Ocean acidification, climate change,
carbon dioxide, calcium carbonate.

Abstract

Due to an equilibration of partial pressure of CO₂ (pCO₂) in the atmosphere, 30% of its concentration has been absorbed by ocean and making it more acidic and generate potential global warming. Future changes of ocean pH and temperature are predicted to impact biodiversity of marine ecosystems, particularly those animals that rely on calcification process. Reduced pH will induce dissolution rates of calcium mineral particularly aragonites and calcites and that alter decalcification rates. The reduction of pH also disrupts acid base balance and metabolic rates that lead to metabolic depression whilst increase temperature affects organisms' thermo-tolerance capacity. Even though decreased metabolic rates were associated with metabolic depression, a strategy to match oxygen demand and availability, however prolong exposure to these stressors have affected growth, survival and reproduction rates. In addition, increase CO₂ and temperature have also magnitude end-product metabolites such as succinic and lactic acids and reduced energy nucleotides (adenosine 5-triphosphate, adenosine diphosphate and adenosine monophosphate) in the cells, indicating an increased reliance on anaerobic metabolism. Furthermore, anthropogenic alteration of CO₂ and temperature may also lead to plastic responses, a fundamental mechanism of many marine gastropods to cope environmental variability. Shells of marine gastropod were also more globular in order to defend desiccation rates, a primary threat to most intertidal organisms to elevated temperature particularly those that lack of mobilization aggregates (sessile). Although level of impacts may also vary from species to species as well as populations, however, physiologically, the result always came at cost.

Introduction:-

Ocean acidification (OA) is the result of an ongoing process caused by an excessive increase of carbon dioxide (CO₂) into the world's oceans (Caldeira and Wickett 2003, Kleypas et al. 2006). This chemical change to seawater is driven by increased levels of atmospheric CO₂. For the past 650,000 years and prior to the Industrial Revolution, the concentration of atmospheric CO₂ was in the range of 180 to 300 ppm by volume (ppmv) (Augustin et al. 2004, Siegenthaler et al. 2005). However, Houghton et al. (2001) reported that CO₂ levels in the atmosphere had reached

367 ppm in 1999 and will continue to increase by 1% per year over the next few decades. Current atmospheric CO₂ levels have increased to 380 ppm (Raven et al. 2005, Kleypas et al. 2006) with a resulting increased atmospheric partial pressure ($p\text{CO}_2$) of the gas (Jacobson 2005) (Fig. 1).

Figure 1:- The increase of mean atmospheric carbon dioxide (CO₂) at Mauna Loa Observatory, Hawaii. The CO₂ data constitutes the longest record of direct measurements of CO₂ in the atmosphere. The red line represents monthly mean values. The black curve represents seasonally corrected data.

(Source: <http://www.esrl.noaa.gov/gmd/ccgg/trends/>)

If CO₂ concentrations continue to increase in line with the current trend (as shown in Fig. 1) then it is predicted that atmospheric [CO₂] will increase by about 50% on the current concentrations by 2030 (McNeil and Matear 2008), exceeding 1000 ppmv by 2100 (Raven et al. 2005).

In general, the increase of CO₂ concentration in the atmosphere is caused by an imbalance of CO₂ exchange (input and output), for example, through the burning of fossil fuels, land-use changes and the industrial production of cement (Orr et al. 2005). Although CO₂ is also absorbed by terrestrial plants (Metaphytes), more than 40% of atmospheric CO₂ enters the oceans (Falkowski et al. 2000). There are several pathways in the carbon cycle which are particularly important for this process. Figure for the global carbon cycle (Fig.2) shows that there is a net flux of CO₂ into the oceans of 1.7×10^{15} g C y⁻¹.

Figure 2:- The global carbon cycle pathways, pools and fluxes. About 3.2×10^{15} g C y⁻¹ of world production CO₂ enters the atmosphere. (Source: Kling et al. 2003).

Although CO_2 is not a chemically reactive gas in the atmosphere, its dissolution in seawater leads to several complex chemical, physical and biological changes (Raven et al. 2005). The initial reaction of CO_2 and water (H_2O) forms carbonic acid (H_2CO_3) which, in turn, forms bicarbonate (HCO_3^-) and, by dissociating H^+ ions, drives pH to lower values (Raven et al. 2005) (Fig. 3).

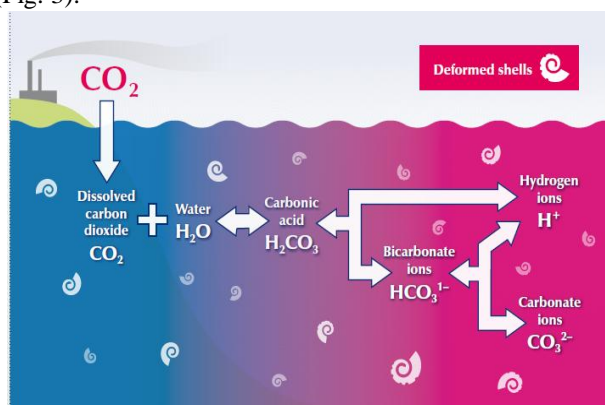

Figure 3:- Increased CO_2 in the atmosphere is being taken up by the ocean resulting in the sea water becoming less alkaline. As CO_2 dissolves in seawater, carbonate ions neutralise free hydrogen ions, causing carbonate levels to drop. (Source: University of Maryland in Andiman et al. 2012).

Therefore, increasing $[\text{CO}_2]$ ultimately leads to an increase in the concentration of carbonic acid (H_2CO_3) which will dissolve rapidly to bicarbonate (HCO_3^-), H^+ and carbonate ions (CO_3^{2-}) (Caldeira and Wickett 2003, Fabry et al. 2008). At present, ocean pH has been reduced by 0.1 units from ambient conditions, equivalent to a 30% increase in hydrogen ions (Sabine et al. 2004, Raven et al. 2005, Dashfield et al. 2008). Future predictions suggest that increased CO_2 levels will reduce seawater pH by 0.3 – 0.5 units by 2100 (Caldeira and Wickett 2003, 2005) and 0.77 units by 2300s if CO_2 release into the atmosphere continues to rise according to 'business as usual' scenario (IPCC 2007). In addition, Feely et al. (2008) have shown that corrosive water with lower aragonite saturation (Ω_{ara}) from the deep sea upwells to the continental shelf and coastal waters where it can affect intertidal regions. These coastal waters may already experience low aragonite saturation states (Feely et al. 2008, Wootton et al. 2008).

As well as altering the pH of the oceans, increased CO_2 has been suggested to be responsible for a 55% increase in radiative forcing (change in net solar radiation between different layers of the atmosphere in unit Wm^{-2}) (Jenkinson et al. 1991) and subsequent increases in air temperatures (McMullen 2009). Increased radiative forcing ultimately alters the incoming and outgoing energy balance between the Earth and its atmospheric system. When radiative forcing is positive, the Earth's surface tends to warm (IPCC 2007). In 2005 the mean value of radiative forcing was $+1.6$ indicating a rate of warming of $+1.6 \text{ Wm}^{-2}$ (IPCC 2007), which could increase to 8.0 Wm^{-2} by 2100 (Sokolov et al. 2009) (Fig. 4a).

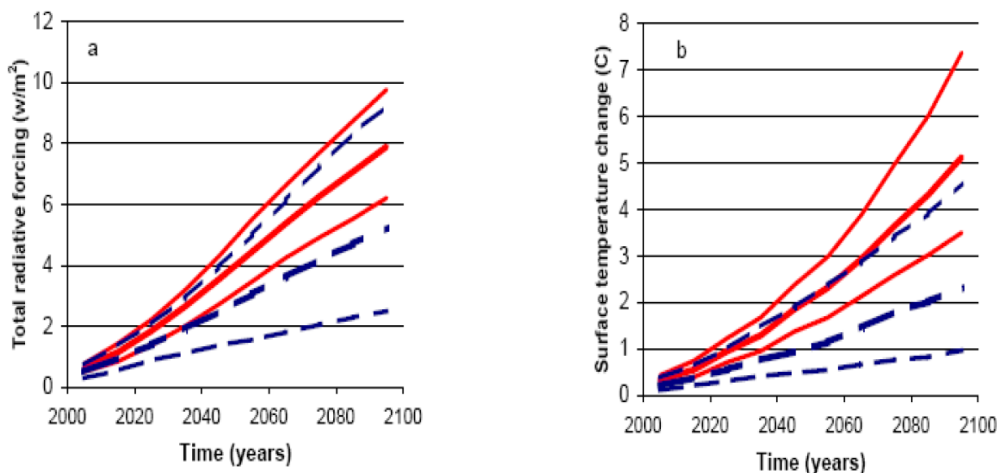

Figure 4:- Projected changes in climatic parameters between 2000 and 2100: a) decadal mean radiative force; b) sea surface temperature change. Red solid lines show median, 5% and 95% percentile values presented in the study by Sokolov et al. (2009) and dashed blue lines show median, 5% and 95% percentile predicted by Webster et al. (2003). (Source: Sokolov et al. 2009).

Jenkinson et al. (1991) also proposed that increased air temperatures would increase emissions of CO₂ gas from soils, through an increase in the turnover of organic matter (Jenkinson et al. 1991). Warming caused by increased atmospheric CO₂ levels will also increase ocean temperatures (Kleypas et al. 2006, Allison et al. 2008). At present, seawater temperature has warmed by approximately 0.7 °C compared with the pre-industrial era (Kleypas et al. 2006) and is predicted to rise by a further 2 °C by 2050 (Huesemann 2006, Guldborg et al. 2007).

Jacobson (2005) developed a model with uncertainty input parameters that predicted an increase of CO₂ to 375 ppmv there would be an increase in temperature of 3 °C. However this model has been corrected by Sokolov et al. (2009) with certainty input parameters (e.g. world volcanic eruptions and gross domestic product (GDP) growth) which predicts that sea surface temperature (SST) will increase between 3.5 and 7.4 °C with a median increase of 5.1 °C by 2100 (Fig. 4b).

Impact of Ocean Acidification and Temperature on Calcifying Organisms:-

Organisms that rely on calcified structures are thought to be particularly vulnerable to OA (Kleypas et al. 1999, Orr et al. 2005, Kleypas et al. 2006, Hendriks et al. 2010, Kroeker et al. 2010, Hale et al. 2011). The increased acidity of seawater reduces calcium carbonate saturation (Ω) and carbonate ion concentration (CO₃²⁻) according to the following reaction:

Therefore, increased H⁺ causes carbonate ions (CO₃²⁻) to react and form bicarbonate ions (HCO₃⁻). Decreases in carbonate ions will decrease the precipitation of CaCO₃ and the carbonate saturation state calculated as:

$$\Omega = \frac{[\text{Ca}^{2+}]_{\text{sw}} \times [\text{CO}_3^{2-}]_{\text{sw}}}{[\text{Ca}^{2+}]_{\text{sat}} \times [\text{CO}_3^{2-}]_{\text{sat}}} \quad (2)$$

In which the solution of saturation state of [Ca²⁺] and [CO₃²⁻] is calculated as:

$$k'_{\text{sp}} = [\text{Ca}^{2+}]_{\text{sat}} \times [\text{CO}_3^{2-}]_{\text{sat}} \quad (3)$$

where k'_{sp} is the stoichiometric solubility product for a particular mineral phase of CaCO₃ (i.e. calcite, aragonite, or high-magnesium calcite) (Kleypas et al. 1999, McNeil and Matear 2007, Gazeau et al. 2007, Boesch et al. 2010). Reduced calcium carbonate saturation can make the process of calcification more difficult (Sigler et al. 2008). Also with a carbonate saturation state less than 1 ($\Omega < 1$) CaCO₃ will start to dissolve, whereas at a value greater than 1 ($\Omega > 1$) CaCO₃ will spontaneously precipitate. Calcium carbonate is represented in seawater in two forms, aragonite and calcite (Raven et al. 2005, Gazeau et al. 2007), which are used in the construction of skeletons and shells in all calcifying organisms (e.g. Bowen and Tang 1996, Thompson et al. 2000, Schmidt 2005, Addadi et al. 2006, Gazeau et al. 2007). Both are soluble in acidified seawater and, although calcite is 35% less soluble than aragonite, under acidic conditions both minerals displayed no consistent pattern of dissolution rate; in other words, calcite does not have a lower dissolution rate than aragonite when exposed to acidified seawater at pH 7.4 (McClintock et al. 2009).

The alteration of CO₂ in seawater has been shown to cause a reduction in calcification rates, induce malformations, and impair growth of shells (Riebesell et al. 2000, O'Donnel et al. 2009, Nienhuis et al. 2010, Findlay et al. 2010a and b, Gaylord et al. 2011, Pistevos et al. 2011). Coccolithophores exhibited a reduction in the mineral content of their shells by about 10 - 30% when exposed to low pH condition (Muller et al. 2010) and reduced calcification rates by 66% when exposed to a CO₂ level three times that of pre-industrial levels (Zondervan et al. 2001). Coralline algae also showed an increased dissolution rate in seawater enriched by CO₂ (pH 7.7) (Martin et al. 2008). The destruction of the protective outer shell layer (periostracum) in gastropods has also been found to occur in the top shell *Osilinus turbinata* exposed to pH 7.2 and in the black foot limpet *Pattela caerulea* exposed to pH 7.4 in the

volcanic CO₂ vents (Hall-Spencer et al. 2008). Pacific Oyster (*Crassostrea gigas*) and edible mussel (*Mytilus edulis*) also reduced calcification between 10 and 25% after incubation in a mesocosm for a month under CO₂ levels ranging between 700 to 2000 ppmv (Gazeau et al. 2007). It has also been found that reef building organisms reduce calcification between 11- 46% (Langdon 2002). However, calcification rate can also increase under extreme CO₂ conditions as demonstrated in the mussel *M. edulis* in the Kiel Fjord (Thomsen et al. 2010).

Effects of OA on traits other than calcified structures have also been found in calcifying organisms. Larvae of the mussel *M. californianus* showed lower tissue growth when it was exposed to CO₂ of 900 ppmv for 8 d (Gaylord et al. 2011). The brittle star *Amphiura filiformis* showed muscle degeneration after being exposed to pH 6.8 in 40 d (Wood et al. 2008). Even more exposure to pH 7.7 after 8 d caused 50% mortality of a brittle star larvae *Ophiothrix fragilis* and after 25 d caused 100% mortality (Dupont et al. 2008). However, adult individuals of the velvet swimming crab *Necora puber* reached 100% mortality within 4 – 5 d when exposed to 6040 ppm CO₂ (pH 7.1) as a result of the ability to compensate for the changes in haemolymph pH (Spicer et al. 2007), contrasting with adult *N. puber* that can survive 30 d exposure to pH 6.69 or 21500 ppmv CO₂ (Small et al. 2010). An indirect effect of OA on the common periwinkle *Littorina littorea* was also reported by Bibby et al (2007); when exposed to low pH conditions (pH 6.6 for 15 d) this species had its ability to exhibit induced shell defences (shell thickness) disrupted.

As well there being clear evidence that OA affects calcifying organisms, temperature has also been shown to affect the process of calcification in marine organisms and can cause dramatic changes in shell plasticity. For example, Trussell and Smith (2000) demonstrated that shell thickness of the snail *Littorina obtusata* was positively correlated with temperature. The phenotypic variation of shell morphology in different temperatures may be related to the chemical properties of the different calcium carbonate shell materials (aragonite and calcite). For example decreased calcium carbonate availability at low temperatures is caused by increased solubility that makes shell deposition more difficult (Graus 1974, Vermeij 1978, Trussell and Etter 2001, Melatunan et al. 2013). Irie and Fischer (2009) also reported that temperature influenced shell size in the cowry *Monetaria annulus*, with this species demonstrating a reduced size during warm season compared with the cold season. In contrast, shell thickness in *Cypraea annulus* increased linearly with increasing temperature (Irie 2006), and in the marine mussel *M. edulis* (Nielsen 1988) increased temperature resulted in increased shell size (length).

Given that increased temperature enhances calcium carbonate precipitation (Kleypas et al. 1999) the physiological mechanism for reduced calcification rates at low temperatures may be linked to reduced metabolic rates and energy production (Whiteley and Faulkner 2005). In addition, increase temperature can also create systemic hypoxia, leading to an increase in ventilation rate and reduce energy production (Pörtner 2001). An overall, increase in temperature may disrupt energy production and a concomitant increases in *p*CO₂ would lead to the disruption in oxygen transport proteins (Seibel and Walsh 2003), which in turn would disrupt calcification.

Impact of Ocean Acidification and Temperature on Ecosystems:-

As well as affecting single organisms, it is now clear that OA (and temperature) can have significant effects at higher ecological levels. For example, OA has serious negative effects on several fundamental biogeochemical and ecosystem processes including key elemental cycles and biodiversity (Widdicombe and Spicer 2008, Blackford 2010) and nutrient fluxes (Widdicombe and Needham 2007). These processes included decalcification of planktonic organisms, carbon and nutrient assimilation, primary production and acid-base balance, all of which potentially affect the composition, size structure and successional processes of ecosystems and may lead to a modification of energy flow and resources (Blackford 2010). Although Blackford and Gilbert (2007) suggested that the alteration of ecological function by OA is still unclear with the potential for populations acclimating to altered ocean carbonate chemistry, Hall-Spencer et al. (2008) have showed that a shallow water benthic community in the vicinity of natural CO₂ seepage might change due to the vulnerability of important groups of organisms, with no evidence for adaptation.

In addition, raised ocean temperatures (IPCC 2007, Sokolov et al 2009) may disrupt the stratification of the upper-ocean, the availability of nutrients for phytoplankton growth and reduce primary production (Behrenfeld et al. 2006). Several studies have also revealed that climate warming has reduced ocean productivity in the past decade with potential implications for marine food webs (Kleypas et al. 2006, Behrenfeld et al. 2006, Guinotte et al. 2006, Guinotte and Fabry 2008). In addition, climate change has been predicted to cause phenological changes (Koeller et al. 2009) and shifts in species ranges and distributional patterns (Easterling et al. 2000, Roy et al. 2001, Thomas et al. 2004, Perry et al. 2005, Sekercioglu et al. 2008).

Impacts of Ocean Acidification and Temperature on Physiological Functions:-

Several studies have revealed negative effects of climate change and OA on the physiological function of various marine calcifying taxa (e.g. Pörtner et al. 2000, 2004, 2005, Michaelidis et al. 2005, Wood et al. 2008, 2010, Small et al. 2010, Melatunan et al. 2011). For example increased levels of $p\text{CO}_2$ in seawater leads to hypercapnia that causes metabolic rate depression in *Sipunculus nudus* (Reipschläger and Pörtner 1996, Pörtner et al. 1998) and brings about 31% metabolic rate reduction in jumbo squid, *Dosidicus gigas* (Rosa and Seibel 2008) and 23% reduced in *L. littorea* (Melatunan et al. 2011). Increased CO_2 levels has also been shown to decrease aerobic scope (Metzger et al. 2007, Walther et al. 2010, 2011), increase induced acidosis in extracellular fluid (Burnett 1997, Miles et al. 2006, Pane and Barry 2007, Spicer et al. 2007). Metabolic acidosis can also reduce protein synthesis, increase respiratory stress and induce metabolic depression (Seibel and Walsh 2002) which may be lethal to organisms unable to compensate for haemolymph acidosis (Burnett 1997, Spicer et al. 2007). Such lethal effects of high $p\text{CO}_2$ were shown in *Necora puber* exposed to highest levels of hypercapnia at 6040 ppm (pH 6.74) (Spicer et al. 2007). Lannig et al. (2010) reported that OA affects energy metabolism in the oyster *Crassostrea gigas*. Under high CO_2 conditions a substantial reduction of ATP was found in gill tissue following an increase of succinate at the same gill tissue. In addition Cumming et al. (2011) demonstrated that high CO_2 (735 ppm equal to pH 7.78) caused low expression of chitin synthase (a key enzyme involved in synthesis of bivalve shells) indicating that the bivalve *Laternula elliptica* is working harder to calcify in acidified seawater conditions.

Rates of calcification under low pH are not only determined by environmental conditions (e.g. Ω_{ara} and Ω_{calc}) but are also determined by physiological capacity and functional performance in terms of the regulation of extracellular fluid acid-base balance and maintenance of metabolic homeostasis (Michaelidis et al. 2005, Cumming et al. 2011, Findlay et al. 2011, Gaylord et al. 2011, Whiteley 2011). The interaction between high $p\text{CO}_2$ and elevated temperature could lead to oxygen limitations (Pörtner and Farrell 2008, Pörtner 2010) which will add to the metabolic acidosis caused by lowering of the environmental pH which is known to disrupt oxygen transport and reduce energy production (Seibel and Walsh 2003). Such effects could be critical for intertidal organisms that may experience hypoxia during emersion – an effect that may occur concomitantly with high temperatures (Sokolova and Pörtner 2003, Larade and Storey 2009). Species populations are likely to have different physiological strategies e.g. shifting metabolic pathways and decreasing energy budget allocation (Sokolova and Pörtner 2001, 2003, Findlay et al. 2010a and b), that would allow them to cope with local environmental conditions such as thermal stress. Such metabolic and energetic shifts are likely to have associated energetic costs. For example, the alteration of metabolism under anaerobic scope leads to a reduction in energy production and mitochondrial density (Pörtner 2002). Under such conditions, time-limited, passive survival is supported by increased synthesis of heat shock proteins (Hsp) as a cellular defence mechanism (Feder and Hofmann 1999) although prolonged exposure is likely to cause lethal effects (Gehring and Wehner 1995).

Increased temperature has also been shown to affect metabolic rates and energy metabolism of marine gastropods (Sokolova and Pörtner 2001, 2003, Melatunan et al. 2011), cause cardiac failure and reduce thermal windows (Stillman 2003, Tomanek and Helmut 2002, Denny et al. 2006). Pörtner (2001, 2002) and Frederich and Pörtner (2000) demonstrated that increasing temperature caused increased ventilation and heart rates of aerobic capacity. Progressive increases in temperature may cause excessive oxygen demand and decrease aerobic capacity (Pörtner 2001). In addition, temperature can also affect biochemical reactions for physiological homeostasis (Hochachka and Somero 1973, Prosser and Nelson 1981, Hoffman and Dionne 1983). Initially, organisms could adjust to such temperature extremes by shifting their thermal tolerance or narrowing thermal windows via the adjustment of mitochondrial densities (Pörtner 2002). However, Pörtner (2002) also suggested that the crucial process in shifting thermal tolerance is that the organisms should face unidirectional (higher or lower) thermal conditions which may disrupt molecular function. As an alternative to coping with extreme temperature conditions, animals may also shift metabolic scope under anaerobic conditions or shift to hypometabolic physiology (Storey and Storey 2004). This mechanism requires shifting metabolic pathways and biochemical mechanisms for regulatory reversible transition to and from anaerobic physiology (Storey and Storey 2004, Hochachka and Somero 2005).

Pörtner and Farrell (2008) suggested that under the optimum temperature conditions (T_{opt}), aerobic performance was high but an increase or decrease in temperature beyond this optimum (T_{pej}) will lead to lowering aerobic performance. Further progress on to the critical temperature (T_{crit}) will lead to a loss in aerobic scope and a transition to an anaerobic mode of mitochondrial metabolism (Fig. 5).

Figure 5:- A model indicating the hierarchies of functional limitation (beyond pejus temperatures, T_{pej}), hypoxemia, anaerobic metabolism and protection through metabolic depression (below and beyond critical temperatures, T_{crit}) and denaturation as well as reparation (beyond denaturation temperatures, T_{den}), (Source: Pörtner and Farrell 2008).

In this stage a progressive insufficiency of cellular energy levels occurs. At more extreme temperatures (T_{den}), only time limited passive survival is supported by anaerobic metabolism or the protection of molecular functions by heat shock proteins and antioxidative defense (Pörtner 2002, Pörtner and Farrell 2008). Pörtner and Knust (2007) have also suggested that increased temperature causes a mismatch between the demand for oxygen and the capacity of oxygen supply to tissues. Such a constraint could affect higher functions such as muscular activity, behavior, growth, and reproduction, ultimately leading to changes in species biogeography (abundance, occupancy, position of range edges and size of the geographical range of distribution).

It is highly likely that marine organisms will be subject to the combined effects of ocean acidification and temperature and recent studies have addressed these combined effects on physiological function in various organisms for example in jumbo squid *Dosidicus gigas* (Rosa and Seibel 2008), in the decapod *Metapenaeus joyneri* (Dissanayake and Ishimatsu 2011) and in brittle star *Ophiura ophiura* (Wood et al. 2010). Rosa and Seibel (2008) found that metabolic rate of jumbo squid *D. gigas* was depressed by 31% and activity levels by 45% under combined high CO_2 and temperature. Dissanayake and Ishimatsu (2011) demonstrated that in the decapod *M. joyneri*, reduced aerobic scope and swimming ability was reduced by 30% under high CO_2 (1000 ppm = pH 6.9) and temperature (20 °C). Even though Wood et al. (2010) found increased in brittle star *O. ophiura* under interaction of high CO_2 and temperature, there was an apparent trade off with increased arm degeneration. Also, increased metabolic rates in oysters *C. gigas* exposed to high CO_2 and temperature (25 °C) was associated with high accumulations of metabolic-end products (Lanning et al. 2010). Finally, Donohue et al. (2012) also found synergistic effects of OA and temperature on metabolic activity and heat tolerance in the intertidal crab *Porcellana platycheles*. These parameters were positively affected by temperature but exoskeleton calcification was negatively affected by high CO_2 of 2707 ppm. Clearly, more studies are needed if we are to understand more fully the synergistic effects of ocean acidification and warming on marine organisms.

Geographical variation in the impacts of Ocean Acidification and Climate Change:-

Impacts of ocean acidification are also suggested to vary across geographical and latitudinal boundaries (Walther et al. 2010, 2011, Findlay et al. 2010a, b). These differences may be linked to variations in interactive effects between CO_2 at each location. For example, annual sea surface temperatures (SSTs) and land surface temperatures (LSTs) in lower latitudes (southern ranges) are significantly different to those observed at higher latitudes (northern ranges) (e.g. Rastrick and Whiteley 2011, Whiteley et al. 2011 see also Whiteley et al. 1997). Such differences in responses to high CO_2 by organisms from different latitudes have been suggested in previous studies (e.g. Findlay et al. 2010a, b, Walther et al. 2010, 2011, Cumming et al. 2011). These studies are limited to comparisons between two populations.

Studies of the effects of elevated temperature caused by climate change in species populations and in different species at different latitudinal gradients have also been documented in various taxa (e.g. Sokolova and Pörtner 2001, 2003, Stillman 2002, 2003, Compton et al. 2007, Pörtner and Knust 2007, Rastrick and Whiteley 2011, Whiteley et al. 2011). Morphological variations in various taxa of calcified marine organisms were also found, for example, in the shallow water gastropod (Graus 1974), cowry the *Cypraea annulus* (Irie 2006), and in the zebra coral *Oulastrea crispata* (Chen et al. 2011). In general they found that morphological variations of these organisms were mainly caused by a change in CaCO_3 saturation state linked to temperature, however, causative factor such as salinity should also be considered.

Chemical effects of OA linked to carbonate saturation state (Ω) are likely to be linked to local seawater temperature regimes as the solubility of carbonate is temperature-dependent (Hill et al. 1999). Since the availability of carbonate depends on the saturation state of aragonite and calcite, which is temperature-dependent (see equations 2 and 3) (Kleypas et al. 1999, Azetsu-Scott et al. 2010), it does vary across latitudinal gradients (Bates et al. 2009, Yamamoto et al. 2009, Fabry et al. 2009, see also Riegl 2003 and Orr et al. 2005). Burton and Walter (1987) showed that the precipitation of aragonite increased rapidly with temperature. Aragonite precipitated four times faster than calcite at 25 and 37 °C respectively, whilst at 5 °C precipitation of aragonite decreased relative to calcite. This trend has also been shown in the ratio of calcite and aragonite in the shell of mussel *M. edulis*, which increased with decreasing water temperature along latitudinal gradient (Lowenstam 1954, Dodd 1963). Variation in biogenic calcification across latitudinal gradients also occurs with most calcified organisms in northern latitudes tending to be thinner shelled due to low temperature (Kuklinski and Taylor 2009, Trussell and Smith 2000, Findlay et al. 2010a). Carter (1980) revealed that such mineralogical differences may have functional consequences as calcite is softer and less strong than aragonite.

Increased dissolution rates may also vary along latitudinal gradients. For example Findlay et al. (2010a and b) showed that a population of the barnacle *S. balanoides* living at the northern range limit for this species was more sensitive to high CO_2 conditions, suggesting that the potential risk of climate change is likely to be greater in populations living at higher latitudes. Latitudinal gradients in pH, $[\text{CO}_3^{2-}]$ and Ω_{ara} and Ω_{calc} have been suggested to exist in both the Northern and Southern hemisphere (Orr et al 2005).

Acknowledgement:-

Special thank is given to the Directorate of Higher Education, The Ministry of Research, Technology and Higher Education of the Republic of Indonesia with its financial support to carry on this work. This review article is a part of the full research program on the impact of ocean acidification and temperature changes to marine organism that took place in the School of Biological Science, University of Plymouth, UK. Special thanks are given to Dr. Simon Rundle, Dr. Piero Calosi in Marine Biology and Ecological Research Centre, University of Plymouth, UK and Prof. Sthephen Widdicombe in Plymouth Marine Laboratory for the inputs, comments and time dedicated for discussion during the writing of this manuscript.

Abstract

The main aim of this paper is to estimate the heart rate and ECG pattern of a person as obtained from a polysomnographic record for detection of respiration related sleep disorders by fusing the data contained from the ECG and BP waveforms.. Polysomnography records the brain waves, the oxygen level in the blood, heart rate and breathing, as well as eye and leg movements during the study Data fusion can be defined as a combination of data from multiple sources to obtain improved information, meaning less expensive, higher quality, or more relevant information. For this study two specific signals from the polysomnogram is chosen- ECG and Blood pressure (BP). They are fused to obtain the improved heart rate of the subjects. Initially the individual heart rates are computed and compared against the heart rate of the fused signal. In case of noisy measurement environments, this method can be implemented.

Introduction:-

Polysomnography is a sleep study. This test records certain body functions as we sleep, or try to sleep. Polysomnography is used to diagnose sleep disorders. A change in the cycle may make it hard for a person to sleep soundly. Multiple sleep latency test (MSLT) test measures how long it takes for us to fall asleep. It also determines whether you enter REM sleep [1]. Maintenance of wakefulness test (MWT) measures whether we can stay awake during a time when we are normally awake. If shift work sleep disorder or another problem with our body's internal clock (circadian rhythm) is suspected, then the test performed is called actigraphy.

Among the three main tests suggested above, polysomnography is perhaps the most elaborate and time consuming, due to the sheer amount of data collected and stored. But this is also the most valuable and reliable test in terms of the accuracy of sleep information obtained, provided they can be analyzed and interpreted in the clinically correct manner. Signal fusion involves the consolidation of all the various signals obtained in the polysomnogram in such a constructive manner so that it can be used constructively for diagnosis of sleep disorders.

Signal processing is an enabling technology that encompasses the fundamental theory, applications, algorithms, and implementations of processing or transferring information contained in many different physical, symbolic, or abstract formats broadly designated as signals. It uses mathematical, statistical, computational representations and techniques for representation, modeling, analysis, synthesis, discovery, recovery, sensing, acquisition, extraction, learning, security, or forensics. Dynamical mathematical model in this context is a mathematical description of the dynamic behavior of a system or process in either the time or frequency domain

Biomedical signals are observations of physiological activities of organisms, ranging from genetic factor and protein sequences, to neural and cardiac rhythms, to tissue and organ images. Biomedical signal processing aims at extracting significant information from biomedical signals. With the help of biomedical signal processing, biologists can discover new methods of detection and physicians can monitor distinct illnesses. Initially the primary focus of biomedical signal processing was on filtering signals to remove noise. Sources of noise arise from imprecision of instruments to interference of power lines. Other sources are due to the biological systems themselves under study. The analysis framework derives its basics from statistical signal processing. This framework treats the data as random signals; the processing, e.g. Wiener filtering or Kalman filtering which utilize statistical characterizations of the signals to extract desired signal components.

Our bodies are constantly communicating information about our health. This information can be captured through physiological instruments that measure heart rate, blood pressure, oxygen saturation levels, blood glucose, nerve conduction, brain activity and so forth. Traditionally, such measurements are taken at specific points in time and noted on a patient's chart. Physicians actually see less than one percent of these values as they make their rounds—and treatment decisions are made based upon these readings.

Biomedical signal processing involves the analysis of these measurements to provide useful information upon which clinicians can make decisions. Engineers are discovering new ways to process these signals using a variety of mathematical formulae and algorithms. Working with traditional bio-measurement tools, the signals can be computed by software to provide physicians with real-time data and greater insights to aid in clinical assessments. By using more refined means to analyze what our bodies are saying, we can potentially determine the state of a patient's health through more noninvasive measures. Our proposed system works in this direction with further emphasis on processing the obtained data to a certain level so that it gives robust estimates of the patient's medical condition.

Sleep is defined as a reversible behavioral state, which involves a substantial form of disengagement and a decrease in the responsiveness to the environment. There are two types of sleep: Non rapid eye movement sleep (NREM) and rapid eye movement sleep (REM). NREM sleep is divided into four types based on the EEG signals. REM sleep is characterized by an increased activity in the EEG which could be a result of muscle atonia in the skeletal muscles or due to short episodic bursts of the REM sleep.

Polysomnography is used to diagnose sleep disorders. A change in the cycle may make it hard for a person to sleep soundly. Channels commonly recorded during a PSG are: Brain wave activity (EEG), Eye movement (EOG), Muscle tone (chin EMG), Airflow via thin catheters placed in front of nostrils and mouth, heart rhythm (EKG), Oxygen level (SpO₂), Leg muscle activity (PLM), Body position, Video recording. All the obtained information in this test can be used suitably for various purposes. This paper is one such application.

Materials and Methods:-

Estimation of respiratory rate [8] from waveforms recorded from passively breathing subjects is notoriously difficult, due in part to the non-stationary nature of the signals and in part the frequent non-stationary noise. Methods for recoding a time series of respiratory effort include impedance pneumography, impedance plethysmography and flow thermography which measures the changes in temperature of air flow as it moves in and out of the mouth and/or nose over a thermistor. Literature on deriving a respiratory signal from other related signals is dense in the case of the electrocardiogram, but relatively less for other signals such as the photo plethysmogram and blood pressure waveform [2]. The field of respiration rate estimation from respiratory signals (whether derived or not) is scantily covered in the public literature, particularly with respect to large data sets. Key works by O'Brien and Heneghan, de Chazal et al., Ishijima, Park et al., and Tarassenko [15] et al. highlights the importance of modeling noise and combining information from multiple ECG leads and sensor modalities to compensate for noisy measurements. To our knowledge, very little work has been public.

To evaluate our methods we have used polysomnographic data from a polysomnographic database obtained from www.physionet.org/cgi-bin/atm/ATM. It consists of the four most basic records namely- ECG, BP, EEG and respiratory rate. In this study we are concerned with the ECG [3] and BP [4] signals only. The records of five patients have been studied. The relation between the above mentioned signals is arrived at by the results of the correlation table presented below [5]. Out of the three signals, the most meaningfully correlated are the ECG and BP [6].

From these two signals the respective heart rates are obtained through a heart rate algorithm. This mainly counts the number of R peaks in an ECG. In the case of a BP signal [7], each peak corresponding to every cardiac cycle is counted. This provides the heart rate of the person. This procedure can also be followed for signals with noise. For a more realistic approximation we have added noise of different SNR values (10dB, 20dB, 30dB, 40dB and 50dB).

Table 1: Correlation between signals.

ECG	BP	EEG	RR
slp01	0.0736	0.1391	0.004
slp14	0.0983	0.1163	0.0098
slp37	-0.0962	0.3556	0.0237
slp41	0.1269	0.2456	-0.0134
slp59	0.0545	-0.0441	-0.0055
slp67x	0.0427	-0.2804	-0.0083

Fig 1: A plot of the correlation table

The main steps involved are presented in the block diagram given below. Both the required signals are obtained from the database. The signals in the database are clean and not corrupted by external noise. The heart rate for this is determined and this acts as the standard for comparison after fusion of the signals. The working data set is obtained by adding suitable noise to the signals. This noisy data is fused by the signal fusion algorithm and the output displayed is of a noiseless fused signal. The heart rate of this signal is computed by the beat detector algorithm and compared against the heart rate value of the reference signal [14].

The beat detection algorithm used is the Hooman Sedghamiz peak detector [9]. This algorithm requires the ECG as a signal vector along with the sampling frequency and the time period for the output window. As the output, it computes the indexes and amplitudes of each wave in the component ECG [8], the estimated heart rate and displays the processed signals. The function used is as given below

```
[R_i,R_amp,S_i,S_amp,T_i,T_amp,Q_i,Q_amp,heart_rate,buffer_plot]=peakdetect(ECG,fs,view)
```

Data fusion [10] is a multidisciplinary area that involves several fields, and it is difficult to establish a clear and strict classification. The fusion of these two signals is brought about by a fusion algorithm [11]. It is based on a kalman filter fusion that merges both the signals as one .this is further used for heart rate comparison after fusion.

The Kalman filter is the most popular estimation technique [9]. It was originally proposed by Kalman and has been widely studied and applied since then.

The Kalman filter estimates the state x of a discrete time process governed by the following space-time model:

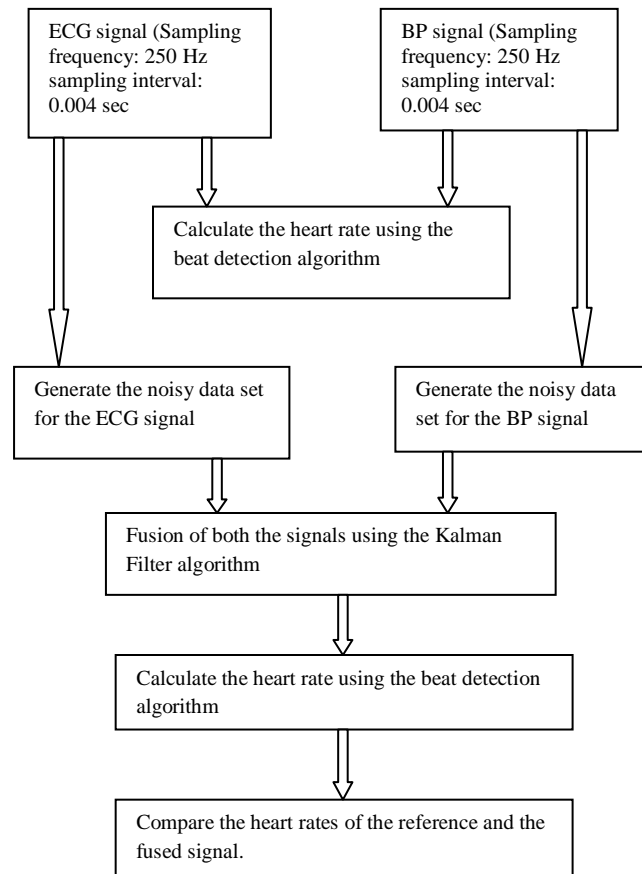

Fig 2: block diagram of the process

$$x(k+1) = \Phi(k)x(k) + G(k)u(k) + w(k) \quad (1)$$

With the observations or measurements z at time k of the state x represented by

$$Z(k) = H(k)x(k) + V(k) \quad (2)$$

Where $\Phi(k)$ is the state transition matrix, $G(k)$ is the input matrix transition, $u(k)$ is the input vector, $H(k)$ is the measurement matrix, and w and V are the random Gaussian variables with zero mean and covariance matrices of $Q(k)$ and $R(k)$, respectively.

The Kalman filter [12] is mainly employed to fuse low-level data. If the system could be described as a linear model and the error could be modeled as the Gaussian noise, then the recursive Kalman filter obtains optimal statistical estimations. However, other methods are required to address nonlinear dynamic models and non linear measurements .The filter as used in this method is given as:

For single signal:

$\hat{x} = \text{kalman}(z_1, A, C_1, R_1, Q);$

For two signals:

$\hat{x} = \text{kalman}([z_1; z_2], A, [C_1; C_2], [R_1 \ 0; 0 \ R_2], Q);$

Where:

\hat{x} = estimated signal

Z = input signal

A = state transition model

C = observation model

R = measurement noise covariance

Q = process noise covariance

Fig 3: A pure ECG signal

Fig 4: The same signal with a noise of 20 db added

Fig 5: With 40db noise

Fig 6: The heart rate obtained from the ECG signal**Fig 7: A pure BP signal****Fig 8: The same signal with 20db noise****Fig 9: With 40db noise**

Fig 10: The heart rate obtained from the BP signal**Fig 11: The fused output signal****Fig 12: The heart rate obtained from the fused signal**

Results and Discussion:-

Table 1 and Fig 1 shows the correlation of ECG signals with BP, EEG and RR signals separately. It is observed from the graph that there is a significant correlation between ECG and BP only. Though there is a wide variation in EEG, it cannot be chosen because brain waves are not only dependent on heart rate alone but have numerous parameters that affect it.

Fig 3 represents a pure ECG signal obtained from the sleep database. In order to process the signal as in a real time environment, noise was added represented by fig 4 and 5(SNR=20dB and 40dB respectively). Fig6 represents the heart rate obtained from the ECG signal.

Fig 7 represents a pure BP signal obtained from the sleep database. In order to process the signal as in a real time environment, noise was added represented by fig 8 and 9(SNR=20dB and 40dB respectively). Fig 10 represents the heart rate obtained from the BP signal.

Fig11 shows the output waveform of the fusion algorithm. The fusion algorithm estimates the combination of both the signals. Visually, it shows the merged form of the ECG and BP signals. Fig12 shows the heart rate of the fused signal in the processed form

Table 2: Comparison of HR between original and estimated signal.

Data/SNR	Actual HR from original ECG signal	10dB	20dB	30dB
		HR obtained by using Kalman fusion algorithm		
Slp01	66	66	66	66
Slp14	72	78	78	78
Slp37	60	66	66	66
Slp41	66	66	66	66
Slp59	78	84	84	84
Sp67x	72	72	72	72

Table 2 shows the outputs of our project that tabulates the improved heart rates of the various inputs considered. The standard or reference heart rate is the heart rate of the ECG alone. The tabulation shows the heart rates of the fused signals. It can be observed that in case of normal inputs; the estimated heart rate is the same as that for the reference signal. Only in the case of records with certain abnormalities, there is a difference.

Table 3: Comparison of error in estimating the HR values.

Data/SNR	Actual HR from original ECG signal	10dB	20dB	30dB
		% Error=(Original HR-Est HR)/Original HR *100 (obtained by using Kalman fusion algorithm)		
Slp01	66	0	0	0
Slp14	78	-7.69	-7.69	-7.69
Slp37	60	-10.01	-10.01	-10.01
Slp41	66	0	0	0
Slp59	78	-7.7	-7.7	-7.7
Sp67x	72	0	0	0

Table 3 displays the percentage error for all the signals considered. Percentage error is obtained as the ratio of the original heart rate to the difference between the original and the estimated heart rate. What we can infer from the table is that the maximum error is only 10%, which is quite a reasonable value considering the amount of noise added to the signals for evaluation purposes.

Conclusion:-

The main purpose of this paper is to obtain the heart rate from the fusion of ECG and BP signals. From the information obtained as the output of the peak detector for the fused signal the estimated heart rate is as shown in the above tables. This implies that fusion of signals gives the heart rate even on a noisy dataset. The added advantage of this approach is that the error value depends on the quality of the signals chosen for the study. In some cases the error is negligible or not present at all, which implies that this approach is headed in the right direction

Abstract

Purpose: The purpose of this study was to document the cytogenetic data obtained from amniotic fluid analysis, as a part of prenatal diagnosing.

Methods: 1.441 samples were analyzed by standard cytogenetic method.

Results: Indications for amniocentesis were divided into six groups. Of them advanced maternal age was the most common, and, as expected, it was associated with the largest number of pathological cytogenetic findings.

Conclusion: In comparison to other indicators for amniocentesis, advanced maternal age had a highest positive predictive value.

Introduction:-

Prenatal diagnostics is a subdivision of clinical genetics; it enables early diagnosis of congenital anomalies and genetic disorders. This is very important because the population risk of having a child with some congenital abnormality varies between 3 and 5%. Although such malformations and genetic disorders can interfere with quality of the life of newborns and their families, sometimes they can also cause the spontaneous abortion.

There are varieties of methods that can be used for prenatal diagnostics. One of them, by which chromosomal abnormalities, neural tube defects and genetic disorders can be detected with high level of accuracy, is amniocentesis (AC). Although it is invasive test which carries a certain risk of miscarriage, it is strongly recommended (after genetic counseling) to a women at increased risk for chromosomal anomalies. So, AC in association with genetic counseling enables early diagnosis of congenital anomalies, which is essential for management the pregnancy and postnatal medical care. It is also crucial to making informed decisions about continuing or terminating the pregnancy. In a latter case it enables to counsel the couples in preparing for a next pregnancy (1, 2).

The purpose of this study was to document the cytogenetic data obtained from amniotic fluid analysis, as a part of prenatal diagnosing.

Methods:-

During the period from 2007. to 2015. the amniotic fluid was collected from 1.441 pregnant women, who attended University Hospital Centre Split (UHC). All women were of European Caucasian origin. The analyses were done in the Department for Medical Genetics with Laboratory for Human Genetics and Genetic Counseling Unit, Paediatrics Clinic, UHC, Split, Croatia. Amniocentesis was performed between 13 and 25 weeks of gestation, with a peak at 17 week.

The study was approved by the Ethics Committee of the UHC Split. Informed consent to present the amniocentesis data was obtained from each couple.

Results:-

By the end of the march 2015. 1.441 amniocenteses and chromosomal analyses were carried out. Indications for amniocentesis were as follows: 1. maternal age, 2. family or personal history data (parental karyotype, syndrome Down in the family, previous child/children born with malformations, or spontaneous abortion or stillborn child with known or not known pathology), 3. results of prenatal tests (triple, double or combined test), 4. nuchal translucency (NT). 5. other fetal anomaly detected by ultrasound, 6. pregnant women demand.

Mother's age (>35) was the most frequent indicator for amniocentesis (1076; 74.67% cases). However, in 26 and 25 of those women indication for amniocentesis was combination of mothers age and anamnestic data and prenatal tests data, respectively. The second most frequent indicator for amniocentesis were the results of prenatal tests (156; 10.82% cases), followed by family or personal history data (129; 8.95 % cases) and fetal anomaly detected by ultrasound (56; 3.87% cases). Nuchal translucency was indication in 20 cases (1.39 %), while amniocentesis was performed on pregnant women demand in one case (0.07%) The majority of AC were conducted on woman between 35-40 years of age (49 %) and women older than 40 years (26 %) (data not shown).

The majority of samples were cytogenetically normal (1372 samples; 95.21%). In others (69 samples; 4.79%) some irregularities were found: balanced translocation (1), unbalanced translocation (2); aneuploidy (60), and mosaicism (6) (Table 1).

In majority of samples (66; 95.65 %) *de novo* chromosomal changes were present. In only three samples the chromosomal changes were either maternally or paternally inherited.

Maternal age was associated with the largest number of pathological findings (36 samples; 52.17%), followed by ultrasound findings (18 samples; 26.09%), results of prenatal tests (9 samples; 13.04%), NT (4 samples; 5.80%) and family or personal history data (2 samples; 2.90%). Sample analyzed on pregnant women demand turn out to be normal (Table 2).

Table 1. Cytogenetic results of amniotic fluid

	Number	Karyotype	
Amniocenteses total	1 441		
Normal	1372		No
Patologycal	69		
Translocation balance	1	46,XY,t(18;20)(18pter->20 q12)mat	No
-----	-----	-----	-----
--	-	46,XY,+21,rob(21;21)(q10;q10)	-
Translocation unbalanced	1	46,XY,add(12q)tr(8p;12q(8p12;12q24.3)(mat	Yes
	1)>parcial trisomy 8p	
Aneuploidy	60	45,X [5] 47,XXX [2] 47,XX+13 or 47,XY+13 [4] 47,XY+ 18 [10] 47,XX+21 or 47,XY+21 [35] 47,XXY [2]	Yes/No* Yes/No* Yes Yes Yes Yes/No*

		47,XY,+iso12p [1] 69,XXX [1]	Yes Yes
Mosaics	6	46,XX(22)/45,X(3) [1] 46,XX(18)/45,X(3) [1] 46,XX(50)/45,X(50) [1] 46,XX(10)/47,XXX(3) [1] 46,XX(8)/47,XXX(1) [1] 46,XY(10)/47,XXY(3) [1]	Yes/No* Yes/No* Yes/No* Yes/No* Yes/No* Yes

*TP (Termination of Pregnancy). In cases where changes in gonosomes were found, especially in mosaic form, the development of severe mental retardation is not expected, but the occurrence of sterility in the adulthood is possible, so the decision of TP should be done only by parents.

Figure 1. Indications for AC were divided into six groups: 1. maternal age, 2. family or personal history, 3. results of prenatal tests (triple, double or combined test), 4. nuchal translucency (NT), 5. fetal anomaly detected by ultrasound, 6. other (pregnant women demand). The numbers above the bars indicate total number of tested samples.

Table 2:- Number of pathological versus non-pathological findings in amniocentesis samples classified according to the indication for amniocentesis

	Non-pathological	Pathological			Mosaics	Total (pathological)
		Aneuploidy	Translocation balanced	Translocation unbalanced		
Maternal age	1040	31			5	36
Prenatal tests	150	8		1		9
Ultrasound	38	17	1			18
Nuchal translucency	16	3			1	4
Family history	127	1		1		2
Demend	1					0
Total	1372	60	1	2	6	69

Discussion:-

In thirty years (1983-2013) period in the Laboratory for Human Genetics and Genetic Counseling Unit more than 10,000 persons with different genetical as well as chromosomal problems were treated. These were children and adults with chromosomal abnormalities, sterile or infertile couples, couples with one or more spontaneous abortions, people with loads of personal or family history, people who were exposed to harmful factors, those with inherited neuromuscular diseases etc.

Special attention was also put on resolving possible cytogenetic cause of recurrent spontaneous abortions (RSA). By analyzing karyotypes of more than 350 couples (both women and men) who suffered from RSA, as well as karyotype of aborted material, some kind of abnormality was found in 17.6%, 11.5% and 25.9% of women, men, and aborted material, respectively. In a latter case, the majority of changes were *de novo* ones (3).

The methods of prenatal diagnostics can be divided into non-invasive (ultrasound and biochemical screening from maternal blood) and invasive ones (amniocentesis, chorionic villus sampling, cordocentesis, etc.) (4,5). In our study we paid attention to the women who were referred for amniocentesis. Indications for amniocentesis we divided into the six groups; similar divisions were also done in other studies (5,6). We found that the most prominent indicator for amniocentesis was the maternal age. This is in accordance with the findings of Yang et al (7), but in contrast to the finding of some other authors who found that the most prominent indicator for amniocentesis was an abnormal maternal serum-screening test or abnormal ultrasound findings (6,8,9).

In our study 4.55% women were pregnant with fetuses that had numerical chromosomal abnormalities. Some studies showed a similar results (4.61–4.85 %) (10,11), while some others showed lower incidence of chromosomal abnormalities (5,12).

The most common changes were autosomal trisomies. Similar to our results, Ocak et al. found that the most frequent numerical chromosomal abnormality was trisomy 21 (8).

After amniocentesis results are known, all women should be again subjected to genetic counseling. For those women where variation in population and balanced translocations were found we did not (we do not) counsel termination of pregnancy (TP). For the cases of gonosomes changes (yes/no), especially in mosaic form, decision about TP should be left to parents, because clinically, in the future, no development of severe mental retardation is expected, although the occurrence of sterility is possible. However, unbalanced translocations, mosaicism and aneuploidy were considered as indication for TP. For these women (couples) it is prerogative to carry out prenatal diagnostic during the next pregnancy as well as to repeat the genetic counseling (13).

In respect to the fact that invasive prenatal testing method bear certain risk of miscarriage, more and more women are choosing non-invasive prenatal testing methods such as analysis of circulating cell-free fetal DNA. Although detection of aneuploidy with this method is not 100% accurate, many couples, especially those with reassuring serum aneuploidy screening and normal ultrasound findings appear to favor a small risk of misdiagnosis of aneuploidy over the risk of procedure-related to pregnancy loss (14,15).

Conclusion:-

De novo chromosomal changes were most abundant in samples obtained from elderly woman. Therefore maternal age is the most prominent indicator for amniocentesis.

Disclosure Statement:-

The authors declare that they have no conflicts of interest.

Abstract

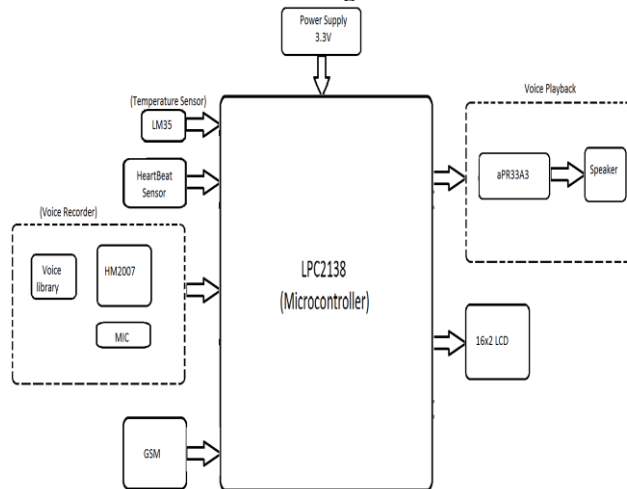

This document gives an overview about how “Personal Healthcare System” can extend a professional advice on what you might find useful to treat your illness. Following proper instructions and the medicine prescribed by the system may temporarily or permanently cure you. You may also consult your doctor if the illness persists or becomes more severe. “Personal Healthcare System” offers professional and free health advice at any time – you don’t need an appointment. From coughs and colds to aches and pains, it can give you expert help on everyday illnesses. Since there is no restriction for gender, you can talk in confidence. It may suggest you to visit your GP (General Practitioner) for more serious symptoms

Introduction:-

The use of computers in health care evolved through a process driven by need. Over the last 30 years, health care has seen few real visionaries who have developed systems to aid in the clinical process. Only in the past five years has the emphasis shifted from applying computer technology to hospital administration, to applying technology to the clinical process. The use of computers in health care began to emerge in the early 1970s (through the use of shared systems) after Medicare reimbursement legislation was enacted, but it wasn’t until the late 1970s, when minicomputers began to become available, that computers began to be widely used in health care. Health care automation was quite limited for the first 10 years because of the insufficient file capacities of most systems.

The remote entry by patients of blood pressure, temperature, pulse, respiration, and conformance with treatment plans is already being accomplished through some home health systems. Innovation in clinical care would be sharply reduced were it not for the way the health care industry has flocked to the Internet. Probably no other technology since personal computers has gained such attention. Five years ago, the primary use of the Internet was for messages and promotional purposes. Today, the Internet has become an integral part of many vendors’ systems. Most important, from the perspective of clinical care, is the access to a myriad of disease and medical databases through the Internet. Such access provides medical data to even the most remote parts of the world. In fact, best-treatment plans that were developed in advanced countries can be made available to physicians in even the least-advanced countries over the Internet.

Block Diagram:-**Robots in Medical History:-**

Robots serving various tasks and purposes in the medical/health and social care sectors beyond the traditional scope of surgical and rehabilitation robots are poised to become one of the most important technological innovations of the 21st century. Traditional medical robots have focused mainly on highly specialized platforms for surgery or rehabilitation and low levels of autonomy, relying on tele-operation and/or the presence of qualified staff to enable and ensure appropriate conditions and use. A novel approach along these traditional lines is the magnetic microbots for vascular network intervention. A recent trend has been to move away from costly, task-specific platforms supporting well-defined medical, commonly surgical tasks, towards cheaper more generic platforms. These robots can commonly support a number of different and —softer human-robot interaction (HRI) tasks and have been used to improve the medical conditions of patients.

Robots have been applied in multiple ways to assist the logistics of health and social care. Non-tactile HRI has also been studied extensively in the health and social care domain. Verbal and gesture-based interaction provides opportunities for robots to support patients in two main ways. First, a robot can act as a conduit for socializing, enabling friends or family to engage with the user remotely, or for (remote) communication with a health professional, allowing professionals to reach a larger number of patients. Second, a robot can present itself as an autonomous entity, providing play scenarios that can reduce the effect of disabilities, or improving wellbeing through entertainment and companionship. The increasing numbers of people with long-term illness and an ageing population are putting an unsustainable demand on the already resource-constrained hospitals and healthcare/social care systems in developed countries. Tele-healthcare, home care and self-care have long been encouraged and pushed as strategic policies and directions in these countries, as the way forward for mitigating the increasing demands and burdens on conventional health/care and social care services. The goal is to shift part of the care burden from hospitals/clinics and healthcare professionals to patients and their informal care-givers, and to help individuals take responsibility of, and better manage, their own health.

Components Required:-

A) Hardware	B) Software
<ul style="list-style-type: none"> • LPC2138(Micro-controller) • HM2007p • LM35 • Heart-Beat Sensor • MAX232 • GSM • LCD (16x2) • aPR33A3(Voice Processor) 	<ul style="list-style-type: none"> • Orcad Capture • Express PCB • μVision IDE

Table I:- Components Used for Personal Health-care System**C) Working Principle:**

LM35 (temperature sensor) and heartbeat sensor are used to monitor physical parameters. Two modes of input are provided viz., voice and text modes. HM2007p is the voice processor used for learning and storing real-time voice inputs. APR33a3 is a voice playback used to give voice output while the LCD displays the same. GSM module receives inputs and reverts the remedy through SMS. LPC2138 is a 32-bit microcontroller which is responsible for all controlling actions.

LPC2138 has 32-bit timers, single or dual 10-bit 8-channel ADC(s), 10-bit DAC, PWM channels and 47 GPIO lines with up to nine edge or level sensitive external interrupt pins make these microcontrollers particularly suitable for industrial control and medical systems.

Advantages and Disadvantages:-**Advantages:-**

1. System has a low operating cost with one-time investment and the time of purchase. Its costing would make it affordable to every strata of the society.
2. Information regarding patients' ailments and treatment methods, and even emergency services can be received anywhere and anytime, regardless of the location. This makes it useful in remote areas lacking medical facilities for diagnosis and immediate treatment procedures.
3. A system that can be remotely accessed by user, even if the user isn't in the vicinity of the system. This makes it advantageous in any type of setting (domestic, industrial etc.).
4. No need of consulting a doctor for minor ailments which can be cured easily with the intake of proper medication.
5. Prognosis on par with professionals and first-aid for all kinds of problems provided.
6. The system can minimize medical errors which can occur due to human error or negligence and ensures safety of the user.

Disadvantages:-

1. Cannot provide treatment methods for major ailments that are life threatening or for which professional assistance is mandatory.
2. Flexibility of medication is restricted due to pre-fed database and hence cannot provide treatments to ailments that are not available in database.
3. Database has to be updated regularly to keep the system in touch with the updates and progress in medicine.

Application:-

1. A personal healthcare unit to provide a complete first-aid solution to user
2. Provides prognosis based on the input given by user
3. Healthcare companion to provide better treatment procedure based on user's medical history
4. Professional advice on par with that of doctors
5. Used in domestic and industrial medical systems for immediate first aid solutions.
6. Can be used as a helper at various critical stages in case of emergencies like stroke etc.

Future scope:-

- The system can be further modified to append an expansion to store the medical history of one or more patients. The database can furthermore be updated to include new treatment methods for existing ailments by doctors.
- The system can comprise of e-nursing and care-bots in addition to treatments.
- The system can be directly affiliated to medical institutions in case of requirement of professional help.
- The system can be made to directly contact nearest hospital in case of extreme emergencies.

Conclusion:-

The aim of this system is to provide professional medical advice for minor ailments and diseases for which a patient would not require to go to a doctor for its treatment. This would be beneficial in remote areas where medical help is sparse and not well facilitated for medical institutions. It would provide first-aid measures for proper treatment of injuries and minor accidents. Also in case of emergencies, the system can provide proper treatment method instead of waiting for emergency services for a solution.

Key words:-

linear combination, convolution, modulus of continuity.

Abstract

In this paper, firstly we have studied some inverse and saturation results for the family of linear positive convolution operators. We have used Bernstein inequality for proving inverse theorems. Then we have found some linear combinations which are not saturated by construction.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Consider a family of linear positive convolution operators [1],

$$(E_{(n,\eta)}f)(x) = (f * g_{(n)})(x) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(t)g_{(n)}(x-t)dt, \quad n \in \mathbb{N} \text{ and } x \in \mathbb{R} \quad (1)$$

where $C_{2\pi}$ is the space of 2π -periodic functions with norm,

$$\|f\| := \max |f(x)|$$

with kernel $\eta = (g_n(x))_{n>0} \subset L^1_{2\pi}$

depending upon the parameters $n > 0$ and $n \rightarrow \infty$.

Here, kernel $\eta = \{g_{(n)}\}_{n=1}^{\infty}$ be a sequence of even trigonometric polynomials of degree at most $m(n) = O(n)$, which are normalized by,

$$\frac{1}{\pi} \int_{-\pi}^{\pi} g_{(n)}(t)dt = 1$$

$$g_{(n)}(x) = \frac{1}{2} + \sum_{k=1}^{m(n)} \rho_{(k,n)} \cos kx \quad (2)$$

Here, the operators are uniformly bounded,

$$\|(E_{(n,\eta)}f)\| \leq A\|f\| \quad (3)$$

and satisfy Bernstein type inequality,

$$\|(E_{(n,\eta)}f)'\| \leq A\varphi(n)^2 \|(E_{(n,\eta)}f)\| \quad (4)$$

Also, we have,

$$(E_{(n,\eta)}f)'(x) = (E_{(n,\eta)}f'(x)) \quad (5)$$

For all f with $\varphi(n) > 0$ monotonely increasing to infinity such that,

Corresponding Author:- Anshul Srivastava

Address:- Northern India Engineering College, GGSIPU, New Delhi, India.

$$\sup_{n > 0} \left\{ \frac{\varphi(n+1)}{\varphi(n)} \right\} = k < \infty$$

For $\delta > 0, 0 < \alpha \leq 2$, we have from [2],

$$\omega_2(f; \delta) = \sup_{0 < h \leq \delta} \|f(x+h) - 2f(x) + f(x-h)\|$$

$$= \sup_{0 < h \leq \delta} \|\Delta_h^2 f(x)\|$$

$$Lip_2 \alpha = \{f \in C_{2\pi}; \omega_2(f; \delta) = O(\delta^\alpha), \delta \rightarrow 0^+\}$$

By the monotonicity of the modulus of continuity,

$$\omega_2(f; h) \leq At^\alpha + Ah^2 t^{-2} \omega_2(f; t) \quad (6)$$

Inverse Results:-

Lemma 2.1. Let Ω be monotonically increasing on $[0, c]$. Then,
 $\Omega(t) = O(t^\alpha)$, $t \rightarrow 0^+$, if for some $0 < \alpha < r$ and all $h, t \in [0, c]$
 And $m \in N$, such that ,
 $h_m \leq t \leq h_{m-1}$
 And
 $\Omega(t) \leq \Omega(h_{m-1}) \leq Bh_{m-1}^\alpha = B(Mh_m)^\alpha \leq B(Mt)^\alpha$

Introducing the Steklov means for $\delta > 0$,

$$f_\delta(x) = \frac{1}{\delta^2} \int_{-\delta/2}^{\delta/2} \int_{-\delta/2}^{\delta/2} f(x+s+t) ds dt$$

Also, we have from [3],

$$\|f - f_\delta\| \leq \omega_2(f; \delta) \quad (7)$$

$$\|f_\delta''\| \leq \delta^{-2} \omega_2(f; \delta) \quad (8)$$

Theorem 2.1. [4] If $0 < \alpha < 2$, then we have,

$$\|E_{(n,\eta)} f - f\| \leq A\varphi(n)^{-\alpha}$$

This implies that, $f \in Lip_2 \alpha$

Proof. By the assumption and using (3), (4), (5), (7) and (8), we have for $h > 0$,

$$\begin{aligned} \|\Delta_h^2 f\| &\leq \|\Delta_h^2 (f - E_{(n,\eta)} f)\| + \int_{-h/2}^{h/2} \int_{-h/2}^{h/2} (E_{(n,\eta)} f)''(x+s+t) ds dt \\ &\leq 4\|f - E_{(n,\eta)} f\| + h^2 \left\{ \left\| [E_{(n,\eta)} (f - f_\delta)]'' \right\| + \|E_{(n,\eta)} f_\delta''\| \right\} \\ &\leq 4A\varphi(n)^{-\alpha} + Ah^2 \{ \varphi(n)^2 \|f - f_\delta\| + \|f_\delta''\| \} \\ &\leq 4A\varphi(n)^{-\alpha} + Ah^2 \left\{ \varphi(n)^2 + \frac{1}{\delta^2} \right\} \omega_2(f; \delta) \\ &\leq A\delta(n)^\alpha + A \left(\frac{h}{\delta(n)} \right)^2 \omega_2(f; \delta(n)) \end{aligned}$$

for $\delta = \delta(n) = \varphi(n)^{-1}$

If we choose, $\delta(n) \leq t \leq \delta(n-1) \leq k\delta(n)$,

then, $f \in Lip_2 \alpha$.

Theorem 2.2. [5] For $0 < \alpha < 2$, we have,

$$E_{(n,\eta)}^* f = O\left(\frac{1}{n^\alpha}\right), \text{ then, } f \in Lip_2 \alpha$$

where, for the polynomial $e_{(n,\eta)}^* f$ of best approximation, $E_{(n,\eta)}^* f$ is given by,

$$E_{(n,\eta)}^* f = \inf_{e_{(n,\eta)} \in \pi_n} \|f - e_{(n,\eta)} f\| = \|f - e_{(n,\eta)}^* f\|$$

π_n being the set of complex trigonometric polynomials of degree n .

Proof. Let $J_{(n,\eta)}$, for $n \in N$, be a sequence of convolution operators (1) satisfying (2),

$$J_{(n,\eta)}f \in \pi_n,$$

$$\text{and } \|J_{(n,\eta)}f - f\| \leq A\omega_2\left(f; \frac{1}{n}\right) \quad (9)$$

using Bernstein inequality for trigonometric polynomials,

$$\|e_{(n,\eta)}^*f\| \leq n^2\|e_{(n,\eta)}f\|$$

We have,

$$\begin{aligned} \|(J_{(n,\eta)}f)''\| &\leq \|J_{(n,\eta)}(f - f_{n-1})''\| + \|J_{(n,\eta)}f_{n-1}''\| \\ &\leq n^2\|J_{(n,\eta)}(f - f_{n-1})\| + A\|f_{n-1}''\| \\ &\leq An^2\omega_2\left(f; \frac{1}{n}\right) \quad (10) \end{aligned}$$

Using (9), (10) and theorem 2.1, we have,

$$\begin{aligned} \|\Delta_h^2 f\| &\leq \|\Delta_h^2(f - (e_{(n,\eta)}^*f))\| + \int_{-h/2}^{h/2} \|(e_{(n,\eta)}^*f)''(x+s+t)\| ds dt \\ &\leq 4\|E_{(n,\eta)}^*f\| + h^2 \|[e_{(n,\eta)}^*(f - J_{(n,\eta)}f)]''\| + h^2 \|[J_{(n,\eta)}f]''\| \\ &\leq 4A\left(\frac{1}{n^\alpha}\right) + n^2h^2\|e_{(n,\eta)}^*(f - J_{(n,\eta)}f)\| + n^2h^2A\omega_2\left(f; \frac{1}{n}\right) \\ &\leq A\left[\frac{1}{n^\alpha} + n^2h^2A\omega_2\left(f; \frac{1}{n}\right)\right] \\ &= A\delta_n^\alpha + h\delta_n^{-2}\omega_2(f; \delta_n) \end{aligned}$$

with $\delta_n = (1/n)$

Now, $\frac{\delta_n}{\delta_{n+1}} \leq 2$, and using (5), we have, $f \in Lip_2\alpha$.

Some Definitions:-

Definition 3.1.

Fejer type kernels.

Let $q \in L^1(R)$ be normalized by,

$$\int_{-\infty}^{\infty} q(t)dt = 2\pi \quad (11)$$

Now, for (2), we will consider even q with its fourier transform \hat{q} with compact support,

$$\hat{q}(v) = \frac{1}{2\pi} \int_{-\infty}^{\infty} q(t)e^{-ivt}dt = 0, \quad |v| > T, \quad (12)$$

for some $T > 0$.

Then $q^* = \{q_n^*\}_{n \in N}$ with,

$$q_n^*(x) = \frac{1}{2} \sum_{k=-\infty}^{\infty} nq[nx + 2nk\pi] \quad (13)$$

is called a kernel of Fejer type.

Closed representation is given by,

$$q_n^*(x) = \frac{1}{2} + \sum_{k=1}^{[nT]} \hat{q}kn^{-1} \cos kx, \quad x \in R, \quad (14)$$

Now with the Poisson formula [6], the singular convolution integral (1) with kernel q may be represented as convolution integral on real line as,

$$(E_{(n,q^*)}f)(x) = \frac{1}{\pi} \int_{-\pi}^{\pi} f(t)q_n^*(x-t)dt = (E_{(n,\eta)}f)(x) = \frac{1}{2\pi} \int_{-\infty}^{\infty} f(t)q_n\left(x - \frac{t}{n}\right)dt \quad (15)$$

The above condition placed on q guarantee that $(E_{(n,q^*)}f)(x)$ defines an approximation process on $C_{2\pi}$.

Definition 3.2.

Jackson Kernel. The positive Jackson kernels $j^{(p)} = \{J_{(n)}^{(p)}\}_{n \in N}$ are given by,

$$J_{(n)}^{(p)} = \frac{1}{\lambda_{(0,n)}(p)} \left\{ \frac{\sin(nx/2)}{\sin(x/2)} \right\}^{2p}, \quad \text{where, } x \in R \quad (16)$$

This is the closed representation of Jackson kernels.

Here, $\lambda_{(k,n)}(p) = \frac{2}{\pi} \int_0^\pi \left\{ \frac{\sin(nt/2)}{\sin(t/2)} \right\}^{2p} \cos kt \, dt$, where, $0 \leq k \leq (n-1)p$ (17)

Corresponding convergence factors are given by,

$$\rho_{(k,n)}(j^{(p)}) = \frac{\lambda_{(k,n)}(p)}{\lambda_{(0,n)}(p)}, \quad (18)$$

Where [1],

$$\rho_{(k,n)} = \begin{cases} (1/\pi) \int_{-\pi}^\pi g_{(n)}(t) \cos kt \, dt, & 0 \leq k \leq m(n) \\ 0, & k > m(n) \end{cases} \quad (19)$$

Here, kernel $\{g_{(n)}\}_{n=1}^\infty = \eta$ be a sequence of even trigonometric polynomials of degree atmost $m(n) = O(n)$, which are normalized by,

$$\frac{1}{\pi} \int_{-\pi}^\pi g_{(n)}(t) dt = 1$$

The Jackson kernels are not of Fejer type.

Also, $\lambda_{(k,n)}(p)$ can be represented as in [7] [8],

$$\lambda_{(k,n)}(p) = \sum_{j=0}^{2p} (-1)^j \binom{2p}{j} \binom{n(p-j) + p - k - 1}{2p-1}, \quad 0 \leq k \leq (n-1)p \quad (20)$$

Using property of central factorial numbers ,

$$\begin{aligned} \text{(i)} \quad & t_k^n = T_k^n = 0, \quad n < k \\ \text{(ii)} \quad & T_k^n = \frac{1}{k!} \sum_{j=0}^k (-1)^j \binom{k}{j} \left(\frac{k-2j}{2} \right)^n, \quad 0 \leq k \leq n \in N_0 \end{aligned} \quad (21)$$

Where, t_k^n is the central factorial numbers of first kind and is uniquely determined coefficients of the polynomials, $x^{[n]} = \sum_{k=0}^n t_k^n x^k$

Similarly, T_k^n is central factorial numbers of second kind and is uniquely determined coefficients of the polynomials, $x^n = \sum_{k=0}^n T_k^n x^{[k]}$

By putting $k = 0$ in (20) and using (21),

$$\lambda_{(0,n)}(p) = \frac{1}{(2p-1)!} \sum_{i=1}^p n^{2i-1} t_{2i}^{2p} \sum_{j=0}^{2p} (-1)^j \binom{2p}{j} (p-j)^{2i-1} \quad (22)$$

and for $1 \leq k \leq n-p$, we have,

$$\begin{aligned} \lambda_{(k,n)}(p) &= \frac{1}{(2p-1)!} \sum_{i=2}^p t_{2i}^{2p} \sum_{m=1}^{i-1} \binom{2i-m}{2m} n^{2i-2m-1} k^{2m} \\ &\times \sum_{j=0}^{2p} (-1)^j \binom{2p}{j} (p-j)^{2i-2m-1} \\ &+ \frac{(-1)^p}{(2p-1)!} \binom{2p}{p} \sum_{i=1}^p k^{2i-1} t_{2i}^{2p} + \lambda_{(0,n)}(p) \end{aligned} \quad (23)$$

For some, $C_{(i,j)} = C_{(i,j)}(j^{(p)})$ and $d_{(k,p)} \neq 0$, polynomial division of (23) by (22) gives,

$$1 - \rho_{(k,n)}(j^{(p)}) = \sum_{j=1}^{p-1} \left(\frac{1}{n^{2j}} \right) \sum_{i=1}^j C_{(i,j)} k^{2i} + d_{(k,p)} n^{-2p+1} + O(n^{-2p}) \quad (24)$$

We can see from (24),

$$j^{(p)} \in S^{(2,p-1)} \text{ and } j^{(p)} \notin S^{(2,p)}$$

For, $p \geq 3$, we have approximation rate higher than $O(n^{-2})$ for the linear combination $\chi = \{\chi_{(n)}\}_{n \in N}$ of even trigonometric polynomials of degree (na_v) , for Jackson kernels,

$$\chi_n(x) = \sum_{v=1}^s \gamma_v g_{(na_v)}(x), \quad x \in R, \quad (25)$$

Definition 3.3.

Central B-splines and Jackson De La Vallee Poussin kernel.

We can define central B-splines [9] as the Fourier transforms of the powers of the sinc function,

$$B_m(v) = \frac{1}{2\pi} \int_{-\infty}^\infty \left(\text{sinc} \frac{t}{2} \right)^m \cos v t dt \quad (26)$$

$$\operatorname{sinc} x = \frac{\sin x}{x}, \quad x \in \mathbb{R} \setminus \{0\}, \quad \operatorname{sinc} 0 = 1$$

Their closed form is given by,

$$B_m(v) = \begin{cases} \frac{1}{(m-1)!} \sum_{j=0}^{[(m/2)-|v|]} (-1)^j \binom{m}{j} \left(\frac{m}{2} - |v| - j\right)^{m-1}, & |v| \leq \frac{m}{2} \\ 0, & |v| > \frac{m}{2} \end{cases} \quad (27)$$

The main properties of B-Splines are,

$$B_m(v) \geq 0, \quad v \in \mathbb{R},$$

$$B_m(v) \in C^{m-2}(\mathbb{R}), \quad m \geq 2,$$

$$B_m(v) \in C^{m-1} \left[-\frac{m}{2} + i, -\frac{m}{2} + i + 1 \right], \quad 0 \leq i \leq (m-1), \quad i \in \mathbb{N} \quad (28)$$

The function, q is given by,

$$q(x) \equiv q_{(n)}(x) = \frac{1}{\left\{ B_{2p}(0) \left(\operatorname{sinc} \frac{x}{2} \right)^{2p} \right\}} \quad (29)$$

satisfies (11) and (12).

For $p \in \mathbb{N}$, the corresponding Fejer type kernel (13), namely, the kernel of Jackson and de la vallee Poussin $\hat{p}^{(p)} = \{P_{(n)}^{(p)}\}$, $n \in \mathbb{N}$, is given by, according to (2),

$$P_{(n)}^{(p)}(x) = \frac{1}{2} + \sum_{k=1}^{np-1} \frac{B_{2p}(k/n)}{B_{2p}(0)} \cos kx, \quad x \in \mathbb{R}, \quad (30)$$

For $p = 1$, we have well known Fejer kernel $f = \{F_n\}$, $n \in \mathbb{N}$ with,

$$F_n(x) = \frac{1}{2\pi} \left[\frac{\sin(nx/2)}{\sin(x/2)} \right]^2, \quad x \in \mathbb{R}, \quad (31)$$

and convergence factors,

$$\rho_{(k,n)}(f) = \frac{n-k}{n}, \quad 0 \leq k \leq (n-1), \quad (32)$$

For $p = 2$, we have classical kernel of Jackson de La Vallee Poussin,

$$P_{(n)}^{(2)}(x) = \left(\frac{1}{2n^3} + \frac{\cos x}{4n^3} \right) \left[\frac{\sin(nx/2)}{\sin(x/2)} \right]^4, \quad x \in \mathbb{R}, \quad (33)$$

Convergence factors for above kernel is,

$$\rho_{(k,n)}(\hat{p}^2) = \begin{cases} (4n^3 - 6nk^2 + 3k^3)/4n^3, & 0 \leq k \leq (n-1) \\ (2n-k)^3/4n^3, & 0 \leq k \leq (2n-1) \end{cases} \quad (34)$$

Saturation Results:-

Here, we will study saturation theorems that are not saturated.

Consider the best trigonometric approximation for $f \in C_{2\pi}$,

$$(I_{(n)}f)(x) = I_{(n)}f = \inf_{t_n \in \pi_n} \|f - t_n\| = \|f - t_n^*\| \quad (35)$$

For convergence factors of a kernel η , there holds,

$$\rho_{(k,n)}(\eta) = 1, \quad 1 \leq k \leq n, \quad (36)$$

We have, $E_{(n,\eta)}(t_n, x) = t_n(x)$, $t_n \in \pi_n$, (37)

$$\|E_{(n,\eta)}(f, \cdot) - f(\cdot)\| \leq \|E_{(n,\eta)}(f - t_n^*, \cdot)\| + \|f - t_n^*\|$$

$$\|E_{(n,\eta)}(f, \cdot) - f(\cdot)\| \leq I_{(n,\eta)} \|f - t_n^*\| + \|f - t_n^*\| \quad (38)$$

For example, the well-known linear combination, $\{\tau_n\}$, $n \in \mathbb{N}$, of the Fejer kernel f ,

$$\tau_n(x) = 2F_{2n-1}(x) - F_{n-1}(x) \quad (39)$$

satisfies (36), so that, we have,

$$\|E_{(n,\tau)}(f, \cdot) - f(\cdot)\| = O(1) (I_{(n)}f), \text{ for, } f \in C_{2\pi}$$

We can generalize above method in the following way.

Suppose the convergence factor of η admits an expansion for $\tau = 1$ or 2 , $\mu \in N$,

$$1 - \rho_{(k,n)}(\eta) = \sum_{j=1}^{\mu} (-1)^{j+1} \psi_j(k) \left(\frac{1}{n^{\tau j}}\right) + h_{(k,\mu)} \left(\frac{1}{n^{\tau \mu + (\tau/2)}}\right), \quad (40)$$

For $h_{(k,\mu)} \in R$, $1 \leq k \leq n$, thus in particular, $\eta \in S^{(\tau,\mu)}$.

We can now build a linear combination similar to (25) such that all terms on right hand side of (40) are cancelled. For example, kernels of Jackson and De La Vallee Poussin $\beta^{(p)}$ with its convergence factors.

For $p = 2$, we have,

$$\chi_n(x) = \gamma_1 P_{a_1 n}^2(x) + \gamma_2 P_{a_2 n}^2(x) + \gamma_3 P_{a_3 n}^3(x), \quad x \in R \quad (41)$$

Where, $a_i = i$, $1 \leq i \leq 3$, coefficients γ_i can be uniquely determined.

Here, for the linear combination,

$$\chi_n(x) = \sum_{v=1}^s \gamma_v g_{(na_v)}(x) \text{ holds (36).}$$

From this, we have the Following:-

Corollary 4.1. The unique linear combination χ of Jackson De La vallee Poussin kernels (41) satisfying (36) is given by,

$$\chi_n(x) = \frac{9}{4} P_{a_1 n}^2(x) - \frac{4}{3} P_{a_2 n}^2(x) + \frac{1}{12} P_{a_3 n}^3(x), \text{ for, } x \in R \quad (42)$$

Corresponding singular integral for $f \in C_{2\pi}$ is given by,

$$\|E_{(n,\chi)}(f, \cdot) - f(\cdot)\| = O(1) E_{(n)}(f)$$

The kernels of Jackson $j^{(p)}$ of (16), $p \geq 2$, admits no expansion of the form (40). Also, here linear combination are not saturated. This will be briefly outlined for $p = 2$. The convergence factors are then given by,

$$\rho_{(k,n)}(j^2) = \frac{1}{4n^3+2n} \begin{cases} 3k^2 - 6nk^2 - 3k + 4n^3 + 2n, & 0 \leq k \leq n \\ -k^3 + 6nk^2 - 12n^2k + k + 8n^3 - 2n, & n \leq k \leq 2n \end{cases} \quad (43)$$

Now for j^2 and $a_i = i$, $1 \leq i \leq 3$, leads to another corollary.

Corollary 4.2. [10] The unique linear combination $\tilde{\chi}$ of Jackson De la Vallee poussin kernels (42) satisfying (36), is given by,

$$\tilde{\chi}_{(n)}(x) = -\frac{1}{18} \left(1 + \frac{1}{n^2}\right) J_n^2(x) + \frac{1}{3} \left(4 + \frac{1}{2n^2}\right) J_{2n}^2(x) - \frac{1}{2} \left(1 + \frac{1}{2n^2}\right) J_{3n}^2(x) + \frac{1}{9} \left(32 + \frac{1}{n^2}\right) J_{4n}^2(x) \quad (44)$$

Corresponding singular integral for $f \in C_{2\pi}$ is given by,

$$\|E_{(n,\tilde{\chi})}(f, \cdot) - f(\cdot)\| = O(1) E_{(n)}(f)$$

Here, the coefficients depend on n , and are bounded by linear combination $\tilde{\chi} = \{\tilde{\chi}_{(n)}(x)\}$, $n \in N$, which defines an approximation process and is not saturated by construction.

Conclusion. Jackson de La Vallee Poussin kernels seems more suitable for these linear combinations since the calculation of coefficients is less elaborate.

Abstract

Present paper Study with the physico-chemical parameters of Maddikunta lake, Tahsil :-Sironcha ,Dist:-Gadchiroli. The work was carried out during the period of Sep- 2015 to Aug 2016. This lake was established for irrigation, Drinking water and fish culture purpose .It was formed 300 years ago from migrant telugu peoples from Andhra Pradesh . It was in the out of 6 km distance from Tahsil:Sironcha . In rainy season it's receiving Village sewage, fertilizers , Pesticides . This typs of water injuries to the health of human other aquatic Fauna. So there is an urgent requirement for its extent of pollution which will help us in further management of conservation. During the study period examine the physico-chemical parameters such as: atmosphere, water temperature, pH, electrical conductivity, alkalinity, total hardness, TDS, Ca, Mg, chlorides, sulphates and phosphate, following stranded methods (APHA 1998). Now this lake is becoming eutrophic in nature.

Introduction:-

Water is the most essential requirements of life. The survival and quality of human life depends up on the availability of fresh water. The aquatic animal's life directly or indirectly depends on water quality status (A. Bajpai, 1993). (A. Mishra et.al.1993). (sayeshwara,2010). Water quality study provide the current information about the suitability of water for designated uses and to improve existing condition (Lloyl 1992).

Now a day's most of the aquatic ecosystem receives million liters of village sewage, and agricultural runoff. Its cause to nutrient enrichment cause to the eutrophication in aquatic ecosystem. (A.A. Ansari,2006). Pollution of the aquatic environment by inorganic and organic chemicals is a major factor to the survival of aquatic organisms and including fish population (Saeed and Shaker 2008). The main object of this paper to examine the physic-chemical parameters of Maddikuntta Lake and to suggested to conservation methods for water for drinking and irrigation purposes.

Study area:-

The lake in Maddikuntta ,Tahsil:Sironcha ,District:Gadchiroli(MS). Maddikuntha is a Village in Sironcha Taluka in Gadchiroli District of Maharashtra State, India. It belongs to Vidarbha region . It belongs to Nagpur Division . It is located 179 KM towards South from District head quarters Gadchiroli. 6 KM from Sironcha.874KM from State capital Mumbai

Corresponding Author:- S . R. Sheikh.

Ramanjapur (vl) (2 KM) , Arda (2 KM) , Nagram (4 KM) , Sironcha (ryt) (4 KM) , Sironcha (4 KM) are the nearby Villages to Maddikuntha. .This Place is in the border of the Gadchiroli District and Karimnagar District. Karimnagar District Mahadevpur is South towards this place . It is near to the Telangana State Border.

Material And Methods:-

The investigation was carried out to study the physico- chemical and biological aspect of the lake during September 2015 to August 2016, the Maddikuntta lake situated 6 km distance from Tahsil: Sironcha, District:Gadchiroli. Figure – 1. 160ht paddy field is irrigation under this lake. Water sample were collected in morning hours at 6-30am to 8-30 am.

Physical chemical parameters such as: temperature, pH, TDS, electrical conductivity, alkalinity, total hardness, TDS, Ca. Mg, chlorides, sulphates and phosphate, following were analyzed in the laboratory by using standard methods (APHA,2005).

Results:-

The result of physico-chemical characteristics of maddikunta lake water has been submitted in table. 1 and table 2.

Temperature:-

Water Temperature is an important role plays in determine the growth of organisms ultimately the water quality. Water is a vital parameter for growth of Organism. It also influences the metabolic rate of aquatic Organism. Excess amount of nutrients, high temperature cause to the eutrophication. The maximum temperature value was recorded to be 35.5 degree Celsius in the month of may at the sampling station B and minimum 19 degree Celsius January at sampling station A. In study period i.e. Sep-2015 to Aug-2016. .

pH:-

The high variation in pH of water is an indicate the highest productivity nature of lake water. According to Hora and Pillay the pH variation is mostly due to diurnal interplay of photosynthesis and community respiration of the biota and also is one of the most important single factors, which influences the aquatic production. The pH considered an important environmental factor. The maximum value of pH was recorded 8.5 in month of May at the sampling station B and minimum 7.8 was recorded in the month of September at sampling station A. In study period i.e. Sep-2015 to Aug-2016. .

Transparence:-

Intensity of light cause to the growth of planktons, it an indicator of productivity. The maximum value of transparency was recorded 25.5 cm in month of November at the sampling station A and minimum 14.5 was recorded in the month of August at the sampling station A. In study period i.e. Sep-2015 to Aug-2016. .

Electric Conductivity:-

Electric conductivity is a numerical expression ability of an aqueous solution to carry electric current. It's the best indicator of water pollution as conductivity is the indirect measure of TDS, nutrient. Conductivity increases with increasing amount and mobility of ions. These ions come from the break down of compounds. The maximum value of conductivity 1800 μm was recorded in month of July at the sampling station B and minimum 1150 μm was recorded in the month of April at the sampling station A. In study period i.e. Sep-2015 to Aug-2016. .

Total dissolve solids:-

Total dissolved solids are composed of mainly of chlorids, Sulphates, Phosphates, Nitrates, Calcium, Magnesium, Sodium, Potassium, Iron, Magnesium carbonates, bicarbonates (H.R. Esmaeli and M.S. Joshi 2005). Total dissolved solids denote mainly the various kinds of minerals available in the water. The maximum value of TDS 1330 mg/lit was recorded in month of September at the sampling station B and minimum 970 mg/lit was recorded in the onth of May at the sampling station A. In study period i.e. Sep-2015 to Aug-2016.

Total Hardness:-

The maximum value of total hardness 152 mg/lit was recorded in month of April at sampling station A and minimum 87 mg/lit was recorded in the month of September. Salve and Hiwre (2006), S.E. shinde et. Al (2011) reported that TH high in winter low in summer and monsoon season. In study period i.e. Sep-2015 to Aug-2016.

Calcium:-

Calcium is one of the most abundant substances present in the natural water. In aquatic environment calcium serves as one of the micronutrients for most of the organisms. The maximum value of calcium 110 mg/lit was recorded in month of May at the sampling station A and minimum 64 mg/lit was recorded in the month of September at the station B. In study period i.e. Sep-2015 to Aug-2016.

Magnesium:-

Magnesium is essential for chlorophyll bearing organism, since it goes into composition of the pigments. Decrease the value of magnesium may be due to plankton and algae. The maximum value of magnesium 57 mg/lit was recorded in month of March at the sampling station B and minimum 17 mg/lit was recorded in the month of September at the sampling station A. In study period i.e. Sep-2015 to Aug-2016.

Alkalinity:-

Separation of alkalinity soft & hard water scale is 40 mg/lit. J.B. Moyle (1949). The maximum value of 325 mg/lit was recorded in month of December and at the sampling station B and minimum 104 mg/lit was recorded in the month of June at the sampling station A. In study period i.e. Sep-2015 to Aug-2016.

Chloride:-

Large amount of chloride in freshwater is an indicator of organic pollution. The maximum value of Chlorides 74.5 mg/lit was recorded in month of May at the sampling station B and minimum 55mg/lit was recorded in the month of December at the sampling station A. Chlorides increase in summer and decrease in winter (Singh 1960, Zafer A.R. 1964) in study period i.e. Sep-2015 to Aug-2016.

Phosphates:-

The maximum value of Phosphates 3.4mg/lit was recorded in month of May at the sampling station B and minimum 0.8 mg/lit was recorded in the month of November at the sampling station A. High value of phosphate during summer may be attributed to the decrease water level and release of phosphate due to decomposition of organic matter. (Seenyya and Jafar, 1979, and Saha 1984). In study period i.e. Sep-2015 to Aug-2016.

Sulphates:-

It's a present in fertilizer they contribute to the water body from agricultural runoff. Discharge of domestic sewage in water tends to increase its concentration. The high concentration of sulphate stimulates the action of sulphur reducing bacteria, which produce hydrogen sulphide, a gas highly toxic to fish life. The maximum value of Sulphates 3.3mg/lit was recorded in month of June at the sampling station B and minimum 1.2 mg/lit was recorded in the month of December at the sampling station A. Reddy et.al (2009) high value recorded in monsoon season. In study period i.e. Sep-2015 to Aug-2016.

Conclusion:-

The present study reveal that Naspur Lake was polluted by the sewage water and domestic uses that's why the lake was polluted.

To prevent the lake pollution some measures to be take.

1. Treatment of sewage water and avoid the Village sewage connection to lake.
2. Avid the washing of cloth.
3. Bathing of cattle.
4. Dumping of Agricultural waste.
5. Water quality comparision of these two sampling station of maddikuntta lake reveals that the situation is not too worst but it is alarming .
6. It needs prper conservation and managements plans,strategies for the restoration etc.

Abstract

Cloud Storage becomes more popular and many corporate, government organizations, share their data in public cloud which are semi-trusted cloud storage. Public cloud storages are hack able and data can be leak out, so we need a system where the files are encrypted and then stored in cloud. If the volume of the files is large then system need search engine to retrieve the file, in-turn search engine need keyword index for the fast performance. There may be a chance for the intruder to get the details of the files through unencrypted index keywords, So in proposed system index keywords are undergo hashing technique and cipher text are stored in index. This system will encrypt the file and encode the index keywords which give double production to the data in cloud. Further to the data security this system has access control system. At present ABE (Attribute Based Encryption) & IBE (Identity based Encryption) are used for the file access control in cloud which requires more processing time and calculations. Proposed system uses a new technique where Access Control is included in search index keywords, which require less computation and quick retrieval.

Introduction:-

Cloud computing allows users to use enormous data storage and infinite computation capabilities at a very low price. Even though cloud storage gives lot of benefits, Data Owner is not having the full control over the outsourced data, it can be hacked. To avoid this problem, user should encrypt their data before outsourcing to the cloud. However, encryption can obstruct some useful functions such as searching over the encrypted data which is outsourced in cloud, while enforcing an access control policy. Moreover, it is natural to outsource the search operations to the cloud, while keeping the outsourced data private. There is a need to allow the data consumers to verify whether the cloud faithfully executed the search operations or not. To the best of our knowledge, existing solutions cannot achieve these objectives simultaneously.

Our Contributions:-

We propose a new concept, called *Smart Cloud File Retrieval using Searchable Cipher text Keywords & Access Control on Index*. This system allows a user to control the search, and retrieve its outsourced encrypted data according to a user access control policy, while allowing the authorized users to search and retrieve files through innovative index based access control system.

In other words, a data user with proper authentication and attribute can access the encrypted files in the cloud with access control rules. This system provide followings (I) Data Owner can upload the files into the cloud in encrypted form, (ii) Data Owner can able to set Access Control Policies for the outsourced files (iii) Data User can able to search and retrieve the file through access control based cipher text index keywords.

We formally define the security properties of proposed system and present schemes that provably satisfy them. The scheme is constructed in a modular method, by using attribute-based encryption, bloom filter, digital signature, and a new building-block we call attribute-based Cipher text keyword search (ABCKS) that may be of independent value. Experimental evaluation shows that the system provides good result and performance.

Associated Works:-

To the best of our knowledge, no existing solution is sufficient for what we want to achieve. In what follows we briefly review the relevant techniques.

Attribute -Based Encryption (ABE). ABE is a popular method for enforcing access control policies via cryptographic means. Basically, this technique allows entities with proper credentials to decrypt a cipher text that was encrypted according to an access control policy [2]. Depending on how the right of entry control policy is enforced, there are two variants: KP-ABE (key-policy ABE) where the decryption key is associated to the right of entry control policy [2], and CP-ABE (cipher text-policy ABE) where the cipher text is associated to the access control policy [5]. ABE has been enriched with various features. In this paper, we use ABE to construct a new primitive called attribute-based keyword search (ABKS), by which keywords are encrypted according to an access control policy and data users with proper cryptographic credentials can generate tokens that can be used to search over the outsourced encrypted data. This effectively prevents a data owner from knowing the keywords a data user is searching for, while requiring no interactions between the data users and the data owners/trusted authorities. This is in contrast to [6], where the data users interact with the data owners/trusted authorities to obtain search tokens.

Keyword Search over Encrypted Data. This method allows a data owner to generate some tokens that can be used by a data user to search over the data owner's encrypted data. Existing solutions for keyword search over encrypted data can be classified into two categories: searchable encryption in the symmetric-key setting and searchable encryption in the public-key setting. Several variants have been proposed to support complex search operations. Moreover, searchable encryption in the multi-users setting has been investigated as well [9], [10], where the data owner can enforce an access control policy by distributing some (state full) secret keys to the authorized users. However, all these solutions do not solve the problem we study, because (i) some of these solutions require interactions between the data users and the data owners (or a trusted proxy, such as a trapdoor generation entity [6]) to grant search capabilities, and (ii) all these solutions assume that the server faithfully executed search operations. In contrast, our solution allows a data user with proper credentials to issue search tokens by which the cloud can perform keyword search operations on behalf of the user, without requiring any interaction with the data owner. Moreover, the data user can verify whether or not the cloud has faithfully executed the keyword search operations. This is true even for the powerful technique called predicate encryption, which does not offer the desired verifiability.

Verifiable Keyword Search. Recently, verifiable keyword search solutions have been proposed in [12], where each keyword is represented as a root of some polynomial. It is possible to check whether a keyword is present by evaluating the polynomial on the keyword and verifying whether the

Output is zero or not. However, these approaches work only when keywords are sent in plaintext to the cloud, and are not suitable for our purpose because the cloud should not learn anything about the keywords. It is worth mentioning that the secure verifiable keyword search in the symmetric-key setting can be insecure in the public-key setting because the attacker can infer keywords in question via an off-line keyword guessing attack (in lieu of the off-line dictionary attack against passwords).

Problem Statement:-

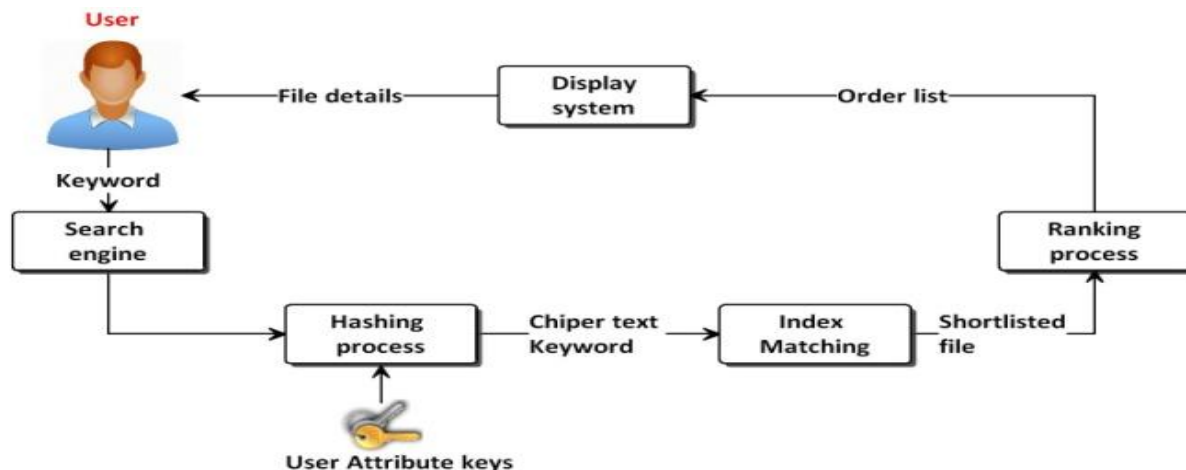

Consider a situation where a college has to store lot of e-books in cloud storage. That e-book has to be accessed by their students. If the e-books are less in number, the students can able to browse and download. Consider a situation the number of e-books is huge it is not possible to browse and download the file, so the students need a search engine. Whenever search engine come into picture, indexing technique have more weight age. The problem here is

to safeguard the file content and index keywords, index keywords are usually sensitive and which are linked with the file they are connected when a hacker get this index data he may guess the file content. Our aim is to safeguard the index keyword, file content and to implement access control system.

Access control is a big challenge, in current cloud storage for access control, attribute based encryption (ABE), identity based encryption (IBE) are used. Now in this system we are using Attribute Based Cipher text Index Keyword for access control.

The assumption in this system is each department in the college will have one Unique Attribute Key (UAK). At the time of uploading the file into the cloud the concern user has to provide the access policy details, like which are the department students and staff can able to access the file from the cloud.

Proposed system will automatically remove the unnecessary words from the file and create the keywords with weights using Term Frequency (TF)

algorithm. All the extracted keywords will processed with hashing technique of allowed department Attribute

Keys which will provide Attribute based cipher text Keywords; these cipher text keywords are stored in index array for searching process. For example there are I keywords are extracted from the e-book and the authority selected J departments in access control setting then in Attribute Based Cipher text Keywords generated will be $I * J$. All the ABCK are inserted into index array. The idea behind this is each keyword will undergo hashing process with accessible department unique attribute keys. Since department based attribute keys are unique and this will create the same Attribute Based Cipher text keywords when the users from the same department search in the search engine. This is show in fig.1.

In this paper, we propose the new approach of *Smart Cloud File Retrieval using Searchable Cipher text Keywords & Access Control on Index* as a better solution, as depicted, in Fig. 2, Data owner only needs to generate one department one attribute key instead of attribute key to all user, instead of $\{k_i\}_{i=1}^m$ for sharing m documents with User, and User only needs to submit a Login ID for accessing the file, from the Login ID user's department is identified and then the corresponding department attribute key is used to generate the attribute based cipher text keywords. The cloud server can use this aggregate trapdoor and some public information to perform keyword search and return the result to User. Therefore, in Smart Cloud File Retrieval, the delegation of keyword search right can be achieved by sharing the single aggregate key. We note that the delegation of decryption rights can be achieved using the key-aggregate encryption approach recently proposed in, but it remains an open problem to delegate the keyword search rights together with the decryption rights, which is the subject topic of this paper. To summarize, the problem of constructing a *Smart Cloud File Retrieval* scheme can be stated as:

"To design a Smart Cloud File Retrieval using Searchable Cipher text Keywords & Access Control on Index scheme under which any keyword cipher texts from any document is searchable with a constant-size cipher text keywords generated by a constant-size department attribute key."

Implementation:-

This system is developed in web technology with MVC architecture. The proxy server has crypto system process which encrypts and decrypts the file, hashing technique which is used to get the keyword from the user and produce user attribute based hash code. A powerful search engine with access control based indexing system. There, is a ranking system which short the shortlisted file based on search keyword weights. The proxy server provides software as a service, which is a private server and the encrypted files are stored in public cloud storage which provides storage as a service. This system combines private server and public server so it forms hybrid cloud approach.

Fig. 2:- System Architecture

Security Analysis:-

The security system of proposed work is very strong. It gives security from outside hackers as well as security from insider (with access control) the registered user. The files which are stored in cloud storage are encrypted and the index keywords are in hash tag which gives double protection from the hackers. Since attribute based cipher text keywords are used even though the registered user can able to retrieve the files for which they have the access.

Conclusion:-

By considering the disadvantage of data outsourcing in public cloud storage we come up with a new idea attribute based cipher text keyword search (ABCK). In this the access control mechanism is built in search index. There is no need to provide attribute based key for each and every user. With the experimental result and evaluation technique our system result shows it is much better in performance and convince in secure file retrieval system from cloud storage for the further feature work. We consider multi owner document storage system and issues related to that.

Abstract

The diffusion mechanism of Na ions in the olivine-type NaMnPO_4 is investigated by first-principles calculations. Electron transport properties studied by first-principles density functional theory (DFT) GGA+U method and achieved Final Energy/Atom -7.03 eV. The calculated diffusion energy was 0.65 eV for Na to diffuse along the (0 1 0) direction. The large inter and intra-layer distance of Mn 3.156 Å° and 6.312 Å° offers feasible channels for fast Na ion diffusion in (0 1 0) direction. Implications of first-principles calculations useful strategy for better understanding the electrochemical properties of olivine-type NaMnPO_4 are discussed for designing better-performing Na ion rechargeable batteries.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Sodium-ion batteries have vast potential as an inexpensive, geopolitically-neutral alternative to Li-based rechargeable batteries, largely due to the global abundance and low cost of sodium-containing precursor materials. Na-ion electrode materials, while conceptually similar to their Li-ion counterparts, give rise to unique challenges and physical properties due to sodium's larger size and lower absolute standard electrode potential. Due to their larger size, Na ions can reversibly intercalate in more materials than Li-ions, giving a much broader chemical space in which electrode materials can be optimized. This, together with sodium's abundance, makes Na-ion batteries excellent candidates for large-scale energy storage [1-4]. In this computational studies with the goal of novel Na-ion electrode discovery, as well as material optimization and understanding of the underlying physics governing material function. First-principle computational efforts are used to obtain insights into phase transitions during electrochemical deintercalation of Na-ion cathodes, as well as diffusion mechanics and diffusivity. High throughput computation is utilized to search for the novel cathode, anode, and solid electrolyte materials. In this paper, we examine olivine-type NaMnPO_4 using first-principles calculations. It has been noted that LDA and GGA give relatively large errors for the sodium intercalation potentials. So we purpose is to extend such calculations to other compounds of the phospho-olivine family and to show that treating electronic correlations within the GGA+U method gives considerably better agreement with experiment and thereby provides a tool to accurately predict Na intercalation potentials. We first present the details of the GGA+U method as well as structural information on the Sodium-orthophosphate oxides and show how the electrochemical reactions take place in a rechargeable Sodium ion battery.

Computational methods:-

The First principle calculations have been performed using the Quantum ESPRESSO PWscf code [5] using a plane-wave basis to express the wave function of the valence electrons and ultrasoft pseudopotentials to describe the

Corresponding Author:- Bikkina Bhuvan Venkat Chowdary.

Address:- B.Tech student, Department of Mechanical Engineering, GITAM University Hyderabad, India.

interactions of ionic cores and valence electrons [6]. QuantumWise VNL-ATK 2016 academic version was used as GUI for Quantum ESPRESSO. The exchange-correlation contribution was described by the generalized gradient approximation (GGA) of Perdew, Burke, and Ernzerhof [7]. Onsite Coulomb correction (GGA + U) was included to describe the localized electronic states of Mn 3d in mixed-valence rare earth metals. A spin polarization calculation was used. A kinetic cutoff energy of 520 eV, and $5 \times 5 \times 3$ k-point meshes in the NaMnPO₄ unit cell (28 atoms) were found by a convergence test (<3 meV/NaMnPO₄). Because the band gaps of both compounds were underestimated, which is typical of the GGA + U functional [8]. The relaxation of unit cell volume was done by total energy minimization, and atom positions were relaxed until the remaining force acting on the atoms was less than 10^{-3} eV/Å. The Na diffusion in NaMnPO₄ is calculated by Na jumps between neighboring M1 sites were obtained by means of the nudged elastic band (NEB) method [9]. The threshold for the total force that is acting on the NEB images of the interpolated reaction path was set to 0.05 eV/Å.

Results and discussion:-

Figure 1. Shows the bulk crystal structure of sodium Manganese phosphate [NaMnPO₄] with orthorhombic (ICSD - 201771) with space group Pnma. The olivine structure of the NaMnPO₄ is a hexagonal close-packed array of oxide ions containing isolated PO₄ tetrahedral and corner-sharing MnO₆ octahedra in the (0 1 1) plane and edge-sharing NaO₆ octahedral, stacked along the [0 1 0] direction. Because the oxygen atoms are strongly bonded to both Mn and P atoms.

Figure 1:- Crystallographic structure of the bulk NaMnPO₄ (Yellow, red, gray and purple balls refer to Na, O, P and Mn atoms, respectively).

The optimized lattice constants for the NaMnPO₄ are summarized in Table 1, along with other experimental values. The calculated values are larger than the experimental ones, but the errors of the computed values compared with the experimental ones are within 0.04–0.33%. The underestimation of the lattice constant compared with the equilibrium values is due to the feature of GGA functional used.

Table 1:- Optimized lattice constants for olivine-type NaMnPO₄ (Å)

		a Å	b Å	c Å	reference
NaMnPO ₄	Exp.*	5.155	6.976	9.210	ICSD ID 201771

* J. Moring and E. Kostiner, J. Solid State Chem., 1986, 61, 379–383.

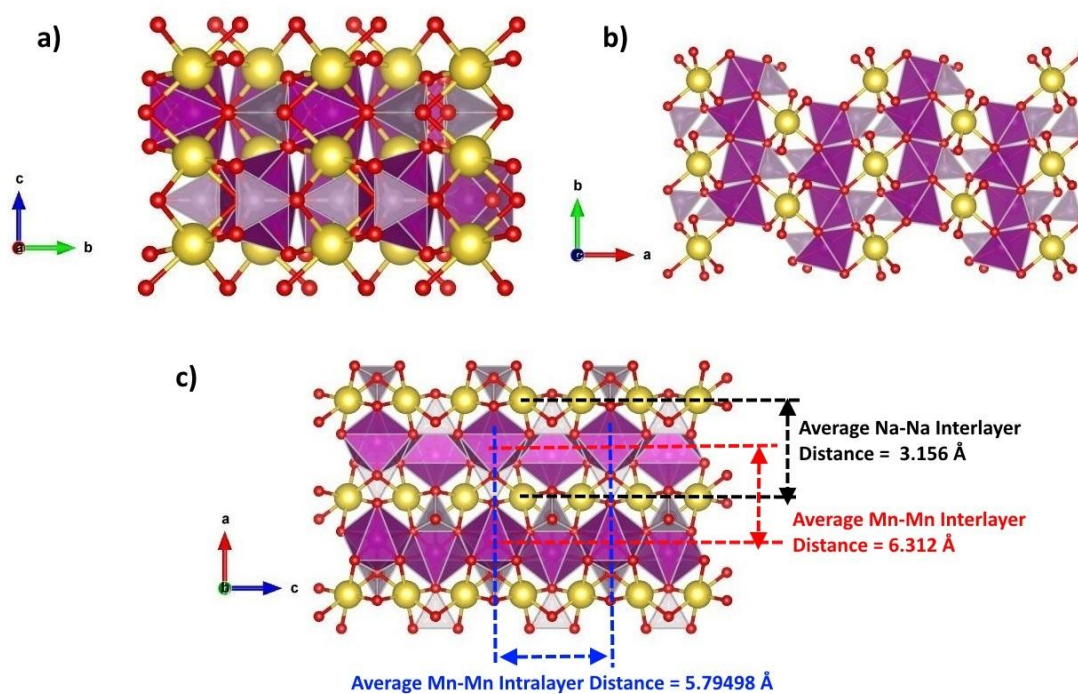

Figure 2:- Crystallographic structures of NaMnPO₄ a) 100 b) 001 c) 010 directions

Figure 2. shows structural illustration of olivine-type NaMnPO₄ (100), (001), (010) directions and Figure 2c shows the Na-diffusion channels in NaMnPO₄ in (010) directions. It offers more interlayer Mn–Mn distance (6.312 Å) than the inter-layer Mn–Mn distance (5.794 Å), which facilitates two-dimensional Na-ion diffusion pathways to achieve the fast intercalation and de-intercalation phenomena along the a and c directions. These free wider paths offer fast Na ion in NaMnPO₄.

Figure 3:- Partial density of states (PDOS) for NaMnPO₄ (PDOS is aligned so that the Fermi energy is zero)

Figure 3. shows the partial density of states (PDOS) around the Fermi level for olivine-type NaMnPO_4 , respectively. The localized Mn 3d bands form a valence band maximum and conduction band minimum, and the band gaps are larger than 3.051 eV in NaMnPO_4 . Therefore, the intrinsic band conduction of electrons is negligible at room temperature because of the localization and wide band gap. Electronic conduction in NaMnPO_4 mainly arises from localized electron/hole (polaron) hopping. [10] Polarons are created by the redox reaction of $\text{Mn}^{2+/3+}$ to maintain charge neutrality during electrochemical Na^+ removal (uptake). In Figure. 3 the calculated energy profiles for localized hole (Mn^{3+}) jumps of ~ 0.2 eV for both compounds. The polaron migration energies are much smaller than the band gaps, and thus polaron migration is the dominant electron conduction mechanism. The similarity of the polaron migration energies of the two compounds indicates that the difference in rate performance does not stem from polaronic migration. Alkali ion migration is another factor affecting the rate performance in batteries.

Figure 4:- Trajectory of Na ions in the NaMnPO_4 bulk structure calculated by the NEB method.

NEB calculations were performed to evaluate the migration energies of alkali ions NaMnPO_4 . The GGA functional was used to avoid the effect of complicated polaron interactions. Figure 4 shows the migration trajectory of Na^+ hopping in the NaMnPO_4 bulk structure. Na ions at the octahedral site jump to the neighboring site via the tetrahedral vacancy site along the (0 1 0) direction, forming a one-dimensional pathway. The migration energy profiles are shown in Figure 5, where the energy maximum is located at the center of migration path (tetrahedral vacancy).

Figure 5:- Diffusion energy curves of Na in bulk NaMnPO_4

The migration energy 0.65 eV achieved in NaFePO₄. The migration energy 0.65 eV is quite higher than in LiMnPO₄ because Na⁺ is slightly larger than that of Li⁺, which may arise from the size effect of the larger ionic radius of 6-coordinate Na⁺ (1.02 Å) compared with Li⁺ (0.76 Å). the diffusion coefficient, D, can be expressed by migration energy, E_m, as follows,

$$D = a^2 v^* \exp\left(\frac{-E_m}{k_B T}\right) \dots\dots (1)$$

Where a, v*, k_B and T correspond to hopping distance, attempt frequency, Boltzmann constant, and absolute temperature, respectively.

Interfacial migration mechanism (Figure 6) indicate that a fast charge–discharge mechanism occurs in Na_{1-x}MnPO₄ electrodes owing to the interfacial Na ion migration mechanism (E_m ~ 0.15 eV) as proposed in the domino-cascade model, whereas a bulk conductivity mechanism is dominant in the Na_{1-x}MnPO₄ electrode (E_m ~ 0.65 eV) because of the miscibility in terms of Na/vacancy arrangements in the lattice.

Figure 6:- Calculated migration energy of alkali ions at the (010) interface for NaMnPO₄/ MnPO₄

In addition, a phase transition will occur during the charge and discharge processes in NaMnPO₄ electrode material, thus a correction to the method will be required to calculate the voltages for Sodiation/deSodiation caused by the phase transition. Moreover, the energy of Sodiation/desodiation is very small in some electrode materials, much smaller than the activation energy of Na migration.

Conclusion:-

First Principle calculation of olivine-type NaMnPO₄ successfully studied by Density function theory. The calculated diffusion energy barriers of the bulk NaMnPO₄ and 0.65 eV. We Studied bulk polaron migration mechanism (Figure 5), and bulk alkali ion migration mechanism (Figure 6). Therefore, the difference in alkali ion size is not a major factor controlling the rate performance of the charge–discharge reaction. However, the phase stability of olivine-type compounds indicates a two-phase reaction mechanism for the NaMnPO₄ electrode Our results suggest that faster Na⁺ migration at the interface than in the bulk originates from the two-phase reaction mechanism. Accordingly, the formation of the interface in NaMnPO₄ may play an important role in the fast charge– discharge properties of olivine-type electrodes.

Bootstrap analysis, Molecular diversity, *Momordica*, Morphological characterization.

Abstract

Background: Genus *Momordica*, is widely distributed over tropic and subtropical region. Besides the cultivated bitter melon (*M. charantia* L. var. *charantia*), many other species of the genus occur in the wild state have been found in India and neighboring countries. Among them, monoecious, *M. charantia* and *M. balsamina* and dioecious, *M.*

dioica and *M. cochinchinensis* exhibit divergence in morphological characters like growth habit, maturity, and fruit shape and size, sex expression, leaf, root and seed characters.

Methods: We studied the twenty-four accessions representing four *Momordica* species including two gynodioecious lines of *M. charantia* namely Gy-323, Gy-333 by morphological and molecular analysis through RAPD, SSR and ISSR markers.

Results: The analysis of study based on dendrogram obtained from the distance matrix from the mean value of the 15 quantitative traits for the genotypes grouped all the accessions into two major clusters. One cluster

separated two distinct groups each accession of *M. charantia* and *M. cochinchinensis* and *M. balsamina* formed distinct group within a major cluster while the second major cluster consisted of all accessions of *M. dioica*. For molecular diversity analysis, 101 primers including 50 RAPD, 16 SSR and 35 ISSR primers produced a total of 600 scorable amplicons across four species, of which 586 (97.08%) were polymorphic. Seventeen markers differentiating monoecious and dioecious and 85 amplicons specific to one of the four *Momordica* species were identified. The UPGMA dendrogram obtained from Jaccard's similarity coefficient (average similarity of 0.38) showed two major clusters clearly distinguishing monoecious and dioecious species with high bootstrap value (100) between nodes.

Conclusions: In the present study, morphological diversity

Introduction

Bitter melon (syn. bitter melon, *Momordica charantia* L.), an economically important member of the genus *Momordica* (Family: Cucurbitaceae) is widely cultivated in India, China, Malaysia, Africa and South America (Raj et al. 1993; Singh 1990) for its immature fruits as vegetable. Bitter melon is also used as a traditional medicine for diabetes in India, China and Central America (Grover et al. 2002; Ye et al. 2003), vaccine (Dutta et al. 1981) and other health related ailments due to its health promoting substances such as charantin (Ye et al. 2003). The genus *Momordica* comprising of 59 species is widely distributed all over tropic and sub-tropic region but the diversity of the species is more in tropical Africa including several species of economical and medicinal importance possessing different sex form and different basic chromosome number. About a third of the species are monoecious and remaining dioecious (Schaefer, 2010). The incompatibility among $2n=2x=22$, $2n=2x=28$ and $2n=4x=56$ species in this genus is indicated by the negative results of crossings between *M. charantia* L. and *M. muricata* L. and between *M. dioica* Roxb. *M. cochinchinensis* Spreng. (Trivedi and Roy 1972). Besides the cultivated bitter melon (*M. charantia* L. var *charantia*), several species are present in India, Sri Lanka, Bangladesh, Myanmar, Malay, etc. (Hooker 1879) occurring in the wild state and are gathered by tribal communities as vegetables. Seven species occur in India and among them *M. charantia* and *M. balsamina* are monoecious while *M. dioica*, and *M. cochinchinensis* are dioecious species and are propagated vegetatively through tuberous root (Rashid 1993). These species exhibit morphological divergence in characters like growth habit, maturity, fruit shape and size, sex expression, leaf, root and seed characters (Robinson and Decker-Walters 1999). The fruits are bitter in taste and are desirable for consumption. Thus, *M. charantia* is perhaps the only species in which bitterness has been considered as a trait for selection during domestication. Besides many culinary uses in south, southeast and east Asia, the genus is also cultivated for its use as folk medicines.

M. charantia provides for relatively broad phenotypic variation (Kundu 2012, Iqbal 2016), which produces large fusiform fruits, while *M. dioica* is an important vegetable in the Indian sub-continent. It has many advantages, like high market price, good nutritional value and longer shelf life (Rasul 2003, Singh 2013). Sweet melon (*M. cochinchinensis*) occurs in peninsular region, humid tropical forests and also in north-eastern region and balsam pear *M. balsamina* occurs in north-western, Indo-Gangetic plains adapted to dry and sandy soils. Sweet melon, tea melon and balsam pear being minor vegetables.

Application of molecular markers as a tool for identification and characterization of germplasm for their efficient management and use in plant breeding has gained importance (Karp & Edwards 1997). Among the different types of molecular markers, random amplified polymorphic DNA (RAPD) (Williams et al., 1990) is useful for the assessment of genetic diversity (Ulanowsky et al. 2001; Baranski et al. 2001; Pradeep Kumar et al. 2003; Cai et al. 2007; Tiwari et al. 2009;). The technique is ideally suited for fingerprinting applications because it is fast (Gwanama et al. 2000), requires little material (Lowe et al. 1996) and technically easy (Fenwick and Ward 2001). The wide availability of commercial primers makes this technique widespread (Gillies et al. 1997), inexpensive and yields large numbers of markers (Martin and Bermejo 2000).

Recently, some understanding of the genetic variations has been achieved using transcriptome analysis of within *M. charantia* species (Shukla et al. 2015) and molecular markers like RAPD (Dey et al. 2006; Behera et al. 2008; Bharti et al. 2012), Inter Simple Sequence Repeat (ISSR) (Singh et al. 2007; Bharti et al. 2012), AFLP (Gaikwad et al. 2008) and Simple Sequence Repeat (SSR) (Ji et al. 2012) in *M. charantia* and in related species (*M. dioica*) using RAPD (Rasul et al. 2007) and SSR markers (Ji et al. 2012). Transferability of SSR markers has also been reported in related

species (Jietal.2012). Although, most of these studies have focused on the efficiency of different molecular markers for assessing the diversity within one species, none aimed at assessing the diversity among some related *Momordica* species. The present efforts aim to get a comparative account of morphological and genetic diversity across the genus and unambiguously identify different species of *Momordica* using molecular and morphological markers.

Materials and Methods

Plant materials

Twenty four accessions of four *Momordica* species collected from different agro-climatic zones of India were selected based on morphological diversity and geographical distribution and were evaluated at the Research Farm, Indian Institute of Vegetable Research, Varanasi, (U.P.) during rainy-winter season of 2014. The list of accessions included in the study is detailed in Table 1.

Table 1: Salient Features of fused *Momordica* genotypes.

Species	Source	Salient Features
Spinegourd (<i>Momordica charantia</i>)		Monoecious, trailing vine with thin stems and tendrils, The leaves are heart-shaped, 5-10 cm in diameter, cut into 5-7 lobes, Flowers are borne singly in the leaf axils, fruits are small to very large, split open, revealing orange flesh and bright red placenta to which these seeds are attached, Seeds are tan and oval, with a rough etched surface.
GY-323	IIVR	Gynoecious plant, Large vines, large size leaves with heart shape,
GY333	IIVR	Gynoecious plant, medium vines, more branching, profuse bearing, green fruits
DRAR-1	TNAU	Monoecious, large vines, medium leaves, less branching, light green fruits
VRBT-1	ANGARU	Monoecious, more branching, medium size leaves, continuous fruiting for longer period, green fruits
MC-84	TNAU	Monoecious, medium size leaves, light green fruits, medium size fruits
DVBTG-7	IIVR	Monoecious, medium size leaves, more branching green fruits, medium size fruits,
DVBTG-5	IIVR	Monoecious, medium size leaves, more branching green fruits, medium size fruits,
PDM	IARI	Monoecious, medium size leaves, more branching green fruits, small size fruits,
Sweetgourd (<i>Momordica cochinchinensis</i>)		Dioecious, roots develop big gertubers, leaves are bigger, flowers are large, yellow, 3 small deep black or blue circular dots at the base of petal, Flowers large oblong fruits, fruits are light green to yellow in colour.
RCSG-1	ICAR Res. Complex Shilong	Dioecious, vigorous plant, light green fruits, more fruiting
RCSG-7	ICAR Res. Complex Shilong	Dioecious, medium plant, light yellow fruits, medium fruiting
RCSG-5	ICAR Res. Complex Shilong	Dioecious, vigorous plant, more spiny fruits, more fruiting, yellow fruits
RCSG-36	ICAR Res. Complex Shilong	Dioecious, vigorous plant, tough rind, less fruiting light green fruiting
DRMC-22	Kalayani (W.B.)	Dioecious, medium plant, tough rind, medium fruiting, green colour fruits
DRMC-25	Kalayani (W.B.)	Dioecious, vigorous plant, soft rind, more seed, medium fruiting, light yellow green fruits
Spinegourd (<i>Momordica dioica</i>)		Dioecious, roots develop small tubers, small leaves, flowers are small yellow colour and open in the evening, no circular dots at the base of petal, round to oval fruits, fruits are dark green to yellow in colour
VRMD-1	Varanasi	Dioecious, medium vine, more fruiting
RSR/DR-1	Mirzapur	Dioecious, long vine, medium fruiting
RSR/DR-2	Mirzapur	Dioecious, medium vine, more fruiting
RSR/DR-3	Sonbhadra	Dioecious, medium vine, less fruiting

VRMD-20-3	Satana	Dioecious, small viny, medium fruiting
VRMD-22-5	Satana	Dioecious, medium viny, less fruiting
VRMD-4	Patana	Dioecious, small viny, more fruiting
Balsampear (<i>Momordica balsamina</i>)		Monoecious, trailing vine with very thin stems and tendrils, The leaves are heart-shaped and 3-6 cm in diameter, cut into 3-4 lobes, Flowers are borne singly in the leaf axils, fruits are small having ridges throughout surface and in the end elongation take place, split open, revealing orange flesh and bright red placenta to which the seeds are attached, Seeds are small, light yellow and oval.
DRBS-1	Ranchi	Monoecious, thin and medium spread vines, bold small fruits with prominent distal end.
DRBS-2	ANGARU	Monoecious, thin and vigorous vines, medium prominent distal end, very small fruits
Sweetgourd (<i>Momordica cochinchinensis</i>)		
DRMC11	Bhagalpur (Bihar)	Dioecious, Dioecious, vigorous plant, soft rind, more seed, medium fruiting, light yellow green fruits

Field evaluation and data collection

For field evaluation, the accessions were planted following the recommended fertilizer dose and cultural practices to raise a good crop. Five plants were randomly chosen with in each accession for data recording, which was done for fifteen plant height, fruit diameter, fruit length, fruit/plant, fruit weight, seed/fruit, yield/plant, petiole length, pedicle length, node to first male flower, node to first female flower emergence and inter-nodal length.

Extraction of genomic DNA and quantification

Total genomic DNA was extracted from the fresh young leaves collected from field in the wee hours of the day following the procedure described by Doyle and Doyle (1990) and modification of Maguire et al. (1994). The DNA solution was purified and quantity of the DNA was estimated by recording OD of spectrophotometer (Gene Space-III, Hitachi, Japan) at 260 nm, and quality was checked on 0.8% agarose gel.

Polymerase chain reaction (PCR) assay and electrophoresis

Out of 120 random decamer primers from Operon Technologies, Inc., Alameda USA, a total of 50 primers were selected for RAPD analysis. Thirty-five commercially available universal ISSR primers of UBC series and 16 SSR primers reported in an earlier study (Wan et al. 2010) were used in the PCR assay. PCR reactions were performed in 96-well plates using Bio-rad thermo-cyclers system with the suitable amplification program using a total of 50 random decamer primers (Operon Technologies, USA). Each 25 µl reaction mixture contained about 50 ng of genomic DNA, 0.2 µM primer, 100 µM each of dATP, dGTP, dCTP and dTTP, 25 mM MgCl₂ and 0.5 U of *Taq* DNA polymerase along with suitable 10x buffer (10 mM Tris-Cl, pH 8.3, 50 mM KCl, 0.001% gelatin). The reaction was carried out at 94°C for 4 min as pre-denaturation step, then the reaction was cycled 40 times at 94°C for 1 min, 33°C for 1 min and extension at 72°C for 1 min. Additionally, a final cycle allowed extension at 72°C for 10 min. For ISSR and SSR assay, annealing temperature was standardized before performing the assay on complete set of accessions. Care was taken to ensure that a set of all accession to be compared were processed in the same machine.

The PCR amplified products from RAPD and ISSR assay were loaded in 1.5% agarose gel and separated by electrophoresis with 1x TAE buffer at 65 V for 1 hr and 30 minutes. The band sizes were estimated by comparing with bands of 1 Kb DNA ladder (MBI Fermentas), which was run along with the amplified products in a separate lane on the same gel. For products from SSR assay, the fragments were electrophoresed through 2.5% Metaphor agarose (FMC Bioproducts, USA) gel at a constant voltage of 90 volts for 5 hours. Fragment lengths were determined with the help of 50 bp ladder (MBI Fermentas, Germany) loaded separately in the gel along with the samples. The gels were stained with ethidium bromide (0.5 mg/ml) and visualized in a gel-documented system (Alfa-Imager 2200, Alfa-Innotech Corporation, California). The PCR amplification was repeated two times to ensure that the amplification obtained with the primers is consistent and reproducible.

Data analysis

Morphological analysis

The mean value of the data was considered for calculating the genetic distance among the accessions. DIST module of NTSYS-pc was used to achieve the same. The Nei and Li genetic distance matrix was used as input file for generating Unweighted Pair Group Method with Arithmetic Mean (UPGMA) based dendrogram using SAHN cluster module of NTSYS-pc.

Molecular analysis

PCR amplified fragments of the 24 accessions were scored as present (1) or absent (0) of bands. Only clear, unambiguous amplicons ranging from 300 bp to 3000 bp were scored. Unique presence or absence of single or group of bands was used for identification of species. Resolving power (Rp) and polymorphic information content (PIC) of primers were calculated to test the efficiency of these parameters in identifying primer that could best distinguish the cultivars. Resolving power is represented as $R_p = \sum I_b$, where $I_b = 1 - [2 \times (0.5 - p)]$, p being the proportion of cultivars containing the bands (Prevost and Wilkinson 1999). $PIC = 1 - (p_2 - q_2)$, where p_2 is proportion of accessions having an amplicon and q_2 is proportion of accessions not having the amplicon (Raina et al. 2001). PIC value of a primer was calculated by averaging the PIC values of all polymorphic fragments generated by the primer.

The genetic associations between accessions were evaluated by calculating the modified Nei and Li's coefficient $N_L = 1 - [2N_{11} / (2N_{11} + N_{10} + N_{01})]$ (Nei and Li, 1979) for pairwise comparisons based on the proportion of shared bands produced by the primers, where, N_{11} is the number of bands/alleles present in both individuals, N_{10} is the number of bands/alleles present only in individual A but absent in B and N_{01} is the number of bands/alleles present only in individual B but absent in A. Binary data based on presence (1) or absence (0) of bands was analyzed by pairwise comparison using Jaccard's coefficient (Jaccard 1908). The similarity matrix thus obtained was subjected to cluster analysis by UPGMA and dendrogram was generated to study the relatedness of the cultivars. The robustness of the nodes of the dendrogram was tested by bootstrap analysis using 1000 resamplings. These analyses were carried out using FreeTree software (Pavlicek et al. 1999). UPGMA dendrogram was drawn using Treeview (Page 1996).

Results

Morphological evaluation based on quantitative traits

The mean value of 15 quantitative traits recorded for 24 genotypes representing four different species of genus *Momordica* (Supplementary Table S1) and high morphological diversity among these accessions is not surprising. The day of flower anthesis and edible maturity is maximum (79.5 and 101.2) in DRMC-25 and minimum (32.5 and 40.5 respectively) is recorded in Gy-333. In addition, the fruit length is recorded highest (18.98) in DVBTG-5, whereas, it is minimum (4.15) in VRMD-20-3. The genotype DRMC-22 shows maximum fruit weight and seed per fruit (126.35 and 24, respectively), while it is minimum in VRMD-22-5 and DRBS-1 (10.87 and 9) and genotype RSR/DR-3 shows high seed number per fruit. The maximum yield per plant is recorded in RCSG-1 (2.255 kg) and minimum in VRMD-1 (0.365 kg). The genotype VRMD-20-3 shows highest fruits per plant (41.25) and is minimum (10.25) in DRBS-1.

Cluster analysis based on quantitative traits

Dendrogram obtained from cluster analysis of the distance matrix from the mean value of the 15 quantitative traits for the 24 genotypes (Fig. 1) groups all the accessions into two major clusters and separates at a distance of 29.00. Perusal of the dendrogram reveals two major clusters. All the accessions of *M. charantia* (Gy-323, Gy-333, DRAR1, MC84, PDM, VRBT1, DVBTG7 and DVBTG5); *M. cochinchinensis* (VRMD1, VRMD203, RSRDR3, RSRDR2, RSRDR1, VRMD225 and VRMD4) and *M. balsamina* (DRBS1 and DRBS2) constituted distinct groups within the major cluster. The second major cluster consisted of all accessions of *M. dioica*. However, RCSG-7 was distinct from other six genotypes and formed a distinct sub-cluster.

Figure 1: UPGMA dendrogram of *Momordica* accessions generated from mean values of 15 quantitative traits used for cluster analysis based on Nei and Ligenetic distance matrix.

Molecular variation and species relationships

The sequence of the RAPD, ISSR and SSR primers used for the molecular genetic fingerprinting of the four *Momordica* species and the basic bands produced by each primer, number of polymorphic bands and percentage of polymorphism produced by each primer are represented in supplementary Table S2, S3 and S4, respectively. The basic band statistics of obtained from the various set of primers in different combination is also given in table 2. The probability of chance identity of two accessions was 5.66×10^{-247} indicating the high efficiency of markers in differentiating the accessions.

Genetic diversity within and among species assessed using Nei's genetic diversity and Shannon information index is given in table 3 and supplementary Table S5.

This high level of polymorphism can easily be attributed to the accessions representing diverse species in the study. The results are not incongruent with earlier studies (Dey et al. 2006 and Behera et al. 2008) due to non-inclusion of accessions representing such diverse species. Rasu et al. (2007) included one accession of *M. dioica* as an out-group to study diversity in *M. charantia* using RAPD markers.

<i>Momordica</i> sp.	24	589 (97.68)	0.3136	0.1274	0.4808	0.1622	0.3511	0.0186

Ht value is for complete set of 24 accessions depicting the diversity in the set of accessions included in the study.

The above results clearly distinguish both monoecious species from the dioecious ones and the species within both groups. Unique markers distinguishing both the groups and some species-specific markers could also be identified through the study (supplementary Table S6). Seventeen markers could be identified differentiating monoecious and dioecious species, while 85 amplicons specific to one of the four *Momordica* species were identified. These results highlight the potential of molecular markers in identifying accessions at species level and accessing the genetic diversity of accessions both within and across species.

Discussion

Morphological evaluation based on quantitative traits

Several species of genus *Momordica* occur in India. Among them *M.charantia*, *M.dioica*, *M.cochinchinensis* and *M.balsamina* are distributed across various agro-climatic zones of India. The accessions included in this study were collected from their respective zones, representing four species: two each of monoecious and dioecious nature (Table 1).

Cluster analysis based on quantitative traits

The dendrogram obtained from cluster analysis of the distinct matrix formed the mean value of fifteen quantitative traits clearly exhibits distinction among accession of four *Momordica* species represented in the study. Further, *M.dioica* forms distinct clusters while the other three species group in separate cluster forming different groups of each species within the cluster. This could probably be because the traits evaluated during the study did not involve those features of floral biology. This clustering pattern of species could not establish any correlation between the clustering patterns with the geographical distribution of the accessions. Dey et al. (2006) also could not establish any such correlation for *M.charantia* accessions. However, non-congruence of the results with previous study (Dey et al., 2006) could be due to inclusion of more number of species in the study and recording different quantitative traits for analysis. The results are in partial congruence with Bharathi et al. (2012) on relatedness of species demonstrated through crossability.

The morphological traits recorded in this study, could efficiently cluster all the accessions representing a species, these traits can be highly effective in diversity analysis of a set of germplasm and in developing core set of the germplasm representing maximum diversity across the species. Kumari et al. (2010) have advocated use of strategy of identifying highly variable descriptors for capturing maximum genetic diversity in the core set. Among *M. charantia* accessions, two gynoeious lines (Gy-323, Gy-333) recorded early days to flower anthesis and days to edible maturity indicating earliness and early harvest. These lines also exhibit maximum fruit per plant, fruit weight and yield per plant indicating their potential to develop high yielding gynoeious variety in future breeding programme (Rama et al., 2002, Dey et al., 2006, Behera et al., 2008 and Shukla et al., 2015). However, plants respond and adapt differently to selection pressures imposed by distinct agroclimatic zones (Singh et al., 1998). These results highlight the potential of quantitative traits in distinguishing accessions at species level. Rasu et al., 2007 also reported similar distinction of species using RAPD markers.

Molecular variation and species relationships

The genetic relationship among the four species is assessed based on Jaccard's similarity coefficient from the pooled data from different marker systems and dendrogram is generated using un-weighted pair group method with arithmetic averages (UPGMA). The robustness of nodes in the dendrogram is assessed by bootstrap analysis by analyzing the data with 1000 replications (Fig. 2) using FreeTree and TreeView softwares. The perusal of the dendrogram shows two distinct clusters of monoecious and dioecious species with bootstrap value of 100 at node. The first major cluster includes the accession from *M. cochinchinensis* with *M. dioica* species while the second consists of accession from *M. charantia* with *M. balsamina*. The result also supports the diversity analysis of plastids, mitochondria and nuclear DNA, where *M. dioica* and *M. cochinchinensis* are nested in a clade (Schaefer and Renner, 2010). The bootstrap values at the nodes differentiating species are high to a level of 100 for *M. cochinchinensis* and *M. dioica*, *M. charantia* and *M. balsamina*. The clustering pattern clearly divides 4 groups, each representing a single species included in this study. The bootstrap values range from 37 to 100 for *M. cochinchinensis*; 22 to 100 for *M. dioica* and 40 to 100 for *M. charantia* representing high level of diversity in accession of these species. The two accessions of *M. balsamina* included in this study were highly diverse from each other with bootstrap value of 100 for node connecting them.

Figure 2: UPGMA dendrogram of *Momordica* accessions with bootstrap values from Jaccard's similarity coefficient obtained from molecular data analysis.

The perusal of dendrogram generated from the molecular data through 1000 replication for bootstrap reveals resolution of four distinct clusters each representing a species with intermediate to high bootstrap values at the nodes revealing high genetic heterogeneity among the accessions of the species. Similar results of high genetic diversity within species have been reported (Dey et al., 2006; Rasu et al., 2007; Behera et al., 2008; Dalam et al., 2012 and Jiet al., 2012).

Based on molecular data, 101 primers generated 600 scorable amplicons across four species, of which 586 polymorphic amplicons exhibiting 97.08% polymorphism among the samples. This high level of polymorphism can be attributed to the accessions representing diverse species in the study. The results are not incongruent with earlier studies (Dey et al., 2006; Behera et al., 2008 and Dalam et al., 2012) due to non-inclusion of accessions representing such diverse species. Rasu et al. (2007) included one accession of *M. dioica* as an out-group to study diversity in *M. charantia* using RAPD markers.

Seventeen markers could be identified differentiating monoecious and dioecious species, while 85 amplicons specific to one of the four *Momordica* species were identified. These results highlight the potential of molecular markers in identifying accessions at species level and accessing the genetic diversity of accessions both within and across species. The perusal of dendrogram generated from the molecular data through 1000 replication for bootstrap reveals resolution of four distinct clusters each representing a species with intermediate to high bootstrap values at the nodes revealing high genetic heterogeneity among the accessions of the species. Similar results of high genetic diversity within species have been reported (Dey et al., 2006; Rasu et al., 2007; Behera et al., 2008 and Jiet al., 2012).

In the present study, morphological diversity based on quantitative traits and molecular diversity showed some correspondence in the clustering pattern of accessions representing a species. All the species could be distinguished clearly, while more traits related to floral biology of the species were required to distinguish species morphologically in the study. The potentiality of gynoeious lines for earliness and yield attributes is evident and can be effectively exploited in future breeding programs. Though accessions of same species grouped together in both morphological and molecular analysis, molecular markers were more efficient than morphological parameters in not only differentiating the accessions at species level but also distinguishing monoecious and dioecious species.

Supplementary Table

Abstract

Background: Different closure techniques are available after lumbosacral meningomyelocele resection (MMC) resection for large defects reconstruction, but wound healing and tension-free closure in the midline remain major considerations. In this study we use Z-plasty technique in closure of MMC defects > 5 cm. Twenty newborns with large lumbosacral MMC were enrolled in this study. The mean age was 57.45 ± 59.8 days. Complete healing of the skin occurred within two weeks in 14 patients (70%). Superficial wound infection was seen in four patients (20%). Necrosis of the edges of the flap was showed in two patients (10%). No mortality or complete wound dehiscence were observed in this study. Almost skin wounds healed without any major complications.

Introduction:-

Meningomyelocele (MMC) is the most common significant birth defect involving the spine ranging from less than one case per 1000 live births in North America to 7.7% of live births born in United Arab Emirates. MMC is associated with several CNS anomalies including hydrocephalus, varying degrees of caudal displacement of hindbrain and cerebellar hypoplasia.⁽¹⁾ Because MMC defects vary in size, shape and location no single procedure applies to all. A large number of techniques have been described for closing the back defects occurring after excision of the MMC sac, but new studies focus more on simple, reliable and versatile alternative. The neurosurgical repair of this defect is performed immediately after birth for those lesions with rupture dural sac and external CSF leakage and can be delayed for several days without additional morbidity or mortality.⁽²⁾

The goal of surgical back closure is to seal the spinal cord with multiple tissue layers, to guard against ascending infection and to prevent CSF leakage with preserving the neurological function and untethering of the spinal cord.⁽³⁾

The plastic surgeon draws and designs the Z plasty flap to close the skin defects without tension.⁽⁴⁾

The aim of this study:-

The aim of this study is to assess the Z-plasty transposition flap in closure of skin defects after lumbosacral (MMC) resection in pediatrics.

Patients and methods:-

Twenty (20) newborns with large MMC were enrolled in this study, presented to the neurosurgical department Damanhour Teaching Hospital with the collaboration of surgical unit, during the period of 1 year from Dec 2009 to Nov 2010. After obtaining informed consent from their parents, our initial step was a careful physical examination conducted by a pediatrician, neurosurgeon and plastic surgeon to reveal any associated anomalies including cardiac, renal and other cranial defects. Preoperative anesthetic consultation was done with the request of blood grouping with cross matching of one unit of packed RBC for all patients; three newborns only needed intraoperative blood transfusion. Premature babies and newborns with low birth weight, anemia, and upper respiratory tract infection were excluded from this study. Over hydrocephalus was associated in four newborns and CSF diversion was done in the same sitting for those cases.

This study included only large-sized MMC with an average diameter more than 5 cm which was impossible to close these defects by using simple closure surgery without tension especially in the presence of kyphosis.

The mean age of the infants was 57.45 ± 59.8 days (approximately 2 months), 11 (55%) were males while 9 (45%) were females. The mean operative time for flap elevation and closure of skin was 40 minutes.

The following steps were done:-

1. A thorough history was taken and clinical examination conducted by pediatrician and neurosurgeon was done.
2. MRI lumbosacral spine was done for those cases with motor defects and CT brain was done for all newborn with large skull diameter.
3. Blood laboratory tests including CBC, bleeding time, clotting time, prothrombin activity, serum albumin were done for all patients.

Surgical technique:-

Under general anesthesia, the newborn was placed in prone position with rolls under the chest and pelvis to allow abdomen to hang free.

Measurement of the expected raw area (skin loss) and designing of the Z-plasty flap and its landmark on the skin was done (Fig. 1). Also, decompression of bladder was done prior to placement in this position. The neurosurgical repair started with transverse or longitudinal elliptical skin incision extending through the subcutaneous tissue. The dural sac is undermined and reflected medially on each side. It is closed in a water-tight fashion using 4/0 non-absorbable suture the posterior layer of thoracolumbar fascia is then closed in a separate layer to reinforce the dural tube. The plastic surgeon made the defect as a rhombus shape placed vertically over the midline, equilateral Z-plasty were elevated at the sides of the rhombus and transposed across the defect. The skin lines of closure were chosen to be away from the dural suture, approximated and secured without tension.

Meticulous hemostasis with bipolar cautery was done, so suction drainage was not used in any patient.

Postoperative care:-

Daily dressing was done for all newborns to guard against fecal and urine contamination and also to detect any early signs of surgical wound complications including infection, subcutaneous seroma, CSF leakage, edge necrosis and wound dehiscence. All patients were discharged after removing the surgical sutures to be followed every week in the 1st month postoperative to secure and document the sound healing of the wound.

Results:-

The closure of the skin defect was possible in all patients, as a tension-free and in one stage. Figure 2, showed a newborn's back two weeks postoperative, the wound has healed without any major complications. No mortality has occurred among newborn in this study. Sound healing has occurred in 14 patients (70%), while total post-operative complications occurred in (30%) of patients. CFS leakage was observed in three patients (15%). Superficial wound infection was seen in four patients (20%). As regard partial wound dehiscence it was detected in two patients (10%). Complete wound dehiscence didn't occur in any patient. Necrosis of the edges of the flap was showed in two patients (10%). Subcutaneous seroma was found in five patients (25%), and it was aspirated under local anesthesia without impact on the flap vascularity. Necrosis of the whole flap did not happen in any patients. Table 2, showed the results of the Z-plasty technique after 1 month follow up in 20 patients with lumbosacral MMC.

Table 1: - Postoperative results of the Z-plasty technique in 20 new born with lumbosacral MMC.

Factor	Number of patients	%
Sound healing	14	70
CSF leak	3	15
Superficial wound infection	4	20
Partial wound dehiscence	2	10
Necrosis of edges of the flap	2	10
Subcutaneous seroma	5	25
Complete necrosis of the flap	-	-
Complete wound dehiscence	-	-
Mortality	-	-

**Fig. (1)****Fig. (2)**

Fig. 1:- showed designing and drawing of the flap and Fig. 2 the sound healing of the flap with sound healing two weeks postoperative.

Discussion:-

Unfortunately, MMC repair by skin direct closure cannot accomplish in nearly 25% of the neonates with large defects.⁽⁵⁾ So, for those with large defects, definitive operative management should be performed by a combined neurosurgical and plastic surgical team as to provide reconstruction and protection of the exposed spinal cord, elimination of any CSF leakage and stable soft tissue coverage.⁽⁶⁾

The suitable technique and skill of the managing of MMC defect have provoked substantial debate.⁽⁷⁾ Myriad plastic surgical techniques have been developed to address these issues.⁽⁸⁾ The literature suggests a number of convincing, effective procedures such as skin, subcutaneous and most frequently muscle flaps, bilateral sliding muscle flaps, and split thickness skin grafts.^(9,10,11) The decision to use a specific technique is dependent on the size of the defect, vascular supply and to some extent to the surgeon experience.⁽¹²⁾

The goal of using Z-plasty technique was not to replace the other techniques but to offer an effective option in the treatment of MMC with large cutaneous defects. Among the different methods, Z-plasty proved in our study to be one of the good options to cover large MMC defects. No major complications were encountered. In a study done by Gumus et al.,⁽¹³⁾ they found that Z-plasty flap is a safe alternative, rapid easy dissection, and short operation time with minimal blood loss. Also as regard this technique a low morbidity and mortality and satisfactory outcome have reported by Ozcelik et al.⁽¹⁴⁾

Conclusion:-

Surgical repair of large myelomeningocele (> 5 cm diameter) may be a challenging problem. The advantages of our method are simplicity, reliability and coverage of the defect with well-vascularized flaps, almost nil major flap complications and no donor site morbidity. Primary closure was possible in all patients. This procedure also provides a thick heavy duty skin and subcutaneous tissues over the dural sac; the flap can be taken 1:3 in diameter without compromising the blood circulation of the flap. No suture lines overlie the cord closure and no contour deviation occurred. The result of this technique is satisfactory as regard blood loss and time elapsed.

Abstract

Present paper focuses on relationship between human being and nature, man being the only literary creature on earth has personified and revered the nature in its varied form, and the ecological wisdom possessed by him speaks of divine status of Mother Nature in ancient times, due to advent of technologies and ignorance, man has called upon the wrath and fury of mother nature, present paper weaves itself around the journey of human being from ecological wisdom to ecological apocalypse.

Introduction:-

Man is a part of ecosystem of earth and relies on it for its survival just like plants and animals but the superiority of man lies in the fact that he is the only literary creature of cosmos. He is unable to participate in small natural processes around the earth but with his brain he can produce enormous literature of different kind and this unique literary talent has kept him above all earthly beings. But his superiority is not independent he is closely related with other living beings for survival, this study we now refer to as ecology it studies interrelationship of living beings to one another and with their surroundings. Human ecology is the study of mankind and its response towards nature which covers all the earthly creatures. We cannot bind ecology with specific subject its appeal is universal its wisdom transcends the boundaries of various fields and manifests in any form. Ecological wisdom appeals to different cultures it manifests in romantic poetry pioneered by William Wordsworth, John Keats and PB Shelly, in pre-classical Greeks, in Zen Buddhism and many paintings.

Ecology has played a distinctive role and influenced Indian philosophy, mythology and literature. A notable feature of Indian thought towards universe is that all creation comes under one fundamental structure that is one universal spirit holds all creatures of this universe and everything has been originated from it. This is the central idea of most of the philosophical discourses of Indian literature, be it Vedas, Mahabharata, Ramayana. Apart from this, this philosophical treatise also teaches us compassion towards all life forms. The doctrine of Ahimsa and compassion towards all living being has been praised and propagated by Buddha in his teachings and sermons. It also held esteemed position in other religions. We can clearly realize that early man and nature were co-existed together in most comfortable way. Indian sages offered their reverences to the supreme which they believe existed in form of water, mountain, fire, trees etc. They revered them consider them as gods and unknowingly giving a way to sustainable development in a true sense. William Wordsworth an English Romantic poet has called the nature as 'Wisdom and spirit of Universe' he gave various stages of his love towards nature in many of his poems like *Tintern*

Abbey, Exursion and The Prelude. Wordsworth two famous poems *The Tables Turned* and *Education of Nature* are wonderful example of his love for nature. And here I quote the very famous lines from *The Tables Turned*.

One Impulse from a vernal wood
May teach you more of man;
Of moral evil and of good
Than all the sages can.

According to the teachings of 'Atharva Veda' Nature is sacred it has to be understand as a friend, revered as mother and nurtured as a beloved child. Man is not separate from earth and universe the idea of dependent co-arising is the central theme of Buddhism, it propagates the idea of interconnectedness it suggests we are all interwoven thread in the complex structures of life. All things are interconnected according to Native American chief Seattle who says 'The earth is our mother. Whatever befalls the earth befalls the sons of earth. If man spits upon the ground they spits upon themselves. All the things are connected like blood which unites one family'. But unfortunately the human beings in this age became deaf and dumb and fail to understand such noble emotions. The brain through which human beings has mastered all other earthly creatures is now provoking him to evaluate plan and execute such manoeuvres which are disastrous for nature and natural existence. He is responsible for destruction and in turn invites the fury of nature. He is deeply engrossed in all the worldly pleasures and forgot about the management and utility of nature in a proper manner. A brilliant example of man's merciless destruction of nature is visible in Ted Hughes poem *Revenge Fable*.

There was a person
Could not get rid of his mother
As if he were her topmost twig
So he pounded and hacked at her
With numbers and equations and laws
He investigated incriminated
And penalized her, like Tolstoy,
Forbidding, screaming and condemning,
Going for her with a knife,
Obliterating her with disgusts
Bulldozers and detergents
Requisition and central heating
Rifles and whiskey and bored sleep
With all her babes in her arms, in ghostly weepings,
She died.

The need of hour is to practice unconditional love towards nature and this will help to change the world into a better place. The power and capacity to being in love is limitless and to fall in love with nature is a true blessing because nature always gives you back treasures of joy, bliss and happiness. Alice walker portrays this sentiment in her novel *The Color Purple*.

My first step away from the old white man was tree. Then air, then birds, then other people but one day when I was sitting quite and feeling like a motherless child, which I was, it come to me that feeling of being part of everything, not separate at all. I knew if I cut a tree, my arm would bleed. And I laughed and I cried and I ran all around the house. I knew just what it was. In fact when it happens you can't miss it... (167).

We should cultivate such emotions to feel the pain of nature. But the modern technologies and mechanization has blinded us and right from elite class every common man has held in its grip. And the greed to get more comfort has led to the serious damage of our biological environment leading to serious catastrophic consequences. Literary studies have played major role in dealing with these difficult issues related to environment. It was in mid eighties environmental literary studies came in existence. It was Joseph Meeker who introduced the term 'Literary Ecology' in the *Comedy of Survival* which is an attempt to analyze the role played by literature in ecology. It basically represents the man's relationship and responses towards nature. Literary theory in general examines relation between writer text with the culture and world. Ecology analyzes the interconnectedness sentiment therefore both ecology and literature emphasize on relationships interconnectedness. The sentiment of inter textuality in literature is similar with the interconnected sentiment in the ecology. And one of the major responsibilities of literature is to

inculcate the sense of compassion in human beings towards nature. Eco criticism refers to the study of relationship between literature and environment it shows how human culture is connected to the environment. Both literary theory and ecology criticize the stance of independent and separate meaning.

The love for the nature can be seen in the writings of many classical poets like Virgil, Horace, Theocritus they all found nature soothing comforting and peaceful. Milton found nature as a refreshing a panacea for city dweller. The rise of romantic age has changed the perspective of nature in the human eyes. Romantic poets and authors of this age personified the nature in various forms and revered its beauty sometimes as a goddess sometimes as a mother, child, lover etc. They redefine nature in new dimensions. Some contemporary poets describes the beauty of natural landscapes some yearns for the lost earthly paradise so these writings plays important role in establishing environmental forums and can help in conservation of nature by arousing human emotions and compelling them to take steps. "Lamenting on mankind Emerson a noted author in his essay *Nature* says 'We are as much strangers in nature as we are aliens from God. We do not understand the notes of the birds. The fox and the deer run away from us; the bear and the tiger rend us' (74).

The chain which bind us together that inter-connectedness between various creature men has lost the vision to appreciate it. And modern man does not find himself in harmony with nature but he found himself as an outside force meant to dominate and conquer the nature. The modern man has lost the sense of unity, oneness with the nature that has lost its meaning. The man's lost innocence has proved disastrous for nature and he is spreading on the globe destroying and burning it. The time demands immediate full stop on this mad dance of fury and exploitation of nature by man. A well planned methodology is needed for the preservation of nature otherwise within no time man will see the fury of nature casting its doom on civilization which he proud on the day of Apocalypse is not far away.

Appendicitis, Eosinophil, Lower gastrointestinal bleeding.

Abstract

Acute eosinophilic appendicitis is a rare type of appendicitis where the inflamed appendix infiltrates by eosinophil rather than neutrophil in the muscularis propria accompanied by edema. Associated with type 1 hypersensitivity that may affect any part of the gastrointestinal track. Acute eosinophilic appendicitis similar to the classical appendicitis in symptoms. However, massive lower gastrointestinal bleeding with appendiceal origin considers a rare presentation of acute appendicitis. Different modalities are needed to reach the definitive diagnosis and identification of the bleeding site. We report a 51-year-old with appendiceal hemorrhage due to acute eosinophilic appendicitis. The Diagnosis was made by a multidisciplinary approach. The patient underwent upper and lower endoscopy, which was inconclusive. Therefore a computerized tomography scan was done to the patient to identify the source of bleeding. A right hemicolectomy was performed and the histopathology showed an acutely inflamed appendix with eosinophilic infiltration.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Acute appendicitis is one of the most common causes of acute abdomen that requires surgical intervention [1]. The lifetime risk of developing acute appendicitis in Western populations is 7 % [4]. It is a clinical-based condition where there is right iliac fossa pain and tenderness, vomiting, fever and high white blood cell (WBC) count [2,3]. The typical histopathologic finding of acute appendicitis is neutrophil infiltration of muscularis propria [2]. Eosinophil infiltration of the muscularis is considered a rare histopathologic cause of acute appendicitis [4]. Acute eosinophilic appendicitis (AEA) is still a not well-studied disease, and few cases were reported [5].

Lower Gastrointestinal Bleeding (LGIB) caused by acute appendicitis is extremely rare [6]. In this case report, the patient presented by severe LGIB as the main manifestation caused by acute eosinophilic appendicitis. The objective of this case report is to document two rare entities: Acute Eosinophilic Appendicitis and severe LGIB caused by appendicitis.

Case Presentation:-

A 51-year-old Saudi male patient known case of hypothyroidism on Levothyroxine (250 mcg/day), He presented to the emergency department of a general hospital due to several attacks of diarrhea, passing dark colored stool, for one day. The last attack of diarrhea ended by passing bright red blood per rectum and was associated with loss of consciousness. In the hospital, he was vitally stable and afebrile; the abdomen was soft and lax with positive bowel sounds. The patient denied any history of fever, nausea, vomiting or abdominal pain.

The initial lab work revealed a hemoglobin (Hb) level of 12 g/dl, white blood cell (WBC) count of 15.3 and platelet count 265,000. The chemistry including liver function tests (LFTs) were within normal.

While in the emergency department, the patient had two episodes of per rectal bleeding. Repeated lab work revealed a severe drop of Hb level to 7.5 g/dl. The patient was shifted to ICU, received two units of Packed RBCs. Urgent upper GI endoscopy was performed without any abnormality detected. A lower GI endoscopy confirmed the presence of fresh blood in the colon; however, the source of the bleeding was not determined.

The patient was transferred to our center for further evaluation by CT angiography of the abdomen and pelvis (GI bleeding protocol) and for possible endovascular embolization.

The CT demonstrated no active bleeding from both upper and lower GI. However; the appendix was increased in diameter (12 mm) with mucosal hyper enhancement, diffuse mural thickening, peri-appendicular fat stranding (Fig. 1 and 2) and multiple ileocecal lymph nodes (Fig. 3). Near the tip of the cecum/the origin of the appendix, focal mural thickening was also noted (Fig. 4 and 5).

Another lower GI endoscopy was done in order to perform an endoscopic biopsy. The performing gastroenterologist was able to reach the ascending colon but was unable to reach the cecum. Again, blood clots were demonstrated in the ascending colon.

General surgery consultation was requested. Due to the focal thickening in the tip of the cecum, there was a serious concern for malignancy, which would explain the LGIB. Virtual CT colonoscopy was performed to further evaluate the cecum, as this was not fully evaluated by the conventional colonoscopy. The findings were more or less the same as the first CT study. A decision was made to perform a right hemicolectomy due to possible underlying malignancy. The histopathology of the specimen revealed an acutely inflamed appendix with transmural eosinophil cell infiltration. There were abundant luminal exudates and widespread mucosal ulceration. The included lymph nodes showed only reactive hyperplasia (Fig. 6).

Fig (1):-CT abdomen and Pelvis, axial view, arterial phase: Circumferential mural thickening of the appendix with mucosal hyperenhancement (red arrow). There is also mild periappendicular fat stranding as shown. The maximum diameter of the appendix is 12 mm (measurement not shown).

Fig (2):- CT abdomen and Pelvis, Coronal Reformats, portal venous phase: Circumferential mural thickening of the appendix with mucosal hyperenhancement (red arrow). There is also mild peri-appendicular fat stranding as shown. The maximum diameter of the appendix is 12 mm (measurement not shown).

Fig (3):- CT abdomen and Pelvis, Coronal Reformats, portal venous phase, Focused on Ileocecal region: multiple small regional lymph nodes with meso-appendicular fat stranding (multiple red arrows)

Fig (4):- CT abdomen and Pelvis, axial view, arterial phase: Focal mural thickening at the tip of the cecum/root of the appendix with mucosal hyperenhancement (red arrow).

Fig (5):- CT abdomen and Pelvis, Coronal Reformat, portal venous phase: Focal mural thickening at the tip of the cecum/root of the appendix with mucosal hyper enhancement (red arrow)

Fig (6):- Dense mucosal infiltration by eosinophilic (black arrows) H&E X20.

Discussion:-

Acute eosinophilic appendicitis was proposed in 1996 for the first time by Aravindan; then it was defined in 2010 by Aravindan et al. They reported that an allergic reaction type 1 hypersensitivity is a predisposing event, which triggers the acute inflammation of the appendix. This inflammation involves muscularispropria eosinophilic infiltration and edema [5], both are considered the hallmarks of this disease entity [8].

Type 1 hypersensitivity is not only developed in the appendix but also in other adjacent areas such as ileum and cecum, whereas the appendix considered the most affected organ by allergic reaction [4]. Although eosinophils are normally found in submucosal layer and lamina propria of the appendix, evidence of infiltration through the muscularispropria combined with edema should raise the suspicion of acute eosinophilic appendicitis [2].

The presentation of acute eosinophilic appendicitis is not different from the classic acute appendicitis, except in AEA, the symptoms are less in duration [2]. In our case report, the patient has presented mainly by acute LGIB, which is a rare presentation of acute appendicitis [6]. Magaz MM, et al, reported 30 cases that presented by bleeding from the appendix none were due to eosinophilic infiltration [10]. To our knowledge, this is the first case of acute eosinophilic appendicitis presenting with LGIB.

Many case reports have used different modalities such as colonoscopy, radionuclide scintigraphy, angiography, and multi-detector computed tomography (MDCT) to diagnose appendicular bleeding [11]. The combination of endoscopy with radiology may increase the accuracy of diagnosis during acute bleeding phase [6].

Management of appendiceal hemorrhage depends on patient's general condition and underlying etiology, and surgical intervention play a major role in treating appendiceal lesions and bleeding including laparoscopic versus open appendectomies, extensive resection of the bowel, and right hemicolectomy. In this case right hemicolectomy was done, as in most cases removal of the cecum is needed to control the bleeding [6].

In order, to reach definitive diagnosis histopathological features are needed which include: abundant eosinophilic infiltration in muscularispropria rather than neutrophil infiltration. This should be associated with edema [4].

According to this case, histopathology examination of the specimen revealed acutely inflamed appendix, mucosal ulceration, transmuraleosinophils infiltrate with no granulomatous formation or malignant changes.

Conclusion:-

Acute Eosinophilic Appendicitis (AEA) is a rare and not well-studied disease and it can be present with unusual symptom as LGIB. It is important to conduct further studies about AEA, for better diagnosis approach and management, as well as understanding the pathogenesis of this entity.

Kinetics, Hydrolysis, Phosphate Monoester.

Abstract

Hydrolysis of 4-hydroxybiphenyl phosphate monoester has been carried out in acid (HCl) Solution at $97 \pm 0.5^\circ \text{C}$ and the inorganic phosphate obtained during hydrolysis has been estimated colorimetrically. Pseudo first order rate coefficients have been calculated neutral and conjugated acid species have been found to be reactive and contributed to the overall hydrolysis in the acid region. The calculated rate coefficients are in good agreement with the experimentally observed ones. The effect of temperature, solvent and substrate concentration on the rate of hydrolysis have been studied. The results suggest that the hydrolysis of monoester occurs by the cleavage of P-O bond fission.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

The effect of the substituents, the hydrolysis of aryl phosphate esters having C-O-P¹⁻³ linkages have been studied exhaustively by Mhala et al⁴⁻⁶ and established that the substituents of graded polarity⁷⁻⁸ not only affect the reaction rates but also alter the course of the reaction path. Bunton et al⁹ found that acid catalyzed hydrolysis occurs only when an electron attracting substituent is present in the aryl moiety as in nitrophenyl phosphate monoester¹⁰, 4-chlorophenyl phosphate monoester¹¹ and 2,6-dimethylphenyl phosphate monoester¹² showed only feeble acid catalysis while 4-bromo-2,6-dimethylphenyl phosphate monoester showed acid catalysis.

Material and Methods:-

Preparation of mono-4-hydroxybiphenyl phosphate:-

Mono-4-hydroxybiphenyl phosphate ester have been prepared by general method¹³. Took 17.0 gm of 4-hydroxybiphenol in a round bottom flask with 200 ml of dry benzene. 9.0 ml of phosphorus oxytrichloride (POCl₃) was added drop by drop with constant stirring to the ice-cooled phenol with the help of separating funnel in about half an hour after the addition of POCl₃. It was refluxed for about 48 hours on the soxhlet heater at constant temperature 85°C in order to ensure complete reaction and then distilled at reduce pressure. The first fraction of benzene and unreacted POCl₃ was removed by distillation at b_{60} , $40-50^\circ \text{C}$.

The second fraction of a pungent smelling liquid, which was supposed to be 4-hydroxybiphenyl phosphate dichloride was distilled at b_{75} , $90-120^\circ \text{C}$. It was dissolved in 100 ml of ice cooled water and kept at low temperature overnight. The 4-hydroxybiphenyldihydrogen phosphate which was extracted with solvent ether. After removing the

solvent ether a white coloured crystalline solid and it was identified to be mono-4-hydroxybiphenyl phosphate with the following physical characteristics.

1. Melting point (observed)=180°C
2. Theoretical percentage of "P"=12.40%
3. Observed percentage of "P"=13.40%
4. The Infrared spectrum of monoesters showed the appearance of absorption bands characteristics of-
 _OH = 3500-3265cm⁻¹
 _CH = 3050-2891cm⁻¹
 _C=C = 1640-1580cm⁻¹
 _P-O = 1385-1290cm⁻¹
 _C_O_P = 1200-1150cm⁻¹
 P_OH = 1040-976 cm⁻¹

Substituted aromatic ring =800-710cm⁻¹

Above characteristics confirm the structure of mono-4-hydroxybiphenyl phosphate.

Result and Discussion:-

Hydrolysis of mono-4-hydroxybiphenyl phosphate was kinetically studied in 0.1 to 6.0 mol dm⁻³ HCl at 97 ± 0.5 °C Psuedo first order rate coefficients have been summarized in table-1

FIG. I
pH - log RATE PROFILE OF MONO - 4 - HYDROXYBIPHENYL
PHOSPHATE AT $97 \pm 0.5^\circ\text{C}$

A plot(fig-1) of pH-log rate of hydrolysis increases with increase in acid molarity. The rate maxima is at 4.0 mol dm⁻³ HCl and it gradually falls with further increase in acid molarity. The rate maxima or bend of pH log rate profile in acid region have also been found in some other cases. In organic amide system, similar rate maxima was observed and was supposed due to full conversion into their conjugate acid species the rate decrease is attributed to the lowering of concentration of attacking nucleophile taking part in the reaction, although it appears that there is no similarity in rate maxima with amides as it is not possible due to complete protonation because there is a small variation in temperature coefficient before and after rate maxima and it may be taken as an indication for the absence of maximum protonation. The rate maxima in mono-4-hydroxybiphenyl phosphate may be due to either ionic strength effect or acid catalyzed hydrolysis or due to both.

The initial decrease in rate hydrolysis may be attributed to the decrease in the concentration of more reactive mononegative species. Increase in rate in the region 1.0 to 4.0 mol dm⁻³ HCl may be due to either acid catalyzed hydrolysis or increase in the reactivity of neutral species by ionic strength effect. Therefore effect of ionic strength was studied by carrying out kinetic runs at different ionic strength maintained constant by adding appropriate mixtures of KCl and HCl. The plots of the rate constant of acid hydrolysis vs acid molarity at different ionic strengths are given in table-2.

Hydrolysis of mono-4-Hydroxybiphenyl phosphate at constant ionic strength at 97± 0.5°C

3.0	3.0	0.0	138.82

Three linear plots show the acid catalyzed hydrolysis of mono-4-hydroxybiphenyl phosphate at three different ionic strengths (1.0u,2.0u,3.0u)

The intercepts on the rate axis are the neutral rates (K_N) which decrease with the increase in ionic strength showing ionic acceleration effect on the hydrolysis of monoester via its neutral species therefore the calculated rates were obtained by equ (1)

$$K_e = K_H \cdot C_H + K_N \text{ -----(1)}$$

Where K_e, K_H, C_H and K_N are experimental rates acid catalyzed rates and neutral rates respectively. The plot of mono 4-hydroxybiphenyl phosphate shows that three plots are intersecting the rate axis at different points (fig.2) hence this indicates in addition to conjugate acid species the presence of some other species.

Since it is established fact that mononegative species cannot be reactive at higher acidities i.e more than 1.0 mol.dm⁻³ HCl, so the neutral species participation may be expected together with conjugate acid species as it is evident that straight lines are intersecting the rate axis at different points which shows the contribution of neutral species at different acid concentration is varying definitely.

K_{H^+} is a slope of linear curve and its value decrease with the increase in ionic strength. It is an ionic retarding effect which indicates the mono-4-hydroxybiphenyl phosphate undergoes acid catalyzed hydrolysis with negative of ionic strength. The slope of these curves represents the specific acid catalyzed rates at the ionic strength which also decrease with the increase in ionic strength. Thus both specific neutral rates are subjected to negative effect of ionic strength. The neutral rates may be calculated using second empirical term of Debye –Huckel equation¹⁴⁻¹⁵ and modifying it logarithmically.

$$\log K_N = \log K_{NO} + b_N \cdot u \text{ -----(2)}$$

And its logarithmic form can be represented as

$$5 + \log K_N = 5 + \log K_{NO} + b_N \cdot u \text{ -----(3)}$$

$$\text{Where } b_N = b_N / 2.303$$

In equ (2) K_N , K_{NO} , b_N and u respectively are specific neutral rates at zero ionic strength and the slope of the linear curve and ionic strength (fig. not shown)

The intercept on the rate axis of such a plot i.e $\log K_N$ is found to be different thus the increase in specific neutral rate is due to($b_N \cdot u$) factor supporting ionic acceleration effect specific neutral rates calculated by equation 2 are almost different from the experimental rate upto 4.0 mol.dm⁻³ HCl and shown in Table-1. The rates above 4.0 mol.dm⁻³ HCl however deviate probably due to decrease in the reactivity of the neutral form as a result of decrease in water acidity therefore the rates beyond 4.0 mol.dm⁻³ HCl were calculated employing the Bronsted-Bjerrum equation¹⁶⁻¹⁷

$$K_e = K_H^+ C_H^+ \exp b_{H^+} \cdot u (a_{H_2O})^n + K_{NO} \cdot \exp b_N \cdot u (a_{H_2O})^n \text{ -----(4)}$$

And its logarithmic form can be represented as

$$5 + \log K_e + 5 + \log K_H^+ + \log C_H^+ + b_{H^+} \cdot u + n \log (a_{H_2O}) + 5 + \log K_{NO} + b_N \cdot u + n \log a_{H_2O}$$

Where $(a_{H_2O})^n$ represents the water acidity parameter.

The values of $n=2,3$ were calculated for 5.0 and 6.0 mol dm⁻³ HCl respectively. The experimental rates thus calculated are in good agreement with the theoretical rates . The thermodynamic parameter for the reaction at 3.0 and 5.0 mol.dm⁻³ HCl were found to be $E=22.70$ and 22.06 K.cal.mol⁻¹ frequency factor (A)= 5.89×10^8 , 1.46×10^8 Sec⁻¹ and $S=-20.83$, -23.60 e.u. These values indicate the bimolecular nature of hydrolytic reaction.

The acid hydrolysis of monoester, therefore, involves bimolecular attack of water on phosphorus of the neutral species as shown in schemes I and II.

Abstract

In the present paper the structures and dynamics of a food chain prey-predator model are proposed and studied. The two stages and refuge in prey and two predators (top and mid) are considered. Different types of functional responses have been proposed. The conditions, which guarantee the existence of equilibrium points, have been investigated. Uniqueness and boundedness of the solution of the system are proven. The local and global dynamical behaviors are discussed and analyzed. Finally, numerical simulations are carried out not only to confirm the theoretical results obtained, but also to show the effects of the refuge and the variation of each parameter on our proposed system.

