TABLE OF CONTENTS **Volume 5, Issue 3, MARCH 2017**

S. No.	Title of the paper	Page Numbers
1	A REVIEW ON IMPLEMENTATION OF MPPT BASED PHOTOVOLTAIC CONVERTER SYSTEM WITH PSO.	1-7
2	FORMULATION DEVELOPMENT OF MUCOADHESIVE BILAYER TABLET WITH METFORMIN HYDROCHLORIDE.	8-14
3	PROBLEMS AND PROSPECTS IN SOUTH ASIA; INDO-CHINA'S EFFORTS OF COOPERATION.	15-19
4	EFFECT OF HEATING RATES AND ZN-ADDITION ON THE THERMAL PROPERTIES OF PB-SN ALLOY	20-27
5	LEAF CLASSIFICATION USING IMAGE PROCESSING: A REVIEW.	28-32
6	INTRAORAL PHOTOGRAPHY IN ORAL MEDICINE –THE USE OF SMARTPHONE CAMERA.	33-36
7	THE STUDY OF VERMICOMPOSTING OPTIMIZATION OF ORGANIC WASTE.	37-43
8	PREVALENCE OF NUTRITIONAL ANAEMIA AMONG PATIENTS REPORTING TO SAVEETHA DENTAL COLLEGE: A SHORT STUDY.	44-49
9	ACUTE STROKE IN CHILDREN: AN OVERVIEW.	50-55
10	MUSCULOSKELETAL PAIN AMONG SAUDI MEDICAL STUDENTS IN MAKKAH.	56-60
11	INCIDENCE OF JAPANESE ENCEPHALITIS VIRUS INFECTION IN WEST BENGAL, INDIA – A TWO YEARS COMPREHENSIVE STUDY.	61-65
12	DEGRADATION OF TEXTILE INDUSTRY'S EFFLUENT USING INTEGRATED CHEMICAL-BIOLOGICAL PROCESS.	66-70
13	IN VITRO ANTI INFLAMMATORY AND ANTI MICROBIAL PROPERTIES OF ALLOPHYLUS SERRATUS LEAF EXTRACTS.	71-80

14	INCIDENCE OF RH NEGATIVE BLOOD GROUP IN BLOOD DONORS FROM HIGH ALTITUDE AREAS OF JAMMU AND KASHMIR STATE, INDIA.	81-85
15	SERUM TOTAL CALCIUM, MAGNESIUM, POTASSIUM AND PH IN SUDANESE PATIENTS WITH TYPE 2 DIABETES MELLITUS.	26-91
16	THE USEFULNESS & ACCURACY OF THE MODIFIED ALVARADO SCORE IN THE PREOPERATIVE DIAGNOSIS OF ACUTE APPENDICITIS.	92-98
17	EVALUATION OF T- REGULATORY CELLS IN BREAST CANCER.	99-107
18	ISOLATION AND CHARACTERIZATION OF FUNGI FROM THE FRUIT OF ORANGE AND TOMATO IN JIMMA TOWN MARKET SELLERS, SOUTH WEST ETHIOPIA.	108-115
19	FREQUENCY OF PERIPHERAL NEUROPATHY IN PATIENTS WITH CHRONIC KIDNEY DISEASE: A CLINICAL STUDY.	116-118
20	ASSESSMENT OF SPIROMETRY IN GASTROESOPHAGEAL REFLUX DISEASE(GERD) ASSOCIATED ASTHMA PATIENTS.	119-123
21	SMOKING PREVALENCE AND ATTITUDE AMONG HEALTH SECTOR STUDENTS IN UMM AL-QURA UNIVERSITY, SAUDI ARABIA.	124-128
22	DENTIGEROUS CYST TRANSFORMING INTO MUCOEPIDERMOID CARCINOMA OF THE MAXILLARY SINUS IN A 10 YEAR OLD CHILD – A RARE CASE REPORT.	129-134
23	RIGHT OF CHILDREN TO MAINTENANCE.3	135-142
24	PERCEPTION OF DISASTER PREPAREDNESS AMONG EMERGENCY PHYSICIAN IN INDIA.	143-159
25	LA GOUVERNANCE DES DESTINATIONS TOURISTIQUES DANS LA NOUVELLE POLITIQUE TOURISTIQUE MAROCAINE: ENTRE CONSTRUCTION INSTITUTIONNELLE ET REALITE OPERATIONNELLE.	160-175

26	SURVEY PAPER ON TEXT RETRIEVAL AND TRANSLATION FROM SIGN BOARD IMAGES.	176-181
27	PREVALENCE OF DENTINAL HYPERSENSITIVITY IN DAKSHINA KANNADA POPULATION	182-186
28	SYSTEMATIC VEHICLE TRACE WITH RELAY CONTROL AND PULSE SURVEILLANCE.	187-196
29	EVALUATION OF AGD IN DIGITAL BREAST TOMOSYNTHESIS RELATIVE TO THOSE IN TWO-VIEW-FULL-FIELD DIGITAL MAMMOGRAPHY.	197-201
30	EFFICIENCY OF SYSTEMIC VERSUS INTRALESIONAL INJECTION OF BONE MARROW CELLS ON BUCCAL WOUND HEALING IN DIABETIC RATS.	202-212
31	TRIPLE TEST SCORE AS AN EVALUATING FACTOR FOR PALPABLE BREAST LUMP.	213-224
32	Assessment of Physico chemical changes in Nigeen lake.	225-236
33	STRATEGIC RESOURCES FOR SUSTAINABLE COMPETITIVE ADVANTAGE.	237-241
34	Digital Wiring Harness Tester.	242-246
35	FREQUENCY DOMAIN ANALYSIS OF HEART RATE VARIABILITY BETWEEN PREMENOPAUSAL AND POSTMENOPAUSAL KNOWN DIABETICS - A COMPARATIVE STUDY.	247-250
36	DENGUE FEVER IN CHILDREN: ROLE OF ULTRASONOGRAPHY.	251-256
37	EVALUATION OF STRAWBERRY CULTIVARS FOR GROWTH AND YIELD CHARACTERISTICS IN SUB TROPICAL REGION OF PUNJAB.	257-264
38	CONGENITAL ANOMALIES OF THE KIDNEY AND URINARY TRACT NEOPLASMS AND IN THE ELDERLY.	265-273
39	QUANTITATIVE ESTIMATION OF HYDROQUINONE IN FOUR COSMETICS SAMPLES FROM LOCAL MARKET OF SANGAMNER TEHSIL, DISTRICT AHMEDNAGAR (M.S.), INDIA.	274-276
40	Changing trend in choice of schooling in selected areas of rural Almora, Uttarakhand: Some case studies.	277-291

41	DEVELOPMENT AND STANDARDIZATION OF MENTAL MATURITY SCALE FOR PRE-SERVICE STUDENTS.	292-296
42	ASSESSMENT OF PUBLIC SATISFACTION AND TREATMENT TOWARD PHC AND PUBLIC PRIVATE HOSPITAL IN EASTERN PROVINCE, KSA.	297-310
43	ROLE OF COMPUTED TOMOGRAPHY IN ACETABULAR FRACTURES.	311-325
44	TOBACCO CESSATION COUNSELING – THE ROLES AND RESPONSIBILITIES OF A DENTIST.	326-331
45	COMPARATIVE EVALUATION OF ANTIMICROBIAL POTENTIAL OF GINGER, GARLIC AND CINNAMON EXTRACTS AGAINST STREPTOCOCCUS MUTANS AND LACTOBACILLUS ACIDOPHILUS.	332-336
46	ANALYZING THE ROLE OF STRATEGIC ALIGNMENT OF BUSINESS STRATEGIES RELATED TO THE (MILES & SNOW) MODEL ON COMPETITIVE INTELLIGENCE.	337-362
47	A CLINICAL STUDY TO COMPARE THE EFFICACY OF AUTOLOGUS PLATELET RICH PLASMA (PRP) VERSUS NORMAL SALINE DRESSING IN CHRONIC NON-HEALING ULCERS	363-371
48	COMPLICATIONS AFTER POSTERIOR ACETABULAR WALL INTERNAL FIXATION – AVASCULAR NECROSIS AND NONUNION.	372-378
49	Comparison of mitotic effect of aqUEOus, aicohol AND petroleum ether extract of THE LEAVES of boerhaavia diffusa l.on root meristem of allium cepa l.	379-388
50	COOPERATIVE LEARNING AND ETHNIC RECONCILIATION IN ESL CLASSROOM.	389-397
51	CLINICAL PROFILE OF BLADDER OUTLET OBSTRUCTION {BOO} IN FEMALE.	398-404
52	FACILE SYNTHESIZE OF GRAPHENE OXIDE BY MODIFIED HUMMER’S METHOD AND DEGRADATION OF METHYLENE BLUE DYE UNDER VISIBLE LIGHT IRRADIATION.	405-412

53	ANALYSIS OF PHYSICOCHEMICAL QUALITY PARAMETERS OF GROUND WATER NEAR MUNICIPAL SOLID WASTE DUMPING SITES AT PIPARIYA.	413-416
54	IMMEDIATE REATTACHMENT OF FRACTURED TOOTH FRAGMENT USING PRE FRABRICATED GLASS FIBER POST IN A MAXILLARY CENTRAL INCISOR - A CASE REPORT.	417-421
55	DENTO-ALVEOLAR EFFECTS OF MEMORAX VERSUS HYRAX RAPID PALATAL EXPANDERS: A COMPARATIVE CBCT STUDY.	422-430
56	IN VITRO PROPAGATION OF SPATHOGLOTTIS PLICATA BLUME VIA ASYMBIOTIC SEED GERMINATION.	431-438
57	Decoding the Formula for Evergreen Business Success.	439-446
58	COMPARATIVE STUDY OF CONSUMER'S INVOLVEMENT FACTORS IN FASHION CLOTHING.	447-454
59	STATISTICAL ANALYSIS OF DETERMINANTS OF CUSTOMER'S SATISFACTION ABOUT SUNDAY BAZAR AT SARGODHA, PAKISTAN.	455-462
60	<i>ARAB SPRING AND THE ARAB -ISRAELI CONFLICT.</i>	463-472
61	ANALYSIS OF METEOROLOGICAL DROUGHT IN IRAQ USING THE RECONNAISSANCE DROUGHT INDEX (RDI).	473-479
62	QUALITY OF HEALTH SERVICE AND ITS EFFECT ON PATIENT SATISFACTION IN DR. SYAIFUL ANWAR HOSPITAL OF MALANG INDONESIA.	480-488
63	IMPACT OF RISK-RETURN ANALYSIS ON STOCK FUTURES AND OPTIONS TRADING IN INDIAN EQUITY DERIVATIVES MARKET WITH SPECIAL REFERENCE TO NSE.	489-499
64	SURVEY ON AWARENESS ABOUT ORTHODONTIC TREATMENT IN GENERAL POPULATION OF NAGPUR DISTRICT.	500-504
65	OMEGA-3 FATTY ACID IMPROVE NON ALCOHOLIC FATTY LIVER INDUCED BY HIGH FAT DIET IN RATS.	505-512

66	LES STRUCTURES DE GESTION DES DESTINATIONS TOURISTIQUES ET LEURS FONCTIONS FACE AUX DEFIS DE LA COMPETITIVITE : UNE SYNTHESE DE LA LITTERATURE.	513-530
67	BANANA PEEL EXTRACTS FOR THE PRODUCTION OF SINGLE CELL PROTEIN BY USING SACCHAROMYCES CEREVISIAE.	531-535
68	Homogeneous Finsler Square Metrics of Douglas Type.	536-546
69	SIMVASTATIN AS A SOLE OSTEOPROMOTIVE MATERIAL IN CRITICALLY SIZED BONE DEFECTS: SYSTEMATIC REVIEW.	549-553
70	PREVALENCE OF REFRACTIVE ERRORS IN RURAL AND URBAN SCHOOL CHILDREN – A CROSS SECTIONAL STUDY.	554-557
71	THE EFFECT OF FRAGMENTATION IN VEGETATIVE AND ECOLOGICAL DYNAMISM OF MYRISTICA SWAMP – A FRAGILE FRESHWATER ECOSYSTEM OF WESTERN GHATS.	558-568
72	POLYPHENOLS CONTENT AND EVALUATION OF ANTIOXIDANT ACTIVITY OF ANACYCLUSPYRETHRUM(L.) LAG. FROM TIMAHDITE A MOROCCAN MIDDLE ATLAS REGION.	569-577
73	Cone-beam computed tomography-A boon to dentistry.	578-583
74	The evolution of GDP growth rate in the economy of Libya.	584-598
75	EXPERIMENTAL STUDY ON SORPTION BEHAVIOR OF DESICCANTS	599-607
76	Knowledge, Attitude and Practices towards Road Traffic Safety Regulations among Health Science Students in Uttarakhand: A cross-sectional study	608-614
77	A STUDY ON PROBLEMS OF THE ELDERLY PARENTS OF MIGRANT WORKERS	615-617
78	REMOVAL OF HEAVY METALS BY SURFACE ASSIMILATIVE.	618-624
79	AHP AND FUZZY TOPSIS METHODS FOR GREEN SUPPLIER SELECTION AND EVALUATION.	625-635

80	DIFFERENTIAL ACTIVITY OF FOUR SELECTED ENZYMES IN THE PISTILS AND POLLEN GRAINS OF TWO VARIETIES OF HAMELIA PATENS JACQ. (RUBIACEAE) FOLLOWING COMPATIBLE AND INCOMPATIBLE POLLINATION.	636-644
81	THE APOCALYPTIC ANTHROPOCENE EPOCH AND ITS MANAGEMENT IN INDIA	645-663
82	PHYTOCHEMICAL SCREENING, ANTIOXIDANT & ANTIBACTERIAL ACTIVITY OF GREEN SYNTHESIZED SILVER & GOLD NANOPARTICLES USING LEAF EXTRACT OF ZIZIPHUS NUMMULARIA AND ITS EFFECTIVENESS AGAINST INFECTED DENTINE: AN IN VITRO STUDY.	664-672
83	PREVALENCE OF OVERWEIGHT AND OBESITY AMONG RURAL PRESCHOOL SCHOOL CHILDREN CAMEROON.	673-678
84	HEPATIC RESECTION: A CHALLENGE TO ANAESTHESIOLOGIST!!!	679-684
85	A VALUE OF ROUTINE INTRAOPERATIVE CHOLANGIOGRAPHY IN CHOLECYSTECTOMY	685-691
86	THE SECURITY VALUES THAT SHOULD BE AVAILABLE IN THE ISLAMIC EDUCATION.	692-700
87	EVALUATING IMPACT OF COMMUNITY MANAGEMENT IN FOREST CONSERVATION: A STUDY ON COMMUNITY FORESTRY PROGRAM IN NEPAL.	701-711
88	COMPARISON OF CHEMICAL COMPOSITION , MAJOR METALS AND VITAMIN C OF CAMEL AND COW RAW MILK.	612-617
89	EVALUATION OF LEFT VENTRICULAR DIASTOLIC FUNCTION IN PREGNANCY INDUCED HYPERTENSION AND ITS COMPARISON WITH NORMOTENSIVE PREGNANT ASIAN INDIAN FEMALES.	718-722
90	ASSESSMENT OF AIR POLLUTION TOLERANCE INDEX OF PLANT SPECIES GROWING NEAR METAL CASTING FOUNDRIES AROUNDPEELAMEDU, COIMBATORE.	723-728

91	EVALUATION OF GLOBAL LV FUNCTION AND MECHANICAL DYSSYNCHRONY IN PATIENTS WITH LEFT BUNDLE BRANCH BLOCK (LBBB) - 2D ECHOCARDIOGRAPHY, 2D SPECKLE TRACKING AND REAL TIME 3D ECHOCARDIOGRAPHY.	729-740
92	EFFECT OF DIVALENT DOPING ON YOUNG'S MODULUS OF ZNO NANOWIRES.	741-745
93	PHYTOCHEMICAL SCREENING AND TOXICOLOGICAL STUDY OF THE AQUEOUS EXTRACT OF STEM BARK OF MITRAGYNA INERMIS (WILD) O. KUNDZE (RUBIACEAE), A TRADITIONAL MEDICINE PLANT.	746-751
94	IP-10 AS A PREDICTOR OF TREATMENT RESPONSE IN CHRONIC HEPATITIS C PATIENTS.	752-766
95	Translational Research; From Bench to Bedside and Community–Brief Review.	767-770
96	TOXICITY OF SELECTED BOTANICALS TO THE COTTON LEAF WORM, SPODOPTERA LITTORALIS (BOISD.)	771-776
97	CHARACTERIZATION AND ANTIMICROBIAL SUSCEPTIBILITY PATTERN OF CLINICAL ISOLATES OF ENTEROCOCCI AT A TERTIARY CARE HOSPITAL IN BHAVNAGAR, GUJARAT.	777-781
98	SYNTHESIS AND HERBICIDAL ACTIVITIES OF PYRAZOLE- 4-CARBOHYDRAZIDE DERIVATIVES.	782-789
99	PERFORMANCE OF GROWTH TRAITS IN BANDUR SHEEP UNDER FIELD CONDITION.	790-794
100	AN EFFICIENT DESIGN OF DIGITAL DOWN CONVERTER FOR SOFTWARE DEFINED RADIO APPLICATION	795-807
101	A STUDY ON RELATIONSHIP BETWEEN ERP IMPLEMENTATION AND MANAGEMENT ACCOUNTING PRACTICES.	808-820
102	COMPARATIVE EVALUATION OF EFFICACY OF TWO COMMERCIALLY AVAILABLE HERBAL AND ALLOPATHIC DENTIFRICE ON DENTINAL HYPERSENSITIVITY AND THEIR EFFECT ON PLAQUE AND GINGIVITIS.	821-824

