% and 51% respectively for oxacillin, vancomycin and ceftazidime. *CONS* isolated were also resistant to commonly prescribed antibiotics.

Kumar *et al.* [15] in their study showed that almost 25% of healthcare workers are stable nasal carriers and 30%-50% of them possess the bacteria in their hands. Tammelin *et al.* [16] also showed in their study that 50.7% of healthcare workers carry bacteria in their nose and 26.3% in their hands.

Several studies have shown that most of the bacteria that cause nosocomial infections are those that have developed resistance to antibiotics used in treating those [17].

Conclusion:-

Since the group of individuals under this study were healthcare workers, their interaction and exposure to hospital environment could cause major risks in transmitting to hospital patients and spreading nosocomial infections.

So, by simple measure of hand washing, various infections can be controlled.

Healthcare workers should wash their hands regularly with antiseptic soap, or disinfect the hand by rubbing with alcohol solution.

Key words:-

New Formulated Milk Tablet (FM),
Gastroprotective, Ethanol, Antioxidant,
Anti-inflammatory, Lipid peroxidation.

Abstract

FM is a newly formulated milk tablet that provides the supplementary food such as milk and honey, also fortified it with high nutritive value components (bee pollen, palm pollen, Royal jelly, Propolis, Ginseng, and Bee pollen) that have many remarkable biological activities such as antioxidant, antibacterial and anti-inflammatory features. The current study aimed to investigate the potential gastroprotective effects of FM against ethanol-induced gastric injury in male albino rats. The experimental set included four groups; Control group, an ulcer control group treated with absolute ethanol (10 ml/kg), FM pretreated groups at doses (157 and 314 mg/kg per oral). The gastric secretion was collected for assessment of pH. The involvement of malondialdehyde (MDA), catalase (CAT), nitric oxide (NO) and tumor necrosis factor- α (TNF- α), alanine aminotransferase (ALT), aspartate aminotransferase (AST), alkaline phosphatase (ALP), Uric acid, and creatinine were also measured. Histopathological studies were undertaken to evaluate the influence of the treatment on the gastric wall mucosal layer. FM suppressed gastric inflammation induced as a result of ethanol administration by decreasing of tumor necrosis factor- α (TNF- α), nitric oxide (NO) and neutrophil infiltration. Meanwhile, FM halted gastric oxidative stress via reduction of MDA level with concomitant enhancement of the activity of a potent antioxidant CAT. These favorable actions were associated with attenuation of the severity of ethanol gastric mucosal injury as evidenced by the morphological and histological observations. Together, these findings postulated the potent gastroprotective action of FM against ethanol-induced gastric injury which was mediated via suppression of gastric inflammation and oxidative stress besides boosting of the antioxidant defense.

Introduction:-

Gastrointestinal ulcer disease poses a serious economic load as a treatment for the ulcers account to at least 10% of the total cost of treating digestive disorders (Brown and Everhart, 1994; Sandler *et al.*, 2002). Peptic ulcer is a common disorder of the entire gastrointestinal tract. Moreover, about 8 to 10% of the global population affected by peptic ulcers, approximately 5% of them suffer from gastric ulcers (Calam and Baron, 2001). The ulcers that affect

the gastrointestinal system are usually aggravated by a disproportion between destructive and defensive factors in the stomach (Calam and Baron, 2001). The major causes of peptic ulcer disease are stress, alcohol, chronic use of non-steroidal anti-inflammatory drugs (NSAIDs), cigarette smoking, genetic predisposition, diet, and *Helicobacter pylori* infection (Nemeroff, 1982).

Alcohol consumption has been commonly associated with gastric mucosal lesions including gastritis, gastric ulcer, and even gastric carcinoma (Franke *et al.*, 2005). The mechanisms underlying ethanol-induced gastric ulcer have not been fully defined. Yet, mounting evidence has indicated that oxidative stress, proinflammatory cytokines and apoptosis play crucial roles in its pathogenesis (Al Batran *et al.*, 2013; Mei *et al.*, 2012; Sangiovanni *et al.*, 2013). Ethanol is widely used to induce experimental gastric ulcer in animals (Loguercio *et al.*, 1993). The experimental model of ethanol-induced gastric injury mimics several features of the human condition and thus provides a mean for assessing agents with potential anti-ulcer actions along with their implicated mechanisms for gastric protection (Liu *et al.*, 2012; Salga *et al.*, 2012). The administration of these drugs has been associated with several adverse effects such as nausea, constipation, gynecomastia and impotence that limit their use (Halabi *et al.*, 2014). Besides, most of these drugs, lack an effect on other factors involved in ulcer disease and therefore, do not achieve all treatment goals. Thus, the search for effective agents with fewer side effects has been regarded as an effective strategy for the management of gastric ulcers (Antonisamy *et al.*, 2014; Halabi *et al.*, 2014). Previously, agents with antioxidant features have displayed beneficial actions in protecting against alcohol-induced gastric ulcer (Antonisamy *et al.*, 2014; Liu *et al.*, 2012; Mei *et al.*, 2012). Hence, there is a strong need for more effective antioxidant, and safe anti-ulcer agents with different protective mechanisms from natural resources.

The primary function of milk is to meet the complete nutritional requirements of human, making it a nutrient dense food. The recognition of milk's richness in nutrients that play a key-role in human physiology has in recent years led to a wide variety of novel applications in dairy technology (Livney, 2010).

New formula of healthier milk tablet aims to improve nutritional status and health. An optimum formula of milk tablet was formulated to minimize cost and maximize nutritional value. Providing the supplementary food such as milk and honey and fortified it with a high nutritive values component (Skim milk powder, honey, bee pollen, palm pollen, Royal jelly, propolis and ginseng). The advantages of new formulated milk tablets with high nutritive value are long shelf-life, convenience, and suitable for the distribution to remote areas. Skimmed milk powder is widely used due to its easy storage facility and immediate availability on hand in all conditions. Milk is a very important substitute for food in most circumstances. So using of skimmed milk powder is safer in such conditions as it contains all the nutritional constituents of calcium, proteins, many vitamins and carbohydrates and no fat.

Most people think of honey as excellent food, but some others consider it as medicine (Zaghloul *et al.*, 2001), but only recently its antioxidant property has come to limelight. With increasing demand for antioxidant supply in the food, honey is becoming important source of antioxidant since it is rich in flavonoids and phenolic acids and other antioxidants including glucose oxidase, catalase, ascorbic acid, carotenoid derivatives, and organic acids. The antioxidants have several preventative effects against different diseases like cancer, cardiovascular diseases, inflammatory disorders, neurological degeneration, wound healing, infectious diseases and aging, which led to search for foods rich in antioxidants (Khalil *et al.*, 2010). Beside all previous benefits for honey it could be as a natural binder for dairy product ingredients.

Bee pollen consider as a valuable therapeutic product greatly appreciated by the natural medicine because of its potential medical and nutritional applications. It demonstrates a series of actions such as anti-inflammatory, hepatoprotective, and immune-stimulating. The use of bee pollen as food supplement has been proposed to ameliorate various inflammatory diseases (Martín-Muñoz *et al.*, 2010). However, there are very few studies about using bee pollen in food and dairy industry. On the other side, palm pollen grains are a good economic nutritional source can be used as human food supplements (Fernández, 1983).

Royal jelly (RJ) is a secretion of the cephalic glands of nurse bees and serves as the most important part of honeybee larvae diet, playing a major role in caste differentiation (Moritz and Southwick, 1992). RJ, one of the most effectual and beneficial remedy for human beings, is widely used both in folk and in official medicine and it is a controversial dietary supplement. Due to its complex composition (water, proteins, lipids, carbohydrates, amino acids, mineral salts, vitamins, enzymes, hormones, and natural antibiotics), RJ has a multitude of pharmacological activities: antioxidant, hypoglycemia, hepatoprotective, antitumor, antibiotic, and anti-allergic (Mărghitaș, 2008). Moreover,

propolis acts as an antibacterial factor. In addition, propolis is a powerful antioxidant (Özcan and Ayar, 2003). These effects are due to its high concentration of phenolics and other antioxidant compounds. Ginseng, the root of *Panax* species, is a well-known folk medicine. It has been used as traditional herbal medicine in China, Korea and Japan for thousands of years and today it is a popular and worldwide used natural medicine. The active ingredients of ginseng are ginsenosides, which are also called ginseng saponins (Kamal *et al.*, 2016). Research suggests that the bioactive components of ginseng, such as ginsenosides and polysaccharides, can decrease oxidative stress, which is a mechanism associated with reduced chronic disease development (Sun, 2007; Uno and Nicholls, 2010).

Yet, the impact of this newly formulated milk tablet (FM) on gastric ulcer has not been previously explored. Thus, the present study aimed to investigate the potential gastroprotective actions of FM in ethanol-induced gastric injury in rats.

Materials and Methods:-

Chemicals

All common chemicals used were purchased from one of the following suppliers Sigma Co. (St. Louis, MO, USA). All other reagents were of the highest grade commercially available. (All chemicals used in the study were of analytical grade).

Experimental Animals

Adult male rats, weighing (150±20) g. They were kept under observation for about 15 days before the onset of the experiment to exclude any infection. The chosen animals were housed in plastic cages with good aerated covers at 25°C ± 0.5°C as well as 12 h light/dark cycles. Animals were allowed free access to water and were supplied daily with a standard diet. The study design was approved by Ain Shams University Research Ethics Committee.

Preparation of new formulated milk tablet (FM)

The ingredients of FM consist of skim milk powder with different proportion as 50, 55, 60, 65 and 70% in parallel with honey proportion as 28, 23, 18, 13 and 8%, respectively then added bee pollen 10%, palm pollen 5%, Royal jelly 5%, propolis 1% and ginseng 1% for each formula. Preparation of FM was prepared in the Dairy Technology Department Animal Production Research Institute. All ingredients were mixed then compressed into tablet form. Milk tablet samples were packed into airtight plastic bags and stored in the refrigerator for further analysis (AOAC, 2006). The chemical composition of milk tablet ingredients and Formulations of milk tablet from mixture design was shown in tables (1, 2). In addition, chemical composition of selected formula of new formulated milk tablet was illustrated in Table (4).

Mucosal injury induction

Gastric ulceration was induced in the animals according to the procedure described by (Huang *et al.*, 2014). Briefly, rats were deprived of food but had free access to water 24 h prior to ulcer induction then, they were administered, with a single oral dose of 75% ethanol (10 ml/kg body weight). Two hours after ethanol administration, animals were sacrificed.

Animal grouping and treatments

Thirty two male rats were randomly divided into four groups (n = 8 per group): Group 1 (normal control) animals received only distilled water. Rats in group 2 (ulcerated control) were given only 75% ethanol (10 ml/kg). Group 3 and 4 animals were given FM at doses 157 mg/kg and 314 mg/kg, respectively, for 4 weeks, then at day 29, 75% ethanol (10 ml/kg) was given orally to each animal to induce gastric ulceration. Two hours after ethanol administration, all rats were sacrificed and stomachs were removed, opened along the greater curvature and gastric content was drained into a centrifuge tube.