Introduction:-

The first pattern formation of predator-prey model was introduced in 1927 by the well-known Lotka[15] and Volterra[28] which starting from a simple and classical supposition, more complexity but factual predator-prey models have been constructed by mathematicians and ecologists. In 1992, Berryman [6] considered that the dynamic interaction between predators and preys has long taken and go on to be one of the most important and central subjects which play a great role in each of the mathematical ecology, natural, social, and technological sciences, especially in the research on biology and ecology [5, 17, 26, 27].

Many researchers working in these fields paying a great amount of attention to improve and generalize the pattern formation of prey-predator models to more involvement and realistic system, and merging this advantage into many applications that give the nature of existence and global asymptotic stability of predator-prey models a great interest.

On the other hand, the dynamical behavior of prey-predator models has been investigated by a lot of articles and peppers which results a significant expansion in the structural of the prey – predator models to involve multi-species; different functional responses, several types of food chain, refuge, harvesting, stage-structure, several types of diseases...etc.

Lately, Samantha[25] studied the existence and global asymptotic stability of a delay predator-prey model with disease in the prey, Paletal.[20–24]proposed prey-predator harvesting model under impreciseness by considering biological parameters as interval number, Naji and Mustafa [19] studied the dynamics of an eco-epidemiological model with nonlinear incidence rate. Majeed and Shawka studied prey-predator model involving SI and SIS infectious disease in prey population and the disease transmitted within the same species by contact and external

source [4]. A lot of researches efforts have been made to investigating the interaction and coexistence mechanism of the harvested prey–predator.

In fact, the influence of refuge, stage-structure and the multiplicity of functional responses in the prey–predator ecosystem are the most important topics of interest. In recent years, stage structure models have been studied widely by a lot of researchers, Aiello and Freedman (1990) studied the single species model with stage structure [1, 2], several researchers studied prey–predator model with different functional responses. The prey–predator models with prey refuge have been investigated by Kar[14]. Maetal. [16]studied the effects of prey refuges on a prey–predator model with a class of function responses. Chenetal.[8] discussedaprey–predator model with Holling type II functional response in incorporating a constant prey refuge.

Moreover, someoftheexperimentalandtheoreticalworkhavestudiedtheeffectsofpreyrefuges and drawn a conclusion thatthepreyrefuges have a positively effectonthestabilityof the consideredinteractions,andprey extinction canbeconserved by theadditionofrefuges[9, 11, 12, 13, 17].Kadhim, Majeed and Naji [29] studied the stability analysis of food web stage structured prey-predator model with refuge involving Lotka-Volterra type of function response, Ali and Majeed discussed stability analysis of a food chain stage structured prey-predator model incorporating a preyrefuge and two types of functional responses such that the mid-predator consumed the mature prey individual only according to the Lotka-Volterra type of functional response and the top predator consumed the mid- predator individual only according to Holling type-II functional response.

In spite of the effect of prey refuges on the dynamical behavior of the system is very difficult in the reality, but it has been considered and analysis in this paper.

In this paper, a complicated four species food chain model with two functional responses has been proposed and analyzed. Two such stages (mature and immature) with refuge in the prey and two predators (top and mid) are also considered.

It is well known that the logistic function represents a mutualism interaction between the mature and immature prey, and due to the short of resources the typeIIfunctionalresponse is considered to describe the nature of the interaction between the mid predator and immature prey, while Lotka-Volterra type of functionalresponse considered due to unlimited resources and the linearly relationship between the mid predator and mature prey.

Furthermore, there is not any relationship between the top predator and the two stages of prey, while according to a food chain the interaction between the two predators has been considered by Lotka–Volterra type of functionalresponse.

Actually, due to the complexity of interactions in the proposed model especially among the top predator and the two stages of prey and the nature of interaction between the mid predator and the immature prey it was not easy to find an example identical of this model in the nature, but in any case is not impossible, so after more efforts and with the help of the biologist, we could find an example across two different environments represented by the aquatic and terrestrial environment such that the two aquatic species Blue Shark (*Prionaceglauca*) and Wels Catfishrepresent the top and mid predators respectively, and the terrestrial species pigeons (doves) represent the two stages of prey.

Finally, the behavior of the catfish when hunting pigeons is highlighted in the study, published on Dec. 5. The study says: “Among a total of 45 beaching behaviors observed and filmed, 28% were successful in bird capture... Since this extreme behavior has not been reported in the native range of the species, our results suggest that some individuals in introduced predator populations may adapt their behavior to forage on novel prey in new environments, leading to behavioral and trophic specialization to actively cross the water-land interface.” [10, 7].

The mathematical model:-

Consider the food chain model consisting of mid and top- predators, stage-structure prey in which the prey species growth logistically in the absence of predation, while the predators decay exponentially in the absence of prey species. It is assumed that the prey population divides into two compartments: immature prey population $X_1(t)$ that represents the population size at time t and mature prey population $X_2(t)$ which denotes to population size at time t . Furthermore the population size of the mid- predator at time t is denoted by $Y_1(t)$, while $Y_2(t)$ represents the population size of top predator at time t .

Now in order to formulate the dynamics of such system the following assumptions are considered:

1. The immature prey depends completely in its feeding on the mature prey that growth logistically with intrinsic growth rate $r > 0$ and carrying capacity $k > 0$. The immature prey individuals grown up and become mature prey individuals with grown up rate $s > 0$. However the immature and mature prey facing death with natural death rate $d_1 > 0$ and $d_2 > 0$ respectively.
2. There is type of protection of the prey species from facing predation by the mid- predator with refuge rate constant $m \in (0, 1)$.
3. The mid-predator consumed the immature prey individual according to Holling type-II functional response with predation rate $a_1 > 0$ and half saturation constant $b > 0$. And consumed the mature prey individual according to the Lotka-Volterra type of functional response with predation rate $a_2 > 0$ and contribute a portion of such food with conversion rates $0 < e_1 < 1$ and $0 < e_2 < 1$ respectively. Moreover, the top predator consumed the mid-predator individual only according to the Lotka-Volterra type of functional response with predation rate $a_3 > 0$ and contributes a portion of such food with conversion rate $0 < e_3 < 1$.

Finally, in the absence of food the mid and top predators facing death with natural death rate $d_3 > 0$ and $d_4 > 0$ respectively.

Therefore the dynamics of the above proposed model can be represented by the following set of first order nonlinear differential equations.

$$\begin{aligned}\frac{dX_1}{dT} &= rX_2 \left(1 - \frac{X_2}{k} \right) - \frac{a_1(1-m)X_1}{b+X_1}Y_1 - sX_1 - d_1X_1 \\ \frac{dX_2}{dT} &= sX_1 - a_2(1-m)X_2Y_1 - d_2X_2 \\ \frac{dY_1}{dT} &= \frac{e_1a_1(1-m)X_1}{b+X_1}Y_1 + e_2a_2(1-m)X_2Y_1 - a_3Y_1Y_2 - d_2Y_1 \\ \frac{dY_2}{dT} &= e_3a_3Y_1Y_2 - d_4Y_2.\end{aligned}\tag{1}$$

With initial conditions $X_i(0) \geq 0$ and $Y_i(0) \geq 0$, $i = 1, 2$.

Not that the above proposed model has fourteen parameters in all which make the analysis difficult. So in order to simplify the system, the number of parameters is reduced by using the following dimensionless variables and parameters:

$$\begin{aligned}t &= rT, u_1 = \frac{b}{k}, u_2 = \frac{s}{r}, u_3 = \frac{d_1}{r}, u_4 = \frac{a_2k}{a_1}, u_5 = \frac{d_2}{r}, a_6 = \frac{e_1a_1}{r}, u_7 = \frac{e_2a_2k}{r}, \\ u_8 &= \frac{d_3}{r}, u_9 = \frac{e_3a_3k}{r}, u_{10} = \frac{d_4}{r}, x = \frac{X_1}{k}, y = \frac{X_2}{k}, z = \frac{a_1Y_1}{rk}, w = \frac{a_3Y_2}{r}.\end{aligned}$$

Then the non-dimensional form of system (1) can be written as:

$$\begin{aligned}\frac{dx}{dt} &= x \left[\frac{y(1-y)}{x} - \frac{(1-m)z}{u_1+x} - (u_2 + u_3) \right] = f_1(x, y, z, w) \\ \frac{dy}{dt} &= y \left[\frac{u_2x}{y} - u_4(1-m)z - u_5 \right] = f_2(x, y, z, w) \\ \frac{dz}{dt} &= z \left[\frac{u_6(1-m)x}{u_1+x} + u_7(1-m)y - w - u_8 \right] = f_3(x, y, z, w) \\ \frac{dw}{dt} &= w[u_9z - u_{10}] = f_4(x, y, z, w).\end{aligned}\tag{2}$$

With $x(0) \geq 0, y(0) \geq 0, z(0) \geq 0$ and $w(0) \geq 0$.

It is observed that the number of parameters have been reduced from fourteen in the system (1) to eleven in the system (2).

Obviously the interaction functions of the system (2) are continuous and have continuous partial derivatives on the following positive four dimensional space.

$$R_+^4 = \{(x, y, z, w) \in R^4 : x(0) \geq 0, y(0) \geq 0, z(0) \geq 0, w(0) \geq 0\}.$$

Therefore these functions are Lipschitzian on R_+^4 , and hence the solution of the system (2) exists and is unique. Further, all the solutions of system (2) with non-negative initial conditions are uniformly bounded as shown in the following theorem.

Theorem (1): All the solutions of system (2) which initiate in R_+^4 are uniformly bounded.

Proof: Let $(x(t), y(t), z(t), w(t))$ be any solution of the system (2) with non-negative initial condition $(x_0, y_0, z_0, w_0) \in R_+^4$.

According to the first equation of system (2) we have

$$\frac{dx}{dt} = y(1-y) - \frac{(1-m)xz}{u_1+x} - (u_2+u_3)x.$$

$$\text{So, } \frac{dx}{dt} \leq \frac{1}{4} - (u_2+u_3)x.$$

Now, by using the comparison theorem on the above differential inequality with the initial point $x(0) = x_0$, we get:

$$x(t) \leq \frac{1}{4(u_2+u_3)} + \left(x_0 - \frac{1}{4(u_2+u_3)}\right)e^{-(u_2+u_3)t}.$$

Thus, $\lim_{t \rightarrow \infty} x(t) \leq \frac{1}{4(u_2+u_3)}$, and hence $\sup x(t) \leq \frac{1}{4(u_2+u_3)}$, $\forall t > 0$.

Now define the function: $N(t) = x(t) + y(t) + z(t) + w(t)$, and then taken the time derivative of $N(t)$ along the solution of the

$$\frac{dN}{dt} = y - y^2 - (1-u_6)\frac{(1-m)xz}{u_1+x} - (u_4-u_7)yz - (1-u_9)zw - u_3x - u_5y - u_8z - u_{10}w.$$

So, due to the fact that the conversion rate constant from prey population to predator population cannot exceeding the maximum predation rate constant from predator population to prey population, hence from the biological point of view, always $u_6 < 1$, $u_9 < 1$ and $u_7 < u_4$, we get,

$$\frac{dN}{dt} \leq y - sN, \quad \text{where } s = \min\{u_3, u_5, u_8, u_{10}\}, \quad \text{and hence, } \frac{dN}{dt} \leq \frac{u_2}{4a_5(u_2+u_3)} - sN.$$

$$\text{Then, } \frac{dN}{dt} + sN \leq G, \quad \text{where } G = \frac{u_2}{4a_5(u_2+u_3)}.$$

Again by solving this differential inequality for the initial value $N(0) = N_0$, we get:

$$N(t) \leq \frac{G}{s} + \left(N_0 - \frac{G}{s}\right)e^{-st}. \quad \text{Then, } \lim_{t \rightarrow \infty} N(t) \leq \frac{G}{s}. \quad \text{So, } 0 \leq N(t) \leq \frac{G}{s}, \quad \forall t > 0,$$

hence all the solutions of system (2) are uniformly bounded and the proof is complete.

The existence of equilibrium points:-

In this section, the existence of all possible equilibrium points of system (2) is discussed. It is observed that, system (2) has at most four equilibrium points, which are mentioned in the following:

● The equilibrium point $E_0 = (0, 0, 0, 0)$, which known as vanishing point is always exists.

● The free predators' equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$, where:

$\bar{y} = 1 - u_5 \left(\frac{u_2+u_3}{u_2}\right)$, and $\bar{x} = \frac{u_5}{u_2} \left(1 - u_5 \left(\frac{u_2+u_3}{u_2}\right)\right)$, exists uniquely in $\text{Int. } R_+^2$ (Interior of R_+^2) of xy -plane if the necessary condition holds:

$$u_5 < \frac{u_2}{u_2+u_3}. \quad (3)$$

● The free top predator' equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, where:

$$\hat{z} = \frac{u_2x - u_5y}{u_4(1-m)y}. \quad (4a)$$

And,

$$\hat{y} = \frac{u_8(u_1+x) - u_6(1-m)x}{u_7(1-m)(u_1+x)}. \quad (4b)$$

While, \hat{x} is a positive root of the following fourth order polynomial:

$$f(x) = \gamma_1 x^4 + \gamma_2 x^3 + \gamma_3 x^2 + \gamma_4 x + \gamma_5 = 0, \quad (4c)$$

where:

$$\gamma_1 = u_7^2(1-m)^3[u_4(u_2+u_3)(u_6(1-m)-u_8) - u_2u_7(1-m)]$$

$$\gamma_2 = -u_4(1-m)(u_6(1-m)-u_8)[u_7(1-m) + (u_6(1-m)-u_8)^2]$$

$$-u_7^2(1-m)^3[u_5(u_6(1-m)-u_8) + u_1u_4u_8(u_2+u_3)] - 2u_1u_7^2(1-m)^3[u_2u_7(1-m) - u_4(u_6(1-m)-u_8)].$$

$$\gamma_3 = u_1 u_4 u_8 (1-m)(u_6(1-m)-u_8)[3(u_6(1-m)-u_8) - 2u_7(1-m)] + u_1 u_4 u_7 (1-m)^2 (u_6(-m)-u_8)^2 - u_1^2 u_4 u_7^2 (u_2 + u_3)(1-m)^3 (3u_8 - u_6(1-m)) + u_1 u_7^2 (1-m)^3 [u_5 u_8 - u_1 u_2 u_7 (1-m)] - u_1 u_5 u_7^2 (1-m)^3 (u_6(1-m)-u_8).$$

$$\gamma_4 = u_1^2 u_7 u_8 (1-m)^2 [u_4 u_8 + u_5 u_7 (1-m)] - u_1^2 u_4 u_8 (1-m)(u_6(1-m)-u_8)[3u_8 + 2u_7(1-m)] - u_1^3 u_7^2 u_4 u_8 (1-m)^3 (u_2 + u_3).$$

$$\gamma_5 = u_1^3 u_4 u_7 u_8^2 (1-m)^2 + u_1^3 u_4 u_8^3 (1-m) > 0.$$

Clearly, by using Descartes' rule of sign Eq. (4 c) has a unique positive root, denoted by \hat{x} , if

$$\gamma_i < 0, \quad i = 1, 2, 3 \quad \text{and} (\gamma_4 < 0 \text{ or } \gamma_4 > 0).$$

Therefore, the free top predator equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ exists uniquely in the interior R_+^3 of xyz -space if the following conditions hold:

$$\frac{u_6(1-m)}{3} < u_8 < u_6(1-m). \quad (4d)$$

$$u_2 > \max \left\{ \frac{u_5 \hat{y}}{\hat{x}}, \frac{u_5 u_8}{u_1 u_7 (1-m)} \right\}. \quad (4e)$$

$$(u_6(1-m)-u_8) < \min \left\{ \frac{u_1 u_8}{\hat{x}}, \frac{2u_7(1-m)}{3}, \frac{u_2 u_7(1-m)}{u_4}, \frac{u_2 u_7(1-m)}{u_4(u_2+u_3)}, \frac{u_2 u_7(1-m)}{u_1 u_7(u_2+u_3)(1-m)(3u_8-u_6(1-m))} \right\}. \quad (4f)$$

Finally, the positive (coexistence) equilibrium point $E_3(x^*, y^*, z^*, w^*)$, where:

$$z^* = \frac{u_{10}}{u_9}. \quad (5a)$$

$$w^* = \frac{u_6(1-m)x + u_7(1-m)(u_1+x)y - u_8(u_1+x)}{u_1+x}. \quad (5b)$$

$$x^* = \frac{(u_4 u_{10}(1-m) + u_5 u_9)y}{u_2 u_9}. \quad (5c)$$

While, y^* is a positive root of the following polynomial:

$$f(y) = y(\delta_1 y^2 + \delta_2 y + \delta_3) = 0, \quad (5d)$$

where:

$$\delta_1 = -u_2 u_9 (u_4 u_{10}(1-m) + u_5 u_9) < 0.$$

$$\delta_2 = u_2 u_9 (u_4 u_{10}(1-m) + u_5 u_9) - u_1 u_2^2 u_9^2 - (u_2 + u_3)(u_4(1-m) + u_5 u_9)^2.$$

$$\delta_3 = u_2 [u_1 u_2 u_9^2 - (u_4 u_{10}(1-m) + u_5 u_9)(u_{10}(1-m) + u_9(u_2 + u_3))].$$

Straightforward computation shows that the quadratic eq. (5 d), has a unique positive root, denoted by y^* , if and only if the following condition holds:

$$u_1 > \frac{(u_4 u_{10}(1-m) + u_5 u_9)(u_{10}(1-m) + u_9(u_2 + u_3))}{u_2 u_9^2}. \quad (5e)$$

Therefore, the positive (coexistence) equilibrium point $E_3(x^*, y^*, z^*, w^*)$ exists uniquely in the interior R_+^4 if in addition to the condition (5 e) the following condition holds:

$$y^* > \frac{u_8}{u_7(1-m)}. \quad (5g)$$

The local stability analysis of system (2)

In this section, the local stability analysis of system (2) around each of the above equilibrium points is discussed through computing the Jacobian matrix $J(x, y, z, w)$ of system (2) at each of them which is given by:

$$J = [a_{ij}]_{4 \times 4}, \quad \text{where} \quad (6)$$

$$a_{11} = -\frac{u_1(1-m)z}{(u_1+x)^2} - (u_2 + u_3), \quad a_{12} = 1 - 2y, \quad a_{13} = -\frac{(1-m)x}{u_1+x}, \quad a_{14} = 0, \quad a_{21} = u_2,$$

$$a_{22} = -u_4(1-m)z - u_5, \quad a_{23} = -u_4(1-m)y, \quad a_{24} = 0, \quad a_{31} = \frac{u_1 u_6(1-m)z}{(u_1+x)^2}, \quad a_{32} = u_7(1-m)z,$$

$$a_{33} = \frac{u_6(1-m)x}{u_1+x} + u_7(1-m)y - u_8 - w, \quad a_{34} = -z, \quad a_{41} = 0, \quad a_{42} = 0, \quad a_{43} = u_9 w, \quad a_{44} = u_9 z - u_{10}.$$

The local stability analysis at E_0 :

The Jacobian matrix of system (2) at E_0 can be written as:

$$J_0 = J(E_0) = \begin{bmatrix} -(u_2 + u_3) & 1 & 0 & 0 \\ u_2 & -u_5 & 0 & 0 \\ 0 & 0 & -u_8 & 0 \\ 0 & 0 & 0 & -a_{10} \end{bmatrix} \quad (7a)$$

Then the characteristic equation of $J(E_0)$ is given by:

$$[\lambda^2 + A\lambda + B](-u_8 - \lambda)(-u_{10} - \lambda) = 0, \quad (7b)$$

where:

$$A = u_2 + u_3 + u_5, \quad B = u_5(u_2 + u_3) - u_2,$$

so, either

$$(-u_8 - \lambda)(-u_{10} - \lambda) = 0, \quad (7c)$$

this gives two eigenvalues of J_0 by: $\lambda_{0z} = -a_3 < 0$, and $\lambda_{0w} = -a_8 < 0$.

Or

$$\lambda^2 + A\lambda + B = 0, \quad (7d)$$

where:

$tr(A) = \lambda_{0x} + \lambda_{0y} = -(u_2 + u_3 + u_5) < 0$, and $det(A) = \lambda_{0x} \cdot \lambda_{0y} = u_5(u_2 + u_3) - u_2$, which gives the other two eigenvalues of J_0 with negative real parts provided that the following condition holds:

$$u_5 > \frac{u_2}{(u_2 + u_3)}. \quad (7e)$$

Then E_0 is locally asymptotically stable in the R_+^4 . However, it is a saddle point otherwise.

The local stability analysis at E_1

The Jacobian matrix of system (2) at E_1 can be written as:

$$J_1 = J(E_1) = [b_{ij}]_{4 \times 4}, \quad (8a)$$

where:

$$\begin{aligned} b_{11} &= -(u_2 + u_3), \quad b_{12} = 1 - 2\bar{y}, \quad b_{13} = -\frac{(1-m)\bar{x}}{u_1 + \bar{x}}, \quad b_{14} = 0, \quad b_{21} = u_2, \quad b_{22} = -u_5, \\ b_{23} &= u_4(1-m)\bar{y}, \quad b_{24} = 0, \quad b_{31} = 0, \quad b_{32} = 0, \quad b_{33} = \frac{u_6(1-m)\bar{x}}{u_1 + \bar{x}} + u_7(1-m)\bar{y} - u_8, \\ b_{34} &= 0, \quad b_{41} = 0, \quad b_{42} = 0, \quad b_{43} = 0, \quad b_{44} = -u_{10}. \end{aligned}$$

Then the characteristic equation of J_1 is given by:

$$[\lambda^2 + \bar{A}\lambda + \bar{B}](b_{33} - \lambda)(-u_{10} - \lambda) = 0, \quad (8b)$$

where:

$$\bar{A} - tr(A) = u_2 + u_3 + u_5,$$

$$\bar{B} = det(A) = u_5(u_2 + u_3) - u_2 + u_2\bar{y},$$

so, either

$$(b_{33} - \lambda)(-u_{10} - \lambda) = 0, \quad (8c)$$

which gives two eigenvalues of J_1 by:

$$\lambda_{1z} = \frac{u_6(1-m)\bar{x}}{u_1 + \bar{x}} + u_7(1-m)\bar{y} - u_8, \quad \text{and} \quad \lambda_{1w} = -u_{10} < 0$$

$$\text{Or} \quad \lambda^2 + \bar{A}\lambda + \bar{B} = 0, \quad (8d)$$

where: $tr(A) = \lambda_{0x} + \lambda_{0y} = -(u_2 + u_3 + u_5) < 0$, and $det(A) = \lambda_{0x} \cdot \lambda_{0y} = u_5(u_2 + u_3) - u_2 + u_2\bar{y}$, which gives the other two eigenvalues of J_1 with negative real parts due to the condition (3).

Then, E_1 is locally asymptotically stable in R_+^4 if in addition to the condition (8e), the following condition holds:

$$u_8 > \frac{u_6(1-m)\bar{x}}{u_1 + \bar{x}} + u_7(1-m)\bar{y}. \quad (8e)$$

However, it is a saddle point otherwise.

The local stability analysis at E_2

The Jacobian matrix of system (2) at E_2 can be written as:

$$J_2 = J(E_2) = [c_{ij}]_{4 \times 4}, \quad (9a)$$

where:

$$\begin{aligned} c_{11} &= -\frac{u_1(1-m)\hat{z}}{(u_1 + \hat{x})^2} - (u_2 + u_3) < 0, \quad c_{12} = 1 - 2\hat{y}, \quad c_{13} = -\frac{(1-m)\hat{x}}{u_1 + \hat{x}} < 0, \quad c_{14} = 0, \quad a_{21} = u_2 > 0, \\ c_{22} &= \frac{-u_2\hat{x}}{\hat{y}} < 0, \quad c_{23} - u_4(1-m)\hat{y} < 0, \quad c_{24} = 0, \quad c_{31} = \frac{u_1 u_6(1-m)\hat{z}}{(u_1 + \hat{x})^2} > 0, \quad c_{32} = u_7(1-m)\hat{z} > 0, \\ c_{33} &= \frac{u_6(1-m)\hat{x}}{u_1 + \hat{x}} + u_7(1-m)\hat{y} - u_8, \quad c_{34} = -\hat{z} < 0, \quad c_{41} = 0, \quad c_{42} = 0, \quad c_{43} = 0, \quad c_{44} = u_9\hat{z} - u_{10}. \end{aligned}$$

Then the characteristic equation of J_2 is given by:

$$[\lambda^3 + A_1\lambda^2 + A_2\lambda + A_3](u_9\hat{z} - u_{10} - \lambda) = 0, \quad (9b)$$

where:

$$A_1 = -(c_{11} + c_{22}) > 0$$

$$A_2 = c_{11}c_{22} - c_{12}c_{21} - c_{13}c_{31} - c_{23}c_{32}$$

$$A_3 = c_{32}(c_{11}c_{23} - c_{13}c_{21}) + c_{22}c_{13}c_{31} - c_{12}c_{23}c_{31},$$

so, either

$$u_9\hat{z} - u_{10} - \lambda = 0. \quad (9c)$$

$$\text{Or } \lambda^3 + A_1\lambda^2 + A_2\lambda + A_3 = 0. \quad (9d)$$

Hence from equation (9c) we obtain that:

$\lambda_{2w} = u_9\hat{z} - u_{10}$, which is negative if the following condition holds:

$$\hat{z} < \frac{u_{10}}{u_9} \quad (9e)$$

Since $A_1 > 0$, then by using Routh-Hawirtiz criterion equation (9d) has roots (eigenvalues) with negative real parts if and only if

$$A_3 > 0 \text{ and } \Delta = A_1A_2 - A_3 > 0.$$

Straightforward computation shows that:

$$\Delta = -(c_{11} + c_{22})c_{11}c_{22} + c_{11}(c_{12}c_{21} + c_{13}c_{31}) + c_{22}c_{23}c_{32} + c_{12}c_{23}c_{31} + c_{21}(c_{22}c_{12} + c_{13}c_{32}).$$

Now, according to the form of A_3 and signs of the Jacobian elements all terms of A_3 will be positive under the following conditions:

$$\hat{y} > \frac{1}{2} \quad (9f)$$

$$u_7 > \frac{u_1 u_6(2\hat{y} - 1)}{u_1(1-m)\hat{z} + (u_2 + u_3)(u_1 + \hat{x})^2}. \quad (9g)$$

However Δ becomes positive, since the first four terms of Δ are positive, while the last one will be positive if and only if in addition to the condition (9f) the following condition holds:

$$u_7 < \frac{u_2(2\hat{y} - 1)(u_1 + \hat{x})}{(1-m)^2\hat{y}\hat{z}}. \quad (9h)$$

Therefore, all the eigenvalues of J_2 have negative real parts under the given conditions and hence E_2 is locally asymptotically stable. However, it is unstable otherwise.

The local stability analysis at E_3

The Jacobian matrix of system (2) at E_3 can be written as:

$$J_3 = [d_{ij}]_{4 \times 4}, \quad (10a)$$

where:

$$\begin{aligned} d_{11} &= -\frac{u_1(1-m)z^*}{(u_1 + x^*)^2} - (u_2 + u_3) < 0, \quad d_{12} = 1 - 2y^*, \quad d_{13} = -\frac{(1-m)x^*}{u_1 + x^*} < 0, \quad d_{14} = 0, \quad d_{21} = u_2 > 0, \\ d_{22} &= \frac{-u_2x^*}{\hat{y}} < 0, \quad d_{23} - u_4(1-m)y^* < 0, \quad d_{24} = 0, \quad d_{31} = \frac{u_1 u_6(1-m)z^*}{(u_1 + x^*)^2} > 0, \quad d_{32} = u_7(1-m)z^* > 0, \\ d_{33} &= \frac{u_6(1-m)x^*}{u_1 + x^*} + u_7(1-m)y^* - u_8 - w^*, \quad d_{34} = -z^* < 0, \quad d_{41} = 0, \quad d_{42} = 0, \quad d_{43} = u_9w^* > 0, \\ d_{44} &= u_9z^* - u_{10}. \end{aligned}$$

Then the characteristic equation of J_3 is given by:

$$[\lambda^4 + B_1\lambda^3 + B_2\lambda^2 + B_3\lambda + B_4] = 0, \quad (10b)$$

where:

$$\begin{aligned} B_1 &= -\alpha_0 > 0. \\ B_2 &= \alpha_1 - \alpha_2 - \alpha_3 - \alpha_4 - \alpha_5. \\ B_3 &= (\alpha_0\alpha_5 - \alpha_6) + d_{11}\alpha_4 + d_{22}\alpha_3 - \alpha_7. \\ B_4 &= \alpha_5(\alpha_2 - \alpha_1) > 0, \text{ with,} \\ \alpha_0 &= (d_{11} + d_{22}) < 0, \alpha_1 = d_{11}d_{22} > 0, \alpha_2 = d_{12}d_{21}, \\ \alpha_3 &= d_{13}d_{31} < 0, \alpha_4 = d_{23}d_{32} < 0, \alpha_5 = d_{34}d_{43} < 0, \\ \alpha_6 &= d_{12}d_{23}d_{31}, \alpha_7 = d_{13}d_{21}d_{32} < 0. \end{aligned}$$

Now by using Routh-Hawartiz criterion equation (10 b) has roots (eigenvalues) with negative real parts if and only if $B_i > 0$, $i = 1, 3, 4$ and $\Delta = (B_1B_2 - B_3)B_3 - B_1^2B_4 > 0$.

Clearly $B_1 > 0$ and $B_4 > 0$ provided that:

$$y^* > \frac{1}{2} \quad (10 c)$$

Straightforward computation shows that:

$$\Delta = [\alpha_0(\alpha_2 - \alpha_1) + (d_{11}\alpha_3 + \alpha_7) + d_{22}\alpha_4 + \alpha_6][(\alpha_0\alpha_5 - \alpha_6) + (d_{11}\alpha_4 - \alpha_6) + d_{22}\alpha_3 - \alpha_7].$$

Now, according to the form of B_3 and signs of the Jacobian elements the last three terms of B_3 are positive, while the first one will be positive in addition to the condition (10 c) the following condition holds:

$$w^* > \frac{u_1u_4u_6(1-m)^2(2y^* - 1)y^{*2}}{u_9[u_1(1-m)y^*z^* + [(u_2 + u_3)y^* + u_2x^*](u_1 + x^*)^2]} \quad (10 d)$$

On the other hand due to the conditions (10 c) and (10 d), all elements of Δ are positive and the two elements $(d_{11}\alpha_3 + \alpha_7)$, $(d_{11}\alpha_4 - \alpha_6)$ will be positive if the following condition holds:

$$L_1 < u_7 < L_2, \quad (10 e)$$

where:

$$L_1 = \frac{u_1u_6(2y^* - 1)}{u_1(1-m)z^* + (u_2 + u_3)(u_1 + x^*)^2}, \quad \text{and} \quad L_2 = \frac{u_1u_6[u_1(1-m)z^* + (u_2 + u_3)(u_1 + x^*)^2]}{u_2(u_1 + x^*)^4}.$$

Therefore, all the eigenvalues of J_3 have negative real parts under the given conditions and hence E_3 is locally asymptotically stable. However, it is unstable otherwise.

The global stability analysis of system (2)

In this section the global stability analysis for the equilibrium points, which are locally asymptotically stable, of system (2) is studied analytically with the help of Lyapunov method as shown in the following theorems.

Theorem (2): Assume that the vanishing equilibrium point $E_0 = (0, 0, 0, 0)$ of system (2) is locally asymptotically stable in R_+^4 . Then E_0 is globally asymptotically stable on the region $\omega_0 \subset R_+^4$, where $\omega_0 = \{(x, y, z, w) \in R_+^4 : y > 1\}$.

Proof: Consider the following function:

$$V_0(x, y, z, w) = x + y + z + w,$$

Clearly $V_0: R_+^4 \rightarrow R$ is a C^1 positive definite function.

Now by differentiating V_0 with respect to time t and doing some algebraic manipulation, gives that:

$$\frac{dV_0}{dt} = y(1-y) - (1-u_6)\frac{(1-m)xz}{u_1+x} - (u_4-u_7)yz - (1-u_9)zw - u_3x - u_5y - u_8z - u_{10}w.$$

Now, due to the facts that is mentioned in theorem (1), always $u_6 < 1$, $u_9 < 1$ and $u_7 < u_4$, we get,

$$\frac{dV_0}{dt} < y(1-y) - u_3x - u_5y - u_8z - u_{10}w.$$

Hence $\frac{dV_0}{dt} < 0$ in the region ω_0 and then V_0 is strictly Lyapunov function. Thus we obtain that E_0 is a globally asymptotically stable in the region ω_0 , and the proof is complete.

Theorem (3): Assume that the free predators equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$ of system (2) is a locally asymptotically stable in R_+^4 . Then E_1 is a globally asymptotically stable on the region $\omega_1 \subset R_+^4$ that satisfies the following conditions:

$$\frac{1}{x} - \frac{(y + \bar{y})}{x} + \frac{u_2u_7}{u_4u_6y} \leq 2 \sqrt{\frac{u_2u_7(\bar{y} - \bar{y}^2)}{u_4u_6x y \bar{y}}} \quad (11 a)$$

$$\bar{y}^2 < \bar{y} \quad (11 b)$$

$$\bar{x} < x \quad (11c)$$

Proof: Consider the following function

$$V_1(x, y, z, w) = c_1 \left(x - \bar{x} - \bar{x} \ln \frac{x}{\bar{x}} \right) + c_2 \left(y - \bar{y} - \bar{y} \ln \frac{y}{\bar{y}} \right) + c_3 z + c_4 w,$$

where: c_1, c_2, c_3 and c_4 are positive constants to be determined.

Clearly $V_1: R_+^4 \rightarrow R$ is a C^1 positive definite function. Now by differentiating V_1 with respect to time t and doing some algebraic manipulation, gives that:

$$\begin{aligned} \frac{dV_1}{dt} = & -c_1 \frac{(\bar{y} - \bar{y}^2)}{x \bar{x}} (x - \bar{x})^2 - c_2 \frac{u_2 \bar{x}}{y \bar{y}} (y - \bar{y})^2 + \left[c_1 \left(\frac{1}{x} - \frac{(y + \bar{y})}{x} \right) + \frac{c_2 u_2}{y} \right] (x - \bar{x})(y - \bar{y}) \\ & - (c_1 - c_3 u_6) \frac{(1-m)xz}{u_1 + x} - (c_2 u_4 - c_3 u_7)(1-m)yz + \left[\frac{c_1(1-m)\bar{x}}{u_1 + x} + c_2 u_4(1-m)\bar{y} - c_3 u_8 \right] z \\ & - (c_3 - c_4 u_9) w z - c_4 u_{10} w. \end{aligned}$$

By chosen $c_1 = 1$, $c_2 = \frac{u_7}{u_4 u_6}$, $c_3 = \frac{1}{u_6}$, $c_4 = \frac{1}{u_6 u_9}$ we get:

$$\begin{aligned} \frac{dV_1}{dt} \leq & - \frac{(\bar{y} - \bar{y}^2)}{x \bar{x}} (x - \bar{x})^2 - \frac{u_7 u_2 \bar{x}}{u_6 u_4 y \bar{y}} (y - \bar{y})^2 + \left[\left(\frac{1}{x} - \frac{(y + \bar{y})}{x} \right) + \frac{u_7 u_2}{u_6 u_4 y} \right] (x - \bar{x})(y - \bar{y}) \\ & - \left[\frac{u_8}{u_6} - \frac{(1-m)\bar{x}}{u_1 + x} + \frac{u_7(1-m)\bar{y}}{u_6} \right] z - \frac{u_{10}}{u_6 u_9} w. \end{aligned}$$

Now by using the conditions (11a), (11b) and (11c) we obtain that:

$$\frac{dV_1}{dt} < - \left[\sqrt{\frac{(\bar{y} - \bar{y}^2)}{x \bar{x}}} (x - \bar{x}) - \sqrt{\frac{u_2 u_7 \bar{x}}{u_6 u_4 y \bar{y}}} (y - \bar{y}) \right] - \left[\frac{u_8}{u_6} - \frac{(1-m)\bar{x}}{u_1 + \bar{x}} + \frac{u_7(1-m)\bar{y}}{u_6} \right] z - \frac{u_{10}}{u_6 u_9} w^2.$$

Clearly, $\frac{dV_1}{dt}$ is negative definite on the region ω_1 due to the local stability condition (8e). Hence V_1 is strictly Lyapunov function. thus E_1 is a globally asymptotically stable on the region ω_1 and the proof is complete.

Theorem (4): Assume that the free top predators' equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ of system (2) is locally asymptotically stable in R_+^4 . Then E_2 is a globally asymptotically stable on any region $\omega_2 \subset R_+^4$ that satisfies the following conditions:

$$\mu_1 \leq 2 \sqrt{\frac{u_1 u_2 u_6 u_7 \hat{x}}{u_4 (u_1 + \hat{x}) y \hat{y}}} (\mu_2 - \mu_3) \quad (12a)$$

$$\hat{y}^2 < \hat{y} \quad (12b)$$

$$\mu_3 < \mu_2,$$

where:

$$\mu_1 = \frac{u_1 u_6}{u_1 + \hat{x}} \left(\frac{1}{x} - \frac{(y + \hat{y})}{x} \right) + \frac{u_2 u_7}{u_4 y}, \quad \mu_2 = \frac{(\hat{y} - \hat{y}^2)}{x \hat{x}}, \quad \mu_3 = \frac{(1-m)\hat{z}}{(u_1 + \hat{x})(u_1 + x)}.$$

Proof: Consider the following function:

$$V_2(x, y, z, w) = c_1 \left(x - \hat{x} - \hat{x} \ln \frac{x}{\hat{x}} \right) + c_2 \left(y - \hat{y} - \hat{y} \ln \frac{y}{\hat{y}} \right) + c_3 \left(z - \hat{z} - \hat{z} \ln \frac{z}{\hat{z}} \right) + c_4 w,$$

where: c_1, c_2, c_3 and c_4 are positive constants to be determined.

Clearly $V_2: R_+^4 \rightarrow R$ is a C^1 positive definite function. Now by differentiating V_2 with respect to time t and doing some algebraic manipulation, gives that:

$$\begin{aligned} \frac{dV_2}{dt} = & -c_1 \left(\frac{(\hat{y} - \hat{y}^2)}{x \hat{x}} - \frac{(1-m)\hat{z}}{(u_1 + \hat{x})(u_1 + x)} \right) (x - \hat{x})^2 - \left(c_1 - \frac{c_3 u_1 u_6}{u_1 + \hat{x}} \right) \frac{(1-m)}{(u_1 + x)} (x - \hat{x})(z - \hat{z}) \\ & + \left[c_1 \left(\frac{1}{x} - \frac{(y + \hat{y})}{x} \right) + \frac{c_2 u_2}{y} \right] (x - \hat{x})(y - \hat{y}) - c_2 \frac{u_2 \hat{x}}{y \hat{y}} (y - \hat{y})^2 \\ & - (c_2 u_4 - c_3 u_7)(1-m)(y - \hat{y})(z - \hat{z}) - (c_3 - c_4 u_9) w z - (c_4 u_{10} - c_3 \hat{z}) w. \end{aligned}$$

By chosen $c_1 = \frac{u_1 u_6}{u_1 + \hat{x}}$, $c_2 = \frac{u_7}{u_4}$, $c_3 = 1$, $c_4 = \frac{1}{u_9}$ we get:

$$\frac{dV_2}{dt} \leq -\frac{u_1 u_6}{u_1 + \hat{x}} \left(\frac{(\hat{y} - \hat{y}^2)}{x \hat{x}} - \frac{(1-m)\hat{z}}{(u_1 + \hat{x})(u_1 + x)} \right) (x - \hat{x})^2 - \frac{u_2 u_7 \hat{x}}{u_4 y \hat{y}} (y - \hat{y})^2 \\ + \left[\frac{u_1 u_6}{u_1 + \hat{x}} \left(\frac{1}{x} - \frac{(y + \hat{y})}{x} \right) + \frac{u_2 u_7}{u_4 y} \right] (x - \hat{x})(y - \hat{y}) - (u_{10} - u_9 \hat{z})w.$$

Now by using the conditions (12 a) and (12 b) we obtain that:

$$\frac{dV_2}{dt} < -\frac{u_1 u_6}{u_1 + \hat{x}} \left[\sqrt{\frac{(\hat{y} - \hat{y}^2)}{x \hat{x}} - \frac{(1-m)\hat{z}}{(u_1 + \hat{x})(u_1 + x)}} (x - \hat{x}) - \sqrt{\frac{u_2 u_7 \hat{x}}{u_4 y \hat{y}}} (y - \hat{y}) \right]^2 - (u_{10} - u_9 \hat{z})w.$$

Clearly, $\frac{dV_2}{dt}$ is negative definite on the region ω_2 due to the conditions (12 c) and the local stability condition (9 e).

Hence V_2 is strictly Lyapunov function. thus E_2 is a globally asymptotically stable on the region ω_2 and the proof is complete.

Theorem (5): Assume that the positive (coexistence) equilibrium point $E_3(x^*, y^*, z^*, w^*)$ of system (2) is locally asymptotically stable in the R_+^4 . Then E_3 is a globally asymptotically stable on any region $\omega_3 \subset R_+^4$ that satisfies the following conditions:

$$\frac{u_1 u_6}{u_1 + x^*} \left(\frac{1}{x} - \frac{(y + y^*)}{x} \right) + \frac{u_2 u_7}{u_4 y} \leq 2 \sqrt{\frac{u_1 u_2 u_6 u_7 x^* (\beta_1 - \beta_2)}{u_4 (u_1 + x^*) y y^*}} \quad (13 a)$$

$$y^{*2} < y^* \quad (13 b)$$

$$z < \frac{u_{10}}{u_9} \quad (13 c)$$

$$w^* < w \quad (13 d)$$

$$\beta_2 < \beta_1, \quad (13 e)$$

where:

$$\beta_1 = \frac{(y^* - y^{*2})}{x x^*}, \quad \beta_2 = \frac{(1-m)z^*}{(u_1 + x^*)(u_1 + x)}.$$

Proof: Consider the following function:

$$V_3(x, y, z, w) = c_1 \left(x - x^* - x^* \ln \frac{x}{x^*} \right) + c_2 \left(y - y^* - y^* \ln \frac{y}{y^*} \right) + c_3 \left(z - z^* - z^* \ln \frac{z}{z^*} \right) \\ + c_4 \left(w - w^* - w^* \ln \frac{w}{w^*} \right),$$

where: c_1, c_2, c_3 and c_4 are positive constants to be determined.

Clearly $V_3: R_+^4 \rightarrow R$ is a C^1 positive definite function. Now differentiating by V_3 with respect to time t and doing some algebraic manipulation, gives that:

$$\frac{dV_3}{dt} = -c_1 \left(\frac{(y^* - y^{*2})}{x x^*} - \frac{(1-m)z^*}{(u_1 + x^*)(u_1 + x)} \right) (x - x^*)^2 - \frac{c_2 u_2 x^*}{y y^*} (y - y^*)^2 \\ + \left[c_1 \left(\frac{1}{x} - \frac{(y + y^*)}{x} \right) + \frac{c_2 u_2}{y} \right] (x - x^*)(y - y^*) - \left(c_1 - \frac{c_3 u_1 u_6}{u_1 + x^*} \right) \frac{(1-m)}{(u_1 + x)} (x - x^*)(z - z^*) \\ - (c_2 u_4 - c_3 u_7)(1-m)(y - y^*)(z - z^*) - (c_3 - c_4 u_9)(z - z^*)(w - w^*).$$

By choosing $c_1 = \frac{u_1 u_6}{u_1 + x^*}$, $c_2 = \frac{u_7}{u_4}$, $c_3 = c_4 = 1$, we get:

$$\frac{dV_3}{dt} \leq -\frac{u_1 u_6}{u_1 + x^*} \left(\frac{(y^* - y^{*2})}{x x^*} - \frac{(1-m)z^*}{(u_1 + x^*)(u_1 + x)} \right) (x - x^*)^2 \\ + \left[\frac{u_1 u_6}{u_1 + x^*} \left(\frac{1}{x} - \frac{(y + y^*)}{x} \right) + \frac{u_2 u_7}{u_4 y} \right] (x - x^*)(y - y^*) \\ - \frac{u_2 u_7 x^*}{u_4 y y^*} (y - y^*)^2 - (1 - u_9)(z - z^*)(w - w^*)$$

Now by using the conditions (13 a) and (13 b) we obtain that:

$$\frac{dV_3}{dt} < - \left[\sqrt{\frac{u_1 u_6}{u_1 + x^*} (\beta_1 - \beta_2) (x - x^*)} - \sqrt{\frac{u_2 u_7 x^*}{u_4 y y^*} (y - y^*)} \right]^2 - (1 - u_9)(z - z^*)(w - w^*).$$

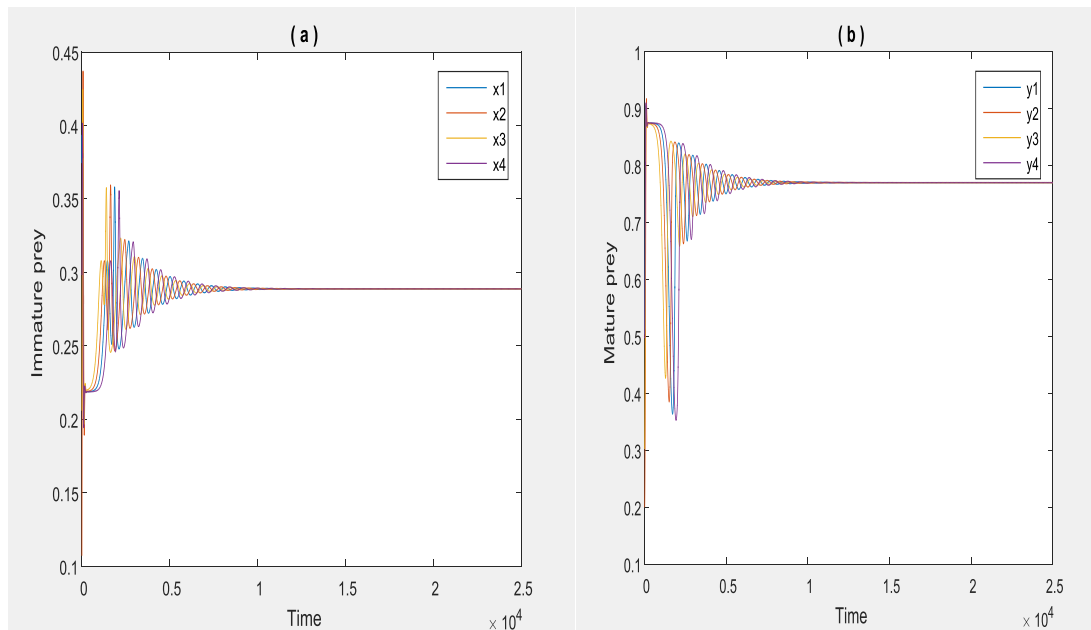

Clearly, $\frac{dV_3}{dt}$ is negative definite on the region ω_3 due to the conditions (13 c), (13 d), (13 e) and the fact that is mentioned in theorem (1), $u_9 < 1$.

Hence V_3 is strictly Lyapunov function. Thus E_3 is a globally asymptotically stable on the region ω_3 and the proof is complete.

Numerical analysis of system (2)

In this section, the dynamical behavior of system (2) is studied numerically for different sets of parameters and different sets of initial points. The objectives of this study are: first investigate the effect of varying the value of each parameter on the dynamical behavior of system (2) and second confirm our obtained analytical results. It is observed that, for the following set of hypothetical parameters that satisfies stability conditions of the positive equilibrium point, system (2) has a globally asymptotically stable positive equilibrium point as shown in Fig. (6.1).

$$u_1 = 0.6, u_2 = 0.4, u_3 = 0.1, u_4 = 0.5, u_5 = 0.1, u_6 = 0.3, \\ u_7 = 0.3, u_8 = 0.1, u_9 = 0.5, u_{10} = 0.1, m = 0.5.$$

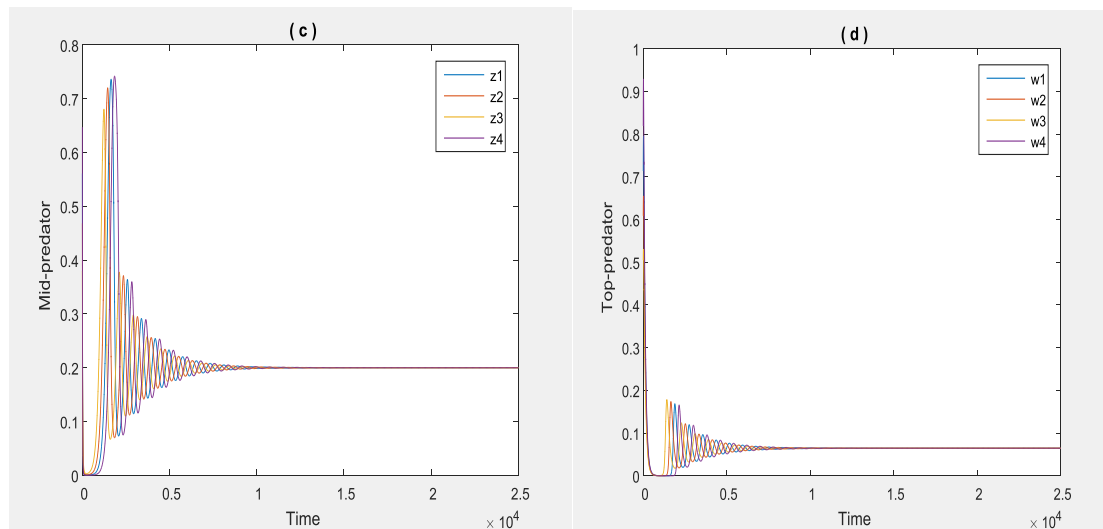

Fig.(6.1):-The time series of the solution of system(2) started from the four different initial points $(0.4, 0.5, 0.6, 0.7)$, $(0.1, 0.2, 0.5, 0.6)$, $(0.2, 0.3, 0.4, 0.5)$, and $(0.3, 0.5, 0.7, 0.8)$, for the data given by(6.1)(a), the trajectories of x as a function of time, (b) the trajectories of y as a function of time, (c) trajectories of z as a function of time, (d) the trajectories of w as a function of time.

Clearly, Fig.(6.1) shows that system(2) has a globally asymptotically stable as the solution of system(2) approaches asymptotically to the positive equilibrium point $E_3 = (0.28, 0.77, 0.2, 0.06)$ starting from four different initial points and this is confirming our obtained analytical results.

Now, in order to discuss the effect of the parameters values of system(2) on the dynamical behavior of the system, the system is solved numerically for the data given in(6.1) with varying one parameter at each time.

By varying the parameter u_1 which represents the half saturation rate of the mid-predator upon the immature prey and keeping the rest of parameters as data given in(6.1) in the range $0.01 \leq u_1 < 2$, it is observed that the solution of system(2) approaches asymptotically to the positive equilibrium point E_3 , as shown in Fig.(6.2), for typical value $u_1 = 0.4$.

Fig. (6.2):-Time series of the solution of system (2) for the data given in(6.1) with $u_1 = 0.4$, which approaches to $E_3 = (0.28, 0.75, 0.2, 0.07)$ in the interior of R_+^4 .

Now, varying the growth rate parameter of immature prey u_2 and keeping the rest of parameters values as data given in (6.1), it is observed that for $0.1 \leq u_2 < 2$ the solution of system (2) approaches asymptotically to a positive equilibrium point E_3 .

On the other hand varying the natural death rate of immature prey parameter u_3 and keeping the rest of parameters values as data in (6.1), it is observed that for $0.01 \leq u_3 < 0.90$ the solution of system (2) approaches asymptotically to the positive equilibrium point E_3 , as shown in Fig. (6.3) a, for typical value $u_3 = 0.6$, while increasing this parameter for $0.90 \leq u_3 < 1$ causes extinction in the top-predator and the solution of system (2) approaches asymptotically to $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ in the interior of the positive quadrant of xyz – space, as shown in Fig. (6.3) b, for typical value $u_3 = 0.95$.

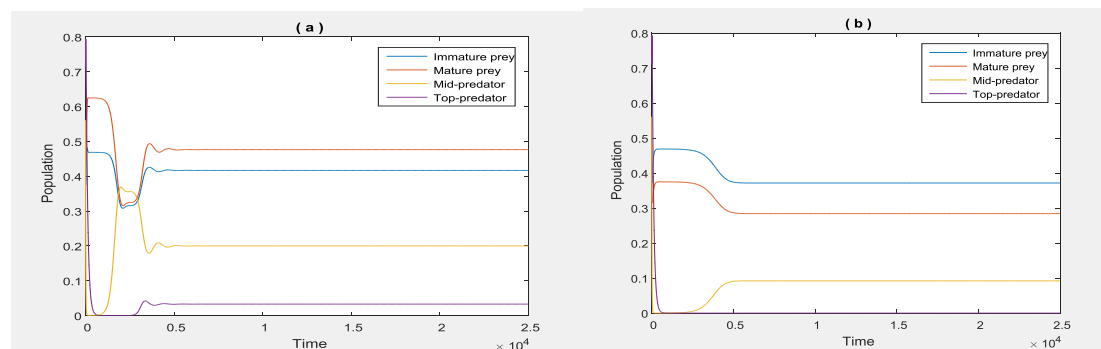

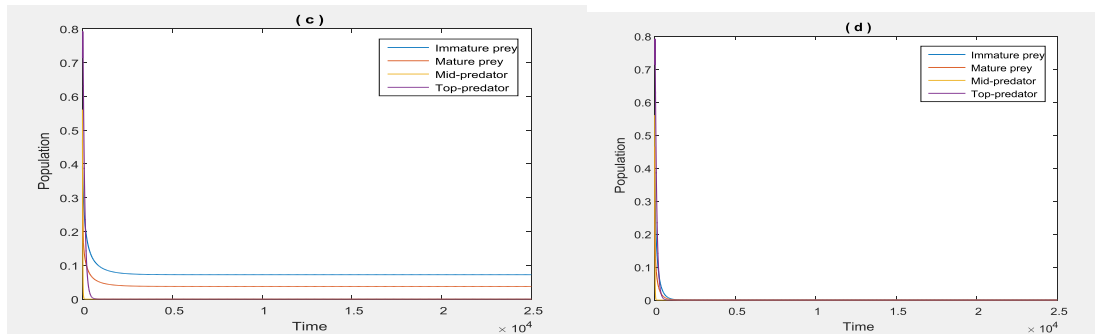

Fig (6.3) (a) :-Time series of the solution of system (2) for the data given by (6.1) with $u_3 = 0.6$, which approaches to $E_3 = (0.21, 0.57, 0.2, 0.02)$ in the interior of R_+^4 , and (b): Time series of the solution of system (2) for the data given by (6.1) with $u_3 = 0.95$, which approaches to $E_2 = (0.16, 0.44, 0.19, 0)$ in the interior of the positive quadrant of xyz – space.

Moreover, varying the parameter ru_4 which represents the predation rate of the mid-predator upon the immature prey, and keeping the rest of parameters values as data given in (6.1), it is observed that for $0.01 \leq u_4 < 1.5$ the solution of system (2) still approaches asymptotically to a positive equilibrium point E_3 .

The effect of varying the mature prey natural death rate parameter u_5 with $0.01 \leq u_5 < 0.41$ and keeping the rest parameters values as data given in (6.1), it is observed that the solution of system (2) approaches asymptotically to a positive equilibrium point E_3 , for typical value $u_5 = 0.3$ as shown in Fig. (6.4) a, however increasing this parameter in the range $0.41 \leq u_5 < 0.58$ causes extinction in the top-predator and the solution of system (2) approaches asymptotically to $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ in the interior of the positive quadrant of xyz – space, as shown in Fig. (6.4) b, for typical value $u_5 = 0.5$, further increasing in the range $0.58 \leq u_5 < 0.8$ causes extinction in the mid-predator and the solution of system (2) approaches asymptotically to the free predators equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$ in the interior of the positive quadrant of xy – plane, as shown in Fig. (6.4) c, for typical value $u_5 = 0.77$, then more increasing of this parameter in the range $0.8 \leq u_5 < 1$ causes extinction in all species and the solution of system (2) approaches asymptotically to the vanishing equilibrium point $E_0 = (0, 0, 0, 0)$, as shown in Fig (6.4) d, for typical value $u_5 = 0.9$.

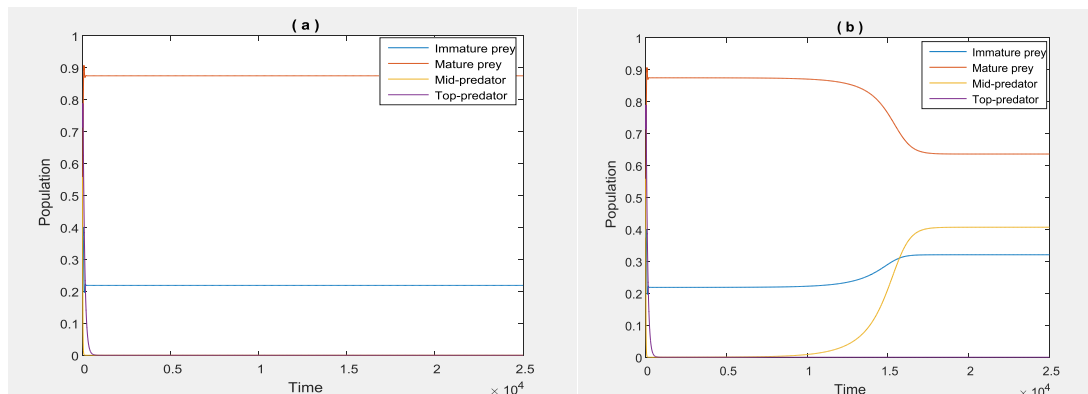

Fig(6.4) (a) :- Time series of the solution of system (2) for the data given by (6.1) with $u_5 = 0.3$, which approaches to $E_3 = (0.41, 0.47, 0.2, 0.03)$ in the interior of R_+^4 , (b) : Time series of the solution of system (2) for the data given by (6.1) with $u_5 = 0.5$, which approaches to $E_2 = (0.37, 0.28, 0.09, 0)$ in the positive quadrant of $xyz - space$, (c) : Time series of the solution of system (2) for the data given by (6.1) with $u_5 = 0.77$, which approaches to $E_1 = (0.07, 0.03, 0, 0)$ in the positive quadrant of $xy - plane$, (d) : Time series of the solution of system (2) for the data given by (6.1) with $u_5 = 0.9$, which approaches to $E_0 = (0, 0, 0, 0)$.

The varying of the parameter u_6 which represents the conversion rate from the mature prey to the mid-predator, and keeping the rest of parameters values as data given in (6.1), it is observed that for $0.01 \leq u_6 < 1$ the solution of system (2) still approaches asymptotically to a positive equilibrium point E_3 .

For varying the conversion rate parameter from the mature prey to the mid-predator u_7 , with $0.01 \leq u_7 < 0.15$ the solution of system (2) approaches asymptotically to the positive free predators equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$ in the interior of the positive quadrant of $xy - plane$, as shown in Fig.(6.5) a , for typical value $u_7 = 0.1$, while for $u_7 = 0.15$ the solution of system (2) approaches asymptotically to $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ in the interior of the positive quadrant of $xyz - space$, as shown in Fig.(6.5) b , which means revival of the mid-predator population, then increasing this parameter in the range $0.15 \leq u_7 < 0.21$ leads revival of the top-predator and a small periodic attractor appears, as shown in Fig.(6.5) c , for typical value $u_7 = 0.16$ for more increasing in the range $0.21 \leq u_7 < 0.5$ the solution of system (2) approaches asymptotically to a positive equilibrium point E_3 , for typical value $u_7 = 0.22$, as shown in Fig.(6.5) d .

Fig(6.5):- (a) Time series of the solution of system (2) for the data given by (6.1) with different values of u_7 , (a) : $E_1 = (0.21, 0.87, 0, 0)$ is a asymptotically stable with $u_7 = 0.1$, (b) : $E_2 = (0.32, 0.63, 0.4, 0)$ is a asymptotically stable with $u_7 = 0.15$, (c) : periodic attractor with $u_7 = 0.16$, (d) : $E_3 = (0.28, 0.77, 0.19, 0.03)$ is a asymptotically stable with $u_7 = 0.22$.

The varying of the mid-predator natural death rate parameter u_8 , it is observed that for $0.01 \leq u_8 < 0.16$ the solution of system (2) approaches asymptotically to the positive equilibrium point E_3 , further increasing of this parameter with $u_8 = 0.16$ which causes extinction in the top-predator and the solution of system (2) approaches asymptotically to $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ in the interior of the positive quadrant of xyz - space, as shown in Fig.(6.6) a , for typical value $u_8 = 0.16$. While for $0.16 < u_8 < 1$ causes the extinction of the mid -predator the solution of system (2) approaches asymptotically $E_1 = (\bar{x}, \bar{y}, 0, 0)$ in the interior of the positive quadrant of xy - plane, as shown in Fig. (6.6) b , for typical value $u_8 = 0.25$.

Fig(6.6) (a):- Time series of the solution of system (2) for the data given by (6.1) with $u_8 = 0.16$, which approaches to $E_2 = (0.30, 0.73, 0.26, 0)$ in the interior of the positive quadrant of xyz - space , (b) : Time series of the solution of system (2) for the data given by (6.1) with $u_8 = 0.25$, which approaches to $E_1 = (0.21, 0.87, 0, 0)$ in the interior of the positive quadrant of xy - plane .

On the other hand, the varying of predation rate parameter of the top-predator upon the mid-predator, for $0.01 \leq u_9 < 0.15$ the solution of system (2) approaches asymptotically to $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ in the interior of the positive quadrant of xyz - space, as shown in Fig.(6.7) a , for typical value $u_9 = 0.1$, while for $0.15 \leq u_9 < 1$ the top-predator population revives and the solution of system (2) approaches asymptotically to a positive equilibrium point E_3 , as shown in Fig.(6.7) b , for typical value $u_9 = 0.5$.

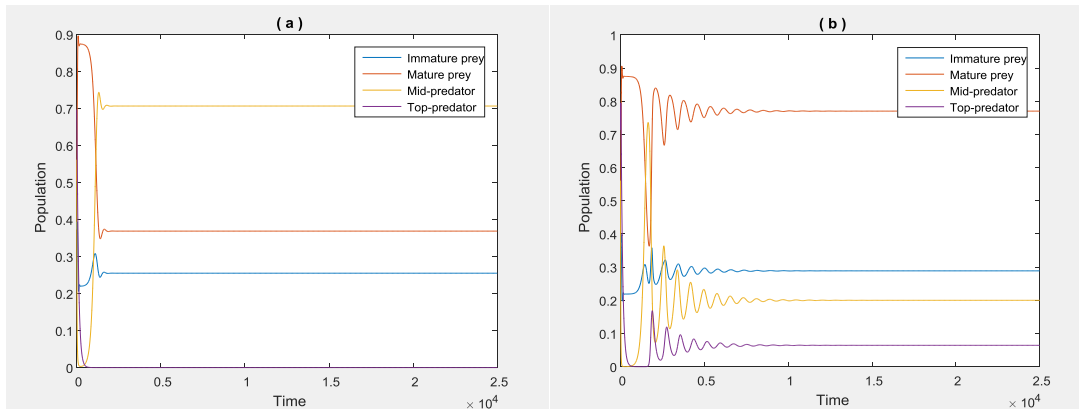

Fig (6.7):- (a) Time series of the solution of system (2) for the data given by(6.1) with $u_9 = 0.1$, which approaches to $E_2 = (0.25, 0.36, 0.7, 0)$ in the interior of the positive quadrant of $xyz - space$, (b):Time series of the solution of system (2) for the data given in(6.1) with $u_9 = 0.5$, which approaches to $E_3 = (0.28, 0.77, 0.2, 0.06)$ in the interior of R_+^4 .

Moreover, increasing the natural death rate of top-predator parameter u_{10} in the range $0.1 \leq u_{10} < 0.35$, the solution of system (2) approaches asymptotically to a positive equilibrium point E_3 , as shown in Fig.(6.8) a , for typical value $u_{10} = 0.3$, while the increasing of this parameter for $0.35 \leq u_{10} < 1$ causes extinction of the top-predator population and the solution of system (2) approaches asymptotically to $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ in the interior of the positive quadrant of $xyz - space$, as shown in Fig.(6.8) b , for typical value $u_{10} = 0.5$.

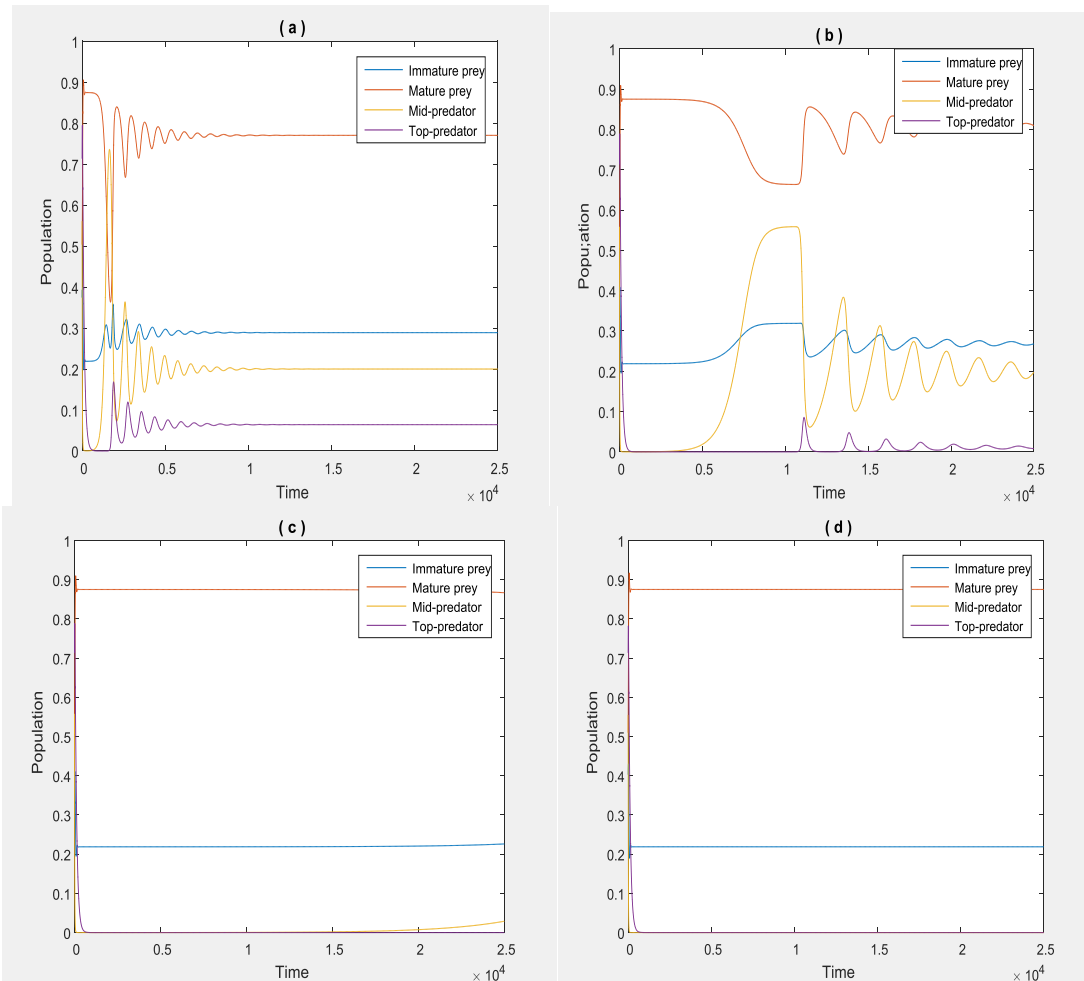

Fig.(6.8):- (a): Time series of the solution of system (2) for the data given by(6.1) with $u_{10} = 0.3$, which approaches to $E_3 = (0.29, 0.47, 0.6, 0.02)$ in the interior of R_+^4 . (b): Time series of the solution of system (2) for the data given by(6.1) with $u_{10} = 0.5$, which approaches to $E_2 = (0.25, 0.36, 0.7, 0)$ in the interior of the positive quadrant of $xyz - space$.

Finally, varying the number of prey inside the refuge parameter m and keeping the rest of parameters values as data given in(6.1) , it is observed that for $0.01 \leq m < 0.63$ the solution of system (2) approaches asymptotically to the positive equilibrium point E_3 , as shown in Fig.(6.9) a , for typical value $m = 0.5$, while increasing this parameter in the range $0.63 \leq m < 0.69$ leads that the solution of system (2) approaches asymptotically to a periodic dynamics in $Int. R_+^4$, as shown in Fig.(6.9) b , for typical value $m = 0.67$, more increasing of this parameter in the range $0.69 \leq m < 0.71$ causes extinction of the top-predator population and the solution of system (2) approaches asymptotically to the free top-predator equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ in the interior of the positive quadrant of $xyz - space$. as shown in Fig.(6.9) c , for typical value $m = 0.7$.and for $0.71 \leq m < 1$ the solution of system (2)

approaches asymptotically to the free predators' equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$ in the interior of the positive quadrant of xy – plane, as shown in Fig.(6.9)d , for typical value $m = 0.9$.

Fig(6.9): – Time series of the solution of system (2) for the data given by(6.1) with different values of m , (a): $E_3 = (0.28, 0.77, 0.02, 0.06)$ is a asymptotically stable with $m = 0.5$, (b): A small periodic attractor with $m = 0.67$, (c): $E_2 = (0.22, 0.86, 0.02, 0)$ is a asymptotically stable with $m = 0.7$, (d): $E_1 = (0.21, 0.87, 0, 0)$ is a asymptotically stable with $m = 0.9$.

Conclusions and discussion:-

In this chapter, we proposed and analyzed an ecological model that described the dynamical behavior of the food chain real system. The model included four non-linear autonomous differential equations that describe the dynamics of four different population, namely first immature prey (X_1), mature prey (X_2), mid-predator (Y_1) and (Y_2) which is represent the top predator. The boundedness of system (2) has been discussed. The existence conditions of all possible equilibrium points are obtain. The local as well as global stability analyses of these points are carried out. Finally, numerical simulation is used to specific the control set of parameters that affect the dynamics of the system and confirm our obtained analytical results. Therefore system (2) has been solved numerically for different sets of initial points and different sets of parameters starting with the hypothetical set of data given by Eq. (6.1) and the following observations are obtained.

1-System (2) has two types of attractor in $Int. R_+^4$ either a stable point or a periodic attractor.

2-For the set hypothetical parameters value given in Eq. (6.1), the system (2) approaches asymptotically to globally stable positive point $E_3 = (0.28, 0.77, 0.2, 0.06)$. Further, with varying one parameter each time, it is observed

that varying the parameter values, $u_i, i = 1, 2, 4$ and 6 do not have any effect on the dynamical behavior of system (2) and the solution of the system still approaches to positive equilibrium point $E_3 = (x^*, y^*, z^*, w^*)$.

3- As the natural death rate of immature prey u_3 increasing to 0.89 keeping the rest of parameters as in Eq. (6.1), the solution of system (2) approaches to positive equilibrium point E_3 . However if $0.90 \leq u_3 < 1$, then the top predator will face extinction then the trajectory transferred from positive equilibrium point to the equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, thus, the $u_3 = 0.9$ parameter is a bifurcation point.

4- As the natural death rate of mature prey u_5 increasing to 0.40 keeping the rest of parameters as in Eq. (6.1), the solution of system (2) approaches to positive equilibrium E_3 , however if $0.41 \leq u_5 < 0.58$, then the top predator will face extinction then the trajectory transferred from positive equilibrium point to the equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, further increasing in the range $0.58 \leq u_5 < 0.8$ causes the mid-predator faced extinction in and then the trajectory transferred from the free top predator equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, to the free predators equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$, then more increasing of this parameter in the range $0.8 \leq u_5 < 1$ causes extinction in all species and then the trajectory transferred from equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$, to the vanishing equilibrium point $E_0 = (0, 0, 0, 0)$, thus, the u_5 parameter when $u_5 = 0.41, u_5 = 0.58$ and $u_5 = 0.8$ is a bifurcation point.

5- As the parameter u_7 which represents the conversion rate from the mature prey to the mid-predator decreasing to 0.15 keeping the rest of parameters as in Eq. (6.1), the solution of system (2) approaches to the positive free predators equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$, while for the $u_7 = 0.15$, then the trajectory transferred from the free predators equilibrium point $E_1 = (\bar{x}, \bar{y}, 0, 0)$ to $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, which means revival of the mid-predator population, then increasing this parameter in the range $0.15 \leq u_7 < 0.21$ leads revival of the top-predator and the trajectory approaches asymptotically to a periodic dynamics in $\text{Int. } R_+^4$, for more increasing in the range $0.21 \leq u_7 < 0.5$, the trajectory will transferred asymptotically from a periodic dynamics in $\text{Int. } R_+^4$ and then approaches asymptotically stable to a positive equilibrium point $E_3(x^*, y^*, z^*, w^*)$, thus, the parameter u_7 when $u_7 = 0.15$ and $u_7 = 0.21$ is a bifurcation point.

6- As the natural death rate of the mid predator u_8 increasing to 0.15 keeping the rest of parameters as in Eq. (6.1), the solution of system (2) approaches to the positive equilibrium point E_3 , further increasing in the range $0.16 \leq u_8 < 0.18$ causes the top-predator faced extinction and the trajectory transferred from the positive equilibrium point E_3 to the free top predator equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, but for $0.18 \leq u_8 < 1$ causes the mid-predator faced extinction and the trajectory transferred from $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ to $E_1 = (\bar{x}, \bar{y}, 0, 0)$, thus, the parameter u_8 when $u_8 = 0.16$ and $u_8 = 0.18$ is a bifurcation point.

7- As the predation rate parameter of the top-predator upon the mid-predator u_9 increasing to 0.14 keeping the rest of parameters as in Eq. (6.1), the solution of system (2) approaches the free top predator equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, while for $0.15 \leq u_9 < 1$ the top-predator population revives and then the trajectory transferred from the point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$ to the positive equilibrium point E_3 , thus, the parameter $u_9 = 0.15$ is a bifurcation point.

8- As the natural death rate of the top-predator parameter u_{10} increasing in the range $0.1 \leq u_{10} < 0.35$ keeping the rest of parameters as in Eq. (6.1) the solution of system (2) approaches asymptotically to a positive equilibrium point E_3 , while increasing this parameter in the range $0.35 \leq u_{10} < 1$ causes extinction of the top-predator population and then the trajectory transferred from positive equilibrium point to $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, thus, the parameter $u_{10} = 0.35$ is a bifurcation point.

9- As the number of prey inside the refuge parameter m varying in the range $0.01 \leq m < 0.63$ and keeping the rest of parameters values as data given in Eq. (6.1), the solution of system (2) approaches asymptotically to the positive equilibrium point E_3 , while increasing this parameter in the range $0.63 \leq m < 0.69$ leads that the trajectory approaches asymptotically to a periodic dynamics in $\text{Int. } R_+^4$, while increasing this parameter for $0.69 \leq m < 0.71$ causes extinction of the top-predator population and restore the stability and then the trajectory transferred asymptotically from a periodic dynamics in $\text{Int. } R_+^4$ to the stable free top-predator equilibrium point $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, then more increasing of this parameter for $0.71 \leq m$ causes extinction of the mid-predator population and the trajectory transferred from $E_2 = (\hat{x}, \hat{y}, \hat{z}, 0)$, to $E_1 = (\bar{x}, \bar{y}, 0, 0)$, thus, the parameter when $m = 0.63, m = 0.69$ and $m = 0.71$ is a bifurcation point.

IMC-PID, Direct Synthesis, SIMC, Set-point tracking and Disturbance Rejection.

Abstract

This paper presents various tuning methods for a first order process with time delay. The performance of IMC based PID controller is compared with other tuning methods like Modification of IMC-PID for disturbance rejection, Direct synthesis, Direct Synthesis with disturbance rejection (DS-d) and Simple Internal Model Control (SIMC). This work analyses the various parameters of the system. The comparative study of set point tracking and disturbance rejection of a first order process is evaluated using performance criteria like ISE and IAE. From the comparison it was found that IMC-PID provides better results for set-point tracking as well as for the disturbance rejection.

Introduction:-

The Proportional-integral-derivative (PID) controllers are extensively used in the industrial applications at the regulatory level. The fundamental reason for choosing PID controllers is their relatively simple structure, which can be readily understood and allows them to easily resolve in the real world. However, it is observed that many PID controllers are not properly tuned and exertion has been made to systematically resolve this problem. Therefore, the goal of this work is , to develop a direct approach tuning method of controller from closed loop set point and comparisons has been made for different tuning methods [1].

There are certain goals for tuning methods. The tuning rules should be transparent and easy to memorize. The tuning rules should work on ample range of process. The tuning rules should be well motivated, and preferably model-based and analytically derived.

There are different types of PID controller tuning techniques and they are based on open-loop or closed-loop plant tests and most of these techniques utilize the process gain (k), time constant (τ) and time delay (θ). The vast article on PID controllers includes a wide variety of design and tuning methods based on the performance criteria. The two most oldest and common method of tuning are Zeigler-Nichols (ZN) [2] and Cohen and Coon[3]. These methods were developed to provide a closed-loop response with a quarter decay ratio. The ZN tuning method yields a very good disturbance response for integrating processes[4], but in another way, it results in rather aggressive settings and also give poor performance for process with a dominant delay.

The popular tuning methods for PID controllers which have been used for different kind of processes are Direct Synthesis (DS) [5] and Internal Model Control [6]. The output response based on both the approaches has satisfactory performance and robustness. The main purpose of using IMC-PID is that, it results in a controller with a

Corresponding Author:-Manju Sharmila.N.

Address:-Department of Electronics and Instrumentation Engineering, St. Joseph's College of Engineering, Chennai-600119, Tamilnadu, India.

single tuning parameter (λ). For a system which is “minimum phase”, λ is equivalent to a closed loop time constant the “speed of response” of the closed-loop system. IMC-PID provides satisfactory response for set point tracking but it provides poor disturbance rejection for higher order processes in order to overcome this various disturbance rejection techniques were proposed. In the Direct Synthesis (DS) method, the controller design is based on a desired closed-loop transfer function. The next step in the controller is calculated analytically so that the closed-loop set-point matches the desired response. The apparent benefit of using direct synthesis is that the performance requirements are fused directly through the closed loop transfer function. Therefore, the resulting direct synthesis controllers contribute to achieve well for set-point changes. The disturbance rejection is considered to be important so different modification techniques were proposed.

The modification proposed by Dan Chen and Dale E. Seborget *al* for disturbance rejection of Direct synthesis(DS-d)[7] does not provide satisfactory results. The modification for IMC-PID[8] proposed by Shamsuzzoha for disturbance rejection[9] could not produce the expected results.

SKOGESTAD [10] has altered the integral time in SIMC method which is an exceptional remedy for processes with a large time constant [11] in order to improve load disturbance rejection.

Although the PID tuning rule on the basis of IMC and direct synthesis methods gives excellent performance for set-point changes, it shows slow output responses to input (load) disturbances for lag-dominant as well as integrating processes.

Therefore the goal of this paper is to find the IMC-PID procedure for set-point tracking and disturbance rejection to the processes. In this paper, first-order with time delay has been considered and comparisons have been made against Direct Synthesis method, IMC-PID, direct synthesis disturbance rejection (DS-d), modified IMC(Shamsuzzoha) and SIMC method. The various parameters are analysed to obtain the satisfactory results for set point tracking and disturbance rejection.

IMC-PID:-

Internal Model Control based PID controller has the advantage of good set point tracking when it is compared with other methods. The fig 1 shows the basic IMC structure

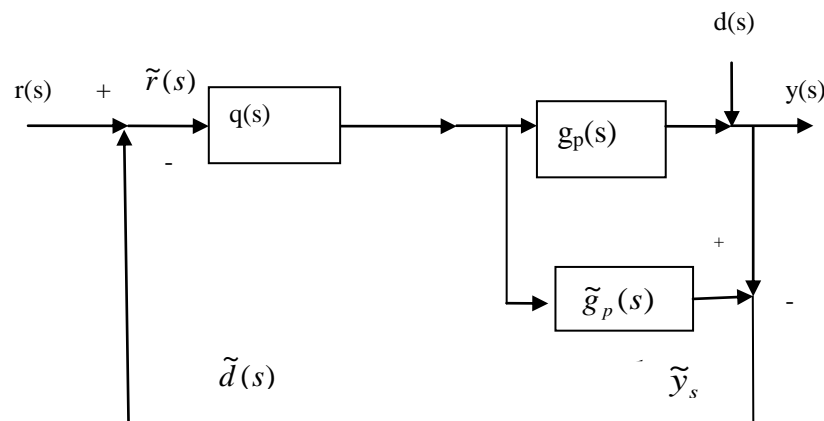

Fig 1:- IMC Structure

It is done by padé approximation technique or using Taylor’s series. In this paper, we have used only the padé approximation technique. IMC-PID provides poor disturbance rejection in order to improve this SIMC have been developed because it provides a better disturbance rejection.

IMC-Based PID Design For A First-Order+ Deadtime Process:-

Consider a first order process with dead time

$$g_p(s) = \frac{ke^{-\theta s}}{\tau s + 1}$$

Where k , τ and θ are the process gain, time constant and time delay.

Step 1: Use a first order padé approximation for the dead time.

$$e^{-\theta s} = \frac{-0.5\theta s + 1}{0.5\theta s + 1}$$

The main reason for using padé approximation is to obtain the simple PID control structure with enhanced performance.

$$\tilde{g}_p(s) = k \left(\frac{-0.5s + 1}{(0.5s + 1)(\tau s + 1)} \right)$$

Separate $\tilde{g}_p(s)$ into invertible and non-invertible parts

$$g_{p-}(s) = k \left(\frac{1}{(0.5s + 1)(\tau s + 1)} \right)$$

$$g_{p+}(s) = (-0.5s + 1)$$

Where $g_{p+}(s)$ and $g_{p-}(s)$ are the non-inverted and inverted parts of the model, respectively.

Step 2: Find the feedback controller

$$q(s) = g_{p-}^{-1}(s) * f(s)$$

Where $f(s) = \frac{1}{(\lambda s + 1)^n}$; $n=1$ (for first order)

$$q(s) = \frac{[(0.5s + 1)(\tau s + 1)]}{k(\lambda s + 1)}$$

Where λ is the filter tuning parameter.

Step 3: The filter $f(s)$ is added and the numerator term to find the PID equivalent,

$$g_c(s) = \frac{[0.5\tau\theta s^2 + (\tau + 0.5\theta)s + 1]}{k(\lambda + 0.5\theta)}$$

Comparing with the standard expression $g_c(s) = k_c \frac{\tau_I \tau_D s^2 + \tau_I s + 1}{\tau_I s + 1}$ we can calculate the values of k_c , τ_I and τ_D .

$$k_c = \frac{2\tau + \theta}{2k(\lambda + \theta)}$$

$$\tau_I = \tau + 0.5 * \theta \quad \tau_D = \frac{\tau\theta}{2\tau + \theta}$$

Rivera et al. (1986) recommend that $\lambda > 0.8\theta$ because of the model uncertainty due to the padé approximation.

MODIFIED IMC-PID (Shamsuzzoha):-

The modified IMC proposed by Shamsuzzoha has the same way of solving as IMC-PID. The variation is only in terms of the tuning parameter. Here we substitute the tuning parameter by 0.6 times of θ .

$$\lambda = 0.6\theta$$

$$k_c = \frac{2\tau + \theta}{3.2k\theta}$$

$$\tau_I = \min\{(\tau + 0.5\theta), 4.8\theta\}$$

$$\tau_D = \frac{\tau\theta}{2\tau + \theta}$$

Direct Synthesis:-

In the direct synthesis method, the design of the controller is based on the closed loop transfer function. It can be done by either padé approximation or Taylor series

Consider a first order system with the dead time

$$\tilde{G} = \frac{k_p e^{-\theta_p s}}{\tau_p s + 1}$$

The exponential term can be approximated using padé approximation and Comparing with the standard form we get the desired parameters as for PID controller as:

$$K_c = \frac{\tau_p + 0.5\theta_p}{k_p(\tau_c + \theta_p)}$$

$$\tau_I = \tau_p + 0.5\theta_p$$

$$\tau_D = \frac{\tau_p \theta_p}{2\tau_p + \theta_p}$$

Direct Synthesis Disturbance Rejection (Ds-d):-

Consider a first order system with delay

$$G_p(s) = \frac{ke^{-\theta s}}{\tau s + 1}$$

The standard form for direct synthesis for a first order system with delay is given by

$$G_p(s) = \frac{\frac{ke^{-\theta s}}{\tau s + 1}}{1 + \frac{ke^{-\theta s}}{\tau s + 1} k_c \left(1 + \frac{1}{\tau_I s} + \tau_D s\right)}$$

The time delay term in the denominator can be approximated by using a first order padé approximation,

$$e^{-\theta s} \approx \frac{1 - 0.5\theta s}{1 + 0.5\theta s}$$

We use padé approximation techniques to obtain the $G_p(s)$, it is then compared with the standard expression to obtain the various parameters k_c, τ_I and τ_D .

By comparing with the standard form, the Parameters obtained are,

$$K_c = \frac{1}{k} \frac{(2\tau\theta + \frac{\theta^2}{2})(3\tau_c + \frac{\theta}{2}) - 2\tau_c^3 - 3\tau_c^2\theta}{2\tau_c^3 + 3\tau_c^2\theta + \frac{\theta^2}{2}(3\tau_c + \frac{\theta}{2})}$$

$$\tau_I = \frac{(2\tau\theta + \frac{\theta^2}{2})(3\tau_c + \frac{\theta}{2}) - 2\tau_c^3 - 3\tau_c^2\theta}{(2\tau + \theta)\theta}$$

$$\tau_D = \frac{3\tau_c^2\tau\theta + \frac{\tau\theta^2}{2}(3\tau_c + \frac{\theta}{2}) - 2(\tau + \theta)\tau_c^3}{(2\tau\theta + \frac{\theta^2}{2})(3\tau_c + \frac{\theta}{2}) - 2\tau_c^3 - 3\tau_c^2\theta}$$

Simple Internal Model Control (Skogestad):-

Skogestad Internal Model Control is the modified method of IMC-PID for improved disturbance rejection than IMC-PID. Here the only parameter used is τ_c . For improved disturbance rejection and good robustness the tuning parameter should be made equal to the value of time delay (θ). Here we consider a first order process with delay and the parameters are obtained using the Half reduction rule[9]

The largest neglected time constant in the denominator is evenly distributed to the effective delay and the smallest retained time constant.

$$G(S) = \frac{\pi_j(-T_{j0}s + 1)}{\pi_i(\tau_{i0}s + 1)} e^{-\theta s}$$

Let the original model be

$$G(S) = \frac{1}{\tau_1 s + 1} e^{-\theta s}$$

Where

$$\tau_1 = \tau_{10} + \tau_{20}/2$$

$$\theta = \theta_0 + \tau_{20}/2 + \sum_{i \geq 3} \tau_{i0} + \sum_j T_{j0} + \frac{h}{2}$$

The delay term is approximated by using Half Rule and from the reduced order of the system the various parameters can be calculated and the PID controller is designed.

$$K_C = \frac{1}{K} \frac{1}{\tau_c + \theta}$$

$$\tau_I = \min(\tau, 4(\tau_c + \theta))$$

Results and Discussion:-

The transfer function considered for our work is $g_p(s) = \frac{e^{-s}}{0.2s + 1}$

Set point tracking:-

Table 1 shows the results obtained for set point tracking for various methods for the above transfer function:

By analyzing the table1, we can see that the settling time is less for IMC-PID when compared with modified IMC, Direct synthesis, Direct synthesis-d and SIMC. Therefore the IMC-PID shows a good set point tracking when compared to other methods. This can also be found from the fig 2.

The fig1 shows the response obtained for the transfer function $g_p(s) = \frac{e^{-s}}{0.2s + 1}$ using various methods to track the

set point. The response shows that IMC settles faster when compared to modified IMC, Direct synthesis, direct synthesis-d and SIMC. The settling time varies depending on the tuning parameter λ or τ_c . The errors were found to be less in IMC-PID method compared to modified IMC, Direct synthesis, direct synthesis-d and SIMC.

Table 1:-Comparison of various tuning method for Set point tracking.

	Settling Time	K_c	τ_I	τ_D	ISE	IAE	τ_c or λ
IMC	8	0.5185	0.700	0.1429	1.12	1.378	0.850
IMC-Mod	10	0.4375	0.700	0.1429	1.193	1.601	0.600
DS	15	0.280	0.700	0.1429	1.614	2.501	1.500
DS-d	13	0.3179	0.665	0.1095	1.46	2.097	0.380
SIMC	10	0.100	0.200	0.00	3.471	4.486	1.00

In Fig 1, The time taken for the IMC-PID to settle is less when compared to the modified IMC-PID. The errors are also found to be lesser.

**Fig 1:-**

In Fig 2, Direct Synthesis provides good set point tracking but when compared with IMC-PID for first order system with dead time performance

**Fig 2:-**

In Fig 3, the performance is evaluated by comparing Direct Synthesis for disturbance In rejection with IMC-PID. It is clear that IMC-PID provides good set point tracking.

**Fig 3:-**

In Fig 4, It is clear from the graph that setting time is less for IMC-PID than SIMC.

Fig 4:-

Disturbance Rejection:-

The table 2 shows the improved disturbance rejection for the transfer function $g_p(s) = \frac{e^{-s}}{0.2s+1}$ using various methods to obtain the improved disturbance rejection.

The fig 5-8 shows the response obtained for the transfer function $g_p(s) = \frac{e^{-s}}{0.2s+1}$ using various methods for disturbance rejection. The response shows that IMC-PID shows a good set point tracking and provides better disturbance rejection compared to other methods.

Table 2:- Comparison of various tuning methods for Disturbance Rejection.

	Settling Time	K_c	τ_I	τ_D	ISE	IAE	τ_c or λ
IMC	9	0.5185	0.700	0.1429	2.408	3.033	0.850
IMC-Mod	8	0.4375	0.700	0.1429	2.510	3.200	0.600
DS	14	0.280	0.700	0.1429	3.218	4.808	1.500
DS-d	12	0.3179	0.665	0.1095	2.920	4.194	0.380
SIMC	8	0.100	0.200	0.00	1.736	2.243	1.00

In Fig 5, It is clear from the graph that disturbance rejection is better for IMC-PID than modified IMC-PID.

Fig 5:-

In Fig 6, The performance is evaluated by comparing Direct Synthesis with IMC-PID. It is clear that IMC-PID provides good disturbance rejection.

Fig6:-

In Fig 7, The graph depicts that the IMC-PID shows better result for disturbance rejection compared to DS-d.

Fig 7:-

In Fig 8, For the first order with time delay process, the IMC-PID shows better result for disturbance rejection compared to SIMC.

Fig 8:-

Conclusion:-

The IMC-PID provides good set point tracking and disturbance rejection considering the above first order with time delay process when compared to other methods. The DS methods are generally dependent upon the desired closed-loop transfer function for the set-point changes. Subsequently, the resulting Direct Synthesis controllers tend to perform well for the set-point changes in comparison to the disturbance rejection where the result is not satisfactory. Hence, controller design that produces satisfactory results for the disturbance rejection compared to the set-point tracking is considered as a major design problem. Therefore, it is withal to develop a modified direct synthesis

approach based on disturbance rejection. The new design method will be denoted by “DS-d”. Another method for disturbance rejection of IMC-PID was proposed by Mohammad Shamsuzzoha. This method does not produce satisfactory results. Another method was proposed by Sigurd Skogestad known as SIMC. This method provides improved disturbance rejection for the higher order process.

endothelial dysfunction; ischemic stroke; endothelin-1; nitric oxide.

Abstract

Background: stroke is the most common cause of disability as well as the second leading cause of mortality worldwide. The role of endothelial dysfunction in stroke is critical. Nitric oxide (NO) and endothelin-1 (ET-1) which are produced in endothelial cells are leading molecules regulating vascular function. **Aim of the work:** the aim of our study was to estimate serum nitric oxide and endothelin-1 levels as biomarkers of endothelial function in ischemic cerebrovascular stroke with or without type 2 diabetes mellitus (T2DM).

Methods: A cross-section study included 100 patients with ischemic stroke who were stratified into two groups according to their fasting blood glucose into non-diabetic group (n=45) and diabetic group (n=55). The levels of serum NO were determined calorimetrically. Serum ET-1 concentrations were also estimated by enzyme immunoassay technique.

Results: Our results showed that non diabetic patients with ischemic stroke had significantly higher values of serum NO compared to diabetic group. On the contrary; there was highly significant elevated serum ET-1 levels in diabetic group compared to non-diabetic group. After adjusted for the traditional risk factors, logistic regression analysis test demonstrated that both serum NO and ET-1 levels were statistically significant predictors of insulin resistance among patients with ischemic stroke. Linear regression analysis test showed that serum NO levels were independently correlated with high density cholesterol (HDL.C) values and systolic blood pressure. Regarding serum ET-1 levels, they were independently correlated with homeostasis model assessment of insulin resistance index (HOMA-IR) and waist/hip ratio (WHR) in patients with ischemic stroke.

Conclusions: Both serum endothelin-1 and nitric oxide levels could be useful diagnostic biomarkers predicting insulin resistance among patients with ischemic stroke.

Introduction:-

Stroke is defined as rapidly developing clinical symptoms and/or signs of focal, and at times global loss of brain function, with symptoms lasting more than 24 hours or leading to death, with no apparent cause other than that of vascular origin [1]. There is much evidence suggesting that stroke is the most common cause of disability as well as the second leading cause of mortality in the world [2,3].

Remarkably, diabetes is increasing in epidemic proportions globally in the third world countries. In Egypt, the prevalence of diabetes in adults is 14.9%, and there are over 7.8 million cases of diabetes in Egypt in 2015. Moreover, the number of undiagnosed diabetic patients is more than 3.2 million according to International Diabetes Federation (IDF), 2015 [4]. Patients with diabetes always show impaired endothelial function, this is somewhat due to the frequent association of the disease with other cardiovascular risk factors, such as hypertension, obesity, and dyslipidemia as well [5].

Endothelial dysfunction is characterized by a shift in the actions of the endothelium toward reduced vasodilatation, a pro-inflammatory state, and prothrombotic properties as well. There is much evidence suggesting that endothelial dysfunction can play a role in the pathogenesis of ischemic stroke [6]. It is associated with most forms of cardiovascular diseases. Free radicals can damage the endothelium, and leave it overly permeable, allowing toxins to pass into body tissues [7].

NO is a pluripotent regulatory gas in the vascular system. Endothelial derived NOS (eNOS) plays an important role in maintenance of vascular homeostasis, including regulation of cerebral circulation [8].

Endothelin (ET) is a bioactive peptide produced by endothelial cells that can constrict vessels vigorously. It can also enhance the constriction of myocardium and smooth muscles, as well as promote neuroendocrine role [9]. ET is a powerful pro-differentiation agent and a cell-growth factor that can promote cell mitosis, participate in tumor growth and induce mitosis in tumor growth as well [10]. Three types of ET have been identified, ET-1, ET-2 and ET-3, of which ET-1 is the most potent biomolecule. It has been also shown that ET-1 plays a major role in the regulation of the pathogenesis of malignant tumors [11].

The burden of stroke and other cardiovascular diseases is raising in low and middle income countries, where especially, prevention remains the most cost-effective means of intervention. Noteworthy, there are few studies about the correlations between endothelial hemostasis and ischemic cerebrovascular stroke. Thus the aim of our study was to estimate serum nitric oxide and endothelin-1 as biomarkers of endothelial hemostasis in ischemic cerebrovascular stroke with or without type 2 diabetes mellitus (T2DM) and to assess the correlation between them and clinical-laboratory features of stroke.

Subjects and Methods:-

A cross-section study included 100 patients with ischemic stroke recruited from Internal Medicine and Neurology Departments; Zagazig University Hospitals. Patients were stratified into two subgroups according to their fasting blood glucose levels based on the American Diabetes Association (ADA), criteria reported in 2015 (American Diabetes Association, 2015). Those without T2DM (n= 45), and 55 patients with T2DM. All subjects were matched, as regard age, gender, and ethnic origin.

The patients were chosen with the following inclusion and exclusion criteria:

[I] Inclusion criteria: Focal or global neurological deficit lasting > 24 hours on initial neurological evaluation, CT scan of the brain showed evidence of cerebral ischemia.

[II] Exclusion criteria: Non-ischemic etiology such as hemorrhagic stroke (patients with intracerebral hemorrhage, subarachnoid hemorrhage), patients who had received drugs known to affect the level of ET-1 or NO, such as glucocorticoids, NSAID, nitrate, beta-blockers or heparin, cases with history of respiratory disease, cancer, severe hepatic, renal diseases, acute illness, hormonal therapy, any active inflammatory diseases, alcoholism, carotid artery surgery and chronic heart failure were excluded from the study.

All patients in the study were subjected to the following: thorough history taking, full clinical assessment including general and neurological examination. Stroke severity within 72 hours of onset of symptoms was assessed using the National Institute of Health Stroke Scale (NIHSS) [12]. CT scan of the brain was performed for each patient to exclude intracranial hemorrhage and to diagnose cerebral infarction including its site and size. If CT scan was negative, it was repeated after 72 h. The size of the lesion was calculated according to the formula $0.5 \times A \times B \times C$ [where A & B are the largest perpendicular diameters measured on CT and C is the slice thickness (10 mm)] [13]. All scans were performed on Siemens Somatom Balance scanner (Siemens Company, Germany).

Full laboratory investigations were carried out including (Complete blood count, erythrocyte sedimentation rate, blood glucose level, lipid profile, liver and kidney function tests. In addition, ECG, transthoracic echocardiography, and carotid duplex were performed as part of stroke workup.

Blood sampling:-

Blood samples were drawn from all subjects after an overnight fast and divided into 3 portions: 1 ml of whole blood was collected into evacuated tubes containing EDTA, for hematocrit, HbA1c. The second ml of whole blood was collected into evacuated tubes containing potassium oxalate and sodium fluoride (2:1) for fasting blood glucose. Sera were separated immediately from remaining part of the sample and stored at -20°C until analysis.

Biochemical assays:-

We measured fasting blood glucose using the glucose oxidase method (Spinreact, Girona, Spain). Total cholesterol, HDL cholesterol, and triglycerides were measured by routine enzymatic methods (Spinreact, Girona, Spain). LDL cholesterol was calculated by Friedewald formula [14].

Fasting serum insulin concentrations were measured using high-sensitivity enzyme-linked immunosorbant assay (ELISA). The homeostasis model assessment of insulin resistance (HOMA-IR) index was calculated.

Estimation of serum NO and serum ET-1 levels:-

Serum NO levels were measured using colorimetric method of Montgomery and Dymock, by kit purchased from Biodiagnostic (Egypt). Serum ET-1 levels were estimated using a quantitative sandwich ELISA method according to manufacturer's instructions (R&D Minneapolis, MN, USA) ELISA kit.

Ethical consideration:

The ethical committee of Faculty of Medicine, Zagazig University approved our study protocol, and all participants assigned written informed consent.

Statistical analysis:-

Statistical analyses were performed using the Statistical Package for the Social Sciences for Windows (version 19; SPSS Inc., Chicago, IL, USA). Continuous data were expressed using (mean \pm standard deviation) and were analyzed using t test. One-way analysis of variance (ANOVA) test was done to compare different parameters between more than two groups. Receiver operating characteristic (ROC) analysis was performed to assess sensitivities, specificities, area under the curve (AUC), and the cutoff values of NO as well as ET-1 for diagnosis of T2DM among patients with ischemic stroke. Linear regression analysis was done to detect the main predictors of NO and ET-1 in patients with ischemic stroke. Logistic regression analysis was performed to determine the predictor markers associated with T2DM among patients with ischemic stroke. We considered P to be significant at <0.05 .

Results:-

Clinical and biochemical characteristics of the studied groups as summarized in Table 1

There were significant higher values of LDL-cholesterol in female group compared to male group, however, there were non-significant differences regarding other parameters ($p > 0.05$).

Table 1:- clinical, anthropometric and laboratory characteristics of studied subjects.

	Male group (mean \pm SD),(n=60)	Female group (mean \pm SD) ,(n=40)	P
Age (years)	59.45 \pm 14.012	57.13 \pm 17.3	0.686
Systolic blood pressure (mm Hg)	131.76 \pm 7.82	134.03 \pm 11.2	0.239

Clinical anthropometric and laboratory parameters in ischemic stroke subgroups:-

As shown in Table 2, diabetic cases group had significantly higher mean values of systolic blood pressure, fasting blood glucose, fasting serum insulin, HbA1c, HOMA-IR and TG than in non-diabetic group. Moreover, type 2 diabetic patients had significant higher values of body mass index and waist/hip ratio ($p < 0.001$) compared to non-diabetic group. On the contrary, there was a significant lower value of HDL-cholesterol in non-diabetic group compared to diabetic group ($p < 0.001$). There were non-significant differences regarding other parameters ($p > 0.05$).

Table 2:- Laboratory and anthropometric parameters in patients with ischemic stroke stratified according to fasting blood glucose.

	Non-diabetic group (mean \pm SD) (n=45)	Diabetic group (mean \pm SD) (n=55)	P

Comparison of serum NO (μ mol/l) and plasma ET-1(pg/ml) levels among the studied groups (Fig.1, 2)

Non diabetic patient with ischemic stroke had significantly higher values of serum NO ($2.47 \pm 0.19 \mu$ mol/l) compared to diabetic group ($1.94 \pm 0.41 \mu$ mol/l) (**Fig .1**). On the contrary, there was highly significant elevated serum ET-1 level in diabetic group (9.5 ± 2.16 pg/ml) compared to non-diabetic group (6.41 ± 1.98 pg/ml) (**Fig .2**).

Figure 1

Figure 2

Linear regression analyses in patients with ischemic stroke

Linear regression analysis was done to assess the main independent parameters associated with serum ET-1. Our results showed that, plasma endothelin-1 levels were independently correlated with HOMA-IR and Waist/hip ratio ($p < 0.001$) (**Table 3**).

Table 3:- Linear regression analysis to test the influence of the main independent variables against endothelin-1 pg/ml (dependent variable). * P < 0.05

Accuracy of plasma endothelin-1 and serum nitric oxide for discriminating diabetic from non-diabetic patients with ischemic stroke by ROC Analyses:-

The cut-off values of plasma ET-1 and serum nitric oxide levels were determined by ROC to discriminate diabetic from non-diabetic patients with ischemic stroke; they were 8.65 and 2.3, and the AUC were 0.836(95% CI 7.45–9.17, $P < 0.001$) and 0.881 (95% CI 0.814–0.948, $p < 0.001$, respectively). The sensitivities and the specificities of endothelin-1 were 72.9 % and 99.8 % and nitric oxide serum levels were 80.1% and 77.8%, respectively (Fig. 3, 4).

Logistic regression analysis evaluating the association of serum NO and ET-1 with T2DM among patients with ischemic stroke (Table 5)

After adjusted for the traditional risk factors, logistic regression analysis test was done to evaluate the predictors of insulin resistance among patients with ischemic stroke, serum NO and serum ET-1 were statistically significant predictors of insulin resistance among patients with ischemic stroke ($p < 0.001$).

Table 5:- Logistic regression analysis of the main clinical and biochemical predictors of diabetic patients with ischemic stroke.

Discussion:-

There was great evidence that the etiology of ischemic stroke is known to be a multifactorial disorder in addition to the commonly accepted risk factors [15]. Additionally, increasing evidences suggested endothelial dysfunction role in the pathophysiology of ischemic stroke. Endothelial dysfunction can be found to be both macro- and microvascular, which leads to an imbalance between vasodilation and vasoconstriction capability in homeostasis regulation [16-19]. ET-1 being a potent vasoconstrictor, increases, while NO, as vasodilator substance, decreases in endothelial dysfunction. The vasoconstrictive effect of ET-1 is more prominent on microvascular wall including subendocardial compared to macrovascular. Moreover, an increase in ET-1 causes an endothelial dysfunction [20-21].

Patients with diabetes mellitus are at markedly increased risk of death due to cerebrovascular disease, and this is true of both T1DM and T2DM [22]. In fact, T2DM patients make up the vast majority of diabetic stroke (97% in the Nurses' Health Study) [23].

Early diagnosis and management of endothelial dysfunction in ischemic stroke especially in diabetics is very important. To address this need, we have focused on biomarker of endothelial dysfunction, especially NO and ET-1. Thus the aim of our study was to investigate the role NO and ET-1 as biomarkers of endothelial hemostasis in ischemic cerebrovascular stroke with or without T2DM and to assess their correlation with clinical-laboratory features of stroke.

Our results showed that, among patients with ischemic stroke, 60 % were males and 40% were females. In comparison between male and female group, our findings confirmed that female group had significantly higher values of LDL-cholesterol. Otherwise all other parameters showed non-significant difference between both groups.

In accordance to our finding, a prospective population-based study, showed an increased relative risk for developing stroke of 1.5 to 2 fold in men and 2 to 6.5 fold in women. This increased risk is seen even early after diagnosis of stroke in newly treated T2DM patients [23].

In our research, we found significant higher levels of systolic blood pressure, fasting serum insulin, fasting blood glucose, HOMA-IR, HbA1c, total cholesterol, triglycerides, body mass index, and waist/hip ratio in T2DM group compared to non-diabetic group.

Similar finding was observed also by **Jeerakathil and his colleagues**; who found higher relative risk of stroke in the T2DM group compared to general population [25]. This can be explained as both diabetic as well as obese patients usually consume a high-calorie diet rich in macronutrients which induce vascular abnormalities [26]. Indeed, protein, lipid, and glucose loads are associated with a marked production of reactive oxygen species (ROS) and high-fat meals, with impaired endothelium-dependent vasodilation [27]. Similar to our finding, several studies detected the impairment of endothelial function in relation to blood glucose levels fluctuation, HbA1c, and insulin resistance [28,29]. In contrast to our results, the study of **Zampetaki et al.**, revealed significantly higher value of low-density cholesterol levels in association with endothelial function in [30].

Increasing evidence suggests that diabetes mellitus, hypercholesterolemia, hypertension, and smoking lead to atherosclerosis as well as endothelial dysfunction [31, 32]. The main finding in the current study that non-diabetic patient with ischemic stroke had significantly higher values of serum NO compared to diabetic group. On the contrary; there were highly significant elevated serum ET-1 levels in diabetic group as compared to non-diabetic group. In agreement with our results, **Manrique et al.** observed that patients with diabetes had endothelial dysfunction. There is a general consensus that hyperglycemia and diabetes lead to impair NO production and damaged vasodilatory activity [33]. **Piconi et al.**, found that chronic hyperglycemia leads to weak integrity and apoptosis of endothelial cell [34]. In light of this fact, several clinical studies have demonstrated an impaired endothelium-dependent vasodilation in conduit or resistance vessels of T2DM patients [35]. ROS produced in diabetic patients also contributes to endothelial injury and impair endothelial repair. They are directly cytotoxic for endothelial cells, react with NO, decrease NO bioavailability, and form peroxynitrite anions which act as powerful oxidants. Lifestyle modification has a potential to increase the number of endothelial progenitor cells and improve their migratory capacity, helping to repair the damaged endothelium [36-38].

The results presented herein are innovative; as this study performs a robust evaluation of NO and ET-1 as diagnostic biomarker of endothelial dysfunction. Both serum ET-1 and nitric oxide could be useful diagnostic biomarkers detect T2DM among patients with ischemic stroke. Interestingly; the power of NO was sensitive and specific parallel to ET-1. Our study explored that after adjusted for the traditional risk factors, serum NO and ET-1 levels were statistically significant predictor of ischemic stroke among patients with ischemic stroke. Endothelial dysfunction seems to precede the development of diabetes, as impaired endothelium-dependent vasodilation was observed in healthy non-diabetic subjects who have a first degree relative with T2DM [32], as well as in subjects with impaired glucose tolerance [31].

Our results showed that, serum NO levels were independently correlated with HDL-cholesterol and systolic blood pressure. In agreement with our results, **Boden and Shulman** found the progression of insulin resistance to T2DM parallels to the progression of endothelial dysfunction to atherosclerosis. Moreover, insulin resistance is closely linked with visceral adiposity, and early data suggested that free fatty acids were responsible for this association [37]. The eNOS acts as a protective role in ischemic stroke by inhibiting platelet aggregation and leukocyte adhesion to vascular endothelium, and thus protects against vascular pathological changes such as vascular muscle cell growth and proliferation [38]. Most importantly, eNOS also protects from atherosclerosis, which is an independent risk factor for ischemic stroke incidence [39-41].

Our results showed that ET-1 concentrations were independently correlated with HOMA-IR and Waist/hip ratio., findings which were similar to results of **Romero et al.** Who observed that ET-1 may contribute to the development of endothelial dysfunction, and consequently insulin resistance by increasing the production of ROS, mainly superoxide anion, in the vasculature. This is mainly dependent upon the activation of NADPH oxidase

protein expression and activity [42]. Similar to our finding, **Lee and Poh** reported in their study that ET-1 values were positively correlated with insulin resistance as well as endothelial dysfunction [43].

Conclusion:-

The results of this study reached to a conclusion that serum ET-1 levels were significantly elevated in T2DM patients with ischemic stroke. While serum NO levels were decreased, hence Serum NO and ET-1 could be early predictors of insulin resistance in patients with ischemic stroke.

Abstract

Background -Listening to music while studying/working has been a commonly observed trait amongst youngsters. Effect of music and personality on short term memory and episodic memory has been studied but there is less evidence regarding the recall of semantic memory. Hence the purpose of the study was to explore the effect of different types of music and personality type on Semantic Memory Retrieval. **Methods**-In this cross-sectional study, asymptotic adults aged between 18-24yrs were administered a questionnaire to determine their personality type. Later, they were assessed on questions related to semantic memory recall in three different conditions namely; Silence, with Lyrical music and with Instrumental music. Total Time taken and the Total Score in all three conditions were analyzed. **Conclusion**- The mean of the Total Time and score was significantly more for Silence as compared to music condition. However they performed the fastest while instrumental music was played. There was no significant difference in Total Time as well as Total Score for both introverts and extroverts

Introduction:-

Memory gives us the ability to encode, store and recall information from our brain that helps us to function optimally. Semantic memory which is a part of explicit long term memory constitutes the knowledge of basic concepts or facts. It differs from the episodic memory related to the events (Tulving, 1972). Psychologists describe semantic memory as the general knowledge/information one has acquired over a period of time. (eg. Mumbai is in India, milk is white in colour etc.) Semantic memory is necessary while using language and a variety of cognitive activities. Recognition and use of objects includes association and combination of concepts, all of which are a part of the semantic memory. Thus it plays a crucial role in learning.

Review of literature suggests that music and type of personality are two important factors affecting memory recall in cognitive tasks. But the results are conflicting. Review of effect of background music on learning showed inconsistent findings (Scholz D.,2011).A autobiographical memory recall in patients with dementia concluded that both familiar and non familiar music facilitated memory retrieval. (Foster NA and Valentine ER, 2001) But a study on Recall of word list suggested that encoding stage was influenced by music but not recall (Konantz E.,2012).Later another study stated that music has a negative effect on recall of words and not digits. (Jameson C., 2013).Similarly personality traits also showed influence on memory recall. Music was found distracting for introverts and extroverts

performing cognitive tasks and introverts performed the cognitive tasks worse than extroverts in presence of music. (Furnham & Bradley, 1997, Furnham 2002) But complexity of music had not much effect on word memory task in introverts and extroverts (Matias L, 2014). Thus the evidence is more on short term memory and episodic (autobiographical) memory. However there is lack of clear understanding of effect of music and personality on semantic memory retrieval.

Today, music has become an integral part of the youngsters' lives in metropolitan city like Mumbai in India. Even while studying/working, people tend to listen to music. Some of them listen to lyrical music while others prefer instrumental music. Hence the objective of our study was to assess the effect of lyrical and instrumental music and personality on semantic memory retrieval in young adults.

Material & Methods:-

Approval of the study was obtained from the Institutional Research Committee. This cross-sectional study was conducted during 4 months (from November 2015 to February 2016) at various colleges in Mumbai and Gujarat. Asymptomatic adults, with level of education above Grade 10, fluency in English language and with intact vision and hearing ability were eligible to participate. Any person with known musculoskeletal, neurological or psychiatric illness or with absence of vision and hearing ability were excluded from this study. A total of 111 participants were a part of this study. The study included the individuals in the age group of 18-24 yrs.

After taking informed consent, the basic information was collected including participant's preference to listening to music, their mode of listening to music and the type of music they preferred to hear. Short-scale Eysenck Personality Questionnaire – Revised (Short-scale EPQ-R) was administered and the psychologist determined the personality type of each participant.

The participants were made to answer 3 sets of 15 questions each, in 3 different conditions, namely in silence, when lyrical music was played and when instrumental music was played. High-tempo lyrical music was chosen as one of the condition. The low-tempo instrumental music was chosen as the second condition. All the questions in the test were validated by a psychologist. The participants were instructed to write the answers on blank sheets which were provided to them. The questions were based on information stored in semantic memory. Although each question was different in all 3 sets, the basic criteria remained the same. For example, if one question was 'Which is the 5th month of the year', in the other set the question would be 'Which is the 7th month of the year?'.

The questions were displayed on a computer/laptop screen. Music was played over a headphone. For the lyrical music, a high tempo popular hindi movie song (Sooraj dooba hain from movie Roy) was chosen. For the instrumental music a low tempo song (relaxdaily N°062) was chosen. The same set of songs was played for each subject. The same headphone was used for everyone. The volume of the songs was also constant for every subject. The sequences of all 3 set of questions were also shuffled amongst all the participants.

For each subject, the time taken for them to complete each of the questionnaire and their score in all three conditions were analysed.

Result:-

Table I:- Demographic Characteristics.

Characteristics	Total participants (n=111)
Age (year)	20.73(mean)
Gender (M: F)	41:70
Dominance (R:L)	91:9
Personality traits	Extroverts 72 Introverts 39
Preference to listening to music while studying/working	Yes : 65 No : 46
Mode of listening (%)*	headphones/earphones : 66 and loudspeaker : 34
Type of music preference* (%)	Lyrical : 80 Instrumental : 20
*For the ones who preferred listening to music while studying/working (n=65)	

Table II:- Comparison of time and score of all participants across 3 conditions(silence,lyrical &instrumental) .

	Mean±SD	Mean±SD	p value
	Silence	Lyrical	
Time (sec)	404.43 ± 108.74	365.55 ± 92.36	0.01*
Score (Out of 38)	32.66 ± 3.00	31.65 ± 3.34	0.06
	Silence	Instrumental	p value
Time (sec)	404.43 ± 108.74	346.04 ± 90.99	0.001*
Score (Out of 38)	32.66 ± 3.00	31.28 ± 3.60	0.0083*
	Lyrical	Instrumental	p value
Time (sec)	365.55 ± 92.362	346.04 ± 90.99	0.11
Score (Out of 38)	31.65 ± 3.34	31.28 ± 3.60	0.42
SD, Standard Deviation; Statistical calculation and comparison between the groups by Kruskal-Wallis Test (Nonparametric ANOVA) and Dunn's Multiple Comparisons Test;*p value <0.05, considered significant			

Statistical analysis shows that the mean of the Total Time was significantly more for Silence as compared to Instrumental music condition as well as for the Lyrical music condition. For the Total Score, mean in Silence was significantly more as compared to Instrumental music condition.

Table III:- Comparison of time and score between Introverts and Extroverts.

	Introverts (n=39)	Extroverts (n=72)	p value
	Mean±SD	Mean±SD	
Silence			
Time (sec)	379.07 ± 78.86	418.22 ± 120.29	0.16
Score (Out of 38)	32.64 ± 2.82	32.68 ± 3.11	0.71
Lyrical			
Time (sec)	350.61 ± 76.21	373.65 ± 99.59	0.46
Score (Out of 38)	31.74 ± 3.30	31.61 ± 3.38	0.76
Instrumental			
Time (sec)	330.07 ± 79.58	354.69 ± 96.03	0.15
Score (Out of 38)	31.41 ± 2.87	31.22 ± 3.95	0.95
SD, Standard Deviation; Statistical calculation and comparison between the groups by Mann-Whitney Test; *p value <0.05, considered significant			

On comparing the mean values of Total Time and Total Score between introverts and extroverts in each condition, the two-tailed P value was considered not significant.

Discussion:-

On comparing the semantic memory recalling capacity in three different conditions, it was found that participants took the longest to complete the questionnaire in silence but scored the best in it. Thus the result of the present study showed that silence is the best environment for studying/working. We observed that the participants were able to focus more readily as there was least amount of distraction around while they performed in silence. This is in agreement with the previous studies on cognitive tasks where participants performed best in silence(Furnham & Bradley, 1997, Konantz E, 2012,Jameson C, 2013).

In both the music conditions,time taken to complete the test was shorter compared to silence.But the scores dropped when music was played as compared to the scores in silence. When comparison was made between lyrical music condition and instrumental music condition, participants performed better when lyrical music was played. A previous study also showed that word recall was better when vocal music was played as compared to when instrumental music was played(Jameson C,2013).

In the current study, we did not test just the word recall but tested the conceptual knowledge. The test included various domains like knowledge about living, non living things as well as their visual and non visual attributes. It has been found that there are different areas in brain that get activated in memory retrieval(Martin A. et al.1995,2001, Thompson-Schill et al, 1999,2003 Martin A. 2007). There is a structured system along a posteroanterior axis in the temporal cortex, anterior temporal lobe being responsible for abstract knowledge and generalisation.(Roger T.T.et al 2006 ,Yee E.et al 2013) Memory and music possess a unique connection as the

auditory processing area is also present in the temporal lobe. A PET study revealed that the verbal and musical semantic processes activated a common network extending throughout the left temporal neocortex. (Groussard et al., 2010) Hence it is difficult for one to perform the memory recall to their optimum level with music.

Based on the Short-scale Eysenck Personality Questionnaire – Revised, each participant was classified as being an introvert or an extrovert (Eysenck, S. B. 1985). In the participants, 35% were introverts and 65% were extroverts. Introverts performed the best during silence and worst when instrumental music was played which is in agreement with previous studies. But in our study, extroverts also performed the best during silence and worst when instrumental music was played, thereby differing with the results of previous studies. (Furnham & Bradley, 1997, Mistry H. 2015) The reason behind this varied result may be because the tasks in the previous studies involved working memory whereas this study demanded recall from long term part of the memory.

The study suggests that silence is the best kind of environment one can study/work in as it aids in maximum semantic memory retrieval for majority of the individuals. For both introverts and extroverts as well, silence is the best environment to be preferred while studying/working. Even if the time required was more in silence in the present study, the difference was very less in terms of minutes.

Further research should be done by investigating semantic memory recall on the basis of the preference of the participants to listening to music while they study/work as well as when music is played in the background versus when it is played over headphones.

Abstract

Music has always occupied a central place in the imagination of Indians. Over the years, the audience started welcoming different genres of music. Hip Hop, a popular form of music which evolved itself from oppression has its share of audience in India. The freedom to "express" oneself without class barriers and conventions popularise this genre. In India, non-commercial Hip Hop has a serious take on social and political issues through strong lyrics. Hip Hop artists are addressing the issues that are more relevant to the times rather than blindly rapping about living in a place with gun fights and racism which imitates the scenario in the West. Issues of poverty, lack of employment, environmental problems, drugs, Kashmir, corporate influence, caste barriers, child care etcetera which are severe issues to be considered in India, are approached through Hip Hop which acts as protest music. This paper analyses the Role of Hip Hop in addressing the social and political issues in India. By analysing the lyrical content qualitatively and by using an online this paper examines how the audience perceives and respond to non-commercial Hip Hop which has socially and politically charged lyrics.

Introduction:-

Music plays a central role in people's lives. Lull (1985) suggested that people select music for particular reasons and are personally involved with their favourite types of music on physical and cognitive levels. Musical content (e.g., rhythm, tempo, melodies) amplifies the message of songs. It "is designed to invoke the emotional state, the state of consciousness, or mental state as it is experienced with the self and others" (Chesebro, Foulger, Nachman, & Yannelli, 1985, page 118).

Rap music is considered as one of the most controversial forms of popular music to find its way into the mainstream popular culture as far as texts go. However, rap has an interesting history. It is said to have evolved from "Reggae", one of the popular music genres in the Rastafarian subculture attributed to the Jamaicans. The Rastafarian subculture had its religion which included music and lifestyle. As far as the music goes, it sounded like a "fusion of rock, soul and calypso underscored by a heavy syncopated bass guitar line and drums" (Neil.J.Savishinsky). This island music espoused a lot of social, political and religious ideologies which expanded the repertoire of transnational music culture. While the music created ripples, the Rastafarian culture was known for its 'set-against-the-flow' style. The music started at an off-beat, which itself is a convention broken in the first place. The idea was to convey the

Address:- Master of Journalism and Mass Communication, Department of Visual Media, Amrita School of Arts and Science, Amrita Vishwa Vidyapeetham University Kochi, Kerala, India.

disagreement to rules and conventions. From there, different types of subcultures were born, and rap is one among them.

The early 2000s saw a sudden surge in Indian rapping population who mainly rapped in English. The year 2011 saw many new underground artists sprouting up with what they call independent music. These rappers from all corners of the country rapped in their regional language and delivered several hits occasionally which proved rap to be futuristic for fresh talents.

When these rappers finally started developing their lyrics, it still had the influence of the American rappers they adored.

However, in recent years, more youngsters have emerged with non-commercial Hip Hop with lyrics that addresses issues that are relevant to the society that they are familiar with, rather than plainly aping the American rap which has stories of gunfights and gang wars.

What draws many musicians to Hip Hop is the lyrical freedom it offers. Many artists raise sensitive issues through their songs which otherwise remain grounded due to political or social pressure. Rappers do not hesitate to sing about the governmental policies and programs and the politics behind everything.

Usually, such take on government is considered as an “attack” to defame the government when other methods, apart from music are used to express one's opinions. In the case of Hip Hop, no such restrictions have been imposed so far which makes it a choice for many to raise an issue.

Literature Review:-

Content analysis and use of language were the focus of previous researchers about rap music. Started out in the form of protest music, rap soon got the attention of many because of its lyrical content. Initially, the musicians came up with responsible protests which were predominantly relevant to the times and represented a larger community. Some research findings show that this genre indeed relates to some communities which can identify the problems as their own and form a system of themselves. Studies suggest that "the core essence of hip-hop is shared by marginalised groups" Motley, Carol M. and Geraldine Rosa Henderson. "The Global Hip-Hop Diaspora: Understanding The Culture". Journal of Business Research 61.3 (2008): 243-253. Web.

Later on, it shrank into a thin form of expressing the artists' frustrations which usually had explicit content. Rap, considered as “intensely violent, both sexually explicit and sexually violent, misogynistic, drug and gang oriented, and politically radical”(Derek Bushton,1986) is said to reflect on the artists as well.

Rap music contained themes depicting gang fights, drive-by shootings, and widespread gang violence. Johnson, Jackson, and Gatto (1995) suggested that those attitudes extend to using violence against women. They observed that those who viewed a violent rap video were more likely than those in nonviolent-music and control conditions to accept the use of violence against women, and to intend to use violence to resolve a decision making conflict.

Conceptualization of Hip-hop:-

Psychological studies provide a different approach to the content of hip hop. There are many conceptualizations of hip-hop as it was not solely a musical phenomenon; it embodied an entire way of existence for those immersed in or touched by its culture. One factor that distinguishes hip-hop from other genres of music is its primary focus on the spoken word”(Kobin and Tyson 343-356)

Cultivation Theory:-

The influence on audience perception was studied by applying Cultivation Theory which proposes that continuous exposure to media content over time can subtly cultivate or instil beliefs about the world that the audience has been part of.

Research Questions:-

1. What is the perception of the audience to socially and politically charged lyrics of Hip Hop?
2. Do the lyrics have any influence on audiences' decision-making?

Method:-

This study incorporated cultivation theory to examine the effect of rap/hip-hop music on shaping the audience attitudes and influencing decision making. By using a qualitative content analysis and an online survey, this study analysed the lyrical content of 10 rap/hip-hop songs released during the year 2010-2016.

The sample set was chosen based on the level of socially and politically charged lyrics that were present in the songs.

Qualitative Content Analysis:-

The study incorporates qualitative content analysis guided by the cultivation theory. The study examined the presence of protest lyrics found in 10 popular rap and hip-hop songs released during the year 2010 to 2016. The lyrics of the songs were obtained from various internet sources and the portion which had the presence of protest was coded. The level of protest was coded based on the presence of words which points towards political and social issues: inequality, discrimination, poverty, hunger, scam, shooting, political injustice, invasion of corporates in public matters, illegal trade and business, drugs and sexual assault.

Coding Descriptions:-

- Songs which had reference to political content was coded as such if they contained words that included: political parties, government, military, scams, etc.
- Songs which had reference to social content was coded as such if they contained words that included: poverty, inequality, hunger, corporates.
- Songs which indicated sexual conquest was coded as such if they contained phrases like: feel the pain, don't have to fight back.

Frequency or Emphasis of Protest Lyrics:-

The songs which had portions indicating protest terminology was first coded, and the amount or emphasis of content was labelled accordingly to determine the protest levels.

- Lyrics which had one or two references to protest- Low level
- Lyrics which had three to four reference to protest- Medium level
- Lyrics which had reference to five or more reference to protest- High level

Survey:-

In addition to a qualitative content analysis, the study performed an online survey administered through Zoho. The respondents were asked to respond to the survey which consisted of 10 questions by clicking on the link provided through email or social media. The survey considered a total population of 100 participants of women and men in equal numbers (N=100).

The first five questions asked the respondents general issues to determine the age, gender and listening habits.

The remaining questions tested the attitude of the interviewees towards non-commercial Indian Hip-Hop. It involved a series of multiple-choice questions graded on Likert Scale.

The questions also tested if the lyrics had any influence on the respondents' decision making.

Findings:-**Content Analysis:-**

Following are the list of popular Hip Hop songs with their year of release and the issues they address. By using a content analysis method, this study analysed the lyrics of 10 rap/hip-hop songs from 2010-2016. The sampling set of music was selected based on the strong political and social themes appearing within the lyrics of these popular hits.

Table 1:- List of songs taken for content analysis.

S. No	Song	Artist/Album	Release Year	Remarks	Level of Protest
1.	Haq Hai	Naezy	2016	Talks about the inequality in India and addresses government frauds.	Medium
2.	Takkaru Takkaru	Hip Hop Tamizha	2016	Addressed the need for Jallikkattu in Tamil Nadu. Became the Anthem of pro-jallikkattu protesters.	High
3.	Tragedy Mein Comedy	Naezy	2016	An attempt to mock the system which is corrupt and hollow.	Low
4.	Kodaikanal Wont	Sofia Ashraf	2015	Issue of mercury poisoning by Unilever Limited in Kodaikanal	High
5.	Sunlo Gall	Krull172	2014	Drug abuse in Punjab	Low
6.	Listen, My Brother	MC Kash	2012	Insurgency in Kashmir	Medium
7.	My People	MC Kash (Rebel Republic)	2012	Military attack on civilians in Kashmir	Medium
8.	Why We Rebel	MC Kash	2012	Explains the torture by Indian military troops on young Kashmiri youth in Indian jails.	Medium
9.	Re-introduction	Cryptographik Street Poets	2012	The battle between Uranium Corporation of India and environmental groups in Shillong.	Low
10.	I protest	MC Kash	2010	Protest demonstrations in Kashmir and remembering every youth who lost his life in mass military firing.	high

Inequality and poverty in the fastest growing metro:-

India is a developing country. However, if one needs to fill the stretched chasm about ultra-rich and ultra-poor, Mumbai is the place to be. The songs by artist Naezy, who hails from Mumbai, reflects the issues that the common man is familiar with. The level of protest is medium. The song involves criticising the government and its unsuccessful programs and policies. The song also talks about how government looted a humongous amount in the name of setting up a telecom network in the country. The artist calls the politicians "thief" and vents out his frustrations about how his city still has kids who go to sleep on an empty stomach. Thirty of India's sixty-eight billionaires live in Mumbai. Though it is a commercially strong city, more than 40 percent of Mumbai's population lives in the slums. The inequality is evident.

The following lyrics refer to the 2G scam in this verse which took the country by storm. The scam involved the teaming up of government officials and politicians to illegally allocate frequencies to telecom companies. This act resulted in the missing of a massive sum of rupees 1,76,645 crores. This scam was ranked second by the TIME magazine's list of top 10 cases of abuse of power.

" Sarkaar apni so ri hai, Paiso ki padi bori hai
 2 g 3 g kyu ji kitni inki chori hai?
 Chori toh chori uppar se seena zori muh par jhooti choli hai
 ye raakshaso ki toli hai."

Lyric Translation:-

2 g 3 g, how much was the whole theft worth?
 They steal and lie about it; they wear masks and cheat
 They are an evil gang
 What a neighbourhood this is? Tell me

The State of Tamil Nadu and “Jallikkattu” Protest:-

South India is a culturally-rich region. Though westernisation is a part of development, people from Tamil Nadu are well rooted in their culture. The recent peaceful protest by the youngsters demanding permission to conduct "Jallikkattu" which is a traditional bull-taming sport of Tamil Nadu is a proof of it. One of the reasons which initiated this protest was the album Takkaru Takkaru by Hip Hop Tamizha, released during early 2016. The lyrics of the song was found to have a profound impact on youngsters. The sport was banned in 2014 upon petitions filed by PETA which stated that animals were mistreated in the name of tradition. However, it was in the year 2016, the release of the song slowly started creating ripples. The song went viral on social media which attracted supporters who demanded a lift of the ban. The song did not plainly talk about the sport. The artist rapped about how large corporations are intruding into the culture and practice of the farmers and grass-root level population.

The artist did not hesitate to lash out on corporations, and PETA whom the artist says has vested interested in this matter. The artist talks about how these non-governmental bodies are so powerful and influential that they are trying to eradicate the culture of a state which puts its population in question.

The song created large-scale protest across Tamil Nadu which was supported by movie artists and was known as the most non-violent protest by youngsters in India. The protest finally resulted in the lifting of the ban on the sport. The song falls under the High-level protest category. The song soon became an anthem for the protesters.

*"idhan pinne ulla sarva desa arasiyal,
 viyabharathirkkaaga nadanthidum veri seyal.
 Indha vilaiyaattai thadai seidhaal, naatu maadu azhiyum, veli naatu niruvanangal,
 viyabaaram perugum Ariyaatha tamizha, un ariyaamai pizhaiyaal,
 un adayalaam izhanthaal, nee methuvaaga azhivaai, un adayalaam izhanthaal,
 un thaai naatil neeyum, oor agathiyai maariduvaai.
 Idhu maatta pathina prechana illa, un naatta pathina prechana da,
 naatin porulaathaaram veezhum, naamum edukanum pichchayada."
 Takkaru Takkaru Lyrics: Hip hop Tamizha". LyricsRaag.Com. N.p., 2017. Web. 10 Mar. 2017.*

Lyric Translation:-

Behind this ruthless act for trading is international politics. Banning this sport will only result in the extinction of our native breeds, increase the profit of foreign corporations.
 Tamizha! Because of your ignorance, you will lose your own identity in your native land.
 If you lose your identity, you will end up being a refugee in your homeland.
 This is not just about the bulls, it is about the downfall of our economy
 which will result in us begging to the foreign countries.

Environmental Issues:-

Sofia Ashraf, in her protest song “Kodaikanal Won't” addresses the illegal dumping of toxic waste into the Kodaikanal river. The song openly slams the company Unilever by mentioning the name of its products that the consumers are familiar with it. The song calls for support to sign the petition demanding the company to take up immediate remedial measures. The artist raps about how the company, being a big corporation is influential and powerful, bends the laws and regulations. Illegal dumping of toxic mercury into the Kodaikanal River and exposure such toxins resulted in children being born with deformities. However, the company was not held accountable for this. The song brought the issue to light. Unilever finally agreed for an out-of-court settlement with the people affected.

*"They dumped their waste in the local shrubbery
 Now that's some toxic shit
 By the way, what'd they say?
 That their factory was safe as day*

*They don't trust a word of what their workers say
 What about the polluting, the mercury poisoning?
 It's life threatening. There's kids suffering.
 Poison in the soil you don't have us foiled.
 Your clean was a sham, there's poison in the air.
 You ain't done done-da done done done
 Unilever has been hiding behind
 Their fake PSAs and Pepsodent smiles
 They washed their hands off Kodai with Lifebuoy
 There's nothing Fair or Lovely about this trial."
 "Kodaikanal Won't". prezi.com. N.p., 2017. Web. 10 Mar. 2017.*

Kashmir Insurgency:-

Jammu and Kashmir, a state in the extreme north, is an integral part of the Indian Union. Since 1990, the state is under Presidential rule due to militancy. The Governor runs the administration with the help of Advisors appointed by the Centre. The Constitution of India applies to the State of Jammu and Kashmir as well. The territories of Jammu, Kashmir, Ladakh and Gilgit form the state of Jammu and Kashmir. In 1846, it was the biggest princely state in India before the 1947-partition. At that time, the total area of the state was 2,22,236sq.km. In 1949, due to a cease-fire line between India and Pakistan, 78932 sq.km of the area(Gilgit, Mirpur, Kotli and part of Poonch) came under the possession of Pakistan.

Again, in 1962, 64000 sq.km was occupied by China, now known as Aksai Chin. Later, Pakistan again made illegal possession over Chhamb, Deva, Chakla and Manawar gaining an area of 3999 sq.km. So finally, India is left with the remaining 12850 sq.kms.

After the defeat of the U.S.S.R, which was a superpower by Afghan mujahideen, General Zia, who was the Pakistani dictator initiated a similar move to bleed India. He sent his trained troops of Islamic militants to Kashmir in the late 1980s. During that time, Pakistan was well aware that it cannot declare a direct war with India.

It began expanding as ISIS, Indian Mujahideen, Al-Qaeda planting their personnel in the soil they want to attack. The tension between India and Pakistan hiked with a five-man suicide squad attacking the Indian parliament in December 2001, and the insurgency still continues.

MC Kash, a youth who hails from Kashmir, talks about everything in Kashmir through his songs as his land remained disconnected to the remaining parts of the country. His songs gained international recognitions. In his song, *I protest*, he speaks about the protest demonstrations in Kashmir and lists the names of every youth who lost his life in the military attack. He refers to his homeland Kashmir as a paradise which is under fire due to the military strike. The murder and rape by Indian troops are unspoken details of insurgency in Kashmir which is covered up by the Indian government.

*My paradise is burning
 With troops left loose with ammo
 Who murder and rape
 Then hide behind a political shadow*
 Other lyrics which relate to such issues are in his song *Why We Rebel* and *Listen My Brother*
*I come from the land of bloody crackdowns
 where silhouettes of life rush to the playgrounds
 you sit your ass down, and don't make a sound
 take off that Pheran, you motherfuckin' clown
 whose son is he? whispers ask
 doesn't matter really 'cause it ain't the last
 faint hearts of men beat a little slow
 doesn't matter when there's a gun down your throat*

Act of torture and violence on Kashmiri kids who are forcibly taken and locked up in Indian jails. They are raped and mistreated. The artist tries to empathise with the victims. The following lyrics imitate the act of rape and sodomy on Kashmiri kids in Indian Jails.

*Pressure Up, You hold the hands
Show this motherfucker how to bleed in this land
Push It Push, let him scream and crawl
make his blood ricochet of these walls
thirteen, and you holdin' a stone?
lemme see those scars and yo broken bones
Brother, allow me to hold you
knowing even the Lord can't console you*

Results:-

Views on Non-Commercial Rap/Hip-Hop and its Interpretations from the Survey:-

91 out of 100 respondents listen to Indian Hip-Hop as compared to the remaining nine who do not. Over 63% of respondents agree that non-commercial Indian Hip-Hop is addressing many social and political issues. Out of this 60% of respondents agree that they are also able to relate to the issues while 31% responded that they could sometimes relate to the issues.

Figure 1:- Population Indicating Agreement/Non-agreement to the Ability to Relate to Societal Issues After Listening to Socially or Politically Charged Rap/Hip-Hop Lyrics.

- When questioned about if the lyrics had any influence on the respondents' decision making, 65% respondents agree that they have been part of/supported a cause/campaign after being influenced by the lyrics

Figure 2:- The population of Respondents who have been a Part of/ Supported a Cause/Campaign After Being Influenced by the Lyrics.

- 68% responded positively to when questioned if they would consider raising an issue through Rap/ Hip-Hop as opposed to 13% who chose not to consider and 18% who may/may not consider.

Figure 3:- Population of Respondents who would Consider Raising an Issue Through Rap/Hip-Hop.

Results of Content Analysis:-

Out of the ten songs analysed, three songs were labelled as High-level protest songs. The songs are found to have influenced the audience in decision making and also to support/be a part of the issue raised. Three songs were labelled as low-level protest songs because of the repetition of subjects and poorly influential lyrics. The songs were not successful in creating a mass perspective. They were restricted to a small group or a place that the artist had a personal connection to.

The remaining four songs were labelled as medium-level protest songs as they were successful in bringing out more global perspective and also got attention for the same. Some of them openly criticised the system and threw light upon issues that were kept under folds.

Comparing Results:-

To consensus between content analysis and survey results, both the methods were tested for differences and similarities. While the content analysis dealt with the explanation of lyrics and its context, a similar analysis was drawn from the survey results which described the audience perception about social issues being raised by Rap/Hip-Hop.

The survey results also indicate a positive response to lyrics having influenced the respondent in decision-making. This is similar to the analysis made about 'Kodaikanal Won't' and 'Takkaru Takkaru' albums which had large scale supporters for the issue that these songs addressed.

Conclusion:-

Over the years, protest songs, which were once used as a medium to voice the voiceless lost its significance as people began venting out the anger and frustration on whatever they found annoyed them. A community's view shrunk to an individual's view and it was tagged as violent and inappropriate. The lyrics lost quality and artists were rapping about anything and everything.

In India, non-commercial rap/Hip-Hop scene is better with the artists sticking to its 'Rasta' roots. Socio-political protest constitute the major feature of this "counter-culture movement" (Derek Bishton(1986:2))

The study, with the help of cultivation theory proves that exposure to media content for a prolonged period has an effect on the perception and decision making of the audience. The role of Rap/Hip-Hop in addressing social and political content has an influence on listeners who may develop "similar attitudes in their own lives, including accepting the objectification of women" (Dixon, Zhang, & Conrad, 2009, p. 348).

The study thus proves that non-commercial Indian Hip-Hop has an influence on the perception of the audience.

Scope Of Study:-

Previous studies on Hip-Hop were mainly about the deteriorating content and excessive use of unaccepted language. From this research results, a positive side of protest music can be inferred. With new artists using rap/hip-hop as a tool to voice serious issues, this could probably be a new music movement in India.

The perception study can be performed on a larger scale which can be used in clinical psychology studies to understand the attitudes and behavioural patterns. Rap therapy is another field of study which is gaining popularity.

Limitations:-

The survey used a convenience sample of 100 respondents who were exposed to this survey through emails and social media. As a result, the final findings cannot be applied to a general population. Additionally, the survey was administered to a population of rap listeners and non-rap listeners. A case of such may have affected the evaluation process. This might have resulted in obtaining skewed data which may otherwise have been different if only rap listeners were considered.

The lyrics may be interpreted differently and individual opinions may vary.

Acknowledgements:-

I am extremely thankful to Vinod Laxman, Assistant Professor, Department of Visual Media And Communications for his constant guidance and advice on completing this research.

Proper nouns, Pronouns, Mumbai-Delhi dialect of Indian Sign Language.

Abstract

The aim of the study was to investigate the expression of proper nouns and pronouns by deaf signers of Indian Sign Language (ISL) (Mumbai-Delhi dialect) in narration. Ten fluent Deaf signers of Indian Sign Language (5 Males & 5 Females), in the age range of 18-40 years using signs of Mumbai-Delhi dialect were included in the study. The picture cards of the story "The snake and the mongoose" was used for the narration task. The participants were presented with the picture cards and instructed to narrate the story using sign language. The signed expressions of the participants were video recorded and later analyzed by two judges individually. The judges transcribed and coded the signed expression of the participants for proper nouns and pronouns types using ELAN software and the frequency of occurrence was calculated for the proper nouns and pronoun types. The results showed that the deaf signers of ISL used noun sign or fingerspelling to express the proper nouns; and used a combination of 'manual pointing and eye gaze' as a predominant strategy to indicate pronouns. Use of other strategies such as a) manual pointing/indexing alone and b) manual pointing/indexing using combination of non-manual markers were also used to express the pronoun types.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Indian Sign language (ISL) is used in Nepal, Bangladesh, Sri Lanka and border regions of Pakistan (Vasishta, Woodward and Wilson, 1978; Woodward, 1993; Zeshan, 2000 & Zeshan, Vasishta & Sethna, 2004). Gordon Jr., (2005) identified three dialects of ISL: Mumbai-Delhi Sign Language, Kolkata Sign Language and Bengaluru-Chennai Sign Language.

The 'Signing space' in Sign languages extends from the top of the head to just below the waist vertically; and from the signer's extreme right to extreme left horizontally/laterally. The signing space is used to express phonological contrasts in signs (Brentari, 1998; Sandler, 1989) and express pronouns, number and verb arguments in the morphological structure of signs (Janis, 1992; Mathur, 2000 & Padden, 1988). At the discourse level, however, spatial locations are associated with discourse referents (Klima & Bellugi, 1979).

Pointing gestures typically co-occur with speech, and are used to draw the attention of the listener (Bangerter, 2004; Clark, 2003 & Haviland, 2000b). Kendon (2004) & Kita (2003a, 2003b, 2003c & 2009) reported that pointing signs in sign language are not different from that of pointing gestures used by non-signers. In pointing gestures, an extended index finger is used to point at the object, location, person etc. In sign languages, pronouns are signed by pointing to a person or thing that is “present” in the space or by pointing to a specific location in the signing space which represents a person or thing that is “not present” in the communication area. Kendon (2004) and Kita (2003a, 2003b, 2003c & 2009) observed that the pointing signs are used to express pronominal reference in sign languages and they do not look different from that of the pointing gestures that are used by the non-signers. The association between the referent and a spatial locus is established by articulating the sign for the referent in space, by producing the sign and then pointing to the locus or by gazing in the direction of the locus being established while making the sign (Lillo-Martin & Klima, 1990; Padden, 1983). Once the locus for a referent is established, the locus is maintained throughout the discourse. This phenomenon of establishing loci in space in sign languages to indicate pronouns is known as ‘Pronominalization’. Bangerter (2004) observed that in sign languages, the signs used for pointing refer to precise, unambiguous, pronominal reference.

The use of pronominalization to express pronouns is well reported in several sign languages such as American Sign Language (ASL) (Hatzopoulou, 2008 & McBurney, 2002), British Sign Language (BSL) (Kyle & Woll, 1985; Meier, 1990), Israel Sign Language (ISL) (Meier, 2003), Swedish Sign Language (SSL) (Bergman, 1980), and Brazilian Sign Language (LSB) (Berenz, 1996). Three distinct signs are often reported across many sign languages in the signed expression of pronouns which include: (a) pointing towards the signer to refer to first person pronoun ‘I/Me’, (b) pointing towards the person to indicate second person pronoun ‘You’ and (c) pointing to another person to indicate ‘He/Him’, or ‘She/Her’ (For example, in American sign language (ASL) [Berenz (1996); Cormier (2005, 2007); McBurney, (2002); Hatzopoulou (2008); Liddell (2000b, 2003)] in British Sign Language (BSL) [Cormier, Fenlon, Rentelis, & Schembri (2011)] in Sign Language of Netherlands [Bos (1995)] in Swedish Sign Language (SSL) [Bergman (1980)] in Israel Sign Language (ISL) [Meier (2003)] in Brazilian Sign language (LSB), [Berenz, 1996]). Further, there are no stand alone signs reported to express pronouns (lexicalized pronouns) in ASL (Friedman, 1975); the pronouns in ASL are signed by establishing a frame of reference in front of the signer’s body, wherein the reference points for objects, persons, and locations are established.

The pointing (with an extended index finger)/ indexing in sign languages convey several functions including the expression of pronominals, adverbials (locative) and determiners. Locative (adverbial) pointing signs are those signs that point to the signing space to refer other location which have adverbial function. E.g., ‘here’ ‘there’ etc. Demonstrative pointing signs are those signs used to express demonstrative pronouns such as ‘this’, ‘that’ ‘here’ and ‘there’ etc. The distinction between proximal demonstrative pronouns (this, these & here) and distal demonstrative pronouns (that, those & there) are made based on the distance of the locus being established by the speaker to indicate object, place etc (Lyons, 1979). Diessel (1999) reported that demonstrative pronouns are the very first words that typical children learn and that demonstrative pronouns are frequently used by typical adults in conversation (Wu, 2004).

Possessive pronouns in sign languages are expressed in the same way as that of Non-possessive pronouns/Personal pronouns, but the latter have a distinct handshape. Non-possessive pronouns/personal pronouns are generally expressed with pointing handshape whereas possessive pronouns assume different handshapes i.e., palm directed towards the referent in several sign languages such as ASL (Cormier & Fenlon, 2009), Australian Sign Language (OGS) (Johnston & Schembri, 2007), and Hong Kong Sign Language (HKSL) (Tang & Sze, 2002). The pointing function is also reported to indicate plural pronominal signs. In ASL and BSL, Cormier (2005 & 2007) found that, the plural pronominal signs have less of a pointing function than that of the singular pronoun signs i.e., plural pronominal signs are less indexic in nature when compared to singular pronominal signs. IPSL has a transnumeral pronominal sign (an extended index finger pointing sign) which is used for singular and plural; pointing towards the signer’s chest refers to the signer or the signer plus others, depending on the context. Most sign languages use spatial inflections to mark person and number inflections (Zeshan et al., 2004).

The expression of pronouns in sign languages also involves signing of a manual sign along with the non-manual markers. The non-manual expressions used to express pronouns include eye gaze, head turn in American Sign Language (ASL) (Baker & Cokely, 1980; Bellugi & Fischer, 1972; Liddell & Metzger, 1998), wherein, the direction of eye gaze follows direction of hand; the direction in which pointing sign is made. Neidle, Kegl, MacLaughlin,

Bahan and Lee (2000) reported that in ASL, in addition to eye gaze, pronouns are often accompanied by other non-manual markers such as wrinkled nose, furrowed brows, and a slight rapid head shake.

Several other studies on ASL have recorded the role of 'body shift' to indicate the third-person reference with a pointing sign directed towards the signer; the shift indicated by the change in orientation of signer's shoulders, head and/or eyes in ASL (Lillo-Martin & Klima, 1990). On the other hand, Meier (1990) reported that head position and the direction of eye gaze in Israel Sign Language (ISL) distinguishes third-person pronoun from non-third person pronoun. MacLaughlin (1997) noted that pointing signs in Hong Kong Sign Language (HKSL) could be interpreted as a pronoun when signed alone. The pronouns in HKSL are optionally signed by using eye gaze directed at the location of referent in signing space. Liddell and Metzger (1998) reported that the use of eye gaze to express pronouns in ASL was consistently directed toward the addressee during the production of both second person pronouns and third-person pronouns and no distinction in eye gaze was found between second and third person referents.

Studies addressing the linguistic attributes of Indian Sign language (ISL) when compared to other sign languages are very scarce (Prajapati & Asai, 2010). There is need to address the sign language structure of Indian Sign language, in order to provide a base for formalizing the approaches towards teaching and learning the Indian sign language by the hearing impaired individuals as well as their communication partners. It will also facilitate and open opportunities to research and develop sign language recognition systems. This study aimed to analyze and report on expression of pronouns used by the deaf signers of Indian Sign language (ISL) using Mumbai-Delhi dialect, including the use of non-manual markers in a story narration task.

Method:-

Participants:-

Ten fluent Deaf Signers (5 Males & 5 Females) using Indian Sign Language (ISL) signs of Mumbai-Delhi dialect were included. The participants were in the age range of 18-40 years. Informed written consent was obtained from each participant prior to the recording of their samples. The participants met the following criteria:

They were pre-lingually deaf born to hearing parents.

They were proficient in using ISL in day to day conversation. They were using ISL for a minimum of 10 years, as ascertained using a checklist prepared for the purpose by the investigator.

They interacted with their parents, family members and other communication partners using a combination of sign language and few verbal expressions for day to day communication.

They had a minimum educational qualification of secondary education in a school for Persons with Hearing Impairment with the medium of instruction for curricular work being English.

They did not have any other disabilities in motor, visual and neurological domains (as ruled out using Quick neurological screening test (QNST) by Mutti, Sterling and Spalding, 1978), and cognitive deficit (as ruled out using Mini-Mental State Examination (MMSE) by Folstein, Folstein, and McHugh, 1975).

All the participants used Mumbai-Delhi dialect of Indian Sign Language (ISL) as ascertained through information collected in the demographic data sheet by the investigator.

Task and procedure:-

A story on the topic 'The Snake and the Mongoose' was selected and depicted as sequential picture event on 6 cards with the help of an artist. This story was selected as it provided opportunities to use pronouns repeatedly when the story was narrated. The pictures depicting the story sequence were verified for disambiguity and order of continuity in the sequence by two qualified speech-language pathologists on a three-point rating scale. Video recording of each participant at a time was carried out at the educational centre or work place of the participant by the principal investigator. The video recording of the signed expression of the participants for narration of story was carried out in a room which was well illuminated with minimal visual and sound distraction. The sequential story cards were initially given to the participant (from whom the data was collected individually) and was asked to understand the concept represented in each card and the summary of the story. The participant was then asked to narrate the story using sign language as naturally as possible and the signed expressions of the participants were video-recorded by

the principal investigator using a hand held Sony Digital Video Camera Recorder (Model no: DCR-SR47E) with the capacity of 800K pixel, 60*optical zooming, and storage capacity of 45 hours of video footage. The camera was mounted in front of the participant on a tripod stand at a distance of minimum 5 to 7 feet and zoomed to capture the sign space from head to trunk and arms extended on both the sides of the participant. Each participant was given two trials each and the same was recorded.

Analyses:-

Of the two video samples recorded, the sample which had less visual distracters/repetitions/good visibility of signing was considered for the analyses. The sample was fed into a computer. ELAN (EUDICO Linguistic Annotator) software (Hellwig & Van Uytvanck, 2007) was used for coding the signed expressions. A set of annotations sharing the same characteristics can be coded on a single tier using ELAN software (Johnston & Crasborn, 2006). Few other investigators have provided annotation guidelines for coding sign language video samples (Crasborn et. al., 2007; Johnston & Crasborn, 2006; Johnston & Schembri, 2006; Neidle, 2002; Zwitterlood, Ozyurek & Perniss, 2008). Based on these guidelines of annotations and transcription conventions, the signed expression of each participant was coded by the principal investigator. The coding of the signed expressions of the participants was carried out to record the use of (a) different pronoun types, (b) strategies used in the expression of the pronouns and (c) the use of non-manual markers to sign various pronoun types.

The data was analyzed and coded under three tiers in ELAN software as follows:-

1st tier - Sign Gloss: The data was transcribed and annotated for expression of lexical signs i.e., glossing for each sign of each participant was carried out by selecting the respective portion in video sample under this tier. The glosses in this tier were transcribed in upper case as per the guidelines.

2nd tier – Identification of types of pronouns: In this tier, data was checked for the presence of pronouns in signed expression. Instances where pronouns were expressed by the participant were noted and coded for types of pronouns such as personal pronouns, demonstrative pronouns, possessive pronouns etc.

3rd tier – Identification of non-manual markers used in the expression of pronouns: In this tier, the data was coded for use of different non-manual markers in signed expression of pronouns. This was carried out as per the operational definition of Non-Manual Markers defined by the investigators (provided in Annexure 3). The function of each of the 3 tiers as defined in this study is presented in Annexure 1.

The annotations used to code different types of pronouns and non manual markers expressed by participants are shown in Table 1 and 2 respectively.

Table 1:- Annotations used in the coding of different pronoun types.

Sl no.	Annotations	Pronoun Types
1.	IX-1P (pe pr)	1 st Person (personal pronoun)
2.	IX-2P (pe pr)	2 nd Person (personal pronoun)
3.	IX-3P: i (pe pr)	3 rd Person (personal pronoun) associated with location 'i'.
4.	POSS-1P (po pr)	1 st Person (possessive pronoun)
5.	POSS-2P (po pr)	2 nd Person (possessive pronoun)
6.	POSS-3P (po pr)	3 rd Person (possessive pronoun)
7.	Dem	Demonstrative Pronoun

Table 2:- Annotations used for various non-manual markers.

Sl no.	Annotations	Non-manual markers
1.	Eg	Eye Gaze
2.	Psp	Pointing to space
3.	Pse	Pointing to self
4.	hm: bd	Head movement: bent down
5.	Hp:ti fr	Head position: tilt front
6.	Hp:ti side	Head position: tilt side
7.	Htu	Head turn
8.	hm:Jut	Head movement: jut
9.	BL: for	Body leaned forward
10.	EBr	Eye Brow: raised

Reliability check:-

10% of the video samples of each participant were subjected to reliability check. Another coder/judge with post graduate degree in speech- language pathology and knowledge of sign language, having normal hearing and vision, and familiar with the operation of a computer was recruited for the reliability check. The 2nd coder was trained by the first coder (principal investigator) using samples of deaf signers that were not included in this study, on the following aspects: 1) identification and selection of signed expressions 2) referring to operational keys and annotating data on ELAN software and 3) coding the pronoun types as per the operational definition of the pronoun types (Annexure 2) and reviewing the annotated samples to confirm the expression of pronouns as per the definitions. Once the data was coded by the 2nd coder, the inter and intra judge reliability was established.

Inter judge reliability: This was established between the two coders, based on item by item verification for agreement/disagreement in various domains of the data. In instances of disagreement between coders for any of the items, analyses were repeated by coders independently and parameters mutually agreed upon by two coders were noted as final. The reliability coefficient was calculated

Intra-judge reliability: Reanalyses of 10% of the data per participant was carried out within a month from the day of first analyses by the 1st coder (investigator) and the 2nd coder also in order to check for intra judge reliability. In instances of disagreement between the two instances of coding, it was resolved by reviewing and confirming the parameter analyzed. The reliability coefficient for the samples analyzed in two instances by investigator and other coder was determined.

The raw data obtained by the coders was tabulated and subjected to statistical analysis.

Results and Discussion:-

The coded data was used to tabulate and record frequency of occurrence of different pronoun types, strategies used to express pronouns and use of non-manual markers/facial expressions by participants to express the pronoun types. The signed expressions of the story narrated by most participants majorly included use of proper nouns (woman, snake, mongoose, baby, and cradle) that occurred in the story and several pronoun types such as demonstrative pronouns (here, there, that, this), 1st person pronoun (I, me), 2nd person pronoun (you, she), 3rd person pronoun (it) and 1st person possessive pronoun (my, mine) that substituted the proper nouns.

The proper nouns were expressed by participants using following strategies: a) Signing the noun signs/lexical signs and b) Finger spelling the nouns. The expression of pronoun types involved use of strategies such as a) manual pointing/indexing alone and b) manual pointing/indexing used along with non-manual markers to mark pronoun types. The frequencies of occurrence of the features under study were calculated as follows:

The frequency of occurrence of proper nouns:

The number of occurrences of proper nouns
The observation period of the sample.

The frequency of occurrence of different pronoun types:

The number of occurrences of a pronoun type
The observation period of the sample

The frequency of occurrence of different strategies:

The number of occurrences of a strategy type
The observation period of the sample

The expression of various features studied as computed by the ELAN software were noted and subjected to statistical analysis. The data was subjected to statistical analysis using SPSS (version 16). Shapiro-Wilk test of normality revealed that the data was not normally distributed ($p > 0.05$). Hence non-parametric tests were used to find significant difference if any in the frequency of occurrence of various pronoun types and proper nouns.

1. Frequency of occurrence of proper nouns and pronoun types

The frequency of occurrence of proper nouns and different pronoun types is represented in table 3.

Table 3:- Frequency of occurrence of proper nouns and various pronoun types

Participants	Proper nouns	Demonstrative pronouns	1 st person pronouns	2 nd person pronouns	3 rd person pronouns	1 st person possessive pronouns
1	0.4395	0.0845	0	0	0	0.0338
2	0.4572	0.0795	0	0	0.0198	0.0397
3	0.2844	0.0890	0	0.0098	0	0.0196
4	0.4333	0.1083	0	0	0.0154	0
5	0.2309	0.0355	0.0355	0.0355	0.0177	0.0177
6	0.3110	0.1072	0.0214	0	0.0214	0.0214
7	0.6068	0.1213	0.0242	0	0	0
8	0.4373	0.2460	0.1093	0.1913	0.0546	0.0000
9	0.4655	0.1643	0.0273	0	0	0
10	0.4939	0.0790	0.0592	0.0197	0	0

The data was subjected to Friedman test and the results revealed a significant difference in frequencies [$\chi^2(5) = 37.997$, $p < 0.01$] across proper noun and various pronoun types. There was a significant difference in the frequency of occurrence of proper nouns, demonstrative nouns, 1st person pronouns, 2nd person pronouns, 3rd person pronouns and 1st person possessive pronouns. Hence, Wilcoxon Signed Rank test was run to make a pair-wise comparison of frequencies of occurrence of proper nouns and pronoun types. Significant differences between the frequency of occurrence of proper nouns and demonstrative pronouns ($Z = -2.805$, $p < 0.01$), proper nouns and 1st person pronouns ($Z = -2.803$, $p < 0.01$), proper nouns and 2nd person pronouns ($Z = -2.803$, $p < 0.01$), proper nouns and 3rd person pronouns ($Z = -2.803$, $p < 0.01$), and proper nouns and 1st person possessive pronouns ($Z = -2.803$, $p < 0.01$) were found. The proper nouns were more frequently signed when compared to demonstrative pronouns, person pronouns (1st, 2nd and 3rd person pronouns) and possessive pronouns (1st person), as represented in Figure 1.

Figure 1. Mean frequency of occurrence of proper nouns and different pronoun types used by the participants.

The participants signed proper nouns using lexical signs representing them and also by using finger spelling. The use of pronouns such as demonstrative pronouns, person pronouns (1st, 2nd and 3rd person pronoun) and possessive

pronouns (1st person) required the participant to establish a loci in space, whereas use of proper nouns by the deaf signers involved signing the noun signs or using fingerspelling, which could probably be the reason for more frequent use of proper nouns when compared to the pronouns.

There was a significant difference in the frequency of occurrence of demonstrative pronouns demonstrative pronouns and 1st person pronouns ($Z = -2.666$, $p < 0.01$), demonstrative pronouns and 2nd person pronouns ($Z = -2.666$, $p < 0.01$), demonstrative pronouns and 3rd person pronouns ($Z = -2.803$, $p < 0.01$), and demonstrative pronouns and 1st person possessive pronouns ($Z = -2.803$, $p < 0.01$). Amongst the pronoun categories, the demonstrative pronouns occurred more frequently compared to 1st, 2nd and 3rd person pronouns and 1st person possessive pronouns. However, difference between the frequencies of 1st, 2nd, 3rd person pronouns and 1st person possessive pronoun were not significant.

Overall, the participants used proper nouns and different types of pronouns in their signed expression of the story. Amongst the pronoun types that represented nouns, demonstrative pronouns were used more frequently compared to that of other pronoun types (1st, 2nd, 3rd person pronouns and 1st possessive pronoun).

2. Frequency of occurrence of demonstrative pronouns

It was observed that the participants used demonstrative pronouns such as 'this', 'that', 'here', 'there' more frequently compared to person pronouns and possessive pronouns while narrating the story. Diessel (1999) reported that demonstrative pronouns are the very first words that typical children learn. Wu (2004) also reported that demonstrative pronouns are frequently used by typical adults in conversation. This seems to be true amongst the deaf signers also as seen in the results of this study. The demonstrative pronouns were expressed using the following strategies by the participants:

Using manual pointing signs/Indexing alone: this involved the signers extending their index finger towards the referent in signing space to establish reference/loci in space.

Using manual pointing/indexing accompanied by various combinations of non-manual markers such as Eye gaze, raising of eyebrows, body leaning forward in the direction towards the loci, head movements such as head bent down towards the loci, head turn towards the loci, head movements such as head bent down towards the loci, head turn towards the loci /referent etc in conjunction with pointing sign to mark the demonstrative pronouns.

Similar findings have also been reported in sign languages such as ASL (Baker & Cokely, 1980; Bellugi & Fischer, 1972; Liddell & Metzger, 1998; Neidle, Kegl, MacLaughlin, Bahan & Lee, 2000) and Israel Sign Language (Meier, 1990), where eye gaze, head turn, body shifts, were observed in addition to manual pointing to mark pronouns.

Several groups of strategies were used by the deaf signers of Mumbai-Delhi dialect of ISL to express the demonstrative pronouns during the story narration task and they are as follows:

Group 1: Pointing to space, eye gaze, head bent down and Body leaned forward

Group 2: Pointing to space, eye gaze, and head bent down

Group 3: Pointing to space, eye gaze

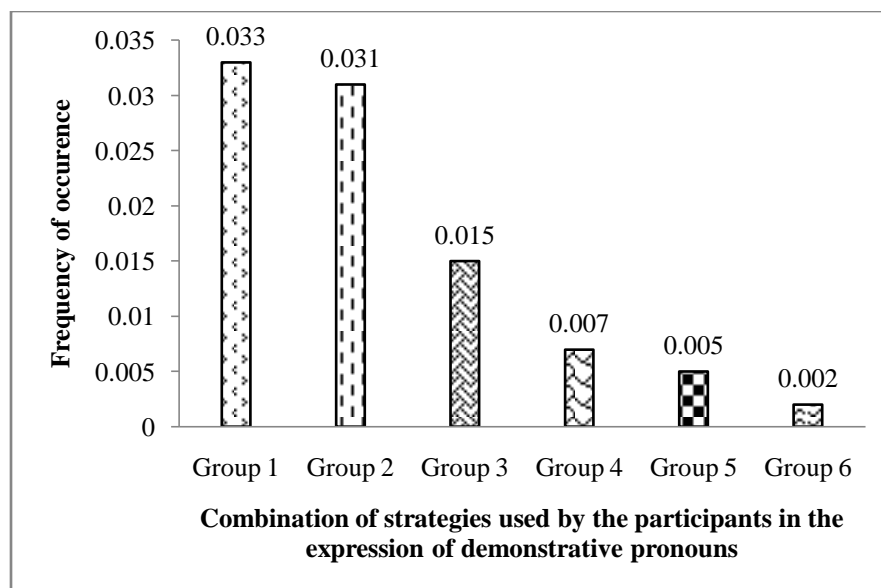

Group 4: Pointing to space, eye gaze and head turn towards the referent

Group 5: Pointing to space

Group 6: Pointing to space, eye gaze, and eyebrows-raised

Shapiro-Wilk test for normality of distribution revealed that the data was not normally distributed ($p > 0.05$). Hence non-parametric tests were administered to verify for significant difference if any in the frequency of occurrence of combination of strategies used in the expression of demonstrative pronouns. Friedman test revealed a significant difference in frequencies of occurrences [$\chi^2(5) = 13.612$, $p < 0.05$] of combination of strategies used to express the demonstrative pronoun.

Several combinations of non-manual markers along with manual pointing were used by participants to indicate demonstrative pronouns in story narration task and the same is represented in Figure 2.

[Combination 1: Pointing to space, eye gaze, head bent down and Body leaned forward; Combination 2: Pointing to space, eye gaze, head bent down; Combination 3: Pointing to space, eye gaze; Combination 4: Pointing to space, eye gaze, head turn towards the referent; Combination 5: Pointing to space; Combination 6: Pointing to space, eye gaze, eyebrows-raised]

Figure 2. Mean frequency of occurrence of different group of strategies used by the participants in the expression of demonstrative pronouns.

A pair –wise comparisons of frequencies of occurrence of combination of strategies was carried out using Wilcoxon Signed Rank test. The results revealed a significant difference in frequency of occurrence ($Z = 2.521$, $p < 0.01$) between combination 1 and combination 4. A significant difference in frequency of occurrence between the combination 1 versus combination 6 ($Z = -2.547$, $p < 0.01$), and combination 3 versus combination 6 ($Z = 1.992$, $p < 0.01$) was also observed.

The predominant strategy used to sign demonstrative pronouns by participants in story narration task involved a) manual pointing sign accompanied by non-manual markers such as Eye gaze, Head bent down, Body leaned forward toward the referent (combination 1) followed by a combination of b) manual pointing sign and Eye gaze (combination 3) when compared to other combination of strategies (Figure 2). Observation of the data also revealed that although various combinations of non-manual markers and pointing were used to express the demonstrative pronouns by participants, manual pointing sign and eye gaze were invariably used as a common strategy by the participants.

Qualitative observation of the data revealed that the proximal demonstrative pronouns ('this' & 'here') were differentiated from that of distal demonstrative pronouns ('that' & 'there') based on the distance of locus being established by the signer in signing space. The demonstrative pronouns 'this' & 'here', were expressed with manual pointing sign in space that was proximal to the signer's body whereas, for pronouns 'that' & 'there', manual pointing signs were far away from the signer's body. This observation is similar to the report by Lyons (1979) for American Sign Language (ASL).

The phenomenon of establishing loci in space through use of manual pointing sign and use of non-manual markers to express the pronouns in sign language is known as pronominalization. Use of 'pronominalization' to express pronouns have also been documented in several sign languages such as American Sign Language (ASL) (Cormier, 2005, 2007; Hatzopoulou, 2008; McBurney, 2002), British Sign Language (BSL) (Kyle & Woll, 1985; Meier, 1990), Israel Sign Language (ISL) (Meier, 2003), Sign Language of Netherlands, (SLN) (Bos, 1995), Swedish Sign Language (SSL) (Bergman, 1980), and Brazilian Sign Language (LSB) (Berenz, 1996).

As reported by several researchers, pointing is also used in spoken language as a co-speech gesture (Clark, 2003; Haviland, 2000b) and it is used to indicate the direction, location, objects and/or people (Kita, 2003b). The sign languages also makes use of pointing gesture to mark person and number inflections (Zeshan et al., 2004). In this study, the deaf signers of Mumbai-Delhi dialect also relied on manual pointing sign to establish the pronominal reference in space. They also used non-manual markers such as raised eyebrows, body leaned forward (towards the referent), head bent down (towards the referent), head turn (towards the referent) in addition to pointing sign. This can be reasoned based on the fact that these were used by the deaf signers to augment semantic meaning for the expression of the demonstrative pronoun.

3. Frequency of occurrence of 1st person pronouns

The participants used 1st person pronouns forms such as 'I', 'Me' in the narration of the story. The expression of 1st person pronouns involved the use of following strategies:

a) Pointing to oneself i.e., usually towards the signer's chest with extended index finger or with open hand touching the signer's chest or

b) Use of non-manual markers along with pointing to oneself

The combination of strategies that were used by the deaf signers of Mumbai-Delhi dialect of ISL to express the 1st person pronouns during the story narration task are as follows:

Combination 1: Pointing to oneself

Combination 2: Pointing to oneself and body leaned forward

Combination 3: Pointing to oneself, head tilted to side, and body leaned forward

Combination 4: Pointing to oneself and head movement in jut position i.e., the chin touching the neck.

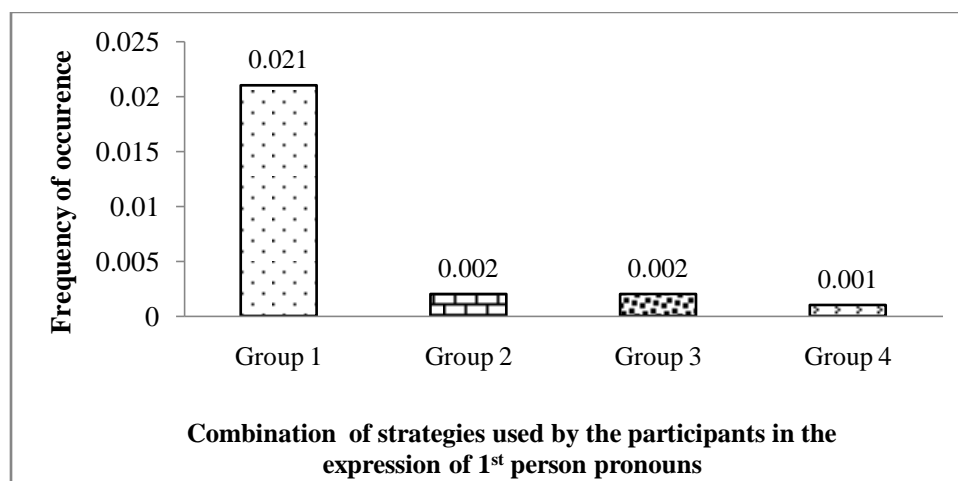

Friedman test revealed a significant difference in frequencies of occurrence [$\chi^2(3) = 14.122$, $p < 0.05$] across various combination of strategies used to express 1st person pronouns. Pair-wise comparisons of different combination of strategies were carried out using Wilcoxon Signed Rank test and results revealed a significant difference between the following combinations:

a) Combination 1 versus Combination 2

b) Combination 1 versus Combination 3 and

c) Combination 1 versus Combination 4.