103	A STUDY ON EFFECT OF SELECTED ANTENATAL EXERCISES ON OUTCOME OF LABOUR AMONG PRIMIGRAVIDA MOTHERS - A LITERATURE REVIEW.	825-828
104	EFFECTS OF CONFIDENCE AND SOCIAL PRESSURE ON DECISION MAKING PROCESSES.	829-836
105	LE VOYAGE DOCUMENTAIRE DE MICHEL LEIRIS EN AFRIQUE NOIRE.	837-843
106	UPDATE ON THE BIOMARKERS FOR TARGETED THERAPY IN TRIPLE-NEGATIVE BREAST CANCER.	844-852
107	THE BENEFITS OF PROBLEM POSING IN THE LEARNING OF MATHEMATICS: A SYSTEMATIC REVIEW.	853-860
108	Oral findings in Zinsser-Engman-Cole syndrome: a case report.	861-867
109	POSTNATAL DEVELOPMENT OF BRUNNER'S GLAND IN RABBIT	868-876
110	CORPORATE SOCIAL RESPONSIBILITY: A STRATEGIC DECISION AND GOVERNANCE	877-879
111	UTILIZATION OF FLOURS OF FOX NUTS AND WATER CHESTNUTS FOR PREPARATION OF PUA.	880-883
112	USE OF CACTUS OPUNTIA AS A NATURAL COAGULANT: WATER TREATMENT IN DEVELOPING COUNTRIES.	884-894
113	ASSESSMENT OF BREAST CANCER RISK AMONG WOMEN USING THE GAIL MODEL, EGYPT.	895-901
114	THE RELATIONSHIP BETWEEN LEARNING PROCESS IN PESANTREN AND ENERGY CONSERVATION LAW (STUDY OF THE INTERNALIZATION OF RELIGION VALUES RELATED WITH LIFE ENVIRONMENT).	902-907
115	DIFFUSION OF PHYSICOCHEMICAL WATER QUALITY PARAMETERS IN A LAB SCALE WATER DISTRIBUTION NETWORK.	908-912
116	ASSESSMENT OF DEMONETISATION , IT'S MATHEMATICAL ANALYSIS AND IMPACT ON THE WHOLE FINANCIAL SYSTEM, TAKING A STEP ON THE ROAD TO DIGITAL TREASURE HUNT IN INDIA.	913-918

117	DRAFTING AND REVISING STRATEGIES TO DEVELOP ENGLISH ESSAY BY INDONESIAN EFL LEARNERS.	919-930
118	A CONTROL STRATEGY FOR THE IMPROVEMENT OF POWER QUALITY IN MICROGRID.	931-940
119	AMELIORATING EFFECTS OF TOMATO PUREE AGAINST ARSENIC INDUCED ALTERATION IN OVARY OF SWISS ALBINO MICE.	941-945
120	CREATING CONSUMER PURCHASE DECISION : ANALYSIS OF BRAND IMAGE, SERVICE QUALITY AND MARKETING COMMUNICATION.	946-956
121	MULTI-CHANNEL MEDIA ANNOTATION USING SOCIAL ACCESSIBILITY COMPUTING.	957-965
122	TRIPLE LAYER SECURE ENCRYPTION: BY COMBINED RSA, IMAGE STEGANOGRAPHY & DIGITAL SIGNATURE.	966-971
123	HAEMONCHUS CONTORTUS AND OVINE HOST: A RETROSPECTIVE REVIEW.	972-999
124	GALLERY WALK TECHNIQUE IN TEACHING SELECTED TOPICS IN ENGLISH AND LEARNERS' PERFORMANCE.	1000-1002
125	NEXT GENERATION SEQUENCING AND MICROBIAL COMMUNITY ASSOCIATED WITH EUKARYOTES INCLUDING PARASITIC HELMINTHS: A REVIEW ARTICLE.	1003-1022
126	SYNTHESIS AND CHARACTERIZATION OF 16, 17-MEMBERED TETRA AZA MACROCYCLIC COMPLEXES.	1023-1026
127	INTER-DISTRICT DISPARITIES IN INDUSTRIAL GROWTH OF ASSAM.	1027-1034
128	EFFECT OF CRYOGENIC TREATMENT ON TOOL STEELS.	1035-1045
129	A COMPERATIVE STUDY ON THE PERFORMANCE OF THE STUDENTS IN MATHEMATICS AND SOCIAL SCIENCE.	1046-1050
130	A PROSPECTIVE STUDY OF FACTORS RELATED TO PLATELET YIELD AMONG DONORS UNDERGOING PLATELETPHERSIS	1051-1054

131	PHYTOCHEMICAL SCREENING, ACUTE TOXICITY AND CARDIOVASCULAR EFFECTS OF WATER EXTRACT OF HALLEA LEDERMANNII (K. KRAUSE) VERDC (RUBIACEAE), MEDICINAL PLANT FROM GABON.	1055-1063
132	HYDROGEOCHEMICAL STUDIES AND GROUNDWATER QUALITY EVALUATION IN HANUR WATERSHED, KOLLEGAL TALUK, CHAMARAJNAGAR DISTRICT, KARNATAKA STATE, SOUTH INDIA.	1064-1075
133	HUMANIZING THE IMPACT OF DISRUPTIVE CLASSROOM ENVIRONMENT ON NIGERIAN STUDENTS DISCIPLINE.	1076-1079
134	A COMPARATIVE CLINICAL AND RADIOLOGICAL STUDY USING BIOGRAFT-HABG ACTIVE AND BIOGRAFT –CPC.	1080-1089
135	AN ANALYTICAL STUDY ON THE RESULTS OF POSTERIOR FOSSA DECOMPRESSION AND LAX DUROPLASTY IN CHIARI 1 MALFORMATIONS.	1090-1093
136	NOISE POLLUTION STUDY ATMHASWADYATRAMAHOTSAV, 2016 MAHARASHTRA, INDIA.	1094-1097
137	EVALUATION OF GRADIENT GEOMETRY FOR MULTIMODAL MEDICAL IMAGE FUSION	1098-1105
138	A STUDY ON RURAL MARKETING PERSPECTIVE OF FAST MOVING CONSUMER GOODS (FMCG).	1106-1110
139	Cryogels Poreux à base des Fibres de Lin traitées par un mélange liquide ionique EMIMAc / DMSO.	1111-1118
140	ETHNOGRAPHIC STUDY OF THE MAO NAGA TRIBE OF MANIPUR, INDIA	1119-1124
141	A COMPARATIVE STUDY ON INTERNET USE BY RURAL AND URBAN COLLEGE STUDENTS.	1125-1132
142	KEYWORD EXTRACTION: A COMPARATIVE STUDY USING GRAPH BASED MODEL AND RAKE.	1133-1137
143	INTRAUTERINE INSEMINATION OF SEMINAL PLASMA AT THE TIME OF OVUM PICKUP: RELATIONSHIP WITH SUCCESSFUL OUTCOME.	1138-1143
144	PREGNANCY OUTCOME IN SHORT CERVIX: PROGESTERONE VS CERVICAL ENCEPCLAGE.	1144-1150

145	RECOVERY OF URANIUM FROM SULFATE LEACH LIQUOR USING ETHANOLIC EXTRACTANT OF AERIAL PART OF HELIANTHUS ANNUUS PLANT.	1151-1164
146	“A study on how we’re interacting with brands on different social media”	1165-1177
147	EPISIOTOMY AND THE IMPACT ON THE PELVIC FLOOR: BIOMECHANICAL OVERVIEW.	1178-1187
148	ACTIVITY OF ASPARAGINASE, PURIFIED AND CHARACTERIZED FROM FROZEN SEEDS OF PISUM SATIVUM.	1188-1194
149	DEMONETIZATION DRIVE IN INDIA AND ITS SOCIO-CULTURAL IMPLICATIONS.	1195-1203
150	SCREENING OF ALKALINE PHOSPHATASE ACTIVITY OF PHOSPHATE SOLUBILIZING FUNGI FROM RHIZOSPHERE SOIL.	1204-1207
151	TO ENHANCE THE PERFORMANCE OF SOLAR STILL WITH REFLECTORS	1208-1216
152	ADHESION OF STREPTOCOCCUS MUTANS BIOFILM ON THE SURFACE OF INDIRECT RESIN COMPOSITES RESTORATIONS.	1217-1223
153	DOES INSPIRATORY MUSCLE TRAINER HAVE AN EFFECT ON DIAPHRAGMATIC EXCURSION IN HEMODIALYTIC PATIENTS?	1224-1229
154	STATUS OF INFORMATION AND COMMUNICATION TECHNOLOGY PROGRAM AND NATIONAL ACHIEVEMENT TEST PERFORMANCE OF PUBLIC SCHOOLS IN THE DIVISION OF LAGUNA, PHILIPPINES.	1230-1237
155	LASERS FOR ESTHETIC REMOVAL OF GINGIVAL HYPERPIGMENTATION: A SYSTEMATIC REVIEW OF RANDOMIZED CLINICAL TRIALS.	1238-1248
156	AN INTRODUCTION TO OCEAN ACIDIFICATION AND TEMPERATURE CHANGES ON PHYSIOLOGICAL TRADE-OFF OF INTERTIDAL MARINE GASTROPODS	1249-1262
157	ESTIMATION OF HEART RATE USING SIGNAL FUSION OF ECG AND BP SIGNALS	1263-1271
158	PRENATAL DIAGNOSIS WITH GENETIC COUNSELING IN UHC SPLIT, CROATIA.	1272-1276

159	PERSONAL HEALTH-CARE SYSTEM.	1277-1280
160	SOME INVERSE AND SATURATION RESULTS ON CONVOLUTION OPERATORS	1281-1287
161	LIMNOLOGICAL STUDY OF MADDIKUNTTA LAKE , DISTRICT: GADCHIROLI (MS)	12898-1292
162	SMART CLOUD FILE RETRIEVAL USING SEARCHABLE CIPHERTEXT KEYWORDS & ACCESS CONTROL ON INDEX	1293-1297
163	FIRST-PRINCIPLES STUDY OF OLIVINE-TYPE NAMNPO ₄ AS POSITIVE ELECTRODE MATERIALS FOR RECHARGEABLE SODIUM ION BATTERIES.	1298-1303
164	GENETIC DIVERSITY AMONG FOUR MOMORDICA SPECIES USING RAPD, SSR AND ISSR MARKERS	1304-1319
165	Z-PLASTY TRANSPOSITION FLAPS A NEW TECHNIQUE IN CLOSURE OF SKIN DEFECTS AFTER LUMBOSACRAL MENINGOMYELOCELE RESECTION IN PEDIATRICS.	1320-1323
166	GOING GREEN IN LITERATURE: AN INSIGHT INTO NATURE AND ECOLOGY THROUGH LITERATURE.	1324-1326
167	ACUTE EOSINOPHILIC APPENDICITIS PRESENTING BY LOWER GASTRO-INTESTINAL BLEEDING.	1327-1332
168	THE CHARACTERISTICS OF COMPANIES AND THE USE OF FINANCIAL REPORTING IN MANAGING PROFITABILITY.	1333-1353
169	KINETICS AND MECHANISM OF THE HYDROLYSIS OF 4-HYDROXYBIPHENYL PHOSPHATE MONOESTER.	1354-1361
170	A FOOD CHAIN STRUCTURES AND DYNAMICS ACROSS A REFUGE STAGE- STRUCTURE PREY-PREDATOR MODEL.	1362-1380
171	COMPARATIVE STUDY ON TUNING METHODS FOR SISO SYSTEM.	1381-1390
172	ASSESSMENT OF ENDOTHELIAL HEMOSTASIS; SERUM NITRIC OXIDE AND ENDOTHELIN-1 LEVELS IN ISCHEMIC CEREBROVASCULAR STROKE WITH OR WITHOUT TYPE 2 DIABETES.	1391-1399

173	EFFECT OF MUSIC AND PERSONALITY ON SEMANTIC MEMORY RETRIEVAL IN YOUNG ADULTS.	1400-1403
174	THE ROLE OF HIP HOP IN ADDRESSING SOCIO-POLITICAL SITUATIONS IN INDIA- A PERCEPTION STUDY.	1404-1412
175	EXPRESSION OF PROPER NOUNS AND PRONOUNS BY DEAF SIGNERS OF INDIAN SIGN LANGUAGE (MUMBAI-DELHI DIALECT).	1413-1427

Abstract

Maximum power point tracking (MPPTs) play a vital role in photovoltaic (PV) power systems as it maximize the output power & efficiency of PV systems. MPPTs are used to find and maintain operation at the maximum power point. Title presents in detail implementation of PSO MPPT using buck-boost converter. Some results such as current, voltage and output power for various conditions can be recorded. The simulation is possible to carried out in MATLAB/SIMULINK software. The results can be obtained and compared with the theoretical operation which confirm the reliability and performance of the proposed model. It is more efficient, accurate, used rapid and low cost technique without need for complicated mathematical operations. This paper presents Particle Swarm Optimization and Perturbation & Observation techniques to find the optimum operating parameters of a solar photovoltaic panel under varying atmospheric conditions. The terminal voltage, current and corresponding duty-cycle, at which the DC/DC converter should be switched to obtain maximum power output, are determined. Simulation of maximum power point tracking of a solar panel is done in MATLAB. It is observed from the results that the particle swarm optimization based algorithm can track the maximum power point for the whole range of solar data (irradiance and temperature) and has high conversion performance.

Introduction:-

Solar panels collect the sun's energy and convert it to electrical energy. Unfortunately, the solar output is not consistent throughout the day due to clouds and the sun's angle relative to the position of the solar panel. Addition to this, the intensity of the sun varies according to season and geographical location. Moreover the characteristic curve of a solar cell shows a nonlinear voltage-current relationship [1]. Therefore, a controller i.e. the maximum power point tracker (MPPT) is an crucial part of a photovoltaic (PV) system, to find automatically the maximum power operating point at all environmental conditions and then power the PV system to operate at the point (MPP), to ensure the optimum use of the available solar energy [1-2]. This function is realized by suitably controlling the power processing circuit that is exactly always used as an interface between the PV generator and the load or the

energy accumulator. Peak Power Tracking algorithms provide the theoretical means to achieve the MPP of solar panels, these algorithms can be realized in very effective manner. In the last few years, several MPPT techniques have been technologically advanced to maintain the PV arrays operating at their MPPs and have been suggested various examples such as the Perturb and Observe (P&O) method, the Incremental Conductance (IC) method, the Artificial Neural Network method, the Fuzzy Logic method [3-5], etc.... It became clear that perturb and observe (P&O) technique was widely used for its ease of implementation and tracking efficiency [6]. This paper present an adaptive perturb and observe MPPT for a photovoltaic module connected to the buck-boost converter (DC-DC converter). The DC-DC converter is able to draw maximum power from the PV module for a given solar radiation level and environment temperature by modifying the duty cycle of DC-DC converter. This paper offers the method to track the MPP for a PV module using Perturb & Observe (P&O) and Particle Swarm Optimization Algorithm (PSO) technique at varying irradiation and temperature. The PSO is a swarm intelligence-based algorithm used to find the global optimum solutions. The reasons why PSO has added the popularity is because it has only a very few parameters that need to be modified. Although PSO is still in its early stages, it has been used across a wide range of applications. On the other hand P&O method has simple structure and high reliability. The assumed techniques find the optimal electrical operating points and corresponding duty cycle at which the maximum power can be transferred. The performance of the proposed MPPT methods is tested by simulation at different irradiation and temperature using MATLAB. Solar panel specifications are used for simulation. To focus the proposed system performance, irradiation and temperature variations were applied in steps. The results are analyzed and compared.

Generalised Block Diagram:-

A. System Design

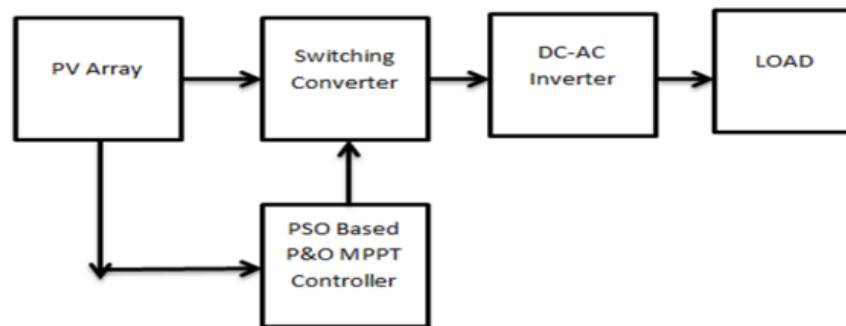

Fig.1:- System Design

The basic design for the photovoltaic system peak power tracker consists of the solar Panel, DC-DC converter (Buck- Boost) connected in a series, the MPPT controller, Voltage and current sensors and the load. This model is known to have better accuracy when the irradiance varies slowly that allows for a more accurate prediction of PV system performance. The Peak Power Tracker is a controlled DC/DC buck-boost converter used by a photovoltaic power system. The microprocessor tries to maximize the output power from the solar panel by controlling the conversion ratio of the DC/DC converter to keep the solar panel operating at its MPP [13]. A DC-DC converter acts as an interface between the load and the module. The Buck-Boost mode DC/DC converter is the most important type of switching regulator. In this converter, the buck and boost topologies are combined into one. The buck-boost converter steps the voltage down when the duty cycle is less than 50% and steps it up when the duty cycle is greater than 50%. The Peak Power Tracker uses an iterative approach to finding this constantly changing MPP [13].