Blood Samples preparation

Blood was collected from sacrificed rat in vacutainer and centrifuged 3000 rpm for 10 min. Plasma samples were collected and stored at -80 until used for biochemical analysis.

Collection of gastric juice for determination of gastric pH

Gastric juice from each animal was centrifuged at 1000 rpm for 10 minutes after adding 5 ml distilled water to remove any solid debris and the volume of the supernatant was measured. The supernatant was then assayed for determination of the pH of gastric juice using a pH meter (Sabui *et al.*, 2015).

Preparation of stomach homogenate for biochemical investigations

The gastric tissue was homogenized in 10ml ice-cold phosphate buffer (PBS, 100 mM, pH 7.4). The homogenized tissue (1g of tissue /10ml PBS) was centrifuged at 4000rpm for 15 minutes. The supernatant was removed and stored at -80°C for determination of oxidative stress markers and cellular defenses markers.

Assessment of oxidant/antioxidant activities

The determination of gastric mucous membrane lipid peroxides, expressed as malondialdehyde (MDA), was carried out according to the thiobarbituric acid assay (Liu *et al.*, 2012). Using the TBA commercial kit (spectrum diagnostics Egyptian company of biotechnology, Cairo, Egypt). Catalase (CAT), and nitric oxide (NO) levels were tested in the gastric tissue homogenate using the CAT and the NO assay kits (spectrum diagnostics Egyptian company of biotechnology, Cairo, Egypt), following the manufacturer's instructions.

Assessment of TNF- α level

The plasma TNF- α level was measured using the Rat TNF-alpha (TNF- α) ELISA kit (KOMA BIOTECH INC., Seoul, Korea) according to the manufacturer's instructions.

Assessment of the liver and kidney functions

The functioning of the liver was assayed by evaluating the alanine aminotransferase, aspartate aminotransferase, alkaline phosphatase, markers of hepatocellular damage, were established by colorimetric assay using a commercial kit (spectrum diagnostics Egyptian company of biotechnology, Egypt). The functioning of the kidney was assayed by evaluating the creatinine and uric acid by colorimetric assay using a commercial kit (spectrum diagnostics Egyptian company of biotechnology, Egypt).

Histological evaluation of gastric injury

From all experimental groups, the stomach of each rat was removed, opened along its greater curvature and rinsed with saline to remove the gastric contents. The stomach was stretched on a piece of cork with the mucosal surface facing upward and was then photographed with a digital camera. The histological evaluation of the gastric injury was performed on the specimens of the glandular stomach of three rats randomly selected from each group of the experiment. In brief, stomachs were fixed in the aqueous Bouin's fluid, embedded in paraplast, and sections were made at a thickness of 5-7 μ m and stained with hematoxylin and eosin (Humason, 1972).

Statistical analysis

Statistical evaluation was conducted with Instat Program GraphPad. Software, Inc, San Diego, USA, version 3.6, Copyright©1992-2003 Results were expressed as mean \pm SEM. The results were analyzed for statistical significance by one way ANOVA followed by Tukey-Kramer multiple comparison post-test. Values of $p < 0.05$ were regarded as significant.

Results:-

Sensory acceptability Consumer acceptance test for products form and mixture design experiment:-

Consumer acceptance test was performed at the Animal Production Research Institute as presented in Table (3) it could be observed that the rate between the milk powder and honey had a highly effect in all sensory attributes. Formulations (E) and (A) showed the lowest scores in the overall acceptability, it was recorded 70 and 76 points. Highest percent of skim milk powder cooperates with the lowest percent of honey in the formula (E) affected tablets properties as hard tablets with weak and pail flavor. On the other hand the lowest percent of skim milk powder and the highest percent of honey as formula (A) gave weak form and body and over sweetness flavor. More acceptance scores recorded by formulas (B) and (D) respectively. From the same table it could be observed that formula (C) gained the highest scores owing to its balance in the all nutritive value and overall sensory acceptability.

Effect of FM on PH:-

Fig.1a shows the effect of (FM) on gastric secretions of ethanol ulcerated rats. EtOH administration caused significant ($p < 0.05$) increase in pH value as compared to control group. Pre-treatment with the FM at both doses produced insignificant increase in pH value when compared with ulcerated control rats. While a significant increase was observed ($p < 0.001$) in both doses as compared to control group.

Effect of (FM) on biochemical parameters of stomach tissue:-

The gastroprotective effect of 157mg/kg and 314mg/kg doses of (FM) on the ethanol-induced gastric ulcer was estimated with various gastric parameters. There were remarkable changes in the gastric parameters of ulcerated and (FM) pre-treated groups as compared with the control animals.

Evaluation of Antioxidant and enzymatic activities:-

The effect of (FM) on the ulceration process in ethanol-induced ulcer was evaluated by the oxidative stress marker level, MDA, catalase activity and gastric NO (Fig.1).

Administration of ethanol triggered an oxidative stress as indicated by significant increase of MDA level ($p < 0.001$) as compared to control group. Pretreatment with both concentrations of (FM) significantly protect the gastric tissue against the oxidative stress as evidenced by significant ($p < 0.05$, $p < 0.001$ respectively) lowering of MDA as compared to ulcer control rats. On the other hand, the gastric ulcer induced group showed a significant increase ($p < 0.001$) in catalase activity in comparison to the normal control. Pretreatment with FM, showed a significant ($P < 0.05$) reduction in the catalase activity at the low dose, and a significant increase at the high dose ($P < 0.05$) as compared to ulcer group. While, both doses of (FM) significantly significant elevate ($p < 0.001$) the enzyme level as compared to control group. Rats subjected to EtOH administration (ulcer control rats) showed significantly decreased NO content ($p < 0.05$) as compared to normal control rats. (FM) pretreatment at both doses significantly increased NO content ($p < 0.001$, $p < 0.001$ respectively) as compared to ulcer group.

Evaluation of plasma TNF- α level:-

Administration of ethanol resulted in a robust inflammatory response as indicated by a marked elevation of serum TNF- α ($p < 0.001$) as compared to the control group (Fig.1c). Pretreatment with (FM) in both doses significantly ($P < 0.001$) lowered the levels of TNF- α when compared to ethanol ulcer group.

Evaluation of liver function:-

EtOH administration did not significantly affect the levels of AST, ALT, and ALP as compared to control group (Fig.2a). (FM) pretreatment at high dose significantly ($p < 0.05$, Fig.2a) decrease AST level as compared to control rats. In addition, both doses of (FM) showed a significant ($p < 0.01$, $p < 0.05$, respectively) decrease of ALP level as compared to ulcer control rats. (Fig.2a).

Evaluation of kidney function:-

EtOH administration did not significantly affect the levels of creatinine, and uric acid as compared to control group (Fig.2b). (FM) pretreatment at low dose significantly ($p < 0.05$, Fig.2b) increased the uric acid level as compared to ulcer control rats, while no significant change was observed in creatinine level at both doses of (FM) as compared to ulcer control rats (Fig.2b).

Microscopic Evaluation of the gastric injury:-

The morphological observations of the stomach of the control group showed that it is pink in colour without any hemorrhagic areas and its mucosa is thrown into prominent longitudinal folds, rugae, (Fig. 3a). Moreover, the ethanol induced gastric injury in the ulcer group that include hyperemia and multiple linear hemorrhagic red bands of different size along the glandular portion of the stomach indicating that the gastric ulcer was completely formed (Fig. 3b). In addition, the FM pre-treatment groups exhibited a dose-dependent protective effect against ethanol-induced gastric injury, with a marked decrease in the gastric mucosa injury and a significant ulcer inhibition compared with the ulcer group at the standard dose and maximal ulcer inhibition at the double standard dose (Figs. 3c and 3d).

The histological observations of the gastric mucosa of the control group revealed that it consists of the lining epithelium, lamina propria and muscularis mucosae (Fig. 4a). The lining epithelium is formed of simple columnar epithelial cells (Fig. 4b). In addition, the lamina propria consists of connective tissue that contains numerous straight tubular gastric glands (Fig. 4a). These glands are lined by three main types of cells; the luminal lining epithelium, oxyntic and peptic (chief or zymogenic) cells (Figs. 4b and 4c). Moreover, the muscularis mucosae is built of smooth muscle fibers (Fig. 4a).

The ethanol induced extensive gastric mucosal lesions in the ulcer group which extended to the two internal thirds or the entire mucosal thickness (Fig. 5a). These lesions included highly necrotic mucosa, epithelial lifting, mucosal

hemorrhage and leukocyte infiltration in the lamina propria and submucosa (Figs. 5a-5c). Moreover, some mucosal cells showed necrosis (Fig. 5d) and others possess pyknotic nuclei (Fig. 5e).

The mucosal damage induced by absolute ethanol was significantly decreased by FM pre-treatment and the mucosa was relatively intact. FM has been shown to exert the cytoprotective effects in a dose-dependent manner. The rats pre-treated with standard diet of FM showed markedly better reductions in gastric lesion and comparatively better protection of the gastric mucosa, (Figs. 6a-6c), as proven by very superficial injury only, (Fig. 6d), and reduction of leukocyte infiltration (Fig. 6a). Moreover, rats treated with a double standard dose of FM showed more or less normal histological architecture of the gastric mucosa (Fig. 7a) and demonstrated significantly better mucosal protection and absence of leukocyte infiltration (Figs. 7b and 7c).

Discussion:-

Milk made formulations provide a simple, novel and patient friendly approach for the delivery of ionized as well as unionized hydrophobic drugs. Incorporation of milk in the formulation results in solubilization of drugs with enhanced pharmacokinetic properties. Taste masking and gastroprotective properties also prove it a promising carrier for drugs. Further in-vitro studies are yet to be carried out to elucidate the colloidal stability of resulting emulsion, particle size and distribution of milk component (Kamal *et al.*, 2016).

The current study highlights, for the first time, the protective role of FM, a new formulated milktable, against ethanol-induced gastric injury in rats. Ethanol is commonly used for inducing ulcer in the experimental rats and leads to intense gastric mucosal injury. Furthermore, alcohol causes indirect destructive effects via the recruitment of leukocytes which drives oxidative stress, inflammatory responses and apoptosis (Arab *et al.*, 2015).

In the present investigation, FM treatment markedly enhances the gastric mucosa and attenuates the gastric injury such as hemorrhage and hyperemia. These results suggest that FM has a protective action by reducing the gastric mucosal injury exposed to ethanol.

Additionally, secretion of mucus is supposed to be such a vital protective factor against gastric injuries. Previous reports suggested that mucus delays the diffusion of protons, which would aid in maintaining a favorable pH at the epithelial apical surface (Schreiber and Scheid, 1997). The pH gives an idea of the level of acidity and volume of gastric secretions. Low pH value is an indicator of decreased hydrogen ion concentration in gastric juice. This has been linked to the pathogenesis of ulcer and gastric damage in experimental animals (Lüllmann *et al.*, 2000). The present study showed that FM neutralized stomach juice pH to (7.30 ± 0.33 , 7.24 ± 0.77 ; respectively) by significantly increasing ($P < 0.001$) of the pH value of the gastric contents at both doses.