The mean frequency of occurrence of combination of strategies used by deaf signers to express the 1st person pronouns are represented in figure 3.

[Combination 1: Pointing to oneself; Combination 2: Pointing to oneself and body leaned forward; Combination 3: Pointing to oneself, head tilted to side, and body leaned forward; Combination 4: Pointing to oneself and head movement in jut position i.e., the chin touching the neck]

Figure 3. Mean frequency of occurrence of different group of strategies used by the participants in the expression of 1st person pronouns.

It was observed that pointing to oneself was the predominant strategy used to indicate 1st person pronoun. Various combinations of non-manual markers and pointing were also used to express the 1st person pronouns by the participants. This confirms the use of 'pronominalization' phenomenon by the participants. Similar observations have also been reported in sign languages such as American Sign Language (ASL) (Friedman, 1975; Padden, 1983), British Sign language (BSL) (Kyle & Woll, 1985; Meier, 1990), Swedish Sign language (Bergman, 1980), Brazilian Sign Language (LSB) (Berenz, 2002) and Croatian Sign Language (HZJ) (Alibasic Ciciliani & Wilbur 2006). It was also observed that the direction of pointing sign in the expression of 1st person pronoun differed from that of pointing sign used in the expression of demonstrative pronouns. The 1st person pronoun was expressed with index finger pointing and moving towards the signer's chest. On the contrary, demonstrative pronouns were expressed with index finger moving away from the signer to a locus in signing space. Thus, in Mumbai-Delhi dialect of ISL, the deaf signers used 'pointing to oneself' as a main strategy to express 1st person pronouns

4. Frequency of occurrence of 2nd person pronouns

The frequency of occurrence of 2nd person pronouns was less when compared to frequency of occurrence of proper nouns and demonstrative pronouns. Few instances of 2nd person pronoun form such as 'You' were observed during narration of the story. It was observed that pronominal reference equivalent to 2nd person pronouns were carried out using few strategies such as pointing to space and use of non-manual markers. Various combinations characterizing pronominalization such as manual pointing to space accompanied by non-manual markers such as eye gaze, head bent down, body leaned forward towards referent were used and the mean frequency of occurrence of these is shown in figure 3. Similar observations are reported in several sign languages such as American Sign Language (ASL) (Berenz, 2002; Cormier, 2005, 2007; Hatzopoulou, 2008; McBurney, 2002), British Sign Language (BSL) (Kyle & Woll, 1985; Meier, 1990), Israel Sign Language (ISL) (Meier, 2003), Sign Language of Netherlands, (SLN) (Bos, 1995), Swedish Sign Language (SSL) (Bergman, 1980), and Brazilian Sign Language (LSB) (Berenz, 1996). The group of strategies that were used by deaf signers of Mumbai-Delhi dialect of ISL to express the 2nd person pronouns during the story narration task are as follows:

Combination1: Pointing to space, head bent down and body leaned forward

Combination 2: Pointing to space and eye gaze

The mean frequency of occurrence of combination of strategies used by the deaf signers to express the 2nd person pronouns are represented in figure 4.

[Combination 1: Pointing to space, head bent down & body leaned forward; Combination 2: Pointing to space and eye gaze]

Figure 4. Mean frequency of occurrence of different combination of strategies used by the participants in the expression of 2nd person pronouns.

Friedman test revealed a significant difference in frequencies [$\chi^2 (1) = 4.000, p < 0.05$] across strategies to express 2nd person pronouns. Further, pair-wise comparisons were made using Wilcoxon Signed Rank test to compare

frequencies between combination of strategies used to indicate 2nd person pronouns. There was no significant difference observed between combination 1 and combination 2. The use of other non-manual markers such as Eye gaze, head bent down and body leaning forward in the direction of the locus accompanied by manual pointing were used to augment the semanticity of the 2nd person pronouns. Similar findings have also been reported in other sign languages such as ASL (Bahan & Lee, 2000; Baker & Cokely, 1980; Bellugi & Fischer, 1972; Liddell & Metzger, 1998; Neidle, Kegl, MacLaughlin,), Israel Sign Language (Meier, 2003), Brazilian Sign Language (LSB) (Berenz, 2002) and Croatian Sign Language (HZJ) (Alibasic Ciciliani & Wilbur, 2006).

5. Frequency of occurrence of 3rd person pronouns

The participants used 3rd person pronouns such as 'It', 'He' and 'she' during the narration task. The 3rd person pronoun form 'it' was expressed by pointing towards the referent in space (Psp); the signed expression of 'He' involved signing the noun 'Boy'/'Girl' (as per the situation) followed by pointing towards the referent in space (Psp). These 3rd person pronouns (it, He & she) were also signed using non-manual markers such as eye gaze, head bent down, body leaned forward towards the referent, and head turn towards the referent. Similar findings have also been reported in several sign languages such as American Sign Language (ASL) (Berenz, 2002; Cormier, 2005, 2007; Hatzopoulou, 2008; McBurney, 2002), British Sign Language (BSL) (Kyle & Woll, 1985; Meier, 1990), Israel Sign Language (ISL) (Meier, 2003), Sign Language of Netherlands, (SLN) (Bos, 1995), Swedish Sign Language (SSL) (Bergman, 1980), and Brazilian Sign Language (LSB) (Berenz, 1996). The following combinations of strategies were observed in the signed expression of the deaf signers to express the 3rd person pronouns and the same is represented in figure 5.

Combination 1:- Pointing to space, eye gaze, Head bent down and body leaned forward towards the referent in combination

Combination 2: Pointing to space and eye gaze in combination

Combination 3: Pointing to space, eye gaze, Head turn towards the referent and body leaned forward towards the referent

Combination 4: Pointing to space, Head bent down towards the referent in combination.

The mean frequency of occurrence of group of strategies used by the deaf signers to express the 3rd person pronouns are represented in figure 5.

[Combination 1: Pointing to space, eye gaze, Head bent down and body leaned forward towards the referent; Combination 2: Pointing to space and eye gaze; Combination 3: Pointing to space, eye gaze, Head turn towards the referent and body leaned forward towards the referent; Combination 4: Pointing to space, Head bent down towards the referent in combination]

Figure 5. Mean frequency of occurrence of different group of strategies used by the participants in the expression of 3rd person pronouns.

The use of non-manual markers in association with the manual pointing sign thereby provided additional semantic cue to the pronoun and the use of these non-manual cues in addition to manual pointing have also been documented in other sign languages such as ASL (Baker & Cokely, 1980; Bellugi & Fischer, 1972; Liddell & Metzger, 1998, Neidle, Kegl, MacLaughlin, Bahan & Lee, 2000), Israel Sign Language (Mier, 2003) Brazilian Sign Language (LSB) (Berenz, 2002) and Croatian Sign Language (HZJ) (Alibasic Ciciliani & Wilbur, 2006). The frequency of occurrence of various combinations of non-manual markers in association with manual pointing used by the deaf signers in the narration of the story to mark the 3rd person pronouns were compared.

The data of 3rd person pronouns was subjected to Friedman's test and the results did not reveal any significant difference in frequencies of occurrence [$\chi^2(1) = 4.000, p > 0.05$] between combination of strategies used to express the 3rd person pronouns. In other words, all these strategies were used equivalently by the deaf signers to refer to 3rd person pronouns.

6. Expression of 1st person possessive pronoun

The 1st person possessive pronouns like 'MY' & 'MINE' were used by the deaf signers while narrating the story. The participants expressed first person pronouns with open hand/palm directed towards the signer's chest (PSe). Similar findings have also been reported in sign languages such as ASL (Cormier and Fenlon 2009), Australian Sign Language (OGS) (Johnston & Schembri, 2007), and Hong Kong Sign Language (HKSL) (Tang & Sze, 2002).

Zeshan et al., (2004) reported that in most sign languages spatial inflections to mark person and number inflections are used; i.e., the pronouns are indicated by pointing to different locations in space to differentiate across person pronoun (first, second and third person pronouns) and possessive pronouns (first, second and third possessive pronouns).

Summary and Conclusions:-

The study aimed to analyze the expression of pronouns by deaf signers using Mumbai-Delhi dialect of Indian Sign language in a story narration task. The results revealed that the signed expression of the deaf signers in the story narration task involved use of proper nouns and different pronoun types such as demonstrative pronouns, 1st person pronoun, 2nd person pronoun, 3rd person pronoun and 1st person possessive pronoun. The proper nouns were expressed by the deaf signers using finger spelling of the noun sign or signing the noun sign. The expression of demonstrative pronoun by the deaf signers involved making a pointing sign in space accompanied by combinations of various non-manual markers such as eye gaze, raising of eye brows, body leaned forward in the direction of the referent, head movements such as head bent down, head turn toward the referent, head tilt to the side etc. The expression of the 1st person pronoun and 1st person possessive pronoun also involved manual pointing but, the pointing sign was directed towards the signers' chest accompanied by non-manual markers. The 2nd person pronoun and 3rd person pronoun also involved making a pointing sign in space accompanied by combinations of various non-manual markers. The expression of pronouns thus confirms the use of 'pronominalization' as a phenomenon in Mumbai-Delhi dialect of Indian Sign language (ISL).

Annexure 1:-

The functions defined for the three tiers of analysis and coding of the signed expressions for the use of plurals by the participants using ELAN software.

Tiers		Functions
Tier 1	Sign Gloss	Identification of signs representing concepts is transcribed using glosses in 'Sign Gloss' tier.
Tier 2	Identifying types of pronouns	Identify the instances of signed expression of pronouns from the tier one, and the type of pronoun (1 st person pronoun, 2 nd person pronoun, 3 rd person pronoun, demonstrative pronouns, possessive pronouns etc) were identified and coded this tier
Tier 3	Identifying non-manual markers used in the expression of pronouns	Identification of the non-manual markers such as eye gaze, pointing, body and head positions etc as evidenced in the signed expressions of the participants for pronouns was carried out and coded across the tier.

Annexure 2:-

Operational Definition of different types of Pronouns.

	Definition
Pronouns	The part of speech that substitutes for nouns or noun phrases.
Personal pronouns	Pronouns which represents particular person, group, or thing in a phrase or a sentence. E.g. I, Me, You, We, Us, He, She, Him, Her, it, they, them.
1 st Person Pronouns	Pronouns which represents first person in a phrase/sentence. E.g. I, Me.
2 nd Person Pronouns	Pronouns which represents second person in a phrase/sentence. E.g. You.
3 rd Person Pronouns	Pronouns which represents person or thing spoken about. E.g. He, She, Him, Her.
Possessive Pronouns	Pronouns that represents the ownership of the noun in a phrase/sentence. E.g. mine (1 st person possessive pronoun), yours (2 nd person possessive pronoun), hers, his, theirs (3 rd person possessive pronoun).
Demonstrative pronouns	Pronouns that takes the place of particular objects or people. E.g. This, That, These, Those, Here, There.
Indexing/Establishing loci in space to indicate many	The participant points to each loci in the sign space and indicates several loci to indicate several referents.

Annexure 3:-

Operational Definition of Non-Manual Markers

Non-Manual Markers	Definition
Pointing	This involves making an action with an extended index finger or with the open hand to show the referent which can be a person, place or thing.
Pointing to self	Pointing to oneself/Pointing to one's own chest.
Pointing to space	Pointing towards the space to indicate the referent (present/absent) which can be a person, place or thing.
Eye Gaze	It is direction in which one looks at the person, thing, place etc steadily and intently.
Head positions and movement	Includes change in the position and movement of the head, such as head tilt (front/back), head turn (left/right), head movement (nod, side to side headshake, raised and bent down).
Body positions	Includes change in the orientation of the body which includes, body leaned forward/backward, body leaned sideways (right/left) etc.

Abstract

This article reviews the different aspects of economic botany of linseed /flax (*Linum usitatissimum* L.), namely, history and origin, morphology, area of cultivation, production and productivity, economic importance and cultural methods.

Key words

Economic Botany, Flax, Linseed, Uses.

Introduction

Linseed or flax (*Linum usitatissimum* L., 2n= 30, X = 15) belongs to the order Malpighiales, the family Linaceae, and the tribe Lineae. It is the second most important *rabi* oilseed crop and stands next to rapeseed-mustard in area of cultivation and seed production in India. The genus *Linum* is composed of approximately 230 species but cultivated linseed / flax is the only species of economic importance in the genus (Rowland *et al.*, 1995; Tadesse *et al.*, 2010) and is one of the oldest plants cultivated for fibre and oil. Linseed is popularly known as *Atasi*, *Pesi*, *Phesi* or *Tisi* in Odia. Although linseed plants have several utilities, it is cultivated commercially for its seed, which is processed into oil and after extraction of oil, a high protein stock feed is left (Sankari, 2000; Kurt and Bozkurt, 2006). Linseed oil has been used for centuries as a drying oil whose oil content varies from 33-45% (Gill, 1987). About 20% of the total linseed oil produced in India is used by farmers and rest about 80% goes to industries for the manufacture of paints, varnish, oilcloth, linoleum and printing ink etc. Fibres obtained from the stem are known for their length and strength and are two to three times as strong as those of cotton (Taylor, 2012). The fibre is lustrous and blends very well with wool, silk and cotton etc. Linseed has an important position in Indian economy due to its wide industrial utility. But the national average productivity of linseed seed is quite low as compared to other countries. In India, linseed is grown mostly under rainfed (63%), *utera* (25%), irrigated (17%) and in input starved conditions in major linseed producing states i.e. Madhya Pradesh, Chhattisgarh, Maharashtra, Jharkhand, Uttar Pradesh and Odisha (Srivastava, 2009).

Due to the availability of other cheaper petroleum products with equally good or some times better drying properties, the widespread use of linseed oil is restricted during recent times in the paints and varnish industries. However, linseed oil continues to be the base stock in medicinal, chemical, pharmaceutical and cosmetic industries as they have renewable, biodegradable properties and are non-allergic in nature along with enriched phytochemical contents.

In order to make linseed crop more remunerative and to generate employment, product diversification for medicinal and other industrial purposes of linseed needs to be improved by concerted research efforts. One of the major lines of researches is crop improvement programme through recombination breeding using elite germplasm for development of double purpose (oil and fibre) crops having high yield and stress resistance (both biotic and abiotic) qualities.

History and origin

The use of flax for the production of lilen dates back to 3000 B.C. as evidenced from the pictures on tombs and temple walls at Thebes of flowering flax plants. The use of flax fibre in the manufacturing of cloth in northern Europe dates back to Neolithic times (New Stone Age). The origin of flax (*Linum usitatissimum* L.), which is one of the oldest of cultivated plants is uncertain. However, it is generally accepted that linseed has originated from "Fertile Crescent"- an area east to Mediterranean Sea towards India (Zeven and Zhukovsky, 1975; Anonymous, 2010) and was probably first domesticated there. The generic name "*Linum*" comes from Celtic word *lin* means thread and the species name "*usitatissimum*" given by Carl Linnaeus, means very useful. So it directly refers to its multiple applications and their importance in ancient times.

Linseed is supposed to have originated in the four centres of origin, viz. Central Asiatic Centre, Near Eastern Centre, Mediterranean Centre and Abyssinian Centre. It spread northward to Europe and other parts of Asia and southward to India. But the botanical origin of linseed has not yet been determined with certainty. However, two theories such as polyphyletic origin and origin from the wild species of *Linum angustifolium* Huds. (2n=30) have been postulated (Gill, 1987).

Theory of polyphyletic origin regarding the probable progenitor of *Linum usitatissimum* L. is based on the postulation on the varying etymology of the names (*lin*, *llion*, *linu*, *linon*, *lien*, *lan*, *linseed* etc.), which existed in the European language and the antiquity of its cultivation in Egypt, Europe and the north India. According to this theory, the origin of the Indo-Gangetic types of cultivated flax (tall plants, small seeded and low oil content) originated through natural crossing of *Linum usitatissimum* with *Linum strictum* and the Peninsular types (shorter plants, bold seeded and more oil content) were derived through natural crossing of *Linum usitatissimum* with *Linum perene* or *Linum mysorensense*. However, experimental evidences to support this hypothesis are still lacking, as it seems to have been based on observation rather than experimentation.

The view of origin of *Linum usitatissimum* L. from a single wild species *Linum angustifolium* Huds. is from Mediterranean region, which might be the probable primary centre of origin of flax. It seems apparent that the species, which might have been cultivated by the lake-dwellers of Switzerland and Italy, was *Linum angustifolium* Huds. This theory is based on the archaeological remains of early civilization and enough experimental evidences. Both species are annual and grow in winter and have long slender stem with profusely branching system. They have small deep blue flowers and dehiscent capsules. The chromosome number in both the species is same (2x=30). However, available evidences indicate that *Linum bienne* Mill. a small seeded flax, might have contributed some germplasm to be the probable progenitor of *Linum usitatissimum* L. The species might have originated from Kurdistan and Iran. However, experiment by Muravenko *et al.* (2003) showed that three species viz. *Linum usitatissimum* L., *Linum bienne* Mill. and *Linum angustifolium* Huds. were assumed to have originated from a common ancestor, *Linum angustifolium* Huds. being closest to it.

Morphology

Linseed (*Linum usitatissimum* L.) is an erect annual herbaceous plant 30-120 cm, in height with slender glabrous, grayish green stem. The linseed types are grown for extraction of oil from the seeds. The flax types are grown for fibre extraction from the stems. The flax types are relatively taller (80-120 cm) in height with straight culms, less number of secondary branches towards the top of the stem (Gill, 1987). These plants generally produce fewer capsules and smaller seeds. The former (linseed) type is 60-80 cm in height and the plant has a short tap root system with fibrous branches. The shoot is profusely branched and bushy in character (Plate 1). Leaves are without stipules, 20-40 mm long and 3 mm broad, simple, narrow, alternate, lanceolate, acute or acuminate with a smooth upper surface and grayish green in colour. Flowers are showy, variously shaped (Plate 2), regular, hermaphrodite, pentamerous, hypogynous and borne in loose terminal raceme or open cyme with blue, white or pink colour. The calyx consists of five ovate acuminate persistent sepals. The corolla consists of five free petals, imbricate or twisted in the bud, fugacious, often clawed, bluish or white, deciduous which fall before noon. The androecium has ten

stamens present in two whorls. But the outer whorl consists of five stamens being reduced to staminodes. The inner five fertile stamens are widened to form a fused ring which surrounds the base of the gynoecium (Plate 3). The petals are narrow at their bases and insert into this ring. Nectar secreting glands are present at the widened bases of the stamens. In most of the flowers of *Linum usitatissimum* L., the anthers encircle and reach over top of the stigma, but in some varieties, the stigma extends beyond the anthers slightly. The anthers are two celled, introrse and dehisce longitudinally. The superior gynoecium consists of five united carpels. The ovary is ovoid and ten celled due to the presence of false septum in each carpel and producing up to two ovules in each carpel. Ovary has axile placentation and ovules are pendulous and anatropous with five styles, which are filiform, free or united below and twisted together forming slightly club-shaped stigmatic surface. Fruit is small round smooth globular capsule of 5-9 mm diameter. *Linum usitatissimum* L. is the only species with non-dehiscent or semi-dehiscent capsules for modern cultivation of the family Linaceae (Getinet and Nigussie, 1997). It contains up to 10 smooth, glossy apple pip shaped, light brown colour seeds which is 4-7 mm long. In most of the varieties, the capsule is of indehiscent type. Linseed is predominantly self pollinating. Cross pollination can occur at a very low level (less than 2%) by insects (Tadesse *et al.*, 2010). Wind pollination is not seen because the pollens are relatively heavy and sticky (Anonymous, 2010).

Area of cultivation, production and productivity

Linseed is being cultivated in Egypt, Europe and India since pre-historic times. The important linseed growing countries are India, Russia, Canada, Argentina, and the U.S.A. From the 21.12 lakh hectares global area, 41.62% i.e. 8.79 lakh ha. belongs to the Asian region with 5.35 lakh tonnes contribution to the total world production (21.23 lakh tonnes). Productivity of this region (608 kg/ha) is approximately 60% of the world productivity of 1006 kg/ha (Anonymous, 2011a). India is the second largest (21.21%) linseed growing country in the world in terms of area of cultivation after Canada. Production wise, India ranks 4th (8.20%) in the world after Canada (40.51%), China (18.68%) and the USA (10.89%) (Srivastava, 2009). But as per Food and Agricultural Organization Statistical data (FAO-STAT, 2007), India ranks 3rd (9%) in the world's top 20 linseed producing countries. However, in terms of productivity, India (449 kg/ha) is far below than Canada (1492 kg/ha), USA (1484 kg/ha), Egypt (1469 kg/ha), Russia (1272 kg/ha) and China (944 kg/ha). Although, the area of cultivation of linseed is decreasing, the productivity is increasing not only in India (+17%), but also all over the world (+18%).

Now, linseed is under cultivation in as many as 13 states of India, viz., Madhya Pradesh, Maharashtra, Chhattisgarh, Uttar Pradesh, Jharkhand, Bihar, Odisha, Karnataka, Nagaland, Assam, West Bengal, Himachal Pradesh, and Rajasthan. At present, linseed is cultivated in about 3.420 lakh ha with the contribution of 1.537 lakh tonnes to the annual oilseed production of our country and the yield being 449 kg/ha is far below the world production of 21.23 lakh tonnes from 21.12 lakh ha with productivity of 1006 kg/ha (Anonymous, 2011a). However, there is significant increase in the productivity of the states like Rajasthan (2006 kg/ha), Bihar (846 kg/ha), Nagaland (689 kg/ha) and Assam (517 kg/ha) is at a par with Asia (608 kg/ha) and the world (1006 kg/ha).

Economic Importance

Linum usitatissimum L. occupies an important position in world market because of its multiple trade use. It is a valuable crop and every part of the plant has specific economic importance.

Uses of flax fibre

Flax fibre is one of the most natural and eco-friendly fibres among all the textile fibres. The characteristic features of flax fibres are their strength, fineness and durability. They are lustrous, stronger, less stretchy, more durable and more resistant to environmental fluctuation than cotton and jute. This fibre blends very well with wool, silk, cotton etc. Bundles of fibres look like blonde hair. The threads are very strong and so are used for shoe making, manufacture of fishing lines and nets etc. The fibre is extensively used in the manufacture of canvas, twine, carpets, blankets and mats. Rough and coarser grade fibres are used in the manufacture of strong ropes, shipping cord, twines and cordage, which are very indispensable for aeronautical and defense purposes. Flax fibre textiles which are called 'lilen' or 'linso-fabrics', in which best grades of flax fibres are used for manufacturing suiting, shirting, bedsheets, cloth laces, damasks, curtains etc. Flax-jute (Linju) and Flax-cotton (Linco) blended fabrics show better quality than cent-percent jute or cotton fabrics (Pandey and Dayal, 2003).

Pulp sweeteners

After extraction of fibre from stalk, the woody core of the stem and short fibres are used as raw pulp for making high grade paper. To increase the quality of the paper more than 20% strong virgin wood fibre must be added to the pulp. This extra strong fibre which is to be added to the pulp is called as "pulp sweeteners". As flax fibres are stronger and longer than any other virgin wood fibre, a small quantity of flax fibre can be used in place of virgin wood fibres. This pulp can be utilized for the manufacture of paper used for currency notes, air mail, parchment paper, good writing paper, cigarette paper and straw boards of all grades of economic value.

Geotextiles (Insulation)

Coarse and fine flax fibres are blended and processed to produce insulation batts (fibre wadded into sheets) having similar insulation properties to fibre glass batts in order to insulate walls and ceilings (Jacobsz and Vander Merwe, 2012).

Plastic composites

As flax fibres are cheaper and lighter in weight, these can be used in place of fibre glass in the manufacture of plastic composite applications (car dashboards, fencing materials, septic tanks etc.). Flax fibre is better known as plastic crop (Vittal *et al.*, 2005), due to their importance in the use of paper and plastic in an eco-friendly condition.

Wax

Commercial wax is extracted from the cortical tissues by different organic solvents. This wax is used in shoe polishes (Gill, 1987).

Commercial industrial grade oil

Linseed oil is a versatile "drying oil" as it undergoes polymerization due to the presence of di- and tri-unsaturated fatty acids. So it is converted into a solid form when exposed to oxygen in air. The polymer forming properties facilitate linseed oil to use by its own or blended with other oils, solvents and resins etc. Raw linseed oil dries in a slow rate. It has tendency of yellowing with poor colour retention. In order to improve the drying and colour retention properties of linseed oil, some processes have been developed by heat modification (heating raw linseed oil at different high temperature range). Linseed oil is also blending or combining with dryers (compounds like linoleates or resinates of lead, manganese, cobalt, zinc etc) or with other compounds/chemicals to meet the demand for special application in dyeing industry. These oils are called modified oils and named as boiled oils (raw linseed oil heated at 90°C-150°C with dryers), blown oil (blowing air through raw linseed oil at 130°C), stand oil (alkali refined), enamel oil (mixing of linseed oil with tung oil), sulphurized oil (linseed oil treatment with sulphur chloride), styrenated oil (reacting with styrene), esskol and solinox oil (hydrogen treated oil) and polymerized oil (treatment with chlorinated hydrocarbon with aluminium trichloride, boron trifluoride, silicon tetrachloride or titanium chloride). These oils have high industrial values as these types of oils are used in the manufacture of paints, varnish, waterproof materials, patent leather (Japanned leather) and special finishes for cotton and silk fabrics etc.

Commercial edible grade oil

The linseed oil is not edible because it contains high linolenic acid, a poly-unsaturated fatty acid, which makes the oil highly susceptible to oxidation as a result of which its drying property increases and gives a pungent flavour and rancidity. Further, the laxative properties of the mucilage in seed coat of the seed make the oil unsuitable for edible purpose. A number of new flax seed varieties, which are low in alpha-linolenic acid content (25-30%) have been identified in India. It produces high quality poly unsaturated edible oil developed through plant breeding techniques. Linola[™] is the trademark for a new form of linseed in Australia developed in 1984 (Srivastava, 2009). These were specifically bred to produce edible oil, rather than for the traditional industrial use (Budwig, 1995). 'Solin' in Canada is another edible variety of linseed developed in 1990/91 (Srivastava, 2009). There are some farmers who are socially and economically forced to cultivate only linseed for years together. Some populations are there, who use only linseed oil for edible purpose. It is a basic need to develop linseed varieties with edible grade oil for these people. By the joint research efforts of Bhaba Atomic Research Centre (BARC) and All India Coordinated Research Project (AICRP) on linseed, five genotypes *viz.*, TL11, TL 26, TL 27, TL36 and TL43 have been developed having less than 1% linolenic acid content (Srivastava, 2009). Further, a number of attempts have been made by induced mutation techniques to develop low linolenic acid types of seeds for edible purpose (Budwig, 1995). When the seeds were treated with chemical mutagens, varieties with less than 2% linolenic acid were developed. Linola oil is better than other edible oils such as sunflower, safflower and corn oil with regard to its composition of low saturated fatty acids (palmitic acid, 6%; stearic acid, 4%; oleic acid, 16% and high unsaturated fatty acid content linoleic acid,

72% and low unsaturated fatty acid content alpha linolenic acid, 2%). However, as edible oil, its prospects may not be progressive in comparison to traditional edible oils like Sun flower, Safflower and Soybean oil etc. (Nagaraj, 1995). Again, the residue (cake) left after extraction of oil from Linola seed is a valuable source of protein and energy for animal feeding. But with respect to its protein and carbohydrate composition, Linola cake is high in linoleic acid and low in linolenic acid. So linola cake can be used for cattle and horses wherever, linseed cake is currently used in animal feeding (Budwig, 1995).

Human consumption

Due to the presence of higher concentration of health promoting omega-3 fatty acids (alpha-linolenic acid), which lowers cholesterol level and imparts cardio vascular benefits, many linseed based recipes have been standardized. The crushed seeds/flour is used for value addition and for making various nutritious food preparations (Chauhan *et al.*, 2009). But the linseed oil is not edible due to the laxative properties of the mucilage in the seed coat and presence of higher level of linolenic acid which causes rancidity and emits pungent flavors on oxidation. So on a very small scale, it is used for edible purpose as flax seed breads, bagels and fried food stuff by a small segment of people (Anonymous, 2006). In Karnataka and parts of Maharashtra, linseed is used as a traditional food adjunct-chutney powder. It is also used as a medium of frying certain foods in Himachal Pradesh (Preethi, 2009).

Nutritional value

Linseed possesses many vital nutrients and nutraceuticals with promising health benefit for both human beings and animals. It contains eight essential amino acids, *viz.*, isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan and valine. It also contains carbohydrates, vitamins, minerals, crude fibre and this is the best herbal source of omega -3 and omega -6 fatty acids (Anonymous, 2006). Health experts prescribe these nutrients and other compounds for better health. One hundred thirty grams (one cup) of ground flax seeds give about 585 kcal energy, 26.0g protein, 53g total fat, high levels of dietary fibres (36.0g), total carbohydrate (38.0g) and all necessary vitamins, minerals for human body (Anonymous, 2003). So in recent years, it has attracted considerable interest due to its nutritional composition which has positive effects on disease prevention providing health beneficial components such as alpha linolenic acid, lignan and polysaccharides (Bozan and Temelli, 2008). Omega-3 fatty acid (alpha-linolenic acid) is a substrate for the synthesis of longer chain poly-unsaturated fatty acids mainly eicosapentaenoic and docosahexaenoic acids, which influence the biophysical properties of the cell membrane and are required for normal cell functions (Preethi, 2009).

As fodder

After the extraction of oil from the linseed seed, the residue left behind is called cake, which is brown in colour. Prior to defatting (to remove all or almost all), this cake contains 21.78% of non nitrogenous extract, 29.37% lipids and 27.78% protein, 7.02% fibre, 3.40% ash and 10.65% total humidity (Gutierrez *et al.*, 2010). So it is a protein rich palatable feed for livestock. It is fed to the cattle to improve their health condition and to develop the gloss of their coat, although linseed meal is used as an additive in baking products (Coskuner and Karababa, 2007). However, linseed contain phytic acid, cyanogenicglucoside and goiterogen which limit the linseed cake as animal feed as these are anti nutritional factors. So meal or seeds should be properly processed to remove the toxic constituents.

Mucilage

Linseed mucilage which resides in seed coat is obtained by precipitation process from aqueous extract of seed (soaking in water for 24 hours) and gives high viscosity solution. It is a white fibrous mass and friable when fully dry and gives high viscosity solution when gets dissolved in water. It is a heterogeneous mixture of polysaccharides made up of xylose, glucose, galactose, arabinose, ramnoseand galacturonic acid. Taking the advantage of the physical properties of linseed mucilage as a water soluble emulsifier, thickener and binder, it is used as a thickener and emulsifier in food products. The potential application of linseed in foods as functional food stuff developed a great interest. The mucilage obtained from flax seed is very similar to gum arabic in its emulsifying properties (Coskuner and Karababa, 2007) and is comparable to guar gum in its capacity to bind water. Mucilage is used in cosmetic and pharmaceutical industries as ademulcent and as a useful base for eye ointment.

As fertilizer

Linseed oil cake is one of the best nitrogenous fertilizer among oilcakes with respect to nitrogen, phosphorus and potassium (4.7% N, 11.7% P₂O₅, 1.3% K₂O) contribution to soil (Anonymous, 2011b). It provides slow and steady nourishment, stimulation, protection from soil nematodes (particularly *Meloidogyne javanica*) and insects. So it also

improves yields and quality of product like taste, flavour and amino acid composition etc. Moreover, it can also be used as a manure to prevent soil from unwanted microbes due to its germicidal properties by improving plant health and thereby gives greater resistance to infection (Anonymous, 2011b).

Composition of linseed seed

Seed is small, flat, oval, brown or yellow or deep brown coloured. The seed composition varies with variety, size, climate and maturity. The seed contains oil (36-48%), which is high in unsaturated fatty acid especially linolenic acid (Khan *et al.*, 2010 and Rahimi *et al.*, 2011) and about 6% mucilage, which resides in the seed coat. The seed has all essential components like crude fibre (5-10%), proteins (20.3%), fats (37.1%), minerals (2.4%), carbohydrates (28.9%), moisture (6.5%), calcium (170 mg/100 g), iron (370 mg/100g), carotene (2.7mg/100 g), thiamine (0.23 mg/100g), riboflavin (0.07 mg/100g), niacin (1.0mg/100g) together with wax, resin, phosphorus, sterols and small quantity of cyanogenic glucoside-linamarin (Nagaraj, 1995) and all essential amino acids such as isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan and valine (Weiss, 1983). Though the amino acid composition is similar to that of any other oilseed, it is rich in lysine and poor in methionine and the quality of linseed protein is better than that of other rapeseed proteins (Nagaraj, 2009). Flax seed contains at least three types of phenolics such as phenolic acids (8-10g/kg), flavonoids (35-70mg/100g) and lignans (secoisolariciresinol diglucoside, SDG) about (1-26mg/g). Due to the presence of all vital elements of proteins, sugars, fats, dietary fibres to a sufficient level now a days, fried and powdered seed is utilized in the preparation of day to day foods.

Linseed oil

The chief constituent of linseed seed is 30-45% oil. The oil is obtained by cold pressing (mechanical extraction with reduced heat, which is produced by rotational friction) has a golden yellow colour whereas a hot pressed oil (heat supply up to 200°C) is yellowish brown. Freshly extracted oil is a viscous, distinct odour and bland taste.

Fatty acid composition of linseed oil

In the aliphatic chain of fatty acid, carboxyl end is called alpha and the methyl end is called omega. From the omega end there is double bond at 3rd carbon called omega-3 and double bond at 6th carbon called omega-6. Body of the human being cannot produce its own omega-3 and omega-6 fatty acids. So there is requirement of omega-3 and omega-6 rich food in the daily diet (Brenna, 2002). Linseed oil is a mixture of triglycerides. The different fatty acid constituents of triglyceride are triple unsaturated α -linolenic acid (an omega-3 fatty acid) (35-67%), saturated palmitic acid (4-16%), saturated stearic acid (0.3-10.0%), mono unsaturated oleic acid (13-38%) and double unsaturated linoleic acid (an omega 6- fatty acid) (7.0-18.0%).

Tocopherols, phytosterols (plant sterols) and campesterol

Tocopherols are a group of closely related fat soluble alcohols which behave like vitamin E. Natural tocopherols exist as a mixture of four homologous series such as α , β , γ and δ tocopherols. Linseed oil contains higher levels of β tocopherols (200 ppm) than α tocopherols (15-20 ppm) and γ tocopherols (5-7 ppm). Phytosterols (plant sterols) are the group of steroid alcohols present in linseed oil (about 70 ppm). In addition to above, linseed oil also contains campesterols, which are the group of phytosterols and their chemical structure is similar to that of cholesterol (23-27 ppm). Due to the presence of higher levels of unsaturated fatty acids (more than 80% of the total fatty acids) and lower levels of α and γ tocopherol in linseed oil, the oil is highly unstable with limited shelf-life. So the oil gives bad frying smell (Nagaraj, 2009).

Medicinal value

Linseed seed contains omega-3 fatty acid in the form of alpha linolenic acid (ALA) which gives cardiovascular benefits by affecting prostaglandins and leukotrienes which are related to blood clotting and inflammatory disorder like rheumatoid arthritis (Anonymous, 2005). Gamma linolenic acid found in flax seed showed tremendous effect in diabetics by normalizing the faulty fatty acid metabolism for diabetics. Linseed contains antibiotics called "Linatine" in its seed, which cures diseases for which no other medicine is effective (Anonymous, 2006). Flax seed contains both soluble and insoluble fibre. The soluble fibre can lower the blood cholesterol and insoluble fibre have laxative property which help to treat varieties of gastrointestinal conditions and provide health benefits for diarrhoea, constipation, irritable bowel syndrome (IBS) and inflammation in the lining of intestines. Linseed is one of the richest sources of lignans which are phytoestrogens, provide protection against certain forms of cancer (Morton *et al.*, 1994). Flax seed sprouts induce apoptosis and inhibit cancer cell growth by demonstrating their anti proliferative effects in breast cancer cell (Lee, 2012). Recent reports (Adugna and Labuschagne, 2003 and Tripathi *et al.*, 2013) indicate that consumption of linseed imparts numerous health benefits, including anti-

hypercholesterolemic and anti-carcinogenic effects and is also beneficial in the development of brain and retinal tissues. Linseed oil may alleviate some cases of Alopecia Areata (hair loss) and facilitates weight loss in persons suffering from obesity. It is also useful in the treatment of some cases of Edema. Linseed oil is the only dietary oil allowed in the orthomolecular treatment (use of naturally occurring nutrients in maintaining health and treating disease) of Acquired Immune Deficiency Syndrome (AIDS) patients. Further, this oil is useful in the alleviation of some cases of Pre Menstrual Syndrome (PMS) and makes pregnancy less eventful, makes deliveries easier and produces healthier offsprings (Tripathi *et al.*, 2013). Linseed tea, which is prepared by boiling 1 part of linseed seed with 20 parts of water till grains are soft, is used as a demulcent in respiratory irritation and in intestinal or urinary catarrhs (Vajpeyi *et al.*, 2005). The anti-microbial activity of linseed oil and its therapeutic efficacy in bovine mastitis (inflammatory disorder) has been reported recently (Kaithwas *et al.*, 2011). Linseed oil is recommended for the treatment of piles. It is also used as a base for different cosmetic and pharmaceutical products. Linseed oil is traditionally used in various skin infections externally as a soothing application for burns, wounds, acne, eczema, psoriasis and boils. This oil is available in the form of *Arectal oil* prepared by equal quantity of lime water with linseed oil (David and Toms, 2006) for various skin treatments. Linseed oil is used as a carrier of vitamins and irritant drugs. Crushed linseed is used in the form of poultice, which is prepared by boiling 28g linseed seeds in 72ml of water. Before its application it may be sprinkled with boric acid. Cough syrup in the name of 'Mucilage lini' is prepared from the mucilage of linseed taking 1 part of mucilage with 8 parts of water.

Linseed oil used as surface treatment materials

Boiled linseed oil is one of the widely used surface treatment materials for protection of concrete structures (Pfeifer and Scali, 1981). It can be used either in the form of solution or emulsion. The solution is prepared by taking linseed oil and mineral spirit with the proportional ratio ranging from 90:10 to 30:70, but commonly used ratio is 50:50. In order to accelerate the dryness of the oil, some dryers such as cobalt, manganese, lead salts or naphthenic acids are often added to the solution. Another type of linseed solution is available taking 50% linseed oil with 50% kerosene. On the other hand, in a linseed oil emulsion equal volume proportions of oil phase is added with water phase (Xie *et al.*, 1995).

Development of linseed varieties with good fibre quality

Now-a-days, eight double purpose linseed varieties (oil and fibre) have been developed. These are Gaurav, Jeevan, Nagarkot, Shikha, Rashmi, Meera, Parvati and Pratap Als-1 (Srivastava, 2009). The productivity of oil (1200-1600kg/ha) and fibre (860-1200kg/ha) of these developed varieties are better than traditional varieties. The disease resistance of these varieties are high but the quality of fibres collected from the available varieties are inferior in comparison to imported fibres from European countries which are used in our country for defense and industrial purposes (Srivastava, 2009). So, more research work is to be initiated to improve the quality of fibre by breeding/agronomic manipulations, which would save 35 crores of rupees foreign exchange and will generate more employment.

Characteristics of flax fibre

Flax fibres are an interesting alternative to mineral fibres due to its low cost, low density, high specific stiffness and recyclability nature. These constitute for their use as rigid composite materials (Baley, 2002).

Composition of flax fibre

According to Batra (1998), flax fibre is composed of cellulose (64.1%), hemicellulose (16.7%), pectin (1.8%), lignin (2.0%), water soluble compounds (3.9%), wax (1.5%) and water (10.0%). However, these compositions are relative to the variety of plant, soil quality, weathering conditions, the level of plant maturity and the quality of retting process etc.

Structure of flax fibre

The detailed structure of flax fibre cell reveals that it consists of two cell walls viz. primary cell wall (0.2µm thick) and secondary cell wall. They are arranged in concentric cylinders with a small channel in the middle called lumen, through which uptake of water continues. The main core of the fibre is contributed by secondary wall, which is designed as S₁, S₂ and S₃, from which S₂ is the main bulk of the fibre (Fig.1 and Fig. 2). Again it has been found that the flax fibre is strengthened by the highly crystalline cellulose fibrils which are spirally arranged in a matrix of amorphous hemicellulose and lignin (Fig.3). Each fibre is made up of macrofibrils, microfibrils and elementary fibrils. Macro fibrils are 0.5mm in diameter and are an assembly of microfibrils, which are 10 to 20 nm in diameter, which in turn are an assembly of up to 20 elementary fibrils called micelles. Each micelle is made up of 50 to 100

molecules of cellulose. The distance between two micelles is about 01 nm and about 10nm between two microfibrils (Baley,2002).

Cultural methods

Linseed is purely a *rabi* and cool season crop, which requires moderate to cool temperature during the growing season. This is generally confined to low elevation, and the plains. It can grow where annual precipitation ranges from 48-76 cm. If the crop is exposed to drought and high temperature (about 32°C) during and after the flowering stage, the yield, size and oil content of seeds are greatly reduced. Linseed also grows on marginal and sub-marginal rainfed soil, which may vary from light to heavy soil. When the plants become golden yellow the capsules turn brown and seeds in the capsules rattle (Plate 4). This is the appropriate time to harvest. In an irrigated field, the crop can produce seed yield of 12-15 q/ha.

Diseases with causal organisms and symptoms

Disease is one of the major constraints that limit productivity of linseed. The linseed crop is infected by all classes of pathogens *viz.* virus, bacteria, fungi and nematodes. There are a number of diseases to which linseed is exposed. But rust, wilt, *Alternaria* blight and powdery mildew are the major ones causing losses up to 80-100%, 80%, 27-60% and 60% respectively (Anonymous, 2005).

Rust (*Melampsora lini*)

Rust disease appears in the form of bright- yellow or orange coloured uredia on the leaves, stems and capsules. Uredia are generally circular on leaves and elongated on the stems and converted to pustules. Later the entire plant becomes covered by yellow-orange pustules. The disease commonly affects stem but more severely leaves, which die prematurely.

Wilt (*Fusarium oxysporum f. lini*)

Wilt is one of the most serious diseases in linseed causing a great loss. It develops in all the stages of their growth of the plants. Infection in seedling stage mostly causes falling off cotyledons. In the growth stage, dark green or brownish spots appear and these leaves shrivel. Infected plants ripen prematurely and develop black colouration of the vascular tissue in the stem and root of the plant. The dead and defoliated plants conspicuously appear in the field.

Alternaria blight (*Alternaria lini* and *Alternaria linicola*):-

All aerial parts of the plants are severely infected which causes heavy damage to the crop. However, disease appears on the floral parts particularly near the calyx in the form of small dark brown lesions. But on the young leaves, these lesions are large and extend to the stem. Later such leaves dry up and get twisted. Severely infected plants dry up by giving a burnt appearance in the field.

Powdery mildew (*Oidium lini*):-

The major symptom of this disease is the appearance of superficial whitish colonies of pathogen on the aerial parts including floral buds.

Abstract

Objective: This study aimed to apply the previously validated Rheumatoid arthritis medical records-based index of severity index (RARBIS) to RA patients in Egyptians and its relation to Comorbidity.

Method: Data of RA patients retrospectively collected from medical records in the follow up unit of the Rheumatology and Rehabilitation Department of Zagazig University hospital. The data were collected as regarding socio-demographic and clinical characteristics of the studied RA patients, the collected data were computerized and statistically analyzed using SPSS program version 20.0

Results: A total of 1142 patients files were reviewed and included in the study, their ages ranged from (20-73) years and the duration of the RA disease ranged from (1-20) years.

We found that the total (RARBIS) score ranged from 3-16 with a mean of 8.09 ± 2.41 . Also, the most frequent comorbidities in our patients are osteoporosis, hypertension, and peptic ulcer. RARBIS total score was high significant statistically increased in RA patients with comorbidities compared to those without comorbidities. In addition, the mean age of RA patients, rural area residency and illiteracy, increasing disease duration, prescribed NSAIDs or prednisolone were associated with high frequency increase in RA comorbidities. It was found that no significant difference when comparing frequency of comorbidities with sex, smoking and working status.

Conclusion: Our study demonstrated that the Egyptian RA patients have relatively high scores of severity index, and most of patients with severe RA suffer from a number of associated comorbidities with significant relationship with the severity index.

Introduction:-

Rheumatoid arthritis (RA) is the most common chronic inflammatory joint disease with the average prevalence of 0.5–1% in developed population¹, and of 0.3–0.5% in developing countries². This disease results in long-term disability and premature mortality in the patients³.

Corresponding Author:-Samah M. Alian.

Comorbid diseases are the medical conditions associated with RA. The mechanisms of this association may be due to the pathogenesis of RA itself, the effects of medications used for treating RA, or only a coincidence⁴. Substantial evidence indicates that the continuous systemic inflammation and immune dysfunction characteristic for RA plays a critical role in the development and acceleration of comorbidities⁵.

Comorbidities most frequently seen in patients with RA include cardiovascular disease, lung disease, malignancies, osteoporosis, changes in body composition and neuropsychiatric disease. Most of these comorbidities occur more frequently than expected in RA patients as compared to the general population. The average patient with RA has two or more comorbid disorder⁶.

RA disease severity is a major predictor of development of comorbidities. Surveys indicate that although clinical outcomes have improved in patients with RA, mainly due to access to more efficient pharmacotherapy, comorbidity remains a major issue in many patients. As a part of strategies to improve further the management of patients with RA, multidisciplinary collaboration for prevention and early detection of comorbidities is of major importance⁷. Because RA severity may affect both choice of treatment and incidence of comorbid conditions, RA severity is an important potential confounder in pharmacoepidemiologic studies⁸.

The patient may have severe RA but been unable to take more potent therapy due to contraindications, including comorbid conditions⁹. As the comorbid conditions may impact treatment regimens of RA, or the prescribed drugs may worsen the comorbidity. Additionally, in many instances, rheumatologist may be forced to prescribe RA medications that exacerbate the comorbid conditions. Therefore, to successfully manage RA, comorbidities should be carefully considered and they should be treated in addition to prescribing anti-rheumatoid medication regimens. As RA patients with more comorbidities experience greater functional impairment¹⁰. Rheumatoid arthritis medical records-based index of severity index (RARBIS) was developed through an expert Delphi panel of six rheumatologists, and convergent validity was assessed by comparing it with intensity of the actual RA treatments that patients received. The index includes indicators from five categories: prior surgical history (C1–C2 fusion and joint surgeries), radiologic findings (C1–C2 subluxation and erosions), laboratory findings (rheumatoid factor (RF), erythrocyte sedimentation rate (ESR), C-reactive protein (CRP), and platelet counts), clinical and functional status (arthritis flares, morning stiffness, physician global rating, and functional status), and extra-articular manifestations (vasculitis and pulmonary nodule)⁸.

This study used a previously validated (RARBIS) for rheumatoid arthritis to estimate the distribution of disease severity and the association between disease severity and comorbidity in Egyptian RA patients from Sharkia Governorate, Egypt

Methods:-

Subjects:-

Data of RA retrospectively collected from medical records in the follow up unit of the Rheumatology and Rehabilitation Department of Zagazig University hospital (Monocentric study). The Zagazig University Hospitals is the biggest hospital in eastern Egypt that provides health care to the population in that part of Egypt, as it full of highly qualified professors and doctors of various specialties.

The data were collected as regarding socio-demographic and clinical characteristics of the studied RA patients, We obtained information on surgical history (C1–C2 fusion and joint surgery), laboratory values (RF, ESR, CRP and platelet counts), extra-articular manifestations (subcutaneous nodules and vasculitis) and X-rays (C1–C2 subluxation, erosions), out-patient medications prescribed, comorbid conditions, and clinics attended were retrieved from the patients' physical file. Because the RARBIS does not require a physician's assessment for its calculation, it is easily applied retrospectively to medical records. All of the data for the RARBIS are accessible from medical records.

A total of 1142 patients files were reviewed, the diagnoses of RA based on the 1987 American College of Rheumatology criteria were included in the study, their ages ranged from (20-73) years and the duration of the RA disease ranged from (1-20) years.

Objective:-

This study aimed to apply the previously validated severity index for rheumatoid arthritis (RARBIS score) to RA groups in Egyptians and its relation to Comorbidity.

Statistical analysis:-

The collected data were computerized and statistically analyzed using SPSS program (Statistical Package for Social Science) version 20.0. Qualitative data were represented as frequencies and percentages. Chi-square test (X²) was carried out for comparing the qualitative data. Quantitative data were compared using student's t-test. The test results were considered significant when p-value <0.05 and highly significant when p-value <0.01.

Results:-

A total of 1142 RA patients were included in the study. Most of them were females (79.6%) with mean age of 43.86 ± 11.40 . Only (14.6%) of them were from urban areas and had higher education (15.1%). Most of patients were non-working (82.3%) but only (7.7%) were current smokers, with mean disease duration of about 9.24 ± 4.76 . As regarding treatment, more than half of patients (68.1%) were on non-steroidal anti-inflammatory drug NSAIDs, and (87.1%) on prednisolone (**Table 1**).

Table (1): Socio-demographic and Characteristics data of the studied RA patients:

Variables	No. (%) (n. =1142)
Age (years)

RA-related medications	
NSAIDs	778 (68.1)
Prednisolone	995 (87.1)

As regard to RARBIS of RA patients (**Table 2**), only 17 patients (1.5%) had prior surgical histories, while 473 patients (41.4%) had radiologic joint destructions. Extra-articular manifestations (vasculitis and pulmonary nodules) were evident in 61 (5.4 %) of RA patients, (RF) were positive in about half of them (53.3%), where the other Laboratory sub-scale (Erythrocyte sedimentation rate > age/2 or C-reactive protein > upper limit normal or platelets > 450 K) were observed in most RA patients (87.5 %). The optional RARBIS score with medication use was also calculated with the addition of data on medication use. As regarding treatment, more than half of patients were on

DMARDS (Disease-modifying Anti-rheumatic Drugs). The Summary score for extended index was calculated by summing the five subscales ranged from 3-16 with a mean of 8.09 ± 2.41 .

Table 2:- Rheumatoid arthritis medical records-based index of severity (RARBIS):

Sub-scale Points	No. (%) (n. =1142)
1. Surgery sub-scale: <ul style="list-style-type: none"> C1–C2 fusion Any hand joint Any foot joint Major joints (hips, knees, shoulder, elbow, wrist, ankle) 	5 (0.4) 0 (0.0) 2 (0.2) 10(0.9)

Summary score for extended index Mean \pm SD Range	8.09 \pm 2.41 3 - 16

Graph (1) showed that the frequency of comorbidity among the studied RA patient was (62.2%). Higher frequencies of comorbidities were noticed for osteoporosis (39.1%), eye (36.5%), hypertension (32.2%) and peptic ulcer (27.2%). (22.4%) of studied RA patients had psychiatric problems (mostly depression), (20.1%) were Diabetic and (17.6) had hepatitis viral infection. (15.1%) of the patients had abnormal serum levels of lipids. While cancer, chronic renal disease, and coronary heart disease, represented lower frequencies (1.1%, 2.6%, 3.7%; respectively).

Graph 1:-Frequency of comorbidity among the studied RA patients

* Patients can be counted more than twice if they have more than one comorbid disease, therefore the total will not equal (the number of patients in the cohort)

Relationship between socio-demographic and characteristics data of the studied RA patients and comorbidity is demonstrated in **Table 3**. Mean age of RA patients with comorbidity was highly significantly older than RA patients without comorbidities ($p < 0.000$). Also, rural area residency and illiteracy ($p < 0.000$) were significant predictors of comorbidity among RA patients. There was a highly significant increase in the frequency comorbidity with increasing disease duration ($p < 0.000$). As regarding treatment, patients with prescribed NSAIDs, or prednisolone showed significantly higher prevalent comorbidities ($p < 0.0001$).

It was found that no significant difference when comparing frequency of comorbidities with sex, smoking and working status ($P > 0.05$).

As regard RA severity index total score analyses, we found that RARBIS total score was high statistically increased in RA patients with comorbidities compared to those without comorbidities (**Table 3**).

* Statistically highly significant.

Discussion:-

Our study demonstrated that the most patients with severe RA suffer from a number of associated comorbidities. These comorbid conditions may impact treatment regimens of RA, or the prescribed drugs may worsen the comorbidity. Therefore, to successfully manage RA, comorbidities should be carefully considered and they should be treated in addition to prescribing RA regimens medication.

Similar to previous studies like **Ikuyama et al.¹¹**, our study showed that more women (79.6%) than men (20.4%) suffer from RA. Also, in our study, the average patient age was 43.86 ± 11.4 years, which is similar to the average age of patients with RA in **Sineglazova et al. study¹²**.

Personal characteristics of Egyptian patients showed lower educational level and smoking status with common non-working status, these findings are may be related to cultural and economic background¹³. Which would have as a consequence poor compliance to treatment, and therefore, poor control of the inflammatory activity of RA. In addition, biologic therapy is expensive and not covered or reimbursed governmentally or routinely by insurance. So, As regarding treatment, more than half of patients (68.1%) were on NSAIDs, and (87.1%) on prednisolone, which were comparable with that from a study on established RA study done by **Osiri & Sattayasomboon⁴**. The rate of prednisolone used in our patients was 87.1%, which was comparable with that from **Briggs et al. study¹⁴** and **Al-Bishri et al. study¹⁵**.

RA severity is considered complex measure determined by objective components such as disease activity (for example, tender/swollen joints and acute-phase reactants) and physical damage (for example, radiologic damage, and functional disability) and subjective components (for example, global health assessment, pain, grip strength, fatigue, and costs). The RARBIS does not require a new physician's assessment and the information on indicators can be routinely collected from typical medical records¹⁶.

To the best of our knowledge, this is the first study discuss the RARBIS among Egyptian RA patients. We found that the total score ranged from 3-16 with a mean of 8.09 ± 2.41 and this relatively consider high score, although our patients haven't large percent of extra articular manifestations like vasculitis (4.5%) or pulmonary nodules (0.9%) or cervical subluxation (1.8%), but our patient have higher disease activity clinically and laboratory with more flares 2-4 (38.7%), with 5 arthritis flare (56.7%), high inflammatory markers as ESR and CRP (78.5%) high RF (53.3%), high DMARDs usage like; hydroxychloroquine, gold, sulfasalazine (70.4%) & methotrexate, leflunomide (74.7%) and this uncontrolled disease may be due to educational and sociocultural aspects, which would have as a consequence poor compliance to treatment, and therefore, poor control of the inflammatory activity of RA, as well as a lower use of biological agents; drugs that show an important ability to induce remission in RA; due to the economic problems in our country.

We studied also the comorbid conditions associated with our RA patients and found that 62.2% patients had at least one comorbidity. These results were consistent with several results where study done by **Al-Bishri et al.¹⁵** found that (66.0%) patients of the 340 investigated were found to suffer from at least one comorbidity. In addition, **Osiri & Sattayasomboon⁴** study revealed that the prevalence comorbidities in RA patients ranged from 54.0 to 56.8%. The higher frequencies of comorbidities were noticed for osteoporosis (39.1%) which is similar to the study

done by **Briggset al. study**¹⁴ which revealed that the frequency of osteoporosis in the studied RA was (31.0%) and this match can reflect that the use of steroid is a major factor in susceptibility to osteoporosis in some RA patients.

As regarding eye problems frequencies (36.5%), our study was in agreement with the study done by **Osiri&Sattayasomboon**⁴, they found that the frequency of eye conditions (34.6%) (KCS, cataract, glaucoma).

Also, our results matched with the study done by **Al-Bishriet al.**¹⁵ among Saudi RA patients, we found that (36%) of RA patients had hypertension in comparison of the studied RA (32.2%). Further, it seems that Egyptian patients had also highest ever prevalence of gastric ulcers (27.2%) which is similar to **El-Zorkany et al**¹³ which revealed the prevalence of gastric ulcer (22.0%) as compared to prevalence in all other participating countries (10.0%). So, the management strategy which concentrates on the use of available NSAIDs, steroids, and synthetic DMARDs would be responsible¹⁷.

We found (22.4%) of studied RA patients had psychiatric problems mainly depression, this finding consistent with previous studies in a cohort study of more than 33000 patients with RA, depressive symptoms were reported by 11.7% of patients. There was association RA and depression and the coexistence of depression and RA is associated with increased pain, fatigue, reduced health-related quality of life, increased physical disability and healthcare costs¹⁸. And also matched the meta-analysis that included 13.189 patients with RA from 72 studies, the prevalence of a major depressive disorder was found to be 16.8 %¹⁹.

In this study we observed that the frequency of diabetes mellitus was (20.1%) which were in agreement with the study done by **Espiño-Lorenzo et al.**²⁰ and revealed that (27.0%) of RA patients were diabetic.

Our results not matched with the study done by **El-Zorkany et al**¹³ which was done on 308 Egyptian patients with RA and found that RA with hepatitis viral infection were (7.1%) but in our study (17.6%) had hepatitis viral infection and these differences may be related to different sample size, and residency and sociocultural aspect.

We observed (15.1%) of the RA patients had abnormal serum levels of lipids and this finding consistent with previous study done by **Al-Bishri et al.**¹⁵ who found that (19.4%) of RA patients had dyslipidemia.

While; cancer, chronic renal disease, and coronary heart disease, represented lower frequencies (1.1%, 2.6%, and 3.7%; respectively). Moreover, these finding matched **El-Zorkany et al.**¹³ study as they found that cancer, chronic renal disease, and coronary heart disease, represented lower frequencies (0.3%, 1.3%, and 3.2%; respectively).

In our study RA patients with comorbid conditions were significantly older and had longer duration of DMARDs treatment than those with-out comorbid diseases. Rural area residency and Illiteracy were significantly associated with comorbidity among RA patients. As regarding treatment, patients with prescribed NSAIDs, or prednisolone showed significantly higher prevalent comorbidities ($p < 0.0001$). And when we comparing RA severity index, we found highly statistically significant differences between RA patients with comorbidity than RA patients without comorbidities

Our study was in agreement with the study done by **Osiri&Sattayasomboon**⁴ they found that RA patients with comorbid conditions were significantly older and had longer duration of DMARDs treatment than those without comorbidity.

Moreover, **Espiño-Lorenzo et al.**²⁰ observed that age is the main predictive factor of comorbidity in these RA patients. They identified four factors associated with comorbidity in the univariate analysis, two related to age and the rest related to the severity of RA, however, age was the only predictive factor for both comorbidity and multi-morbidity in the multivariate analyses. Because many health problems are known to increase with age, this demographic trend may lead to an increase in the absolute number of chronic conditions in RA patients. For this reason, age always appears as the strongest predictor of comorbidity in addition to pre-existing comorbidity in RA patients.

In study done by **El-Zorkany et al.**¹³, they observed that the degree of RA disease activity found among Egyptian patients (highest ever among different COMORApopulation cohort) might reflect that the reason for patients visiting the rheumatologist is a flare of disease activity. In some countries, patients are evaluated routinely even when their

RA is under good control. So, uncontrolled RA disease contributes to the increased risk of comorbidity in RA patients.

In addition, **Navarro-Cano et al.²¹**, concluded that both comorbidity and RA severity scales displayed strong bivariate associations with the probability of survival, and these associations were statistically significant.

Conclusion:-

This is the first time to apply the severity index for RA among Egyptian RA patients and we found that the Egyptian patients have relatively high scores of severity but may not reflect the actual severity nature of the disease as they have the higher score in the clinical activity subscale and this continuously active disease may be due to socioeconomic problems in our country. We found also high percent of comorbid conditions associated with the disease with significant relationship with the severity index.

Limitation of our study is the retrospective nature, since some data may be overlooked; additionally, data regarding the impact of comorbidities on disease activity and quality of health were not available. New researches should focus on the complex interdependencies between RA severity and comorbidity. The RARBIS may have great utility for researchers using medical record.

Ultrasonic velocity, Acoustical properties, Molecular interactions.

Abstract

The ultrasonic velocity, density and viscosity have been measured in the binary systems of dimethyl sulfoxide (DMSO) with triethylamine (TEA). From the experimental data, various acoustical parameters such as adiabatic compressibility (β), intermolecular free length (L_f), free volume (V_f), internal pressure (π_i), Relaxation time (τ), Acoustic impedance (Z), Gibb's free energy (ΔG) and Vander Waal's constant (b) were calculated. The results are interpreted in terms of molecular interaction between the components of the mixtures.

Introduction:-

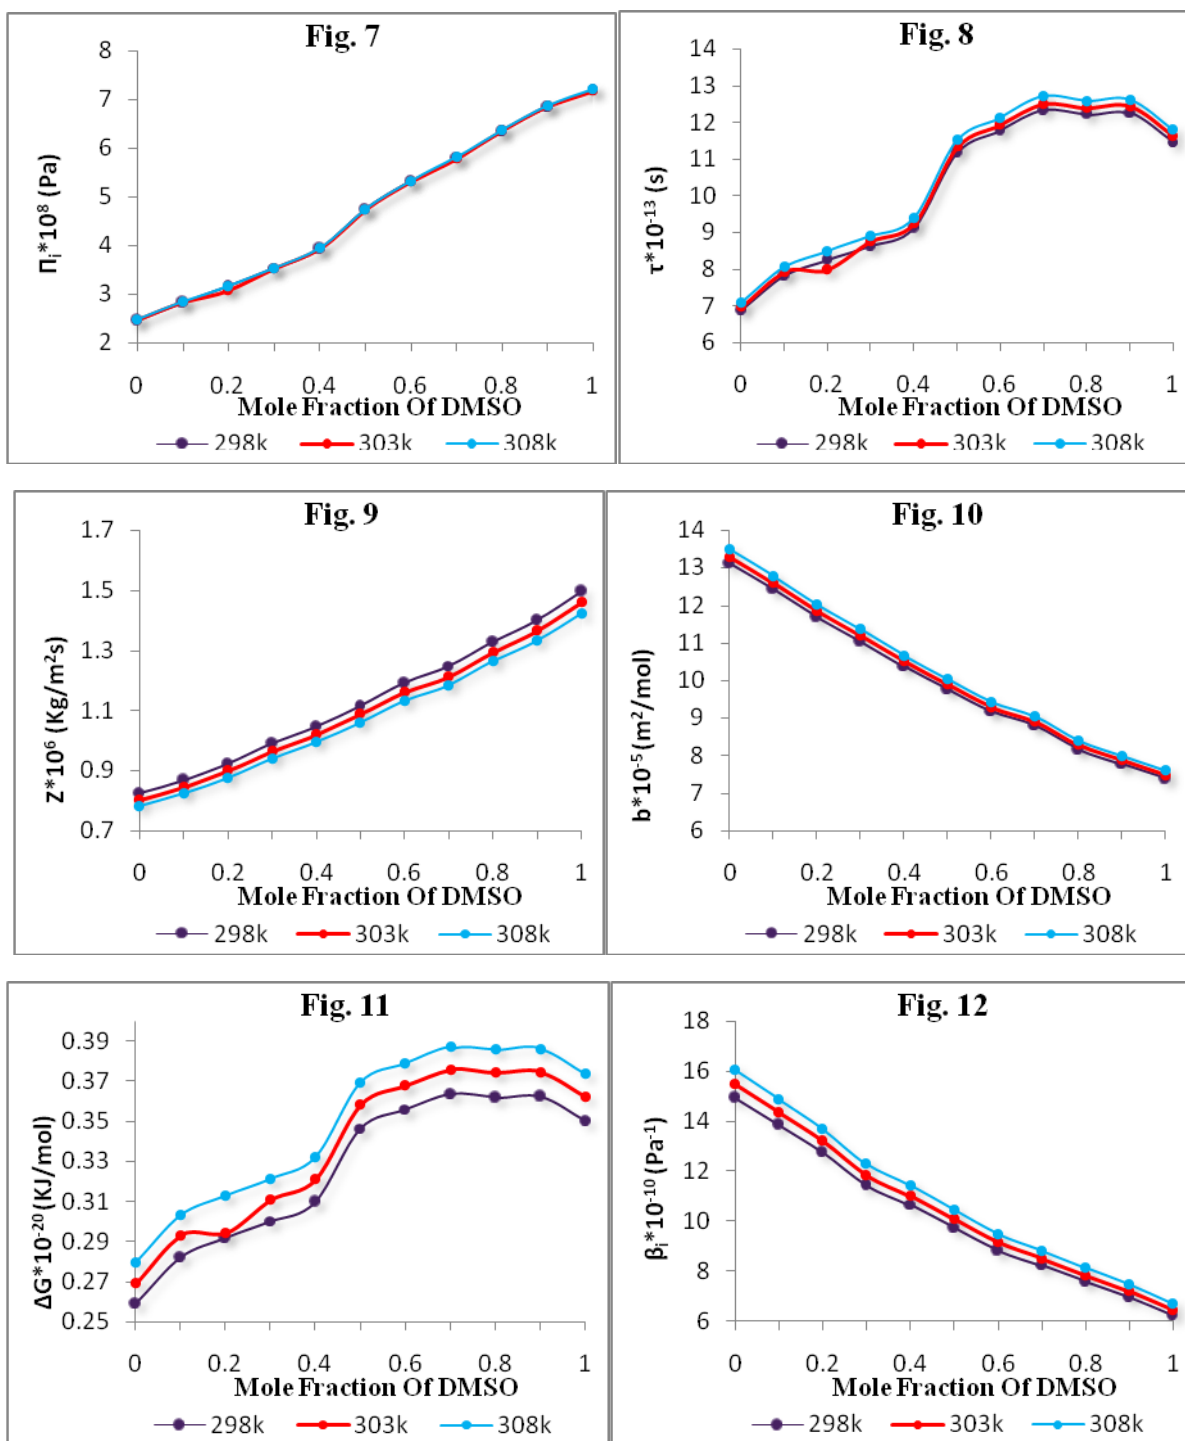

In recent years, ultrasonic technique has become a powerful tool for studying the molecular behavior of liquid mixtures [1-3]. The measurements of ultrasonic velocity have been adequately employed in understanding the molecular interactions in liquid mixtures. Molecular interaction studies can be carried out by both spectroscopic [4-5] and non-spectroscopic [6-7] techniques. A large number of studies have been made on the molecular interaction in liquid systems by various physical methods like, Raman Effect, Nuclear Magnetic Resonance, Ultra Violet and ultrasonic method [8-10]. However, ultrasonic velocity and viscosity measurements have been widely used in the field of interactions and structural aspect evaluation studies. In recent years ultrasonic technique has become powerful tool in providing information regarding the molecular behavior of liquids and solids, owing to its ability of characterizing Physico-chemical behavior of the medium. The ultrasonic velocity data for binary and ternary liquid mixtures have been used for by many researchers [11-14].

In order to have a clear understanding of the intermolecular interactions between the component molecules, the authors have performed thorough study on the liquid mixtures using ultrasonic velocity data. The present work deals with the ultrasonic velocity and computation of related parameters in binary system of dimethyl sulfoxide + triethylamine at 298.15K, 303.15K and 308.15K at frequency 7MHz. For preparing various concentration mixtures, mole fractions of component liquids were varied from 0.0 to 1.0. Dimethyl sulfoxide, as a polar solvent, is certainly too some extent associated by dipole-dipole interactions, and is of particular interest because of the absence of any significant structural effects due to the lack of hydrogen bonds; therefore, it may work as an aprotic, protophilic solvent with a large dipole moment and high dielectric constant.

Results and Discussions:-

The variation of density, viscosity and ultrasonic velocity Vs mole fraction for the binary system dimethyl sulfoxide +triethylamine at 298.15K, 303.15K and 308.15K are shown in **fig.-1, 2 and 3 respectively**. While other thermodynamics parameters such as adiabatic compressibility (β_a), free length (L_f) free volume (V_f) internal pressure (π_i), relaxation time (τ), and acoustic impedance (Z), Gibb's free energy (ΔG), Vander Waal's constant (b), Isothermal compressibility(β_i) at temperature 303K are shown in **fig.-4,5,6,7,8 9,10,11 and 12 respectively**.

Fig. 1 shows the graph of ultrasonic velocity versus concentration. It is observed that ultrasonic velocity increase with increase in the concentration of DMSO in TEA, indicating association in constituent's molecules. The association may involve due to hydrogen bonding or dipole-dipole interaction between DMSO in TEA.

Fig.2 shows the graph of density versus concentration. It is observed that density increases with increase in concentration of DMSO in TEA. Increase in density decrease in volume, indicating association in component molecules. The density of binary liquid mixtures may be increase due to structural reorganization indicating the closed packed structure of the molecules cluster. This makes the liquid medium less compressive. Increasing temperature of the mixture decreases its density (ρ). The decrease in density (ρ) with temperature indicates decrease in cohesive force. Thus increase of temperature favors increase of kinetic energy and volume expansion and hence decrease of density.

Fig. 3 consists of viscosity (η) versus concentration. It is observed that viscosity increases with increase in the concentration of DMSO in TEA, indicating strong molecular interaction. The viscosity gives the strength of molecular interaction between interacting molecules. Increase in temperature of the mixture, increasing disorders of the medium and hence entropy increases. As entropy increases, viscosity of binary mixture decreases.

Free Length, Increase in concentration of DMSO thus results in decrease in adiabatic compressibility (β_a) and free length (L_f) as shown in **Fig. 3 and Fig 4**. The regular fall in free length with increase in concentration of DMSO causes a rise in sound velocity [16]. This trend is an indication of clustering together of the molecules as the associative effect of the polar group dominates over the other type of interaction [17]. Velocity shows a reverse trend as temperature is increased. This happens as the spacing between the molecules increases leading to a less ordered structure.

The adiabatic compressibility (β_a) and Isothermal compressibility (β_i) exhibit similar trend. From **Fig.4 and 12**, it is observed that adiabatic compressibility (β_a) and isothermal compressibility (β_i) decreases with increase in molar concentration of DMSO in TEA indicating strong intermolecular interaction in the component molecules in binary mixtures shows associating tendency of the component molecules.

Fig. 6, it is observed that free volume decreases (V_f) with increase in mole concentration of DMSO in TEA, indicating association in the molecules of the component liquids. It was observed that the variation in the free volume values show exactly the reverse trend as that of internal pressure as shown in **Fig. 7**, gradually increases indicating weak molecular interaction amongst DMSO in TEA [18]. In the present paper, it is observed that free volume decreases and internal pressure increases.

Increase in internal pressure (Π_i) may be due to strengthening of cohesive force. Since the interaction in our case is weak, ' Π_i ' increases slowly with concentration of DMSO, but decreases rapidly with increase of temperature.

Relaxation time (τ) increases with increase in mole fraction of DMSO as presented in **Fig. 8**, but increases as temperature increases. The former indicates weak molecular interaction between the components of the mixture, and the latter is true because of instantaneous conversion of excitation energy to translational energy. . The relaxation time which is in the order of 10^{-13} sec is due to structural relaxation process [19] and in such a situation, it is suggested that, the molecules get rearranged due to co-operative process [20]. Relaxation time is the time taken for the excitation energy to appear as translational energy and it depends on temperature and impurities.

Acoustic impedance (Z) is the ratio of the effective sound pressure at a point to the effective particular velocity at that point. The pressure is measured by the totality of the force of dispersion, repulsion, ionic and dipolar. In our present investigation, **From Fig. 9**, acoustic impedance increases with increase in concentration of DMSO, showing weak molecular interaction. Since $Z = U\rho$, as temperature increases, Z decreases. Acoustic impedance is also used for assessing the absorption of sound in the medium.

Fig. 10 represents the Vander Waal's Constant (b). Vander Waal's constant (b) is also known as the co-volume in in Vander Waal's equation and it varies in similar way to that of the available volume. The co-volume decrease with increasing concentration of DMSO in TEA indicating strong interaction between the component molecules. Also the linear variation of these acoustical properties indicating absence of complex formation in the mixture. These

parameters help for the study of range of Repulsive [21] and attractive forces in the molecules of the components. The change in Vander Waal's Constant (b) would be due to a change in intermolecular geometry (micro geometry).

Gibb's free energy measures mobility of the medium. Higher the mobility of the medium, higher will be the entropy; lower will be the free energy. **Fig. 11** represents the variation of Gibb's free energy with concentration. It is observed that Gibb's free energy increase with increase in concentration DMSO in TEA, indicating decrease in mobility of the mixture hence disorder decreases. This leads to the low entropy and hence salvation increase. This is because of the fact that salvation is directly proportional to size of the molecule.

Conclusions:-

Density, viscosity and ultrasonic velocity increases with increase in mole fraction of dimethyl sulfoxide in triethylamine. This is due to the dipole - dipole interaction between dimethyl sulfoxide and triethylamine components. The decrease in adiabatic compressibility and free length for the system- dimethyl sulfoxide in triethylamine is due to strong association. The dipole-dipole interactions between dimethyl sulfoxide and triethylamine are found to be responsible for association in the binary liquid mixture.

Abstract

Mild steel is employed widely in most industries due to its low cost and availability in ease for the fabrication of various reaction vessels such as cooling tower tanks, pipelines etc. It can be subjected to aggressive and unfavorable environmental conditions, making it susceptible to corrosion. From the economic and environmental view, plant extracts are an excellent alternative as inhibitors because of their availability, biodegradability, non toxicity and environmental friendly. The rich source of anthraquinone and other chemical composition of Aloe Vera has been resulted a wide range uses in different sector. The present study deals with the inhibition effect of biodegradable, nontoxic and eco-friendly. Aloe Vera leaf extract on corrosion of mild steel in HCl. The corrosion inhibition of mild steel in the presence of *Aloe Barbedensis Miller* in 0.5 MHCl was studied by weight loss measurement; electrochemical techniques (Potentiodynamic polarization, AC Impedance). The maximum efficiency was found to be 81% at 150 ppm. From the result of weight loss studies, the mode of adsorption is found to be physisorption. Kinetic and thermodynamic parameters were calculated and discussed. Potentiodynamic polarization studies indicate that *Aloe Barbedensis Miller* acts as a mixed type of inhibitor. The surface morphology has been analyzed.

Introduction:-

Corrosion is the destruction of material resulting from an exposure and interaction with the environment. It is a major problem that must be confronted for safety, environmental and economic reasons in various chemicals, mechanical, metallurgical, biomedical and medical engineering applications and more specifically in the design of a much more varied number of mechanical parts. Several efforts have been made using corrosion preventive practices and the use of green corrosion inhibitors is one of them. Natural products have been studied extensively as corrosion inhibitors both in product mixtures extracted from natural sources such as plants or essentially pure products derived from animals or plants (i.e., vitamins and amino acids)[1]. From the economic and environmental view points, plant extracts are an excellent alternative as inhibitors because of their availability and biodegradability. These extracts contain a variety of natural products such as essential oils, tannins, pigments, steroids, terpenes, flavones and flavonoids, among other well-known active substances used as CIs. In general, these compounds contain conjugated aromatic structures, long aliphatic chains such as nitrogen, sulfur, and oxygen heteroatoms with free electron pairs that are available to form bonds with the metal surface; in most cases, they act synergistically to exhibit good efficiency regarding the corrosion protection. Aloe Vera is an important medicinal plant which

belongs to the family of Liliacea. A more recent review concludes that the cumulative evidence supports the use of Aloe barbadensis miller for the healing of first to second degree burns. Aloe Vera plant is used for corrosion protection of metal in acidic medium since it was found for environmental eco-friendly and available in affordable price. The Aloe Vera leaves contain several free anthraquinones and phenolic compounds that aid in absorptive processes in metal surface. The rich source of anthraquinone and other chemical composition of Aloe Vera has been resulted a wide range uses in different sector. In most of the studies related to Aloe Vera gel alone was taken and the outer part of the skin was considered as a waste material. In the present study the outer part of Aloe Vera alone was taken to investigate the inhibitive effect for the corrosion of mild steel in 0.5M HCl.

Materials and Methods:-

Preparation of Mild Steel Specimens:-

The mild steel samples were obtained from a locally available industrial Fe-C steel with very low concentration of carbon. A large sheet of cold rolled mild steel coupons have the following chemical composition 0.026% Si, 0.006% P, 0.4% Mn, 0.1% C, 99.4% Fe. The mild steel samples, with an active surface of $1.2 \times 4.0 \times 0.3$ cm were used for Mass loss measurements and $1\text{cm} \times 1\text{cm}$ specimen for electrochemical measurements. The mild steel samples were mechanically polished, washed in double distilled water and degreased with acetone and used for the weight loss method and surface examination studies.

Weight – loss method:-

Determination of Corrosion Rate:-

Weight loss measurements were carried out using an ACCULAB Electronic balance with readability/sensitivity of 0.1 mg in 210g range. The specimens were immersed in beaker containing 100ml acid solutions without and with different concentration of Aloe Barbedensis Miller leaves extract using hooks. At the end of exposure period, specimens were cleaned according to ASTM G-81 and the weight recorded. The average mass loss of two parallel mild steel specimens was obtained. The test specimens were removed and then washed with de-ionised water, dried and reweighed [2]. From the change in weight of specimens the corrosion rate was calculated using the following relationship,

$$\text{Corrosion Rate} = 87.6 \times W / A \times T \times D (\text{mpy})$$

$$\text{Corrosion Inhibition Efficiency (IE)} = 100[1 - (W_2/W_1)] \%$$

Electrochemical Impedance Spectroscopy:-

Electrochemical measurements were run using a Potentiostat/galvanostat (Electrochemical system Model Vertex.100mA.D) and a personal computer was used. IVIUM software was used for Electrochemical Impedance Spectroscopy (EIS) and potentiodynamic polarization (PDP) analysis. The EIS measurements were carried out using AC signals of amplitude 10 mV peaks-to-peaks at the open circuit potential in the frequency range of 10 MHz to 1 Hz. The charge transfer Resistance (R_{ct}) values have been calculated from the difference in the impedance at low and high frequencies. The capacitances of the double layer (C_{dl}) values are estimated from the frequency (f) at which the imaginary component of the impedance ($-Z''$) is maximum and the double layer capacitance (C_{dl}) was calculated by using following equation:

$$\text{Obtained from the equation: } C_{dl} = \frac{1}{2} \times 3.14 \times R_{ct} \times f_{\max}$$

Potentiodynamic Polarization:-

After impedance spectrum was obtained, the potentiodynamic current potential curves was recorded immediately by changing the electrode potential automatically taken from OCP value with scan rate of 5 mV / S [3]. Tafel lines extrapolation method was used for detecting I_{corr} and E_{corr} values for the studied systems.

Scanning Electron Microscope and Energy Dispersive Spectroscopy Analysis:-

For surface morphological study of the uninhibited and inhibited mild steel samples were sent to SEM and EDX analysis [4][5].

Results and Discussion:-

Mass Loss Measurements:-

Effect of Inhibitor Concentration:-

Inhibition efficiency of mild steel with different concentration of *Aloe Barbadensis Miller* extract in 0.5M HCl at room temperature are presented in Table 1. From the table, it is clear that the corrosion rate decreases with an increase in inhibitor concentration, i.e. the corrosion inhibition enhances with the inhibitor concentration. This behavior is due to the fact that the adsorption and coverage of the inhibitor on the mild steel surface increase with the inhibitor concentration. Maximum inhibition efficiency of 81% was shown at 150ppm in 0.5M HCl at 3 hour immersion, period beyond 200 ppm the system remains constant. The high inhibitive performance of *Aloe Barbadensis Miller* suggests a higher bonding ability of inhibitor on mild steel surface[6].

Table 1:- Corrosion rate of mild steel in 0.5M HCl.

S.no	Concentration(ppm)	Corrosion rate(mpy)	Surface coverage(θ)	% I.E
1	Blank	18	-	-
2	50	6	0.66	66
3	100	5	0.72	72

5	200	3.7	0.79	79
6	250	3.6	0.80	80
7	300	3.6	0.80	80

Fig 1:- Corrosion rate of *Aloe Barbadensis miller* at different concentration.

Fig 2:- Inhibition efficiency of *Aloe Barbadensis miller* at different concentration.

Effect of temperature:-

To show the effect of temperature on inhibition efficiency of Aloe Barbedensis Miller, Weight loss experiment was performed in the temperature range of 308 to 328 K at optimum concentration. The variation of inhibition efficiency with temperature at optimum concentration are listed in Table 2. From table 2, it is clear that corrosion rate is temperature dependent and increases with increase in temperature [7], [8].

Table 2:- Effect of temperature on the CR of mild in 0.5 M HCl.

S.no	Temperature (K)	Corrosion rate(Blank)	Corrosion rate(Inhibitor)	Surface coverage	% I.E
1	308	22	5.3	0.76	76
2	313	31	9.1	0.71	71
3	318	41	10.8	0.73	73
4	323	50	15	0.70	70
5	328	75	26	0.65	65

Kinetic and Thermodynamic parameter for corrosion rate:-

The apparent activation energy (E_a), the enthalpy of activation (ΔH^*) and entropy of activation (ΔS^*) for the corrosion of mild steel in 0.5M HCl solution with and without inhibitor at different temperatures are calculated from Arrhenius equation:

$$CR = A \exp(-E_a/RT) \quad (1)$$

And from Transition state equation:

$$CR = RT/h \exp(\Delta S^*/R) \exp(-\Delta H^*/RT) \quad (2)$$

Figure 3:- Arrhenius plots of log CR Vs $1000/T(K^{-1})$

The Arrhenius plot for mild steel immersed in 0.5M HCl with optimum concentration and blank solution is depicted in fig.3. The Activation energy (E_a) is obtained from the slope ($-E_a/2.303RT$) and the values are listed in table 3. It is evident from the increase in activation energy value in the presence of inhibitor that the reaction undergoes through different mechanism which has a high E_a value compared to uninhibited system. Hence the rate of corrosion is decreases, as less reactants have that activation energy to reach the activation state.

Table 3:- Thermodynamic parameters for Mild steel in 0.5M HCl in the absence and presence of optimum concentration of *Aloe Barbadensis Miller* leaves.

	E_a (KJmol ⁻¹)	ΔH^\ddagger	ΔS^\ddagger
Blank	49.21	46.5	-68.18
Inhibitor	61.7	59.12	-39.07

Figure 4:- Transition state plots of Log CR/T Vs $1000/T(K^{-1})$.

A plot of $\log (CR/T)$ Versus $1000/T$ is shown in fig.4. Straight lines are obtained with slope $(-\Delta H^*/2.303R)$ and intercept of $[\log(R/Nh) + (\Delta S^*/R)]$. The positive value of enthalpy of activation (ΔH^*) in the absence and presence of inhibitor at different temperatures reflects the endothermic nature of mild steel dissolution process, which indicates that the dissolution of steel is difficult. It is evident from the table that the value of ΔH^* increases in the presence of the inhibitor than in the absence. This shows the higher protection efficiency of the inhibitor. This may be attributed to the presence of high energy barrier for the reaction and hence there is rise in enthalpy of the corrosion process.

From Table 3, it is clear that there is an increase in the entropy of activation in the presence of inhibitor system compared to its absence. The large negative value of entropy of activation in the absence of inhibitor shows that it has more ordered arrangement in the transition state whereas in the presence of inhibitor system the entropy of activation becomes less negative showing that the surface of the metal is covered with inhibitor molecules thus moving the system towards less ordered arrangement.

Adsorption Parameter:-

The primary step in the action of inhibitors in solution is generally agreed to be adsorption on the metal surface. This involves the assumption that the corrosion reactions are prevented from occurring over the area (or active sites) of the metal or alloy surface covered by adsorbed inhibitor species, whereas these corrosion reaction occurred normally on the inhibitor free area. Accordingly, the fraction of surface covered with inhibitor species ($\theta = \%IE/100$) can be followed as a function of inhibitor concentration and solution temperature. The surface coverage (θ) data are very useful while discussing the adsorption characteristics. When the fraction of surface covered is determined as a function of the concentration at constant temperature, adsorption isotherm could be evaluated at equilibrium condition. The dependence of the fraction of the surface covered θ on the concentration C of the inhibitor was tested graphically by fitting it to Langmuir's isotherm, which assumes that the solid surface contains a fixed number of adsorption sites and each site holds one adsorbed species.

Figure 5:- Langmuir adsorption plot of $\log C/\theta$ Versus C .

Table 4:- Langmuir adsorption of *Aloe Barbadensis* Miller in 0.5M HCl on the mild steel.

Inhibitor	Intercept	K_{ads}	R^2	ΔG_{ads}° (KJ/mol)
<i>Aloe Barbadensis miller</i>	0.014	71.428	0.998	-10.75

The equilibrium constant for the adsorption process is related to the standard free energy of adsorption by the equation:

$$\Delta G_{\text{ads}}^{\circ} = -RT \ln K \quad (3)$$

The value of K can be obtained by the following equation

$$C/\theta = 1/K + C, \quad (4)$$

where C is the concentration of inhibitor (g/lit), θ is the surface coverage which is given as $\theta = \%IE/100$. A plot of C/θ VS C gives a straight line, from the intercept of the straight line the value of K can be calculated and the value is substituted in above equation and hence the $\Delta G_{\text{ads}}^{\circ}$ value is obtained. The negative value of $\Delta G_{\text{ads}}^{\circ}$ from Table 5 shows that the adsorption process is spontaneous. Normally, the magnitude of $\Delta G_{\text{ads}}^{\circ}$ around -20 KJ/mol or less negative is assumed for electrostatic interactions exist between inhibitor and the charge metal surface (i.e. physisorption). Those around -40 KJ/mol or more negative are indication of charge sharing or transferring from organic species to the metal surface to form a coordinate type of metal bond (i.e. chemisorption). The calculated $\Delta G_{\text{ads}}^{\circ}$ value is -10.75 KJ/mol which is less than -20 KJ/mol indicates that the adsorption is physical adsorption. The data are also used to study the El-Awady isotherm. The characteristic of the isotherm is given by:

$$\text{Log } (\theta/1-\theta) = \text{log } K + y \text{ log } C \quad (5)$$

Where C is the concentration of the inhibitor, θ is the degree of surface coverage, K_{ad} is the equilibrium constant of adsorption process and $K_{\text{ad}} = K^{1/y}$.

Figure 6:- El-Awady adsorption plot of $\text{Log}(\theta/1-\theta)$ Versus $\text{Log } C$.

Table 5:- El-Awady adsorption of *Aloe Barbadensis Miller* in 0.5M HCl on the mild steel.

Inhibitor	K_{ads}	$1/y$	R^2	$\Delta G_{\text{ads}}^{\circ}$ (KJ/mol)
<i>Aloe Barbadensis miller</i>	87.09	2.207	0.930	-11.25

In this model, the number of active sites y is included. Values of $1/y$ is less than one implies multilayer adsorption, while $1/y$ greater than one suggests that a given inhibitor molecule occupies more than one active site. Curve fitting of the data to the thermodynamic-kinetic model is shown in fig 6. The plot gives straight line which clearly show that the data fitted well to the isotherm. The value of $1/y$ and K_{ad} calculated from the El.Awady et.al model curve is given in table 5. It is evident from table.7 that the value of $1/y$ is greater than unity showing that the inhibitor molecule occupies more than one active site. The $\Delta G_{\text{ads}}^{\circ}$ value can be obtained by substituting the value of K_{ad} in equation.3. The negative value of $\Delta G_{\text{ads}}^{\circ}$ from Table.3 shows that the adsorption process is spontaneous. The calculated $\Delta G_{\text{ads}}^{\circ}$ value is -11.25 KJ/mol which is less than -20 KJ/mol indicates that the adsorption is physical adsorption.

SEM Analysis:-

The SEM mages were recorded to establish the interaction of inhibitor molecule with metal surface .Figure 7.represents the SEM images of (a) mild steel immersed in 0.5 M HCl, (b) mild steel immersed in the presence of Aloe Barbedensis Miller in 0.5 M HCl covered with the inhibitors. Result shows that the phytochemical constituents present in the *Aloe leaves* form a protective layer of the mild steel specimen and thereby reduce the corrosion rate.

Fig.7:- SEM micrograph of (a) Mild steel immersed in acid (b) Mild steel immersed in the presence of ABMLE in 0.5M HCl).

Energy Dispersive Spectroscopy:-

Energy dispersive x-ray analysis (EDX) technique was employed in order to get information about the composition of the surface of the mild steel sample in the absence and presence of the inhibitor in 0.5 M HCl solution. The EDX spectra of uninhibited and inhibited mild steel samples are shown in fig.8.

Fig.8:- EDX spectra of mild steel specimens (a) After immersion without inhibitor (b) After immersion with inhibitor.

The percentage atomic content of various elements of the uninhibited and inhibited mild steel surface determined by EDX is listed in table 6. The percentage atomic content of Fe for mild steel immersed in 0.5 M HCl solution is 79.69 % and those for mild steel dipped in an optimum concentration of Aloe Barbedensis Miller are 71.96 respectively. From figure 8, the spectra of inhibited samples show that the Fe peaks are considerably suppressed, When compared with the uninhibited mild steel sample. This suppression of Fe lines is due to inhibitory film formed on the mild steel surface.

Table 6:- .Percentage atomic contents of elements obtained from EDX spectra.

Mild steel	Fe	C	O	Si	Ca	Cr	Ni	Cu	Zn
Blank	79.69	8.46	11.85	-	-	-	-	-	-
Inhibitor	71.96	10.52	10.61	1.18	0.22	0.47	0.34	0.54	4.15

Electrochemical Impedance Spectroscopy:-

In general, as impedance diagrams for solutions examined have almost a semi circular appearance, it indicates that the corrosion of mild steel is mainly controlled by a charge transfer process. The impedance data such as R_s , R_p and C_{dl} were estimated by assuming Randles circuit. The values of charge transfer resistance (R_t) and double layer capacitance (C_{dl}) were evaluated from Nyquist and Bode plots. The values of R_t , C_{dl} and %IE derived from these investigations are given in table 7. The existence of single semicircle showed that single charge transfer process occurred during dissolution of mild steel which is unaffected by the presence of extract. It was found that addition of extract increases the value of R_t and reduces the C_{dl} value[9]. The decrease in C_{dl} value attributed to increase in thickness of electrical double layer. The increase in R_t value is attributed to the formation of protective film on the metal-solution interface.

Table 7:- The Electrochemical Impedance Parameters of Aloe Barbadensis Miller in 0.5 M HCl at optimum concentration.

System	$R_s(\Omega)$	$R_{ct}(\Omega \text{ cm}^2)$	$C_{dl}(\text{F cm}^{-2})$
Blank	20.9	31.19	6.39×10^{-5}
Inhibitor	20.31	108.3	5.780×10^{-5}

The impedance behavior of mild steel in 0.5 M HCl in the absence and presence of inhibitor at optimum concentration of Aloe Barbadensis Miller is shown as Nyquist plot in fig.10 and EIS parameter such as R_s , R_{ct} and C_{dl} were derived from the Nyquist plot are given Table.7 The ω_{max} represents the frequency at which the imaginary component reaches the maximum. It is the frequency at which the real part (Z_r) is midway between the low and high frequency X-axis intercepts. It is clear from the result that the value of R_{ct} increases from $31.19 \Omega \text{ cm}^2$ (Blank) to $108.3 \Omega \text{ cm}^2$ on the addition of 150 ppm of inhibitor. The value of C_{dl} decreases from $6.39 \times 10^{-5} \text{ F cm}^{-2}$ (Blank) to $5.780 \times 10^{-5} \text{ F cm}^{-2}$. The decrease in capacitance (C_{dl}) on the addition of the inhibitor may be due to increase in the local dielectric constant and /or may be due to increase in the thickness of the double layer, showing that *Aloe Barbadensis Miller* leaves inhibited Iron metal corrosion by adsorbing at metal/acid interfaces.

**Fig 9:-** Nyquist plot in absence and presence of optimum concentration of Aloe Barbadensis Miller.

Linear Polarization Measurement:-

The inhibition behavior of Aloe Barbadensis Miller in 0.5M HCl in the presence and absence of the inhibitor at optimum concentration are calculated by linear polarization Parameters and are given in Table.8.The efficiency found by linear polarization shows good agreement with efficiency obtained from Tafel and EIS data.

Potentiodynamic Polarization Measurements:-

The potentiodynamic polarization behavior of mild steel in 0.5 M HCl in the absence and in the presence of Aloe Barbadensis Miller is shown as Tafel plot in fig.10 .The various electrochemical potentiodynamic parameters such as corrosion potential(E_{corr}),corrosion current density (I_{corr}),anodic and cathodic slope (β_a and β_c) are calculated from Tafel plots and the values are listed in Table.8.It is seen that addition of Aloe Barbadensis Miller decreases the corrosion current (I_{corr}) density from 420.9(Blank) to 101.8 $\mu\text{A cm}^{-2}$ and shifts the E_{corr} from -426.8 to -396.8 m V SCE. Even though the slight shift of E_{corr} to less negative side makes one to think it as anodic inhibitor, but the large shift in the cathodic slope points to the control of cathodic process. Hence it is a mixed inhibitor controlling both cathodic and anodic process.

Table 8:- The potentiodynamic polarization and linear polarization parameters of Aloe Barbadensis Miller.

System	E_{corr} (m V /SCE)	I_{corr} ($\mu\text{A cm}^{-2}$)	β_a (m V /dec)	β_c	R_p
Blank	-426.8	420	987	1023	51.6
Inhibitor	-396.8	101	985	629	213.2

Fig10:-Tafel polarization curves for corrosion product of mild steel in 0.5M HCl in the absence and presence of Aloe Barbadensis Miller.

Conclusion:-

Aloe Barbadensis Miller skin is good corrosion inhibitors for corrosion of mild steel in 0.5 M HCl solution. The maximum efficiency was found to be 81 % at 150 ppm. The adsorption of *Aloe Barbadensis Miller* on mild steel surface obeyed the Langmuir and Al-Ewady Isotherm. The potentiodynamic studies reveal that Aloe Barbadensis Miller is a mixed type inhibitor. The negative value of ΔG° shows that adsorption of *Aloe Barbadensis Miller* on mild steel is a spontaneous process. The increase in E_a value is proportional

to the inhibitor concentration, indicating that the energy barrier for the corrosion interaction is also increased. The results obtained from the Weight loss, electrochemical methods, SEM, EDX suggested that the mechanism of corrosion inhibition is occurring mainly through adsorption process. EIS measurement results indicate that the charge transfer resistance of the mild steel electrode increases and double layer capacitance decreases by increasing the inhibitor concentration, showing the formation of the film. The SEM proves the formation of a film on the surface of the metal.

Underutilized trees, tribal livelihood
, lepidopteran fauna.

Abstract

Some plants (underutilized) are lesser-known plant species in terms of marketing and research, but well adapted to marginal and stress conditions. Their indigenous potential and ethno-botanical data are well known to people, whereas, commercial importance and market value is unknown to the public. A socio-economic survey was conducted in Jamboori Panchayat samiti of Abu Road area in Sirohi district of Rajasthan to assess the role of four edible underutilized food plants in tribal livelihood of Jamboori Panchayat Samiti. Findings reveals that the Garasia tribes inhabiting the area are unique in their ethno cultural heritage, far from the modern civilization and mostly depend on the forest and forest produce for their livelihood. These tribes are most backward and live in the interior forest. Livelihood systems in the study area are complex, based on primitive mode of agricultural practices. Common species in natural forest include *Butea monosperma*, *Anogeissus latifolia*, *zizyphus* spp., *Azadirachta indica*, *Madhuca longifolia*, *Boswellia serrata*, *Manilkara hexandra*, *Diospyros melanoxylon*, *Phonix* spp., *Pithocellobium dulce*, *Annona squamosa*, etc. and the main forest product exploitable commercially are *Diospyros melanoxylon* (leaves), bamboo, firewood, gum and barks etc. but naturally occurring and underutilized species includes- *M. hexandra*, *D. melanoxylon*, *M. dioica* and *P. dulce* which are good source of vitamins proteins carbohydrates and minerals. Due to good source of proteins they are also found associated or infested by many insects and also serves as their host plants. In the present paper the association of lepidopteron fauna (Butterflies & Moth) with some selected underutilized plant species with their role in tribal livelihood has been studied. The fruits were nutritionally rich and could be utilized for making by-products. Survey data reveals that if managed properly, these underutilized species could easily compete with commercial fruit-yielding species. Therefore, such fruit trees deserve priority action for conservation in natural forest stands and domestication in farmers' fields as a source of income generating activity.

Introduction:-

Plants have been a good source of nutrition since the time immemorial and can be categorized as underutilized or neglected crops that occur in wild or are grown in local scale with their poorly addressed economic potential, confining them for mostly traditional and local use only. A considerable proportion of tribal population is still undernourished and the people living in remote areas cannot produce enough food grains to meet the yearly requirement. Therefore, a large share of such population meets its food requirement through non conventional means by consuming various wild plants and animal resources especially in periods of food scarcity (FAO, 2004; Balemie & Kebebew, 2006). Wild food plants serve as alternative to staple food during periods of food deficit and are the valuable supplements for a nutritional balanced diet; one of the primary alternative source of income for many resource poor communities, and the source of species for domestication (Shrestha & Dhillon, 2006). Wild fruits are important for the potential resources which could be utilized at the time of scarcity or during normal days or cultivated as a source of food material for an ever increasing population (Rashid et al, 2008). Besides, these trees and shrubs harbor butterflies, honey bee and other insects of economic importance. Being food source for many insects and animals; these underutilized plants serve as a host for caterpillars whereas other plants provide sustenance for butterflies. In turn, butterflies help to pollinate plants. Insects visit flowers to obtain food, usually in the form of pollen or nectar. (Sharma & Sharma, 2013)

Materials and Methods:-

A preliminary survey was conducted to gather information on geographic area of villages, occupation pattern and socio-economic status of households. The interaction was held with State Forest Department, Sirohi, Zila Parishad and District Statistical Officer, Sirohi and Revenue Department, Abu Road. Similarly Key informant interviews were conducted with selected community leaders, traders and collectors at various study sites. For detailed socio-economic survey 10% families in each study village was surveyed. Total 160 households were surveyed in four study villages of Jamboori Panchayat Samiti through semi-structured and pre-tested questionnaire. Secondary data were collected from State Forest Department, Sirohi, Zila Parishad and District Statistical Officer, Sirohi and Revenue Department, Abu Road. Quantitative data was analyzed using SPSS where as qualitative data through coding and memoing (Punch, 2005). Results were analyzed for livelihood approach through strategic intervention for further implication. To find out the food resources of butterflies & Moth in Jamboori Panchayat Samiti, Abu Road, a systematic study was carried out. The butterflies and moth were observed and identified with the help of various field guide (Evans, 1932).

Result and Discussion:-

Jamboori Panchayat Samiti of Abu Road area of Sirohi district in Rajasthan situated in 24.4641° N, 72.7718° E and consists of four tribal dominated villages viz. Jamboori, Meen, Taleti and Bosa. The main tribes of the region are Garasia but small population of Bhils- Gameti are also found. Their average literacy rate is 55.25% with male and female literacy as 69.98 % and 39.73 % respectively. Ratio of female per 1000 male is 940. There are practically no basic amenities like safe drinking water, electricity, health services, roads and schools etc. These tribes reside in the interior parts of the forest and depend on the forest as their main source of livelihood. They also undertake agricultural activities during the monsoon season. 65% of the total area consists of forestland and only 6 % land is under cultivation (Tripathi, 2016).

Socio-economic status:-

Most of the tribals of the region belongs to BPL category and percentage poverty ratio and intensity ranges from 54.49 -130.70. The Average distance of a village from Block Head quarter is 21 Km and from the district head quarters is 72 Km. Hinduism is the main religion followed in the villages. Hand pump and wells are the most important sources of domestic use of water. Almost all the villages reported to have a primary school at the village level. The average distance of a secondary school from these villages is reported to be around 6 kms. Friends and relatives are the sources for availing credit by the households at the time of the need of credit. Ground water is available at a depth of around 120 feet and the quality of water is good and non brackish.

Average family size is 5.75 in Jamboori, 5.87 in Meen, 6.17 in Bosa and 9.51 in Taleti. Average land holdings per family is 1.39 beegha in Bosa, 1.61 beegha in Jamboori, 1.90 beegha in Taleti, and 2.00 beegha in Meen. Agriculture is mostly rainfed. *Zea mays* (Maize), *Triticum aestivum* (Wheat), *Cajanus cajan* (Tuar), *Phaseolus vulgaris* (Chanwla/Lobia), *Cicer arietinum* (Chana/gram), Vegetables, *Ricinus Communis* (Arandi/castor), *Cyamopsis tetragonoloba* (Gawar), *Brassica juncea* (Raida), *Brassica campestris* (Mustard) are some of the

important crops that are cultivated in the study villages. Animal husbandry is also one of the important source of livelihood. Every family has one or two cows/buffaloes and 5-10 goats but the milk production from cows is very low i.e. 1-1.5 litres per day. Average Cattle owning families per village is 95.49% in Bosa, 96.51% in Jamboori, 98.03% in Taleti and 100% in Meen. People usually do not sell milk and they use it for household consumption. However, the sale of goat and poultry fetches some money (about 1000- 1500) every year. Women equally share the economy of a household and in some instances earns up to 75% of the income (Tripathi, 2016).

Fuelwood is the only source of cooking and is being extracted from nearby forest. On an average minimum and maximum amount of fuel-wood used by a household ranged 50- 70 kg/household respectively and average collection of fuelwood from natural forest ranges between 50-70% percent and remaining requirement is fulfilled by crop residue and cowdung. The distance travelled by tribals for collection of fuelwood is less than 5 km in all the villages. The preferred species for fuelwood includes *Manilkara hexandra*, *Butea monosperma*, *Anogeissus latifolia*, *Acacia nilotica*, *Tamarindus indica* etc. whereas firewood of *Diospyros melanoxylon*, *Madhuca indica*, *Annona squamosa*, *Feronia limonia* etc. are generally not preferred as firewood by tribals.

The average income of households ranges from Rs. 20,000-25,000/- per annum. On average NTFPs contributes about 17% of the total income. However, the contribution ranges from 10-30% to different families. Among underutilized species maximum collection/family/annum is done by *P. dulce* followed by *D. melanoxylon*, *M. dioica* and *M. hexandra* (Table-2; Fig.1) whereas *P. dulce* is maximum underutilized species followed by *M. hexandra*, *D. melanoxylon* and *M. dioica* respectively (Table-2, Fig.-2). Honey collection is also done in Bosa. Tribals generally destroy the bee hive completely during honey collection. Intervention by NGO (Samarthak Samiti, Udaipur) / Agriculture Department etc. may help in non-destructive honey collection. Traders play an important role in NTFP selling. Most of them are local traders operating as middlemen simply collecting NTFP from village agents/shopkeepers and deliver in the nearby town. The tribals barter the daily NTFP collection for their daily use food items viz., pulses, jaggary, soap etc. All the underutilized NTFP species are nutritionally rich and some of them are good source of Vitamin A, B & C (Misra & Misra, 2016).

Table 1:- Socioeconomic status of the people in the study area.

S. No.	Study area and villages →	Bosa	Jamboori	Meen	Taleti
	Variables ↓

Lepidopteron fauna associated with selected underutilized edible wild plant species**Plant species:-** *Diospyros melanoxylon****Grammodes geometrica* Fabricius, 1775 (Lepidoptera: Noctuidae):-**

This is a beautiful moth colored in brown, black and cream. Fore wing consists of a distinct white band flanked on either side by broader black bands. The more distal one is also edged narrowly with white. Beyond this narrow white lining, an orangish-brown band is seen. Again an irregular black lining is present in discal area that goes upto apex. Costa is broadly grey-brown and none of the bands reach upto it. A black lined boundary in wavy manner is present beyond which fringes are clear in brown. The wild host of the moth were found to be *Phyllanthus* (Euphorbiaceae); *Diospyros* (Ebenaceae); *Ricinus* (Euphorbiaceae); ‘grasses’ (Gramineae); *Polygonum* (Polygonaceae); *Zizyphus* (Rhamnaceae).

***Grammodes stolidia* Fabricius, 1775 (Lepidoptera: Noctuidae):-**

This is a beautiful moth colored in brown, black and cream. Forewing consists of a distinct white band flanked on either side by broader black bands. The more distal one is also edged narrowly with white. Beyond this narrow white lining, an orangish-brown band is seen. Again an irregular black lining is present in discal area that goes upto apex. The moth was found to be polyphagous. The larvae feed on Rosaceae, Rhamnaceae (*Zizyphus jujuba*), and Zygophyllaceae (*Tribulus*).

***Euthalia nais* Forster, 1771 ((Lepidoptera: Nymphalidae):-**

This butterfly species is generally seen in dry forested areas. It is beautiful orange colored with black boundary on terminals of both wings with hind wing boundary being broader and diffuse. The edges of wings are wavy, more clearly in HW. FW is shaped like a right angled triangle. The butterfly is fond of sunshine and is attracted by sap, over-ripe fruit and toddy. It feeds on Ebony, *Diospyros melanoxylon* (Ebenaceae) which grows in regions of light rainfall

Plant species:- *Momordica dioica* Roxb.***Pelopidas mathias* Fabricius, 1798 (Lepidoptera:Hesperiidae):-**

It is commonly known as small branded swift. Presence of brand has given it the common name *Small branded swift*. White spots are present on forewing. 2 separate cell spots, 1 in 1b may/may not be present. 3 large quadrangular spots are present in discal area. 3 small spots lie in subapical region. Hind wing shows 2-3 inconspicuous spots. Ventral side shows similar spots on forewing while hind wing shows spots from 1 to 7 in a curved manner. 1 spot is visible in cell area. The common food plants are *Momordica dioica* and monocots.

***Pelopidas conjuncta* Herrich-Schaffer, 1869 (Lepidoptera:Hesperiidae):-**

This is a small brown colored butterfly with white spots. Most of these spots appear to merge with each other. Their flight is very smooth and powerful, therefore the name *Conjoined swift* is given to it. Ventral side is similar. Antennae are small, reaching upto end cell spots. Male has no brand. This butterfly for food depend on *Rottboellia exaltata* (Poaceae), *Tridax procumbens* (Asteraceae), *Aerva lanata*, *Amaranthus gracilis* (Amaranthaceae).

Plant species:- *Manilkara hexandra*

***Graphium sarpedon sarpedon* Linnaeus, 1758 (Lepidoptera: Papilionidae):-**

The blue bands on wings give it the common name *Common bluebottle*. Ground color of wings is brownish-black and the species is generally seen mud puddling. Hind wing is produced to end in a short tail or tooth. A pale blue or greenish blue discal band runs from inside apex of forewing and through cell of hind wing nearly to its dorsum. The adult Common Bluebottle feeds on nectar from a variety of flowering herbs. The larvae feed primarily on the leaves of trees in the families *Myrtaceae*, *Sapotaceae* and *Rutaceae*. Some other favorites are *Polyalthia longifolia* and *Miliusa tomentosa* (Annonaceae).

***Graphium sarpedon teredon* Felder and Felder, 1864 (Lepidoptera: Papilionidae):-**

The blue bands on wings give it the common name *Common bluebottle*. Ground color of wings is brownish-black and the species is generally seen mud puddling. Hind wing is produced more compared to *sarpedon* to end in a short tail or elongated tooth. The discal bands are narrower compared to *sarpedon* on both the wings. The adult Common Bluebottle feeds on nectar from a variety of flowering herbs. The larvae feed primarily on the leaves of trees in the families *Myrtaceae*, *Sapotaceae* and *Rutaceae*. Some other favorites are *Polyalthia longifolia* and *Miliusa tomentosa* (Annonaceae).

***Graphium agamemnon* Agamemnon Linnaeus, 1758 (Lepidoptera: Papilionidae):-**

The triangular shaped wings and green spots gives it the common name *Green spotted triangle*. The synonymous name is *Zetides*. It is a large tailed butterfly with green colored spots or bands all over the wings. The ground color is black with spots towards the base in band form, especially on hind wing. These large butterflies are very fond of *Lantana camara* (Verbenaceae), *Ixora* and *Mussaenda*.

***Graphium agamemnon menides* Fruhstorfer, 1904 (Lepidoptera: Papilionidae):-**

The synonymous name is *Zetides*. It is a large tailed butterfly with green colored spots or bands all over the wings. The ground color is black with spots towards the base in band form, especially on hind wing. Females are similar but with a streak of greenish white along the dorsal margin on both dorsal and ventral sides. They are rarer compared to males. Thorax and abdomen on sides streaked with greenish grey. These large butterflies are very fond of *Lantana camara* (Verbenaceae), *Ixora* and *Mussaenda*.

***Graphium nomius* Esper, 1793 (Lepidoptera: Papilionidae):-**

The presence of prominent spots on forewing and pointed tail on hindwing gives it the common name *Spot swordtail*. Wings are bluish white. Dorsal side shows black while ventral side shows brown bands. Forewing cell with 5 broad transverse black bands, a terminal black band occupies a terminal third of the wing and is traversed by a subterminal series of rounded spots of the ground color. The lower discal area is blackish. This butterfly also feed on *Gmelina arborea*.

Plant species:- *Pithocellobium dulce*

***Charaxes athamas* Drury, 1773 (Lepidoptera: Nymphalidae):-**

Their extremely swift and powerful flight on high trees gives it the common name *Nawab*. It is also known as *Ergolis athamas*. The ground color of wings is black characteristic to the genus. Broad yellowish or slightly green bands are present. They feed on various Fabaceae plants like *Acacia*, *Albizia lebbek*, *Caesalpinia* sp., *Delonix regia*, *Leucaena leucocephala*, *Grewia* sp.

***Charaxes solon* Fabricius, 1793 (Lepidoptera: Nymphalidae):-**

The royal black color of wings gives it the common name *Black Rajah*. It is also known as *Charaxes fabius*. It is a large sized butterfly with basal area and costal margin tinged blue.

***Hypolimnias bolina* Linnaeus, 1758 (Lepidoptera: Nymphalidae):-**

The prominent egg shaped marking on forewing and hindwing gives it the common name *Great Eggfly*. Wings are completely black with forewing having a rounded white patch shaded blue outside covering interspaces 3,4,5. Another small similar patch lies in pre-apical area and a series of white dots in curvy fashion is visible in post discal area. These are attracted to *Lantana camara* (Verbenaceae), *Bauhinia purpurea* (Fabaceae) and *Celosia argentea* (Amaranthaceae). The caterpillar feeds on various tropical plants. Food plants of female are low growing species of *Urticaceae*- *Pouzolzia zeylanica*.

***Danaus chrysippus* Linnaeus, 1758 (Lepidoptera: Danaidae):-**

It is the most common butterfly seen flying at low heights with low speed. It displays warning colors of black and orange which resembles like that of a tiger's body. Abdomen is yellowish while head and thorax are black. These butterflies could be seen at any time of the day. The female form of Danaid eggfly mimics this species.

***Eurema blanda* Linnaeus, 1758 (Lepidoptera: Pieridae):-**

As the name suggests, three spots are present in the cell area of forewing on ventral side, therefore the name derived as *Three Spot Yellow Grass*. The adult butterfly are distinct yellow, small butterflies, with black marginal marks on the wings similar to *Eurema hecabe*. During the five larval instars, the yellow, hairless caterpillars successively defoliate the host tree. Pupae exuviae are often abundant on infested trees. The symptoms of *Eurema blanda* infestation are: skeletonized leaflets, during severe infestation host can be completely defoliated, often pupal exuviae abundant on skeletonized leaves, mostly young trees are affected.

***Ascalapha odorata* Linnaeus, 1758 (Lepidoptera: Noctuidae):-**

Ascalapha odorata is a large bat-shaped, dark-colored nocturnal moth. The forewings are shaped like an obtuse triangle with a fairly long apex. Males can attain a wingspan of 16 cm. The wings are mottled brown with hints of iridescent purple and pink, and, in females, crossed by a white bar. The forewing reniform spot is comma shaped, with dark filling except lighter bluish in the "tail," producing a convincing eyespot. *Ascalapha odorata* is a large bat-shaped, dark-colored nocturnal moth. The forewings are shaped like an obtuse triangle with a fairly long apex. Males can attain a wingspan of 16 cm. The wings are mottled brown with hints of iridescent purple and pink, and, in females, crossed by a white bar. The forewing reniform spot is comma shaped, with dark filling except lighter bluish in the "tail," producing a convincing eyespot.

***Ascalapha odorata* Linnaeus, 1758 (Lepidoptera: Noctuidae):-**

Ascalapha odorata is a large bat-shaped, dark-colored nocturnal moth. The forewings are shaped like an obtuse triangle with a fairly long apex. Males can attain a wingspan of 16 cm. The wings are mottled brown with hints of iridescent purple and pink, and, in females, crossed by a white bar. The caterpillar feeds on woody Legumes such as *Cassia*, *Acacia*, *Albizia*, *Prosopis*, *Pithecellobium* and other Fabaceae species plants. Adults are highly vagile and migrate for hundreds of miles. They are primarily nocturnal and come to light and sugar baits, bananas. They also feed on Anacardiaceae and Moraceae plants.

Conclusion:-

The underutilized crops are species are used traditionally for food, fibers, fodder, oil or medicinal properties. They also have an underexploited potential to contribute to food security, nutrition, health, income generation and environmental services. Considering the importance of the crops as food, medicine and for industries, these underutilized crops can be exploited at the commercial level and their commercial potential will also provide important environmental services, as they are adapted to marginal soil and climatic conditions. Therefore, these underutilized crops have been included in world-wide plans of action after having successfully raised the interest of decision makers. The high nutritional qualities indicate that the cultivation and consumption of these crops may be helpful in overcoming the nutritional deficiencies predominant in many rural areas of the country and boost the socio-economic condition of the society.

On the other hand, butterflies are known to be the most fascinating creatures existing on this earth and have a great aesthetic value too. They are in close relation with these underutilized species in Jamboori Panchayat Samiti as they procure nectar from flowering plants to meet their energy requirements as well as they serve to be pollinators for various plant species which is the only means of their propagation. Hence, induction of these underutilized crops in agro-ecosystem for value addition products and their commercial exploitation through Village Forest Protection Committees /Self Help Groups as income generating activity will be beneficial for conservation of lepidopteron fauna of the region.

Abstract

Background: The use of biosurfactants to protect the marine environment seems possible since a number of marine bacterial strains can produce biosurfactants during growth on hydrocarbons (Bertrand *et al.*, 1993). For the sake of the environment, the use of biosurfactants is preferable to those of synthetic surfactants. However, little information on either biosurfactant produced by marine microorganisms or biosurfactants active in saline has been reported so far.

Objective: The isolated colonies were identified, potential biosurfactant producer was screened out. Biosurfactant extraction was done by lowering pH using 5M HCl followed by the detection and purification. The extracted biosurfactants were also used to study the effect on metal removal and anticancer activities.

Materials and method: The antibacterial activity was carried out by disc diffusion method, screening of potential biosurfactant producers by hemolytic assay, drop collapsing test, oil displacement test and emulsification activity, detected and purified by silica gel plate (TLC). Anticancer activity was done by *Dimethyl thiazolyl diphenyl tetrazolium bromide*, (MTT). Effects on metal removal were studies using the media with salts of CrSO₄ and ZnSO₄.

Result: Antimicrobial activity of SP2 showed highest activity against *Pseudomonas aeruginosa* (1cm) and *Bacillus megaterium* (2.2cm). Species 2 showed highest activity in the screening methods. TLC showed the presence of lipopeptide and rhamnolipid. The biodegradation using same concentration of bio surfactants produced by SP2, increased with increased concentration of the salts. SP2 microbial extracts showed cytotoxic activity in L929 cell line. These findings suggest that the identified sponges are source of pharmaceutical important compounds.

Introduction:-

The number of natural products, discovered from several organisms that include plants, animals, and microorganisms, overcomes millions of compounds. Forty to sixty percent derives from terrestrial plants, from

which twenty to twenty-five possess bioactive properties such as antibacterial, antiviral, anticancer and anti-inflammatory activity (Berdy, 2005). Bio surfactants are categorized mainly by their chemical composition and microbial origin. Major classification includes glycolipids, phospholipids, fatty acids, polymeric bio surfactants and particulate bio surfactants (Desai and Banat, 1997). They have many advantages, such as biodegradability, low toxicity (Poremba *et al.*, 1991) and environmental compatibility (Georgiou *et al.*, 1990). The use of biosurfactants to protect the marine environment seems possible since a number of marine bacterial strains can produce biosurfactants during growth on hydrocarbons (Bertrand *et al.*, 1993). They have the same physical and chemical properties as the synthetic surfactants. However, little information on either biosurfactant produced by marine microorganisms or biosurfactants active in saline has been reported so far. This article aims to provide an overview on the production of biosurfactants by marine microorganisms and to discuss their potential use in bioremediation.

Materials And Methods:-

Collection of algae:-

The algae were collected from Muttom Beach, Kanyakumari District, Tamilnadu. They were found attached to the rocks. Unwanted components were removed from the algae by washing with sea water and then preserved in refrigerator to carry out further studies.

Isolation and Enrichment of Bacterial Species from Marine Algae:-

Frozen algae were cut into small pieces. Mixed colonies of bacterial species were isolated from the algae by growing one of the small pieces of algae in Zobell Marine Broth for 24-48hrs at 37°C. The bacterial colonies were then isolated by spread plate technique (Shirling and Gottlieb, 1966). Characterization of bacterial strains was performed based on Bergey's manual of determinative bacteriology (Bergey *et al.*, 1994).

Screening Methods for Potential Biosurfactant Producers:-

The potential biosurfactant producer was screened by different method such as Hemolytic assay (Carillo *et al.*, 1996), Drop collapsing test by Bodour and Maier (1998) and Oil displacement test (Morikawa *et al.*, 1992). Maximum biosurfactant producing marine bacterial species was maintained on Zobell Marine Agar medium for further study. Those species with highest activity is selected for further studies.

Extraction of Biosurfactant:-

The extraction procedure was carried out based on the method described by (Kingsley *et al.*, 2004). After 96 hrs cultivation, each culture was centrifuged at 8000 rpm, 4°C for 10 min to harvest the cells. The culture supernatant was taken and pH of the culture supernatant was lowered to 2 with 5M HCl and incubating at 4°C for 24 hrs. The precipitate was separated by centrifugation at 8000 rpm for 20min. White precipitate formed culture was selected for further experimentation

Detection and Purification of Bioactive Bio surfactant:-

Thin layer chromatography was carried based on the procedure described by Rashedi (2005), using silica gel plate. A small quantity of crude extract was dissolved in chloroform: methanol (15:35 v/v). 10µl of the crude extract was added onto a TLC plate (silica gel 60) and apply at point of origin near the bottom of the plate. Once dried, develop plate in solvent system of chloroform: methanol: water (65:25:4). When developed remove plate and allow air drying in a fume cupboard. Spray the plate evenly with water or a solution of 5% sulphuric acid and place in an oven at 110°C for 20 min to visualize spots. At preparative scale, remove lipopeptide spots by scraping the silica from plate into a flask. The extract was dissolved in chloroform: methanol (2:1), incubated overnight.

Effect of Bio surfactant on Metal Removal:-

The extracted bio surfactants were used for the removal of metal such as chromium and zinc ions. The nutrient broth medium containing the salts of Chromium sulphate and Zinc sulphate was prepared and sterilized. The salts of Chromium and Zinc were added to the medium at a concentration of 60mg, 80mg, 100mg at 50mL of broth respectively. The pH of the medium was adjusted to 7 and sterilized in an autoclave at 15Lbs pressure for 15 minute. Then the extracted bio surfactants (about 50µL) was inoculated into the medium and incubated for 24hrs, 48hrs, 72hrs at 30°C to study the degradation effects. The tubes were analyzed for the concentration of metals present after treatment using a spectrophotometer. The absorbance can be read at 650nm (Perez *et al.*, 2007)

Antimicrobial Activity:-

The crude bio surfactant was tested for antimicrobial activity using Kirby Bauer disc diffusion method (Bauer *et al.*, 1996). The filter paper disc of uniform size 6mm were impregnated with the bioactive compound and then placed on the surface of the agar plate seeded with the microorganism to be tested. All the plate culture was incubated in an inverted position at 26-28°C for 24-48 hrs. The disc which showed maximum zone of inhibition was selected for further studies.

Invitro cytotoxic assay:-

MCF cells were purchased from NCCS Pune was maintained in Dulbecco's modified eagle's media (HIMEDIA) and grown to confluency at 37°C and 5% CO₂ in a humidified atmosphere in a CO₂ incubator. The cells were trypsinized (500µl of 0.025% Trypsin in PBS/ EDTA solution) for 2 minutes and passaged to T flasks in complete aseptic condition. Extracts were added to grown cells at a concentration of 100µg, 500µg and 1000µg from a stock of 100mg/ml and incubated for 24 hours.

MTT assay:-

MTT assay was performed based on the method followed by (Arung *et al.*, 2000). MTT is a colorimetric assay that measures the reduction of yellow 3-(4, 5dimethylthiazol-2-yl)-2, 5-diphenyl tetrazolium bromide (MTT) by mitochondrial succinate dehydrogenase. The MTT enters the cells and passes into the mitochondria where it is reduced to an insoluble, coloured (dark purple) formazan product. The cells are then solubilised with an organic solvent Dimethyl sulfoxide (Himedia) and the released, solubilised formazan product was measured at 540nm. Since reduction of MTT can only occur in metabolically active cells the level of activity is a measure of the viability of the cells.

The cell culture suspension was washed with 1x PBS and then added 30 µl of MTT solution to the culture (MTT - 5mg/ml dissolved in PBS). It was then incubated at 37°C for 3 hours. MTT was removed by washing with 1x PBS and 200µl of DMSO was added to the culture. Incubation was done at room temperature for 30 minutes until the cell got lysed and colour was obtained. The solution was transferred to centrifuge tubes and centrifuged at top speed for 2 minutes to precipitate cell debris. OD was read at 540 nm using DMSO as blank.

Results:-**Isolation and Identification of Marine Bacteria associated with Ulva lactuca:-**

Four individual marine bacteria have been isolated by Zobell Marine Agar and were named as SP1, SP2, SP3 and SP4. The marine bacteria were identified as *Bacillus* species 1, *Bacillus* species 2, *Pseudomonas* species and *Staphylococcus* species based on Bergey's manual of determinative bacteriology (Bergey *et al.*, 2004).

Screening of biosurfactant:-

Hemolytic test was done for all the four biosurfactants produced from marine bacteria. The highest activity is shown by SP2 which is represented by a clear zone around the colony. In Drop collapsing test, the culture supernatant was added to the surface of oil droplet placed in a 96 well micro titer plate lid. The flat drops shown by the bio surfactant producing culture were scored as positive. More positive results were shown in vegetable oil and petrol by SP1 and SP2 (TABLE-1). Oil biodegradation activity was checked by oil displacement test. Of the four-culture species SP1, SP3, SP4 showed degradation against vegetable oil. SP2, SP3, SP4 showed degradation against kerosene. SP3 and SP4 showed degradation against petrol. SP1, SP3, SP4 shows degradation against diesel (TABLE-1).

Table 1:- Screening By Drop Collapsing And Oil Displacement Test.

Isolates	Drop collapsing test				Oil displacement test (cm)			
	Vegetable oil	Kerosene	Petrol	Diesel	Vegetable oil	Kerosene	Petrol	Diesel
SP1	+	+	+	-	1.3	-	-	1.2
SP2	+	-	+	+	-	1.5	1.9	-
SP3	+	-	-	-	1.5	2.1	1.3	1.6
SP4	+	+	-	-	1.4	1.6	1.5	1.8

Screening of antimicrobial activity:-

The antimicrobial activity was done against pathogenic bacteria *Salmonella typhi* (MTCC-733), *Klebsiella pneumoniae* (MTCC-4030), *Enterobacter aerogenes* (MTCC-111), *Mycobacterium tuberculosis* (MTCC-300), *Streptococcus pyogenes* (MTCC-928), *Pseudomonas aeruginosa* (MTCC-4676), *Bacillus megaterium* (MTCC-453). SP1 showed activity against *Mycobacterium tuberculosis*, *Streptococcus pyogenes*, and *Bacillus megaterium*. SP2 showed high activity against *Pseudomonas aeruginosa* and *Bacillus megaterium*. SP3 showed high activity against *Mycobacterium tuberculosis* and also have activity against *Salmonella typhi*, *Streptococcus pyogenes* and *Bacillus megaterium*. SP4 showed activity against *Klebsiella pneumoniae*, *Streptococcus pyogenes* and *Bacillus megaterium* (GRAPH-1)

Graph 1:- Antimicrobial activity of biosurfactants isolated from the algae.**Separation of Biosurfactant:-****Thin Layer Chromatography:-**

The biosurfactant produced by SP2 were characterized by using TLC plates. The sediments obtained was placed in the TLC plate and the plates when sprayed with 5% sulphuric acid reagent it showed pinkish red spots and yellowish spots in the plates. This shows the lipopeptide and rhamnolipid biosurfactants production by the organism (TABLE-2)

RF Value =

Table 2:- rf value of the compounds separated by tlc.

Species	Rf value		Name of compound
SP1	Pink	0.93	Rhamnolipid
	yellow	0.73	Lipopeptide
SP2	Pink	0.86	Rhamnolipid
	Yellow	0.76	Lipopeptide
SP3	Pink	0.95	Rhamnolipid

SP4	Pink	0.91	Rhamnolipid
	Yellow	0.82	Rhamnolipid

Effect of Biosurfactant on Metal Removal:-

The biodegradation of heavy metal salts ZnSO_4 and CrSO_4 using same concentration of biosurfactants produced by SP2 and different concentration of salts at pH 7 revealed that there was significant degradation of the heavy metals by the surfactant. The degradation increased with the increased concentration of the salts which is illustrated in the following tables (TABLE-3)

Table 3:- Efficiency Of Biosurfactant On Reduction Of Zinc And Chromium.

Concentration of ZnSO_4 (mg)	OD at 650nm				Concentration of CrSO_4 (mg)	OD at 650nm

Anticancer activity of bioactive compound produced from algae on MCF cell line:-

The cytotoxic effect of SP2 microbial extract on MCF (Breast cancer) cell line was tested by MTT cell viability assay. The percentage of viability of MCF cell line by 1000 μg of microbial extract showed 54.9% viable cell. Results were showed in (TABLE-4, PLATE-1)

Table 4:- Anticancer Activity Against Cell Line Mcf.

Sample concentration	OD at 540nm	% viability
Control	1.2	100
100 $\mu\text{g}/\text{ml}$	0.7844	65.36
500 $\mu\text{g}/\text{ml}$	0.6840	57.0
1000 $\mu\text{g}/\text{ml}$	0.6588	54.9

Discussion:-

During the last decade, they have been under investigation as potential replacements for synthetic surfactants and are expected to have many potential industrial and environmental applications (Banat *et al.*, 2000). Among them lipopeptides represent a class of microbial surfactants with increasing scientific therapeutic and biotechnological interests. Currently there is a limited offer of commercially available biosurfactants e.g., surfactin, sophorolipids and rhamnolipids. A variety of new biosurfactants respectively producing strains are the key issue in overcoming the economic obstacles of the production of biosurfactants. Therefore, increased efforts in the discovery of new biosurfactant producing microbes must be made by applying a broad range of different screening methods.

Biosurfactants were first discovered as extracellular amphiphilic compounds of fermentation bacteria (Kitamoto *et al.*, 2009). Initially they were seen interesting due to their ability to increase solubility of insoluble or poorly soluble hydrocarbons. However, the more and more popular trend of using renewable resources in industry (especially in food and pharmaceutical industries) have led to relentless interesting in gaining and application of natural surfactants, mainly biosurfactants. Biological degradation of light crude dispersed in sea water by a surfactant produced by a hydrocarbon degrading microorganism has been monitored in laboratory tests and it showed that oil dispersed by a biosurfactin was more easily degraded than chemically dispersed oil (Francesco Crescenzi *et al.*, 1971) Many bacterial strains have been isolated from coastal and oceanic environments; these bacteria, including the genera *Pseudomonas*, *Vibrio*, and *Flavobacterium*, has been considered to be representative of marine bacteria (Harayama *et al.*, 2004). In this work, four different species of microorganisms have been isolated namely *Bacillus sp. 1 and 2*, *Pseudomonas* and *Staphylococcus*.

In the past few decades, biosurfactants have gained attention because they exhibit some advantages over chemically synthesized surfactants, such advantages include bio degradability, low toxicity, ecological acceptability and ability to be produced from renewable and cheaper substrates and effectiveness at extreme temperature and pH values (Cameotra and Makkar., 1998). The range of industrial applications of biosurfactants includes enhanced oil recovery, crude oil drilling, lubricants, bio remediation of pollutants, health care and food processing. The

antibacterial, antifungal and antiviral activities of biosurfactants make them relevant molecules for applications in combating many diseases and as therapeutic agents (Rodrigues *et al.*, 2006).

Biological methods for the removal of heavy metals from industrial waste may provide an attractive alternative to the physico-chemical process; bio surfactants are one of the compounds that aid in alleviating the heavy metals. Several microbes such as *Bacillus* sp., *Pseudomonas* sp., *Acinetobacter* sp., and *arthrobacter* sp., are reported to carry out the process of bioremediation. In this work, it has been proved that the lipopeptide bio surfactants isolated from the fungal species are also capable of degrading heavy metals like chromium and zinc salts. Hemolysis may occur in vivo or in vitro (inside/outside the body). In vivo hemolysis can be caused by a large number of medical conditions including many gram-positive bacteria (e.g., *Streptococcus*, *Enterococcus* and *Staphylococcus*). There are at present several methods for the detection of hemolytic activity (Arimi *et al.*, 1990; Fricker *et al* 1985). It is the preliminary test for anticancer activity studies. Anticancer activity of the bioactive compound from algae had been performed which results in 54.9% viability in 1000g/ml concentration of SP2 microbial extract. This shows that the compound produced by SP2 cause destruction of half of the total viable cells. The results of the present study thus suggest that isolated biosurfactant may prove to be a promising agent and requires further investigation of its potential cytotoxic activity.

Conclusion:-

Biodiversity of marine algae and its associated microorganisms have been reported to produce several pharmaceutically and industrially important compounds. This work has been done concentrating mainly on the antimicrobial screening and heavy metal degradation of the lipopeptide bio surfactant. It was found that the bacterial species isolated from marine algae *Ulva lactuca* have antimicrobial activity. It is thus concluded that the algal associated bacterial strains are a good source for the treatment of infectious diseases and also it is a good candidate for the treatment of breast cancer (MCF cell line). It was also confirmed that the bio surfactant produced from the antagonistic bacterial strains are a good vector for bioremediation. In future, these properties can lead to the production of novel drugs for the treatment of various diseases including cancer treatment.

Abstract

Aim: Chronic periodontitis may act as a source for systemic inflammation that impacts overall health. It is associated with an increased risk of systemic illness such as cardiovascular diseases, rheumatoid arthritis, adverse outcomes in pregnancy and diabetes. So it triggered the need of a close association between physician and dentist. Hence the present study was conducted to know the awareness of medical interns and post graduates towards periodontal diseases.

Materials and Methods: A cross sectional study was conducted from June to November 2015. Total 300 participants are selected, in that 260 were responded to participate in the study. A 14-Question survey was distributed to participants chosen randomly from various medical colleges in Andhra Pradesh, India. Questions are designed to assess the knowledge of participants about periodontitis and its association with systemic diseases. The study was approved by institutional ethical committee. Data were analysed by using commercially available statistical software SPSS(P <0.05).

Results: Of the 260 participants, 65% are male and 35% are female. About 52.4% don't know that periodontal infection may cause preterm low birth weight child. Only 2% have rated their knowledge regarding the association of periodontal disease with systemic diseases was excellent but 51.4% know that periodontal disease is a risk factor for systemic diseases. About 25% never screened their patients for periodontal disease i.e. they were not prepared nor trained to screen periodontal diseases.

Conclusion: In this study medical interns and post graduates had limited awareness towards periodontal diseases. Oral health training as part of the medical curriculum is strongly recommended.

Introduction:-

Periodontal disease is a multifactorial with a complex interaction between microbial infection and host responses. Several risk factors and susceptibilities include age, sex, socioeconomic status, tobacco usage, genetic factors and systemic diseases¹.

There is growing evidence that periodontal disease may act as a source for systemic inflammation that affects the overall health status². Literature stated that systemic inflammatory markers like blood leukocytes and plasma level of C-reactive proteins are highly elevated in persons with periodontal disease^{3,4}. The chronic elevation of inflammatory markers due to periodontitis might be associated with an increased risk of systemic diseases like cardiovascular disease, stroke, peripheral vascular disease⁵, diabetes mellitus⁶ and adverse pregnancy outcomes^{7,8}. This association poses a compelling reason for physician to increase their role in screening oral problems and led to a call for greater collaboration between dentist and physicians⁹.

Periodontal disease may be associated with cardiovascular diseases (CVD) due to mutual risk factors for atherogenesis and periodontal disease. One of such risk factors is pathogens like *T. denticola*, *P. gingivalis*, *F. nucleatum*, *P. intermedia* etc. which are associated with periodontal infection should be localized in serum or atheromatous plaques. Chronic presence of these periodontal microbes can lead to atherogenesis via direct invasion of the arterial wall and the release of systemic inflammatory mediators with atherogenic effects in response to infection. Serum C-reactive protein (CRP) plays a role in endothelial dysfunction and elevated levels of CRP provide insight into the linking of periodontal disease and CVD^{10,11,12,13}.

The bidirectional inter-relationship between diabetes and periodontal disease has been described¹⁴. In other way systemic inflammation play a major role in insulin sensitivity and glucose dynamics. Evidence suggests that periodontal disease can induce an elevated chronic inflammatory state which can exacerbate the insulin resistance by preventing autophosphorylation of insulin receptor and inhibiting second messenger signalling via inhibition of the enzyme tyrosine kinase there by increasing the risk of diabetes^{15,16}. Diabetes results in impairment of neutrophil adherence, chemotaxis and phagocytosis, which may facilitate bacterial resistance in the periodontal pocket and significantly increase the periodontal destruction.

The growing evidence that infection remote from the fetal-placental unit may have a role in the preterm delivery of low-birth-weight infants has led to an increased awareness of the potential role of chronic bacterial infections in the body. Periodontal disease with chronic gram-negative infections results in local and systemic elevations of pro-inflammatory prostaglandins and cytokines¹⁷. Up-regulation of pro-inflammatory cytokines resulting from the normal host response to an infectious agent may represent the key mechanism linking periodontal disease to pre-term low birth weight (PLBW). Microbiological products such as endotoxin will trigger a host immune response, causing both local inflammation and activation of soluble pro-inflammatory mediators such as IL-1, TNF- α and matrix metallo proteinases (MMPs). These inflammatory markers have been shown to cross the placental barrier and to cause fetal toxicity, resulting in preterm delivery and low-birth-weight babies¹⁸.

All these evidence clearly provides an outline, the influence of periodontal disease on systemic health. About 60% of Indian population and half of the American population have been reported with periodontal diseases¹⁹.

Hence the present study was conducted to evaluating periodontal awareness among medical interns and post graduates towards periodontal disease in Andhra Pradesh.

Materials and methods:-

A Cross sectional Study was designed and conducted by department of periodontics, Lenora institute of dental sciences, Rajahmundry, India. Source of the data was collected from the medical interns and post graduates from various medical colleges in Andhra Pradesh, during June to November 2015. Total of 300 participants were selected for the study, in that 260 were responded to participate in the study. A self-administered, structured questionnaire was distributed to all participants. The questionnaire had 14- questions. These questions were developed to assess the knowledge of medical interns and postgraduates regarding the etiopathogenesis of periodontitis and its relationship with systemic diseases. Participants were asked to circle the single best answer. The study was approved

by the Ethical Committee, Lenora Institute of Dental Sciences, Rajahmundry, Andhra Pradesh. Informed consent was taken from all the participants.

Analyses were performed using commercially available statistical software (SPSS). Chi-square analysis was done to compare male and female subgroups. The spearman correlation co-efficient was used to correlate the self-assessed knowledge /orientation of medical interns and post graduates.

Results:-

The survey was conducted with a sample of 300 participants, in that 260 were responded. The 260 responders were medical interns and post graduates from various medical colleges in Andhra Pradesh. Mean age of the participant's ranges from 26-34 years. All participants answered all questions.

Table 1 & Graph 1 summarize the true or false knowledge items with correct answers and percentage of subjects who answered correctly. Among the participants 39.8% of the people don't know the signs and symptoms of the periodontal diseases and nearly 50.8% didn't know the effect of diabetes increasing the severity of periodontal diseases. Most of the participants i.e. 75% of medical interns and post graduates knows that poor oral health may increase the risk of cardiovascular diseases but its percentage is less when compared to the results of Farah Asaad et al. study in medical interns of Saudi Arabia i.e. 92.8%.

Graph 2 shows that percentage of medical interns and post graduates exploring clinical practice behaviours/ orientations. 73.8% participants believed that the smoking is an etiological agent for periodontal disease, only 15.8 % of participants knows that the periodontal disease act as a risk factor for systemic diseases. About 52.4% people don't know that the periodontal diseases associated with low birth weight baby and 33.5% of people marked that genetics may have a role in periodontal diseases.

Graph 3 shows that the percentage of attitudes towards periodontal disease and perception that may influence the clinical practices. More than half of the people i.e. 44.6% never asked their patients whether they were diagnosed with periodontal diseases nor screened for it. About one fourth of the people only often referred their patients to a dentist for evaluation and care.

About 40% of the respondents disagree/ strongly disagree that discussing or evaluating periodontal status of their patients was peripheral to their role as physician. Half of the study population (53.1%) rate their knowledge about periodontal diseases and its association with systemic disease was moderate whereas only 2.3% rated as excellent and about half of the people known that periodontal disease is a risk factor for systemic diseases.

Table 1:- True/ false knowledge items with correct answer percentage of subjects who answered correctly

S.No	Question	Correct answer	Yes	No
1.	Bleeding gums, gum recession, unsteady teeth and tooth loss are signs and symptoms of periodontal diseases	True	63.2	39.8
2.	Periodontal diseases is associated with suppressed level of serum inflammatory markers	False	45	54.5
3.	Poor oral health may increases the risk of cardiovascular diseases	True	75	25
4	Is periodontal disease related to coronary heart disease	Yes	51.2	48.8
5.	Periodontal diseases are less prevalent/ severe in patients with diabetes	False	49.2	50.8

Graph 1:- shows the true/ false knowledge items with the correct answer and the percentage of subjects who answered each question correctly.

Graph 2:- Percentage of medical interns and post graduates questions exploring clinical practice behaviours/ Orientations.

Graph 3:- Medical interns and post graduates attitudes and perceptions towards periodontal disease**Discussion:-**

Periodontal diseases are the most common diseases of the oral cavity caused due to the microbial interactions and host immune response. More than 500 different bacterial species are capable of colonizing the oral cavity²⁰. The wide spread of bacterial products like lipopolysaccharides throughout the body may cause interaction between periodontal and systemic diseases^{21,22,23,24}. Hence periodontal diseases may act as an independent risk factor for

systemic diseases. In this study we found that awareness of medical interns about periodontal diseases is limited. Medical interns and post graduates rarely asked about periodontal diseases when taking medical history and they were not comfortable in performing a simple periodontal examination.

Most of the medical interns and postgraduates did not have enough knowledge about the relationship between periodontal diseases and diabetes. Only 49.2% know that the periodontal disease is more prevalent in patients with diabetes.

In our study 31% of medical interns and post graduates agreed that periodontal diseases might increase the risk of premature foetal death but Farah asaadet al²⁵. showed 60% of medical interns know about the risk of periodontal diseases in pregnancy.

Our study explored the attitudes of medical interns and post graduates towards periodontal disease. 23.8% of the participants never screened for periodontal diseases in their patients and 44.6% people never asked their patients if they ever diagnosed with periodontal diseases. Nearly 40% of the participants disagree/ strongly disagree that discussing/ evaluating periodontal status is peripheral to my role as a physician. In a similar study done by Quijano et al²⁶ in medical trainees and found that 30% strongly disagree that evaluating/ discussing periodontal status is peripheral to their role. Sometimes patients require a physician opinion regarding the dental treatment; therefore there is a crucial need of a knowledge regarding the periodontal diseases and its effects on systemic health.

Our results stated that medical interns and post graduates are not prepared or nor trained to screen their patients for periodontal diseases and they had limited knowledge about association between periodontal health and general health. Since there is a strong correlation between the periodontal and systemic health; it is wise to implement oral health education training in medical curriculum. This will result in relevant and more efficient collaboration between medical and dental professionals which will improve the overall health of a patient.

Limitations of the study include limited population size and area. Larger population size is indicated for precise observations. It is a self-reported attitudes and practices; it might be biased to what participants believe.

Our study concluded that medical interns and post graduates have limited knowledge regarding the periodontal diseases and its influence on systemic diseases. Hence the oral health education and training as a part of medical school curriculum is strongly recommended to medical council of India.

Abstract

This study aimed at studying and understanding the factors influencing the Emotional Intelligence of teachers of management education in Coimbatore City and studying the relationship between the demographic variables and factors of the Emotional Intelligence. Present study is descriptive in nature and convenience sampling technique was adopted. Both primary and secondary data were collected for the study. Primary data were collected through questionnaire and the secondary data were collected from magazines, journals, online databases, websites etc. The collected were analysed using percentage analysis and ANOVA. From the analysis, certain findings were made. Based on the findings some suggestions were given and certain conclusions are drawn.

Introduction:-

The relationship between teachers and students was oriented towards just imparting knowledge in the past. This concept is gradually changing though not in a radical manner; education is not restricted with knowledge but formation of students. Developing students in courage and maturity to encounter the complexity of life is capturing the visionary educators of present day.

Current theories - The Multiple Intelligences Theory (Gardner, 1983) & The Emotional Intelligence Theory (Mayer & Salovey, 1995 Goleman, 1995) - point out the important of emotional intelligence for the students of higher learning. IQ alone does not guarantee the required success in the modern organizations; in fact it only counts for 20%, and the rest goes for Emotional and Social Intelligences, and luck (Goleman, 1995).

Emotional intelligence is increasingly becoming an important concept in the workplaces, workshops and conferences are organized to help employees and managers to understand the important of Emotional Intelligence and to implement it in their work place (Abraham, 1999). If Emotional Intelligence is considered nowadays vital for success, then it becomes imperative that students of higher learning must pay more attention to the components of Emotional Intelligence.

The purpose of this study is to understand the factors influencing Emotional Intelligence of teachers of management education in various colleges.

Emotional Intelligence

Emotional Intelligence: It is being able to monitor our own and others' feelings and emotions, to discriminate among them, and to use this to guide our thinking and actions (Salovey & Mayer, 1990). The emotionally intelligent person is skilled in four areas: Identifying, using, understanding, and regulating emotions (Salovey & Mayer, 1990).

According to Goleman (1995) emotional intelligence consists of five components: Knowing our emotions (self-awareness), managing them, motivating ourselves, recognizing emotions in others (empathy), and handling relationships.

Teaching emotional and social skills is very important at school, it can affect academic achievement positively not only during the year they are taught, but during the years that follow as well. Teaching these skills has a long-term effect on achievement. (Elias et al, 1991).

Richardson and Evans (1997) explored some methods for teaching social and emotional competence within a culturally diverse society. Their purpose was to help students connect with each other, in order to assist them in developing interpersonal, intrapersonal, and emotional intelligences, arguing that these intelligences are essential for personal accomplishment.

At La Salle Academy, a private school in providence, Rhode Island, students are given lessons in emotional intelligence across the curriculum. This is part of an exhaustive program in social and emotional education called "Success for Life."

Finnegan (1998) argues that schools should help students learn the abilities underlying emotional intelligence. Possessing those abilities, or even some of them, "can lead to achievement from the formal education years of the child and adolescent to the adult's competency in being effective in the workplace and in society".

People with emotional intelligence have a confidence in themselves and they know that their personal happiness is up to them and no one else. They check their emotions before labeling other people and their actions. Such people can inspire and lead and make others feel good about them, while maintaining their own integrity and sense of personal worth. People with emotional intelligence look out for their own well being, as well as that of others as they understand that life is not just about them, it's about balance.

There are two types of intelligence: rational and emotional. Deliberate, analytic reflection is the hallmark of the thinking mind, but the emotional mind is a moment quicker, springing into action on impulse unless tempered by the rational mind.

There should be a balance between emotional and rational thinking, with the emotional brain feeding into and informing the operations of the rational brain, and the rational mind refining the inputs of the emotional mind. Developing a harmony between the head and the heart can foster happiness and promote success in life.

EI is defined as the ability to process emotional information, particularly as it involves the perception, assimilation, understanding, and management of emotions (Mayer & Cobb, 2000). Baron (1997) considers EI as an array of non-cognitive capabilities, competencies, and skills that influences one's abilities in succeeding and coping with the environmental demands and pressures.

According to Hein (2005), EI is the innate potential to feel, use, communicate, recognise, remember, learn, manage and understand emotions. Goleman (1998) considers EI as the capacity for recognising our own feelings and those of others, for motivating ourselves, and for managing emotions well in ourselves and in our relationships. It describes abilities distinct from, but complementary to, academic intelligence, the purely cognitive capacities measured by IQ. Daniel Goleman's theory is one of the most widely accepted concepts of EI.

According to Goleman's emotional competence framework, EI can be viewed within a set of personal and social competencies. Table 1 illustrates the Goleman's EI competency framework. Within this framework, Goleman has indicated the factors that influence the EI levels of an individual. Goleman (2001) has also suggested that these factors could be measured and improved. Henceforth, begins the concept of learning EI and improving leadership qualities of an individual and thereby the organisation.

Table-1:- Goleman's EI competency framework.

	Self Personal Competence	Other Social Competence
Recognition	Self-Awareness <ul style="list-style-type: none"> Emotional self-awareness Accurate self-assessment Self-Confidence 	Social Awareness <ul style="list-style-type: none"> Empathy Service Orientation Organisational awareness
Regulation	Self-Management <ul style="list-style-type: none"> Self-control Trustworthiness Conscientiousness Adaptability Achievement drive Initiative 	Relationship Management <ul style="list-style-type: none"> Developing others Influence Communication Conflict management Leadership Change catalyst Building blocks Teamwork and collaboration

History of Emotional Intelligence:-

1930 – Edward Thorndike describes the concept “social intelligence” as the ability to get along with other people.

1940 – David Wechsler suggests that affective components of intelligence may be essential to success in life.

1950 – Humanistic psychologists such as Abraham Maslow describe how people can build emotional strength.

1975 – Howard Gardner publishes the Shattered Mind, which introduces the concept of multiple intelligence.

1985 – Wayne Payne introduces the term emotional intelligence in his doctoral dissertation entitled “A study of emotion: developing emotional intelligence; self- integration; relating to fear, pain and desire”.

1987 – In an article published in Mensa Magazine, Keith Beasley uses the term “emotional quotient.” It has been suggested that this is the first published use of the term, although the Reuven Bar-On claims to have used the term in an unpublished version of his graduate thesis.

1990 – Psychologists Peter Salovey and John Mayer publish their landmark article, “Emotional intelligence,” in the journal *Imagination, Cognition, and Personality*.

1995 – The concept of emotional intelligence is popularized after publication of psychologist and New York Times science writer Daniel Goleman's book *Emotional Intelligence: Why it can matter more than IQ*.

Significance of the study:-

“More students leave college because of disillusionment, discouragement, or reduced motivation than because of lack of ability or dismissal by school administration”.

- The use of Emotional Intelligence to aid the student development process can address these non- academic challenges.
- Investing in the emotional development of students also impacts leadership effectiveness, both on campus and in the future.

Finally, emotional competency development benefits the career development process, promoting a successful transition from college into the workplace.

Why EI is important for teachers?

- It influences what we do
- It affects who we meet
- It determines how we look
- It decides students and teachers course of life
- It helps to express emotions appropriately instead ignore them

Statement of the problem:-

Emotional intelligence of teachers plays an important role in determining the educational institution success. Now a days, students are more sensitive and very reactive towards the action of their teachers. Emotional intelligence of teachers not only affects the students but also affect their peer group. So it is one of the important duties of every teacher to control and deliver his/her Emotional Intelligence in a positive way.

- Teachers can't focus on their work fully when their family problem interrupts their mind. So normally they deliver negative emotions.
- Usually most of the teachers show the negative emotions when they receive negative comments from the higher authority in front of their peer group.
- Most of the times misbehaving students are subject to receive negative emotions from the teachers.

These are the major problems that every institution and the students were facing in the current scenario. This study helps to understand the factors influencing their Emotional Intelligence.

Scope of the study:-

The study of Emotional Intelligence focuses on handling of emotions by oneself and with others. There is no relation between the qualification and the intelligence level. The study is based on the evaluation of Emotional Quotient among the teachers. The reason for the study of Emotional Intelligence is that nowadays students are more sensitive and inactive. So the teachers should have a positive Emotional Intelligence that may help the students' growth as well as the institution growth because the teachers are the foundation for the students' life and for the institution. This study helps to understand the factors that influence the Emotional Intelligence of teachers of Management education.

Objectives of the Study:-

Core Objective:-

To study and understand the factors influencing the Emotional Intelligence of teachers of management education in Coimbatore City.

Secondary Objectives:-

1. To trace the theoretical perspective of Emotional Intelligence.
2. To study the relationship between the demographic variables and factors of the Emotional Intelligence.

Hypotheses:-

1. The influencing factors of Emotional Intelligence have a positive relationship when compared with Age.
2. The influencing factors of Emotional Intelligence have a positive relationship when compared with Gender.
3. The influencing factors of Emotional Intelligence have a positive relationship when compared with Working Experience.
4. The influencing factors of Emotional Intelligence have a positive relationship when compared with Marital status.

Methodology:-

Present study is descriptive in nature and convenient sampling technique was adopted. Both primary and secondary data were collected for the study. The major sources of the data used to carry out the analysis were primary data. First-hand information was collected through a questionnaire from 250 management education teachers working in various colleges in Coimbatore city. The secondary data namely literature relating to the study was gathered from the national and international journals, newspaper, magazines, articles, other records and also from web sources on the internet. Pilot study was done for 50 among the sample respondents. The data were first evaluated for their validity and Reliability. Incomplete and ambiguous responses were rejected. The tools of analysis like Percentage Analysis, ANOVA were used in the study. The Statistical Package for Social Sciences (SPSS) was used to analyse the data and draw the inference.

Table – 2:- Gender

S.No	Gender	Frequency	Percent
1	Male	117	46.8
2	Female	133	53.2
	Total	250	100.0

From the table it could be understood that a 53.2 percent of the teachers were female and a remaining 46.8 percent of the teachers were Male. It is understood that the Female respondents were higher in the management education appointments.

Chart-1:- Gender

Table – 3:-Age

S.No	Age	Frequency	Percent
1	20-25yrs	36	14.4
2	25-30yrs	71	28.4
3	30-35yrs	57	22.8
4	35-40yrs	54	21.6
5	>40yrs	32	12.8
	Total	250	100.0

It is clear from the analysis that 28.4 percent of the teachers age ranges from 25 – 30 years, 22.8 percent of the respondents age ranges between 30 – 35 years, 21.6 percent of the respondents age ranges between 35 – 40 years, 14.4 percent of the respondents age ranges between 20 – 25 years, and a least of 12.8 percent of the respondents age was above 40 years.

Chart-2:- Age

Table – 4:- Marital status

S.No	Marital Status	Frequency	Percent
1	Single	39	15.6
2	Married	102	40.8
3	Widow	52	20.8
4	Divorcee	57	22.8
	Total	250	100.0

From the table it could be understood that 40.8 percent of the respondents were married, 22.8 percent of the respondents were Divorcees, 20.8 percent of them were Widow, and a least of 15.6 percent of them were Single. It is well understood from the table that a 40.8 percent of the respondents were married.

Chart-3:- Marital Status

Table – 5:- Work Experience

S.No	Work Experience	Frequency	Percent
1	Less than 5 yrs	33	13.2
2	5-10yrs	72	28.8
3	10-15yrs	53	21.2
4	15-20yrs	52	20.8
5	Above 20yrs	40	16.0
	Total	250	100.0

It could be learnt from the table that 28.8 percent of the respondents have an experience of 5- 10 years, 21.2 percent of the respondents have an experience of 10 -15 years, 20.8 percent of them have an experience of 15 – 20 years, 16 percent of the respondents have an experience of above 20 years, 13.2 percent of the respondents have an experience of less than 5 years.

Chart-4:- Work Experience

Table – 6:- Influencing Factors of Emotional Intelligence

S.No	Statements	Agree	Disagree	Total
1	I enjoy establishing a good working relationship with a group	110 (44)	140 (56)	250
2	They often seem just not motivated to join in	134 (53.6)	116 (46.4)	250
3	I am always worried I am going to be asked the question that will catch me out.	135 (53.6)	116 (46.4)	250
4	When teaching I see myself as making the best of a bad situation	73 (29.2)	177 (70.8)	250
5	Although I get anxious, I feel confident and relaxed in my role.	124 (49.6)	126 (50.4)	250
6	There always seem to be learners who are simply lazy.	128 (51.2)	122 (48.8)	250
7	Sometimes I wonder what is the point	142 (51.2)	108 (43.2)	250
8	I do worry I am going to be found out as knowing as much as they think.	111 (44.4)	139 (55.6)	250
9	It is really like casting pearls before swine.	139 (55.6)	111 (44.4)	250
10	I sense that nothing really changes.	123 (49.2)	127 (50.8)	250
11	I often feel that I have let at least some of the learners down .	125 (50.0)	125 (50.0)	250
12	When I approach a new session I expect that both they and i will enjoy ourselves and learn something useful.	111 (44.4)	139 (55.6)	250
13	No matter how much effort I put in there will always be some who are just not going to get it.	128 (51.2)	122 (48.8)	250
14	I am always conscious of some members not getting much from it.	128 (51.2)	122 (48.8)	250
15	I enjoy corresponding to the challenges each new session brings	122 (48.8)	128 (51.2)	250
16	Sometimes I think they look as despondent as I feel.	124 (49.6)	126 (50.4)	250

The above table shows how many percent of respondents agree and disagree to the statements regarding the factors influencing the Emotional Intelligence. The numbers within the brackets indicate the respective percentage value. These statements are clustered into four life positions and those are given below.

Table-6.1 Get Rid of Position

S.NO	GET RID OF POSITION	Agree	Disagree	Total
2	They often seem just not motivated to join in	134 (53.6)	116 (46.4)	250
6	There always seem to be learners who are simply lazy.	128 (51.2)	122 (48.8)	250
9	It is really like casting pearls before swine.	139 (55.6)	111 (44.4)	250
13	No matter how much effort I put in there will always be some who are just not going to get it.	128 (51.2)	122 (48.8)	250

The agreeability towards the statements 2,6,9 ,13 indicates that the teaching professionals spends time and on the idea on “**Defensive or Get Rid of Position**”. These statements responds to the life position that “I am ok, You are not ok. A defensive position where generally see the teaching professionals as blameless but good at seeing failings in others.

Table-6.2 Get Away Position

S.NO	GET AWAY POSITION	Agree	Disagree	Total
3	I am always worried I am going to be asked the question that will catch me out.	135 (53.6)	116 (46.4)	250
8	I do worry I am going to be found out as knowing as much as they think.	139 (55.6)	111 (44.4)	250
11	I often feel that I have let at least some of the learners down .	125 (50.0)	125 (50.0)	250
14	I am always conscious of some members not getting much from it.	128 (51.2)	122 (48.8)	250

The agreeability towards the statements 3,8,11 and 14 indicates that the teaching professionals spends time on the idea on “**Get Away Position**”. These statements indicate to the life position that “I am not ok, you are ok”. Where in the teaching professionals find fault with themselves and feels that others are capable and as “Potential prosecutors”.

Table-6.3 Get –Nowhere- With Position

S.NO	GET- NOWHERE-WITH POSITION	Agree	Disagree	Total
4	When teaching I see myself as making the best of a bad situation	73 (29.2)	177 (70.8)	250
7	Sometimes I wonder what is the point	142 (51.2)	108 (43.2)	250
10	I sense that nothing really changes.	123 (49.2)	127 (50.8)	250
16	Sometimes I think they look as despondent as I feel.	124 (49.6)	126 (50.4)	250

The agreeability towards the statements 4,7,10 and 16 indicates that the teaching professionals spends time on the idea on “**Get nowhere with**” position. These statements indicate to the life position that “I am not ok, you are not ok”. And can be acknowledged as the teaching professionals are having negative view of yourself and everyone else and feel “Despair”.

Table-6.4

S.NO	GET ON WITH POSITION	Agree	Disagree	Total
1	I enjoy establishing a good working relationship with a group	110 (44)	140 (56)	250
5	Although I get anxious, I feel confident and relaxed in my role.	124 (49.6)	126 (50.4)	250
12	When I approach a new session I expect that both they and I will enjoy ourselves and learn something useful.	111 (44.4)	139 (55.6)	250
15	I enjoy corresponding to the challenges each new session brings	122 (48.8)	128 (51.2)	250

The agreeability towards the statements on 1,5,12 and 15 indicates that the teaching professionals spends time and on the idea on “**Get on with**” position. These statements indicate to the life position that “I am ok, you are ok”. These statements link to the life position I am ok and you are ok. The teaching professionals are open minded and tackle problems.

Analysis of Variance:-

H1 : The influencing factors of emotional intelligence have a positive relationship when compared with Age.

Findings:-

- 53.2 percent of the teachers were female and a remaining 46.8 percent of the teachers were Male. It is understood that the Female respondents were higher in the B- school appointments.
- 28.4 percent of the teachers age ranges from 25 – 30 years, 22.8 percent of the respondents age ranges between 30 – 35 years, 21.6 percent of the respondents age ranges between 35 – 40 years, 14.4 percent of the respondents age ranges between 20 – 25 years, and a least of 12.8 percent of the respondents age was above 40 years.
- 40.8 percent of the respondents were married, 22.8 percent of the respondents were Divorcees, 20.8 percent of them were Widow, and a least of 15.6 percent of them were Single. It is well understood from the table that a 40.8 percent of the respondents were married.
- 28.8 percent of the respondents have an experience of 5- 10 years, 21.2 percent of the respondents have an experience of 10 -15 years, 20.8 percent of them have an experience of 15 – 20 years, 16 percent of the respondents have an experience of above 20 years, 13.2 percent of the respondents have an experience of less than 5 years.
- The agreeability towards the statements on They often seem just not motivated to join in, There always seem to be learners who are simply lazy, It is really like casting pearls before swine, No matter how much effort I put in there will always be some who are just not going to get it, indicates that the teaching professionals spends time and on the idea on **“Get rid of Position”**. These statements respond to the life position that “I am ok, you are not ok. A defensive position where generally see the teaching professionals as blameless but well at seeing failings in others.
- The agreeability towards the statements on, I am always worried I am going to be asked the question that will catch me out, I do worry I am going to be found out as knowing as much as they think, I often feel that I have let at least some of the learners down, I am always conscious of some members not getting much from it. Indicates that the teaching professionals spends time and on the idea on **“Get away from Position”**. These statements indicate to the life position that “I am not ok, you are ok”. Where in the teaching professionals find fault with themselves and feels that others are capable and as “Potential prosecutors”.
- The agreeability towards the statements on when teaching I see myself as making the best of a bad situation, Sometimes I wonder what is the point, I sense that nothing really changes, Sometimes I think they look as despondent as i feel, indicates that the teaching professionals spends time and on the idea on **“Get nowhere with position”**. These statements indicate to the life position that I am ok, you are ok”. And can be acknowledged as the teaching professionals are having negative view of yourself and everyone else and feel “Despair”.
- The agreeability towards the statements on I enjoy establishing a good working relationship with a group, Although I get anxious, I feel confident and relaxed in my role, When I approach a new session i expect that both they and i will enjoy ourselves and learn something useful, I enjoy corresponding to the challenges each new session brings, indicates that the teaching professionals spends time and on the idea on **“Get on with”**

position. These statements indicate to the life position that “I am ok, you are ok”. These statements link to the life position I am ok and you are ok. The teaching professionals are opening minded and tackle problems.

Results of hypothesis:-

1. The influencing factors of emotional intelligence have a positive relationship when compared with Age.
2. The influencing factors of emotional intelligence have a positive relationship when compared with Gender.
3. The influencing factors of emotional intelligence have a positive relationship when compared with Working Experience.
4. The influencing factors of emotional intelligence have a positive relationship when compared with Marital status.

Suggestions:-

1. Emotional literacy can be introduced into the standard curriculum of Faculty Development Programmes.
2. Teachers can be given Affirmation training which helps build in their self- confidence and self –esteem not only in their teaching profession but in their personality too.
3. Students can be given orientations on Emotional Intelligence before even they step in to their curriculum which may help in better co-operation with the teachers.
4. Provision of good organization climate from the institutions will induce positive emotions in teachers.
5. Relaxation and recreation programmes can be organized for the teachers.

Conclusion:-

It is found that the teachers are aware of overt behavior which helps them to identify the emotions. When they are capable of identifying the emotions then they can understand and manage their emotions. This means that they are emotionally intelligent. The study reveals that the respondents have a high level of emotional awareness. This is good sign. In their reaction they seem to be wiser and everyone wants to have healthy relationship with in defense of their position, power and other factor. And in handling grievances and problems they adopt a smooth way of expressing their feelings, redressing grievances and solving problem. The study emphasizes the importance and the value of imparting emotional intelligence through continuous Faculty Development Programs by claiming that teachers with emotional intelligence skills will be able to maintain better classroom management. Thus the study will help the teachers to identify the situations in which the negative emotions arise and help them to overcome those through various coping strategies like relaxation and recreation programmes. This will directly or indirectly create positive emotions in them.

Abstract

Agriculture, being the backbone of India, needs huge improvement for economic growth of India. So an effective technology is needed which helps in the expansion of agriculture, productivity and profit gain. The green house and its parameters play a very important role for the production of good quality crops. In this paper an automatic control system is discussed which throws light on the monitoring and controlling of the green house ecosystem parameters. The proposed system targets on the development of a hardware which is capable of measuring temperature, humidity, soil wetness using an Arduino based system which can make decision for turning the actuators on and off for balancing the green house parameters. In present greenhouses, various points of measurement are required to track the local ambience parameters, for making the automation system of the greenhouse, work properly. Wired system will make the system expensive. Moreover, the location sensor measurement nodes are hard to change once they are positioned. So, a Wireless Sensor Network (WSN) having wireless nodes with sensor on an Arduino based system with a communication device is a very attractive and economic option for building the require measurement system.

Introduction:-

The greenhouse vegetable production is managing the growing environment to produce an ideal ecosystem for the crop. Agriculture is the worldwide prime occupation of human beings. A greenhouse farmer cannot detect the level of greenhouse parameter accurately, they only know the parameters manually. So they cannot produce the ideal eco system for crop. The global warming due to climate change has effect on temperature and water availability which are critical for crop production. The climate change will increase temperature, reduce the water availability for irrigation and other domestic uses. Plants need water for growth and cooling. Plants extract water from the bottom of the soil and transport the water to the plant leaves. Small apertures (stomata) located on the upper and lower surfaces of the leaves allow for the intake of CO₂ required for photosynthesis and plant growth. Water vapor is gone from the plant leaves by evaporation in the stomatal cavity and the flow of the vaporized water through the stomata into the atmosphere. A considerable amount of energy is required to dissolve the water in the stomatal cavity. If the water did not evaporate, the energy would be used to heat the plant. Without transpiration, plants could reach lethal temperatures. So, good irrigation water management improves crop quality. Humidity, or air moisture content, may also play a role. High humidity can create high temperatures and heavy dew at night, which can be beneficial in reducing moisture stress, but which can create the development of certain diseases, such as leaf rust and leaf spots,

on some crops. A system proposed in this paper helps to monitor and control the microclimate parameters of a Greenhouse atmosphere. Use of this technique, off season production of crops is also possible. Control on weather condition like temperature, humidity, soil moisture can improve the crop production & quality both [1]. Precision irrigation [2] is one of the most important practice maximizing the productivity while saving water.

Wireless Sensor Network (WSN) is a useful part of the automation system in modern greenhouses [3, 4]. Wireless communication system can be used for the collection of measurement values and for communication between the central control system and the actuators situated at various parts of the greenhouse. Compared to the wired systems, the installation of WSN is fast, cheap and easy. Moreover, it is easy to relocate when needed by just moving sensor nodes from one location to another within a range of the operating device. If the greenhouse flora is high and dense, the small and light weight nodes can be held up to the plants' branches. WSN maintenance is also relatively cheap and easy. The only extra costs occur when the sensor nodes run out of batteries life and the batteries need to be charged or replaced, but the ability to give power supply can be several years if an efficient power saving algorithm is applied. Related work in this field is discussed in next section and third section gives an outline of the proposed system.

Related Work:-

Nagesh K.D.N. proposed an ARM based remote monitoring and Control System for environmental parameters in greenhouse [5]. They discussed about Greenhouse environment parameter monitoring and control system based on GSM communication using ARM7 microcontroller. It will regulate the environmental parameters in every greenhouse automatically.

Ahonen, T. Virrankoski, R.; Elmusrati, M., have discussed on Greenhouse Monitoring with Wireless Sensor Network [6]. In this article greenhouse monitoring, control and sensor network feasibility and reliability is given. Tiantian Guo, Weizhu Zhong, presented the new structure integrated data acquisition system and intelligent control system on agricultural facilities [7], in order to promote the information-based and intelligent level of comprehensive agricultural zone and to improve the production efficiency and effectiveness.

Purna Prakash Dondapati proposed an Automated Multi Sensor Green House Management [8], which gives the explanation on how to overcome the disadvantages in the normal cultivation without any observation of human being. It also explains the effective working of sensors which help the project to become automated to yield more useful results in cultivation.

Hybrid wired/wireless approach for green house was given by Orazio Mirabella and Michele Brischett; where Controller Area Network & ZigBee protocol are used to find its flexibility and ability to operate in different environments [9].

Vijay S. Kale and Rohit Kulkarni have discussed on "Real Time Remote Temperature & Humidity Monitoring Using Arduino and Xbee S2" [10]. An Arduino Uno based system that measures and monitors the temperature and relative humidity of a remote place and passes data through network to the main location that the base location.

Proposed System:-

Greenhouse atmosphere monitoring and controlling system is used to measure the various parameters like temperature, humidity, light, soil moisture and air moisture. Sensor is a device that receives and responds to a signal and generates corresponding electrical signal. It is an element that senses a variation in input energy to produce a variation in another or same signal.

Figure 1:- Functional block diagram

The block diagram of the system is shown in Fig.1 which is composed of remote sensor nodes and the sensor nodes are implemented with an ESP 8266 Wi-Fi module and analog sensors. These radios support ESP 8266 topologies which are configured to read analog signals directly from sensors and generate digital data to be transmitted within a data packet. Each node is enabled to read temperature, humidity, moisturizer, CO₂ level, light level. The measured data are sent periodically to the central computer.

Arduino:-

In this project we use Arduino Uno [11] which has ATmega328P i.e. 32 bits AVR microcontroller uses power supply with a regulated voltage ranging from 5-9 volts with 14 digital input output pins, 6 analog inputs that may be interface with the various expansion boards and also with the other circuit.

Arduino Uno has 16MHz crystal oscillator and a USB serial communications port. This is an open source hardware. The microcontrollers are programmed using the programming language C and C++. And also the Arduino provides an integrated development environment (IDE) which is cross platform application written in Java, allows users to write program for Arduino in C or C++.

Figure 2:- Arduino Uno

Temperature-Humidity Sensor:-

The DHT11 is temperature and humidity sensor with digital signal output. This sensor is relatively a cheap sensor for any kind of project. The digital output of the sensor gives accuracy and it ensures highly reliable and long term stable system. This module includes resistive type humidity measurement subpart and temperature measurement subpart and offers excellent quality with fast response. It is small in size and low power consumption.

Figure 3:- DHT11 sensor

DHT11 works on 5V and gives the both output i.e. temperature and humidity in the clocked out values in handshaking mode. Its working temperature range is from 0 to +50 degree Celsius with accuracy of +/- 2 degree Celsius and humidity range 20 -95% RH with +/- 5.0% RH humidity accuracy and response time is less than 5 sec. DHT11 has four lines: GND, +5V, NC and a single data line.

Soil moisture sensor:-

Water is needed for the basic growth of plants. When enough quantity of water is not present at the time of plant desires, then eventually the plant can prompt lessened quality or dying.