Modelling of Solar Cell:-

In this study the five parameter model (The single diode model for solar cells figure 2) is a very proper choice. Firstly, because most times the results have a high degree of uniformity with data, secondly, as they are not too complex, it is relatively simple to implement and analyze them [7-8]. The equivalent circuit consists of a photocurrent, a diode, a parallel resistor expressing a leakage current, and a series resistor describing an internal resistance to the current flow, as shown in Figure 2.

Fig. 2:- The equivalent circuit of practical PV cell.

The characteristic equation I-V is given by:

$$I = I_{ph} - I_0 \left[\exp \left(\frac{V + IR_s}{AV} \right) - 1 \right] - \frac{V + IR_s}{R_p} \quad (1)$$

Where,

I_{ph} : Photo generated current.

I_0 : Saturation current of diode.

R_s : Cell series resistance.

R_p : Cell parallel resistance.

A : Diode quality factor.

V : Thermal voltage.

Here, the PV model parameters; I_{ph} , I_0 , R_s and R_p are determined based on electrical parameters; I_{sc} , I_{mp} , V_{mp} , V_{oc} and A . The aim is to find the model parameters such that the resulted I-V curve accurately matches the experimental curve. These parameters are obtained by solving the fundamental equation (1) for the key points. The values for I_{ph} , I_0 , R_s and R_p are then determined through an iterative procedure [9-10].

Characteristics of Solar Cell:-

Several Cells are connected in series forms a PV panel/module whereas several PV modules are linked together to form PV arrays. If panels are in series current through the cell is constant and voltage across it increases while on the other hand when panels are in parallel current through the cell increases and voltage remains constant.

The I-V and P-V curve of a module is shown in the Fig. For a certain value of voltage and current the panel provides a maximum output. The output power of the panel increases as the module voltage increases, it reaches to a peak (called as peak power or maximum power point (MPP) in the module) and drops as the voltage approaches to the open circuit voltage. The peak power or MPP is defined at standard test condition (STC) of irradiation of 1000 W/m² and 25 °C module temperature, but these condition does not exist for the most of the time, due to which, normally, the module output power will be less than the peak output power.

Fig.3:- Waveforms showing the effect of (a) Radiation and (b) Temperature on I-V characteristics

Fig.4:- PV curves at various temperatures and Constant irradiation.

In addition to this, the output current and the voltage are affected by the variations in the irradiation and temperature. Fig.4 and Fig.5 shows the waveforms for the effect of irradiation and temperature on I-V characteristics of a solar cell.

Fig.5:- PV curves at various irradiation levels and constant temperature

Under different conditions, there is a unique point on the curve, called the maximum power point (MPP), at which the photovoltaic cell operates with maximum efficiency and produces maximum output power.

MPPT Using Perturb and Observe Method (P&O):-

The perturb & observe (P&O) algorithm, also known as the “hill climbing” method, is very popular and the most commonly used in practice because of its simplicity in algorithm and the ease of implementation. The concept behind the “perturb and observe” (P&O) method is to modify the operating voltage or current of the photovoltaic panel until you obtain maximum power from it. For example, if increasing the voltage to a panel increases the power output of the panel, the system continues increasing the operating voltage until the power output begins to decrease. Once this happens, the voltage is decreased to get back towards the maximum power point.

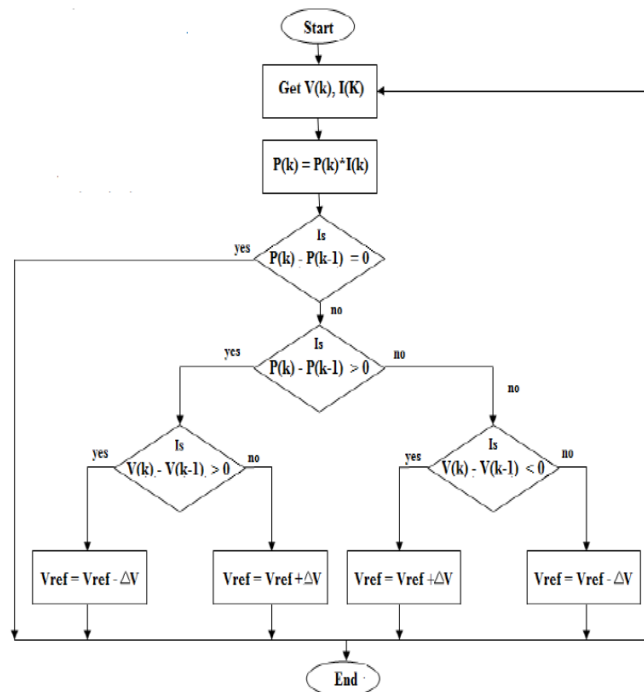

Fig.6:-Flow Chart for P&O MPPT Technique.

This perturbation continues indefinitely. Thus, the output power oscillates around a maximum power point and never stabilizes. The P&O technique has been widely used due to the simple feedback structure, reduced number of parameters and thus can be implemented quickly. In this algorithm the array terminal voltage and current were sensed and processed and power output is calculated. The present PV output power is compared with the power of previous perturbation cycle as shown in the flow chart. The PV voltage and current is perturbed periodically after comparing. If the PV operating voltage varies and change of power is greater than zero $dP/dV > 0$, the algorithm moves the operating point in the same direction, and if the change of power is less than zero $dP/dV < 0$, the algorithm moves the operating point in the opposite direction and if the change of power is equal to zero $dP/dV = 0$ that represents the condition of maximum power point.

The advantages of P&O algorithm is previous knowledge of the PV array characteristics is not required and its simple procedure. But the oscillation of the operating point around MPP under steady state conditions and inability to respond for the rapid changing atmospheric conditions are the drawbacks of this system.

Particle Swarm Optimization Application to MPPT Control:-

Particle Swarm optimization is an optimization method that tries to improve the particle solution with respect to given measure of quality. These particles moves around the search space according to position and velocity. Each particle is influenced by its own best position and velocity.

In PSO, particles are randomly initialized at different positions followed by position update based on new velocity, previous best positions and distance to Pbest to Gbest. Search process is continued till optimum value is obtained. As the particles, approach to MPP they get closer to Gbest position. Correspondingly, Pbest factor and Gbest factor in velocity term moves towards zero.

Eventually, zero velocity is obtained and duty cycle remains almost unchanged under this condition PV system reaches MPP. PSO is useful to track MPP in partial shading conditions. PSO can be used in conjunction with P&O MPPT technique to improve the tracking efficiency. PSO method;

- 1) Used to find out optimal duty cycle
- 2) PSO search starts with random initial guess and it is possible to explore the search region with continuous updation of duty cycle.

- 3) Reduction in steady state oscillations around MPP.
- 4) PSO alongwith MPPT technique responsible for direct duty cycle control.

Main feature is that absence of steady state oscillations at MPP and ability to track MPP for extreme environmental conditions i.e. effective in locating MPP. Drawback is its initial duty cycle selection. If duty cycle values are not within well defined limits and algorithm takes more no. of iterations to obtain the global maximum. This causes reduction in power output. Therefore it is necessary to specify limits of initial duty cycle.

A) Algorithm for PSO Implementation:

Step 1- Set the number of particles and searching parameters along with the limit for position and velocity

Step 2- Randomly initialize Position and velocity of each particle.

Step 3- Compute the fitness value of each particle.

Step 4- The particle having the best fitness value is set as Gbest (Global Best).

Step 5- Update the position and velocity of each particle with respect to the Gbest.

Step 6- Repeat Step 3 & 4 till the optimum solution is reached.

Step 7- Gbest at the end of the last iteration gives the optimized value.

Step 8- Compute the Duty-cycle using the given formula.

$$D = \frac{1}{1 + \sqrt{\frac{R_{in}}{R_{out}}}}$$

DC-DC Converters:-

They are power electronic circuits that convert a dc voltage to a different voltage level. Generally switched mode DC-DC converters are used i.e. the use of a switch or switches for the purpose of power conversion can be regarded as an SMPS. In order to perform power conversion with highest possible efficiency. Converter switches can be implemented using power BJT, power MOSFET, GTO thyristor, IGBT. There are different types of DC-DC converters such as Buck, Boost, Buck-Boost, Cuk converters etc.

One of the basic switched mode converter is the buck-boost converter. The output of the buck-boost converter can be either higher or lower than the input voltage. Assumption made about the operation of this circuit are;

Analysis of the boost converter begins by making these assumptions:-

- 5) The circuit is operating in the steady state.
- 6) The inductor current is continuous (always positive).
- 7) The capacitor is very large, and the output voltage is held constant at voltage V_o .
- 8) This restriction will be relaxed later to show the effects of finite capacitance.
- 9) The switching period is T , the switch is closed for time DT and open for time $(1-D)T$, The components are ideal.

Fig.7:- Schematic of a buck–boost converter

The two operating states of a buck–boost converter: When the switch is turned-on, the input voltage source supplies current to the inductor, and the capacitor supplies current to the resistor (output load). When the switch is opened, the inductor supplies current to the load via the diode D.

Conclusion:-

The aim of this work is to propose a design of PV system peak power tracker and to realize a simple digital controller capable of optimizing the amount of power recovered from a solar panel over a range of environmental conditions. The basic design of the peak power tracker is to read the voltage and current levels at the solar panel simulator output, process these values using the P&O algorithm, and then adjust the voltage in order to obtain

maximum power. The results can be obtained and compared with theoretical operation which confirm the effectiveness of peak power tracking technique. Simulation of Maximum Power Point Tracking of a Solar PV panel using Particle Swarm Optimization and Perturbation & Observation techniques is responsible for direct duty cycle control. If Comparison of SPV panel output with and without optimization is carried out then the results show that particle swarm optimization technique given better results. Hence PSO technique can be employed for MPPT of Solar PV panels. This system is not only able to track MPP for extreme environmental conditions but also it reduces steady state oscillations at MPP which results in stability of the system.

Mucoadhesion, gastroretentive, sustained release, kinetic model, ex-vivo study.

Abstract

In the present study, an attempt was made to design and evaluate bilayer gastroretentive drug delivery system exhibiting a combination of an immediate release layer and a sustained release mucoadhesive layer as second layer to prolong residence time in stomach using Metformin HCl as a model drug to reduce frequency of administration and to overcome bioavailability problems. A total of 5 formulations of bilayer tablets containing the drug were prepared by direct compression method using 5 different mucoadhesive polymers in 5 different formulations (F₁-F₅) respectively to impart mucoadhesion. Formulated bilayer tablets were evaluated by different parameters such as; *ex vivo* mucoadhesion strength, *ex vivo* mucoadhesion time, *In vitro* drug release study. *In vitro* drug release data were fitted to various kinetic models (Zero order, 1st order, Higuchi model, Korsmeyer- Peppas model). Upon R² value analysis it was observed that release from F₁, F₃, F₅ followed Higuchi model and F₂, F₄ followed Korsmeyer- Peppas kinetic model. Mechanism of drug release was found to be Fickian diffusion (value of n < 0.45). F₄ with Na CMC was found to be more promising in *ex vivo* mucoadhesion study showing residence time of 4.08 hrs. This study concludes that formulated bilayer tablets were satisfactory in providing prompt release from 1st layer then maintained sustained release effect with promising mucoadhesion behavior in stomach.

Introduction:-

The new drug delivery system with better efficacy and safety with reduced dosing frequency and improved patient compliance is the current area of research by formulation development scientists. Tablet being most preferred dosage form for its ease of manufacturing and patient convenience is always a first choice of dosage form. The single layer tablets leads to frequent dosing and unpredicted plasma level for drugs with shorter half-lives. Number of diseases require immediate release of drug for instant effect and then plasma concentration has to be maintained for prolong effect of the drug. So, in order to deliver drugs in a predictable time frame, multilayered oral controlled release delivery systems are designed. These systems enhance the efficacy, minimize the adverse effects and increase the bioavailability of drugs.

Mucoadhesive drug delivery is a topic of interest in the design of drug delivery systems to prolong the residence time of the dosage form at the site of application or absorption and thereby to facilitate the intimate contact of dosage form, thus to improve and enhance the bioavailability.

Dosage forms designed for mucoadhesive drug delivery should be small and flexible enough to be acceptable for patients and should not cause irritation. Other desired characteristics of a mucoadhesive dosage form include high drug loading capacity, controlled drug release (preferably unidirectional release), good mucoadhesive properties, smooth surface, tastelessness, and convenient application. Erodible formulations can be beneficial because they do not require system retrieval at the end of desired dosing interval. A number of relevant mucoadhesive dosage forms have been developed for a variety of drugs (Boddupalli et al., 2010).

The mechanism of adhesion of certain macromolecules to the epithelium of a mucous tissue is understood. They are characterized with an epithelial level whose surface is protected by mucus. The mucus contains glycoproteins, lipids, inorganic salts and 95% water by mass, making it a highly hydrated system. Mucin is the significant glycoprotein of mucus and is responsible for its structure. The principal functions of mucus are covering and lubricating the epithelium and some other functions based on the epithelium protection. Mucus width can change from 50-450 μm in the stomach to less than 1 μm in the oral cavity (Smart, 2005).

The mucous area, majorly used for the drug administration and absorption, is gastrointestinal mucus. The mucoadhesion ought to extend over the substrate to initiate the close connection, enhance the surface contact, and in turn increase the diffusion of its chains inside the mucus. The mechanism of mucoadhesion is usually separated in two stages, the contact stage and the consolidation stage. The first stage is characterized by the contact between the mucoadhesion and the mucous membrane, with covering and swelling of the formulation and initiating its deep contact with the mucous level (Hägerstrom and Edsman, 2003).

The development of sustain release dosage form can achieve the aim of releasing the drug slowly for a long period but this is not sufficient to get sustained therapeutic effect. They may be cleared from the site of absorption before emptying the drug content. Instead, the mucoadhesive dosage form will serve both the purposes of sustain release and presence of dosage form at the site of absorption.

In the recent times, multi-layer matrix tablets are gaining importance in the design of oral controlled drug delivery systems. Bi-layer tablets are novel drug delivery systems where combinations of two or more drugs are given in a single unit. They are preferred for the following reasons: To co-administer two different drugs in the same dosage form, to minimize physical and chemical incompatibilities, for staged drug release, IR and SR in the same tablet, for chronic condition requiring repeated dosing.

In the present research, an attempt was made to develop oral mucoadhesive bilayered tablet of Metformin HCl (MH) using Xanthan gum, NaCMC, HPMC 100CPS, HPMC (K-100LV) and Methocel K4M polymers. Metformin HCl, chemically N,N-Dimethyl imido dicarbonimidic diamide, is a biguanide anti hyperglycemic agent used for treating non-insulin-dependent diabetes mellitus (NIDDM). It improves glycemic control by decreasing hepatic glucose production, decreasing glucose absorption and increasing insulin-mediated glucose uptake. Metformin is the only oral anti hyperglycemic agent that is not associated with weight gain. Metformin may induce weight loss and is the drug of choice for obese NIDDM patients. When used alone, metformin does not cause hypoglycemia; however, it may potentiate the hypoglycemic effects of sulfonylurea's and insulin. The half-life of metformin is 6.2 hrs (Kadhe and Arasan, 2002; Desvergne and Wahli, 1999; Berger and Moller, 2002). It is freely soluble in water, slightly soluble in alcohol, practically insoluble in acetone and in methylene chloride (Chawla et al., 200; Chinetti et al., 2000; Willson et al., 2001).

It is a hydrophilic drug and is slowly and incompletely absorbed from the gastrointestinal tract, and the absolute bioavailability of a single 500 mg dose is reported to be 50% to 60%. This indicates the need to develop dosage forms that can retain the drug in the stomach for better absorption. An obstacle to more successful use of metformin therapy is the high incidence of concomitant gastrointestinal symptoms, such as abdominal discomfort, nausea, and diarrhea that especially occur during the initial weeks of treatment. The compound also has relatively short plasma elimination half- life (1.5 - 4.5hrs). Sustained release formulations may be administered once or twice daily. By considering above parameters, mucoadhesive bilayer tablet of metformin may be utilized.

This study describes the preparation of bilayer device comprising Metformin HCl as API and mucoadhesive layer of polymer to prolong its duration of action and improve patient compliance.

Materials and methods:-

Materials:-

Metformin HCl was received as a gift sample from Square Pharmaceutical Ltd, Bangladesh.; Methocel was purchased from Colorcon; Hydrochloric acid was obtained from Merck, Germany; and Xanthan gum, NaCMC, HPMC 100CPS, HPMC (K-100LV), Lactose, Magnesium stearate, Talc and Aerosil were obtained from local market. All other ingredients were of analytical grade.

Methods:-

Preparation of bilayer tablet:-

A total of 5 different types of formulations were prepared in 2 stages using a 13 mm- diameter die on an infrared hydraulic press with 5N compression force for a total of 1 minute 30 seconds. Initially the mucoadhesive layer was prepared according to Formulation plan (Table-1) for 30 seconds by simple thumb pressure then the 2nd layer (immediate release layer) was prepared by final compression force of 5N for 1 minute.