The involvement of oxidative stress in the pathogenesis of ethanol-induced gastric injury has been confirmed by several studies. One of the possible mechanisms of EtOH induced acute gastric mucosal injury is thought to arise as a result of extreme generation of free radicals (Schlorff *et al.*, 1999). The free radicals have a high tendency to react rapidly with lipids, thus, triggering lipid peroxidation that can lead to disorganization of the membrane and consequently reduces its fluidity (Recknagel and Ghoshal, 1996).

In harmony with these mentioned data, the current study showed that, ethanol administration initiated gastric oxidative stress and significantly increased the MDA level, a byproduct of lipid peroxidation, as compared to control group. While, this elevation of MDA level was reversed by pretreatment with FM in both doses ($p < 0.05$, $p < 0.001$ respectively) suggesting a reduction in the lipid peroxidation activity upon the oral administration of FM.

Catalase, a highly reactive enzyme, plays a protective antioxidant effect against the harmful actions of lipid peroxidation by reacting with H_2O_2 to form water and molecular oxygen (Zakaria *et al.*, 2015). Data of the current study demonstrated that FM combated oxidative stress and enhanced the antioxidant status in animals with ethanol gastritis as revealed by the reduction of MDA levels. This was accompanied with a significant ($P < 0.001$) increase of CAT in both doses. These findings highlight the premise that the antioxidant features of the components of this new formulated milktable are implicated in the alleviation of ethanol gastric injury. In fact, scavenging of ROS has been considered as one of the mechanisms involved in the healing of ulcers (Mei *et al.*, 2012), which confirmed that FM anti-ulcerogenic properties are partially based on its antioxidant function.

Emerging evidences support the concept that the elevation of NO levels is a protective mechanism against the damage of gastric mucosa (J'uniore *et al.*, 2014; Nordin *et al.*, 2014). It is considered one of the most important

defensive endogenous mediators in the gastric mucosa and a potent chain-breaking antioxidant in free radical-mediated lipid Peroxidation (O'Donnell *et al.*, 1997; Halabiet *et al.*, 2014). Additionally, NO plays a vital role in maintaining the gastric mucosal alkaline production (Calatayud *et al.*, 2001), and inhibiting neutrophil aggregation (Wallace *et al.*, 1997).

According to our results, EtOH administration significantly ($P < 0.05$) decreased NO content in the stomach. Similarly, as reported by (Abdulla *et al.*, 2009; Goswami *et al.*, 2011). So, one of the protective way against harmful effect of ethanol on gastric mucosa is try to keep the normal level of nitric oxide to stop infiltration of the neutrophil.

The present study showed that the NO reduction induced by ethanol was significantly attenuated by FM that increase gastric NO level in both doses ($P < 0.001$). This result is consistent with the present histological results that have revealed protection of the gastric mucosa and inhibition of leukocyte infiltration in rats pre-treated with FM. Similar results were reported by Kobayashi *et al.*, (2001) who stated that the inhibition of neutrophil infiltration in the ulcerated gastric tissue is a protective effect against mucosal lesions. The neutrophils are a main source of inflammatory mediators, therefore, suppression of neutrophil infiltration during inflammation was found to improve gastric ulcer healing.

On the other hand, it has been suggested that gastric ulcers are considered to be the manifestation of an inflammatory response (Kang *et al.*, 2014). It is characterized by the migration of polymorphonuclear leukocytes and macrophages in the ulcer area. Migrated macrophages release proinflammatory cytokines such as TNF- α and this upregulates leukocyte recruitment and transmigration in gastric inflamed areas. Our experimental results are in line with these previous data. Ethanol ingestion upregulated the inflammatory response as evidenced by the increase of gastric proinflammatory TNF- α ($P < 0.001$). These findings are consistent with previous reports (Liu *et al.*, 2012; Li *et al.*, 2013). TNF- α has been closely linked to gastric inflammation via activation of immune cells, generation of other proinflammatory mediators and overexpression of NF- κ B (Li *et al.*, 2013). TNF- α also subdues gastric microcirculation around ulcerated mucosa and thus delays its healing (Hasgulet *et al.*, 2014).

Interestingly, FM significantly suppressed gastric TNF- α in both doses ($P < 0.001$). Thus, the reduction of TNF- α which was accompanied with an elevation of gastric NO, has been viewed as a successful strategy for the management of gastric injury. Meanwhile, the above findings reinforced the histopathological results that described attenuation of neutrophil infiltration, edema and hemorrhage by new formulated milk tablet in ethanol-induced ulcer in rat.

The liver is the main metabolic organ for ingested alcohol; therefore, the series of events that occur in the liver following alcohol intake may predispose the organ to damage. Thus, biochemical markers in the liver and plasma have been widely used as effective methods for the early diagnosis of liver diseases and to determine the functional components for prevention of hepatic lesions. In contrast to the previous studies (Gramenziet *et al.*, 2006; Purohit *et al.*, 2009) that reported an elevated plasma activity of AST and ALT in alcohol-treated rats, our results demonstrate that AST, ALT, and ALP activity was insignificantly induced by ethanol ingestion. This result could be attributed to that observation of plasma AST and ALT induced by ethanol have been dependent on the animal strain, feeding period and method, and/or dosage of ethanol (Baldiet *et al.*, 1993). Nevertheless, our data show that pretreatment with high dose of FM lowered the activity of serum AST ($P < 0.05$). Notably, the present data showed that pretreatment with low dose of FM significantly ($P < 0.05$) increase in uric acid and creatinine levels. This could be an indicative of the renal cellular injury due to kidney dysfunction and with alteration in membrane permeability.

Conclusion:-

In conclusion, Based on the above mentioned data, oxidative stress has been involved in the development of ethanol-induced gastric injury where a store of reactive oxygen species (ROS) generated by leukocyte activation triggers mucosal damage via lipid peroxidation and via the antioxidant defenses depletion. Activation of neutrophils is associated with an unregulated inflammatory response with an increased gastric generation of proinflammatory cytokines, including tumour necrosis factor- α (TNF- α). The current study highlights evidences for the anti-ulcer effect of new formulated milk tablet (FM) could be attributed to the its marked antioxidant features abolish lipid peroxidation and preserve gastric antioxidant defenses. It also acts by boosting of NO biosynthesis accompanied reduction of neutrophil infiltration with the suppression of the proinflammatory cytokine TNF- α .

Table 1:- Chemical composition of the new formulated milk tablet (FM) ingredients.

Chemical composition	Fat	Protein	Carbohydrate	Ash	Moisture
Skim milk powder	0.90	36.0	48.0	8.5	03.0
Honey	01.5	12.0	16.0	0.6	58.0
Bee pollen	06.0	20.0	40.0	2.2	07.5
Palm pollen	20.5	31.5	14.0	4.5	28,8
Royal jelly	03.0	17.0	18.0	2.0	57.0
Propolis	15.5	25.0	28.0	4.5	10.0
Ginseng	1.2 0	12.0	75.0	7.0	11.0

Table 2:- Formulations of the new formulated milk tablet(FM) from mixture design.

Formulation	Skim Milk powder (%)	Honey (%)	Other ingredients*(%)
A	50	28	22
B	55	23	22
C	60	18	22
D	65	13	22
E	70	8	22

* Other ingredients: bee pollen, palm pollen, Royal jelly, propolise and gensing

Table 3:- Sensory evaluation of the new formulated milk tablet (FM) formulation.

Formulation	Body & Texture (50)	Flavor (30)	Color (10)	Sweetness (10)	Total (100)
A	40	22	7	7	76
B	42	25	8	8	83
C	48	28	9	9	94
D	45	25	8	8	86
E	40	18	7	5	70

Abstract

Background: Tuberculosis of the central nervous system is an important cause of morbidity and mortality. Once a disease mainly of childhood, it is now seen at any age and is equally frequent in adults. They may present as Meningitis, Tuberculoma, Potts Paraplegia, Intrapinal Granuloma or Arachnoiditis. This study was conducted to analyse various clinical presentations of CNS tuberculosis and their sequelae. **Methods :** An observational study was conducted in 30 patients admitted in Kanniyakumari Government Medical College from Jan 2016 to December 2016 with CNS manifestations of Tuberculosis. Computed tomography(CT), electroencephalography (EEG) and clinical findings were taken. **Results:** In the present study, the most common CNS presentation was Tuberculous Meningitis followed by Tuberculoma. Common age group being between 15-19 yrs. Aseptic meningitis had a good prognosis compared to Obstructive Hydrocephalus which had a bad prognosis. In this series, complete recovery was 66.6%, mortality was 13.4% and Sequelae in 20%. **Conclusion:** CNS tuberculosis is being reported more often nowadays due to its awareness and improved diagnostic modalities. Resistance to drugs has added a new challenge. Morbidity and mortality can be reduced by a great extent with early recognition and timely treatment

Introduction:-

Both as a cause of death and disability, Tuberculosis of the Central Nervous System is of great clinical importance. In children the condition most often arises as a consequence of primary or miliary tuberculosis, but in adults it usually develops in individuals with known tuberculosis elsewhere, especially in the lung. Once a disease mainly of childhood, it is now seen at any age and is equally frequent in adults. The pattern of Tuberculous infection of the Nervous System is changing. In an American epidemiological study of extrapulmonary tuberculosis, up to 10% of cases showed CNS involvement¹, whereas CDC data showed that 6.3% of extrapulmonary cases (1.3% of total tuberculosis cases) had CNS TB². A study done at Taiwan, 1.5% of TB deaths between 1997 and 2001 were attributable to CNS disease, a percentage that had increased from previous years³.

Corresponding Author:- Bhamini Prakash.

Address:- Assistant Professor of Medicine, Kanniyakumari Govt. Medical College.

Risk factors for CNS tuberculosis include age (children > adults) HIV-coinfection, malnutrition, recent measles in children, alcoholism, malignancies, the use of immunosuppressive agents in adults and disease prevalence in the community⁴. The clinical presentation is determined by the nature of the pathological process. It commonly takes the form of a meningitis, but encephalopathy (encephalitis) can also occur. At other times, extra medullary Tuberculosis can produce secondary neurological lesions or tuberculosis disease is confined to spinal cord. Seizures, either focal or generalised, may occur during acute illness or months after treatment⁵.

Materials and Methods:-

An observational study was conducted in 30 patients admitted in Kanniyakumari Govt. Medical College from Jan 2016 to December 2016 with CNS manifestations of Tuberculosis. CT Scan was done for all 30 patients. EEG (Electro Encephalogram) was done for 7 Patients

Following the clinical, CSF and CT Scan, study patients were analysed for

1. Age and Sex Incidence
2. Mode of presentation
3. Symptom analyses
4. Neurological Sequelae

Observation

Table – 1:- Age Incidence

Age group	No. of patients
15 – 19	7
20-24	3
25-29	3
30-34	3
35-39	3
40-44	4
45-49	4
50 and above	3

In the present study, the vulnerable age group of CNS TB belonged to 15-19 years carrying 23% of the total patients.