Figure 4:- Soil moisture sensor

Since it is very agitated for human to appear when plants all the time, engineers designed soil moisture sensors to reduce the burden. Now using the sensing element system designer will build any sorts of system that may take care of the water desires of plant.

Carbon dioxide sensor:-

To gardening the green house we might control carbon dioxide that critical to plant growth and development. Photosynthesis, the process through which plants use to create food, requires CO_2 . So, at the time of plants growing in greenhouse, the CO_2 levels will be reduced as the plant use it up during photosynthesis. Increase the CO_2 levels in this environment is essential for good results. Here we use the K30 CO_2 level measuring sensor.

Transmitter/Receiver:-

For the transmission of the data from node to base station and to receive the data here we use ESP8266 Wi-Fi SOC module which is low cost with full TCP/IP stack and microcontroller unit capable. This module has on-board processing and storage capability and its on-chip integration allows us to minimal external circuitry. It has 32 bit RISC processor with 64 KB of instruction RAM and 96 KB of data RAM, follow IEEE 802.11 b/g/n Wi-Fi. It has more features like integrated PLLs, power management units. +19.5dBm power output in 802.11b mode, flash memory of 1MB, wake up and transmit packets in less than 2ms and standby power consumption is less than 1mW. Figure-5 shows the control station which consists of the same ESP 8266 module as a coordinator connected base station PC with RS232 serial communication.

Figure 5:- Block diagram of components in base station.

Figure 6:- Flowchart of Processing Data.

A flowchart of the proposed automatic atmosphere temperature, humidity and soil moisture control system is shown in figure-7. Each node calculates these parameters and compare with the preset values. The process flow of this automatic control system is as follows: Initialize the system and read the sensors data. Next store these data. After storing these data, first compare the temperature data with preset value, if the value crosses the upper threshold then cooling actuator will be turned on, if the temperature is less than lower threshold then heating actuator will be turned on till the surrounding temperature maintained at the required level. Similarly perform and control the humidity which is shown in figure-6. The current sensors values are send to the base station and permanently stored. And halt the process for a minute and repeat again and continue.

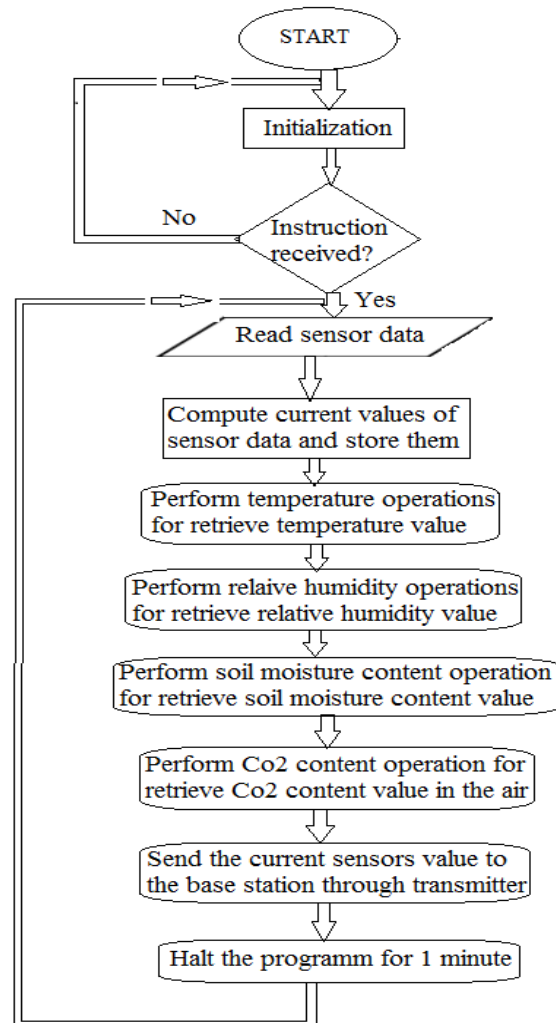

Figure 7:- flowchart of Processing Data

Result and Discussion:-

Recording of variation of temperature and humidity along with time during February and March is given in table 1. Field observations for various crops have been discussed in past by some researchers[12, 13]. Optimum temperature range is very important for agriculture and is to be maintained for maximum dry matter accumulation. It is well known that for wheat and some other important crops the optimum temperature required is 25 °C. We set the upper threshold value of temperature to be 27°C and lower threshold value to be 22°C. As discussed above the actuators are controlled by the threshold value of the temperature and maintain the required optimum temperature.

Table 1:- Observations for the crop in duration February- March

Time	Temperature(°C)	Humidity(RH)
9:00PM	25	34%
10:00PM	24	37%
11:00PM	24	39%
12:00AM	24	40%
1:00AM	23	41%
2:00AM	22	44%
3:00AM	22	44%
4:00AM	21	46%
5:00AM	21	45%
6:00AM	21	43%
7:00AM	23	41%
8:00AM	25	39%
9:00AM	25	39%
10:00AM	26	38%
11:00AM	27	36%

The graphical representation of variation between temperature and time with the controlling action of actuator is shown in figure 8 whereas figure 9 relates the variation of relative humidity at that temperature. We can notice the maximum temperature of 27°C and minimum humidity at 11 am morning. Cooling fan turns on at this temperature till it reaches 25°C i.e. the optimum temperature required. Temperature dip and humidity peak can be seen between 4 am to 6 am in the morning which is maintained to the required level by the controlling action of heater. Heater turns on as soon as the lower cutoff is reached at 2 am night. Heater is turned off, once the temperature returns to its optimal value.

**Figure 8:-** Temperature variation curve

Figure 9:- Humidity variation curve

Future Aspect:-

The proposed implementation of ESP 8266 based WSN for greenhouse parameters monitoring system offers less energy consumption and long battery life is presented. The use of high power WSN is good for various works in industries such as manufacturing, constructing and also can be used to monitor pollution level of a city. Another important fact about the system is the easy installation because of wireless mobility where the database center can be positioned at the local center near the target area and the monitoring task can be done and can generate alarm message to user mobile using GSM/GPRS technology.

Conclusion:-

In future various parameters can be controlled as required by the huge variety of crops. The varieties of crop are increasing day by day because of the development in agriculture technology. In this situation, the wireless sensor network and additional hardware with software is a better solution for green house control. This flexibility in precision agriculture through Wireless Sensor Network in greenhouse control is very useful.

Infertility, Lower genital tract infection, *Candida* spp., Fluconazole resistance

Abstract

Introduction: Infertility is a major public health problem across worldwide and in India. As per WHO, 60 to 80 million couples worldwide currently suffer from infertility. The role of female reproductive tract infection, symptomatic or asymptomatic, is well recognized. Studies reveal that *Candida albicans* have sperm-immobilizing property which might lead to infertility. Keeping this in mind the present study was done. **Aim:** To screen infertile females for vaginal candidiasis. **Material & Methods:** 100 infertile women were screened for vaginal candidiasis. High Vaginal swab collected from them were processed for fungal culture using conventional methods. Anti-Fungal susceptibility testing was done for all the isolates of *Candida* spp. as per guidelines. **Results:** 17% of the patients suffered from vaginal candidiasis. *Candida albicans* followed by *Candida tropicalis* were the most common isolates. None of the isolates were resistant to Amphotericin B and Nystatin while maximum resistance was shown for Fluconazole. **Conclusion:** There was more predominance of non albicans *Candida* in the study thereby showing a change in causative agent of vaginal candidiasis. Moreover since studies show sperm-immobilising property of *Candida* spp., infertile women should be routinely screened for vaginal candidiasis.

Introduction:-

Infertility is a major public health problem across worldwide and in India. World Health Organization (WHO) defines infertility as “the inability of a sexually active, non-conceiving couple to achieve pregnancy in one year” (WHO laboratory manual for the examination and processing of human semen, 2010). As per WHO, 60 to 80 million couples worldwide currently suffer from infertility (Infecundity, infertility and childlessness in developing countries. Demographic and Health Surveys (DHS) Comparative reports No. 9, 2004).

Besides other causes of female infertility, the role of female reproductive tract infection is well recognized. Infections may be in the form of Pelvic Inflammatory diseases (PID) or lower genital tract infection, either of which can be asymptomatic or symptomatic. These infections need to be diagnosed and treated properly to set the patient free from the grasp of infertility. *Candida* infection plays an important role in this regard. As per studies, *Candida albicans* have sperm-immobilizing property (Harpreet & Vijay, 2015; and Tian et al., 2007). When the sperm-immobilizing strains of *Candida albicans* were intravaginally inoculated into female mice, it showed 100% decrease in fertility in all groups as compared with control mice. Moreover, since no clinical or histopathological changes were observed in the reproductive organs, colonization of the genital tract with sperm-impairing micro-organisms could be the reason behind female infertility (Harpreet & Vijay, 2015). As per Mathur et al. (Mathur et al., 1980), patients with chronic vaginal candidiasis of at least 5 years duration showed high titres of auto-antibodies to ovary which may be due to the presence of one or more cross-reactive antigens on ovarian follicle and *Candida* spp. Thus chronic vaginal candidiasis may be associated with decreased ovarian function, thereby affecting the fertility outcome.

In view of this, our study was carried out to evaluate vaginal candidiasis in infertile females.

Material and Methods:-

It was a cross sectional study carried out for a period of one year (2014-2015) in a Tertiary care teaching hospital in Western India. The study was approved by the institutional ethics committee. A total of 100 married reproductive age group females (18 – 49 years) attending infertility clinic, with the exception of those receiving antibiotic and antifungal therapy in previous one month, were included in the study. A questionnaire covering demographic data, menstrual history, contraceptive use, recent antibiotic use, medical history & history of vaginitis and infertility was completed for each of the participants. After taking consent, High Vaginal swab (HVS) was collected under speculum examination using sterile swab.

KOH (10%) mount was prepared to detect presence of *Candida*. A gram stained smear was examined for the composition of bacterial morphology and presence of yeasts and leukocytes. All the specimens were inoculated on Sabouraud Dextrose Agar (SDA) which was incubated at 37°C. In case of growth, discrete colonies were picked and processed further for identification using conventional methods like Germ Tube Test (GTT), Chrome agar, Corn Meal Morphology.

Antifungal susceptibility testing was done by disc diffusion method as per guidelines (NCCLS May 2004). Antifungal agents used for susceptibility testing (HIMEDIA Hexa Antimyc-01) are mentioned in Table 1. Antifungal susceptibility pattern was interpreted as per NCCLS (NCCLS May 2004) and manufacturer's guidelines.

Table 1:- Antifungals used for susceptibility testing

Sr. No.	Antifungal agent	Dose
1.	Fluconazole	25 µg
2.	Ketoconazole	10 µg
3.	Itraconazole	10 µg
4.	Nystatin	100 units
5.	Amphotericin B	100 units
6.	Clotrimazole	10 µg

Results:-

The various findings of our study were analysed as follows. Out of 100 patients, *Candida* spp. was isolated from 17 of them. Among the fungal isolates of our study, *Candida albicans* (35.3%) was the most predominant fungal isolate followed by *Candida tropicalis* (29.4%). The distribution of various *Candida* spp. was as shown in Fig 1. The resistance pattern of the isolates was as shown in Fig 2.

Fig 1:- % distribution of *Candida* spp

Fig 2:- Anti-fungal resistance pattern

Discussion:-

In our study, *Candida* spp was isolated from 17% of the cases which is bit higher than that reported by Rodriguez et al. (Rodriguez et al., 2001). Ghiasi et al. (Ghiasi et al., 2014) and Gupta et al. (Gupta et al., 2014) had shown prevalence of *Candida* spp. as low as 1.4% and 5.9% respectively. Unlike our study, other studies showed prevalence of *Candida* spp. as high as 22%, 25%, 30.8% and 43.5% (Saleh, 2010; Okonofua et al., 1995; Paul et al., 2011; Ogiogwa et al., 2012).

Candida albicans (35.3%) was the most common fungal isolate which is similar to results of the study done by Verghese et al. (Verghese et al., 2001). In our study, *Candida tropicalis* (29.4%) was the second most predominant fungal isolate, unlike Verghese et al. (Verghese et al., 2001) where the second most common isolate was *Candida glabrata*. *Candida krusei* constituted 5.9% of the fungal isolates in our study which is similar to Verghese et al. (Verghese et al., 2001).

Broadly speaking, none of *Candida* spp. in our study showed resistance to Amphotericin B and Nystatin. Maximum resistance was shown for Fluconazole followed by Ketoconazole, Itraconazole and Clotrimazole. Unlike our study, Fluconazole was the drug of choice for vaginal candidiasis in another study (Khan & Rakshanda, 2010). As per Gandhi et al. (Gandhi et al., 2015), antifungal susceptibility pattern showed that *Candida* isolates were more sensitive to Amphotericin-B (98.36%) and Nystatin (100%), compared to that of Clotrimazole (79.5%) and Azoles like Fluconazole (79%), Itraconazole (52%) and Ketoconazole (76%). As per Verghese et al. (Verghese et al., 2001),

16.7% *Candida* strains showed resistance to Fluconazole, 45.23% of the strains showed resistance to Itraconazole, 9.5% strains showed resistance to Nystatin while there was no resistance to Amphotericin B.

A comparative analysis of the resistance pattern of *Candida* species isolated in our study, for Fluconazole, Itraconazole, Ketoconazole and Clotrimazole are given Table 2-5 respectively.

Table 2:- Comparison of Resistance pattern (%) for Fluconazole

<i>Candida</i> species	Our study	Gandhi et al., 2015	Adeshji et al., 2010	Sachin & Santosh, 2013	Salehei et al., 2012
<i>C. albicans</i>	33.33	17	84.6	-	81.13
<i>C. tropicalis</i>	60	17	66.7	29.5	100
<i>C. parapsilosis</i>	75	0	-	10	-
<i>C. krusei</i>	100	33	100	18.8	100
<i>C. glabrata</i>	100	15.70	50	27.3	100

Table 3:- Comparison of Resistance pattern (%) for Itraconazole

<i>Candida</i> species	Our study	Gandhi et al., 2015	Sachin & Santosh, 2013	Salehei et al., 2012
<i>C. albicans</i>	16.67	13.50	-	15.09
<i>C. tropicalis</i>	20	8.34	9.8	0
<i>C. parapsilosis</i>	25	16.66	10	-
<i>C. krusei</i>	100	33.33	21.9	0
<i>C. glabrata</i>	0	15.78	12.7	0

Table 4:- Comparison of Resistance pattern (%) for Ketoconazole

<i>Candida</i> species	Our study	Gandhi et al., 2015	Sachin & Santosh, 2013	Salehei et al., 2012
<i>C. albicans</i>	33.33	11	-	43.39
<i>C. tropicalis</i>	20	17	39.4	25
<i>C. parapsilosis</i>	25	0	10	-
<i>C. krusei</i>	100	33.5	25	0
<i>C. glabrata</i>	0	5	13.7	12.25

Table 5:- Comparison of Resistance pattern (%) for Clotrimazole

<i>Candida</i> species	Our study	Gandhi et al., 2015	Ajitha & Maimoona, 2014	Salehei et al., 2012
<i>C. albicans</i>	16.67	9	20	1.88
<i>C. tropicalis</i>	20	17	45.5	50
<i>C. parapsilosis</i>	50	0	50	-
<i>C. krusei</i>	0	67	-	0
<i>C. glabrata</i>	0	5	33.3	0

Conclusion:-

There was more predominance of non albicans *Candida* in our study thereby showing a change in causative agent of vaginal candidiasis. *Candida* spp. isolated in our study were least resistant to Amphotericin B and Nystatin while showed maximum resistance to Fluconazole. As per reports from other studies, *Candida albicans* plays an important role in female infertility; hence infertile females should be routinely screened for vaginal candidiasis.

Abstract

Background: Understanding and recall of human physiology is much easier when it is linked to the real life patient cases. Case-based learning (CBL) is a teaching method where the students are motivated towards self-directed learning and to develop analytic and problem-solving skills.

Aim: The present study aimed to measure dental students' perceptions of introducing small group case-based learning in teaching cardiorespiratory physiology.

Methodology: Data were collected from semester one dental students at MAHSA University, Malaysia. Cardiorespiratory case-based questions were given to the students after finishing their didactic lectures of cardiovascular and respiratory physiology. 74 students were divided into 9 groups to learn and discuss the case. At the end of the session, a 23 items perception scale was given to the students to measure their acceptance of CBL, impact of CBL on personal skills and impact of CBL on professionalism.

Results: The results showed that the students enjoyed CBL and reported that CBL improved their personal skills and professionalism. There was a positive correlation between CBL acceptance and impact of CBL on personal skills as well as professionalism. The study showed a significant difference in between the small groups in their acceptance of CBL and their opinions on the impact of CBL on the professionalism with insignificant difference in their opinions about the impact of CBL on their personal skills.

In conclusion: CBL helped in understanding and integrating cardiovascular and respiratory physiology, improved the student's personal skills and professionalism.

Introduction:-

Human physiology is seen as an important core component of any medical curriculum [1]. The main objective of the physiology teacher is to make sure that the subject of physiology is easily understood by diverse groups of students belonging to different courses [2]. Learning and remembering human physiology is much easier when you can link it to real life patient cases. A genuine feel for how essential it is to clinical practice is thereby obtained which makes it not only interesting but also understandable. From this point of view emerged the importance of the new learning

Corresponding Author: -Mona Mohamed Ibrahim Abdalla.

Address: -Physiology Department, Faculty of Medicine, MAHSA University, Kula Lumpur, Malaysia.

strategies such as Problem-Based-Learning (PBL) [3] and Case-Based-Learning (CBL) [4] in teaching physiology for medical students. Conventionally, teaching of undergraduate students is done with the help of didactic lectures, practical's, tutorials, and clinics, which are mostly used as passive teaching and learning methods and mostly they lack in the development of problem solving or reasoning skills of the students. Furthermore, there is hardly any involvement of students in the teaching-learning process [4].

MAHSA University college dental program started in 2007 uses a traditional curriculum where Anatomy, Physiology and Biochemistry are taught along with dental anatomy in the first year of a 5 year program. The teaching learning modalities followed are didactic lectures, tutorials, question based discussions and practical's- both hands on and demonstration. Since this is a traditional subject based curriculum, introducing problem based learning seemed to be difficult with students in their first semester. The physiology department decided to introduce CBL instead of PBL to stress on physiological principles and facilitate proper learning amongst the students.

CBL is a teaching method where students are motivated to learn on their own so as to inculcate the habit of self-learning and integrating knowledge from different subjects [5]. CBL is similar to PBL in the sense that both of the methods are based on the use of a case, problem, or inquiry to stimulate and motivate the students to acquire knowledge [6]. However CBL is different from PBL in the following: first, CBL uses a guided inquiry method in which the facilitator plays an active role however PBL uses an open inquiry method in which the facilitator plays a passive role, second, in CBL, the students are already had the knowledge and CBL motivates them through learning the application of their knowledge, however in PBL the students are motivated to identify what they need to know and learn themselves [7].

The objective of this study was to assess the attitude of the dental students in their first semester towards using an active learning strategy in the form of case based learning and whether it was fruitful in improving their knowledge, skills and attitude.

Methods:-

Design and Procedure:-

This is an observational retrospective study involving 74 students who were admitted in the Doctor of Dental Surgery (DDS) program in 2013.

Institutional Setting:-

MAHSA University College, a relatively new private institution in Kuala Lumpur, Malaysia offers a 5 year Doctor of Dental Surgery [DDS] course. The curriculum requires basic sciences namely Anatomy, Physiology, Biochemistry along with Dental Anatomy to be taught in the first year, followed by preclinical subjects of Microbiology, Pharmacology, Pathology in the second year and subsequently three years of clinical training.

Study format:-

The study was conducted among year one DDS students at MAHSA University College. After students had finished the didactic lectures, tutorials, practical's of the physiology of cardiovascular and respiratory systems, a cardiorespiratory case (Appendix 1) and physiology based questions on the case were prepared by a team of physiologists in the physiology department. The case was formulated in a brief format and framed in a way that matches the student's acquired knowledge that they have been taught in their didactic lecture classes. The questions were discussed in a systematic way and each member of the group had a chance to participate [8].

The 74 students were divided into 9 groups each group contained 8 students and the whole groups were facilitated by two facilitators from the physiology department. The students were given the important instructions of how to handle the CBL session (read the case & questions, discussing on between themselves, using their learning resources and keep their findings ready to be presented at the end of the session).

The role of facilitators was to guide the students, discuss with them the answers, clarifying any doubt and remained as facilitators and not instructors. The total time for supervision was 60 min, and 45 min was the wrap-up discussion presented by all groups; 5 minutes for each group. The facilitators divided the questions in between the groups and asked each group to present their answers for one to two questions.

At the end of the session, the students were given a questionnaire (Appendix 2) to check for their acceptance of the CBL and the ability of this TLA in helping them to improve their knowledge & understanding of the cardiorespiratory physiology, improving their cooperativeness, communication skills and presentation skills.

Research material and Statistics:-

A 23 items- questionnaire was given to the students after the intervention with a response scale of 5 points rated from (strongly disagree, disagree, neither agree nor disagree, agree, strongly agree) were framed in such a way to cover the opinions of students regarding;

- Acceptance of CBL.
- Impact of CBL on their interpersonal, communication and oral presentation skills.
- Impact of CBL on their attitude and professionalism.

The data was analyzed through the Social Sciences (SPSS) program in its version 22 using descriptive statistics for the means and standard deviation for the responses for each item. Statistical significance was decided whenever $p < 0.05$. Simple regression analysis test was used to determine the relationship between the three factors of the CBL scale, Tukey's range test in conjunction with ANOVA were used to find any significant differences in means of the responses of the different groups.

Reliability and factor analysis of the questionnaire- items:-

Reliability which is the best single measure of test accuracy is the extent to which test results are consistent, stable, and free of error variance. It is the extent to which a test provides the same ranking of students when it is readministered, and it is measured by Cronbach's α . Factor analysis, which is the first step in the calculation of α -coefficient, is a data reduction technique used to group various items having homogeneity/unidimensionality [9]. This reduced the twenty three items into three meaningful factorial groups, which were grouped as F1, F2, and F3 under the following headings: acceptance of CBL F1 items 1- 11, perception of the impact of CBL on interpersonal, communication and oral presentation skills F2 items 12- 18, and perception of the impact of CBL on their attitude and professionalism F3 items 19-23. Spearman's rank correlation was calculated to check the interrelation of each item's score with the total score (item interrelatedness) [10]. Cronbach's α reliability coefficient was then calculated. The value normally ranges between 0 and 1. The closer Cronbach's α coefficient to 1.0, the greater the internal consistency of the items in the scale. Interpretation of the value varies according to the number of items. Reliabilities as low as 0.50 are satisfactory for short tests of 10–15 items, but tests with >50 items should have reliabilities of 0.80 or higher. If reliability is <0.8 , a single test score should not be used to make important decisions about individuals [11]. The results for factor analysis of the items are shown in Table 1.

Results:-

The results of the study showed high acceptance of CBL among first year dental students (M of 3.37 and SD of 0.66) and the mostly appreciated was that CBL helped the students to demonstrate constructive and critical thinking process (M of 3.91 and SD of 0.78). The results showed a positive impact of CBL on the skills (Mean of 3.62 with SD of 0.65) especially small group working dynamics (M of 3.79 and SD of 0.83), then searching skills-locating and finding information skills (M of 3.69 and SD of 0.86). Also the figure showed a positive impact of CBL on the student's professionalism (M of 4.07 with SD of 0.75) especially punctuality and attending the discussion (M of 4.19 and SD of 0.93) followed by respect of other students opinions (M of 4.14 and SD of 0.78) (Fig. 1).

The results showed a significant difference between the groups in their acceptance of CBL ($p = 0.020$) and the impact of CBL on attitude & professionalism ($p = 0.021$) done by ANOVA test (Fig. 2). Both were higher in group 6 (TukeyHSD^{a,b} test) with insignificant difference in the impact of CBL on the personal skills ($p = 0.543$). ANOVA also showed insignificant differences within the groups in CBL acceptance, impact of CBL on personal skills and impact of CBL on professionalism (Fig. 2).

CBL acceptance was found to be positively correlated with the impact of CBL on personal skills and professionalism, p -value = 0.00. The simple regression test between the acceptance of CBL as an independent variable and impact of CBL on personal skills, attitude and professionalism as dependent variables showed that acceptance of CBL could predict 52% change in the impact of CBL on the personal skills, adjusted; $R^2 = 0.525$ ($F = 27.458$; $p < 0.001$) and 45% of the impact of CBL on attitude and professionalism with adjusted $R^2 = 0.456$ ($F = 18.865$; $p < 0.001$) (Table. 2)

Discussion:-

Understanding of cardiorespiratory physiology is one of the important human body systems required for dentists. Depending only on a traditional way of teaching through lectures lacks the advantages of motivation, active interaction from the students, triggering of thinking and empowering them with the ability of integrating the knowledge and their application [12]. Learning human physiology through relevant cases has been shown a positive impact on understanding physiology among medical students [3] and to promote a deep learning in dental students [13]. The aim of the current study was to explore the perception of dental students to CBL and whether the method helped in understanding the knowledge about cardiorespiratory physiology and improved the ability to apply these knowledge's and to assess the perception of the students about the effectiveness of CBL in improving the personal skills and professionalism.

The results of this study showed that CBL was interesting, motivated the students to learn by themselves, and helped them in gathering knowledge and application of this knowledge in the understanding the current case. This is in agreement with Yooet *al. who* examined the effects of CBL on learning motivation in nursing students and found that it was significantly higher in the CBL group than in the non-CBL one [14]. The results showed that CBL helped students to demonstrate constructive and critical thinking process which is in line with Kaddoura who found same effect of CBL in nursing students [15]. This enforces the aim of introducing this type of teaching for dental students.

The results also showed that CBL improved the student's personal skills specially their communication skills which are known to be essential for medical as well as dental doctors [16]. In line with our findings, it has been reported that student communication skills and ability to work within a team were significantly improved due to CBL implementation in a microbiology course [17-18] and pharmacology course [19]. Our data indicated that this innovative pedagogical approach not only improved students' personal skills but also improved students' professionalism in the form of punctuality and respect of others opinions in the group.

The results of this study showed a positive correlation between the acceptances of CBL and the student's opinions about CBL impact on their personal skills and professionalism with higher correlation found with the personal skills. Although the study showed insignificant difference between the individual groups in the impact of CBL on the personal skills there was a significant difference in the acceptance of CBL and their perception about impact of CBL on the professionalism. This can be due to the different personality traits of the students which was found to affect the preference of medical students to problem based learning [20] or any other factors which affect the acceptance of the students of any teaching methods.

Conclusion:-

Teaching human physiology becomes much easier if the students understand its application in their clinical life. This can be achieved by using a relevant case- based learning which will not only help in understanding but empower the students with the critical thinking skills, problem solving skills, communication skills as well as proper attitude and professionalism.

Recommendations:-

Further studies on the effectiveness of CBL in teaching human physiology to be joined with pre and post assessment of the students, personality scales, quality of life and other factors which can affect the effectiveness of CBL as a teaching method

Appendix A: Case – Scenario:-

A 45-year-old man presented at the dental clinic with bleeding gums. After checking the dentist found the gums were healthy but his blood pressure was found to be 160/110 and was equal on both arms and legs. The dentist referred the patient to a physician for assessment. The patient was alert and cooperative but appeared to be anxious. The patient reported that he had been having frequent coughs with sputum production and feels uncomfortable while breathing, which worsen with exertion. He reported that he is a social drinker and smokes 2 packs of cigarettes a day for the past 20 years. He also indicated that he was too busy to exercise. There was a family history of heart disease but no family history of diabetes.

Physical examination showed:-

Vital signs:

Pulse	80/min
Blood pressure	160/110
Temperature	37 ⁰ C
Respiratory rate	15/min
BMI	32

Cardiovascular examination:-

ECG: normal

Heart sounds: normal

Respiratory examination:-

Wheezes were heard on both sides of the chest

The physician referred him to get a pulmonary function test done

Appendix B: Feedback questionnaire about CBL:-

Using 5-point Likert scale (Strongly disagree- Disagree- neither agree or disagree- Agree- Strongly agree)

- Acceptance of CBL:-**

- The case was interesting to me
- It helped me to demonstrate constructive and critical thinking process
- CBL helped me to develop better skills of gathering information, organizing it and storing for future use.
- I believe that CBL will make me capable of applying knowledge to new situations to solve problems and reach decisions
- CBL method has motivated me to learn
- CBL method has instilled self-learning skills in me
- I think CBL method will change my way of learning
- My overall experience with case-based-learning is satisfactory
- Though this was the first case study, I understood the pathogenesis of the condition
- Though this was the first case study, I was able to interpret the investigations done for this patient
- Though this was the first case study, I was able to understand the case and answer the questions given

- CBL and personal skills:-**

- I was able to participate in the group discussions and activities
- I liked the small group working dynamics
- I find that I am discussing with other students more than usual
- I feel CBL will help me improve my communication skills
- I think CBL will improve my oral presentation skills
- I think CBL will improve my searching skills-locating and finding information
- I think CBL will improve my skill of comprehension, express my views in my own words

- CBL and professionalism:-**

- I was punctual and attended the discussion
- While doing this case study, I showed responsibility and commitment in the group activity
- I learnt to respect other student's opinions
- CBL method has developed positive attitudes providing and accepting constructive feedback
- I became more perceptive and sensitive to the needs of others during group work-contribute to group harmony, listening to conflicting opinions, tolerating shortcomings of others.

Acknowledgements:-

Authors express their appreciation to first-year dental students for their cooperation, physiology department and faculty of medicine at MAHSA University, Malaysia for providing support and the resources required.

Disclosures:-

The authors declare no conflicts of interest

Introduction:-

The appropriateness of Laboratory tests selection and reliability of reference interval is crucial for healthcare delivery and clinical diagnosis. This is one of the main functions of clinical laboratory and test manufacturers.¹

With the increasing life expectancy in Middle East countries, osteoporosis should be set as one of the health priorities; addressed by the International Osteoporosis Foundation (IOF). According to the Egyptian national nutrition institute, osteoporosis is a major health problem in Egypt. Among adult females, 12.2% to 15.3% have osteoporosis. This percent reaches 28.4% to third of postmenopausal women.^{2,3,4,5} Moreover, it has been calculated that more than one-quarter of females aged 10-19 years and up to 53.9% of postmenopausal were relatively osteopenic. In the 40 to 50 years age group, 42% of females have low bone mineral density.^{3,5} Besides, almost 50% suffer vitamin D deficiency.⁶

Bone remodeling is a physiological process that occurs continuously in healthy adult bone tissue with coupling of both resorption and formation.⁷ Every year around 20% of total bone tissue is replaced.⁸ This process begins in the intra uterine life and continues all through life.⁸ Bone turnover is monitored either by dynamic histomorphometry or bone turnover markers.⁹ The dynamic histomorphometry had some impracticability and imprecision,⁹ Thus the need for development of highly specific, accurate and fully automated noninvasive bone turnover markers was essentially needed.¹⁰

Bone turnover markers (BTMs) are classified as either bone formation, including peptides and enzymes secreted by osteoblasts during bone formation, or resorption markers, which are the degradation products of bone collagen or enzymes secreted by osteoclasts.¹¹ Their level in blood or urine reflect bone formation and resorption rates, respectively, this is affected by several variables either physiological or pathological.^{12,13} These changes in BTM proves the coupling of formation and resorption.

Biochemical markers of bone turnover are used in the initial assessment of osteoporosis, including the suspicion of secondary causes and the identification of patients with rapid bone loss, but the most important function is to monitor the response to treatment.^{14,15,16}

Address:- Medical Research Institute, Alexandria University, 165 El-Horreya Avenue, El-Hadara, Alexandria, Egypt.

The biochemical markers levels varies rapidly and correspondingly to bone turnover, thus could be used to assess response and efficacy of pharmacological agents used in treatment of bone diseases such as osteoporosis.¹⁷ There are so many causes of high BTM levels other than osteoporosis, such as hyperparathyroidism, myeloma or thyrotoxicosis.^{18,19} Vitamin D insufficiency as defined by 25(OH)D levels between 30 and 50 nmol/L is associated with an increase in parathyroid hormone (PTH) levels that is attributed to decreased calcium absorption. This may indicate secondary hyperparathyroidism in postmenopausal women.¹⁵

The aim of antiresorptive treatments is to reduce BTMs to the lower part of the healthy premenopausal reference interval.²⁰ Thus the lower limits of BTMs became more important than previously, as not only has it been questioned if decreases of BTMs below the reference interval could harm microdamage repair of the bone, but they also may be helpful in taking decisions in clinical practice, such as whether or not to give the next dose of a potent antiresorptive drug.^{21,22}

Therefore accurate and robust reference intervals for bone turn over markers become mandatory.²³ Unfortunately the available reference ranges are released through commercial laboratory kits, which lack standardization and don't take in consideration preanalytical variables.²⁴ As a result establishment of population based reference intervals that takes in consideration the preanalytical variables including age is considered a priority.

Several BTM reference intervals for healthy premenopausal women have previously been established.^{17, 25,26, 27} In the last few years, reference intervals in premenopausal women from different countries in Europe (UK, France, Belgium and Denmark)^{27,17} and the US²⁸, have been reported. In addition, data from Germany on men and women have been recently published.²⁹ In Spain, there are data on Procollagen I intact N-Terminal (PINP) and Carboxy-terminal collagen cross links (CTX-I) in older men and in postmenopausal women^{30,31,32} as well as on CTX-I in a subset of 50 premenopausal women.³³

To our knowledge up till this moment there is no published data regarding reference values in premenopausal Egyptian females. Thus establishment of a valid and robust reference interval will allow comparing BTMs among different studied groups, differentiate between normal and osteoporotic patients³⁴ also predict the likelihood of fracture in osteoporotic patients and monitoring the suggested effective treatment response which cannot be done by bone mineral density as the latter can't detect minor and acute changes caused by therapeutic agents.^{17,35}

It is reported that nearly 70-80% of adult BMD is attained by the age of 18 years. One study indicated that there was no significant bone loss in 30- 45 year-old women who were calcium balanced and of optimal bone health; we chose women aged 30-45 yrs for reference interval calculations because these women have achieved peak bone mass and are not yet perimenopausal.³⁶ This study aims to establish robust reference intervals for some bone turnover markers in healthy premenopausal Egyptian females between the age of 30-45 yrs.

Material and method:-

Study population:-

This study protocol was approved by the Medical Research Institute, Alexandria University Ethics committee in accordance with the Code of Ethics of the World Medical Association (Declaration of Helsinki) for experiments involving humans.

This cross sectional study was conducted in Alexandria governorate. The specimens used in this study were obtained from an age stratified random sample. All subjects provided written consent.

The clinical and Laboratory Standards Institute (CLSI) released the EP28-A3c document that recommends 120 reference values as an adequate sample size for each reference population or subclass. This study included one hundred and fifty one healthy, non pregnant, regularly menstruating (10 or more periods per year), premenopausal females who were recruited as volunteers from the outpatient clinic of the MRI, Alexandria university, family planning clinics as well as volunteers from the medical, nursing, or secretarial staff of the units or their relatives from April 2015 till November 2015. The sample of this study was age-stratified random sample, the participants where 30-45 years of age; as women in this age have their bone turnover markers stabilized, making them suitable for calculation of clinically useful reference ranges for BTMs.²¹ (mean age 36.6 ± 4.5), with a body mass index (ranging from 17-27 Kg/m²) (mean 22.8), each having regular cyclic menses (12/year) , Weighed between (55-85Kg)

Women under this range were excluded as they might have elevated BTMs due to skeletal immaturity, while those above 45 were excluded as they tend to have increased markers in the perimenausal period with normal estrogen levels.²⁵

Exclusion criteria:-

None of the subjects taking part in the study had cancer, chronic disease, or any medical condition known to affect bone metabolism. All subjects were not receiving, within a year of starting the study, any bone metabolism affecting medications such as : selective estrogen receptor modulators , phytoestrogens , anticonvulsants , calcitonin , anabolic agents , steroids , vitamin D supplements , hormonal treatment for endocrinopathies , NSAID and depo-provera as well as calcium supplements, serotonin uptake inhibitors, L-troxin , antihypertensive drug and antiresorptive treatments . Subjects with history of alcoholism, smoking, recent clinical fracture, pregnancy, lactation, renal and endocrinal disorders were excluded. All participants were subjected to a detailed questionnaire concerning demographic data, medical history, lifestyle, etc.

Sample collection:-

Venous blood were taken from all subjects on a gel separator tube, as well as urine sample after overnight fasting from 8am till 10 am in the second week after menstruation . Venous samples were kept for 10 minutes at room temperature and centrifuged under standard guidelines (2500 g) for 10 min and serum was separated and stored at - 80 C , no freezing and thawing is allowed only once upon analysis.

CTX has significant diurnal rhythm with a peak in the morning and a nadir in the afternoon. Moreover the circulating levels are influenced by food intake. In non fasting conditions, the peak is reached at night, followed by a significant decrease and nadir from 1100 to 1500 h. Therefore all the samples were collected after overnight fast in the morning within a standardized time period ideally from 8 and 10 a.m. thus reducing the day to day variation^{12,37}

Analytical standardization and biochemical analysis:-

Standard Operating Procedures were followed during pre-analytical and analytical phases of the study with two levels of internal quality control included in each run. Corrective actions were done based on Westgard rules . The following biochemical markers were measured at the same time point using a single lot of reagents and the same batch.

Alkaline phosphatase , 25 (OH) vitamin D , PTH and CTX were measured in serum by immunoenzymatic assay on Cobas 411e (Roche diagnostics) with an intra-assay CV of 0.6-0.9 % , 1.7-7.8% , 1.4-7.4% and 1.0-4.6% the interassay CV was 0.9- 2.4 % , 2.2- 10.7% , 3.1-9.4% and 1.6-4.7% while the limit of detection (LOD) was 5 U/L , 3.00 ng/ml (7.5 nmol/L), 5.5-2300 pg/ml (0.583-244 pmol/L) , 0.01 ng/ml (10 pg/ml) respectively.

While Calcium and Phosphorus were carried out on Beckman coulter Olympus with an intra-assay CV of 0.46- 0.55% and 0.6-1.9%, the interassay CV of 0.68-1.34% and 0.9-2.1% respectively. The limit of detection (LOD) was 0.13mg/dl and 1mg/dl respectively.

Statistical analysis:-

Statistical analyses were performed using SPSS version 22.0. The data were analyzed using nonparametric statistical techniques.

The initially collected 151 values were tested for outliers (outliers were considered for data point below $Q1 - 1.5 \times IQR$ or above $Q3 + 1.5 \times IQR$), outliers were investigated and overall, 20 cases were excluded from all the parameters for the reasons mentioned above.

Results:-

In this study one hundred fifty one females participated, of these women; four were excluded for having a fracture within one year, ten were excluded for medication intake (vitamin D, calcium and oral contraceptive pills), 4 were excluded for having abnormally low calcium levels and 2 were excluded for having abnormally high PTH level. 131 women completed all lab tests and the questionnaire fig(1)

**Fig (1)**

The age selected was between 30-45, the sample was restricted to this age group and our results showed no statistically significant correlation between age and any of the studied parameters except phosphorus (weak indirect correlation $r_s = -0.189$) and Vit D (intermediate correlation $r_s = -0.58$); thus the norms were established from the whole participants for each of the 6 parameters, furthermore VitD values were presented for the age categories 30-<35yrs ($n=45$), 35-<40yrs ($n=42$) and 40-45 yrs ($n=44$) as the values of VitD varied between the 3 age categories using Kruskal Wallis test. And phosphorous was presented by the age groups <40 ($n=87$) and 40+ years ($n=44$) as values differed using Mannwhitney U test.

Guided by the Clinical and Laboratory Standards Institute (CLSI) analysis of reference values¹, and Adult Reference Intervals on the Basis of the Canadian Health Measures³⁸, values were presented as median (90%CL) and the Survey reference values were constructed using 2.5th and 97.5th percentiles as lower and upper reference limits. The 90% confidence intervals around the estimates of the limits of the reference intervals were constructed by bootstrapping of 500 random samples of the same size.³⁵

Table (1) displays the range and Median (90%CI) values of the 6 parameters (Ca, Phosphorous, Alkaline phosphatase, PTH, CTX and Vit D) for the studied sample ($n=131$). The Coefficient of Variation (CV) of all the studied parameters lay in the accepted values of the Canadian quality standards except CTX which exceeded 33.3%. In the present study the premenopausal women had a median value for calcium 9.4 mg/dl (9.3-9.4), phosphorous 3.5mg/dl (3.4- 3.6), alkaline phosphatase 66 U/L (64-68), PTH 44 pg/ml (39.1- 45.6), CTX of 188 pg/ml (178 – 191pg/ml) and vitamin D 16 (15-16) ng/ml.

Table (1):- Reference intervals for 6 biochemical BTM

Parameter	Range	CV	Median (90%CI)	Bootstrap no. of samples	Lower value 90% CI	Higher value 90% CI	Mean \pm SD	Normal values set by manufacturer
Calcium (mg/dl)	8.5-10.5	2.7%	9.4 (9.3-9.4)	500	8.5-8.7	9.9-10.41	9.34 \pm 0.36	(min-max)8.6-10
Phosphorous(mg/dl)	2.5-4.7	10.0%	3.5 (3.4-3.6)	500	2.5-2.73	4.37-4.64	3.54 \pm 0.49	2.5-4.8
Age(yrs)								
30-<40(n=87)	2.5-4.7	8.3%	3.6 (3.5-3.7)	500	2.5-2.82	4.38-4.7		
40+(n=44)	2.5-4.4	10.6%	3.3 (3.2-3.5)	500	2.5-2.8	4.1-4.4		
Alkaline phosphatase (U/L)	41-99	13.6%	66 (64-68)	500	41.0-44.3	95.0-99.0	67.89 \pm 14.6	35-104
PTH (pg/ml)	21-77	20.5%	44 (39.1-45.6)	500	21.78-24.2	71.35-75.5	45.00 \pm 14.3	(mean) 31.3
CTX(pg/ml)	91-430	42.8%	188 (178-191)	500	91.6-97.95	396.1-428.8	213.9 \pm 95.34	299
Vitamin D (ng/ml)	10-24	15.6%	16 (15-16)	500	10.0-10.0	21-23.7	15.70 \pm 3.40	21.6
Age (yrs)								
30-<35(n=45)	10-24	9.7%	18 (17-19)	500	10.0-13.34	22.8-24		
35-<40(n=42)	10-23	15.4%	17 (16-17.5)	500	10.0-11.0	20.9-23		
40-45(n=44)	10-16	14.4%	13 (12-14)	500	10.0-10.0	15-16		

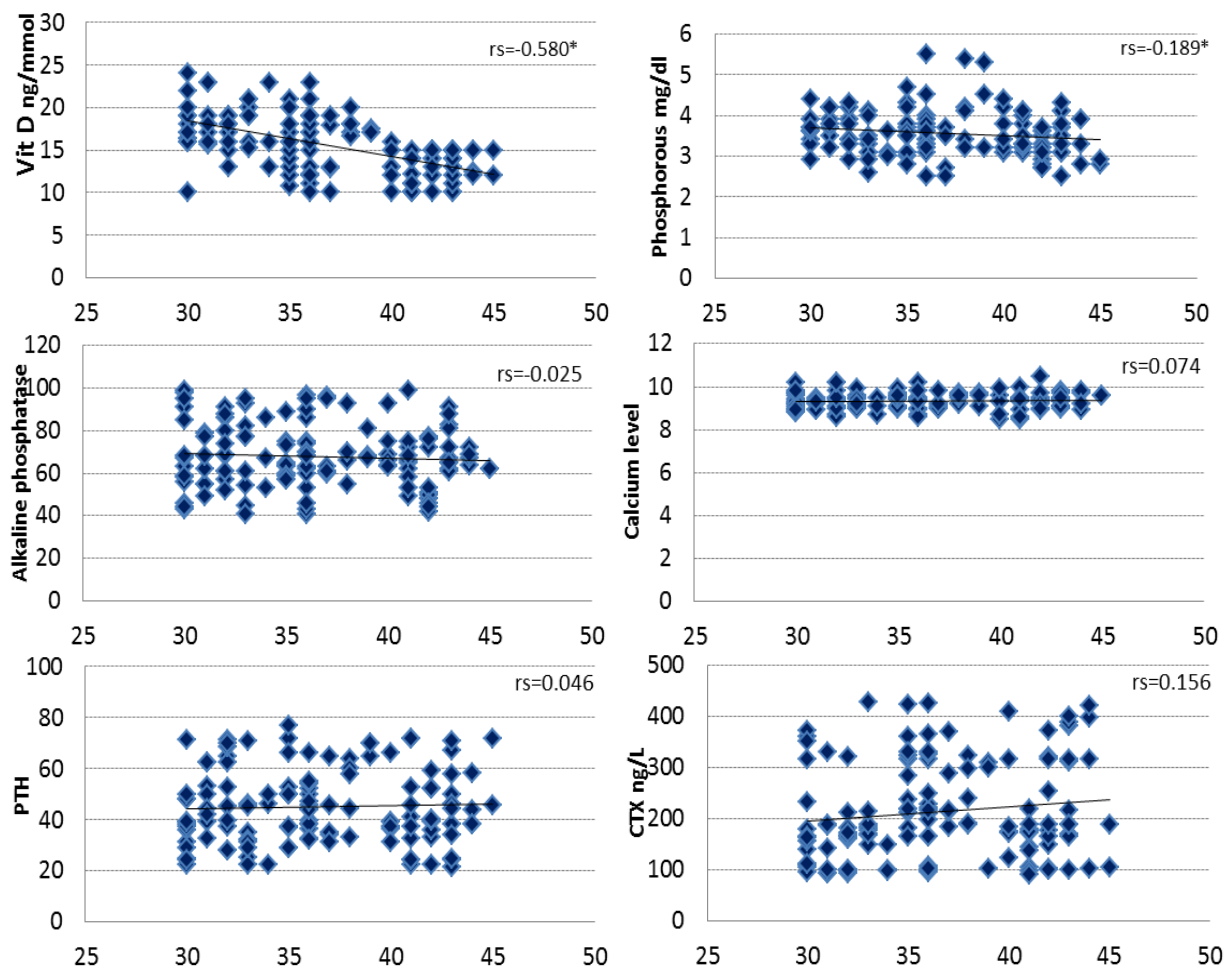

Figure 2:- Correlation between age and each of the 6 biochemical BTM

The new values for Ca and phosphorous did not statistically differ from the manufacturer though accepted higher upper limit (10.4) for Ca and a lower upper limit for phosphorous (4.64).

The new values for ALP as well did not statistically differ from the manufacturer. Concerning CTX and Vit D the new averages were lower than that set by the manufacturer, the differences were statistically significant ($t=-10.2$, $p=0.0001$ for CTX, and $t=-19.7$, $p=0.0001$ for Vit D). While, the new average for PTH was higher than that of the manufacturer, the difference was statistically significant ($t=10.9$, $p=0.0001$).

Discussion:-

The importance of establishment of a reliable reference interval is because most medically important decisions are based on comparing the laboratory tests with their reference intervals.

In fact most reference intervals used in many laboratories are those of the manufacturer. These reference intervals don't represent the actual population and thus needs to be verified or established for the relevant population.

Bone turnover markers are convenient tool used to assess systemic bone turnover rates, both in clinical practice and in clinical trials.

It has been recommended that normal reference ranges for BTMs shall be established in large samples of healthy premenopausal women.¹⁷ However, the reference ranges currently reported by commercial laboratories are often not rigorously established and fail to account for relevant preanalytical variables.¹² Some of these variables including fracture, metabolic bone disease, chronic disease (including; malignancies, rheumatoid arthritis, diabetes), abnormal laboratory results of serum calcium, phosphorous.¹⁷

In the last few years many reference intervals in premenopausal women in different countries like UK, France, Belgium, Denmark, US and Germany have been established and to our knowledge this is the first for Egyptian population.^{17,27,28,29}

The present study aimed to establish robust reference interval of some bone turn over markers in healthy premenopausal females aged from 30 to 45 years with mean age 36.6 ± 4.5 years. This age range was taken because BTM levels were considered to be stable by Glover et al. in their study assessing the reference interval in premenopausal British women which is beneficial in the assessment of response to antiresorptive therapy in postmenopausal osteoporosis.⁽¹⁷⁾

One of the main limiting factors was to include larger number of healthy individuals based on the literature exclusion criteria.¹⁷ The CLSI released EP28-A3c document to help researchers by trying to unify reference interval studies. However bone turn over markers required detailed history due to many factors influencing their level.

The women who participated in the current study fulfilled the detailed inclusion criteria and provided additional information that was used to characterize the population as a whole.

The exclusion criteria to the studied group included: vitamin D supplements, history of fracture, smoking, consumption of alcohol, metabolic bone disease and chronic diseases.¹⁷

All these preanalytical variables contribute to the BTM markers in premenopausal females.

This study includes 151 premenopausal females who reached 131 after application of the above exclusion criteria. Calcium, phosphorous, Alkaline phosphatase, 25 (OH) vitamin D, PTH and CTX were done to all the candidates of this study.

As shown in table (1) the Coefficient of Variation (CV) of all the studied parameters lay in the accepted values of the Canadian quality standards except CTX which exceeded 33.3%. In the present study the premenopausal women had a median CTX value of 188 ng/L (178 - 191 ng/L). This is in accordance with Gossielet al 2014²⁰ who reported a median CTX value of 190 ng/L.

Although these values were lower than those reported by Jenkins et al^{xxxix}, De Papp et al¹⁰, Glover et al²⁵, Martinez et al³⁰ and Lenora et al^{xi} where the median CTx values were 289, 280, 300, 387, 312 ng/L respectively. These discrepancies could be attributed to inter-assay variability of BTM, which represents a significant problem in their clinical application. Variability of collection as well as diurnal variability and intra individual variability have been described and lead to wider reference intervals and less diagnostic certainty. It is known that circadian variation is greater for bone resorption than bone formation. For example serum CTX exhibits a circadian rhythm with an amplitude of 80% of the 24 hour mean.^{xli}

Also Figure (2) shows scatter plots for the age range 30-45 years, showing that VitD values decrease by age (intermediate inverse correlation) and phosphorous values as well decrease by age but with a weak inverse correlation. Otherwise the correlation between age and the other 4 parameters was not statistically significant.

Other studies shows negative correlation between BTM and age, but these studies included women aged from 21-54, so they included women with skeletal immaturity.^{35,xlii} Other study included the same age group as ours and reported higher CTX between the age of 30-34 suggesting they haven't yet reached skeletal maturity.²⁵ This highlights the need for determination of the age at which each bone mass is reached. In our study this problem was unlikely and therefore the selected age group was the optimum for bone turnover markers reference interval establishment.

Comparing the norms resulted from the current research with those set by the manufacturer it was found that:

The new values for Ca and phosphorous did not statistically differ from the manufacturer though accepted higher upper limit (10.4) for Ca and a lower upper limit for phosphorous (4.64).

The new values for ALP as well did not statistically differ from the manufacturer. Concerning CTX and Vit D the new averages were lower than that set by the manufacturer, the differences were statistically significant ($t=-10.2$, $p=0.0001$ for CTX, and $t=-19.7$, $p=0.0001$ for Vit D).

While, the new average for PTH was higher than that of the manufacturer, the difference was statistically significant ($t=10.9$, $p=0.0001$).

The low level of vit D in the Egyptian population may be due to lack of direct sun exposure and reduced intake of vit D supplements as well as reduced calcium, this decreased vit D stimulates the parathyroid gland to secrete more parathyroid hormone and this explains the increased level of PTH which exceeds the manufacturer reference range.

Conclusion:-

BTM are widely used in therapeutic monitoring of osteoporosis or other bone diseases as well as having a significant impact in research. Our trial for establishment of reference interval in Egyptian population may help in harmonization of reporting by Egyptian laboratories. The strength points of this study are the standardization of the preanalytical and analytical conditions with adherence to the CLSI guidelines recommendations together with considering seasonal variation. The small sample size and the absence of the bone mineral density data with relatively low level of 25OHD were the limitations of this study. For a new or improved assay for BTM it is important to include a larger sample size with for a clinical reliable reference range to be used in assessment of the efficacy of the antiresorptive therapy.

Abstract

Mathematical Modeling has emerged as an important tool for understanding dynamics of many infectious diseases, one of which is the Ebola virus. The main focus of the presented work was to model mathematically the transmission dynamics of Ebola virus, for this purpose, the basic Susceptible-Infected-Recovery (SIR) model of Ebola was reviewed. The basic concept was underpinning the implementation of different numerical techniques like Euler, RK-2, and RK-4 of SIR model. Most optimistic estimates for each group of individuals were obtained like the susceptible group of individuals did not change their values and remained 460, but the infected group of individuals gradually decreased their values, and only nominal increase in case of recovered group of individuals were observed due to the high mortality rate of infected group in case of Ebola.

Introduction:-

Ebola virus is negative stranded RNA virus causing Ebola haemorrhagic fever. It is an infectious and fatal disease. Its signs and symptoms appear in two days and after two or three weeks fever, sore throat, and muscular pain initiates by reducing the function of the liver and kidneys following the diarrhea and rashes. Bleeding may start from the body in certain cases. Ebola virus spreads by direct contact as well as through blood transfusion. It is so dangerous that after the recovery, the breast milk and semen of the male may carry this virus for several weeks to months as per World Health Organization report (WHO, 2016).

Ebola was first identified at two different places, one is Yambuku and the other is Nazara. It was mostly confined to Central Africa, but recently was also identified in West Africa [1]. A village near the Ebola River, was first affected by this disease, so the disease was named as Ebola Virus Disease (EVD). World Health Organization (WHO) reported 4656 cases of Ebola virus deaths in October 8, 2014, with most cases occurring in Liberia [9]. Natural environment of Ebola consists of 3 hosts which are from the natural host, intermediate animal host and then to humans. There are four sub types of Ebola virus: Ebola Sudan, Ebola Zaire, Ebola Ivory, and Ebola Reston [10].

Mathematical modeling is a significant and powerful tool that can be employed in analyzing the spread and control of infectious diseases such as Ebola. Mathematical models are assumed to provide understanding of methods and suggest prevention, and control strategies [11].

The basic concept in mathematical modeling is to understand the transmission dynamics of diseases. The current study mainly deals with mathematical model of Ebola Virus and implication of three numerical methods Euler,

Runge- Kutta-2 and Runge-Kutta-4. Finally the numerical results obtained are very optimistic for each group of individuals.

Materials and Method:-

The motivation of this study was to solve the well-known Mathematical model called Susceptible-Infected-Recovery (SIR) model. The real physical problems in the world usually exhibited nonlinear mathematical models which includes biological issues. It was extremely challenging to obtain the exact solutions for such problems that actually represented such phenomena. It was a big task for scientific community to search for appropriate methods such as numerical or perturbation method to solve nonlinear problems [4], but the numerical methods were considered to best for such problems. Therefore numerical techniques Euler, Runge-Kutta 2 and Runge-Kutta 4 were applied to solve the proposed Susceptible-Infected-Recovery(SIR) model in this study.

Description of Model:-

The total population in a specific place was divided into three groups, the susceptible group $S(t)$, the infected group $I(t)$ and the recovered group $R(t)$, "t" was anytime interval ([2], [3], [14]).

The total population was represented by "N" and was taken to be constant for a short time interval and was given by $N=S(t)+I(t)+R(t)$.

Population of the susceptible group reduced as the infected peoples come into contact with them by the rate of infection β . Therefore the change in population of susceptible group was equal to the negative product of $-\beta$ with $S(t)$ and $I(t)$:

$$\frac{dS(t)}{dt} = -\beta \frac{S(t)I(t)}{N} \quad (1)$$

Population of the infected group was changed according to two different ways:

(a) Susceptible group who joined the infected group by adding the total population of infected group with the term $\beta S(t)I(t)$

(b) Infected group who joined the recovered group in any time interval, in such way that the total population of infected group was decreased by a term $\mu I(t)$. Therefore the differential equation of infected group was written as:

$$\frac{dI(t)}{dt} = \beta \frac{S(t)I(t)}{N} - \mu I(t) \quad (2)$$

Finally, the differential equation of recovered group that based on those peoples who recovered from the Ebola virus by a rate μ .

$$\frac{dR(t)}{dt} = \mu I(t) \quad (3)$$

Euler Method:-

Values of parameters used were $\beta = 0.000318$ and $\mu = 0.0175$ and the initial conditions were $S(0) = 460$, $I(0) = 12$, $R(0) = 0$

The Euler method

$$\begin{cases} w_0 = \alpha \\ w_{i+1} = w_i + hf(t_i, w_i) \end{cases}, \quad i = 0, 1, 2, \dots, N-1$$

The time interval was $[0, 90]$ and $N=10$ so

$$h = \frac{b-a}{N}$$

$$h = \frac{90-0}{10} = 9$$

$$t_0 = 0, t_1 = 9, t_2 = 18, t_3 = 27, \dots, t_{10} = 90$$

$$w_0 = \begin{pmatrix} S(0) \\ I(0) \\ R(0) \end{pmatrix} = \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} = \begin{pmatrix} w_{1,0} \\ w_{2,0} \\ w_{3,0} \end{pmatrix}$$

Iteration-1 for $i = 0$

$$w_1 = w_0 + hf(t_0, w_0)$$

$$w_1 = \begin{pmatrix} w_{1,0} \\ w_{2,0} \\ w_{3,0} \end{pmatrix} + hf(0, w_0)$$

$$w_1 = \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + 9 \begin{pmatrix} -0.00038 \\ -0.20962 \\ 0.21 \end{pmatrix}$$

$$w_1 = \begin{pmatrix} 459.99658 \\ 10.11342 \\ 1.89 \end{pmatrix}$$

The successive iterations of Euler method were given in Table-1.

Table 1:- Solution of SIR Model by Euler method up to 10 iterations.

9	81	460	459.9829	2.90783	2.5740	9.0921	9.4429
10	90	460	459.9821	2.48409	2.1693	9.5159	9.8483

Runge-Kutta-2 Method

Solution of the SIR model by RK-2 Heun's method is presented as.

$$\begin{matrix} w_0 = \alpha \\ \left\{ w_{i+1} = w_i + \frac{h}{4} \left[f(t_i, w_i) + 3f\left(t_i + \frac{2h}{3}, w_i + \frac{2h}{3}f(t_i, w_i)\right) \right] \right\}, \quad i = 0, 1, 2, \dots, N-1 \end{matrix}$$

The time interval was [0 90] and N=10

so

$$h = \frac{b-a}{N}$$

$$h = \frac{90-0}{10} = 9$$

$$t_0 = 0, t_1 = 9, t_2 = 18, t_3 = 27, \dots, t_{10} = 90$$

$$w_0 = \begin{pmatrix} S(0) \\ I(0) \\ R(0) \end{pmatrix} = \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} = \begin{pmatrix} w_{1,0} \\ w_{2,0} \\ w_{3,0} \end{pmatrix}$$

Iteration-1 for $i = 0$

$$\begin{aligned} w_1 &= w_0 + \frac{h}{4} \left[f(t_0, w_0) + 3f\left(t_0 + \frac{2h}{3}, w_0 + \frac{2h}{3}f(t_0, w_0)\right) \right] \\ w_1 &= \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + \frac{9}{4} \left[f\left(0, \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix}\right) + 3f\left(0 + \frac{2(9)}{3}, \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + \frac{2(9)}{3}f\left(0, \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix}\right)\right) \right] \end{aligned}$$

$$\begin{aligned}
 w_1 &= \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + 2.25 \left[\begin{pmatrix} -0.00038 \\ -0.20962 \\ 0.21 \end{pmatrix} + 3f \left(6, \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + 6 \begin{pmatrix} -0.00038 \\ -0.20962 \\ 0.21 \end{pmatrix} \right) \right] \\
 w_1 &= \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + 2.25 \left[\begin{pmatrix} -0.00038 \\ -0.20962 \\ 0.21 \end{pmatrix} + 3f \left(6, \begin{pmatrix} 459.99772 \\ 10.74228 \\ 1.26 \end{pmatrix} \right) \right] \\
 w_1 &= \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + 2.25 \left[\begin{pmatrix} -0.00038 \\ -0.20962 \\ 0.21 \end{pmatrix} + \begin{pmatrix} -0.00101 \\ -0.56295 \\ 0.56397 \end{pmatrix} \right] \\
 w_1 &= \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + \begin{pmatrix} -0.00313 \\ -1.73828 \\ 1.74143 \end{pmatrix} \\
 w_1 &= \begin{pmatrix} 459.99687 \\ 10.26172 \\ 1.74143 \end{pmatrix} = \begin{pmatrix} w_{1,1} \\ w_{2,1} \\ w_{3,1} \end{pmatrix}
 \end{aligned}$$

The successive iterations of RK-2 Heun's method are given in Table-2.

Table 2:- Solution of SIR Model by RK-2 method up to 10 iterations.

i	t_i	$S(t_i)$	$w_{1,i}$	$I(t_i)$	$w_{2,i}$	$R(t_i)$	$w_{3,i}$

Runge-Kutta-4 Method

The approximate solution by RK-4 method was

$$\begin{cases} w_0 = \alpha \\ w_{i+1} = w_i + \frac{1}{6}[k_1 + 2k_2 + 2k_3 + k_4] \end{cases}, \quad i = 0, 1, 2, \dots, N-1$$

Where

$$\begin{aligned}
 k_1 &= hf(t_i, w_i) \\
 k_2 &= hf\left(t_i + \frac{h}{2}, w_i + \frac{k_1}{2}\right) \\
 k_3 &= hf\left(t_i + \frac{h}{2}, w_i + \frac{k_2}{2}\right) \\
 k_4 &= hf(t_i + h, w_i + k_3)
 \end{aligned}$$

Iteration-1 for $i=0$

$$\begin{aligned}
 k_1 &= 9f(t_0, w_0) \\
 k_1 &= 9f\left(0, \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix}\right) = \begin{pmatrix} -0.00342 \\ -1.88658 \\ 1.89 \end{pmatrix} \\
 k_2 &= 9f\left(t_0 + \frac{9}{2}, w_0 + \frac{k_1}{2}\right)
 \end{aligned}$$

$$\begin{aligned}
 k_2 &= 9f\left(4.5, \begin{pmatrix} 459.99829 \\ 11.05671 \\ 0.945 \end{pmatrix}\right) = \begin{pmatrix} -0.00315 \\ -1.73835 \\ 1.74143 \end{pmatrix} \\
 k_3 &= 9f\left(t_0 + \frac{9}{2}, w_0 + \frac{k_2}{2}\right) \\
 k_3 &= 9f\left(4.5, \begin{pmatrix} 459.99842 \\ 11.13082 \\ 0.87072 \end{pmatrix}\right) = \begin{pmatrix} -0.00315 \\ -1.74996 \\ 1.75310 \end{pmatrix} \\
 k_4 &= 9f(t_0 + 9, w_0 + k_3) \\
 k_4 &= 9f\left(9, \begin{pmatrix} 459.99685 \\ 10.25004 \\ 1.75310 \end{pmatrix}\right) = \begin{pmatrix} -0.00288 \\ -1.61145 \\ 1.61438 \end{pmatrix}
 \end{aligned}$$

The obtained results were

$$\begin{aligned}
 w_1 &= \begin{pmatrix} 460 \\ 12 \\ 0 \end{pmatrix} + \frac{1}{6} \left[\begin{pmatrix} -0.00342 \\ -1.88658 \\ 1.89 \end{pmatrix} + 2 \begin{pmatrix} -0.00315 \\ -1.73835 \\ 1.74143 \end{pmatrix} + 2 \begin{pmatrix} -0.00315 \\ -1.74996 \\ 1.75310 \end{pmatrix} + \begin{pmatrix} -0.00288 \\ -1.61145 \\ 1.61438 \end{pmatrix} \right] \\
 w_1 &= \begin{pmatrix} 459.99685 \\ 10.25422 \\ 1.74891 \end{pmatrix} = \begin{pmatrix} w_{1,1} \\ w_{2,1} \\ w_{3,1} \end{pmatrix}
 \end{aligned}$$

Similarly, the successive iterations of the RK-4 method were presented in Table-3.

Table 3:- Solution of SIR Model by RK-4 method up to 10 iterations.

i	t_i	$S(t_i)$	$w_{1,i}$	$I(t_i)$	$w_{2,i}$	$R(t_i)$	$w_{3,i}$

Results and Discussion:-

Results obtained in case of all three numerical techniques were found to be exactly the same as were found by homtopyperturbation method in [4]. Solution of the model is presented graphically in Fig-1. Moreover we solve the model analytically by linearization as follows:

The system of equations 1-3 was nonlinear which was linearized as:

Let

$$\begin{aligned}
 f_1 &= \frac{dS(t)}{dt} = -\beta \frac{S(t)I(t)}{N} \\
 f_2 &= \frac{dI(t)}{dt} = \beta \frac{S(t)I(t)}{N} - \mu I(t) \\
 f_3 &= \frac{dR(t)}{dt} = \mu I(t)
 \end{aligned}$$

$$J = \begin{pmatrix} \frac{\partial f_1}{\partial S} & \frac{\partial f_1}{\partial I} & \frac{\partial f_1}{\partial R} \\ \frac{\partial f_2}{\partial S} & \frac{\partial f_2}{\partial I} & \frac{\partial f_2}{\partial R} \\ \frac{\partial f_3}{\partial S} & \frac{\partial f_3}{\partial I} & \frac{\partial f_3}{\partial R} \end{pmatrix}_{(0,0,0)}$$

$$J = \begin{pmatrix} 0 & 0 & 0 \\ 0 & -\mu & 0 \\ 0 & \mu & 0 \end{pmatrix}$$

For Eigenvalues

$$|\lambda I - J| = 0$$

$$\begin{vmatrix} \lambda & 0 & 0 \\ 0 & \lambda & 0 \\ 0 & 0 & \lambda \end{vmatrix} - \begin{vmatrix} 0 & 0 & 0 \\ 0 & -\mu & 0 \\ 0 & \mu & 0 \end{vmatrix} = 0$$

$$\lambda(\lambda(\lambda + \mu) + 0) = 0$$

$$\lambda = 0, 0, -\mu$$

Eigen vectors were found as

$$(\lambda I - J)x = 0$$

For $\lambda = 0, 0, -\mu$, Eigenvectors obtained were

$$\begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix}, \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix}, \begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix}$$

And the solution of SIR Model was

$$\begin{aligned} X &= C_1 e^{\lambda_1 t} V_1 + C_2 e^{\lambda_2 t} V_2 + C_3 e^{\lambda_3 t} V_3 \\ \begin{pmatrix} S(t) \\ I(t) \\ R(t) \end{pmatrix} &= C_1 e^{(0)t} \begin{pmatrix} 0 \\ 0 \\ 1 \end{pmatrix} + C_2 e^{(0)t} \begin{pmatrix} 1 \\ 0 \\ 0 \end{pmatrix} + C_3 e^{-\mu t} \begin{pmatrix} 0 \\ -1 \\ 1 \end{pmatrix} \\ S(t) &= C_1 e^0(0) + C_2 e^0(1) + C_3 e^{-\mu t}(0) \\ S(t) &= C_2 \\ I(t) &= C_1 e^0(0) + C_2 e^0(0) + C_3 e^{-\mu t}(-1) \\ I(t) &= -C_3 e^{-\mu t} \\ R(t) &= C_1 e^0(1) + C_2 e^0(0) + C_3 e^{-\mu t}(1) \\ R(t) &= C_1 + C_3 e^{-\mu t} \end{aligned}$$

By the use of initial conditions $S(0) = 460$, $I(0) = 12$, $R(0) = 0$ at $t = 0$ obtained values were

$$C_1 = 12, C_2 = 460 \text{ and } C_3 = -12$$

Final analytical solution for nonlinear SIR model was:

$$S(t) = 460 \quad (4)$$

$$I(t) = 12e^{-\mu t} = 2.4841 \quad (5)$$

$$R(t) = 12 - 12e^{-\mu t} = 12(1 - e^{-\mu t}) = 9.5159 \quad (6)$$

These results are presented in Fig-1 for justification purpose. Each group of individuals i.e., Susceptible, Infected, and recovered were taken along y-axis versus time along x-axis.

Figure1:-Solution of SIR Model (Time along X-axis & S, I,R along Y-axis).

Different numerical methods like Euler, Runge- Kutta 2, RK-2 and RK-4 were used to solve the model numerically, the results were presented in Tables 1, 2 and 3 were exactly the same as in Equations 4, 5 and 6 obtained by analytical method .

Conclusion and Future Work:-

Solution of model by three numerical methods Euler, Runge-Kutta-2 (Heuns) and Runge-Kutta-4 were presented in Tables 1, 2 and 3. Conclusion was drawn that most optimistic estimates for each group of individuals were obtained like the susceptible group did not change and remained 460, but the infected group gradually decreased its values, due to the high mortality rate of infected group, and the recovered group slightly increased its values. This study can be extended further for parameter estimation and sensitivity analysis of the model.

Abstract

The effects of deformation on the bulk modulus and compressibility of different elemental metals were computed and studied based on pseudopotential formalism. The electron density parameters of deformed metals under the application of different strains were obtained for different metals. The poisson ratio relating the transversal compression to elongation in the direction of applied deformation for different elemental metals were computed using elastic moduli for homogeneous isotropic material and used in this work. The results obtained revealed that there is a good agreement between the computed and experimental value of the bulk modulus and compressibility of metals. There is high concentration of electron in the high density region than in the low density region for the bulk modulus and compressibility of metals these seems to suggest that the bulk modulus and compressibility of metals depend on the density of valence electron in metals. The bulk modulus of all the metals investigated decreases as deformation increases. These could be due to reduction in electron compressible rate, fracture density and increase in inter atomic distance between the electrons in the metals. The effect of deformation is more pronounced on the polyvalent metals than in alkaline metals these could be due to the high electronic concentration and high electronic energy level of the free atom in the alkaline metal. Compressibility increases with an increase in deformation for all the metals investigated. These could be due to an increase in the collision between the interacting electrons in metals which forces the compressibility of the electron in metals to increase as deformation increases.

Introduction:-

The simplest model for describing electrons in solid is to assume that the valence electrons of an atom in solids are free to move anywhere throughout the volume of the material but are not allowed to leave (Pillai, 2010). The electric and magnetic properties of solids are mainly determined by the properties of electrons in them, the energy levels of electrons hold the key to the properties of solids (Solymar and Walsh, 1984). The electrons in solid behave as a delocalized gas of free electrons (Elliot, 1999).

Pseudopotential approach in a way gives organizing experimental and computational information about conduction electrons in solid in a compact and physical form (Marder, 2000). The goal of pseudopotential theory is to obtain the key physical properties of solids by dealing with only the valence electrons (Kiejna, 1993). Transport processes in solids leads to electrical conductivity, thermal conductivity, thermal resistivity etc. These are affected by electron-electron, electron-impurity and electron-phonon scattering. Carriers in conductors move in a definite direction under applied fields and temperature gradients (Duan and Guojun, J.2005)

The bulk modulus of solid is a measure of its resistance to uniform compression and is defined as the ratio of the infinitesimal pressure increase to the resulting relative decrease in volume (Animalu, 1977). Bulk modulus is a thermodynamic quantity, and is specify by how the temperature varies during compression (Kittel, 1976). Compressibility is determined by the second derivative of the total energy with respect to the volume and can also be express as the reciprocal of the bulk modulus of solids (Kukkonen and Wilkins, 1979). The compressibility sum rule expresses the self-consistency condition that the static response of the system to the long-wavelength perturbation is equal to the compressibility where the density dependent ground state energy obtained via the Monte Carlo method is used to determine the compressibility via thermodynamic relations. (Iwamoto, 1999).

Deformation is the change in shape or size of solid (Backofen, 1972). A solid body is deform when a stress is applied to it, all solid materials exhibit nearly Hookean behaviour for small enough strain or stress (Borg,1990). When a material is subjected to external forces its behaviour depends not only on the magnitudes of the forces and the inherent strength of the material itself but also on the way the forces are applied and combined. The particular combination of forces may cause the material to deform elastically or plastically. The amount of deformation depends on knowing the intensity of the forces at all points throughout the material (Hugh Ford and Alexander, 1977). Metals can be deformed by compressive, tensile and torsion force. During deformation, atoms at the surface and interior of metals changes together with their atomic distance depending on the metallic surface area that is subjected to different deformation. The contact potential difference on the metal surface also changes during deformation (Borg, 1990).

Over the years, the bulk modulus and the electron compressibility of solids has been studied both theoretically and experimentally. Osiele and Edenma, (2009) developed a model for computing the bulk modulus of metals based on the theory of structureless pseudopotential. The results obtained revealed that the calculated and experimental bulk modulus of metals varies in the same manner with experimental values. Ling and Gelatt(1981) used a local pseudopotential constructed from the bulk stability condition alone to calculate the shear and bulk moduli of 19 simple metals. They also studied the chemical trends in the elastic modulus of the simple metals and calculated the ratio of shear modulus to bulk modulus, the result obtained was in good agreement with experimental value. Vackar et al, (1998) developed the all-electron pseudopotential model and used it to calculate the lattice constant and bulk modulus of silicon, diamond, non-magnetic cobalt, cubic TiC and hexagonal TiS. The results they got were in satisfactory agreement with experimental values. Osiele et al (2011) develop a model for computing thermal resistivity, compressibility ratio and screening parameter of metals based on free electron theory. The result obtained revealed that thermal resistivity of metals increases with an increase in the electron gas parameter. While the compressibility ratio of metals decreases with an increase in the electron gas parameter. On the screening parameter, the thermal resistivity also increases with an increase in the screening parameter while the compressibility ratio decreases with an increase in the screening parameter. Keijna and Pogosov, (2000) experimentally investigate the effect of deformation on electronic properties of some metals by measuring directly a sample of deformed metal using kelvin method. They observed that the contact potential difference of metals decreases when tensed and increases when compressed. Adeshakin and Osiele (2012) computed the surface energy and surface stress of deformed metals based on the structureless pseudopotential formalism. The results obtained revealed that deformation causes a reduction of surface energy and this reduction is more pronounced in simple and alkaline metals. Tensile stress is present in most metallic surfaces whose surface stress were computed, although a few metals possess compressive stress on their surfaces. In the presence of deformation, the surface stress of some metals decreases, while deformation causes an increase in the surface stress of some metals. Adesakin, (2016) develop a model to compute the electrical conductivity of different elemental metals based on pseudopotential formalism. The results obtained revealed that there is a good agreement between the computed and experimental value of the electrical conductivity of metals. There is high concentration of electron in the high density region than the low density region. The electrical conductivity of metals decreases as deformation (strains) increases for all the metals investigated. The effect of deformation is more pronounced on the electrical conductivity of noble and transition metals than in alkaline metals.

In this work the structureless pseudopotential is extended to the study of the effects of linear deformation on the Bulk modulus and compressibility of some metals. This will give an insight into how the Bulk modulus and compressibility of metals changes with deformation. The metals were chosen based on their technological and industrial applications and availability of some physical constants of metals that is required for computation.

Theory And Calculations:-

Electrons are quantum not classical particles and so the allowed electronic states must be the solutions of the Schrodinger equation which in the general (non-relativistic) case where the potential energy V is a function of both space and time is:

$$\frac{\hbar^2}{2m_e} \nabla^2 \psi(r, t) + V(r, t) \psi(r, t) = i\hbar \frac{\partial}{\partial t} [\psi(r, t)] \quad (2.1)$$

Where m_e is the electron mass, \hbar is the normalised Planck's constant and $\psi(r, t)$ is the electron wavefunction. The energy functional of the system of interacting electron in an external potential arising from the interaction with ions represented by a local pseudopotential ϕ can be expressed as a functional of the valence electronic density as

$$E[n] = T_s[n] + E_{xc}[n] + \frac{1}{2} \int d^3r \int d^3r' \frac{n(r)n(r')}{|r' - r|} + \int d^3r \phi(|r - R_i|)n(r) + \frac{1}{2} \sum_i \frac{Z^2}{|R_i - R_j|} \quad (2.2)$$

where the first three terms represents the kinetic, exchange-correlation and electrostatic energy of the interacting system. The two last terms describes the interaction of electrons with the ions at sites R_i via a pseudopotential, ϕ and the Coulomb interaction between the ions.

The total energy required to assemble the valence electrons and ions to form the solid which is the binding energy is

$$E = T_s(n) + E_{xc} + W_R + E_m \quad (2.3)$$

Where T_s is the kinetic energy, E_{xc} is the sum of the exchange and correlation energies, W_R is the average value of the non-Coulombic part of the pseudopotential and E_m is the Madelung energy of points ions embedded in a uniform negative background.

Based on the density functional theory in the low density limit, the kinetic and exchange energies are given as (Kiejna and Wojciechowski, 1996)

$$T_s = \frac{1.105}{r_s^2} \text{ and } E_{xc} = \frac{-0.458}{r_s} \quad (2.4)$$

Where r_s is the electron density parameter, which is describe as the radius of a sphere containing one electron on the average.

The correlation energy used in this work is that of Carperly and Alder as parameterised by Perdew and Zunger and is given as

$$E_c = \frac{-0.1423}{1 + 1.0529r_s^2 + 0.3334r_s} \quad (2.5)$$

From equation (2.3), the binding energy is

$$E = \frac{1.105}{r_s^2} - \frac{0.458}{r_s} - \frac{0.1423}{1 + 1.0529r_s^2 + 0.3334r_s} + W_R + E_m \quad (2.6)$$

The average value of the repulsive part of the pseudopotential is

$$W_R = \frac{n}{2} \int d^3r W_R(r) = \frac{n_{av}}{2} \int 4\pi r^2 \frac{Z}{r} dr = 2\pi n_{av} r_c \quad (2.7)$$

Where n_{av} is the average density of the electron.

The self-energy of the electrostatic interaction average over the whole Wigner-Seitz sphere is

$$E_{es} = \frac{\frac{1}{2} \int V(r) 4\pi r^2 dr}{\frac{4\pi r_0^3}{3}} = \frac{3Z}{5r_0} \quad (2.8)$$

The factor of half is to avoid double counting. The positive contributions are compensated for by the negative energy of the electrons interacting with the uniform positive background.

The Medelung energy for a jellium system is given by (Perdew and Zunger, 1981) as

$$E_m = \frac{-3Z}{2r_0} + E_{es} = \frac{-9Z}{10r_0} \quad (2.9)$$

Where $r_0 = Z^{1/3}r_s$. Substituting equation (2.7) and (2.9) into (2.8), the binding energy according to the structureless pseudopotential model is obtain as

$$E = \frac{1.105}{r_s^2} - \frac{0.458}{r_s} - \frac{0.1423}{1 + 1.0529r_s^2 + 0.3334r_s} + 2\pi n r_c - \frac{9Z}{10r_0} \quad (2.10)$$

But $r_0 = Z^{1/3}r_s$, and $n = 4\pi r_s^3/3$, hence

$$E = \frac{1.105}{r_s^2} - \frac{0.458}{r_s} - \frac{0.1423}{1 + 1.0529r_s^2 + 0.3334r_s} + \frac{3r_c^2}{2r_s^3} - \frac{9Z^{2/3}}{10r_s} \quad (2.11)$$

Where r_s is the electron density parameter of metals and r_c is the Ashcroft core radius given as (Perdew, et, al, 1990)

$$r_c = \left[\frac{-2}{15} \left(\frac{9\pi}{4} \right)^{2/3} r_s + \frac{1}{6\pi} \left(\frac{9\pi}{4} \right)^{1/3} r_s^2 + \frac{1}{5} Z^{2/3} r_s^2 + \frac{2}{9} r_s^4 \frac{dE_c}{dr_s} \right]^{1/2} \quad (2.12)$$

Where E_c is the correlation energy given by equation (2.5)

Since the conduction electrons in a solid is being treated as a gas of particles, albeit a quantum gas, they will exert a pressure given at zero kelvin by (Pillai, 2010)

$$P = - \left(\frac{\partial E}{\partial V} \right)_N \quad (2.13)$$

Since it is assumed that the potential energy is zero, the origin of the pressure is regarded as being due to the repulsion experienced by electrons caused by the Pauli Exclusion Principle, when they are compressed and tend to occupy the same region space.

The bulk modulus which measures resistance to structure preserving volume-changing for an underformed metal is (Ling and Gelatt, 1981)

$$B = -V \left(\frac{\partial p}{\partial v} \right)_{T,N} = \frac{1}{12\pi} \left(\frac{1}{r_s^2} \frac{\partial^2 E}{\partial r_s^2} - \frac{2}{r_s^2} \frac{\partial E}{\partial r_s} \right) \quad (2.14)$$

While compressibility for an undeformed metals is obtained as

$$\tau = \frac{1}{\frac{1}{12\pi} \left(\frac{1}{r_s^2} \frac{\partial^2 E}{\partial r_s^2} - \frac{2}{r_s^2} \frac{\partial E}{\partial r_s} \right)} \quad (2.15)$$

Considering only the kinetic energy of the free-electron for which $P \propto V^{-5/3}$, the zero kelvin electronic contribution to the bulk modulus is (Elliott, 1997)

$$B_{KE} = \frac{0.586}{r_s^5} (a.u) \quad (2.16)$$

The compressibility of the uniform electron gas is determined by the second derivative of the total energy with respect to volume

$$K = \left(V \frac{\partial^2 E}{\partial V^2} \right)^{-1} \quad (2.17)$$

The compressibility of the ratio of the non-interacting electron gas K_{free} to that of the interacting electron gas K is given as (Bowen Etal, 1974)

$$\frac{K_{free}}{K} = \left[1 - \frac{4}{\pi} \alpha r_s \frac{1}{4} \frac{\pi \alpha}{24} r_s^5 \frac{d}{dr_s} \left(\frac{1}{r_s^2} \frac{dE_c}{dr_s} \right) \right] \quad (2.18)$$

Where r_s is the electron density parameter, $\alpha = (4/9\pi)^{1/3}$ and E_c is the correlation energy per electron which is given by equation (2.5)

For a deformed metal, the average electron density parameter of metal is

$$r_{su} = r_s [1 + (1 - 2\nu)U_{xx}]^{1/3} \quad (2.19)$$

where ν is the Poisson ratio relating the transversal compression to elongation in the direction of applied deformation and U_{xx} is the uniaxial strain.

The bulk modulus and the compressibility of the deformed solid at absolute zero is given by

$$\beta = \frac{1}{12\pi} \left(\frac{1}{r_{su}^2} \frac{\partial^2 E}{\partial r_{su}^2} - \frac{2}{r_{su}^2} \frac{\partial E}{\partial r_{su}} \right) \quad (2.20)$$

and

$$\gamma = \frac{1}{\beta} = \frac{1}{12\pi} \left(\frac{1}{r_{su}^2} \frac{\partial^2 E}{\partial r_{su}^2} - \frac{2}{r_{su}^2} \frac{\partial E}{\partial r_{su}} \right) \quad (2.21)$$

This study generalized the work of Kiejna and Pogoss (2000) due to the shortcomings of the electron density parameter of deformed metals. They failed to account for metal dilation by assuming a constant value for the Poisson ratio of metals which leads to neglect of the uniaxial strain in their computation. In this work, the Bulk modulus and electron compressibility of deformed metals were computed using equation (2.20) and (2.21) and how deformation affects these properties of metals is studied. Also the variations of Bulk modulus and electron compressibility with electron density parameters were computed and studied using equation (2.14) and (2.15).

Results And Discussion:-

Figure 1 shows the variation of bulk modulus with electron density parameter for some monovalent, divalent, trivalent and polyvalent metals. Figure 1 revealed that there is high concentration of electron in the high density region than the low density region for both computed and experimental values of the bulk modulus. These seem to suggest that the higher the density of valence electron and the electronic concentration of metal the higher the bulk modulus and the lower the density of valence electron and electronic concentration of metal the lower the bulk modulus. In the high density region we have the alkaline metals and in the lower density region we have the noble and inner transition metals. Although, the bulk modulus of metals in figure 1 seems not to exhibit a particular trend and these could be due to the fact that there are some basic properties that contribute to the bulk modulus of metals that the model does not take into consideration such as the nature of chemical bonding, impurity atom and atomic size of the metals. The trend exhibited by metals in figure 1 revealed that there is an agreement between the computed and experimental values of the bulk modulus. This is more pronounce in some of the metals the high density region. The experimental value of the bulk modulus used in these work is obtained from solid state Physics by Kittel (1976). Figure 2 shows the variation of compressibility with electron density parameter for group one, group two, group three and transition metals. The trend exhibited by metals in figure 2 seems to be linear and exhibit a neither increase nor decrease in compressibility for metals the high density region but towards where $r_s \geq 2.75$ a.u there is a clear increase in the compressibility of the metals as we go from one metals to another. The trend exhibited by metals in figure 2 shows that compressibility is truly the inverse of bulk modulus. Figure 2 revealed that metals in the high density region have low compressibility while metals in the low density region have high compressibility. These could be due to the variable valence electron contribution in the solid and the nature of their electronic state structure.

Figure 3 shows the variation of bulk modulus with deformation for some monovalent, divalent, trivalent and polyvalent metals. Figure 3 revealed that the bulk modulus of all the metals investigated decreases with an increase in deformation. These could be due to reduction in electron compressible rate, fracture density and the pressure increase during deformation. The trend exhibited by metals in figure 3 shows that potassium has the lowest bulk modulus while molybdenum were found to be having the highest bulk modulus among all the metals subjected to different deformation. These could be due to the high electronic concentration, high equilibrium distance between the electron and high electronic energy level of the free atom in the alkaline metal that cause the bulk modulus of potassium to be the least affected among all the metals subjected to different deformation. Figure 3 also revealed that metals in the high density region has high bulk modulus while metals in the low density region were found to be having low bulk modulus among all the metals subjected to different deformation. These seems to suggest that as deformation increase the pressure and the atomic volume of the metals increases and thereby reduces the strength of interaction between the electron which forces the bulk modulus of the metals to decrease as deformation increases. Furthermore, the trend exhibited by metals in figure 3 revealed that as deformation increases, there is an increase in the electron temperature due to delocalisation as these may cause a decrease in some of the elastic properties that the bulk modulus of metals depend upon.

Figure 4 shows the variation of compressibility with deformation for some metals containing group one, group two, group three and transition metals. Figure 4 revealed that the electron compressibility increase with an increase in deformation for all the metals investigated. These seems to suggest that as deformation increases the collision and temperature between the interacting electron in metals increases and their by forces the compressibility of the electron in metals to increase as deformation increases. Figure 4 also revealed that metals in the high density region has low compressibility while metals in the low density region has high compressibility, these could be due to the

change in the electronic energy level of the free atoms in the solid that causes the number of valence electrons per unit cell to occupy more sites during deformation which result to an increase in the compressibility as deformation increases. Among all the metals subjected to different deformation, potassium has the highest compressibility; this could be due to the high density of the free valence electron, compression factor and electronic concentration in the metal. The trend exhibit by metals in figure 3 and 4 revealed that the bulk modulus and compressibility of metals is strongly affected by deformation.

Conclusion:-

In this work, a generalized approach for computing and studying the effect of linear deformation on bulk modulus and compressibility of metals based on the structureless pseudopotential formalism is presented. The results obtained for bulk modulus and compressibility of undeformed metals were in agreement with the experimental values which shows the validity of the model used in the computation. There is high concentration of electron in the high density region than the low density region for both computed and experimental values of the bulk modulus. Metals in the high density region have low compressibility while metals in the low density region have high compressibility. These could be due to the variable electron contribution in the solid and the nature of their electronic state structure. The bulk modulus and compressibility of metals is strongly affected by deformation due to the trend exhibited by different metals during deformation (strain).

Abstract

This project reviews synthesis, properties and technological applications of carbon nanotubes. The different synthesis methods of carbon nanotubes are illustrated briefly. The energy dependence of density of states was used to determine the optical properties of CNT. Finally, brief description of optical and electronic properties was presented. Using MATLAB Code the theoretical simulation of electronic band structure as a function of wave vector, the band gap as a function of tube diameter and the density of state as a function of energy band are generated.

Introduction:-

The history of nanotechnology is generally understood to have begun in December 1959 when physicist Richard Feynman gave a speech, "There are Plenty of Rooms at the Bottom" at an American Physical Society meeting at the California Institute of Technology in which he identified the potential of nanotechnology. Feynman said it should be possible to build machines small enough to manufacture objects with atomic precision, and that if information could be written on an atomic scale, "all of the information that man has carefully accumulated in all the books in the world can be written in a cube of material 12700 nm wide about the size of the smallest piece of dust visible to the human eye."

Nanotechnology and Nanoscience got a boost in the early 1980s with two major developments: the birth of cluster science and the invention of the scanning tunneling microscope (STM). This development led to the discovery of fullerenes in 1985 (Prasada *et al.*, 2008) and carbon nanotube a few years later. In another development, the synthesis and properties of semiconductors was studied; this led to a fast increasing number of metal and metal oxide nanoparticles and quantum dots.

Nanotechnology as one of the most modern technologies has attracted many researchers all over the world to study the different aspects of nanosystems and nanostructures. Among various nanostructures, carbon nanotube (CNT) has an influential role in this technology due to its remarkable mechanical, electrical, thermal and chemical properties. This nanostructure has been employed in different fields including nanomaterial, nanoelectronics and nanomechanics during recent decades. Due to these extensive applications, its modeling and analysis in various conditions are more demanded (Fakhrabadi *et al.*, 2012).

Carbon nanotubes (CNTs) are tubular structures that are typically of nanometer diameter and many micrometers in length. This fascinating new class of materials was first observed by Endo in 1975 and later by Iijima in 1991 in the

soot produced in the arc-discharge synthesis of fullerenes (Dresselhaus *et al.*, 2004). The structure of a CNT can be described in terms of a single graphite layer (graphene) rolled up to form a single cylinder or concentrically arranged cylinders. The former is referred to as a single-wall nanotube (SWNT) and the latter are called multi-wall nanotubes (MWNTs). MWNTs can form starting from double-walled tubes (DWNTs) to tubes with 50 or more walls or layers.

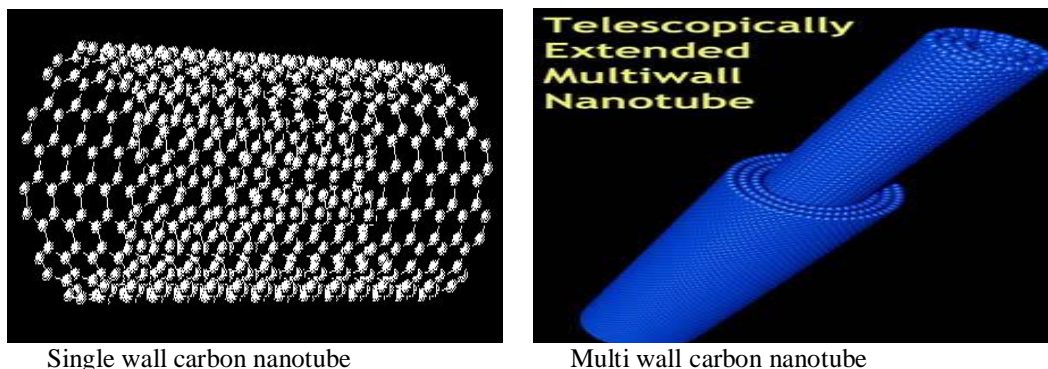

Figure 1:- Structure of single-wall and multi-wall carbon nanotubes (Zhang *et al.*, 2003).

Single-wall nanotubes has only one single layer and with a diameter of 1 to 5 nm. The properties of SWNT are more stable than MWNT so it is more favorable. This is due to the degree of relative stability for carbon CNT bundle interconnects versus the length bundle and the diameter of each individual CNT has been obtained. The obtained results show that with increasing the length of the CNT bundle and the diameter of each individual CNT to be interconnected, then the relative stability increase, and the system become more stable (Fathi, 2009). MWNT is a little bigger than SWNT because MWNT has about 50 layers. MWNT's inner diameter is from 1.5 to 15 nm and the outer diameter is from 2.5 nm to 30 nm. SWNT have better defined shapes of cylinder than MWNT, thus MWNT has more possibilities of structure defects and its nanostructure is less stable (Zhang *et al.*, 2003).

It is a well-known fact that much of the Carbon Nanotubes produced are usually formed along with a mixture of amorphous carbon, fullerenes and other impurities. Cost effective and efficient ways of separation and filtration of Carbon Nanotubes are yet to be discovered. Amongst the available methodologies the three most commonly used techniques includes Arc-Discharge method, Laser Ablation method and Chemical Vapor Deposition (CVD). The CVD has proved to be a comparatively reliable way of synthesizing CNTs (Tripathi *et al.*, 2010).

Within material science, the optical properties of carbon nano tubes refer specifically to the absorption, photoluminescence and Raman spectroscopy. Spectroscopic methods offer the possibility of quick and non-destructive characterization of relatively large amounts of carbon nanotubes. There is a strong demand for such characterization from the industrial point of view: since numerous parameters of the nanotube synthesis can be changed, intentionally or unintentionally, to alter the nanotube quality. Optical absorption, photoluminescence and Raman spectroscopes allow quick and reliable characterization of this nanotube quality in terms of non-tubular carbon content, structure (chirality) of the produced nanotubes, and structural defects. Those features determine nearly any other properties such as optical, mechanical, and electrical properties.

General Objective of this work being reported here was:-

- To review the synthesis, properties and application of carbon nanotubes

Specific Objectives were:-

- ❖ To explain optical and electronic properties of carbon nanotubes
- ❖ To review the applications of carbon nanotubes

Literature Review:-

Fabrication of Carbon Nanotubes:-

Following the rapid advancement of carbon nanotubes and applications, different techniques to produce carbon nanotubes have been developed. Carbon nanotubes can be fabricated using techniques such as arc discharge, laser ablation, and chemical vapor deposition (CVD) methods.

Arc discharge method:-

This was the first available method to fabricate carbon nanotubes. An electric arc discharge is an electrical breakdown of a gas producing a plasma discharge, very similar to a spark, which is the flow of current through a nonconductive medium such as air or an insulator. In a conventional carbon arc discharge fabrication, a plasma discharge is generated in a small gap between two graphite electrodes. In this method, carbon nanotubes are produced at the core in the cathode deposit (Javey *et al.*, 2002).

Figure 2:- Schematic diagram of an arc-discharge system

Source: <http://students.chem.tue.nl/ifp03/synthesis.html>.

As shown figure 2 during the arc discharge, two graphite rods are placed in an enclosure that is filled with some inert gas (like helium or argon) at low pressure (between 50 and 700 *mbar*). The carbon rods act as electrodes which are kept at different potentials. The anode is moved close to the cathode until an arc appears and the electrodes are kept at the distance of 1 *mm* for the whole duration of the process that takes about one minute. After the de-pressurization and cooling of the chamber, the nanotubes together with the by-products can be collected. Most nanotubes deposit on the cathode. The synthesis product yield which represents the amount of carbon nanotubes expected in the converted carbon is 60% (Isaacs *et al.*, 2010).

Laser ablation:-

Laser ablation is a process of removing materials from a solid surface by irradiating the surface with a laser beam. It was developed in 1995 to produce CNTs. Figure 3 illustrates the growth setup of laser ablation. In a typical laser ablation process for CNT growth, the graphite block is placed inside an oven and hit by a pulsed laser, and Argon gas is pumped along the direction of the laser point. The oven temperature is set approximately to 1200°C. As the laser ablates the target, carbon is vaporized and carried by the flowing gas onto a cool copper collector. CNTs grow on the cooler surfaces of the reactor as the vaporized carbon condenses. Sometimes, a water cooled surface may be included in the system to collect the CNTs. SWNTs are formed from a composite block of graphite and metal catalyst particles, whereas MWNTs form from pure graphite as the starting material (Guo *et al.*, 1995).

Figure 3:- Laser ablation equipment to produce CNTs.

Source: <http://students.chem.tue.nl/ifp03/synthesis.html>

Disadvantages of Arc-Discharge and Laser ablation:-

Both arc-discharge and laser ablation produce some of the most high quality nanotubes but suffer from the following disadvantages, which limit their use as large scale industrial processes.

- ✓ Both need extensive amount of energy to produce nanotubes. Such a huge amount of energy is not only impossible but also uneconomical for large scale production.
- ✓ Both methods require solid carbon/graphite as a target which has to be evaporated to get nanotubes. It is difficult to get such large graphite to be used as target in industrial process which limits its exploitation as large scale process.
- ✓ Both processes grow nanotubes in highly tangled form, mixed with unwanted form of carbon or catalysts. Thus CNTs produced by these processes require purification to get purified and assembled forms. The designing of such refining processes is difficult and expensive.

All the above mentioned factors severely limit the use of both arc-discharge and laser ablation as large scale processes for production of carbon nanotubes. In order to address these issues other methods were developed.

Chemical vapor deposition (CVD) grown carbon nanotubes:-

During CVD, a substrate covered with metal catalysts, like nickel, cobalt, iron, or a combination is heated to approximately 700°C. As shown figure 4, the growth starts after two gases are passed through the chamber, a carrier gas like nitrogen, hydrogen or argon, and some hydrocarbon gas like acetylene (C_2H_2) or methane (CH_4). The synthesis production yield, which indicates the amount of carbon nanotubes in the converted carbon, reaches 90% (Isaacs *et al.*, 2010). CVD is commonly used for industrial purposes because the method is already well investigated and offers acceptable results on the industrial-scale.

Figure 4:- Schematic diagram of chemical vapor deposition method.

Source: http://en.wikipedia.org/wiki/Chemical_vapor_deposition

Advantages of Chemical vapor deposition:-

This method has many advantages as compared to the arc discharge and the laser ablation method. To mention some:

- Reaction process and reactor design is simple, reaction is easy to control and manipulate.
- Raw materials are abundant and available readily in the form of gases.
- The process does not need huge amount of energy to produce high quality and large quantity of carbon nanotubes.
- Process is capable of producing CNTs directly onto substrates which ease out the process of further collection and separation and eliminates post refining processes to a large extent. Some refining is required in some cases for further purification.
- Process is unique for the production of vertically aligned nanotubes. No other process can produce aligned nanotubes.

More and more research is underway in the world today for the production of large quantities of high purity carbon nanotubes by chemical vapor deposition process. Researchers are developing method and designing reactors, which could be utilized as units for large scale production of carbon nanotubes.

The major pitfall for CVD grown MWNTs is the high defect density in their structures. The defective nature of CVD-grown MWNTs remains to be thoroughly understood, but is most likely due to the relatively low growth temperature, which is not sufficient to provide adequate thermal energy to anneal nanotubes into perfectly crystalline structures.

Properties of Carbon Nanotubes:-

The wide range of electronic, optical, thermal, magnetic mechanical, chemical, physical and structural properties of carbon nanotubes vary according to the different diameter, chirality, length, and direction of 'twist' of the nanotube. Many applications arise from the surprising and desirable properties they exhibit, some of which are already being used in new and improved products. Among these properties of carbon nanotubes, optical and electronic properties are discussed in detail.

Optical properties of carbon nanotubes:-

The optical properties of CNTs are linked closely to their structural and electronic properties and are fully governed by one parameter, its chiral vector, which describes how the carbon-atom honeycomb is organized with respect to the CNT axis. Depending only on this parameter, CNTs may behave as a direct band gap semiconductor or as a metal.

Optical properties of carbon nanotubes derive from electronic transitions within one dimensional density of states (DOS). A typical feature of one-dimensional crystals is that their DOS is not a continuous function of energy, but it descends gradually and then increases in a discontinuous spike. The sharp peaks found in one-dimensional materials are called van Hove singularities. These van Hove singularities would be discussed later in the discussion part.

For an individual CNT, the optical properties of single walled (SWNTs and MWNTs should be considered separately. The optical properties of SWCNTs, especially those with diameters less than 1 nm, exhibit very strong dependence on the detailed atomic structure (chirality) (Bachilo *et al.*, 2002). Chirality-controlled CNT growth or chirality separation is still difficult in experiments. Thus SWCNT arrays usually contain much different chirality with a random distribution, which complicates the engineering of optical properties and functionalities. In contrast, MWCNTs, due to their larger size, have more regular and uniform optical properties. It is thus reasonable to treat each MWCNT as a homogeneous medium and design the structure for different applications (Lidorikis and Ferrari, 2009).

The optical properties of a CNT array further depend on the manner in which the CNTs are arranged, including pattern and intertube distance. Vertical arrays of nanotubes and nanowires have attracted much attention recently in solar, photonic crystal, mode-locked fiber lasers, and nanoantenna applications. For example, absorption enhancement in silicon nanowire arrays has been predicted using electromagnetic calculations and observed in experiments. Also, anisotropic optical scattering is predicted and observed for an individual semiconductor nanowire. In comparison, MWNT arrays possess a similar cylinder array structure. Although enhanced absorption and anisotropic scattering are experimentally observed, they have been less investigated theoretically, and quantitative analysis is still lacking (Ruan *et al.*, 2010).

Raman spectroscopy:-

Raman spectroscopy is one of the most powerful tools for characterization of carbon nanotubes. Without sample preparation, a fast and non-destructive analysis is possible. All allotropic forms of carbon are active in Raman spectroscopy (Arepalli *et al.*, 2004): fullerenes, carbon nanotubes, amorphous carbon and polycrystalline carbon.

Raman spectroscopy provides information about molecular vibrations that can be used for sample identification and quantification. The technique involves shining a monochromatic light source that is laser on a sample and detecting the scattered light. The majority of the scattered light is of the same frequency as the excitation source; this is known as Rayleigh or elastic scattering. A very small amount of the scattered light is shifted in energy from the laser frequency due to interactions between the incident electromagnetic waves and the vibration energy levels of the molecules in the sample.

Raman scattering offers a unique tool to characterize carbon materials such as graphite, diamond and carbon nanotubes, since the amount of ordering and degree of sp^2 and sp^3 bonding leaves a unique Raman fingerprint. Therefore, Raman spectroscopy is used here to identify carbon nanotubes and to characterize the obtained carbon structures by their degree of crystallinity.

Figure 5:- Raman spectrum showing the most characteristic features of CNTs: Radial Breathing Mode (RBM), the D band, G' band and G band (Belin and Epron, 2005)

From figure 5 Raman spectrums showing the most characteristic features of CNTs are summarized as follows:

- A low-frequency peak $< 200 \text{ cm}^{-1}$ (or bunch of peaks for poly disperse samples) when resonating conditions were met characteristic of the SWNT assigned to an A_{1g} breathing mode of the tubes, whose frequency depends essentially on the diameter of the tube (RBM: radial breathing mode).
- A large structure (1340 cm^{-1}) assigned to residual ill-organized graphite, the so-called D-line (D: disorder).
- The D- line or D-band is observed in the Raman spectra of semiconducting and metallic SWNT at the single nanotube level. The D-band in graphite involves scattering from a defect which breaks the basic symmetry of the graphene sheet, it is observed in sp^2 carbons containing porous, impurities or other symmetry-breaking defects.
- A high-frequency bunch (between 1500 and 1600 cm^{-1}) called G band also characteristic of nanotubes, corresponding to a splitting of the E_{2g} stretching mode of graphite.
- A second order observed mode between 2450 and 2650 cm^{-1} assigned to the first overtone of the D mode and often called G mode; a combination mode of the D and G modes between 2775 and 2950 cm^{-1} .

Radial breathing mode (RBM) corresponds to radial expansion-contraction of the nanotube. Therefore, its frequency ν_{RBM} (in cm^{-1}) depends on the nanotube diameter d (in nm) and can be estimated (Fantini *et al.*, 2004).

$\nu_{\text{RBM}} = \frac{234}{d} + 10$ for SWNT or $\nu_{\text{RBM}} = \frac{234}{d}$ for DWNT, which is very useful in deducing the CNT diameter from the RBM position.

Raman spectroscopy for the RBM is therefore often used to determine the diameter or diameter distribution in SWNT samples and is further used to assign the chiral index (n, m) of individual SWNTs by considering their resonant transitions.

Nonlinear optical properties:-

Non-linear optics (NLO) is the branch of optics that describes the behavior of light in non-linear media, that is media in which the dielectric polarization \mathbf{P} responds nonlinearly to the electric field \mathbf{E} of the light. This nonlinearity is typically only observed at very high light intensities (values of the electric field comparable to interatomic electric fields, typically 10^8 V/m) such as those provided by pulsed lasers.

The rapid development of nanoscience and nanotechnology provides lots of new opportunities for nonlinear optics. A growing number of nanomaterials have been shown to possess remarkable nonlinear optical (NLO) properties, which promotes the design and fabrication of nano and nanoscale optoelectronic and photonic devices (Hasan *et al.*, 2009; Loh *et al.*, 2010). The wonderful carbon allotropes discovered in recent decades are the most representative products of nanotechnology: from 3D carbon nanoparticles (graphite), to 0D fullerenes, to 1D carbon nanotubes (CNTs), and then to 2D graphenes discovered most recently. Interestingly, all of these nano-carbons exhibit diverse NLO properties. For instance, carbon black suspensions show strong thermally-induced nonlinear scattering (NLS) effect and hence optical limiting (OL). For intense ns laser pulses fullerenes show large third-order optical nonlinearity and reverse saturable absorption (RSA) at certain wavelength band. CNTs show ultrafast second- and third order nonlinearities and saturable absorption (SA) in the near infrared (NIR) region and graphenes show ultrafast carrier relaxation time and ultra-broad-band resonate NLO response.

Materials with large second or third order optical nonlinearities are of great interest for data processing in photonic computing. Since the invention of laser in 1960 by Maiman and the first discovery of nonlinear optical (NLO) effect of quartz crystals, there has been a great deal of research directed at finding new materials with higher order NLO properties. Only noncentrosymmetric or polar materials could possess second order NLO susceptibility. Most third order NLO materials are generally too low for practical applications. Since the discovery of carbon nanotubes, which possess optimal properties (like highest thermal conductivity, Young modulus 100 times higher than steel, zero bandgap metal, ballistic conductance, simple structure, nanometer-size and ultra-light weight) by a NEC scientist Sumio Iijima in 1991, a heat of studying and engineering the properties of carbon nanotubes has been raised worldwide.

Electronic properties of carbon nanotubes:-

Carbon nanotubes (CNTs) provide a number of unique and special properties that suggest great promise for nanoelectronics applications. In particular, the high electrical conductivity of quantum wires provides a potential solution for on chip interconnect metals and transistors of future integrated circuits.

One crucial obstacle to overcome in fabrication is controlling whether the CNT is metallic or semiconducting. The critical parameter determining the electronic properties of CNTs is the chiral vector, $c_h = na_1 + ma_2 \equiv (n, m)$, where n and m are integers and a_1 and a_2 are the real space unit vectors of the graphene sheet. When $n - m$ is a multiple of 3, the simple theory leads to a crossing of bands at the Fermi energy, implying that CNT is metallic; otherwise, it is expected to be a semiconductor. Thus, armchair (n, n) , CNTs are expected to always be metallic, whereas zigzag $(n, 0)$, CNTs are semiconductor except when n is a multiple of 3.

Since a carbon nanotube (CNT) is a rolled graphene sheet, the band structure of CNT is also predetermined by electronic structure of graphene. However in contrast to graphene, CNT is a quasi-one-dimensional structure, in which electronic properties depends on how the graphene sheet was rolled up. To classify the variety of ways to wrap the nanotube from a graphene sheet two indexes, n and m are commonly used (Saito *et al.*, 2000). Figure 6 illustrates an example of graphene sheet about to be wrapped into a nanotube with the primitive translation vectors a_1 and a_2 . once wrapped, the length of the chiral vector becomes the tube circumference and the tube diameter d can be calculated from this circumference as:

$$d = \frac{a}{\pi} \sqrt{n^2 + nm + m^2} \quad (2.2.1)$$

The chiral angle is the angle between the translation vector c_h and the $(n, 0)$ line as seen in figure 7:

$$\alpha = \arctan\left(\frac{\sqrt{3}n}{2m+n}\right) \quad (2.2.2)$$

Defined by the integer index pair, (n, m) , the chiral angle ranges from 0 to 30°. Zigzag nanotubes have chiral angles of 0 degrees, armchair nanotubes have chiral angles of 30° and chiral nanotubes have chiral angles between 0 < α < 30°.

Figure 6:- Graphene model of a CNT showing the index pair notation used to characterize the CNT geometry.
Source: [http://en.wikipedia.org/wiki/ Carbonnanotube](http://en.wikipedia.org/wiki/Carbonnanotube)

$a = 2.46\text{\AA}$ from the graphene structure and by convention $n \geq m$. If $m = 0$, the nanotubes are called zigzag, while if $n = m$, the nanotubes are called armchair. Otherwise, they are called chiral. Therefore varying the way of the rolling up one can arrive at CNT of different chirality and hence to different periodicity of the electronic wavefunction. In the electronic spectrum, such a periodicity manifests itself as delta-shaped peaks known as van Hove singularities which positions depends on a diameter and chirality of the SWNT. In particular the diameter is responsible for the band gap or type (metal or semiconducting) of the nanotube (Kataura *et al.*, 1999). The electronic bands with the corresponding density of one-electron states (DOS) calculated for metallic and semiconducting single walled carbon nanotubes.

The electronic and optical properties of the tubes are considerably influenced by the environment (Charlier *et al.*, 2001). Under externally applied pressure, the small interaction between the tube walls results in the internal tubes experiencing reduced pressure (Puech *et al.*, 2004). The electronic transition energies are in the infrared and visible spectral range.

Generally, one can view carbon nanotubes as giant conjugated molecular wires with conjugation length corresponding to the whole length of the tube. In order to understand their electronic structure, we have to start with graphene, a single sheet of graphite. Carbon has four valence electrons of which three are strongly bound to neighbor atoms giving graphene its very high in-plane rigidity. The fourth electron is delocalized and shared by all the atoms, thus allowing for electronic current transport. However, because of its particular structure, graphene is electronically between semiconductor and metal. It is a semimetal or a zero-gap semiconductor.

Application of Carbon Nanotubes:-

A carbon nanotube is inert, has a high aspect ratio and a high tensile strength, low mass density, high heat conductivity, a large surface area, and a versatile electronic behavior, including high electron conductivity. However, while these are the main characteristics of individual nanotubes, many of them can form secondary structures such as ropes, fibers, papers and thin films with aligned tubes, all with their own specific properties. These properties make them ideal candidates for a large number of applications provided their cost is sufficiently low. The cost of carbon nanotubes depends strongly on both the quality and the production process. High-quality single-wall carbon nanotubes can cost 50–100 times more than gold. However, carbon nanotube synthesis is constantly improving, and sale prices are falling rapidly. The application of carbon nanotubes is therefore a very fast moving field, with new potential applications found every year, even several times per year.

Photovoltaic solar cells:-

Carbon nanotubes (CNTs) have been widely used in solar cells research, for example, CNTs have been integrated in organic photovoltaic devices both as an electron acceptor material and as a transparent electrode. This is because the high conductivity along the tube axis of CNTs helps carrier's separation and collection. In 2005, GE Global Research observed a photovoltaic effect in a pristine nanotube diode device consisting of two CNTs with different electrical properties (Lee, 2005).

Photovoltaic device is a device that converts the energy of light directly into electricity by the photovoltaic effect. It is a crucial part of solar cells. Currently, wafer-based silicon (single crystal, poly crystalline and multicrystalline) solar cells and thin film solar cells based on amorphous silicon, CdTe, CuInGaSe₂, and III-V semiconductors dominate photovoltaic manufacturing (Singh *et al.*, 2008; Gupta *et al.*, 2009). However, they are of low efficiency and expensive, which have limitations for replacement of current energy sources. There is a clear need to look for low-cost and high-efficiency solar cells. Many new kinds of solar cells have been proposed, such as p-n junction solar cells, dye-sensitized solar cells and organic solar cells.

Nanomaterials have been widely used in the above proposed solar cells. The advantages of using nanostructure-based solar cells are, on one hand, their high manufacturing costs as a result of using a low temperature process similar to printing instead of the high temperature vacuum deposition process typically used to produce conventional cells made with crystalline semiconductor material, and on the other hand, their low quantum efficiency which can be improved by using multiple electron-hole pair generation in nanostructures, like quantum dots and carbon nanotube (Hanna *et al.*, 2004; Jin Kim *et al.*, 2008; Stubbs *et al.*, 2010).

Recently, carbon nanotube (CNT) and graphene are playing an important role in such nanostructure-based solar cells. The dispersion of CNTs in a solution of an electron donating conjugated polymer is perhaps the most common strategy to implement CNT materials into organic photovoltaic devices to obtain higher efficiency. Enhancements of more than two orders of magnitude have been observed in the photocurrent from adding the single walled carbon nanotube to the poly matrix (Kymakis *et al.*, 2003). The use of CNTs in DSSC has doubled the efficiency of this kind of photoelectrochemical solar cells (Kongkanand *et al.*, 2007).

Graphene thin films also have been used as anode in dye-sensitized solar cells and organic solar cells layered graphene for photovoltaic devices have been reported to have an even better photovoltaic performance than the single walled carbon nanotube/quantum dots devices (Guo *et al.*, 2010).

As one of major variables of DSSC, the dye absorbed light energy transits from ground state to excited state and gets electron injection. Electrons are injected in a very fast speed of femtosecond or picoseconds unit and oxidized dye is renewed within several nanoseconds. On the other hand, since rejoining speed that the electron becomes dissolved into electrolyte via surface state is slow such as micro seconds or milliseconds and most of photons are injected semiconductor conduction band, those electrons that are not injected meet holes again to be restored and decrease efficiency of solar cell. If we utilize CNT that is advantageous for electrical and thermal conduction as a compound material, we can increase electron injection speed than rejoining speed and increase efficiency of dye sensitized solar cells through movement of more electrons.

Since multi walled carbon nanotube (MWNT) is a material to transfer electricity and heat well, it can function as a basic electrode. Nanotubes function as electrodes to penetrate into broad TiO₂ surface mutually and assist extracting charge carriers efficiently from dye layer. Since these electrodes are very clear under longer wavelength, they are advantageous for solar light spectrums.

Chemical sensors:-

The electrical conductance of semiconductor SWNTs was recently demonstrated to be highly sensitive to changes in the chemical composition of the surrounding atmosphere at room temperature, due to charge transfer between the nanotubes and the molecules from the gases adsorbed onto SWNT surfaces. It has also been shown that there is a linear dependence between the concentration of the adsorbed gas and the change in electrical properties, and that the adsorption is reversible. SWNT-based chemical NO₂ and NH₃ sensors are characterized by extremely short response times unlike conventional sensors (Kong *et al.*, 2000; Chang *et al.*, 2001).

The electrical response has been measured by exposing MWNT films to sub-ppm NO₂ concentrations (10–100 ppb in dry air) at different operating temperatures ranging between 25 and 215°C (Cantalini *et al.*, 2003). For SWNTs, the sensor responses are linear for similar concentrations, with detection limits of 44 ppb for NO₂ and 262 ppb for nitro toluene (Li *et al.*, 2003). High sensitivity to water or ammonia vapor has been demonstrated on a SWNT-SiO₂ composite (Varghese *et al.*, 2001). This study indicated the presence of p-type SWNTs dispersed among the predominantly metallic SWNTs, and that the chemisorptions of gases on the surface of the semiconductor SWNTs is responsible for the sensing action.

Generally speaking, the sensitivities of these new nanotube-based sensors are three orders of magnitude higher than those of standard solid state devices. Another reason for using nanotubes instead of current sensors is their simplicity, the facts that they can be placed in very small systems and that they can operate at room temperature, as well as their selectivity. These advantages allow a limited number of sensor device architectures to be built for a variety of industrial purposes, while the current technology requires a large variety of devices based on mixed metal oxides, optomechanics, catalytic beads, electrochemistry, and so on.

Multifunctional Materials:-

One of the major benefits expected from incorporating carbon nanotubes into other solid or liquid materials is that they endow the material with some electrical conductivity while leaving other properties or behaviors unaffected. As already mentioned in the previous section, the percolation threshold is reached at very low nanotube loadings. Tailoring the electrical conductivity of a bulk material is then achieved by adjusting the nanotube volume fraction in the formerly insulating material while making sure that this fraction is not too large. As demonstrated by (Maruyama and Alam, 2002), there are three areas of interest regarding the electrical conductivity:

- ❖ Electrostatic discharge (for example, preventing fire or explosion hazards in combustible environments or perturbations in electronics, which requires an electrical resistivity of less than 10¹² Ωcm).
- ❖ Electrostatic painting (which requires the material to be painted to have enough electrical conductivity – an electrical resistivity below 10⁶ Ωcm to prevent the charged paint droplets from being repelled).
- ❖ Electromagnetic interference shielding (which is achieved for an electrical resistivity of less than 10 Ωcm).

Materials are often required to be multifunctional; for example, to have both high electrical conductivity and high toughness, or high thermal conductivity and high thermal stability. An association of several materials, each of them bringing one of the desired features, generally meets this need. The exceptional features and properties of carbon nanotubes make them likely to be a perfect multifunctional material in many cases. For instance, materials used in satellites are often required to be electrical conductive, mechanically self-supporting, able to transport away excess heat, and often to be robust against electromagnetic interference, while being of minimal weight and volume. All of these properties should be possible with a single nanotube containing composite material instead of complex multilaterals combining layers of polymers, aluminum, copper, and others.

The special nature of carbon combines with the molecular perfection of single-wall CNTs to endow them with exceptional material properties, such as very high electrical and thermal conductivity, strength, stiffness, and toughness. No other element in the periodic table bonds to itself in an extended network with the strength of the carbon-carbon bond. The delocalized pi-electron donated by each atom is free to move about the entire structure, rather than remain with its donor atom, giving rise to the first known molecule with metallic-type electrical conductivity. Furthermore, the high-frequency carbon-carbon bond vibrations provide an intrinsic thermal conductivity higher than even diamond.

In most materials, however, the actual observed material properties - strength, electrical conductivity, etc. - are degraded very substantially by the occurrence of defects in their structure. For example, high-strength steel typically fails at only about 1% of its theoretical breaking strength. CNTs, however, achieve values very close to their theoretical limits because of their molecular perfection of structure. This aspect is part of the unique story of CNTs. CNTs are an example of true nanotechnology: they are only about a nanometer in diameter, but are molecules that can be manipulated chemically and physically in very useful ways. They open an incredible range of applications in materials science, electronics, chemical processing, energy management, and many other fields.

CNTs Ceramic Applications, CNTs Air and Water Filtration, CNTs Biomedical Applications, CNT Catalyst Supports, CNTs Fibers and Fabrics, CNTs Structural Composites, CNTs Thermal Materials, CNTs Molecular Electronics, CNTs Conductive Adhesives and Connectors, CNTs Energy Storage, CNTs Conductive Plastics, CNTs

Field Emission Applications, and CNTs Thermal Conductivity are the application of this nanotube which is responsible for the current manufacturing industry, agricultural industry and also many other industry.

Other CNT Applications:-

There is a wealth of other potential applications for CNTs, such as solar collection; nanoporous filters; catalyst supports; and coatings of all sorts. There are almost certainly many unanticipated applications for this remarkable material that will come to light in the years ahead, and which may prove to be the most important and valuable ones of all. Many researchers are looking into conductive and or water proof paper made with CNTs. CNTs have also been shown to absorb Infrared light and may have applications in the I/R Optics Industry.

Electronic Band Structure of Carbon Nanotubes:-

In order to examine the electronic structure of carbon nanotubes, it is necessary to define the structural configuration. Carbon nanotube structures are defined by the indices (n, m) inscribed in the chiral vector. The chiral vector is a vector along the perimeter of the carbon nanotube.

Crystal lattice:-

The primitive cell of a carbon nanotube can be described from the unit vectors:

$$\vec{a}_1 = \frac{\sqrt{3}}{2}a\hat{x} + \frac{1}{2}a\hat{y} \quad (2.4.1)$$

$$\vec{a}_2 = \frac{\sqrt{3}}{2}a\hat{x} - \frac{1}{2}a\hat{y} \quad (2.4.2)$$

Where \vec{a}_1 and \vec{a}_2 are the unit cell vectors, a is the lattice constant of graphene with the value $a = \sqrt{3}a_{c-c} = 2.46 \text{ \AA}$, Where a_{c-c} is the nearest distance between two carbon atoms.

Reciprocal lattice:-

The reciprocal lattice vectors \vec{b}_1 and \vec{b}_2 are of the form:

$$\vec{b}_1 = \frac{2\pi}{\sqrt{3}a}\hat{x} + \frac{2\pi}{a}\hat{y} \quad (2.4.3)$$

$$\vec{b}_2 = \frac{2\pi}{\sqrt{3}a}\hat{x} - \frac{2\pi}{a}\hat{y} \quad (2.4.4)$$

Energy dispersion relation:-

The energy dispersion relation for carbon nanotubes can be calculated from the electronic structure of graphene. The energy dispersion of graphene is given by (Heo, 2008):

$$E(k) = \pm\gamma\sqrt{1 + 4\cos\left(\frac{\sqrt{3}ak_y}{2}\right)\cos\left(\frac{ak_x}{2}\right) + 4\cos^2\left(\frac{ak_x}{2}\right)} \quad (2.4.5)$$

Where γ is the transfer integral and k is the wave vector, k_x and k_y are denote the allowed reciprocal wave vectors along the tube and the circumference axis are found using the relation:

$$k_x = \frac{(2n+m)b_1 + (2m+n)b_2}{Nd_R} \quad (2.4.6)$$

$$k_y = \frac{mb_1 - nb_2}{N} \quad (2.4.7)$$

Where N is the number of hexagons within a unit cell and it is given by:

$$N = \frac{2(n^2 + m^2 + nm)}{d_R} \quad (2.4.8)$$

where d_R the greatest common divisor of $(2n + m)$ and $(2m + n)$.

One-dimensional (1D) energy band structure of carbon nanotubes can be adopted from Eq. (2.4.5). For armchair and zigzag carbon nanotubes the energy band structures as follows:

$$E_{1D,arm}(k) = \pm\gamma\sqrt{1 + 4\cos\left(\frac{q\pi}{n}\right)\cos\left(\frac{ka}{2}\right) + 4\cos^2\left(\frac{ka}{2}\right)} \quad (2.4.9)$$

where ka is $-\pi \leq ka \leq \pi$ and q is $0 \leq q \leq 2n - 1$,

$$E_{1D,zig}(k) = \pm\gamma\sqrt{1 + 4\cos\left(\frac{\sqrt{3}ka}{2}\right)\cos\left(\frac{q\pi}{n}\right) + 4\cos^2\left(\frac{q\pi}{n}\right)} \quad (2.4.10)$$

where ka is $-\frac{\pi}{\sqrt{3}} \leq ka \leq \frac{\pi}{\sqrt{3}}$ and q is $0 \leq q \leq 2n - 1$

where γ is the transfer integral and \pm corresponds to the valance and the conduction band of the nanotubes.

Energy gap of carbon nanotubes:-

Furthermore, the (n, m) integers also determine whether a CNT is metallic or semiconducting. When $n - m$ is a multiple of 3, the nanotube is metallic, otherwise the nanotube is semiconducting with an energy gap depending on its diameter as follows:

$$E_{g,v} = \sqrt{3}a\gamma \frac{2\pi}{na} \left(v - \frac{2n}{3} \right) = \sqrt{3}a\gamma \frac{2}{d} \left(v - \frac{2n}{3} \right) \quad (2.4.11)$$

where $d = \frac{na}{\pi}$ is tube diameter and $v = 1, \dots, 2n$

$$E_g = \frac{2\gamma a_{c-c}}{d} = \frac{0.72 \text{ eV}}{d(nm)} \quad (2.4.12)$$

where a_{c-c} is the nearest distance between two carbon atoms which is equal to 0.144 nm and d is the diameter carbon nanotubes. The density of states of carbon nanotubes are given by the following formula:

$$g(E) = \sum_v^{all \text{ band}} \frac{8}{3\pi a_{c-c}\gamma} \frac{|E|}{\sqrt{E^2 - E_{g,v}^2}} \quad (2.4.13)$$

This equation is valid for all semiconductor and metallic carbon nanotubes.

Discussion:-

From section 2.4. we have seen how the energy band structure depends on the wave vector of a given nanotubes. In order to identify whether the given nanotube is metallic or semiconducting, one can simulate the wave vector dependence of energy band structure of carbon nanotubes. With the help of equation (2.4.9) for armchair tubes and equation (2.4.10) for zigzag tubes, we simulate the variation of energy band structure of the tubes as a function of wave vector as showed in figure 7 respectively using MATLAB codes.

Figure 7:- Band structure of armchair tubes as function of wave vector using Eq. 2.4.9

From figure 7a we observe that for (4, 4) armchair tube has 10 different subbands; half of the total belongs to conduction and half of the total belongs to valence bands. From the half of conduction and/or valence bands two of them are non-degenerate and the remaining three subbands are degenerate. We also observe that the first conduction and the first valence bands meet at a Fermi level ($ka = \pm 2.032$). Because of the degeneracy point between the valence and conduction bands at the band crossing, the (4, 4) nanotube is thus a zero-gap semiconductor. This implies that the tube is metallic. This discussion is also true for (7, 7) armchair tubes as shown in figure 7b except the number of subbands and the degeneracy. In general, all (n, n) armchair nanotubes yield $2n$ conduction subbands and $2n$ valence bands, and of these bands, two are non-degenerate and $n - 1$ are doubly degenerate. They all have a band degeneracy between the highest valence band and the lowest conduction band at ($ka = \pm 2.032$) where the bands cross the Fermi level. The degeneracy comes from the two subbands with the same energy dispersion, but different q values. All armchair nanotubes are expected to exhibit metallic conduction.

Figure 8:- Band structure of zigzag tubes as function of wave vector using Eq. 2.4.10

From figure 8a we observe that there are 10 sub bands in (4,0) tubes. Half of the total belongs to the conduction band (red color) and half of the total belongs to the valence band (blue color). We observe that the valence and the conduction bands are symmetric with respect to Fermi energy ($E = 0$). Again from figure 8a the valence bands and the conduction bands do not meet along the wave vector ka . Therefore, this tube is a semiconducting one since there is a band gap. In general most of the zigzag nanotubes are $(n, 0)$ a semiconducting. But when n is a multiple of 3, there is no energy gap, then the zigzag nanotubes are metallic, otherwise semiconducting. An example of metallic zigzag nanotube is (9,0). Because as we observed from figure 8b above, the first valence and conduction band meet at $ka = 0$. Simply there is no energy gap between the conduction and valence band in (9,0) zigzag tubes.

Figure 9:- Energy gap as a function of tube diameter using Eq. 2.4.11

From figure 9 we observe that the band gap for semiconducting tubes is found to be inversely proportional to the tube diameter. The energy gap decreases for larger tube diameters and increases for smaller diameters. Most of the time SWCTs have high energy gap when we compared to MWCTs. The diameter of MWCTs is greater than that of SWCTs. It has been shown that electronic conduction mostly occurs through the external tube for MWNTs.

a) Density of state for metallic tube

b) Density of state of semiconductor carbon nanotube

Figure 10:- Density of state as function of energy band structure of the carbon nanotubes using Eq. 2.4.13

From figure 10a we observe that at the Fermi energy (the highest occupied energy level) the density of states is finite for a metallic tube (though very small) and from figure 10b we observe that at the Fermi energy the density of state is zero for semiconducting tubes. As the energy increased, the sharp peaks in the density of states called the van Hove singularities, appear and specific energy levels. The density of state is highest at the energies where the band structure has a smallest slope and is lowest at the energies where the band structure is steepest. As we observe from the figures the density of state is not a continuous function of energy but it descends gradually and then increases in a discontinuous spike. It is clear that the density of state is inversely proportional to the square root of energy in both

tubes, (i.e., semiconducting and metallic tubes). Van Hove singularities results a remarkable optical properties of carbon nanotubes:

The energies between the van Hove singularities depend on the nanotube structure. Thus by varying this structure, one can tune the optoelectronic properties of carbon nanotube. Such fine tuning has been experimentally demonstrated using UV illumination of polymer-dispersed CNTs (Iakoubovskii *et al.*, 2006).

Optical transitions occur between the $V_1 \rightarrow C_1$, $V_2 \rightarrow C_2$ and so on states of semiconducting or metallic nanotubes and are traditionally labeled as S_{22} , S_{22} , M_{11} , and so on or, if the conductivity of the tube is unknown or unimportant, as E_{11} , E_{22} and so on. Crossover transitions $V_2 \rightarrow C_1$, $V_1 \rightarrow C_2$ and so on are dipole-forbidden and thus are extremely weak, but they were possibly observed using cross-polarized optical geometry (Miyauchi *et al.*, 2006).

Conclusion:-

In this project work synthesis, properties and technological applications of carbon nanotubes are reviewed. From the reviewed the synthesis methods chemical vapor deposition method is the most effective method which produces large quantities and high quality of carbon nanotubes. The technique is commonly used for the industrial purposes because the method is already well investigated and offers acceptable results on the industrial-scale.

The electronic band structure of a semiconductor consists of a valence band, conduction band, and Fermi level that are at energy levels particular to a given semiconductor. The Fermi level is the energy of the highest occupied state of electrons at absolute zero, and the valence band contains the valence electrons that when excited can move to the higher energy levels of the conduction band.

The electronic band structure calculations predict that the (n, m) indices determine the metallic or semiconducting behavior of CNT. It is clear that the result shows zigzag tubes $(n, 0)$ should have two distinct types of behavior; metallic when $n/3$ is an integer, and otherwise semiconductors. The gaps of the semiconducting $(n, 0)$ zigzag tubes should depend inversely on diameter and (n, n) armchair tubes band gap is remain independent of diameter.

The energy dependence of the nanotube density of states as where, the density of states for metallic and semiconductor zigzag nanotubes was compared. It was observed and demonstrated that the density of states near the Fermi level located at $E = 0$ are zero in pure semiconducting nanotubes. But density of states has a value of non-zero for metallic nanotubes even at the Fermi level located at $E = 0$.

Abstract

This paper reports the results of numerical study undertaken to investigate the effect of impeller rotational speed on velocity field in mixing tank. The hydrodynamic of the flow in standard mixing tank generated by retreat curve 3-bladed impellers, (radial flow) is studied. Using ANSYS FLUENT v15.4 to solve the continuity and momentum equations incorporating the RNG K- ϵ turbulence model with the standard wall function available in Fluent. The multiple frames of reference (MFR) model is used for impeller modeling. The results show that the velocity fluctuated increased with the rotational speed.

Introduction:-

Mixing tanks is one of the techniques that is widely used and play a significant role in industrial processes to homogenize the mixture of two or more fluids/solids by using rotating impeller. The better understanding of the fluids behavior in mixing vessel may improve the performance of impeller and the mixing process. Means e.g. the main aims of using missing is to improve the mass and heat transfer and to generate a homogenized mixture to minimize the settling of the particles at the bottom of the tank. A summary of some recent published works in the literature is given below.

(Wei et al 1997) [1] Studied the influence of the number and width of baffles in mechanically mixing vessel with and without aeration on the fluid hydrodynamics and mixing tank. (Ducoste and Clark 1999) [2] Employed the Computational Fluid Dynamics (FIDAP) code called Fluid Dynamics International, Evanston, IL in the study. The model was a simple geometry consists of the submerged impellers in cubical mixing vessel. The k- ϵ model was used to simulate the turbulence and the flow pattern induced in the vessel. (Masoud Rahimi 2005) [3] Used CFD simulation to study the influence of impellers number and layout on mixing time. A large storage tank of 19000m³ contain three types of crude oil with difference density. (Aoyi et al 2008) [4] Investigated the hydrodynamics of fluid in mixing stirred vessel agitated by Rushton turbine with low clearance condition. The CFD technique and LDV measurements were performed in order to understand the flow pattern and estimated the mixing time. (Angelique Delafosse et. al. 2008) [5] Investigated the hydrodynamics in mixing tank by CFD simulation. Two models were used to determine the dissipation rate and its distribution in mixing vessel. Three dimensional simulations using the commercial CFD code FLENT 6.2.16 based on the Unsteady Reynolds Averaged Navier-Stokes equations (URANS) model and Large Eddy simulation (LES) model was used (Zadghaffari et. al. 2008)[6] Studied the flow field, power and mixing time in mixing tank agitated by a double Rushton turbine. It was observed that a considerable reduction in mixing time can be achieved by increasing impeller rotation speed and reasonable agreement between the simulation and experimental results were obtained. The comparisons pointed the advantages

of this CFD approach as a computational tool for designing mixing reactors. (Ameur and Bouzit 2012) [7] Studied the effect of blades number on mixing performance in shear thinning fluid. The simulations and calculations of impeller were performed using computer code (CFX11.0). It has been shown that the axial velocity is directly proportional to Reynolds number which results an increasing in cavern size. The maximum values of tangential velocity are located at the tip of blade for any number of blades. The tangential velocity degradation is greater with impeller have two blades when compared with the other cases, while the difference becomes insignificant between an impeller with six and eight blade. (Meriem Ammar et. al. 2012) [8] Studied the effect of tank design on the flow pattern. Three baffles less stirred vessel types have been prepared, cylindrical, curved, and spherical vessel. It has been mentioned that the curved bottom tank reduced the low velocity flow zones, and established more uniformity for entirely tank volume. By the comparison between LDV data and simulation results, it can be consider that the CFD code is valid for predicting the fluid hydrodynamics in mixing vessel. (Sharma and Genitha 2014) [9] Numerically investigated the effect of different impellers on aerobic baffles stirred tank fermenter. The performance of aerobic stirred tank fermenter evolution was performed by using various software packages, Autodesk simulation CFD, and ANSYS FLUENT. The $k-\epsilon$ model, $k-\omega$ model, Shear Stress Transport (SST) model and Scale Adaptive Simulation (SAS) model were used to represent the turbulence. It has been observed that the axial flow component for all impellers was restrained on the bottom of the tank; consequently the overall flow was mainly radial. This will weak the axial velocity distribution at the bottom of mixing vessel, therefore the solid particles stays around the bottom of the tank. The 6-blade Rushton turbine equipped with walled baffles induced the best state for mass transfer. (Arturo J. et. al. 2015)[10] Examined the optimal location of one or two axial impellers on central shaft in tall stirred tank through establishing a connection of Evolutionary Program EP and CFD technique. It has been noted the optimum mixing time and power consumption can be achieved through the utilization of EP method. For mixing process established with one impeller the optimum mixing performed at clearance $C = 0.13418$ m and for two impellers system it's achieved with clearance $C = 0.26441$ and impeller space $h = 0.1601$ m. The evolution process selected the best entities according to operation condition for realizing optimum conditions.

In this paper, the flow field in stirred tank is studied using ANSYS Fluent v15.4 to identify the dead zones in the tank where the fluid is not mixing by presenting the velocity vectors at different planes in the tank. This will give better information which improves tank design in accordance with operation conditions.

Theoretical Analysis:-

CFD Model and Simulation:-

A schematic diagram of the tank and the impeller is shown in Figure 1. The system consists of a flat bottomed cylindrical vessel, the vessel diameter ($D_t = 0.3$ m) of which equals the height of the liquid ($H = D_t$). Four baffles having width, $W = D_t/10$ are spaced equally around the vessel. The shaft of the impeller is concentric with the axis of the vessel. The impeller diameter, D_i , equivalent to $D_t/3$. And the bleed radius 0.3 m and bleed height is $.03$ m. The distance between the tank bottom and the impeller position C is set to $C = D_t/3$. The rotational speed of the impeller, N , is ranging from 60 rpm to 135 rpm increasing step 15 rpm, leading to a tip speed, V_{tip} , ranging 0.314 m/s to 1.05 m/s. The working fluid is water with density, ρ , of 1000 kg/m³ and viscosity, μ , of 1×10^{-3} Pa.s. The mixing tank was design depending on the standard configuration [11], (Georgy 1991)[12]. The retreat impeller showed in Figure 2.

Figure1:- mixing Tank in Present Study

Figure 2:- Retreat impeller Geometry.

Governing equations:-

Continuity equation:-

The net flow of mass across the boundary of a control volume is zero in steady state flow:

$$\nabla \cdot \vec{G} = 0 \quad (1)$$

Where:

$\vec{G} = \rho \vec{V}$, is mass velocity.

Equation (1) can be written relative to cylindrical coordinates as follows:

$$\frac{\partial G_z}{\partial z} + \frac{1}{r} \frac{\partial}{\partial r} (r G_r) + \frac{1}{r} \frac{\partial G_\theta}{\partial \theta} = 0 \quad (2)$$

The subscripts z, r and θ are representing to the axial, radial and tangential components respectively. The \bar{u} , \bar{v} and \bar{w} are the components for the time mean velocity in z, r and θ directions respectively, and u' , v' and w' be the corresponding velocities of fluctuation. The continuity equation can be written as conservation of mass equation with the following form : (Joseph 1997), (Ronald 1984)

$$\frac{\partial}{\partial z} (\bar{u}) + \frac{1}{r} \frac{\partial}{\partial r} (r \bar{v}) + \frac{1}{r} \frac{\partial}{\partial \theta} (\bar{w}) = 0 \quad (3)$$

Momentum Equation:-

The general momentum equations in terms of shear stress τ governing the fluid motion for three dimensions for cylindrical coordinate are [9]:

In Z-direction

$$\rho \left(\frac{\partial U}{\partial t} + U \frac{\partial U}{\partial z} + V \frac{\partial U}{\partial r} + \frac{W}{r} \frac{\partial U}{\partial \theta} \right) = - \frac{\partial p}{\partial z} + \left[\frac{1}{r} \frac{\partial}{\partial r} (r \tau_{rz}) + \frac{1}{r} \frac{\partial}{\partial \theta} \tau_{\theta z} + \frac{\partial}{\partial z} \tau_{zz} \right] + \rho F_z \quad (4)$$

In R-direction

$$\rho \left(\frac{\partial V}{\partial t} + U \frac{\partial V}{\partial z} + V \frac{\partial V}{\partial r} + \frac{W}{r} \frac{\partial V}{\partial \theta} - \frac{W^2}{r} \right) = - \frac{\partial p}{\partial r} + \left[\frac{1}{r} \frac{\partial}{\partial r} (r \tau_{rr}) + \frac{1}{r} \frac{\partial}{\partial \theta} \tau_{\theta r} + \frac{\partial}{\partial z} \tau_{zr} - \frac{\tau_{\theta \theta}}{r} \right] + \rho F_r \quad (5)$$

In- θ -direction

$$\rho \left(\frac{\partial W}{\partial t} + V \frac{\partial W}{\partial r} + \frac{W}{r} \frac{\partial W}{\partial \theta} + \frac{WV}{r} + U \frac{\partial W}{\partial z} \right) = - \frac{1}{r} \frac{\partial p}{\partial \theta} + \left[\frac{1}{r^2} \frac{\partial}{\partial r} (r^2 \tau_{r\theta}) + \frac{1}{r} \frac{\partial}{\partial \theta} \tau_{\theta \theta} + \frac{\partial}{\partial z} \tau_{z\theta} + \frac{\tau_{\theta r} - \tau_{r\theta}}{r} \right] + \rho F_\theta \quad (6)$$

The previous equations of mass conservation and momentum can be combined to form of one general form (Versteeg 1995)

$$\frac{\partial \psi_z}{\partial z} + \frac{1}{r} \frac{\partial (r \psi_r)}{\partial r} + \frac{1}{r} \frac{\partial (r \psi_\theta)}{\partial \theta} = S_\phi \quad (7)$$

For the continuity and momentum the ψ_z , ψ_r , and ψ_θ are the total diffusion fluxes defined by:

$$\psi_z = \rho U \phi - \Gamma_\phi \frac{\partial \phi}{\partial z} \quad (8)$$

$$\psi_r = \rho V \phi - \Gamma_\phi \frac{\partial \phi}{\partial r} \quad (9)$$

$$\psi_\theta = \rho W \phi - \Gamma_\phi \frac{\partial \phi}{r \partial \theta} \quad (10)$$

Where Φ stands for any of the dependent variables and the corresponding values of Γ_ϕ and S_ϕ is indicated in table

(1). For axisymmetric swirling flow $\left(\frac{\partial \phi}{\partial \theta} = 0\right)$, equation (7) becomes:

$$\frac{\partial \psi_z}{\partial z} + \frac{1}{r} \frac{\partial (r \psi_r)}{\partial r} = S$$

$$\rho \frac{\partial}{\partial z} \left(U \phi - \Gamma_\phi \frac{\partial \phi}{\partial z} \right) + \frac{1}{r} \frac{\partial}{\partial r} \left(r V \phi - r \Gamma_\phi \frac{\partial \phi}{\partial r} \right) = S_\phi \quad (11)$$

Table (1):- variables of equations

Equation	Φ	Γ_ϕ	S_ϕ

Conservation of momentum in z – direction eq. (4)	U	μ_{eff}	$-\frac{\partial \bar{p}}{\partial z} + \frac{\partial}{\partial z} \left(\mu_{eff} \frac{\partial \bar{u}}{\partial z} \right) + \frac{1}{r} \frac{\partial}{\partial r} \left[r \mu_{eff} \left(\frac{\partial \bar{v}}{\partial z} \right) \right] + \frac{1}{r} \frac{\partial}{\partial \theta} \left[\mu_{eff} \left(\frac{\partial \bar{w}}{\partial z} \right) \right]$
Conservation of momentum in r – direction eq.(5)	V	μ_{eff}	$-\frac{\partial \bar{p}}{\partial r} + \frac{\partial}{\partial z} \left[\mu_{eff} \frac{\partial \bar{u}}{\partial r} \right] + \frac{1}{r} \frac{\partial}{\partial r} \left[r \mu_{eff} \frac{\partial \bar{v}}{\partial r} \right] + \frac{1}{r} \frac{\partial}{\partial \theta} \left[\mu_{eff} \left(r \frac{\partial \left(\frac{\bar{w}}{r} \right)}{\partial r} \right) \right] + \rho \frac{\bar{w}^2}{r} - \frac{2\mu_{eff}}{r} \left(\frac{1}{r} \frac{\partial \bar{w}}{\partial \theta} + \frac{\bar{v}}{r} \right)$
Conservation of momentum in θ -direction eq.(6)	W	μ_{eff}	$-\frac{1}{r} \frac{\partial \bar{p}}{\partial \theta} + \frac{\partial}{\partial z} \left[\mu_{eff} \left(\frac{1}{r} \frac{\partial \bar{u}}{\partial \theta} \right) \right] + \frac{1}{r} \frac{\partial}{\partial r} \left[\mu_{eff} \left(\frac{\partial \bar{v}}{\partial \theta} - \bar{w} \right) \right] + \left[\frac{\mu_{eff}}{r} \left(r \frac{\partial \left(\frac{\bar{w}}{r} \right)}{\partial r} + \frac{1}{r} \frac{\partial \bar{v}}{\partial \theta} \right) \right] - \frac{\rho \bar{w} \bar{v}}{r} + \frac{1}{r} \frac{\partial}{\partial \theta} \left[\mu_{eff} \left(\frac{1}{r} \frac{\partial \bar{w}}{\partial \theta} + \frac{2\bar{v}}{r} \right) \right]$

THE K- ϵ TURBULENCE MODEL:-

Jones and Launder had proposed the following equations for both the turbulence kinetic energy (k) and for energy dissipation (ϵ) [10]

For turbulence kinetic energy (k)

$$\rho \bar{u} \frac{\partial k}{\partial z} + \rho \bar{v} \frac{\partial k}{\partial r} + \rho \bar{w} \frac{\partial k}{\partial \theta} = \frac{\partial}{\partial z} \left(\frac{\mu_t}{\sigma_{k,t}} \frac{\partial k}{\partial z} \right) + \frac{1}{r} \frac{\partial}{\partial r} \left(\frac{\mu_t}{\sigma_{k,t}} r \frac{\partial k}{\partial r} \right) + \frac{1}{r} \frac{\partial}{\partial \theta} \left(\frac{\mu_t}{\sigma_{k,t}} \frac{\partial k}{\partial \theta} \right) - \rho \epsilon + \mu_t G \quad (12)$$

For energy dissipation rate (ϵ)

$$\rho \bar{u} \frac{\partial \epsilon}{\partial z} + \rho \bar{v} \frac{\partial \epsilon}{\partial r} + \rho \bar{w} \frac{\partial \epsilon}{\partial \theta} = \frac{\partial}{\partial z} \left(\frac{\mu_t}{\sigma_{\epsilon,t}} \frac{\partial \epsilon}{\partial z} \right) + \frac{1}{r} \frac{\partial}{\partial r} \left(\frac{\mu_t}{\sigma_{\epsilon,t}} r \frac{\partial \epsilon}{\partial r} \right) + \frac{1}{r} \frac{\partial}{\partial \theta} \left(\frac{\mu_t}{\sigma_{\epsilon,t}} \frac{\partial \epsilon}{\partial \theta} \right) + C_1 \frac{\epsilon}{k} \mu_t G - C_2 \frac{\epsilon^2}{k} \quad (13)$$

Where G refers to the generation term and is given by [37]:

$$G = 2 \left[\left(\frac{\partial \bar{u}}{\partial z} \right)^2 + \left(\frac{\partial \bar{v}}{\partial r} \right)^2 + \left(\frac{\bar{v}}{r} \right)^2 \right] + \left[\left(\frac{\partial \bar{u}}{\partial r} \right) + \left(\frac{\partial \bar{v}}{\partial z} \right) \right]^2 + \left(\frac{\partial \bar{w}}{\partial z} \right)^2 + \left(\frac{\partial \bar{w}}{\partial r} - \frac{\bar{w}}{r} \right)^2 \quad (14)$$

The turbulent kinetic energy (k) and the dissipation rate of the turbulent energy (ϵ) are chosen as the two properties in order to determine the turbulent viscosity μ_t

$$\mu_t = \frac{C_\mu \rho k^{\frac{1}{2}}}{l^{-1}} \quad (15)$$

Where: C_μ is a constant. It is assumed that at a high Reynolds number, (ε) value to be Proportional to $k^{\frac{3}{2}}/l$, the above equation becomes:-

$$\mu_t = \frac{C_\mu \rho k^2}{\varepsilon} \quad (16)$$

The quantities $\sigma_{k,t}$, C_1 , C_2 , $\sigma_{\varepsilon,t}$ and C_μ that appear in the k- ε model and μ_t equations, are the universal k- ε model constants, whose values are reproduced in table (2).

Table (2):-shows the variable of k- ε model.

Equation	Φ	Γ_Φ	S_Φ	C_1	1.44
Turbulent K.E.eq. (12)	K	$\mu_t/\sigma_{k,t}$	$-\rho\varepsilon + \mu_t G$	C_2	1.92
Dissipation rate eq.(13)	ε	$\mu_t/\sigma_{\varepsilon,t}$	$\mu_t G C_1 \frac{\varepsilon}{k} - C_2 \frac{\varepsilon^2}{k}$	C_μ	0.09
				$\sigma_{k,t}$	1
				$\sigma_{\varepsilon,t}$	1.3

The CFD modeling of mixing problem, consist of three steps which are pre-processing, equation solving and post-processing. In first part the problem geometry should be built and meshed. In the second step the partial differential equations describing the flow (Continuity and Navier-Stokes) are discretized on the mesh and solved simultaneously. The boundary and initial conditions should be introduced to the CFD. The turbulence model selected which is describing the effect of turbulence on the bulk flow properties of the fluid. Finally, the obtained results should be analyzed.

The Numerical Solution Setup:-

In the present study, mixing in 21.2 liter of water agitated by Retreat impellers. The mixing tank model mesh type is tetrahedron and it divided in to 58244 nodes as shown in figure 3. The MFR method was applied for modeling the impeller rotation. Also the continuity and Navier-Stokes equations together with the RNG version of the K- ε were used to describe the equation of motion.

Figure 3:- Mixing Tank Modeling and Mesh Geometry.

Results and Discussions:-

The impeller rotation speed has a great effect on fluid motion in mixing processes. Consequently, the efficiency of settling process for the solid material is affected by the changing of impeller rotation speed. Also, the concentration of chemical additives would become more homogeneous when the optimum impeller rotation speed has been correctly selected.

Figure 4 illustrates the velocity vectors and contours for Z-0 planes for Retreat impeller rotates at 90 rpm. For plane at $\theta = 0^\circ$, the impeller blades pumped the fluid radially toward tank wall that cause fluid to split into two jets. The small jet is circulated downward to the bottom of tank and then returns to the impeller zone so produces an eddy in

the zone below the impeller. The center of eddy is located at radius of 0.113 m from the tank center and 0.061m from the bottom of tank. A Poor or weak mixing region is exists at the center of tank below the impeller.

The second jet of the fluid will be circulated in upward direction, so generates an eddy which is located at same radial direction with lower one but with height of 0.138m from the bottom of the tank. The flow pattern will be same at 30° and 60° plan except the reduction in the fluid flow velocity at the upper zone especially at 30° plan and velocity of fluid near the wall of tank increases in the upward direction. The fluid flow behavior in 90° plan is similar to that observed at 0° plan.

Figure 4:- Velocity Vectors and Contour for retreat Impeller Rotate at 90 Rpm.

Figuer.5 showed the velocity vectors and contours In Z-R direction at height 0.01 m velocity vectors and contour shows the poor mixing zone in the center of tank. The velocity increases toward the wall of tank, and then the velocity decreases near the tank wall, this fluctuation of velocity lead to form zones with high mixing. At height of 0.1m (impeller zone) the velocity linearly increases along the blade of impeller until it reaches to its maximum value at the tip of the blade. Then the velocity is sharply decreases as a result of the pumping direction. At the free surface of fluid the velocity decreases because most of the fluid circulates in the lower zone due to the influences of impeller pumping capacity. The high mixing zone reduces especially at the center of tank but swirling motion continues near the baffles wall.

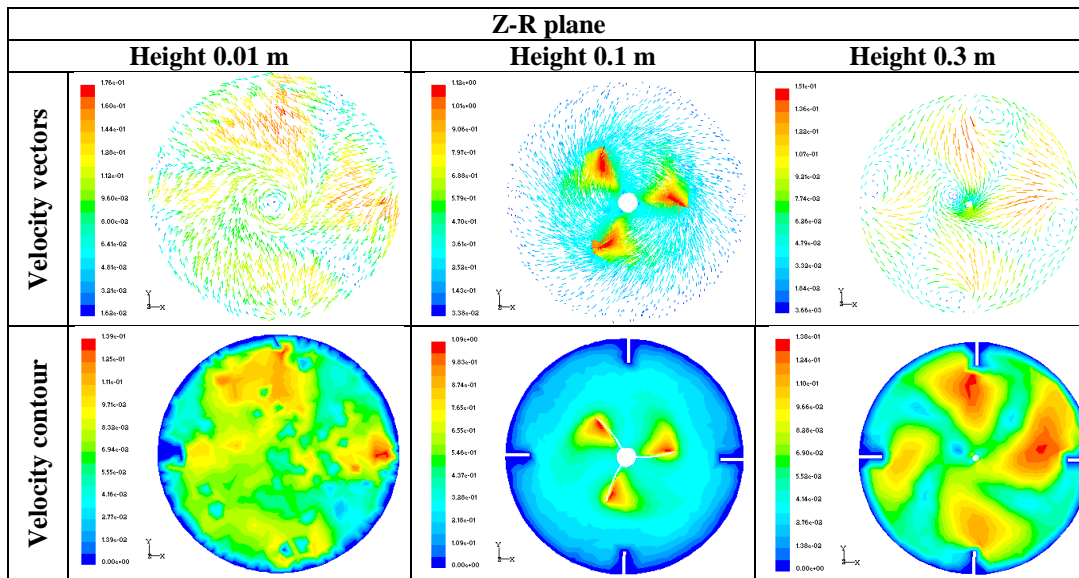

Figure 5:- Velocity Vectors and Contour for Retreat Impeller Rotate at 90 Rpm

Figure 6 showed the velocity vectors and contours in the Z- θ plan and Z-R plan at impeller rotational speed 135 rpm. It can observe that there are no significant changes on the fluid behavior or on the flow pattern. But the velocity magnitude increases as the impeller rotation speed increases.

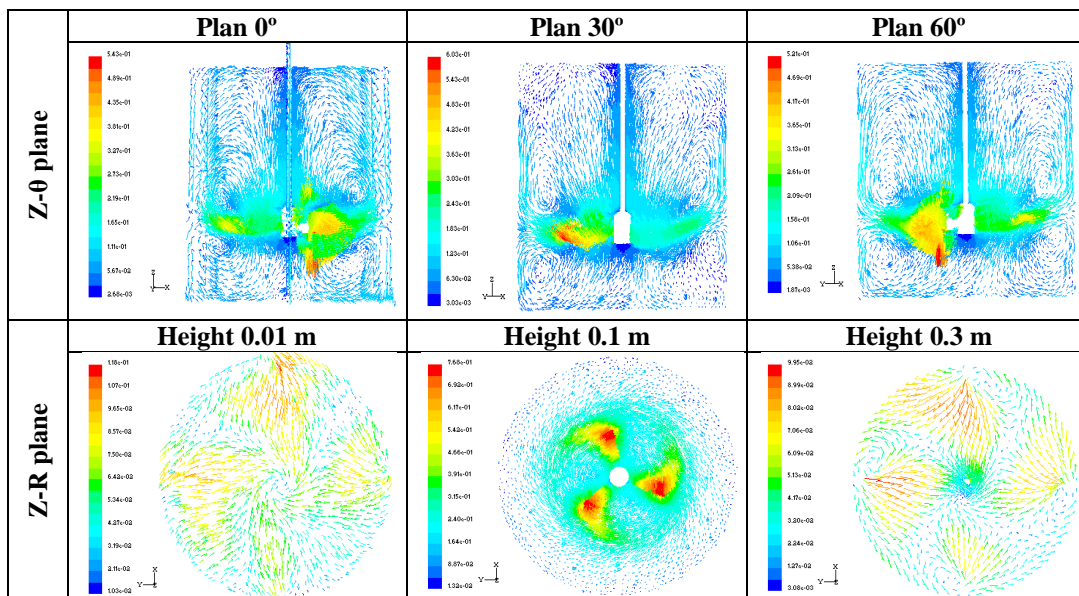

Figure 6:-Velocity Vectors for Retreat Impeller Rotate at 135 rpm

Figures (7-9) illustrates the velocity magnitude distribution with respect to tank radius in Z-R plan with various impeller rotational speeds. It can observe that the velocity fluctuations are not sufficient at low rotational speed and it becomes more sufficient at 90 rpm and the velocity fluctuated increased as rotational speed of impeller increased. This occurs at three difference levels (0.1, 0.1, and 0.3) m in mixing tank. The same thing occurs with velocity distribution at R- θ plan (0°, 30° and 60°) as shown in figures (10-12)

Figure 7:- Velocity Distribution for Retreat Impeller Z-R plan and Height 0.01 m

Figure 8:- Velocity Distribution for Retreat Impeller Z-R plan and Height 0.1 m

Figure 9:- Velocity Distribution for Retreat Impeller Z-R plan and Height 0.3 m

Figure 10: Velocity Distribution for Retreat Impeller at Z-θ plan 0°

Figure 11:- Velocity Distribution for Retreat Impeller at Z-θ plan 30°

Figure 12:- Velocity Distribution for Retreat Impeller at Z-θ plan 60°

Conclusion:-

The FLUENT v.15.4 is used to analysis the Retreat impeller used for mixing purpose in cylindrical mixing tank. The following conclusions and the results of the study:

1. The numerical analysis gives good results of velocity distribution and mixing rate with the tank. Such results can be used for describing the flow behaviour.
2. Velocity vectors show that the poor mixing zones are generated in the mixing tank.
3. The velocity fluctuation of the fluid increases as rotational speed increased.

Abstract

Traffic signaling systems can be optimized by reducing the cycle time byway of minimizing the traffic phases. In this study the concept of graph colouring and the book thickness were used to develop an algorithm in order to minimize the number of traffic phases at Borella junction in the Colombo city and optimize the traffic signaling system. The proposed algorithm facilitates a mechanism to reduce the Cycle Time of that junction by reducing the number of traffic phases in a traffic signaling system. As a result, the number of traffic phases of Borella junction was reduced from five to four.

Introduction:-

Road traffic is a critical problem in Sri Lanka especially in the Colombo city and suburbs. According to the ComTrans report [5], a huge speed drop due to the heavy traffic is clearly visible during the peak hours. During the peak hours, lengthy vehicle queues are there in many junctions even though they are controlled through the traffic light signaling system. Most of the junctions with traffic light systems are operated manually by the traffic police during the peak hours due to heavy traffic.

Moreover, a direct connection between the Cycle Time of a traffic signaling system and the traffic queue formation can be witnessed, since the other traffic movements should be stopped when one traffic movement is allowed. Then the queues will form in the traffic movements which were stopped within the time period of inter green. Similarly when the unnecessary excess amount of green time was allocated for certain traffic movements, all the other vehicles in other traffic movements should be stopped and it will be result in the queue formation in those traffic movements. In that situation if the green time given for a certain traffic movement is not adequate to flow the length of the newly formed queue, the traffic congestion in that area will increase further.

Since the Cycle Time contains with the green time of each phase with inter green time, the reduction of the Cycle Time needs to be considered when forming a system to reduce the traffic. The Cycle Time of a certain traffic signaling system depends on the number of traffic phases in the relevant junction. Therefore obtaining the minimum number of traffic phases will lead to optimize the traffic signaling system.

Graph theoretical concepts such as planarity, book thickness together with graph colouring can be used to avoid intersecting edges. Also there can be seen a method of managing the signaling process using graph theory with the concept of grouping the traffic movement (Baruah and Baruah 2012). Moreover the concept of circular arcs in Graph theory has been used when installing the traffic light system (Darshankumar and Jhala 2014), (Hosseini and Orooji 2009).

The graph colouring is a method which has used to avoid edge intersection. Therefore the formulation of the traffic phases is possible when the concepts in graph colouring are used. The concept of graph colouring has used to find the different types of accident zones in traffic flows (Myna 2015). However they have used the edge colouring to obtain the accident zones. Similarly the vertex colouring concept was used in many applications including air traffic flow management (Barnier and Brisse 2002), scheduling radio transmission networks (Ramanathan and Lloyd 1993), time table scheduling and Biprocess tasks (Marx 2004).

Borella is a junction where currently traffic signaling system is operated but considered as a junction where huge traffic congestion occurs during the peak hours. Thus graph theoretical concepts such as planarity, book thickness and graph colouring were used in this study to come up with more suitable model and optimize the performance of the model.

Methodology:-

There is a need for the identification of a graph for the selected junction. Planar graphs from the identified graph should be obtained while minimize the number of planar graphs. The junction with traffic signaling system should be converted to a graph by properly identifying the relevant edges and vertices. Since the objective of this study is to optimize traffic signaling through the reduction of number of traffic phases, a proper attention must be paid to the traffic movements. The graph will reflect a representation of the traffic movements. A junction can be converted to a graph by taking the entering or exit point as vertices and the road segments connected by them as edges. Moreover the corresponding traffic movements can be represented through directed edges, since those road segments will represent the traffic movements from entering point to the junction and from junction to exit point.

After converting the traffic movements of the selected junction to a graph, the existence of planar graphs must be examined. Since each planar graph includes the traffic movements which doesn't intersect with each other, it can be regarded as traffic phases to the relevant junction. The process of obtaining the traffic phases can be considered through obtaining planar graphs using graph colouring.

For this purpose (to apply graph colouring), an edge of the graph should be formed between two vertices if those traffic movements are intersecting. Then according to the concept of graph colouring, the different colours will be assigned to the vertices which connected through edges. Then two vertices which have same colour will represent two traffic movements which doesn't intersect while the two vertices with different colour will provide the traffic movements which intersect with each other. As a result, the chromatic number of the graph is obtained. Hence minimization of planar graphs can be obtained through this process which will provide the set of traffic movements (edges in the former graph) which doesn't intersect with each other. And the chromatic number will provide the minimum number of colours that can be used when generating the planar graphs which is referred as the book thickness.

The program which constructed to implement the above algorithm will be facilitated to input the traffic movements which are intersecting with each other as a set of edges to obtain the set of traffic phases as the output.

Algorithm:-

- Step 1: Construct a graph (G) for the selected junction in terms of the edges (E) and vertices (V).
- Step 2: Select any vertex $v_i \in V$ and create two empty sets (S_1 & S_2).
- Step 3: Assign a colour to v_i and add it to the set S_1 .
- Step 4: For $v_j \in V$ when $v_i \neq v_j$ and if v_i, v_j is not connected then assign the same colour to v_j and add to S_2 , otherwise assign a different colour and save in a different set S .
- Step 5: Take another v_k from S and repeat the step 4.
- Step 6: Repeat the process till all the vertices has assigned colours such that no two vertices which are connected has same colours.
- Step 7: Return the chromatic number.
- Step 8: Build a book (book embedding) using all planar graphs which were obtained from the chromatic number.

The traffic phases are designed by converting the planar graphs to the traffic movements in a manner that each vertex represents an edge in the graph. There are the vertices that will be used to represent the entering and exit points while the edges represent traffic movements. Hence each planar graph in above process can be identified as a representation of a traffic phase.

A suitable method of calculating the Cycle Time was used to model the signaling system after the traffic phases were designed. Here the following equation was used to obtain the green time for each traffic phase after obtaining the traffic phases. It was developed by considering the time which a car (not a vehicle since the calculations were done using passenger car equivalence) with average speed will be needed to pass the entering and exit points in a certain traffic movement along with the number of vehicles in a certain traffic length. The traffic length represents the optimum number of vehicles which needed to be flowed to reduce the possibility of occurring the traffic congestion in the nearest junction which connected to the entering point.

$$T_i = t + (N-1) \cdot v \cdot 1000 / (3600 \cdot c),$$

where T_i – Green time for the relevant traffic movement,

t – Time needed for first vehicle to pass the junction,

N – Number of vehicles in the traffic length in passenger car equivalence,

v – Average vehicle speed and

c – Average length of a car.

Then the maximum T_i for a relevant traffic phase can be considered as the corresponding green time for that phase and using all the green times for the traffic phases in the junction and the inter green time, the cycle time can be calculated. Thereafter the results from the new algorithm and manual results can be compared to validate the new method.

Results:-

Formation of the graph was done by considering the traffic movements in the junction where entering/exit point of each road connected to the junction was labelled as A, B, C, D and E (See the Fig. 1)

Fig. 1:- The map of Borella Junction.

The complete graph model $G=(V, E)$ is given by Fig. 2 where V represents the set of all intersecting traffic movements and E represents set of all edges to represent the relation of intersection between two traffic movements. For example the traffic movements BD and AC intersect with each other. Then both traffic movements were included in V and $[BD, AC]$ was taken as an edge.

Fig. 2:- Graph of the traffic movements which intersect with each other in Borella junction.

Above algorithm was used to construct a procedure in Maple 12. Then the minimum colours that needed in the vertex colouring was provided by the program along with the relevant planar graphs as output. Since here the number of planar graphs which was used as the traffic phases was minimized, the minimum number of colours will be the book thickness.

The program for the above mentioned algorithm had provided the output of the above graph (in Fig. 2) as follows; $\{AC, AD, AE\}$, $\{BA, BD, BE\}$, $\{CA, CB, CE\}$ and $\{DA, DB, DC\}$ in different sets. The traffic movements that not included here do not intersect with any other movement and hence the flow of those movement can be allowed in any time.

The above four sets represent four planar graphs which can be obtained through a simple transformation. Then the above sets of vertices were transformed to a more comprehensive form where the book embedding was easily obtained. There each vertex which represent a traffic movement was transformed to an edge by taking the entering and exit points as vertices. For example if the vertex AC in set one was considered, it will transformed to the edge $[A, C']$ in the planar graph G_1 . Here C' represents an exit point while A represent entering point. Similarly from converting each vertex in the set one, the planar graph G_1 was formed. Then $G_1 = (V_1, E_1)$ where $V_1 = \{A, C', D', E'\}$ and $E_1 = \{[A, C'], [A, D'], [A, E']\}$. In a similar process all the planar graphs were obtained. Afterward the book embedding was obtained considering whether the number of pages were minimized. There it was compared that the chromatic number obtained through the above procedure was equivalent to the book thickness. The book embedding which was obtained using above planar graphs are given in Fig. 3.

Fig. 3:- The book embedding obtained using above planar graphs.

Since the traffic movements which doesn't intersect with each other will not affect the planarity in each graph which obtained earlier, the edges was added to each page without violating the planarity. Each page of the book embedding

was clearly given as the pages in Fig. 4 along with the edges for the traffic movements which doesn't intersect each other (Those traffic movements were given in light green colour). Here the number of pages were optimized and the book thickness is four.

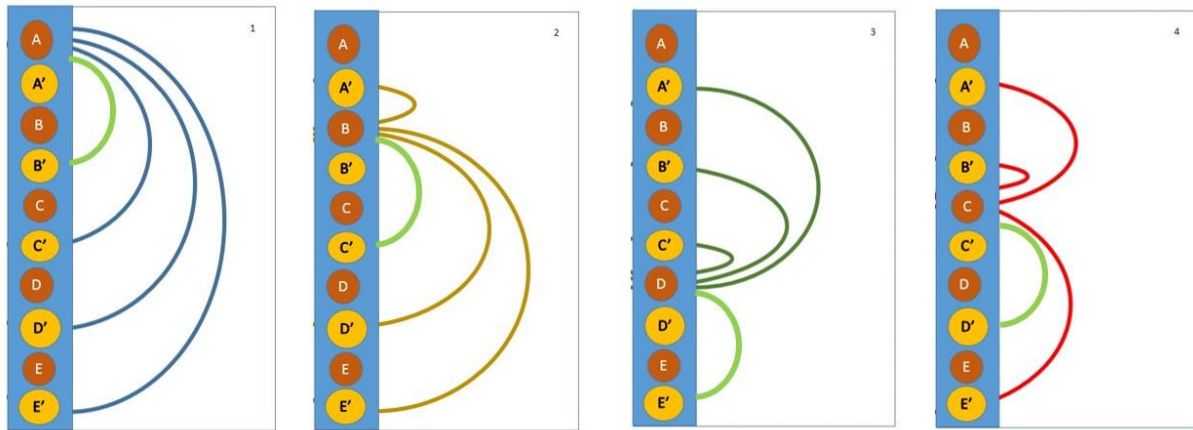

Fig 4:- Pages obtained through book embedding.

Moreover each edge of the above book embedding represent a traffic movement and therefore the pages were taken as the traffic phases. For example, phase 1 was taken as $[[A, C], [A, D], [A, E]]$.

The Cycle Time for the junction was calculated using above mentioned process. Here the Cycle Time was obtained for the current process and for the traffic phases obtained by the book embedding. Then the green time for each phase has been around 9.1 seconds and inter green time was taken as 4.8 seconds.

There is five traffic phases in the current traffic signaling system in this junction, which has the Cycle Time of 69.5 seconds. For the traffic phases obtained from book embedding, the Cycle Time was 55.6 seconds. The number of traffic phases were reduced to four through this approach and as a result of that approximately 14 seconds was reduced from the Cycle Time.

Discussion:-

The output of the program of above mentioned algorithm only reflects the traffic movement which at least intersecting once. Then the traffic movements which doesn't intersect with any other traffic movement can be allowed without any restriction and it will not be reflected in the Cycle Time. Because those traffic movements always will have free flow since it will not be encountered any restriction.

However there should be a proper knowledge of the road capacity of the road segment which the flow projects in, because allowing the flow of that road segment might cause the traffic congestion when other flows are projected in to the same road segment concurrently.

Conclusion:-

When the concept of graph colouring was used to design the traffic phases, the number of traffic phases were reduced ultimately reducing the Cycle Time.

Furthermore the Cycle Time calculation which was developed was considered the vehicle density in a certain traffic length when calculating the green time and therefore it was considered as a proper indication of the traffic flow. Here both current and the proposed processes were compared and the proposed process is better than the current process when considering the number of phases and Cycle Time.

Abstract

Respiratory syncytial virus (RSV) is the major cause of bronchiolitis and viral pneumonia in children younger than 1 yr of age.

Infection with respiratory syncytial virus (RSV) is one of the major causes of childhood respiratory morbidity and hospitalization. Palivizumab, a humanized monoclonal antibody, has been recommended for high risk infants to prevent severe RSV-associated respiratory illness.

Key ward: palvizumab + bronchiolitis + RSV

A randomized clinical trial was done in Karballa Teaching Hospital For Pediatrics from October 2015-march 2017 to studies the protective effect of palivizumab prophylaxis for reducing RSV-associated hospitalizations in infants with congenital heart disease and premature infants.

We studied 84 patients divided to 2 groups (group A & B): 30 patients with congenital heart disease their age less than 1 year considered group A and 54 premature neonates who are delivered at the season of RSV (October – March) considered group B.