Table 1:- Formulation plan:

Ingredients (mg/ tablet)	Immediate release layer	Mucoadhesive sustained release layer				
	(F ₁ – F ₅) Composition is same for all formulations	F ₁	F ₂	F ₃	F ₄	F ₅
Metformin HCl	150	250	250	250	250	250
HPMC100cps	-	200	-	-	-	-
HPMC(K-100LV)	-	-	200	-	-	-
NaCMC	-	-	-	200	-	-
Methocel K4M	-	-	-	-	200	-
Xanthan gum	-	-	-	-	-	200
Lactose	100	50	50	50	50	50
Magnesium stearate	1	1	1	1	1	1
Talc	1	1	1	1	1	1
Aerosil	1	1	1	1	1	1
Total weight	253	503	503	503	503	503

Evaluation of physical and biological parameters of formulated bilayer tablets:-

In vitro drug release study for mucoadhesive bilayer tablet:-

In vitro release profile for each formulated bilayer tablet was performed using USP type II dissolution apparatus (Electrolab, Mumbai, India). Dissolution studies were carried at rotation speed of 50 RPM, in 900 ml of 0.01 N HCl of pH 2.0 at $37 \pm 0.5^\circ\text{C}$. Aliquot of 5 ml was withdrawn upto 8 hrs. The withdrawn volume was replaced with same volume of dissolution medium in order to keep the total volume constant. The absorbance of sample was measured by an UV spectrophotometer at 233 nm after suitable dilution if necessary. After filtration, the amount of drug release was determined from the standard calibration curve of pure drug (Singh et al., 2012).

Kinetic modeling of *in vitro* drug dissolution profile:-

In vitro drug release data of all the bilayer tablet formulations of Metformin HCl was subjected to goodness of fit test by linear regression analysis according to zero order, first order kinetics and according to Higuchi's and Korsmeyer-Peppas models to ascertain mechanism of drug release.

Measurement of *ex-vivo* mucoadhesive strength:-

Bioadhesive strength of the tablets was measured on modified physical balance. A piece of goat stomach mucosa was pasted to a petri-dish with cyanoacrylate adhesive and the mucus membrane was wetted with 2-3 drops of 0.01 N HCl media. The tablets were tied with thread and attached with the mucous membrane. Another end of thread tied with one side of the physical balance. The weight required to detach the tablet from the mucosal surface was taken as the measure of mucoadhesive strength. Force of adhesion was calculated from the mucoadhesive strength as per following equation:

Force of adhesion (N) = (mucoadhesive strength \times 9.81) \div 1000:

Measurement of *ex-vivo* residence time:-

The *ex-vivo* residence time was determined using a locally modified USP disintegration apparatus. A segment of goat stomach mucosa was glued to the surface of the beaker, vertically attached to the apparatus. The mucoadhesive tablet was then pasted to the mucosal membrane by applying a light force with a finger trip for 30 seconds. Then the tablet and mucosa was hydrated by the medium of 800 ml 0.01 N hydrochloric acid of pH 2.0, allowing the apparatus to move up and down maintaining $37^{\circ}\text{C} \pm 0.5^{\circ}\text{C}$; monitoring the tablet adhesion for 8 hours to see retention time and correlate with sustaining property of formulation. The time for the tablet to detach from the goat stomach mucosa was recorded as the mucoadhesion time (Umarji et al., 2012).

Results and Discussion:-

The main goal of this work was to develop new mucoadhesive bilayer tablets of metformin HCl; consisting of an immediate release and a of sustained release layer. The double layered structure design was expected to provide immediate release of metformin HCl from the outer layer to produce a prompt pharmacological action then sustained release from second layer to provide a sustained release of enough drug over an extended period of time and retain in stomach for an extended period of time.

A total of 5 formulations of mucoadhesive bilayer tablets were prepared and evaluated for biological and physical parameters. The composition of final bilayer formulation had been chosen from the previous single sustained release layer formulation which gives the best average percent release and best fitted with kinetics model of dissolution release pattern. Different amounts (150 mg, 180 mg, 200 mg, 220 mg) of 5 different mucoadhesive polymers (HPMC 100 cps, HPMC K-100LV, Xanthun gum, NaCMC, Methocel K4M) were used to prepare single sustained release layer. The study indicated that increase of concentration of polymer decreases *In vitro* drug release and gives larger $T_{50\%}$ value; which indicates more sustained release effect. Thus the middle amount of polymers (200 mg) was selected for the final bilayer formulation.

According to work plan, the formulated bilayer tablets were evaluated for their *in vitro* drug release profile study, *ex vivo* mucoadhesive strength, *ex vivo* residence time, $T_{50\%}$, $T_{25\%}$, $T_{70\%}$ determination.

Physical appearance:-

The appearance of bilayer tabs was smooth and uniform on physical examination.

Kinetic modeling of *in vitro* drug dissolution profile:-

In vitro drug release studies were conducted and fitted to different kinetic models. Cumulative percent of drug release from the formulations upto 8 hrs is shown in the Figure-1; release rate kinetic constants and R^2 values obtained from different kinetic models are tabulated in the following Table 2.

Table 2:- Interpretation of release rate constants and R^2 values for different release kinetics of formulated bilayer tablets:

Formulations	Zero order		First order		Higuchi		Korsmeyer	
	K_0	R^2	K_1	R^2	K_H	R^2	N	R^2
F ₁	5.935	0.873	-0.040	0.940	19.25	0.978	0.426	0.956
F ₂	7.084	0.839	-0.059	0.950	23.36	0.971	0.328	0.988
F ₃	6.614	0.864	-0.050	0.940	21.48	0.970	0.370	0.962
F ₄	6.648	0.883	-0.048	0.953	21.46	0.980	0.414	0.964
F ₅	6.851	0.854	-0.054	0.948	22.42	0.974	0.354	0.978

Fig 1:- *In vitro* release profile of formulated bilayer tablets containing different types of polymers. Here, used mucoadhesive polymer indicated the formulations. F₁ is formulated with HPMC 100 cps, F₂ is formulated with HPMC (K-100LV), F₃ is formulated with Xanthun gum, F₄ is formulated with NaCMC, F₅ is formulated with Methocel K4M.

The *in vitro* release data are treated with different model of release kinetics in the above Table 2 and the best fitted model was explained by the help of R² value in Table 3 given below. Evaluated, T_{25%}, T_{50%}, T_{70%} were also tabulated in the Table 3 and n values were also mentioned for drug transport mechanism explanation. Fig 2 illustrates the evaluated values of successive fractional dissolution time of formulated bilayer tablets.

Table 3:- Drug release kinetics and dissolution parameters of formulated bilayer tablets:

Formulations	Best Fit Model	R ²	n	K _H	T _{25%}	T _{50%}	T _{70%}
F ₁	Higuchi	0.978	0.426	19.25	1.18	5.98	18.03
F ₂	Korsmeyer	0.988	0.328	-	0.35	2.93	12.27
F ₃	Higuchi	0.970	0.370	21.48	0.66	4.32	15.37
F ₄	Korsmeyer	0.978	0.414	-	0.88	4.69	14.6
F ₅	Higuchi	0.980	0.354	22.42	0.51	3.62	13.67

Fig 2:- Successive fractional dissolution time of formulated bilayer tablets.

$T_{50\%}$ values of formulations manifest the drug release rate of dosage form and the retarding efficacy of polymers. Higher $T_{50\%}$ value indicates a higher drug retarding ability of polymer and vice versa. Fig - 2 indicates better sustained release effect was found in F_1 and F_3 compared to other formulations.

Diffusional release mechanism of the formulations was interpreted from *in vitro* drug release data by analyzing the n values by fitting in Korsmeyer Peppas kinetic model and results are tabulated in Table 4.

Table 4:- Interpretation of diffusional release mechanism from *in vitro* drug release data from formulated bilayer tablets:

Formulation	n (Release exponent)	Drug Transport Mechanism
F_1	0.426	Fickian diffusion
F_2	0.328	Fickian diffusion
F_3	0.370	Fickian diffusion
F_4	0.414	Fickian diffusion
F_5	0.354	Fickian diffusion

Ex-vivo study for evaluation of mucoadhesive behavior of bilayer tablets:-

The *Ex- vivo* mucoadhesive strength of the tablets was determined for different formulations using goat stomach mucosa. *Ex vivo* residence time was evaluated by conducting a study for 8 hrs by recording the time for complete detachment of tablet from mucosal surface. The evaluation results are tabulated in Table 5 and illustrated in Fig 3, Fig 4.

Table 5:- *Ex- vivo* evaluation of mucoadhesive behavior of formulated bilayer tablets:

Formulations	Detachment force (N)	Residence time (hrs)
F_1	0.661	2.22
F_2	0.621	1.4
F_3	0.6	3.07
F_4	0.916	4.08
F_5	0.523	2.02

Fig 3:- Detachment force of different formulation containing different mucoadhesive polymer.

Fig 4:- Ex vivo residence time of different formulation containing different ratio of mucoadhesive polymer.

From the Table 4, Fig 3 and Fig 4; it was observed that the highest mucoadhesive strength was observed with the formulation showing highest detachment force. F₄ containing NaCMC showed highest mucoadhesive strength. Tablet containing an increased concentration of polymer showed higher mucoadhesion with long residence time (4.08 hrs). This finding is owing to the hydrophilic nature of NaCMC; it is hydrated easily with less contact time and forms a strong interpenetrating network with mucin molecules because of the polymer's long linear chain structure. A linear increase in mucoadhesion was observed with an increase in contact time.

Conclusion:-

In the present study, 5 different formulations of mucoadhesive bilayer tablet of metformin HCl (F₁ – F₅) were prepared by using 5 different Polymers by direct compression method. The results of *in-vitro* drug release profile of bilayered tablets were satisfactory. But, F₁ and F₄ provided better controlled and sustained *In vitro* drug release compared to other three formulations. The T_{50%} values of these five formulations which is an important parameter for knowing the retarding ability of drugs were also found satisfactory. Results from *ex vivo* evaluation of mucoadhesive behavior of these five formulations were also good which provides increased residence time of drug in GIT and gave clear understanding about the bioadhesion properties of the bilayer tablet. However, an appropriate balance between various levels of the five polymers is needed to acquire proper release and mucoadhesion. Finally, it can be concluded that by formulating mucoadhesive bilayer tablets of metformin HCl, its complete release can be ensured prior to absorption and hence the problem of incomplete drug release and erratic absorption of pure metformin HCl can be solved by increasing the retention time of drug in GIT for a longer period with the help of mucoadhesive polymers.

Abstract

This paper attempts to analyse the problems and prospects in south Asia by using various indicators based on data from secondary sources. The study reveals that South Asia a land of natural beauty and also known as paradise on Earth, and Switzerland of Asia. But the countries of South Asia are not able to evolve co-operative relations and their relations are characterizing by numerous conflicts. The type and level of conflicts which take place in the sub-continent however vary with changing circumstances, both internal and external, which affect the region. Of late, of course the countries of South Asia realize the need of cooperation and make some progress in this direction. Indo-china both are the most powerful nations of region performing their role in various direction for maintaining the peace, cooperation and integration in the region.

Introduction:-

The term South Asia is used for the countries lying south of Himalayas and surrounded by the Indian Ocean from three sides. The countries of this region include India, Pakistan, Bangladesh, Sri Lanka, Nepal, Maldives and Bhutan. Apart from Nepal and Bhutan, the rest of the South Asian region has been subject to colonial rule. These countries gained independence in 1947; Pakistan came into existence as a result of partition of India in 1947; Sri Lanka got independence in 1948. Bangladesh emerged as an independent sovereign state after breaking away from Pakistan in 1971. Though the countries differ from each other with regard to climate, race, religion and history, they constitute a single region and possess some common features. Firstly, most of the countries are very poor and majority of their people live below poverty line. Secondly, religion is a predominant factor in these states. In fact, some of the states like Pakistan and Bangladesh were created on religious basis. Thirdly, these countries are faced with problems of unemployment, illiteracy, over population, etc. Fourthly, the countries are agriculturally and industrially backward. However, India is an exception and has made considerable industrial progress. Fifthly, most of the countries are faced with the problem of political instability. Finally, most of the countries (except Pakistan) do not have close military links with super powers. In contrast with the external boundaries of the region, the political geography within the region does not follow any neat pattern. The three most important rivers-Indus, Ganga and Brahmaputra cut across the boundaries of the principal countries in the Indian sub-continent. In spite of differences in physical appearance, complexion, stature and other ethnological features, a common cultural and ethnic outlook unifies the people of the entire region of South Asia. However, the South Asian countries have sharp differences in their perception and approaches on the details of major global and regional issues of peace, security and stability. The pattern of these differences has remained somewhat consistent over a long period except for some occasional minor shift in their strategies.

South Asia has become an area in which India and China have been seeking to gain political and economic influence over many years. Therefore, it seems appropriate to analyse their relationship with South Asian countries through the lens of the regional power debate. Both countries have claimed regional power status, i.e. a dominant position, and have invested in different ways to shape their respective regions according to their political interests. India has used different bi- and multilateral strategies to pursue its regional leadership role in South Asia. In contrast, China has concentrated on bilateral relations rather than on multilateral structures, in order to expand its traditional regional focus from North East and South East Asia to South Asia¹.

Conflicts in south asia:-

The harsh geo-political realities point towards greater potential for conflict rather than peace. These may be well routed in geo-strategic factors and in the strategies of the leading powers of the world to influence these factors in their own interests. Some of the geo-strategic factors are:

Military Stand Off in the Region- Whereas India has tended to find greater convergence in its perceptions with Russian position on many issues; however other South Asian states have reflected towards west towards their world views.

Emergence of China as a Reckonable Power- China's growing power and its assertive approach in dealing with other nations can only create apprehensions and a sense of insecurity in the countries of South Asia excepting those like Pakistan who have sought a quasi-alliance relationship with it. Similarly, China's growing capabilities of power projection could pose a major challenge to peace and security in the days ahead.

Situation in Afghanistan and Middle East- Afghanistan and Middle East are the two conflict areas where local indigenous conflictual factors have been entangled in great power strategies and interests. The continuation or resolution of the conflict in the two areas will have far-reaching influence on the peace and security in the region.

Growth of Extra Regional Military Forces in the Indian Ocean- There has been a massive growth of extra regional military forces in the Indian Ocean in the recent years. The presence of extra regional forces only helps to exacerbate conflictual responses and aggravate the problem of peace and security in the region. Strategically too the Indian Ocean region is important for global nuclear warfare and thus it has become a victim of US and European game plan. The success of US Coalition Strategy to undertake military responses outside NATO areas in conflict situation during the second half of 1987 in Persian Gulf Arabian Sea is noteworthy².

Cooperations:-

Religious and Cultural Interrelation:-

South Asian region has uniqueness in shared history, heritage, literature, culture, religion and language. The commonality of culture and religion provides a strong motive for regional cooperation as it has similar lifestyle, fashion and clothing trends, music, food or even cinema. Even the people have family relations across borders that were formed before partition and have sympathy towards them. So this cross-religious, cross-cultural pattern also demands cooperation at regional-level to provide better access and opportunity to people for harmony and religious beliefs. South Asia develops greater economic and political cooperation it is also possible that the notion of pan-South Asian identity will emerge at local and global level and trickle down to the people. That is why AmartyaSen (2006) gives notion of cultural identity where people could have multiple identities.

Economic Acquisitions:-

In regional cooperation processes trade must be a means not an aim per se to increase the productive power of a state. A long-term economic strategy of any developing state must have diversion in trade destinations including its neighbour destinations, diversity in trade pattern/products including both labour intensive and capital intensive. Most states in this region lack skills, research capacity, financial and technical resources for research and education, in this context establishment of South Asian University and signing of South Asia Free Trade Area agreement (SAFTA) are significant step (Mehta and Kumar 2004; Banik 2006; Ratna and Sidhu 2008; Taneja et al. 2011). 2 The share of intra-regional trade is very low in South Asia with comparison to intra Association of Southeast Asian Nations (ASEAN) or intra-EU trade for intraregional trade of SAARC nations; also for SAARC trade with rest of the World. The share of SAARC trade has remained same ranging from 4-6 percent between 2000 and 2013. This low intra-regional trade has been on account of positive list based approach on exchange of tariff preferences, small product coverage, narrow margins of preferences and inability to address non-tariff barrier³.

political integration, for instance the promotion of democratic values, were only used selectively and remained contingent on India's security concerns *vis-à-vis* the neighbours. In 2009, the South Asian Association for Regional Cooperation (SAARC) agreed on a Charter of Democracy to strengthen democratic structures in South Asia. The Charter becomes fully operational, it can become an important instrument that allows India to support democratic institutions in neighbouring countries. But it is also an ambivalent instrument because this could be seen as interference in the internal affairs of countries, which India itself rejects. The Indian Technical & Economic Cooperation Programme (ITEC) has trained many bureaucrats from South Asia and has helped New Delhi to increase its political clout in the region. In 2013–2014 more than 80 per cent of India's total loan and aid budget was allocated to its South Asian neighbours, especially Bhutan, Bangladesh, and Afghanistan.

India's efforts

INDIA seems to be a regional power in South Asia by default. Governments in New Delhi have used a variety of instruments to further their interests in the region: wars have India been fought and won (for instance with Pakistan); militant groups have been supported in their fight against authoritative regimes (East Pakistan) and democratic governments (Sri Lanka); trade sanctions and border blockades have been imposed; secret arrangements have been negotiated (Nepal); unilateral economic and political concessions (SAARC) have been made; development aid has been provided (Afghanistan, Bhutan, Nepal); and successful (Nepal) and unsuccessful (Sri Lanka) attempts for mediation in civil wars have been made

Since its independence in 1947, India has been perceived as a regional power or hegemon in South Asia. Due to the asymmetry of its territorial and demographic size, its military dominance, and its economic potential, India seems to be a regional power by default. But a closer look reveals that India's superior economic and military resources have hardly resulted in the achievement of its foreign policy goals.