Table – 2:- Sex distribution

Sex	No. of patients	Percentage
Male	19	64
Female	11	36

In the present study, 64% were males and 36% were females.

Table -3:- Classification Of The Illness

Classification	No. of patients	Percentage
Tuberculous meningitis	19	63.3
Tuberculoma of brain	07	23.3
Spinal Arachnoiditis	2	6.6
Potts Paraplegia	2	6.6

In the present study of 30 patients, 19 patients, (63.3%) belongs to the class tuberculous meningitis, 7 Patients (23.3) belongs to the class tuberculoma of brain, 2 patients (6.6%) belongs to the group spinal arachnoiditis and 2 patients belongs to the group pott's paraplegia (6.6%)

Table -4:- Symptom Analysis

Major Classification	Symptom	No.of patients
TB Meningitis	Fever	18
	Headache,Vomiting	17
	Altered sensorium	6
	Double vision	5
	Photophobia	4
	Convulsion	3
	Weakness of limbs	2
	Numbness of extremities	1
	Retention of Urine	1
	Dysphagia	1
Tuberculoma of Brain	Fever	3
	Convulsion	6
	Headache and Vomiting	5
	Numbness limbs	2
	Weakness of limbs	2
	Numbness and weakness of lower limbs	2
	Numbness and weakness of lower limbs	2
	Retention of urine	1

Table 4:- Symptom Analysis

In patients with tuberculous Meningitis, fever associated with headache, vomiting was the main presentation, presented in 89.4%. Photophobia was present in 4 cases who also had features of rise in intracranial tension. Numbness in the right half of the body was presented in one case. Weakness of right upper and lower limbs was presented in one case of Tuberculoma of brain.

2 patients of TB Meningitis in the course of their treatment developed spinal arachnoiditis in the form of lower limb weakness and numbness after 45 days.

2 patients had pott's paraplegia. They presented as weakness and numbness of lower limbs and bladder retention developed in one case in the later period

Table 5:- Analysis Of Fever

Duration of days	No.of cases	percentage
0-9	1	3.3
10-19	7	28
20-29	8	32
30-39	4	16
40-49	2	8
50-59	1	3.3
>60	2	6.6

In the present study, higher number of cases had duration of fever for 2-3 weeks. 2 Cases (6.6%) had duration of fever for a longer period, more than 60 days.

Table 6:- Types Of Seizures

Type	No.of cases	percentage
Generalised	4	13.3
Focal	5	16.6

In the present study generalized seizures were present in 4 patients(13.3%) , Focal seizures were present in 5 patients (16.6%). Generalised seizures were present invariably in Tuberculous meningo encephalitis patients and focal seizures were present in patients with tuberculoma of brain.

Table – 7:- Neurological Presentation And Sequelae

Type of presentation	No.of Cases	Recovery	Sequelae
Tuberculous meningitis	7	7	-
Meningo encephalitis	4	3	Dead (1)
Basal meningitis	1	-	Dead (1)
Brainstem lesion (quadripareisis)	1	-	Dead (1)
Cranial Nerve Palsy	5	4	Optthalmoplegia(1)
Monoparesis (TB meningo encephalitis)	1	1	-
Spinal Arachnoiditis	2	-	Paraplegia(2) Optic atropy(1)
Tuberculoma	7	5	Dead(1) Hemiplegia(1)
TB Spine	2	-	Paraplegia(2)

In the present study 7 patients of tuberculous meningitis recovered after treatment without any sequelae. 4 patients developed meningo encephalitis with fits and altered sensorium, and 1 patient died during the illness. 1 patient

developed right lower limb monoparesis, but recovered 4 patients had third nerve palsies who had not good recovery. 1 patient had combination of third, sixth and seventh nerve palsies and features of basal meningitis and died during the illness. One case presented with focal neurological damage as Brainstem lesion with features of Quadriplegia and dysphagia and died during the illness.

Fundus findings included:-

Papilloedema in 6 Patients

2 patients of tuberculous meningitis

4 patients of Tuberculoma Brain

Optic atrophy in 1 patient (Tuberculous Arachnoiditis)

Discussion:-

Tuberculosis remains a serious medical problem in economically depressed countries. Tuberculous meningitis constitutes 50-55% of all bacterial meningitis⁶.

Sex Incidence:-

Among the sex incidence, males rank foremost. 19 out of 30 cases were males (63%) and 11 out of 30 cases (36%) were female. previous studies favoured incidents among males are more than females (Udani et al)⁶

Classification:-

In the present study of 30 patients, 19 patients (63.3%) belongs to the class Tuberculous meningitis, 7 patients (23.3%) had tuberculoma of Brain. Two patients (6.6%) had pott's paraplegia. Among the extrapulmonary tuberculosis, TB Meningitis has a higher incidence. (Tandon et al)⁷

Tuberculous Meningitis:-

Onset : In the present study the onset is acute in 4% and subacute in 30% previous studies favoured subacute onset in adults 35% (Dastur, Udani)⁸

Fever : Fever was observed invariably in all patients 95.7% It is of low grade pyrexia and fever associated with headache and vomiting is presented in 89.4% Fever is absent in 10% (Tandon et al)⁷

Convulsion : Convulsion was present in 3 cases (10%) in the present study

Licoll et al study⁹ said convulsion are frequent below 2 yrs (17%) and less frequent in adults (9.5%)

Neurological Presentation

Signs of meningeal irritation like neck stiffness and kernigs sign positive was present invariably in all patients with tuberculous meningitis.

Hydrocephalus

Raised intracranial pressure is present at all stages of the disease. Papilledema is seen in 40% which may lead to optic atrophy. Mactier et al study of 79 cases in Australia incidence of obstructive hydrocephalus in 2.8%¹⁰. In the present series 2 patients (6.6%) had obstructive hydrocephalus and one patient (3.3%) had communicating hydrocephalus.

Cranial Nerve Palsy

20 – 30% may develop cranial nerve palsies (Dastur et al)⁸. As per Tandon et al⁷ – 10 to 25%. The sixth nerve is the most affected followed by third, fourth and Seventh⁴. In the present series 4 patients had 6th nerve palsy, One patient had third nerve palsy. All of them recovered. One patient had Combined third, Sixth and Seventh nerve palsy who died during the illness.

Focal Neurological Deficit

One case presented with Quadriplegia and dysphagia, died during the illness probably due to brain stem lesion.

Tuberculoma Of The Brain:-

In the present study, 7 cases (23.3%) were found to have tuberculoma of brain. The Incidence of tuberculomas among intracranial space occupying lesions varies from 3.3 – 17.6% in different series since 1970.

Papilledema:-

Presented in 4 patients with tuberculoma (57.1%). Reported incidence by Tandon study⁷ is 87%

Tuberculous Arachnoiditis:-

In the present study 2 cases of tuberculous meningitis (6.6%), in the course of their treatment later presented as spinal arachnoiditis. They showed good recovery, but they carried a morbidity of paraparesis as their sequelae, but they are on follow up further.

Potts Paraplegia:-

In the present study 2 cases had presented with potts paraplegia(6.6%)

Both of them were males, below 40 years and both of them, the thoracic spine was involved.

The incidence of potts paraplegia is around 10% of CNS tuberculosis¹¹

Conclusion:-

1. In the present series of 30 cases during the period from January 2016 to December 2016, 19 patients (63.3%) were tuberculous meningitis, 7 Patients (28.3%) were tuberculoma of brain, 2 patients (6.6%) were tuberculous Arachnoiditis and 2 patients were pott's paraplegia (6.6%)
2. Males are more affected than females.
3. 15-19 years were vulnerable age group for TBM in adults
4. Minimum period of fever for 2 weeks is present in a majority of cases
5. In TBM patients, Who had presented as 'Aseptic Meningitis' had good recovery without any sequelae.
6. Patients presented with obstructive hydrocephalus had a bad prognosis
7. Optic atrophy was observed in a patient with Tuberculous Arachnoiditis
8. CT Scan finds an important role in the diagnosis of tuberculoma of Brain
9. Successful management of TBM depends on early diagnosis and effective antituberculous therapy
10. In this series complete recovery was 66.6%, mortality was 13.3% and Sequale in 20%

Abstract

Computer Vision (CV) is a discipline that studies methods to reconstruct, interpret and comprehend a 3D scene from its 2D pictures in terms of the homologies of the constitution gift in the scene. For the implementation of CV, a man or woman should have the skills of more than a few different subjects. In this paper we will be able to be aware of concerning the Computer imaginative and prescient, then we will speak about the advantages and downsides of CV. Then we will be able to examine the imaginative and prescient of a human with Computer imaginative and prescient. On this paper, we will be able to talk about various strategies of CV and in the end, we will talk about quite a lot of functions of CV in quite a lot of fields.

Copy Right, IJAR, 2017., All rights reserved.

Introduction:-

People utilize their eyes and their brains to detect their general surroundings for all intents and purposes. CV is the science that intends to give a comparable ability to a machine or Computer. CV (picture comprehension) is teaches that arrangements with 2D pictures and reproduces, decipher and comprehend a 3D scene from it as far as the properties of the structures exhibit in the pictures. CV is the study with the programmed extraction, investigation, and comprehension the helpful data from a solitary picture or an arrangement of pictures. It includes the advancement of a hypothetical and

Algorithmic premise to accomplish programmed visual comprehension. A definitive objective of CV is to demonstrate, recreate and surpass the capacity of human vision utilizing computer programming and equipment at various levels. It needs information of various subjects like software engineering, electrical designing, arithmetic, science, psychological science, and physiology.

Advantages of computer vision:-

1. Simple & Faster processes: - Speedy computer systems replace lengthy visual tests.
2. Reliability: - Cameras and computers, as opposed to a human eye, in no way get tired.
3. Accuracy: - By using utilizing computer imaginative and prescient the completing of the tip product increases to a large extent.
4. A wide variety of use: - It has an awfully huge range of applications.
5. Price discount: - Time is saved on people and devices, therefore misguided merchandise are eliminated.
6. No boundaries like human perception.
7. Do not must have instruments embedded, bodily printed or externally hooked up to objects specified for detection.
8. Picture shooting gadgets are convenient to mount, do away with, substitute and upgrade.

Corresponding Author:- Amrita Parashar.

Address:- Research Scholar, Amity University Madhya Pradesh.

9. Upgrading photo sensors doesn't require upgrading tags, identifiers or transponder devices.

Disadvantages of computer vision:-

1. Data processing and analytics is intensive and requires a lot of computation resources and memory.
2. Main technical barriers are its robustness in the face of fixing the environment.
3. Illumination variation further complicates the design of effective algorithms on account that of changes in shadows being cast.