Group A (30 patients): subdivided to 2 subgroups: A1 & A2, both had hemodynamically significant CHD (large VSD & PDA, complete AV canal with heart failure and on medical treatment, TOF and D-TGA). 18 patients who received 5 doses of palvizumab monthly (from October- March) considered as group A1 and 12 patients who received 3 doses monthly considered as group A2, with monthly follow up for signs of any respiratory illness.

Group B (54 patients): subdivided to 2 subgroups: B1 & B2 both were premature neonates their gestational age less than 35 weeks of gestation and their body weight less than 1500 gm. 25 patients they were received 5 doses of palvizumab monthly for 5 months from October-March considered as group B1 and 25 patients they were received 3 doses of palvizumab monthly considered as group B2. 2 patients received 2 doses only and developed irritability & cough therefore we stopped palvizumab injection, 2 patients received one dose and escape from follow up (therefore those 4 patients were excluded from the study). premature neonates with severe sepsis, severe jaundice, severe congenital malformation, history of birth asphyxia and complex congenital heart disease also were excluded from the study.

Address:- Cabp/Ficmsp, Karballa Teaching Hospital for Pediatric, Karballa .Iraq.

All 4 groups were received palvizumab 15mg/kg intramuscular monthly with regular follow up each months for any sign of respiratory distress.

For each group we select control group C1(30 patients with CHD)&group C2(50 premature infants) :they didn't received palvizumab ,both groups were taken from cardiology clinic,outpatients clinic &premature department &compared with each group.

The results for group A1, 3 patients developed mild bronchiolitis without hospitalization,for group A2 only one patient(8.33%) need hospitalization .

The results for group B1, 7 of them they developed mild bronchiolitis and they didn't need hospitalization,for groupB2, 8 of them they developed mild bronchiolitis and one of them(4%) need hospitalization for 2 weeks.no death was reported.

Regarding control group: 30 patients with CHD(group C1) who didn't received palvizumab,21(70%) patients they were need hospitalization &1 death was reported . and from 50 patients premature infants(group C2) ,39 patients(78%) developed bronchiolitis and they need admission &4 death was reported.

In this study we found breast feeding had significant factor that contribute to the reduction of severity of bronchiolitis and rate of hospitalization.

From this study we recommend :the usage of palvizumab as prophylaxis against RSV for premature infants & hemodynamically significant CHD because its effectiveness in reduction of morbidity &mortality. And encourage breast feeding for its effectiveness against severe disease in infants below 1 year.

..... **Introduction:-**

Respiratory syncytial virus (RSV) is the major cause of bronchiolitis and viral pneumonia in children younger than 1 yr of age.

RSV is an enveloped RNA virus with a single-stranded negative-sense genome that replicates entirely in the cytoplasm of infected cells and matures by budding from the apical surface of the cell membrane.Because this virus has a nonsegmented genome, it cannot undergo antigenic shift by reassortment like the influenza viruses do.(1)

Infection with RSV does not grant permanent or long term immunity. Reinfections are common and may be experienced throughout life. Other viruses identified as causing bronchiolitis are human metapneumovirus, influenza, adenovirus, and parainfluenza.(2).

The virus can live for a half an hour or more on hands. The virus can also live for up to 5 hours on countertops and for several hours on used tissues.(3).

Epidemiology:-

RSV is distributed worldwide and appears in yearly epidemics. In temperate climates, these epidemics occur each winter over 4-5 mo.During the remainder of the year, infections are sporadic and much less common. In the Northern hemisphere, epidemics usually peak in January, February, or March. RSV outbreaks often overlap with outbreaks of influenza and human metapneumovirus but are generally more consistent from year to year and result in more disease overall, especially among infants younger than 6 mo of age.

RSV is one of the most contagious viruses that affect humans. Infection is nearly universal among children by their 2nd birthday. Reinfection occurs at a rate of at least 10-20% per epidemic throughout childhood, with a lower frequency among adults. In situations of high exposure, such as daycare centers, attack rates are nearly 100% among previously uninfected infants and 60-80% for second and subsequent infections.

Asymptomatic RSV infection is unusual in young children. Most infants experience coryza and pharyngitis, often with fever and frequently with otitis media caused by a virus in the middle ear or bacterial super infection.

Transplacentally acquired anti-RSV maternal immunoglobulin G serum antibodies, if present in high concentration, appear to provide partial but incomplete protection. These immunoglobulin Gs may account for the lower severity of RSV infections during the 1st 4-6 wk of life, except among infants born prematurely, who receive less maternal immunoglobulin. Breastfeeding provides substantial protection against severe disease, an effect that may pertain only to female infants and not male infants.(1)

Clinical manifestation:-

Typically, the first sign of infection in infants with RSV is rhinorrhea.

Cough may appear simultaneously but more often does so after an interval of 1-3 days, at which time there may also be sneezing and a low-grade fever. Soon after the cough develops, the child who experiences bronchiolitis begins to wheeze audibly. If the disease is mild, the symptoms may not progress beyond this stage. Auscultation often reveals diffuse fine inspiratory crackles and expiratory wheezes. Rhinorrhea usually persists throughout the illness, with intermittent fever. Chest radiograph findings at this stage are frequently normal.

Signs of severe, life-threatening illness are central cyanosis, tachypnea of >70 breaths/min, listlessness, and apneic spells. At this stage, the chest may be significantly hyperexpanded and almost silent to auscultation because of poor air movement.

Chest radiographs of infants hospitalized with RSV bronchiolitis have normal findings in approximately 30% of cases, with the other 70% showing hyperexpansion of the chest, peribronchial thickening, and interstitial infiltrates. Segmental or lobar consolidation is unusual and pleural effusion is rare.

Fever is an inconstant sign in RSV infection. In young infants, particularly those who were born prematurely, periodic breathing and apneic spells have been distressingly frequent signs, even with relatively mild bronchiolitis. RSV infections in profoundly immunocompromised hosts may be severe at any age of life.(1)

Bronchiolitis and pneumonia resulting from RSV are more common in boys than in girls by a ratio of approximately 1.5 : 1. Other risk factors with similar impact include 1 or more siblings in the home, white race, rural residence, maternal smoking, and maternal education <12 yr. The medical factors in infants associated with highest risk are chronic lung disease of prematurity, congenital heart disease, immunodeficiency, and prematurity.(1).

The incubation period from exposure to first symptoms is approximately 3-5 days. The virus is excreted for variable periods, probably depending on severity of illness and immunologic status. Most infants with lower respiratory tract illness shed infectious virus for 1-2 wk after hospital admission. Excretion for 3 wk, and even longer, has been documented. Spread of infection occurs when large, infected droplets, either airborne or conveyed on hands or other fomites, are inoculated in the nasopharynx of a susceptible subject.(1).

Nosocomial infection during RSV epidemics is an important concern. Virus is usually spread from child to child on the hands of caregivers or other fomites. Adults undergoing reinfection also have been implicated in spread of the virus. Contact precautions are sufficient to prevent spread when compliance is meticulous, as the virus is not usually spread by small particle aerosol.(1).

Pathogenesis:-

Bronchiolitis is caused by obstruction and collapse of the small airways during expiration. Airway narrowing likely is caused by virus-induced necrosis of the bronchiolar epithelium, hypersecretion of mucus, and round-cell infiltration and edema of the surrounding submucosa. These changes result in formation of mucus plugs obstructing bronchioles, with consequent hyperinflation or collapse of the distal lung tissue.(1).

Bronchiolitis is a disorder most commonly caused in infants by viral lower respiratory tract infection. It is the most common lower respiratory infection in this age group. It is characterized by acute inflammation, edema, and necrosis of epithelial cells lining small airways, increased mucus production, and bronchospasm.(2)

A large number of soluble factors, such as cytokines, chemokines, and leukotrienes, are released and may predispose some individuals to more severe disease. There is also evidence that genetic factors may predispose to more severe bronchiolitis.(1)

Diagnosis:-

Bronchiolitis is a clinical diagnosis. RSV can be suspected with varying degrees of certainty on the basis of the season of the year and the presence of the virus in the community.(1)

RSV plays a causative role in an estimated 40-75% of cases of hospitalized bronchiolitis.(1)

History & physical examination: Clinicians should diagnose bronchiolitis and assess disease severity on the basis of history and physical examination. Clinicians should not routinely order laboratory and radiologic studies for diagnosis.(2)

Clinical signs and symptoms of bronchiolitis consist of rhinorrhea, cough, wheezing, tachypnea, and increased respiratory effort manifested as grunting, nasal flaring, and Clinical signs and symptoms of bronchiolitis consist of rhinorrhea, cough, wheezing, tachypnea, and increased respiratory effort manifested as grunting, nasal flaring, and intercostal and/or subcostal retractions preceded by viral upper respiratory tract prodrome.(2) Older children most often have only mild, cold-like symptoms, such as croupy cough (often described as a "seal bark" cough), stuffy nose, or low-grade fever. (3). Rarely, RSV infection can cause death in infants. However, this is unlikely if the child is seen by a health care provider in the early stages of the disease. Children who have had RSV bronchiolitis may be more likely to develop asthma(3)

The course of bronchiolitis is variable and dynamic, ranging from transient events such as apnea or mucus plugging to progressive respiratory distress from lower airway obstruction. Young infants with bronchiolitis may develop apnea, which has been associated with an increased risk for prolonged hospitalization, admission to intensive care, and mechanical ventilation.(2) Apnea can be the first sign of bronchiolitis in an infant. This occurs more commonly in infants born prematurely and infants who are younger than 2 months. Difficulty feeding related to nasal congestion and rapid breathing, which can result in dehydration.(4)

risk factors for severe disease include prematurity, hemodynamically significant congenital heart disease, chronic lung disease (bronchopulmonary dysplasia, cystic fibrosis, congenital anomaly), and the presence of an immunocompromised state.(1)(2)(3)(4).

Radiography: may be useful when the hospitalized child does not improve at the expected rate, if the severity of disease requires further evaluation, or if another diagnosis is suspected. (2)

Routine laboratory tests are of minimal diagnostic use in most cases of bronchiolitis or pneumonia caused by RSV.

The white blood cell count is normal or elevated, and the differential cell count may be normal with either a neutrophilic or mononuclear predominance. Hypoxemia as measured by pulse oximetry or arterial blood gas analysis is frequent and tends to be more marked than anticipated from the clinical findings. A normal or elevated blood CO₂ value in a patient with a markedly elevated respiratory rate is a sign of respiratory failure.

Definitive diagnosis of RSV infection is based on the detection in respiratory secretions of live virus by cell culture. The presence of viral RNA (detected by a molecular diagnostic test using reverse transcription PCR) or viral antigens (detected by a rapid diagnostic test, usually a membrane blotting test incorporating antibody detection of viral proteins) is strongly supportive in the right clinical setting. Endotracheal tube lavage fluid from patients intubated for mechanical ventilation can be tested. The specimen should be placed on ice, taken directly to the laboratory, and processed immediately for culture, antigen detection, or PCR analysis (1)

Treatment:-

Treatment at home usually includes antipyretic, increased oral fluid, Parents should encourage their child to drink an adequate amount of fluids. and saline nose drops (with bulb suctioning for infants). Monitoring at home periodically for signs or symptoms of worsening. Specifically, this includes monitoring for an increased rate of breathing, worsening chest retractions, nasal flaring, cyanosis, a decreased ability to feed or decreased urine output. Parents

should contact their child's healthcare provider to determine if and when an office visit is needed, or if there are any other questions or concerns. Smoking in the home should be avoided.(4)

Recovery — Most children with bronchiolitis who are otherwise healthy begin to improve within two to five days. However, wheezing persists in some infants for a week or longer, and it may take as long as four weeks for the child to return to his or her "normal" self.(4).

The treatment of uncomplicated cases of bronchiolitis is symptomatic. Humidified oxygen and suctioning are usually indicated for hospitalized infants who are hypoxic. Intravenous fluid can be given for moderately dehydrated infants. NG tube feeding is helpful when sucking is difficult because of tachypnea.(1)

Ribavirin is an antiviral agent delivered through an oxygen hood, face mask, or endotracheal tube with use of a small-particle aerosol, indicated for:

- ❖ Infants younger than 1 yr of age with hemodynamically significant congenital heart disease
- ❖ Children 24 mo of age or younger with profound immunocompromising conditions during RSV season
- ❖ Infants in the 1st yr of life who have either congenital abnormalities of the airway or neuromuscular disease that compromises handling of respiratory secretions
- ❖ Administration in the 2nd yr of life is recommended for children who required 28 or more days of oxygen after birth and who have on going treatment for chronic pulmonary disease (oxygen, steroids and diuretics)(1).

In 2006, the AAP, in conjunction with the American Academy of Family Physicians (AAFP), the American College of Chest Physicians (ACCP), and the American Thoracic Society (ATS), published guidelines for the diagnosis and management of bronchiolitis in children 1 through 23 months of age. These guidelines were updated in 2014 and include the following recommendations (5) :

- Diagnosis and severity should be based on history and physical findings and not on laboratory and radiologic findings
- Bronchodilators should not be routinely used
- Corticosteroids should not routinely be used
- Ribavirin should not be used
- Risk of serious bacterial infection, especially in infants 30-90 days old with bronchiolitis is low. Antibacterials should be used only upon proven coexistence of bacterial infection
- Nutrition and hydration should be assessed.
- Supplemental oxygen should not be routinely used for patients with saturations above 90% on pulse oximetry; continuous pulse oximetry monitoring may not be necessary
- Chest physiotherapy has not shown to benefit infants with bronchiolitis
- Deep suctioning may provide temporary relief
- Nebulized hypertonic (3%) saline may improve symptoms of bronchiolitis when length of stay is expected to exceed 3 days
- Palivizumab prophylaxis should only be administered to selected children
- Hand decontamination is indicated to prevent nosocomial spread
- Infants should not be exposed to passive smoking
- Breastfeeding is recommended.

Prevention : There are several ways to prevent severe bronchiolitis:

- ❖ Avoid smoking in the child's home because this increases the risk of respiratory illness.
- ❖ Wash hands frequently with soap and water, especially before touching an infant. Hands should ideally be wet with water and plain or antimicrobial soap, and rubbed together for 15 to 30 seconds. Hands should be rinsed thoroughly and dried with a single-use towel.
- ❖ Use alcohol-based hand rubs.
- ❖ Avoid other adults and children with upper respiratory infection.
- ❖ A yearly vaccination for influenza virus is recommended for everyone older than 6 months, especially for household contacts of children younger than five years.
- ❖ Infants who are younger than 24 months with specific types of chronic lung disease and infants who are younger than 12 months who were born before 29 weeks, have specific types of heart disease, or have other risk

factors for severe respiratory syncytial virus (RSV) infection may be given a special medication (palivizumab) to prevent severe RSV infection requiring hospitalization.(4).

Breastfeeding and avoidance of cigarette smoke are also presumed to decrease the incidence and/or severity of viral respiratory tract infections (5)(6).

Immunoprophylaxis: Palivizumab(synagis):-

Palivizumab, a humanized murine monoclonal immunoglobulin G-1 directed against an epitope on the F glycoprotein of RSV, is produced by recombinant DNA technology, and has 95% human and 5% murine amino acid sequences. Rare cases of anaphylaxis are the only recognized serious adverse event. Standard dosing is 15 mg/kg administered intra muscularly every 30 days during RSV season for a maximum of five dose. Palivizumab is available in 50 mg or 100 mg vials.(6).

Palivizumab was licensed in June 1998 by the Food and Drug Administration for the reduction of serious lower respiratory tract infection caused by respiratory syncytial virus (RSV) in children at increased risk of severe disease.(7).

The American Academy of Pediatrics has updated its guidance for the use of palivizumab in infants and young children at greatest risk of hospitalization attributable to RSV infection:

Preterm Infants Without Chronic Lung Disease of Prematurity or Congenital Heart Disease:

Palivizumab prophylaxis may be administered to infants born before 29 weeks, 0 days' gestation who are younger than 12 months at the start of the RSV season. For infants born during the RSV season, fewer than 5 monthly doses will be needed. Infants 29 weeks, 0 days' gestation or later may qualify to receive prophylaxis on the basis of congenital heart disease (CHD), chronic lung disease (CLD), or another condition. Palivizumab prophylaxis is not recommended in the second year of life on the basis of a history of prematurity alone.(7).

Infants With Hemodynamically Significant CHD:

Certain children who are 12 months or younger with hemodynamically significant CHD may benefit from palivizumab prophylaxis. Children with hemodynamically significant CHD who are most likely to benefit from immunoprophylaxis include infants with acyanotic heart disease who are receiving medication to control congestive heart failure and will require cardiac surgical procedures and infants with moderate to severe pulmonary hypertension.(7)

Decisions regarding palivizumab prophylaxis for infants with cyanotic heart defects in the first year of life may be made in consultation with a pediatric cardiologist.(7)

Children younger than 2 years who undergo cardiac transplantation during the RSV season may be considered for palivizumab prophylaxis.(7)

Because 5 monthly doses of palivizumab at 15 mg/kg per dose will provide more than 6 months (>24 weeks) of serum palivizumab concentrations above the desired level for most children, administration of more than 5 monthly doses is not recommended within the continental United States. For qualifying infants who require 5 doses, a dose beginning in November and continuation for a total of 5 monthly doses will provide protection for most infants through April and is recommended for most areas of the United States.(7).

Discontinuation of Palivizumab Prophylaxis Among Children Who Experience Breakthrough RSV Hospitalization: If any infant or young child receiving monthly palivizumab prophylaxis experiences a breakthrough RSV hospitalization, monthly prophylaxis should be discontinued because of the extremely low likelihood of a second RSV hospitalization in the same season (<0.5%).(7).

Use of Palivizumab in the Second Year of Life: Hospitalization rates attributable to RSV decrease during the second RSV season for all children. A second season of palivizumab prophylaxis is recommended only for preterm infants born at <32 weeks, 0 days' gestation who required at least 28 days of oxygen after birth and who continue to require supplemental oxygen, chronic systemic corticosteroid therapy, or bronchodilator therapy within 6 months of the start of the second RSV season.(7).

Lack of Therapeutic Efficacy of Palivizumab: Passive antibody administration is not effective in treatment of RSV disease and is not approved or recommended for this indication.(7)

Effect of Palivizumab Prophylaxis on Subsequent Wheezing:

Prophylaxis is not recommended for primary asthma prevention or to reduce subsequent episodes of wheezing.(7) Clinicians may administer palivizumab prophylaxis in the first year of life to certain infants with hemodynamically significant heart disease.

Clinicians may administer up to a maximum of 5 monthly doses of palivizumab (15 mg/kg per dose) during the RSV season to infants who qualify for prophylaxis in the first year of life. Qualifying infants born during the RSV season may require fewer doses. For example, infants born in January would receive their last dose in March.(7) palivizumab reduced the risk of hospitalization due to RSV infection by 55% and 45%. Via monthly intramuscular (IM) injection, to be administered throughout the duration of the RSV season.

Palivizumab targets the fusion protein of RSV, inhibiting its entry into the cell and thereby preventing infection.(8)

Other potential target groups for palivizumab prophylaxis include:(9)

1. Children younger than one year of age with neuromuscular disorders impairing the ability to clear secretions from the upper airways or pulmonary abnormalities.
2. Children younger than two years of age who are immunocompromised (e.g. those with severe combined immunodeficiency; those younger than two years of age who have undergone lung transplantation or hematopoietic stem cell transplantation) during the RSV season.
3. Children with Down syndrome who have additional risk factors for lower respiratory tract infections.

Side effects of palvizumab: (10)

- Sore throat
- Runny nose
- Redness or irritation at injection site
- Vomiting
- Diarrhea

Some more serious side effects include:

- Severe skin rash
- Itching
- Hives (urticaria)
- Difficulty breathing

Adverse events such as injection site reactions (2.3%), fever (1.5%), diarrhea (<1%), and nervousness/irritability (<1%).(11)

palivizumab, a humanized monoclonal antibody that binds RSV F protein, have been shown to reduce RSV-associated hospitalization. Palivizumab the preferred choice of RSV immunoprophylaxis because of its lack of concern with fluid overload, particularly in children with pre-existing cardiac or pulmonary disease, ease of administration, lack of interference with immunization schedules.(11)

palivizumab was able to neutralize both subtype A and B strains of RSV

and it was safe and well-tolerated, there were no significant changes in urinalysis, hematological values, blood urea nitrogen, creatinine, and transaminase levels.(11)

Monthly prophylaxis resulted in a 55% relative reduction in RSV hospitalization. Significant decreases in hospitalizations were seen in children greater than 5 kg (51%), less than or equal to 5 kg (57%), and in infants born

before 32 weeks gestation (47%). Palivizumab recipients also had significantly reduced hospital days, days with supplemental oxygen requirement, moderate/severe lower respiratory tract infections, and intensive care unit (ICU) admissions.(11)

Risk factors for RSV hospitalization:

Reported host risk factors include the following: congenital malformations, congenital airway anomaly, neuromuscular impairment, birth weight, gender, lack of breastfeeding, duration of breastfeeding, cord serum anti-RSV antibody concentration, small for gestational age, Down syndrome, epilepsy, cord blood vitamin D concentration, family history of atopy, viral load, malnutrition, multiple births, and singletons versus multiple birth subjects.

Environmental risk factors include the following: environmental pollution, crowded living conditions, living at increased altitude, meteorological conditions, low parental education, low socioeconomic status, child care attendance, size of child care facility, month of birth, smoke exposure, maternal smoking during pregnancy, and proximity to hospital care. One publication suggested that malformations of the urinary tract increase the risk of RSV hospitalization.(7)

A study was done in Spain for premature infant found that, age ≤ 10 weeks at start of RSV season, breast-feeding ≤ 2 months, at least 1 school age sibling, at least 4 people living in the household (excluding the infant and school-age siblings), and a family history of wheezing were significantly associated with an increased risk of RSV hospitalization .(11)

Storage and administration of palivizumab:-

The storage must be in the refrigerator, not allowed to be freeze and must be used within 6 hours once you mix it. Palivizumab can be used after dilution with 1 mL of sterile water, should be added slowly to the palivizumab vial and then gently swirl the vial (do not shake it) for 30 seconds. then let the vial sit at room temperature for 20 minutes until the solution becomes clear. The solution should be clear and free of floating material. (12).

Palivizumab is administered intramuscularly at a dosage of 15 mg/kg once a month. The drug is packaged in single-dose liquid solution vials at 50 mg/0.5 mL and 100 mg/1.0 mL and does not contain preservative. A vial cannot be stored once it is opened. Anaphylaxis has occurred after palivizumab administration after initial exposure or reexposure, with some cases of severe hypersensitivity reactions reported.(13).

Palivizumab does not interfere with the immune response to live or inactivated vaccines. The childhood immunization schedule should be followed for all children, regardless of palivizumab use.(13)

Material and Methods:-

A randomized clinical trial was done in Karballa Teaching Hospital For Pediatrics from October 2015-march 2017 to studies the protective effect of palivizumab prophylaxis for reducing RSV-associated hospitalizations in infants with congenital heart disease and premature infants.

The study included 84 patients with CHD and premature infants, 2 premature infants were received 2 doses only and developed irritability & cough therefore we stopped palvizumab injection and 2 premature infants received one dose and escape from follow up(therefore those 4 patients were excluded from the study).

The remaining 80 patients were divided to 2 groups(group A&B) : 30 patients with congenital heart disease their age less than 1 year considered group A and 54 premature neonates who are delivered at the season of RSV(October –March) considered group B. Group A(30 patients) :subdivided to 2 subgroups: A1&A2, both had hemodynamically significant CHD(large VSD &PDA,complete AV canal with heart failure and on medical treatment,TOF and D-TGA) . 18 patients who received 5 doses of palvizumab monthly(from October- March) considered as group A1 and 12 patients who received 3 doses monthly considered as group A2,with monthly follow up for signs of any respiratory illness.

Group B (50patients): subdivided to 2 subgroups:B1&B2 both were premature neonates their gestational age less than 35 weeks of gestation and their body weight less than 1500gm .25 patients they were received 5 doses of

palvizumab monthly for 5 months from October-March considered as group B1 and 25 patients they were received 3 doses of palvizumab monthly for 3 months considered as group B2.

Exclusion criteria:-

1. Premature infants with severe sepsis ,severe jaundice,severe congenital malformation and history of birth asphyxia.
2. complex congenital heart disease

All 4 groups were received palvizumab 15mg/kg intramuscular(antrolateral aspect of the thigh) monthly with regular follow up each months for any sign of respiratory distress and side effects.the vial of palvizumab was diluted with 0.5ml of steril water for 50 mg vial and 1ml for 100mg , the sterile water was added slowly to the palvizumab vial and then gently swirl the vial for 30 seconds. then the vial was left at room temperature for 20 minutes until the solution becomes clear and then injected by well trained nursing staff.the patients was observed for any sign of allergy or anaphylaxis for half an hour.

For each group we select control group(group C)80 patients :30 patients with CHD(group C1) &50 premature neonats(group C2) was taken from cardiology clinic,outpatients clinic &premature department &compared with each group.

For each patient and control there was a list of information that include: the name of patient,age,body weight,date of palvizumab injection(first,second,3rd,4th and fifth dose),amount of palvizumab,side effects,type of feeding(breast,mixed and artificial),diagnosis(premature or CHD),if the patient developed bronchiolitis,if the patient need hospital admission,phone or mobile number.

The patients were followed monthly and examined for any signs of respiratory illness and asked the parents for any noticeable side effects.

For all patients we asked them to continue their routine vaccination according to the vaccination program in Iraq,because the palvizumab not interfere with routine vaccination.

THE RESULTS: we in ruled in this study 80 patents with the following results:

For group A1:

The hospital admission was zero percent

The number of patients that developed mild bronchiolitis was 3 patients and no death was reported.

For group A2:

The hospital admission was 8.3%

The number of patients that developed mild bronchiolitis were 4 patients and no death was reported.

For group B1:

The hospital admission was zero percent.

The number of patients that developed mild bronchiolitis were 7 patients and no death was reported.

For group B2:

The hospital admission was 4%

The number of patients that developed mild bronchiolitis were 8 patients and no death was reported.

For group C1:hospital admission was 21(70%) and one death was reported(3.3%),as shown in table (1).

For group C2: Hospital admission was 39(78%) and 4 death was reported(8%).as shown in table (2).

No significant side effects was reported.

Palvizumab didn't interfere with routine vaccination program

Breast feeding had significant factor that contribute to the reduction of severity of bronchiolitis and rate of hospitalization as shown in table(3).

Table (1):- the effectiveness of palvizumab in reduction hospital admission between congenital heart disease group and control group:

Patients group	Total No.	No.of patients developed mild bronchiolitis	No.of hospital admission	No. of death
Group A1	18	3 ¥ #	zero ¥ *	Zero ¥ #
Group A2	12	4 #	1(8.3%) *	Zero #
Control group(C1)	30	3	21(70%)	1(3.3%)

¥ No significant difference ($p>0.05$) as compare with group A2 .

#No significant difference ($p>0.05$) as compare with control group

* Significant difference ($p<0.05$) as compare with control group

Table (2):- the effectiveness of palvizumab in reduction hospital admission between premature group and control group:

Patients group	Total No.	No.of patients developed mild bronchiolitis	No.of hospital admission	No. of death
Group B1	25	7 ¥ *	Zero ¥ *	Zero ¥ #
Group B2	25	8 *	1(4%) *	Zero #
Premature infants(C2)	50	1	39(78%)	4(8%)

¥ No significant difference ($p>0.05$) as compare with group B2 .

#No significant difference ($p>0.05$) as compare with control group

* Significant difference ($p<0.05$) as compare with control group

Table (3):- the effectiveness of breast feeding between patients and control groups:

Group of patients	Total No.	Breast feeding	mixed	artificial
Group A	30	24(80%)	4	2(6.6%)
Group B	50	25(50%)	19	6(12%)
Patients with CHD(C1)	30	3(10%)	4	23(76.6%)
Premature patients(C2)	50	4(8%)	10	36(72%)

**Figure (1):-** hospital admission and death between patients whom received palvizumab and control groups.

Figure (2):- effectiveness of breast feeding between group A&B and control(group C):show significant number with breast feeding didn't developed severe bronchiolitis

Discussion:-

Guidance from the American Academy of Pediatrics (AAP) for the use of palivizumab prophylaxis against respiratory syncytial virus (RSV) was first published in a policy statement in 1998. Guidance initially was based on the result from a single randomized, placebo-controlled clinical trial conducted in 1996–1997 describing an overall reduction in RSV hospitalization rate from 10.6% among placebo recipients to 4.8% among children who received prophylaxis. The results of a second randomized, placebo-controlled trial of children with hemodynamically significant heart disease were published in 2003 and revealed a reduction in RSV hospitalization rate from 9.7% in control subjects to 5.3% among prophylaxis recipients.(13).

From our study we found there is significant reduction in RSV hospitalization rate from 70% in control group to 8.33% among infants with CHD were prophylaxed with palvizumab for 3 doses and to zero percent for those infant who received 5 doses of palvizumab and no death was reported(P.value less than 0.05).regarding premature infants, the reduction rate of hospitalization was from 78% in control group to 4% among premature infants were prophylaxed with 3 doses of palvizumab and to zero percent for premature infants who received 5 doses of palvizumab .

The mortality rate was zero in both prophylaxed groups and 3.3% for patients with CHD & 8 % for premature infants whom didn't receive palvizumab.

Therefore in this study we found there is significant reduction in morbidity and mortality.

The effectiveness of palvizumab in this study indicat that RSV is the main cause of bronchiolitis in our country. From our study we found that breast feeding had significant preventive measure that contribute to decrease the incidence and severity of bronchiolitis in both groups,this result go with the guidelines were updated in 2014 and recommend the use of breast feeding is a must. (5)(6)(1).

The results of Farber didn't go with our study, Farber found that the effect of palivizumab administration on hospitalization for bronchiolitis with or without an RSV diagnosis among healthy preterm infants born at 29 to 36 weeks of gestation during their first RSV season occurring in 2012, 2013, or 2014, limited utilization and benefits of palivizumab were observed and no benefits were observed for those born between 33 and 36 weeks. , new diagnostic testing for a wide variety of respiratory pathogens has demonstrated that multiple viruses, such as coronaviruses, human metapneumovirus, influenza virus, parainfluenza virus, and rhinovirus, circulate at the same time as RSV and cause bronchiolitis syndromes that are indistinguishable clinically from RSV.(14)

Palivizumab, a humanized monoclonal anti-RSV antibody, was shown to reduce hospitalizations and the clinical severity of RSV infection in high risk infants and children by 55% in a randomised controlled trial. (15)

The result of our study go with (IMPact-RSV study group 1998) was a multi-center, randomized, double-blinded, placebo-controlled trial that enrolled 1502 children (500 placebo and 1002 palivizumab recipients). Eligible participants were ≤ 35 week's gestational age, they found that the monthly prophylaxis resulted in a 55% relative reduction in RSV hospitalization (10.6% placebo, 4.8% palivizumab) with significant relative reductions in premature infants (78%). (11).

My study like two studies (16, 17) which included any premature infant born at GA < 36 weeks reported a statistically significant reduction in RSV hospitalization among prophylaxed compared to nonprophylaxed infants (19–29% rate reduction), but one study (18) which included late preterm infants (GA 33 to 35 weeks) reported a non significant reduction of 0.6%.

our study go with another studies of a total of 1287 children less than or equal to 2 years of age with hemodynamically significant CHD that was uncorrected or palliated were randomized in a double-blind, placebo-controlled trial conducted in Canada, France, Germany, Sweden, United Kingdom, and the United States found that Palivizumab prophylaxis was significantly associated with a 45% relative reduction in hospitalization rates. RSV hospitalization rates were 9.7% in the placebo group and 5.3% in the palivizumab group. (11)

A similar rate of hospitalization (4.6%) was found in 108 Japanese infants with CHD who received palivizumab with no children requiring mechanical ventilation and no mortality (Saji et al 2005). Other investigators have found similar or lower incidences of RSV hospitalizations in patients with hemodynamically significant CHD than the 9.7% rate reported in the placebo arm of Feltes et al (2003) who were not given palivizumab prophylaxis (Duppenthaler et al 2004; Meberg and Bruu 2006). RSV hospitalization rates in patients with severe CHD in Norway were 9.2% (Meberg and Bruu 2006) and only 2.4% in Switzerland (Duppenthaler et al 2004). (11)

Like our study, in 3 studies (19, 20, 21) which included infants born at GA < 32 weeks, the rate of RSV hospitalization was lower in infants who received palivizumab, the reported reduction ranged between 1.2% and 12.4% and this reduction was statistically significant and this is go with my study

Like our study, a study (22) based on hospital record review investigated the effect of palivizumab among 266 children aged < 2 years with CHD, they found that the rates of RSV hospitalization in prophylaxed children were 19% lower than for nonprophylaxed infants from a different RSV season.

Another cohort study (22) among children with CHD reported a reduction in RSV hospitalizations from 7–9 cases/year when children received palivizumab ad hoc to 2–3 cases/per year when prophylaxis was administered systematically (5 doses) and in accordance with recommendations.

Like our study, a cohort study (23) that included premature infants of GA 29 to 32 weeks also reported a lower RSV hospitalization rate in children prophylaxed according to the standard recommendation of 5 doses, compared with the rate in children who received inadequate prophylaxis, that is, children who did not receive the recommended five full doses (3.3% versus 8.1%,).

Our study didn't go with the only study (24) that stratified by gestational age did not find a significant reduction in hospitalization rate in prophylaxed infants born at GA 33 to 35 weeks without CLD. The review of the studies suggests that groups of children who are likely to benefit most from palivizumab prophylaxis are premature infants born at GA ≤ 32 weeks and children with CLD.

Recommendations:-

From this study we recommend:

1. the use of palvizumab in premature infants less than 35 weeks of gestation and their body weight less than 1500 gm as immune-oprophylaxis against severe bronchiolitis
2. the use of palvizumab in hemodynamically significant congenital heart disease: large VSD, large PDA, complete AV canal with heart failure, TOF and D-TGA.
3. 5 monthly doses of pavizumab is very effective in reducing the RSV associated hospitalization.
4. 3 monthly doses of palvizumab is also effective in preventing severe bronchiolitis specially if it was given during the RSV season

5. Breast feeding is recommended in all infants less than one year because of its protective effect against severe bronchiolitis.
6. We need further studies to see the effectiveness of palvizumab in patients with chronic lung disease, cystic fibrosis, neuromuscular disease and immunocompromised patients in order to reduce the rate of hospital admission
7. No significant side effects or anaphylaxis from intramuscular injection of palvizumab.
8. Palvizumab should be supplied for each pediatric hospital to be used in high risk infants.
9. Palvizumab not interfere with routine vaccination.

Tilapia, frozen storage, cryoprotectants, apparent reduced viscosity, calcium ATPase Activity, gel filtration profile

Abstract

In the present investigation, changes in functional properties of proteins from tilapia (*Oreochromis mossambicus*) in the form of whole tilapia (WHT), water washed minced meat of tilapia without addition of cryoprotectants (WMT) and with cryoprotectants (WMCT) during frozen storage have been evaluated. Gradual reduction in moisture content and marginal increase in protein content was observed in all the samples with progressive frozen storage. The reduction in non protein nitrogen (NPN) content was lower in WMCT as compared to WHT and WMT. All the samples exhibited decreased calcium-ATPase activity as a function of frozen storage. WMCT had a higher activity index during frozen storage as compared to WHT and WMT. The enzymatic activities decreased with progressive frozen storage period with relatively higher activity in WHT. Proteins from washed meat with cryoprotectants had minimum change in reduced viscosity profile at single protein concentration during different periods of frozen storage. Changes in structure of proteins were evident from apparent reduced viscosity and gel filtration profile as a function of frozen storage.

Introduction:-

Being a rich source of proteinaceous material, fish is consumed worldwide as a source of nutrition. Tilapia is becoming an increasing substitute for traditional white fish species. The consumption of tilapia in the year 2014 was around 5.4 MMT worldwide (Fernandes et al., 2015). Around 4% of the catch spoils as a result of lacuna in transportation and storage conditions (Jackson et al., 1997). In order to increase the consumer preference for tilapia, value addition is one of the options. Due to the presence of bones, preparation of value added products is problematic. To overcome the problem, production of mince from fish by mechanical means is a good alternative. Fish mince needs freezing and frozen storage and can be a good source of raw material for production of various value added products (Venugopal and Shahidi, 1998).

Water washed mince meat blended with additives, frozen and stored under frozen storage is termed as surimi (Park and Lin, 2005). Few white flesh varieties are commercially used for production of large quantities of surimi. In India, surimi production accounted for 58000 million metric tonnes in the year 2011 (Park and Lin, 2013). Gelation behavior of fish on heat processing is an important characteristic in surimi production. Use of tilapia for production of surimi has been attempted (Pan et al., 2010). However, the information on changes in properties of tilapia proteins added with cryoprotectants during frozen storage is limited.

Due to the perishable nature of tilapia, frozen storage is required in order to maintain its quality. However, after prolonged storage even at temperatures below -20°C , marked undesirable sensory changes in the product take place. There are many reports on frozen storage of tilapia in relation to its biochemical, sensory and microbiological quality (Ng and Bahurmiz, 2009). Protein denaturation and/or aggregation may take place during frozen storage of tilapia meat (Shenouda, 1980). Protein denaturation leads to alteration of functional and gelation properties (Badii and Howell, 2001). Cryoprotectants are generally used to prevent these undesirable changes in the myofibrillar protein and to preserve maximum functionality of surimi (Yoon and Lee, 1990). It is well documented that these sugars work by stabilizing actomyosin, increasing surface tension (Arakawa and Timasheff, 1982) and the amount of bound water, preventing protein water loss (Buttkus, 1970) and maintaining protein solubility (Herrera and Sampedro, 2002). A mixture of sucrose and sorbitol is the preferred as cryoprotectant for fish surimi as both have excellent cryoprotective effects on fish myofibrillar protein (Yoon and Lee, 1980).

Utilization of tilapia has been attempted to produce surimi and have been found to be suitable for surimi production (Park et al., 1990). Properties of the protein of fish intended for surimi production play a pivotal role in the end product quality (Murthy and Rajanna, 2011). In order to produce mince based products from tilapia, it is essential to have understanding of properties of proteins during frozen storage so as to improve the textural properties. The aim of this study was to evaluate the effect of freezing and frozen storage on the quality of tilapia with and without cryoprotectants. We investigated freeze-induced denaturation of samples by evaluation of Ca^{++} -ATPase activity, MIPase activity of tilapia fish mince with and without addition of cryoprotectants.

Methodology:-

Raw material:-

Fresh tilapia (*Oreochromis mossambicus*) caught from natural freshwater body near Mysore, Karnataka, India was used for the study. The length of fish used was 21 to 28.5 cm, weighing 150 to 340 g. The fish samples were washed and iced in the ratio of 1:1 (fish: ice) and transported to the laboratory immediately after harvest. Head and entrails were removed manually, washed with chilled water (3°C) and subjected to further analysis.

Chemicals and reagents:-

Sodium chloride, sodium di-hydrogen phosphate, di-sodium hydrogen phosphate, tri-chloro acetic acid (TCA) were procured from E-Merck India Limited. Ellman reagent was procured from Sigma Chemical co., St. Louis, USA. The synthetic Krehalan casings (copolymer of vinylidene chloride and vinyl chloride) of size 50mm x 280mm (diameter x length) were obtained from Kruhea Chemical industry Co. Ltd., Japan. All chemicals and reagents used in the present study were of AR or GR grade.

Freezing and frozen storage:-

From minced meat, surimi was prepared from minced meat (Nishiya et al., 1961) and mixed with cryoprotectants (w/w) such as sodium tri-poly phosphate (0.2%), sorbitol (4%) and sucrose (4%). The fish meat packed in polyethylene bags was frozen in air blast freezer at -35°C . The total time for freezing was 4 to 6 hours. Whole fish were frozen in similar fashion. All three, washed meat (WMT), washed meat with cryoprotectants (WMCT) and whole fish (WHT) frozen samples were stored in deep freezer (Vest frost, Holland) at $-20\pm 2^{\circ}\text{C}$ during the period of study. Samples were drawn at regular intervals up to 360 days frozen storage period.

Changes in properties of proteins from whole fish, washed meat and washed meat with cryoprotectants of tilapia fish meat during frozen storage:

Changes in moisture, total protein content and non-protein nitrogen (NPN) content:-

The samples were macerated well using a pestle and mortar and the macerated meat was used. Moisture and protein in the meat were determined as per AOAC, 2000. NPN content was determined by TCA method (Velankar and Govindan, 1958). About 5 g of meat was ground with 10 ml of 15% TCA for 5 min using pestle and mortar. The

slurry was filtered and made up to 50 ml with distilled water and 5 ml of aliquot was taken for nitrogen estimation by Kjeldahl method.

Changes in apparent reduced viscosity:-

Total proteins from tilapia meat were extracted using phosphate buffer (50 mM, pH 7.5) containing 1 M NaCl referred to as extraction buffer (EB) and the solution was used for viscosity measurements. Ostwald viscometer with capillary diameter of less than 0.5 mm was used. The temperature of the viscosity measurements was done at $25 \pm 1^\circ\text{C}$. The ratio of fish meat to buffer for extraction of proteins was 1:10. The clear supernatant obtained was taken for viscosity measurements after determining protein concentration by Lowry's method (Lowry et al., 1951). Appropriate dilutions of protein solution were made using EB as solvent so as to get different concentration of protein solution. A known quantity of protein solution (10 ml) was taken into viscometer and equilibrated in a water bath at $25 \pm 1^\circ\text{C}$ for 15 min. Time taken by the protein solution to pass through the two markings on the viscometer was monitored with the help of a stop watch (Rocar, Switzerland) with 0.2 sec sensitivity. The solution was taken up to mark by suction and the flow time in seconds required to flow between the markings in viscometer was recorded. For each protein concentration 3 readings were taken and the average flow time was used for calculation.

Apparent reduced viscosity was calculated using the following formula (Yang, 1961) and expressed as ml/mg of protein in the solution. Apparent reduced viscosity was plotted against different protein concentration (mg/ml).

$$\eta_{red} = \frac{t_1 - t_0}{t_0 \times C}$$

Where;

η_{red} = reduced viscosity (ml/mg)

t_1 = flow time for protein solution (sec)

t_0 = flow time for solvent, EB (sec)

C = concentration of protein in the solution (mg/ml)

Changes in calcium ATPase activity:-

Calcium ATPase activity was measured by using spectro-photometric method (Noguchi and Matsumoto, 1970). About 1 g of meat was homogenized in 10 ml of 0.05M Tris-HCL buffer, pH 8.0. The homogenate was centrifuged at $8000 \times g$ using IEC B22 high speed refrigerated centrifuge for 15 minutes at 4°C . The supernatant thus obtained was used as a source of enzyme. The reaction mixture consisting of 0.06 ml of 0.05 M adenosine tri-phosphate (ATP) solution, 0.4 ml calcium chloride (0.1 M), 2 ml (0.05 ml) Tris-HCl buffer (pH 8.0). About 0.4 ml meat extract was added to reaction mixture and incubated for 5 minutes at $28 \pm 1^\circ\text{C}$. The reaction was stopped by adding 2 ml of 15% TCA. All the assays were done with both samples blank as well as reagent blank in triplicate. The mixture was filtered, the inorganic phosphorous in the filtrate was determined (Taussky and Shorr, 1952). To the 2 ml filtrate, 3 ml of ammonium molybdate ferrous sulphate solution (freshly prepared) was added. The intensity of the colour developed was read at 660 nm. The concentration of liberated inorganic phosphate was measured using standard curve obtained by using potassium di-hydrogen phosphate as a standard. The activity was expressed as $\mu\text{g P}_i/\text{mg protein/ minute}$. The initial calcium ATPase activity was taken as 100 and designated as activity index.

Changes in modori inducing proteases (MIPase) activity:-

Modori inducing protease in tilapia meat was determined spectrophotometrically (An et al., 1994). The crude enzyme extract was prepared by homogenizing 5 g of fresh tilapia meat with 15 ml phosphate buffer (50 mM; pH 7.5) at 3000 rpm for 2 minutes in the homogenizer (Nihon Seiki Kogyo Co., Tokyo, Japan). The homogenate was centrifuged at $8000 \times g$ for 15 minutes. The supernatant was diluted with phosphate buffer in the ratio of 1:1 and used as crude enzyme extract. The substrate solution was prepared by dissolving 4 mg casein (according to Hammerstein) in 1.25 ml phosphate buffer (50 mM, pH 7.5) and making up to 2 ml with distilled water. To determine the modori inducing protease activity, 2 ml of the substrate solution was pre-incubated at $55 \pm 1^\circ\text{C}$ for 5 minutes in water bath. To this 0.5 ml of crude enzyme was added and again incubated at $55 \pm 1^\circ\text{C}$ for 1 hour for the enzymatic reaction to occur. The reaction was terminated by adding 1 ml cold 20% TCA. The slurry was centrifuged at $8000 \times g$ for 15 min at 4°C . The supernatant containing the hydrolyzed oligo peptide was collected without disturbing the pellet. The oligo peptide content in the supernatant was determined by measuring the absorbance at 280 nm in a UV- VIS Spectrophotometer (Spectronic 21 Bausch and Lomb, USA). The blank was prepared in the same manner except that the crude enzyme extract was added immediately after TCA precipitation. The enzyme

activity was expressed as the difference of absorbance at 280 nm between the sample and the blank. The concentration of protein in the crude enzyme was estimated by measuring absorbance at 280 nm.

Changes in gel filtration profile:-

Gel filtration profile of WHT, WMT and WMCT samples as a function of frozen storage was carried out on a sepharose 6B gel packed in a column of 1.5 x 80 cm (dia x height) using EB as an eluent. Total bed volume of the column was 160 ml. The void volume (V_o) of column was determined using blue dextran and was found to be 50 ml. Two grams of meat sample was homogenized with 18 ml EB using a homogenizer (Nihon Seiki Kogyo, Co., Japan) and the homogenate was centrifuged at 9000 X g using IEC refrigerated centrifuge for 15 min at 4°C. A clear supernatant (1.5 ml) was loaded on to the top of gel column after determining the protein concentration. The protein concentration loaded to the column varied between 10-12 mg/ml. Flow rate was adjusted to 30 ml/hour and fractions of 3 ml were collected manually. The protein concentration was measured by taking absorbance at 280 nm using a UV/VIS spectrophotometer (Spectronic – 21, Bausch and Lomb, USA). A plot of absorbance at 280 nm against elution volume was obtained to get the gel filtration profile.

Statistical Analysis:-

In order to assess the effect of frozen storage period and cryoprotectants from different sources on various properties of tilapia meat, two-way analysis of variance (ANOVA) without replication was carried out using MS-Excel.

Results and Discussion:-

Physical characteristics of fresh tilapia meat:-

The fishes used in the present study were relatively big in both size and weight. The dressing yield (after removal of head, entrails) was 64.3% and the meat yield from the whole fish was 44%. Normally bigger size fish will give higher yield compared to small size fish. The yield of separated meat of the fresh water fishes like common carp and silver carp varies from 40-47 % (Arekere, 1993; Siddaiah et al., 2001).

Changes in moisture, total protein and non-protein nitrogen (NPN) content as a function of frozen storage period:-

The changes in moisture content of whole fish (WHT), washed meat (WMT) and washed meat with cryoprotectants (WMCT) during frozen storage are given in Fig. 1a. The initial moisture content of washed meat was higher than whole fish meat. The increased moisture content of washed meat may be attributed to hydration of myofibrillar proteins (Suvanich et al., 2000; Karthikeyan et al., 2004). A reduction in moisture content was recorded as a function of frozen storage period in all the samples. It is usual to find reduction in moisture content of fish and fishery products during frozen storage because of dehydration (Shenouda, 1980). The moisture content of WMCT sample registered minimum changes during frozen storage. The variation in the moisture content of WHT, WMT and WMCT as a function of frozen storage was significant ($p < 0.05$). Significant difference was also observed between WHT, WMT and WMCT for similar storage days ($p < 0.05$). Similar type of reduction in moisture content was observed in croaker fish washed meat samples (Basavanagouda, 2001) and in pink perch surimi (Nopianti et al., 2012). Cryoprotectants added in the surimi reduced the protein aggregation by increasing the hydration and prevented drastic fall of moisture content.

The total protein content of samples as a function of frozen storage period showed a marginal increase in all the samples and is given in Fig. 1b. The initial protein content of whole fish and washed meat was found to be 17.47 and 12.80% respectively. Reduced protein content on washing has also been reported (Fogaca et al., 2015). Addition of cryoprotectants to washed meat reduced the total protein content. There was a gradual increase in protein content in all the three samples during frozen storage. Protein content of WHT sample was significantly higher than WMT and WMCT throughout the storage period ($p < 0.05$). WMCT sample registered a higher increase in protein content than WMT possibly due to higher reduction in moisture content.

The changes in non-protein nitrogen (NPN) content of tilapia meat samples during different periods of frozen storage are given in Fig. 1c. There was a significant decrease in NPN content in all the samples throughout the storage period ($p < 0.05$). The reduction in NPN content was higher WHT than WMT followed by WMCT. The results of analysis of variance indicated that the changes in NPN values were altered both due to storage and sample condition. The loss of NPN constituents in frozen fish may be observed due to the leaching effect during thawing. The initial NPN content of whole fish meat was 365 mg%, which was more than that of washed meat indicating that washing has reduced the NPN content. Similarly washed meat of pink perch showed reduction in NPN content

(Karthikeyan et al., 2006). The loss of NPN constituents in frozen fish meat is mainly due to leaching effect during thawing.

Changes in apparent reduced viscosity as a function of frozen storage period:-

Measurement of viscosity of protein samples has been used to determine the protein denaturation. A plot of frozen storage period vs apparent reduced viscosity at a single protein concentration (3 mg/ml) was obtained (Fig. 2a). All the three frozen stored samples initially showed an increasing trend and later the value decreased. The decrease was more rapid in washed meat samples without cryoprotectants. Denaturation of myofibrillar proteins lead to changes in viscosity due to the change in particle axis ratio (Suzuki, 1981). It could be seen that proteins from washed meat with cryoprotectants had minimum change in reduced viscosity profile at single protein concentration during different periods of frozen storage. This is due to the preferential hydration of protein molecules induced by added cryoprotectants. Similar reduction in apparent reduced viscosity has been reported for horse mackerel, blue whiting and croaker (Colmenero and Borderias, 1983; Basavanagouda, 2001). The apparent reduced viscosity of protein from tilapia clearly indicated that washed meat with cryoprotectant has undergone lesser degree of conformational changes than that of proteins from whole fish and washed meat.

Changes in calcium ATPase activity as a function of frozen storage period:-

The calcium activated ATPase activity which arises from globular head of myosin, S1 fraction is generally taken as an index of denaturation of fish proteins during ice storage and frozen storage (Lehninger, 1993; Lin and Park, 1998). The calcium ATPase activity of WHT, WMT and WMCT as a function of frozen storage period is given in Fig 2b. The reduction in enzyme activity index was higher in whole fish meat than washed meat and washed meat with cryoprotectants. The decrease in ATPase activity of all the three frozen tilapia samples was evident during different periods of frozen storage. Washed tilapia meat with cryoprotectants had a higher activity index during different periods of frozen storage in comparison to whole and washed tilapia meat. The effect of cryoprotectants in minimizing the aggregation/ denaturation is the possible reason for the retention of higher ATPase activity. Ca^{++} ATPase activity of actomyosin from tilapia fillets stored over 2000 atm showed apparently falling trend and the protein denatured evidently (Ko and Hsu, 2002). The present investigation indicates sucrose and sorbitol could minimize the reduction in Ca^{++} ATPase activity during frozen storage by retarding the deteriorative reaction. Similar observations have been recorded for frozen stored tilapia (*Sarotherodon nilotica*) meat added with cryoprotectants (Zhou et al., 2006).

Changes in modori inducing protease (MIPase) activity as a function of frozen storage period:-

The MIPase are group of cathepsins present in muscle cell, hydrolyzing myofibrillar proteins or any other suitable substrates. The modori inducing protease activity of tilapia samples during different periods of frozen storage is given in Fig. 2c. The activity of enzyme decreased with increase in frozen storage period and relatively higher activity was observed in whole fish meat. It is evident that the initial MIPase activity of WHT was significantly higher than that of WMT and WMCT. It clearly suggests that MIPase activity is associated with sarcoplasmic fraction of the muscle and hence reduction in activity was observed in washed meat because of washing. Degradation of protein network during gelation process by cathepsin has been studied extensively. Tilapia surimi is known to have high proteolytic activity at 60°C (Yongsawatdigul et al., 2000). Sarcoplasmic fraction and MIPase activity are associated hence, washing reduces the MIPase activity.

Changes in gel filtration profile as a function of frozen storage period:-

Changes in gel filtration profile of WHT, WMT and WMCT samples during different from storage periods are given in Fig. 3. The gel filtration profile of total proteins from WHT showed more of low molecular weight components at the initial stage with further marginal increase in the high molecular weight components with progressive storage up to 90 days after which a gradual decrease in concentration was observed. The elution volume of high molecular weight fraction was shifted from 67.89 ml in the fresh sample to 90.65 ml at the end of 240 days of storage. At the end of 360 days of storage the elution volume was shifted to 74.4 ml. This clearly demonstrates that there is initial dissociation after which the association phenomenon has taken place. Altered elution profile indicated association-dissociation phenomenon (Binsi et al., 2007). In WMT sample, decrease in high molecular weight components at the end of 240 days storage period was recorded whereas WMCT sample revealed increase in high molecular weight components up to 90 days followed by low molecular weight components during storage period. WMT sample showed the dissociation phenomenon immediately after freezing whereas, WMCT sample exhibited relatively higher concentration of high molecular weight components throughout the storage period. The indication of high molecular weight components at relatively higher concentration indicated lesser extent of degradation. The data

obtained on apparent reduced viscosity and gel filtration profile supported that there is a minimum conformational change in proteins in WMCT than WHT and WMT. Structural change of proteins during frozen storage was evident from reduced viscosity and gel filtration profile. Changes in protein structure as a function of frozen storage of common carp meat, tilapia were also reported (Ganesh et al., 2006; Murthy et al., 2011). Peak reduction may be attributed to removal of free amino acids, peptides and other low molecular weight compounds (Suvanich et al., 2000).

With the increasing production of tilapia catch, it is necessary to think towards better utilization of tilapia in order to get higher economic returns. Better utilization relies on understanding of fish in relation to the protein properties. Properties of proteins exhibited changes in structure as evident from gel filtration profile and apparent reduced viscosity values in all the samples namely whole fish, meat without and with cryoprotectants as a function of frozen storage. In order to utilize the catch throughout the year, use of cryoprotectants and frozen storage play an important role. Water washed frozen stored tilapia meat with cryoprotectants could be used in product development.

Abstract

The study was conducted to investigate the Ethnobotanical Study and Conservation Status of Medicinal Plants in and around Yayo forest. The purpose of the study was to document and analyze information on the use, conservation and sustainable use of medicinal plants. Data collection was accomplished through active participation of healers and familiar elders who practice traditional medicine locally. A variety of Ethnobotanical techniques were used to collect the data: semi-structured interview, field observation and group discussion. Data were analyzed quantitatively and by Microsoft office excels. A total of sixty nine (69) plant specimens belonging to thirty four (34) families and sixty one (61) genera were documented and identified both in the field and the National Herbarium, Addis Ababa University. From the total documented medicinal plant species, about 42.63% are used to treat human ailments while 36% are used to treat livestock ailments and 22.27% are used to treat both livestock and humans. Among the documented families, family Fabaceae had the highest species richness followed by Asteraceae, Euphorbiaceae, Lamiaceae, Moraceae, and Poaceae. To protect and conserve this forest, appropriate management strategy and awareness creation is very crucial. As it was recommended, some cultural believes and traditional practices associated with traditional medicines were found to be contributed much for the conservation of medicinal plants in the study area.

Introduction:-

Ethnobotany is a multidisciplinary science defined as the interaction between plants and people or the study of the relationship between plants and people: From "ethno" - study of people and "botany" - study of plants (Debela Hunde, 2001). It focus on how plants have been or are used, managed and perceived in human societies and includes plants used for food, shelter, medicine, divination, cosmetics, dyeing, textiles, for building, tools, ornamentation, currency, clothing, rituals, social life and music (Choudhary *et al.*, 2008).

Basic quantitative and experimental ethnobotany includes basic documentation, quantitative evaluation of use and management and experimental assessment. Today, ethnobotanical surveys include applied projects that have the potential to improve poverty levels of these people, allowing them to make more educated decisions about their

future directions (Graves, 1996). These new approaches enhance the quality of the science, provide compensation for the cultural groups and take into account environmental concerns.

This modern approach is based on an interdisciplinary team usually composed of an Ethnobotanist, an anthropologist, an ecologist and a physician (Etana Tolasa, 2007). The preliminary results of a study on behalf of WHO has shown that the number of individuals using medicinal plants is large and on the increase, even among young people. It is not just in developing countries that medicinal plants are important (Endalew Amenu, 2007).

Medicinal plants and traditional medicine play an important role in the health care system of most developing countries. In Ethiopia about 80% of human population and 90% of livestock rely on traditional medicine (Choudhary *et al.*, 2008). In light of the importance of these resources that provide the health care needs for the majority of human and livestock population in Ethiopia, and also the fact that medicinal plants could be used as sources of revenue for farmers (STCP, 2005). Efforts made to conserve forests in general and medicinal plants in particular. However, it did not have significant impact as they did not take into account the interests of the local community by failing to include farmers in decision making processes (Teklu Tesfaye and Thomas, 2004). Lack of continuity of the already initiated conservation efforts, tenure insecurity, lack of awareness and participation by local communities in different project phases, impacts of population growth and resettlement are the major factors contributing to forest degradation (STCP, 2005).

Today many medicinal plants face extinction or severe genetic loss, but detailed information is lacking. For most of the endangered medicinal plant species no/less conservation action has been taken (Erlangung and Fakultat, 2009). Therefore, this study was designed to give scientific information and methodology on how to use medicinal plants in sustainable manner and how to conserve these medicinal plants.

Materials and Methods:-

Study Area:-

The research was conducted at Yayo district particularly in and around Yayo forest, which is found in Ilu Abba Bor zone, Oromia Regional State that is found at 564 km Southwest of Addis Ababa, the capital City of Ethiopia and 36Km from the zonal capital of Mettu Town. The study area is located between 8°2'42" North and 8°31'18" North latitude and 35°37'48" East longitude. The district has a total area of 162,901 hectares (1,629.01km²) that constitutes 9.97 percent of the total land of the zone.

Yayo is one of the few areas in the country that is endowed with a variety of vegetation types including few species found only in Ethiopia. This forest covers about 90,890.7 hectares constituting 58.8 percent of the total area of the district. Yayo forest represents the largest (10,000 ha) undisturbed forest fragment kept for the conservation of wild *Coffea arabica* population earlier identified as a potential Coffee gene reserve (Teklu Tesfaye and Thomas, 2004). The mean annual temperature is about 23°C ranging between 18.59°C mean minimum annual temperature and 27.88°C mean maximum temperature. The physical conditions and variations in altitudes have resulted in a great diversity of Climate, Soil and Vegetation which in turn, has brought about the evolution of many plant species with large diversity. The rainfall pattern of the districts varies annually from 1,191.6 to 1,960.7mm showing variations from year to year. It is a unimodal type of rainfall that increases from May to October and declines in November. The district has three agro-climatic zones which includes highland (*Badda*); temperate (*Badda-daree*) and lowland (*Gammoojji*). Such diverse climatic conditions and habitats partly contributed to the occurrence of high species diversity in plants and animals, making Ethiopia.

Study Design:-

Materials used for the study was Plant cutter, Plant frame, Magazine, Blotter and Belt. The interview of key informants, focus group discussion, direct observation, and household survey were the main techniques used in the primary data collection. In-depth interview was conducted with experts and professionals at different levels of administrative staff, community representatives, elders, traditional healers and farmers. The plant specimens were identified in the field and by consulting experts. In addition to this it was compared with plants specimens which was already collected and identified from different parts of the country and found in the National Herbarium of Addis Ababa University, Ethiopia; and by referring the flora book of Ethiopia and Eretria. The name of family, genus and species as well as growth habit were identified and recorded.

Methods of Data Collection:-

Quadrants Methods: Quadrants (20m×20m or 400m²) in size were laid down purposefully along transects at 100 meters distance in three sites which was randomly selected in the site of study area for collecting of plant specimens. Frequency of medicinal plant individuals were counted and recorded. GPS was used to record the data of altitude, latitude and longitude of each quadrant of the study area. The collected data were recorded, summarized and entered into Microsoft offices excel for analysis. In the case of data analysis different methods for analyzing of quantitative data were used.

Results:-

Medicinal Plant Resources of the Study Area:-

A total of 69 medicinal plants were recorded in the sites of study area. Out of these collected and identified plant species, the greater numbers of Medicinal plants were from the wild vegetation. These species belong to thirty four (34) different families and sixty one (61) genera. Among these thirty four (34) families, family Fabaceae was represented by ten (10) species followed by Asteraceae, Euphorbiaceae, Lamiaceae, Moraceae, and Poaceae were represented by four (4) species for each. Family Meliaceae was represented by three (3) species while Acanthaceae, Boraginaceae, Malvaceae, Musaceae, Myrtaceae, Rutaceae, Verbenaceae and Zingiberaceae were represented by two (2) species. The remaining sixteen families had one (1) species each (Figure 1).

Figure 1:- The families' name with total number of individuals documented in the study area

The result point out that relatively more family Fabaceae were found at the sites of study area and they are used as medicinal values for treatment of disease for both human beings and livestock compared to the remain families. Concerning habit diversity; herbs were the most common and stood first with (23 species), followed by trees (22 species) and shrubs (19 species, and climbers (2 species) and the remaining were like epiphytes.

From the total documented medicinal plant species from the study area, about 42.63% were used to treat only human ailments while about 36% were used to treat livestock ailments and about 22.27% were used to treat both livestock and humans. The sustained existence and utilization of such a large number of medicinal plants by people in the study area indicates that the majority of the people used and continued to use indigenous medicinal practices for different ailments (Table 1).

Table 1:- The percentage use of medicinal plants to treat various ailments found in the study area

Useful Medicinal Plants to Treat Various Ailments	Total percentage
To treat human ailments	42.63%
To treat livestock ailments	36%
To treat both humans and livestock	22.27%

From 69 plant species, 29 plant species were used to treat human ailments while 25 plant species were used to treat livestock ailments and 15 plants species were used to treat both humans and livestock respectively (Figure 2).

**Figure 2:-** The number of useful medicinal plants used for treatment of various ailments

Threats and Conservation of Medicinal Plants:-

Threats to Medicinal Plants:-

The cause of threats to medicinal plants can be generally grouped in to natural and human induced factors. However, as reported in this study most of the causes for the threats to medicinal plants and associated knowledge were the anthropogenic factors such as deforestation due to over exploitation of plants for different uses/charcoal, fire woods, construction woods, overgrazing, cutting and burning of plants to create new agricultural lands ,medicinal plants trade for different uses and others.

The results of the present study showed that agricultural expansion, fuel woods (charcoal and fire woods), harvesting for construction and urbanization and over grazing and medicinal plants for the threats to medicinal plants and associated knowledge of the plants in the study area. The other reason for the threats of the knowledge of medicinal plant was modernization and refusal to practice/ inherit the knowledge by new generation. As reported by the informants, the expansion of modern health institutions, schools some environmental and cultural modifications reason for the losses (threats) of the knowledge of medicinal plant.

Figure3:- Collecting of plants for firewood and other purposes by local community.

Discussion:-

Medicinal principles are present in different parts of the plant like root, stem, bark, heartwood, leaf, flower, fruit or plant exudates. These medicinal principles are separated by different processes; the most common is being extraction. Extraction is the separation of the required constituents from plant materials using a solvent (Paroda, 1993).

Descriptions of the most frequently reported medicinal plants used to treat different ailments

***Vernonia amygdalina* Del. (Astraceae) Eebicha (Afaan Oromoo):-**

Is shrub or small tree usually branched from near the base and it is 2-10m high. The leaves are used to wash the materials during the preparation of locale beer (Tella) and katikala (Areke) with that of *Rhamnus prinoides*. In Ethiopia it is found in many parts including Bale, Gamo-gofa, Gonder, Gojam, Tigray, Shewa, and Ilu Abba Bor (Edwards *et al.*, 2000). Elsewhere in Ethiopia, the leaves and bark are bitter and used in local medicine for instance, in the study area it is used for the treatment of skin infections and sudden sickness (Dhukkuba tasaa).

***Solanum incanum* L (Solanaceae) Hiddii (Afaan Oromoo):-**

Solanum incanum is a shrub up to 1.5m high, but often less, seasonally deciduous, found in heavily grazed areas, Waste places, in altitude of above 2100m, Solanaceae. In Ethiopia it is found in Gonder, Sidamo, Bale, Shewa, Tigray, Gamo-gofa and Ilu Abba Bor. This form is common in Somalia and the Sudan and widespread in tropical Africa, the Middle East and India (Edwards *et al.*, 2000).

***Ocimum lamifolium* Hochst .ex Benth. (Lamaceae) Damakesee (Afaan Oromoo):-**

Is sub shrub or shrub, 0.7-3m tall a very common species of primary and secondary mountain forest and Bush lands, tall grasslands, rarely also cultivated as an ornamental. In Ethiopia it is found in Gojam, Gonder, Kefa, Shewa, Ilu Abba Bor, and Wollega. In Africa it found in East Africa, Malawi, Democratic republic of Congo and Cameroon (Edwards *et al.*, 2000). In the study area this plant is used for treatment of head ache, eye infection and other related diseases.

Descriptions of the most frequently reported medicinal plant species used to treat livestock:-

***Nicotiana tabacum* L. (Solanaceae) Tamboo (Afaan Oromoo):-**

An erect and it is annual or biennial herb growing to 2.5m high. It is a cultivated plant in home gardens in some parts of the country and sometimes escaped into waste ground and along streams at altitudes range of between 1700 and 2400m, Solanaceae. In the study area, it is found in farmers' home garden or under the shade of life fence. It has a medicinal use for internal parasites, Trypanosomiasis, eye infection and headache. The local people use this plant

to treat for human disease). Leaf of *Nicotiana tabacum* is pounded with root of *Carissa spinarum*, mixed with water and cup of tella given to patient. In addition, dried and powdered leaf of *Nicotiana tabacum* sniffed by human for relive to headache, and its leaves with the leaves of *Capparis cartilaginea* used to treat cough.

Descriptions of the most frequently reported medicinal plants used to treat both human and livestock disease ***Croton macrostachyus* Del. (Euphorbiaceae) Bakkannisa (Afaan Oromoo):**

It is shrub or tree, 2-25m long. Found in forest margins and secondary woodlands, extending in to disturbed areas and along edges of roads, mostly in soils of volcanic origin, an altitude range so far recorded for the plant is 500-2350m, Euphorbiaceae. In Ethiopia, this plant is found in Tigray, Gonder, Gojam, Wello, Shewa, Arsi, Wollega, Ilu Abba Bor, Kefa, Sidamo, Bale and Harerge. In Africa it is distributed west to Guinea, south to Angola, Zambia, Malawi and Mozambique (Edwards *et al.*, 2000). The stem bark of this species is also known for its medicinal value in treating leprosy. In the study area this plant is more effective for the treatment of ringworms, gonorrhea and rabies.

***Phytolacca dodecandra* L.Herit. (Phytolaccaceae) Handodee (Afaan Oromoo)**

It is semi- succulent, scrambling shrub to 10m tall or more. It grows in ever green bush lands, forest edges and distributed places in altitudinal range of 1500-3000m, Phytolaccaceae. In Ethiopia, this plant is found distributed in Tigray, Bale, Gamo-Gofa, Gonder, Wollo, Gojam, Wellega, Shewa, Ilu Abba Bor, Kefa, Arsi, Sidamo and Hararge regions. It is also found in other African countries in Eritrea, Madagascar and in tropical and South Africa. It is widely used as soap specially for cleaning cotton cloths, also as Molluscicides for the control of the snails that are vectors of Bilharzias. The importance of this plant due to molluscidal properties has led to setting up of the Endod Foundation, with its head quarter in Addis Ababa. Endod varieties with high molluscidal content have been identified and are now being cultivated by farmers. In the study area this plant is used for treatment of malaria and rabies (Edwards *et al.*, 2000).

Conservation of Medicinal Plants:-

Although various threats have profound effect on medicinal plants, local people attempt to grow medicinal plants in home garden though the effort is minimal. For instance, some people and/ or office have started conserving the plants by in-situ method (in original/natural habitat), fenced/protected pasture land at different worship areas (churches, mosques, etc) in their (farms' field/farm margins and so on. And also conserving by ex-situ method/ outside the original/ natural habitat/ like in and around their farmers' home gardens, live fences of the gardens, plantation fields, and so on were started in the study area. As reported by Moa Megersa (2010), home gardens are central target for in-situ and ex-situ conservation of traditional medicinal plants.

Conclusions:-

The study reported that medicinal plants have revealed that there was an insight of the local indigenous knowledge on the utilizing of medicinal plants from the study area. The study was also inferred that sixty nine (69) different plant species belonging thirty four (34) families and sixty one (61) genera were identified and recorded. Of these different families documented; family Fabaceae was found to be represented by ten (10) species followed by Asteraceae, Euphorbiaceae, Lamiaceae, Moraceae, and Poaceae were represented by four (4) species for each. Family Meliaceae was represented by three (3) species while Acanthaceae, Boraginaceae, Malvaceae, Musaceae, Myrtaceae, Rutaceae, Verbenaceae and Zingiberaceae were represented by two (2) species. The left over families had one (1) species for each.

Out of sixty nine documented medicinal plant species from the study area about 29 (42.63%) of them were found to be used to treat human ailments while about 15 (36%) were used to treat livestock ailments and about 25 (22.27%) were used to treat both livestock and humans. The main use of medicinal plants are to treat human diseases than livestock ailments by local people as they pointed that; the local communities of the study area seek to find traditional medicine for their ailments first and then after for livestock ailments. Consequently, the local people possibly gained smaller understanding of medicinal plants to treat livestock ailments than knowledge of medicinal treating human ailments. Some local communities are knowledgeable about the use and conservation of medicinal plants. This is due to a given Indigenous practices somewhat contributed to the sustained use, management and conservation of medicinal plants and multiple use of indigenous trees. Traditional medicinal plants harvested mostly from wild followed by home gardens. Furthermore, the use of medicinal plants for different purposes in addition to their medicinal value such as charcoal and firewood, construction, useful materials and other anthropogenic activities. Thus, directly or indirectly leads to threat medicinal plants. Regardless of this fact, traditional healers still

depend to a greater extent on naturally growing species, as they believe those species in the wild vegetation are more powerful in the treatment of different ailments and health problems.

The results of the study also revealed that many wild species of medicinal plants are under pressures from various human induced factors. In addition, disinterest of young generation on traditional medicine; put the continuity of traditional medicinal knowledge under question. Because of young generation shows lack of attention to make use of and to be aware of medicinal plants from elder, the knowledge of traditional medicine possibly get rid of in the near future except that appropriate documentation is made. Furthermore, creation of awareness for young generation and other concerning body about medicinal plant uses and how elders used traditional plants to be continued to treat their livestock ailments, human ailments in proper manner and to use it in sustainable manner for future generation as well.

Acknowledgement

We would like to express our sincere appreciation to Mettu University and the researcher coordinator for the financial support during this study. We are thankful to the local communities of the district, Ilu Abba Bor Forest Management enterprise institution and other organization for their providing the necessary information about Yayo forest on the study area during data collection. We are gratefully acknowledged the late Prof. Ensarmu Kalbessa for his providing moral, constructive advice and guidance when the plants specimen identification was carried out. My thanks also extend to members of National Herbarium, Addis Ababa University, for their support throughout plant identification.

Key words:-

Emergence agitation, deep sedation, tooth extraction.

Abstract

Purpose: Emergence agitation (EA) is a condition where factors associated with patient, surgery and anesthesia play role in occurrence, and that may occur in any age groups—particularly well-defined in children and delay discharge. Emergence agitation has been investigated for medical interventions under general anesthesia in children, but not for dental treatment under deep sedation. The objective of this study was to investigate the incidence of EA in pediatric cases scheduled for tooth extraction under deep sedation and its relationship with drugs for sedation.

Materials and Methods: 120 cases, less than 12 years old and in ASA I-II group according to “American Society of Anaesthesiologists (ASA)” risk classification were scheduled for elective tooth extraction under deep sedation without premedication. The patients were admitted in operating room just according to our anesthesia protocol. With the aim of achieving Richmond Agitation Sedation Scale (RASS)=(-4), In Group K who allowed IV (Intravenous) cannula insertion: 2-3 mg.kg⁻¹ IV Ketamine was administered. In Group KM who also allowed IV cannula insertion: 0.5 mg of Midazolam was added to 2-3 mg.kg⁻¹ IV Ketamine. In Group S: 8% Sevoflurane in 50% O₂/N₂O through face mask (connected to a Mapleson C circuit) was administered to the Group S who did not allow inserting IV cannula. Detecting the RASS as -4 local infiltration anaesthesia was applied for the extraction of associated teeth. Following the procedure recovery was evaluated at T₀, than 15 min. later (T₁₅), 30 min. later (T₃₀), 45 min later (T₄₅), 60 min later (T₆₀) with RASS.

Results: The RASS values at T₀ were statistically significantly higher in Group K than those of other groups. No significant differences were found between groups for RASS mean at T₁₅ RASS values at T₃₀, T₄₅, T₆₀ minutes were statistically significantly lower in Group S than Group K and Group KM.

Conclusions: We concluded that use of ketamine alone or in combination with low dose of midazolam for short-time surgical procedures did not cause agitation compared to sevoflurane, increased

quick recovery and child-parent satisfaction and efficiency of operating room.

Introduction:-

Dental fear and anxiety complicates and sometimes even makes treatment impossible in children (1). It is required to use sedation or general anesthesia in patients for whom dental treatment cannot be performed under local anesthesia and behavioral and psycho-pedagogical techniques remain inadequate (2, 3). The sedation is a method that is often used for dental treatment of children for performing dental treatment in safe and comfortable conditions; reduces the time apart for the child-parent and the occupancy time of patient beds, and increases the efficiency of operating room. The sevoflurane, midazolam and ketamine are therefore commonly used anesthetics. The sevoflurane is the preferred inhalation agent because it has low solubility and low risk for hepatotoxicity, is less irritant, maintains hemodynamic stability, and results in quick recovery (4, 5). However, the sevoflurane is also reported to cause agitation more often in pediatric patients than other anesthetics during recovery from general anesthesia (5, 6). The ketamine is a non-competitive N-methyl-D-aspartate receptor antagonist that is commonly used anesthetics for outside anesthesia. Ketamine allows for sedation, analgesia and amnesia without suppressing the functions of respiratory tract and circulatory system (7). But, hallucinogenic properties of the ketamine is its unwanted effect. Midazolam is one of the benzodiazepine class sedative, and dose-dependent, anxiolytic, sedative-hypnotic and safely used with presence of specific antidote, working by increasing GABA activity in the central nervous system (8). However, low doses of midazolam is reported to cause agitation not sedation in some cases (9).

The EA was first defined in 1960 and is a problem that occurs within the first 30 minutes after surgery, often spontaneously improves within 15 minutes, includes disorientation, agitation, delusion, hallucination, discomfort, unstoppable crying, cognitive changes and impaired memory, and delays the discharge (9-13). It has been reported that selected anesthetics may play role in the incidence of EA in general anesthesia practice for medical reasons (9). Although there is not only one cause for EA, it is important to know the risk factors causing this condition in order to reduce the contributing factors and treat it (7). The factors playing role in occurrence of EA may be grouped in association with patient, surgery and anesthesia (9). The EA has been investigated in detail in the literature for the pediatric population and medical procedures performed under general anesthesia (e.g., strabismus surgery, adenotonsillectomy), but it has not been sufficiently studied for the dental treatment performed under deep sedation (9, 13, 14). Therefore, the objective of this study was to examine the characteristics of postoperative recovery for evaluating the incidence of EA and its relationship with drugs used for anesthesia in pediatric cases scheduled for tooth extraction under deep sedation (15).

Materials and Methods:-

With the approval of local ethics committee of Faculty of Dentistry, Ankara University, this study was performed with data of 120 cases, less than 12 years old, ASA I-II group according to 'American Society of Anesthesiologists (ASA)' risk classification, who were scheduled for tooth extraction under deep sedation because it was not possible to perform tooth extraction under local anesthesia. The informed consent form was read and signed by the children's parents.

The cases whose parents did not provide informed consent, who had drug allergy, mental-motor retardation, uncontrolled systemic disease and psychiatric complaint or diagnosis, and were on antiepileptic or sedative medication and above 12 years of age were excluded from the study.

Patient's age, body weight (kg), height (cm), ASA risk group and number of teeth extracted were recorded in the study protocol. The anesthesia protocol used for tooth extraction in our clinic was followed. After 6-hour fastening time, a topical anesthetic (EMLA®) was applied on the hand dorsal surface of all cases 30 minutes before transferring them to the operating room. All the cases were transferred to the operating room without premedication. Group K allowed to insert intravenous (IV) cannula and intravenously received 2-3 mg.kg⁻¹ of Ketamine (Ketalar®, Pfizer, 50 mg ml⁻¹, Istanbul, Turkey). Group KM (Ketamine-Midazolam, n=40) intravenously received 0.5 mg Midazolam (Dormicum®, Roche, 5 mg.ml⁻¹, Fontenay-sous-Bois, France) in addition to 2-3 mg.kg⁻¹ of Ketamine. Group S disallowed to insert intravenous cannula and received 8% Sevoflurane in the 50% O₂/N₂O (Sevoflurane®, Abbott, Italy) through a face mask (connected to a Mapleson C circuit). The aim was to achieve Richmond Agitation SedationScale(RASS, Table 1): -4 (deep sedation) in all of the groups. Research method was planned to obtain

(RASS: -4) sedation level. For that reason if we could not obtain RASS = -4 level, another doses of ketamine (0.05 mg kg⁻¹ iv ketamine in Group K, KS) or additional Sevoflurane (in Group S) inhalation was planned. The EA was assessed another anesthesia personnel who was blinded to which anesthetic agent was administrated to the patients. The cases were oxygenized through nasal cannula for 4 L/min during the procedure, and noninvasive Systolic Arterial Pressure (SAP), Diastolic Arterial Pressure (DAP), Heart Beat Rate (HR), and peripheral oxygen saturation (SPO₂) were monitored. When desired sedation level (RASS=-4) was obtained, dental surgeon performed infiltration anesthesia (Ultrakain DS[®], 1 mL/40 mg Articaine hydrochloride+0.006 mg epinephrine hydrochloride, Sanofi Aventis, Istanbul) on the teeth planned for extraction, and then dental procedure was performed. The anesthetic gasses were terminated in Group S when RASS was -4; spontaneous breathing was maintained and oxygenation through nasal cannula was performed during the procedure. Anesthetic agents were administered performed by Anesthesiologist to obtain RASS=-4 level. Doses of anesthetics, procedure time and unwanted side effects were recorded by same Anesthesiologist. At the end of the procedure, another anesthesia personnel (allied health staff) who were blinded groups were recorded RASS at minute 0 (T₀) in the operating room and the RASS at minutes 15., 30., 45. and 60. [respectively (T₁₅), (T₃₀), (T₄₅), (T₆₀)] were recorded in the wards with parents. The cases numbered for 2 months were grouped by the anesthetist according to anesthetics administered, and the data of first 40 cases in each group was included in the study.

Statistical Analysis:-

The data was analyzed using SPSS version 20.00. The descriptive analysis was performed to determine mean and standard deviation of data. ANOVA was used to analyze intergroup differences. Tukey test was performed to analyze differences between groups that had equal variances, and post hoc Dunett's test was performed when the variances were not equal between the groups. Normal distribution of data was assessed by Kolmogorov Smirnov test and the data had normal distribution ($p < 0.005$). The homogeneity test was performed to determine whether or not intergroup variances were homogeneous.

Results:-

The data of all cases (n=120) was included in the study. The groups were created according to anesthetics administrated in accordance with our clinical protocols (Group K: Ketamine, n=40, Group KM: Ketamine + Midazolam, n=40, Group S: Sevoflurane, n=40).

No statistically significantly differences were found in comparison of groups for height, body weight, procedure time, and number of teeth extracted. In comparison of groups for the age of cases, the age of cases in Group KM was statistically significantly higher than that of cases in Group K ($p < 0.05$). No significant differences were found between the Group KM and the Group S (Table 2).

In comparison of study groups for RASS, statistically significantly differences were found between the groups ($p < 0.001$). The RASS values at minute 0 were statistically significantly higher in Group KM than that of other groups. While no statistically significantly differences were found between the groups for mean RASS at 15, the RASS values at minute 30., 45. and 60. were statistically significantly lower in Group S (Table 3).

Comparison of groups by number of cases in RASS score groups (Table 4, 5, 6, 7, 8 and Graphic 1)

Discussion:-

In the study groups, the targeted sedation level [RASS=(-4) score (deep sedation)] was achieved with anesthetics administered and the tooth extraction was successful in all of the cases.

RASS was used by *Kerson et al.* (15) to assess consciousness and awareness in the pediatric population, to titrate sedative agents, and to evaluate childhood delirium, and is one of the validity and safety proven scales that is intuitive, easy to use, includes agitation and sedation scales together, and has the highest adaptation among practitioners (16). The score "0" represents ideal level on the scale, and the values up to "+4" represent increasing agitation, and values up to "-5" represent increasing sedation level (17).

According to the memorandum published by ASA in 1999 and revised in 2004, the *deepsedation* is a sedation manifestation during which consciousness is depressed by or totally disappears by drugs, defense reflexes are partially maintained, patients cannot be easily aroused and occasionally respond to physical and verbal stimulus,

interventions may be required to maintain the airway patency and spontaneous ventilation but no cardiovascular functions are affected (18).

Our clinic practice aims at RASS:-4 (deep sedation) to achieve a proper mouth opening during dental treatment and successfully perform the procedure. We obtained RASS:-4 level in all of the cases, started the procedure and extracted the teeth without any undesirable effects. Upon completion of the procedure, we assessed the emergence agitation with RASS.

The factors establishing the incidence and severity of EA are multifactorial (7). However, one of the factors contributing to the development of EA is *anesthesia time*. No statistically significant differences were found between the groups for the procedure time and number of teeth extracted (7,9, 12, 14).

Children with EA are unaware of the things around them and cannot be calmed by parents and other caretakers (19). Literature reports that EA mostly occurs between the ages of 2 and 5, but preschoolers are at risk (7, 9, 20, 21). In comparison of study groups by mean age, the age of cases in Group KM was statistically significantly higher than that of cases in Group K ($p < 0.05$), but not different from the Group S (Table 2). After the procedure was completed, 12.5% of cases in Group S were agitated, 22.5% of cases were restless at minute 0 (Table 4). None of the cases in two other groups were agitated from the completion of procedure and to the discharge. In our opinion, this may be due to anesthetics selected as well as the age characteristics of children.

One factor responsible for EA is personality traits of child and stressed induction of anesthesia (11). The children in all groups were the cases for who tooth extraction was attempted under local anesthesia but could not be performed due to dental anxiety and fear. Therefore, the fear and anxiety level of all cases in the study was higher than those who were treated under local anesthesia. Kain *et al.* (22) concluded that there was a relationship between the preoperative anxiety and the postoperative behavior disorder. The cases in Group KM and Group K allowed intravenous cannulation but not the cases in Group S, and the number of agitated and restless cases in Group S was greater. We therefore judge that preoperative anxiety level may have an effect on the development of EA.

Another responsible factor among other factors causing EA is the presence of pain (9, 21). However, the surgeon performing the procedure administered infiltration anesthesia to all the cases during tooth extraction, and none of the cases complained about the pain for 60 minutes after the procedure.

Another factor that is associated with EA is a noisy environment distant from family (9, 12, 20, 21). During the study, deep sedation was administered in a quiet and peaceful environment and all the cases were exposed to the same conditions.

The other factors that increase the incidence of EA include quick recovery of patients and possibility of airway obstruction. All of the cases included in this study were in the ASA I risk group and none of them had systemic diseases that might cause airway obstruction. We oxygenated our cases in 4L/min through nasal cannula during the procedure and did not have airway obstruction that might disturb the oxygenation or similar unwanted side effects. When we examine the groups for quick recovery of consciousness in an environment without family, we consider that anxiety caused by preoperative dental anxiety and fear was quickly remembered because midazolam had amnesic effects that was used in standard dose in addition to Ketamine in Group KM, Ketamine used in Group K had amnesic effects, and had no such effect in Group S; therefore the number of agitated and restless cases in Group S was statistically significantly higher than that of other groups.

The factor that is mostly responsible for EA is anesthetics. The pediatric anesthesiologists underline that they observe higher agitation with Sevoflurane and associate this with low blood/tissue solubility and its EEG (electroencephalography) changes (6, 23). Işık *et al.* suggested that EA was also observed for administration of sevoflurane for MRI where no surgical intervention was performed (24). Cravero *et al.* (25) compared the sevoflurane and halothane anesthesia in children who underwent magnetic resonance imaging, and reported that no agitation was observed in cases received halothane and that 33% of cases received sevoflurane had agitation. The authors concluded that quicker recovery with sevoflurane and sudden awakening of child in a foreign environment resulted in agitation. The studies comparing propofol and sevoflurane reported that recovery was quicker with propofol and the agitation was higher in the sevoflurane group (26, 27). In the present study, 55% of cases in Group K, 20% of cases in Group KM and 0 case in Group S were alert and calm following completion of procedure. The

recovery was quicker in Group KM and Group K than that of Group S, and the number of agitated and aggressive cases was higher in this group as compared to two other groups. Therefore, we consider that recovery time may have an effect on the EA.

There are contradictory data for premedication with midazolam: a number of studies suggest that it is effective in reducing preoperative anxiety and EA in children received anesthesia with sevoflurane (28). Despite this, *Cole et al.* pointed out that EA was higher after isoflurane and halothane anesthesia in children received midazolam for premedication (30%-40%)(19). They explained that this might be due to a gap caused by midazolam in the memory of children, sudden awakening in an environment that was totally strange to children, and an intense sense of fear accompanied by irritating stimulus. *Shrestha S et al.* (29) compared placebo and midazolam by orally administering (0.5 mg/kg) paracetamol, and reported that 96.7% of children in midazolam group and 53.3% of children in placebo group were calm when leaving their parents. The authors also reported that induction of anesthesia was calm in 73.3% of children in midazolam group and 33.3% of children in placebo group, and no differences were found between two groups for recovery. *Lapin et al.* (28) and *Ko et al.* (30) reported that premedication with midazolam reduced the EA; *McGraw et al.* (31) reported that it had no effects on the EA, moreover children developed postoperative unfavorable behavioral changes. We administered 0.5 mg/kg standard dose of midazolam to all of the cases in Group KM in addition to ketamine. We found that less cases were alert and calm and more cases were drowsy and sedated at minute 0 according to RASS at the end of procedure compared to the group received Ketamine alone (Group K). We judge that standard dose of midazolam added to ketamine deepened the anesthesia, slightly prolonged the recovery time, however, we did not have any agitated cases in these two groups for 60 minutes following completion of procedure.

Literature has no studies that evaluate the effect of ketamine on the postoperative agitation in children who underwent dental treatment. On the other hand, there are studies reporting that premedication with ketamine reduced postoperative agitation compared to placebo (7, 32). *Hadi et al.* (7) intraoperatively administered bolus low dose of ketamine to cases undergoing adenotonsillectomy with sevoflurane, and reported reduced incidence and severity of agitation developed with sevoflurane. *Chen et al.* (33) reported that dexmedetomidine and ketamine reduced EA and pain in strabismus surgery. We did not have agitated cases in the groups (Groups KM and K) received ketamine neither.

In comparison of study groups for postoperative RASS values, the cases in Group KM were statistically significantly drowsy at minute 0 compared to the other groups, and we associated this deepened anesthesia with midazolam. In regard to RASS values at minute 30, 45 and 60, we observed that cases in Group S were statistically significantly restless and agitated than other cases. We consider that sevoflurane delays recovery in short-time surgical procedures, which is in consistent with literature, and results in agitation because it has no amnesic effects. Finally, we used anesthetics (Ketamine, Ketamine-Midazolam and Sevoflurane) in cases of tooth extraction to achieve deep sedation, which are not compared alone in the literature for incidence of recovery and agitation. We achieved quicker recovery with ketamine alone (Group K) and did not have any agitated cases. We concluded that use of ketamine alone or in combination with low dose of midazolam for short-time surgical procedures did not lead to agitation compared to sevoflurane, increased quick recovery and child-parent satisfaction and efficiency of operating room, and that preoperative anxiety or agitation level may be an indicator for development of postoperative behavior disorder. However, the limitations of this study include selection of anesthetics according to characteristics of cases and lack of randomization. Secondly, age distribution was not comparable in the groups. Therefore, we consider that postoperative, randomized and controlled studies on similar age groups are needed.

Graphic 1:-Comparison of groups by number of cases in RASS score groups T₀, T₁₅, T₃₀, T₄₅, T₆₀**Table 1 :-**Richmond Agitation SedationScale (RASS)

Numbers correspondings RASS scoring	Scoring	Clinical status
1	+4	Combative
2	+3	Very agitated, aggressive
3	+2	Agitated (frequent non-purposeful movement)
4	+1	Restless
5	0	Alert and calm
6	-1	Drowsy
7	-2	Light sedation
8	-3	Moderate sedation
9	-4	Deep sedation
10	-5	Unarousable

Abstract

Kinetics of oxidation of glycine by permanganate in presence of Palladium(II) catalyst was studied spectrophotometrically. It was found that the reaction exhibits first order dependence on [catalyst] & [oxidant] and less than unit order in [glycine] and [alkali]. The data suggests that oxidation proceeds via formation of a complex between the substrate and the catalyst, which then reacts with one mole of permanganate in a slow step to form a glycine free radical followed by a fast step to yield the products. The activation parameters of the rate determining step were computed and are discussed. The reaction constants involved in the mechanism were calculated and there is good agreement between observed and calculated rate constants under different experimental conditions.

Introduction:-

The kinetic investigations on the oxidation of amino acids are important because of their biological significance and a precise understanding of the mechanism of such biological redox reactions helps in the synthesis of reaction products. Amino acids act as building blocks in protein synthesis and also play a significant role in metabolism. Presently large numbers of oxidation studies on α -amino acids are being carried out using various oxidants. Glycine, is a non-essential, simplest amino acid and mild reductant, requires drastic conditions or powerful oxidants for studying its kinetic behavior. The oxidation of glycine has been studied from mechanistic point of view with potassium permanganate in aqueous phosphate buffers by Joaquin et al [1], where the reaction is auto catalyzed by one of the products, colloidal manganese dioxide. The uncatalyzed and the surfactant catalyzed oxidation of glycine by acidic permanganate [2] have been studied in which the reaction followed first order dependence in both glycine and permanganate. Amino acids have been oxidized by number of reagents [3]. The oxidations of amino acids are of interest as they produce different oxidation products for different oxidants [4, 5]

Permanganate is one such powerful multi-electron oxidant which can exist in various oxidation states, among which +7 is its highest oxidation state, which occurs in the oxocompounds like MnO_4^- , Mn_2O_7 , MnO_3F . Out of which MnO_4^- is the most commonly used well known oxidant species to carry out kinetic studies in acidic, neutral and alkaline media. Oxidation by permanganate ion is used in organic synthesis especially in phase transfer catalysis [6-12].

Palladium (II) is known to catalyze various reactions [10]. Most studies using Palladium (II) as catalyst have been used in the form of Palladium (II) chloride [11] and the nature of its active form in such reaction remains obscure. Hence the effect of chloride on the reactions was studied in order to study the active species of palladium in chloride medium. The uncatalysed reaction of glycine and permanganate has been reported earlier [13]. Here we have described the results of the title reaction in order to know the active species of oxidant, reductant and catalyst in such media and to interpret the possible mechanism.

Results and Discussion:-

Reaction Order:-

As the oxidation of glycine by permanganate in alkaline medium proceeded with a measurable rate in the absence of Pd(II) catalyst, the catalysed reaction is understood to occur in parallel paths. The reaction orders were determined from the slopes of $\log k_c$ versus (concentration) plots by varying the concentrations of oxidant, reductant, alkali and catalyst, while keeping other parameters constant.

Effect of oxidant, Substrate and Catalyst:-

The oxidant permanganate was varied in the range of $0.5-5.0 \times 10^{-4} \text{ mol dm}^{-3}$ and the linearity of the plot of $\log [\text{MnO}_4^-]$ versus Time indicates the order in $[\text{MnO}_4^-]$ is unity. This was also confirmed by varying $[\text{MnO}_4^-]$, which did not show any change in pseudo-first order rate constants k_c (Table 1). The dependence of rate on substrate [glycine] was studied by varying the concentration of glycine in the range of $1.0 - 6.0 \times 10^{-3} \text{ mol dm}^{-3}$ keeping the concentrations of all the other reactants constant at three different temperatures 298, 303 and 308K. The rate increased with increase in [glycine] (Table-1) and the order with respect to [glycine] was found to be fractional. Further, the plots of $[\text{Pd(II)}] / k'$ vs $1/[\text{glycine}]$ (Fig.1) are linear with positive intercepts on rate axis indicating that the reaction obeys Michelis-Menton behavior. The concentration of Palladium(II) catalyst effect was studied by varying the concentration in the range of $(0.2 \text{ to } 2.0) \times 10^{-6} \text{ mol dm}^{-3}$ and it was found that rate constants increased with increase $[\text{Pd(II)}]$. The order in $[\text{Pd(II)}]$ was found to be unity.

Fig 1:- Effect of concentration of glycine on Palladium (II) catalyzed oxidation of glycine by permanganate in alkaline medium

Effect of alkali:-

The effect of alkali on the rate of the reaction was studied at constant concentrations of glycine, permanganate, Pd(II) and ionic strength at 30°C . The rate constants obtained were found to increase with increase in [alkali] (Table 1) and the order with respect to alkali is found to be fractional order.

Fig 2:- Effect of $[OH^-]$ on the pseudo first order rate constant, k' on Palladium (II) catalyzed oxidation of glycine by permanganate in alkaline medium.

Effect of ionic strength:-

The effect of ionic strength on the reaction rate was studied by varying the concentration of sodium perchlorate in the reaction mixture in the range of 0.2- 0.7 mol dm^{-3} at constant [glycine], [permanganate], [Pd(II)] and [alkali]. The rate constants obtained were found to be constant (Table 1) which shows that the ionic strength has negligible effect on the rate of the reaction.

Effect of the product:-

The effect of the product, manganese(VI) on the reaction rate, was studied by carrying out kinetic runs keeping the concentrations of all other reactants constant and varying the concentration of manganese(VI) from $(0.25-2.5) \times 10^{-4}$. The pseudo-first order rate constants thus obtained are found to remain practically constant indicating that manganese (VI), one of the products does not have any significant effect on the rate of the reaction (Table 1).

Test for free radical:-

The free radical test has been carried out by taking glycine, sodium hydroxide in a thumborg tube and acrylonitrile and permanganate in the bent tube. After evacuating the system the solutions were mixed by tilting the tube. The reaction mixture was kept aside and after 24 hours a soft precipitate was observed which indicates the formation of free radical.

Effect of Temperature:-

The influence of temperature on the rate of reaction was studied for the reaction at 25, 30, 35 and 40°C. With varying $[\text{OH}^-]$ by keeping other conditions constant. The rate was found to be increased with increase in temperature. The rate constants, k , for the slow step of Scheme 1 were obtained from the slopes and the intercept of the plots $[\text{Pd(II)}]/k$ versus $1/[\text{OH}^-]$ and were used to calculate activation parameters. The values of k ($\text{dm}^3 \text{mol}^{-1} \text{s}^{-1}$) were 5.2×10^4 , 6.2×10^4 , 7.5×10^4 and 8.32×10^4 at 25, 30, 35 and 40°C respectively. The activation parameters for the rate determining step were obtained by the least square method of plot of $\log k$ versus $1/T$ are given in Table 3 and are good agreement with uncatalysed reaction.

Table 2:- Thermodynamic activation parameters for the Pd(II) catalysed oxidation of glycine by alkaline permanganate at 25°C ($I = 0.20 \text{ mol dm}^{-3}$).

ΔS (kJmol^{-1})	-306.23 ± 1.62	-285.45 ± 1.45

Discussion:-

Glycine, an optically inactive non-essential amino acid exists in the form of zwitter ion(gly) $\text{H}_3\text{N}-\text{CH}_2-\text{COO}^-$ in neutral medium, in the form of the cationic species $\text{H}_3\text{N}-\text{CH}_2-\text{COOH}$ in acid medium and in the form of anionic species (gly-) $\text{H}_2\text{N}-\text{CH}_2-\text{COO}^-$ in alkaline medium. pH metric method using computer augmented programs SCPHD and MINQUAD75[18] has been used to determine the pKa values of glycine for carboxylic acid and amino groups. Glycine exists predominantly in the anionic form, $\text{H}_2\text{N}-\text{CH}_2-\text{COO}^-$ (gly-), under the experimental conditions employed, in presence of alkali.

It is interesting to note that the probable species of Pd(II) chloride in alkaline medium. It is noted that the reaction is not influenced by chloride ions, which is usually expected in Pd(II) catalysed reactions[19]. In alkaline solutions Pd(II) is mostly presented as hydroxilated species, $[\text{Pd(OH)}(\text{Cl})]$, represented by $\text{Pd(II)}^\#$ in **scheme 1**, which is in accordance with earlier work[20] and not as its chloride complex as in the other works[19].

Permanganate acts as powerful oxidant in acid as well as alkaline media. Its oxidation reactions are very interesting because of the several oxidation states to which it can be reduced. The stable reduction product of manganese is largely determined by the pH of the medium.

In solutions of low alkali and in neutral media, manganese (VII) is reduced to manganese (IV) [21, 22].

In strongly alkaline medium ($\text{pH} > 12.5$) permanganate is usually reduced to manganese (VI).

Most of the oxidations by permanganate in neutral and alkaline media proceed through intermediate complex formation between oxidant and substrate [23, 24]. In alkaline medium, MnO_4^- is the only active species of permanganate known to exist. Though oxidations by permanganate involve multi electron changes in neutral and acidic media but in strong alkaline media ($\text{pH} > 12.5$) they involve only one electron change, forming manganese (VI). In the present investigation in the presence of pd(II) catalyst the stoichiometry of the reaction indicates that permanganate is reduced to manganese(VI) state only and no evidence is obtained for further reduction of manganese(VI) by glycine to manganese(IV).

The results suggest that first alkali combines with permanganate to form an alkali permanganate species in an equilibrium step which is also supported by the fractional order of $[\text{OH}^-]$ and reciprocal of Michalis-Menton plot,

which is linear with positive slope (Figure.2). Glycine reacts with Pd(II) species to form complex. The complex further reacts with alkali permanganate in a slow step to form glycine free radical, which further reacts with another permanganate species in a fast step to form the products. Based on these observations the following mechanism has been proposed.

MECHANISM

SCHEME-1

The spectral evidence for such complex is obtained from the UV-Visible spectra of pd(II) and mixture of Pd(II) and glycine. A bathochromic shift λ_{max} 4 nm from 220-224 nm and hyperchromicity at λ_{max} 224-380 was observed. Thus the above scheme leads to rate law given as

$$\text{Rate} = -d[\text{MnO}_4^-] / dt = K K_1 K_2$$

$$\begin{aligned}
 \text{Rate} = -d[\text{MnO}_4^-] / dt &= K K_1 K_2 [\text{gly}] [\text{MnO}_4^-] [\text{Pd(II)}] [\text{OH}^-] \\
 &= \frac{K K_1 K_2 [\text{gly}] [\text{MnO}_4^-] [\text{Pd(II)}] [\text{OH}^-]}{(1 + K_1 [\text{OH}^-]) (1 + K_2 [\text{gly}]) (1 + K_1 [\text{MnO}_4^-]) (1 + K_2 [\text{Pd(II)}])} \quad \text{----- (2)}
 \end{aligned}$$

$$\text{Rate} = \frac{d[\text{MnO}_4^-]}{dt} = \frac{KK_1K_2 [\text{gly}] [\text{MnO}_4^-][\text{OH}^-] [\text{Pd(II)}]}{1 + K_1[\text{OH}^-] + K_2 [\text{gly}]}$$

$$\frac{\text{Rate}}{[\text{Pd(II)}]} = K_{\text{obs}} = \frac{KK_1K_2[\text{gly}][\text{OH}^-]}{1 + K_1 [\text{OH}^-] + K_2 [\text{gly}] + K_1K_2[\text{gly}][\text{OH}^-]} \quad \text{-----} \quad (3)$$

$$\frac{[\text{Pd(II)}]}{K_{\text{obs}}} = \frac{1}{KK_1K_2[\text{gly}][\text{OH}^-]} + \frac{1}{KK_2[\text{gly}]} + \frac{1}{KK_1[\text{OH}^-]} + \frac{1}{K} \quad \text{-----} \quad (4)$$

Rate Law

Further equation (4) predicts the plots of $[\text{Pd(II)}]/k$ versus $1/[\text{glycine}]$ and $[\text{Pd(II)}]/k$ versus $1/[\text{OH}^-]$ (Fig.1,2) is a linear with a positive intercept supports the Pd(II) - Glycine complex, which is reported earlier [25]. Experimentally observed plots are the one similar predicted from the rate equation thus supporting the proposed mechanism. Also the rate constants of the rate determining step, k , are determined from the intercepts of the plots of $[\text{Pd(II)}]/k$ versus $1/[\text{glycine}]$ at three different temperatures (25, 30 & 35°C) and the activation parameters E_a and ΔS^\ddagger are computed using linear least square method and were found to $24.36 \pm 0.03 \text{ KJ}^{-1} \text{ mol}^{-1}$ and $-266.13 \pm 2.62 \text{ JK}^{-1} \text{ mol}^{-1}$ respectively. A high negative value of entropy indicates that the transition state is rigid in nature. This type of radical intermediate has been observed in earlier work [26] on alkaline –permanganate oxidation of amino acids.

Conclusion:-

The observations in the present study reveal that anionic form of glycine, $\text{H}_2\text{N}-\text{CH}_2-\text{COO}^-$ (gly-) and MnO_4^- are the reactive species in alkaline medium and formaldehyde is the product of oxidation. It is interesting to note that the oxidant species $[\text{MnO}_4^-]$ requires a $\text{pH} > 12$ otherwise the system becomes disturbed and the reaction proceeds further to give reduced product of the oxidant as manganese (IV). Pd (II) catalyst is known to catalyze various reactions, especially in alkaline medium. Which catalysis the reaction in a measurable velocity at a concentration of $1.0 \times 10^{-6} \text{ Mol dm}^{-3}$. The active species of the catalyst was found to be PdCl.

Experimental:-

Materials and Methods:-

A stock solution of glycine (E.Merck) was prepared afresh by dissolving in required volume of water and its strength is determined by the acetuous-perchloric acid method [14].

A stock solution of permanganate is prepared by dissolving potassium permanganate in double distilled water. The solution is boiled gently for 15-30 minutes, cooled and filtered through a sintered glass crucible. It is standardized by titrating with sodium oxalate [15].

A stock solution of manganese(VI) is prepared by heating potassium permanganate in 8.0 mol dm^{-3} sodium hydroxide until a clear green color is produced and is standardized spectrophotometrically [16] at 610 nm using a molar absorbance value of $1530 \text{ dm}^3 \text{ mol}^{-1} \text{ cm}^{-1}$. All the chemicals used in this investigation were of analytical grade. Double distilled water is used throughout the investigation. NaOH and NaClO_4 were used to provide required alkalinity and ionic strength respectively.

A palladium(II) stock solution was prepared by dissolving a known weight of palladium(II) chloride (S.D. Fine Chem.) in $0.20 \text{ mol dm}^{-3} \text{HCl}$ and standardized against EDTA [17]. For some kinetic runs in the absence of chloride, the chloride ion in the palladium(II) stock solution was precipitated with AgNO_3 and removed by repeated centrifugation. The resulting clear palladium(II) solution contained less than $5.0 \times 10^{-5} \text{ mol dm}^{-3}$ of Cl^- and Ag^+ . Such extremely low concentrations of Cl^- and Ag^+ were found to have no significant effect on the reaction. The chloride concentration was maintained between 2.0×10^{-5} and $4.0 \times 10^{-5} \text{ mol dm}^{-3}$ with KCl.

Kinetic measurements:-

Kinetic measurements were carried out at $30 \pm 0.1^\circ\text{C}$ in alkaline medium under the conditions [glycine] is tenfold excess over permanganate ion at constant ionic strength. The reaction was initiated by mixing the thermostated solutions of MnO_4^- , palladium(II) and glycine, which also contained the required amount of NaOH and NaClO_4 to maintained requisite alkalinity and ionic strength respectively. The progress of the reaction was followed by measuring the absorbance of permanganate at 526 nm using Milton Roy 1201 UV-VIS Spectrophotometer with 1cm path length glass cells. As no other species except manganese(VII) has any significant absorbance at this wave length under the conditions employed, the absorbance of the solution is taken as the residual concentration of manganese(VII) at time 't'. The plots of log (absorbance) versus time are found to be linear up to 85% completion of the reaction and the rate constants were reproducible within $\pm 5\%$.

The effect of carbonate on the rate of reaction was studied and it is found that added carbonate has no effect on the rate of reaction. The effect of dissolved oxygen on the rate was also studied in the presence of N_2 . No significant result was observed in the presence of N_2 and air. However fresh solutions were used while conducting the experiments.

Stoichiometry and product Analysis:-

In order to identify the products formed, different sets of reaction mixtures containing different reactant concentrations at constant ionic strength and alkali were kept to react at 30°C . After 24 hours the residual permanganate in each case was determined spectrophotometrically at 526nm. The results showed that 2 mole of permanganate consumed 1 mole of glycine according to the equation (1).

The main product formaldehyde is identified by chromotropic acid test [6] in which, a drop of the reaction mixture is mixed with 2ml of sulphuric acid (72% solution) in a test tube and a little of solid chromotropic acid is added. The test tube is heated for 10 minutes in a water bath at 30°C . A bright violet colour appeared in the test tube confirming the presence of formaldehyde as the main product along with ammonia and carbon dioxide, which are identified by Nessler's reagent and lime water respectively and manganate by its visible spectrum. The main product aldehydic was also confirmed by its IR spectrum, which shows a band at $2845\text{--}2019\text{ cm}^{-1}$ due to aldehydic stretching and was found that it does not undergo further oxidation. The concentration of catalyst, Pd(II), remained unchanged at the end of reaction, as found by estimating the palladium as azide complex [17] at 315 nm ($\epsilon = 12000\text{ dm}^3\text{ mol}^{-1}\text{ cm}^{-1} \pm 10\%$).

Abstract

In the modern era, where biology and biotechnology have replaced the chemistry, we are exploring “biological solutions to biological problems.” The breakthrough of stem cells has produced new possibilities in the regeneration of different organs and tissues. The scope of application of stem cells in dentistry is vast and includes continued root formation, in pulp/dentin tissue regeneration, in replantation and transplantation, and reconstruction of the periodontium, in cancer management and research. In few years plenty of studies have been conceded which showed that stem cells and tissue engineering are giving rise to a separate branch termed “Regenerative Dentistry” that will have its own position in future dental practice. This article provides an insight into the various aspects of stem cells therapies in oral mucosal lesions and its future perspectives.

Introduction:-

Stem cells are the precursors of the body tissue which are undifferentiated biological cells that can differentiate into specialized cells and can divide (through mitosis) to produce extra stem cells.^(1,2) They are also defined as immature or undifferentiated cells that are capable of generating daughter cells identical to themselves or of differentiating into diverse cellular phenotypes. These cells are originated in multicellular organisms^(3,4). Human dental tissues have a limited potential to regenerate but the discovery of dental stem cells have developed new and surprising scenario in regenerative dentistry.

History Of Stem Cells:-

Stem cells also known as “progenitor or precursor” cells and are clonogenic cells capable of both self-renewal and multi-lineage differentiation. In 1868 the term “stem cell” for the first time appeared in the works of German biologist Haeckel^(4,5). Wilson coined the term stem cell⁽⁵⁾. In 1908 Russian Histologist Alexander Maksimov postulated existence of hematopoietic stem cells at congress of hematologic society in Berlin⁽⁶⁾. Then the term “stem cell” was proposed for scientific use.

Stem Cell Properties:-

A classic stem cell should possess two properties namely *self renewal* and *potency*^{7,8,9}.

- **Self-renewal** is the capacity of the cell to undergo numerous cycles of cell division maintaining the undifferentiated state. An ideal stem cell should have the capacity of self renewal (the ability of the cell to proliferate to about 40-60 population doublings).
- **Potency** means the differentiation capacity of the stem cells.

Classification Of Stem Cells^{(10,11):-}

There are different types of stem cells that are usually considered for their potential use in research. They can be classified on the basis of the following:

1. The extent to which they can differentiate into different cell types.
2. Source of stem cells.

Extent to which they can Differentiate:-

- a. **Totipotent cells:** These stem cells have the potential to differentiate into any kind of cell in the body.
- b. **Pluripotent cells:** These are true stem cells, with the potential to differentiate into any differentiated cells in the body, except the cells of placenta or other supporting tissues of the uterus.
- c. **Multipotent cells:** These are true stem cells, but only differentiate into a limited number of cell types, **e.g.** the bone marrow contains multipotent stem cells that give rise to all the cells of the blood but not to other types of cells. Multipotent stem cells are of three major types - *ectodermal* (skin and nerves), *mesodermal or mesenchymal* (bone, cartilage, muscle and adipose tissue) and *endodermal* (intestines and other organs).

On the Basis of Source^{(12,13):-}

- a. Embryonic stem cells
- b. Embryonic germ cells
- c. Adult stem cells
- d. Induced pluripotent stem cells

a. Embryonic stem cells^{(14):-}

Embryonic stem cells (ESCs) are derived from 4 to 5day old embryo, (early-stage embryo, 4-5 days old, consist of 50-150 cells) or earlier morula-stage embryo. At this stage, the embryos are spherical and are known as blastocysts. Each blastocyst consists of 50 to 150 cells and includes three structures: an outer layer of cells, a fluid filled cavity and a group of about 30 pluripotent cells at one end of the cavity called the inner cell mass(Figure 1) .

Figure 1:- Embryonic stem cells from blastocyst . COURTESY: K. Saraswathi Gopal et al : Stem cell and the regenerative dentist: International Journal of Contemporary Dental and Medical Reviews (2015)

b. Embryonic germ cells (or foetal germ cells):- Embryonic germ cells are pluripotent stem cells derived from the so-called primordial germ cells, which are the cells that give rise to the gametes (sperm and eggs) in adults. These can be isolated from the precursor to the gonads in aborted tissues.

c. Adult Stem Cells:- Adult stem cells are characterised as *haematopoietic* or mesenchymal. Hematopoietic stem cells are capable of forming all types of white blood cells and red cells. Sources of Haematopoietic stem cells are Umbilical cord blood, Umbilical cord, bone marrow and peripheral blood. Haematopoietic stem cells have been used to treat blood cancers such as leukaemia and other blood disorders. *Mesenchymal* are capable of forming a wide variety of connective tissues such as bone, muscle, cartilage, fat, tendons-but not internal organs or skin. Sources of Non-haematopoietic Stem Cells or Mesenchymal Stem Cells are adipose tissue, bone marrow and almost all body tissues including the pulp tissue of the teeth⁽¹³⁾.

Bone marrow^(14,15):- Bone marrow stem cells (BMSCs) can be harvested from **sternum** or **iliac crest**. It is composed of both hematopoietic stem cells and mesenchymal stem cells (MSCs). The advantage of bone marrow is that it has a larger volume of stem cells and can be differentiated in to wide variety of cells. Isolation of BMSCs can be carried out only under general anesthesia. Bone marrow contains both types of stem cells and has been most extensively researched.

Adipose tissue^(8, 16):- They can be harvested from the lipectomy or liposuction aspirate. Adipose derived stem cells (ADSCs) contain a group of pluripotent mesenchymal stem cells. Advantage of adipose tissue is that it is easily accessible and abundant in many individuals.

d. Induced pluripotent stem cells:-⁽¹⁷⁾

Induced pluripotent stem cells (iPSCs) are adult cells that have been genetically reprogrammed to an embryonic stem cell-like state by being forced to express genes and factors important for maintaining the defining properties of embryonic stem cells. They express stem cell markers also and are capable of generating cells characteristic of all three germ layers. iPSCs may prove to be useful tools for drug development and modeling of diseases and in transplantation medicine. In this evolving concept 3-4 genes found in the stem cells are transferred into the donor cells using appropriate vectors. The stem cells thus derived by culturing will have properties almost like embryonic stem cells. This path breaking discovery may have a major role in future stem cell therapy.

Source Of Stem Cells From Dental Tissues^(18,19):-

Stem cells from oral and maxillofacial region predominantly contain mesenchymal stem cells. Deciduous teeth, wisdom teeth and tooth extracted for orthodontic treatment are the major sources of dental tissue. In oral and maxillofacial area different types of dental stem cells were isolated and characterized (Figure : 2). They include

- **Dental pulp stem cells (DPSCs)**
- **Stem cells from exfoliated deciduous teeth (SHED)**
- **Periodontal ligament stem cells (PDLSCs)**
- **Stem cells from apical papilla (SCAP)**
- **Dental follicle progenitor cells (DFPCs)**

Dental pulp stem cells (DPSCs) were successfully isolated by Gronthos et al⁽¹⁸⁾., in 2000. They were able to demonstrate odontoblast like cells from DPSCs producing ectopic dentin in the immunocompromized mice.

Stem cells from exfoliated deciduous teeth (SHED)⁽¹⁹⁾ were identified to be cells of higher proliferation rate, with increased population doublings, immature multipotent clonogenic cells isolated from deciduous teeth that can differentiate into several cell types.

Periodontal ligament stem cells (PDLSCs) were isolated from periodontal ligament of 25 human third molars by Seo BM et al in 2004⁽²⁰⁾. They demonstrated cementoid cells, adipocytes when transplanted into immunocompromized rodents.

Stem cells from apical papilla (SCAP) Sonoyama et al in 2008⁽²¹⁾ isolated mesenchymal stem cells from apical papilla which are capable of forming odontoblast like cells in vivo.

Dental follicle progenitor cells (DFPCs) Morszeck C et al in 2005⁽²²⁾ obtained stem cells from dental follicle which can form cementoblasts, periodontal ligament cells and osteoblasts.

Figure 2:- Stem cells of dental origin

Dental Stem Cells Advantages ^(6,24) :-

The advantages of stem cells from oral and maxillofacial region is that

1. Have high plasticity.
2. It can be cryopreserved for longer period.
3. It showed good interaction with scaffold and growth factors.
4. The dental pulp stem cells will be better fitting tool due to easy surgical access, the very low morbidity of the anatomical site.

Stem Cells Storage And Transport ^(24,25) :-

Tissue samples containing stem cells are placed in a screw top vial containing Hypothermosol, mesencult basal medium or phosphate-buffered saline media, which nourishes it during transport. The sample should reach the processing storage facility before 40 hours. In the laboratory the samples were trypsinized and cryopreserved at -150°C to yield colonies of stem cells. The required cell type can be manipulated by utilizing right inductive signals and appropriate growth factors to the stem cells.

Stem Cell Application In Oral Diseases:-

Clinical applications of dental stem cells will continue to emerge in the near term and longer term. Currently dental stem cell research focuses on **regeneration of dentine, pulp and teeth, alveolar bone, regeneration of periodontal ligament, and various other applications of mesenchymal and hematopoietic stem cells in repair of craniofacial defects, oral mucosal lesions and salivary gland regeneration after radiation therapy.**

Regeneration of teeth ^(25,26) :-

Tooth regeneration represents a new era in dentistry as the concepts of repair is being shifted to regeneration. Regenerative dentistry restores a tissue defect to its original form and function by biological substitutes. Dental tissue stem cells/ progenitor cells can differentiate into dental cell lineages, and are used to regenerate some dental tissues in the treatment of tooth defects and tooth loss. Research focuses on whole tooth regeneration using a strategy of transplanting artificial tooth germ and allowing it to develop in the adult oral environment. Two means of regenerating teeth include **conventional tissue engineering**, in which the application of cells in a carrier material *in vitro* under the influence of a stimulus leads to tissue regeneration. The second process of tooth regeneration is using **dental epithelium and mesenchymal cells** ^(27,28) *in vivo* after direct implantation, which is based on knowledge of embryogenesis and physiological tooth development during childhood.

Handa K (2002) ⁽²⁹⁾ isolated progenitor cells from bovine dental follicles. In invitro conditions these cells formed clusters of spheroid like cells and in invivo conditions, cementum matrix formation took place by these cultured dental follicle cells. Gronthos et al 2002⁽²⁵⁾ demonstrated both in vivo and in vitro in animals that dental pulp stem cells (DPSCs) were able of forming ectopic dentin and related pulp tissue⁽²⁵⁾. Batouli et al. 2003⁽³⁰⁾ demonstrated the capacity of dental pulp stem cells to form a dentin pulp-like complex by transplanting them in immunocompromised mice. After 16 weeks, the pulp-like tissue contained a fibrous connective tissue, blood vessels, and odontoblasts associated with newly formed dentin indicating the possibility of using those stem cells for the repair of injured dental structures. Duailibi *et al.* 2004⁽³¹⁾, in their studies were able to form tooth from single cell suspensions of cultured rat tooth bud cells. They confirmed bioengineered rat teeth grown in 12 weeks with Poly Lactic co glycolic

acid (PLGA) and Poly glycolic acid (PGA) scaffold. Honda *et al* 2005⁽³²⁾ developed tissue engineered teeth, when implanted into omentum of rat utilizing porcine tooth bud cells and PGA fiber engage scaffold that reminds of the model of odontogenesis. Young *et al* 2005⁽³³⁾ using porcine tooth bud cells, PLGA and PGA scaffolds produced a crossbred tooth bone for the cure of tooth loss beside with alveolar bone resorption. Huang *et al* 2008⁽³⁴⁾ in his review article summarized new protocol for endodontically involved immature permanent teeth in which minimal instrumentation was done in it followed by disinfection with triple antibiotic paste. Treated tooth is coated with mineral trioxide aggregate (MTA) and filled with glass ionomer cement. Periodical observation was done to ascertain root maturation.

Periodontal regeneration:-

Recently new techniques of cell transplantation have been developed to regenerate periodontium using Periodontal ligament cells (PDLs) isolated from extracted human teeth and Dental follicle stem cells (DFSCs) which could become an alternative cell source for periodontal regeneration therapy. When transplanted into immunocompromised mice, PDLs have shown to regenerate collagen fibers and cementum/periodontal ligament-like structures. Periodontium can also be regenerated by culturing of periosteum, non-dental stem cells such as bone marrow mesenchymal stem cells, and adipose-derived stem cells. Studies have shown that grafted autologous cultured cell membrane derived from periosteum into a surgically created class III furcation defect in dogs, lead to the formation of cementum, periodontal ligament-like tissues, and alveolar bone in 3 months after the grafting procedure. Another research reported a treatment using cells derived from periosteum in human periodontal disease by Kawaguchi *et al* 2004⁽³⁵⁾. It is also confirmed by Hasegawa *et al* 2005, that periodontal defects can be managed by reimplantation of these cells⁽³⁶⁾. Autologous mesenchymal stem cells from iliac crest in combination with platelet rich plasma from peripheral blood was used for periodontal regeneration. Significant closure of bone defect and improvement of attachment level was observed after one year follow up. It also showed good healing and regeneration of interdental papilla⁽³⁷⁾. Nagatomo *et al* 2006⁽³⁸⁾ in their experimental studies found that PDL cells having stem cell properties can regenerate periodontium. Transplantation of PDL derived cells into animal models were shown to regenerate periodontal tissue. Iwata *et al* 2009⁽³⁹⁾ harvested and expanded primary canine PDL cells *in vitro* and also made into transplantable constructs containing Poly glycolic acid (PGA) Scaffold and PDL cell sheets. The transplantable constructs in combination with porous tricalcium phosphate (b-TCP) induced regeneration of periodontal structures, including alveolar bone, cementum, and periodontal fibers. Liu *et al* 2008 regenerated periodontal tissue in miniature swine using scaffolds seeded with periodontal ligament derived stem cells⁽⁴⁰⁾. PDLSCs can differentiate into cells that can colonize on biocompatible scaffold, suggesting an easy and efficient autologous source of stem cells for regeneration of dental tissues⁽⁴¹⁾. Marie MK *et al* 2009 in their experimental on goat was able to regenerate periodontal tissues around titanium implant using autologous bone marrow stem cells with scaffold⁽⁴²⁾.

Repair of craniofacial defects:-

Craniofacial defects results from post-cancer ablative surgery, craniofacial osseous deficiencies can also arise from infection, trauma, congenital malformations and progressively deforming skeletal diseases. Although autologous bone graft is considered the best option, it has the limitation of donor sites. Use of skeletal or dental stem cells can be used in future to repair craniofacial region and may provide a promising alternative approach for reconstruction of craniofacial defects. Lagenbach *et al* 2010⁽⁴³⁾ in their *in vitro* studies used microspheres (scaffold free tissue construct) to close the bone defects. They found osteogenically differentiated microspheres with outgrowing cells can be used to fill up bone defects. This new procedure has added advantage of permitting the transplantation of more cells and better integrity compared with cell suspensions or gels⁽⁴⁴⁾. Degenerative bone diseases including TMJ defects can be bioengineered with stem cells. Cells from various sources like articular cartilage cells, fibroblasts, mesenchymal stem cells have been used to reconstruct TMJ⁽⁴⁵⁾. Bone tissue engineering endeavours to repair large bone losses using three dimensional scaffolds to deliver vital cells to the defective site.

Stem Cell Therapy in Oral Mucosal Lesions:-

Among oral mucosal lesions, stem cell research is presently focused on the treatment of certain lesions only. These oral mucosal lesions are:

Ulcerative lesions: oral ulcers and wounds, oral mucositis, pemphigus vulgaris

Potentially malignant disorders: Oral submucous fibrosis (OSMF), Oral lichen planus (OLP).

Malignant lesions: oral carcinoma.

The main mechanism behind the use of stem cells in these lesions is discussed in detail.

Oral ulcers and wound healing ⁽⁴⁶⁾:-

Optimum healing of a cutaneous wound requires a good integration of the complex biological and molecular events of cell migration and proliferation and extracellular matrix deposition, angiogenesis and remodeling. Large wounds take a long time to heal, and defective healing leaves behind unacceptable scars and strictures.

Bone marrow-derived mesenchymal stem cells (BM-MSCs) are self-renewing, expandable stem cells and are able to differentiate into adipocytes, osteoblasts, and chondrocytes. These cells possess the ability to engraft at the site of injury and promote tissue regeneration and wound healing through synergistic downregulation of proinflammatory cytokines and increased production of soluble factors with antioxidant, antiapoptotic, and proangiogenic properties.

In oral wounds, they exhibit increased re-epithelialization, cellularity, intracellular matrix formation and neoangiogenesis, thereby accelerate wound healing. Hence, MSC therapy can be a promising therapeutic modality for oral ulcers and wounds. El-Menoufy *et al* 2010⁽⁴⁷⁾. Submucosally injected autologous Bone Marrow-Mesenchymal Stem Cells suspended in phosphate buffered saline around formocresol induced oral ulcers in dogs. There was increased expression of both collagen and vascular endothelial growth factor (VEGF) genes in Mesenchymal Stem Cells-treated ulcers compared with controls. Similar results were seen by Aziz Aly *et al* 2012.⁽⁴⁸⁾ in a study on formocresol induced oral ulcers in dogs using Bone Marrow and adipose-derived stem cells. Hence He concluded Mesenchymal Stem Cells transplantation may help to accelerate the healing of oral ulcers [Figure 3].

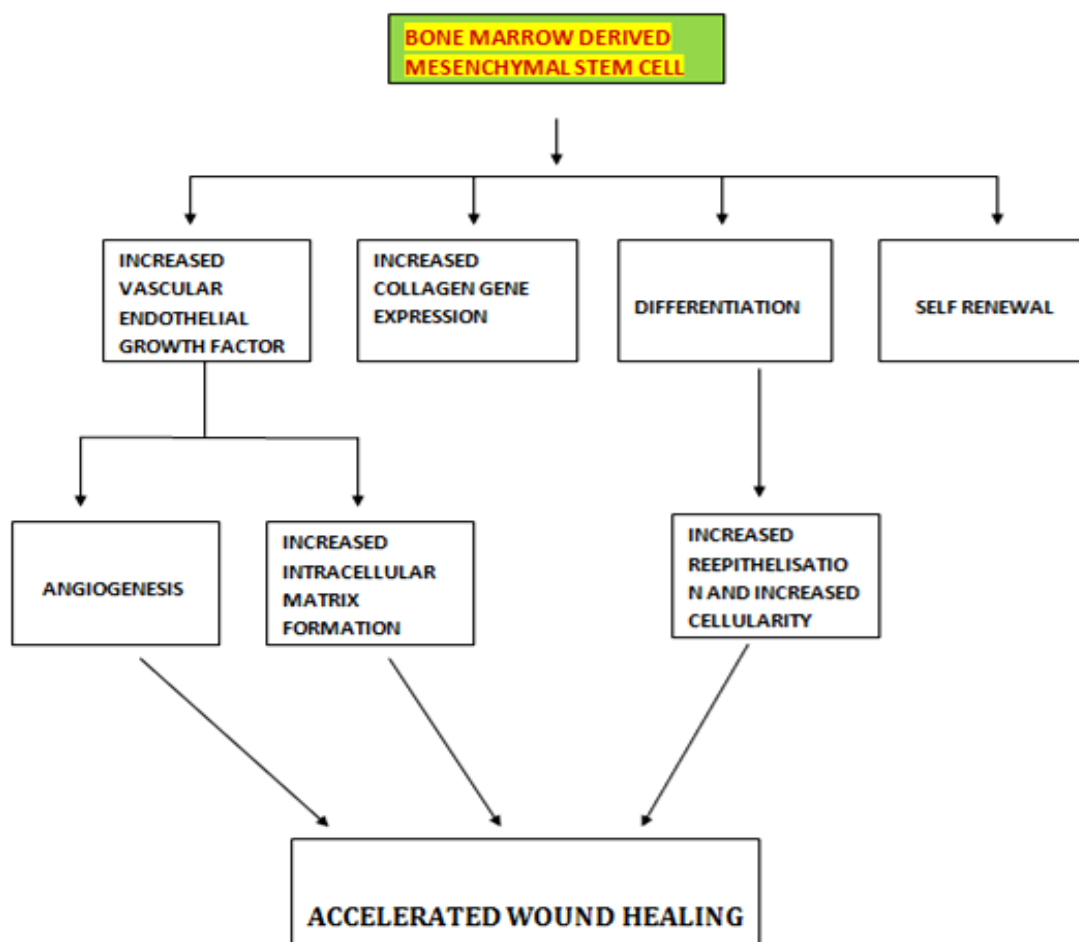

Figure 3:- Role of mesenchymal stem cells in wound healing Courtesy : Journal of Pharmacy & Bioallied Sciences : Jan-Mar 2015; 7 (1): 2-8

Oral mucositis:-

Oral mucositis is one of the most debilitating side effects which occur with chemo or radiotherapy. Management of mucositis is fairly symptomatic. Presently mesenchymal stem cells have been explored in its management by virtue of their immunomodulatory, anti inflammatory functions as well as regenerative properties. Their therapeutic efficacy can further be increased by transgenic approach or preconditioning them with certain factors like pro-inflammatory cytokines.

Zhang *et al* 2012.⁽⁴⁹⁾ injected spheroid Gingiva-Derived Mesenchymal Stem Cells (GMSCs) in mice with chemotherapy-induced oral mucositis and found that treatment with GMSCs decreased the severity and incidence of ulceration and restored the papillae structure, the lining, and thickness of the epithelial layer as compared with those of untreated disease group. The improved therapeutic benefits of spheroid-derived GMSCs may be attributed to their increased capabilities for engraftment and survival at the injury sites, trans-differentiation into epithelial cells, and preconditioning to hypoxic and oxidative challenges. Hence GMSCs could prove a sure shot therapy in oral mucositis following the cancer therapies.

Pemphigus vulgaris:-

Pemphigus vulgaris is a potentially life-threatening disease, primarily affects the mucous membranes of patients over the age of 50 years characterised by formation of autoantibodies, directed against desmosomal glycoproteins (dsg1, dsg3) present on the cell surface of the keratinocyte resulting in the formation of intraepithelial bullae and mucosal ulceration. The effective treatment of pemphigus vulgaris is long-term use of corticosteroids that itself has detrimental systemic complications. The immunomodulatory and antiinflammatory properties of stem cells can be utilized in the treatment of the condition.

In a research Vanikar *et al.*(2007) ⁽⁵⁰⁾ performed allogenic hematopoietic stem cell transplant (HSCT) with nonmyeloablative low-intensity conditioning in nine patients of Pemphigus vulgaris and found that the existing skin lesions started to regress within 24 h of stem cell treatment . In a similar study conducted by Vanikar *et al* in 2012, consisted of clinical trial on patients with pemphigus vulgaris to evaluate the effects of allogenic Hematopoietic Stem cell Transplantation into thymus, bone marrow and peripheral circulation on central and peripheral arms; it was found that the recovery began within 24 h of HSCT and new lesions stopped after 6 months⁽⁵¹⁾. Stem cell therapy in pemphigus not only has shown promises in treatment but also brings about a shift towards non steroidal approach in autoimmune diseases. However the use of stem cell therapy for oral pemphigus is yet to be ascertained and needs new clinical trials.

Stem Cell Therapy In Potentially Malignant Disorders:-**Oral submucous fibrosis:-**

Oral submucous fibrosis is a chronic, insidious disease associated with both significant morbidity (including pain, reduced mouth opening) and an increased risk of malignancy. Various agents like *Areca nut*, gutkha, spices etc., are known to cause insult to oral mucosa by increasing cytokine production and release of reactive oxygen species; which in turn results in increased synthesis of collagen, decreased collagen breakdown, compromised vascularity and increased tissue oxidative stress, ultimately resulting in clinical OSMF⁽⁵²⁾.

Stem cell therapy is primarily aimed at neoangiogenesis by releasing cytokines and growth factors (paracrine effect)⁽⁵³⁾. This may result in increased free radical scavenging by antioxidants (either naturally occurring or exogenous). Neoangiogenesis may also facilitate the removal of senescent cells from the lesions by supplying more number of scavenging defense cells and reversal of hypoxia in the diseased tissue. Stem cell therapy may help to stimulate resident tissue stem cells to transform into new fibroblasts, which may help in the removal of disintegrated biochemically and morphologically altered collagen fibers(Figure 4)

Sankaranarayanan *et al* 2013.⁽⁵⁴⁾ have demonstrated the effectiveness of stem cell treatment in OSMF patients by injecting 0.5–1 ml of marrow-derived stem cell concentrate into labial and buccal mucosa and tongue under local anesthesia. They found reduction in blanching, decrease in the burning sensation while consuming spicy food, significant increase in the mouth opening and the results were found to be sustained in the follow-up period from 6 months to 5 years

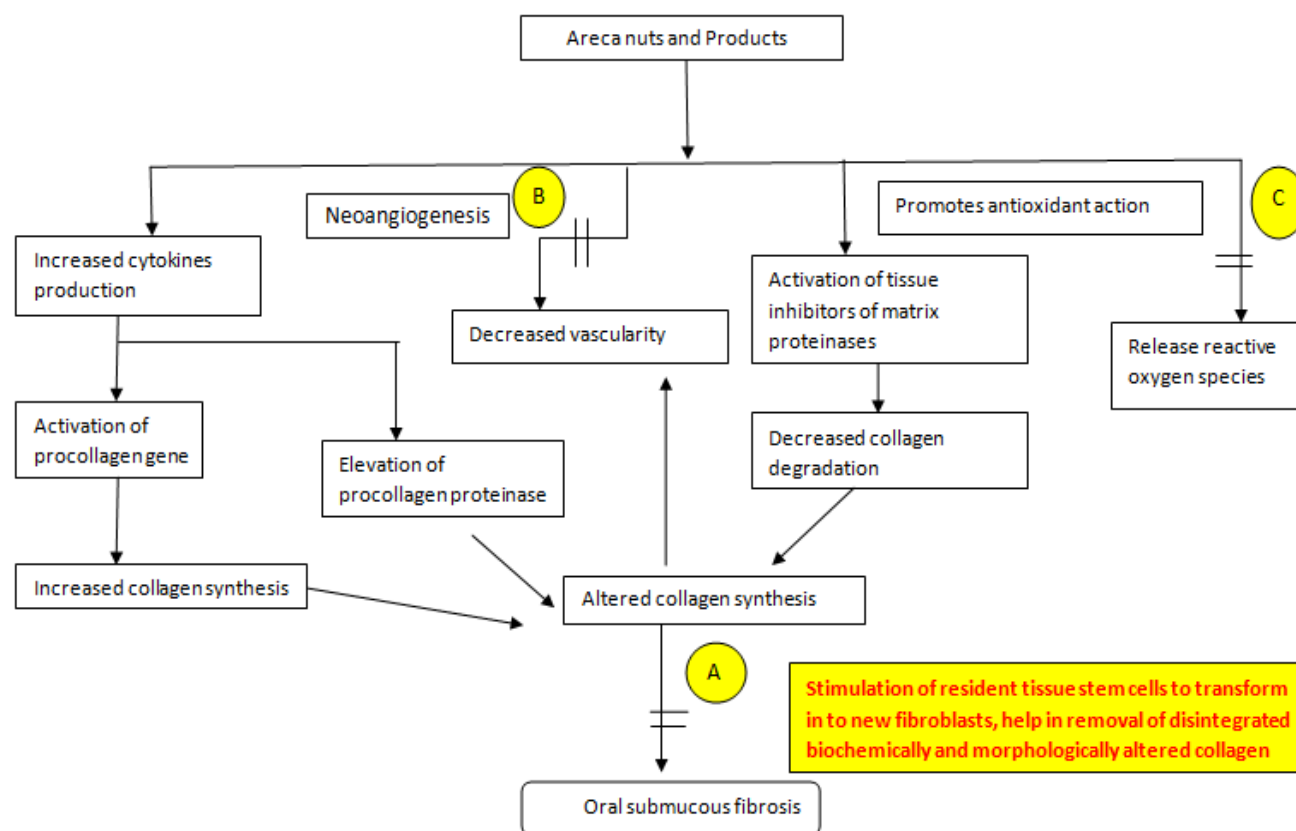

Figure 4:- Role of stem cell therapy in oral submucous fibrosis at various levels. (a) Removal of pathologically altered collagen and stimulation of healthy collagen. (b) Promoting neoangiogenesis. (c) Promoting antioxidant action. **Courtesy:** Journal of Pharmacy & Bioallied Sciences : Jan-Mar 2015; 7 (1): 2-8

Oral lichen planus:-

Oral lichen planus (OLP) is a T cell-mediated, chronic mucocutaneous disease with uncertain etiopathogenesis. Various factors like stress, genetics, systemic diseases, drugs, dental restorative materials and viruses are known to cause the disease either by an antigen-specific mechanisms like activating cytotoxic T-cells and nonspecific mechanisms like mast cell degranulation and matrix metalloproteinase activation. Both of these cause the disruption of the basement membrane, which in turn triggers apoptosis of basal epithelial cells⁽⁵⁵⁾. Recent advance in the treatment of lichen planus employ the use of immunomodulating agents such as tacrolimus which may treat the disease. In the past several years, studies have focussed on immunosuppressive properties of mesenchymal stem cells on various immune cell type as shown in **figure 5**. Based on these studies it is proposed that mesenchymal stem cells can be utilized to treat oral lichen planus via systemic infusion or local application^(56,57)

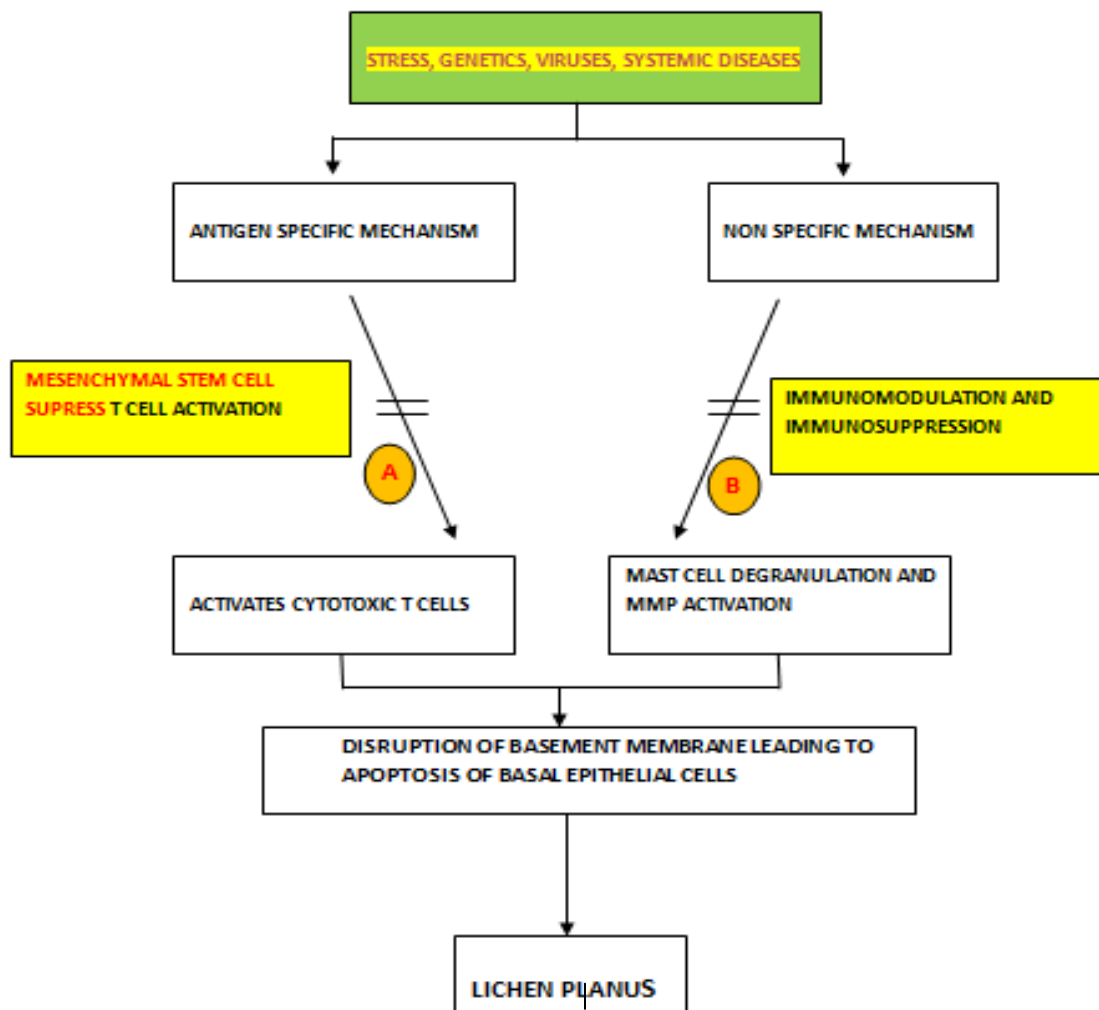

Figure 5:- Action of stem cells in modulation of immune response in oral lichen planus (shown at points A and B).

Courtesy: Journal of Pharmacy & Bioallied Sciences : Jan-Mar 2015; 7 (1): 2-8

Malignant lesions:-

Oral carcinomas:-

Surgery and external beam radiation has been the mainstay of treatment for head and neck squamous cell carcinomas. Studies in a wide variety of malignancies have demonstrated that a distinct subpopulation of tumor cells, termed Cancer stem cells (CSCs) ⁽⁵⁸⁾, contain the ability to undergo self-renewal and differentiation and hence have the ability to initiate tumorigenesis and support ongoing tumor growth. Stem cells here play a dual role-in carcinogenesis and in the development of possible new cancer treatment options in future. For past so many years stem cells have been used in the replenishment of blood and immune system damage during treatment of cancer by chemotherapy or radiotherapy.

Apart from their use in the immuno-reconstitution, the stem cells have been reported to contribute in the tissue regeneration as they have extraordinary capacity to regenerate and differentiate. Recently, a new model of carcinogenesis was suggested, which lead to the cancer stem cell hypothesis. According to this hypothesis, not all epithelial cells are capable of generating a tumour, and only long- surviving cells such as stem cells, can undergo the summative oncogenic alterations required for carcinogenesis ^(59,60).

The Mesenchymal stem cells (MSCs) have been used in the cell-based bone reconstruction following chemotherapy and surgery in malignancies like osteosarcoma and Ewing sarcoma⁽⁶¹⁾

Another important aspect of their use in cancer therapy is the use as delivery vehicles. Systematic delivery of drug or gene therapy has promising future but is currently limited by various factors such as immune detection, nonspecific accumulation in normal tissues and poor permeation. Stem cells can act as cell-based carriers that may target the desired site⁽⁶²⁾. The recent concept of use of stem cells as delivery vehicles came from the fact that the tumors send out chemo-attractants such as Vascular endothelial growth factor (VEGF) to recruit mesenchymal stem cells (MSC) to form the supporting stroma of the tumor^(63,64). However, further work is required to understand the role of stem cells in cancer therapies, with the eventual goal of eliminating the residual disease and recurrence.

Salivary gland regeneration after radiation therapy:-

Radiation induced hyposalivation is a major problem in the treatment of head and neck cancer. Studies have shown that stem cell therapy may provide a means to reduce radiation-induced hyposalivation and improve the quality of life of patients. The ability of salivary gland tissue to regenerate after atrophy has provided knowledge about location and isolation of cell populations that contain salivary gland stem cells. It has been determined that within the ducts of salivary glands reside cells capable of proliferation and differentiation known as stem/ progenitor cell population. Application of specific growth factors to these cells induces differentiation into functional units⁽⁶¹⁾. Stem cells isolated from mouse salivary glands have shown to rescue saliva production in irradiated salivary glands.

Pringle et al in 2016⁽⁶⁵⁾, showed engraftment and functional capabilities of human adult epithelial stem cells in salivary gland demonstrated in vitro self renewal and differentiation into multilineage organoids. He also showed in vivo functionality, long term engraftment and functional restoration in Xenotransplantation model.

Applications of dental stem cells in medical field:- ⁽⁶⁶⁾

Dental pulp stem cells were proven to differentiate into functionally active neurons, and when implanted dental pulp stem cells induce endogenous axon guidance, suggesting their potential as cellular therapy for neuronal disorder. Thus based on these findings, stem cell research has hope in the field of medicine directed toward: brain damage, spinal cord injury, Parkinson's disease, Alzheimer's disease, multiple sclerosis and other neurological and neurodegenerative disorders. The Tissue regeneration concept hopes to repair heart damage, baldness, deafness, blindness, impaired vision, muscle damage, diabetes mellitus, etc. Stem cell research is a boon to drug research as the drug application can be directly given on to human cells, and this will provide more relevant data than testing on animal models.

Conclusion:-

Stem cell research in dentistry has given opportunity for dentists to assume a leading role not only in the treatment of dental pathosis and also in medical diseases. With the advances in the stem cell biology, dental stem cells will hopefully be able to correct cleft palate, periodontal defects, save injured teeth, jaw bones and most strikingly regenerate the entire teeth structures. Though certain studies have confirmed the effectiveness of stem cell therapy treatment in pemphigus vulgaris, potentially malignant disorder like Oral submucous fibrosis, the research is mainly confined to animal models in oral mucositis, cancer management and Lichenplanus, thus more human research trials are needed to ascertain the role of stem cells in their management. The evolution of more methods of stem cell therapy in the future will give simple, definitive and effective treatment of most of the oral mucosal diseases.

Abstract

In recent years, advances in both hardware and software technology has allowed us to automatically record transactions and other information everyday at a rapid rate. Huge volumes of web, sensory and transactional data are continuously generated everyday as data streams, which need to be analyzed online as they arrive. Analysis of data streams have been researched extensively because of its emerging, imminent, and broad applications. One of the important method is clustering have been widely studied in the data mining community. Many existing data mining methods cannot be applied directly on streaming data because of the fact that the data needs to be mined in single pass. Furthermore, in data stream processing temporal locality is also quite important, because the essential patterns in the data may change and therefore, the clusters in the past history may no longer remain relevant to the future. In this paper we explore various issues and challenges on clustering data streams.

Introduction:-

Nowadays, many applications with huge amount of data which are caused limitation in data storage capacity and processing time. Traditional data mining algorithms are not suitable for this kind of applications so they should be changed or designed with new algorithms.

The main challenge is the *data-intensive* mining using a bounded number of resources to perform an analysis to an unlimited dataset. Furthermore, traditional Data Mining Algorithms work with a static dataset and the algorithm can afford to read the data several times on the other hand Stream Mining can afford the data reading once so the algorithms for this subfield of data mining are based on a single scan.

The data generation rates in some data sources become faster than ever before. This fast generation of continuous streams of information has challenged our storage space, computation and communication capabilities in computing systems. Models and techniques have been proposed and developed over the past few years to address these challenges [3].

A data stream is a massive, infinite, temporally ordered, continuous and rapid sequence of data elements [1]. Research on data stream is motivated by emerging applications involving massive data sets such as customer click streams, supermarket, telephone records, stock market, meteorological research, multimedia data, scientific experiments data and engineering experiments data and sensor type of data. A new generation of mining

algorithms are needed for real-time analysis & query response for these applications since the majority of conventional data mining algorithms can only be applied to static type of data sets that may be updated periodically in big chunks, but not in continuous streams of data. While data mining has become a reasonably well recognized field now, the data stream problem poses a no. of unique challenges which are not easily solved by traditional data mining methods.

Some of issues of data stream [2] like dynamic nature, Infinite size and high speed, unbounded memory requirements, Lack of global view, handling the continuous flow of data impose a great dispute for the researchers dealing with streaming data sets. Unlike traditional data sets, it is impossible to store an entire data stream or to scan through it multiple times due to its incredible volume. New methods may keep on growing in data streams at different times, to deal with this any data stream processing algorithm must continuously update their models to adapt to the changes.

Data streams pose special challenges to several data mining algorithms, not only because of the huge volume of the online data streams, but also because of the fact that the streaming data may show temporal association. Such temporal association may help disclose important data evolution characteristics, and they can also be used to develop efficient and effective mining algorithms [3]. Moreover, data streams require online mining, in which we wish to mine the data in a continuous fashion. Furthermore, the system needs to have the capability to perform an offline analysis as well based on the user interests. This is similar to an online analytical processing (OLAP) framework which uses the paradigm of pre-processing once, querying many times [5].

Rest of the paper is organized as follows. Section 2 presents types of data streams, its characteristics, applications. Overviews of data stream clustering techniques are presented in section 3. Research issues and challenges are discussed in section 4. Finally, section 5 summarizes this paper.

Data Streams: -

A data stream is a real-time, continuous, ordered sequence of items. It is not possible to control the order in which items appear nor is it feasible to locally store a stream in its entirety [7]. There are two kinds of data streams, transactional data streams and measurement data streams [8].

Transactional data streams: These are the data streams which recorded the communication between data attributes, for example; purchasing item details in credit card, phone calls details of callers to dialed parties.

Measurement data streams: Consists of data from sensors on things of interest. These types of data streams which monitored the changes of entity states, for example; traffic information at router interfaces, weather forecasting data at weather stations and traffic data in sensor networks.

Characteristics [4] of data streams as follows:-

- Huge volumes of continuous data, possibly infinite
- Quick changing and requires high-speed, real-time response
- Data stream captures properly our needs of data processing today
- Random access is expensive—single scan algorithm
- Store only the summary of the data
- Most streaming data are at pretty low-level or multi-dimensional in nature, needs multi-level and multi-dimensional processing

Some of the applications evolving data streams:-

- Telecommunication calling records
- Transaction flows of credit card
- Network traffic flow and monitoring
- Stock exchange details in financial market
- Power supply and manufacturing details
- Sensor, monitoring and surveillance flows
- Video streams, RFIDs
- Security monitoring details
- Web logs and Web page click streams

- Massive amount of data sets

There are some of the main differences between Traditional data & Data Stream [9] shows in Table-1:

Table 1:-Traditional Vs Stream

	Traditional	Stream
No. of passes	Multiple	Single
Processing time	Unlimited	Restricted
Memory Usage	Unlimited	Restricted
Types of Results	Accurate	Approximate
Distributed	No	Yes

There are some of the differences between Traditional Data base Management System (DBMS) & Data Stream Management (DSMS) [10] shows in table-2:

Table 2:-Traditional DBMS Vs DSMS.

DBMS	DSMS
Random access	Sequential access
No real time services	Real time requirements
Unbounded Disk store	Bounded main memory
Access plan determined by query processor, physical data base design	Unpredictable because of variable data
Data at any granularity	Data at fine granularity
One time queries	Continuous queries

Most data mining and knowledge discovery techniques assume that there is a finite amount of data generated by an unknown, stationary probability distribution, which can be actually stored and evaluated in multiple steps by a batch mode algorithm. For data stream mining, however, the successful development of algorithms has to take into account the following restrictions [5]:

- Data objects arrive continuously;
- There is no control over the order in which the data objects should be processed;
- The size of a stream is (potentially) unbounded;
- After processing, data objects are discarded. In practice, one can store piece of the data for a given period of time, using a forgetting mechanism called to discard them later;
- The unknown data generation process is possibly non-stationary, i.e., its probability distribution may change over time.

Data Stream Clustering:-

Imagine an enormous amount of dynamic stream data, many applications involve the automated clustering of such data into groups based on their similarities. Although there are many powerful clustering algorithms for data sets in static form, clustering data streams involves other constraints on such algorithms, as any data stream model requires algorithm to make a single scan over the data, with restricted memory and limited processing time. Several algorithms have been developed for clustering data streams described as below:

STREAM –A k-median based Stream Clustering Algorithm is presented by Guha, Mishra, Motwani and O'Callaghan [11]. It consists of two phases and follows divide and conquer approach. In first phase, it divides the data streams in relevant buckets and then finds 'k' clusters in each bucket by applying k-median clustering algorithm. It stores cluster centers only and cluster centers are weighted based on the number of data points belongs to corresponding cluster and then ignore the data points. In second phase weighted cluster centers are clustered in small number of clusters. Though its space and time complexity is low but it cannot use to concept evolution in data.

CluStream [12] clustering evolving data streams is proposed by Aggarwal et al. It divides the clustering process in following two online component and offline components. The summary of data in the form of micro clusters is stored in online component. Micro-cluster is the temporal extension of clustering feature of BIRCH [11]. Summary statistics details of data are stored in snapshots form which gives the user flexibility to specify the

time interval for clustering of micro-clusters. Offline component apply the k-means clustering algorithm to cluster micro-clusters into larger clusters.

ClusTree [13] any time Stream Clustering is proposed by Kranen et al. It divides the clustering process in following two online and offline components. Online components are used to learn micro clusters. The micro clusters are arranged in hierarchical tree type of structure. Any variety of different offline components can be developed. It is a self adaptive algorithm and delivers a model at any time.

DenStream [14], a new approach for discovering clusters in an evolving data stream. The dense micro-cluster called as core-micro-cluster is introduced to summarize the clusters with different arbitrary shape, while the potential core-micro-cluster and outlier micro-cluster structures are projected to maintain and differentiate the potential clusters and outliers. A novel pruning strategy was designed based on these concepts, which guarantees the precision of the weights of the micro clusters with limited memory.

HPStream (clustering of high dimensional data streams) [15] is proposed by Aggarwal et al. This clustering technique uses a Fading Cluster Structure (FCS) to stores the summary of data streams and it gives more significance to recent data by fading the old data with moment in time. To handle high dimensional data selects the subset of dimensions by projecting on original high dimensional streaming data. Number of dimensions and dimensions are not same for each cluster. This is due to the fact that significance of each dimension in each cluster may differ. It is incrementally updatable and highly scalable on number of dimensions. Moreover it cannot find out the cluster of different arbitrary shapes and it requires domain knowledge for identifying the number of clusters and average number of projected dimension parameters.

E-Stream [16] is a data stream clustering technique which supports following five type of advancement in streaming data: Appearance of new cluster, Disappearance of an old cluster, Splitting of a large cluster, combining of two similar type of clusters and change in the behavior of cluster data itself. It uses a fading cluster structure with histogram to approximate the streaming data. Though its performance is better than HPStream clustering algorithm but it needs many parameters to be specified by user.

HUE-Stream [17] extends E-Stream which is described earlier, to support uncertainty in mixed data (heterogeneous data). A distance function with probability distribution is introduced in between two objects to support uncertainty in categorical attributes. To detect change in clustering structure, the proposed distance function is used to combine(merge) similar clusters and find the closest cluster of a given incoming data and proposed histogram management is used to split cluster in categorical data.

POD-Clus (Probability and Distribution-based Clustering) [18] is a model based clustering technique for streaming data. It is applicable to both clustering by example and clustering by variable scenario. For summarizing and updating the cluster information incrementally, it uses a cluster synopsis which comprises the mean, standard deviation, and number of points for each cluster. It maintains concept evolution by allowing new cluster appearance, splitting of a cluster, combining of two similar clusters and disappearance of a cluster.

Issues and Challenges: -

Data stream mining is an inspiring field of study that has raised many challenges and research issues to be addressed by the database and data mining communities.

The following are the some of the research issues and challenges [18, 19]:

Handling the continuous flow of data streams: this is a data management issue. Traditional database management systems are not capable of dealing with such continuous high data rate. Novel indexing approach, storage and querying methods are required to handle this non-stopping fluctuated flow of information streams.

Unbounded memory requirements due to nonstop continuous flow of data streams: most of the machine learning methods represent the main source of data mining algorithms. Most of machine learning methods require data to be resident in memory while executing the algorithm for analysis. Due to the huge amounts of the generated streams, it is absolutely a very important concern to design space efficient techniques that can have only one scan or less over the incoming streaming data.

Required result accuracy: design a space and time efficient techniques should be accompanied with acceptable result accuracy. Approximation algorithms as described earlier can assure error limits.

Modeling changes of mining results over time: in some cases, the user is not interested in mining data stream results, but how these results are changed over time. If the number of clusters generated for example is changed, it might represent some changes in the dynamics of the arriving stream. Due to dynamic nature of data streams using changes in the knowledge structures generated would advantage many temporal-based application analysis.

Visualization of data mining results on small screens of mobile devices: conventional data mining visualization results on a desktop is still a research issue. Visualization in small screens of a PDA for example is a real challenge. Imagine a businessman is being streamed and analyzed data on his PDA. Such results should be efficiently visualized in a way that enables.

The specific challenges [20] in the context of data stream clustering scenario are as follows:

- Streams usually have massive volume, and it is often not possible to store the data explicitly on disk. Therefore, the data needs to be processed in a single look, in which all the summary data required for the process of clustering needs to be stored and maintained. The time needed to process each record must be small and constant. Otherwise, the model creation process would never be able to take up with the data stream.
- The patterns in the data stream may continuously evolve over time. From a stream mining perspective, this implies that the underlying clustering models need to be updated continuously. A usable model must be available at any time, because the end of data stream computation may never be reached, and an analyst may need results at any point in time.
- Different domains of data may pose different challenges to data stream clustering. For example, in a massive domain of discrete attributes, it is impossible to store summary representations of the data clusters efficiently without increasing the computational complexity of the problem significantly. Therefore, space-efficient methods need to be designed for massive domain clustering of data streams.

Another challenge that should be handled by data stream clustering algorithms is the ability of properly dealing with outliers, and also of detecting changes in the data distribution. The dynamic nature of evolving data streams, where new clusters often emerge while old clusters fade out, imposes difficulties for outlier detection. In general, new algorithms should provide mechanisms to distinguish between seeds of new clusters and outliers. Regarding the challenge of dealing with non-stationary distributions, the current and naive strategy employed by most available algorithms is to implicitly deal with them through window models.

Even though more robust change detection mechanisms have been implemented in generic frameworks, we believe future data stream clustering algorithms should explicitly provide mechanisms for performing change detection. Dealing with different data types imposes another challenge in data stream clustering. Different data types such as categorical and ordinal values are present within several application domains. In addition, complex data structures like DNA data and XML patterns are largely available, thus a more careful attention should be given to algorithms capable of dealing with different data types.

Conclusion: -

Now a days, continuous massive generation of stream data has lead to new trend in the field of data mining named as Data Stream Mining. So in this paper, we discussed various issues elevated by data streams and to be had an overview of various technology used for generating synopsis data structures from continuous generation of stream data. From our study we can conclude that streaming data evolves immense volumes of temporally data changing so, traditional techniques of data mining cannot be applied straightforwardly. Research in data stream mining is in early stage. If the problems caused by data streams are solved and if more efficient and interactive mining methods which are user friendly are developed, it is likely that in the near future stream mining will play vital role in business world, as it deals with many applications which involves mining from continuous data streams.

Bearing in mind that clustering data streams is a relevant and challenging task, we believe that much effort should be addressed to developing more sophisticated evaluation criteria, high-quality benchmark data, and a sound methodology for reliable experimental comparison of new data stream clustering algorithms.

Legal Aid, Dignified Justice, Pancasila Legal System

Abstract

It is a postulate in the Dignified Justice Theory perspective (Dignified Justice), that the law might only be found in the spirit of the people (*Volksgeist*, or the legal system, and in this case the Pancasila Legal System), in which the research of finding of the law has to be undertaken. The spirit of the people as such is manifested in the existing laws and regulations in the legal system in question. The same case apply in the effort to understand and describe the principle of legal aid in Indonesia, research has to be conducted in order to find it in the existing laws and regulations in the Pancasila Legal System. It has been found that an important principle of legal aid in the Pancasila Legal System is that, legal aid is the instrument of the state to protect stability in terms of close the gap between the haves and the have nots parties living in the country. Such efforts as to try as best as possible to close the gaps; may also be termed as the effort of the law in upholding human dignity (*nguwongke uwong*); in particular, serving those who has been struggling to have themselves freed from entangled legal problems encountered in the process of the court or out of the court settlements.

Introduction:-

Referring to the direction or perspective in the what we called the Dignified Justice Theory or Dignified Justice that legal norms and principles can only be found in a particular legal system or in the spirit of the people (*Volksgeist*) which has been set as the focus of an observation and a study. Therefore, the principle or rule which are related to the legal aid as a legal concept or legal institution in Indonesia can only be found in the existing laws and regulations. There are several existing laws and regulations in Indonesia (the Pancasila Legal System), in particular the Indonesian Criminal Procedures Act, (Law Number 8 of 1981) which governing or containing the principle on legal aid as such.

Legal Aid in Laws and Regulations in the Pancasila Legal System:-

Norm and principle on legal aid in Indonesia could be found in the Definitional Section, Part 1 number (3) letter (e), of the Law Number 8 of 1981, it has been stipulated that: "every person which is connected with a criminal case is necessarily be given access to legal aid which is mostly given in order that the litigant is enabled to take every efforts in defending his or herself". This is the most important principle of legal aid in the Pancasila Legal System

governing the due process of law stated in the Law Number 8 of 1981. This principle has a particular function, i.e. to give protection to the dignity of human being, or in other words to protect the human rights.

Concerning the issue of legal aid, an interesting issue must be discussed in this paper. The issue in question is the principle of protection to the dignity and self of human being. Accordingly, this principle is a derivative principle stated in the Indonesian Constitution, and it could also be termed as one of the manifestations of the spirit of the Indonesian people (the Indonesian *Volksgeist*) which is found its ultimate source in the Pancasila as the name of the First Agreement of the Indonesian people. Furthermore, with regard to the issue of principle of legal aid, there are also several legislations (Acts of Parliaments and several instruments) has to mentioned below.

In its history, legal aid has been regulated with clear stipulation in the Indonesian Law Number 14 of 1970 on The Basic Principles of Judicative Power. More than that, even when the Law Number 14 of 1970 was replaced by the Republic of Indonesia Law number 4 of 2004 on the same matter, in order to have it adjust to the Law Number 8 of 1981 on Criminal Procedures, the main principle of legal aid as mentioned above has still been uphold until the coming into force of the very recent Law Number 48 of 2009 governing all the Basic Principles of Judicial Power in the Pancasila Legal System.

The principle of legal aid which has justified the existing Indonesian legal aid system as mentioned above has become part of the Indonesian Criminal Justice System. To be viewed from the Dignified Justice Perspective, the principle of legal aid as such has become the principle of law, since it is derived from Pancasila. In this view, Pancasila is the supra-principle (*grundnorm*). Since the Dignified Justice recognizes that a scientific theory has various levels of application. The level is hierarchical, with lower levels subordinated to the higher ones. The highest is the core of the principle of law, and all other level are subordinated to Pancasila.

Although different with Kelsen (the Germany Jurist), in the Dignified Justice perspective once even the lowest level of principle has been derived from the highest principle (i.e. Pancasila), the (lowest) rule as such can also be termed as Pancasila, or *grundnorm*, since it contained the spirit of the people (*Volksgeist*) i.e., Pancasila. Some philosophers in Indonesia has considered Pancasila as an ideology, although in legal field it has to be called the First Agreement of the Indonesian People. Pancasila is the ultimate of all the sources of laws.¹

Pancasila is the highest norm the place where all norms under it is depended. In this case, the principle that every person which has got involved in any legal cases is obligated to be granted rights to have access to legal aid which solely to be given to him in order that he or she can take every efforts to defend his or her interest.² This could be considered as the philosophy of legal aid in general, and also the principle of legal aid which apply to the have not litigants, those who are economically weak to pay the litigation or criminal justice process.

Juridically the existence of the Indonesian Criminal Procedures Code, in which the principle of legal aid is stipulated, would not only depend its being from the Pancasila as the spirit of law in Indonesia. It is also the derivative principle of rule of law, as clearly stated in the Indonesian Constitution (the Basic Act of the State of the Republic of Indonesia of 1945). Therefore the principle of legal aid has to be understood as a logical consequence that Indonesia is also recognizing the principle of Negara Hukum (the rule of law).

As it has been generally known that the principle of the rule of law in the Pancasila Legal System as stated in the General Definition Section of the Basic Act of the State of the Republic of Indonesia of 1945 concerning The System of Government. It has been stated there that: "The State of the Republic of Indonesia is based on (*rechtsstaat*), not to be based on mere power (*machtstaat*)". This principle has been underlined and restated in the Article 1 section (3) of the Basic Act of the Amendments to the Constitution of the State of the Republic of Indonesia of 1945 with several Decrees promulgated by the People Consultative Assembly of the Republic of Indonesia. It is stated that: "the State of the Republic of Indonesia is the state of law".

¹ *Pancasila the Ultimate of All the Sources of Laws (A Dignified Justice Perspective)*, Journal of Law, Policy and Globalization, International Institute for Science, Technology and Education (IISTE), Vol. 54, October 2016.

² Teguh Prasetyo, *Hukum dan Sistem Hukum Berdasarkan Pancasila*, Cetakan Kesatu, Media Perkasa, Yogyakarta, 2013, hal., 69.

It has also been given a meaning to such a principle, that the State of Indonesia also strongly uphold the human rights and guaranteeing that all its citizens is equal to the law and government, and being obligated to upholding that law and the government without exceptions what so ever. The principle of legal aid has become fundamentally essential, and intrinsic, what a nation state has made a declaration that it is a state of law or based its principle on the rule of law. The principle of legal aid might also be found implicitly if further research has to be done to find it in another historical constitutional documents.

In the constitutional history of the Republic of Indonesia, stipulations on the concept of legal aid has been there for a very long time on the Document, called Five Year Term of National Development Plan. In that Document, legal aid was considered as part of national strategy stated in that Document. (the Third National Development Plan). The stipulation of principle of legal aid continue to be stated and implementing in the next national Plan, until the last National Plan, i.e. the fifth. On the lowest level of instrumental regulation, the principle of legal aid was stated in the Ministerial of Justice Decree Number: M.02 UM. 90.08 of 1980 on Guidelines for the Implementation of Legal Aid.

Latter on, the Ministerial Decree was replaced by Ministry of Justice Instruction of The Republic of Indonesia Number M. 08-UM.06.02 of 1992 on the Amendment to the Ministry of Justice Instruction Number M.24-UM.06.02 of 1985 on the Guidelines to the Implementation of Legal Aid for the Section of the Society which Has Been Considered as the Have Not.

While in the Ministerial Instruction Number M.24-UM.06.02 of 1985, legal aid was regarded as general, in the Minister of Justice Instruction Number M. 08-UM.06.02 of 1992 on the Amendment to the Justice Minister Instruction Number M.24-UM.06.02 of 1985, the principle of legal aid has put much weight as the legal aid program for the underprivileged of societies or the have not.

The meaning to the concept of legal aid has been enriched and also has been adjusted to the spirit of the Indonesian people to direct it to its mission as the tool for national stability. By national stability it meant, to maintain the balance in order that the increasing gap between the have and the have not in the society could be closed. This problem of economic segregation in the Indonesian society at that time was very large, and therefore was considered as dangerous to the national stability. Legal aid was given more emphasis in order to combat the economic gaps between the rich and the poor in the society.

Later on, the principle of legal aid has been given more emphasis on the help that also been given to the rich, and therefore the principle has been changed from structural principle to neutral principle. Legal aid has been given to all the people, without considering their social and economic background. Although still, legal aid is understood as legal instrument that containing the structural dimension. Legal aid has been conducted to serve the section of the society that was considered as marginalized and outcast.

The court has been used to channel the free of charge legal aid services to the section of the society, the marginalized society as mentioned above. In this case, the district court all over Indonesian has been appointed as the institutions that channels the legal aid service as such. This is understood, as when the legal aid was implemented, the judicial power was under the control of the executive, as made possible by the Law Number 14 of 1970 on the Judicial Power.

Its meaning has also been expanded, to cover the involvement of universities and law schools in the Archipelago. The doctrine of the higher education which has to be understood as universities has to get involve in teaching, research and serving the society (tri dharma) was utilised. Legal aid was placed under the higher education doctrine of serving the society. Many legal aid department at the universities all over the country was set up to serve the need of legal aid. Legal aid has been implemented via accompanying the parties in the disputes or any criminal cases, whether it is in or out-side the court. Private cases, criminal cases, including cases in which the individual has to face the Government in the Administrative Court has been the targets of the legal aid programme.

It is interesting to note, that legal aid at this stage has also been given to the Government who has to face the trial at the Administrative Court with the individual who has brought it to the court. This is the case which has been named as cases of abuse of governmental power. (*onrechtmatige daad zaken/onrechtmatigover heidsdad*).

The Aim or Purposes of Legal Aid:-

It must also be mentioned here regarding the aim and purposes of legal aid in the Pancasila Legal System. Firstly, for humanity. This particular purpose, is in line with the purposes postulated by the Dignified Justice perspective which has been constructed with the aim to create a dignified justice.³ One, from many of the orientations of the Dignified Justice perspective is to make human as human or using the Javanese phraseology *nguwongke uwong*. The legal aid programme is given in order that it could lightening the burden of life of the section of the society which is considered as the have not. This will increase the opportunity for the most part of the society to have justice and also legal protections.

Secondly, the aim of legal aid is to risen the legal awareness. It is expected that legal aid would educate, or in terms used by the Dignified Justice theory, is *nguwongke uwong* for those part of the society which is considered as the have nots, and that it could make them manage to live as members of the society with the required level of understanding, with which they are aware of their rights and obligations as member of society and as citizens. Some has saidt, "through the increasing legal awarnes of the society, the people can understand their rights and obligations, and also the utilities of the legal aid itself"⁴.

In the Era of President Joko Widodo, through the Ministry of Law and Human Rights, it has been alocated resources to manage and implementing the principle of legal aid. The emphasis has been back to the idea that legal aid has to be directed to help the marginalized and underprivileges part in the society. The task to undertake and implementing the legal aid program has been considered as a noble task, since it has been directly making contact with the neede part of the society. It has also interesting to submit here that the noble task of legal aid is associated with the term using in Part I Introduction, number (2) the Attachment of the Instruction of the Ministry of Justice of the Republic of Indonesia Number M.08-UM. 06.02 of 1992, on the Guideline of the Implementation of the Legal Aid Program for the Poor. In this regulation, the poor has been termed as *buta hukum* (lay person). In this particular aspect, legal aid has been considered as noble task since it has opened the "door" for justice to all of the people, particularly for the poor⁵.

The concept of poor in the legal aid program has been connoted as the people who has no money, and live under the poverty line, as used by the economist. This understanding has been reiterated in the Law Number 13 of 2011 on the Poor. In this law, the concept poor have to be restricted to the people who has no money, and live under the poverty line. The laws have stated that the poor means the people who have no money to pay for legal services given by the legal practitioners. No indication that the term poor have to be related with the "legal blind" or person who does not have a clear understanding of the law.