For many years, India perceived its neighbouring countries as a major part of its national security and its strategic sphere of influence. India's policy *vis-à-vis* the Himalayan states has always been determined by its relations with China and it has always aimed to reduce China's influence on its northern border. The friendship agreements with the Himalaya kingdoms Bhutan (1949), Sikkim (1950), and Nepal (1950) gave India a great involvement in the internal affairs of its neighbours. Prime Minister Jawaharlal Nehru, who is often blamed for being an 'idealist' in international affairs, appears to have had a much more 'realistic' perspective with regard to India's neighbours in the Himalayas⁴.

Indira Gandhi's South Asia doctrine saw the region as part of India's national security. This became the basis for various political and military interventions during the 1970s and 1980s. But many of the interventions did not bring about the desired long-term results for India. The military victory over Pakistan in 1971 was not followed by a permanent solution of the Kashmir issue. India supported Bangladesh after its independence in 1971 but could not prevent Bangladesh's economic and political realignment after the military coup in 1975. India's attempts to mediate in the Sri Lankan civil war in the late 1980s ended in political and military disaster.

After the economic liberalisation in 1991, economic issues became more and more important for India's foreign policy at both the regional and the global levels. In the mid-1990s, the Gujral doctrine highlighted the concept of non-reciprocity: India was now willing to make unilateral, political, and economic concessions to weaker states. South Asia was no longer seen as a part of India's national security, but as part of its economic development. The new focus on economics gained more importance *vis-à-vis* the traditional security concerns. Prime Minister Manmohan Singh moved economic relations to the centre of India's foreign policy, promoted economic development, gave greater importance to India's relations with the great powers, and tried to establish friendly relations with the neighbouring countries.

China's efforts:-

China's relations with India and South Asia have also undergone several changes. The good relationship it had with India in the 1950s was overshadowed by the boundary dispute. After the border war in 1962, China deepened its relations with Pakistan. As part of its ideological foreign policy, China supported various militant movements in South Asia, as for instance rebel groups in India's northeast.

China's strong economic and military support for Pakistan since the 1960s and its later efforts to develop its economic relations with India's neighbours have always raised apprehensions in India, that China's South Asia policy was aimed at pressuring India. Following its economic liberalisation in the late 1970s, China has also shifted its focus *vis-à-vis* South Asia. Its security interests *vis-à-vis* the region are dominated by the domestic challenges in Xinjiang and Tibet. China's South Asia policy has been characterised as 'multi-layered and complicated and not necessarily compatible and complementary'. China's attempts to create new access to the Indian Ocean as part of its 'One Belt, One Road' (OBOR) initiative by building land corridors through Pakistan and Bangladesh will increase the strategic importance of South Asia in the long-term.

In the field of security, China has the upper hand with regard to military hardware and strategic investment, whereas India has stronger military-to-military relations with its neighbours. In 2011, India's National Security Advisor Shiv Shankar Menon pointed out that India has to expand its role as security provider for South Asia as well as for the Indian Ocean region in order to counter the growing Chinese influence⁵. Prime Minister Modi also emphasised this point during his various visits to the SAARC countries and the island states of the Indian Ocean in spring 2015⁴.

Conclusion:-

It seems that despite its superior material resources, India has hardly ever managed to establish itself as regional power in the long-term perspective. Nehru's and Indira Gandhi's attempts to portray the region as part of India's national security and to secure the country's foreign political interests through military, economic, and political interventions have proven counterproductive in two ways. First, the process of nation-building in the neighbouring countries prevented a close approximation with India. Because of common religious, linguistic, and ethnic ties, nation-building was about delimitation of the dominant neighbour. Second, all neighbours have used the strategy of internationalising their bilateral disputes with India, sometimes more and sometimes less successfully. Pakistan is the most obvious case, but Bangladesh, Nepal, and Sri Lanka have also played the 'China card' at various times. Since its liberalisation in 1991, India has put its South Asia policy on a new basis with the Gujral and the Manmohan doctrines. South Asia is regarded more as a market that can contribute to India's economic development and therefore the focus of bilateral and multilateral initiatives is on regional public goods, like better connectivity as well as on unilateral economic concessions, in order to expand intra-regional trade.

In contrast to India, China enjoys a comfortable position. Politically, China is regarded as a 'neutral' player in South Asia. China has never been part of the discourse on nation-building and its relations with the region are not marred by the baggage of history. Economically, China is a more attractive trade and investment partner for South Asian countries. In the field of security, China is an important partner for the acquisition of military hardware. However, India has also improved its security collaboration with many South Asian countries in recent years.

India seems to be caught in a catch-22 situation in South Asia. On the one hand, religious, linguistic, and ethnic ties bind India with the region. On the other hand, those ties do separate India from its neighbours with regard to nation-building. Hence, India will scarcely be able to overcome its resentments in the neighbouring countries and to counter the advantages that China enjoys in South Asia with regard to politics, economics, and security. However, China's growing influence in South Asia does not imply a claim for any regional power status. It pursues its national interests and does not seem to be interested in providing regional public goods. It remains arguable whether China's activities within the region serve its own economic development, or how far it pursues a policy of 'encirclement' against India. It should not be overlooked that India and China are also cooperating in joint regional initiatives like the Bangladesh-China-India-Myanmar and that China has also promised to make large-scale infrastructure investment in India. Despite its disadvantageous position, India should continue its efforts to provide regional public goods through both bilateral and multilateral initiatives. This will foster regional cooperation in South Asia, so that the question of 'who is the regional power' may even become superfluous in the long time

Abstract

The variations of thermal properties with temperature for Pb-Sn alloys were measured using a heat flow apparatus. According to present experimental results, the thermal parameters (T_{onset} , T_{end} , T_m) of Pb-Sn alloys increase with increasing heating rates, also the results showed that the small amount of zinc improved significantly these parameters. Furthermore the change in enthalpy of fusion and activation energy of fusion for different heating rates were studied experimentally by the differential thermal analysis (DTA). The apparent activation energies of Pb-Sn alloys have been determined based on the Kissinger equation.

Introduction:-

Pb-Sn alloys are the basis of many engineering materials [1]. An Extensive theoretical and experimental study of the nature of the relationships among microstructure, physical properties and solidification processing parameters has been created [2-5]. Pb-Sn solders are one of the most familiar materials used for various microelectronic connections in computer industry. Different compositions of Pb-Sn solders have considerable potential for advanced structural and electronic applications. Pb-Sn alloys have several attractive attributes: low cost, low eutectic temperature (183°C), good wettability on many common workpiece metals, and good thermal and electrical conductivities, and a choice between eutectic freezing or a wide freezing range which produces "pasty" solid-liquid mixtures[5-8]. Also, a great deal of efforts has been carried out on Pb-Sn eutectic alloys, which is currently used in computer industry for various microelectronic connections [9-12]. Although Pb-Sn solders are still widely used for many applications (e.g., body panel soldering on automobiles). Pb-Sn alloys make excellent solders for electrical and mechanical joining[13]. One of the important benefits of the thermal analysis experiment is its usefulness in selecting appropriate temperatures for the heat treatment cycles of the samples as well as for the investigation of the phase development[14, 15].

Most studies have dealt with the thermal properties of Pb-Sn solders with different compositions at room temperature, but a few papers have been focused on the dependency of thermal properties of these alloys on the temperature and composition of alloy. Thus, the purpose of present work was to determine the following parameters: temperature of onset of melting (T_{onset}), temperature of offset of melting (T_{offset}), heat of fusion, and the activation energy occurring during melting, besides the effects of different heating rates and Zn addition on melting temperature, heat of fusion, and the activation energy of the alloy samples.

Figure 1:- Phase Diagram of Pb–Sn System

Phase diagram of Pb–Sn system has been evaluated as shown in Figure 1. Solubility of Pb in solid Sn and Sn in solid Pb at the eutectic temperature (456 K) are 2.2 wt.% Pb and 18.3 wt.% Pb, respectively [16]. Thus, the compositions of Pb–Sn alloys were chosen to be Pb–61.9 wt% Sn, Pb–61.9 wt% Sn–2 wt% Zn to investigate the dependence of the thermal measurements on the temperature and the effect of addition of Zn in the Pb–Sn alloys.

Experimental Details:-

Material Preparations:-

The two solder alloys, Pb-61.9wt%Sn and Pb-61.9wt%Sn-2wt% Zn were prepared from high purity Pb, Sn and Zn of purity 99.99%. The appropriate weights of the elements for the binary and ternary alloys were well mixed with CaCl_2 flux to prevent oxidation in a graphite mold. Casting in rod form was performed in a 15 x 1 x 1 cm graphite mold. The casting rod was annealed at 438K for 50 hours. The ingots were rolled into wires of diameter 1mm. In this study, the samples were annealed at 443K for 4h and then slowly cooled to room temperature at cooling rate $T = 2 \times 10^{-2} \text{ K s}^{-1}$.

Mechanical Tests:-

Differential thermal analysis (DTA) measurements were carried out on 40 mg of small pieces of alloy samples using a Labsys Evo_TG DTA thermal analyzer. DTA experiments were performed by heating the samples in a Pt crucible with Al_2O_3 as the reference material. Five different heating rates (10, 15, 20, 25 and $30 \text{ }^\circ\text{C min}^{-1}$) were examined during the measurements.

Results and Discussion:

Melting Temperature (T_m) of Alloys:-

The melting temperature is a critical alloy characteristic because it determines the maximum operating temperature of the system. Figure 2 represents the results of DTA analysis of the Pb-61.9wt%Sn and Pb-61.9 wt%Sn-2wt%Zn alloys measured at the heating rates of 10, 15, 20, 25 and $30 \text{ }^\circ\text{C min}^{-1}$, from room temperature to $450 \text{ }^\circ\text{C}$.

Figure 2:- Different Thermal Analysis (DTA) Curves for (a) Pb-61.9wt%Sn and (b) Pb-61.9 wt%Sn-2 wt% Zn Alloys Taken at Different Heating Rates.

It is shown that there is only one main endothermic peak for the samples during the measurements observed in the temperature range 30 – 450 °C, namely the melting which is indicated by the endothermic peak. The endothermic peak appears in DTA curve has two regions of heat extraction that are indicative of the melting temperature. The melting points were considered in support of probable industrial applications. The temperature of onset of melting, T_{onset} , (the onset point of heat absorption during heating) is defined by the extrapolated beginning of the curve, being defined by the point of intersection of the tangent with the point of maximum slope, on the principal side of the peak with the base line extrapolated [17, 18].

From Figure 2 (a, b) and Table 1, it can also be seen that the heating curves of the Pb-61.9wt%Sn and Pb-61.9 wt%Sn-2wt% Zn alloys are shifted towards higher temperature with the increasing rate of heating. The first effect of the heating rate can be explained by the decrease of the precipitated Zn atoms amount because of its increased solid

solubility at the increased precipitation temperatures when using higher heating rate [19, 20]. However the second effect is explained by the diffusive nature of the precipitation reactions.

Figure3 shows a schematic of the heat flow curve versus the temperature of Pb-61.9 wt%Sn-2 wt% Zn alloy obtained at the heating rate of $10\text{ }^{\circ}\text{C min}^{-1}$ and how the DTA curve is formed from the data recorded. The graph shows that the sample presents an onset temperature for melting of $169.809\text{ }^{\circ}\text{C}$ with $\Delta H = 8.425\text{ }(\mu\text{V.s/mg})$ and a melting temperature of $180.246\text{ }(^{\circ}\text{C})$.

The obtained values of the temperature of onset of melting (T_{onset}), the temperature of offset of melting (T_{offset} or T_{end}) and melting temperature (T_m) are listed in Table 1 and marked on the DTA curves as shown in Figure3 for Pb-61.9 wt%Sn-2 wt% Zn alloy obtained at a heating rate of $10\text{ }^{\circ}\text{C/min}$ (as example).

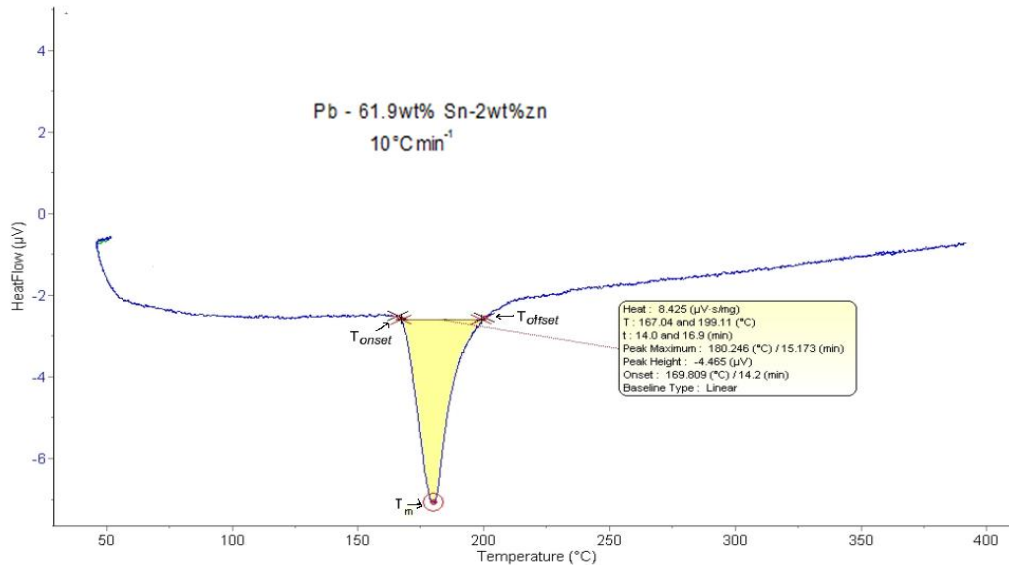

Figure 3:- Schematic of Heat Flow Curve Versus the Temperature for Pb-61.9 wt%Sn-2 wt% Zn Alloy at a Heating Rate of $10\text{ }^{\circ}\text{C/min}$.

Figure: 4 shows the comparison between the values of the melting temperature T_m for Pb-61.9 wt% Sn and Pb-61.9 wt%Sn-2 wt% Zn alloys at a heating rate of $10\text{ }^{\circ}\text{C/min}$. Addition of Zn increased the T_{onset} , and T_{end} as illustrated in Figure4 whereas, the Zn addition caused a further depressed of the melting temperature T_m of Pb-61.9wt%Sn alloy for different heating rate, which makes this alloy interesting for technical applications. In addition the melting range (temperature range between solidus and liquids points according to DTA) is extended as zinc metal addition.

Figure 4:- Heat Flow Curve Versus the Temperature for Pb-61.9 wt% Sn and Pb-61.9 wt%Sn-2 wt% Zn Alloys at a Heating Rate of 10 °C/min.

Table 1:- Comparison of Onset Temperature (T_{onset}), Offset Temperature (T_{end}), Melting Temperature (T_m), and Heat of Fusion (ΔH) for Pb-61.9wt%Sn and Pb-61.9wt%Sn-2wt%Zn Alloys.

Determination of activation energy (E_a) of fusion:-

To determine the activation energy E_a for fusion of alloys by Kissinger methods, which determine the activation energy of the samples starting from the change in the temperature that corresponds to the maximum of the endothermic peak T_m according to the heating rate β as shown in Figure2 (a,b).

The activation energy of the Pb-61.9wt%Sn and Pb-61.9 wt%Sn-2wt%Zn alloys under continuous heating condition can be calculated by the Kissinger equation[21-23]:

$$\ln \left[\frac{\beta}{T_m^2} \right] = -\frac{E}{RT_m} + C, \quad (1)$$

Or it can be written as

$$\frac{d \ln \left(\frac{\beta}{T_m^2} \right)}{d \left(\frac{1}{T_m} \right)} = -\frac{E_a}{R} + C, \quad (2)$$

Where β is the heating rate, E_a is the activation energy of fusion and R is the gas constant (8.314J/mol K), T_m denotes the maximum melting endothermic peak, and C is a constant.

If the fusion mechanism remains constant with the heating rate (β), the plot of $\ln (\beta/T_m^2)$ vs. $1000/T_m$ gives a straight line and E_a is calculated from the slope of this line. Figure5 shows the Kissinger plot for the Pb-61.9Sn-2Zn alloy.

Table 1 lists the calculated activation energies for fusion. The calculated value of E_a decreased from 47.7 kJmol^{-1} for Pb-61.9wt%Sn alloy to 31.5 kJmol^{-1} for Pb-61.9 wt%Sn-2wt%Zn alloy. It is clear that a small amount of Zn-addition enhances the activation energies of fusion.

Figure 5:- Kissinger plot of Pb-61.9wt%Sn and Pb-61.9wt%Sn-2wt%Zn

Measuring the enthalpy and specific heat of fusion:-

The heat of fusion is calculated by integrating the area under the melting peak between the peaks start T_{onset} and end T_{end} temperatures. The heat of fusion, ΔC_p , can be determined by Eq. (3) for each material[24]:

$$\Delta C_p = \frac{KA}{m}, \quad (3)$$

Where K is a constant that depends on crucible shape and regards as a constant in the DAT system, m is the mass of the sample, and A is the area under the endothermic peak.

At the melting point, the heat supplied to system will be used supplying the enthalpy of fusion (latent heat of fusion) that is required to convert solid to liquid. Latent heat of fusion is the energy absorbed in a material during its phase change from solid to liquid. For a transformation from solid state to liquid state, enthalpy of fusion can be expressed as:

$$\Delta H \approx \Delta C_p T_m, \quad (4)$$

The enthalpy of fusion (ΔH) and the specific heat change (ΔC_p) were determined because of they are very important parameters for industrial applications. The values of T_{onset} , T_{end} , and ΔH for the two alloys are listed in Table 1. It is obvious that, the fusion heat of Pb-61.9wt%Sn-2wt%Zn is larger than that of the Pb-61.9wt%Sn alloy.