Computer Vision Vs Human Vision:-

In object classification, it was known that the human brain tactics visible know-how in a semantic area traditionally, i.e. Extracting the semantically significant elements equivalent to line segments, shape, boundaries etc. In any case, by late data handling methods, these sorts of components can't be recognized by PCs heartily so that in PC vision it's still hard to prepare visual data as people do. PCs need to prepare visual data in information space framed by the vigorously distinguishable yet less important components, for example, hues, surfaces, and so on. In this way, the handling philosophy in PCs is entirely not the same as that in individuals.

Different Techniques of Computer Vision:-

There are various systems of CV like:

Registration and Stitching:-

Image Stitching is the method of editing the point of view of portraits and blending them in order that the photos can be aligned seamlessly.

Snapshot stitching system will also be divided into three main categories, In First category is, Image Registration entails matching points in a collection of images or making use of direct alignment methods to search for snapshot alignments that minimise the sum of absolute variations between overlapping pixels.

In Second Category is, Image Calibration targets to minimise variations between excellent lens units and the camera-lens combo that was used, optical defects akin to distortion, and exposure differences between pictures, camera response and chromatic aberrations.

In Third Category is, Photo mixing entails executing the changes found out within the calibration stage, mixed with remapping of the portraits to an output projection. Colours are adjusted between photographs to catch up on exposure differences. Snapshots are blended collectively and seam line adjustment is done to diminish the visibility of seams between images.

Video Processing:-

Video processing is a specified case of sign processing, which most often employs video filters and the place the input and output signals are videos records or video streams. Video processing systems are utilised in television units, VCRs, DVDs, video codec, video avid gamers, and so forth.

Detection and Tracking:-

Identification and following of autonomously moving items from the scene are vital components in video observation. On account of a moving camera, the recognition and following issues are naturally more mind boggling, since the camera movement incorporates a movement in all pixels of the picture.

A typical approach for recognizing moving districts depends on the adjustment because of the camera movement utilizing parametric movement models and characterizing moving pixels as the ones that have not been balanced out. This functions admirably when the seen can be viewed as planar, or when the movement of the camera is dish or zoom.

Visual Inspection:-

Regardless of technological developments in inspection approaches the principal and primary inspection/scan manner is visual inspection.

Visible inspection is an extraordinarily mighty method, and it should be the main method incorporated in any powerful quality manage application. It has been shown many times that, “visual Inspection” performed by adequately informed inspectors, the outcome in the discovery of the large majority of these defects which might simplest be found out later by using some more high-priced non-harmful experiment procedure. Even as visual inspection is confined to materials surface the handiest examination.

Pattern and Character Recognition:-

Spatial sample recognition, of which the recognition of alphanumeric characters is a subclass, is a principal and functional trouble. More efficient coding of transmitted pictorial knowledge and extra efficient utilisation of humanly produced information could outcome from its solution.

The pattern realisation has been mentioned as the challenge of a significant code to a recognisable structure in a suite of signals. The signals are the outcome of a metamorphosis from a visible picture area to an electrical illustration of this field.

Photo Enhancement:-

In computer photographs, the process of improving the nice of a digitally stored snapshot by way of manipulating the snapshot with the application. It's rather effortless, for illustration to make a picture lighter or darker, or to increase or lower distinction. Evolved photo enhancement application also helps many filters for alternating images in more than a few methods. Packages specialised for snapshot enhancement are in many instances referred to as photo editors.

Applications of Computer Vision:-

The CV is being utilized today as a part of a wide assortment of true applications, as:

1. Optical character realisation (OCR): Studying handwritten postal codes on letters and Automatic Number Plate Recognition (ANPR).
2. Desktop Inspection: Rapid parts inspection for quality confirmation utilising stereo vision with particular enlightenment to quantify resistances on flying machine wings or auto body parts or searching for deformities in steel castings utilizing X-beam vision.
3. Retail: Object acknowledgment for mechanized checkout paths.
4. 3D model building (Photogrammetry): Fully mechanized development of 3D models from airborne photos utilized as a part of frameworks, for example, Bing Maps.
5. Medical Imaging: Registering pre-agent and intra-agent symbolism or performing long haul investigations of individuals' cerebrum morphology as they age.
6. Automobile defence: Detecting startling deterrents like people on foot in the city, under conditions where dynamic vision strategies, for example, radar don't function admirably.
7. Fit transfer: Merging Computer Generated Imagery (CGI) with no frills footage by following element focuses in the source video to gauge the 3D camera movement and state of nature. Such strategies are generally utilized as a part of Hollywood (e.g. in films like Jurassic World), they additionally require the utilization of exact tangling to embed new components amongst forefront and foundation components.
8. Movement seizes (mocap): Using retro –reflective markers saw from different cameras or other vision-based systems to catch on-screen characters for Computer animation.
9. Surveillance: Monitoring for gate crashers, investigating thruway activity, and observing pools for suffocating casualties.
10. Fingerprint attention and biometrics: For programmed get to validation and additionally scientific applications.
11. Stitching: Turning covering photographs into a solitary flawlessly sewed display.
12. Exposure bracketing: Merging various exposures taken under testing lighting conditions (solid daylight and shadows) into a solitary flawlessly uncovered picture.
13. Morphing: Turning a photo of one of your companions into another, utilizing a consistent transform move.
14. Image founded walkthroughs: exploring a huge accumulation of photos, for example, the inside of your home, by flying between various photographs in 3D.
15. Face detection: For enhanced camera center and also more significant picture looking.
16. Visible authentication: robotically logging family individuals onto your residence computer as they sit down in front of the webcam.

Conclusion:-

We got here to grasp that CV has a big scope in future with its titanic advancement corresponding to it's a self-discipline that reviews how one can reconstruct, interrupt and realise a 3D scene from its 2d pics in phrases of the residences of the structure gift in the scene. For the implementation of CV, we came to understand that an individual will have to have the talents of quite a lot of different subjects. In this paper we have now learned about the COMPUTER imaginative and prescient, then we've discussed the advantages and downsides of CV. Then we've got when compared the vision of human with CV. In this paper, we've got also mentioned more than a few procedures of CV and eventually we now have mentioned quite a lot of functions of CV in various fields.

Abstract

Knowing the medical students' knowledge, attitude and practices of nutritional and lifestyle habits helps to enhance the nutrition of the community, which will consequently lead to a healthier society, as they will constitute the main body of future physicians and professionals. We aimed to evaluate their nutrition knowledge, their eating habits and overall perception regarding importance of healthy eating habits and lifestyle habits of medical students of Hail University, Kingdom of Saudi

Arabia . A cross-sectional study included 207 students between ages 19-24 years from basic and clinical levels in the faculty of medicine. A self-reported questionnaire was employed to assess perceived attitude and barriers to healthy practices by the study participants. Overall most medical students were aware of importance of minerals and vitamins in diet yet they were not practicing it adequately in their daily life but the majority of the students were not aware of the composition of balanced diet, improving nutrition knowledge, attitude and dietary practices through nutritional education may help to prevent many nutrition related diseases.

Introduction:-

During the 20th century, the leading causes of death shifted from infectious to chronic diseases: Cardiovascular disease, cancer, and diabetes are now among the most prevalent, costly, and preventable of all health problems.[1] These diseases have been strongly associated with unhealthy lifestyle habits, including inappropriate nutrition, lack of exercise, smoking, alcohol consumption, caffeine overuse, and improper sleeping habits.[2]

Recently, the Kingdom of Saudi Arabia has faced marked changes in the demographics, socioeconomics, and public health. This increasingly higher economic development of Saudi Arabia has resulted in a rapid Westernization of lifestyle habits. [3] The Westernization of dietary habits and lifestyle reflects the national increasing trend towards consumption of macronutrients including total food, fats, animal products, and refined foods. [4,5] In contrast, this new trend in the Saudi dietary patterns is accompanied by low consumption of vegetables and fruits, which are some of the main sources of essential micronutrients. [6,7] Changes in lifestyle and socioeconomic status in KSA have also had a significant impact on Saudis' physical activity. With the availability of modern techniques and entertainments, life has become more sedentary. The college students; representing the young age population of community, for different reasons are prone to eat unhealthy foods and to have bad health habits during their college

years, and it is often assumed that the medical students have a greater knowledge about healthy lifestyle and dietary habits when compared to non-medical students. However there is no evidence to indicate that this knowledge translates into maintaining good health practices [8].

In Saudi Arabia, there are few studies reflecting medical students knowledge and perception of healthy lifestyle habits, so this study was conducted to assess knowledge, attitude and practice of medical students in University of Hail, Hail, Saudi Arabia regarding lifestyle and dietary habits.

Methods:-

Study design:-

A cross-sectional survey was conducted from 2016 October 18th to 2017 March 28th involving 207 participants from medical students enrolled at University of Hail, Hail, KSA.

Study participant:-

A total of 207 students out of 439 medical students in UOH were selected by convenience sampling method. Include all male and female students from basic and clinical years.

Electronic Informed consent of participants were properly obtained before data collection.

Data collection:-

The Knowledge, Attitude and Practice (KAP) of dietary habits and exercise were assessed by an electronic questionnaire which contained three questions about nutrition knowledge, four questions about attitudes, four questions about dietary practice, and four questions about the exercise were completed by the students.

Data Analysis:-

The collected data was coded and analyzed by using descriptive statistics via SPSS , and planned in on deferent charts abstraction.

Results:-

A total of 207 students participated of which females were higher (58.8%) compared to males (41.5%).44% were from basic years and 56.1% were from clinical years. The mean age for male and female student subgroups was 19-24 years respectively. Figure (1)(2)

Figure 1:-

**Figure 2:-**

Nutritional knowledge of the study participants is summarized by their answers to three questions in **Table (1)**. Overall, only 11.6% of the students were aware of the composition of balanced diet, 69.6% were aware of the importance of fruits and vegetables, and 73.4% were aware of the meaning of organic food.

Table 1:- Nutritional knowledge among the study cohort (N=207).

	No. (%) of respondents answered correctly	No. (%) of respondents answered incorrectly
Composition of balanced diet	11.6%	79.4%
Importance of fruits and vegetables	69.6%	30.3%
Meaning of organic food	73.4%	26.5%

When the students were asked about how would they rate their nutrition Separately, in females only (2.4%) percent of 125 students rated their nutrition excellent, (14.6%) answered good and most of them (50%) answered quite good. Where the remaining of students their answers varies between poor (25.6%) and very poor (7.3%).(Figure3)

In males, (2.4%) percent of 82 students rated their nutrition excellent, only (9.6%) answered good and (52%) answered quite good, (28%) answered poor, where (8%) answered very poor. So males and females have no big difference in diet rating.(Figure3)

Figure 3:-

Although 69.6% knew about the importance of consuming fruits and vegetables only 11.1% admitted that they eat fruits and vegetables daily, and 21.3% eat it monthly, the rest of students are in between. Figure (4)

Importance of Fruits and vegetables

Figure 4:-

About half of the students (54.1%) knew their daily calorie need, but the majority (84.5%) do not calculate their calories whereas 15.5% calculate their calories. About 35.3% of students based all their meals around starchy foods, 28% have only one starchy meal, 31.4% have two starchy meals and 5.3% does not count on starchy foods in any of their meals. Percentage of students who consume sugary snacks daily is 33.3%, and 13% of students consume it in monthly manner. The consumption of pre-prepared food among study cohort is 21.7% daily, and only 15.5% monthly.