In the past, however, as mentioned on the regulations stated above, the poor that has to be given legal aid was also related with the "legal blind". The person who was ask for his or her expertice to give legal aid, in the law at that time has been considered as those who do the noble task and this in the old Latin frase was *officium nobile*. It might be also interesting to mention it here that the structure in the relation between the giver of the legal aid and its receiver has been regarded as sub-ordinative, one is higher then the other.

In the beginning, the lower status as such was understood as a section in the society that does not have the ability to see the law ("legal blind"). Therefore, the concept poor at that time has been understood as similar to the meaning people who does not know the law. Meanwhile, the party that was regarded as having the higher status was called *officium nobile* since they understood the law, and that they were able to give their legal service. In the position as *officium nobile* as such, it has been overwhelmed with virtues such as *charitable*. Therefore, the State, as dictated by the Constitution has invited their readiness as *ofcium nobise* to dedicate their live to the modern institution of the law with the task of legal aid.

⁵ Ministry of Justice Instruction Republic of Indonesia Number: M. 08-UM.06.02 of 1992. According to Ismael Saleh, the Ministry of Justice at that time: "all person have always hope that poverty will not be the obstacle to have access to justice and law protection". *Ibid.*, The Attachment of the Ministry of Justice Instruction Republic of Indonesia Number: M. 08-UM.06.02 Tahun 1992.

Apart from those meaning of legal aid as mentioned above, legal aid has also been considered as a part of the criminal policy to prevent the what so called criminogenic factor. It means that legal aid has become an institution to prevent people become the criminal perpetrator or victims. Again, in this aspect, legal aid has been linked to the function of protecting the *national security*. This has been reflected in the phrase used in the Constitution that: "The state protecting all the Indonesian nation and all one's birthplace Indonesia...".

Such a formulation is used as a principle statement in the Preamble of the Indonesian Constitution, that legal aid is not monopoly the business of the state alone. The task has been linked with the concept outsourcing the sovereignty with the tight control still at the hands of the Government as the holder of the sovereign power. The task has been transferred to the practising lawyers (*Advokat*), as they have the skills, knowledges and expertise to be given power in order to accompany their client before the law (the court).

Practising Lawyers in Structural Legal Aid:-

Advokat or practising lawyers are the profession who give legal services, whether in or out-side the court of law. This principle has been formulated in the Article 1 Number (1) the Law Number 18 of 2003 on Practising Lawyer (*Advokat*).

According to Article 56 section (1) of the Criminal Procedures Act:

In case if the defendant or the accused was charged with the crime that threatened with the capital punishment or imprisonment up to fifteen years or more or for those who are poor which was threatened with five years or more which does not have their own legal council, the officer in charged on all level of investigations and court proceeding is obligated to appoint legal counsel for them.

It has to be added that legal services is also to be understood as legal aid, and it could be given by a legal counsel or practising lawyer (*Advokat*) to give legal advice, legal consultation, legal opinion, legal audit, defend either in or out of the court and also accompanying in the criminal cases, including handling of trade matters, arbitration and labour.⁶ For all of that functions, the practising lawyer has now been regarded in Indonesia as law enforcement officers. This was not the case before the Act. Therefore the Practising Lawyers as part of the "Law enforcement as a system has several components", that they must mastered: a) legal substance; b) legal structure; and c) legal culture⁷. The Law Number 18 of 2003 on Practising Lawyer (*Advokat*) is the Indonesian *Volkgeist* that dictating all of the aspects in the law enforcement system as mentioned above. This has strengthening their character as *officium nobile*.

It has to be noticed that now in Indonesia, as law enforcement officers, the practising lawyers are now having the same status as the police, public prosecutors, and also judges. At the same time, when they give legal aid to their client, they have to face the other law enforcement officers as such; which is tend to sided with those in society who have influence and economic power. Therefore it is important for the practising lawyers to understand the concept of structural legal aid. The meaning of structural legal aid is that the legal aid has to side with the individual or part of the society which is marginalized, as this is the postulate in the Dignified Justice as well. If they have to defend workers (employees) who are in conflict with the employers the lawyer has to side with the employees according to the law⁸.

In the structural legal aid, the mind set (the system) of the lawyers has to be changed. The change of legal culture for the benefit of the client has to be seriously considered. They have to think about the new legal culture, which is purely based on law, not in the political power as happened in the past Indonesia. They have to be consistent, for example with the dictate of the law to conduct the legal process with speedy, low cost, and also simple and opened or transparent procedures. They have to change the bureaucratic culture of the court and criminal justice system to side with their poor client.

In the structural legal aid, the practising lawyers have to be concerned with the broad approach in their tasks. They have to considered aspects such as conflicts dimensions between centre vs. peripherals and also aspects such as

⁶ Ropaun Rambe, *Teknik Praktek Advokat*, Grasindo, Jakarta, 2001, hal., 10.

⁷ Teguh Prasetyo dan Abdul Halim Barkatullah, *Filsafat, Teori dan Ilmu Hukum Pemikiran Menuju Masyarakat yang Berkeadilan dan Bermartabat*, Cetakan Kesatu, RajaGrafindo Persada, Jakarta, 2012, hal., 312.

⁸T. Mulya Lubis, *In Search of Human Rights*, Gramedia Pustakan Utama, Jakarta, 1993, hal., 55.

social, politics, economy, and also cultural. Legal formal approach has to the main priority, but material aspects in laws such as social factors must not be forgotten. Legal aid has to be constructed as a social movement.

They have to create a short of *power resources* to face the sections in the society which is tended to oppress the poor.⁹ The vision of structural legal aid as seen above is important. Particularly, since the legal culture, and also legal structure recognized by the Indonesian Criminal Procedures Law is based on the principle of *aquisatoir*. With this system in mind, the suspects, accused or convicted criminal, for example has all the rights to have legal aid. Since the process of investigation in the Police office, the suspects have to be accompanied by legal counsels.

This in order that they may give proper treatment in that legal process. It has been stipulated in Article 69 of the Indonesian Criminal Procedures Act that: “legal council has the right to have contact with the suspects since he or she is got caught by the police or detained in every stage of the proceedings according to ways that has been stated in the Act”. This principle has been provided in order that the legal counsel has every opportunities to implement his duties and noble task accordingly.

Conclusion:-

Legal aid, in particular the service to providing support for or assist parties which has been involved in disputes or criminal charges in the court in the Pancasila Legal System is by its nature a legal institutioun which has been provided in the legal system to protect society as a whole and in particular protecting the weaker section in the society. In the Pancasila Legal System, legal aid has to side with the poor, wheter those who are weak economically and also those who lack knowledge about the law and all its complexcities. This task of the lawyer (Advocates) who give the legal aid as such must be regarded as a noble task. This task is in line with the ideal of justice in the Dignified Justice, i.e. to make human as human within the Law.

Abstract

This paper presents a novel structure for a three phase four-wire (3P4W) distribution system utilizing unified power quality conditioner (UPQC). The 3P4W system is realized from a three-phase three-wire system where the neutral of series transformer used in series part UPQC is considered as the fourth wire for the 3P4W system. A new control strategy to balance the unbalanced load currents is also presented in this paper. The neutral current that may flow toward transformer neutral point is compensated by using a four-leg voltage source inverter topology for shunt part. Thus, the series transformer neutral will be at virtual zero potential during all operating conditions. The simulation results based on MATLAB/Simulink are presented to show the effectiveness of the proposed UPQC-based 3P4W distribution system. Index Terms- Active power filter (APF), four-leg voltage-source inverter (VSI) structure, three-phase four-wire (3P4W) system, unified power quality conditioner (UPQC).

Introduction:-

The use of sophisticated equipment/loads at transmission and distribution level has increased considerably in recent years due to the development in the semiconductor device technology. The equipment needs clean power in order to function properly. At the same time, the switching operation of these devices generates current harmonics resulting in a polluted distribution system. The power-electronics-based devices have been used to overcome the major power quality problems. To provide a balance, distortion-free, and constant magnitude power to sensitive load and, at the same time, to restrict the harmonic, unbalance, and reactive power demanded by the load and hence to make the overall power distribution system more healthy, the unified power quality conditioner (UPQC) is one of the best solutions. A three-phase four-wire (3P4W) distribution system can be realized by providing the neutral conductor along with the three power lines from generation station or by utilizing a delta-star (Δ -Y) transformer at distribution level. The UPQC installed for 3P4W application generally considers 3P4W supply. This paper proposes a new topology/structure that can be realized in UPQC-based applications, in which the series transformer neutral used for series inverter can be used to realize a 3P4W system even if the power supplied by utility is three phase three-wire (3P3W). This new functionality using UPQC could be useful in future UPQC-based distribution systems. The unbalanced load currents are very common and yet an important problem in 3P4W distribution system. This paper deals with the unbalanced load current problem with a new control approach, in which the fundamental active powers demanded by each phase are computed first, and these active powers are then redistributed equally on each of the phases. Thus, the proposed control strategy makes the unbalanced load currents as perfectly balanced source currents using UPQC. The proposed 3P4W distribution system realized from existing 3P3W UPQC-based system

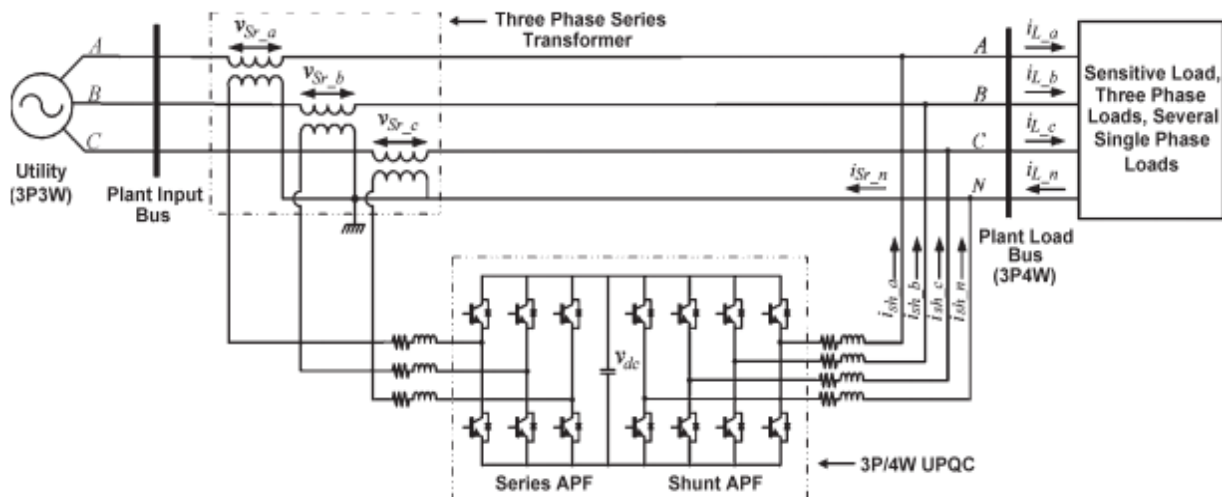

Fig:-Proposed 3P4W system realized from a 3P3W system utilizing UPQC.

Proposed 3p4w Distribution System Utilizing Upqc:-

Figure: - Simulation Block Diagram of 3P4W system realized from a 3P3W system utilizing UPQC.

Generally, a 3P4W distribution system is realized by providing a neutral conductor along with three power conductors from generation station or by utilizing a three-phase Δ -Y transformer at distribution level shows a 3P4W network in which the neutral Conductor is provided from the generating station it shows a 3P4W distribution network considering a Δ -Y transformer. Assume a plant site where three-phase three-wire UPQC is already installed to protect a sensitive load and to restrict any entry of distortion from load side toward utility

If we want to upgrade the system now from 3P3W to 3P4W due to installation of some single-phase loads and if the distribution transformer is close to the plant under consideration, utility would provide the neutral conductor from this transformer without major cost involvement. In certain cases, this may be a costly solution because the distribution transformer may not be situated in close vicinity. Recently, the utility service providers are putting more and more restrictions on current total harmonic distortion (THD) limits, drawn by nonlinear loads, to control the power distribution system harmonic pollution. At the same time, the use of sophisticated equipment/load has increased significantly, and it needs clean power for its proper operation. Therefore, in future distribution systems and the plant/load centers, application of UPQC would be common. It shows the proposed novel 3P4W topology that can be realized from a 3P3W system. This proposed system has all the advantages of general UPQC, in addition to easy expansion of 3P3W system to 3P4W system. Thus, the proposed topology may play an important role in the

future 3P4W distribution system for more advanced UPQC based plant/load center installation, where utilities would be having an additional option to realize a 3P4W system just by providing a 3P3W supply. The UPQC should necessarily consist of three-phase series transformer in order to connect one of the inverters in the series with the line to function as a controlled voltage source.

If we could use the neutral of three-phase series transformer to connect a neutral wire to realize the 3P4W system, then 3P4W system can easily be achieved from a 3P3W system. The neutral current, present if any, would flow through this fourth wire toward transformer neutral point. This neutral current can be compensated by using a split capacitor topology [2], [9], [10] or a four-leg voltage-source inverter (VSI) topology for a shunt inverter [2], [11]. The four-leg VSI topology requires one additional leg as compared to the split capacitor topology. The neutral current compensation in the four-leg VSI structure is much easier than that of the split capacitor because the split capacitor topology essentially needs two capacitors and an extra control loop to maintain a zero voltage error difference between both the capacitor voltages, resulting in a more complex control loop to maintain the dc bus voltage at constant level. In this paper, the four-leg VSI topology is considered to compensate the neutral current flowing towards the transformer neutral point. A fourth leg is added to the existing 3P3W UPQC, such that the transformer neutral point will be at virtual zero potential. Thus the proposed structure would help to realize a 3P4W system from a 3P3W system at distribution load end.

Simulation Block Diagrams and Results:-

The simulation results for the proposed 3P4W system realized from a 3P3W system utilizing UPQC.

Utility voltage are assumed to be distorted with voltage THD of 35.41%. The resulting load current profile has THD of 12.1%. The UPQC should maintain the voltage at the load bus at a desired value and free from distortion. The plant load is assumed to be the combination of a balanced three phase diode bridge rectifier followed by an RL load, which act as a harmonic generating load and three different single. This would eventually result in easy expansion from 3P3W to 3P4W systems. A control strategy to generate balanced reference source current under unbalanced load condition is also proposed in this paper.

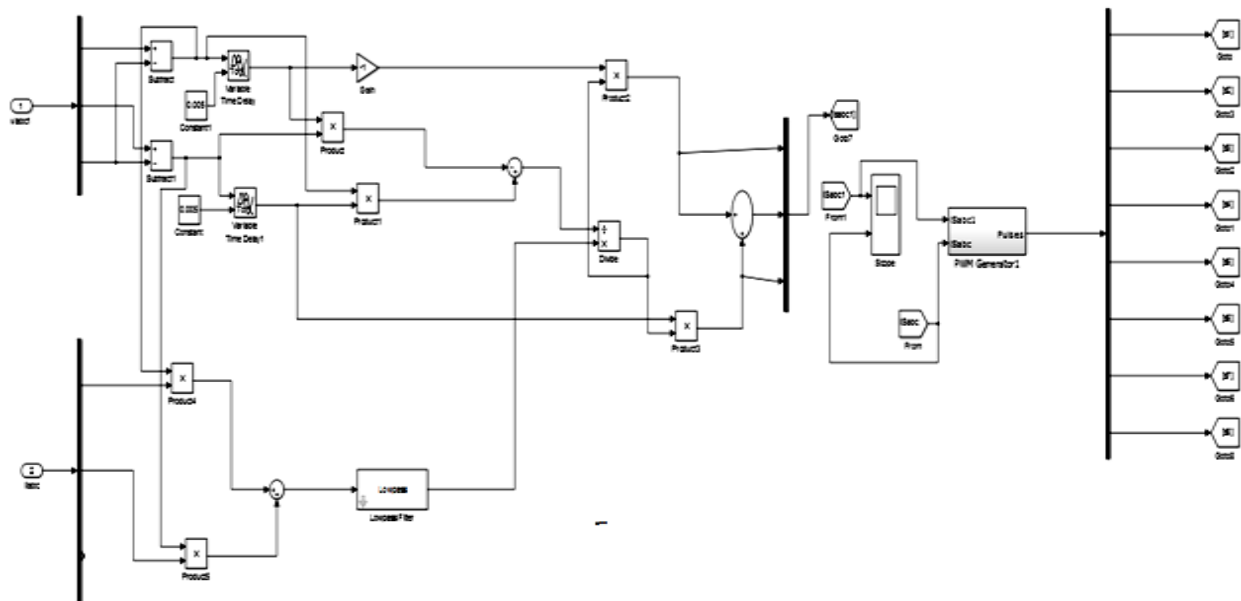

Fig: - Shunt Active Power Filter.

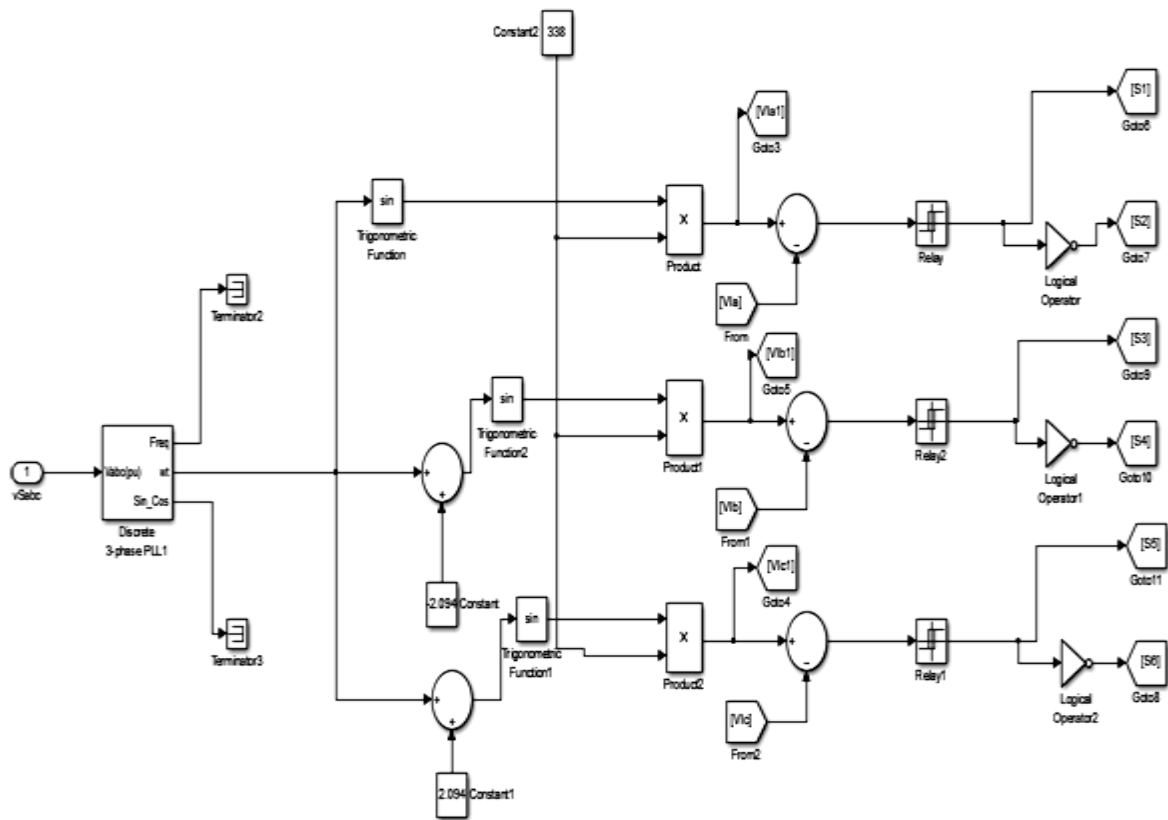

Figure: - Series Active Power Filter

The series active power filter injects the required compensating voltages through series transformer, making the load voltage free from distortion (THD = 1.51%) and at a desired level in load voltage. The series active power filter injected voltage profile

The compensated source currents are perfectly balanced with the THD of 2.26% .The compensating current injected through the fourth leg of the shunt APF. The load neutral current profile, the shunt APF effectively compensates the current flowing toward the transformer neutral point. Thus, the series transformer neutral point is maintained at virtual zero potential Simulation Block Diagram of 3P4W system realized from a 3P3W system utilizing UPQC.

Conclusion:-

The design of a unified power quality conditioner (UPQC) connected to 3P4W distribution system has been presented in this project. Where UPQC is installed to compensate the different power quality problems, which may play an important role in future UPQC- based distribution system. The simulation results shows that the distorted and unbalanced load currents seen from the utility side act as perfectly balanced source currents and are free from distortion. Here we can absorb the power quality problems like voltage and current unbalanced and reduced the total harmonic distortion (THD) of 3P4W system utilizing 3P3W system to connect the UPQC. The neutral current that may flow toward the transformer neutral point is effectively compensated such that the transformer neutral point is always at virtual zero potential.

Scope for Future Work:-

Proposed model for the UPQC is to compensate input voltage harmonics and current harmonics caused by non-linear load. The work can be extended to compensate the supply voltage and load current imperfections such as sags, swells, interruptions, voltage imbalance, flicker, and current unbalance. Proposed UPQC can be implemented using Multi converter-unified power quality conditioning system (MC-UPQC).

Abstract

In this study we planned to identify and quantify the lipid composition of Saudi *Lepidium sativum* seed and to evaluate the potential antimicrobial activity of the extracted fixed oil. GC-MS analysis of the fixed oil revealed the presence of 16 components. Major constituents are: β -amyrin(31.33%), 9,12,15-octadecatrienoic acid methyl ester(15.97%), 9-octadecenoic acid methyl ester(11.93%), α -amyrin(9.32%), 11-eicosenoic acid methyl ester (6.64%), 9,12-octadecadienoic acid (6.03%), hexadecanoic acid methyl ester(5.24%). In cup plate agar diffusion bioassay, the oil which was extracted by two different methods (soxhlet and maceration) was evaluated for antimicrobial activity and the effect of the method of extraction on the antimicrobial potency was investigated.

Introduction:-

Lepidium sativum (Crusifereae) is an annual plant about 50cm in height. The plant can grow easily tolerating difficult environmental conditions(Sharma and Agrawal, 2011; Wadhwal et.al, 2012). It has many branches on the upper parts and white-pinkish flowers(Derek, 1997; Boswell and Sowerby, 1863). The plant is genetically related to mustard and watercress and is known in some regions as garden cress, garden pepper cress, pepperwort, pepper grass(Cassidy and Hall, 2002; Staub and Bduchert, 2008).

Lepidium sativum L. contains significant amount of iron, calcium, folic acid beside vitamins A and C. It also contains protein(25%); leucine (8.21%); glutamic acid(19.3%) and methionin(0.97%). Seeds mainly contain alkaloids, calcium, iron, carotene, riboflavan, uric acid, phosphorus, thiamine and niacin. Seed oil contains palmitic, linoleic, stearic, behenic, oleic, arachidic and ligneric acids(Hiba and Wasfeih, 2014).

Lepidium sativum is a key species in African system of medicine where it is mainly used against bronchitis. In some Asian communities the plant is used against a wide array of human disorders(Baquar, 1989; Duke et.al, 2002). It was reported that garden cress possesses anti-inflammatory, analgesic, anticoagulant(Al-Yahya, 1994), diuretic(Patel et.al, 2009), antihypertensive (Maghrani et. al., 2005), antirheumatic (Ahsan et.al, 1989), antidiarrheal, antispasmodic, laxative(Rehman et.al., 2011) and hypoglycemic(Patole, 1998) properties.

Aqueous extracts of seeds exhibited significant water excretion in spontaneously hypotensive models without any significant change in heart rate.. The petroleum ether extract of seeds showed antimicrobial activity against some

Corresponding Author:- Abdel Karim M.

Address:- Sudan University of Science and Technology, Faculty of Science, Dept. of Chemistry.

standard human pathogens, while oral administration of seeds proved a hypoglycemic effect(Hiba and Wasfeih ,2014).

It was reported that *Lepidium sativum* juice possess chemoprotective effect(Hiba and Wasfeih ,2014).The aqueous methanolic extract of seeds showed important improvement in various parameters of pulmonary function in a clinical experiment(Najeeb-Ur-Rehman et.al.,2012). In another clinical study , the seeds were evaluated for the management of osteoarthritis. Seeds showed considerable relief of joints pain , swelling, stiffness and other symptoms associated with osteoarthritis(Nita and pandye,2009).

It seems that *Lepidium sativum* seeds are well tolerated . In clinical experiments of the effect of seed administration on bronchial asthma, none of the test subjects showed the presence of adverse effects or any other problems physically or at hematological profile(www.bioline.org.). Feeding model animals with *Lepidium sativum* seeds (2% w/w) for six weeks was non-toxic , while a dose of 50% (w/w) was lethal(www.worldscientific.com).

Materials and Methods:-

Materials:-

Plant material:-

Lepidium sativum seeds were purchased from the local market-Ryad-Saudi Arabia and authenticated by direct comparison with a herbarium sample.

Instruments:-

A Shimadzo GC-MS-QP2010 Ultra instrument with a RTX-5MS column (30m,length ; 0.25mm diameter ; 0.25 μ m, thickness)was used.

Methods:-

Extraction of oil:-

Powdered *Lepidium sativum* seeds (400g) were exhaustively extracted with n-hexane (soxhlet).The solvent was removed under reduced pressure and the oil was kept in the fridge at 4°C for further manipulation.Another seed sample (400g) was exhaustively macerated with n-hexane.

Esterification of oil:-

A Methanolic solution of sodium hydroxide was prepared by dissolving (2g) of sodium hydroxide in (100ml) methanol.A stock solution of methanolic sulphuric acid was prepared by mixing (1ml) of concentrated sulphuric acid with(99ml) methanol.

The oil(2ml) was placed in a test tube and (7ml) of alcoholic sodium hydroxide were added followed by(7ml) of alcoholic sulphuric acid. The tube was stoppered and shaken vigorously for five minutes and then left overnight.(2ml) of supersaturated sodium chloride were added,then (2ml) of normal hexane were added and the tube was vigorously shaken for five minutes. The hexane layer was then separated.(5 μ l) of the hexane extract were mixed with (5ml) diethyl ether . The solution was filtered and the filtrate(1 μ l) was injected in the GC-MS vial.

GC-MS analysis:-

Lepidium sativum oil was analyzed by gas chromatography – mass spectrometry. A Shimadzo GC-MS-QP2010 Ultra instrument with a RTX-5MS column (30m,length ; 0.25mm diameter ; 0.25 μ m, thickness)was used. Helium (purity; 99.99 %) was used as carrier gas. Oven temperature program is given in Table 1, while other chromatographic conditions are depicted in Table 2.

Table 1:- Oven temperature program.

Rate	Temperature (°C)	Hold time (min ⁻¹)
-	150.0	1.00
4.00	300.0	0.00

Table 2:- Chromatographic conditions.

Column oven temperature	150.0°C
Injection temperature	300.0°C
Injection mode	Split
Flow control mode	Linear velocity
Pressure	139.3KPa
Total flow	50.0ml/ min
Column flow	1.54ml/sec.
Linear velocity	47.2cm/sec.
Purge flow	3.0ml/min.
Spilt ratio	- 1.0

Antimicrobial Assay:-**Preparation of bacterial suspensions:-**

One ml aliquots of 24 hours broth culture of the test organisms were aseptically distributed onto nutrient agar slopes and incubated at 37°C for 24 hours.

The bacterial growth was harvested and washed off with sterile normal saline, and finally suspended in 100 ml of normal saline to produce a suspension containing about 10⁸-10⁹ colony forming units per ml. The suspension was stored in the refrigerator at 4°C until used. The average number of viable organism per ml of the stock suspension was determined by means of the surface viable counting technique.

Serial dilutions of the stock suspension were made in sterile normal saline in tubes and one drop volumes (0.02 ml) of the appropriate dilutions were transferred by adjustable volume micropipette onto the surface of dry nutrient agar plates. The plates were allowed to stand for two hours at room temperature for the drop to dry, and then incubated at 37°C for 24 hours.

Preparation of fungal suspensions:-

Fungal cultures were maintained on dextrose agar incubated at 25°C for four days. The fungal growth was harvested and washed with sterile normal saline, and the suspension was stored in the refrigerator until used.

Testing for antibacterial activity:-

The cup-plate agar diffusion method was adopted, with some minor modifications, to assess the antibacterial activity. (2ml) of the standardized bacterial stock suspension were mixed with 200 ml of sterile molten nutrient agar which was maintained at 45°C in a water bath. (20 ml) Aliquots of the incubated nutrient agar were distributed into sterile Petri dishes. The agar was left to settle and in each of these plates which were divided into two halves, two cups in each half (10 mm in diameter) were cut using sterile cork borer (No 4), each one of the halves was designed for one of the test solutions. Separate Petri dishes were designed for standard antibacterial chemotherapeutics.

The agar discs were removed, alternate cups were filled with 0.1 ml samples of each test solution using adjustable volume microtiter pipette and allowed to diffuse at room temperature for two hours. The plates were then incubated in the upright position at 37°C for 24 hours. The above procedure was repeated for different concentrations of the test solutions and the standard chemotherapeutics. After incubation, the diameters of the resultant growth inhibition zones were measured in triplicates and averaged.

Results and Discussion:-**GC-MS analysis of *Lepidium sativum* seed oil:-**

The GC-MS analysis of *Lepidium sativum* seed oil was conducted and the identification of the constituents was accomplished by comparison with the MS library (NIST) and further confirmed by the observed fragmentation pattern. 80-95% match was observed.

Identification of oil constituents:-

The GC-MS spectrum of the studied oil revealed the presence of 16 components (Table 3). The typical total ion chromatogram (TIC) of the hexane extract is shown in Fig.1.

Fig.1:- Total ion chromatograms of hexane extract.

Table 3:- Constituents of *Lepidium sativum* seed oil.

The following major constituents were detected:

β -Amyrine(31.33%):-

The EI mass spectrum of β -amyrine is shown in Fig. 2. The peak at m/z 426, which appeared at R.T. 25.723 in total ion chromatogram, corresponds $M^+[C_{30}H_{50}O]^+$. The peak at m/z 411 corresponds to loss of a methyl function.

9,12,15-Octadecatrienoic acid (15.97%):-

The EI mass spectrum of 9,12,15-octadecatrienoic acid (as methyl ester) is shown in Fig. 3. The peak at m/z 292, which appeared at R.T. 24.720 in total ion chromatogram, corresponds $M^+[C_{19}H_{32}O_2]^+$. The peak at m/z 277 corresponds to loss of a methyl function.

9-Octadecenoic acid methyl ester(11.93%):-

The EI mass spectrum of 9-octadecanoic acid methyl ester is shown in Fig. 4. The peak at m/z 296, which appeared at R.T. 24.696 in total ion chromatogram, corresponds $M^+[C_{19}H_{36}O_2]^+$. The peak at m/z 264 corresponds to loss of a methoxyl function.

α -Amyrine(9.32%):-

The mass spectrum of α -amyrine is displayed in Fig. 5. The peak at m/z 426, which appeared at R.T. 25.268 in total ion chromatogram, corresponds $M^+[C_{30}H_{50}O]^+$. The peak at m/z 411 corresponds to loss of a methyl function.

11-Eicosenoic acid(6.64%):-

The mass spectrum of 11-eicosenoic acid is shown in Fig. 6. The peak at m/z 324 (R.T.26.655) corresponds $M^+[C_{21}H_{40}O_2]^+$. The signal at m/z 292 is due to loss of a methoxyl function.

9,12-Octadecadienoic acid methyl ester(6.03%):-

The EI mass spectrum of 9,12-octadecadienoic acid methyl ester is depicted in Fig. 7. The peak at m/z 294, which appeared at R.T. 24.640, corresponds $M^+[C_{19}H_{34}O_2]^+$. The signal at m/z 263 accounts for loss of a methoxyl group.

Hexadecanoic acid(5.24%):-

Mass spectrum of hexadecanoic acid methyl ester is shown in Fig.8. The peak at m/z 270 (R.T. 22.720) corresponds $M^+[C_{17}H_{34}O_2]^+$. The signal at m/z 239 corresponds to loss of a methoxyl function.

13-Docosenoic acid(2.64%):-

The EI mass spectrum of 13-docosenoic acid is displayed in Fig. 9. The peak at m/z 352, which appeared at R.T.28.423 in total ion chromatogram, corresponds $M^+[C_{23}H_{44}O_2]^+$. The signal at m/z 320 corresponds to loss of a methoxyl group.

9-Octadecenamide(2.32%):-

The mass spectrum of 9-octadecenamide is shown in Fig.10. The peak at m/z 281, which appeared at R.T.27.282, corresponds $M^+[C_{18}H_{35}NO]^+$. The peak at m/z 238 corresponds to loss of acetyl function.

Eicosenoic acid(1.93%):-

The EI mass spectrum of eicosenoic acid is depicted in Fig. 11. The peak at m/z 326, which appeared at R.T.26.867 in total ion chromatogram, corresponds $M^+[C_{21}H_{42}O_2]^+$. The peak at m/z 295 is due to loss of a methoxyl group.

Antimicrobial assay:-

Lepidium sativum seed oil was extracted by two different methods (A; soxhlet and B; maceration) to evaluate the effect of heating(soxhlet) on the antimicrobial potency of the extracted oil. Table (4)shows that the oil extracted by maceration is partially active against *Escherichia coli* at concentrations of 10 and 50 µg/ml , while the soxhlet

sample was devoid of activity at these concentrations. At 50 µg/ml both samples were partially active against *Klebsiella pneumoniae*. Furthermore, the soxhlet sample exhibited partial activity against *Bacillus subtilis* at a concentrations of 10 and 50 µg/ml while the macerated sample was inactive at these concentrations. However, both samples were inactive against *Staphylococcus aureus* at test concentrations. It seems that the potency of such extracts depends largely on the type of test organism and the concentration of the sample. Similar trends were observed for the minimum inhibition concentration (Table 5).

Monte Carlo modeling

Abstract

Simulations using Monte Carlo N-particle transport code MCNP5 were carried out to model a ^{252}Cf -based system for detection of buried landmines. The study explores the performance of the neutron backscattering methods in providing elemental characterization for the buried landmine. The net elastically back-scattered (EBS) neutron energy spectra at both fast and thermal neutron ranges were calculated. The net (EBS) neutrons from the major constituent elements of a landmine simulant (TNT) have shown definite structures that can be used for identification of buried landmines.

Introduction:-

The most common explosives used in landmines are TNT ($\text{C}_7\text{H}_5\text{N}_3\text{O}_6$) and RDX ($\text{C}_3\text{H}_6\text{N}_6\text{O}_6$). As their composition indicates, they are composed of four basic elements: hydrogen, carbon, nitrogen and oxygen. Although many organic materials buried in soil are also composed of the same elements, use can be made of the fact that explosives have concentrations that are different than in soil and in most common organic materials. One way for the detection and identification of explosives is the use of neutrons. Several investigations were carried out on the advantages and limitations of neutron-based techniques used for the detection and identification of anti personnel landmines (e.g. Csikai, 1999, ElAgib and Csikai, 1999, Datema et al., 2000, Hussein and Waller, 2000, Kiraly et al., 2001, Brooks et al., 2004). The incident neutrons will interact with the nuclei of the major chemical elements in the mine (H, C, N and O), emitting elastically backscattered fast and thermal neutrons spectra which can act as fingerprints of the these chemical elements.

The elastically backscattered (EBS) neutrons can be detected by a suitable detector capable of differentiating the EBS neutrons according to their energy and their flux. The concentration of hydrogen, carbon, nitrogen or oxygen can be evaluated by calculating the elastically backscattered net relative yield of the neutrons and observing the different patterns of their energy spectra (Hussein, et al., 2005). One other detection approach based on neutron backscattering is to simply detect the hydrogen content in soil by measurement of thermal backscattered neutrons from hidden explosives. The change in hydrogen concentration in soil can be made by calculating the intensity of low energy neutrons reflected back from soil (Hussein and Waller, 2000). The chemical elements of interest for the detection of explosives require neutron sources of different energies in order to be observed.

Hydrogen is best observed through nuclear reactions initiated from very low energy neutrons. Other elements such as C, N, and O require neutron energies of several MeV to be observed at all. To satisfy this, the required neutron source should produce high energy neutrons for the detection of elements such as C, N, and O, and low energy neutrons for elements such as H (Vourvopoulos and Sullivan, 2006). Such a task can be accomplished with the use of a spontaneous fission source such as ^{252}Cf . The present work was done by considering a simple sample-source-

detector geometry, simulating the elastically backscattered (fast and thermal) neutrons from the constituent elements of the explosive material and studying the variation in the net flux with the source energy spectrum. Such geometry was chosen in order to tally the EBS fast and thermal neutrons spectra.

MCNP Modeling & calculation procedure:-

Monte Carlo simulation of a land-mine localization device using the neutron backscattering method was reported by Datema et al. (2002). The general-purpose Monte Carlo N-Particle (MCNP) code, as described by the X-5 Monte Carlo Team (2003), was used in the present study. The code accounts for all neutron reactions given in a particular cross-section evaluation (such as ENDF/B-VI). The evaluated data are processed into a format appropriate for MCNP with the help of codes such as NJOY (MacFarlane et al., 1982). Continuous nuclear cross section data based on the ENDF/B-VI were used in the present computations. The net elastically backscattered neutron spectra were computed for the major elements of a landmine when buried in soil. Calculations were performed using a fixed point source with enough histories to have the statistical error less than 2% in all energy bins.

The sample-source-detector geometry used in the present study is shown in Fig. 1.

Fig 1:- Geometry used in the MCNP simulations.

The model consists of a soil of dimensions 200cm×150cm×100cm, with the sample as an explosive material in the form of a cylindrical cane TNT of 5cm radius×5cm height, buried 5cm deep in soil. A point neutron isotopic ^{252}Cf source was used in the study. The source was located at vertically above the soil at $y = +10\text{cm}$. Measured and normalized neutron spectra of ^{252}Cf employed in the calculations were taken from Griffith, et al. (1990). A ring detector with 10cm radius was centered on the ^{252}Cf source. This is tally the elastically backscattered (EBS) neutrons from the major constituent elements of the buried landmine. The net elastically backscattered neutrons spectra were calculated by subtracting the background spectrum (soil) from the signal (soil and sample). The calculations were carried out in duration of 100s.

The composition of soil and TNT explosive as modeled in the MCNP simulations is shown in Table 1, with the data taken from Maucec and Rigollet (2004) and Hussein et al. (2005). Mass densities (in g.cm⁻³) of H (0.02), C (2.23), N (0.81), O (1.14) and Si (2.33), that were used in the MCNP simulations, were taken from the same sources.

Table 1:- Composition of soil and TNT explosive as modeled in MCNP simulation [8,11]

Material / Mass Density (g.cm ⁻³)	Elemental Mass Fraction / Mass Density (g.cm ⁻³)					
	H	C	N	O	Si	Al
Soil	0.0146			0.5520	0.3607	0.0731
1.12	0.016			0.618	0.404	0.082
TNT (C ₇ H ₅ N ₃ O ₆)	0.0217	0.370	0.185	0.4229		
1.65	0.0358	0.610	0.306	0.689		

Results and Discussion:-

The net EBS neutron energy spectra from H, C, N, O and landmine stimulant are shown in Figs. 2-6, respectively. Fig. 2 represents the net EBS neutron energy spectra from H. A few peaks of low energy elastically backscattered (LEBS) neutrons are observed in the low neutron energy range (0.022MeV -0.052 MeV). Negative indications are observed, because fast elastically backscattered (FEBS) neutrons are higher from the constituent elements of soil.

**Fig. 2:-** The EBS neutron energy spectra from H.

The net EBS neutron energy spectra from C are shown in Fig. 3. More relatively high peaks of LEBS neutrons are observed at the low neutron energy range (0.39MeV-0.64MeV). Compared with H, it is reasonable, since C is less effective as a moderator compared to hydrogen. Relatively high peaks of FEBS neutrons are also observed at the energies 1.58MeV, 2 MeV and 3.51MeV.

Fig. 3:- The EBS neutron energy spectra from C.

The net EBS neutron energy spectra from N are shown in Fig. 4. Intensive peaks of LEBS neutrons are observed at the low neutron energy range (0.022 MeV-0.64 MeV). Relatively high peaks of FEBS neutrons are also observed at the energies 1.21 MeV, 2.32 MeV, 3.35 MeV and 3.25 MeV.

Fig. 4:- The EBS neutron energy spectra from N.

Fig. 5 shows the net EBS neutron energy spectra from O. A high peak of LEBS neutrons is observed at 0.64 MeV. Relatively high peaks of FEBS neutrons are observed at energies 2.33 MeV and 3.27 MeV

Fig. 5:- The EBS neutron energy spectra from O.

Fig. 6 represents the net EBS neutron energy spectra from landmine. Relatively high peaks of LEBS neutrons are observed at the energies 0.324 MeV, 0.531 MeV and 0.74 MeV. In addition, relatively higher peaks of FEBS neutrons are observed at 3.35 MeV. It is clear from the above results that the EBS neutrons spectra are spread throughout the slow and fast neutron energy regions. Effective detection of such neutron yields can be achieved by employing a detector capable of detecting both slow and fast neutrons.

Fig. 6:- The EBS neutron energy spectra from landmine.

Conclusion:-

In the present work, Monte Carlo code was used to model a point ^{252}Cf neutron source centering a ring detector of 10cm radius. The energy spectra of the net EBS neutrons from the major constituent elements of landmine; H, C, N and O were explored. The EBS neutron energy spectra of fast and thermal neutrons of the major constituent elements of landmine stimulant have shown definite and detectable structures that can be used for the identification of a buried landmine.

Abstract

Background: In recent years, non-alcoholic fatty liver disease is considered as a novel component of insulin resistance and metabolic syndrome, which is found to be associated with mild elevation of liver enzymes.

Aim of the Study: The aim of this study was to correlate the ALT/AST ratio with insulin resistance calculated by HOMA-IR (Homeostatic model assessment-Insulin resistance) method among patients found to have metabolic syndrome.

Design and Methodology: This was an observational cross sectional study which included 60 subjects of metabolic syndrome defined by International Diabetes Federation criteria. The relevant clinical examination and basic investigations were done. Fasting insulin levels were analysed by chemiluminescence method. Liver function tests were done by fully automated Analyzer Synchron CX-9 using Roche kits, calibrators and Randox control Sera. Data was processed and analyzed by SPSS version 17.0 software. The Correlation between ALT/AST ratio and HOMA-IR was assessed using The Pearson correlation test.

Results The ALT/AST Ratio was found to have positive correlation with HOMA-IR (Pearson's correlation coefficient is +0.742 and the significance was <0.001). This study shows that ALT/AST ratio can be used as screening tool of insulin resistance in the community.

Introduction:-

The aminotransferases (transaminases) are sensitive indicators of liver cell injury. They include the aspartate aminotransferase (AST) and the alanine aminotransferase (ALT). AST is found in the liver, cardiac muscle, skeletal muscle, kidneys, brain, pancreas, lungs, leukocytes, and erythrocytes in decreasing order of concentration. ALT is found primarily in the liver and is therefore a more specific indicator of liver injury [1].

The aminotransferases are normally present in the serum in low concentrations. These enzymes are released into the blood in greater amounts when there is damage to the liver cell membrane resulting in increased permeability. The normal range for aminotransferases varies widely among laboratories, but generally ranges from 10-40 U/L [1].

Address:-Ramya SG-Junior Resident, Department of General Medicine, Lady Hardinge Medical College, Newdelhi.

The liver plays an important role in maintaining normal glucose concentrations during fasting as well as postprandially. A number of recent studies have suggested that abnormal hepatocellular function is associated with obesity, insulin resistance, and type 2 diabetes [2], [3].

The metabolic syndrome is a condition characterized by a cluster of features including glucose intolerance, insulin resistance, abdominal obesity, atherogenic dyslipidemia, elevated blood pressure, a proinflammatory and a prothrombotic state [4]. It increases the mortality and morbidity due to cardiovascular diseases significantly. Insulin resistance is the key feature of metabolic syndrome. It means greater amount of insulin are required to elicit normal biologic response at a cellular organ or whole body level [4].

In recent years, nonalcoholic fatty liver disease (NAFLD), as a novel component of insulin resistance and metabolic syndrome (MS), has drawn the attention of many researchers. NAFLD encompasses a wide spectrum of liver diseases ranging from simple benign steatosis to steatohepatitis, fibrosis and cirrhosis. This condition which is associated with long-standing elevations in liver enzymes is related to higher risk of adverse cardiovascular events, oxidative stress, endothelial dysfunction, and MS [5]. Although not all patients with NAFLD are obese, obesity is considered the most important risk factor [5], [6]. Typically, liver biopsy is the ultimate test for diagnosis and delineation of the extent. It is usually not done except for situations of conflicting diagnosis. Liver ultrasonography although not sensitive enough to differentiate simple steatosis from more advanced hepatic involvement, is widely used [7]. Recently ALT/AST ratio has attracted great interest as potential novel marker of insulin resistance.

Aim of the Study:-

The aim of this study was to correlate the ALT/AST ratio with insulin resistance calculated by HOMA-IR (Homeostatic model assessment-Insulin resistance) method in metabolic syndrome patients.

Materials and Methods:-

This was an observational cross sectional study conducted among 60 patients of age ≥ 18 years with metabolic syndrome. This study was approved by the Ethical committee of the institution.

Inclusion Criteria:-

The study population included the adult patients of age ≥ 18 years who were diagnosed to have Metabolic syndrome based on following International Diabetes Federation criteria.

Waist circumference ≥ 90 cm in men and ≥ 80 cm in women with two or more of the following:-

Fasting triglyceride ≥ 150 mg/dl or specific medications.

HDL cholesterol < 40 mg/dl and < 50 mg/dl for men and women respectively or specific medications.

Blood pressure ≥ 130 mm systolic or ≥ 85 mm diastolic or previously diagnosed hypertensive or specific medications.

Fasting blood glucose ≥ 100 mg/dl or previously diagnosed type 2 Diabetes mellitus.

Exclusion Criteria:-

The following cases were excluded from the study:-

History of alcohol intake.

History of liver disease due to autoimmune, viral, genetic, drug induced causes.

Severe cardiac/renal/hepatic dysfunction.

Patient on insulin therapy for treatment of diabetes mellitus.

Methodology:-

A detailed history and examination of the study population were noted and anthropometric measurements, including height, weight, BMI, waist circumference and hip circumference were noted and the waist hip ratio was calculated (WHR). 10 ml of fasting venous blood sample was taken with aseptic precautions and distributed in EDTA, plain and fluoride containers. EDTA sample was used for complete blood count, fluoride vial sample for blood glucose and serum for estimation of Liver function tests, Kidney function tests and Lipid profile. Fasting insulin level in a plain test tube was analysed by chemiluminescence method. HBsAg and Hepatitis C were tested by Elisa method. Liver function tests, kidney function test and lipid profile were checked using fully automated Analyzer Synchron CX-9. Normal ALT and AST levels were considered to be 10-40 IU/L.

Insulin resistance is calculated by following formula using homeostasis model assessment of insulin resistance,

$$\text{HOMA-IR} = \frac{\text{fasting insulin } (\mu\text{U/ml}) \times \text{fasting glucose}(\text{mmol/l})}{22.5}$$

Statistical analysis of the study:-

Data was processed and analysed by SPSS version 17.0 software. Sample statistics i.e, mean, median and standard deviation were calculated for quantitative data. Chi-square test and difference of proportion were applied for qualitative analysis. Mean and standard deviation were compared by student t test. Mann Whitney's test and Kruskal Wallis test were used for non-normally distributed data. The Correlation between ALT/AST ratio and HOMA-IR was assessed using the Pearson correlation. Statistical significance was set at $p \leq 0.05$.

Results:-

68% of patients were from the group of age 50-69 years and 8% of patients were from the group of age ≥ 70 years and 23% from the group of age 30-49 years (table 1). The mean age is found to be 57.05 ± 8.83 years. The study population ranged from 36 years to 74 years. There were 30 males and 30 females. There was no statistically significant difference between the age distribution of males and females ($p=0.806$).

Patients who were both Diabetic and hypertensive patients (43.33%) were more in number compared to isolated diabetes (26.67%) and isolated hypertension (28.33%). The Blood pressure did not show any statistically significant difference among sex groups and different age groups but diastolic BP was significantly higher with people having higher BMI. The mean BMI was 29.44 ± 2.83 kg /m². Majority (93.33%) of study group were with BMI > 25 kg/m² and females were found to have higher mean BMI. 68.3 % patients among the study group had WHR ≥ 0.95 . The mean fasting Blood sugar among study group was 170.12 ± 36.37 mg/dl.

The mean ALT level among the study group is 51.45 ± 9.12 IU/L. The mean AST level among the study group is 44.18 ± 6.19 IU/L. The Study group is divided based on normal cut off as 40 IU/L for both the enzymes and it was found that 56 patients (93.33%) were found to have ALT levels ≥ 40 IU/L and 36 patients (60%) were found to have AST ≥ 40 IU/L (table 2). The mean ALT/AST Ratio among the study group is 1.173 ± 0.186 . The ALT/AST Ratio among the study group ranged from 0.69 to 1.60. 83.3% of patients were in the group ALT/AST RATIO ≥ 1 (figure 1).

The mean HOMA-IR level among the study group is 4.14 ± 2.27 . The HOMA-IR among the study group ranged from 1.23 to 11.28. The definite cut off of HOMA-IR to identify insulin resistance is not defined yet as the people in different areas of world also differs in their ethnicity and clinical background. On considering patients whose HOMA IR ≥ 2 as insulin resistant and HOMA < 2 as non insulin resistant, it was found that about 81.7% patients among the study group were insulin resistant.

The ALT/AST Ratio was correlated to HOMA-IR among the study group using Pearson Correlation test and it was found that Pearson's Correlation coefficient is +0.742 and the significance (2 tailed) was < 0.001 (Figure 2). Hence the correlation was found to be statistically significant. The correlation between ALT enzyme levels and HOMA-IR was also found to be statistically significant ($r = +0.58$ and $p < 0.001$).

There was positive correlation between ALT/AST Ratio with fasting Blood Sugar and fasting insulin levels with significance (2 tailed) value < 0.001 . The ROC curve of ALT/AST Ratio is calculated in relation to HOMA-IR value as gold standard test (figure 3). Among the study group it was found that about 49 patients had HOMA-IR > 2 where as 11 patients had HOMA-IR < 2 . The area under the curve is 0.862 and it was found that the cut off of HOMA-IR value-1.06 has the sensitivity of 93.9% and the specificity of 81.8 % but the cut off of 1.07 has the sensitivity of 91.8 % and specificity of 81.8%. Since ALT/AST Ratio is easy to use as a screening tool of insulin resistance the cut off of 1.06 is considered better to achieve better sensitivity.

Table 1:- Age and Sex distribution of study group.

Sex	Age 30-49 years	Age 50-69 years	Age ≥ 70 years
Male	6(20%)	21(70%)	3(10%)
Female	8(26.66%)	20(66.66%)	2(6.67%)
Total	14(23%)	41(68%)	5(8%)

Table 2:- Frequency distribution of ALT, AST and HOMA-IR.

Parameter	Frequency	Percentage
ALT<40 IU/L	4	6.7%
ALT ≥ 40 IU/L	56	93.3%
AST<40	24	40%
AST ≥ 40	36	60%
ALT/AST<1	10	16.7%
ALT/AST ≥ 1	50	83.3%
HOMA-IR ≥ 2	49	81.7%
HOMA-IR <2	11	18.3%

**Figure 1:-** Distribution of ALT/AST Ratio among study group.

Figure 2:- Scatter Plot showing correlation of ALT/AST ratio to HOMA-IR.

Figure 3:- ROC curve of ALT/AST ratio in relation to HOMA-IR.

Discussion:-

The mean age of this study population was found to be 57.05 years which is similar to study in Eastern India by Prasad et al [8] which showed that prevalence of metabolic syndrome increases with age and maximum number of patients were from age 50-59 years. Another study by Kumar et al [9] in Warangal, Andhra Pradesh also showed maximum prevalence was found in age group 51 -60 years with a mean of 52.8 ± 11.6 years. Deepa et al [10] conducted a study conducted in Chennai among metabolic syndrome patients defined by IDF criteria showed mean age to be 44 ± 11 years. Tan et al [11] studied metabolic syndrome among Asians which also showed increasing prevalence of metabolic syndrome and maximum prevalence was among age group 60-69 years (50.8%). Kanjilal et al [12] conducted a study among metabolic syndrome patients from Bangalore and Mumbai also showed maximum prevalence among the age group 50-59 years.

26 patients among our study group (43.33%) were suffering from both diabetes and hypertension and 16 patients were only diabetic and 17 patients were only hypertensive. There was one patient with impaired glucose tolerance. This shows that patients with both Diabetic and hypertensive patients were more in number compared to isolated diabetes and isolated hypertension. But Prasad et al [8] it was shown that hypertension is the most common abnormality observed among metabolic syndrome patients with about 89.2% prevalence.

The Mean BMI among our study group was 29.44 kg/m^2 and 93.33% of study group had BMI $>25 \text{ kg/m}^2$. BMI was significantly higher among females. Prasad et al [8] showed that 67% of patients of metabolic syndrome were of BMI $>25 \text{ kg/m}^2$. Garg et al [13] in their study observed that mean BMI was $28.1 \pm 2.1 \text{ kg/m}^2$ similar to our study. Kumar et al [9] observed mean BMI of $25 \pm 4 \text{ kg/m}^2$ in their study. Bhat et al [14] observed a mean BMI of $25.01 \pm 3.24 \text{ kg/m}^2$ in their study. Indulekha et al [15] observed a mean BMI of $25.6 \pm 4.2 \text{ kg/m}^2$ in their study. Deepa et al [10] observed a mean BMI of $25.7 \pm 3.1 \text{ kg/m}^2$ in their study.

The mean Waist circumference /Hip circumference ratio was 0.95 and the standard deviation was 0.046. It was found that 68.3 % patients among the study group had WHR ≥ 0.95 . In a study from Qatar among metabolic syndrome patients it was found mean WHR was 0.89 ± 0.09 . Deepa et al [10] observed a mean WHR of 0.94 ± 0.08 . Garg et al [13] in their study observed a mean WHR of 1.18 ± 0.1 in males and 1.21 ± 0.1 in females.

In a study from Texas by Hanley et al [16] it was shown that ALT, ALP and CRP were found to have positive association with various components of metabolic syndrome .It was also found that there was negative association between AST/ALT ratio to components of metabolic syndrome. In another study among Mexican Children with Metabolic syndrome it was showed that higher prevalence of elevated ALT compared with those without the syndrome (30.9% vs. 9.4%), as well as higher mean serum ALT levels (42.1 IU/L , 95%CI 33.4–50.7 vs. 23.9 IU/L , 95%CI 21.0–26.8), and higher prevalence of an AST/ALT ratio <1 (47.3% vs. 18.2%) [17]. Among Korean adolescents, a study by Park et al showed positive association of ALT with components of metabolic syndrome [18]. AST/ALT ratio showed positive correlations with HDL-C and negative correlations with BMI, WC, TG, and HOMA-IR in a study from Taiwan [19]. ALT levels were significantly higher in subjects with MS compared to those without MS in another study from China [20].

In our study, ALT/AST Ratio was found to correlate with HOMA-IR value which is calculated using fasting blood sugar and fasting insulin levels among metabolic syndrome patients (pearson's correlation coefficient is +0.742 and the significance was <0.001). The HOMA-IR cut off of about 1.06 had the sensitivity of 93.9% and the specificity of 81.8 %. At this cut off, Positive Predictive Value was 95% and Negative Predictive Value was 75%. Positive Likelihood Ratio was 5.16 and Negative Likelihood Ratio was 0.07. Hanley et al [16] in their study "The Insulin Resistance Atherosclerosis Study" showed that elevated ALT was independently associated with insulin resistance by HOMA-IR method. In another study from China it was found that obesity and elevated ALT are significantly associated with insulin resistance by HOMA-IR method [21]. In a study among Japanese population [22] ALT/AST ratios were independently and significantly associated with HOMA-IR and the optimal cut-off point to identifying insulin resistance for these markers yielded ALT/AST ratio of ≥ 0.82 in non-obese subjects and ≥ 1.02 in overweight subjects to identify insulin resistance which is very similar to our study. In another study from China, both ALT and GGT concentrations were linearly correlated with HOMA-IR and independently associated with HOMA-IR [23]. To the contrary, in a study by Esteghamati et al, both Serum ALT and AST were significantly higher in patients with MS [24].

Conclusion:-

ALT/AST Ratio was found to have positive correlation with HOMA-IR. Fasting blood sugar and fasting insulin, ALT enzyme levels were also found to have positive correlation with HOMA-IR. The best cut off of ALT/AST Ratio to identify insulin resistance was 1.06 with sensitivity of 93.9% and the specificity of 81.8 % among study group. 93.3% of patients with metabolic syndrome had raised ALT and 83.3% patients with metabolic syndrome had ALT/AST ratio >1.

Abstract

The manuscript deals with investigation of lexical-semantic specifics of translation of English idioms into the Uzbek language with maximum possible preservation of primarily semantic, lexical and morphological content. The author presents all possible ways of an adequate translation of lexical-semantic meanings and images, mechanisms and principles of translation of English idioms into the Uzbek language. Theoretical part of the manuscript is proved by numerous examples of English idioms and their Uzbek equivalents or analogues.

Copy Right, IJAR, 2017., All rights reserved.

Methods and Materials:-

Methodological ground of the present investigation covers English idioms and their possible Uzbek equivalents or analogues; theoretical issues in the aspect of theory of translation. The main issue among them is Uzbek linguist in the aspect of translation Ganisher Rakhimov's book printed in the Uzbek language "Tarjima nazariyasi va amaliyoti" ("Theory and practice of translation"). – Tashkent, 2016. – 176 p. In this book the author proposes modern methodology and principles of adequate and correct translation of English idioms and proverbs into the Uzbek language. The present investigation is based on his concept of translation. The following methods were used in investigation: descriptive method, componential analysis, comparative method, method of lexical translation and other methods.

Results and Discussion:-

There is an important role of language, its lexical-semantic functions and artistic issues in esthetic translation. By using both effective and efficient proportion means of the language, translator can form adequate and equivalent ways of artistic translation. Hence, translator should be able to have deep life experience, emotional and logical observation knowing and understanding emotions clearly as writers. The most important part is, by knowing the secrets of cultural and mentality, keeping nationalism of the translation work, translator can create other cultural environment. Otherwise translator can describe cultural and national importance of the translation which readers can't get other foreign culture. Thereby, there is an important role of understanding adequately lexical-semantic significance in artistic translation. In this case there is a great interest determine the principles of translation of English idioms into Uzbek.

Idioms are simulation word phrase unit, it applies semantic unit than basis of interior construction and it demonstrates the functionality of the language¹. That is the language is not based on certain models, it uses

¹ Amosova N.N. The basis of the English phraseology. – Leningrad: Leningrad State University, 1963. – P. 24.

repeatedly every time and applies as an integral part of the language. In spite the changes of the idioms in interior construction; it can't affect its main features. So, idiom is semantic structure. Idiom includes its care and periphery. The care is invariable semantic part of idiom (mare's nest-nonsense, spiel the beans-reveal a secret). This part is usually changes its real meaning. In some cases the real meaning of idioms are stored (husband's tea-very weak tea, dressed up to the nines-dressed to perfection). Idioms are linguistic reality of the language, its semantic richness and colorfulness, the diversity of its potential units. Usually idioms can be translated in such cases as:

- Idioms aren't compatible by meaning and content of the expressions in translated language
- Idioms are partly appropriate by the meaning in expressions in translated language, even though they haven't adequate meaning and equivalent.
- Idioms are full logically and content suitable in expressions.

In both translated language lexical opportunities are refused. The aim of refusing is, to make a clear total solution. The aim of the solution is, find a translation of the word which can be reflect the both culture of the language. For example, there are specific sides of the word "time" in English. Beside linguistic, semantic and grammatical features, it has psycho-linguistic features of the word "time". For instance, there is an "Indian time" and "European time" concept in India. And they have different meaning. If they organize some event according Indian time, participants can come at any suitable time for them, it isn't violation of ethical norms if they are late, but in European time they must be on time. So, time concept has special features in translation. Time concept is logical and semantic differs from Uzbek language. Searching semantic unity of the concept will require efforts. So, in artistic translation each word of original text is rich with its meaning. Opinion idiom is a structure of a word unit. Concentrated in this part of the idioms is necessary to understand fully the idea. Each idiom has exact, clear and concise meaning. By the metaphor way of ideas many idioms are clear and concise. Poetic vivid expressions are used to express the idea is called figurative expression.

In order to translate idioms we need to understand and reform figurative expressions. Figurative expressions in idioms reform by the help of epithet, metaphor, allusion, assimilation, repeated, antithesis and contra-position, the most important part of idioms and its translation is to understand clearly figurative expression and to create its duplication in other language. For instance, *to give smb the finger*² – *birovning qo'ynini puch yong'oqqa to'ldirmoq*. But in idiom it is clear as to give present smb the finger. In fact, we can't give finger itself to smb. By this, imaginative content of artwork is found. Giving nothing but promise to give smth situation based on the metaphor of the idiom will be suitable and adequate in translation. That's why this idiom translated as "*birovning qo'ynini puch yong'oqqa to'ldirmoq*" into Uzbek.

Adequacy of meaning takes a great role in translating idioms. Adequacy of translation is to clarify the real meaning of the text and to save the rule of the language. The translation of idioms refers to the adequacy of the content, repeat and rebuilds it. Because, by translating English idioms into Uzbek, it is difficult to save language rules. Because they aren't refer to two similar types of languages.

According to G. Rakhimov, to find analogue to an idiom means to find a similar expression in the translating language which has full or partial semantic meaning: *Business before pleasure*. – *Mehnat, mehnatning tagi rohat*³.

The ability of the unit of speech expresses the function of another speech unit is called the equivalent of the language. In this case the unit of speech can be suitable for both languages. Equivalent idioms mean essentially the same unit in the same language and live in the conditions of the same conditions. Using and expressing the translation of idioms in the same way is called the equivalence of idioms. The main unit of speech in translation isn't a word, we call it syntagma. Syntagma is a group of word meaning that is used in relation to understanding the basis of semantic-syntactic combination. That's why, in idioms translation we use a lot of variation than in-variation.

In translating the idioms we need to pay attention to the following features:

- Translating the text should carry out on the basis of original text, work with it and know it as a best way in translation.

² Longman dictionary of English Idioms – Oxford, 1979. – 1st edition. – P. 312.

³ Ganisher Rakhimov. Tarjima nazariyasi va amaliyoti. (Theory and practice of translation). – Tashkent: "Uzbek national encyclopedia" State publishing house, 2016. – P. 127.

- Using actively metaphor, assimilation, part of artistic language such as laconism, allusion, associative, adequacy and equivalence in translation.
- To occupy the properties of the original authors technique and try to give this technique by translating the text.
- Saving social status and mental characteristics of English describe the characteristics which are expressed through the language option and translate it into Uzbek. (For example: in English there isn't a word "sen" so while translating we translate it as a "siz" "you").
- Taking into consideration of the idea and literary method of the author, when giving the meaning of the translated work.
- To observe the full text of the original work reproduce of the author's style, rhythmic repetition of the original text circumstance is the effective use of the art possibilities of language.
- The peculiarities of translation language of the work are to keep heroes language as a mean of creating artistic image and use.
- The wealth of Uzbek language, to know Uzbek fables and proverbs deeply, and to use opportunities of the Uzbek language effectively⁴.

Conclusion:-

To follow the rules of proportionality and compatibility, equivalence and adequacy, association and observance of phraseology in translation the idioms into Uzbek we need to pay attention to the following features:

1. Clarity. To pay attention to the author's idea. Learning and thinking deeply different shades and variations is important than meaning itself. Specific manifestation of meaning and colorfulness plays an important role in translation of idioms. Relationships between author's artistic and aesthetic search for the author's style of instruction. Not to violate linguistic and the meaning of the original text.
2. Laconic. English language avoids different kind of reality, pathos and luxurious. In translation especially translation of idioms the main idea and linguistic unit gives by laconism. To avoid a word which expresses different meanings.
3. Clarify and distinct. Each of the text is hidden special meaning. Meaning wears a dress of words. This dress may be shine and luxurious or it may be clear, right and unique. English language is such language which can describe these clear ideas. Clarify and distinction of idioms helps to identify full idea of meaning and to give it readers. To understand the meaning clearly in translation is very important. In order to come one solution words must be analyzed, systematized and collected. Therefore, the translation language should be not far from author's work, on the other hand idea expresses simply, smooth and clearly.
4. Full possibilities of the literature language in translation. Works will be created on the basis of the norms of the literary language and grammar. English psychology, on the other hand Uzbek psychology describes clearly in translation. Translation reflects the two linguistic norms as a result of their strict observance of the two languages. These rules are shown in translation of idioms. Because in translating idioms stylistic, semantic-linguistic and meaning is more important than linguistic request.
5. Analogue. Between English and Uzbek language linguistic social and cultural relations are carried out. At the same time English and Uzbek language is in one language group, but by grammatical meaning they are differ from each other. Except this, learning all possibilities of both languages and finding Uzbek analogues to English idioms. For example: *daryodan tomchi – drop in the bucket*.
6. Find out number of stable and adequate idioms. Translating idioms we should pay attention meaning adequacy. The adequacy of each idiom relies on imaginative of the content. Each idiom represents the most efficient use of language, its wealth and requires the use of language effectively.
7. To use a variety of methods. Complex of variety method helps to be proportionate of idioms. To find out analogues, adequacy and equivalence of meaning, to provide identification of the meaning, anatomic translation and using stylistic complex is important in translation.

Consequently, artistic translation is targeted to clear aim it has many unique and unplanned features. To understand these specific features involved specific people in translation.

Embedded vision algorithm, low complexity detection, Smart camera, vision-based measurement (VBM) yawning detection.

Abstract

For the safety purpose of drivers yawning detection is very important. There are many important applications of yawning in a drivers fatigue detection, humans well behavior, driving behavior and understanding the language of tongue disability person. It is observed that heavy vehicle drivers keep going continuously driving without giving a frequent rest period. Considering above applications, an automatic detection of yawning is one important system component. Uptil now yawning detection system does not satisfy the real time requirement which is having a high computational complexity and does not satisfies the challenges like facial obstruction, ease of implementation, accuracy and safety. Uptil now there is no any idea suggested or presented on vehicle side hardware. In this paper we will be reviewing hardware of engine start or stop control by using microcontroller.

In previous, for yawning detection two different algorithms are used such as for face viola-Jones and mouth detection contour activation algorithm. Previously presented systems are in position to recognize other persons faces while finding the biggest face in all of the frame that we are interested and other faces also considered; hence face search time is not optimized. By studying these disadvantages of traditional yawning detection method possible improvement algorithm is proposed.

Introduction:-

In earlier years the amounts of road accidents have been suddenly increased. These accidents because of continuous driving ability, not getting proper sleep. Especially in the transportation industry the heavy vehicle drivers keep continuously driving without giving a rest period. Due to this most of the accidents are occurs. Because of this it has become an area of great socioeconomic concern. Driver Fatigue is one of major reasons causing most fatal road accidents around the world.

The global status report on road safety 2013 shows that survey or information from 182 countries, calculated about 99% of the world's population. The report shows that around the world the number of deaths is due to the road accidents are high at 1.24 million per year. About 3,400 people die every day in world due to road accidents. Tens of millions of people are injured or disabled per year. Cyclist, pedestrians, children and the elderly are the most susceptible of road users. So it is very necessary to design such a prototype system which prevents road accidents by detecting driver's inattention, driver's drowsiness and giving a audio sound when yawning is detected. In this paper

the aim is to develop a prototype system which detects yawning to prevent road accidents. This system includes a video camera either externally attached or the inbuilt camera in laptop which extracts video to detect face and mouth features. This system is non intrusive real time monitoring system. The programming for this is done in MATLAB 2013a using the image processing toolbox.

The purpose for so much attention towards drivers yawning detection is that suddenly increases road accidents and for the people's safety. Once fatigue has been detected, a number of activities we can performed for the safety purpose of person who drives the vehicle, mainly producing the persons alert voice, fluctuations in steering wheel or persons chair, showing text, providing large amount of oxygen for person himself.

There are many other applications for yawning detection is helpful in to be concerned with home health care technique. That proves yawning is one important method to detect the people's health information and modify their lifestyle. There are also more applications for yawning detection such as operator attentiveness to determining whether the operators such as heavy machines, nuclear reactor controls and monitors, and air traffic controllers in critical system is paying attention or not. Another application is that the system used in to determine the communication purpose of human being with language defect, particularly to detect false estimation.

For all of the above systems that require a natural investigation of involuntary intake, the value of technique is more important to create it cost effective. For that purpose VBM is very co-operative. VBM is a technique where a camera or optical sensor captures the photo from various scenes. Later this photo is used in process of yawning detection through manipulation component. This camera and manipulation component is called as intelligent camera. Because of this, VBM technique is most popular and useful now a day. Today the VBM, studied a experimental answer for the operations like investigation of persons natural or well being characteristics, for example facial expression or self propelled functional technique. Yawning detection system has number of important applications such as drivers fatigue detection, drivers behavior detection and also other automotive applications to prevents road accidents. Driving is a most common activity in people's everyday life. So it is very necessary to make driving safe for the peoples. The main reason to discover yawning detection method is significant increases the probability of car accidents. Most of the yawning detection system does not satisfy the real time requirement have a high computational complexity. So now a day's very few yawning detection system uses in a luxury cars to prevent car accidents. They do not have a sufficient accuracy. There are three main reasons why existing system is not used in our car system is

1. Computational complexity
2. Facial obstruction and
3. Lighting conditions

The main goal of this yawning detection method is lower the computational complexity and make this system safer to the person by studying real boundaries and can designing in actual intelligent cameras.

Literature Survey:-

In 2008 author described drivers fatigue detection based on trailing the jaws and to survey on controlling and recognising the involuntary intake. Author explained a technique to trace and trail the mouth cascade of classifiers is applied also the yawning images. After locating the mouth from face images using classifiers the SVM technique is applied to distinguish jaws also for to detect yawning then alert fatigue.

This is the non intrusive real time monitoring system. Many researches deal with yawning detection uses the geometric feature of the mouth techniques, but there are some disadvantages of that technique that is the left and right mouth corners are important feature point .But in this lip position are difficult to detect at that time the lips move, then lip detection makes more difficult. Also, geometric features liable to pose and have more difference for individual. This paper author used cascade of classifiers to train and trail with the help of viola-Jones. Then SVM is used for data classification.

After studying this paper we have conclude that, because of using SVM (support vector machine) computational cost is reduced and provide better generalization. There is disadvantage, two algorithms is used, hence increases computational time and this viola-Jones technique is not efficient to run in a real time on smart cameras if implemented as above that using cascade of classifiers [1].

In 2009 author describes to locate and tracking the drivers mouth using two CCD cameras. This is the real time monitoring system. Camera A is fixed; it is used to locate drivers head position. Camera B is movable or controllable, which is used to locate the mouth and extract the mouth information. In this first collecting all the videos from camera A and using image processing algorithm locate the drivers face. Then second with the help of face position in camera A shoot driver head position all the time by sending command to camera B through serial port. Then to detect and track driver's mouth in camera B, use haar- like features. Then at last by comparing the ratio of mouth height and width, yawning is detected.

After studying this paper we have concludes that, through this method resolution ratio of driver's mouth is higher than single camera. Also the feature information is higher accuracy. There is some disadvantage of this method, once the position between the driver or two cameras is changed, and then the relation between angle control volume and pixel control volume is also changed. So this technique is not intelligent, it needs some future work [2].

Authors Dr. Sheifali Gupta, Er. Garima describes a prototype system for detection of driver's drowsiness to prevent road accident. This system is non intrusive real time monitoring system. This system detects facial features and extracts video with the help of a video camera either externally attached or inbuilt camera in laptop. Eye closure and yawning is detected followed by alert. In this programming is done with the help of MATLAB 2013a with the help of computer vision toolbox.

After studying this paper we have concluded that, the aim of this paper is to prevent the road accidents by detecting eye closure and involuntary intake of drivers. A 1.3 Mp video camera used to capture the real time videos and for processing. In this the vision based system is used because of its accuracy and non intrusiveness. Only the disadvantage is that, a night vision camera is not used to capture the images in dark or dim light to increase the usability [3].

Narender Kumar, Dr. N.C. Barwar Presented eye blinking and yawning detection system in real time for monitoring drivers drowsiness. This system is the non intrusive real time monitoring system. In this system if the drivers eyes are remains closed for certain period of time and his mouth remains open to yawning then driver is said to be drowsy and then alarm is sounded. In this the detection of facial features viola Jones algorithm is applied and for mouth detection contour activation algorithm is used to find the contour of the lips.

After studying this paper we have concluded that, this system was tested in different light conditions for different subjects that are without eye glasses, with eye glasses, without moustache and with moustache. In case of females there is also same set up, programming, webcams for night and late experiments. Without eye glasses eye blink rate detected more accurate. Only the disadvantage is that different algorithm is used for face and mouth detection, so not easy to implement and uses OpenCV method in that considering the biggest face we are interested, also other faces are considered, hence face search time is not optimized [4].

In 2016 article author proposes yawning detection is important application in driving behaviour monitoring. In this author used to either faces or jaws detection very efficient algorithm that is viola-Jones algorithm. Later used back projection theory to determine yawning. The author used in yawning detection method for implementing and testing smart embedded camera is used. This is the real time monitoring system.

After studying this paper we have concluded that, by comparing existing method this system gives correct yawning detection rate. In this the camera is installed on the dash board of the car or in front mirror. The result of face and mouth detection also the involuntary intake or tiredness alarm indication is display on monitor. Only the disadvantage is that the author is not address the challenge of lighting condition, safety, facial obstruction. They only implementing up to detection of yawning, there is no further implementation on hardware side for safety purpose. They only improve computational complexity [5].

Algorithm used:-**Face detection algorithm**

Comparing to previous system this yawning detection method is explaining the structure of a quick or recapture, well organized face investigation algorithm known as viola-Jones algorithm. Firstly in face investigation method, each and every information given by prepared facial characteristics of every lump can be removed or reserved mainly five different folders in intelligent camera for maintains the calculating period. After some time for the investigation algorithm this folders which are answer of prepared facial characteristics are applied. As related to that same direction, this controlling method uses store costs rather than preparing or making division or using whole photo for searching facial characteristic at starting.

Every folder has above sets of information.

- a. Facial characteristic point
- b. Facial characteristic costs
- c. Facial characteristic load
- d. Perform division

In the face investigation, for viola-Jones algorithm it is possible nothing but since the different persons are multiple face dimensions, rather since the people have capability to near or taking out against the camera in related period, according to bigger or shorter face dimensions. For that purpose facial characteristic is necessary to measured.

One of important advantage of this yawning detection system, by comparing the Open CV method of viola-Jones, this method ends detecting the different face later on searching the primary face of every structure that is needed. Specially face with original topic, so remaining faces not studied. Hence face investigate period is saved. The face which is any time nearest to the camera this face is investigate primary in this method. The other persons faces is not considered and they are not large than the original persons face.

The diagram 1 shows instances for the vehicle riding situation, in that persons face and mouth investigate correctly. Also, for storing prepared facial characteristic in folders is help straightly through camera and ignoring prepared face investigation, the effect of this method is gains the rate of face investigation step and the capability of controlling method.

Mouth detection Method:-

After detecting the face, the down partial face is selected for the goal detection area. This is the identical method like a face investigation. Later on searching the largest mouth in structure all the information nearest to mouth area and dimension send towards yawning detection.

Fig 1:-Persons face and mouth searched between different peoples.

Fig 2:- Yawning sequence.

Yawning detection Method:-

The last part is yawning detection. The image is color image, so it is necessary to convert it into the gray scale image. The back-projection theory is used for that purpose.

After conversion of that grayscale photo the design take care not any involuntary intake in the structure. This is searched by comparing black and white elements. For that two rules are necessary to fulfilled.

- Relation between black element in present folder and in relating folder should be larger than starting point.
- Relation between black element in mouth area and white element in area surrounding to the mouth should be larger than second starting point.

Suppose these situations are fulfilled, according the design investigate specific folder shows involuntary intake and that procedure is copied for all of the later folders of motion picture.

Proposed Work:-

After studying literature survey and understanding need globally these papers are modified and a novel technique is build called yawning detection.

Below fig 3 displays the projected figure of yawning detection method. In this system the camera is installed in front of mirror or dash board in the car. MATLAB is used to build mathematical model of this system. In this viola-Jones algorithm is used for detecting face and mouth of driver. Viola-Jones algorithm is already installed in MATLAB. In hardware side microcontroller PIC16F877A is used along with other peripherals. PIC is family of Harvard architecture microcontroller made by micro chip technology.

Hardware side foot acceleration in that rack and pinion mechanism is used, which converts the rotary motion into the linear motion. Then amount of force is coming is passing on to the potentiometer, then that force is read on to the ADC.

The microcontroller understands only digital logic that is either 0 or 1 also incoming voltage is AC; hence it needs to convert that AC voltage into DC volt. So ADC is used. The engine ON and OFF is depend on servo motor and in servo motor PWM that is pulse width modulation wave is inbuilt.

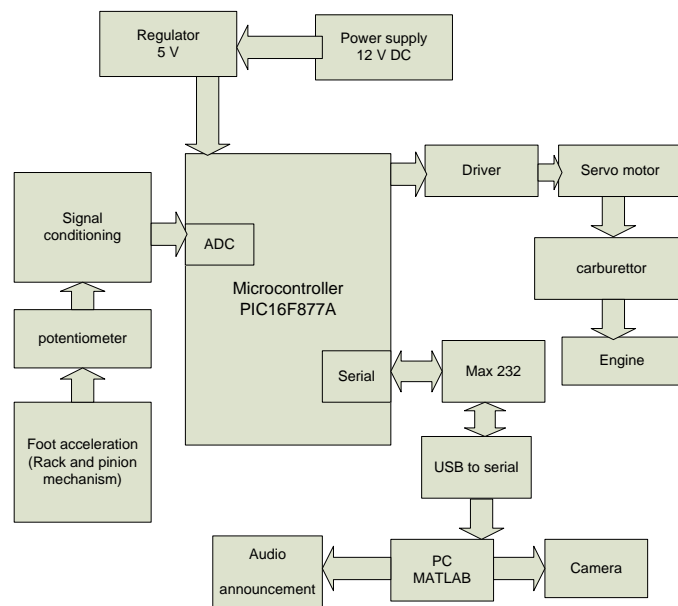

Fig 3:- projected yawning detection Method.

Conclusion:-

As we discussed until now yawning detection system, this system gives better accuracy, safety, easy implementation and reliability, reduce complexity, and increase efficiency. The previous papers have some disadvantages like no any implementation on vehicle side hardware and biggest candidate is the final detected mouth. In this paper we have reviewing hardware on PIC microcontroller and image processing part on MATLAB. For face and mouth detection this system monitors the condition based on delay and then takes decision. We will be reviewing hardware of engine start or stop using microcontroller. Also we will be taking care of acceleration of vehicle.

In car intex smart camera is placed in instrument panel, also in the foreground of the mirror. All the actions performed by the camera are running on embedded based system with help of this yawning detection method. To create yawning detection method act on a computationally limited platform & address the problem of lighting condition, facial obstruction much effort was made in allocating or improving algorithm and codes to act in actual period. Also do not need any complex hardware.

Floods in Bihar, Kosi, Flood Impacts, Flood Management, Structural and Non-structural Measures.

Abstract

Floods are most recurring and frequent natural hazard in India causing enormous loss to life and livelihood, and damage to infrastructure. In India, Bihar is one of the worst affected states due to floods. As per one estimate, in Bihar flood affects about 6.880 million hectares of land out of about 9.416 million hectare, which is about 73.06%. It not only affects the infrastructure but also the socio-economic life in the state. So, there is a need to minimize negative consequences and ill effects of flooding by means of flood management. In Bihar, most of the times, the decision makers go for structural measures like construction of embankments, flood retention walls, flood levees and channel improvements, etc. However, it is felt that structural measures itself is not sufficient to reduce the adverse impacts of floods in the state. Hence non-structural measures like flood plain management policy, building bye-laws, flow and silt management policy are also required. It contemplates the use of flood plains judiciously, simultaneously permitting vacating of the same for use by the river whenever the situation demands. The purpose of this paper is to highlight the severity of flood impacts on development of state and to discuss the possible flood management measures in context of Bihar.

Introduction:-

Floods have been a recurrent phenomenon in India causing huge losses to lives, properties, livelihood systems, infrastructure and public utilities affecting the development of the region. Bihar is one of the States of the India bounded by Nepal in the north. Main drainage system of the state, the River Ganga flow eastward direction in a stretch of 432 km across Bihar and divides the state in two unequal halves. The plains in north of the River Ganga are drained by two major rivers, the River Kosi and the Gandak (Fig.1). In addition to this there are several smaller systems such as the Adhwara group of rivers, the Bagmati, the Bhutahi Balan, the Burhi Gandak, the Ghaghara, the Kamala, and the Mahananda. All these rivers mainly originate in Nepal from the Himalayas whereas the River Kosi also includes its catchment in Tibet. Thus, the rivers of North Bihar mostly share basins outside the country in Nepal and Tibet. The water carried from the part of catchment lying in Tibet also passes through Nepal. To fulfil the requirement of fuel for domestic purposes and reclamation of area for occupational needs, there is an increasing deforestation in Nepal which further causes degradation in vegetative cover in the catchment areas. Due to this practice, soil has been increasingly getting eroded from these areas. So the rivers carries significant sediment load from the upper part of catchments. These sediments in addition to inadequate carrying capability of the rivers cause congestion in natural drainage leading to inundation and floods. So, flood is a state of hydrological extreme of high

Corresponding Author:- Kumar Abhishek Kishore.

water level in a stream channel or on bank that results in inundation of land that isn't ordinarily submerged. Generally it occurs in event of heavy rainfall and becomes a hazard once it causes loss to the lives, livestock and livelihood. "The trend shows that the intensity and frequency of floods in Bihar Plains have increased over the years causing human suffering and destruction of agriculture, habitation and infrastructure" (NIDM, 2007).

The National Flood Commission, set by Government in 1976 put the country's flood prone area at about 40 MHa out of total area of 329 MHa. This report, thus, revealed a rapid increase in flood proneness in just over a decade. Most of these area falls under Ganga and Brahmaputra basins. The most flood prone basins are those of the Ganga and Brahmaputra in Uttar Pradesh, Bihar, West Bengal and Assam. These five states are the most flood prone. But the commission analyzed the share of damage went up from 25 to 50 percent of the total and chronically flood prone area in case of Bihar.

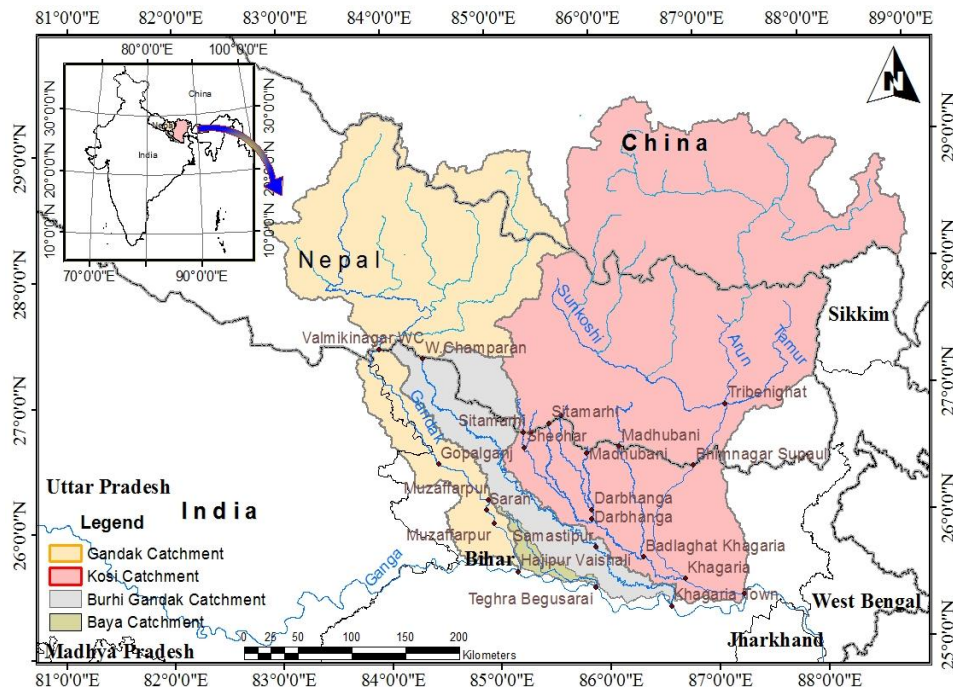

Figure 1:- Map Showing Catchment of Major Rivers in North Bihar

Three fourths area and population of Bihar lie in the natural flood plains of the Ganga and its Himalayan tributaries. About 6.880 out of 9.416 million hectare comprising 73.06 percent of the state is flood affected which accounts for approximately one-sixth of the flood prone area in India. Geographically, northern Bihar is prone to flood as major rivers flowing through North Bihar originates from Nepal and the Tibetan region of China. About 65% of the catchment area of Bihar's rivers fall in Nepal and Tibet and only 35% of the catchment areas lie in Bihar (Sinha et. al.).

The upper part of catchment is liable for the morphological activities within the downstream reaches. It carries huge sediment load with its flow every year which is responsible for change in morphological behaviour of the stream. The matter of the flooding is implicitly guided by sedimentation in river. This sedimentation has gradually reduced the capability of the river to drain extreme flows leading to flooding within the plains.

The variation of minimum and the maximum flows in the Himalayan Rivers is significantly high. This causes huge seasonal variation in river discharge. In addition to this terrain of North Bihar is almost flat having elevation at Indo-Nepal border ranging from 90-95 m whereas elevation at confluence of these rivers in Ganga is of the order of 40-45m.

So, Vulnerability to flood of Bihar lies in its flat topography, wide variation in flow in Himalayan rivers, excessive rainfall levels (more than 1200 mm annually), annual rainfall concentration during only three monsoon months and high sediment loads. The plains of Bihar and adjoining Nepal are drained by rivers that carry high discharge and very high sediment loads, which then fall out onto the plains of Bihar. "Gradients vary from 22 cm per km near the

Indo-Nepal boundary to 7.5 cm per km near the confluence of the rivers with the Ganga main stem” (Sinha et. al., 2012). The flat terrain and the major seasonal variations in water volume in the rivers cause extensive flooding in the northern plains. In addition, as the rivers reach the plains and lose momentum, they begin to meander. Rivers like the Kosi are notorious for changing course. “As per the records it is evident that during 1736 to 1953 the river Kosi has shifted its course through a distance of approximately 112 Km. towards westward” (Kumar D., 2015) (Fig.2). Further Kosi embankment was constructed with a series of spurs on both banks confining the course of river Kosi.

(Source: Kumar D., 2015)

Figure 2:- Kosi River Course.

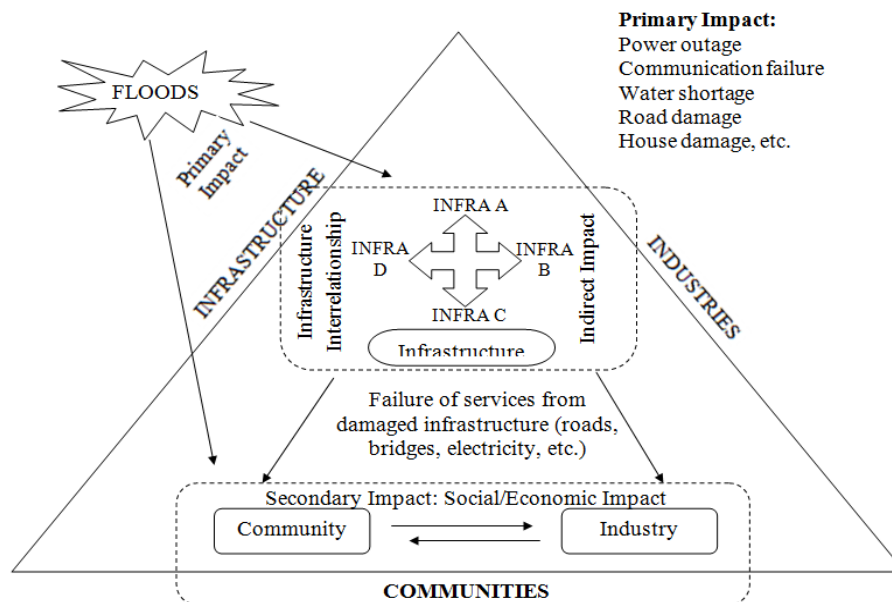

The embankments on both sides spaced five to sixteen km apart have confined the lateral shift of the river within the embankments; however flooding is still a challenge in the area. Human intervention in the flood plain is also making this problem more acute.

Impacts of Flood:-

Flood impacts can be broadly divided into primary impact that occur due to contact with water like loss of life, livestock and property, damage caused to infrastructures like road, bridges, railways, disruption in services like electricity, telephone lines, water supply lines, etc. and secondary impact that occur because of the flooding, such as disruption of services, prolonged health and malnutrition impacts. Secondary impacts cause indirect losses and its ill effect continues on-long time scales and sometimes may be more important. These include prolonged health impacts due to failure of water supply and sewage disposal system, shortage of food and other essentials due to failure in transportation network. A frame work of flood impacts is shown in fig.3.

Infrastructure networks sustain various activities and services of the communities and industries. Due to failure of services from damaged infrastructure economic activities in the region are also poorly affected. It may lead to partially or completely shut down of industries and business establishments causing reduced production followed by adverse impact on economic growth. There may be some long term impacts like sediment deposited by flooding may destroy farm land for coming few years leading to cultivator and labours economically vulnerable. Based on the assessment of losses in monetary values, they are termed as tangible if can be assessed in terms of monetary values and if not then termed as intangible losses. Intangible losses are generally higher in less developed region because of the more consequences of flooding especially in case of frequent and devastating floods.

“Impacts of flood depend on maximum depth and duration of flooding, the extent of inundation in the floodplains, velocity of flow and rate of rise of flood levels” (Gautam et al.). Flash flood causes immediate and huge impacts, whereas gradually occurring floods allows much time for evacuation and protection of properties.

(Source: Deshmukh, A. (2010))

Figure 3:- Framework of Flood Impacts.

Flood Losses in Bihar:-

Almost every year floods severely damages property, both movable and immovable, destroys standing crops and food grains and badly cripples the infrastructure in Bihar. The loss of life and limb caused due to flood events cannot be compensated. However in monetary values, it costs several crores every year. The flood brings untold miseries to the people as they have to leave their damaged houses and spend a long time in relief camps, raised platforms or in temporary shelters. Government has to allocate huge amount for rehabilitation, and relocation of people which requires diversion of capital required for maintaining production. Table 1 shows the extent of flood loss in Bihar for last 15 years.

Table.1:- Flood losses in Bihar from 2000 to 2015.

Flood Impacts on Growth of Bihar:-

Bihar is one of the states in India whose economy largely depends either on agriculture or in agricultural activities. It's share in Net State Domestic Product (NSDP) of Bihar is 29.33% which is considerably higher in comparison to contribution in national GDP which is 20.06% (Central Statistical Organisation, Govt. of India, 2014) (Fig.4(a) and 4(b)).

(Source: Directorate of Statistics and Economics, Bihar)

Figure 4:- (a) Share of various sectors in India's GDP (b) Share of various sectors in NSDP of Bihar.

Beside this fact, about 78% of population are involved in agriculture and its allied activities either as cultivator or agricultural labour (Fig.5(a)). According to government of Bihar 73% of the farmers are small and marginal farmers, who not only cultivate their land but serves as agricultural labour. The situation is more vulnerable in the region of North Bihar with large flood prone area (Fig.5(b)). So, agriculture is the backbone of Bihar's economy and socio-economic status. Hence sustainable development of Bihar principally depends upon agriculture sector.

(Source: Directorate of Statistics and Economics, Bihar)

Figure 5:- (a) Classification of workers category in Bihar (b) District wise proportion of various workers category

In occurrence of flood, hectares of agricultural land get submerged and silted, which makes it uncultivable for few consequent years and remains as fallow field (Fig.6). A significant increase in fallow land can be visualised after 2008-09 which is the consequence of Kosi flood in year 2008. The area became uncultivable due to high silt deposition in the farm land. Several hectares of lands gets eroded and grains preserved by households gets destroyed which results into many small and marginal farmers becomes landless. Women from vulnerable families work as

agricultural labour but due to flood this activity is completely stopped. Fig. 7 summarises the direct physical impacts of floods on agriculture sector.

(Source: Directorate of Statistics and Economics, Bihar)

Figure 6:- Yearly variation in fallow area in Bihar

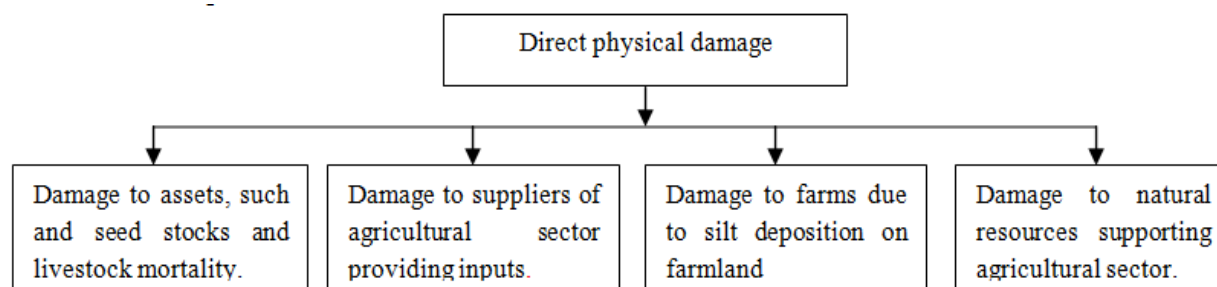

Figure 7:- Direct physical impact of flood on agricultural sector.

Generally the small cultivators as being on marginal level, takes agriculture inputs on credits from the local input dealers but due crop failure they are not in a position to re-pay these amounts. Further they do not remain in the position to manage for the next year and migrates in search of livelihood. This ultimately affects the agricultural production in consequents years also. Such adverse impacts of flood on agriculture badly affect the economy of state and its growth. These ill effects are shown in fig. 8.

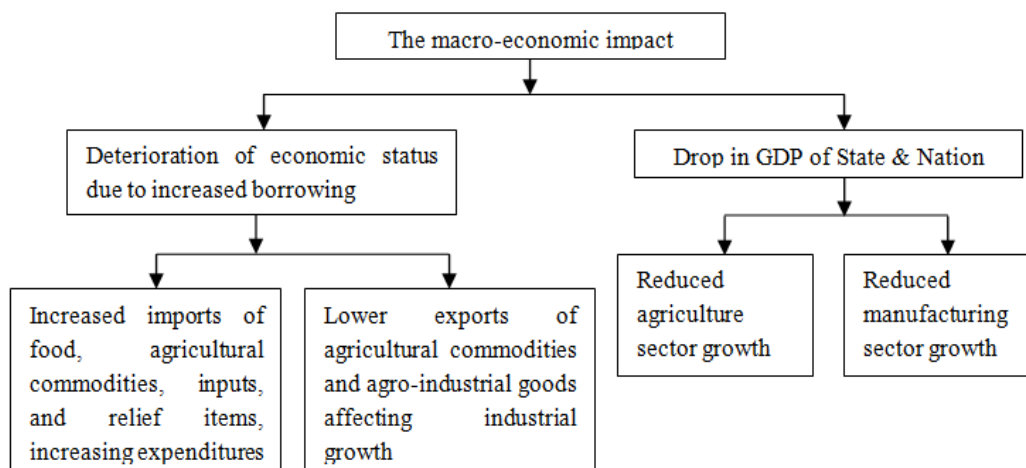

Figure 8:- Economic impact of poor agricultural growth.

Due to recurrent flood events the miserable growth rate in agriculture and its allied services in Bihar for last one decade can be seen in fig. 9(a). As agriculture is the mainstay of Bihar's economy so poor growth in agriculture sector directly affects the GSDP of the state. Comparisons of Growth Rates (GNP of India & GSDP of Bihar) are shown in fig.9(b). The overall GSDP of Bihar shows almost similar trend as that of GSDP in agricultural and allied sectors.

Figure 9 (a):- Yearly Growth Rate (National and Bihar) in Agriculture & Allied Sector

(Source: CSO, 2015)

Figure 9 (b):- Yearly Growth Rate (GNP of India & GSDP of Bihar)

Next to agriculture sector which is contributing to NSDP of Bihar and equally affected by negative impacts of floods are industrial and manufacturing sector. These sectors are closely linked with infrastructure like power supply, water supply, communication, etc. In case of any disruption in these services, the production will be affected immediately. In event of flood, these services are affected primarily causing its consequence as temporary stoppage of production due to lack of electricity or water, disruption of raw material availability and inflow, temporary unavailability or shortages of labour, etc. During the flood, the industrial sector may confront damage that may include buildings, equipment and machinery, stocks of raw materials and of manufactured goods. In addition, after flood the sector may face changes in its production flows, including production decline and possible higher costs of production arising from the destruction of assets or other causes such as lack of raw materials, strategic inputs of water and electricity, temporary absence of labour, lack of working capital, etc. Furthermore, some branches of industry – such as the food producers – that rely on the production obtained from agricultural sectors for raw materials may suffer production declines even if no damage has happened to their facilities. In case of damage to building, equipment and machinery there is a need of funding to ensure returning the sector to its normal level of functioning or production. Fig. 10 shows the percentage growth or decline in various sectors in Bihar. Positive peak refers to potential of state whereas the negative fall shows the impact of flood during the year and its consequence. So flood is playing a vital role in miserable growth rate of state. Observation on growth rate in various sectors in last decade shows the highly unsustainable pattern.

Flood Management in Bihar:-

In the above context, to minimize negative consequences and ill effects of flooding to maintain the sustainable growth of the state, there is a need of planning for flood management. As floods cannot be controlled completely so planning for flood management implies management of flood in such a manner to get maximum benefit in the given circumstances. Flood management measures can be broadly categorised in two types, (i) structural measures involving like construction of embankments, flood retention walls, flood levees, channel improvements, detention basins, and other such structural components whereas (ii) non-structural measures includes land use planning, redevelopment of flood prone areas, flood insurances, watershed management, flood forecasting, disaster mitigation and preparedness, etc. Both the measures are not mutually exclusive rather complementary to each other should be taken as integrated approach for best and effective result.

Structural Measures:-

In Bihar, mostly flood management works consists of constructing and maintaining the embankments (Fig.11). It comes under the category of short-term structural measures.

Construction of flood embankments:-

These are very popular structural measure adopted in the state not because of their efficacy but due to being cheap and quicker to construct. By March, 2013, a total of about 3732 km of embankments has been constructed and 1555 km is under construction which is scheduled to be completed by 2017 (WRD, Govt of Bihar, 2014).

Channel improvements:-

The existing embankments are under increasing pressure due to rise in the bed level of rivers due to heavy silts brought by the rivers from its upstream catchment area which lies in Nepal. It has been observed in Gandak that during the past three decades, the rise of bed level had been of the order of 1.8 meters approx. This type of aggradations necessitates perpetual raising and strengthening of the embankments. But this raising river bed levels, decreases their carrying capacity and causing drainage congestion in the countryside. To overcome such issues, method of improving the natural drainage or rivers by dredging and de-silting is a better option. It re-develops the carrying capacity of channels and enables it to flow at safe levels and within its banks. But this measure is not generally adopted due to its high cost of execution and others associated problems.

Embankment protection works:-

Embankment protection works are broadly classified in two categories, (i) Anti-erosion works and (ii) Flood-fighting works. Anti-erosion works are carried out during the period of January to May every year for the restoration of embankments damaged during the flood period (monsoon months) due to excessive discharge in rivers and construction of any additional embankment protection structures like spurs, aprons, flood levees. Flood fighting works are carried out during flood period on need basis to protect the embankments during flood events. These are of emergent nature.

In addition to above, it has also been observed so many times that creation of appropriate flood storage in reservoirs and detention basins will provide the long-term solution for the flood problems in the area. No such dam has been constructed either in Bihar or in Nepal on any of the tributaries of the Ganga which may provide flood moderation in the region. The major issue in this regard is there is no suitable site available in Bihar for dam building on any of the north Bihar Rivers as they originate from Nepal.

Fig 11:- Embankment and embankment protection works as structural flood control measure.

Hence, it is felt that structural measures itself is not sufficient to reduce the adverse impacts of floods in the state. There is need to adopt non-structural measures too as a judicious mix for effective flood management practices.

Non-structural Measures:-

But, losses in recent years contemplate that structural measure alone can't solve the problem. So it is felt necessary to adopt non-structural measure along with structural measures as an integrated approach to efficiently mitigate flood impacts. These non-structural measures includes,

Land-use planning:-

Use of land in flood prone area should be given consideration to master plan or governing laws. The land on a stream should be used for parks and recreational purposes, moreover as for ecological reserves. Infrastructures like washroom, picnic facilities etc. should be made flood proof. Private developments like golf courses may be brought up. The necessary purpose here is to integrate the land-use coming up with for flood-prone lands into the broader plans for the urban and surrounding space.

Zoning of flood-prone lands:-

To reduce flood damage in future the effective way is to prevent development in flood prone lands. So the best approach is zoning of such land, however the land use planning as discussed should be adopted so the land contains an outlined use. Zoning can be used to scale back damages from flooding and must be so flexible to acknowledge that different types of land use are compatible (Fig.12).

Figure 12:- Zoning of flood prone lands.

As in flood prone areas having water velocities are low and not causing serious erosion, agricultural use of lands is acceptable. Particularly in case of Bihar, where agricultural land is limited so in view of self sufficiency in food supply, flood prone lands can judiciously be used as agricultural lands.

Redevelopment of flood-prone areas:-

A major flood disaster can be taken as opportunity to correct past planning errors. Removal of flood-prone development as well as conversion of the land to a defined and restricted use is an option to be considered. It should be more cost-effective in long run to physically relocate flood-prone development as a part of a disaster reduction programme.

Compensation and incentives:-

Compensation is provided to victims after the event of disasters. It helps them to restore their living up to some extent. But as part of disaster help, compensation must have a goal to reduce the future flood damages. So, instead to just paying for damage, the funds should be centred on flood proofing, buyouts and relocation to avoid recurrences of such events. Similarly, incentives should be developed to encourage flood proofing and relocations from flood prone areas. It should be supported through cost shared program having shares of government and owners as well.

Flood Insurance:-

Flood insurance works on the policy of distributing the losses among the wider segment of society. Peoples living in flood plains should be made aware regarding the flood insurance. The authority is needed to advice the peoples of the requirement of flood insurance and its benefits. Then in case of flood disasters, the losses of the affected peoples will be paid from the accumulated premiums of policy holders. So, flood insurance can be adopted as an important measure to reduce the flood impacts and its losses. “*The Pradhan Mantri Fasal Bima Yojana*” is an initiative in this regard but needs to be implemented more effectively and for all assets like livestock and livelihood in affected areas.

Silt management:-

The Lower reach of river Kosi and its contributing tributaries are severely affected floods every year. As the Kosi with its tributaries like Adhawara group, Bagmati and Kamla Balan originates from the hills and reaches to plains of Nepal Terai and Bihar, their flow velocity drops significantly. It results in increase of depth of flow and hence silt carrying capacity reduces. Due to reduction in water carrying capacity, silts get deposited (fig.13) at river bed resulting rise of river bed and consequently erosion of banks. The mouth of the channels oftenly gets obstructed and hence shifting of river course takes place taking new area under threat of flood. This development is additional attributed causing increase in the water level that ultimately results into overtopping and breaches of embankments and flooding within the basin. Therefore it needs watershed management with an effective silt management policy to resolve such issue.

Figure 13:- Silt deposition in Kosi River at Saharsa.

Flood forecasting and warning:-

Flood forecasting and early warning system is a predominant non-structural flood protection measure. On the basis of mathematical modeling, experts can convert the past information like discharge, stage and inundation area from data base to present on the basis of rainfall, moisture and snow cover. For small catchments time lag between rainfall and peak flood is very small leading to flash floods. So quantitative precipitation forecasting and installing of radars is advisable in such areas. A framework for flood forecasting and warning system is shown in fig.14. In

case of large rivers, it allows sufficient time for respond. Accurate forecasting is necessary as well as its formulation into reliable warning and effectively disseminated to the communities at risk to take necessary steps and reduce losses.

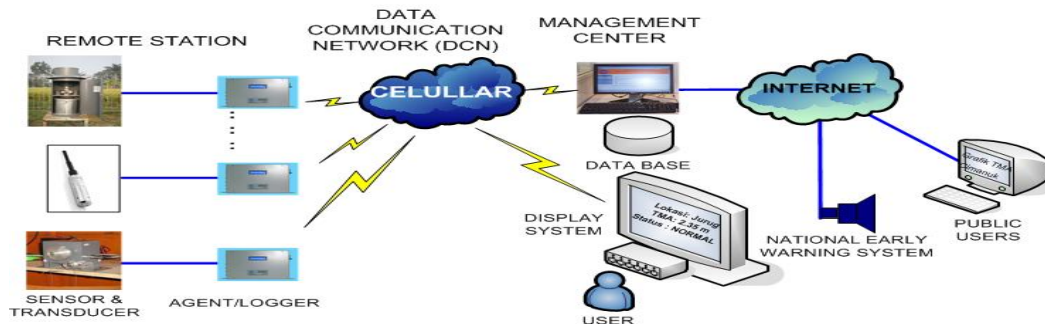

Figure 14:- Framework for flood forecasting and warning system.

Conclusion:-

Flooding is a perennial problem in the state of Bihar with devastating impact on the livelihood of people. The effects of damages to life and property caused by flooding were severe for several years. The damage to infrastructure also badly affects the industry sector. Agriculture is the mainstay to our large growing population and the back bone of state's economy playing primary role in its development. However, due to recurrent floods in the state, agriculture and allied sectors have accounted miserable growth rate but still play a vital role in the development of Bihar. It has been observed that flood events badly affect the agriculture sector and the GSDP of state in almost similar fashion. Majority of rural population belong to the lower socio-economic strata of the society. Small and marginal farmers, landless labour, and petty traders dominate the rural economy of the state, which suffers from extreme poverty conditions due to recurrent losses due to floods. In spite of the government's measures of flood management, households continue to live with suffering on an account of severe damage to their life and assets. It is not possible to avoid floods, but flood preparedness can be developed and its impact can be minimized. With appropriate planning and management, it is possible to reverse the uneven trend of growth in state and check the migration of the people in search of their livelihood. To minimize the negative consequences of flood impacts, flood management works so far implemented comprise of structural measures like, construction and maintenance of embankments, aprons in selected portions of river banks, land spurs and other necessary flood protection works. But structural measures alone cannot solve the problem. So there is need to adopt non structural measures as well. Non-structural flood management measures such as land use regulations, flood forecasting and warning, flood proofing and disaster prevention, preparedness and response mechanisms should be adopted. The awareness of the community at risk of flooding should be raised and maintained with a clear understanding of their role in responding to emergency situations appropriately. They need to be developed so as to adaptation to the flood risk and living with them in flood plains and simultaneously permitting vacating the same for use by the river whenever the situation demands.

Errors, Misconceptions, Scientific Attitude, Concept Achievement Test.

Abstract

To promote effective and meaningful learning there is need to identify misconceptions as prevalence of misconceptions among students not only presents an obstacle to learning but also interferes in further learning. A descriptive study was conducted on a sample of 912 students studying in ninth class in various schools of Punjab. For the study Concept Achievement Test in Science was constructed and standardized and was administered to identify errors and misconceptions among students. Scientific Attitude Scale (SAS) developed and standardized by Gakhar and Kaur (1995) was used for measuring the attitude relevant in science education. The results related to patterns of errors indicate that secondary school students with unfavourable scientific attitude committed more errors as compared to their counterparts with favourable scientific attitude. The suggestions for educational implications are also discussed.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Attitude has been identified as an important correlated towards achievement of students. Chen, Hui-Ling (2001); and Mehra (2004) found mathematics attitude to be related to achievement while findings of studies by Bandopadhyaya (1984); Paul (1986); Kar(1990); and Nelliappan (1992); showed significant relationship between scores on scientific attitude and achievement in science. On the other hand Many researches were done in various subjects to identify the naïve ideas (misconceptions) of students that can create learning difficulties for students and ultimately causing low achievement (Arnaudin and Mintzes, 1985; Boyes and Stainstreet, 1991; Driver, 1993; Marques and Thompson, 1997; Palmer, 1998). Researches were conducted to identify misconceptions of various concepts of science by Eryilmaz and Surmeli(2002), Cetin(2004), Haki(2005) and Kutuluay(2005) who revealed that errors among secondary school students were due to mistakes, lack of knowledge and misconceptions. While identifying errors and misconceptions among students they referred mistakes as the incorrect answers given by the students who have correct scientific conceptions while lack of knowledge as the incorrect answers given by the students who have incorrect scientific conceptions and have no confidence for their wrong conceptions, in case the students have confidence for their wrong conceptions, these were referred as misconceptions. There are a lot of researches in the area of science achievement but there is paucity of researches in the area “errors and misconceptions in learning of scientific concepts” in Indian context. So the present study is an endeavor in this direction to provide empirical evidence with regard to problems in learning of scientific concepts with objectivity and scientifically.

Corresponding Author:- Dr. Manmeet Baweja (Oberoi).

Address:- Principal cum Professor, Shah Satnam Ji College of Education, Sirsa.

Objectives:-

- To find out the level of performance of secondary school students on Concept Achievement Test (CAT) in science in relation to scientific attitude.
- To find out the percentage of secondary school students who committed errors and misconceptions on Concept Achievement Test (CAT) in science in relation to scientific attitude.
- To study the patterns of errors and misconceptions on Concept Achievement Test (CAT) in science in relation to scientific attitude.

Hypothesis:-

The students with favourable scientific attitude will differ from students with unfavourable scientific attitude in their pattern of errors and misconceptions on Concept Achievement Test (CAT) in science.

Method:-

A descriptive method of research was used in the conduct of the study. The study was completed in two phases:

Phase I: Construction and standardization of Concept Achievement Test (CAT) in science by the researcher for the identification of errors and misconceptions to include the concepts of adaptations, habitat, biosphere, ecosystem, food chain and food web, functions of ecosystem, biomass and biodiversity from the PSEB prescribed science text book of ninth class.

Phase II: Field Work

The preliminary draft of the test contained fifty three test items to be responded on three tiers. This draft was administered to 220 students of ninth class from various schools in Patiala. On the basis of the indices of the item difficulty and in the view of the experts 23 items were discarded and 30 items were selected. Then that test was administered to 125 secondary school students of Patiala to find out the reliability and validity of the test. First tier included multiple choice items having one right answer and three distracters. The second tier required students to write reason for the response. Third tier asked students about their confidence for the answer in first two tiers. Total achievement score of each student was calculated according to the students' multiple choice item scores, reasoning part scores and the confidence level scores together.

Sample:-

A sample of 912 students of 9th class studying in high and senior secondary government schools was selected randomly selecting 33 schools from seven districts of Punjab namely, Patiala, Ropar, Ludhiana, Bathinda, Mansa, Fatehgarh Sahib and Sangrur.

Tools:-

Following tools of research were used for the collection of data:-

1. Concept Achievement Test constructed and standardized by researcher herself.
2. Scientific Attitude Scale (SAS) developed and standardized by Gakhar and Kaur (1995) was used for measuring the attitude relevant in science education.

Findings:-

The major findings of the study are summarized below: The achievement of secondary school students of Punjab on Concept Achievement Test (CAT) in science was moderate.

- The secondary school students with favourable scientific attitude performed significantly higher than their counterparts with unfavourable scientific attitude on Concept Achievement Test (CAT) in science. The level of performance on Concept Achievement Test (CAT) in science was directly/positively affected by achievement and attitude. The secondary school students with unfavourable scientific attitude committed more errors in the concept areas of 'adaptations', 'habitat', 'food chain and food web', 'functions of ecosystem' and 'biomass and biodiversity'.
- The secondary school students with unfavourable scientific attitude significantly have more objectively false conceptions as compared to their counterparts with favourable scientific attitude on Concept Achievement Test (CAT) in science.
- There is no significant difference in the mean misconceptions of secondary school students with favourable and unfavourable scientific attitude on Concept Achievement Test (CAT) in science.

- It is found that students with unfavourable scientific attitude have significantly more mean mistakes, lack of knowledge and misconceptions as the sources of errors as compared to their counterparts on Concept Achievement Test (CAT) in science.

Testing of Hypothesis:-

The hypothesis formulated was accepted. The results related to patterns of errors indicate that secondary school students with unfavourable scientific attitude committed more errors as compared to their counterparts with favourable scientific attitude.

Educational Implications:-

In the light of the findings of the present study regarding errors and misconceptions in science learning among secondary school students, following implications emerged that can be used by teachers to improve the delivery of science education.

1. The findings of this study could facilitate teachers in their planning and implementation of relevant measures to reduce the incidence of students' misunderstandings about the concept of environment. A teacher should focus on students cognitive level to eliminate misconceptions, because most of the students in high schools and all students in elementary and junior high schools are in concrete levels; therefore, the major focus of instruction for those students should link between concept and concrete experiences and expect difficulties on linking concrete experiences to abstract concepts because any science concept has a relationship with other concepts, so students have to link the ideas and other concepts.
2. The teacher plays a pivotal role in identifying, reconstructing and internalizing the scientific knowledge among the students. The teacher should encourage students to test their conceptual frameworks in discussion with other students and by thinking about the evidence and possible tests. He should revisit common misconceptions as often as he/she can. He should allow students to have sufficient experience of the first concept before introducing the next one.
3. Teachers should involve use of animations, videos, activities and alternative methods of teaching viz. concept mapping (representing knowledge in graphs), clustering (finding groups for data), mental modeling (asking open ended questions), problem solving and laboratory skills.
4. The results of the study showed that students made errors, due to mistakes, lack of knowledge or due to misconceptions. These misconceptions resist changing and obstructing the learning process. The teachers are required to take students misconceptions into account. The more the teachers know about their students' misconceptions the more guidance they will be able to provide them to learn. This could contribute to the professional development of science teachers. Smith and Anderson (1993) and Lawrenz (1986) advocated that during (preservice and in-service) teacher education programmes the teachers should be given chances to identify misconceptions held by the pupils in their classrooms.
5. Identification of the students' misconceptions in science for the unit of environment by Concept Achievement Test (CAT) in science can give some feed back to the text book editors.
6. Students' misconceptions and alternative ideas can be taken into consideration by curriculum developers and remediation techniques of them should be designed. If these techniques can be combined with small group work with demonstration and appropriate hands-on activities, they should be very powerful methodology for science classrooms.
7. To remove misconceptions among students the teachers should provide more structured opportunities for students to talk about ideas at length, both in small groups and whole class discussions.
8. This work has identified new material which can be utilized by science educators both in the classroom and in teachers' pre-and in-service courses. This new material includes a number of misconceptions. These new pieces of information add to the overall picture of students' conceptual development and with this knowledge, educational practitioners will be in a better position to make necessary changes and improvements in their classroom practices to enhance the student learning.

measures, Hygiene practices

Abstract

Aim of this investigation is to provide the general information about prevalence of members of *Enterobacteriaceae* in raw seafoods sold in fish markets in Eastern province of Saudi Arabia. Studies were carried out to isolate and identify different bacterial species belongs to the family of *Enterobacteriaceae* in 448 seafood samples comprising Fishes (353), Prawns (49) and Cuttlefishes (46), collected during the period from January 2015 until May 2016. Bacterial isolates were characterized on specific culture media and further confirmed using API 20E Strips and identified by "api web". Out of 448 samples analysed, 304 (67.85%) samples showed positive isolation of *Enterobacteriaceae*. *Morganellamorganii* showed highest prevalence (18.52%), followed by *Proteussp* (12.27%), *Citrobactersp* (8.03%), *Enterobactersp* (6.69%), *Providenciasp* (5.58%), *Hafniaalvei* (4.46%), *Escherichia coli* (4.24%), *Klebsiellasp* (2.90%), *Rahnellaaquatilis* (2%), *Serratialiquefaciens* (1.78%) and *Pantoeaagglomerans* (1.33%). The presence of these organisms in the fresh seafood samples showed that the source of contamination may be from environment, catching, unhygienic handling and transportation. Thus it is strongly recommended that the improvements in handling and processing are needed to minimize the prevalence of pathogenic bacteria by implementing preventive measures and application of appropriate procedures for hygiene practices to monitor the quality of raw seafoods.

Introduction:-

Fish is a valuable and nutritious food, and an essential source of high quality and cheap animal protein crucial to balance of diets in marginally food secure communities (United Nation, 2004). Production of Fish and Shellfish by aquaculture is the fastest growing sector of world food economy. World aquaculture output has been growing at 11% per annum during the past decade and has reached 33.3 million tonnes in the year 1999 (Biradaret *et al*, 2001).

Unlike meat and poultry, fish are more liable to contamination with pathogenic bacteria from human reservoirs which may contaminate the water depending on the fishing and also may be further contaminated during handling, processing and packaging. While the muscle flesh of fish, which is the main edible part is normally sterile but microorganisms can penetrate from the skin and the gut to the flesh (FAO, 1983).

Fishery products have been recognized as a major carrier of food-borne pathogens. The contamination can occur prior to harvest, during harvest and processing operations, distribution, storage and preparation of the product. In a simplified overview, poor quality products, spoiled or decomposed are rarely responsible for food poisoning because they are usually discarded before consumption. Food poisoning in seafood products such as scombroid or histamine poisoning, normally is the result of mishandling during or after preparation. The microbial flora of seafood is related to the environment from which the fish are harvested (Wekellet *al*, 1994; Falana, 2005).

Fresh fish is a very perishable product and spoil due to microbiological activity, chemical oxidation of lipids and autolysis. However, microbial spoilage is the main mechanism affecting fresh fish quality. As the bacteria grow they utilize nutrients and produce by-products. It is well established that the accumulation of metabolic products is the primary cause of the organoleptic rejection of fresh fish. It is also known that spoilage is caused only by a fraction of the initial microbial population, known as specific spoilage organisms (SSO), which produce metabolites responsible for off-flavors and cause the organoleptic rejection of the product. The fraction of the initial micro-biota that dominate and the metabolic products that are produced are determined mostly by the temperature and atmospheric conditions during storage (Gram and Huss, 1996).

The *Enterobacteriaceae* count is considered as an index to determine the seafood quality. Some human pathogens such as *Escherichia coli*, *Klebsiellasp*, *Salmonellasp*, *Citrobactersp* and *Proteus sp*, when isolated from fish and fish products gives an identification about environmental fecal pollution of fish. These organisms have been found to survive and multiply in the gut, mucus and tissues of fish and that render fish acting as potential vector of human disease over long periods (Onyangoet *al*, 2009; Wogu and Maduakol, 2010).

Contamination of seafood with *Salmonella* is a major public health concern. Salmonellosis is a worldwide problem responsible for food poisoning outbreaks but it is mainly difficult to determine whether the contamination of fishes occurred in their aqueous habitat or during their handling and marketing (Etzelet *al*, 1998). Coliforms and Fecal coliforms in fish demonstrate the level of pollution of their environment because these organisms are not the normal bacterial flora in fish. (Cohen and Shuval, 1973).

Therefore, the intention of this study is to determine the contamination level of seafood samples with *Enterobacteriaceae* collected from the Eastern province of Saudi Arabia. And to take recommendations to reduce risk associated with the consumption of seafood.

Materials and Methods:-

A total of 448 samples comprising of Fishes (353), Prawns (49) and Cuttlefishes (46) were randomly collected from retail and wholesale fish markets in Damman during the period from January 2015 until May 2016. The collected samples were individually kept in sterile polyethylene bags embedded with ice and transported rapidly to the laboratory in an insulated box.

Sample processing for Bacteriological Examination:-

Bacteriological analyses of collected seafoods were performed within 2 hours of sampling. All media used in the present study were from Oxoid, U.K. and prepared according to the standard procedures. Media were sterilized by autoclaving at 121°C at 15 psi pressure for 15 minutes, unless otherwise specified. Sterility of the media was checked by incubating at 37°C for 24 hours. The microbiological analysis was performed as per the standard methods adopted from the Online Bacteriological Analytical Manual, USFDA (BAM 8th edition Online).

***Salmonella* species:-**

25 g of the sample was homogenized in 225 ml of Lactose Broth (LB) and incubated overnight at 37°C. After the initial pre enrichment step, samples were selective enriched in Tetrathionate Broth (TTB) at 37°C and Rappaport Vassiliadis (RV) medium at 42°C and incubated overnight. A loopful of growth from each of these media was streaked on Bismuth Sulphite Agar (BSA), Xylose Lysine Deoxycholate Agar (XLDA) and Hektoen Enteric Agar (HEA). After 24 (HEA, XLDA) – 48 (BSA) hours of incubation at 37°C, both atypical and typical colonies were picked up, purified and identified further by subsequent biochemical tests which included Gram staining, Motility, Oxidase production and then identified at the genus and species level using API 20E (Biomerieux, France) test kits. The identification was obtained by using the identification software “api web”.

Other Enterobacteriaceae:-

25 g of the sample was homogenized in 225 ml of sterile physiological saline in a filter stomacher bag and made in to slurry using the BagMixer® (Interscience, France) and the diluted samples were plated on MacConkey Agar. After 24 hours of incubation at 37°C, both pink and colourless colonies were picked up, purified and identified further by subsequent biochemical tests which included Gram staining, Motility, Oxidase production and then identified at the genus and species level using API 20E (Biomérieux, France) test kits. The identification was obtained by using the identification software “api web”.

Results and Discussion:-

The *Enterobacteriaceae* are all occurring on fish products as a result of contamination from the animal/human reservoir. This contamination has normally been associated with fecal contamination or pollution of natural water or water environments, where these organisms may survive for a long time (months) or through direct contamination of products during processing (FAO).

This study was conducted to determine the incidence of *Enterobacteriaceae* in Seafoods (353 Fishes, 49 Prawn and 46 Cuttlefish) for sale in wholesale and retail outlets of fish markets in Eastern province of Saudi Arabia. The results related to the incidence and identification at the species level of *Enterobacteriaceae* from Fishes, Prawn and Cuttlefish are summarized in Table 1. The overall percentages of prevalent bacterial species are shown in Table 2.

Out of 448 samples analysed, 304 (67.85%) samples showed positive isolation of *Enterobacteriaceae*. The ranges of incidence levels of *Enterobacteriaceae* were from Fishes 233 out of 353 (66%), Prawn 44 out of 49 (89.79%) and Cuttlefish 27 out of 46 (58.69%).

The obtained results were revealed that the dominant bacterial species occurred most frequently in the three types of seafood samples includes *Morganellamorganii* with 83 isolates (18.52%), followed by *Proteus* spp with 55 isolates (12.27%), *Citrobacter* spp with 36 isolates (8.03%), *Enterobacter* spp with 30 isolates (6.69%), *Providencia* spp with 25 isolates (5.58%), *Hafnia alvei* with 20 isolates (4.46%), *Escherichia coli* with 19 isolates (4.24%), *Klebsiella* spp with 13 isolates (2.90%), *Rahnella aquatilis* with 9 isolates (2%), *Serratia liquefaciens* with 8 isolates (1.78%) and the lower isolate was *Pantoea agglomerans* with 6 isolates (1.33%).

Salmonella was not detected in any of the samples analysed in this study, which was in agreement with previous studies (Popovic *et al*, 2010; Rodriguez *et al*, 2011; Figenet *et al*, 2014) in seafood products. Conversely, different workers (Shabarinath *et al*, 2007; Kumar *et al*, 2009; Bakret *et al*, 2011) reported varying incidence rates of *Salmonella* in seafood.

Morganellamorganii is widely distributed in nature, commonly found in the environment and the intestinal tracts of humans, mammals and reptiles as a part of the normal flora. Generally *Morganellamorganii* can act as an opportunistic pathogen that mainly causes wound and urinary tract infections. The drug resistance of *Morganellamorganii* is increasing in recent years, which often results in Clinical treatment failure (Hui Liu *et al*, 2016). In the present study *Morganellamorganii* showed highest prevalent (18.52%) in all the analysed seafoods. In a study conducted by Sureeratphuvasate (2008), he clearly demonstrated the ability of *Morganellamorganii* to produce Histamine in fish samples. Histamine is a biogenic amine formed through the decarboxylation of the amino acid histidine by the enzyme histidine decarboxylase. Consumption of fish containing histamine may result in illness known as Scombroid poisoning with a variety of symptoms, including rash, facial flushing, sweating, vomiting, diarrhea, head ache, burning sensation and metallic taste in the mouth.

Proteus sp. were involved in the spoilage of seafoods which can result in potential health hazard to the consumers. It can cause enteric infection in humans, summer diarrhea in infants, sinusitis, otitis as well as urinary tract infections (Bryan 1980; Varnam and Evas, 1991). The isolation of *Proteus* sp. from fish samples has been reported in previous studies by Tosun *et al* (2016). Sanaa O. Yagoub (2009) isolated *Proteus* spp in fish with an incidence of 10.2%. In the present study, the percentages of *Proteus mirabilis* and *Proteus vulgaris* were 7.58% and 4.68% respectively. Some investigations involve *Proteus* genus as an indicator of fecal contamination in marine fish, although their use as an indicator is not very common (ILSI, 2011).

In this study, members of *Citrobacter* were identified, represented by species in the ranges of *Citrobacter freundii* (4.24%), *Citrobacter braakii* (2.67%) and *Citrobacter koserii* (1.11%). Olugboje *et al* (2015), detected the presence of

Citrobactersp in fish samples of commercial importance collected from Nigeria. In a study conducted by Tosunet *al* (2016), *Citrobactersp* showed highest prevalence (45.56%) among all other *Enterobacteriaceae* from Horse Mackerel fish sold in public markets of Istanbul, Turkey. *Citrobactersp* are widely distributed in soil, water, food and the intestinal tract of humans and animals. They make up the normal flora of the human gut and were previously considered as a purely environmental contaminants or non-pathogenic colonizers, but known to be opportunistic pathogens, as they can cause serious infections, sepsis, food borne outbreaks of gastroenteritis, respiratory infections and urinary tract infections, especially in high-risk groups such as infants and immune compromised adults (Rusulet *al*, 1991; Dos santoset *al*, 2015).

The *Enterobactersp* can be found in soil, water, sewage, intestinal tract of man and animals (Banwart, 1989). In the present study, several species of *Enterobacter* has been isolated which includes *Enterobacter cloacae* (2.67%), *Enterobacter aerogenes* (2.23%), *Enterobacteramnis* (1.11%) and *Enterobactersakazakii* (0.66%). In a study conducted by Mai F. Elsheriefet *al* (2014), he isolated *Enterobactersp* along with other members of *Enterobacteriaceae* from the farmed and retailed fishes of Tilapia and Mugilcephalus. *Enterobactersp* can act as opportunistic pathogens that rarely cause primary diseases in humans. They are described as agents associated with respiratory infections, skin, urinary tract, bones, joints, central nervous system and gastro intestinal tract infections (Dos Santos *et al*, 2015).

In this study, members of *Providencia* were isolated, identified and represented by species in the percentages of *Providenciastuartii* (2.67%), *Providenciaertgeri* (1.56%) and *Providenciaalcalifaciens* (1.33%). Sanaa O. Yagoub (2009), isolated *Providencia* spp along with other members of *Enterobacteriaceae* including, *Escherichia coli*, *Enterobactersp*, *Klebsiellasp*, *Citrobactersp*, *Salmonellasp*, *Shigella* sp, *Serratiasp* and *Proteussp* from raw fish sold in fish market in Khartoum state of Sudan. *Providenciasp* are generally considered to be commensals in the gastrointestinal tract of humans, warm blooded animals, often also in soil and sewage water. *Providenciaertgeri*, *Providenciastuartii* and *Providenciaalcalifaciens* has been isolated from samples of human feces, either as part of the human intestinal microbiota as well as a cause of gastric disorder, such as traveler's diarrhea. In 2001, *Providenciaalcalifaciens* was reported in a major outbreak of food borne illness among children in Japan. They can act as opportunistic pathogen involved in urinary tract infections, keratitis, dacryocystitis, conjunctivitis and endophthalmitis. The bacteria *Providenciastuartii* is reported as more resistant species of the family *Enterobacteriaceae*. The emerging of resistance in *Providenciasp* is a clinical concern as it may lead to increased treatment cost and delays in treatment, which can be fatal to the patient (Dost Santos *et al*, 2015).

Hafniaalvei, a member of the family *Enterobacteriaceae* and the only species of the genus *Hafnia* described, is part of the human gastrointestinal flora, but can be found in environmental habitats such as surface water and food. *Hafniaalvei* is normally considered as a colonizing organism and rarely appears to be a pathogen. Recent findings suggest that it is a rare but may contribute to opportunistic infections in humans apart from diarrhea; it can cause extra intestinal infections such as septicaemia, liver abscess, peritonitis and pneumonia (Podschunet *al*, 2001; Dos Santos *et al.*, 2015). In the present investigation, the prevalence range of *Hafniaalvei* is around 4.46% in seafoods, followed by *Escherichia coli* with the percentage of 4.24% and members of *Klebsiellasp*, represented by its species in the ranges of *Klebsiellaterrigena* (1.56%) and *Klebsiellapneumoniae* (1.33%). Isolation of *Escherichia coli* and *Klebsiellasp* from the seafood samples analysed in this study was in agreement with the previous studies done by different workers (Yagoub, 2009; Mai F. Elsheriefet *al*, 2014; Romero Jarero Jorge, 2016; Tosunet *al*, 2016) who reported varying incidence rates of such organisms in seafoods.

Infections associated with *Escherichia coli* through the ingestion of seafoods are directly related to fecal contamination. *Escherichia coli* is normally present in the intestinal flora of humans and warm-blooded animals which may transfer to the foods due to the poor hygienic conditions, cross contamination or contaminated water (Huss *et al*, 2004; Renata Albuquerque costa, 2013). *Klebsiellasp* can also act as an opportunistic pathogen that cause wide range of infections including foodborne outbreaks of gastroenteritis, urinary tract infections, pneumonia, bacteremia, neonatal sepsis and wound infections (Rahkiaet *al*, 1998; Podschunet *al*, 1998).

In the present study members of *Enterobacteriaceae* such as *Rahnellaaquatilis*, *Serratialiquefaciens* and *Pantoeaagglomerans* were isolated in the ranges of 2%, 1.78% and 1.33% respectively from the analysed seafoods. All the above organisms can act as opportunistic pathogen in humans. *Rahnellaaquatilis* is typically associated with fresh water, since been isolated from blood, surgical wounds, urine, sputum, bronchial washings and stool, usually in immune compromised patients or in young children (KaleyTash, 2004). *Serratialiquefaciens* also an opportunistic

pathogen which is capable of colonizing a wide variety of surfaces in water, soil, the digestive tracts of rodents, plants, insects, fish and humans (Grimont and Grimont, 1978). *Pantoea agglomerans* inhabits plants, soil, and water, reported as both commensal and pathogen of animals and humans. They rarely cause disease in healthy individuals, such as septic arthritis, outbreak secondary to contaminated parental nutrition, occupational respiratory infections and skin allergy (Maria Carla Liberto *et al*, 2009).

Most of the *Enterobacteriaceae* members isolated and identified in this study were comes under the group of Coliforms and Fecal Coliforms. Austin and Austin (1985) have demonstrated the presence of *Escherichia coli*, *Enterobacter* sp, *Citrobacter* sp, *Salmonella* sp, *Proteus* sp, in fish that lives in contaminated marine water by domestic waste water. Priyanka Rani Majumdar *et al* (2014), stated that the untreated and the improper way of sewage disposal system in the water body is one of the main sources for microbial water contamination which results in the accumulation of these bacterial pathogenic species in the commercial edible fishes. Moreover, unhygienic handling by infected people or healthy carriers, during the capture, transport and processing may also act as a source of contamination by pathogenic organisms in seafoods.

Conclusion:-

The monitoring and control of seafood quality is one of the main goals in the seafood industries. The findings of this study revealed that the raw seafoods sold in fish markets in the eastern province of Saudi Arabia could be a source of food borne bacterial pathogens. The presence of such contaminating bacteria could be attributed to cross contamination from the environment, source and unhygienic handling by the sellers. Hence, the findings of this study may be considered as an additional knowledge to enhance proper controlling of the storage and shelf life of seafoods by implementing preventive measures such as HACCP and application of Sanitation Standard Operating

Procedures (SSOP) in fish markets to monitor the quality of seafoods by minimizing the prevalence of the pathogens.

Abstract

Aim: To compare the dentinal damage induced by stainless steel hand and rotary nickel-titanium instruments using K files, ProTaper Universal, Neoniti A1 and iRaCe files. **Materials and Methods:** Sixty single rooted premolars were collected and randomly divided into four groups of 15 teeth each. Group 1- Stainless steel K Files, group 2- ProTaper Universal, group 3- Neoniti A1 file and group 4 - iRaCe rotary instruments. Cleaning and shaping was done with the respective files. The roots were then cut horizontally at 3mm, 6mm and 9 mm from apex and were examined under stereomicroscope. The sections were checked for dentinal defects. **Statistical analysis:** Groups were analysed with the Fishers exact test. **Results:** It was found that all instruments examined caused dentinal defects with maximum defects in the apical third. Neoniti A1 file showed least number of dentinal defects compared to other file systems. **Conclusion:** The present study revealed that all the instruments could result in an increased chance for dentinal defects.

Introduction:-

The main objective of endodontics is a three dimensional seal of the root canal system. There are various steps in root canal treatment and each step has its importance in the success of the treatment. The biomechanical preparation is one of the steps in the root canal treatment for removal of bacteria and debris from the root canal to receive an obturating material.^{1,2,3}

Traditionally, the shaping of the root canal was achieved by the use of stainless steel hand files.⁴ Stainless steel root canal instruments clean the canal superficially and can create canal aberrations such as ledges, zips, and elbows.⁵ To eliminate these shortcomings of stainless steel instruments, nickel titanium (NiTi) instruments have been introduced.

It offers many advantages over conventional files. They are flexible (Walia et al. 1988), have increased cutting efficiency (Kazemi et al. 1996) and have improved time efficiency (Ferraz et al. 2001). Furthermore, Ni-Ti instruments maintain the original canal shape during preparation.⁴

ProTaper Universal (DENTSPLY Tulsa Dental Specialties) utilized multiple tapers of an increasing or decreasing percentage on a single file. This revolutionary, progressively tapered design limits each file's cutting action to a specific region of the canal.⁶

Recently Neoniti A1, a single file nickel titanium (NiTi) has been introduced which completes the canal preparation with only one instrument, this file system is made by the EDM (Electric Discharge Machining) process which is responsible for the unique behavior of the file⁷ which is claimed to relieve stress on the instrument because of its peculiar cutting action requiring even lesser time than rotary full-sequence systems.⁸ It is assumed that this movement reduces the risk of cyclic fatigue caused by tension and compression.

iRaCe (FKG) provides a quick, safe and effective protocol for preparation of curved root canals. These recently introduced NiTi rotary files have the same design features as RaCe files. The working part has alternating cutting edges. This design avoids "screwing-in" effect and allows better control of the instrument's progression.⁹

Rotary files have increasing taper design that increases the cutting efficiency and relatively removes more dentin compared to other systems which leads to formation of more complete and incomplete dentinal cracks.¹⁰ Vertical root fractures, which is one common complication associated with mechanical canal preparation¹¹, initiated from this dentinal crack (Wilcox et al. 1997), can lead to extraction.

A vertical root fracture is a longitudinally oriented fracture of the root, extending throughout the entire thickness of dentin from the root canal to the periodontium. It may be initiated in the crown or at the root apex or in some cases, along the root between these two points.¹²

Dentinal microcracks can occur during tooth extraction and tooth-sectioning procedures, and pre-existing defects may not be detected using root sectioning and microscopic observation techniques.¹³ A crucial goal in endodontic research is to overcome the potential problem of dentinal microcrack formation during instrumentation with rotary or reciprocating instruments.¹³ The purpose of this study is to evaluate dentinal defects caused by different NiTi file systems and K files.

Material and Methods:-

Sixty single rooted premolars were collected, cleaned with periodontal scaler and stored in purified water. Teeth with curved roots, calcified canals, developmental anomalies or extra canals were discarded. The coronal portions of all teeth were removed with diamond disk with water cooling leaving roots of 15mm in length. All the root surfaces were observed with stereomicroscope under 24x to rule out preexisting cracks or any craze lines.

Apical patency was checked using a 10 no. K file. Working length was determined by leaving 10 no. K file in the canal so that it was just visible at the apical foramen and from that length 0.5mm was subtracted. The specimens were divided into 4 groups each group containing 15 specimens each.

Group 1- K Files stainless steel files (Mani)

Group 2- ProTaper Universal (DENTSPLY Maillefer)

Group 3- Neoniti A1 (NEOLIX, FRANCE)

Group 4- iRaCe (FKG Swiss endo)

In all the groups each canal was irrigated with 3% sodium hypochlorite and saline alternatively. Along with RC-Prep (EDTA 15% and urea peroxide 10%) used between each sequential instrument in canal preparation.

Hand file group was prepared using stainless steel K files up to apical size 25 at the working length and step-back technique was used up to 40 no. K file.

In the ProTaper Universal group, the following sequence was used for canal preparation at 300 rpm using a crown down technique. Sx file was used for coronal enlargement and S1, S2, F1 and F2 corresponding to apical size 25 used at working length.

In the Neoniti A1 (25/0.08) file group, the file was taken to the middle third using 3 or 4 circumferential brushing actions followed by taking it to the working length using a pecking motion at 300 rpm.

In the iRaCe group, the file R1 in rotation was introduced into the canal and reached up to working length with long back and forth strokes and shaping of the canal was finished with R2(25/.04) up to working length. These files were used at 600 rpm.

For efficient cleaning of the canals EndoActivator (Dentsply Tulsa Dental) was used in all the groups, with no.25 tip for 30 seconds by agitating the solution vigorously.¹⁴

Examination of roots:-

After the biomechanical preparation, roots were sectioned from 3mm, 6mm and 9 mm from the apex using a diamond disk under water cooling. Digital images of all the section were captured using a 24x stereomicroscope by using a digital camera (Olympus, Tokyo, Japan). Specimens were checked for dentinal defects by two examiners. Defects were classified using Wilcox *et al.* classification¹⁵ with modification.

Defects were classified as 'no defect', 'fracture' and 'all other defects'.

"No defect" was root dentine without any lines or cracks, neither the external surface nor the internal root canal wall had no defects.

"Fracture" was the teeth with crack that was extending from the root canal space to the outer root surface (Figure 1).

"Other defects" were other cracks that did not extend from the root canal to the outer root surface. This includes the internal and external craze lines and partial cracks.

"Internal craze lines" included cracks extending from the canal lumen wall into the dentin without reaching the root surface; however, "external craze lines" were defined as cracks extending from the root surface into dentin without reaching the canal lumen.

Samples were considered defective if at least one of the three sections showed any defect. Data were collected and statistical analysis was done.

Figure 1:- (A) No defect (B) Partial Crack
(C) External Craze line

Statistical analysis:-

The data was analysed using statistical software SPSS (SPSS Inc., Chicago). Fisher's exact test was used to determine statistically significant difference in the appearance of defected roots between the experimental groups.

Fisher's exact test was also performed to determine the defects at different horizontal sections in each group. The level of significance was set at $P < 0.05$.

Results:-

Table 1 shows the number and percentage of cracks in each sections and the total number of defective samples. Figure 2 is a bar chart representing the percentage of defects in each group. Neoniti A1 group showed lowest defect (1/15) followed by ProTaper Universal and K files which showed same number of defects (3/15). iRaCe group showed maximum number of defects (4/15). Statistical significant difference was seen between Neoniti A1 group and iRaCe group ($P < 0.05$). No significant difference was found between other groups ($P > 0.05$). Only in the middle section, iRaCe and K files produced significantly more defects than ProTaper Universal and Neoniti A1 ($P < 0.05$).

Table 1:- Number and percentage of cracks.

	Group 1		Group 2		Group 3		Group 4	
	Number	%	Number	%	Number	%	Number	%
Apical	0	0%	0	0%	1	6.7%	1	6.7%
Middle	3	20%	1	6.7%	0	0%	4	26.7%
Coronal	0	0%	2	13.3%	1	6.7%	0	0%
Total	3	20%	3	20%	1	6.7%	4	26.7%

Figure 2:- Percentage of defects.

Discussion:-

NiTi instruments are used in rotational motion and rotational force is applied to root canal walls. This can create dentinal defects in root dentin.¹⁶ The aim of the present study was to detect the dentinal damage in the form of cracks and craze lines caused by K files and NiTi instruments.

In our study, we selected premolars because these teeth are probably more prone for forces of instrumentation. These teeth have got smaller dimensions and thin dentinal walls. If large tapered files cannot induce cracks in premolar, it is unlikely that rotary files induce cracks in other teeth.¹⁷

Only partial cracks were observed in this study, which indicates that fractures do not occur immediately after root canal preparation. In a study by Bier et al.¹⁸ the samples prepared with either hand or rotary instruments did not show any complete fracture. However, overtime these dentinal defects like craze lines or incomplete cracks may turn into fractures. But it has a potential effect on root fracture that makes these defects clinically significant.¹⁹

Rotary files cause more number of defects may be attributed to various reasons: Tip design, cross-section geometry, constant or variable taper, pitch and flute form.^{16,18,20,21,22} Crown down technique used in the canal preparation can also be considered as a contributor in the formation of dentinal cracks.^{21,21,23}

In this study K file group as well as ProTaper Universal group showed dentinal defects (20%). In a study by Dilek et al.¹⁹ all instruments including hand files showed dentinal defects. Though all the teeth selected in this study were having straight canals apical foramen is located eccentrically in 68 to 80% of the teeth.²⁴ This indicates that even in straight roots canals are not straight and can curve apically. In fact all the roots have some degree of curvature.²⁵ Stainless steel files are stiffer than NiTi files and this could be the reason why the K file group showed more defects.²⁶ This is in contradiction to other studies which showed least number or no defects in the hand file group.^{18,27,28} This may be due to the fact that hand files removed less amount of dentin because of the less taper of the hand files.^{18,20}

ProTaper Universal files caused significantly more cracks. Finishing files of ProTaper Universal files has got more taper. This may cause the dentinal cracks by generating increased stress on the dentinal walls as compared to other rotary system.²⁹ These files have got more active rotating movement that may result in that may result in high levels of stress concentrations in root canal walls that may result in crack formation.³⁰

Neoniti A1 file used in this study showed least number of defects. A literature search did not reveal any previous studies regarding the effect of this file system on root dentin. These files are made by EDM (Electric Discharge Machining) process offers unique features such as progressive flexibility, sharp cutting edges and built in abrasive properties.⁷ The relatively high flexibility of Neoniti A1 file may be the reason for the less number of cracks in this study.³¹ Moreover, Neoniti A1 is a single file system. Only one file is required for the complete shaping of the canal and this may also contributes to the less number of defects.³¹ As the EDM technology is a newly introduced method for the manufacture of files, future studies with more focus on dentinal defects in root dentine are therefore suggested.

Among the groups iRaCe showed maximum number of defects (26.7%). The RaCe files have a sharp cutting edge with convex triangular cross-section. They have asymmetrical longitudinal design. A set of cutting edge alternates with the second set pitched at a different angle leading to two different cutting edges on the same file. This could cause stress concentration at specific points rather than distribute it along the entire length of file.³² This concentration of stresses could have led to significantly more cracks seen with this system.²⁶ Moreover these files were used at a higher rpm (600). This can be the other reason for the higher number of cracks with these files.^{18,23,33,34} On the contrary Peters et al. (2014) and Ceyhanli et al (2015) reported that high rotational speeds enhanced cutting efficiency and decreased defect formation.

Limitations:-

1. Use of different speed settings for each rotary system.
2. Simulation of periodontal ligament was not done in the present study. Capar et al ³¹ stated that simulation of the periodontal ligament is necessary for investigating the influence of forces on formation of crack or fracture strength. Moreover, the periodontal ligament has viscoelastic property. It plays a vital role in stress dissipation due to application of load on the teeth.
3. Pre-existing defects due to excessive force during tooth extraction or during sectioning of the tooth that could not be evaluated.

Conclusions:-

Even though this in vitro study did not reflect the clinical settings, within the limitations of this study it can be concluded that all the instruments examined caused dentinal defects. More defects were observed in the apical one third followed by middle one third. Neoniti A1 file showed least number of dentinal defects compared to other file systems. More studies using techniques such as micro CT is suggested for further evaluation.

Abstract

A static headspace gas chromatographic (GC-HS) method is developed for quantitative determination of residual organic solvents such as acetone, ethyl acetate and acetonitrile used in the synthesis of Neostigmine Methylsulfate. Separation was achieved on capillary column DB-624 of length 30 m having internal diameter 0.32 mm and 1.8 μ m film thickness using a Flame ionization detector with gradient column oven temperature program. The headspace condition was optimized with the vial equilibration temperature of 100°C and time at 30 min. The injection was carried out in split mode, with a split ratio of 10:1. N-methyl-2-pyrrolidone is selected as a diluent to obtain good sensitivity along with the recovery. Analytical method validation was performed within the requirements of ICH validation guidelines Q2 (R1). System suitability parameter set with tailing factor, theoretical plate and relative standard deviation as required with various pharmacopoeias are checked. Limits of detection and quantitation, precision, linearity and accuracy along with robustness are performed, and acceptable results are obtained. The proposed developed method is demonstrated to be simple, sensitive, linear, accurate and robust, hence can be used to determine the residual organic solvents in Neostigmine methylsulfate drug substance.

Introduction:-

Neostigmine methylsulfate is a acetylcholinesterase inhibitor used in the treatment of myasthenia gravis and to reverse the effects of muscle relaxants such as gallamine and tubocurarine and is currently recommended by the WHO for the treatment of neurotoxic snakebite [1-4].

In the synthesis of drug substances various organic solvents are used at various stages. These solvent may be used as a medium for the reaction or purification of intermediates or drug substances. Intermediates and drug substances are dried at a specific temperature to remove the used solvents, but traces of them may carry forward to drug substance as impurities which are called as residual solvents.

Residual solvents are unwanted chemical which does not have any no therapeutic benefit and in some cases they are toxic. Based on their toxicity, they are classified into three categories Class 1 solvents are known or suspected to be carcinogens to human and environmental hazards, hence these should be avoided in the production of drug substances, unless their use is strongly justified in a risk-benefit assessment. Class 2 solvents are non-mutagenic and known or suspected to be carcinogens in animals, therefore these solvents should be limited in order to ensure patient safety. Class 3 solvents with low toxic potential to humans; no health based exposure limit is needed. Residual solvents are generally determined using Headspace gas chromatography (GC-HS) techniques. Analytical methods used for determination of residual solvent should be validated as per ICH guidelines. The aim of this study is to develop and validate the GC-HS method of analysis for residual solvents namely acetone, ethyl acetate and acetonitrile in Neostigmine methylsulfate. Some of the methods for identification of residual solvent in drugs are also discussed [5-9].

Neostigmine Methylsulfate

Fig. 1:- Structure of Neostigmine methylsulfate

Table 1:- Residual solvent with there class and limits.

Solvent	Class	Limit (ppm)
Acetone	3	5000
Ethyl acetate	3	5000
Acetonitrile	2	410

Materials:-

Reagent and Chemicals:-

Neostigmine Methylsulfate sample was received from Analytical research and development department of Indoco research centre (Navi Mumbai). GC grade Acetone, Ethyl acetate and Acetonitrile were purchased from Merck (India). N-methyl-2-pyrrolidone used as diluent for preparation of sample and standard was purchased from Spectrochem.

Instrumentation:-

Perkin Elmer, Clarus 500 gas chromatographic system with a Turbo matrix headspace gas sampler and Flame ionization detector (FID) was used for separation and detection of solvents. Sartorius (Germany) analytical balance was used for weighing the materials.

Methodology:-

Method optimization:-

Various GC columns such as DB-Wax, DB-1 and DB-5 were used of various dimensions, but the best separation was achieved on DB-625 (Make-Agilent) with dimension 30 m length and 0.32 mm of internal diameter and coated with stationary phase of 1.8 μ m film thickness. Details of other optimized gas chromatographic and headspace parameters are given in Table 2 and Table 3 respectively. For suitability of a system, tailing factor kept was not more than 2.0, theoretical plate not less than 5000 and % RSD not more than 5.0% was kept for peak area of each solvent for six standard solution replicate injections.

Table 2:- Optimized gas chromatographic conditions.

Detector	Flame Ionization Detector
Column oven temperature program	Initial 40°C, hold for 8.0 minutes
	Increase @ 20°C per minute to 200°C
	Hold at 200°C for 4.0 minutes
Detector Temperature	220°C
Injector Temperature	200°C
Attenuation	-6
Split Ratio	10:01
Carrier Gas	Nitrogen
Carrier Gas Flow	1.50 mL/min
Run time	20 min
Range	01

Table 3:- Optimized headspace conditions.

Oven equilibration temperature	100°C
Needle temperature	110°C
Transfer line temperature	120°C
Thermostat time/Vial incubation time	30.0 minutes
Pressurization time	3.0 minutes
Injection time	0.05 minutes
Withdrawal time	0.5 minutes
GC cycle time	34.0 minutes

Preparation of solutions:-**Blank solution:-**

Transferred 1.0 mL of diluent into headspace vials and sealed the vials immediately using PTFE septa with aluminium crimp cap.

Standard stock solution:-

Transferred 5.0 g of Acetone, 0.410 g of Acetonitrile and 5.0 g of Ethyl acetate into a 100 mL volumetric flask containing about 20 mL diluent and made up to mark with diluent.

Standard solution:-

Transferred 1.0 mL standard stock solution into a 100 mL volumetric flask and made upto mark with diluent. Transferred 1.0 mL of diluted solution into headspace vials and sealed the vial immediately using PTFE septa with aluminium crimp cap.

Test solution:-

Transferred 0.10 g sample into a headspace vial, added 1.0 mL of diluent and sealed the vial immediately using PTFE septa with aluminium crimp cap.

Procedure:-

Conditioned the column at 200°C and then equilibrated at 40°C. Injected blank solutions, six standard solution and test solution. Recorded the peak area of each solvent and calculated solvent content in Neostigmine Methylsulfate by formula below

$$\text{Ethyl acetate/Acetone/Acetonitrile (ppm)} = (\text{AT/AS}) \times (\text{WS/WT}) \times 100$$

Where, AT is area of solvent in the test sample, AS is average area of corresponding solvent in the standard solution, WS is weight of corresponding solvent taken for standard solution preparation (g) and WT is weight of Neostigmine Methylsulfate test sample (g).

Analytical Method Validation:-

The analytical method validation work was conducted according to the ICH (International Conference on Harmonization) guidelines and with reference to other literature [10-16]. The parameter with which analytical method is validated is Specificity, Limit of detection, Limit of quantitation, Linearity, Accuracy, Precision and Robustness.

Specificity:-

Capability of the method to measure the analyte peak (solvent) response in the presence of other components is termed as specificity. For this, blank, standard, test sample and spiked test sample solutions were injected and observed the chromatogram for any interference from blank and test sample peaks at a retention time of solvent peaks. It was observed that there was not interference at a retention time of solvent peaks (Fig. 3). Also the retention time of the solvent peaks for standard and the spiked test sample were matching (Table 4).

Table 4:- Retention time of solvent peaks

Solvent	Retention time (min)	
	Standard solution	Spiked test sample
Acetone	4.280	4.276
Acetonitrile	4.804	4.801
Ethyl acetate	8.592	8.592

**Fig 3:-** Neostigmine Methylsulfate sample spiked with solvents.**Limit of detection (LOD) and Limit of quantitation (LOQ):-**

For the establishment of LOD and LOQ, six standard solutions of known concentration were injected and average signal-to-noise ratio for solvent peak was determined. Concentration for each solvent was calculated for which signal to noise is 3 and 10 and reported as the limit of detection and limit of quantitation respectively (Table 5).

Limit of detection (ppm) = $3 \times C/S$

Limit of quantitation (ppm) = $10 \times C/S$

Where C is the concentration of solvent in standard solution (ppm) and S is the signal to noise ratio of that solvent peak.

Table 5:- Detection and quantitation limits.

Solvent	Limit of detection (ppm)	Limit of quantitation (ppm)
Acetone	3.97	13.23
Acetonitrile	9.49	31.65
Ethyl acetate	7.87	26.23

Linearity:-

Six linearity solutions were prepared ranging from LOQ to 150% of limit level concentration of each solvent. Injected each solution in triplicate and calculated average peak area for each solvent. Linearity curves were drawn by plotting the graph of the average peak area of solvent against its concentration in ppm in linearity solutions (Fig. 4-6). Reported slope, intercept, % y intercept, regression coefficient (r^2) and range for which linearity is established (Table 6).

Table 6:- Linearity and range of solvents.

Solvent	Slope	Intercept	% y intercept	r^2	Range (ppm)
Acetone	367.78	2621.6	0.14	1.0000	13.23 to 7514.58
Acetonitrile	147.41	458.64	-0.76	0.9999	31.65 to 624.65
Ethyl acetate	232.83	2226.1	0.19	1.0000	26.57 to 7547.85

**Fig. 4:-** Linearity plot for Acetone.**Fig. 5:-** Linearity plot for Acetonitrile.

Fig. 6:- Linearity plot for Ethyl acetate

Accuracy:-

Accuracy was established by performing the recovery studies where each solvent was spiked in the test sample at four different concentration levels, i.e. LOQ, 80, 100 and 120 % of target concentration. Each level was prepared in triplicate. The solvent content for each accuracy sample was calculated as per methodology and reported as observed concentration. To calculate the recovery for solvent, the ratio is taken of the observed solvent content and the theoretical solvent content spiked. Calculated percent accuracy for each sample and reported the average for each level. Recovery for each solvent was between 80% and 120% (Table 7).

Table 7:- Recovery of Acetone, Acetonitrile and Ethyl acetate.

% Recovery	Acetone	Acetonitrile	Ethyl acetate
LOQ	94.79	109.51	103.68
80%	95.32	92.54	100.77
100%	98.14	93.19	104.03
120%	94.97	88.43	100.75

Precision:-

System precision was carried out by analysing six standard solutions prepared as per methodology. % RSD for the peak area for each solvent was found to be less than 5.0 %. Six samples were prepared by spiking each solvent with LOQ concentration and RSD for peak area was calculated which was less than 5.0 %. For repeatability (Inter-day) and intermediate precision (Intra-day and Inter-day), six test solutions were prepared by spiking the solvents at limit level concentration. RSD observed for each solvent content for repeatability and intermediate precision solution was less than 5.0 % also cumulative RSD for repeatability and intermediate precision was less than 5.0 %.

Table 8:- Precision for acetone, acetonitrile and ethyl acetate.

Parameter	% RSD for peak area		
	Acetone	Acetonitrile	Ethyl acetate
System precision (Standard solution)	1.56	1.53	1.55
Precision at LOQ	1.30	1.56	1.36
Repeatability (Intra-day)	0.64	0.96	0.58
Intermediate precision (Inter-day)	0.61	1.01	0.68
Cumulative (Intra-day and Inter-day)	0.64	1.54	0.67

Robustness:-

For robustness, two deliberate changes were done with respect to carrier gas flow rate and vial incubation temperature. Each change consists of one upper set and one lower set (Table 9). For each set, three preparations were done by spiking the solvents in the test sample at limit level and analysed. % RSD for each solvent content individually for three determinations and cumulative with six determinations of repeatability was observed for robustness solutions. RSD was found to be less than 5.0 % (Table 10).

Table 9:- Robustness parameter changes.

Changes	Lower set	Upper set
Change in carrier gas flow rate	1.4 mL/min	1.6 mL/min
Change in vial incubation temperature	95°C	105°C

Table 10:- Robustness parameter changes.

Sample ID	Individual % RSD			Cumulative % RSD		
	Acetone	Acetonitrile	Ethyl acetate	Acetone	Acetonitrile	Ethyl acetate
Robustness-1	0.53	1.26	0.43	0.82	0.99	0.84
Robustness-2	0.59	1.13	0.44	0.61	1.19	0.54
Robustness-3	0.27	0.13	0.17	0.90	0.79	0.84
Robustness-4	1.28	0.48	1.26	0.90	0.96	1.13

Result and Discussion:-

The retention time of the solvent peak of standard solution matches with that of the spiked test sample solution. No interference was observed at a retention time of the solvent peak from blank and test sample. The percentage recovery obtained for each solvent was in the range of 80% to 120%, which is within ICH acceptance. Precision parameter shows the RSD was less than 5.0 % for all the solvents in system precision, repeatability and intermediate precision at 100% concentration. Linearity was observed in the concentration range of LOQ to 150% with r^2 values greater than 0.999 and y-intercept less than 5.0% showing a good correlation between the response and solvent concentration. The calculated limit of detection and limit of quantitation for Acetone was 3.97 ppm and 13.23 ppm, Acetonitrile was 9.49 ppm and 31.65 ppm and for Ethyl acetate 7.87 ppm and 26.23 ppm respectively. The method is robust as in robustness parameter deliberate changes were made for which individual and cumulative RSD values for each set were less than 5.0 %.

Conclusions:-

Headspace gas chromatographic method developed can be successfully applied for quantitative determination of Acetone, Acetonitrile and Ethyl acetate in Neostigmine Methylsulfate bulk drug sample on a manufacturing level in the pharmaceutical industry. The method is validated and found out to be specific, linear, accurate, precise and robust, Acceptable data for all method validation parameters tested and found out to be satisfactory.

Abstract

India is a country which discerns between “wilful” and other defaulters. The issue of wilful default by a large number of borrowers had been receiving the attention of Government of India, Reserve Bank of India, and credit institutions since 1986. This study is an attempt to critically examine the regulatory framework on “wilful defaults”.

This paper has been divided into three phases. Phase I introduces the concept of wilful defaults and the scheme framed for disclosure of such information. Phase II was during 2001 to 2005, when the monitoring tools were strengthened and penal measures were framed. During Phase III greater transparency and accountability was brought in the process of identification of a “wilful” defaulter. A centralized mechanism of credit information and dissemination was put in place to alert the lenders against the borrowers who abuse the public funds and jeopardize the health of the institutions.

The relevance of this study at this juncture, is very crucial for credit risk management of the financial institutions in India. A thorough understanding of the policy prescriptions would enable these institutions to employ an ex-ante approach to detect early stages of strategic defaults and thus avert high costs associated with it.

Introduction:-

“If you owe your bank manager a thousand pounds, you are at his mercy. If you owe him a million pounds, he is at your mercy” -- J.M. Keynes

Genesis:-

The issue of “wilful default” and withholding of credit facilities to defaulting borrowers, to enforce credit discipline had been receiving the attention of the regulatory authorities in India for more than three decades now. Reserve Bank of India (RBI), the central bank of the country, in 1986 had noticed that the credit institutions are sanctioning term loans to borrowers for setting up of new units or expansion of their existing businesses even when such borrowers had not respected the repayment commitments of their existing debts. Reserve Bank had, therefore, issued guidelines to all scheduled commercial banks to ascertain the cause of such defaults and delay in repayment of the principal or the interest. The guidelines further stated that the same may be condoned only if these have been due to genuine factors which were beyond the control of the defaulters. Otherwise, not meeting the financial obligations for a prolonged period indicates some serious lacunae in the financial management of the borrowing company. In such cases, it is expected that the borrower resolves the issues of the existing unit rather than

Corresponding Author:-Lakshmi Karthik.

Address:-Research Scholar, Gitam School of International Business, Gitam University, Visakhapatnam, India.

considering expansion or enlarging his business by setting up new ones. Banks were directed not to consider fresh loans in respect of such borrowers either exclusively or jointly with other banks / financial institutions. To overcome this, banks were directed to ascertain the overdue position from other credit institutions before sanctioning fresh term finance.

With respect to working capital finance, as stoppage or withdrawal of such facility may lead to closure of the business and adversely affect the workers, the banks were directed to withheld such credits and not sanction fresh loans only when it could be established that the management of the defaulting borrowers are indulging in siphoning off the company's funds or such other malpractices. The guideline states that the banks may even freeze the operations of the account, if warranted, for bringing round the management of the company to comply with the required financial discipline. Credit institutions were also required to assess whether there is need to consider change in management of such recalcitrant borrowers.

Introduction of a reporting mechanism to Reserve Bank:-

To assess the overall position in respect of these persistent defaulters in the banking system, the Reserve Bank introduced a reporting mechanism in the year 1986. The details of the same are as under:

Table 1:-Details of annual report to be submitted by the banks.

S. No.	Periodicity	Amount and nature of the loan	Description of the report to be submitted
1.	Annually by 31 January of the following year. (First such report for the calendar year 1986 to be submitted not later than January 31, 1987).	Borrowers enjoying aggregate working capital limits of Rs.50 lakhs and above from the banking system.	From banks to Reserve Bank Action taken on: (i) the persistent defaulters in repayment of principal / interest on terms loans and deferred payment guarantees. (ii) Management of the defaulting companies who have siphoned off funds from the companies. (iii) Impact of such action on the units. (If it is a consortium arrangement, leader to furnish the report) Report to indicate: (i) nature of offence / default (ii) name of the promoter group (iii) the period of default (iv) steps taken by the bank.
2.	Annually	Borrowers enjoying aggregate working capital limits of Rs.10 lakhs and over, and up to Rs.50 lakhs	From banks to its Board of Directors In order to strengthen their internal management, the report as detailed at point number 1 above for Rs.10 lakhs and above, to be submitted annually by the banks to its Board members.
3.	Quarterly - to be submitted within fifteen days after the close of the quarter. (beginning from the quarter ending March 1987)	Borrowers enjoying aggregate working capital limits of Rs.50 lakhs and above from the banking system.	From banks to Reserve Bank At shorter interval (quarterly), report to contain snapshot of the defaults: (i) names of the defaulting borrowers (ii) nature of action taken in each case.

The lending institutions were directed to inculcate the necessary financial discipline with regard to the borrowers who abhorrently exploit the system with impunity. The impacts of such action were analyzed by these reports.

Evolution of wilful default management:-**Phase I – 1990 to 2000**

The journey of the wilful defaults management can be divided into three phases. In the first phase i.e., the period from 1990 to 2000, the Reserve Bank introduced the definition of “wilful defaults” and also framed a scheme of disclosure of information on defaulting borrowers.

Definition of a “Wilful Default”:-

RBI (1990) defined “wilful” defaults as “*defaults other than those caused by genuine factors beyond the control of the borrowers*”. During that period there was a rapid increase in number of wilful defaulters and also it was brought to the notice of the central bank that such borrowers do not co-operate with the lending institutions when appropriate corrective measures are initiated by these institutions. Reserve Bank attached considerable importance to the feedback received on the subject and reviewed the matter.

With a view to strengthen the existing monitoring mechanism, it was decided to increase the frequency of reporting from annually to half-yearly and also enlarge the scope by including the other borrowers belonging to the same group which had wilfully defaulted. With the introduction of the revised reporting arrangement, RBI advised the banks to discontinue the then existing yearly reporting. The details of the revised reporting mechanism are as under:

Table 2:-Details of the half-yearly report to be submitted by the banks.

S. No.	Periodicity	Amount and nature of the loan	Description of the report to be submitted
1.	Half-yearly reports as on March 31 and September 30 of every year. To reach RBI within a month from the end date. (First such report for March 1990 to be submitted by end of April 1990)	Borrowers enjoying fund based aggregate credit facilities (term loans and working capital) of Rs.2 crores and above from the banking system.	From banks to Reserve Bank The details of each borrower have to be submitted separately along with a summary sheet on the number of cases and names of the wilful defaulters. The details of each of the borrower had to be reported in a prescribed format with complete particulars such as name, health code, nature of the business, constitution of the company, credit facilities enjoyed by the same group, with brief remarks indicating the circumstances for becoming irregular and the measures proposed to be taken to regularise it.

RBI framed a Scheme of Disclosure of information on defaulting borrowers:-

In 1994, the issue of defaulting borrowers again came to the fore with the rapid increase of non-performing assets of the banks and financial institutions. The Honourable Union Finance Minister in his Budget Speech on February 28, 1994, announced that RBI will put in place an arrangement for circulating the names of the defaulting borrowers amongst lending institutions. This mechanism would alert and guard these institutions against borrowers who have defaulted in their dues to other lenders. Government further mentioned that RBI would also publish a list of defaulting borrowers in cases where suits have been filed by these institutions.

Accordingly, RBI framed a Scheme of Disclosure of information on defaulting borrowers of banks and financial institutions for collection / dissemination of information from / to the banking companies. RBI issued a circular under the powers vested to it by the provisions of Chapter IIIA of the Reserve Bank of India Act, 1934. Under the scheme all the commercial banks and all India financial institutions were advised on April 23, 1994 to furnish to RBI the prescribed details of defaulting borrowers with outstanding amount (both funded and non-funded) of Rs.1 crore and above which were classified as “doubtful” and / or “loss” and suit filed accounts on half-yearly basis (March 31 and September 30).

This scheme had the following objectives:-

- to alert banks and financial institutions and to put them on guard against borrowers who have defaulted in their dues to other lending institutions.
- to make public the names of the defaulting borrowers against whom suits have been filed by the banks and financial institutions.

As stated in the budget, RBI had started publishing such information in a booklet form for use of these institutions since 1994.

Establishment of Central Vigilance Commission by Government of India:-

The matter of “wilful default” received further impetus with the establishment of Central Vigilance Commission (CVC) by the Government of India in 1998. The Central Vigilance Commission Ordinance 1998 under Section 8(1)(h) directs that the power and function of the CVC will be the following:

- (a) “Exercise superintendence over the vigilance administration of the various Ministries of the Central Government or Corporations established by or under any Central Act, Government companies, societies and local authorities owned or controlled by that Government”.
- (b) “Improving vigilance administration is possible only if system improvements are made to prevent the possibilities of corruption and also encourage a culture of honesty.”

Directions issued by the Central Vigilance Commission on “wilful defaults”:-

In exercise of the above powers conferred on the CVC, it issued instructions on November 27, 1998 on “Improving vigilance administration in Banks” which *inter alia*, included directions on “Lack of communication between banks” and directed banks, financial institutions and RBI on the following for compliance:

- (a) “all cases of wilful default of Rs.25 lakh and above will be reported by banks and RBI as and when they occur or are detected.
- (b) whether a matter is a case of “wilful default” will be decided in each bank by a Committee of Officers.
- (c) RBI will circulate the information received from the banks of wilful default every three months. The data with the RBI will also be accessible directly by the banks concerned.
- (d) there should be greater intra-bank communication about wilful default, frauds, cheating cases, etc., so that the same bank does not get exploited in different branches by the same defaulting parties.”

Scheme framed by RBI for reporting the names of the “wilful defaulters”:-

Pursuant to the instructions of the Central Vigilance Commission, a scheme was framed by RBI under which all the scheduled commercial banks and all notified All India financial institutions were required to submit the details of the wilful defaulters to RBI. The scheme came into effect from April 1, 1999.

Objective of the Scheme:-

Dissemination of information in respect of wilful defaulters, amongst the credit institutions would make them more vigilant while considering requests for new or additional loans from these defaulters. The risk of plundering of public money can thus be mitigated.

Definition of “wilful default” revised by RBI:-

Hitherto the definition of “wilful default” given by RBI only indicated that if the defaults are caused other than by genuine factors, it would deem to have been “wilful”. However, in 1999, RBI expanded the scope of the definition of a “wilful default”.

The revised definition broadly covers the following:-

1. “Deliberate non-payment of the dues despite adequate cash flow and good net worth.
2. Siphoning off of funds to the detriment of the defaulting unit.
3. Assets financed have either not been purchased or have been sold and proceeds have been misutilised.
4. Misrepresentation / falsification of records.
5. Disposal / removal of securities without bank’s knowledge.
6. Fraudulent transactions by the borrower.”

Mechanism prescribed for identification of “wilful default”:-

The Reserve Bank had advised the credit institutions that *prima facie* for a default to be categorized as “wilful” it must be intentional, deliberate and calculated. Further, for the purpose of identifying the cases of wilful default, the banks and financial institutions were advised to form a Committee consisting of three General Managers / Deputy General Managers or equivalent to them. However, it was made amply clear that the wilful defaulters should be identified based on their track record and the decision of the credit institutions should not be based on isolated transactions or incidents. Further, these credit institutions need to report the cases of wilful defaults at their overseas branches also, if such disclosure is permitted under the laws of the host country. RBI also instructed that names of the “Professional Directors” and “Nominee Directors” of the financial institutions, Central or State Governments need not be reported. It was further clarified that names of the directors who are stakeholders only should be reported in the list. In case of consortium / multiple banking arrangements, the credit institutions will report wilful

defaults to other participating / financing institutions also. Further, any fresh limit / renewal or enhancement of the loan in respect of wilful defaulters can be considered only by the Board of Directors of the credit institutions.