Summary and Conclusions:-

In this work, a detailed analysis of the effects of different heating rates and Zn addition on the melting temperature, heat of fusion, and the activation energy have been investigated. Both Zn addition and heating rates significantly affect the alloys behavior. DTA curves indicate that a small amount of Zn-addition enhances the transition temperature and also melting temperature decrease significantly.

The obtained data on the thermal properties measurements have shown an increase on T_{onset} , T_{end} and T_m values of the samples when the heating rates was increased. The maximum peak in Figure2 is shifted to the higher temperature with increasing heating rates.

In conclusion, this study demonstrated that the heating rate had a significant effect on the values obtained for alloy samples prepared, since the values of T_{onset} , T_{end} and T_m diminish as the heating rate increases. The results showed

that the addition of small amount Zn in Pb–Sn alloy leads to a decrease of thermal parameters (T_{onset} , T_{end} and T_m) and activation energy of fusion.

Abstract

Earth consists of unicellular and multicellular organisms. Unicellular organisms like bacterium and multi cellular organisms like flora and fauna. Since plant species cannot survive on their own from artificial disasters, it is the responsibility of human beings to protect plant species from such calamities. In order to meet that goal, it is necessary to classify the different plant species and prevent them from extinction. Even though there are huge numbers of databases existing for plant species, there are some species which are still unknown to humans. So it is essential to distinguish the different plant species and classify them into proper categories and protect them. Earlier, manual databases were there for getting this job done. But as technology progressed, automation has its effect in almost all the fields. Classification of plant species through automation is possible through methods like leaf recognition technique. Leaf recognition has its own advantages; apart from the classification plant species, it also helps in recognizing various diseases which can result in their extinction.

Much research works happened in the field of leaf recognition. Most of the researchers used extraction techniques involving spatial or frequency domain. Only few researchers used features extracted using both frequency and spatial domain. In this paper we are trying to come up with a reason for less researches being conducted in the field of leaf database in India.

Introduction:-

Earth is a huge planet consisting of number of known and unknown species. It is necessary to stand by each other and co-operate with each other and share the resources available in order to lead a happy and prosperous life. Unnecessarily interfering in each other's space may lead to extinction of particular species. [1]Moreover plant species has some special abilities which benefits both flora and fauna. The oxygen has to be circulated in cycles in order to balance the natural consumption. So the cycle is maintained from time to time for the purpose of balancing the life process. The temperature level of atmosphere is also balanced by plant species by the process of transpiration. Leaf recognition is very useful for biodiversity.

Classification is very important when it comes to taxonomy. As a result, such categories of species can be grouped or clustered to a particular location like a park or a dedicated garden. [2]Identification of plant species has many advantages including identification of medicinal plants used in Ayurveda as well as poisonous plants. This process is tedious because human senses are limited and hence identification becomes very difficult especially when there are

Corresponding Author:- Aby Joseph.

Address:- Dept. of Computer Science, Christ University, Bengaluru, India.

large number of species. So it is necessary to train the computer system using algorithms and develop a system in such a way that it can identify the species by capturing the images of different parts of the plants.

Leaf recognition technique works by identifying the patterns present on the leaf surface and based on the patterns the system can identify the species of the plants. The categorization of both medicinal and poisonous species of plants will help to conserve the medicinal species under extinction and keep away from poisonous plant species and thereby saving lives.

Leaf recognition is based on different characters present on the leaf surface. These characters will determine the category to which a particular plant species belong to. The leaf recognition technique has been followed by botanists to categorize particular plant species. Leaf recognition is limited to factors like climate and plant health because the external surface of the leaf can have change in color due to diseases or climate changes. This makes it even more difficult to proceed with the process.

The climate of a particular region is a key factor which determines the leaf characteristics. The plant has to adopt to different climatic conditions. Thus the plant structure has to be in tune with the particular region in which it is growing. In tropical regions there is high availability of rains and moist winds. Thus the barks and other parts will be thin and the leaves should be capable of enduring strong winds and heavy rains. Desert plants are thornier in nature because loss of water should be prevented. As compared to tropical and desert region of the world, databases on Indian leaf species and South Indian in particular are limited to very small numbers. So my intention is to bring this crisis under attention of the researchers. So that, in future more databases will be generated in South Indian regions. This will in turn help the future researchers to do more study on South Indian leaf classification. Unlike, developed countries, India has limited research facility and resources for students and researchers to work upon. As young researchers require more references, more databases should be made available for further studies. Thus more and more researchers will come forward to invest time and energy in this field of research.

Literature Review:-

There is lot of surveys conducted on leaf recognition from a very long time. Most of the works are concentrated on multiple features of same plant. As time progressed the size of the database started growing and the number of plant species known to mankind also increased considerably. As the number of surveys increases the size of plant database will also increase. The increase in information will result in increase of knowledge regarding plant species. Discovery of more medicinal herbs can cure day to day changing human conditions. Discovery of more poisonous plant species can save lives as human beings and animals can keep away from them. The gap between man and nature can be bridged and reduced day by day.

[3] As part of his contribution, has concentrated on fruit/leaf analysis. He used the technique of wavelet based analysis for classifying the obtained images. This classification helps in identifying the damage caused by pests on fruit/leaf without the involvement of human beings by manually inspecting the fruit/leaf. The method suggested by him has more than 90% accuracy. The method involves neural network for classifying the diseases or damages caused by pests. His method was successful using neural network up to a great extent. Since time consumption is also reduced due to limited human interference in the process.

[4] Proposed a method which is less complicated yet effective in terms of computation using leaf recognition. This method was dedicated for plants with flat leaves which were two dimensional in nature. The base point on the leaf and reference point were decided by the user and with reference to these base points the leaf shape is generated followed by a binary image. Set of features are collected by segmenting the leaves across major axis at the same time segmented across parallel minor axis. The next step is to normalize the feature points. These inputs are taken to neural network.

[5] Here twelve features are used for the purpose of classification. In order to have a faster processing the dimensions are reduced i.e., twelve dimensions are reduced into five dimensions. Probabilistic Neural Network (PNN) technique was used for the above mentioned purpose. Features including leaf area, psychological width, smooth processing, psychological length, perimeter ratio factor, aspect ratio, narrow factor, rectangularity, form factor, perimeter ratio diameter, perimeter ratio of psychological length and psychological width, vein features. Even though there are different sizes of leaves of same plant a standard size should be used, otherwise features of the leaf may vary.

[6] Developed a method for identifying 60 types of leaves. The identification was based on color patterns on the leaves. Even if the plant leaves have the same shape the color on the leaf surface will be different for the leaves. Gray-level co-occurrence matrix (GLCM) and geometric features, Zernike moments were used for the identification of the leaves feature. There were two approaches used for identification. The first being distance measure and the second being Probabilistic Neural Network (PNN).

[7] The proposed technique is based on hybrid image segmentation. A histogram is developed based on the obtained image segmentation. The result of the above operation contains PSNR (peak to signal ratio) and calculation of energy mean square. Based on these two parameters the quality of segmentation is obtained.

[8] Technique of feature extraction and shape analysis is used for leaf recognition. They are given as input for the neural network. The neural network is based on the algorithm with multilayer propagation architecture. The result is ranging between 90 and 94 in its feature category. The error range is between 0-0.7. As a conclusion it is very clear that the accuracy rate is about 94%.

[9] Used 12 features of morphology in which 5 principal variables where is used. In order to classify 32 types of plants by using 1800 leaves probabilistic neural network system was used. The input is obtained using scanners or digital cameras. The following step is to select the base points from the obtained leaves.

[10] Proposed leaf classification based on ontology. Vein recognition is extracted using combined neural network approach as well as thresholding. This will result in improved detailing of leaves. Here automation of the system is carried out by machine learning techniques. For better performance, modified Fourier descriptor and curvature scale space techniques are employed. In order to identify the basic shapes, CCD code system is proposed. Since plant leaf shape is considered to be 2D, an efficient method should be devised to obtain proper characterization of plant species.

[11] Came up with radial basis probabilistic neural network which uses orthogonal least square algorithm as well as optimized recursive square algorithm. The partially damaged leaves are identified using plant recognition. The plant recognition technique is optimized using Fourier descriptors. The final result reveals RBPNN is more efficient when compared to BP neural network and radial basis function neural network.

[12] Proposed a feature extraction technique using natural image. The method comes handy for research students. For obtaining information about leaves, a multidirectional Curvelet transform is employed. The orientation of leaves is not considered, which will enhance the rate of accuracy. SVM classifier uses the coefficients for the purpose of categorization of the obtained results.

[13] Introduced move median centers (MMC) hypersphere classifier for the leaf classification. During classification, pre-processing of data occurs. While doing so it was found that not only storage space is saved but also classification time is reduced. This method is more efficient when compared to contour features because it is very difficult to spot the curvature points.

[14] The approach by them utilized PCA based surface order and complex calculation for the shape highlight delivered a consequence of 89.2% in which the researcher focused on the parameters like angle proportion, conservativeness, linearity. The morphological component extraction strategy has been utilized numerous a times.

[15] Actualized a leaf acknowledgment framework utilizing leaf vein and shape. They proposed the calculation utilizing leaf shape extraction. Projection histogram was utilized to recognize the vein and after that the components were extricated. The exploratory result demonstrated an exactness of 97.19%.

Methodology:-

The remaining parts of plants like flowers are three dimensional in nature. So the process involved in image processing will be more complex as compared to two dimensional image processing. Since the leaf surface is flat it is a two dimensional structure. Image captured can be passed through two dimensional image processing algorithms. After image processing the resultant information characteristics are compared with e-botanists database and the traits will determine the leaf category. This will reduce the human effort by automating the entire process of leaf identification using dynamic programming techniques

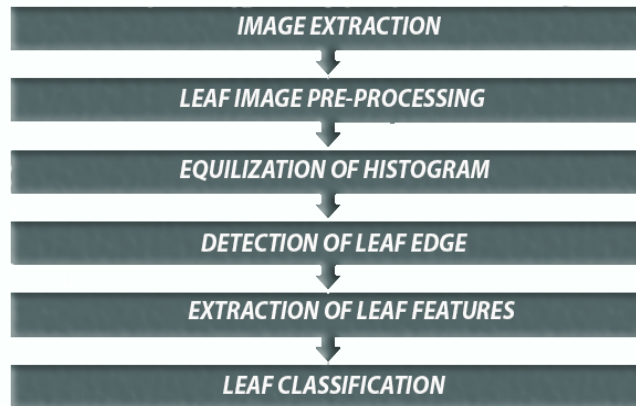

Figure 1:- Image based plant identification system

Image Processing:-

Leaf recognition process involves capturing of images. Image has to be captured using a 2D camera or a scanner. The equipment should be good enough to capture the external surface of the leaves crisp and clear. So that, veins or patterns on the leaves can be properly identified. High quality equipment is used for image capturing. Cameras capable of capturing high definition contents are used for this purpose. Once this process is over the captured image in digital format will be forwarded to the system for further processing. Here 2D cameras are used because the leaf surface is flat and at the same time the amount of details and algorithm complexity required for processing will be very less when compared to 3D image processing. Hence time complexity and space complexity can be reduced up to a great extent.

Image conversion involves the following steps:

- The captured image from the camera in RGB format.
- RGB format will be converted into Grayscale image.
- Grayscale image gets converted to Binary image.
- Next step is to smoothen the image.
- Final pre-processing step involves filtering of the obtained image after smoothening.

Figure 2:- Image pre-processing steps

The process of leaf recognition involves quite a few steps. The foremost step is to capture the leaf image, followed by two parallel processes. Leaf Contour extraction and Leaf Vein extraction. The following processes will determine contour-centroid distance and leaf direction determined using Projection histogram. The next process is distance sequence rearrange. There are subsequent processes for distance sequence rearrangement including FFT (it can be used for feature extraction), Feature extraction based on geometric and digital morphological features, and finally Feature extraction based on Convex Hull. Using FFT method, analysis is focusing more on frequency domain. Even though same plant can have different shapes for its leaves, the basic structure of the leaves will remain same. This makes the classification easier. After performing these complex techniques, the final result is obtained.

Conclusion:-

A number of methods were discussed in the above surveys. But very few works are available for the future researchers to work on and contribute to their research. As discussed earlier, databases for South Indian leaf species are few in numbers. So my work is to bring the attention of researchers all over the world towards the lack of availability of databases of the endangered leaf species of South India. So that they won't suffer extinction in the near future. There are wide varieties of medicinal herbs available in southern region of India which are facing extinction in the near future. So these species will also be preserved by the creation of South Indian leaf databases. With the creation of more precise methods of extraction of Indian based leaves more plant species can be protected.

Abstract

The aim of this study was to report the use of smartphone cameras for intraoral photography in oral medicine. The smart phone photographs were evaluated to determine if they would be useful for diagnosis and other applications in oral medicine. In the absence of a standard intraoral camera system, it was found that smart phones could be useful in capturing and transmitting digital intraoral images that could assist in dental education, tele dentistry and other aspects.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Due to the technological revolution, the use of smart phone cameras substitutes in the absence of an intra oral camera or DSLR camera set up.

Smart phones are high end mobile phones with advanced computing ability and connectivity. Current models combine many functions and can be accessed via the internet. Smart phones have been sporadically mentioned in literature. The mobility, communication functions, relative to supporting treatment at distant locations, a process known as telemedicine.

The primary purpose of this study was to evaluate the feasibility of dental students acquiring and transmitting intraoral images to the dental specialist using a smart phone technology.

Material & Methods:-

The study was conducted in the Department of Oral Medicine & Radiology of our esteemed institute.

A smart phone with the following specifications were used.

Primary	16 MP, f/2.2, 31mm, OIS, autofocus, LED flash, check quality
Features	1/2.6" sensor size, 1.12 μ m pixel size, geo-tagging, touch focus, face/smile detection, panorama, HDR
Video	2160p@30fps, 1080p@60fps, dual-video rec., check quality

Intraoral photographs with no extra oral imaging were acquired from 4 different patients with four different lesions. Informed consent was obtained and patient's basic information recorded on a proforma. The smartphones were used by the postgraduate students. The brand of the smartphone would be kept hidden and will not be compared to another brand. The students were asked to take photographs in different angles and numbers.

All intra-oral photographs were acquired with the smartphone cameras in a horizontal direction. Metal retractors and intraoral mirrors were used. No external light sources were used. The LED auto lighting of the camera flash was used.

Corresponding Author:- Dr. Lakshmi. C.

Address:- A study of Recent Advances in Technology.

None of the images were enhanced or edited prior to transfer onto the computer system and were viewed by photography experts.

**Results:-**

The assessment of the photographs were done by the oral medicine specialist and a photography expert. They agreed that , given the characteristics of the intra oral photographs produced by the smart phone, they could use those photographs to assist in diagnosis, treatment planning.

According to the speciality of Oral Medicine, when coupled with the signs and symptoms, smart phone photographs: Could lead to a rank ordered clinical differential diagnosis provided to the practitioner via text messaging or email, with treatment recommendation. This would be beneficial for solo practitioners in locations without access to servers. Could assist in biopsy material submission. Intra operative surgical photos may provide valuable information regarding consistency and form of the lesions.

Discussion:-

The photographs could be taken without a hindrance with the use of metal cheek retractors and intraoral mirror. Tongue retraction however was difficult. If the smart phone device was held steadily, there were very low incidence of blurring of images.

Using smart phone cameras for intraoral photography is not seen as an alternate to the need of using specialized intraoral photographic equipment. As in all, the minimum requirements for the smart phone images to be useful include –

Proper focus on the intended area.

Sufficient lighting.

Consistency of colour of images.

Surprisingly, very few problems or no problems were faced with light source as the LED light being close to the lens in the smart phones.

The smart phones are compact to handle and due to pre specified settings, photographs could be taken more quickly. Intraoral video recording also was done successfully.

Conclusion:-

This project demonstrates that intraoral photographs can be efficiently taken using smart phone cameras and the images relatively quickly transferred or shared among inter disciplinary professionals for quick viewing, patient education and to store inter visit records,

Abstract

The study of vermicomposting optimization of organic waste aimed to produce vermicompost from urban raw waste, and to select one of three kinds of worm which had significant effect in the production of vermicompost. The writers conducted a research during June to August 2012, by treating three varieties of worm named: G1 = *Lumbricus rubellus*; G2 = *Lumbricus terrestris*; G3 = *Eisenia foetida*, and used Fully Randomized Design (FRD) for each type of worms. The research variables were C/N ratio, C organic, N, P-2O₅, and K₂O. The writers analysed the vermicompost treatment results in the laboratory, followed by ANOVA. The researchers used gentong (barrel-shaped potteries) as a research tool; and obtained organic waste materials from the local landfill. The result showed that it was possible to produce organic fertilizer from urban waste materials with vermicomposting process using *Lumbricus rubellus*, *Lumbricus terrestris* and *Eisenia foetida*. Moreover, apparently, *Lumbricus rubellus* had the highest influence in the production of vermicompost.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Organic fertilizers are largely or entirely composed from organic materials which are derived from plants and animals that have been through a technical process. The fertilizers can be used to supply organic matter, and to improve the physical, chemical and biological soil [1]. Organic fertilizers can be made from waste, because it comprises of inorganic and organic materials. Organic waste consists of plant and animal materials which were taken from nature, or produced from agricultural activities, fisheries or other activities, these rubbish is easily described in the natural processes [2].