These charts shows practices of physical exercises among the study participants (cohort study) . Those who are physically active represent 45.1% of students, 48.6% of them exercise for about 1-2 hours weekly, 22.9% exercise for 2-4 hours weekly, 16.5% exercise for 4-6 hours weekly and only 11.9% exercise for more than 7 hours weekly. Figure (5)

ACTIVE HOURS (WEEKLY)

Figure 5:-

When the students were questioned whether their daily routine involve physical activity, most of them 31% stated that they perform more than one type of Exercise and the same percent perform brisk walking only . 15% run, 6% climb stairs as exercise, 8% do high intensity workouts, and only 1% swim. 8% of students perform other types of exercise like weight lifting or self-defense. Figure (6)

Figure 6:-

Students responded that they practice physical exercises in more than one place, including home about 42.2% of them, 18.3% exercise in public open area, also 18.3% exercise at the gym, only 6.4% exercise at the university campus and 14.7% exercise in more than one of these places .

Concerning attitude towards healthy lifestyle, most of students 29% prefer to eat burger and French fries than other meals, 27.5% of them prefer kabsa (rice and meat) with green salad, 22.7% prefer grilled chicken with white rice and steamed vegetables, 12.1% chose steak with mushroom sauce and mashed potato, and 8.7% prefer green salad only. Regarding fat consumption 58% of students would choose low fat products, 30% would prefer fat free products, 12.1% would prefer full fat products (Figure (7)).

Figure 7:- Regarding weight fluctuations, (53.60%) of females and (41.5%) of males loss their weight during last year. (21.6%) of females and (32.9%) of males gain more weight in last year. The remaining of them have no weight charges.

Feigure 8:-

When females who follow special diet questioned about their diet, only (10.4%) follow the diet always and regular. and majority of them (36.8 %) follow it sometimes (Table2). And regarding type of diet in females' population most of them preferred low fat diet (Table3).

Where in Males (11.0%) follow the diet always and regular, (32.9%) follow it sometimes (Table1) . And about type of diet it varies, where most of them preferred low fat diet and others preferred low calories diet.(Table3).

Table 2:- Male & Females who follow special diet.

Males Population	Frequency	Percentage
1 (Always)	9	11.0%
2 (Sometimes)	27	32.9%
3 (Rare)	16	19.5%
4 (Never)	30	36.6%
	Total = 82	Total = 100%

females Population	Frequency	Percentage
1 (Always)	13	10.4%
2 (Sometimes)	46	36.8%
3 (Rare)	11	8.8%
4 (Never)	55	44.0%
	Total = 125	Total = 100%

Table 3:- Males & Females in type of diet.

Males Population	Frequency	Percentage
1 (Low carbohydrates diet)	7	8.5%
2 (Low calories diet)	18	22.0%
3 (low fat diets)	23	28.0%
4 (None)	34	41.5%
	Total = 82	Total = 100%

Females Population	Frequency	Percentage
1 (Low carbohydrates diet)	14	11.2%
2 (Low calories diet)	22	17.6%
3 (low fat diets)	31	24.8%
4 (None)	58	46.4%
	Total = 125	Total = 100%

Discussion:-

The general Saudi diet is largely dependent on carbohydrates, fats and animal sources of protein. so this study was held to assess whether being in a medical field has increased the knowledge and improved the lifestyle of the medical students in University of Hail or not.

When it comes to knowledge, our study found some variations, majority of the students (79.4%) were not aware of the composition of balanced diet, unlike other KAP held at Jeddah study shows.[9]

Meanwhile (69.6%) knew the importance of minerals and vitamins, which goes in parallel with the previously mentioned KAP study.

Depending on the study results, it seems like the knowledge students earned has no significant role in improving their lifestyle. Despite the majority were aware about importance of minerals and vitamins, less than half the study cohort (40.6%) consume fruits and vegetables on regular basis, contrary to medical students at University of Dammam.[10]

Recently, the interest in adopting a healthy lifestyle and counting calories has significantly increased among young Saudis, but we did not notice this in our study where only 15.5% of the study cohort stated they count their daily

calorie intake. This could be contributed to the ignorance of the true concept of healthy lifestyle and the new applications that counts calories and facilitates committing to a calculated and balanced diet.

Physical activity defined by the WHO as bodily movement produced by skeletal muscles that require energy expenditure and known to has significant benefit to the human body. In this study cohort lower than half of the sample are physical active (45.9%) by deferent forms of activity for 1-2 hours per week in the majority. In a study held at Dammam only 35.5% of their sample are active physically [11]. This is may be due to the lack of time and stressful academic life of the medical students .

With deferent types of diet or physical activity almost have of the study sample (48.8%) loss weight during last year where in the study held at Jeddah only (38%) of their sample [9].

Being a medical student makes them busy most of the time so they would not be able to cook everyday and as the university facilities do not provide healthy food so these factors make it likely to have unhealthy dietary choices among our study cohort. The majority of the students about 30% eat fast food twice or thrice weekly, and about 19.3% do it once a week, although about 33.3% eat cakes, chocolate and drink soda daily, yet 28.5% do it twice or thrice weekly, but more than 88% of the student admitted that they will choose low fat or fat free products instead of full fat products if it's available for them.

Other study held at Dammam have shown that the majority of the students (91.3%) admitted eating fast foods, most of them do it twice or less per week, and about 25% of the students; most of them are males (85%) do it 3 times or more per week, 77.4% of the students are consuming soft drinks slightly higher in females versus male (85% and 67% respectively), furthermore 30% of them do it 3 times or more per week. [10]

Conclusion:-

Overall most medical students were aware of importance of minerals and vitamins in diet yet they were not practicing it adequately in their daily life but the majority of the students were not aware of the composition of balanced diet, improving nutrition knowledge, attitude and dietary practices through nutritional education may help to prevent many nutrition related diseases.

Despite the interest in adapting a healthy lifestyle and counting calories has significantly increased among young Saudis, but we did not notice this in our study, this may be contributed to the ignorance of the true concept of healthy lifestyle and the new applications that counts calories and facilitates committing to a calculated and balanced diet. Or may be due to lack of time as the learning system in the college of medicine, Hail University is very tough.

Acknowledgments:-

Our sincere gratitude to the students in the faculty of medicine, Hail University who cooperate with us and participate in our study giving us these results.

Abstract

In this study, we present a compartmental model for the spread of malaria in a population where group of individuals were vaccinated. The purpose of this paper is to analyze the transmission dynamics of Malaria by using the compartmental model, including ordinary differential equations for human host and mosquito vector populations. A parallel system is obtained, which has two equilibriums: a disease-free equilibrium and an endemic equilibrium. The stability of the equilibrium points is verified by the basic reproduction number R_0 . Asymptotically stable solution is obtained only for disease-free equilibrium and results are presented graphically.

Introduction:-

Malaria is most common in Africa. The disease prevails in warmer climates and in areas where there is abundance of humidity and rain. According to latest WHO estimates released in December 2015, there were 214 million cases of malaria in 2015 and 438,000 deaths. At present five known species of plasmodium exists which are; *P falciparum*, *P vivax*, *P ovale*, *P malariae* and *P knowlesi* among them *P. falciparum* is responsible for most fatal infection and is widespread in the tropics. Clinical symptoms of malaria include: high fever, muscle and joint aches, headache, vomiting, chills, sweating and anemia etc. Young children and travellers (who do not have developed immunity) are at high risk of malaria. In highly endemic areas people develop a degree of acquired immunity which is boosted-up by new infections. Immunity lasts for a certain period in the absence of new infection. The duration of infection depends on many factors such as degree of infection, method and time of treatment, resistivity of parasite to drugs and biology of host.

Mathematical modeling has been frequently used in epidemiology and several other fields. Epidemiological modeling is very helpful in identifying important model parameters and suggests improvements in models for future predictions.

We modified the model of NidhiNirwani, R. Khandelwal and V.H. Badshah by performing the stability analysis. The purpose of this study is better understanding the dynamics of malaria.

Description of Model:-

Let N_H and N_V denote human and mosquito population respectively with total population at time t . We assume that human and mosquito population has constant size with birth and death rates equal to μ_H and μ_V .

The human population of size N_H is composed of Susceptible S_H , Infective I_H and Recovered R_H whereas vector population consists of Susceptible S_V and Infective I_V .

We say group of people ρ , $0 \leq \rho \leq 1$ of newborns host population be vaccinated. Assume that vaccine is not perfect and let the effectiveness of vaccine is s , then $\mu_H(1 - \rho s)N_H$ newborns remain susceptible, and $\mu_H \rho s N_H$ directly being removed to R_H . The governing equations are:

Human population:-

$$\begin{aligned} \frac{dS_H}{dt} &= \mu_H(1 - \rho s)N_H - \frac{ab S_H I_V}{N_H} + v I_H + \gamma R_H - \mu_H S_H \\ \frac{dI_H}{dt} &= \frac{ab S_H I_V}{N_H} - v I_H - r I_H - \mu_H I_H \\ \frac{dR_H}{dt} &= \mu_H \rho s N_H + r I_H - \gamma R_H - \mu_H R_H \end{aligned} \quad (1)$$

Vector Population:-

$$\begin{aligned} \frac{dS_V}{dt} &= \mu_V N_V - \frac{ac S_V I_H}{N_H} - \mu_V S_V \\ \frac{dI_V}{dt} &= \frac{ac S_V I_H}{N_H} - \mu_V I_V \end{aligned} \quad (2)$$

The human population of size N_H is formed of susceptible S_H , infective I_H and recovered R_H where vector population is composed of S_V and I_V .

Table 2.1:- Description of parameters of the model.

Variables	Interpretation
a	The average infection rate on man by single mosquito.
b	The proportion of bites on man that produce an infection.
c	The probability that a mosquito becomes infectious.
γ	The per capita rate of loss of immunity in human hosts.
r	The rate at which human hosts acquire immunity.
v	The rate of recovery of human hosts from the disease.