Reporting mechanism on wilful defaulters strengthened:-

The reporting mechanism in respect of “wilful defaulters” was further strengthened by the Reserve Bank in the year 1999. The periodicity of the reporting was reduced from half-yearly to quarterly and also the threshold amount was brought to Rs.25 lakhs from the earlier figure of Rs.2 crores.

Table 3:-Details of the quarterly report to be submitted by the banks.

S. No.	Periodicity	Amount and nature of the loan	Description of the report to be submitted
1.	Quarterly – detected after March 31, 1999	All non-performing borrowal accounts with outstanding (funded facilities and such non-funded facilities which are converted into funded facilities) aggregating to Rs.25 lakhs and above.	The data has to be reported by the credit institutions to RBI in a prescribed format. The format contains all details of the borrower viz., name, address, amount outstanding, names of the directors and details of the reporting bank and branch etc.

Inclusion of “Consent Clause” in the loan agreements:-

As banks were under an obligation to maintain secrecy of their customers’ accounts, Reserve Bank (October 1999) under section 21 and 35A of the Banking Regulation Act, 1949 issued directions to all commercial banks and the notified all India financial institutions to obtain consent from the borrowers for publicizing their names if they commit default in repayment of their dues. Therefore, the circular had directed the credit institutions to include a condition to that effect in the loan agreement. However, after enactment of CICRA, this clause was withdrawn in July 2013.

Phase II – 2001 to 2005

Review of wilful default management:-

Report of the Parliament’s Standing Committee:-

The Parliament’s Standing Committee on Financial Institutions - Objectives, Performance and Future Prospects, in its Eighth Report submitted to the Parliament on December 20, 2000 had underlined the need for effective action by the credit institutions’ against the entrepreneurs who exploit the public funds and thereby jeopardize the health of the institutions. This Committee had *inter-alia* also made certain recommendations relating to wilful defaulters, diversion and siphoning of funds, change of management of borrowing companies and other related issues. The following are some of the major conclusions / recommendations of the Committee in respect of wilful defaults:

Comprehensive system of credit information:-

The Committee was of the view that all the credit institutions should have access to an efficient system of credit information. This would prevent the headstrong defaulters from availing fresh credit from other lenders despite their deplorable past. This database of credit information should be a comprehensive system and should include details of the defaulters, wilful defaulters including the information on the promoters and the group companies who have abused the public funds with impunity. Further, the Committee recommended that the ambit of credit institutions sharing the said information should also be enlarged and more institutions should be made eligible for this purpose. Further, these institutions should also adhere to the directions issued by the RBI on wilful defaulters so that uniformity in interpretation, identification, classification and reporting is ensured in the system. This would also facilitate in having a standardized format for compilation of the data in respect of these defaulters.

Strengthen the process of recovery:-

The Committee had noticed that the procedure for recovering the dues from the “wilful” defaulters is similar to that of the “genuine” defaulters. The data revealed that recovery of dues from the wilful defaulters was not very encouraging and it showed that only a small percentage had been brought back. It had to be noted that lenient view taken on such defaulters who are robbing public money would jeopardize the health of the credit institutions and would also adversely affect the economy. Hence, the committee concluded that the process of recovery and the action taken against such persistent defaulters should be strengthened.

Recommendation of penal measures:-

The Committee recommended stringent penal measures including filing of criminal cases against the companies which have siphoned off bank funds, have resorted to falsification of accounts, misrepresented and fraudulently processed their transactions. Further, it stated that promoters of such companies should be debarred from availing the institutional finance for floating new ventures for at least a period of 15 years. The report further states that wilful defaulters should not be allowed to become directors on the Board of any Government controlled or owned companies / corporations. The Committee recommends that if such defaulter is already on the Boards of these companies or corporations, immediate steps should be taken for removal of such director. Also, the credit institutions should take proactive steps to change the management of the companies which have wilfully defaulted.

Deny access to capital markets:-

The Committee has recommended that if a company is accessing the primary market for raising funds through equity or debt issue and has in its Board a wilful defaulter/s then it would be mandatory on the part of the company to mention this fact in their prospectus and offer documents. This would enable the investors to factor this point while considering investment on such issues. These steps were felt necessary to have a deterrent effect on the wilful defaulters who enter the capital market.

Recommendation on Guarantees:-

With regard to guarantees the Committee recommended that the entrepreneurs, who had the capacity to honor the guarantees but were delinquent in meeting their commitments when invoked, should also be debarred from becoming directors on the Board of Government owned and controlled companies / corporations. Further, such entrepreneurs should also be debarred from financial assistance from credit institutions for a period of 15 years.

Constitution of a working group by RBI in 2001:-

Government of India, Ministry of Finance, had desired RBI to examine the recommendations of the above report and furnish comments thereon to the Government. Hence, in May 2001, RBI in consultation with Government of India, constituted a "Working Group on Wilful Defaulters". The said group was chaired by Shri S.S. Kohli, the then Chairman of the Indian Banks' Association. After receiving the recommendations of this working group in November 2001, RBI constituted another in-house Working Group. This group examined the recommendations of Shri Kohli's Committee report and thereafter, various directions and guidelines on "wilful defaulters" were issued by the Reserve Bank to the credit institutions, by way of Circulars.

Filing of suits to recover dues from Wilful Defaulters:-

RBI in the year 2001 reviewed the information received in respect of wilful defaulters. They had observed that though there were large amounts of outstanding against these defaulters, yet the credit institutions had not initiated any legal action against them. Hence, RBI issued the following directions in May 2001:

Table 4:-Details of legal action to be taken up by the banks.

S. No.	Details and Amount outstanding	Action to be taken
1.	Cases of wilful default having outstanding amount of Rs. One crore and above	Examine each case and file suits if not already done by the institution.
2.	Cases of cheating / fraud by the defaulting borrowers having outstanding of Rs. One crore and above.	Examine each case and file criminal cases against the borrowers.
3.	Cases of defaulting borrowers having outstanding of less than Rs. One crore	Examine each case and take appropriate action including legal action.

Definition of "Wilful Default" redefined:-

RBI (2002) issued the landmark circular on wilful defaulters and action there-against on May 30, 2002. The definition of "wilful default" was redefined and it superseded the earlier definition given in 1999. RBI stated that "A wilful default would be deemed to have occurred if any of the following events is noted":

- "the unit has defaulted in meeting its payment / repayment obligations to the lender even when it has the capacity to honor the said obligations.
- the unit has defaulted in meeting its payment / repayment obligations to the lender and has not utilized the finance from the lender for the specific purposes for which finance was availed of but has diverted the funds for other purposes.

- (c) the unit has defaulted in meeting its payment / repayment obligations to the lender and has siphoned off the funds so that the funds have not been utilized for the specific purpose for which finance was availed of, nor are the funds available with the unit in the form of other assets.”

“Diversion of funds” and “siphoning of funds” – meaning of the terms:-

In the year 2002, the meaning to be construed for the terms “diversion of funds” and “siphoning of funds” was also framed by RBI as hereunder:

“Diversion of funds” would be construed to include any one of the undernoted occurrences:

- utilization of short-term working capital funds for long-term purposes not in conformity with the terms of sanction;
- deploying borrowed funds for purposes / activities or creation of assets other than those for which the loan was sanctioned;
- transferring borrowed funds to the subsidiaries / Group companies or other corporates by whatever modalities;
- routing of funds through any bank other than the lender bank or members of consortium without prior permission of the lender;
- investment in other companies by way of acquiring equities / debt instruments without approval of lenders;
- Shortfall in deployment of funds vis-à-vis the amounts disbursed / drawn and the difference not being accounted for.

“Siphoning of funds” would be construed to have occurred if any funds borrowed from banks / FIs are utilized for purposes un-related to the operations of the borrower, to the detriment of the financial health of the entity or of the lender. But RBI in its circular has stated that the decision as to whether a particular instance amounts to “siphoning of funds” or not, would be the judgement of the credit institutions, based on the objective facts and circumstances of the case.

Directions on monitoring the end use of funds:-

In 2002, RBI further directed the credit institutions to strengthen their monitoring mechanism and credit risk management. RBI had stated in its circular that these lending institutions should enhance the quality of their loan portfolio by strengthening their internal controls. The institutions in addition to obtaining certificates from the chartered accountants with regard to utilization of the loan funds, should put in place an independent monitoring mechanism with due diligence, to verify the end use of funds. The said mechanism should form part of the loan policy document and appropriate systems and procedures should be laid down by the lending institutions. Some of the illustrative measures that could be followed by the credit institutions were also indicated in this circular, for example, undertaking periodical in depth scrutiny of borrowers’ books of accounts, balance sheets and other reports. Regular inspection of his assets, periodical visits to the site, stock audit and comprehensive management audit should be taken up to detect systemic flaw, if any, on the credit administration.

Introduction of penal measures and access denied to capital market:-

To deter the growth of wilful defaults in the financial sector, RBI directed certain penal measures to be applied on the defaulters identified as “wilful”. However, the credit institutions were directed to ensure that there is no misuse and also that an isolated case is not made as a basis for imposing these provisions. RBI emphasized on putting in place a transparent mechanism for the whole process and also stated that the discretionary powers should be kept at, the bare minimum.

RBI also decided to share the list of wilful defaulters with Securities and Exchange Board of India which is the regulatory authority of the capital market to enable them to deny access of the same to such defaulters. This measure was a major step as it closed the other channel of raising funds by the wilful defaulters. These steps were applicable for all the borrowers who were identified and declared as “wilful” with an outstanding balance of Rs.25 lakhs and above.

The other penal measures which need to be initiated by the institutions were:

- Wilful defaulters to be debarred from any kind of institutional finance for a period of five years from the date of publication in the list of RBI.
- Institutions may initiate legal process or criminal proceedings wherever necessary.
- Adopt proactive approach for change of management.

- Companies not to induct wilful defaulters on its board and if such person is already a member on the Board, effective steps to be initiated immediately for removal of such member from the Board.
- Guarantees not honored when invoked by a company of the same group, such group company will also be reckoned as wilful defaulter by the lender.

The Role of Auditors:-

In order to strengthen the role of audit, RBI had directed the credit institutions to lodge a complaint with the Institute of Chartered Accountants of India, where it is observed that the auditor was negligent or deficient in conducting the audit of the wilfully defaulted company.

Introduction of Grievance Redressal Mechanism:-

Till 2003 the credit institutions did not have a grievance redressal mechanism in respect of wilful defaulters. Hence, RBI in July 2003 reviewed the position and directed the institutions as under:

- Higher functionaries of the credit institutions to constitute the identification committee to impart more objectivity to the process. Hitherto the identification committee consisted of three General Managers / Deputy General Managers or equivalent to them. In 2003, RBI revised the constitution of the said Committee and directed that the same should be headed by an Executive Director and two General Managers / Deputy General Managers should form part of the Committee, as members.
- Identification committee should specify the reasons for classifying a borrower as a “wilful” defaulter and advise the borrower accordingly. The borrower should also be provided reasonable time of say around 15 days, to represent his case, if he desires to do so.
- A system of “hearing” to the borrowers who represented that they have been wrongly classified as “wilful” was also put in place by creating a grievance redressal mechanism. The redressal team was headed by the Chairman and Managing Director of the institution and included two other senior officials as its members. Final view to be taken by this Committee. RBI (2004)
- RBI reiterated that the credit institutions should identify and declare a borrower as “wilful” defaulter with requisite evidence and support the same with proper documentation.

Observations and Recommendations of the Joint Parliamentary Committee:-

The Joint Parliamentary Committee (JPC) on Stock Market Scam and matters relating thereto was constituted on April 27, 2001, which presented its report to both the houses of Parliament on December 19, 2002. This Committee in the course of their examination *inter alia* observed that in a number of cases the funds taken from banks / financial institutions was not used for the purposes for which the funds were lent but had been diverted by the borrowing entities. In this context, the Committee examined the extant legal provisions and following were the observations:

- Banking Regulation Act, 1949 does not include any provision as to the rights and responsibilities of borrowers or depositors.
- Loan funds are governed by the agreements, contracts and other documents entered into between the banks and their customers. Thus, it is the responsibility of the lending institutions to ensure the proper end-use of funds by periodical monitoring of the borrowal accounts.
- Diversion of funds has to be considered as per the provisions of the Contract Act for civil remedy and as per the Indian Penal Code 1860 for penal recourse, if any. However, criminal law rests on the principle of *mens-rea* which requires the proof of certain degree of malafide intention at the time of commission of the alleged crime (dishonest intention, fraudulent intention).
- Sections 405 and 415 of the Indian Penal Code (IPC) relating to criminal breach of trust and cheating needs to be considered whether relevant in cases of diversion of funds.

Interpretation of Sections 405 and 415 of IPC:-

As per the judicial interpretation of implications of diversion of funds vis-a-vis provisions of Section 405, the Courts have observed that, “*If a sum of money is advanced by way of loan no criminal breach of trust is committed even if the borrower uses it for a purpose other than that for which the advance was made*”.

As regards Section 415 of IPC, in order to make an offence of cheating, the presence of dishonest intention from the beginning is necessary. In case of borrowing of funds from the bank, the proposal submitted before the bank depicts a genuine purpose for borrowing. It is only at the subsequent stage that the borrowed funds are utilized for some other purpose. Thus it would be difficult to prove the presence of dishonest intention on the part of the borrower

from the beginning and in the absence of such proof the offence of cheating as provided under section 415 of IPC cannot be made out.

Therefore, unless the provisions of IPC are suitably amended as to make such acts on the part of borrowers as an offence punishable under IPC, there is no recourse available for penalizing the borrowers.

Recommendations of the JPC Report:-

The JPC suggested exploring the possibility of (i) criminal action against wilful defaulters and (ii) obtaining a certificate from the borrower certifying that the funds have been used for the purpose for which it was borrowed.

The JPC concluded that as the activity of diversion of funds is not culpable either under the Banking Regulation Act or under the Indian Penal Code, *“it is essential that such offences are clearly defined under the existing statutes governing the banks, providing for criminal action in all such cases where the borrowers divert the funds with malafide intention. However, the Committee agreed that such penal provisions should be used sparingly and after due diligence and caution, at the same time it is also essential that banks closely monitor the end use of the funds and obtain certificates from the borrowers certifying that the funds have been used for the purpose for which these were obtained. Wrong certification, should attract criminal action against the borrower.”*

Recommendations of the Standing Technical Advisory Committee on Financial Regulation:-

RBI (2004) in consultation with the Standing Technical Advisory Committee on Financial Regulation examined the recommendations of the Joint Parliamentary Committee report of 2002. Guidelines were issued to the credit institutions on “Checking of wilful defaults and measures against wilful defaulters” and on the need for initiating criminal action against the concerned borrowers. They are:

- it is essential that offences of breach of trust or cheating construed to have been committed in the case of loans should be clearly defined under the existing statutes governing the banks, providing for criminal action in all cases where the borrowers divert the funds with malafide intentions.
- it is essential that banks closely monitor the end-use of funds and obtain certificates from the borrowers certifying that the funds have been used for the purpose for which these were obtained.
- wrong certification should attract criminal action against the borrower.

RBI further advised the credit institutions to:-

- put in place a transparent mechanism for initiating criminal proceedings.
- based on the facts and circumstances of the case, consider initiating criminal action against wilful defaulters, under the provisions of Sections 403 and 415 of the Indian Penal Code (IPC) 1860.
- With due approval of their Board, and after careful consideration and due caution, use these penal provisions effectively and determinedly.

Enactment of the Credit Information Companies (Regulation) Act, 2005:-

RBI in 1999 constituted a Working Group under the chairmanship of Shri N.H. Siddiqui to examine the possibilities of setting up of a Credit Information Bureau in India. It was recognized that in order to arrest the growth of the non-performing advances of the credit institutions, it is necessary to put in place an institutional mechanism for collecting and furnishing information on the borrowers of these institutions.

Formation of Credit Information Bureau (India) Ltd. (CIBIL):-

Based on the recommendations of Shri Siddiqui's Committee, Credit Information Bureau (India) Ltd. (CIBIL), being a company, was formed and registered under the Companies Act, 1956. CIBIL was set up by the State Bank of India in association with Housing Development Financial Corporation in January 2001. The Working Group, however, observed that it would not be possible to set up a credit information company within the existing legal framework. Therefore, with a view to provide the necessary legislative support to the business of credit information, it was proposed to enact legislation for regulation of credit information companies and to facilitate efficient distribution of credit.

The 15th report of the Standing Committee on Finance on the Credit Information Companies (Regulation) Bill 2004 was presented to the Parliament on February 25, 2005. *This Act would provide for regulation of credit information companies and facilitate efficient distribution of credit and for matters connected therewith or incidental thereto.* On

June 23, 2005 the Government of India had notified the Credit Information Companies (Regulation) Act, 2005 and the Act came into force with effect from December 14, 2006.

Reporting to Credit Information Bureau (India) Ltd. (CIBIL):-

Credit institutions had to submit the list of suit-filed accounts on wilful defaulters of Rs.25 lakhs and above as at end March, June, September and December every year only to Credit Information Bureau (India) Ltd. (CIBIL) from the quarter ended on March 31, 2003. However, they had to submit the quarterly lists of wilful defaulters where suits have not been filed only to RBI in the prescribed format.

Phase III – 2006 to 2015

Introduction of Master Circular on “Wilful Defaulters”:-

Till July 1, 2006 RBI had been issuing circulars to credit institutions from time to time, containing instructions on matters relating to wilful defaulters. Master Circular on Wilful Defaulters incorporating all the instructions and guidelines on the subject is being issued annually in the month of July since 2006.

The scope of the definition of wilful defaulters expanded by RBI in 2008:-

Pursuant to the Hon'ble Supreme Court's Order relating to writ petition Civil No.291 of 1998 titled Common Cause (A registered Society) Vs. Union of India &Anr., RBI had received a suggestion to expand the scope of definition of "wilful default". The suggestion was examined by RBI and it was decided to expand the scope of definition of "Wilful Defaulter". The additional criterion is as indicated below:

“The unit has defaulted in meeting its payment / repayment obligation to the lender and has also disposed of or removed the movable fixed assets or immovable property given by it for the purpose of securing a term loan without the knowledge of the bank / lender.”

Issuance of Certificate of Registration to four Credit Information Companies:-

Four companies were granted Certificate of Registration by RBI to carry on the business of credit information in terms of Para 5 of the Credit Information Companies (Regulations) Act, 2005 (CICRA).

1. Experian Credit Information Company of India Pvt. Ltd. (Date of Registration: February 17, 2010)
2. Equifax Credit Information Services Pvt. Ltd. (Date of Registration : March 26, 2010)
3. CRIF High Mark Credit Information Services Pvt. Ltd. (Date of Registration: November 25, 2010)
4. Credit Information Bureau (India) Ltd.(Date of Registration: March 5, 2012)

Credit Information Bureau of India Ltd. (CIBIL) has been functioning as a Credit Information Company (CIC) from January 2001 onwards and credit institutions have been reporting data to CIBIL as per the instructions of RBI.

Reporting of credit information to Credit Information Companies:-

With issuance of Certificate of Registration to four Credit Information Companies by RBI, credit institutions were instructed in 2010 to submit the list of suit-filed accounts of wilful defaulters of Rs.25 lakh and above as at the end of March, June, September and December every year to CIBIL and / or any other credit information company which has obtained certificate of registration from RBI in terms of Section 5 of the Credit Information Companies (Regulation) Act, 2005 and of which it is a member. It was further clarified that if outstanding amount falls below Rs. 25 lakhs the banks / financial institutions need not report and also in respect of cases where banks have agreed for a compromise settlement and the borrower has fully paid the compromised amount, the same need not be reported.

Dissemination of Suit filed accounts by CICs on their websites:-

In order to have a system of wider dissemination, RBI in 2011 advised the Credit Information Companies to disseminate credit information covering data supplied by credit institutions on suit-filed accounts on their respective websites.

Withdrawal of “Consent Clause”

Section 17 of the CICRA, 2005 provides for collection and furnishing of the credit information by Credit Information Companies. Hence, RBI (2013) states that CIC Act now provides statutory backing for sharing of the credit information by credit institutions to the credit information companies. Therefore, with CIC Act coming into force, the consent clause becomes redundant and hence the same need not be insisted upon by the institutions.

Reporting of data to Credit Information Companies and not to RBI:-

Till September 2014, RBI was collecting the data on non-suit filed wilful defaulters of Rs.25 lakh and above and the same was being disseminated by RBI to the credit institutions to enable them to take credit decisions after factoring in the details of this list in their credit appraisal. However, this system predates the enactment of Credit Information Companies Act, 2005 (CICRA), when there was no system of centralized credit information on borrowers. With the establishment of these four Credit Information Companies in India, such a system was now put in place. Therefore, the credit institutions were advised to furnish the requisite data to these Companies, and not to RBI. Further, the periodicity was also made monthly or more frequent basis instead of quarterly hitherto, as this would enable such information to be available to the institutions on a real time basis.

Modifications / clarifications issued in the guidelines – 2015:-

As the reporting and dissemination of the names of the wilful defaulters started strengthening and consequences of the same was felt in the economy, it also gave rise to many references / queries from the banking sector and other agencies. RBI examined all such references and the issues emanating from them, made suitable modifications in the guidelines and issued a detailed circular on the same on January 7, 2015.

Objective:-

To put in place a systematic mechanism of all the credit information available in respect of wilful defaulters and disseminate the same periodically amongst the credit institutions in order to alert and caution them from further lending to these borrowers.

Clarification on term “lender” and “Unit” in the definition of “Wilful Default”**Table 5:-**Description of the term “lender” and “Unit”

Lender	<ul style="list-style-type: none"> Covers all banks and financial institutions To which amount is due on account of banking transactions Includes off balance sheet transactions.
Unit	<ul style="list-style-type: none"> Individuals Juristic persons Any type of business enterprise Persons responsible or In-charge for the management of the affairs in case of business enterprise.

“Grievances Redressal Mechanism” now titled as “Mechanism for identification of Wilful Defaulters”

With a view to bring in accountability and greater transparency the process put in place by the credit institutions for identifying, declaring and reporting a borrower as “wilful” defaulter, has been revised. The title of the mechanism has also been reformed from “Grievances Redressal Mechanism” to “Mechanism for identification of wilful defaulters”.

The changes brought are as under:**Table 6:-** Procedure for identification of “wilful defaulters” – old and new.

Step-wise procedure of “Grievances Redressal Mechanism”	Step-wise procedure of “Mechanism for identification of wilful defaulters”
With a view to imparting more objectivity in identifying cases of wilful default, decisions to classify the borrower as wilful defaulter should be entrusted to a Committee of higher functionaries headed by the Executive Director and consisting of two GMs/DGMs as decided by the Board of the concerned bank / financial institution.	The evidence of wilful default on the part of the borrowing company and its promoter/whole-time director at the relevant time should be examined by a Committee headed by an Executive Director and consisting of two other senior officers of the rank of GM/DGM.
The decision taken on classification of wilful defaulters should be well documented and supported by requisite evidence. The decision should clearly spell out the reasons for which	If the Committee concludes that an event of wilful default has occurred, it shall issue a Show Cause Notice to the concerned borrower and the promoter/whole-time director and call for their submissions and after considering their submissions issue an

the borrower has been declared as wilful defaulter vis-à-vis RBI guidelines.	order recording the fact of wilful default and the reasons for the same. An opportunity should be given to the borrower and the promoter/whole-time director for a personal hearing if the Committee feels such an opportunity is necessary.
The borrower should thereafter be suitably advised about the proposal to classify him as wilful defaulter along with the reasons therefor. The concerned borrower should be provided reasonable time (say 15 days) for making representation against such decision, if he so desires, to a Grievance Redressal Committee headed by the Chairman and Managing Director and consisting of two other senior officials.	The Order of the Committee should be reviewed by another Committee headed by the Chairman / CEO and MD and consisting, in addition, of two independent directors of the Bank and the Order shall become final only after it is confirmed by the said Review Committee.
Further, the above Grievance Redressal Committee should also give a hearing to the borrower if he represents that he has been wrongly classified as wilful defaulter.	As regard a non-promoter/non-whole time director, it should be kept in mind that Section 2(60) of the Companies Act, 2013 defines an officer who is in default to mean only the following categories of directors: (i) Whole-time director (ii) where there is no key managerial personnel, such director or directors as specified by the Board in this behalf and who has or have given his or their consent in writing to the Board to such specification, or all the directors, if no director is so specified; (iii) every director, in respect of a contravention of any of the provisions of this Act, who is aware of such contravention by virtue of the receipt by him of any proceedings of the Board or participation in such proceedings and who has not objected to the same, or where such contravention had taken place with his consent or connivance. Therefore, except in very rare cases, a non-whole time director should not be considered as a wilful defaulter unless it is conclusively established that i) he was aware of the fact of wilful default by the borrower by virtue of any proceedings recorded in the Minutes of the Board or a Committee of the Board and has not recorded his objection to the same in the Minutes, or, ii) the wilful default had taken place with his consent or connivance. A similar process should be followed when identifying a non-promoter/non-whole time director as a wilful defaulter.
A final declaration as 'wilful defaulter' should be made after a view is taken by the Committee and the borrower should be suitably advised.	

The major changes which have been brought about in the mechanism are:

1. In addition to the borrowing company, the evidence of wilful default is being examined in respect of its promoter / whole-time director as they represent the core management of the company who are responsible for such default.
2. The reviewing committee which takes the final decision on the borrower being wilful has in addition to the Chairman / CEO and MD of the bank two independent directors of the bank now. Inclusion of independent directors in the committee makes the process more fair and unbiased.

3. In view of the limited role of non-promoter / non-whole time directors (Nominee and Independent directors) in the management of a company's debt contracts, their names shall now be excluded from the list of wilful defaulters, except in the rarest circumstances.

Clarifications issued on guarantees furnished:-

As there were references received from the credit institutions with regard to guarantees issued by individuals, group companies and non-group companies in respect of the wilfully defaulted company, hence clarifications on the same were issued by Reserve Bank in its circular of 2015.

RBI had advised that in terms of Section 128 of the Indian Contract Act, 1872, "*The liability of the surety is coextensive with that of the principal debtor unless it is otherwise provided by the contract.*" It is therefore, clarified that the credit institutions can go ahead with invoking the guarantee against the guarantor / surety even without exhausting the available remedies against the wilful defaulter, who is the principal debtor. Further, it states that when the credit institution makes a claim on the guarantor, the liability of the guarantor is immediate.

The major instructions on this aspect are as under:

Table 7:-Action to be taken by banks on guarantees

Type of Guarantee	Action to be taken by credit institution
Wilful default of a single borrowing company in a Group.	Institution to consider track record of the individual company with reference to its repayment performance to its lenders.
Guarantees furnished by the companies within the Group on behalf of the wilfully defaulting units.	If the guarantee is not honoured when invoked, such group companies should also be reckoned as "wilful defaulters"
Claim made on the guarantor on account of the default made by the wilful defaulter.	As the liability of the guarantor is immediate, in case he refuses to pay in spite of having means to make payment, such guarantor would also be treated as a "wilful defaulter".

Strengthened the role of auditors:-

Hitherto, whenever the credit institutions observed that the auditors of the borrowers were negligent or deficient in conducting the audit of the wilfully defaulted company they were instructed to lodge a formal complaint against such auditors with the Institute of Chartered Accountants (ICAI).

In 2015, RBI had further strengthened the mechanism of audits. The credit institutions have been directed that in addition to the complaint being filed with the ICAI, they should also forward the same to the Department of Banking Supervision, Central Office of RBI and the Indian Banks' Association (IBA) for records. IBA in turn, would circulate the names of these Chartered Accountant firms amongst the credit institutions, who should consider this aspect before assigning further task to these firms. RBI would also share such information with other financial sector regulators / Ministry of Corporate Affairs (MCA) / Comptroller and Auditor General (CAG).

Specific Certificate from auditors on end-use of funds:-

The credit institutions should award a separate mandate to the auditors if they desire to have a specific certificate from them regarding diversion / siphoning of funds. However, if such a certificate is called for from the auditors, the credit institution should ensure that an appropriate covenant exists in the loan agreement which enables them to award such a mandate from the borrowing company or its auditors. Credit institutions may also engage their own auditors for obtaining specific certificate on the end use of funds, in addition to their own "due diligence" in monitoring the end use of funds lent.

Role of Internal Audit / Inspection spelt out:-

The credit institutions were also directed that while conducting their internal inspection or audit of their branches periodically, they should look into the defaulters' accounts exhaustively and scrutinize carefully to check whether there are diversion and / or siphoning of funds. The cases where "wilful" defaults are found, it should be reported to the Audit Committee of the bank.

Directors' to be identified by "Director Identification Number" (DIN):-

Ministry of Corporate Affairs (MCA), Government of India has introduced the concept of Director Identification Number (DIN) with insertion of Section 266A and 266G of Companies (Amendment) Act, 2006. Hence, as per the

extant notification all the existing and intending Directors have to obtain DIN within the prescribed time-frame from the MCA.

RBI (2015) had directed all the credit institutions to include the DIN against the names of the directors so that directors are correctly identified and names of the directors who do not appear in the list of wilful defaulters are not denied credit due to the similarity in the names with that of the person who is in the said list. The institutions should carefully examine this issue while scrutinizing the credit proposals and in case of doubt should independently verify the names from other sources.

Way Forward:-

The twenty-seventh Standing Committee Report on “Non-performing assets of Financial Institutions” presented by the Ministry of Finance, Government of India to both the houses of Parliament on February 24, 2016 *inter alia* states that the “wilful defaulters owe public sector banks a total of Rs.64,335 crore, which constitutes 21% of the total non-performing assets.” As a measure of public accountability the said Committee has recommended that as a deterrent measure, credit institutions must pay attention to their top 30 wilful defaulters and make their names public. Such measure will help in recovering the existing debt from such defaulters and also prohibit these borrowers from availing further credit from the system. The report also states that to facilitate publishing of names of the wilful defaulters, if need be, the provisions of RBI Act or any other extant law governing prohibiting the same should be amended. There is need to examine the recommendations / conclusions of this report and mitigate the huge credit risk and stressed assets piled up in respect of “wilful defaults”.

A thorough understanding of the above policies and regulatory prescriptions would enable credit institutions to employ an ex-ante approach to detect early stages of wilful defaults and thus avert high costs associated with identification, classification, reporting and legal recourse undertaken by filing a suit.

Abstract

Down syndrome is the commonest chromosomal disorder causing mild to moderate intellectual disability. A child with disability is a serious stress factor for parents. In India persons with intellectual disability have traditionally been cared for by their families. Multifaceted factors have made parenting vulnerable to stress. Indian studies are lacking on care arrangements of children with Down syndrome and their caregiver's psychological issues. A cross sectional study was conducted to assess care arrangements of children with Down syndrome and caregiver burden and depression. 70 caregivers of children less than 18 years attending the Down syndrome clinic at Government Medical College Hospital, Thrissur from January 2013 to July 2014 were enrolled in the study. Subjects were interviewed by questionnaire method using internationally accepted measuring tools like client service receipt inventory, burden interview, caregiver activity survey and general health questionnaire. Mothers were the primary givers in 69(99%) of cases. 29(40%) caregivers experienced moderate to severe burden. Depression was detected in 44(63%). There was a significant positive correlation between caregiver burden and level of depression (correlation coefficient 0.62, p value 0.001). Severe burden was reported in caregivers having children with hypothyroidism (p value-0.026) and hearing impairment (p value-0.001). Depression was more prevalent in older mothers (p value-0.05) but less in mothers who were better educated (p value-0.005) and those who were employed (p value-0.03).

Introduction:-

Down syndrome is the commonest chromosomal disorder causing mild to moderate intellectual disability. The worldwide incidence is 1 in 733 live births (1). A mentally retarded child in a family is usually a serious stress factor for parents. It often requires reorientation and re-evaluation of family goals, responsibilities and relationships (2). Multifaceted factors like social isolation, financial constraints, poor marital relationships, behavioral, health and developmental problems of the child and above all limited family and social support have made parents vulnerable to stress. In India the majority of persons with intellectual disability have traditionally been cared for by their families (3).

Corresponding Author:- Dr. Sangeetha. P. S.

Address:- Junior resident, Dept. of Paediatrics, Govt. Medical College, Thrissur Kerala.

Parents of children with Down syndrome perceived more care giving difficulties and child related stress like distractibility, demanding or unacceptable behavior. Parent related stress like incompetence, depression and health problems were also more in these parents (4).

Children with Down syndrome when intervened early by speech therapy, physiotherapy and occupational therapy and given proper medical attention for different health issues, can have a better long term outcome as compared to other genetic causes of intellectual disability.(5). Hence the need for their long term care .But this also poses challenges to the caregivers and adds to their emotional and social stress. Indian studies done were mainly on caregivers of children with intellectual disability as a broad category which also included Down syndrome. Hence this study was planned on care arrangements of children with Down syndrome and the caregiver's psychological issues and is probably the first of its kind from South India done solely on caregivers of children with Down syndrome.

Materials and Methods:-

A cross sectional study was done on 70 caregivers of children below 18 years attending the Down syndrome clinic at Government Medical College Hospital(GMCH),Thrissur from January 2013 to July 2014 ,a period of one and a half years . Subjects were interviewed by questionnaire method using internationally accepted research methods and measuring tools, which included *client service receipt inventory*, *burden interview*, *caregiver activity survey* and *general health questionnaire*. Data was obtained by personal interview using standard proforma and consent, from caregivers of children attending Down syndrome clinic at GMCH, Thrissur. *Client service receipt inventory (CSRI)* is a research method and instrument for the collection of data on service utilization and related characteristics of people with mental disorders as the basis for calculating the cost of care. . It is a questionnaire for collecting retrospective information about study participant's use of health and social care services, usual living situations, employment and income, service receipts and medication profile(6) *The Zarit Burden Interview* has been specially designed to address the stresses experienced by caregivers of patients with dementia and chronic illnesses . It consists of a set of 22 questions to the caregivers for assessing the impact of the patient's disabilities on their life. Higher scores indicate greater caregiver distress(7). *The Caregiver Activity Survey (CAS)* is a tool developed to measure the time caregivers spend aiding Alzheimer's patients with their day-to-day activities and this would help to determine the economic impact of the illness(8). *The General Health Questionnaire* is a method to quantify the risk of developing psychiatric disorders. The instrument targets on the inability of the caregiver to carry out normal functions and the appearance of distress in order to assess well being in a person. The format is 60 item test (9). The test exists in several alternate forms: GHQ-30(30 items), GHQ-28 and GHQ-12. In this study the GHQ 12 version was employed to assess depression. The advantage of GHQ 12 is that it can be used in busy clinical settings and in situations where the patients are illiterate ,the questionnaire can be read out to them(10).These tools were modified suitably to use in caregivers of disabled children. Data was analysed using SPSS version 18.

Results:-

A total of 70 caregivers were interviewed. The median age of the children cared for was **4.5** years and the male to female ratio was almost equal. Mothers were the primary caregivers in all families.. Grandparents were informal carers for 32 (46%) and mothers sole caregivers for the rest 38(64%). 40 mothers (57.1%) were more than 30 years at the time of delivery .Even though **51(73%)** mothers had up to secondary education and above, only **20(29%)** were working. Out of 22 working mothers, 14(63%) had to quit or cut down their working hours. The majority of children (68 , 96%) stayed with their parents .Out of the 38 children attending school 24(73%) went to normal schools and 14(27%)to special schools.Only 33 (47%) received any financial assistance from the government.Living conditions of many were not satisfactory. Overcrowding was found in many homes. Among the daily caregiver activities, feeding was reported to be the most time consuming part.

Severe burden was perceived in 11(16%), moderate burden in 17(24%), and mild burden in 38(54%). 4 (6%) caregivers perceived no burden which was assessed using Zarit Burden Interview Score.

Figure 1:- Severity of burden in caregivers as per Zarit Burden Interview.

A positive correlation was seen between increasing burden (Zarit burden interview score) and level of depression (General health questionnaire score). (correlation coeff-0.62, p value-0.001).

Figure 2:- Correlation between burden interview score and general health questionnaire score (GHQ).

Caregiver depression was detected in 44 (63%) cases according to general health questionnaire 12 score.

Figure 3:- Caregiver Depression As Per General Health Questionnaire (Ghq).

Hypothyroidism(p value-0.026) and hearing impairment(p value-0.001) in children imparted severe burden to their caregivers. Severe burden was not reported by caregivers with friend's or relative's help.(p value-0.005). Child needing more assistance in their daily activities increased burden of the caregiver.(p value-0.035).

Depression was also found to be more associated in caregivers of children with hypothyroidism (p value-0.005) & hearing impairment (p value-0.005).It was more prevalent in older mothers than younger ones. (p value-0.05) and less in better educated mothers (p value-0.005) and caregivers who continued with their jobs (p value-0.030).

Discussion:-

Most children in the study group were cared for at their homes and mothers were the primary caregivers in almost all cases. Among the mothers about two third were the sole caregivers and hence they alone had to bear the entire burden of care giving . For this , many had to quit or cut down their jobs. Among the children attending school, three fourth went to normal school which shows a change in outlook among people towards disability with their community and educational inclusion rather than segregation. Less than half received financial assistance from the government. Medical professionals need to be sensitized about the burden on the caregiver so that they adopt a more favourable approach while issuing disability certificates and pensions About 40% of caregivers experienced moderate to severe burden .In a study from India by Bhatia et al (2015)severe burden was detected in 39% of caregivers of mentally disabled children(11). Depression was found in 63%. Prevalence of depression was 70% in a study from Pakistan by Azeem et al (2013)on parents of children with intellectual disabilities (2). But in a European study by Van Riper et al the rate of depression was 30% which was comparatively lesser(12). This could be due to better economic and educational status of caregivers and their constant contact with the health care system. There they have support groups that allow sharing, contact with each other, provide information about the child's condition and assistance in choosing healthy coping strategies(12).

A positive correlation was found between caregiver burden and depression. It could be that the increasing burden contributing to depression or the depression among caregivers that made them feel burdened. In an Australian study, Jenna Serr, BS et al (2007) also found positive correlation between depression and caregiver burden. They also found that burden was more in mothers compared to fathers(13). Children with more disabilities caused more burden

and depression among caregivers (14,15,16).Hearing impairment and hypothyroidism in children increased the burden of caregivers, may be the hearing impairment causing difficulty in communication and hypothyroidism further contributing to worsening of their cognitive impairment.

Age of the mother was found to be significantly associated with depression. Older mothers perceived more depression than younger ones. But Anna J Esbensen et al(2011)in her study on North American parents found older maternal age at the time of birth of the child ,experienced less depression and better well being compared to younger mothers. It could be attributed to greater maturity and financial stability and larger social support networks among older mothers there(17).

Better educated and working mothers were less burdened and depressed. In a study by Cuskelly M et al (2014) similar finding was obtained where older and better educated parents and constant contact with health care services were associated with less depression(14).Sujatha sethu et al (2013)in her study from India found that parents' education and economic status of the family did not make any difference to the perceived stress and burden(18,19). Working mothers reported less stress and more life satisfaction despite the extra demands of work, child care and family. Working outside provided mothers with social contacts and friends, a different role, a change of daily demands and an increase in income.(4). Presence of relative's (informal carers) help was associated with lesser degree of caregiver burden. Feldman M et al (2011)in his study also had similar experiences(20,21).

Conclusions:-

Mothers are the sole caregivers in our country and they have to be involved in activities apart from care giving. Strategies focussing on the physical, mental and psychological wellbeing and upliftment of mothers have to be adopted. Fathers and other family members have to be motivated to play better roles in the care of their child with disability. The community also should be involved and support systems and groups created to reduce the burden on the caregiver. Preventive health care guidelines have been made available to both parents and doctors . Health facilities for the differently abled in government sector have to be improved ; so also the awareness and utilization of existing services Registries have to be created for different types of disabilities The caregiver should also to be included as a recipient of care.

Mixed Layer Depth (MLD), Upwelling variability, CTD Profile, optimal threshold, gradient criterion.

Abstract

The determination of the ocean mixed layer depth (MLD), in relationship with the upwelling phenomenon, is important to a wide variety of oceanic investigations including ocean productivity, air-sea exchange processes, and long-term climate change. The MLD can be estimated using different methods including the threshold value criteria or the gradient method. The aim of this study was to create scripts combining both approaches using an optimal threshold value 0.5 °C of the temperature relative to the surface and a maximum gradient of each parameter temperature and density determined depending on its profile in water column. Moreover, we used surface distributions of Temperature, salinity, oxygen and Fluorescence in sea surface to detect the upwelling activity. The CTD data was collected along the Atlantic coast of Morocco during the winter season of 2011/2012 and the summer season of 2012. Our results revealed high seasonal variability of the MLD. The MLD is generally much deeper in winter as compared to summer all over the Atlantic coast of Morocco following the spatial and temporal variability of the upwelling phenomenon.

Introduction:-

Understanding the seasonal variability of the mixed layer depth in the Moroccan Atlantic coast, in relationship with the upwelling phenomena in this region, which is the key to improve our knowledge about the Atlantic flow towards the Moroccan coast. The atmosphere and the ocean are connected through their limit layers where the turbulence is dominant and the MLD is strongly conditioned by air-sea exchanges (Wang et McPhaden 2000).

The mixed layer (ML) is defined as a surface layer with nearly no variation in density with depth (Clayson, et al 2000). The MLD is highly variable in time and space, ranging from 10 m in the equatorial zones and up to 400 m in the high latitude regions in winter season (Brainerd et Gregg 1995).

In the other hand, the upwelling is an oceanographic phenomenon identified by cool sea surface temperature and high concentrations of fluorescence. The Atlantic coast of Morocco is amid regions characterize by the coastal upwelling in the world (Lazier et Mann 1989).

Address:-Laboratory of engineering and Materials, Department of Physics, Hassan II University of Casablanca, Faculty of Sciences Ben M'Sik, P.B 7955, Sidi Othmane, Casablanca, Morocco.

The upwelling observed along the Atlantic coast of Morocco is characterized by a cold sea surface temperature (SST) and high ocean productivity (Lazier et Mann 1989). This phenomenon was studied along the Moroccan Atlantic coast since the 50's. An upwelling index is calculated as the difference of temperature in the surface waters and the deep-sea water. The upwelling phenomenon is studied by the National Fisheries Research Institute, Casablanca (INRH) since 90's. They defined four major areas of upwelling activity in the Atlantic coast of Morocco (Makaoui, et al. 2005) (Fig.1).

The objective of this study is to understand the variability of the MLD and its relationship with the activity of the upwelling phenomenon in the Moroccan Atlantic coast.

Figure 1:- The zone of Study and The four zones of upwelling along the Morocco Atlantic coast according to (Makaoui et al., 2000).

Material and Methods:-

The study area is part of the African North-West coast, between latitudes 36°N and 21°N (Fig. 1). The results of this study were based on CDT data (Conductivity, Depth, and Temperature). The data used in this study were the results of the framework of the project CCLME "Protection of the marine ecosystem of the current of the Canary Islands" (GCP/INT/023/GFF). The project was financed by the global environment facility, with the collaboration of the project EAF-Nansen «Strengthening of the base of the knowledge for the implementation of an Eco-systematic approach of sea fishing in developing countries» (GCP/INT/003/NOR). The project was realized by the FAO, two Eco-systematic campaigns were realized aboard the Norwegian N/R 'Fridjof Nansen' covering the sub-region of Guinea, in the South, to Morocco in the North. The first campaign was realized from October 20th until December 21st, 2011 and the second from May 08th until July 22nd, 2012.

The SST, salinity, windspeed, and the chlorophyll-a data are from the EU-Copernicus-Marine database. The satellite data for the SST and salinity are combined products from satellite observations (Sea Level Anomalies, Mean Dynamic Topography and Sea Surface Temperature) and in-situ (Temperature and Salinity profiles) on a 1/4 degree regular grid. The wind is estimated from ASCAT retrievals. The analyses are estimated as monthly averaged data over global ocean with spatial resolution of 0.25x0.25 degrees in latitude and longitude. For the distributions of the chlorophyll-a is estimated from the OC5ci algorithm, a combination of OCI and OC5 (Gohin, F., et al., 2008.), developed at PML. Separate chlorophyll products are produced from MODIS and VIIRS data.

Usually, because of the difficulty measuring the turbulence, the MLD is often deduced from ocean data CTD profiles. Different methods for determination of the MLD were found in literature. We can detect the MLD from the gradient of density (Keith, et al. 1995). Otherwise, the MLD is defined by the gradient of temperature (Montegut, et al. 2004) (Mignot, et al. 2009). Moreover we can define the MLD with a threshold value between 1 °C and 0.1 °C, that means that the MLD is defined as the depth in which the temperature is equal to the temperature of surface minus the threshold value.

The 0.2°C is the best value adapted to the global detection of the MLD in the seasonal and internal timescales (Montegut, et al. 2004). In the other hand, the 0.8 °C is the optimal threshold value deduced from statistical

comparisons between observations and climatology (Levitus 1982). We noticed that the threshold value is different depending on the literatures. For the detection of the upwelling areas, distributions of temperature, salinity and fluorescence are necessary, because the upwelling is detected by the appearance of cold, less salt water and a maximum of fluorescence, which are often, visualized on the surface near the coast.

Several studies have noted methods to define the MLD using either density or temperature profiles (Thomson et al. 2003)(Talley, et al. 2009)(Lorbacher, et al. 2006) and various threshold criteria (Kara, et al. 2000). In our study we defined the MLD with a gradient of Temperature and a gradient of density. In addition, we used the most popular method of the threshold value ΔT because it is simple and can be applied to profiles with various vertical resolutions (Sato et al. 2009). In our case we used the $\Delta T = 0.5^\circ\text{C}$ as the threshold value for the North Atlantic (Montegut, et al. 2004).

The threshold method is usually defined as the depth where the property has changed by a certain value from the surface, for the case of temperature

$$T(z) - T(0) = \Delta T$$

Where $T(0)$ is the value at the surface and ΔT is the specified difference criterion.

The gradient methods are defined as the depth where the gradient surpasses a specified value, for the case of density.

$$\frac{\Delta\sigma}{\Delta z} = \left(\frac{\partial\sigma}{\partial z}\right)$$

Where $\Delta\sigma$ are respectively the difference of the temperature and density over a vertical distance Δz .

The figure 2 shows the variation in temperature, and density with depth at station N°1016 (Latitude = 09 11.13 N, Longitude = 015 22.51 W, and the estimation of the MLD for the two parameters. The MLD was estimated at 28 m by the gradient method of temperature and density versus depth.

Figure 2:- Vertical distribution at 1016 station (Latitude = 09 11.13 N, Longitude = 015 22.51 W) of the temperature, and the density, plus the estimation of the MLD.

Results:-

In situ Results:-

In this work, we estimated the MLDs with the threshold value of temperature, the gradient of temperature and the gradient of density in winter and summer season. The Figures 4 and 6 presents the seasonal climatology of the Moroccan Atlantic cost MLD obtained from the analysis of individual in situ profiles. The comparison between the three methods showed similar results. In addition, we made satellite distributions of the average SST, salinity, Chl-a and wind in February 2011 and July 2012 to liken the in situ results and the satellite results.

The results revealed that in winter season, the upwelling activity detected by sea surface temperature and sea surface salinity is marked south of Boujdor cape especially between Dakhla (24°N) and cape of Blanc, where the water salinity is under 36.1psu (Fig.3). In this season, the MLD as calculated by the threshold value methods is over 50 m offshore and the depth of ML is near the surface in the South of Boujdor Cape (Fig. 4). This situation is reflected on

the sea surface chlorophyll which show a high fluorescence in large South area (Fig. 3). Contrarily to the winter season, in summer season, the activity of upwelling is both important in south and north of the Atlantic coast. Fresh and low saline water was detected along the coast (Fig. 5), following by the MLD shallowing to the surface from Cape of Cantin to Cape of Barbas as compared with winter (Fig. 6).

Satellite Results:-

This study has been conducted using E.U. Copernicus Marine Service Information. The satellite distributions of the SST (Fig. 7), show that in winter season we have temperature between 15 and 18°C we have a case homogenize temperature, but in summer season we have a large scale of temperature from 15 to 25°C. the fresh water in the cost it can be explained by the activity of the upwelling in summer season. The Figure 8 confirm this hypothesis because we have less salinity 36 PSU in the regions where the upwelling is active. Moreover, the distributions of Chl_a indicate that the peak is about 3 mg/m³ in summer and less than 1.2 mg/m³ in winter (Fig. 9). All this parameters are related to the upwelling phenomena (Makaoui, et al. 2005). In addition, we made the average wind direction and speed for February 2011 and July 2012 (Fig. 10). The distributions of the wind illustrate that we have an intense winds in summer about 6 to 10m/s from the North and the North-Est. Otherwise, in winter the intensity of wind is low, compared to summer about 2 to 8 m/s from the North and the North-Est.

Discussion:-

In the Moroccan Atlantic coast, we found that temperature-based MLDs are similar to density-based MLDs. This implies that salinity is a less important factor than temperature in determining the MLD distribution. On the other hand, the low salinity in the upper ocean near the Moroccan coast associated with the low depth of the ML exists. However, none of the earlier studies has addressed the relationship between the MLD and the upwelling.

Our results of the MLD in the winter exceeds 50 m. However, in the areas (-18° – -15° E and 21° – 25° N) in winter were less than 50 m, due to highly activity of the upwelling, but detailed analysis is required to confirm the relation and is beyond of our scope. In summer season, the activity of upwelling is both important in South and North of the Atlantic coast. Fresh and low saline water was detected along the coast. The MLD reached the 10m with maximum of the oxygen concentration and cold sea surface temperature. It can be explain by the cool water raised to the surface and reach of nutriment caused by the upwelling activity.

We find that overall good agreement in surface distribution between mixed layer and the fluorescence. The mixed layer shallow corresponding with the elevated fluorescence, while relatively low fluorescence concentration corresponds to deep mixed layer. It can be explained that, in summer, the activity of the upwelling contributes to the elevated fluorescence concentration and to pushing the MLD to the surface.

Conclusion:-

In this work, we studied the relationship between the MLD and the upwelling activity in the Moroccan Atlantic coast for two different seasons using two different methods to estimate the MLD in the region. Our results show that the MLD is highly variable between seasons and regions. The problem of the limited data is magnified since much of the MLD variability is linked to the seasonal cycle.

The MLD reached the surface along the coast less than 50m, according of the upwelling activity during the summer season. We found that the MLD is in a good agreement with the activity of the upwelling during this season along the Morocco Atlantic coast. While in winter season, when the upwelling is active in the South of Morocco the MLD shallow in the South areas.

The good correspondence in distribution between MLD and Upwelling activity during the season suggests that MLD climatology is important in understanding the spatial pattern of the upwelling dynamics in the Moroccan Atlantic Coast.

Sludge treatment, Anaerobic digestion, Energy, Transportation, Land scarcity

Abstract

Arising metropolitans, industrialization and urbanization caused urgency to solve the sludge problem appropriately in the world, especially in developing countries such as China; sewage sludge treatment technology and site selection is crucial for cost reduction; the objective of the research is to investigate the economic sustainability of Shanghai Bailonggang sewage sludge Treatment Plant and the newly constructed sewage sludge treatment plant in Changsha. The economic sustainability of a wastewater treatment plant in Helsinki, Finland is discussed as well in this paper as a contrast subject. The results have showed that increased economic burden and growth of plants globally increased amount of sludge that affected sludge treatment location scarcity to energy intensive transportation methods issuing anaerobic digestion to be vital in wastewater treatment plant to utilize energy recovery. Viikinmäki has 25 341MWh energy recovery which has officially reported to covers 60% of plant's needs and heat recovery by engines with AD are altogether 8 922MWh (100%) which is total wastewater treatment plants heat using capacity.

Introduction:-

High rising of demand for clean water is becoming a more serious issue all over the world. Currently large scale urbanization is carrying on in China. Increasingly, more wastewater is produced; besides, water quality has deteriorated significantly over the last few decades. All these urge the municipal governments to solve wastewater and sewage sludge problem. In metropolitan cities like Shanghai some old wastewater treatment plants located at city center may have to be torn down, wastewater and sewage sludge are transported to suburb areas for treatment and disposal. The city growth and urbanization have placed a critical burden to Shanghai with sanitation and wastewater treatment. Water and power supply requirements (**Fig 1.**) have increased within 50 years massively by 32 million cubic meters of water and 1300 million kWh. Discharge of wastewater has increased annual rate of 67.7 million tons (**Cui & Shi, 2012**). All happens due to land constraint in downtown areas. As a result, super-long pipelines and powerful pump stations have to be constructed for transportation of megatons of sewage sludge from downtown to suburb areas. Within Chinese studies economics is the most important criterion in decision making and it's the most common in developing countries when considering wastewater or sludge treatment plants (**Massoud, Tarhini, & Nasr, 2009**). Commonly used indicators were globally cost of operation, technology, maintenance or

replacement (Annelies J. Balkema a, 2002). The strongest factor to technology selection has been cost, which reflected to sludge treatment in China by less interests about AD. Currently only 50 Chinese WWTP's, that is less than 5% of Chinese sewage treatment plants, used anaerobic digestion in the wastewater and sludge treatment process. Anaerobic digestion has been reported to be the lowest environmental and economic burden by significant sludge reduction in volume, thus it decreased further sludge, recovered energy, however required expensive treatment preparations (Xu, Chen, & Hong, 2014).

Figure 1:- Water supply increase and power consumption in shanghai from 1949 until 2009 (Cui & Shi, 2012)

Bailonggang WWTP, which is the largest WWTPs in Asia, and one of the largest WWTPs in the world is located in Shanghai and has a capacity of 2,000,000 m³/d. Initially this WWTP used chemically enhanced primary treatment (CEPT) as its technology, but it has been upgraded to a secondary treatment plant. The major technology used in this WWTP is the multi-mode A²/O (anaerobic/anoxic/oxic) process, which is characterized by its flexibility to switch and optimize flow rates of mixed liquid and returned sludge. A two-stage centrifugation process is used for sludge thickening and the sludge is dewatered to water content below 80%. In the advanced sludge dewatering process, the dewatered sludge of Bailonggang WWTP and the three adjacent WWTPs are combined and mixed with gravity-thickened sludge to reach water content of 93%, then conditioned by CaO (20%) and FeCl₃ (8%), and then pressed to reach water content below 60% by filter press. Daily sludge amount being treated: 204 tDS/d (design parameter), sludge quantity: 4080 m³/d (with MC of 80%, design parameter), 156.3 ± 23.8 tDS/d (operating parameter), daily produced methane gas: 44512 m³/d (design parameter), 16503 m³/d (operating parameter), average yearly gas production: 10.73 m³/m³ sludge with MC of 80%, methane gas yield: 0.82 m³/kg VSS, average daily gas consumption: 21106 m³/d. (Ren et al., 2015).

In contrast, the newly built sewage sludge treatment plant in Changsha suburb area receives 500 tons a day of dewatered sewage sludge with MC (moisture content) of 80% from all WWTPs located in Changsha City. The dewatered sludge is transported to this newly built plant by trucks. Then it is diluted to 86% MC with clean water. Afterwards, it enters the reactor for thermal hydrolysis. Thermal hydrolysis is a two-stage process combining high-pressure boiling of waste or sludge followed by a rapid decompression. This combined action sterilizes the sludge and makes it more biodegradable, which improves digestion performance. Thermal hydrolysis can quickly realize the reduction of sludge. The thermal hydrolysis of dewatered sludge is realized by steam injection at a temperature of 170°C for 30 minutes. The HAD of hydrolyzed sludge is done within a HRT (hydraulic retention time) of 15 days and reaches volatile reduction of more than 40% on dewatered biological sludge. The digested sludge is further

dehydrated to MC of 60% and further heated to MC of 40%, which can be applied as landfill cover soil material. (Liu Xiao Jun, 2015).

Current situation in Finland of sludge treatment has harnessed AD reaching over 50% in WWTP's that is used mostly in the largest treatment plants. The main and largest WWTP's in Helsinki region, Viikinmäki has treatment plant size of 278 011 m³/day including Suomenoja 100 191 m³/day, those treat wastewater in Helsinki, Espoo and Vantaa area. Viikinmäki sludge pre-treatment's primary sedimentation tank pumps around 3.4% DS (dry solids) sludge to 4x10,000m³ anaerobic chambers with temperature of 36-37°C for 14-20 days total by daily 2,400m³ flow rate. AD's gas is collected to 4x2,500m³ chambers to stay for 3-4 days (HSY, 2013), meanwhile sludge processed to temporary storage until dried by 4x160kW powerful, 1,700l centrifuges. These centrifuges have rated input flow of 67m³/h, 2.0tTS/h, those spend polyelectrolyte 100t annually performing 28% DS, which equals 60 000t of dry sludge (Mari Heinonen, 2016). Treatment methods of average Finnish sludge treatment are presented in table 1. eleven questionnaire treatment plants are displayed in table 2. revealing distances of sludge transportation treatment. An estimated optimal sludge content in Finnish wastewater sludge has an average of 20% DS, which equals 80% MC (moisture content) represented in Chinese data.

Methods and Techniques:-

Sludge treatment in Finland is regularly based on following the favorable treatment as following Table 1 and 2; composting (529 RMB/t), digestion with composting (483 RMB/t), thermal drying (791 RMB/t), thermophilic digestion (385 RMB/t), incineration (676 RMB/t), kemicond (368RMB/t) and lime stabilization (245 RMB/t). Kemicond process is thickening or digestion, sludge conditioning with H₂O₂ and H₂SO₄, processed with NaOH and polymers to drying by helix vise, centrifuge, belt press or chamber press. Lime stabilization utilizes burnt CaO to react with sludge reaching pH level of 12, halting biological activity and sanitizing sludge in 60°C. Kemicond and lime stabilization won't release any useful energy, composing them inefficient practices in Finland. Incineration is generally avoided, nonetheless used in conditions without proper treatment preparations. Thermophilic digestion is less likely used and commonly it has 0, 20, 40% replaced by food industry slurry. Commonly digestion in Finland had been used in half of the plants according to a table 2. however it has a secondary sludge composting possibility or thermal drying, that can utilize heat produced from biogas. Alternative heat sources respectively as follows external steam (489 RMB/t), external biogas (431 RMB/t) for thermal drying. Composting seen in table 2. is used almost always as an end product that doesn't depend on size or distance of the treatment plants (Pöyry Environment Oy, 2007). It is considered to be environmentally sustainable technology, however economic sustainability is to reproduce useful material from sludge, which is not considered in this treatment cost of composting.

Table 1:- Finnish methods for sludge treatment 80% DS. (Pöyry Environment Oy, 2007), (Elina Lohiniva, 2001)

Sewage sludge treatment technology	Operation investment (€/t)	Operating investment (RMB/t)

10	40	km	19279	31,0 %	Thickening, Digestion, Centrifuge	Compost, Digest, Dumb waste
11	40	km	60500	30,0 %	Digestion, Centrifuge	Compost

Chinese WWTP have estimated from five options: 1.Anaerobic digestion with land application, 2.Composting with land application, 3 Lime stabilization with land application, 4.Lime stabilization and landfill, 5.Incineration with landfill to apply. From those choices the most environmental friendly method was chosen to be 1.Anaerobic digestion with land application (Xu et al., 2014). Sludge treatment in China is approximately based on 71.5%, 40.6%, 38%, 5% and 3.5% by using thickening, dewatering, drying, anaerobic digestion and composting. End of life treatment process agricultural use 45%, landfill 31% and incineration 3,5% (Xu et al., 2014). Sludge in agricultural use contains a wide diversity of pathogens, therefore its use could be banned or restricted (Gianico, Braguglia, Cesarini, & Mininni, 2013). Two of the most powerful economic outcomes are disposal of sludge and income acquired from electricity sold (Tomei et al., 2016) ,noticing cost cannot exceed the benefits (Annelies J. Balkema a, 2002). Noticed 50 WWTPs (5%) in China have AD struggle with stable operation and investment costs compared with non-AD WWTPs. Those payoffs of biogas production from Chinese sludge in AD doesn't have specific conditions to economic benefits which influences to site selection and technical schemes. (Zhou, Barjenbruch, Kabbe, Inial, & Remy, 2016). In the following table 3. gravity concentration, anaerobic digestion, landfilling and land use operation investments approximately follow 20RMB/t, 38 RMB/t, 75RMB/t and 42RMB/t. The cost of capital investment gives a direction of using sludge treatment by favoring cheaper options and economic stability.

Table 3:- Chinese sewage sludge operation and capital investment of Changsha sludge treatment when moisture content reaches 95%. (Liu Xiao Jun, 2015)

Sewage sludge treatment technology	Capital investment (RMB/t·d) ($\times 10^4$)	Operating investment (RMB/t)
Gravity concentration	4.5	20
Anaerobic digestion	27	38
Dehydration	14	30
Heat drying	35	175
Heat hydrolysis	2	50
Sewage sludge disposal technology	Capital investment (RMB/t·d) ($\times 10^3$)	Operating investment (RMB/t)
Landfilling	125	75
Land use	0	42

Table 4:- Chinese sewage sludge operation and capital investment of Bailonggangsludge treatment when moisture content reaches 80%. (Liu Xiao Jun, 2015)

Sewage sludge treatment technology	Capital investment (RMB/t·d) ($\times 10^4$)	Operating investment (RMB/t)
Gravity concentration	18	80
Anaerobic digestion	72	152
Dehydration	56	120
Heat drying	140	700
Heat hydrolysis	8	200
Sewage sludge disposal technology	Capital investment (RMB/t·d) ($\times 10^3$)	Operating investment (RMB/t)
Landfilling	500	300
Land use	0	168

Techniques:-

Continuous process of sludge treatment calculates operation cost by following table 4. and equation of continuous process TR, where belt press has 500 tons/d sludge treated with moisture content of 0.99 by operation cost of 20 RMB/t that represents daily operation cost of $3,333 \text{ RMB} \times 10^3/\text{t}$. Following **Fig: 2, 3, 4, 5, 6** are using by same replicated equation. In this replicated model sludge cost depends on moisture content of previous treatment followed to the next treatment, which considers before treatment amount of sludge with process cost from table 3 in China and table 1 in Finland by noticing the MC and starting amount of sludge.

Continuous process of sludge treatment $TR = S_0 * TrC * MC_{-1}$

Where,

TR represents calculated sludge treatment operation cost or calculated capital investment S_0 represents treatment of sludge per day

TrC represents treatment unit cost for operation or treatment unit cost of capital investment

MC_{-1} represents moisture before current treatment

Table 5:- Data provided for TR calculation to Changsha, Bailonggang and Viikinmäki. (Liu Xiao Jun, 2015), (Tukiainen, 2009), (Pöyry Environment Oy, 2007)

Changsha process	MC (%)		Bailonggang process	MC (%)		Viikinmäki process	MC (%)
Start	0,99		Start	0,99		Start	0,99
Belt press	0,8		Anaerobic-anoxic-aerobic	0,99		Sedimentation	0,964
transportation	0,8		Centrifuge two stage 1	0,8		Anaerobic Chamber 1	0,85
Dilution	0,86		Centrifuge two stage 2	0,8		Anaerobic Chamber 2	0,85
Thermal hydrolysis	0,91		Thickening	0,8		Anaerobic Chamber 3	0,85
AD	0,4		Gravity thickening	0,93		Anaerobic Chamber 4	0,85
Dehydration	0,6		Conditioning	0,93		Centrifuge 1	0,72
Heat drying	0,4		Filter press	0,6		Centrifuge 2	0,72
landfilling	0,4		Landfill	0,6		Centrifuge 3	0,72
						Centrifuge 4	0,72
						Composting	0,6

Figure 2:-Calculated operation cost of Changsha

Figure 3:-Calculated capital investment of Changsha

Figure 4:- Calculated operation cost of Bailonggang.

Figure 5:- Calculated capital investment of Bailonggang.

Figure 6:- Calculated operation cost of Viikinmäki.

Result and Discussion:-

The average Chinese WWTP final disposal includes thickening, conditioning, dewatering, stabilization and drying (Yang, Zhang, & Wang, 2015). As seen in Fig 2. Changsha operation cost is relatively high in heat drying and transportation. AD in Fig 2-6 have operation costs of Viikinmäki ($38,044 \text{ RMB} \cdot 10^3/\text{t}$) and Changsha ($5,763 \text{ RMB} \cdot 10^3$) those represented a significant cost difference and treatment efficiency of AD in Viikinmäki by 4 digesters. Anaerobic digestion ($270 \times 10^3 \text{ RMB}/\text{t} \cdot \text{d}$) has higher capital investment than heat drying ($350 \times 10^3 \text{ RMB}/\text{t} \cdot \text{d}$) in Fig 3, however heat drying can be energy demanding which can be seen in Fig 2. Changsha's operation costs ($17,500 \times 10^3 \text{ RMB}/\text{t}$) results. Viikinmäki's AD ($38,044 \times 10^3 \text{ RMB}/\text{t}$) is comparatively higher to Changsha AD ($5,763 \times 10^3 \text{ RMB}/\text{t}$), but Changsha capital investment in Fig 3. has fluctuation by high cost peak in AD ($122,850 \text{ RMB} \cdot 10^3$) and heat drying ($105,000 \text{ RMB} \cdot 10^3$), when compared to Fig 5. Bailonggang's, that has more stable capital investment. Changsha Fig 2. and 3. lead to a result of inefficient technical schemes, where transportation, AD and heat drying have the fluctuation higher in operation cost and capital investment. Fig 4. Bailonggang, Fig 6. Viikinmäki had more stable treatment costs and Fig 5. Bailonggang capital investment had more stabilized investments in treatment of sludge in comparison of Changsha. Those differences between Changsha, Bailonggang and Viikinmäki implicated financial shortage affected technical schemes of Changsha in constraint of the space, thus price of land raised higher and transportation became an issue. Transportation of wastewater or sludge is necessary in larger cities due to price of land constraint, when populations in cities grows bigger (Cui & Shi, 2012). "In the future centralized approaches are non-sustainable with high investment and require maintenance and update, which is burden for location selecting (Ma, Xue, González-Mejía, Garland, & Cashdollar, 2015)". Location selection and Lifetime had common prediction to whole collection systems or of parts of WWTP's had to be renewed every 50-60 years, besides the long lifetime WWTP's required many periodic of maintenances, that can be seen in electricity and heating low values in Table 6. and 7. during June, July and August. (Libralato, Volpi Ghirardini, & Avezzu, 2012)

Sludge treatment coordination and location selection is critical for future demands, Changsha contractors can momentarily bring a lot of sludge in which case all the sludge cannot be immediately dealt within, the storage space can end and feeding material can also become a shortage. Coordinating of sludge will also take into account the introduction of different stages and schemes of sludge to treatment plants. For example in Finland composting plant is imported from different sources, treated at the same time very wet sludge, requiring supporting material and promoting very wet and dried sludge at the same time for treatment (Tukiainen, 2009). Table 2 illustrates Finnish wastewater treatment plants sludge transportation distances, those lead to a fact treatment plants are in urban or semi distances to next treatment, whereas composting is chosen to be the most common treatment method within nearby location(Hong, Hong, Otaki, & Jolliet, 2009). Sludge treatment centralized approaches are non-sustainable with high investment, difficult maintenance and upkeep, including WWTP location selection by land scarcity(Ma et al., 2015).Decentralized approaches are more flexible, however transportation is typically in China 50-80km to be equivalent of 0,65RMB/km, respectively 52rmb of maximum transportation cost for 80km (Liu Xiao Jun, 2015). Affordable transportation distances in Finland for AD sludge and agricultural sludge are 25km's, industrial and municipal sludge distances can be 150-250km's at maximum. Table 2. sludge treatment questionnaire of schemes follow commonly at site of WWTP or nearby location between 0-15km's, estimated 20% transports sludge outside of WWTP over 15km's. Treated sludge end product as composting 0-15km's, over 15km's and external party represent 50%, 20%, 30%. In any huge scale industrial plant's sludge is worth pre-dry thermally, whether alternative option is to suburb area incineration, transportation of sludge becomes non-profitable between 50-100km distances or more.

The main transportation method from centralized plant to urban is pumping sludge, which is responsible for about 20 percent of the world's electricity consumption. (Tukiainen, 2009) Helsinki suburb area has over 500 wastewater pumping stations, 30 pumping stations located above ground and rest located underground. Pumping is an electricity consumer, used in many industrial processes and the highest electricity required process. Reduction in the amount of sludge can be clearly seen in handling costs and environmental impact, although reducing the length of the pipeline is a principle solution to minimize pumping energy consumption.

Thermal dryers in plants consume a lot of energy, this can make a fully dried sludge (>85% TS) to incineration process a possible solution as sludge disposal. Under 45% TS causes commonly a dust problem, this is for centralized plants a critical decision of sludge to pump suburbs. Transported sludge with lime stabilization increases amount of sludge. Whether quantity grows larger, preparations of ammonia recovery are necessities. Some sludge disposals in forms of incineration require large scale preparations to establish facility in any residential neighborhood and affects residents by environmental concerns (Eggimann, Truffer, & Maurer, 2015). Focusing of the pumping process is the most efficient and common way to transport sludge from place A to B. Energy intensive pumping has a side-effect, "centralized plants returning recycled water can require tremendous energy due to pumping"(Naik & Stenstrom, 2016). Pumping focuses an importance to reduce the consumption of electricity, which can be costly in certain situations. The two considerations those have the greatest impact on the final economic outcome are sludge disposal cost and income deriving from electric energy sale. In average 75% of wastewater capital needs are for pipe repair (Ma et al., 2015) however electricity use accounts for approximately 80% of drinking water treatment distribution cost and 25%–40% of the operating budgets for wastewater facilities. Urbanization, land scarcity, cities growing bigger, the longer the distances to transport water and the higher the energy demand becomes(Ma et al., 2015).

There is a strong dependency on electrical energy supply, total investments in China have increased by 99.08% and 2.78 times nearly in ten years (Zhang et al., 2015). Scheme of a typical Chinese WWTP uses 60% of energy in water treatment, those 40% left are for sludge treatment. (Liu Xiao Jun, 2015). Table 6 and 7 indicate produced electricity and heat of Viikinmäki, which officially can cover 60% of electricity in whole wastewater treatment process and 100% of heat consumption that is officially announced by Viikinmäki. Provided data in wastewater and sludge process is $25341\text{MWh} / 35\,024\text{MWh} = 72\%$ percentage of electricity in this WWTP process according to data in table 6, which is revealed to be 60% by Viikinmäki WWTP.AD-model from Viikinmäki's 60% recovering would cover the scheme of typical Chinese WWTP's scheme or alternatively sludge treatment with 20% energy leftover to be used for example in pumping process. Energy as resource to trade cost or buyback in operation process represents a huge possibilities whether treatment plants last longer than pipe-chain of life.Nowadays the in-plant pumping and aeration in common primary and secondary treatment often consists of more than 60% of the total plant electricity use. The further sludge treatment and disposal is also energy-intensive because of dewatering. Viikinmäki's biogas electricity production line in table 6. focuses AD into 4 digestion chambers. Chambers pay-off (25 341MWh) of the

energy produced in whole wastewater treatment process, rest of the energy is bought from local district electricity (14 245MWh). Comparing the overall production of biogas to overall consumption of electricity in treatment plant can utilize around 72% of electricity (Johanna Castrén, 2016). Total consumption of WWTP is (39 586MWh), which uses (35 024MWh) in main process. Leftover electricity is counted as in maintenance, backup electricity or used in service tasks. Energy loss in this situation can be estimated as building heating or upkeep of the control service systems.

Conclusion:-

China favors low cost medium efficiency treatment methods, whereas AD is useful in the future for large scale and medium scales WWTP's. Anaerobic digestion investment in China is expensive according table 3 and 4, moreover it's more expensive in Helsinki Viikinmäki with energy recovery by 60% announced officially by Viikinmäki that is 39 586MWh of electricity and heat recovery measured in 2015 by 40 153MWh annually, which covers 100% heating process in total wastewater plants usage. Digestion cost of sludge treatment is generally more expensive in Finland compared to Changsha or Bailonggang and more efficient, when moisture content is considered to be equally same in Viikineva, Bailonggang and Changsha. However large investments and controlled anaerobic digestion process have huge benefits in sludge treatment process for energy recovery and controlling operation cost. Investing incineration or AD to nearby WWTP commits a possibility to utilize energy recovery that can reduce burden of transportation or sludge volume reduction. Transportation of sludge by trucks is causing extra costs in Changsha that can be avoided by structuring nearby sludge treatment plant considering example of Viikinmäki WWTP, which has over 500 wastewater pumping stations. After all growing cities and treatment plants of Bailonggang and Changsha will face land scarcity in the future, which would need preparations to relocate treatment plants to suburb areas.(van Afferden, Cardona, Lee, Subah, & Muller, 2015) Technical schemes in the two Chinese WWTPs might not be reasonable enough from the energy recovery and economic perspective, but for today's China, those combinations of technologies may be the only reasonable way to solve the sewage sludge problem without scars due to financial shortage, constraint in the space of the existing WWTPs, sky-high land price and land scarcity in Chinese metropolitan areas.

Acknowledgements:-

This research was partially supported by Xu Wenying. I thank our professor for providing information and great expertise that assisted the research from Tongji University Environmental management and Engineering faculty, although they may not agree with all of the interpretations provided in this paper. I thank information shared by Helsinki regional authors about wastewater treatment plant and data given by them.

I thank Tongji University students: Prantor Kumar Mondal for giving assistance in this research who improved the writing in this paper significantly and I appreciate AidanaOskenbayeva, Ramesh Kumar Neupane by sharing the knowledge of our professor Xu Wenying.

We have to express our appreciation to the Tongji University for sharing their pearls of wisdom with us during the course of this research. We are also immensely grateful to all participants and comments on an earlier versions of the manuscript, although any errors are our own and should not tarnish the reputations of these esteemed professionals.

Abstract

The rights of crime victims, particularly crime victims or conventional crime in relation to the efforts to achieve restorative justice in the criminal justice system in Indonesia. This research was a socio-legal research, which orientation is focused on legal and non-legal aspects and the operation of law in society. The results of the research indicates that the essence of legal protection for crime victims in the handling of conventional crime in Indonesia is not yet optimal to take attention and gives legal protection to conventional crime victim in achieving fairness, expediency and legal certainty as a legal purpose. Conventional crime victims are an integral part of a legal system, which received less attention in obtaining their rights in the criminal justice system in Indonesia. Legal protection of conventional crime victim in Indonesia has been set in legislations, but it is not optimal because the mostly of legislation is more focused of legal protection to the perpetrators rather than the victims. As a result, the implementation of legal protection for conventional crime victim is not optimal, so it is very important the understanding of community, the victim and also law enforcement officers in the implementation of rules and mechanisms of legal protection against conventional crime victims to get their rights.

Introduction:-

Indonesia is a constitutional state. It is implied in the Preamble of the 1945 Constitution of the Republic of Indonesia which makes specificity that Indonesia intended to protect the entire Indonesian nation and homeland, promote the welfare, educating the nation, and participates in establish the world order.

Indonesia as a constitutional state provides protection for its citizens by establishes an institution that able to provide justice in the form of free judiciary and impartial. It is based on the argument that every human being from birth bears the rights and obligations that are free and rights, and the holding power of a country should not diminish the meaning of freedom and the humanity rights. A form of protection against the society which should be done by the state is to provide legal protection through a process of judicial in a crime act or called as criminal justice system.

Corresponding Author:- Taswin Imransyah.

Address:- Graduate School, Hasanuddin University, Indonesia.

A party who very wanted the protection in a crime is a crime victim. The victim has important role to be given attention and protection in the criminal justice system. This view is based from the idea that the victim as aggrieved party in a crime, so it should receive the attention and care in order to provide protection against their interests.¹

In Indonesia, criminal justice system in general put the interests of victims are represented by the public prosecutor, as well as the wider community. Victim losses may be material that can be measured by money, and immaterial includes fear, pain, sadness, surprise psychic and others. Victim protection in the form of compensation for material loss could be charged directly to the perpetrator, but for the restitution of immaterial losses in some countries (if the perpetrators who cannot afford), then the burden to the state.²

Provisions regarding the protection of victim crime in the Code of Criminal Procedure are more dominant in the provision regarding restitution, by grouping into 4 (four) forms of victims rights, as follows:³

- a. Right to control the actions of investigators and public prosecutors, namely right to object to the termination of investigation and/or prosecution in their capacity as an interested third party as stipulated in Article 109 and 140 paragraph (2) Criminal Code Procedure;
- b. Victim's rights in their position as a witness, as stipulated in Article 168 of Criminal Code Procedure;
- c. Rights for victims' families in case the victim dies, to allow or not the police to conduct a post-mortem or grave digging for autopsy. These rights are stipulated in Article 134 and 136 in the Criminal Code Procedure;
- d. Right to demand restitution for losses suffered as causes of criminal acts in their capacity as the suffered party as stipulated in Article 98 and 101 in the Criminal Code Procedure.

The disadvantages of provisions the Criminal Code Procedure in regulating the victim in view of Barda Nawawi Arief,⁴ as follows:

- a. There is no legal effort to be conducted by the victim if the victim is not satisfied with a court decision. In contrast with the suspect that can make appeal or judicial review. Victims are represented by the prosecutor as a public prosecutor can only accept the decision.
- b. The protection of criminal victims is only stipulated in Chapter XII (Article 98-101) of Criminal Code Procedure, which allows the combination of restitution case to the criminal case.
- c. Article 99 of the Criminal Code Procedure asserts that the restitution which can be decided by the judge is only the costs incurred by the suffered party; while the other losses can only be sued through the civil judicial process takes a long time and begins a new procedural.
- d. The judge can set a specific requirement that the convicted person within a certain time, which is shorter than the probation, having to retribute the whole or part of losses that caused by the criminal act or in other words that the victim's rights as result of criminal acts only applies when the judge sentenced him/her to probation, while in a crimes that cause huge losses or violent, probation difficult to be given.
- e. Cost charged to the perpetrator for restitution is only restricted to the value that is materially.

The disadvantages indicate that the existence and the legal position of crime victims in the criminal justice system is not favorable to crime victims, due to the fundamental problem, namely the victim is only as a witness (complainant or victim). Victims are not included in the elements involved in the criminal justice system; it is not similar to the dependant, the police and the prosecutor.

In principle, the protection of victim has been stipulated in several laws in Indonesia as the embodiment of human rights in the constitution and the rights of victims in the Criminal Code Procedure. The criminal justice system prioritizes the protection of human rights, but if the provisions concerning it be in-depth considered, only the rights of suspects/defendants that many prominent, while the rights of crime victims is very little regulated.

⁴Ibid. Page. 6

Crime victims who are basically a party that suffered in a criminal act, because it has not gained as much protection as provided by the Act to the offender. Crime victims are placed as evidence that provide information, i.e only as a witness, so little possibility for victims to obtain flexibility in fighting their rights. Victims are not given the authority and not actively involved in the process of investigation and trial, so he/she lost the chance to fight their rights and restore their condition as result of a crime. The condition raises a tendency that the right of victim is not protected when the offenders have been sentenced to criminal sanctions by the courts, whereas the issue of justice and respect for human rights does not only apply to offenders but also crime victims. Therefore, the authors are interested in conduct further research and study on the rights of crime victims, particularly crime victims or conventional crime in relation to the efforts to achieve restorative justice in the criminal justice system in Indonesia.

Method of Research:-

This research was a socio-legal research, which orientation is focused on legal and non-legal aspects and the operation of law in society. Law is conceived not only in the normative dimension but also as an empirical phenomenon that can be observed in the context of reality in the community. In other words, this research examines law both in the aspect of *law in books* and *law in action*. The main objective of this research was to examine whether a normative rule (postulate) can or cannot be used to solve a legal problem in reality (in concreto).⁵

This study describes a problem in the community, the procedure applicable in the community and situations, attitude, views, ongoing process, effects of a phenomenon, careful measurement of the phenomenon in the community. The author developed the concept, gather facts, but did not test the hypothesis. Fieldwork was conducted by using in-depth interviews to obtain data in the form of views, thoughts and opinions of the informants. Primary data were intended to obtain confirmation as well as complementary research based on the library study.

Conception of Legal Protection:-

Guilarmo S. Santos⁶ argued that the concept of constitutional State is understood as a condition in a society where the law in a democratic State is determined by the people which are nothing other than the regulation of relationship between the people. Furthermore, Bothink in Ridwan H.R.⁷ argued that the constitutional State is a State where the freedom of power holders is restricted by law. The other view as proposed by Burkens as quoted Attamimi⁸ argued that the constitutional State (*rechtsstaat*) are simply as the State that put law as the basis of State power and the implementation of the power in all its forms is done under the rule of law. H.W.R. Wade⁹ argues that in a constitutional State, everything must be done according to law; it specifies that the government must be subject to the law, not the law should be subject to the government.

Constitutional State in Munir Fuady's view¹⁰ is an administration system that is governed by the law applicable and equitable arranged in a constitution, in which all people in the country, both the governed and the governing, should be subject to the same laws, so everyone is treated same and different people are treated differently on the basis of distinctions rational, irrespective of color, race, gender, religion, region and confidence, and the governments' authority is limited by a principle of distribution of power, so that the government does not act arbitrarily and not in violation rights of the people, hence to give the public an appropriate role and its role in a democratic capabilities.

Budiyanto,¹¹ the theory of constitutional State is generally divided into 2 (two) types, i.e the theory of formal constitutional State and the theory of material constitutional State. *First*, the theory of constitutional State was pioneered by Immanuel Kant. His theory resulted in a country is passive; it means that the duties of a State is only maintaining order and security in the country, or the country simply as "*night watchman*", whereas in social and economic affairs, the State should not interfere. *Second*, the theory of material constitutional State (*welfare state*) was pioneered by Kranenburg. This theory states that countries other than the duty to foster public order, and it

also responsible for developing and realizing the welfare of people. This theory is widely practiced in developing countries, such as Indonesia.¹²

As definitions above can be said that the definition of a constitutional State is every act of ruler or its people should be based on the law and as well as put the purpose of the constitutional State, which guarantee the rights of its people. One characteristic of the constitutional State is the realization of an effort to protect the people or legal protection.

Protection comes from the word *protect* that means put themselves under something to hidden. The protection has the sense of an act, to protect, provide assistance.¹³

According to J.C.T. Simorangkir and Woerjono Sastropranoto, law is an application of restoration justice in the framework of legal protection for victims of conventional crime victim among others by carrying out *penal mediation* in order to restitute to the conventional crime victims. However, the restitution does not mean that criminal elements were done then be lost. The restitution will only relieve the perpetrators. Therefore, the concept of restorative justice cannot be implemented purely without a retributive justice, meaning that the restitution to the victims did not causes the offender was not convicted. The development of sentencing is currently in *restorative justice models* with not negate *retributive justice model* called the balance perspective sentenced is a balance between the offender's interests, the victim and the community¹⁴ are regulations that are forcing, which determine human behavior in a community environment created by the agency official. R. Soeroso¹⁵ argued that the law is a set of rules made by the authorities with the aim to arrange the social life that have a characteristic to commanding and forbidding, and force by impose sanctions for those who break them.

Mochtar Kusumaatmadja¹⁶ argued that the definition of law should not only look at the law as a set of rules and principles that govern human life in society, but should also include institutions and processes necessary to realize law in reality.

Legal protection is a protection that given to the subject of law in the form of legal instruments preventive and repressive, written and unwritten. In other words, legal protection as a description of the legal function i.e a concept in which law can provide a justice, order, certainty, usefulness and peace.¹⁷

Facility, Principles and Form of Legal Protection:-

The term of legal protection for the people is a term that does not include "toward the government" or the action of government. The reason as stated by Philip M. Hadjon¹⁸ that:

- a. The term of *people* already implies a sense as opposed to the term of government. The term of *people* is essentially means the governed, (*geregeerde*). Thus, such term is more specific than the other terms in foreign languages such as *folks*, *people*.
- b. In essence, the term of *people* means the governed and not included the term "towards the government" or on the action of government due to the inclusion of the term might create an impression that there is a confrontation between the people who governed by the government as the ruling.

Philip Hadjan¹⁹ in his view that puts the legal protection as anything that enabling a person can do and defend their rights as determined by law and its relation to the action of government as a central point of the Philips M. Hadjon, suggests that there are 2 (two) types of legal protection for the people, namely:

- a) Preventive legal protection

¹⁹*Ibid*. 2

Preventive legal protection provides a chance for people to file an objection or opinion before a government decision in definitive. Thus, the preventive protection aimed at preventing disputes.

b) Repressive legal protection

In a repressive legal protection, the people is given a chance to file an objection after the result of a government decision which is definitive in the sense that repressive protection is solve problem. In addition to the preventive and repressive legal protection is also known as the formal and substantive legal protection. Formal legal protection is a legal protection refers to the implementation of the rights and formally adopted in legislation and regulation or agreement. The substantive legal protection is a legal protection refers to the implementation of the rights attached to the substantive law. This means that although it is not applied in the Act but its implementation is attached to the people or their activities.²⁰

Victims of Crime:-

Definition of Victims:-

The word of victim is derived from the Latin word “*victim*”²¹ then the sense of victim in the *Declaration of Basic Principles of Justice for Victims of Crime and Abuse of Power* are person either individually or collectively have suffered losses either physical, mental, emotional and decay (impairment) against their fundamental rights through acts or not, but it is a violation of national criminal law in addition also based on internationally recognized norms relating to the human rights.²²

Victims in the Indonesian General Dictionary areman or person who suffers an accident because the self-act (desire etc) or others. I.S. Susanto argued that the victim was divided into 2 (two), in both narrow and broad senses. Victims in the narrow sense is the victim of a crime, whereas in a broader sense also includes the victims in various fields such as pollution victims, victims of abuse and so forth.

The victim is a person who suffered a loss in physical, mental or financial as a result of a criminal offense (as aneffect) or a factor the incidence of criminal offense (as a cause). The victim is defined as someone who has suffered a loss as a result of a crime and his/her sense of justice is directly disrupted as a result of his/her experience as a target/criminal target.²³

Stanciu²⁴ argued that in the broad sense a victim is a people who suffer as result of injustice. There are 2 (two) basic characteristic to the victims is suffering and injustice. Victim is not only been seen as a result of illegal acts that the real cause can also create injustice, and then causing victim. The definition is also restricted in the narrow sense as stipulated in the positive law. Indonesian positive law which gives decisive definition of victim, among others, Article 1 number 2 of Witnesses and Victims Protection Acts asserting that the victim was a person who suffered in physical, mental, and/or economic loss as result of a criminal offense.

Declaration of Basic Principles of Justice for Victims of Crime and Abuses of Power defines victims as follows:

“*Victims*” means persons who, individually, or collectively, have suffered harm, including physical or mental injury, emotional suffering, economic loss or substantial impairment of their fundamental rights, through acts or omissions that are in violation of criminal laws operative within Member States, including those laws proscribing criminal abuse of power.²⁵

Classification of Crime Victims:-

Crime victim conception is also formulated in the *Declaration of Basic Principles of Justice for Victims of Crime and Abuse of Power*, namely:

a. Victims of crime include:

- 1) *Direct victims*, i.e victim who directly suffering with criminal offense with the characteristics of victims were either individually or collectively, suffered losses in the form of physical injuries, mental, emotional suffering, loss of income and the suppression of basic human rights, caused by the act or omission that is formulated in the criminal law or caused by the abuse of power.
- 2) *Indirect victims*, the emergence of victim as cause of interference of a person in helping the victims directly (*direct victims*) or participating in the prevention of victim, but he also became a victim of crime, or they depend their life to the direct victims, such as : wife/husband, children and relatives.
- b. Victims of abuse of power, the victim is a person who individually or collectively suffered harm, including physical or mental injury, emotional suffering, economic loss or the suppression of the basic human rights, through acts or omissions that do not constitute a violation of National Criminal Act but internationally recognized norms relating to human rights.

Sellin and Wolf made a classification of victims into 5 (five) categories, namely:²⁶

- 1) *Primary victimization*, i.e individual victim. So, their victim is individual or group.
- 2) *Secondary victimization*, in which the victim is a group as a legal entity.
- 3) *Mutual victimization* occurs because the attitude or behavior of victims who agree to crimes against him/her.
- 4) *Tertiary victimization* victims arising from the implementation of the social order.
- 5) *No victimization*, here it does not mean there is no victim, but the victims were not immediately known.

Steven Schafer, in relation to the role of the victim suggested several types of victim in relation to the accountability, namely:²⁷

- 1) *Unrelated victims*, are those who do not have any relationship with the perpetrator unless the offender who has committed a crime against him/her. In this type of responsibility lies fully in the hands of the perpetrators.
- 2) *Provocative victims* are those who are doing something against the perpetrators and consequently they become victims. Victims in this case were the main perpetrators. In this type of responsibility lies with the two parties that is victim and perpetrator.
- 3) *Precipitative victims*, the behavior of victims who unwittingly encourage perpetrator to do evil. In this type of responsibility lies with the perpetrator.
- 4) *Biologically weak victims* are those who have certain physical and mental shape that encourages people to do evil against him/her, as an example of small children, the elderly, and women, people who are physically or mentally. In this type, those accountable were public and the government, because it is not able to protect helpless victims.
- 5) *Socially weak victims* are those that are not considered by the public as a member, for example, immigrants and minorities. In this type, the accountability lies on criminals and society.
- 6) *Self-victimizing victims* are those who become victims because of his/her own actions, such as drug addiction, homosexuality and gambling. In this type, the accountability lies fully on the perpetrators who are also victims.
- 7) *Political victims* are those who suffer because of their political opponents. In this type that no one can be justified.

The Handling of Legal Protection for Victims of Crime:-

Barda Nawawi Arief said that the positive criminal law in force recently the protection of victims is more as an "abstract protection" or "*indirectly protection*" it means various formulations of criminal offenses in the legislations during this *per set* there is *in abstract* directly protection against rights and legal interests of victims.²⁸

²⁶ Bedi Setiawan Al Fahmi. (2009). Perlindungan Korban Tindak Pidana Perkosaan Dalam Proses Peradilan Pidana Perspektif Pembaharuan Hukum Acara Pidana Indonesia. *Jurnal Hukum dan Pembangunan* No. 1 Vol. 16 Januari 2009. Page. 65

²⁸ Barda Nawawi Arief. (2001). *Masalah Penegakan Hukum Dan Kebijakan Hukum Pidana dalam Penanggulangan Kejahatan*. Citra Aditya Bakti : Bandung. Page. 56

Article 1 point 6 of Act No. 13 of 2006 on Witness and Victim Protection as amended by Act No. 31 of 2014 on the Amendment of Act No. 13 of 2006 on Witnesses and Victims Protection, confirmed that the protection is all effort rights fulfillment and the provision of assistance to provide security to witnesses and/victim that must be implemented the Agency of Witness and Victim Protection or other Institutions in accordance with the provisions of this Act. The sense of victims protection can be seen into 2 (two), namely:

1. As legal protection for not being a crime victim (it means the protection of Human Rights or individual legal interests).
2. As protection to obtain guarantee/legal compensation for the suffering/loss of suffered people (it is similar to the sympathetic of victim). This type that can be vindication/rehabilitation, recovery of equanimity among others with forgiveness, compensation, such as restitution, guarantees/social welfare benefits and so on.

The purpose of victim protection were providing security to victims, particularly when providing information on any criminal justice process, providing encouragement and motivation to the victim not to be afraid to undergo criminal justice process, restore the confidence of victims in social life, and a sense of fairness, not just to the victims and their families, but also to the community.²⁹

In general, in theory there are 2 (two) models of the victim protection, namely.³⁰

1. The procedural rights model

In France, this model is called "*partie civile model*" (*civil action system*). In short this model emphasizes the active role of victims in the criminal justice process, such as helping the public prosecutors, involved in every level of examination of the case, shall be heard if the convict is released conditionally, and so forth. In addition, with the participation actively in the criminal justice process, victims can regain self-esteem and confidence. The involvement of the victim has a positive aspect in law enforcement, and also has a negative side because active participation of victims in the criminal justice process execution can lead to personal interests over the public interest.

The theory as background to the formation of the prosecutor institution, as stated by Jan JM van Dijk, the Hague, that "*historically this has been the main justification for the establishment of the office of the public prosecutor*".

Furthermore, another reason put forward a group that opposes the procedural right to the victim is given the role of individual to the victim in trial process or prosecution of perpetrators, making it participate to responsible for the trial, and the results of that process so that the burden of this responsibility will be pressure heavy enough for victims in many respects. Pressure can come from a person with whom the victim made contact and/or caused by police or prosecutors who will take advantage of their rights in the public interest. Offender and his lawyer will seek to influence the behavior of victims during the process and sometimes using intimidation.

2. The services model

This model emphasizes compensation or restitution and making an effort to gain condition of traumatized victims, fear and distress as a result of crime. A policy of sentenced formulation system that oriented in the positive law of victims to come include a policy of victim protection formulation in material criminal law, a policy of victim protection formulation under formal criminal law and a policy of victim protection formulation in criminal law enforcement. The substance of positive law in question is the Draft Law on the Criminal Code Procedure of 2008 and the Draft Law on the Criminal Code Procedure of 2009.

Additional penalty in the draft law on the Criminal Code Procedure in the elucidation of Article 67 paragraph (1) is defined as "compensation payments" that may be imposed only if the judge "clearly stated in the formulation of crime". The provisions of Article 54 in the Criminal Code Procedure assert that the punishment aimed at resolving the conflict posed by crime, restoring balance, and bring a sense of peace in society." The provisions of Article 55 paragraph (1) determines that the Guidelines of Punishment must be considered judges includes the influence of criminal offenses against victims or their families; forgiveness from the victim and/ or her/his family." Explanation of the provisions of paragraph (1) contains Guidelines of Punishment were very helpful in considering the measure or judge the severity of the punishment to be imposed. Taking into account the matters specified in the guidelines is expected sentence or punishment imposed is proportionate and can be understood both by society and the convict.

²⁹Article 4 of Act No. 13 on 2006 on *Witness and Victim Protection*

³⁰Ahmad Kamil. (2012). *Mediasi Penal dalam Penanganan Tindak Pidana*. Mahkamah Agung Republik Indonesia : Jakarta . Page. 4

The details of this provision are not limiting, meaning that the judge may add other considerations other than those listed in this paragraph (1).

The provisions of Article 71 c, d and g specifies that “by keeping into account Article 54 and 55, imprisonment may be imposed so far, if encountered the following circumstances: 1. loss and suffering of victims is not too big; 2. the defendant has paid compensation to victims of crime victims; 3. Victim of crime encourage the occurrence of criminal offense.” Elucidation of Article 71 confirms that the provisions of Article 71 are intended to assist the judge in determining the penal measure to be imposed.

Article 54 and 55 provides guidelines for the judge can convict proportionately and effectively and the provisions of Article 71 of this as a rule of sentencing for the judge in the case will not impose imprisonment in conditions that are described in Article 71. Formulation of the provisions of Article 77 is not operational because there are “provisions of the criminal types that can be imposed judge” after he did not impose imprisonment. Such provisions are also not listed in the explanation. The provisions of Article 65 paragraph (1) under the paragraph “types of criminal” in addition to prison, also listed as principal criminal, namely; closing, supervision, fines and community work. The problem is if the provisions of Article 71 are met, what type of punishment can be imposed judge to determine criminal dose to be imposed proportionate and effective.

The compensation or restitution to victims of crime has been adopted by other countries, especially the Anglo-Saxon legal systems. New Zealand is one of the countries that recognize compensation to victims in a legal setting. In New Zealand, the compensation of victims has been approved as a type of punishment in its legislation. This is motivated by the view that in terms of the nature of suffering or material losses suffered by the victim as a result of criminal acts committed by others, it is only fair perpetrators of criminal acts (the other person) who provide compensation.³¹

Another example is in Japan. Rationale and culture of the Japanese people against the Constitution is not contrary to the ideology that is universal, but rather relied on the ideology of the special (particular), because in this way, Japan can suppress the crime rates into the lowest in the world. Law enforcement practices in Japan prefer an agreement or consensus as compared with the settlement via litigation.³²

Restorative Justice:-

Restorative justice is a concept that responded the development of the criminal justice system by focusing on the needs of victims and community involvement that feels marginalized by mechanisms that work in the criminal justice system that exists today.³³ Muladi argued his view that in restorative justice, the position of case must be changed, no longer in the interest of order, but for the sake of victims and the recovery of material and psychological. The point is how to prevent offenders from imprisonment, but remain responsible.

Van Ness suggested that restorative justice is a theory of justice that promotes the recovery of losses due to malicious behavior, in which the complete recovery through a process of inclusive and cooperative. If viewed from the recovery of various conflicts, the essential elements of the definition of restorative justice by some experts is more priority to reconciliation or improvement efforts between the perpetrator, the victim, and the community rather than retaliation.³⁴

Restorative justice is a fair solution that involved offenders, victims, their families and other relevant parties in a criminal act jointly seek solutions to the offense and its implications by emphasizing restoration to the original condition

Restorative Justice is a concept of punishment, but as a concept of punishment is not confined to criminal law provisions (formal and material). It also must be observed in terms of criminology and the prison system. From the

³¹Roeslan Saleh. (1984). *Segi Lain Hukum Pidana*. Ghalia Indonesia : Jakarta. Page. 21.

³²Romli Atmasasmita. (2001). *Masalah Santunan Terhadap Korban Tindak Pidana*,” *Majalah Hukum Nasional Departemen Kehakiman*. 1992. Pages 44-45

³³Eva Achjani Zulfa. 2010. *Pergeseran Paradigma Pemidanaan*. Lubuk Agung : Bandung. Page. 65

³⁴*Ibid*

facts, the applicable criminal system does not guarantee integrated justice, namely justice for perpetrators, justice for victim, and justice for the people. This has encouraged the concept of "Restorative Justice."³⁵

Bagir Manan argued that restorative justice contains principles, such as build participation together between the offender, victim and community groups to resolve an incident or crime, putting perpetrators, victims, and the community as "stakeholders" working together and immediately tried to find a solution which is perceived to be fair to all parties (win-win solutions).³⁶

Restorative justice approach offers different views and approaches in understanding and dealing with a criminal offense, as depicted on the definition put forward by Dignan, as follows:

Restorative justice is a new framework for responding to wrong doing and conflict that is rapidly gaining acceptance and support by educational, legal, social work, and counseling professionals and community groups. Restorative justice is a valued-based approach to responding to wrongdoing and conflict, with a balanced focus on the person harmed, the person causing the harm, and the affected community.

The definition requires a certain condition that puts restorative justice as a fundamental value that used in response to a criminal offense. In this case, the focus of attention required balance between the interests of offenders and victims and take into account the impact of the settlement of the criminal cases in the community.

The goal of restorative justice is to encourage the creation of a fair judicial and encourage the parties to participate therein. Victims feel that their sufferings are cared and compensation agreed balanced by suffering and loss suffered. The main objective is to empower the victim restorative justice, where offenders are encouraged to pay attention to recovery.

Restorative justice attaches great importance to the fulfillment of material, emotional, and social victim. The success of restorative justice, as measured by the large of loss has been recovered by offender, not measured by how sentence imposed by the judges. Its essence, as far as possible the perpetrator is removed from the criminal proceedings and prison. But, as said by Kent Roach, restorative justice is not only provides an alternative to prosecution and imprisonment, but also ask the responsibility of the perpetrators. Criminal acts in restorative justice are interpreted as a violation of the law and the state, besides facing the perpetrator is the victim and the community, not the government.

The process for resolve disputes, restorative justice is no longer use conventional methods that have been used in the criminal justice system, which only focuses on finding who is right and who is wrong, and to find what is appropriate punishment given to the guilty party. While in resolve disputes through restorative justice are no longer either case, desired by restorative justice is a restoration of the offender so that he will no longer commit crimes, the recovery also helped addressed to the victim as an injured party and the relationship between the victim, the offender and society to the course life can return to normal.

The theory of punishment recognizes a system derived from the conception of individualization of criminal and known as the *double track system*. This system introduces two penalties together that are criminal and action sanctions. This system puts the two in parallel and equal. Both equality are based on the premise that element of suffering through criminal sanctions and the elements of imprisonment through action sanction is two things that are equally important.

These linkage is described by Gerber and Mc Anany argued that criminal sanctions or retributive is not fully removed in sentencing because under certain conditions despite the implementation of sanctions moving towards rehabilitation as goal fully but still there should be criminal prosecution and instead sanctions only relying on criminal sanctions (retributive) proved ineffective to restore social and moral qualities of a criminal in order to

³⁵Joint Decree between the Chairman of the Supreme Court, the Attorney General of the Republic of Indonesia, the Head of the Indonesian National Police, Minister of Justice and Human Rights of the Republic of Indonesia, Minister of Social Affairs of the Republic of Indonesia and the Minister of Women Empowerment and Child Protection of the Republic of Indonesia.

³⁶Lies Sulistiani. (2010). *Perlindungan Saksi dan Korban di Indonesia*. Press Release No.02/LPSK/PR/II/2010. Lembaga Perlindungan Saksi Republik Indonesia : Jakarta. Page. 4

integrate more with the community. This is the reason for the need to integrate between criminal and action sanctions.³⁷

Double track system requires the element of suffering and imprisonment are equally accommodated in the system of criminal law sanctions. This view was expressed also by Albert Camus,³⁸ who stated that the application of criminal sanctions there needs to be equality between *punishment* and *treatment*. *Punishment* is a logical consequence of freedom is misused by offenders but on the other hand a perpetrator remains of a man who has the right to reach the new values and new adjustments in order to be a good human being.

Hart³⁹ argued that a theory of punishment that is morally acceptable is able to demonstrate the complexity of the prosecution and described it as a compromise between different principles and contradictory that any punishment is complex. Complexity is expressed by Hart according to the author showed that the punishment in view of Hart combines the suffering sanctions and for imprisonment. Arief⁴⁰ said that the fundamental difference between criminal sanctions and action sanctions is the criminal question questioned why the imprisonment is held while the action sanctions questioned to what the imprisonment is held. Criminal sanctions are reactive to an act, while action sanctions are anticipatory against the perpetrators of such acts. The focus of criminal sanction is perpetrators act through an affliction to deter while the focus of criminal sanctions is to give assistance for change.

J.E. Jonkers also argued that criminal sanctions emphasized for crimes committed while action sanctions focused on goals that are social.⁴¹ Description and views on criminal sanctions and action sanctions indicate that criminal sanctions oriented to sanctions for action, while the action sanctions oriented to the community protection. The debate of philosophy and theory of punishment always have ups and downs in its development, which leads to the emergence of new strategies in sentencing, as follows:

a) *Indeterminate sentence*

Indeterminate sentence is a strategy of criminal sanction that provides flexibility to judges in sentencing. The development of this strategy gained sharp criticism because they provide greater uncertainty than benefits. The uniformity for any criminal offense generates inequality in the process of criminal prosecution.

b) *Just desert model*

Just desert model is a strategy that is based on fairness with regard punishment as prevention and retribution. *Prevention* aimed at preventing a perpetrator to repeat offense or crime in later while *retribution* aimed to provide vengeance for a criminal offense committed.

c) *Restorative model*

Restorative model is a model of punishment that proposed by the abolitionists. This model is often confronted with retributive models.

Conclusion:-

The essence of legal protection for crime victims in the handling of conventional crime in Indonesia is not yet optimal to take attention and gives legal protection to conventional crime victim in achieving fairness, expediency and legal certainty as a legal purpose. Conventional crime victims are an integral part of a legal system, which received less attention in obtaining their rights in the criminal justice system in Indonesia. Legal protection of conventional crime victim in Indonesia has been set in legislations, but it is not optimal because the mostly of legislation is more focused of legal protection to the perpetrators rather than the victims. As a result, the implementation of legal protection for conventional crime victim is not optimal, so it is very important the understanding of community, the victim and also law enforcement officers in the implementation of rules and mechanisms of legal protection against conventional crime victims to get their rights.

The implementations of restoration justice in the framework of legal protection for conventional crime victim were by carrying out *penal mediation* to compensate the conventional crime victims. However, the compensation does not mean that criminal elements were done then be lost. The compensation will only relieve the perpetrators. Therefore, the concept of restorative justice cannot be implemented purely without a retributive justice, it means that the

⁴⁰Barda Nawawi Arief. 2002. *Perbandingan Hukum Pidana*. RajaGrafindoPersada : Jakarta Page. 51

⁴¹*Ibid*

compensation to victims did not causes the offender was not convicted. Currently, the direction of sentencing is in restorative justice models with not negate retributive justice model in which called as a balance perspective sentencing that is a balance between the interests of offenders, victims and communities or called as criminal prosecution balance perspective.

Abstract

A crop that is nourishing using fertilizer usually gives a better growth performance and yield. Different types of fertilizer giving a different impact on the growth performance and yield of a crop. The presence of different types of fertilizer such as organic, inorganic and semi organic fertilizer boost crops in different rate. As we know that the use of fertilizer seems to be an obligation to the farmer, identifying the best types of fertilizer that can bring the best of the crop should be determined. This experiment was conducted to study the growth performance and yield of Stevia (*Stevia rebaudiana* BERTONI) responses to different types of fertilizer. The study was carried out at UiTM Jasin share farm by using a randomized complete block design (RCBD) for every treatment. Data collection or the perimeter for plant height, number of leaf and leaf area were recorded once every seven days while the yield of this plant were recorded at the end of the experiment. Data analysis was carried out by using Minitab and Microsoft Excel. At the end of this experiment, Stevia plants were harvested and the yield is being calculated. The results obtained in this study indicate that there are significant different in the number of leaves, area of leaves and the yields harvested toward the application of different fertilizer. It is concluded that the best fertilizer to be applied to Stevia plant is semi organic fertilizer.

Introduction:-

Belonging of the Asteraceae (Compositae) family, *Stevia rebaudiana* (Bertoni) also known as herbaceous perennial plant (Brian., 2003). Nowadays, stevia is one of the importance plants as substitute to the sugar that made up by the sugarcane because the stevia's leaves are applied as non nutritive high potency of natural sugar especially in Asia especially Japan, Korea, China and South America. Besides, the increasing cases such as obesity, diabetes and cardiovascular disease are due to the high consumption of sucrose in daily use such as beverages and food. Geuns (2003) studied the diterpene glycosides that produce by *Stevia rebaudiana* Bertoni called as steviol glycosides mainly natural, high potency of low caloric sweeteners where it has been used as sugar substitute.

Stevia rebaudiana leaves are rich in glycosides that contribute to sweet taste with low caloric value and very vital for diabetes as natural substitute for sugar (Kinghorn., 1987). Regarding to the previous studies that has been conducted, the stevia leave's extract has beneficial effect on human health as a natural source of antioxidant (Xi et

al.,1998), used avoid the formation of cavities and plaque in teeth, non toxic (Elkins.,1997),cardiotonic (Machado *et al.*,1986) and also beneficial against microbes *Streptococcus mutan*, *Pseudomonas aeruginao*, and *Proteus vulgaris* (Yabu *et al.*,1997).

Materials And Method:-

Location of study:-

The experimental site is situated at UiTM Jasin share farm. The essential material for the study that is the three types of fertilizer, organic fertilizer, chemical fertilizer and semi organic fertilizer which are the variables in this study. The other material included stevia cutting, poly bag and net.

Planting materials:-

The stem cutting process will be made in a slant form from the young apical shoot for MS012 variety. Consequently, the end of cut plant will be dipped in IBA concentration. The dipped stem cuttings will be placed in the micro cutting chamber propagation box which is contained a medium of perlite and light expanded clay aggregates (LECA). The stevia's parent was supplied by Agriculture Department District of Tampin, Negeri Sembilan.

Experimental treatment and design:-

After two weeks of propagation, the cuttings were transferred to the pot which contained medium of coco pit with rice husk and soil. Experimental treatments comprised the different types of fertilizers i.e. T₀ -control, T₁- Organic fertilizer (FAA), T₂- Inorganic fertilizer (18+33+18+TE), T₃- Semi organic fertilizer(12+7+25).The dosage recommended for organic fertilizer(FAA) 2ml fertilizer + 1000ml of water, inorganic fertilizer (18+33+18+TE) 2.5g fertilizer + 1000ml of water, and semi organic fertilizer (12+7+25) 20 ml fertilizer + 1000 ml of water. All types of fertilizers being applied once a week in the liquid form. Treatments of experiment were conducted in RCBD with five replications for each treatment.

Data collection and analysis:-

The data of growth parameter was recorded based on the plant height, number of leaves, leaves area and the yields of stevia. The data of growth parameter was taken once a week for five weeks. Recorded plant height was measured from poly bags top soil surface up to the highest leaf tip by straightening all leaves using ruler. Every seven days interval, the total number of leaves was counted. Leaf area was recorded in seven days interval by using Portable Leaf Area tool. Total yield of plants were recorded by plant fresh weight being subtracted to the amount of dry weight of the plant. Dry weight of plant was recorded after reduction of moisture from the plant by using oven. The analysis was carried out by using Minitab 16 software. All the data were analyzed by using Analysis of Variance (ANOVA), and descriptive analysis. The different between the treatments means data were compared using Turkey Family Error Rate Test.

Result and Discussion:-

Figure above shows the mean of plants height planted with different application of fertilizer for 5 weeks. From the graph, plant applied with semi organic fertilizer (T₃) show the highest mean of plant height followed by T₁ and T₂. The lowest mean of plant height is the T₀. However, there is no significant different between all the treatments based

on the plant height. By referring to the ANOVA table, it can be concluded that there is no significant different in the plant height of Stevia response to different types of fertilizer. It is because of the P-value in the table (0.237) is lower than the confident interval applied, 0.05.

Figure above shows the mean from the number of leaf from different treatment for 5 weeks. Stevia in the T_3 shows the highest average number of leaf. The treatment shows that it is suitable to apply in order to get the highest number of leaf. The plant that is left without applying any fertilizer (T_0) shows the lowest number of leaf to the plant. The higher mean of T_3 in the leaf number was due to the higher presence of humic acid that accelerates plant cell division and promotes growth.

From the analysis using Turkey's family error rates, the means of T_3 and T_0 indicates there is a significant different as shown by the different letters in the graph. By referring to the ANOVA table, it shows that there significant different in the number of leaf of Stevia applied with different types of fertilizer. This is because the P-value in the table (0.029) is lower than the confident interval used for the test, 0.05.

Figure 4.3.2 above shows the mean data of the leaf area from different treatment for 5 weeks. Stevia that is treated with T_3 (semi organic) indicates the highest mean among the treatment applied to the plant. Stevia that is applied with T_0 (control) shows the lowest mean of leaf area. This is due to the nutrient that is absorbed by plant in treatment 3 is faster cause by the presence of humic acid in the fertilizer. From the analysis using Turkey's family error rates, the mean of T_3 shows letter A while the other treatment mean that are T_0 , T_1 and T_2 shows letter B indicates that there is significant different from T_3 toward the other treatment. By referring to the ANOVA table, it can be said that there is significant different in the leaf area of Stevia. It is due to the P-value in the table (0.002) which is lower than the confident interval applied, 0.05.

The above figure shows the mean of the Stevia yield for all the treatment. Stevia that is applied with T₃ (semi organic) fertilizer has the highest mean weight which is more than 140 gram. Stevia that is not applied by any types of fertilizer shows the lowest mean reading that is less than 71 gram. The higher mean of the yield in T₃ indicates that the plant absorb a lots of nutrient from the soil and fertilizer and store it in their plant body. From the Turkey's family error rate, there are several different mean on the treatment applied to the plant. First, the mean of T₃ indicates by letter 'a' show significant different toward the mean of T₀, T₁ and T₂ as the letter indicates them are different from T₃. Then, there is significant different in the mean of T₀ with T₁ and T₂ as the letters shows in the graph is different from each treatment. The ANOVA table above was gained by using Minitab 14. From the table above, it can be concluded that there is significant different between the treatments applied and the yield of the Stevia plant. This is because of the P-value in the ANOVA table (0.000) which is lower than the confident interval use, 0.05.

Conclusion And Recommendation:-

By referring to the result of the study, it can be concluded that Stevia plant (*Stevia Rebaudiana* Bert) shows better growth performance and yields in the application of semi organic fertilizer. This is due to several finding that were obtained during this experiment. Stevia plants that were applied using semi organic fertilizer indicated the best growth in the term of growth performance and yields. This is supported by the significant different of those three parameter tested in the study. Thus, the findings from the study have provided information on the types of the fertilizer that generates the highest yield and plant growth performance toward the farmers. From this research, it is recommended for the farmers to practice the application of semi organic fertilizer to their crops. The used of semi organic significantly increase the yields thus will provide them with more income.

Acknowledgement:-

All praise to ALLAH S.W.T who showered the kindness and affection during the course of study that cannot adequately thank for. His endless grace and love have provided the strength to complete this research. The authors are thankful to the Management of Faculty of Plantation and Agrotechnology, Universiti Teknologi MARA for their constant support and encouragement. Also thanks to Fundamental Research Grant Scheme (FRGS) 600-RMI/FRGS 5/3 (43/2014) as financial support to complete this research. Also to everyone that helping in completing this experiment directly or indirectly is highly appreciated.

Abstract

Objectives: Immune thrombocytopenia (ITP) is a disorder characterized by immune-mediated accelerated platelet destruction and suppressed platelet production. Low vitamin D levels have been found in several autoimmune diseases, such as rheumatoid arthritis, SLE. The mechanisms underlying the link between vitamin D with autoimmunity are not completely understood. No currently available studies about vitamin D status in primary ITP patients.

Aim: To evaluate vitamin D levels in patients with primary chronic ITP and compare these levels with normal control subjects and patients with thrombocytopenia due to other non-immune causes **Methods:** The study included 80 adult subjects, 40 ITP patients (They were segregated into 20 responders and 20 non-responders), 20 cases of thrombocytopenia due to non ITP causes and 20 healthy control subjects. Measurement of serum 25monohydroxyvitamin D was done with ELISA.

Results: Vitamin D levels were significantly lower in patients with ITP (range=2-40ng/ml; mean±SD=17.29±10.96 ng/ml) and thrombocytopenia due to non-ITP causes (range=10-40ng/ml; mean±SD=21.05±8.31 ng/ml) in comparison to normal healthy controls (range = 10-65 ng/ml; mean±SD=36.70±16.30 ng/ml) (P=0.000), but there was no statistically significant difference between levels in ITP versus non- ITP thrombocytopenia (P=0.225). There was no statistical significant difference between responders & non-responders

Conclusions: Vitamin D levels are lower among chronic ITP patients in relation to healthy control subjects which might point out to a role in aetiopathogenesis of ITP attributable to vitamin D deficiency.

Introduction:-

Immune thrombocytopenia (ITP) is a disorder characterized by immune-mediated accelerated platelet destruction and suppressed platelet production^[1]

Corresponding Author:-Walaa A Elsalakawy.

Address:-Clinical Hematology and Bone Marrow Transplant Unit, Internal medicine department , Faculty of Medicine – Ain Shams University, Abbasiya, Cairo, Egypt.

In patients with ITP, antiplatelet auto-antibodies frequently appear to be directed against GpIb/IX and GPIIb/IIIa expressed on platelets and megakaryocytes^[2]

Abnormalities of cell-mediated immunity are known to contribute to the pathologic process. Like many other autoimmune diseases, ITP has a T helper cell type 1 bias and a reduced activity of T-regulatory cell^[2]

Vitamin D, a steroid hormone, which is known to play an essential role in calcium homeostasis, but since the receptor for vitamin D (VDR) is found in cells in almost every tissue, and the enzyme 1- α hydroxylase necessary for the final activation of vitamin D also has a widespread distribution, it appears obvious that vitamin D must have a multitude of function^[3]

Lower vitamin D levels have been found in several autoimmune diseases, such as rheumatoid arthritis, systemic lupus erythematosus, systemic sclerosis, type 1 diabetes mellitus, multiple sclerosis, inflammatory bowel diseases, and, autoimmune gastritis^[4]

The mechanisms underlying the link between vitamin D with autoimmunity are not completely understood, but probably are associated with its anti-inflammatory and immunomodulatory functions^[5]

Several studies confirm that vitamin D enhances the innate immune response, whereas it exercises an inhibitory action on the adaptive immune system by inhibiting the proliferation of type 1T helper cells, increasing the quantity of type 2 T helper cells, increasing the quantity of CD4+/CD25+ T-regulator cells, inhibiting B cell proliferation, generation of B memory cells, plasma cell differentiation and immunoglobulin production^[6]

No currently available studies about vitamin D status in primary ITP patients.

SUBJECTS AND METHODS:-

Subjects:-

The current case-control study was conducted on 80 adult subjects (age \geq 18years) including 40 ITP patients, 20 patients with thrombocytopenia secondary to other non-immune diseases, and 20 healthy control subjects. All patients were recruited from the Clinical Hematology Unit, Internal Medicine Department, Faculty of Medicine, AinShams University, Cairo, Egypt.

An informed consent was taken from all subjects participating in the present study according to declaration of Helsinki.

The subjects enrolled in this study were divided into the following groups:-

- **Group-I:** Included 40 adult patients diagnosed as having chronic primary ITP who met the diagnostic criteria of ITP as previously described in the international consensus report published in 2010^[7]. This group was subdivided into:
 - **Group-Ia:** Included 20 patients who were responders to treatment.
 - **Group-Ib:** Included 20 non-responder ITP patients.
- **Group-II:** Included 20 patients with secondary thrombocytopenia. This group included: 8 patients with acute myeloid leukemia (AML), 5 patients with myelodysplastic syndrome (MDS), and 7 patients with aplastic anemia. All the patients with the above diseases were undertreatment.
- **Group-III:** Included 20 sex and age matched healthy controls subjects with normal platelet count and no concurrent illnesses or medications at the time of blood withdrawal.

Inclusion criteria:-

- Adult (age \geq 18 years).
- Primary chronic ITP.
- ITP patients who received the first line treatment by steroid therapy.

Exclusion criteria:-

- Age < 18 years.
- Secondary ITP.
- ITP patients on second line therapy like azathioprine or TPOs
- Chronic renal disease.

- Chronic liver disease.
- Malnutrition and malabsorption.

Plan of treatment in ITP patients:-

Patients were treated by the first line steroid therapy (i.e. prednisolone 1mg/kg) for 3-4 weeks followed by tapering. Patients on second line therapy (e.g. Azathioprine, TPO and danazol, ...etc.) were excluded from this study, and the patients were subdivided into responders and non-responders.

Definition of response:-

Patients were considered responders if they have platelet count between 30 and 100x10⁹/l, doubling of the baseline platelet count and no clinically overt bleeding^[7].

While patients were considered resistant "Non-responders" if they have any platelet count lower than 30x10⁹/l or less than doubling of the baseline count, active bleeding, or steroid dependence^[7].

Methods:-

Assessment of serum level of 25 (OH) D:-

Sample collection:-

For each subject, about 5 ml of venous blood was drawn under complete aseptic conditions and dispensed into a labeled vacutainer containing gel and clot activator, and serum was separated by centrifugation for 5 minutes, then stored at temperature -20°C till assay for measurement of 25(OH) vitamin D was done by ELISA assay using a commercially available ELISA kit (Calbiotech, A Life Science company). The values were expressed in ng/ml.

Definition of vitamin D deficiency:-

Vitamin D deficiency is defined as a 25(OH) D level of 20 ng/ml or less, vitamin D insufficiency as 21 to 29 ng/ml, and vitamin D sufficiency as 30ng/ml or greater.^[8]

Statistical analysis:-

Data were collected, revised, coded and entered to the Statistical Package for Social Science (IBM SPSS) version 20. Qualitative data were presented as number and percentages while quantitative data were presented as mean, standard deviations and ranges when parametric and median with interquartile ranges (IQR) when non parametric.

The p-value was considered significant as the following:

P > 0.05: Non significant

P < 0.05: Significant

P < 0.01: Highly significant.

RESULTS:-

Demographic data and disease characteristics

Subjects enrolled into the study were 80 adult subjects, they were divided into 40 chronic ITP patients (equally subdivided into responders and non-responders), they were 36 females and 4 males with a female: male ratio of 9:1 with mean age± SD of 33.41 ± 9.67 years ranging from 18-50 years, 20 cases of thrombocytopenia due to other reasons with 16 females (80%) and 4 males (20%) with mean age ± SD of 36.70 ± 13.30 years ranging from 19 – 60 years, and 20 adults apparently healthy control subjects , 17 females and 3 males with age range of 18 – 44 years and mean ± SD of 29.90± 8.07 years.

The three groups were matched as regards age (P=0.123) and sex (P=0.560).

Demographic data and disease characteristics amongst the 3 studied groups are illustrated in table number (1).

Hemoglobin levels across the studied groups

Hemoglobin levels were significantly lower in patients with thrombocytopenia due to other (non-ITP) causes (mean±SD =7.80±1.03 g/dl) than ITP patients (mean±SD=11.31±1.48 g/dl) (P=0.000) or healthy normal controls (mean±SD= 12.66±1.37 g/dl) (P=0.000).

Platelet counts across the studied groups

As regards platelet counts, they were significantly reduced in ITP patients and patients with thrombocytopenia due to other causes as compared to healthy controls ($P=0.000$).

The mean platelet volumes were significantly higher in ITP patients ($\text{mean} \pm \text{SD} = 11.16 \pm 2.14$ fl) than patients with thrombocytopenia due to non-ITP patients ($\text{mean} \pm \text{SD} = 9.10 \pm 3.40$ fl) and healthy controls ($\text{mean} \pm \text{SD} = 9.79 \pm 1.01$ fl) ($P=0.004$).

Vitamin D levels across the studied groups:-

25 monohydroxyvitamin D levels were significantly lower in patients with ITP (range=2-40 ng/ml; $\text{mean} \pm \text{SD} = 17.29 \pm 10.96$ ng/ml) and thrombocytopenia due to non-ITP causes (range=10-40 ng/ml; $\text{mean} \pm \text{SD} = 21.05 \pm 8.31$ ng/ml) in comparison to normal healthy controls (range = 10-65 ng/ml; $\text{mean} \pm \text{SD} = 36.70 \pm 16.30$ ng/ml) ($P=0.000$), but there was no statistically significant difference between levels in ITP versus non-ITP thrombocytopenia ($P=0.225$), this is well illustrated in figure (1) attached to the appendix.

Calculating the degree of deficiency of vitamin D in the 3 groups, it was found that 27 (67.5%) of the ITP patients were deficient in vitamin D; with recording values ≤ 20 ng/ml. Of those 27 patients, 15 patients are severely deficient (≤ 10 ng/ml). Other 6 ITP patients (15%) were insufficient and only 7 of them (17.5%) were having sufficient values of vitamin D.

When these data are compared to healthy normal controls, we observed that only 4 (20%) of them were deficient, 1 of them had severe deficiency. Other 4 were insufficient while 12 (60%) had normal levels.

In thrombocytopenia due to non-ITP causes, half of them were deficient (10) while 5 (25%) were insufficient. And 5 only (25%) had normal values).

Vitamin D levels in ITP patients in relationship to response:-

When further segregating ITP patients into responders and non-responders; we found that at enrollment time, the platelet count was significantly lower among non-responders (median $= 64.5 \times 10^9$ /L) than responders (median $= 200.5 \times 10^9$ /L) with highly significant P value ($P=0.000$). At the same time there was no significant difference in hemoglobin level between non responders and responders ($\text{mean} \pm \text{SD} = 11.18 \pm 1.63$ g/dl versus 10.65 ± 1.56 g/dl respectively) ($P=0.296$).

The two subgroups (non-responders and responders) showed no statistical significant difference as regards vitamin D levels being as following ($\text{mean} \pm \text{SD} = 15.73 \pm 10.00$ ng/ml in responders in relation to $\text{mean} \pm \text{SD} = 18.85 \pm 11.89$ ng/ml in non-responders with a P-value of 0.374).

25(OH) D levels when correlated to age, disease duration, dose of steroids given and platelet counts in ITP patients, they showed no significant correlation.

DISCUSSION:-

Immune thrombocytopenia (ITP) is an autoimmune disorder characterized by accelerated platelet destruction and suppression of platelet production, resulting in low platelet count^[9]

Vitamin D is recognized as a true steroid hormone that exerts several biological activities, including regulation of the immune system. So, its deficiency can contribute to the pathophysiological mechanisms for the development of autoimmune diseases^[10]

The aim of this study is to assess vitamin D status in adult patients with primary immune thrombocytopenia (ITP) and to correlate it with response to first line treatment (steroid therapy).

The present study included forty chronic ITP patients (36 females and 4 males), twenty patients with thrombocytopenia secondary to other non-immune diseases (16 females and 4 males), and twenty normal healthy subjects (17 females and 3 males). There were no statistically significant differences between the three groups as regards sex and age (with p values= 0.560 and 0.123 respectively).

In this study, 90% of the ITP patients were females and only 10% were males with female to male ratio 9:1, which reflects a higher incidence of ITP in females. This observation is consistent with the results of *Schoonen et al.*^[11] who found that the incidence of ITP was statistically significantly higher in women compared to men. And also *Saeidi et al.*^[12] who found that the ITP prevalence was higher in females those aged above 16 compared to males of the same age with ratio 7: 3. As an autoimmune disease; ITP is expected to have higher incidence in females.

The mean age of ITP patients in our study was 33.41 ± 9.67 years, this was same as that described by *Cines and Busnel*^[13] who stated that the incidence of ITP is more common in women aged between 18 and 40 years. On the other hand, *Neylon et al.*^[14] estimated a higher incidence of ITP among those aged 60 years and older.

The platelet count in ITP patients (median of $114 \times 10^9/L$) and in the patients with thrombocytopenia due to non-ITP causes (median of $36.5 \times 10^9/L$) were significantly decreased in comparison to healthy controls ($296 \times 10^9/L$) ($p < 0.001$). On the other hand, the haemoglobin levels were significantly lower in patients with thrombocytopenia due to non-ITP causes (mean \pm SD = 7.80 ± 1.03) than in normal healthy controls (mean \pm SD = 12.66 ± 1.37) and ITP patients (mean \pm SD = 11.31 ± 1.48) with p value = 0.000, this finding was due to the nature of the diseases included in this group of patients (AML, aplastic anaemia, and MDS) that are characterized by the manifestations of bone marrow failure. The ITP patients show mean haemoglobin level around the normal because it is the disease of isolated thrombocytopenia.

In this study; we observed that the mean platelet volumes (MPV) were significantly higher in patients with ITP (mean \pm SD = 11.16 ± 2.14 fl) than that in patients with thrombocytopenia due to non-ITP causes (hypoproliferative thrombocytopenia) (mean \pm SD = 9.10 ± 3.40 fl) and in normal controls (mean \pm SD = 9.79 ± 1.01 fl) with p value 0.002 and 0.035 respectively. This result agrees with the finding reported by *Ntaios et al.*^[15]; *Negash et al.*^[16] who found that the MPV is significantly elevated in ITP patients than in patients with hypoproliferative thrombocytopenia. In disagreement with this result, a study conducted by *Borkataky et al.*^[17] who found no significant difference in the MPV between the destructive thrombocytopenia groups and the control group. However, larger platelets have more granules, aggregate more rapidly with collagen, have a higher thromboxane A2 level, and express more glycoprotein Ib and IIb/IIIa receptors than smaller platelets, which may explain the lower bleeding tendency in ITP patients^[18].

Results in the present study revealed non-significant difference in serum 25 (OH) D levels among ITP females and male patients. In concordance to our results, study by *Elsammak et al.*^[19] who evaluated the vitamin D status of a cohort of healthy young Saudi Arabians in the Eastern region of Saudi Arabia. A sample of 139 blood donors studied. They found that serum 25(OH) D levels did not differ significantly between males and females. And this result is consistent with the findings of *Amital et al.*^[20] who conducted their study on SLE patients from several European and Israeli cohorts and found that vitamin D level did not differ by gender. However the results of this present study did not agree with the results of a study by *Wright et al.*^[21] conducted on SLE patients who found that female sex was a predictor for vitamin D deficiency. To our knowledge; no similar studies were conducted on ITP patients before.

In the present study, we did not find a significant correlation between vitamin D levels and age or disease duration in ITP patients. This finding is in line with the results of a study by *Emam et al.*^[22] who studied a comparable number of Egyptian SLE patients (40 SLE patients and 20 age and sex matched controls) and did not find significant correlation between vitamin D level and age or disease duration. And another study by *Rossini et al.*^[23] conducted on rheumatoid arthritis patients did not find an association between vitamin D level and disease duration. Also *Dias de Castro et al.*^[24] in their study on patients with Inflammatory Bowel Disease found no correlation between vitamin D and age or disease duration. However, *Karatay et al.*^[25] studied 32 patients with Behcet's disease and found that age was one of the predictors of 25(OH) D levels.

In the present study, we have found significantly lower mean 25(OH)D levels among ITP cases compared to healthy control group, (17.29 ± 10.96 ng/ml) vs (36.70 ± 16.30 ng/ml) respectively with p value < 0.001 .

When ITP patients and control subjects were classified according to vitamin D status, 33 out of 40 ITP patients (82.5%) had inadequate (insufficient and deficient) 25(OH)D levels (< 30 ng/ml): of which 6 patients (15 %) being insufficient (21-29 ng/ml), 27 (67.50%) being deficient (≤ 20 ng/ml). In contrast, 4 out of 20 healthy control subjects (20%) were found to be insufficient, 4 (20%) being deficient. Out of our knowledge, there was no previous studies evaluating vitamin D levels in patients with ITP in Arabian country, but there were on other autoimmune disorders

such as SLE disease. The frequency of 25(OH) D deficiency among patients with ITP in our study is similar to that reported in a study conducted by *Emam et al.* [22] on 40 SLE Egyptian patients and 20 controls which revealed low vitamin D levels in patients with SLE compared with healthy controls, and (85%) of SLE patients had inadequate (insufficient and deficient) vitamin D levels.

Despite Egypt is a sunny country, many contributing factors lead to low vitamin D level in our population in general as in most Middle East countries, including the dark skin, use of sun screen, the cultural and religious practice of wearing clothes that cover the entire body, and the limited amount of vitamin D obtained from dietary sources due to lack of fortification and even lack of measures to confirm adequacy of fortification of fortified staple foods [26]. Also *Fragoso et al.* [27] explained this to be a result from increased modern indoor life activities.

In the present study, the result is concordant to a study by *Fattizzo et al.* [28] conducted on 103 patients with autoimmune cytopenias (included 44 patients with ITP, 35 with primary autoimmune hemolytic anemia, 5 with Evans' syndrome, and 19 chronic idiopathic neutropenia) and 40 controls, which revealed low 25 (OH) D level in patients with ITP compared with healthy controls (mean \pm SD= 2.3 ± 1.8 vs 6 ± 6 ng/ml, $P < 0.001$), they also found, that 25(OH) D levels were significantly lower in patients with primary autoimmune hemolytic anemia, Evans' syndrome, and chronic idiopathic neutropenia than in controls (mean \pm SD= 2.4 ± 1.6 ng/ml, 1.3 ± 0.5 ng/ml, 2.1 ± 1.3 ng/ml vs 6 ± 6 ng/ml, $P < 0.001$).

Also, in agreement with our results a Chinese study conducted on 45 ITP patients showed that the levels of 25(OH)D (10.6 ± 7.7 ng/ml) and $1\alpha,25(\text{OH})_2\text{D}$ (69.9 ± 29.0 pg/ml) of the ITP patients were lower than those of healthy controls (13.7 ± 9.1 ng/ml, 87.3 ± 19.9 pg/ml) ($P < 0.05$) [29].

In the present study there was no statistical difference between the ITP patients and patients with thrombocytopenia secondary to other causes (non ITP) as regard vitamin D levels. Serum 25(OH) D levels were significantly lower in patients with thrombocytopenia due to non ITP causes than normal healthy controls (mean \pm SD = 21.05 ± 8.31 ng/ml) vs (mean \pm SD = 36.70 ± 16.30 ng/ml) ($p < 0.001$). In fact, the patients included in this group (patients with thrombocytopenia secondary to other causes) unfortunately were patients with acute myeloid leukemias, myelodysplastic syndrome, and aplastic anemia, and vitamin D deficiency has been implicated in the pathogenesis of these hematological and onco-hematological disorders. However, many of the diseases with thrombocytopenia were associated with vitamin D deficiency, and we could not enroll patients with thrombocytopenia secondary to HCV or HBV because patients with liver diseases were excluded from this study as liver disease is one of the causes of vitamin D deficiency.

In our study there was no statistically significant difference in 25 (OH) D levels between responders and non-responders (median = 15.5 ng/ml vs 19 ng/ml, respectively. $p = 0.327$). This result is in concordance with the results of a study by *Fattizzo et al.* [28] in which all ITP patients were treated with steroids, rituximab was administered in 1 case, cytotoxic immunosuppressives in 7, and splenectomy performed in 8; 5 cases unsuitable for or refractory to splenectomy were treated with thrombopoietin receptor agonists, and they found no significant association among the number of therapy lines and vitamin D levels. This observation may indicate that vitamin D deficiency has a role in ITP pathogenesis, but did not contribute in disease activity and treatment response. However, more studies with larger populations may be required to define the actual role of vitamin D in treatment response and the activity of disease in patients with ITP.

However, vitamin D was inversely correlated to disease activity in many other studies, in a study conducted by *Haga et al.* [30] on 302 patients with rheumatoid arthritis, they found that very low serum 25(OH) D levels (≤ 6 ng/ml) were associated with very high disease activity and with increase the requirement of treatment with at least 3 disease modifying anti-rheumatic drugs. Furthermore, a case-control study by *Ricceri et al.* [31] conducted on 68 patients with chronic plaque psoriasis and 60 healthy controls demonstrated a statistically significant inverse linear correlation between patient's vitamin D levels and their Psoriasis Area Severity Index (PASI) scores. Also *Mok et al.* [32] in their study on SLE patients found that 25(OH) D level correlated inversely and significantly with SLE activity. On the other hand *Ruiz-Irastorza et al.* [33] found no association between vitamin D levels and SLE disease activity. *D'Aurizio et al.* [34] found that low serum levels of vitamin D did not correlate with Hashimoto's thyroiditis or with Grave's disease activity. Also, no correlation between vitamin D levels and disease activity was observed in a cross-sectional study conducted by *Levin et al.* [35] on children with inflammatory bowel diseases.

In the present study there was no significant correlation between vitamin D levels and platelet counts at enrollment time. Our observations are consistent with the findings of *Fattizzo et al.* [28] who found no significant

association among vitamin D levels and hemoglobin, platelets, and absolute neutrophil counts values at enrollment for AIHA, ITP and chronic idiopathic neutropenic patients, respectively. However, 20 ITP patients with very low vitamin D levels (<1.3 ng/ml) displayed reduced platelets counts compared with the remaining 24. However, the majority of our patients were enrolled from the outpatient clinic and their platelet counts were not severely low at time of enrolment.

Despite corticosteroid use is thought to increase the catabolism of vitamin D by activating the expression of the Steroid and Xenobiotic nuclearReceptor (SXR), which induces the destruction of 25(OH)D and 1 α ,25(OH)₂D through the expression of CYP3A4^[36]. We found no correlation between use of steroids / steroid doses and vitamin D levels in our patients. Our observations are consistent with the findings of *Fattizzo et al.*^[28] where no relationship was found between serum 25(OH) D levels and steroid doses in ITP patients. Also, in a study conducted on SLE patients by *Schoindre et al.*^[37] they did not find an association between corticosteroid use or dose and vitamin D status. This finding may indicate that vitamin D deficiency in our patients was not due to steroid therapy itself. However, *Tolozza et al.*^[38] found that cumulative corticosteroid exposure in SLE patients was associated with low vitamin D levels.

Additional support for our results, two refractory thrombocytopenic patients with concomitant lupus-like syndrome responded to hydroxychloroquine and high-dose vitamin D replacement therapy^[39]. Also in a case study, 48-year-old female with refractory ITP, who was found to have an inadequate level of 25(OH) D, and significantly responded to high dose vitamin D^[4]

Thus, the present findings conclude that vitamin D deficiency may have an important role in the pathogenesis of primary immune thrombocytopenia and vitamin D supplementation might reduce the risk of the disease by modulating the immune system.

Abstract

This paper tries to find out the implications of trade liberalization on international trade tax revenues and its macroeconomic implication on Pakistan economy. The theoretical approach of trade reforms and its impact on the direction of change of revenue is ambiguous because of its dependence on the productivity of 'trade tax revenues'. By using the data of twenty five years, the paper first establishes the productivity of 'trade tax revenues' in Pakistan, then by an econometric analysis exploration of the relationship between trade revenues and trade liberalization in Pakistan is done. It was observed through our analysis that there is high productivity of trade tax revenues, further, our results show a positive and significant relationship between trade liberalization and collection of trade tax revenue. To support this relationship, a second test of Granger's causality is also performed which confirm the causal relationship between trade tax revenues and trade liberalization. It was suggested that supportive macroeconomic policies are prerequisite for successful trade liberalization.

Introduction:-

Rheumatoid arthritis is a disease of chronic polyarticular inflammation that leads to joint swelling, joint deformity and loss of joint function. RA occurs in 1 to 3% of adult population with women affected slightly more than men¹. Rheumatoid hand deformities usually are bilateral and symmetrical. Wrist and metacarpophalangeal Joints are affected early². Management depends upon pain and loss of function. Operative treatment varies with the patient's age, handedness, occupation, needs, and expectations³. Five patients of RA from agricultural back ground were reviewed after wrist arthrodesis using 3.5mm reconstruction plate and iliac crest bone graft. All cases united well with marked improvement in wrist strength and diminished pain allowed improved function.

Material and Methods:-

Five patients(four female and one male) aged between 28 to 44 years underwent this procedure in our hospital. All conservative methods including wrist brace, intra articular steroid and PIN denervation⁴ were tried. Patients were explained about the procedure and limitations. Patients were admitted after all relevant investigations and preanaesthetic check up. wrist arthrodesis was done through dorsal approach and fusion was done in 10 to 20 degree of dorsiflexion and neutral to 5 degree of ulnar deviation. Pop slab was given from above elbow to mcp joint with finger in slight flexion. At 3 weeks stitches were removed and below elbow pop cast was given for further 6 weeks. Routine radiography at 6 and 12 weeks was done to check bony fusion.

Observation and Results:-

Patients were followed for a period of ten months. There were five wrist in four female and one male. Right side was in three and left in two. All procedures were done in dominant limbs. Finger motion was regained after 3 months of aggressive physiotherapy in four cases. One female aged 44 years took 5 months to regain full finger movements due to poor follow up and uncomplained physio. All cases united well between 12 to 16 weeks.

2. X ray pre operative lateral view

3. Interosseus radio ulnar ligaments (intraoperative)

4. Xray at 3 weeks AP view

5. X ray at 3 weeks lat view

6. X ray 3 months lateral view

7. X ray 3 months lateral view

Discussion:-

Despite having trends towards many reconstructive procedures wrist arthrodesis remains an important procedure. Sorial et al. reported successful fusion in 18 patients with the use of a radial sliding graft fixed with a dynamic compression plate⁵. There are many studies in literature of wrist arthrodesis in painful wrist with syntheses fusion plate^{6,7} but due to poor patient affordability we used 3.5 mm reconstruction plate. Rheumatoid arthritis with painful destruction of the joint is a common indication for wrist fusion. Plate fixation provides great stability in all directions and delivers a high fusion rate. Common problems associated with wrist arthrodesis plates are plate discomfort and tendon irritation⁸. But we did not encounter any of these problems.

Key words:-

Guyon's canal, giant cell tumor.

Abstract

A case of ulnar nerve compression in Guyon's canal is reported in 43-year-old woman. Magnetic resonance imaging demonstrated a giant cell tumor confirmed by histological examination. Surgical treatment had fully restored sensory and partial motor function of the right hand.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

La compression du nerf ulnaire n'est pas rare, c'est la 2^e neuropathie compressive après celle du nerf médian au niveau du canal carpien. Si le site de compression le plus fréquent est le coude, la compression au niveau du canal de Guyon n'est pas exceptionnelle et souvent et souvent due à une cause locale. Nous rapportons le cas d'une patiente présentant un syndrome du canal de Guyon révélant une tumeur à cellules géantes.

Observation:-

Il s'agit d'une patiente âgée de 43ans, droitière, femme au foyer, ayant consulté pour des paresthésies avec fourmillements et picotements au niveau du territoire du nerf ulnaire. L'examen clinique a révélé une atrophie de l'éminence hypothénarienne, un signe de wartenberg positif [figure 1], une diminution de la sensibilité des deux derniers doigts et une absence de l'abduction et de l'adduction des deux derniers doigts. La radiographie standard a objectivé la masse en regard de l'éminence hypothénarienne et l'IRM a précisé son origine au niveau de la gaine des fléchisseurs comprimant et refoulant le pédicule ulnaire [figure 2]. L'exploration chirurgicale a montré une tuméfaction jaunâtre, encapsulée, se développant à partir de la gaine des fléchisseurs des quatres derniers doigts [figure 3]. L'intervention a consisté en une résection de la totalité de tumeur et la neurolyse du nerf ulnaire jusqu'à sa division dans le hiatus pisi-unciformien puis section du ligament pisi-unciformien et de l'arcade fibreuse des hypothénariens. Les suites postopératoires ont été simples, la patiente a démarré la rééducation fonctionnelle une semaine après l'intervention. L'examen anatomopathologique a confirmé le diagnostic de tumeur à cellules géantes. Un an après son intervention la patiente a récupéré complètement la sensibilité de la main et partiellement la force motrice.

Discussion:-

La compression du nerf ulnaire dans le canal de Guyon n'est pas exceptionnelle. Décrite pour la première fois par l'urologue français Félix Guyon en 1861 [1]. Ses limites anatomiques bien précises conditionnant la symptomatologie clinique ont permis de diviser le canal de Guyon en trois zones [2,3].

La zone I, correspond à la zone où le nerf ulnaire va se diviser en ses deux branches terminales, superficielle sensitive et profonde motrice. La compression en cette zone va produire soit un déficit sensitivo-moteur, soit sensitif ou moteur.

La zone II, se situe autour de la branche motrice. La compression à ce niveau sera responsable d'une symptomatologie purement motrice.

La zone III, autour de la branche superficielle. Sa symptomatologie sera purement sensitive.

Plusieurs étiologies peuvent être responsables du syndrome du canal de Guyon [3]. Les tumeurs à cellules géantes viennent au 2^o rang après les kystes synoviaux. Ces tumeurs bénignes malgré leur grande fréquence au niveau de la main [4] sont mal diagnostiquées en préopératoire. Dans une revue de la littérature seulement quelques cas de tumeurs à cellules géantes responsables de syndrome du canal de Guyon ont été décrits [5-11]. Ces tumeurs bénignes se développent à partir de la gaine synoviale des tendons et des articulations du poignet et de la main, et plus précisément au niveau du dédoublement externe de la gaine ce qui les différencie des synovites villonodulaires à développement interne [12]. Les tumeurs à cellules géantes peuvent être localisées ou diffuses pouvant intéresser également le genou, la hanche...

Pour le diagnostic, l'électromyogramme (EMG) reste le maître examen complémentaire des syndromes compressifs. Dans notre cas, il a objectivé un allongement de la conduction sensitive du nerf ulnaire à sa partie distale et une atteinte de la branche profonde motrice. L'IRM a un rôle prépondérant dans le diagnostic étiologique, elle permet de faire le diagnostic différentiel avec le sarcome des parties molles qui produit un signal d'intensité égale ou supérieure à celle de la graisse en T2, alors que les tumeurs à cellules géantes ont un signal entre le muscle et la graisse en T2 [13]. De plus, les tumeurs à cellules géantes se rehaussent après injection de Gadolinium du à la prolifération des capillaires dans le stroma, ce qui les différencie des kystes synoviaux [14]. Le traitement des tumeurs à cellules géantes est essentiellement chirurgical et repose sur l'excision complète de la tumeur avec un risque de récurrence moyen de 26,5% durant les deux premières années [15]. Ces récurrences sont favorisées par l'excision incomplète, la localisation au niveau du pouce ou l'érosion de l'os [16]. L'irradiation, autrefois utilisée pour éliminer le risque des récurrences est actuellement dépassée vu ses effets secondaires, en particulier la contracture de la main [17]. À côté de l'exérèse de la tumeur, on procède à une neurolyse du nerf jusqu'à sa division dans le hiatus pisi-unciformien où la section de l'arcade fibreuse des hypothenariens et du ligament pisi-unciformien est indispensable [18].

Conclusion:-

Le syndrome du canal de Guyon est rare, souvent due à une cause locale. Les tumeurs à cellules géantes fréquentes au niveau de la main doivent faire partie des diagnostics différentiels dominés par les kystes synoviaux. L'IRM est très utile dans l'orientation étiologique.

 glomus tumor-hallux.

Abstract

- Glomus tumors are rare and benign, arising from a neuromyoarteriel glomus body. If the digital location is well known in surgery of the hand, the extradigitales locations suffer from a misunderstanding ending in diagnostic and therapeutic errors. We report a new case of tumor glomique of the hallux, and through a review of the literature, we would try to draw the attention towards these atypical location.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Les tumeurs glomiques sont des tumeurs bénignes et rares qui se développent aux-dépends du glomus neuromyoartériel des anastomoses artério-veineuses. Elles touchent surtout les extrémités digitales, mais les localisations extra digitales ne sont pas rares mais surtout méconnues ce qui est responsable du retard de leur diagnostic et de leur prise en charge. Le but de notre travail est de rapporter un nouveau cas de tumeur glomique de l'hallux et d'attirer l'attention vers cette localisation inhabituelle.

Cas Clinique:-

Il s'agit d'une patiente âgée de 35 ans, sans antécédents pathologiques particuliers qui présente depuis 4 ans, des douleurs intermittentes siégeant à la base du gros orteil droit, coïncidant avec un traumatisme du même orteil. Nous avons reçu la patiente qui a consulté à plusieurs reprises vu l'augmentation de l'intensité des douleurs et l'absence d'amélioration sous traitement symptomatique. L'examen clinique de cette patiente montrait une décoloration de la base de l'ongle qui était très douloureuse à la palpation. L'examen ostéo articulaire de l'hallux droit était sans particularités. La radiographie standard ainsi que le bilan biologique étaient normales. L'IRM a objectivé un hyper signal autour du lit unguéal suggérant la possibilité d'une tumeur glomique [figure 1]. Une excision par voie latérale sous unguéale a été réalisée et l'examen anatomopathologique a confirmé le diagnostic de tumeur glomique. Les suites opératoires ont été simples, la patiente a eu un soulagement immédiat des douleurs et l'examen clinique de la patiente après un recul de 3 ans n'a pas montré de récurrence de la symptomatologie.

Discussion:-

Les tumeurs glomiques sont rares et bénignes, elles représentent environ 1 à 5% de l'ensemble des tumeurs des tissus mous [1]. Ce sont des tumeurs qui touchent le sujet adulte, l'âge moyen est de 40 ans, elle est rare avant 20 ans [2]. Signalée pour la première fois par Wood en 1812 [3] qu'il a dénommé (nodule sous cutané douloureux), c'est Masson [4] en 1924 qu'il l'a défini en décrivant le glomus qu'il nomme ainsi à cause de sa similitude avec la glande vasculaire coccygienne de Luschka [5]. Si la localisation digitale est bien connue en chirurgie de la main [6], les localisations atypiques [7-13], comme notre cas au niveau de l'hallux, souffrent de méconnaissance, ce qui conduit à des erreurs diagnostiques et thérapeutiques. La symptomatologie clinique associe une triade classique

avec douleurs sévères, point sensible et intolérance au froid. Ce qui caractérise également la symptomatologie est le contraste entre l'intensité des signes subjectifs et la pauvreté des signes objectifs. Rarement sont les cas où il y a une histoire traumatique comme dans notre cas [14]. Il n'y a pas d'imageries spécifiques permettant la confirmation diagnostique, cependant l'échographie, malgré sa faible spécificité aide à localiser la lésion [15]. L'IRM reste le gold standard dans le diagnostic des tumeurs glomiques, elle précise le siège exact de la lésion et sa relation avec les structures avoisinantes [16-18]. Son traitement est toujours chirurgical, il consiste en une exérèse chirurgicale qui entraîne une disparition rapide des douleurs. Les récurrences sont rares mais possibles, elles sont toujours précoces et le fait d'exérèse incomplète, d'où la recommandation de certains auteurs [18-20] d'exciser plus que les limites apparentes de la tumeur.

Figure 1:- aspect IRM objectivant un hyper signal autour du lit unguéal.

Conclusion:-

Les tumeurs glomiques sont rares mais non exceptionnelles. Elles peuvent siéger partout ou existe les glomi. Devant toute douleur avec ou sans masse palpable, sans étiologie évidente, le diagnostic de tumeur glomique doit être évoqué.

Acute Leukemia, HLA Polymorphism.

Abstract

Background: expression of certain HLA alleles, considered susceptible factor to acute leukemia (AML, ALL), there were clear associations between resistance or susceptibility to cancer and (HLA) profile, this work **aims to** investigate role HLA-DRB1 and anti HLA-G in development of AML. **Patients and methods:** (40) patients with acute leukemia aged from 4 to 60 years (23 male and 17 female), and 20 healthy subjects as a control, all were tested for anti-HLA-G by four-color flow cytometer using FACS Canto (BD Biosciences: USA), HLA-DRB1 by Sequence Specific Oligonucleotide PCR (SSO-PCR), DNA purification by (Spin Protocol), Qiagen, Hilden, Germany, QIA amp DNA Mini, thermal cyclers BIO-RAD PTC-100 (USA), hybridization with DNA probes, alleles detection; INNO-LiPA HLA typing, Fuji Rebio Group, Belgium, with the INNO-LiPA HLA-DRB1 Plus kit, Cat. No. #58355. **Statistical analysis:** SPSS 19 edition was used, gene frequencies of HLA-DRB1 alleles were calculated by direct count. **Results:** there is an allelic association between HLA-DRB1 and leukemia, patients and control showed significant difference between DRB1*13 ($p = 0.006$ and $p = 0.016$ respectively) (protective nature), but there were moderate difference among DRB1*06 ($p = 0.098$), DRB1*14 ($p = 0.098$), (also, protective nature) and *15 ($p = 0.098$) (Risk factor). However, we did not observe any significant difference for the others HLA-DRB1. **Conclusion:** HLA-DRB1*13, and HLA-DRB1*15 alleles were protective while HLA-DRB*06 and DRB1*14 were predisposing factor for AML.

Introduction:-

Leukemia is uncontrolled proliferation of hemopoietic cells (1). Acute leukemia is divided into a number of different subtypes based upon clinical, morphological, immunophenotyping, cytochemical, cytogenetic and molecular biology or by combinations of these characteristics (2). Although a study of HLA understanding of that relationship has been slow to emerge (3). Studies show that HLA genes are involved in various mechanisms of pathogenesis and immunoediting of hematological diseases (4). Leukemia was the first disease in which involvement of the major (MHC) was reported (5). Studies on the role of the HLA in leukemia susceptibility represented a lot of data with many questions were raised but few confirmatory answers were available (6). Although, not all studies of leukemia and HLA demonstrate associations. Further studies are required to support these conclusions (7). Studies of the

correlation between HLA polymorphisms and susceptibility or resistance to disease started soon after serological methods for HLA class I had been standardized (8).

There are clear associations between resistance or susceptibility to cancer and (HLA) profile of an individual (9). The association between HLA and various hematological malignancies has been studied extensively (10).

The rate of expression of certain HLA alleles is considered among the factors of susceptibility to develop leukemia. Many studies have been performed in humans investigating the role of HLA antigens in pathogenesis of hematological malignancies. Although, the association of HLA with the molecular features of leukemic cells is still unclear (11). HLA-G contributes to tumor escape host responses, and its potential clinical relevance in various malignancies was discussed (12). The part devoted to HLA-G in tumor escape remains to be more precisely determined in these acute pathologies (13).

Patients and methods:-

Design and population:-

This prospective study has been carried out in Hematology Unit in Clinical and Chemical Pathology department of Sohag University Hospital in the period from January, 2012 to August, 2015. Study was conducted on forty (40) patients; 23 males (57.5%) and 17 females (42.5%), suffering from acute leukemia of both lymphoid and myeloid lineage, they aged from 4 to 60 years old. The control group consisted of 20 unrelated healthy volunteers. The control panel reasonably corresponds to the same age, sex distribution, living in the same geographical area and with the same ethnic origin of the patients' panel.

Ethics:-

This study was conducted in accordance with the ethical standards of the Helsinki Declaration of 1964, as revised in 2000 and was approved by the Institutional Review Board of the Faculty of Medicine, Sohag University. Informed consent was obtained from all the study participants.

Sampling: Blood samples were collected from all patients and healthy subjects. 2 ml of EDTA anticoagulated blood were collected. Diagnosis of leukemia was based on complete blood count, blood film morphology, B.M examination cytochemistry and immunophenotyping.

Flowcytometry for anti HLA-G: Four-color flow cytometer; FACS Canto (BD Biosciences, USA) was used. Purified mouse anti-human HLA-G denatured: FITC goat anti-mouse IgG/IgM 0.5 mg polyclonal Cat. No. # 555988. Purified mouse IgG1, κ isotypic control 0.1 mg, MOPC-21 Cat. No. # 555746. FACS lysing solution 10X ; BD Cat. No. # 349202. Falcon disposable 12 x 75-mm capped polystyrene test tubes B.D Cat. No. #2058.B.D. Monoclonal antibodies to human cell surface antigens (anti-CD33, anti-CD13 and anti-CD19 stained with Fluorescein isothiocyanate (FITC) and anti-CD45 antibodies stained with phycoerythrin (PE)).

Flowcytometry for anti HLA-G was carried out in Hematology Unit in Clinical and Chemical Pathology Department of Sohag University Hospital.

HLA Typing:-

All patients and controls were subjected to molecular HLA-DRB1 typing. 2ml EDTA-anticoagulated blood samples were collected from patients and controls. Samples stored by freezing to -80°C then thawed in 37°C in the incubator in the day of the run. Samples were processed for detection of HLA-DRB1 alleles by Sequence Specific oligonucleotide PCR (SSO-PCR) in following steps : DNA extraction using the spin column technique (QIAamp DNA Blood Mini kits; Qiagen, Hilden, Germany) was performed according to the manufacturer's guidelines; polymerase chain reaction (PCR) amplification of (exon 2) of the HLA-DRB1 alleles (INNO-LiPA HLA-DRB1 Amplification Plus kit; Fuji Rebio Europe, Ghent, Belgium) were performed and the amplicons were chemically denatured to form single-stranded DNA. Reverse dot-blotting was performed on a nylon membrane (INNO-LiPA HLA-DRB1 Plus strips, Fuji Rebio Europe), which contains an array of immobilized, sequence-specific oligonucleotide (SSO) probes. The biotin-labeled amplicons were then bound (hybridized) to these SSO probes, which contain a complementary target sequence and, thus, were captured onto the membrane strip; 3) visualization of the results was achieved by incubating with an enzyme conjugate (streptavidin and alkaline phosphatase), which binds to the biotin of the PCR product, followed by the addition of a substrate. The bands with the captured PCR product turned blue. Interpretation was achieved by using standard tables with the help of specialized software:

LiRAST™ FOR LiPA HLA V6.0X.

HLA typing was carried out in Immunology Unit in Clinical and Chemical Pathology Department of Mansoura University Hospital.

Statistical Analysis:-

Statistical analyses were carried out using the SPSS® statistical package. Released 2010. IBMSPSS Statistics for Windows, Version 19.0. Armonk, NY: IBM Corp., Microsoft Office Excel 2013 for Windows and online analytical computer assisted sites.

Gene frequencies of the HLA-DRB1 alleles of both study groups were calculated by direct count. For comparison between the groups, we used χ^2 analysis by using 2×2 contingency tables and Fisher's exact test when appropriate; *P* values less than 0.05 were considered statistically significant. For estimating risks, we employed odds ratio (OR) with a 95% confidence interval (95% CI).

Results:-

The polymorphism of HLA-DRB1, genes was investigated in twenty normal individuals and forty leukemic patients. The clinical data of the examined subjects were presented in table (1)

Comparison of the results between the normal population and acute leukemia patients revealed that there is no difference between anti HLA-G antibodies in both patients and control groups as in table (2) figure (1,2 and), there is an allelic association between certain HLA-DRB1, and leukemia disease. Our results showed that in leukemic patients and in normal individuals, the difference between DRB1*13 was significant (*p* = 0.006 and *p* = 0.016 respectively) (protective nature), but there were moderate difference among DRB1*06 (*p* = 0.098), DRB1*14 (*p* = 0.098), (also, protective nature) and DRB1 *15 (*p* = 0.098) (Risk factor). However, we did not observe any significant difference for the others HLA-DRB1.

As regard gender the HLA-DRB1*10 allele was not detected in any of the male patients (*P* = 0.091). With no significance difference between males and females in other HLA-DRB1, illustrated in figure (3). According to the immunophenotyping of leukemia, the HLA-DRB1*01 allele was not detected in any of the AML patients in relation to ALL patients (*P* = 0.109). With no significance difference between AML and ALL in other HLA-DRB1. The HLA-DRB1*14 allele was not detected in any of the controls in relation to ALL patients with moderate significance (*P* = 0.057) (relatively risk factor). The HLA-DRB1*13 show high frequency in controls in relative to ALL patient with moderate significance (*P* = 0.054) (Relatively Protective). With no significance difference between ALL and controls in other HLA-DRB1 as demonstrated in table -3 and 4.

HLA-DRB1*06 allele was not detected in any of the controls in relation to AML patients that significant difference (*P* = 0.044) (risk factor). The HLA-DRB1*13 show high frequency in controls in relative to AML patient (*P* = 0.006) (Protective nature). With no significance difference between AML and controls in other HLA-DRB1.

Discussion:-

The first study on HLA in human leukemia demonstrated an increased frequency of HLA-A2 in ALL in 1967. From that date many previous studies have demonstrated some significant differences in HLA allele frequencies in leukemic patients and normal subjects which had reported by Diase et al (2015) and others (14, 15,16). In our study, significant positive association with the disease, in patients compared to controls, was found for two alleles: HLA-DRB1*013. Also there were moderate difference among DRB1*06 DRB1*14, and *15. It is suggested that HLA-DRB1*13, and HLA-DRB1*15 alleles may play a protective genetic factor against leukemia while the HLA-DRB1*06 and –DRB1*14 allele could be a presumptive predisposing factor. Regarding anti-HLA-G antibodies analysis, no significant association was found between patients and control groups. Also, our study shows that HLA-DRB1*10 allele was not detected in any of the male patients with moderate significance with no significance difference between males and females in other HLA-DRB1 or anti-HLA-G antibodies. Our results are consistent with Du et al (2013), that demonstrated that the allele frequencies of DRB1*15 obviously decreased in patients with leukemia so, it can be considered as genetic indicators for resistance of leukemia. But they demonstrated that the DRB1*07 have a protective role too (17). Diase et al (2015) had reported that HLA-DRB1*13, which showed a decrease in patients, should be protective against ALL (14). The findings that were demonstrated also by Dorak et al (2013), who reported that the frequency of the HLA-DRB1*13 allele was lower in male patients of leukemia (15).

Also Bosen et al (2013); reported that the frequency of the HLA-DRB1*13 allele was lower the female ALL patients compared to controls (7). On the other hand, Chaing et al (2012) had found that there is significant positive association with the disease, in patients compared to controls, was found for three alleles: HLA-DRB1*13 and HLA-DRB*01 (10). Also there were moderate difference among DRB1*04, *03 and *15. It is suggested that HLA-DRB1*13 (on contrast to our results), *03 and *04 alleles may play a presumptive predisposing factor while the HLA-DRB*01 and *15 (on contrast to our results) alleles could be a protective genetic factor against leukemia (16). A significant increase in the frequency of the HLA-DRB1*04 allele in the overall and ALL patients, was reported in many studies although there is no significant difference between patient and controls (17). We found that the HLA-DRB1*14 allele was not detected in any of the controls in relation to ALL patients with moderate significance (relatively risk factor). There is no significance difference between ALL and controls in other HLA-DRB1 or anti-HLA-G antibodies. Our results are consistent with Ehernberg et al (2014); who found, significant decrease in HLA-DRB1*04 (in contrast to be previously reported by Bosen et al (2013), and an increase in allelic distribution of HLA-DRB1*03 in ALL patients in relative to controls which show no significant difference in our study(7,18).

In our study, The HLA-DRB1*06 allele was not detected in any of the controls in relation to AML patients that significant difference) (risk factor). The HLA-DRB1*13 show high frequency in controls in relative to AML patient (protective nature). There is no significance difference between AML and controls in other HLA-DRB1 or anti-HLA-G antibodies.

Our findings are inconsistent with Elansary et al (2015), who reported that high significant increase allelic distribution in HLA-DRB1*11 and moderate decrease in HLADRB1*07 in AML patients in relative to controls which show no significant difference in our study (19).

Bosen et al (2013), observed that the frequencies of the HLADRB1*15 alleles in patients with AML were significantly higher in AML patients compared with healthy controls, Du et al (2013), observed significant increase in allelic distribution of HLA-DRB1*07 in AML patients and suggests that it is susceptible to the disease in contrast to Ehernberg et al (2014) observations. These results not consistent with Chaing et al (2012) that demonstrated that allelic distribution of the HLA-DRB1*13 is significantly high among AML and overall acute leukemia patients group in relation to controls (7, 10, 17 and 18). Few studies had been performed on HLA-G expression in different types of leukemia patients, however, data are limited and conclusions remain controversial and discordant (19). Regarding anti-HLA-G antibodies analysis, no significant association was found between patients and control groups. Also our results are inconsistent with the results of other authors who have not found membrane bound or cytoplasmic HLA-G expression (7). A group of previous studies addressed that no cell surface HLA-G was expressed in various types of hematopoietic diseases, such as AML, ALL, CLL and CML. In contrast to these previous studies, B-CLL samples express cell surface HLA-G antigen in a variable proportion of leukemic tumor cells. Methodology difference address this controversy (20). The discrepancy between the results of different studies, including our results, may be attributed to the differences in population race and geographical distribution. However, further larger studies are required to support our findings.

Conclusion:-

Some HLA alleles are associated with an increased susceptibility while others are protective. Although, some of the results from the present study support these earlier findings. The discrepancy between the results of different studies, including our results, may be attributed to the differences in population race and geographical distribution, environmental, occupational factors.

Conflicts of interest:-The authors had no conflicts of interest to declare in relation to this article.

Table (1):- Clinical data of the studied groups

Variables	Control	Patients
Age (years)		
Mean± SD	32.35 ± 19.07	33.08 ± 21.79
Male/Female	11/9	23/17
Diagnosis and Frequency	100 % healthy normal	AML (22) 55% ALL (18) 45%
Total	20	40

Table (2):- Anti-HLA G positivity between cases and controls

Item		Anti HLA-G		Total
		Negative	Positive	
Patients number		17	23	40
% within group		42.5%	57.5%	100.0%
Control number		6	14	20
% within group		30.0%	70.0%	100.0%
Total number		23	37	60
% within group		38.3%	61.7%	100.0%

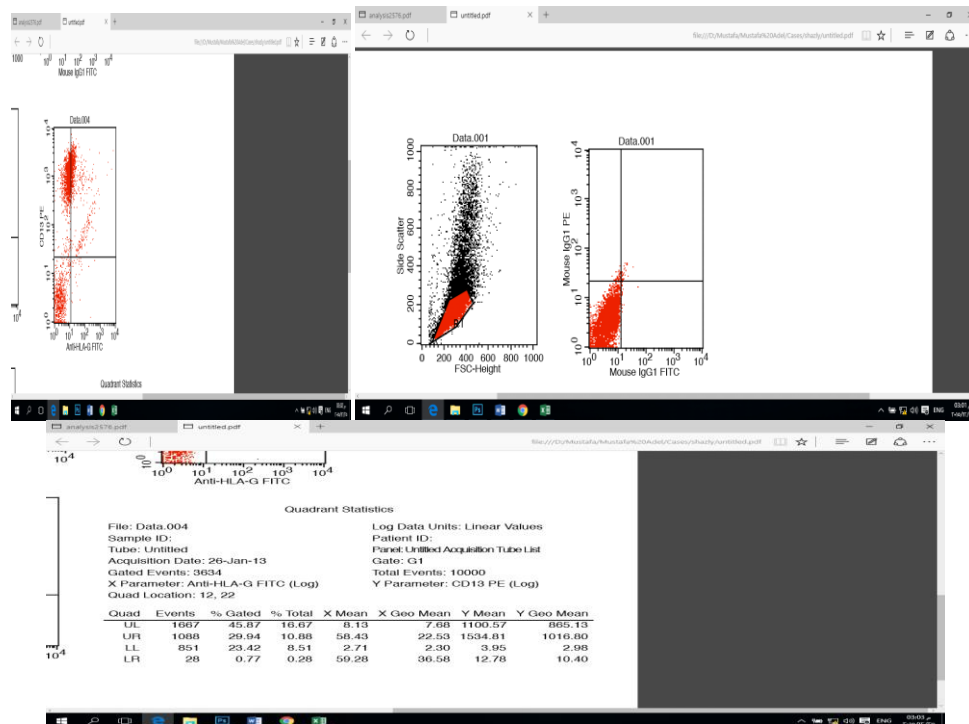

Table (3):- HLA-DRB1 alleles in acute leukemia patients compared with healthy control.

Allele	P value	Odd's ratio	Confidence interval of odd's	
			Minimum	Maximum
1	0.534 (NS)	2.662	0.122	58.122

Abstract

Objective: To explore the sociodemographic profile and long term psychosocial needs of children and adolescents survivors of snowstorm disaster who survived a natural disaster (snow storm) in Kashmir more than a decade back.

Methods: It is a cross sectional study done in a disaster affected population of children and adolescents in South Kashmir 10 years after the snow storm disaster. The study was designed as a survey of the sociodemographic and long term psychosocial correlates and mental health status of young adults living in the same vulnerable area today also.

Results: Participants were 139 young adult inhabitants of snow storm stricken area in south kashmir in 2005 (exposed group) and 71 residents of a geographically and ethnoculturally identical population in central Kashmir area. Rampant psychosocial problems among the young disaster survivors long after the disaster, when no one is around to help after the initial knee jerk response of relief agencies, is clearly reflected through the results of our study.

And measures to address them as clearly revealed by our study through an outreach psychosocial and clinical service programme long after the disaster when no one is around to help after the initial knee jerk response of relief agencies is greatly stressed.

Conclusion: The results indicate that disasters can have long-standing adverse effects on survivor's psychosocial well being and mental health even after 10 years later. Post trauma morbidity is more lasting in people with lesser support viz lower socio economic class, rural background and lower education.

Introduction:-

Though disasters are inevitable part of human existence but increasingly frequent massive disasters and horrendous events over the past decade or so have not only directly impacted many regions of the world but indirectly affected humanity as a whole¹⁶.

A disaster is the outcome of an extraordinary occurrence that destroys property, kills people, and produces physical or psychological damage as well as overwhelming the adaptive potential of the social group¹².

Disasters produce multiple patterns of outcome depending on a combination of risk and resilience factors.² As compared to manmade disasters; natural disasters occur suddenly, usually without warning and kill a large number of people in defined or limited geographical area over a limited period of time.

The consequences of natural disasters are worse and the death toll is greater in developing countries¹.

Children and adolescents are at a higher risk of becoming victims and suffering the losses resulting from disasters. Recent findings have shown that children's reactions to disasters can be severe and are not merely fleeting, transitory events that quickly dissipate⁴. Often an entire community is impacted, further undermining a child's sense of security and normalcy. These factors present a variety of unique issues and coping challenges, including issues associated with specific types of natural disasters, the need to relocate when home and/or community have been destroyed, the role of the family in lessening or exacerbating the trauma, emotional reactions, and coping techniques¹¹. Efforts to provide effective services and interventions for children and adolescents following a disaster therefore represent an important, but frequently overlooked, mental health need.