The use of waste as an organic fertilizer for direct application to soil generally experiences a variety of problems, for instance: (1) the waste contains inorganic material that is not biologically and easily weathered, such as: glass, plastic, metal, (2) trash has high level of C/N ratio, (3) the composition of organic waste varies too much, and sometimes there is a toxic compound [3]. Other problems are caused by sewage pollution of the environment by heavy metals and chemicals [4]. Toxic heavy metals such as As, Hg, Pb, and Cd can contaminate or damage the environment [5]. Heavy metals As, Cd, Pb, and Hg are very poisonous which can accumulate in crops such as rice, grass, vegetables, and other crops [6].

Vermitechnology is a system in which earthworms are utilized for the bio-conversion of organic waste into vermicompost. Vermicompost has wide applications in organic waste management and has been proven to be an efficient method to manage organic waste materials with diminutive complexity and economic feasibility [7]. Vermicompost is a process to convert organic waste into fertilizer [8]. Taking into account that the organic waste and compost application in agriculture has many positive effects [9], so that it is necessary to conduct research on organic fertilizer with vermicomposting method by utilizing worms performance to process raw materials from waste. Based on the above facts, therefore, the study of vermicomposting optimization of organic waste was conducted, which aims to (1) produce vermicompost from urban waste materials, (2) select one of the three types of worms that have the highest influence in the process of vermicomposting.

Waste:-

Waste is an invaluable material flawed or damaged goods in manufacturing or fabrication, or from excessive materials which are rejected or discarded. Waste is also from discarded materials from human activities and natural processes which do not have economic value. It is the leftover of human day-to-day activities and natural processes that is solid. Specific waste is a waste that needs a special treatment because of its nature, concentration, and volume. Organic waste is waste consisting of plant and animal materials which were taken naturally, or produced from agricultural activities, fisheries or other activities, this kind of waste is easily described in vermicomposting processes.

Vermicompost:-

Vermicompost is a method of waste disposal which is costly effective, fast and environmentally friendly [10]. Urban waste can be effectively degraded by earthworms in vermicompost process resulting in the production of pathogen-free fertilizer [11]. Organic waste can be more useful by converting them into fertilizer using vermicompost process. Although the nutrients contained in the fertilizer having no significant increase, the the ratio of C/N undergoes significant decrease making plants easily absorb the substance. Vermicompost plays an important role in protecting the environment because it uses waste as its raw materials, helps building soil fertility and improves soil health for sustainable agriculture [12].

Vermicomposting is in the same page with the principle of healthy environment because it has the value of resource conservation and sustainable practices, as a process for handling organic residue which is an alternative approach in waste management, which is not dumped or incinerated but recycled [13].

In the composting process, the C/N ratio is one of the important parameters that give an indication of the decomposition rate, and it is proven that vermicomposting decrease the ratio of C/N significantly [14].

Vermicompost can significantly improve the growth and yield of vegetables and fruits. The effect of vermicompost on plant is caused by the quality of the mineral provided. It is also to regulate the growth of other components such as plant growth hormones, and to improve soil quality by increasing microbial activity [15]. Giving efficient conversion of organic waste, stabilizing the soil conditions, helping in reducing the population of microbial pathogens and heavy metal toxicity, relatively easy and inexpensive economical technology, as well as its function as the most environmentally safe nutritional supplement for organic crop production is many advantages of using vermicompost [16].

Earthworms:-

Lumbricus has flattened body shape, and body segments around 90-195. Klitelum lies in the 27th-32th segment. *Lumbricus rubellus* has relatively small body size with a length of 8-14 cm; the body color, especially the back, is light beige to reddish purple. Most part of the belly is beige, and tail is yellowish; the shape of dorsal is rounded and vertically flat; the number of segment on the klitelum are around 6 - 7 segments; the male sex hole lies in the 13th segment; its movement is slow; and its body contains 70-78% of water [17]. Meanwhile, *Eisenia foetida* is 3 – 10 cm in body length, 0.4 – 0.6 g in body weight, 50 – 55 days of lifespan, cocoon production is 1 in every 3 days, cocoon incubation is 20 – 23 days [16].

Research Method:-

The study began in June to August 2012. The place of extraction of urban waste materials was in the landfill of Sekoto Village, Badas Sub-district, Kediri regency. The vermicomposting research process was conducted in Lirboyo Kediri, East Java, Indonesia.

The experiment was carried out using three types of worms G1 = *Lumbricus rubellus*; G2 = *Lumbricus terrestris*; G3 = *Eisenia foetida*, each worm was treated repeatedly for approximately three times using fully randomized design (CRD). The experimental variable is the content of: C/N ratio, C organic, N, P₂O₅, and K₂O, statistically analyzed by ANOVA. Laboratory analysis for C organic was measured using the Walkey-Black method, N using the method of Kjeldahl, P and K using calorimetric and photometric methods, C/N ratio was calculated from the measured values of C and N, the elements of As, Pb and Cd using AAS (Atomic Absorption Spectrophotometry), and Hg using Cold Atomic Absorption of Mercury Analyser.

Gentongs (barrel-shaped potteries) were used as the container during the experiment, and the experimental materials were organic wastes and three types of worms namely *Lumbricus rubellus* and *Eisenia foetida*, both worms were imported from wormbreeders in Bandung regency of West Java, while *Lumbricus terrestris* were taken from Kediri, East Java, Indonesia.

Research Implementation:-

The study began in June to August 2012. The place of extraction of urban waste materials was in the landfill of Sekoto Village, Badas Sub-district, Kediri regency. The vermicomposting research process was conducted in Lirboyo Kediri, East Java, Indonesia.

The research was started from the preparation of organic waste as the medium and worm food. Worm could not live in a pile of garbage in landfills, the waste needed to be sorted between organic and non-organic waste. Organic waste was composted using EM-4 and was left for 30 days, then it was used for the research materials. These materials were tested in the laboratory before being used; the result was used as a control in the statistical analysis. Vermikomposting has been proven to be better technology than the compost and more suitable for the management and recovery of nutrients from urban waste [18].

Nine barrel-shaped potteries were placed on the ground randomly. Sand was used to keep the moisture by watering them every day. Low temperature and bright light condition will disturb the earthworm; however, when the temperature is warm and humid, it will be favorable for the worm [19]. The barrel-shaped potteries were filled with organic waste, each as much as two pounds, then one kilogram of worms per barrel was put inside of them. Earthworms eat variety of organic wastes, the number of foods per day is equal to his weight [20]. One kilogram of earthworms can process one kilogram of waste per day, and produces 0.5 pounds of earthworms' waste [17].

In every three potteries, they were filled with the same type of worm. G1.1, G1.2, G1.3 = *Lumbricus rubellus*; G2.1, G2.2, G2.3 = *Lumbricus terrestris*; G3.1, G3.2, G3.3 = *Eisenia foetida*. Next, the barrels were closed using gauze so that the worms could not get out.

After two days, all the contents of the barrels were removed and separated between worms and vermicompost. It was estimated, that the organic waste would have been eaten by the earthworms in two days. Earthworms refuse to stay in their own excrement (vermicast) for a long time and die if there is no food available [19]. In the end, Vermicompost in each treatment was collected to be tested in the laboratory.

Result and Discussion:-

The vermicomposts were tested in the laboratory of soil science, Faculty of Agriculture, University of Brawijaya, Malang, Indonesia, to obtain the value of the variables. Further, they were statistically analysed using ANOVA, the result is as follows:

The analysis of the organic C content from the three types of worm treatment is presented in Table 1.

Table 1:- The Organic C content

Treatment	C organic %
Control	22,2 b
<i>Lumbricus rubellus</i>	6,01 a
<i>Lumbricus Terrestris</i>	5,84 a
<i>Eisenia foetida</i>	6,03 a
5% LSD	0,59

Description: The numbers followed by the same letter are not significantly different at 5% LSD.

The content of C-organic before worm treatments was 22.2%, after the worm treatments of *Lumbricus rubellus*, *Lumbricus terrestris* and *Eisenia foetida*, all organic C content decreased to 6.01%, 5.84% and 6.03%, significantly different from the previous treatment. The decomposition process is the release of carbon from complex into more simple bonds due to the use of C elements by the organism to get their life energy through respiration and biosynthetic processes, releasing CO₂ to organic material so that the organic materials that have undergone the decomposition process will have lower levels of C, compared to the C levels of raw materials [21].

The result of N content analysis from the three types of worm treatment is presented in Table 2.

Table 2:- Total N content

Treatment	N total %
Control	0,49 a
<i>Lumbricus rubellus</i>	0,63 b
<i>Lumbricus Terrestris</i>	0,69 b
<i>Eisenia foetida</i>	0,76 c
5% LSD	0,06

Description: The numbers followed by the same letter are not significantly different at 5% LSD.

The content of N-total before worm treatment was 0.49%, and after the worm treatment of *Lumbricus rubellus*, *Lumbricus terrestris* and *Eisenia foetida*, all content of N-total increased up to 0.63%, 0.69% and 0.76%, significantly different from the previous treatment. This is caused by the weathering process of mineralization of organic matter involving the performance of enzymes that hydrolyze the protein complex that will increase the nitrogen content in the vermicompost [22], on the other hand, there is a simultaneous addition of nitrogen by worms in the form of mucus and excretory material, this process occurs in a high intensity so that the content of nitrogen will increase [18].

The result of the C/N ratio content from the three types of worm treatment is presented in Table 3.

Table 3:- The C/N ratio content

Treatment	C/N %
Control	46,08 b
<i>Lumbricus rubellus</i>	9,54 a
<i>Lumbricus Terrestris</i>	8,46 a
<i>Eisenia foetida</i>	7,93 a
5% LSD	6,52

Description: The numbers followed by the same letter are not significantly different at 5% LSD.

The C/N ratio before worm treatment was 46.08, however, after the worm treatment of *Lumbricus rubellus*, *Lumbricus terrestris* and *Eisenia foetida*, the content of C/N ratio decrease up to 9.54, 8.46 and 7.93, all of them decreased significantly. The decline of C/N ratio was caused by the decreasing number of carbon as well as the increasing number of nitrogen.

The decomposition process is the release of carbon from complex into more simple bonds due to the use of C elements by the organism to get their life energy through respiration and biosynthetic processes, releasing CO₂ to organic material so that the organic materials that have undergone the decomposition process will have lower levels

of C, compared to the C levels of raw materials [21]. The decreasing amount of C/N ratio is also due to the increasing content as the result of mineralization, a process that changes the organic nitrogen into inorganic nitrogen through the weathering process which involves the work of enzymes that hydrolizes protein complexes, as well as the nitrogen that was produced from the worms' excrement [23].

P2O5 content analysis of the results of treatment of various worms are presented in Table 4.

Table 4:- The P2O5 content

Treatment	P2O5 %
Control	0,57 a
<i>Lumbricus rubellus</i>	0,97 d
<i>Lumbricus Terrestris</i>	0,78 c
<i>Eisenia foetida</i>	0,68 b
5% LSD	0,02

Description: The numbers followed by the same letter are not significantly different at 5% LSD.

The P2O5 content before worm treatment was 0.57%. Nevertheless, after the worm treatment of

Lumbricus rubellus, *Lumbricus terrestris* and *Eisenia foetida*, all contents of P2O5 increased up to 0.97%, 0.78% and 0.68%, significantly different from the treatment before. The total P value at the end of vermicomposting process will be higher than the initial value at the beginning of the process, this indicates that there is Phosphorus mineralization process [18]. In general, when the organic materials is passing through the worms' digestive organs, most of the phosphorus will be converted into the form of dissolved P by enzymes in the worm's digestive organs, namely acid phosphatase and alkaline phosphatase. Afterward, the P element will be released by microorganisms in the worm excrement [24].

K2O content analysis of the results of treatment of various worms are presented in Table 5.

Table 5:- The K2O content

Treatment	K2O %
Control	0,04 a
<i>Lumbricus rubellus</i>	0,07 b
<i>Lumbricus Terrestris</i>	0,10 c
<i>Eisenia foetida</i>	0,07 b
5% LSD	0,013

Description: The numbers followed by the same letter are not significantly different at 5% LSD. The content of K2O before worm treatment was 0.04%; however, after worm treatment of *Lumbricus rubellus*, *Lumbricus terrestris* and *Eisenia foetida*, all content of K2O raised up to 0.07%, 0.10% and 0.07%. It was significantly different compared to the initial treatment. Probably, this was caused by the fact that the remains of plants from organic waste was a source of potassium, and potassium is classified as mobile elements not only in the plant cell, but also in the plant tissue, as well as in the xylem and phloem. Potassium can also be found in the cytoplasm. The existing K element on the substrate is converted into a soluble form by the existing microorganisms in the gastrointestinal worms [18], which makes the element of potassium higher than the control which was treated without any worm treatment.

The content of heavy metal in organic waste before worm treatment, and the heavy metal content in the vermicompost, is descriptively presented in Table 6 as follows.

Table 6:- The Heavy metal content

Treatment	Pb	Hg	Cd	As
Organic wastes (pre-treatment)	21	0,7	5	22
EM-4 treatment	20	0,6	4	20
<i>Lumbricus rubellus</i>	tu	tu	tu	tu
<i>Lumbricus terrestris</i>	18	tu	tu	tu
<i>Eisenia foetida</i>	tu	tu	tu	tu

Description: tu = not measurable with AAS analytical methods and CA3M

The result from the laboratory said that the organic waste contained 21 ppm Pb, 0.7 ppm Hg, Cd 5 ppm and 22 ppm As. Next, the composting process using EM4 was done resulting in the decrease of Pb content to 20 ppm, Hg to 0.6

ppm, Cd to 4 ppm and As to 20 ppm. After the worm treatment with three types of worms, vermicompost contained no heavy metal such as Pb, Hg, Cd and As, but the vermicompost with the worm treatment of *Lumbricus terrestris* that contained Pb approximately 18 ppm. It is assumed that the process of vermicompost can reduce heavy metal toxicity [12] [16]. Worms can absorb high concentration heavy metals; the process is, worms absorb the heavy metal particles at first, and coat each particle with a specific protein which prevents these metals to interact with the inside of the body [25]. Worms can also absorb arsenic [26].

Next, regression test was conducted to test the effects of the worms in producing the vermicompost and to find out which one is the most influential worm in producing the vermicompost according to the standard of Minimum Technical Requirements of Organic Fertilizer by Permentan (The Regulation of Ministry of Agriculture) No. 28 / SR.130 / 5 / 2009. The regression analysis showed the value of F was 82.493 > F table 6.23. It could be concluded that the vermicompost from urban solid waste can be made using *Lumbricus rubellus*, *Lumbricus terrestris* and *Eisenia foetida* worm. Presumably, there was one of the most dominant worms to produce the vermicompost, it had been

proven using the regression analysis to select the highest value on the coefficient of partial determination or r^2 using SPSS 17.0 for Windows, and the results are presented in Table 7 below.

Table 7:- partial results coefficient of determination regression analysis.

Treatment	r	r^2
<i>Lumbricus rubellus</i>	0,954	0,910
<i>Lumbricus terrestris</i>	-0,887	not significantly
<i>Eisenia foetida</i>	-0,905	not significantly

The analysis showed that the effect of *Lumbricus rubellus* was 0.910 or 91%. This suggested that *Lumbricus rubellus* had contributed partially to the production of 91% vermicompost fertilizer. While the coefficients of partial determination for two other variables were negative, the negative values were less influential or not significantly meaningful so it could be ignored. From the results of this analysis, it could be concluded that the *Lumbricus rubellus* was a worm that had the highest influence in the production process of vermicompost. According to [27], *Lumbricus rubellus* is a major waste eater and it is also considered as the biodegrader earthworm species, they are used throughout the world for waste degradation and being the most important and successful thing in the ecology management of urban organic waste.

Conclusion:-

1). It is possible that urban waste could be made into vermicompost using the three types of worm (*Lumbricus rubellus*, *Lumbricus terrestris* and *Eisenia foetida*.) However, this vermicompost must still be in accordance with the standard of Minimum Technical Requirements of Organic Fertilizer by Permentan (The Regulation of Ministry of Agriculture) No.28/Permentan/SR.130/5/2009.

2). From the study, among the three worms, *Lumbricus rubellus* showed the most significant influence in producing many important contents in the process of vermicomposting.

Abstract

Nutritional anaemia affects all the age groups and sex in developing countries like India. Iron deficiency is the most common micronutrient deficiency in the world affecting more than 2 billion people. In the present study, 50 patients were selected who were subjected to routine hemogram and were diagnosed anaemic. 2 ml of venous blood was drawn and analysed using autoanalyser method and were interpreted according to the WHO criteria. The study showed that 13 % of the patients were mildly anaemic, 34% were moderately anaemic and 03% were severely anaemic. Various factors like social, economic status, age, sex, social class, dietary habits are some of the major etiological factors for nutritional anaemia.

Copy Right, IJAR, 2017,. All rights reserved.

Aims & Objectives:-

Aim:-

To study the prevalence of nutritional anaemia among the patients.

Objectives:-

Measuring the incidence of anaemia among the selected patients using hemoglobin percentage as cut off value provided by WHO.

To find out correlation between dietary habits and prevalence of anaemia.