Using $S_H + I_H + R_H = N_H$ and $S_V + I_V = N_V$, eqs (1) and (2) become

$$\begin{aligned}\frac{dS_H}{dt} &= \mu_H(1 - \rho s)N_H - \frac{abS_H I_V}{N_H} + \nu I_H + \Upsilon(N_H + S_H + I_H) - \mu_H S_H \\ \frac{dI_H}{dt} &= \frac{abS_H I_V}{N_H} - \nu I_H - r I_H - \mu_H I_H \\ \frac{dI_V}{dt} &= \frac{acI_H(N_V - I_V)}{N_H} - \mu_V I_V\end{aligned}\quad (3)$$

Writing the eq (2.3) in population proportion

$$\begin{aligned}S_h &= \frac{S_H}{N_H}, I_h = \frac{I_H}{N_H} \text{ and } I_v = \frac{I_V}{N_V}, \\ \frac{dS_h}{dt} &= \mu_H(1 - \rho s) - ab\phi S_h I_v + \nu I_h + \Upsilon - \Upsilon(S_h + I_h) - \mu_H S_h \\ \frac{dI_h}{dt} &= ab\phi S_h I_v - \nu I_h - r I_h - \mu_H I_h \\ \frac{dI_v}{dt} &= acI_h(1 - I_v) - \mu_V I_v\end{aligned}\quad (4)$$

Where $\phi = \frac{N_V}{N_H}$ is the ratio of host and vector population.

Further we rescale t by ac and let $x = S_h, y = I_h$ and $z = I_v$

$$\begin{aligned}\frac{dx}{dt} &= \mu(1 - x) - \sigma x - \eta x z + k y + \varphi - \varphi y \\ \frac{dy}{dt} &= \eta x z - (k + m)y \\ \frac{dz}{dt} &= y(1 - z) - \omega z\end{aligned}\quad (5)$$

Where

$$\mu = \frac{\mu_H}{ac}, \pi = \rho s, \eta = \frac{b\phi}{c}, m = \frac{\mu_H + r}{ac}, \omega = \frac{\mu_V}{ac}, k = \frac{\nu}{ac}, \sigma = \frac{\mu_H + \Upsilon}{ac}, \varphi = \frac{\Upsilon}{ac}$$

Euler Method:-

Values of parameters used were $\beta = 0.000318$ and $\mu = 0.0175$ and the initial conditions were $S(0) = 460, I(0) = 12, R(0) = 0$

The Euler method

$$\begin{cases} w_0 = \alpha \\ w_{i+1} = w_i + hf(t_i, w_i) \end{cases}, \quad i = 0, 1, 2, \dots, N-1$$

The time interval was [0 90] and $N=10$ so

$$h = \frac{b-a}{N}$$

$$h = \frac{90-0}{10} = 9$$

$$t_0 = 0, t_1 = 9, t_2 = 18, t_3 = 27, \dots, t_{10} = 90$$

$$w_0 = \begin{pmatrix} S(0) \\ I(0) \\ R(0) \end{pmatrix} = \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} = \begin{pmatrix} w_{1,0} \\ w_{2,0} \\ w_{3,0} \end{pmatrix}$$

Iteration-1 for $i=0$

$$w_1 = w_0 + hf(t_0, w_0)$$

$$w_1 = \begin{pmatrix} w_{1,0} \\ w_{2,0} \\ w_{3,0} \end{pmatrix} + hf(0, w_0)$$

$$w_1 = \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + 9 \begin{pmatrix} -0.00038 \\ -0.20962 \\ 0.21 \end{pmatrix}$$

Steady State And Equilibrium Points:-

The system (5) has a disease-free equilibrium point $E_0 (\frac{\mu(1-\pi)+\varphi}{\sigma}, 0, 0)$ and an endemic equilibrium point $E_1(x_e, y_e, z_e)$, where

$$\begin{aligned} x_e &= \frac{(k+m)[\mu(1-\pi)+\varphi+(m+\varphi)\omega]}{\eta(m+\varphi)+\sigma(k+m)} \\ &= \frac{(v+\mu_H+r)[ac\{\mu_H(1-\rho s)+\gamma\}+(\mu_H+r)\mu_V]}{ac[ab\phi(\mu_H+r+\gamma)+(\mu_H+\gamma)(v+\mu_H+r)]} \\ y_e &= \frac{\eta[\mu(1-\pi)+\varphi]-\sigma(k+m)\omega}{\eta(m+\varphi)+\sigma(k+m)} \\ &= \frac{a^2bc\phi[\mu_H(1-\rho s)+\gamma]-(\mu_H+\gamma)(v+\mu_H+r)\mu_V}{ac[ab\phi(\mu_H+r+\gamma)+(\mu_H+\gamma)(v+\mu_H+r)]} \\ z_e &= \frac{\eta[\mu(1-\pi)+\varphi]-\sigma(k+m)\omega}{\eta[\mu(1-\pi)+\varphi+(m+\varphi)\omega]} \\ &= \frac{a^2bc\phi[\mu_H(1-\rho s)+\gamma]-(\mu_H+\gamma)(v+\mu_H+r)\mu_V}{ab\phi[ac\{\mu_H(1-\rho s)+\gamma\}+(v+\mu_H+r)\mu_V]} \end{aligned}$$

This has been obtained by setting the time derivatives of the Eq (5) equal to zero. Here the basic reproduction number R_0 is defined by

$$R_0 = \frac{\eta[\mu(1-\pi)+\varphi]}{\sigma(k+m)\omega} = \frac{a^2bc\phi[\mu_H(1-\rho s)+\gamma]}{(\mu_H+\gamma)(v+\mu_H+r)\mu_V}$$

And an endemic equilibrium $E_1(x_e, y_e, z_e)$ is stable when

$$R_0 = \frac{\eta[\mu(1-\pi)+\varphi]}{\sigma(k+m)\omega} > 0$$

$$w_1 = \begin{pmatrix} 459.99658 \\ 10.11342 \\ 1.89 \end{pmatrix}$$

Asymptotic Behaviour Of The Model:-

Theorem 1: If $R_0 < 1$, then the disease-free equilibrium is locally E_0 is locally stable and if $R_0 = 1$, E_0 is stable.

Proof:

To discuss the stability of the model, the governing dynamical system is

$$F_1 = \mu(1-\pi) - \sigma x - \eta xz + ky + \varphi - \varphi y \quad (6)$$

$$F_2 = \eta xz - ky - my \quad (7)$$

$$F_3 = y(1-z) - \omega z \quad (8)$$

The variation matrix of the above system is given by

$$J = \begin{bmatrix} -\sigma - \eta z & k - \varphi & -\eta x \\ \eta z & -k - m & \eta x \\ 0 & 1 - z & -y - \omega \end{bmatrix}$$

For disease free equilibrium $E_0 (\frac{\mu(1-\pi)+\varphi}{\sigma}, 0, 0)$ the variation matrix will be

$$J(E_0) = \begin{bmatrix} -\sigma & k - \varphi & \frac{-\eta[\mu(1-\pi)+\varphi]}{\sigma} \\ 0 & -k - m & \frac{\eta[\mu(1-\pi)+\varphi]}{\sigma} \\ 0 & 1 & -\omega \end{bmatrix}$$

The characteristic equation of it will be

$$(\sigma + \lambda) \left[\lambda^2 + (k+m+\omega)\lambda + (k+m)\omega - \frac{\eta[\mu(1-\pi)+\varphi]}{\sigma} \right] = 0 \quad (9)$$

By the above equation at eigenvalues, one can easily see that disease-free equilibrium E_0 is locally stable if

$$(k+m)\omega - \frac{\eta[\mu(1-\pi) + \varphi]}{\sigma} > 0$$

i.e., $R_0 < 1$

Stability of disease-free equilibrium:-

The assumed values of all the parameters are given in the table below:

Parameters	Values
μ	1.16
η	0.00492
π	0.009
σ	2.1724
ϕ	0.9
k	0.0026
ω	1
m	0.011

With initial conditions $(x(0), y(0), z(0)) = (0.5, 0.5, 0.4)$

After substituting the values in equation (4.4) we get;

$$(2.1724 + \lambda)(\lambda^2 + 1.0136\lambda) + 0.0089 = 0(10)$$

Where,

$$\lambda_1 = -2.1724$$

$$\lambda_2 = -0.0089$$

$$\lambda_3 = -1.00475$$

We see all Eigen values are real and negative, also $R_0 = 0.3413084471 < 1$, so the system is stable.

Stability of disease-free equilibrium:-

Taking equations (6) and (7); the variation matrix is given by

$$J_1 = \begin{bmatrix} -\sigma - \eta z & k - \varphi \\ \eta z & -k - m \end{bmatrix}$$

For disease free equilibrium $E_0 \left(\frac{\mu(1-\pi)+\varphi}{\sigma}, 0, 0 \right)$ the variation matrix will be

$$J_1 = \begin{bmatrix} -\sigma & k - \varphi \\ 0 & -k - m \end{bmatrix}$$

And putting the values from the table of disease-free equilibrium, we will get the following linear system;

$$\dot{x} = -2.1724x - 0.89747y$$

$$\dot{y} = -0.0136y$$

Now we take the graph of above equation through p-plane

Now, taking equations (6) and (7); the variation matrix is given by

$$J_2 = \begin{bmatrix} -k - m & \eta x \\ 1 - z & -y - \omega \end{bmatrix}$$

For disease free equilibrium $E_0 (\frac{\mu(1-\pi)+\varphi}{\sigma}, 0, 0)$ the variation matrix will be

$$J_1 = \begin{bmatrix} -k - m & \frac{\eta[\mu(1-\pi) + \varphi]}{\sigma} \\ 1 & -\omega \end{bmatrix}$$

And putting the values from the table of disease-free equilibrium, we will get the following linear system;

$$\begin{aligned} \dot{y} &= -0.0136y + 0.004047z \\ \dot{z} &= y - z \end{aligned}$$

Now we take the graph of above equation through p-plane

Now, taking equations (6) and (9); the variation matrix is given by

$$J_3 = \begin{bmatrix} -\sigma - \eta z & \eta x \\ 0 & -y - \omega \end{bmatrix}$$

For disease free equilibrium $E_0 (\frac{\mu(1-\pi)+\varphi}{\sigma}, 0, 0)$ the variation matrix will be

$$J_1 = \begin{bmatrix} -\sigma & \frac{\eta[\mu(1-\pi) + \varphi]}{\sigma} \\ 0 & -\omega \end{bmatrix}$$

And putting the values from the table of disease-free equilibrium, we will get the following linear system;

$$\begin{aligned} \dot{x} &= -2.1724x + 0.004047z \\ \dot{z} &= -z \end{aligned}$$

Now we take the graph of above equation through p-plane

Conclusion

In this paper we present compartmental model for spread of malaria. An identical system is obtained which has two equilibrium points; a disease-free equilibrium and an endemic equilibrium. We discussed the stability of the disease-free equilibrium point numerically by computing Eigen-values and by using basic reproduction number. Further we perform stability analysis and graphically verify our results. All the graph indicate that the system is stable.

Future Work

The model presented here is multi-dimensional. In future we can perform stability analysis for endemic-equilibrium. Furthermore we can establish these results by using any of the numerical methods. Also we can work on its sensitivity analysis and parameter estimation.

Madhuca longifolia, pre-sowing treatment, seedling growth.