The northern most state of the country, Kashmir (Jammu and Kashmir) has been regarded as the heaven on earth. Its beauty and hospitable population is legendary. Unfortunately the state has been witnessing a continuous mass manmade disaster situation for more than 25 years, with thousands of people dead, maimed and mutilated, many missing or confined, thousands of children orphaned, and women widowed, a colossal damage to the property, and a damage to the cultural ethos including en-mass migration of a minority community¹³. As if this unrelenting manmade mass traumatic situation and its sequel was not enough, a small picturesque village "Waltengo Nard" at the foothills of Pir Panchal range of Himalayas about 90km from Srinagar, the summer capital of Kashmir, was struck by a devastating snowstorm following continuous heavy snowfall for five consecutive days.^{7,18}

The snowstorm was named "Snow Tsunami" by the Air Chief of India and the other rescue agencies. Almost 25% (n=164) population perished within minutes. Since dead bodies could not be moved out to graveyard, 5-10 bodies had to be buried together in mass graves in the same houses where some of the injured and surviving people were still trapped. One-year longitudinal study of the snow storm disaster survivors by Margoob et al. in 2006 had revealed a very high level of psychological problems and psychiatric morbidity among the surviving population¹⁸. Disasters can have detrimental consequences at the individual and community level, altering the infrastructure of societies and causing both physical and psychological suffering among those affected. Mental health research has increasingly focused on the adverse consequences of disasters on the health of survivors but most of the research available so far from natural disaster related literature is confined to only short term impact of such catastrophes. So to advance our understanding of the consequences of disasters on survivor's mental health, by examining the possible sociodemographic vulnerabilities and psychosocial outcomes 10 years after storm disaster was undertaken as the objective of this research endeavor.

Material and Methods:-

Study Design:-

This was a cohort cross sectional study, the study group comprised of the young adults of the whole surviving population of the disaster affected area (exposed) at the Waltengo Nard, Qazigund. The control group included the population of snow storm unaffected area (unexposed) about 100 km away from the disaster site at Inder Nard, Kangan, District Gandral with identical sociodemographic and socio cultural background

Sample:-

All the young adult snow storm disaster survivors of age between 19 years to 39 years were approached to be included in the study, after the households were enumerated with the help of key persons at the site. Similarly in the control population, households were included randomly and their corresponding age inmates were enrolled as study subjects. Informed consent was obtained from the from each subject included in the study. Those who refused to consent or could not be contacted were excluded.

Tools:-

A semi-structured interview schedule specifically prepared for the study was used to collect information on the socio-demographic variables in both groups and the extent of exposure to snow storm disaster in the study group. Kuppaswamy's Socioeconomic Status Scale ¹⁰ was used for determining socio-economic status. Oslo-3 Social Support Scale (OSS-3) was used to calculate social support ³. Appropriate statistical tools to analyse the results were used.

Results:-**Table 1:-** Present age wise make up (as on ending Oct.2016) of disaster survivors and Comparison population.

Discussion:-

The studied population of Gujars (semi-nomadic) tribe had a comparable age wise distribution between the two groups as reflected by Table 1. Gujar are a pastoral agricultural ethnic group with populations in India and Pakistan and a small number in north-eastern Afghanistan. According to the 2011 Census of India, Gujar is the most populous scheduled tribe in the state of Jammu and Kashmir having a population of 763,806. Though there were no statistically significant differences between the snow storm-exposed and comparison groups with regard to most of the demographic information, but as revealed by the result the study sample is mostly comprised of young adults belonging to the poorest strata of the society with lowest education level, families without any sustained or permanent source of income, poorest social support, (71.22% in study group and 60.56% among the control group.)

Undesirably except for the initial 1-2 months after disaster, the survivors' real immediate and future concerns were never secured. Almost every year the extremely poor and marginalised disaster hit community continues to be subjected to severe re-traumatisation in winters when following a snow fall they are evacuated and rescued to safer places by the government agencies which has continued till this year's snow fall on 18th January 2017. The importance of psycho-social consequences need to be recognized earnestly so as to develop appropriate policy with relevant plan of action and integrate it into the overall disaster management strategy to meet the mental health needs of the disaster effected populations. For children, adolescents, and young adults response to disaster involves a complex interplay of pre-existing psychological vulnerabilities, stressors and nature of support in the aftermath.

The present study is a far-sighted one which aims to determine long term psychological morbidity among the surviving children and adolescents of this disaster affected area ten years after the snowstorm disaster. Since, sociodemographic factors also play a role in trauma vulnerability and resilience, therefore, the age group studied in this research was obviously more vulnerable sub group of the disaster hit population and has faced the brunt of the storm as young children and adolescents. This is consistent with the research that has suggested that younger children possess fewer strategies for coping with both the immediate disaster impact and its aftermath, and thus may suffer more severe emotional and psychological problems¹⁷ and adolescents are also known to suffer significant morbidity under such conditions¹⁹

Our study shows that people with lower educational level have higher psychiatric morbidity. This was in accordance with an earlier study by Kar et al⁸. These findings are also in agreement with the findings of another study which found maximum morbidity (34.1 %) in less educated young population⁵, but nothing can be commented about the reported protective role of higher educational status in our studied group due to the harsh reality that more than 85% of the young adults studied by us were forced by unfavourable circumstances to abandon education before qualifying even before qualifying the 8th Std. As recently observed by Kousky(2016) not only are disasters themselves stressful and frightening, but children suffer psychological harm from the damage to their homes and possessions; from migration; from the grief of losing loved ones; from seeing parents or caregivers undergo stress; from neglect and abuse; and from breakdowns in social networks, neighbourhoods, and local economies⁹. Disasters can interrupt children's education by displacing families, destroying schools, and pushing children into the labour force to help their families make ends meet in strained times. Reinforcing coping and resilience among the disaster survivors is also imperative.

The coping strategies adopted by our subjects to tackle the psychological distress were surrender to the will of God, sharing with relatives and family members, getting busy, using tobacco and other medication, and some of them could not define it. This resulted in their rationalising the event and hence, possibly, prevented them from much psychological distress. This observation is in agreement with the observation reported by Margoob et al in the same population at one year post disaster period.¹⁴ Spiritual help from faith healers, clergy and respected elders from the community was of immense help in helping survivors to come to terms with and live down the trauma. Eastern

religions teach inevitability of fate, which helps survivors to accept and live beyond trauma.¹⁵ Spiritual involvement in the survivors of Waltengo also involved attachment to and obedience of local clergy (Imams) and spiritual leaders (Pirs). In many cases extreme avoidance or numbing of even desperate cases was significantly reduced, within a few sessions of advice and counselling by them. Integrating spiritual components as a part of the psychosocial interventions was rewarding in the management of many patients with severe post disaster psychopathology.¹⁴ Spiritual healers (Pirs) and clergy (Imams) have a central role in this process among socioeconomically deprived and educationally backward people, who in the absence of any mental health care service hold the pir in high reverence.⁶ Psychotherapeutic intervention through the medium of spirituality actually contains some essential elements of cognitive behaviour therapy including informal administration of elements of prolonged exposure, stress inoculation therapy and cognitive reframing.

Summary and Conclusion:-

The following conclusions can be drawn from the study:-

- The results indicate that disasters can have long standing effects on survivor's psychosocial well being and mental health even 10 years later.
- Post trauma morbidity is more lasting in people with lesser support viz lower socioeconomic class, rural background and low education level.
- Post trauma sequel need to be recognised in the study sample in view of having a high prevalence of trauma.
- The positive coping methods and socio- cultural bonds and spirituality need to be further strengthened.

Suggestions:-

As reflected by the study, disasters can have a long term negative impact on the psychosocial well being of the survivors, particularly the vulnerable groups such as children and adolescents. The interaction at the interface of society and environment in developing countries essentially determines the outcome of disasters. There is a need to frame a timely and well framed policy to solve disaster related problems. Raising the awareness regarding the coping mechanisms for disasters especially in the developing world should be given priority for measures of post disaster recovery. Attention needs to be paid to high risk groups and strong policy support and appropriate guidance mechanisms need to be put in place.

AES algorithm, Personal data, Encrypt
 Once and Decrypt in Any Operation
 System
 [EODAS], Self-encryption, Reset
 Operations.

Abstract

Objectives: Securing portable devices with the help of existing technology of Bit-Locker drive encryption, with more security of reset operations, if you lost your portable devices like memory cards, pen drive etc. The main objective is to make Data more secured and unauthorized access is denied when they try to access the personal information that are present in SD card after the User lost his/her Mobile/SD card.

Methods: a performance difference between Bit-Locker enabled device and Bit-Locker not enabled device with varying of read/write operation is more in non-enabled Bit-Locker device, so we will suggest to encrypt SD card using Existing Method Bit-Locker and also we suggest an Idea that User can Encrypt once in Windows Platform and Decrypt in Other Platform (Ex: Ubuntu) better way of protecting the SD card.

Findings: The issues of Bit-Locker device that is we enabled Bit-Locker drive encryption, even the drive is locked but the user can be able to format the entire drive without any interruption. so we have given better solution for these type of problem and also if you lost your portable device without encrypting the unknown user can easily misuse the data present in portable device, so we provided a solution if any unknown user wants to access your data it will ask for password, if unknown user enters 5 times wrong password the portable device will be locked and all the data is format the unknown user cannot perform any read/write operation on portable device. And also if we enabled bit-locker drive encrypted it will have decrypted in windows operating system so we introduced a concept of encrypt once and decrypt in any operating system [EODAS].

Improvements: The privacy data is more secured compared to Bit-Locker technology, with reset operation if unknown user enters five times wrong password the portable device will be format and lock the portable device with read/write operations. Performance is more improved.

Introduction:-

Data security is the main challenges that prevents the wider acceptance of mobile devices especially within business¹. Mobile Technologies are rapidly replacing the traditional cellular phones because of its PC-like features which allow them to use many services like (browsing, money transaction etc.). all the smartphone as the feature to install the third-party application and if not enough storage is available in the internal memory the user can explicitly move all the installed third party application to SD card as the installed application are moved to SD card the user data stored on this SD card and the services that they provide becomes more and more vital. Mobile operating systems naturally become the target for security inspection as they are responsible for managing all the information and services.² studied on the analysis of security weakness in bit-locker technology and puts forward some measures to improve its security.

So, the existing problem in Bit-Locker technology we encrypt SD card and It cannot be decrypted in any other operating system and it takes lot of time for encrypting. Unfortunately, we discovered that Bit-Locker possesses some critical weaknesses. In this paper, we illustrate our discoveries about the vulnerabilities of the scheme. We also suggest a way to take advantage of the ideas introduced with Bit-Locker technology using standard tools in order to provide an efficient and strongly secure encryption scheme, if the Smartphone lost/stolen the content of SD card can easily misuse by any person like SD card consists of personal photos, videos, third party applications data (WhatsApp backup file, Account password text file etc.) for better way to eliminate this problem our paper explain the different way of encrypting the SD card that helps protect your files and folders from unauthorized access in case your SD card is lost or stolen. To Provide better security we introduce a concept called Encrypt once and Decrypt in any Operating system (EODAOS) usually if the user encrypts SD card in Android Operating System, the user can only decrypt in that particular operating system, our paper will explain about encrypt in one operating system and decrypt in any operating system with secure password/passcode authentication.

Literature Review:-

An algorithm of SE (self-encryption)^{1,2} is an efficient encryption for sensitive files requiring the user to enter password or PIN code, the author explains detailed analysis of the weaknesses of the SE scheme.

The algorithm takes better way when using AES encryption³ algorithms based on the high-performance computing of GPU, usually encrypting time of traditional AES algorithm is too long to meet fast encryption. The author come up with better way to encrypt with High performance computing with GPU Using AES Encryption.

A comparison between DES, BLOWFISH and AES, the author^{4,5,11} explains the different Cipher type, Possible keys, Key length and rounds, and time consumption for each algorithm with specific cipher type. Discusses an algorithm the increasing need for Secured data communication⁶ has led to development of several cryptographic algorithms, the author explains secured High throughput implementation of AES algorithm, author explains complete detailed explanation of AES algorithm and comparison between AES Versions, Key Length, Block Size and Number of Rounds.

The key-based security for document encryption⁷ system, utilizing the security key on the key usage of effective administration to guarantee that exclusively approved clients can decode the document and make the proper operation, and utilize the hash calculation for document honesty check, and in this way successfully enhance the security of electronic records, guaranteeing its respectability, proposed a new design to give a safe authentication⁸ such that the Hardware and security measures executed in the system vanquishes any endeavors of unauthorized access to retrieve the information and to keep up extreme control to secure information and prevent theft, by dealing with outline measurements also, proposed discusses Mobile security^{9,10,13} testing targets to detect vulnerabilities and malicious apps on a mobile devices explains various mobile security model like Android security model, IOS security model, Windows Phone security model and briefly explains about Application-based Mobile Threats in all mobile platforms^{12,14,15} explains about image encryption in mobile devices and explains elliptic curve cryptography (ECC) and apply the same for convenient encryption and decryption of an image^{16,17} author explains the securing applications in windows phone, To have an excellent security to the windows phone the developers and Microsoft will utilize the better methodology, By utilizing the sandbox idea, applications won't have the entrance to utilize the information of different applications.

Existing System:-

In order to encrypt the disk, we currently use Bit locker (or) other third party software (Ex: True crypt, File vault, McAfee Drive Encryption (safe boot), private disk etc.). So using Existing Method we are going to Explain How to Securing SD card with Bit Locker Drive encryption.

Bit Locker:-

BitLocker Drive Encryption¹⁹ is built into the Windows operating system and uses Advanced Encryption Standard (AES) with configurable key lengths of either 128 bit (default) or 256 bit (as to configure in Group Policy). The idea behind the BitLocker Drive Encryption¹⁸ is that once you secure your drive, only you, or someone who has your password and recovery key, will be able to get to your data. Explains the attack strategies²⁰ against Bit-Locker which goal the way Bit-Locker is using the TPM sealing device.

Bit Locker Drive encryption encrypts your entire drive.

Bit Locker Performance:-

Enabling Bit Locker drive encryption in PC/Mobile to protect the personal files/folders, but we have to think about the performance. If we configure Bit Locker drive encryption there is a performance degradation in both read and write operation of the disk. Performance depends on the combination of processor, RAM and hard disk type (SSD, HDD).

The Performance was tested the performance of read/write operation using a free tool called AS-SSD-Benchmark version number 1.9 with laptop configuration of 1.50 GHZ AMD A4-5000 APU with Radeon™ HD Graphics with 4 GB RAM and 16 GB SanDisk Ultra USB 3.0 pen drive with Bit Locker Drive Encryption and without Bit Locker Drive Encryption.

Tool Explanation:-

Article²¹ explains the tool as test the sequential or random read/write performance without using the cache. AS SSD Benchmark reads/writes a 1 GByte file as well as randomly select 4K blocks. Moreover, it performs the tests using 1 or 64 threads and it determines the SSD's access time.

Two extra benchmark tests inspect the drive's behavior when (1) copying a few big files, a lot of small files and a combination of file sizes by using cached copy functions of your OS as well as (2) Reading/writing data depending on the data's compressibility.

Read operation:-

Figure 1:- Read operation.

Read operation takes data out of a specified address in the memory. In Figure¹ explains the performance of varying in Without Bit locker, the reading speed will be more, if we Enable Bit Locker Drive encryption then the speed will be less than 25 %. Taking more time to retrieve the address of specified block in Bit Locker drive encryption because of each block encrypted and taking more time to decryption, for increasing the speed of Bit Locker drive encryption the processing as done both using GPU and CPU to increase the efficiency of an encryption.

Write operation:-**Figure 2:-** Write operation.

In Figure ² explains the performance of varying in Write operation puts data into a specified address in the memory. If you are copying small file, the file copied very fast. But think if you are copying more than 10 – 20 GB in Bit Locker Drive Encryption disk it takes lot of time to get copied.

Proposed System:-

our algorithm and it's working, algorithm follows two fundamental operations. This include a phase of reset operations, increases the speed of encryption process in bit-locker. Since it undergoes two operations (phases) the overall complexity increases and algorithm becomes quite difficult to attack from hackers or attackers. The fixed length of key is generated which must be kept secret. Even through the complexity is very high, but time taken by the algorithm for encryption is less and

Procedure to encrypt the portable device is simple. Thus, algorithm can be used to any portable devices, such as camera SD card, PC, Mobile etc. The following section discusses the procedure to encrypt the SD card.

Algorithm for Encrypting: -

1. User has to Select Key length (64 bits, 128 bits, 256 bits).
Note: if we select lower bits for encryption it will take less time to complete encryption.
2. The key is generated and stored in Flash memory i.e. Root folder of SD card [System Volume Information]
3. The SD card blocks are divided based on the Key Size that user as selected.
4. Temporary master file is created in User selected local disk. By default, master file is secured by AES cipher encryption.
5. All the block address is stored in the master file.
Initial password has been written in master file.
 $M = \text{AES}(BA)$
Where,
M=master File
BA=Block Address
6. After successful store of master file, the shift rows or mix column Sub-programs will execute with all blocks.
7. Encrypt all the blocks with key size if not go to step 6.
8. After encrypting the master file consists of two separate section one is before encrypting block address and after encrypting block address.
9. Now master file, reset program and auto run programs are flashed to SD card.
10. Now SD card is encrypted.

Figure 3:- Encryption Process of SD card.

Algorithm for Decrypting: -

1. User Mounts SD card.
2. When User Opens the SD card Drive the Command prompt will be shown The user has to enter password, If password does not match the reset program will be executed will be formatted everything in SD card, after that the user still unable to save any content in SD card.
3. If password matches the block is divided with Key size.
4. After that the master file will assign the block with before encryption content.
5. Now the SD card is decrypted.

Results:-

Table 5.1:- Comparison between existing method.

	<u>Read</u>	<u>Write</u>	<u>Format</u>	<u>Platform support</u>	<u>Security</u>
Without Bitlocker	YES	YES	YES	All platform	Less
With Bitlocker and Password	YES	YES	YES	windows	More but not portable
With Bitlocker and without Password	NO	NO	YES	windows	Less
With Bitlocker and EODAS without password	NO	NO	NO	Windows, Ubuntu	More with portable
With Bitlocker and EODAS with password	YES	YES	YES	Windows, Ubuntu	More with portable

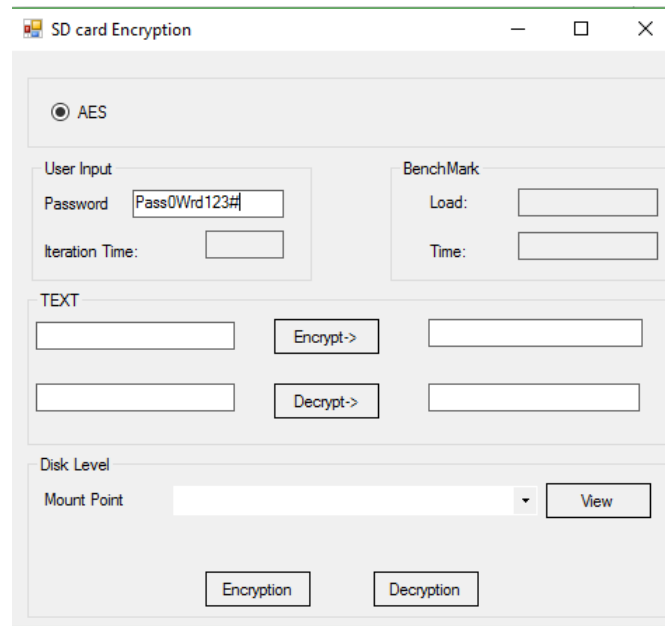

Figure 4:- GUI for Mount Point.

In figure ⁴ the user select Mount Point and Enter password based on password the Key length will be taken, if user has given less time it will take less time to encrypt, It will display how much time it has taken for loading and how much time it takes for encrypting complete disk using this Approach.

Select Disk Location:-

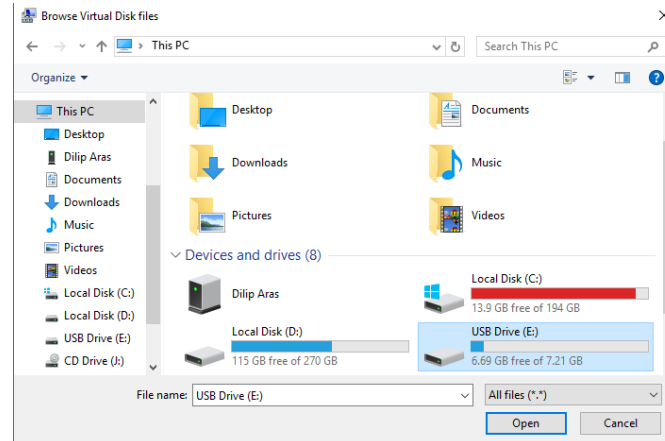

Figure 5:- Select Disk Location.

In figure ⁵ if the user wants to decrypt the disk he will first select disk location in my computer, If user decrypts SD card the SD card is no more secure it just clears the password and encryption information from Autorun.exe.

SD Card Reset Operations:-

When User Opens the SD card drive the Command prompt will show in which user has to enter password, if password does not match the reset program will be executed and will be formatted everything in SD card

Figure 6:- Enter Password Screen.

If user enters Wrong Password the Disk will be formatted.

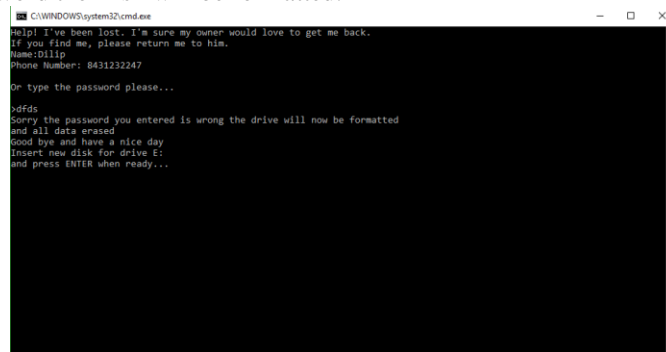

Figure 7:- Displays Error Message Screen.

The SD card data completely formatted and hence unknown user can not get any information.

Conclusions:-

The AS-SSD-Benchmark tool is used to help to determine the speed of the Bit Locker Disk encryption in both read/write operation. We suggest to encrypt the disk using Bit-Locker and new way of resetting the disk, if the password as entered wrong for 5 times the disk will be formatted.so far we tested in two platforms (windows, Ubuntu) if idea succeeded we will try to improve in all platforms.

The encryption is faster and more secure with reset option and disabling the format option under Context Menu which was the disadvantage in Bit locker drive encryption security. Then we proposed ideas in order to construct an encrypt once and decrypt in many devices, we verified the feasibility of our ideas by making a performance analysis which involves experiments on a popular mobile platform and popular desktop operating system.

Published: March 2017

Key words:-

Dental extractions; local anesthesia;
local anesthetics; centbucridine;
lidocaine; lignocaine.

Abstract

Purpose: The aim of the present study was to identify significant differences between centbucridine and lignocaine with regard to efficacy of local anesthesia, cardiovascular stability, and side effects of the local anesthetics.

Materials and methods: We performed a systematic and electronic search of several databases using specific keywords, and a manual search through February 2017. The inclusion criteria were clinical human studies, including randomized controlled trials (RCTs), controlled clinical trials (CCTs), and retrospective studies, with the aim of comparing the two drugs in dental/oral surgical practice. Meta-analysis was used to select a fixed or random effects model according to the heterogeneity of the studies. Heterogeneity was assessed using Cochran's Q - test and I^2 . The standard difference in means (SDM) was used as the effect measure for all variables. The results were graphically presented using Forest plot. Funnel plot was used to assess publication bias. The significance level was set at p -value ≤ 0.05 .

Results: Three studies met our inclusion criteria. No statistically significant difference was found between the 2 groups regarding onset of anesthesia ($P = 0.870$), duration of anesthesia ($p=0.327$), depth of anesthesia ($P=0.794$), and pulse rate after 10 minutes ($p=0.087$). A statistically significant difference was found between the two drugs regarding pulse rate after 30 minutes ($p = 0.017$).

Conclusion: The results of the meta-analysis have shown that Centbucridine significantly reduced pulse rate 30 minutes after dental extractions compared with the lignocaine.

Introduction:-

The development of local anesthetics (LAs) has marked the beginning of new era in the field of dentistry. The use of local anesthetics in dentistry and other surgical procedures for adequate pain control with minimum systemic side effects is one of the major concerns all over the world. Control of pain has been one of the medical portents of twentieth century (Malamed, 2004; Gupta et al., 1989).

Address:- Department of Oral and Maxillofacial Surgery, Faculty of Oral and Dental Medicine, Cairo University, Cairo, Egypt.

Lignocaine is the 'Gold Standard' local anesthetic agent against which all new local anesthetics are compared. Although its properties resemble an ideal LA agent, it is not completely free from cardiovascular toxicity and has an inherent vasodilating property (Malamed, 2004; Gupta et al., 1982; Patnaik et al., 1982). As a result of the vasodilating characteristic, it has to be combined with a vasoconstrictor, such as adrenaline, to decrease its rate of absorption at the injection site and hence prolong the duration and depth of anesthesia for routine minor dental or oral surgical procedures. The use of adrenaline as a vasoconstrictor is sometimes contraindicated for medically compromised patients. To overcome these disadvantages, other local anesthetics have been developed over the past few years (Dugal et al., 2009; Mansuri et al., 2011 ; Goyal et al., 2013).

Search for a more effective local anesthetic led to the development of centbucridine (Mansuri et al., 2011) which was mainly developed in India (Muthu et al., 2007). Centbucridine, chemically known as 4-N-butylamino-1,2,3,4-tetrahydroacridine hydrochloride, is a new quinoline derivative with LA action. It was synthesized at the central drug research institute, Lucknow, India, by Patnaik, and has the advantage of having an inherent vasoconstrictor property (Patnaik & Dhawan, 1982). It has an inherent vasoconstrictor effect so it does not need adrenaline to be added. Its efficacy and safety has been proven with its use in subdural anaesthesia and ocular anaesthesia but it has not been widely used for dental anaesthesia (Muthu et al., 2007).

Many studies have been performed on centbucridine in the medical field including ophthalmic surgery (Gupta et al., 1985; Ghose et al., 2004), subarachnoid (Dasgupta et al., 1984), and spinal blocks (Samsi et al., 1983). Most of the clinical work on centbucridine has been published in Indian medical journals. Centbucridine does not affect the central nervous or central vascular system except when administered at very large doses (Gupta et al., 1982; Goyal et al., 2013). However, in dentistry, only a few studies have been published (Gupta et al., 1989; Vaccharajani et al., 1983; Dugal et al., 2009) and most of them were carried out in the early 1980s. All of the published literature has shown centbucridine to be a potent and reversible LA. One study reported it to be four to five times more potent than lignocaine (Dasgupta et al., 1984). The aim of this study is to focus on the question: "Is there a significant difference in the clinical outcomes between the two drugs in dental/oral surgical practice?"

Patients and Methods:-

Data sources and key words:-

An electronic search was performed without language and date restrictions in February 2017 in the following databases: Pub Med, Cochrane Database of Systematic Reviews, Cochrane Central Register of Controlled Trials (Central) and manual search

The key words and their combinations used in this search included

In PubMed: (((((((tooth extraction [MeSH Terms]) OR oral surgery [MeSH Terms]) OR oral surgical procedure [MeSH Terms]) OR tooth extraction [Title/ Abstract]) OR dental extractions [Title/Abstract]) OR dental extraction [Title/ Abstract]) OR tooth extractions [Title/Abstract]) OR minor oral surgery [Title /Abstract]) OR oral surgery [Title/Abstract]) OR dental surgery [Title/Abstract])) AND (((((local anesthesia [MeSH Terms]) OR local anesthetics [MeSH Terms]) OR centbucridine [Title/Abstract]) OR centbucridine HCl [Title/Abstract]) OR local anaesthesia [Title/Abstract]) OR local anesthesia [Title/Abstract]) OR local anesthetics [Title/ Abstract])) AND (((lidocaine [MeSH Terms]) OR lidocaine [Title/Abstract]) OR lignocaine [Title/Abstract]).

In Cochrane Database: (Tooth extraction [MeSH Terms]) OR (surgery, oral) [MeSH Terms]) OR (oral surgical procedure [MeSH Terms]) OR "tooth extraction" (Title, Abstract, keywords) OR dental extraction (Title, Abstract, keywords) OR tooth extractions (Title, Abstract, keywords) OR minor oral surgery (Title, Abstract, keywords) OR oral surgery (Title, Abstract, keywords) OR dental surgery (Title, Abstract, keywords) AND Anesthesia, local [MeSH Terms] OR anesthetics, local [MeSH Terms] OR "centbucridine" (Title, Abstract, keywords) OR local anaesthesia (Title, Abstract, keywords) OR local anesthesia (Title, Abstract, keywords) OR local anesthetics (Title, Abstract, keywords) AND lidocaine [MeSH Terms] OR lidocaine (Title, Abstract, keywords) OR lignocaine (Title, Abstract, keywords).

A manual search of oral and maxillofacial surgery related journals including British Journal of Oral and Maxillofacial Surgery, the International Journal of Oral and Maxillofacial Surgery, Journal of Maxillofacial and Oral Surgery, Journal of Craniofacial Surgery, Journal of Oral and Maxillofacial Surgery, Oral Surgery, Oral Medicine, Oral Pathology, Oral Radiology and Journal of CranioMaxillofacial Surgery was performed. Relevant reviews on the subject and the reference lists of the studies identified were scanned for possible additional studies.

Inclusion and exclusion criteria:-

Inclusion criteria were studies in humans including randomized controlled trials (RCTs), controlled clinical trials (CCTs), prospective studies (RS), and retrospective studies (RS). The aim of the studies had to be a comparison between centbucridine and lignocaine in physically fit (ASA Class I) adult patients of either sex scheduled for extraction of teeth using nerve blocks, with the outcome variables being efficacy of local anesthesia, cardiovascular stability and side effects of the anesthetics.

Exclusion criteria were: highly anxious patients, patients with a history of allergies to local anesthetic agents and known cardiovascular problems, cases with acute infection in the orofacial area, technical reports, case reports, in vitro studies, animal studies, and review papers.

Selection of relevant studies:-

The following data were extracted from the studies included in the final analysis: authors, year of publication, study design, number of participants, patient age range and/ or mean age, sex, site of extraction, types of local anesthesia, intradermal sensitivity test, informed written consent, efficacy of local anesthesia including onset of anesthesia, duration of anesthesia, the depth of anesthesia, cardiovascular stability (blood pressure and pulse rate), side effects to the anesthetic (if any).

Assessment of quality:-

A methodological quality analysis was performed by merging the proposed criteria of the Strobe statement (Von Elm et al., 2007), Moose statement (Stroup et al., 2000), and Prisma statement (Moher et al., 2009), to verify the force of scientific evidence in making clinical decisions. The classification of the risk of potential bias for every article was based on the following criteria: random selection in the participants, definition of inclusion and exclusion criteria, report of losses to follow up (attrition bias), validity of assessments, and statistical analysis. A study that comprised all the criteria mentioned above was categorized as having a low risk of bias, a study that did not comprise one of these criteria was categorized as having a moderate risk of bias. If two or more criteria were missed, the study was classified to have a high risk of bias.

Meta-Analysis:-

Meta-analysis of the present study was performed using Comprehensive Meta-analysis version 2.2.048 software (Biostat, Inc., Englewood, NJ, USA). The first step in meta-analysis is to select the model to be used whether fixed or random effects model according to heterogeneity of the studies. A variety of heterogeneity measures were provided to decide on the fixed or random effects approach. Cochran's Q provides a P-value for the test of homogeneity. I^2 was deemed to be more reliable in assessing inconsistency between studies, with values of 25%, 50% and 75% corresponding to low, moderate and high heterogeneity respectively (Higgins et al., 2003).

Whenever heterogeneity was identified with Cochran's Q - test and/or I^2 , a random effects model was preferred over the fixed effects. Heterogeneity was identified by rejecting the homogeneity hypothesis. Meta-analysis done for prevalence of post-operative sensitivity used the Odds Ratio (OR) as the effect measures while meta-analysis for pain scores (VAS) used the standard difference in means (SDM) as the effect measure.

The results were graphically presented using forest plot. In forest plot, each study is represented by a line. There is a box (or circle) in the line for each study. The mid-point of the box (or circle) represents the point effect estimate, that is, the mean effect estimate for each study. The area of the box (or circle) represents the weight given to the study. The diamond below the studies represents the overall effect. The width of the line showed the confidence interval (95% CI) of the effect estimate of individual studies. The

width of the diamond shows the confidence interval (95% CI) of the overall effect estimate. The vertical line in the middle of the Forest plot (Corresponding to the value 0) is the line of no effect. If the confidence interval overlaps this line (Overlaps 0 value), then there is no statistical significance at 0.05 significance levels. If 0 value is not included in the 95% CI, the results are statistically significant at 0.05 significance level. This is applicable for the effect estimates for the individual studies and the overall estimate.

Funnel plot was used to assess publication bias. The plot by precision is the traditional form. Large studies appear toward the top of the graph, and tend to cluster near the mean effect size. Smaller studies appear toward the bottom of the graph, and (since there is more random variation in the small studies) are dispersed across a range of values. This pattern tends to resemble a funnel, which is the basis for the plot's name. In the absence of publication bias the studies will be distributed symmetrically about the combined effect size. By contrast, in the presence of bias, the bottom of the plot would tend to show a higher concentration of studies on one side of the mean than the other.

Egger's test of the intercept was used to quantify the display of the funnel plot. This approach may offer a number of advantages over other approaches. Under some circumstances this may be a more powerful test. Additionally, this approach can be extended to include more than one predictor variable, which means that we can simultaneously assess the impact of several factors, including sample size, on the treatment effect. The significance level was set at $p\text{-value} \leq 0.05$.

Results:-

Summary of the study selection process is shown in Fig. 1. The electronic search resulted in 575 studies; three additional articles were added from hand-searching and other sources. After the initial screening of articles, 123 articles were excluded because of duplication. Of the remaining 455 articles assessed, 380 were excluded by title and abstract because they were not related to the topic. Seventy five studies were selected for full text analysis leading to the exclusion of 72 articles because they did not meet the inclusion and exclusion criteria. Thus, a total of 3 articles were included in this systematic review and meta-analysis.

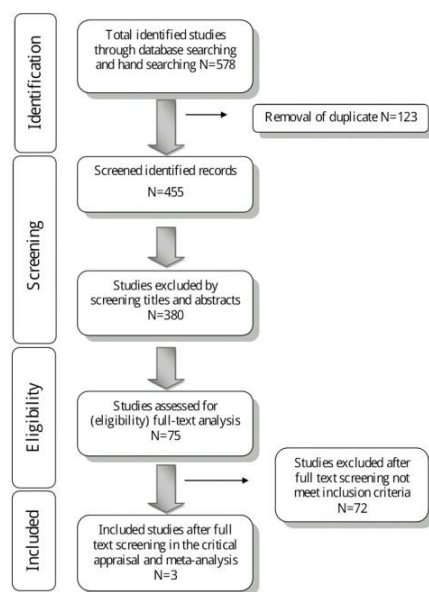

Fig.1:- Flow diagram of study selection process

Description of included studies:-

Extracted data of the included 3 studies are listed in Table 1. Three prospective studies were included in this study (Dugal et al., 2009; Mansuri et al., 2011; Goyal et al., 2013). A total of 760 patients were

enrolled in the three studies. 390 patients in interventions group (0.5% Centbucridine) and 370 patients in control group (Lignocaine HCl with Adrenaline 1:200,000). The ages ranged from 16-60 years. Intradermal sensitivity test was performed for all patients and informed written consent was obtained from all patients.

In first study the patient received 3 ml of anesthetic for nerve blocks using either 0.5% Centbucridine HCl or 2% Lignocaine HCl with adrenaline (1:200,000) (Dugal et al., 2009). In the second study patients randomly received a single anesthetic dose of either 0.5% Centbucridine HCl or 2% Lignocaine HCl with adrenaline (1:200,000) (Mansuri et al., 2011). In last study both drugs were supplied in equal amounts in identical vials labeled only with a code number (Goyal et al., 2013).

Table 1:- Studies comparing 0.5% Centbucridine HCl and 2% Lignocaine HCl with Adrenaline (1:2,00,000).

Authors, Publication year	Study design	P(n)	Patient age range (mean), years	Sex	Site of extraction	Type of local anesthesia	Groups types	Dose of local anesthesia
Dugal et al., 2009	PS	240	Adult either sex	Either sex	Extractions (surgical/ closed method) of teeth requiring nerve block (upper anterior or lower molar teeth)	(G1) 0.5% Centbucridine (n=120) (G2) 2% Lignocaine + Adrenaline (n = 120)	Intervention Control	3 ml of anesthetic was injected for nerve blocks
Mansuri et al., 2011	RCT	198	18 -60 (mean 37.7)	94M/ 104F	extraction of lower molars	(G1) 0.5% Centbucridine (n=100) (G2) 2% Lignocaine + Adrenaline (n = 98)	Intervention Control	They each randomly received a single anesthetic dose of either 0.5% Centbucridine HCl or 2% Lignocaine HCl with adrenaline
Goyal et al., 2013	RCT	322	18 -60 (mean 36.7)	182M /140F	Extraction of lower molars	(G1) 0.5% Centbucridine (n=170) (G2) 2% Lignocaine + Adrenaline (n = 152)	Intervention Control	Both drugs were supplied in equal amounts in identical vials labeled only with a code number

PS , Prospective study; RCT, randomized controlled trial; P, participants.

Assessment of quality:-

The risk of bias outcomes is summarized in Table 2. One study was considered to have high risk of bias (Dugal et al., 2009), one was considered to have moderate risk of bias (Goyal et al., 2013) and one was considered to have low risk of bias (Mansuri et al., 2011).

Table 2:- Results of the quality assessment.

Authors and year of Publication	Random selection of participants	Definition inclusion/exclusion criteria	Attrition bias (Loss of follow-up)	Validity of assessment	Statistical analysis	Reported potential risk of bias
Dugal et al., 2009	No	Yes	No	Yes	yes	high
Mansuri et al., 2011	yes	yes	yes	yes	yes	low
Goyal et al., 2013	yes	No	yes	yes	yes	Moderate

Effect of intervention:-**Onset of anesthesia:-**

Heterogeneity measures showed statistically significant Cochrane Q value (p -value <0.001). I^2 value was 91.0 % indicating high heterogeneity. So the homogeneity hypothesis was rejected and the random effects model was used.

The random effects model showed a standardized mean difference (effect size) of -0.042 with a 95% CI (-0.546 – 0.462). The effect size was not statistically significant with p -value = 0.870 Fig. 2. Thus, there was no statistically significant difference between onset of anesthesia in the two groups.

The relative weight of the included studies revealed that the Goyal et al., 2013 study had the highest weight (34.3%) while Mansuri et al., 2011 study showed the lowest weight (33.0%).

Funnel plot analysis for the included studies showed no publication bias Fig. 3. This was confirmed by Egger's regression intercept which showed a non-statistically significant result (p -value = 0.464). As the results were not statistically significant, we concluded that there was no publication bias.

**Fig. 2:-** Forest plot for onset of anesthesia.

Fig . 3:- Funnel plot for onset of anesthesia.

Duration of Anesthesia:-

Heterogeneity measures showed statistically significant Cochrane Q value (P -value = 0.001). I^2 value was 86.6% indicating high heterogeneity. So the homogeneity hypothesis was rejected and the random effects model was used.

The random effects model showed a standardized mean difference (effect size) of 0.206 with a 95% CI (-0.206 – 0.618). The effect size was not statistically significant with p -value = 0.327 Fig. 4. Thus, there was no statistically significant difference between duration of anesthesia in the two groups.

The relative weight of the included studies revealed that Goyal et al., 2013 study had the highest weight (34.7%) while Dugal et al., 2009 study showed the lowest weight (32.6%).

Funnel plot analysis for the included studies showed no publication bias Fig. 5. This was confirmed by Egger's regression intercept which showed a non-statistically significant result (p -value = 0.709). As the results were not statistically significant, we concluded that there is no publication bias.

Fig. 4:- Forest plot for duration of anesthesia.

Fig. 5:- Funnel plot for duration of anesthesia.

Depth of anesthesia (VAS score):-

For the ease of calculation, the mean VAS score was computed according to the data presented in the study. However, the Dugal et al., 2009 study was not included in the meta-analysis because the standard deviation in Lignocaine group was zero (all cases had zero score on VAS).

Heterogeneity measures showed a non-statistically significant Cochrane Q value (p -value = 0.967). I^2 value was 0.0% indicating no heterogeneity. Thus, the homogeneity hypothesis was not rejected and the fixed effects model was used.

The fixed effects model showed a standardized mean difference (effect size) of 0.023 with a 95% CI (-0.149 – 0.195). The effect size was not statistically significant with p -value = 0.794 Fig. 6. Thus, there was no statistically significant difference between depth of anesthesia in the two groups.

The relative weight of the included studies revealed that the Goyal et al., 2013 study had the highest weight (61.8%) while the Mansuri et al., 2011 study showed the lowest weight (38.2%).

Fig. 6:- Forest plot for depth of anesthesia.

Pulse Rate:-**After 10 minutes:-**

Heterogeneity measures showed non-statistically significant Cochran Q value (P -value = 0.079). I^2 value was 60.6% indicating moderate heterogeneity. Thus, that the homogeneity hypothesis was not rejected and the fixed effects model was used.

The fixed effects model showed a standardized mean difference (effect size) of 0.129 with a 95% CI (-0.019 – 0.276). The effect size was not statistically significant with p -value = 0.087 Fig. 7. Thus there was no statistically significant difference between pulse rate after 10 minutes in the two groups.

The relative weight of the included studies revealed that the Goyal et al., 2013 study had the highest weight (45.4%) while the Dugal et al., 2009 study showed the lowest weight (26.6%).

Funnel plot analysis for the included studies showed no publication bias Fig. 8. This was confirmed by Egger's regression intercept which showed a non-statistically significant result (p -value = 0.473). As the results were not statistically significant, we concluded that there was no publication bias.

Fig.7:- Forest plot for pulse rate after 10 minutes.

Fig. 8:- Funnel plot for pulse rate after 10 minutes.

After 20 Minutes:-

No meta-analysis could be performed because the Dugal et al., 2009 study didn't report the pulse rate after 20 minutes and the Mansuri et al., 2011 study reported that in Lignocaine group the pulse rate after 20 minutes was the same as pre-operative rate so no p -value was computed for the comparison. This left only the Goyal et al., 2013 study so no meta-analysis could be done with just one study.

After 30 Minutes:-

Heterogeneity measures showed non-statistically significant Cochran Q value (p -value = 0.810). I^2 value was 0.0% indicating no heterogeneity. Thus, the homogeneity hypothesis was not rejected and the fixed effects model was used.

The fixed effects model showed a standardized mean difference (effect size) of 0.212 with a 95% CI (0.038 – 0.385). The effect size was statistically significant with p -value = 0.017 Fig. 9. Thus, there was a statistically significant increase in pulse rate after 30 minutes and the direction of effect is in favor of Lignocaine indicating that Lignocaine causes higher increase in pulse rate after 30 minutes compared to Centbucridine.

The relative weight of the included studies revealed that the Goyal et al., 2013 study had the highest weight (62.6%) while the Dugal et al., 2009 study showed the lowest weight (37.4%).

Publication bias could not be assessed because there were only two studies.

Fig. 9:- Forest plot for pulse rate after 30 minutes

After 60 minutes:-

No meta-analysis could be performed because the Dugal et al., 2009 study didn't report the pulse rate after 60 minutes and the Mansuri et al., 2011 study reported that in both groups the pulse rate after 60 minutes was the same as pre-operative rate so no p -values were computed for the comparison. This left only the Goyal et al., 2013 study and no meta-analysis could be done with just one study.

No meta-analysis could be performed for blood pressure because only one study reported it.

Regarding side effects, no meta-analysis could be performed because no study reported it.

Discussion:-

Although Centbucridine is relatively new in dentistry, it has demonstrated good clinical results in the literature (Vacharajani et al., 1983; Muthu et al., 2007). The aim of this review was to verify through a meta-analysis whether there is a significant difference in the clinical outcomes between centbucridine and lignocaine plus adrenaline. In general, the results of the present meta-analysis show statistically good results for centbucridine as a local anesthesia in dental extraction.

Regarding onset of local anesthesia, when the onset of both anesthetics is compared, there was not much difference. This is in accordance with the reports by (Gupta et al., 1982; Muthu et al., 2007). This could be due to the inherent vasoconstrictive effect of Centbucridine as compared to Lignocaine. On average, patients felt the anesthetic effect of Centbucridine a few seconds quicker than that of Lignocaine but this difference was not statistically significant and more importantly, is not clinically significant. The onset of action of Centbucridine was within the reported range of initiation of anesthesia as reported by others to be between 1 and 6 minutes (Vacharajani et al., 1983; Gupta et al., 1989).

Regarding duration of local anesthesia, our study found the duration of anesthetic action of Centbucridine compared favorably to lignocaine with adrenaline. There was no statistically significant difference between them $p=0.327$. This is similar to what has been reported previously (Gupta et al., 1982; Muthu et al., 2007). This duration is sufficient for both surgical and nonsurgical extractions. A possible reason could be the fact that since Centbucridine has a natural vasoconstrictive effect; the LA solution remained close to and around the nerve tissue for a longer period of time. The solution was prevented from being absorbed and dispersed, and this could have resulted in the sufficient duration of anesthetic time that was obtained (Gupta et al., 1989).

Regarding depth of local anesthesia, there was no statistically significant difference between the two groups ($p=0.794$). All patients were sufficiently anesthetized to carry out the procedures. Centbucridine showed sufficient efficacy as a local anesthetic agent. A possible reason could be the fact that since Centbucridine has a natural vasoconstrictive effect; the LA solution remains close to and around the nerve tissue for a longer period of time (Gupta et al., 1989).

Regarding pulse rate, there was no statistically significant difference between the two groups after 10 minutes ($p\text{-value} = 0.087$). Mild elevation of this parameter during this initial time was attributed to anxiety and fear. This has also been reported by other authors (Malamed, 2004; Gupta et al., 1989; Vacharajani et al., 1983). However, there was a statistically significant increase in pulse rate after 30 minutes ($p\text{-value} = 0.017$) and the direction of effect is in favor of Lignocaine indicating that with Lignocaine caused a higher increase in pulse rate after 30 minutes compared to Centbucridine. Lignocaine has an inherent vasodilating property, which in turn requires the addition of adrenaline. This has been shown to increase the blood pressure and heart rate in some studies (Malamed, 2004; Gupta et al., 1989); which may become more significant in cardiac cases (Dugal et al., 2009).

Regarding blood pressure, no meta-analysis could be done for blood pressure because only one study reported it. Three studies declared lignocaine has an inherent vasodilating property, which in turn requires the addition of adrenaline. This has been shown to increase the blood pressure and heart rate in some studies (Malamed, 2004; Gupta et al., 1989).

Regarding side effects, no meta-analysis could be done for side effects because no study reported it. One study reported side effects of Centbucridine like headache, dizziness and nausea, which gradually resolved within 10 minutes without any medication (Dugal et al., 2009). Other studies showed that there were no adverse, toxic, or allergic reactions to either of the LAs in their sample population and confirmed its safety (Mansuri et al., 2011; Goyal et al., 2013). It is not surprising that there were no patients who reported adverse reactions to Centbucridine. Centbucridine has demonstrated an antihistaminic activity by blocking the H1 histamine receptors which makes it an ideal LA agent in patients with known allergy to other conventional LAs (Gupta et al., 1985; Gupta et al., 1989; Mansuri et al., 2011; Goyal et al., 2013).

In conclusion, the overall results of meta-analysis showed no statistically significant difference between the 2 groups regarding onset of anesthesia ($p = 0.870$), duration of anesthesia ($p=0.327$), depth of anesthesia ($p=0.794$), and pulse rate after 10 minutes ($p=0.087$). But there was a statistically significant difference between the two drugs with regard to pulse rate after 30 minutes ($p = 0.017$) with lignocaine causing higher increases in pulse rate compared to Centbucridine. Hence Centbucridine had good CVS stability and was devoid of any cardiovascular effects. Centbucridine can be effectively used as an ideal substitute in place of

lignocaine in patients undergoing minor oral surgical procedures when adrenaline is absolutely contraindicated due to systemic problems.

Abstract

Koozh is a product of double fermentation of millet and rice caused by a mixture of micro flora involving lactic acid bacteria and yeast. The present study was undertaken to determine the effect of germination and fermentation on macro and certain micro nutrient contents in koozh prepared using finger millet, Pearl millet, Red sorghum and white sorghum. It was inferred from the study that fermentation of millet koozh enhanced the protein levels with a substantial reduction in carbohydrate and energy content. Germination and fermentation resulted in a concomitant raise in thiamine levels along with iron and vitamin C. A sensory evaluation of both germinated & fermented and non-germinated & fermented millet koozh revealed equal acceptance with no significant difference in their hedonic scale ratings. There was an increase in the yeast content of fermented koozh which explained the increase in B vitamin content. Thus this study concludes that millets can be used in different proportions to formulate various fermented nutritious food products for all age groups.

Introduction:-

Millets are one of the oldest foods known to humans and possibly the first cereal grain to be used for domestic purposes^[1]. Millets are not only comparable to major cereals with respect to their nutritional features but are very good sources of carbohydrates, micronutrients and phytochemicals with nutraceutical properties. Millets contain 7-12 per cent protein, 2-5 per cent fat, 65-75 per cent carbohydrates and 15-20 per cent dietary fiber. These millets are a good source of both soluble and insoluble dietary fiber^[2]. A variety of foods from the millets are traditionally prepared and consumed, over the centuries, in the Indian subcontinent, Africa and Central America.

Several traditional household food processing and preparation methods are used to enhance the bioavailability of micronutrients from millets. Koozh is one such preparation that has strong connection with South Indian culture and tradition and has been consumed regularly for breakfast before rice became a common consumable. Koozh is a full millet based preparation along with rice. Millets like finger millet, pearl millet and sorghum are used singly or in combination for Koozh preparation. It is a soft porridge prepared from traditionally processed millet (germinated and fermented).

Preparation of Koozh involves two fermentation processes, before (primary fermentation) and after cooking (secondary fermentation). During fermentation, the millet slurry would undergo major biochemical changes like starch hydrolysis, sugar transformation and softening. So the conventional process of fermentation is believed to increase the nutritive value of millets. The processing methodology is similar throughout south India with slight modifications in fortifying substances and raw materials. Unlike other cereal and millet based fermented foods in which fermenting microorganisms are killed by thermal treatment, secondary fermentation step in Koozh offers live microbes along with the product. This feature adds functional value to the traditional product and makes it to stand on par with probiotic dairy foods.^[3]

Aim of the study:-

To assess the influence of germination and fermentation on the levels of specific nutrients in millet koozh prepared using finger millet, pearl millet, Red sorghum & white sorghum and broken raw rice

Objectives of the study

To estimate the energy, carbohydrate, protein and fat, ash, fibre, moisture, vitamin C and iron content of millet koozh prepared in the following combinations of processing methods.

1. Non-Germinated and Non-fermented millet Koozh
2. Non- Germinated and fermented millet koozh.
3. Germinated and fermented millet koozh.
4. Germinated and Non-fermented millet Koozh

To assess the levels of Thiamine, Riboflavin and Niacin in

1. Non-germinated & fermented millet koozh and
2. Germinated & fermented millet koozh

To conduct sensory evaluation of

1. Non-germinated & fermented millet koozh and
2. Germinated & fermented millet koozh.

Methodology:-**Research design:-**

The research design of this study is experimental in nature.

Sample selection:-

As the study comprises of germination of millets, those millets which germinated well under optimum conditions were chosen after experimenting on all the major and minor millets available in the market. Red and white varieties of sorghum (*L.Monech*), pearl (*Pennisetum glaucum*) and Finger millet (*Eleusine coracana*) were selected for the study. The millets were obtained from the millet retailer supplying at the Tamil Nadu Agricultural University Centre at Chennai. Ponni raw rice was procured from the grocery.

Flow chart showing the preparation of millet koozh using Finger millet (*Eleusinecoracana*), pearl millet (*Pennisetumglaucum*) and Bi color sorghum (*L.Monech*)

Millet Koozh was prepared in four different combinations of processing methods as shown in table 1. The steps included and omitted in the preparation of millet koozh using the four processing methods are spelt out. This was done to find out the actual effect of germination and fermentation on the nutrient quality of the millet koozh.

Table 1:- Different combinations of Processing Methods adopted in the preparation of millet koozh

Processing methods	Steps adopted and omitted in the preparation of millet koozh
Non-germinated and Non-fermented millet koozh	No germination of millets and fermentation of millet koozh
Non- Germinated and fermented millet koozh	No germination of millets but only fermentation of millet koozh
Germinated and Fermented millet koozh	Germination and fermentation adopted in the preparation of millet koozh
Germinated and Non-fermented millet koozh	Only germination of millets but no fermentation of millet koozh

Results and Discussions:-

Comparison of the proximate principles (carbohydrate, protein and fat) and energy content of millet Koozh

A comparison of the proximate principles (carbohydrate, protein and fat) and energy content of millet Koozh prepared using the stated combinations of processing methods is presented in table 2.

Table 2:- Comparison of proximate composition of Millet Koozh prepared using varying combinations of processing methods.

NS- Not significant * - statistically significant

From table 2, it is evident that fermentation of the millet koozh resulted in a substantial reduction in the energy and carbohydrate levels. The fermented samples had the lowest energy value which is due to the low fat and carbohydrate content. The reduction in carbohydrate content in fermented koozh could also be attributed to increased activity of alpha-amylase which hydrolyses starch to simple sugar. The sugar provides a source of energy for the fermenting micro-organisms.^[4] In the present study, fermented koozh was found to exhibit significant ($p < 0.01$) reduction in carbohydrate content. This observation confirms the utilization of the carbohydrate by the fermenting microbes. Carbohydrates are a major energy source for fermenting microbes.

The protein levels also have shown a considerable rise in the fermented millet koozh which reflects on the activation of the proteolytic enzymes during fermentation. Antony and Chandra (1998)^[5], concluded in their study that as fermentation is associated with the degradation of antinutrients, there is an increase in the bioavailability of minerals and an improvement in the digestibility of proteins in tannin-rich cereals.

There was a decrease in fat content after fermentation and a further statistically significant decrease in germinated and fermented millet koozh which may be attributed to the breakdown of fats to fatty acid and glycerol by lipolytic organisms present in the sample during fermentation and the utilization of fat for energy purposes by the fermenting microbes. A similar observation has been reported by Anthony and Babatunde (2014)^[6] where the break down resulted in an increase in aroma, taste, odour and texture of fermented food.

Comparison of Ash and Fiber content of Millet Koozh:-

A comparison of the Ash, fiber and moisture content of millet Koozh prepared in different combinations of processing methods is presented in table 3.

From table 3, it can be seen that the ash content of the millet koozh prepared using different processing methods ranged between 1.03 to 1.4 g/ 100g. The present study elucidates that in all the preparative methods of koozh, even though there was a marginal decrease in the overall ash content of the koozh on germination and fermentation, there were no significant changes. Arora, Jood and Khetarpaul (2011)^[7] found that germination of grains decreased ash content. In the present study, the least ash content was found in germinated and fermented millet koozh.

The fermented koozh samples showed a significant appreciation in the fiber content compared to the non-fermented samples. A similar trend was also observed in the germinated and fermented koozh. It is interesting to note that fermentation increased the crude fiber content.

Table 3:- Comparison of Ash and Fiber content of Millet Koozh prepared using varying combinations of processing methods.

Processing methods	ASH (g)			FIBER (g)		
	Mean ± SD	t value	Level of sig	Mean ±SD	t value	Level of sig

Vitamin C and Iron content of Millet koozh:-

The vitamin C and iron content of millet koozh subjected to four different processing methods are presented in table 4.

Table 4:- Vitamin C and Iron content of Millet koozh prepared using varying combinations of processing methods.

Processing methods	Vitamin C (mcg/100g)	Iron (mg/100g)
Non-germinated & Non-fermented millet koozh	16.63	2.24
Non-germinated & Fermented millet koozh	36.45	3.17
Germinated & Non-fermented millet koozh	28.83	1.06
Germinated & Fermented millet koozh	53.73	2.81

From table 4 it can be observed that the germinated & fermented millet koozh had the highest vitamin C content of 53.73 mcg/ 100g and the lowest content of 16.63 mcg / 100g was detected in the non-germinated & non-fermented millet koozh. Millets are generally not a source of vitamin C. However on germination, some amount of vitamin

C is synthesized in the grain and on fermentation there is a further rise in the vitamin content as also observed by Juana, Miranda and Doblado (2005)^[8].

It can also be observed from Table 4 that the Non-germinated and fermented millet koozh had the highest iron content of 3.71mg/ 100g and the lowest iron content of 1.06mg/100g was observed in the germinated but non-fermented millet koozh. Saleh et al., (2013)^[9] observed a marked reduction in phytic acid during germination and fermentation that helps release the iron bound to phytates which in turn increases the bioavailability of iron from foods.

Comparison of the vitamin B content in millet koozh:-

The thiamine, riboflavin and niacin content of non-germinated & fermented millet Koozh and germinated & fermented millet koozh are presented in Table 5.

Table 5:- Thiamine, Riboflavin and Niacin content in Non-germinated & fermented millet koozh and Germinated & fermented millet koozh.

Processing method	Thiamine B ₁ (mg/100g)	Riboflavin B ₂ (mg/100g)	Niacin B ₃ (mg/100g)
Non-germinated & fermented millet Koozh	0.2788	0.21	1.7714
Germinated & fermented millet Koozh	0.625	0.272	1.4486

It can be inferred from table 5 that there is an increase in vitamin B₁ and a negligible raise in B₂ in millet Koozh prepared using germinated millets and subjected to subsequent fermentation. The Niacin content of the Non-germinated & fermented millet Koozh was found to be slightly higher than the Germinated & fermented millet Koozh.

The marginal increase in B₁ (Thiamine) from 0.278 to 0.625 mg in the germinated and fermented sample could be due to the presence of yeast in the millet koozh. Khetarpaul et al., (1989)^[10] have stated that yeast fermentation raises the level of thiamine two-three fold times.

In the present study, the appreciation in thiamine and riboflavin levels places the millet koozh as a good complementary food as it meets the RDA of children 1-3 years of age. It can also be used as a nutritious food supplement during convalescence, a nourishing diet for the elderly and a healthy breakfast option for all age groups.

LAB and yeast content of millet koozh:-

In this study, the presence of Lactic Acid Bacillus (LAB) was seen both in the non-germinated & fermented and the germinated & fermented millet koozh. LAB were generally reported to be the predominant bacteria in almost all fermented cereal and millet products (Khetarpaul et al., 1989)

The yeast content in the germinated & fermented millet koozh was significantly high which also substantiates the increase in B vitamins in the germinated and fermented millet koozh.

Sensory evaluation of millet koozh:-

Non-germinated & fermented millet koozh and Germinated & fermented millet koozh were evaluated for their colour, flavour, texture, taste, aroma and over all acceptability using the 9 point hedonic scale by a panel of twenty five respondents in the age group of 18 to 50 yrs

The germinated & fermented millets scored better on texture than the non-germinated & fermented millet koozh, as the germinated millet koozh was found to be less viscous than the non-germinated & fermented millet koozh (significance at $p < 0.01$). Due to enzymatic breakdown of starch to sugars during germination, the viscosity and bulk density of porridge made from sprouted grains were significantly lower.

It was observed that fermentation generally enhanced the taste, flavour, aroma and consistency of the food product. This may be due to softening of the substrate by starch hydrolysing microorganisms causing amylolytic activity (Ojijo&Shimoni, 2004). This emphasizes the importance of starch hydrolysing bacteria population in the koozh fermentation process.

Conclusion:-

This study reveals that germination and fermentation of millets are good processing methods that can be adopted to enhance not only the quantity of nutrients but also their bioavailability. They could serve as a less expensive source of nutrients for all strata of society across all age groups. It could also serve as an ideal food for convalescents and as a weaning food, compared to expensive commercially available formulas. The introduction of millets into the public distribution system and into government meal programmes like the mid-day meal scheme can help the poor and the marginalized households in meeting their nutrition needs.

Abstract

Background: Many patients visit dental hospital every day and the reasons for their visit can be varied. While few of them went for regular dental check-up, a majority of the patients visited dental hospital only when they have primary complaints most commonly being pain. Thus, this survey is done to find out the details about patients' dental check-up and primary complaints.

Materials and methods: The data was collected within three continuous working days of the Saveetha dental hospital in the outpatient hospital department. The study sample consisted of 110 people, from the age group of 18-65 years. A self-administered, anonymous questionnaire was prepared in both local language and English version used to accumulate data regarding demographic details, history of dental visit, patients' primary complaints and reasons for not visiting dental clinic.

Results: The study revealed that the patients' primary complaints were toothache which scored the highest about 39%. With the primary complaints, patient would proceed with invasive procedures such as tooth extraction and if possible root canal treatment. If stains were patients' primary complaints, procedures such as scaling can be carried out. Majority of the patients have received scaling as the treatment undergone so far with the least was prosthetic treatment. Patients' primary complaints can proceed with either preventive or corrective treatment.

Conclusion: Data from the study revealed that diverse patients of a private dental hospital had toothache as their primary presenting complaints. There is an essential to mobilize community health approach in order to increase awareness of importance of dental healthcare to encourage regular dental check-up by more preventive treatment rather than corrective treatment.

Introduction:-

Nowadays, missionaries and nongovernmental organizations in addition to government dental healthcare have provided improved healthcare access especially dental healthcare though there is inequitable distribution. As there is increasing prevalence of oral diseases in government dental healthcare associated with prolonged patient physical waiting-time, thus patients are motivated to seek care in missionary and also private-owned dental health care. There is an evidence that missionary healthcare provides various dental healthcare services to various population as the cost of dental care is lesser in comparison to private clinics. As most of the available studies were conducted

primarily in government-owned dental healthcare, thus there is paucity of information regarding reason of patients for seeking dental care services in missionary hospital (1,2).

People visiting dental healthcare for various reasons. Most of them visited dentist only when there was toothache or follow-up treatment. The reasons can be varied depending upon the current situations. Patients' complaints could be toothache, fractured teeth, mobile teeth, routine dental check-up, follow-up appointment, decayed teeth, stains and others. People went to dentist to solve dental problems and relieve pain.

Therefore, this survey was conducted to study the patients' primary presenting complaints for visiting dental healthcare, dental history and reasons for not visiting dentist.

Materials and Methods:-

The data was collected within three continuous working days of the dental college hospital. The survey was done in the outpatient hospital department. The study sample were patients visiting the department during 3-days period.

The study sample consisted of 110 people, aged 18-65 years. Out of 110 people, 87 people had previously visited a dentist. A self-administered, anonymous questionnaire was prepared in both local language and English version used to accumulate data regarding demographic details, history of dental visit, primary patients' complaints and reasons for not visiting dental clinic.

For those who had previously visited dental hospital were requested to state the time from their last dental visit, reason for it and the treatment received during last dental visit. In the questionnaire, the participants were asked to choose from a list, the reason for not visiting dental hospital. The statistical analysis was collected and presented in percentages.

Results:-

The results from the study has shown that majority of people who had previously attended a dental hospital belonged to the age group of 20-40 years, approximately 73%, and majority of the participants who had never previously attended dental healthcare service was in age group of 41 and above.

More numbers of female had visited dental hospital, about 60% in comparison to male participants, 40%.

Discussion:-

In this study, more females than males seek dental healthcare services. This result is similar with likely studies regarding oral health seeking behaviour conducted in Southern Nigeria (3,4).

The study results showed that majority of the people visited dentist mostly sometimes, about 60% followed by first visit, 27% and frequent, 14% as shown in Figure 1.

Figure 1:- Frequency of dental visit.

In figure 2, most of the patients visited dentist for the first time at the age of 21-30 and 31-40, altogether contribute approximately 62%. 41 and above scored for the least whose people visited dentist for the first time.

Figure 2:- Age on first dental visit.

The purposed of their first dental visit was tooth pain which scored the highest about 39%. This finding is similar with reports of others studies citing pain as the most likely reason stated by patients for seeking dental healthcare services (1,4). Stains scored the second highest, followed by mobile teeth, decayed teeth, missing teeth and others for the patients' primary complaints. Toothache complaints were primarily due to dental caries and its complications are gingivitis periodontitis, fractured teeth, impacted teeth, and oral ulcers.

Figure 3:- Primary complaints of first dental visit

Almost 54% of the patients went for last dental visit last year, followed by last week and last month. The percentages recorded by each were 30% and 16% respectively.

Figure 4:- Last dental visit.

The main reason of their last dental visit which scored highest and least were tooth pain and mobile teeth, 39% and 5% respectively. Other reasons were decayed teeth, stains and missing teeth as depicted in Figure 5. Each has corresponding percentages. Shaking teeth accounted for 5% of the last presenting complaints which is an indication of irreversible periodontal diseases, periodontitis.

Figure 5:- Main reason of last dental visit.

Approximately, treatments received by 35% of the patients were scaling, followed by tooth extraction, 25%, restoration, 19%, others, 10%, orthodontic treatment, 6% and prosthetic treatment, about 5%.

Figure 6:- Treatments undergone so far.

There were few reasons why people did not attend dental healthcare. They were frequent visits are required, fear of dental treatment, thinks problem is not severe enough, neglect oral problems, no dental problem and treatment is costly as shown in Figure 7. Percentages contributed by each were 24%, 23%, 18%, 14% and 8% respectively. Symptomatic and irregular dental visit has been reported to be more common than preventive dentist visits. This could be due to ignorance, poor oral health awareness, and poverty.

Figure 7:- Reasons for not attending dentist.

The toothache complaints and dental caries were highest among all range of patients visited dental hospital. Follow-up appointments, 20% being the second most common presenting complaints in this study reflects an aesthetic demand/need among dental patients. Fractured teeth, 17% were the third most common primary presenting complaints among the patients. The prevalence of fractured teeth as one of the major contributor to factors prompting the patient to seek dental healthcare services. Routine dental check-up and others scored the least, 11% and 9% respectively.

Figure 8:- Primary presenting complaints.

Conclusion:-

Data from the study revealed that diverse patients attended a private dental hospital had toothache as their primary presenting complaints. There is an essential to mobilize community health approach in order to increase awareness of important dental healthcare.

Abstract

Geomorphology is the study of the landforms of the earth and the process that form them especially those that lead to the erosion, transport, and deposition of sediments. The present study has been made to record the varied coastal geomorphic features along the Thiruvallur coastal stretch. The coastal zone of southeast coast have contained a lot of morphological changes due to the many natural hazards. The area of Thiruvallur is the part of the Southeast coast of India. The geomorphic features of this area resulted from various coastal landward process of erosion-accretion or due to other natural causes of sea level changes and sea water interactions. The details of the features such as strand lines, sandy beach, mudflat, lagoon, back swamps, barrier Island, salt marshes, estuary, tidal creeks, spit and shoal has been recorded as well as the significance of their occurrence is presented. The coastal geomorphology of the study area clearly established not only the sea level changes but also landward process and climatic conditions.

Introduction:-

The geomorphology is the study of the physical features of the surface of the earth and their relation to its geological structures. Coastal geomorphology is a branch of geomorphology in- Geomorphology methodologies focused mainly on field observation, description and measurement but also included physical experimentation, there is growing recognition of the importance of geomorphology and geomorphologists in contributing to a range of environmental investigations and management issues. The coastal geomorphology was highly descriptive and much of it was influenced by concept related to the erosion cycle. Much of the research in coastal geomorphology in the past four decades has been concentrated in the zone influenced by wave and tides wave, generated currents, and tidal currents and on the erosional and depositional features associated with these. The coastal zone features have been developed due to the process of erosion-accretion or due to other natural causes. The features can be categorized as depositional features, erosional, and special features (Nair, 1990). The geomorphic unit under different heads namely features formed by present day wave action, features formed due to sea level oscillations and features formed by rock and sea water interaction have been presented. The influence of the sea level oscillations and land and sea interactions forms a diverse coastal geomorphology along the coast (Jaganadha Rao, 2012). The response of coastal geomorphic types and landforms to sea level rise is complex, coastal forms being a product of interactions between energy and material, with stepwise adaptations external forcing sea level rise as a driver of coastal change needs to be seen within the context of other process and determinant particularly in relation to wave tides, storms and

sediment supply (Flemming, 2011). Geomorphic hazards are regarded as related to landscape changes that affect human systems. The process that produces the changes are rarely geomorphic in nature but are better regarded as atmospheric or hydrologic (Paul, 1994). Geomorphology is also concerned with the study of earth surface forms and their evaluation in time and space due to the physicochemical and biological factors acting on them most of the evolution is the product of a cyclic process based on erosion transport deposition of sediment particle (Gerardo, 1995). The geomorphology mapping it involves the partitioning of the terrain into conceptual spatial entities based upon criteria that include morphology, genetics compositions, and structure, chronology environmental system (Michael, 2012). Extreme rainfall and flood events in steep upland catchments leave geomorphological traces of their occurrence in the form of boulder berms, debris and alluvial fans (Foulds, 2014).

The Geoinformatics system provides multiple applications for studying different coastal aspects. With the rapid development and change of GIS software package in the late 1980's their utility for coastal management was quickly recognized. The satellite remote sensing due to its repetitive multispectral and synoptic nature provides a unique view to recognize various features on land and sea (Siddiqui, 2003). This technique can be a great help in the collection of continuous wave current, wind, tides, suspended matter, shallow water area, wetlands, mangroves mudflats and other coastal features and coastal change like accretion or erosion.

Study Area:-

The study area lies in the coastal stretch of Thiruvallur district, Tamil Nadu, India it is bounded to the north by Pulicat lake south by Chennai east by the bay of Bengal and west by Minjur area. It lies between $80^{\circ}02'30''\text{E}$ and $80^{\circ}22'30''\text{E}$ longitude $13^{\circ}15'00''\text{S}$ and $13^{\circ}35'00''\text{S}$ latitude. The coastal stretch of the study area has a total length of 28km along the Bay of Bengal. The Thiruvallur coastal stretch is known for diverse coastal geomorphic features. The environment namely as strand lines, sandy beach, mudflat, lagoon, back swamps, Barrier Island, salt marshes, estuary, tidal creeks, spit and shoal resulted in characteristic and significant coastal geomorphology because of land-sea interaction. This coast has a very vast coastal plain, which extends from north of toppalapalayam to south of sattangadu. The physiography of the coast consists of sandy beach sands and extends over a width of 500m from the coastline. The main geological formation occurring in the coast are upper Gondwana sand silt, quaternary sand and clay undulation by Archean crystalline rocks Charnockite.

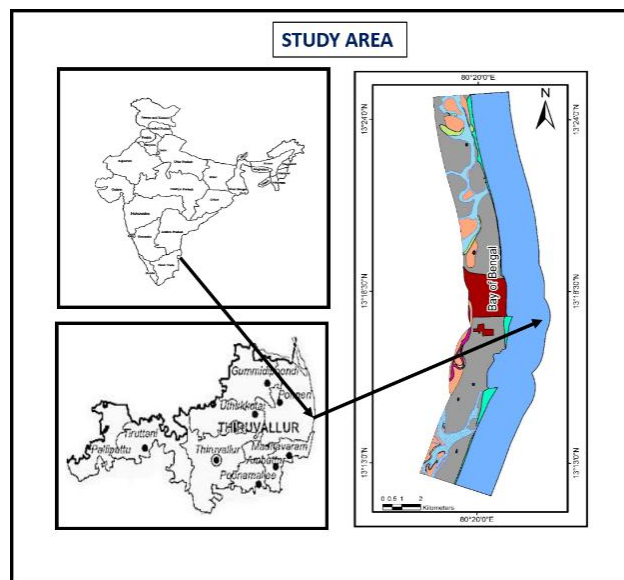

Figure 1:-study area map.

Methodology:-

In this study deals with the description, mapping, and field analysis of various coastal geomorphological assemblages along the southeast coast of Thiruvallur. Coastal geomorphological studies involve mapping of different types of landforms. Mapping of coastal is primary to the understanding of the evolution of any coastal area. The integrated remote sensing and GIS techniques are employed for extracting the coastal geomorphological landforms at high resolution. The success met with the geomorphology mapping from imagery for obtaining accurate results and imageries are mainly utilized for mapping. The various types of spatial data source such as

topographical map (scale of 1:50,000) published by Survey of India the year of 1970-1971, satellite data Landsat- 8 OLI image interpreted based on the visual interpretation keys and identified the geomorphology of the study area using ArcGIS 10.2 software. The Trimble GPS was used for ground truth validation. The geomorphic features formed by present day coastal process, features formed due to sea level oscillation and most of the coastal features has been developed due to the process of erosion and accretion or due to the natural causes have been identified at different places and description of individual features have been recorded. The features were confirmed using field data.

Results and Discussion:-

The area of Thiruvallur coastal stretch between Pulicut to Tiruvottiyur a length of the shoreline 28km the entire area is marked by varied and geologically significant geomorphological features the geomorphic units under different domes namely features formed by present day wave action features formed due to sea level changes and land and sea water interaction have been presented. The entire area is marked by varied geomorphological features. The extensive structure-activity due to rapid urbanization is resulting in the damage of these beautiful features day by day. As such these features are verified for the help for the feature researchers. All the significant features have been studied for scientific documentation. Geomorphological map of this area is prepared fig:2. The study area occurs different land forms that detailed description of individual features is presented below. For the ease of arrangement, the features have been classified into two types that are marine landforms and fluvial landforms.

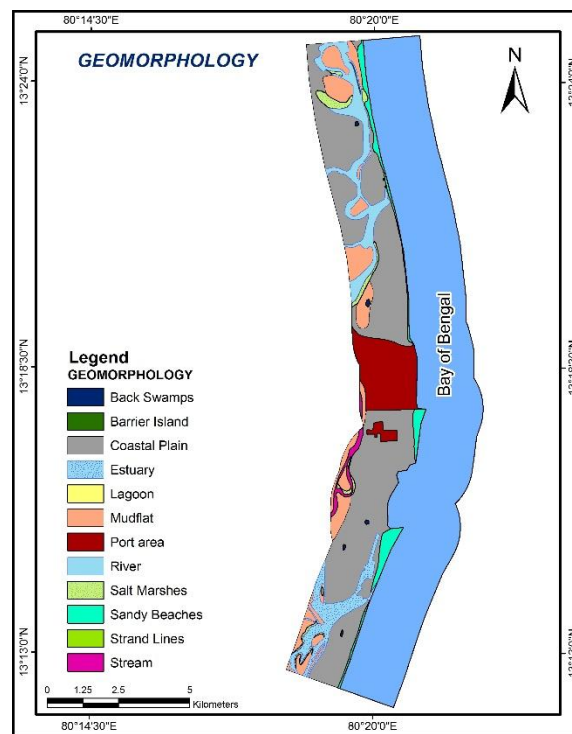

Figure 2:-Geomorphology Map.

Depositional features:-

Coastal deposition is the arranging depressed of material on the coast by the sea it occurs when waves lose energy or when large inputs of sediments are made into the coastal system. Here, the study area occurs different type of depositional features that is a sandy beach, coastal dunes, Barrier Island, coastal plain, Back swamps, mud flats, strand line, salt marshes, and tidal creek. In this study area, the coastal depositional features are categorized by marine landforms and fluvial landforms.

Marine landforms:-

The sea implements the function of erosion and deposition through sea waves, supported by currents, tides, and storms in coastal areas. The study area falls under different marine landforms such as the sandy beach, Sand dunes, Coastal plains, Barrier Island, Strandlines, Lagoons, Mudflat, Salt marshes.

Sandy Beach:-

The sandy beaches are extensively developed along the entire coast and its occupied nearly 3 sq.km of the study area. A gently sloping zone and it is composed of particles. Beach typically occur in areas along the coast where wave or current action deposit and rework sediments. Coastal sediments are affected by wave courses, but commonly the deposition of sediments along the shoreline are referred to as the beaches. In this study area beaches are present for about a length of 28 km in a linear from Tiruvottiyur to Pulicut. A marked landward ridge which forms the landward limit of wave swash is referred to as the berm. The berm is predominantly visible in the Kattupalli and Tiruvottiyur location also it has been observed all along the beaches between Tiruvottiyur to Pulicut. Wave cut face of the berm reveals the alternative layering of black sand and white sands thickness of the individual layers varies from a few mm to few cm. beach morphology of the study area is highly dynamic and changes with wave energy, sediment supply, long shore current and substrate physiography. The surface structure like ripple marks also occur. The ripple formation can be ascribed in due to the oscillatory flow of wind.

Sand dunes:-

In this study area, coastal morphological features of dunes are presently more active. the feature is met all along the south-eastern side of the study area. Coastal is the formation of coastal and dunes the material for the formation these dunes is essentially derived from the present day beach covering from foreshore to backshore. The furthestmost characteristic of this features are dunes is the vegetative cover the vegetation is a good effect in helping to bind together the sand by their complex root system and those help to protect the dunes from erosion. Coastal dunes sediments from the intertidal area get regularly and periodically exposed to the onshore winds to be reworked in the form of coastal dunes. Dunes from where constructive wave encourage the accumulation of sand and where preventing onshore winds blow this sand inland. The wind starts to affect the mound of sand by eroding sand particles from the windward side and depositing them on the leeward side gradually this action causes the dune to migrate inland as it does so it accumulate more and more sand.

Coastal plains:-

The coastal plain is the relatively flat landforms created by the deposition of sediment over a long period of time by one or more rivers coming highland regions. The study area occurred 25 sq.km of flat coastal plain along the Tiruvottiyur to Pulicut region. The coastal plain is a flat, low laying piece of land next to the ocean are separated from the rest of the interior by nearby landforms such as mountains coastal plains can also develop when river current carry rock soil and sedimentary material into the ocean (Nsengmuuremayi 2016). Level or gently sloping region or a slightly undulating land surface produced by extensive deposition of alluvium usually adjacent to the river that periodically overflows its banks.

Barrier Island:-

These islands are long, narrow, offshore deposits of sand or sediment that run parallel to the coastline. They are separated from the mainland and it's a type of dune system that is exceptionally flat or lumpy areas of sand that form by a wave and tidal action parallel to the mainland coast. The area of Pulicut Lake occurred one barrier island north part of the study area. The length and width of the barrier and overall morphology of barrier coast are related to parameters containing tidal range, wave energy, sediment supply, sea-level trends and basement controls. Barrier islands are very important for reducing the divesting effect of wind and waves and for absorbing storm energy. They are also imported marine habitats that support commercially important fish species as well as birds, sea turtles, and other wildlife species.

Strandlines:-

The study area contains two strand lines it is a broad belt of sand along a shoreline with a surface exhibiting well defined parallel sand ridges separated by shallow swales. A strand plain differs from a barrier island in that it lacks either the lagoons or tidal marshes that isolated barrier islands from the shoreline. The strand plain is directly attached strand plain typically are created by the redistribution by waves and longshore current of coarse sediment on either side of a river mouth. Beach ridges include all relict strand plain ridges, whether dominated by wave/swash-built or by Aeolian lithesome. A strand line refers collectively to the assemblages of various features characteristics of the former coastal area the strand lines here represent the transgression and regression process.

Lagoons:-

A lagoon is the shallow body of water separated from a larger body of water by Barrier Island of reefs. The inside of Ennore estuary has lagoon they have also been identified as occurring on mixed sand and gravel coastline. Coastal

lagoons from along gently sloping coasts where barrier islands or reefs can develop off-shore, and the sea level rise is rising relative to the land along the shore, coastal lagoons do not form from a long steep or rocky coast or if the range of tides is more than 4 meters due to the gentle slope of the coast the coastal lagoons are shallow. The lagoons are sensitive to change in sea level due to global warming. Coastal lagoons are young and dynamic and many be short lived in the geological term. Coastal lagoons are usually connected to the open ocean.

Mudflat:-

Mudflat is a flat area containing 6 sq.km of the study area. Mudflats are fluid to a mixture of finely divided particles and solid materials mainly silt, clay and water they are associated with the sheltered environment like lagoons, estuaries and another embayment the barrier beaches occurring on the seaward side of the backwaters create a sheltered environment which has favored the development of mud flat. Mudflats are developed where enough fine sediments are available and the wave action is not strong enough to disturb the sediments. This area is very suitable sites for the deposition of mud flats because of the availability of sediments monthly suspended very fine grained. Are wide expanses of fine grained soft mud along the shore they generally consist of deposit of clay, silt, oozes etc. they are further classified into high tidal, subtidal and supratidal mudflats, intertidal slopes and subtidal zones. High tide tidal flats are more or less flat and are near the high – water line deposition is provided by the highest tides. The intertidal slope is the area of instability and is affected by daily tides.

Salt marshes:-

Low laying Athipettu area that is stabilized by cordgrasses and flooded by daily tidal activity. Salt marshes are salty because they are flooded by seawater every day. The study area contained 2 sq.km marshy because their ground is composed of grass and peat. The more often area is flooded, the more saline it is planted living in salt marshes have different tolerance to salt. Those with higher tolerance and found in the low marsh, and those with lower tolerance to salt are found in the high marsh zones. Plants from one marsh zone are never found the other. Salt marshes serve as the transition from the ocean to the land, where fresh and salt water mix. Salt marsh plants are salt tolerant and adapted to water levels that fluctuate with the tide. Tide carry in nutrients that stimulate plant growth in the marsh and carry out organic material

Fluvial landforms:-

The fluvial landform process associated with rivers and streams and the deposits and landform created by them. Coastal lowlands contain a variety of landforms most of which are geologically young. Today coastal landforms are quite recent their formation and properties depend in part on whether fluvial process interacted with the marine process. The combined actions of fluvial and marine process determine whether or not a depositional body can form at the mouth of a river and what kind of body will form.

Estuary:-

An estuary is a partially enclosed coastal body of brackish water with one or more rivers or streams flowing into it and with a free connection to the open sea. The estuary is otherwise known as where the salt water and fresh water mix. The study area have included Ennore estuary and it is very vast and extent from Tazhamkuppam to Tiruvottiyur. Estuaries and their surroundings wetlands are bodies of water usually found where rivers meet the sea. Estuaries are home to single plant and animal communities that have adapted to brackish water a blend of fresh water draining from the land and salty seawater. Estuaries are among the most productive ecosystems in the world many animals rely on estuaries for food. Estuarine environments are among the most productive on earth, creating more organic matter each year than comparably-sized areas of forest, grassland or agricultural land. The sheltered waters of estuaries also support unique communities of plants and animals specially adapted to life at the margin of the sea.

Figure 3:-Sand Dune.

Figure 4:-Sand Berm.

Figure 5:-Sandy Beach.

Figure 6:-Sand Ripple.

Figure 7:-Ennore Estuary.

Figure 8:-Coastal Plain Area.

Figure 9:-Salt Marshes.

Back swamps:-

Back swamps are the section of floodplain where a deposit of fine silts and clays settle after a flood. These are usually lying behind a stream's natural levees are located some distance away from the stream channel on the flood plain when water spills over onto the flood plain. The fine-grained alluvium holds much water and drains rather slowly creating altered areas back swamps are retained water that might cause severe flooding downstream. Some area has identified with back swamps and that contains the very small area.

Tidal creek:-

Any inlet through which water flows alternatively towards landward with the rising tide and seaward with the falling tide is called as tidal creeks or inlets. Inlet may be permanent or temporary. Kalikuppam location south one permanent inlet through which water flows alternatively towards land with the rising tide and seaward with the falling tide throughout the year is seen. Is a tidal water channel in the coast creeks may often dry to a muddy channel with little or no flow at low tide but often with significant depth of water at high tide, creek are seen mostly in the southern region and some in the northern region of the study area, which includes the Ennore creek. The mouth of certain paleochannels is also seen as present day creeks in the study area.

River and stream:-

The river is a natural flowing watercourse, the river flowing over gently sloping ground begin to curve back and forth across the landscape the moving water washes away the sediment like sand and mud. The stream is a narrow river and it also a body of water. Rivers in the study area covers nearly 4 Sq. km. all rivers are carrying flood during monsoons.

Conclusion:-

The attempt to determine the coastal geomorphology from Tiruvottiyur to Pulicat by using Landsat- 8 OLI data. The present study shows the satellite remote sensing based coastal geomorphological features mapping is very useful and very effective for getting the result of coastal geomorphology. The study has been conducted with Landsat- 8 OLI data; the study area falling the coastal area Tamil Nadu shows major geomorphological landforms under the influence of the coastal parameters.

The geomorphological features are classified by two that is marine landforms and fluvial landforms. The study area is marked by diverse geomorphic features of these two landforms with the help of the field validation. The coastal geomorphic features clearly established the sea level oscillations and variations in climatic conditions along this study area.

Abstract

Background: Bronchial asthma is one of the most common chronic disease in the world affecting around 334 million people. Management of bronchial asthma includes multidrug therapy for long duration, which leads its association with adverse drug reactions (ADRs). Pharmacovigilance studies of antiasthmatic agents are scarce in India. Therefore, the present study was planned to monitor and evaluate adverse drug reactions associated with antiasthmatic agents.

Objectives: The present study was conducted to evaluate the pattern, causality and severity analysis of adverse drug reactions associated with antiasthmatic agents in a tertiary care centre.

Materials and Methods: 150 patients of either gender, ageing above 18 years with established bronchial asthma attending outpatient and inpatient department of medicine at a tertiary care centre interviewed during the time period of October 2016 to February 2017. Central Drugs Standard Control Organisation (CDSCO) ADR forms were filled. World Health Organisation- Upasala Monitoring Centre (WHO-UMC) causality categories were used for assessment of causality. Severity of ADRs was assessed by using Hartwig and Siegel scale.

Results: A total 33 ADRs were reported in 23 patients out of 150 bronchial asthma patients. Among the 23 patients reported with ADRs 10 (43.47%) were male while 13 (56.52%) were female. Oral thrush was most common ADR (33.33%) followed by palpitation (15.15%), sore throat (12.12%), running nose, tremors (each 9.09%), dry mouth, GI distress, bitter taste (each 6.06%) and headache (3.03%) among the patients of bronchial asthma receiving antiasthmatic agents. Most ADRs were associated with inhalational Beclomethasone (58.33%) followed by inhalational budesonide (25%), montelukast (23.07%), salbutamol (18.75%), theophylline (14.29%), ipratropium (7.4%) and salmeterol (02.22%).

According to WHO-UMC categories 48.57% ADRs were found to be probable while 51.42% were possible. Highest percentage of ADRs 75.79% were classified as mild and 24.24% were moderate on Hartwig and Siegel scale.

Conclusion: Results of our study highlighted the need for ADR monitoring of antiasthmatics in asthma patient. Patients receiving inhalational steroids need to be properly counselling and also written

advice about cleansing mouth after steroid inhalation to reduce the risk of oral thrush.

..... **Introduction:-**

Bronchial Asthma is defined as reversible obstruction of airways of lungs due to its hyper-responsiveness to external or internal allergen or nonspecific stimulus like exercise, cold and characterized pathologically by chronic airway inflammation and clinically by cough, wheeze, chest tightness and dyspnoea.¹ The global prevalence of asthma is anticipated to be approximately 4.5 per cent.^{2,3} There are about 334 million patients with asthma affecting all age groups, across the world. The prevalence of asthma has increased over the time and an additional 100 million people worldwide are expected to develop asthma by the year 2025.⁴

In the Indian study on epidemiology of asthma, respiratory symptoms and chronic bronchitis in adults (INSEARCH), the prevalence of asthma in adults was 2.05 per cent, with an estimated burden of 17.23 million.⁵ A recent analysis using three different estimate models (INSEARCH, GINA and WHO survey) suggests that the prevalence of asthma in India varies between 2.05 to 3.5 per cent (17-30 million patients).⁶ India is projected to become the world's most populous nation by the year 2050. As a result, further predicted increase in the prevalence of asthma will result in a marked increase in the number of asthmatics.⁷

Adverse drug reaction (ADR) is associated with almost every drug ranging from mild to serious and life threatening. WHO defines ADR as "any noxious, unintended & undesired effect to a drug that is administered in standard doses by the proper route for the purpose of prophylaxis, diagnosis or treatment".⁸ WHO, 2004 pioneered the concept of pharmacovigilance i.e. "Science and activities relating to the detection, assessment, understanding and prevention of ADR or any other medicine related problems".⁹

ADRs constitute a considerable burden of society both financially and in terms of human suffering, and systemized ADR monitoring and reporting may sensitize physicians to rational prescribing.¹⁰

Pharmacovigilance studies for monitoring ADRs related to antiasthmatic agents have been performed by various workers around the globe. Reports on monitoring of ADRs in India are scarce.¹¹ Oral thrush, tremor, palpitations, throat irritation and cough are common adverse effects of antiasthmatic agents.¹² However causality and severity of these adverse effects remains undetected due to lack of pharmacovigilance studies in Indian context. The monitoring and evaluation of ADRs associated with antiasthmatic agents would provide the necessary information on adverse effect of different antiasthmatic agents. Therefore, the present study is planned to study the pattern of ADRs associated with antiasthmatic agents and their analysis for causality and severity in a tertiary care centre.

Materials and Methods:-

It was a non-comparative and hospital based cross-sectional questionnaire based pharmacovigilance study. The study protocol was approved by Institutional Ethics Committee. The study was carried out in outpatient and inpatient medicine department of tertiary care teaching hospital. Total 150 patients were interviewed from October 2016 to February 2017 and informed consent form was taken. All the patients of bronchial asthma, who were receiving antiasthmatics not less than 1 month were included in this study. Patients with other co-morbid conditions like hypertension, diabetes mellitus, arthritis, respiratory infections (such as COPD, bronchitis, lung diseases) and immunocompromised state were excluded from study.

Based on an ADR monitoring form which is drafted according to Central Drug Standard Control Organisation (CDSCO) monitoring guidelines. Demographic details (age, sex, weight) relevant medical history, present drug therapy, adverse event description, adverse event outcome and assessment information were collected. World Health Organisation-Uppsala Monitoring Centre (WHO-UMC) causality categories¹³ was used for assessment of causality. Severity of ADRs was assessed using Hartwig and Siegel scale. The obtained data was analyzed by using percentage method and chi square test to conclude the study results.

Results:-

A total 33 ADRs were reported in 23 patients out of 150 bronchial asthma patients. Among the 23 patients reported with ADRs 10 (43.48%) were male while 13 (56.52%) were female. 8 (34.78%) patients associated with ADRs observed in the age group of 41-50 years, followed by 5 (21.74%) in age group 21-30 years, 4 (17.40%) in age group 31-40 years, 3 (13.04%) in age group 51- 60 and 61-70 each were observed. Distribution of ADRs among various age groups ([Table 1](#)).

Oral thrush was most common adverse drug reaction (33.33%) followed by palpitation (15.15%), sore throat (12.13 %), running nose, tremors (each 9.09%), dry mouth, GI distress, bitter taste (each 6.06%) and headache (3.03%) among the patients of bronchial asthma receiving anti asthmatic agents ([Table 2](#)).

Most ADR was associated with inhalational Beclomethasone (58.33%) followed by inhalational budesonide (25%), montelukast (23.07%), salbutamol (18.75%), theophylline (14.29%), ipratropium (7.4%) and salmeterol (02.22%) ([Table 3](#)).

Among the total 23 patients, 11 were on monotherapy while 12 were on combination therapy. There was no significant difference in ADRs associated with monotherapy and combination therapy [Chi- square test, $p > 0.05$] ([Table 4](#)).

According to WHO-UMC categories, 48.49% ADRs were found to be probable while 51.51% were possible. ([Table 5](#)).

Highest percentage of ADRs (75.76%) were classified as mild on Hartwig and Siegel scale which included oral thrush, sore throat, running nose, dry mouth, GI distress, bitter taste, headache and were well tolerated by patients. While 24.24% were moderate which included palpitations and tremors, no severe reaction was observed ([Table 6](#)).

Discussion:-

A total 33 ADRs were reported in 23 patients out of 150 bronchial asthma patients. Among the 23 patients 10 (43.48%) were male while 13 (56.52%) were female.

Oral thrush was most commonly observed adverse drug reaction and was observed in 11 patients out of 23 (33.33 %) who received inhalational Beclomethasone and Budesonide corticosteroids, Most ADR (oral thrush) was associated with inhalational Beclomethasone in 7 out of 11 patients (58.33%). Oral thrush is an infection in the mouth caused by a yeast germ called, candida. Inhalational steroids may cause an overgrowth of candida which can lead to a bout of oral thrush. Cleansing mouth and brushing teeth after using the steroid inhaler may reduce the risk of oral thrush.^{14,15,16,17,18} All 7 patients were not rinsing mouth or brushing teeth after use of inhalation. No prior advice was given to patients regarding cleansing mouth after beclomethasone inhalation. High incidence of oral thrush in patients receiving inhalational beclomethasone is suggestive of need of counselling and advice to reduce the risk of oral thrush. There was no significant difference in ADRs associated with monotherapy and combination therapy. Highest percentage of ADRs (75.79%) were classified as mild ADR on Hartwig and Siegel scale which included oral thrush, sore throat, running nose, dry mouth, GI distress, bitter taste, headache and were well tolerated by patients. While 24.24% were moderate which included palpitations and tremors.

Conclusion:-

Results of our study highlighted the need of ADR monitoring of antiasthmatics in asthma patient. Patients receiving inhalational steroids needs to be proper counselling and also written advice about cleansing mouth after steroid inhalation to reduce the risk of oral thrush.

Table 1:- ADRs among various age groups of asthmatic patients.

AGE RANGE	MALE	FEMALE	Total (%)
21-30	2	3	5 (21.74)
31-40	2	2	4 (17.40)
41-50	3	5	8 (34.78)
51-60	2	1	3 (13.04)
61-70	1	2	3 (13.04)

Table 2:- Types and number of Adverse Drug Reactions.

Type of Adverse Drug Reaction	Number of ADRs (Percentage)
Oral thrush	11 (33.33%)
Palpitations	5 (15.15%)
Sore throat	4 (12.13%)
Running nose	3 (9.09%)
Tremors	3 (9.09%)
Dry mouth	2 (6.06%)
GI distress, nausea	2 (6.06%)
Bitter taste	2 (6.06%)
Headache	1 (3.03%)

Table 3:- Suspected drugs and their associated type of ADRs and number.

Antiasthmatic class	Drugs	No. of ADRs/ No of prescriptions (percentage)	ADRs (No.)
β_2 Agonist	Salbutamol	6/32 (18.75%)	Palpitations (3) Bitter taste (1) Tremors (1) Headache (1)
	Salmeterol	1/45 (02.22%)	Bitter taste (1)
Methyl Xanthines	Theophylline	4/28 (14.29%)	Palpitations (2) Tremors (2)
Corticosteroids	Beclomethasone	7/12 (58.33%)	Oral thrush (5) Sore throat (2)
	Budesonide	8/32 (25%)	Oral thrush (6) Sore throat (2)
Anti cholinergic	Ipratropium	4/54 (7.40%)	G I Distress (2) Dry mouth (2)
Leukotrine Antagonist	Montelukast	3/13 (23.07%)	Running nose (3)

Table 4:- Number of ADRs in patients receiving mono therapy and combination therapy.

Therapy	No. of Patients	No. of ADR	P > 0.05
Mono therapy	11	15	
Combination therapy	12	18	
Total	23	33	

Table 5:- Causality assessment of ADRs according to WHO-UMC categories.

Assessment	No. of ADRs	Percentage of ADRs
Certain	0	0
Probable	16	48.49
Possible	17	51.51
Unlikely	0	0
Conditional	0	0
Unconditional	0	0

Table 6:- ADR classification on basis of severity by Hartwig and Siegel scale

Severity	No of ADRs	Percentage of ADRs
Mild	25	75.76
Moderate	8	24.24
Severe	0	00.00

Abstract

Background: Polycystic ovary is a highly variable condition with a wide array of presentations. The Polycystic ovary syndrome should meet at least two of the following three criteria: oligo- or anovulation; clinical and/or biochemical signs of hyperandrogenism; polycystic ovaries on ultrasound. The prevalence of PCO is largely unknown in Saudi Arabia.

Objectives: The aim of this study was to investigate the reproductive hormones levels in patients with PCOS in addition to the effect of age and body mass index (BMI) on the hormonal findings and ultrasound & to determine the clinical, biochemical and etiologic features of hirsutism in Saudi females.

Methodology: A cross sectional study has been conducted among total of 183 patients diagnosed with PCOS have been assessed clinically along with measuring the level of reproductive hormones in Obstetrics and Gynecology Clinic at King Abdul-Aziz hospital and oncology center in Jeddah, Saudi Arabia, between June 2015 and June 2016.

Conclusion: Elevated levels of LH/FSH and testosterone and reduced FSH, SHBG, and progesterone were predictors of PCOS. This was independent of BMI or age. Future studies with larger sample size and data on insulin levels are needed for greater understanding of the manifestation of PCOS in the Saudi population.

Introduction:-

Polycystic ovary (PCOS/PCOD) is the most common endocrinopathy in women of reproductive age, with a prevalence of up to 10%. It is a complex condition that was first described in women who had PCOS as the underlying cause of hirsutism and chronic anovulation ^[1]. PCOS is a growing epidemic among Saudi Arabian women, and women around the world although is a highly variable condition with a wide array of presentations. In study conducted on Saudi girls, the estimated prevalence of PCOS was observed to be 53.7% which is strikingly higher ^[2].

With the new guidelines for diagnosis of PCOS, The European Society of Human Reproduction and Embryology/American Society for Reproductive Medicine criteria, often called Rotterdam, includes various phenotypes based on a combination of any two of the three findings of hyperandrogenism, menstrual irregularity, and polycystic ovaries on ultrasound^[3]. However, polycystic ovary as a phenomenon is very common in women with idiopathic hirsutism and oligomenorrhea^[4]. Also a wealth of literature agrees that women may present an appearance of PCOS at ultrasound without any sign of androgen excess, although with indicators of ovarian dysfunction^[5]. Similarly, PCOS is diagnosed by exclusion, and disorders having a phenotype related to that of PCOS must be ruled out; such as congenital adrenal hyperplasia, Cushing syndrome and virilising tumors^[6].

The principal findings in patients with PCOS include irregular menstruation, acne, and excessive amounts of androgenic hormones. Obesity is a common finding of women with PCOS^[7-8-9]. PCOS is not merely a disease of the reproductive system, since type 2 diabetes, metabolic syndrome, and sometimes cardiovascular disease have been associated with this condition [9].

Ultrasound evaluation of patients with suspected PCOS in study has been confirmed that presence of 12 or more 2–9 mm follicles appears more sensitive than either ovarian volume or stromal brightness to diagnose PCOS^[2].

In the literature, several groups have investigated the reproductive hormones of women with PCOS in comparison to healthy controls. Follicle stimulating hormone (FSH) and sex hormone-binding globulin (SHBG) were found to be lower in several studies^[10-11-12-13]. In addition, mean concentration of testosterone was higher in patients with PCOS compared to controls^[14]. Furthermore, it has been shown that luteinizing hormone (LH) and LH/FSH ratio were elevated in PCOS patients compared to normal controls^[15-16-17]. The results, however, depended on the day of the cycle on which the hormones are measured, wherein LH was significantly elevated in PCOS patients only late in the menstrual cycle but not earlier^[12].

In Study has been done in 2006 explained that PCOS has three major pathophysiologic hypotheses have been proposed to explain the clinical findings^[18]: the LH hypothesis, the insulin hypothesis and the ovarian hypothesis although the fact that the pathogenesis of PCOS has not clear.

Methodology:-

This study was conducted on women who attended the Obstetrics and Gynecology Clinic at King Abdul-Aziz hospital and oncology center in Jeddah, Saudi Arabia, between June 2015 and June 2016. Women aged between 18 and 45 years were screened for the presence of PCOS.

Study subjects:-

A total of **183** Saudi patients diagnosed with PCOS based on the Revised 2003 Rotterdam Criteria during this study period were included in the study. According to the Rotterdam ESHRE/ASRM-sponsored PCOS consensus workshop group, two out of three of the following must be present to establish diagnosis: Oligo- and/or anovulation, clinical and/or biochemical signs of hyperandrogenism, and polycystic ovaries. Exclusion of other etiologies (congenital adrenal hyperplasias, androgen-secreting tumors, Cushing's syndrome) was conducted. The agreed ultrasound features of PCOS was confirmed by presence of 12 or more 2–9 mm ovarian follicles; a peripheral distribution of ovarian follicles; an ovarian volume of more than 10 cm³ and a highly echogenic ovarian stroma^[2]. For the purpose of this study, all diagnoses were made by a consultant gynecologist in association with a senior ultrasonographer. All participants signed an informed consent form.

Hormonal investigations:-

Blood samples were withdrawn between days 1 and 5 of the period. LH, FSH, estradiol (E2), dehydroepiandrosterone sulfate (DHEA-SO₄), SHBG, total testosterone, prolactin, and progesterone were determined by immunoassay. Serum levels of thyroid stimulating hormone (TSH) and 24-h urinary cortisol were not measured.

Other information:-

Regular menstruation was defined as 9–16 cycles of 21–35 days duration within a year, and no more than a 4-day difference in duration between cycles. The subjects were checked for the presence of acne and/or blackheads on the face, neck, upper arm, chest, and back. Using the modified Ferriman and Gallwey score^[18], the subjects were checked for hirsutism. A Ferriman and Gallwey score higher than 7 indicated hirsutism.

Results:-

The main demographics of cases and controls are presented in Table 1. A total of 183 participants; 77 (42.08%) aged 38 to 45 years old, 71 (19.13%) aged 18 – 27 years old, and 35 (19.13%) aged 28 – 37 years old. In relation to body mass index (BMI) 0 (00%) were under weight, 45 (24.59%) were normal weight, 15 (8.20%) were overweight, 58 (8.20%) were class I obesity, 62 (33.88%) were Class II obesity, and 3 (1.64%) class III obesity. Regarding the clinical presentation (80.33%, 93.44 %, 68.31%, and 20.77%) of the participants were had acne, hirsutism, oligomenorrhea, and infertility respectively. In addition to that 97.81% of the participant has 12 or more follicles measuring 2–9 mm.

Table 1:- Main Demographics Of Cases.

VARIABLES		NUMBER	PERCENTAGE
AGE (YEAR)	18 - 27	71	38.80%
	28 - 37	35	19.13%
	38 - 45	77	42.08%
BMI	< 18.5	0	0.00%
	18.5 - 24.9	45	24.59%
	25 - 29.9	15	8.20%
	30 - 34.9	58	31.69%
	35 - 39.9	62	33.88%
	> 40	3	1.64%
HISTORY OF ACNE	yes	147	80.33%
	No	36	19.67%
FERRIMAN–GALLWEY SCORE	< 7	12	6.56%
	> 7	171	93.44%
HISTORY OF OLIGOMENORRHEA	yes	125	68.31%
	No	58	31.69%
HISTORY OF INFERTILITY	Yes	38	20.77%
	No	145	79.23%
Positive finding OVARIAN FOLLICLE	≥ 12 follicles or more follicles measuring 2–9 mm	179	97.81%
	Ovarian volume of more than 9 cm ³	4	2.18%

To eliminate the potentially confounding bias of age and BMI, we carried out multivariate analyses in Table 2. Indeed, LH/FSH and total testosterone were positively correlated with the disease (regression coefficient = 0.2 and 0.06, respectively, with $P = 0.03$ and 0.02 , respectively). However, FSH, SHBG, and progesterone were negatively correlated with the disease (regression coefficient = -0.02, -0.004, and -0.2, respectively, with $P = 0.05$, 0.02 , and 0.002 , respectively).

Table 2: Age and BMI adjusted comparison of reproductive hormones

VARIABLE	Regression coefficient	P value
LH	0.04	0.18
FSH	-0.02	0.05
LH/FSH	0.2	0.03
E2	0.001	0.6
DHEA - SO4	-0.002	0.92
SHBG	-0.004	0.02
TOTAL TESTOSTERONE	0.06	0.02
PROLACTIN	0.003	0.5
PROGESTERONE	-0.2	0.002
CORTISOL	0.002	0.8

Discussion:-

In this study, we have assessed the clinical presentation along with measuring the level of reproductive hormones of Saudi women diagnosed with PCOS according to the Rotterdam criteria. The importance of our study lies in the fact that studies describing PCOS in the Saudi population are very scarce.

In our studied population most of the participants were 38-45 years old (42.08%) although PCOS can occur throughout reproductive age ^[19]. Other study show that PCOS can occur in younger age group up to 9 years old ^[20]. In addition to that (33.88%) of them were class obesity with BMI between 35 - 39.9 which reflects the fact that obesity is a common finding in PCOS and also in the general Saudi population although obesity is not part of the diagnostic criteria. In the literature, BMI has been suggested to influence the levels of reproductive hormones with some contradictory results. Indeed, some studies found that higher BMI was associated with lower LH ^[21-22-23-24], but others described that BMI had no influence on LH ^[25-26]. On the other hand, recent research has indicated that age can also influence both the clinical presentation and metabolic manifestations of PCOS ^[27-28].

In fact, the results of the multivariate regression analyses confirmed that regardless of the age and weight factor, cases had higher levels of LH/FSH and total testosterone, and that cases had lower level of FSH, SHBG, and progesterone. Even in the adjusted comparison, we could not find a significant increase in LH levels. Unlike the previous published studies ^[15-16], we have failed to find a significant increase in LH in patients with PCOS. A major factor that tends to affect the results is the variation of hormonal level with the menstrual cycle. According to a published study ^[12], elevated LH levels are not very reproducible in the early menstrual cycle, which was the time at which we measured LH in this study. Furthermore, it was previously demonstrated that LH is more elevated in lean PCOS patients compared to obese PCOS patients ^[17] and having most of our patients with BMI >25 (75.41%) could have been a major influence of the results. Several studies in the literature have reported that not all PCOS patients have elevated LH ^[15-16-29], and this could be very well the reason why the average increase in LH observed in our study was not statistically significant. The absence of data on insulin levels has impacted some constraints on the interpretation of the hormonal findings.

Recommendations:-

Future studies with a larger number are required to further clarify the hormonal variations in PCOS. Another limitation is the unavailability of a measurement for insulin level for the study subjects.

Conclusion:-

Elevated levels of LH/FSH and testosterone and reduced FSH, SHBG, and progesterone were predictors of PCOS. This was independent of BMI or age. Future studies with larger sample size and data on insulin levels are needed for greater understanding of the manifestation of PCOS in the Saudi population.

Abstract

The purpose of this study was measuring the effectiveness of using Virtual Mathematics Lab (VML) to improve teaching and learning of calculus. For learning calculus in VML mathematics classroom is proposed that describes the interactions among the students, VML, and the learning tasks, and how they lead to the learning of calculus. A design experiment was conducted in a class of 50 students from a secondary school. Use of VML was integrated into the teaching and learning of calculus concepts in the classroom with the aid of Acadox environment Navigator, a wireless classroom network system that enables instant and active interaction between students and teachers. It was found that the appropriate use of graphical, numerical and algebraic representations of calculus concepts using VML enabled students to better visualize the concepts and make generalizations about relevant mathematical properties. In addition, the students were able to link multiple representations, especially algebraic and graphical representations, to improve their conceptual understanding and problem-solving skills. VML was used as an exploratory tool, graphing tool, confirmatory tool, problem-solving tool, visualization tool and calculation tool. This suggests that VML is a multi-dimensional tool that supports mathematics learning. Overall, the findings of the study indicate that VML is an effective tool to develop mathematical concepts and promote learning and problem solving.

Introduction:-

The graphing calculator has been widely used as a technological tool in teaching and learning mathematics. There is a growing body of research which shows that the pedagogical affordances of the graphing calculator have a close relationship with improving learning of mathematics. Indeed, mathematics can be taught in a more coherent way by providing students with the opportunities to connect mathematical concepts within and between topics, and here the graphing calculator is well-positioned to offer a learning environment that enables mathematics to be experienced through multiple representations [1].

The curriculum standards of the National Council of Teachers of Mathematics[2] Suggest the use of graphing calculators to provide students with multiple representations to explore and investigate mathematical concepts. Extensive research has been conducted to answer questions such as whether graphing calculators significantly

Corresponding Author:-Elsaeed Elsaed Mohamed Abd Elrazek.

Address:-Computer Teacher Preparation Department, Faculty of specific education, Damietta University, Egypt.

improve mathematical learning and problem solving [3]. However, many such studies have compared the use of graphing calculators to traditional chalk-and-talk learning, and little research has examined how students use graphing calculators in learning and the relationship between pedagogical strategies for learning and the use of graphing calculators.

Chu & et al. Out an extensive review of research on graphing calculators, they found that certain teaching styles, such as interactive and inquiry oriented, are more compatible with the use of graphing calculators than others. However, they also point out that many studies fail to address the use of graphing calculators in an instruction context, which leads to inconsistent findings on their effectiveness in teaching and learning. This review suggests a need for studies that address the use of graphing calculators in an instruction context within a particular learning environment [4].

Accordingly, the purpose of this study was to investigate how the use of VML, an advanced graphing calculator, could enhance teaching and learning of calculus. This article provides the details and results of a designed experiment, which involved the design and conduct of a VML for a class of 50 Secondary students. Use of VML was integrated into the teaching and learning of calculus concepts with the Acadox environment Navigator

Conceptual Frameworks:-

In the literature of mathematics reform, learning mathematics is viewed as a social endeavor, with the mathematics classroom functioning as a community in which thinking, presenting, talking, agreeing and disagreeing are encouraged [5]. Mathematical tasks are given to students to develop and extend their mathematical thinking and problem-solving ability. Student interaction with mathematical tasks and tools encourages them to construct mathematical ideas. Hence, create meaning for their learning.

Hwang Et Al. [6] observed that students should construct meaning from the tools that they use and the mathematical tasks in which they are engaged. They elaborated that learners construct mathematical meanings from tools as they use them. This leads to meaningful learning, as the tools become intertwined with the mathematical tasks. Bruce [7] pointed out that the quality of mathematics tasks is important in determining whether a task engages students and whether they attain higher order learning by being given opportunities to explain and justify their reasoning.

It is widely acknowledged that calculus concepts are abstract and complex for students and that teaching and learning these concepts can be challenging and even exasperating at times. Research has shown that many students have difficulties in learning the key concepts of calculus. It does not help that traditional calculus courses tend to focus on algebraic drills and the practicing of calculus problems without generating an understanding of the underlying concepts.

Specifically, in terms of calculus, many researchers have advocated that teaching and learning should focus on concepts, rather than simply techniques to improve student performance. Tall emphasized the need to help students move flexibly from one representation to another in learning calculus. Using a graphing calculator extends the teaching and learning of calculus concepts from being based solely on algebraic methods to the incorporation of numeric, algebraic and graphical representations. The idea of using the graphing calculator to provide a better connection between algebraic and graphical representations of calculus has been reported in several studies.

It is believed that the use of technology in the teaching of calculus can be beneficial if it is accompanied with appropriately designed activities. Lazonderet al.[8] highlighted that mathematical tools are important in helping students to make connections to build their mathematical understanding. Activities such as guided discovery and inquiry learning have been used in the design of worksheets to encourage interaction with graphing calculators to help students develop an understanding of calculus concepts.

In this study, many activities using Acadox environment were designed by the author, with inputs from the teacher of the participating class, hereafter the participating teacher, to provide students with opportunities to explore, generalize mathematical concepts, to help them develop confidence and ability in communicating mathematically. The preliminary framework for the use of VML in the intervention programme is an adaptation.

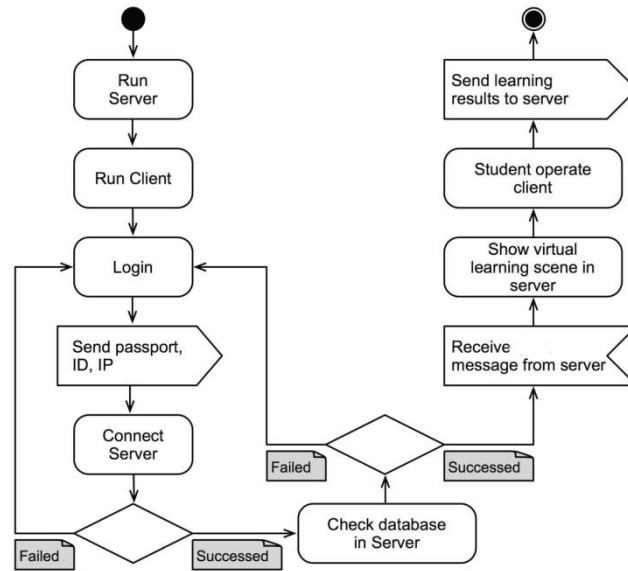

Fig. 1:- the steps to enter the student for Acadox environment.

A conceptual framework for calculus learning and teaching using Acadox environment was devised based on the foregoing literature review, and is illustrated in Fig. 2 This study seeks to the interactions among the students, VML, and the learning tasks lead to the learning of calculus. It describes Student Guided discovery and inquiry-based design learning tasks VML with acadox environment

Fig. 2:- Conceptual framework.

Figure 3:-Architecture of the setting up the VCL in acadox environment.

Methodology:-

This study employed a designed experiment methodology that involved the preparation, design, implementation and retrospective analysis of a teaching experiment. A designed experiment is an iterative process that features cycles of invention and revision. The participating teacher worked in close partnership with the author to incorporate the use of VML in lessons, examining the strengths and limitations of existing pedagogy and practice and acknowledging areas for future development with the VML.

Research Design:-

The subjects of the study were 50 students from a secondary school. Each student was trained before the start of the VML. The purpose of the training sessions was primarily to introduce the interface design and to train the participating students in the use of the algebraic, graphical and numerical functions of VML while engaging the students in inspiring activities involving mathematical problem solving and exploration with the acadox environment.

To determine more precisely, the role of VML in teaching and learning calculus in the participating class, a calculus package focusing on differentiation and integration that integrated VML was designed. The topics covered were Differentiation by First Principles, Equations of the Tangent and the Normal, Rate of Change, Stationary Points, Derivatives of Trigonometric Functions, Derivatives of Exponential and Logarithmic Functions, Integrations and Indefinite Integrals, Definite Integrals, Integration of Trigonometric Functions, Integration of Exponential Functions and $1/x$, and Area of a Region. It starts with a known pattern: a parabolic, sine or circular. The curves will be shaped by the graphical effect that corresponds to the presence of the parameter k in the algebraic expression. Different forms and graphical effects are included on considering the mathematical functions listed in Table 1.

Table 1:- Functions and graphical effects considered in the application.

Graphical effect	Parabola	Sine	Circle
Original	$y = x^2$	$y = \sin x$	$y = \sqrt{1 - x^2}$
Vertical scroll	$y = x^2 + k$	$y = \sin x + k$	$y = \sqrt{1 - x^2} + k$
Horizontal scroll	$y = (x + k)^2$	$y = \sin(x + k)$	$y = \sqrt{1 - (x + k)^2}$
Contraction	$y = kx^2$	$y = k \sin x$	$y = k\sqrt{1 - x^2}$
Expansion			
Other		$y = \sin kx$	$y = \sqrt{R^2 - x^2}$

The VML learning activities focused on introducing mathematical concepts through exploration using VML. Students were encouraged to examine the setting of a given problem or to manipulate the parameters of a simulation in a VML document that was

d

$$dx (\sin x) = \cos x \quad (1)$$

Notes:-

- Use VML to verify the above results. The gradient of the tangent line to $y = \sin(x)$ at a given point gives the value of the derivative of $y = \sin(x)$ at that point.
- Use the tangent line to trace an approximate graph of the derivative of $y = \sin(x)$. The slope of the tangent is shown at the top right of the screen. Your goal is to move the tangent line by grabbing and dragging the point of tangency such that it is positioned directly above each of the 13 points, beginning with the leftmost point.
- Inspect the resulting scatter plot, which represents the approximate graph of the derivative of the sine function. Write down your observations.
- Use the Graphs and Geometry application to verify your answer.

They were asked to formulate conjectures and examine and confirm those conjectures, culminating in the derivation of a formula, the generalization of the results or the summarization of the underlying concepts. A worksheet was designed to accompany these activities to facilitate guided discovery and inquiry learning.

In the second category, the students were assigned tasks to reinforce their conceptual understanding using VML. In a typical activity, an exercise consisting problems related to the concept being taught was assigned and students were required to complete the exercise with the aid of VML.

Occasionally, a formative assessment using the 'Quick Poll' function of ACADOX Navigator, which allows the teacher to gather instant feedback from students through the network, was conducted to assess student understanding. Where time permitted, students were invited by the participating teacher to share their solutions or ideas through the use of the 'Presentation' function of ACADOX Navigator. VML Navigator was also used by the participating teacher to monitor the progress of the students in the in-class tasks by periodically viewing their ACADOX screens.

Acadox presents the following functionalities:-

- **Web-intercom:-** This functionality allows the user take part in chats within the 3D environment. The records of such chats can be viewed both in the virtual environment and in Acadox server. These records are stored in Acadox's database.
- **Registration booth:** This functionality allows relating student's avatars to their corresponding Acadox's accounts. It is required because students frequently have different names for their accounts and their avatars which can pose some problems when recording their activities.
- **Quiz tool and 3D Drop Box:** This functionality allows the students to execute tasks involving the creation of objects in the virtual environment. The objects created are then transferred to Acadox similar to the way a file is uploaded.
- **Multi-function Toolbar:** This functionality allows the user to activate the blog development function within the virtual environment. Such blogs can be viewed both in the virtual environment and in Acadox.
- **Presenter:** This functionality allows the users to post in the virtual environment, slideshows or videos that can be viewed or downloaded from the Acadox server.
- **Quiz Chair:** This functionality allows the students to answer prepared questions in Acadox, which also stores the answers.

All of the activities and accompanying worksheets were designed after thorough discussion with the participating teacher who then co-taught the calculus package with a research assistant of the project who assisted the participating teacher with the use of VML and its Navigator, Activities such as guided discovery.

Data Collection Instruments:-

A questionnaire was used to measure the quality of the suggested system in a simple way. To make sure of clarity of statements, they were adjusted by some professional professors.

Data Analysis:-

To analyze the questionnaire statements, SPSS19 was used to extract mean M, standard deviation SD and T-test to regard the studied statements as qualitative data for knowing if there is a relationship between science laboratories and their support to the educational process.

Expert's attitudes:-

The use of SPSS software to make a statistical analysis of the terms of the views of expert's form towards the use of VML system to conduct ,Experiments and the results were as follows:

Table 2:- Descriptive statistics of Expert's attitudes toward the VML system.

● **The views of students' attitudes:** A field study focused on the importance of VML system in the laboratory of traditional real to the stage of a secondary school where the number of students involved in this experiment are 50 students of a secondary school simulation was conducted. Data were collected by the views of a questionnaire to gauge the views of students about the use of the proposed VML system includes wage trial on four steps:

The first step: Students have been creating content for laboratory experiments by having competent to rule clarification and guidance to the students' action steps prescribed by the laboratory tests that were true through most of the meeting between the competent and students.

The second step: The students were trained on how to use the VML and guide students in dealing with the system pragmatic system pragmatics, by training students on how to enter the system, and keep track of work experience measures and how to move from a chemical experiment to another.

The third step: The students to re-do the experiments using the proposed application. The role of the researcher and competent to rule at this stage, is to follow the progress of students in work experience, and providing assistance to them, and answering questions raised by students during the experiment At the end of each experiment, there was a discussion with the students about what is implementation.

Step Four: A questionnaire was distributed to measure the views towards the use of VML system to conduct experiments.

B. Results:

The use of SPSS software to make a statistical analysis of the terms of the views of students form towards the use of VML system to conduct experiments and the results were as follows:

Table 3:- Descriptive statistics of student's attitudes toward the VML system.

NO	statements	N	Minimum	Maximum	Mean	Std. Deviation
1-	VML is a new teaching method	50	1	2	2.62	0.490
2-	Help install information.	50	1	2	2.48	0.505
3-	Easy to use.	50	1	2	2.60	0.495
4-	Makes the learner's active and positive.	50	1	2	2.48	0.677

7-	Offer to extract information.	50	1	2	2.56	0.577
8-	Take into account individual differences.	50	1	2	2.44	0.611
9-	It provides an opportunity to work outside the formal learning tools.	50	1	2	2.60	0.571
10-	It helps to learn many skills in a short time.	50	1	2	2.72	0.454
11-	It provides an opportunity to end the learning process according to your own pace and his ability to learn.	50	1	3	2.56	0.577
12-	Grown self-learning skills.	50	1	2	2.62	0.490
13-	This application is an advanced technical system and is important to face the challenges of the times.	50	1	2	2.72	0.454
14-	The application provides the privacy of student.	50	1	2	2.34	0.626
15-	Application to understand the information deeper help.	50	1	2	2.38	0.753
16-	It helps to learn and absorb mathematics.	50	1	2	2.64	0.485
17-	Encouraged to overcome the negative reception of information to active participation in education.	50	1	2	2.54	0.579
18-	Encourages the application on the stimulus and preview the information and control.	50	1	2	2.60	0.571

The Alpha physical coefficient was calculated about student attitudes towards VCL system, It gave the highest score of acceptance ($\alpha=0.898$). It was also found that students showed their acceptance that VML is a new teaching method ($M=2.62$, $SD=0.490$) and that Help install information. ($M=2.49$, $SD=0.505$) and that easy to use. ($M=2.60$,

SD=0.495). Makes the learner's active and positive. (M=2.48, SD=0.677) and It provides the use of a suitable environment. (M=2.38, SD=0.667). Provide interactive experiences. (M=2.56, SD= 0.611).

Students also agreed that Offer to extract information. (M=2.56, SD=0.577). There was also taking into account individual differences. (M=2.44, SD= 0.611), It provides an opportunity to work outside the formal learning tools. (M=2.60, SD=0.571) and It helps to learn many skills in a short time. (M=2.72, SD=0.454).

It also provides an opportunity to end the learning process according to your own pace and his ability to learn. (M=2.56, SD=0.577), It also Grown self-learning skills. (M=2.62, SD=0.490). This application is an advanced technical system and is important to face the challenges of the times. (M=2.72, SD=0.454). The application provides the privacy of student (M=2.34, SD=0.626). Application to understand the information deeper help (M=2.38, SD=0.753). It helps to learn and absorb mathematics. (M=2.64, SD=0.485). Encouraged to overcome the negative reception of information to active participation in education. (M=2.54, SD= 0.579). Encourages the application on the stimulus and preview the information and control (M=2.60, SD= 0.571).

Comparison between RML and VML:-

The comparison of Real Mathematic Lab (RBL) and Virtual Mathematic Lab (VBL) the terms of learning performance and the factor of learning time.

Comparison of learning performance:-

In this selection, we want to understand whether or not there is a difference between learning methods. This research employs a T-test to analyze the relation between students' "pre-examination achievement", "post-examination achievement" and "learning model (VML)".

Table 4:- Results of the t-test between pre-test and post-test regarding Comparison of learning performance.

Group	Mean	Standard deviation	t-test
Pre-test	11.87	3.09	5.685
Pro-test	14.91	2.27	

Table 4. Shows that the results of the t-test shows there was a statistically significant difference between the pre-test (M= 11. 87) and the post-test (M = 14. 91). In terms of VML application, where we find T-TEST = 5.685

Learning Time:

In this selection, we want to understand whether or not there is a difference learning time between in RML and VML, This research employs an ANOVA to analyze the relation between VML, RML

ANOVA					
Table 4. ANOVA result for assessment learning time between in RML and VML					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	568.367	23	24.712	.982	.562
Within Groups	151.000	6	25.167		
Total	719.367	29			

On average, there was a significant difference in the percentage learning time, where we find that the average learning time through the RML (Mean= 44.47), while we find learning time through VML (Mean= 17.03), from indicates the effectiveness of the system in reducing the learning time.

Discussions:-

The results of the study support the research hypothesis that the new mathematical experiences afforded by VML offer students a rich setting to explore calculus concepts. The dynamic features of graphing calculators, such as multiple representations of mathematical concepts, if used appropriately, can improve students' ability to make the connection between graphical and algebraic representations. This feature was found to be particularly useful in teaching and learning calculus.

Many ways of using VML as a tool in the mathematics classroom were identified in this study. In the Simulation programme, VML was used as an exploratory tool, graphing tool, confirmatory tool, problem-solving tool, visualization tool and calculation tool. Underlying these uses was the pedagogy of the design of the mathematical tasks and the interaction between the students and the tasks designed for use with VML.

Zacharia et al. [9] theorized four roles for technology in relation to teaching and learning interactions: master, servant, partner and extension of self. In the current study, uses of VML as a confirmatory tool, a calculation tool or a graphing tool by the students certainly have characteristics of the servant role while uses of VML as an exploratory tool, a problem-solving tool or a visualization tool illustrate using the technology as a partner. It was evident that students in this study were able to use VML beyond the level of using it as a master as it was clear that the students were not 'subservient to the technology'. However, there was insufficient evidence to suggest that they could use the technology as an extension of self, the highest level of functioning which involves 'users were incorporating technological expertise as an integral part of their mathematical repertoire'. On the other hand, Lampi [10] found five patterns and modes of graphing calculator tool use: computational tool, transformational tool, data collection and analysis tool, visualizing tool and checking tool. While students in this study used VML as a computational tool in evaluating numerical expressions, and as a checking tool in confirming conjectures.

Analysis of the interviews with the students from the participating class on the Concept of the derivative at a point revealed that the use of VML, and particularly its emphasis on visual and numerical representations of the derivative, affected the students' conceptual development. Students interviewed were able to find the derivative of a given function using a visual conception of the derivative that they had learned in the intervention programme. This finding suggests that the students were able to form connections between the different representations of the derivative in calculus using VML, which helped them to develop a conceptual understanding of the derivative. The conventional teaching and learning of mathematics over-emphasizes algebraic methods, and the students had been trained to use such methods to solve most mathematics problems. However, the use of a graphing calculator can change the teaching and learning of calculus concepts from relying solely on algebraic method to encompassing numeric, algebraic and graphical methods, as indicated by Elizondo [11]. Several studies have shown that the connection of International Journal of Mathematical Education in Science and Technology different representations leads to the development of conceptual understanding and the improvement of students' problem-solving skills [12].

It was found that some of the students claimed that they have been taught mainly using algebraic methods since they were young. Thus, the predominant approach that they used in problem solving remained algebraic even after using VML, although they saw the usefulness of the graphical approach in solving problems and understanding concepts better. Some even claimed that they only realized the accuracy and efficiency of the graphical method in problem solving after the intervention programme. These findings suggest that the use of a graphing calculator should be integrated into mathematics teaching and learning at an early stage, such as Secondary Stage.

Teachers play an important role in conventional mathematics teaching and learning in the classroom. Most of the time, they are in full control of the teaching and learning situation and act as the knowledge provider. However, the teacher's role changes when VML is used in the classroom from an instructor to a learning facilitator. Students play an active role in the learning process, and construct their learning through guided discovery and inquiry-based learning tasks that they can then share using VML Navigator.

The visualization aspect of VML engendered a better conceptual understanding through demonstrating graphs and simulations. In addition, the mathematical tasks were designed in a way that facilitated students' learning. The

conventional mode of learning that focuses on the regurgitation of what teachers have taught does not necessarily allow students to gain a full understanding of concepts, which are of utmost important in calculus.

Conclusions:-

The findings from this research demonstrate the potential of VML as a tool to promote learning in mathematics. The encouraging results recommend the use of the graphing calculator to provide multiple representations for mathematics learning and problem solving. A framework is also proposed that shows the importance of the interactions among the students, VML, and the learning tasks in the learning of calculus. In the future, VML could be used to stimulate students to think mathematically so that they will engage strongly with mathematical structures and concepts in ways that are not possible with traditional paper and pencil approaches. However, before it is used for this purpose, training should be provided so that teachers and students can become familiar with the features and functions of VML as a pedagogical tool.

Abstract

The MgAl_2O_4 spinel doped with Eu^{2+} ions powder phosphor was prepared at temperature as low as 500 °C using the combustion route. A structural property of the powder was characterized by X-ray diffraction (XRD). This XRD pattern shows the well crystallized cubic phase, Fd-3m space group of MgAl_2O_4 . The estimated average crystalline size is about 36 and 30 nm for MgAl_2O_4 and Eu doped MgAl_2O_4 particles respectively. The photoluminescent property of prepared powder was investigated using excitation and emission spectroscopy at room temperatures. Energy levels scheme is proposed for emission from $\text{MgAl}_2\text{O}_4\text{:Eu}^{2+}$.

Introduction:-

In recent years, rare earth ion doped inorganic nanomaterials have received significant attention in the field of science and engineering [1, 2]. Inorganic phosphors doped with rare earth ions have been used in lighting systems and for multicolor displays to overcome the drawback such as poor color rendition, high toxicity and complicated synthesizing process [3,4]. Among them, magnesium-aluminum oxide (MgAl_2O_4) spinel crystals have received a great deal of attention due to its mechanical strength, high resistance to chemical attacks, and its outstanding dielectric and optical properties [5]. Europium (Eu) doped in host can improve the photoluminescence properties of $\text{MgAl}_2\text{O}_4\text{:Eu}^{3+}$ phosphors [6]. $\text{MgAl}_2\text{O}_4\text{:Eu}^{3+}$ phosphors have been prepared by various methods such as solid-state reaction, sol-gel, spray-drying, co-precipitation, microwave assisted hydrothermal method and combustion synthesis. Among the methods combustion is a simple method which requires low temperature and less time as compare to other one. In the combustion process, the phosphors can be synthesized within 5 minutes at low temperatures. In the present investigation we have reported the synthesis of Eu^{2+} activated MgAl_2O_4 ($\text{MgAl}_2\text{O}_4\text{:Eu}^{2+}$) and it was characterized by using techniques such as powder X-ray diffraction (XRD), and photoluminescence (PL).

Experimental:-

In the present study analytical grade reagents were used without any further purification. $\text{MgAl}_2\text{O}_4\text{:Eu}^{2+}$ was prepared by combustion technique [7] using precursors Magnesium Nitrate ($\text{Mg}(\text{NO}_3)_2$), Aluminium Nitrate, ($\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$) and Urea ($\text{NH}_2\text{CO.NH}_2$). Metal nitrates are used as oxidizers, and urea is employed as fuel. Starting materials ($\text{Al}(\text{NO}_3)_3 \cdot 9\text{H}_2\text{O}$) and $\text{NH}_2\text{CO.NH}_2$ were taken in the stoichiometric ratios to crushed and ground in an agate mortar to form gel-like paste with the help of distilled water. The china dish containing the mixture was inserted in a vertical furnace preheated at 500 °C. Initially, the paste melts and undergoes dehydration followed by decomposition with the evolution of large amounts of gases. The mixture then foamed and finally

ignited, yielding a white fluffy powder, which was collected after removing the dish from the furnace. The structural characterization of the product was performed by an X-ray diffractometer (Rigaku rotating anode H-3R). Photoluminescence spectra at room temperature were recorded in the range 200-750 nm on Spectrofluorophotometer (Shimadzu RF-5301 pc).

Results and Discussions:-

Structural Characterizations:-

The phase composition of the synthesized powder was analyzed by XRD using Cu-K α radiation (1.54184 \AA) in the 2θ range of 10° to 80° . Fig. 1 shows the XRD pattern of the as-prepared MgAl_2O_4 sample and Eu doped MgAl_2O_4 sample. The observed diffraction peaks correspond to those of the standard patterns for cubic MgAl_2O_4 (JCPDS, No.77-0435). The XRD data of sample is very similar to standard pattern and there are no additional peaks observed for the doped MgAl_2O_4 materials. This pattern indicates that the well crystallized cubic phase, Fd-3m space group of MgAl_2O_4 was obtained by the urea-assisted combustion method even at furnace temperature 500°C . The XRD pattern of this phosphor contains three phases: the main spinel type MgAl_2O_4 phase (Fd3m space group) and some additives of MgO (Fm3m space group) and $\alpha\text{-Al}_2\text{O}_3$ (space group R3c). Eight diffraction peaks can be indexed as the (111), (2 2 0), (3 1 1), (4 0 0), (4 2 2), (5 1 1), (4 4 0) and (5 3 3) diffraction lines of high intensities. A stronger peak (3 1 1) at 2θ of around 36° is used to calculate the average crystalline size (D) of the MgAl_2O_4 and Eu doped MgAl_2O_4 particles.

Fig. 1:- X-ray diffraction of MgAl_2O_4 and $\text{MgAl}_2\text{O}_4:\text{Eu}^{2+}$ phosphor powder.

The average crystallite size was estimated from the full width at half maximum (FWHM) of the diffraction peaks by using the Scherrer formula [8]

$$D = \frac{0.9\lambda}{\beta \cos\theta}$$

The estimated average crystalline size is about 36 and 30 nm. It has been reported that the particle size of MgAl_2O_4 spinel synthesized by various methods have been in the range of 43–55 nm [9].

Photoluminescence studies:-

Fig. 2:- shows the photoluminescence spectrum.

Fig. 2 shows the photoluminescence spectrum (excitation and emission spectra) of Eu ions incorporated in MgAl_2O_4 ranging from 200 to 750 nm. Excitation spectra of $\text{MgAl}_2\text{O}_4:\text{Eu}$ materials prepared at 500°C were recorded under emission monitored at 440 nm. The excitation spectra display intense peaks at 275 nm would be due to the defects within the host material [5].

From the spectra it can also be noted that the broad emission peak is located at 440 nm, which could be attributed to the emission of Eu^{2+} ion. The short-wavelength part of the spectrum, bluish green broad band emission at 430–570 nm, is attributed to the $4f^65d^1 \rightarrow 4f^7(^8S_{7/2})$ transitions of Eu^{2+} [10,11]. Europium is the most versatile among all lanthanides. It occurs more often in the divalent than trivalent state, which is in the contrast to all the other lanthanides. The high stability of the divalent state originates from the stability of the half filled shell configuration ($4f^7$) for Eu^{2+} . The valence state of europium has a great influence on its luminescence properties. The 5d-4f transitions of Eu^{2+} emissions are parity allowed. The luminescence of divalent europium consists mostly of broad intense band emission in the visible spectral range. The ground state of the $4f^7$ configuration of Eu^{2+} is $^8S_{7/2}$, while the lowest $4f^7$ excited state is the 6P_J state in the UV region. In most Eu^{2+} activated phosphors, the lowest level of the $4f^65d$ configuration lies below the 6P_J state, leading to broadband luminescence due to the inter-configurational electronic $4f^65d - 4f^7 (^8S_{7/2})$ transition [12].

Fig.3:- Proposed energy levels scheme for emission from $\text{MgAl}_2\text{O}_4:\text{Eu}^{2+}$

On excitation with UV, two types of lowest excited states are possible, namely 6P_j (f-f) or $4f^65d$ (f-f), depending on the host matrix [13]. In case of Eu^{2+} ion in MgAl_2O_4 the possible lowest excited states is $4f^65d$ (f-f) [5]. The optical band gap energy value of magnesium aluminate is estimated as 4.5 eV [14]. Based on above discussion the possible emission mechanisms from the Eu^{2+} activated MgAl_2O_4 is illustrated in Fig 3.

Conclusions:-

The nanocrystals of the $\text{MgAl}_2\text{O}_4:\text{Eu}^{2+}$ spinel was prepared via combustion method. Present investigation revealed that urea-nitrate combustion synthesis has outstanding potential for producing Eu-doped MgAl_2O_4 phosphors in a single step. Nanopowder demonstrated a strong and quite short lived luminescence, characteristic for the doped Eu^{2+} ions. The broad emission peak at 440 nm is attributed to the usual near UV emission of Eu^{2+} ion from the $4f^65d^1 \rightarrow 4f_7({}^8S_{7/2})$ transition.

Key words:-

Cadmium, tobacco and morphological parameters.

Abstract

Cadmium is one of the most toxic heavy metal in the environment. Cadmium presence in soil can cause serious problem to all organisms through food chain. The present study was conducted through pot culture experiment to estimate the effect of cadmium (10, 25, 50, 75, 100, & 200mg kg⁻¹ soil) on the morphological parameters (root length, shoot length, number of leaves, total leaf area, fresh and dry weight of root, stem, leaf) of tobacco. The values were recorded on 30th, 60th, 90th, 120th, 150th and 180th days of tobacco. For all the morphological parameters, the highest values were recorded in control. Due to increase in cadmium concentrations all the morphological parameters were decreased from 10mg kg⁻¹ to 200mg kg⁻¹ of soil.

Introduction:-

Due to globalization and industrialization, heavy metal (HM) pollution is one of the most important and widespread environmental problem of the modern world, due to its hazardous and toxic effects on all living organisms. Heavy metal pollution is a serious environmental problem because heavy metals are non-biodegradable and persistent in nature [10,11].

Heavy metals are defined as a group of metals and metalloids with atomic density higher than 5 g cm⁻³. The remediation of heavy metal contaminated soil requires the removal of toxic metal from contaminated areas. Heavy metals were important environmental pollutants particularly in areas where there was a high anthropogenic pressure, but they also occur naturally (Sanità and Gabbrielli, 1999). Anthropogenic cadmium contamination often results from mining or smelting of metal ores, but cadmium is also released into the environment by power stations, heating systems, waste incinerators, urban traffic, and cement factories and as a by-product of phosphate fertilizers. Use of sewage sludges as fertilizers has further contributed to a significant contamination of agricultural soils. Cadmium presence in the soil can cause serious problems to all organisms. Although non-essential for plant growth, when bio available, cadmium is readily taken up by roots and translocated into aerial organs where it can accumulate to high levels. The most apparent visible symptoms of cadmium toxicity in plants are retardation of plant growth, chlorosis and stunting (Das *et al.*, 1997). The present investigations was carried out to analyse the changes in growth parameters such as, root and shoot length, number of leaves and total leaf area, fresh and dry weight of root, stem, leaf of tobacco plants due to cadmium toxicity.

Materials and Methods:-

Seed Materials:-

The seeds of tobacco were procured from Central Tobacco Research Institute, Research Station, Vadasandur, Dindugal Dt, Tamilnadu. The duration of the crop was 180 days. Seeds of uniform size, colour and weight were chosen for the experiments. Cadmium and other chemicals used in this investigation were analytical grade. Cadmium was used in the form of chloride.

Pot Culture Experiments:-

The experiments were performed during the months of December 2011 to May 2012. Tobacco plants were grown in pots in untreated soil (control) and in soil to which cadmium had been applied (0, 10, 25, 50, 75, 100 and 200 mg kg⁻¹ of soil). The inner surface of pots was lined with a polythene sheet. Each pot contained 3.00 kg of air dried soil. Cadmium as chloride (CdCl₂ 2½ H₂O) were finely powdered and applied to the surface soil. This was then thoroughly mixed with the soil and 1 gram of seeds was sown in each pot. All pots were watered to field capacity twice a day. Plants were thinned to a maximum of three per pot after a week of germination. The treatments were replicated five times in a completely randomized block design.

Sampling:-

Plant samples were collected at random, at regular intervals (30, 60, 90, 120, 150 and 180th days) and used for morphological growth parameters. Three plants from each replicate of a pot were analysed for its various parameters and the average was calculated. These mean values of the replicates were used for statistical analysis.

Growth:-

Root and Shoot Length:-

The root and shoot length and elongation rate are essential for plants exploring for water and mineral nutrients. In the pot culture experiments there was a gradual decrease in the root and shoot length with an increase in cadmium level 10, 25, 50, 75, 100 and 200 mg kg⁻¹ in the soil in all the sampling days. The inhibitory action of excess of cadmium in root and shoot length might be due to reduction in cell division, toxic effect of heavy metals on photosynthesis, respiration and protein synthesis. These obviously contributed to the retardation of normal growth Kupper, et al. (1996). The above results were in agreement with the findings of Chen, et al. (2003) in soybean, Rai, et al. (2005) in *Phyllanthus amarus* and Xu, et al. (2008) in garlic. Hagemeyer et al. (2002.) and Marciano et al. (2002) also suggested that the morphological and structural effects caused by metal toxicity in plants was due to decrease in root elongation, root tip damage, decrease in root formation, suppression of elongation growth rate of cells, affecting the ultra cellular structure of meristematic cells and inhibition of the size of plant cells and inter cellular spaces.

Number of Leaves and Total Leaf Area:-

Number of leaves and total leaf area were decreased due to the increase of cadmium concentrations in all the sampling days. Number of leaves, branches and leaf area decreased as the concentration of metal increased. Strong decrease in leaf area was correlated to accumulation of chlorophyll pigments as disturb integration of chlorophyll molecules into stable complex (Skkorzynska Polit and Baszynski, 1997). Similar findings have been reported by Mehendirata et al. (2000)

Fresh and Dry weight:-

Fresh and dry weight of various parts of the tobacco plants showed a marked decline with the increase in cadmium level in the soil in all the sampling days. Hédiji et al. (2010) reported fresh weight reduction of *Solanum lycopersicum* under high Cd levels. There was a progressive fall in the dry matter yield of root, shoot and leaves with the corresponding increase in cadmium (10-200 mg kg⁻¹) level in the soil, in all the sampling days. Similar results were obtained by several authors in a number of plants such as Vitoria et al., (2001) in radish, Kim et al., (2002) in cabbage and lettuce, Zhang et al., (2002) in wheat, Shukla et al., (2003) in wheat, Rai et al., (2005) in *Phyllanthus amarus*. Abdo, Fatma (2008) in soybean.

Table 10:- Efficacy of cadmium treatment on leaf dry weight (g plant⁻¹) of tobacco (*Nicotiana tabacum* (L.)).

Cadmium added in the soil (mg kg ⁻¹)	Sampling days					
	30	60	90	120	150	180
Control	2.564	6.435	11.546	17.756	15.762	13.453
10	2.380 (-7.18)	6.319 (-1.80)	11.345 (-1.74)	17.534 (-1.25)	15.564 (-1.26)	13.235 (-1.62)
25	2.245 (-12.44)	6.212 (-3.47)	10.689 (-7.42)	17.231 (-2.96)	14.432 (-8.44)	13.154 (-2.22)
50	1.987 (-22.50)	5.289 (-17.81)	10.453 (-9.47)	16.564 (-6.71)	14.245 (-9.62)	13.058 (-2.94)
75	1.589 (-38.03)	5.167 (-19.70)	10.156 (-12.04)	15.780 (-11.13)	14.180 (-10.04)	11.890 (-11.62)
100	1.420 (-44.62)	5.098 (-20.78)	10.098 (-12.54)	15.324 (-13.70)	13.657 (-13.35)	11.134 (-17.24)
200	0.982 (-61.70)	4.545 (-29.37)	09.437 (-18.27)	15.160 (-14.62)	13.423 (-14.84)	10.985 (-18.35)

Conclusion:-

In the present study tobacco plants were grown in control and different levels of cadmium were assessed. Results showed that all the morphological parameters of tobacco were decreased as cadmium level increased. The results indicated that all the morphological parameters dependent on both the different levels of cadmium accumulation and biomass of the plants, when the tobacco plants were grown in cadmium contaminated soil.

Key words:-

Obesity, herbs, marjoram.

Abstract

Background: Obesity is a global epidemic and consequently many individuals are seeking strategies to reduce their body weight. These strategies may include weight-loss food supplements, including plant food supplements PFS, such as appetite suppressants or those increasing resting metabolism. PFS that claim to contribute to weight loss are marketed worldwide and readily available over the Internet. This increased usage has coincided with a resurgence of interest in nutritional therapy and complementary and alternative medicine. Marjoram is one of the most familiar kitchen herbs. Marjoram is gastrointestinal tract stimulant, tonic, carminative, hypoglycemic and diuretic as well as antibacterial and as antioxidant.

Objectives: The present work was designed to study the effects of marjoram on weight reduction in obese and overweight humans.

Methodology: The study was conducted on 64 healthy students, female students were from Faculty of Applied Medical Sciences, and male from College of Medicine, Umm Al-Qura University, Makkah, Saudi Arabia. 40 students consume marjoram one month. Anthropometric measurements were done before and after marjoram consumption. Statistical analysis was performed using SPSS software version 20.

Results: The obtained data showed most of student's preferred strategy of physical activity and diet to reduce their weight. A significant reduction on body weight after one month of consuming marjoram was observed.

Conclusion and Recommendation: The present study suggested that marjoram has effective herb on weight reduction.

Introduction:-

Obesity is a public health problem, which is increasing in KSA with an overall obesity prevalence of 35.5% ⁽¹⁾. It is strongly associated with diabetes, hypercholesterolemia, and hypertension in the KSA, although the epidemic's characteristics differ between men and women. Therefore, the reduction in overweight and obesity are of considerable importance to public health ⁽²⁾.

Many people who are obese or overweight try to lose their weight by following different strategies, such as increasing physical activities, diets prescribed by health professionals or from official dietary recommendations, or by using medications if the lifestyle modification is not sufficient ^(3,4).

A cross-sectional study was done in Australia in normal, overweight, and obese subjects showed that participants tried losing their weight by using one or more of strategies, which include weight loss center programs, prescription medication, over the counter supplements, changed diet, increased exercise or consulted a specialist. This study showed that changing diet and increasing exercise are the most common strategies used by participants ⁽⁵⁾.

Another group of people tends to use herbs as a safest, costless, and effortless way to lose weight. Nowadays, herbal medical is a growing area of alternative medicines. Many active ingredients in manufactured drugs are derived from plant compounds and have a wide range of use. Plants and plant extracts considered as safer as and more popular than chemical products ⁽⁶⁾.

In recent years, many studies have focused on the bioavailability of phenolic compounds in the prevention and treatment of obesity. Phenolic compounds and flavonoids have pharmacological properties such as antioxidant, antimutagenic, antithrombotic, anti-inflammatory, anticancer and antihyperlipidemic. They are widely distributed in plants and form part of the human diet ⁽⁷⁾.

Marjoram (*Origanum majorana*) is one of the herbal plants that contains phenolic compounds. It is found all over Asia, Arabian Peninsula, Africa, America, and Europe ⁽⁶⁾.

Ethanol extract of *Origanum majorana* has been shown to possess anti-inflammatory, antioxidative, hypolipidemic and hepatoprotective effects against LPS-induced endotoxemia. So it can be used as an effective and safe alternative complementary treatment ⁽⁸⁾.

In addition, medicinal effects of marjoram also include gastrointestinal tract stimulant, tonic, carminative, diaphoretic, hypoglycemic, diuretic as well as antibacterial ⁽⁷⁾.

One of the previous study was done on rats to see the effect of natural herbs of marjoram and ginger on weight gain and level of cholesterol, this study found that the hypercholesterolemic rats which fed on hypercholesterolemic diet with marjoram, ginger or mixture of them demonstrated lower values of body weight gain compared to control group which fed also on hypercholesterolemic diet without taken marjoram or ginger ⁽⁶⁾.

Subjects And Methods:-

Subjects:-

Study was conducted on 64 healthy students (36 female – 28 male), female students was study on Faculty of Applied Medical Sciences, and male from College of Medicine, Umm Al-Qura University, Makkah, Saudi Arabia. The students were Saudis and have been collected in variation of different stages and different medical specialties.

Methods:-

Study design:-

40 students were agreeing to consume marjoram tell one month all these who participated were met the following inclusion criteria:

1. Consent to participate in the study.
2. Healthy
3. Not use any medications or nutritional supplements.
4. Not pregnant or lactating women.
5. Not following any regimen for weight loss
6. Not allergic.
7. Not suffering from any chronic illness like Diabetes Mellitus, Chronic renal failure, asthma etc.

Data collection:-

The data were collected by direct interview. The questionnaire was completed by the researchers.

The study questionnaire: The questionnaire covering three sections as follows:

Demographics-Socio- Economic Data:-

Include data about the general characteristics of the study sample such as gender, age, and income.

Dietary and Health Assessment Questionnaire:-

Include dietary habit and intake, interest of weight management, and health status of the participants.

Anthropometric Measurements:-

Anthropometric measurements are reliable and valid measurements that indicate nutritional status of the subjects. Bioelectrical Impedance Analysis (BIA) device was used to measure weight, BMI, visceral fat, body fat percentage, body muscle percentage. Regarding to weight, participants were asked to remove their heavy outer garments and their shoes.

Height was measured by using a measuring tape, with the shoulders in relaxed position and arms hanging freely.

Body Mass Index (BMI):-

Body mass index (BMI) is a simple index of weight-for-height that is commonly used to classify overweight and obesity in adults (table A). It is defined as a person's weight in kilograms divided by the square of his height in meters (kg/m²)⁽⁹⁾.

Table (A):-Categories of BMI (WHO, 2016) (9).

BMI Kg/m ²	Classification
≤18.5	Underweight
18.5to24.9	Desirable weight
25to29.9	Overweight
≥30	Obese

Herbal Material:-

Organic marjoram herb (dried leaves) was purchased from local markets. It was placed in small storage bags, each containing 1.5 g of herb (equivalent to one heaped teaspoon). Preparation of marjoram tea was performed by participants. They were taught to prepare this in accordance with the traditional method, which steeping the bag of marjoram tea in 250 mL of boiled water until the color changed, followed by straining. Participants were instructed to drink one cup (250 mL) of the assigned tea, unsweetened, daily after their main meal by 2 hours.

Statistical Analysis:-

All results were tabled with SPSS software 21th edition. Descriptive statistics were run to summarize the collected data, and the results were displayed in frequencies and percentages. Chi square analysis was performed to test the differences between variables. Obtained results were tabulated and expressed as (mean ± SD). The differences among the participants were analyzed by T, test. All statistical analyses were performed at significant level of 95% (P. value ≤ 0.05).

Results:-

The demographic profile of participants presents in table (1) which shows that out of 36 subjects, 56.2 % were females and 43.8 % were males. Income vary between them, nearly half of them has >8000 SR/month .All of the participants were falling in the age group of 19- 25 years old.

Table 1:-Demographic, social, and economical characteristics of male and female participants including both intervention and control group.

~8000	10	15.6
>8000	30	46.9
Total	64	100.0

As showed In table (2) the number of females have regular weight monitoring and looking for ideal weight is more than males which represents (83.3% Vs.72.4%) respectively. Most of females showed that they measure their weight once in a month or less (44.4%), while most males showed to measure it twice a month (35.7%). Females have interest to loss their weight to improve confidence and appearance and health status with a significant difference with males ($P<0.05$). Most participants prefer using diet on weight reduction than other methods.

In table (4) data shows that 28.6% of males have heard about marjoram herb, while 44.4% of female heard about it, 71.4% of males and 55.6% of females did not have knowledge and background about marjoram herb. 7.1 % of males known about health benefits of marjoram herb while the same percentage (7.1%) of them answered that marjoram herb doesn't has health benefits, and the majority of males (85.7%) don't know whether the herb has health benefits or not. The same trends were found on females.

Table 4:-Knowledge and attitude towards marjoram herb.

In Table (5) data and results shows Post-consumption feedback by asking six questions, then make a comparisons between males and females. 33.3% of males noticed effect of marjoram herb, compared to 66.7% did not. On the other hand, 37.5% of females noticed effect of marjoram herb, while 62.5% did not. Half of males said that they have experienced a side effect while the other half did not. 9.4% of females experienced a side effect while the majority (90.6%) did not with a significant difference ($P<0.05$). 16.7% of males have nausea and abdominal pain accompanied with using herb while there's no reported case of associated diarrhea. In females, results show that 93.8% have no side effect, 10% have nausea and no reported case of them associated with diarrhea or abdominal pain. Data show a significant difference ($P<0.05$) between meals and females who decide to use marjoram, 71.9% of females would like to continue drink it compared to 66.7% of males decided to not continue drink marjoram tea. Regarding to the role of

marjoram in suppress appetite, 33.3 % of males and 31.3% of females answered (yes), while 66.7% of males and 68.7% of females answered (no). Most of them noticed suppression effect of marjoram toward fat foods with insignificant difference between them.

Visceral fat	8.62 ± 1.11	8.16 ± 1.07	0.314

Discussion:-

Obesity becomes more prevalent, weight-loss practices grow increasingly popular in developed and developing countries. More than two-thirds of the adult population of the United States has attempted to lose or maintain weight⁽¹⁰⁾, and between 15 and 35% of adults in Canada, Netherlands and the European Union are trying to lose weight at any given time⁽¹¹⁾. The proportion of adolescents and university students attempting to lose weight is even greater: 30% in Lebanon⁽¹²⁾, 23% in Canada⁽¹³⁾, 37% in Japan⁽¹⁴⁾.

Obtained data in the present study showed that 57.1%, 72.2% of male and female respectively interest to monitor their weight and 71.4% of male and 83.3% of female take care of IBW, to feel satisfied with their body shape

appearance and to prevent diseases related to obesity. These finding agree with **Lynch *et al.*, (2007)**⁽¹⁵⁾ they reported that, thin body is the most preferred body shape in Western countries. Data showed that the first priority of females to loss their weight is to improve confidence and appearance. In agreement with this result **Najat *et al.*, 2011**⁽¹⁶⁾ they found that females were more worried about their body shape than males as 89% of the worried students were females, whereas, the majority of the “not worried” group were male students.

Most of students preferred diet and physical activity to reduce their weight, in the study of dieting practices, weight perceptions, and body composition: a comparison of normal weight, overweight, and obese college females, **Malinauskas *et al.*, 2006**⁽¹⁷⁾ found that 80% of their participated students used physical activity as a weight control strategy. Another study done by **King *et al.*, 2007**⁽¹⁸⁾ among 204 students, recruited from Midwestern University, reported that students did exercise to lose weight and improve their body appearances.

Less of participants use herbs for weight control (7.1% of male and 16.7% of female). In disagreement with this results **Mamtaniet *et al.*, (2005)**⁽¹⁹⁾ they found that most participants favored herbal supplements for reducing weight and they reported that all health-care practitioners and students should be educated about benefits and risks of herbal supplements. In the study of Herbal Medicine among Saudis: Awareness, Uses, Reasons and Common Herbs, **Abdulaziz Alanzi *et al.*, 2016**⁽²⁰⁾ found that (80%) out of their sample have used herbs as a medications and herbs used for acute conditions account for (70%) while chronic conditions only (20%).

Data presented in table (6) showed significant reduction on body weight after one month of marjoram consumption. In agreement with this result **Lobna *et al.*, 2014**⁽²¹⁾ they found that food weight gain, food intake and food efficiency ratio showed significant decreases in experimental group of rats consumed marjoram compared to normal control group. **Soltan and Abdel Wahab, 2006**⁽²²⁾ reported that the hypolipidaemic activity of marjoram in rats could be attributed to the presence of valuable polyphenolic compounds, terpenoids, flavonoids, tannins, hydroquinone, phenolic glycosides and sabinene. **Amarowicz *et al.*, 2008**⁽²³⁾ found that marjoram ethanolic extract contain considerable amounts of total phenolics compounds and have antioxidant activity and free radical-scavenging capacity. **Rang and Dale, 1991**⁽²⁴⁾ reported that the hypocholesterolemic effect of marjoram could be attributed to presence of isoflavones which prevent intestinal absorption of cholesterol by competition for its absorption sites. These results are also in accordance with **Negm, 2002**⁽²⁵⁾ who found that marjoram extract lead to significantly lowering in TG ($p < 0.01$) than may be due to lower fatty acids synthase. In the study of Biochemical and histopathological studies on the water extracts of marjoram and chicory herbs and their mixture in obese rats **Lamiaa *et al.*, (2009)**⁽²⁶⁾ found a significant weight reduction in rats group take 5% marjoram than negative control group.

Conclusion:-

The present study suggested that marjoram has a good effect on weight control and percent of body fats.

Recommendations:-

- More scientific studies on the effects of marjoram on weight reduction on the human are needed.
- Make other study emphasis on side effect of mega dose of marjoram.

Limitations:-

The limitation in this study may be related to the small sample size and limited time.

Ayurveda, case study, galactorrhoea , hyperprolactenemia, *srotodusti*.

Abstract

Galactorrhoea is one of the common complain found in adolescence to post menopausal women. Though it has varied etiology but most common cause is hyperprolactenemia. Long term use of hormonal therapy is the only way of management in modern medical science. This gives scope to find alternative treatment measures to relieve the patient from physical, mental, social discomfort and also harmful effect of long term hormonal therapy.

In *Ayurveda*, galactorrhoea can be compared to a symptom manifesting due to *Rasavaha sroto dusti*. Here type of *srotodusti* is *Atipravritti*. *Stanya*(milk) is the *upadhatu* of *rasa dhatu*. Galactorrhoea is nothing but *Stanyavridhi*. The objective of the treatment includes finding out exact culprit for galactorrhoea and symptomatic relief.

The present study has been conducted on a patient suffering from galactorrhoea for fifteen days which is due to mild elevation of serum prolactine level. The treatment plan includes *Langhan* in term of dietary restriction, life style modification and capsule Punarnava and capsule Trikatu orally. After ten days galactorrhoea stop and patient was symptomatically fine. The pathogenesis, treatment details, mode of action, result are discussed in detail in full paper.

Introduction:-

Galactorrhoea is a discharge of milk or a milk-like secretion from the breast in the absence of parturition or beyond six months' post-partum in a non breastfeeding woman. The secretion may be intermittent or persistent, scant or abundant, free-flowing or expressible, and unilateral or bilateral. The condition is more common in women who are 20 to 35 years of age and in previously parous women; it is less common in children and nulligravid women. Galactorrhea also can occur in men. In children, galactorrhea is more common in infants and teenage girls. The condition may result in patient anxiety and can signify a serious underlying disorder. Galactorrhea is commonly associated with hyperprolactinemia. [1] Prolactin plays an important role in growth of mammary gland. It causes proliferation of epithelial cell of alveoli thereby inducing and maintaining milk production. Prolactin is responsible for lactogenesis. During pregnancy, particularly in latter months; large quantity of prolactin is secreted. But the activity of this hormone is suppressed by estrogen and progesterone secreted by placenta. Because of this, lactation is prevented during pregnancy. Immediately after the delivery of the baby and expulsion of placenta, there is sudden lissos of estrogen and progesterone. Now, the prolactin is free to exert its action on breast and to promote lactogenesis.[2]

Corresponding Author:- Khatun Hazera.

Address:- Dept of Samhita and Siddhanta. Asst. professor of Raghunath Ayurved Mahavidyalaya and hospital. Contai, PurvaMedinipur.West Bengal.

Galactorrhea itself isn't a disease, but it could be a sign of an underlying problem. This condition occurs in less than 1% of the general population and in 5-14% of patients presenting with secondary amenorrhea. Approximately 75% of patients presenting with galactorrhea and amenorrhea have hyperprolactinemia. Of these patients, approximately 30% have prolactin-secreting tumors.[3]

Mortality/Morbidity:-

Mortality is unlikely; however, in cases where the condition is due to a large prolactin-secreting tumor, local mass effect can lead to significant morbidity. [4]

Causes of Galactorrhea:-[5]

Some Medications Associated with Galactorrhea:-

Dopamine-receptor blocker:- Butyrophenones, Metoclopramide (Reglan), Phenothiazines, Risperidone (Risperdal).

Selective serotonin reuptake inhibitor:- Sulpiride, Thioxanthenes, Tricyclic antidepressants.

Dopamine-depleting agents:- Methyldopa (Aldomet), Reserpine (Serpasil).

Inhibition of dopamine release:- Codeine, Heroin, Morphine.

Histamine-receptor blocker:- Cimetidine (Tagmet) etc.

Other causes of galactorrhea include:-

Herbal supplements, such as fennel, anise or fenugreek seed, Birth control pills, Noncancerous pituitary tumor (prolactinoma) or other disorder of the pituitary gland, Underactive thyroid (hypothyroidism), Chronic kidney disease, Excessive breast stimulation, which may be associated with sexual activity, frequent breast self-exams with nipple manipulation or prolonged clothing friction, Nerve damage to the chest wall from chest surgery, burns or other chest injuries, Spinal cord surgery, injury or tumors

Idiopathic galactorrhea:-

Sometimes doctors can't find a cause for galactorrhea. This is called idiopathic galactorrhea, and it may just mean that your breast tissue is particularly sensitive to the milk-producing hormone prolactin in blood.

Galactorrhea in Men:-

In males, galactorrhea may be associated with testosterone deficiency (male hypogonadism) and usually occurs with breast enlargement or tenderness (gynecomastia). Erectile dysfunction and a lack of sexual desire also are associated with testosterone deficiency.

Galactorrhea in newborns:-

Galactorrhea sometimes occurs in newborns. High maternal estrogen levels cross the placenta into the baby's blood. This can cause enlargement of the baby's breast tissue, which may be associated with a milky nipple discharge.

In *Ayurveda*, galactorrhea can be compared to a symptom manifesting due to *Rasavaha sroto dusti*. As *Stanya* is the *upadhatu* of *rasa dhatu*. [6] Normal function of *stanya* are breast development and maintenance of life. [7] Galactorrhea is nothing but *Stanyavridhi*. Feature of *stanyavridhi* increased size of breast (*stanya-pinatva*), frequent flow of milk (*muhur-muhur pravritti*) and breast pain (*toda*). [8] *Rasavahasrota* get vitiated due to excessive intake of heavy (*guru*), cold (*shita*), unctuous (*snigdha*) food and over-worry. [9]

B. diffusa L. (*Punarnava*) occurs abundantly as a weed throughout India. It is a creeping and spreading perennial herb. It is an important medicinal plant much used in traditional medicine in many parts of the world. The plant dies during hot summers and puts forth fresh shoots after rains and is believed to be a rejuvenator. This plant was named in the honor of Hermann Boerhaave a famous 18th century Dutch physician commonly known as *tarvine*. It is an herbal species of flowering plant in the four-o'clock family. *Punarnava* means which rejuvenates the body or renews the body. It is taken in herbal medicine and often used as a green vegetable in many parts of India. [10] The properties and action of *punarnava* are –

Rasa – Tikta, Kasaya, Modhur, Guna – Laghu, Ruksha, Veerya – Ushna, Vipak – Katu, Probhava – Not signify. Dosh-karma-Vata-kapha Shamak. [11]

Worldwide Ethno medical uses of Punarnava are- In India B.diffusa has a long history of medicinal use in Ayurveda and Unani. Different plant parts used as an appetizer, eye tonic, flushing out the renal system, to treat seminal weakness and blood pressure. Its roots are used in treating Jaundice Ascites, Anasarca, scanty urine, internal inflammation, Asthma, Piles. The plain juice used as an antidote for rat poisoning. The seed are use as expectorant, carminative, muscular pain, lambago, scabis, scorpion sting, in Yunani medicine. Seed powder mixed with dried ginger, it is given in Urticaria. In Punjab, the drug is considered useful for eye. In Mumbai, it uses for dropsical swelling. In Goa, it uses as a diuretic in Gonorrhoea. In West Indies, use for gonorrhoea. In Arab country, it uses for the treatment of diabetes, stress, dyspepsia, inflammation, congestive heart failure, anti convulsant, anti fibrinolytic, night blindness, corneal ulcer etc. In Brazil the plant as a whole or, its extracts is used for albuminuria, Beri-beri, bile insufficiency, cystitis, edema, gall stone, gonorrhea, guinea worms, hepatitis, Hypertension, Jaundice, Kidney disorders, Renal stone, Liver sclerosis, snake bite, splenomegaly, urinary retention. In Guatemala, it is used for erysipelas, and guinea worms (Taylor, 2005). In Iran, it is used for abdominal pain, amaemia, ascites, asthma, blood purifier, cancer cararacts, child birth, cholera, constipation, cough, debility, digestive sluggishness, dropsy, dyspepsia, edema, eye problem, fever, heart ailments child birth hemorrhage, thoracic hemorrhage, internal parasites, lactation aid, menstrual disorder, rheumatism, as a diuretic, expectorant. In Iraq, it is used for edema, gonorrhea, liver, intestinal gas, joint pain, lumbago, nephritis, an appetite stimulant. In Nigeria, it is used for abscesses, asthma, boils, convulsions, epilepsy, fever, laxative, In West Africa it is used for abortion, guinea worms, and menstrual irregularities and as an aphrodisiac. In Tropical Africa the boiled roots are applied to ulcer abscess: The boiled leaves are considered expectorant and febrifuge and in large doses emetic. A decoction of aerial parts is also taken to treat gastro intestinal pains, intestinal worms and to regulate menstruation. In Mauritania, the seeds are ground and made into cakes which are coocked and eaten as a remedy for dysentery.[12]

Pharmacological Activities of B. diffusa L.(Punarnava) as per recent research are Diuretic, Hepatoprotective, Cholorectic activity, Anti inflammatory activity, Haematinic Effect, Ca^{+2} channel antagonistic Effect, Corticosteroids like effect Emetic and cathartic Effect, Anti convulsant activity, Anti cancer activity, Anti Diabetic/Hypoglycaemic effect, Anti Amoebic, Anti Fibrinolytic activity, Anti fungal activity, Restorative activity against stress induced changes in adrenal cortisol level, Anti oxidant property (It produced 50% inhibition of lipid peroxidation), Anti viral activity, Anti microbial activity specially Gram negative bacteria, Negative chronotropic activity. etc[13]

Details of the case:-

A 19 year old female patient, reported to IPD of Raghunath Ayurved Mahavidyalaya and Hospital, Contai, West Bengal with complain of galactorrhoea of both breast predominantly left side, mild tenderness of both breast for last fifteen days. Associated complaints were dysmenorrhoea, general weakness, nausea and occasional vomiting, headaches. There was no history of serious systemic illness, any positive past and family history.

History:-

Mode of Onset:- Sudden.

Duration:- For fifteen days.

Precipitating Factors:- No such

Past History:- No such

Family History:- patient's mother suffer from psychological disturbance probably schizophrenia for last fifteen years and she is under treatment.

Drug History:- A detailed drug history is crucial; galactorrhoea is associated with a wide variety of drugs that raise serum prolactin levels. Frequent use of Domperidon for nausea and vomiting is positive here.

Gynecologic History:- Irregular menstrual cycle in 3 to 5 days of duration. Patient is suffering from dysmenorrhoea, nausea, occasional vomiting during first day of menstruation. Her LMP was 12th May, 2015.

Associated Symptoms:- Nausea, occasional vomiting, and headaches, loss of appetite, Constipation, cold intolerance, lethargy. etc

Physical Examination:-

General:- On examination patient is thin built, weight 45kg, non pallor, non icteric, no lymph gland enlarged and other vital signs are normal. Pulse rate 72 bpm and blood pressure 110/70 mm of Hg. Visual field within normal limit.

Breast Examination:- No sign of local irritation, infection, or trauma in the both breast.

Nipple Discharge:- A milky, thin, intermittent discharge from bilateral breasts, the discharge is scanty from right side and abundant from left one, on expressed and sometimes spontaneous. There was mild tenderness and no nodules.

Laboratory Evaluation:-

1. Pregnancy test –negative. (Dated on 31th July, 2015).
2. Levels of serum prolactin(fasting)-53.94ng/ml (Dated on 4th Aug,2015).
3. Level of serum T3-0.801ng/ml. T4-6.74mcg\100ml, TSH-4.41microIU\ml. (Dated on 4th Aug, 2015).
4. Levels of serum prolactin (fasting)-0.48ng/ml (Dated on 5th Nov,2015).
5. CT of brain and pituitary-nothing abnormality detected. (Dated on 14th Nov, 2015).
6. Levels of serum prolactin(fasting)-0.377ng/ml (Dated on 16th Aug,2016).

Materials and Methods:-

1. Capsule Punarnava 2cap thrice daily (Himalaya Drug Company) for 3month.
2. Capsule Trikatu 2cap twice daily after meal (Himalaya Drug Company) for 30days.

Patient was advised to avoid day sleep, night awakening, guru and Kapha aggravating substance like heavy meal ,fast food, fatty food, curd,etc.. Breast stimulation by clothing, suckling, self-manipulation, or stimulation during sexual activity should be avoided.

Observation:-

The sign and symptoms observed like discharge and tenderness were subsiding after 10 days. Occasional scanty discharge was found on expressed. After 30 days discharge was completely absent.

Discussion and Conclusion:-

In *Ayurveda*, galactorrhoea can be compared to a symptom manifesting due to *Rasavaha sroto dusti*. As *Stanya* is the *upadhatu* of *rasa dhatu*. Normal function of stanya is breast development and maintenance of life. Galactorrhoea is nothing but *Stanyavridhhi*. Feature of stanyavridhhi increased size of breast (*stanya-pinatva*), frequent flow of milk (*muhur-muhur pravritti*) and breast pain (*toda*). *Rasavahasrota* get vitiated due to excessive intake of heavy (*guru*), cold (*shita*), unctuous(*snighdha*) food and over-worry(*ati-cinta*). Feature of *Rasavahasrota dusti* is similar to feature of *Rasa dhatuvridhhi*, that is feature of increased *Kapha dosha*. *Kapha* when increased produces poor digestion (*Agni sadan*), excess salivation (*Proseka*), laziness(*alasya*), feeling heaviness of the body(*gourava*), *paleness(sveta)*, coldness(*saita*),feeling looseness of the body parts (*slathangata*) i.e, weakness ,dyspnoea (*swas*),cough(*kasa*), excess of sleep(*ati nidra*).These all features are very much similar with Hyperporlactenemia. On the other hand, Punarnava being a *ushna virya* and *katu vipak dravya*, it alleviate *Kapha dosha* as well as *Vata dosha*. Persons suffer from glactorrhoea must be avoid diet and regime which increases kapha dosha like heavy meal, curd, dairy product, day sleep etc and use fat free, little in quantity, warm meal possessing katu, tikta kashaya taste, honey, drugs which reduce fat, fasting ,different kind of exercisese etc . Extensive study and research is necessary to find out the role of punarnava in hyperprolactenemia as well as others endocrinal disorder.