Abstract

Madhuca longifolia L (Family : Sapotaceae) is a medicinal and economic important tree. This study was carried out to know the effect of pretreatment on seed germination and seedling growth parameters of size graded *M. longifolia* seeds viz. large, medium and small. The result shows that the large and medium sized seeds treat with tap water is significantly increased the germination and seedling growth compared to control and other treatments.

Introduction:-

To achieve success in any plantation programs a good start is essential from the germination stage. In order to that, many tree species germinate readily when subjected to favorable conditions of moisture, gaseous balance, light and temperature, but many other species possess degree of seed dormancy or have other germination problems. In order to ensure quick and even germination in nursery beds, artificial treatments to be attempted before sowing (Hanumantha et al., 2002). Trees have been considered as vital part of the life and their significance being described in epics. Many traditional societies all over the world value a large number of plant species for a wide variety of reasons viz., food, fibre, shelter, medicine, etc..

Madhuca longifolia L. is a commonly known as Mahua, or Butter nut tree. It is a medium sized deciduous tree distributed in Nepal, India and Srilanka (Saluja et al., 2011). *M. longifolia* seeds are of economic importance as they are good source of edible fats (Chatterjee and Pakrashi 2000). The medicinal properties attributed to this plant are stimulant, demulcent, emollient, heating and astringent (Awashti and Mitra 1967). The flowers have been traditionally used as cooling agent, tonic, aphrodisiac, and astringent, demulcent and for the treatment of chronic tonsillitis (Chandra 2001). The leaves are expectorant and also used for chronic bronchitis. The bark is used for rheumatism (Sunita and Sorojini, 2013). The root powder is used to cure diarrhea and other chronic fluxes (Chatterjee and Pakrashi 2000).

Since the present study was carried out to find out the effectiveness of size graded seeds in various pretreatment methods to understand the behavior of seed germination and seedling growth which will reduce the maintenance cost in nursery and result in good crop-stand.

Materials and Method:-

The freshly collected seeds of *M. longifolia* were sorted out into three groups namely large, medium and small on the bases of visual observation. The following treatments was given to the seeds

- T0: Control (non-treated)
T1: Seeds were soaked in warm water (50-55°C) for 10 minutes,
T2: Seeds were soaked in warm water (50-55°C) for 15 minutes,
T3: Seeds were placed under running tap water for 12 hours,
T4: Seeds were placed under running tap water for 24 hours,
T5: Seeds were soaked in concentrated sulfuric acid for 10 minutes,
T6: Seeds were soaked in concentrated sulfuric acid for 20 minutes,
T7: Seeds were soaked in concentrated sulfuric acid for 1 hour,
T8: Seeds were soaked in concentrated nitric acid for 10 minutes,
T9: Seeds were soaked in concentrated nitric acid for 20 minutes,
T10: Seeds were soaked in concentrated nitric acid for 1 hour,
T11: Seeds were manually by rubbing on sand paper at the cotyledon ends,
T12: A small piece of seed coat was removed mechanically using razor blade.

After pretreatment by various methods (T1- T10), the seeds were thoroughly washed in tap water and were sown in 30cm X 11cm polythene bags containing sand medium kept at room temperature (28±2°C). The germination studies were carried out with five replicates and each replication consisted of fifty seeds of uniform size. The mechanically scarified (T11 and T12) seeds are sown immediately. Watering was done daily and germination was recorded on alternate days during 90 day period for experimentation. The statistical analysis was done by the method of Duncan's Multiple Range Test (DMRT).

Result and Discussion

In *M. longifolia*, large sized seeds treated with tap water (24 hours) were enhanced the higher percentage of germination when compared to other treatments. Whereas the medium and small sized seeds exhibited poor germination in all the treatments (Fig. 1). The continuous soaking of seeds in running tap water will leaches out inhibitory chemicals, thereby improving the germination of chemically dormant seeds (Bewley and Black 1994). The root and shoot length of large sized seeds exhibited more in 12 hours tap water treated seedlings followed by 24 hours treatment compared to control (Fig. 2 & 3). Mean number of days taken for germination of the seedlings was also less for large and medium sized seeds than the small size.

In the present study large sized seeds of *M. longifolia* treated with tap water for 48 hrs showed higher percentage of germination and seedling growth. This study is concordant to Naidu and Mastan (2001) in *Pterocarpus santalinus*. They observed that the seeds kept under running tap continuously for 6 days exhibits more germination.

Seedling growth

Abstract

The present study was undertaken to examine the effect of physical characters seeds on physiological characters like seed germination and seedling growth of *A. marmelos* L. Corr. Seeds were size graded in to large, medium and small based on seed size (length and breadth) and weight. The result revealed that the size-graded seeds influence the seed germination and seedling growth. The large seeds gave maximum germination followed by medium and small size seeds.

Introduction:-

Aegle marmelos (L.) Corr., is an endangered medicinal tree generally known as Bael belonging to the family Rutaceae. It is a medium sized deciduous and aromatic tree about 12-15m height, leaves trifoliate, aromatic, alternate. Leaflets ovate or ovate- lanceolate; greenish white flowers, Large, globose fruits, woody berry (Mazumder et al 2006). It is a popular medicinal plant in Ayurveda and siddha medicines to treat a variety of ailments (Venudevan 2013). Bael fruits are popular due to its medicinal and nutritional properties. Fruits juice is used to cure of diarrhea and dysentery, jaundice, ulcer and eczema (Nadkani 1954). The roots are useful for treating diarrhea and dyspepsia (Pallab Maity 2009). The tree is normally propagated through seeds and seeds required specific quality for better performance with uniformity on seedling production in nursery. However, seeds are exhibit wide varieties such as seed morphological characters as per the influence of development and maturation (Abdul- Baki and Baker, 1973) therefore the present study was conducted to evaluate the effect of seed size and weight on germination and initial growth in the nursery

Materials and Method:-

Physical characters:-

Mature fruits of *Aegle marmelos*, were collected during November to April in Coimbatore district, Tamilnadu, India. The seeds were extracted by macerating the fruits and washed in running water and then air dried at room temperature ($28 \pm 2^\circ\text{C}$). The seeds were graded into three size grades i.e., large, medium and small. Seed samples (100 seeds) were drawn from each grade and measured for length and breadth using vernier- scale. The length was measured from the base to the tip of the seed and recorded in cm. The breadth was measured at its broadest portion and expressed in cm. One hundred seeds were counted and its weight was recorded in grams using electronic top pan balance as per ISTA (1985) rules. Number of seeds per kilogram was also calculated.

Physiological Characters:-

Hundred seeds of three different sizes (based seed size) were sown in 30/11 inch polythene bags with holes at the rate of one seed / bag. These bags were filled with sand + red soil (1:1). The weight of the medium was one kilogram in each bag for all cases. The optimum depth was 1.0 to 1.5 cm below the surface of the soil. There were four replications consisting of one hundred bags /replication. The bags were watered daily. Germination percentage was calculated using the following formula:

$$\text{Germination \%} = \frac{\text{No. of seed germinated}}{\text{Total no of seeds sown}} \times 100$$

The growth and biomass productions of seedlings were taken once in fifteen days from the date of germination up to 90 days. Ten seedlings in each replication at random were uprooted by cutting the polythene bags without damaging the roots were washed with water. The root and shoot lengths were measured and expressed in cm. The seedlings were dried in a hot-air oven at 60°C for 48 hours. After cooling, them in desiccators weighed in electronic top pan balance and expressed in grams.

Result and Discussion:-**Physical Parameter :**

The physical characteristics of seeds viz., seed length, seed breadth, 100 seeds weight, percentage of occurrence and No. of seeds / kg was observed and tabulated [Table-1].

The seeds of *A. marmelos* were oblong in shape and milky white in colour. They were size Graded into large, medium and small representing in the ratio of 2:4:1. Seed length, breadth and 100 seed weight were noticed to be more in larger seeds followed by medium and small. Number of seeds / Kg was lowest in larger seeds 5300 (± 237.1) followed by higher number in medium 6437 (± 515.3) and 8125 (± 772.9) in small. Similar seed morphological studies were made by Athaya (1985) in certain tree species growing in tropical dry deciduous mixed forests of central India. Roy [1985] in *Albizia lebbbeck*, Ponnammal *et.al.* , [1993] in *Hardwickia binnata* ,Suresh *et .al.*, [2003] in *Bassia longifolia* and Kathiravan(2004) in *Jatropha*.

Physiological characters:-

Seed grading is a continuous process in seed cleaning in which the seeds are graded according to their size or weight. The purpose of grading is to improve the physiological quality of the seed lot by eliminating small, empty and underdeveloped seeds

Among freshly collected seeds of *A. marmelos* germination was noticed 6- 10 days after sowing. The large sized seeds exhibited higher (98%) percentage of germination compared to that of medium and smaller sized seeds (Fig: 1.) This may be due to large quantity of stored food materials in the larger seeds, which contributed for best germination. The better germination of larger seeds also noticed in, *Aholo sercia* by Hillum (1990), *Syzigium cumini* by Ponnammal *et al.*, (1992) and *Hardwickia binnata* by Ponnammal *et al.*,(1993). *Dalbergia sissoo* by Yadav *et al.*, (1998), *Bassia longifolia* by Suresh *et al.*, (2003) and *Pinus wallichiana* by Ghildiyal and Sharma (2005)

In the growth performance of the seedlings (90 day old), root and shoot length was higher in large sized seeds (25.1 cm and 20.3 cm) followed by medium (22.1 cm and 16.5 cm) and small (18.9cm and 15.2cm) respectively. This result conformed that the bigger seeds giving rise to larger seedlings. Due to bigger embryo, which had more nutrients to support more growth has been reported by Ponnusamy *et al.*, (1991) in *Neem*. Similar findings were also reported by Chauhan and Raina (1980) in *Pinus roxburghii.*, Ponnammal (1992) in *Syzigium cumini* Arjunan *et al.*, (1995) in *Pongamia pinnata* and Dar *et al.* , (2002) in *Albizia lebbck*, *Acacia catechu* and *Pinus roxburghii*. In all these three sized seeds, the root growth was found to be faster than the shoot growth. After 90 days of seed germination, highest biomass production was noticed in seedlings from large seeds (0.186 g/plant) (Table.13).

Table 1:- Physical characters of *A. marmelos* seeds.

Seed size	100 Seed weight (g)	Seed length (cm)	Seed breadth (cm)	Occurrence (%)	No. of seeds / Kg	Seed Shape and Colour
Large	37.0 \pm 1.85	0.81 \pm 0.09	0.38 \pm 0.05	20-25	5300 \pm 237.1	Oblong Milky White
Medium	30.0 \pm 3.29	0.65 \pm 0.05	0.32 \pm 0.04	55-60	6437 \pm 515.3	
Small	22.0 \pm 2.94	0.48 \pm 0.06	0.25 \pm 0.07	18-22	8125 \pm 772.9	

\pm = Standard deviation

Conclusion:-

Seed is one of the most important inputs for forest nursery production. Based on the results of the present study, seed germination and seedling growth characters were higher in larger seeds. So this study concluded that the seed size and seed quality are positively related.