Introduction:-

Nutritional anaemia is a worldwide problem with the highest prevalence in the developing countries. It frequently occurs due to inadequate iron intake, chronic blood loss or disease, malabsorption or a combination of these factors. Nutritional anaemia is prevalent all over the world with an estimated 2 billion people being iron deficient and is one of the most common nutritional disorders in the developing world. With an average prevalence of 40% among the general population that it affects nearly two third of pregnant and one half of non pregnant women which is three to four times higher than that in the developed countries, where prevalence of anaemia is between 4-12% among women of child bearing age (WHO/UNICEF 2001). Iron deficiency can arise either due to inadequate intake or poor bioavailability of dietary iron or due to excessive losses of iron from the body. Although most habitual diets contain adequate amounts of iron only a small amount (less than 5 %) is absorbed. This poor bioavailability is considered to be a major reason for the widespread iron deficiency. Women lose a considerable amount of iron especially during menstruation. Most commonly, people with anaemia report feelings of weakness, fatigue, general malaise and sometimes poor concentration and dysnoea on exertion.

In India, recent data from the District Nutrition Project (ICMR) in 16 districts and 11 states on prevalence of anaemia in non-pregnant adolescent girls (11-18 years) showed rates as high as 90.1% with severe anaemia ($Hb \leq 7 \text{ gm/dl}$) in 7.1% (Teoteja G.S, Singh P, 2002).

By far, the most frequent cause of nutritional anaemia is iron deficiency and less frequently folate or Vitamin B12 deficiency.

Materials & Methods:-

A cross sectional study was done among patients reporting to the institute. The age group of the patients were from 18- 65 years.

A total of 50 patients were taken. Study procedure was explained to the patient and a written informed consent was taken. All the patients' demographic details, habit history, dietary patterns etc., were collected in a structured questionnaire. A detailed clinical history taken from them for any present symptom regarding anaemia and physical examination was done to look for anaemic signs and symptoms and the same was noted in the proforma. The data and privacy of the patients were protected. 2 ml venous blood was obtained and the blood hemoglobin was estimated using the autoanalyser method and interpreted as per WHO criteria. Anaemia is established if the hemoglobin is below the cut off points as recommended by WHO.

INDICATOR	HB (gm/dl)
Non - anaemic	≥ 13 (males); ≥ 12 (females).
Grade 1 (mild) anaemia	10.0 -11.9
Grade 2 (moderate) anaemia	7.0-9.9
Grade 3 (severe) anaemia	≤ 7

Results:-

In the present study anaemia was observed in all the patients.

Figure 1:- Sex wise distribution of anaemia among patients.

MALES	FEMALES	TOTAL
03(6%)	47(94%)	50(100%)

Figure 2:- Sex wise grading of severity of anaemia (WHO Criteria).

GRADING	MALES	FEMALES	TOTAL
MILD	1(1%)	12(12%)	13%
MODERATE	2(2%)	34(34%)	34%
SEVERE	0(0%)	03(3%)	03%

Figure 3: Dietary Pattern Of Patients :

VEGETARIAN DIET	30 (60%)
MIXED DIET	20 (40%)

Discussion:-

Nutritional anaemia is a major health threat to the developing countries. Interventions like iron and folic acid supplementation and other strategies such as diet modification, infection control, nutrition education must be undertaken.

Iron deficiency can be caused due to either inadequate intake, poor bioavailability of dietary iron or due to excessive loss of iron from the body.

Nutritional anaemia especially iron deficiency anaemia is more prevalent among women in the adolescent and reproductive age group due to menstrual blood loss, poor diet, bleeding during parturition etc., Patients must be monitored periodically, iron supplements and diet counseling should be given. In this study there is no significant correlation between the diet pattern of the patient and anaemia.

Conclusion:-

Nutritional anaemia especially iron deficiency anaemia is more prevalent among females especially adolescent girls due to causes like menstrual blood loss, poor diet and under nutrition as compared to males. Nutritional anaemia is easily preventable as well as treatable and the available measures are relatively affordable. Iron supplementation is required for this group of patients. Periodical screening, health check ups and routine hemograms must be performed. The patients should be motivated and educated about the importance of a balanced diet, nutritional supplements. If anaemia is severe, high doses of iron or blood transfusion may be necessary.

Further studies with large sample size are required to estimate the exact prevalence of nutritional anaemia in the target population so that appropriate preventive and treatment measures can be initiated.

Abstract

Objective: The aim of this study was to delineate the different characteristics of stroke in children and their outcome.

Method: Clinically diagnosed stroke in children patients underwent general, full neurological examination and radiological investigation with evaluation of severity by pediatric National institute of health scale of stroke (NIHSS) and outcome disability by using Modified Rankin Scale for children (mRS).

Results: The study was conducted on 60 patients with mean age \pm standard deviation was (5.98 ± 5.65) , median age 3.5 (1-18), 32 (53.3%) of them were male and 28 (46.7%) were female. Most of patients (83.3%) arrived to hospital after 12 hours from the stroke onset. Etiologically, 12 (20%) patients had congenital heart disease, 8 (13.3%) had hemorrhagic diseases, while 23 (38.3%) were cryptogenic. Ischemic stroke represent 83.3% of all patients. MRI brain imaging had better evaluation in patients with hemorrhagic stroke (2 of 6 patients (33.3%) revealed underlying pathology) rather than ischemic ones (only 2 of 44 ischemic stroke patients (4.5%) showed hemorrhagic transformation in one case and vascular anomaly in the other). Twenty (33.3%) patients had mild severity using pediatric NIHSS on admission, 35 (58.3%) were mild to moderate, 3 (5.0%) were severe and 2 (3.3%) were very severe. mRS for children after three months revealed 3 patients (5.0%) with complete recovery, 14 (23.3%) had no significant disabilities despite symptoms in clinical examination, 18 (30.0%) had slight disability, 10 (16.7%) with moderate disability, 2 (3.3%) had moderately severe disability while 13 (21.7%) patients died. There was significant weak positive correlation between severity of stroke at the onset and disability outcome three months later.

Conclusion: Etiological factors in childhood are quite different from those present in adulthood. Despite a careful investigation, some causes of stroke in children remain unidentified. MRI brain imaging is modality of choice in patients with hemorrhagic stroke.

Introduction:-

The word stroke is used to refer to a rapidly developing focal or global neurological deficit lasting more than 24 hours if it has a vascular basis. The term "children" is between one month and 18 years of age (1), (2). In adults,

aetiology and outcome of stroke is well known, but it is quite few information about children especially in Egypt. The studies of stroke in children are few with variable results and under estimation of hemorrhagic stroke (3). The aim of this study was to delineate the different characteristics of stroke in children and their outcome.

Material and Methods:-

An informed consent was taken from at least one of each child parents. This study was conducted on sixty clinically diagnosed strokes in children patients obtained from Mansoura University Hospitals and other governmental hospitals in Mansoura from July 2011 till April 2016. With the following *Inclusion criteria*: stroke in children between one and 18 years of age, both hemorrhagic and ischemic strokes in children and both parenchymatous and non parenchymatous stroke in children. *Exclusion criteria*: includes stroke in the first year of life, in hospital stroke in children and hemorrhagic brain tumors in children. All patients were subjected to the following: Detailed history, including previous medical diseases and hospital delay duration in hours (<6 hours, 6-12 hours, 12-24 hours, 24-48 hours and >48 hours) according to Charlotte Martin et al. (4). General examination: with the following clinical items that should be considered in the diagnosis of stroke in children: Body mass index, measurement of head circumference, the skin should be examined for rash, signs of trauma, splinter haemorrhage or embolic skin rash and detailed cardiovascular examination including blood pressure. Neurological examination: Pediatric (NIHSS) at three points (on admission, on discharge and three months later) (5), fundoscopic examination for papilloedema or hemorrhage and (mRS) for children at three points (on admission, on discharge and three months later) (6). Laboratory investigations and radiological examination: Chest x-ray, electrocardiogram, echocardiogram, brain computed tomography, brain magnetic resonance imaging. The study was approved by the institutional board review of Mansoura University, faculty of medicine.

Statistical Analysis Of The Data:-

Data were fed to the computer and analyzed using IBM SPSS software package version 20.0. Qualitative data were described using number and percent. Quantitative data were described using (minimum and maximum), mean, standard deviation and median. Significance of the obtained results was judged at the 5% level. The used tests were Monte Carlo correction for categorical variables, to compare between different groups Correction for chi-square when more than 20% of the cells have expected count less than 5.

Results:-

The study was conducted between 2011 and 2016 on 60 patients with (mean age \pm standard deviation) (5.98 ± 5.65), median age 3.5 (1-18), 32 (53.3%) of them were male and 28 (46.7%) were female (Table.1). As regard distribution of studied patients according to their presenting complaints, lateralization was the most common presentation (in 44 (73.3%) patients), disturbed conscious level was found in 24 (40%) patients, convulsions in 21 (35%) patients, headache and/or vomiting in only 10 (16.7%) patients (Table.1). According to the hospital delay duration of studied patients, most of patients (56.7%) arrived to hospital within 12-48 hours, 16 (26.7%) patients were arrived after 48 hours while only 10 (16.7%) patients were arrived before 12 hours (Table.2). Twenty (33.3%) patients were mild severity using pediatric NIHSS on admission, 35 (58.3%) were mild to moderate, 3 (5.0%) were severe and 2 (3.3%) were very severe (Table.3). Cardiac evaluation of our cases revealed 12 (20%) patients with cardioembolic stroke (Table.4). Three cases had transposition of great arteries one of them associated also with patent ductus arteriosus (PDA) and atrial septal defect (ASD). Ventricular septal defect (VSD) proved in 2 patients. Infective endocarditis with VSD was seen in 2 cases. There was one case for each of the following: PDA, restrictive cardiomyopathy, mitral prolapse with mitral regurge, atrial myxoma with left atrial septal thrombosis and complex congenital heart disease (secondary to Down syndrome). Forty four (73.3%) patients were discovered ischemic stroke in CT brain imaging, however by MRI brain imaging, only 2 of them showed hemorrhagic transformation in one case and arteriovenous malformations (AVM) in the other, while 10 (6.7%) patients showed intracerebral hemorrhage (ICH) by CT brain imaging, 4 (6.7%) of them died before doing MRI brain imaging and 2 of the remaining 6 patients (33.3%) showed underlying pathology by MRI brain imaging (AVM and venous angioma) (Table.4).

The rest of the patients in our study were cryptogenic (38.3%), with 2 cases had AVM, 2 had moyamoya disease and one had venous angioma (Table.5).

Most of our cases (58.3%) showed no to mild disability after three months using mRS for children; three patients (5.0%) were completely recovered, 14 (23.3%) had no significant disabilities despite symptoms in clinical examination and 18 (30.0%) had slight disability. Moderate to severe disability was proved in (20%) of our patients;

10 (16.7%) patients showed moderate disability and 2 (3.3%) had moderate severe disability. The rest of patients (21.7%) died (mRS score 6) (Table.3). There was significant weak positive correlation between severity of stroke at the onset and disability outcome three months later (Table.3).

Table.1:- Age, gender and complaint

Age: Mean \pm Standard deviation	5.98 \pm 5.65
Gender: Number %

Etiology	Studied patients n=60	
	N	%
1. Cryptogenic	23	38.3%
2. Vasculitis	4	6.7%
3. Congenital Heart Disease, Rheumatic Heart Disease	12	20.0%
4. Mitochondrial cytopathy*	2	3.3%
5. Hemorrhagic diseases	8	13.3%
6. Sinus thrombosis	4	6.7%
7. Diabetes Mellitus	2	3.3%
8. Vascular anomaly	5	8.3%

*One case proved by biopsy and other proved by high lactate level with stroke, myopathy and diabetes Mellitus

Discussion:-

Estimates of the incidence of stroke in the general population of children vary widely, ranging from 2.5 to 13 cases per 100,000 children per year (7). It frequently has the sequelae of cognitive and motor impairment, as well as epilepsy (8), (9). In adults the frequency of cerebral stroke is more in males than females and this has been attributed to neuroprotective effects of estrogen in females (10). Our study revealed that the frequency of stroke in children is also more common in males than females (53.3% versus 46.7%). The same trend has been clarified in other worldwide childhood stroke studies (10), in spite of absence of estrogen predominance before puberty (11). Severity of stroke in most of our children (91.7%) measured by pediatric NIHSS was mild and mild to moderate with lateralization as the most common presenting complaint in (73.3%) of patients. In a study by Del Balzo about stroke in children: inherited and acquired factors and age-related variations in the presentation of 48 pediatric patients, lateralization was the most common presenting stroke manifestation (12). Signs of lateralization were early picked only by neurologist and this might explain the hospital delay of stroke in children as showed by Zacharias et al., (13). On the other hand disturbed conscious level proved in 24 (40%) patients and convulsions in 21 (35%) patients. These were agreed with Brian Chung et al., (14). Coma and convulsions were the higher warning signs for stroke in children diagnosis and helps to early hospitalization and rapid management (15). Hospital delay duration in our study was mostly (83.3%) after 12 hours. However in multiple researches most of patients about (35%) arrived early before 6 hours of the disease onset (16), (17). The reasons for delay of our studied cases were diverse but typically included underestimation of the disease severity by the parents or healthcare providers of first or second referral, especially less than 40% of our patients presented with the higher warning signs; coma and/or convulsions. These reasons were matched with results from similar societies in India and Taiwan (18), (19), which raise the attention to increase the public awareness of early stroke symptoms and signs. Heart disease and stroke statistics-2016 update

revealed that there is no major difference between ischemic strokes percentage in adults compared to children (about 85% of all strokes) (20). In our study, most of patients had ischemic insults (83.3%). MRI brain imaging is superior than CT brain imaging in diagnosis of hemorrhagic stroke secondary to vascular malformations (21). The use of MRI brain in our hemorrhagic stroke patients showed that 2 of 6 patients (33.3%) revealed underlying pathology while only 2 of 44 ischemic stroke patients (4.5%) showed hemorrhagic transformation in one case and vascular anomaly in the other. This highlights the importance of MRI brain in patients with hemorrhagic stroke. In adults, ischemic stroke is often associated with the atherosclerosis while major etiology in hemorrhagic stroke is hypertension (22), (23), but in childhood, ischemic stroke has various causes, such as blood diseases, sickle cell anemia and heart diseases while hemorrhagic stroke main etiology is coagulopathy (3), (24). Seven different causes of stroke in our series had been found. Cardiac diseases and hemorrhagic blood diseases were common in the studied patients. Congenital heart disease is one of the leading causes of stroke in children, accounting for 15-30% (25). Cardiac evaluation of our cases was not different from them, revealed 12 (20.0%) patients with cardioembolic stroke. Our study also showed 8 (13.3%) cases with hemorrhagic blood diseases. Another recognizable cause of stroke in children worldwide is sickle cell disease (SCD) (26), (27). Our study revealed no proved SCD cases using hemoglobin electrophoresis in anemic patients. This could be explained by genetic and racial differences as it is not frequent in Egypt along the Nile Valley (28), and HbS gene is almost nonexistent except in the Oases where the carrier rate varies from 9 to 22% (29). In pediatric stroke the cause is often unidentified. The clinical presentation is often subtle and early radiological investigation may reveal normal findings (30). While most of our patients were secondary to various causes, 38% were cryptogenic. In a systemic review in stroke in children: Lindsey Barst Gumer et al., the cryptogenic etiology were only 14% with no recognizable risk factors (23). The mismatching of our study could be explained by short follow up time in our research, because some etiologies needs longer period to diagnose like mitochondrial cytopathies and other metabolic inherited disorders (31). Also fund limitation restricted investigations needed to detect other rare causes incriminated in the pathogenesis of stroke in children. Assessment of the stroke survivors after three months in our case study showed significant improvement in severity and disability. This could be explained by the high neuroplasticity and regeneration in children brain cells (32), (33), (34). In conclusion, diagnosis of stroke in children proves challenging, because symptoms are often unspecific in nature which reflected on hospital delay time, etiology is diverse and different from those present in adulthood. MRI brain imaging proved more efficacious in patients with hemorrhagic stroke rather than ischemic ones. Our limitations were the unawareness of the disease and short follow up time. Our study was unfunded to clarify the various and rare genetic causes seen in stroke in children and highlight the need of specialized stroke management teams at pediatric hospitals, with rapid transport, specific neuroimaging protocols, early therapeutic strategies that have improved outcomes.

Abstract

Objective: To determine the prevalence and associated risk factors for musculoskeletal pain among medical students in Saudi Arabia.

Method: A cross-sectional analysis for one Saudi medical school in 2015-2016 academic year. The main outcomes were measured by The Nordic Musculoskeletal Questionnaire (NMQ) which was used to screen for pain in different anatomic joints during the past week and past year. Another questionnaire was developed to assess for contributing factors for the pain.

Result: 849 medical students were analyzed with a response rate (73.31 %). There were 57.85% of the students suffering of musculoskeletal pain in the past week, and 43.47% in past year. There is a higher prevalence among female medical students with p value <0.01. Previous trauma, family history of trauma, high computer hours use, being in clinical years, and high BMI were the main factors contributing to MSP in this study.

Conclusion: The study demonstrates a very high prevalence of musculoskeletal pain medical students which may affect the lifestyle and academic performance in medical schools.

Background:-

Musculoskeletal pain (MSP) which includes commonly low back pain, shoulders pain and neck pain is a common health problem that affect both male and female. World-wide estimates of lifetime prevalence of low back pain (LBP) vary from 50 to 84 % and 20-30% at any given time [1]. Musculoskeletal pain affects people's mood leading to depression, anxiety, irritability, poor social interactions, and lower overall health status, and that can limit the individual productivity, induces stress and it is socially costing in terms of health care. Although the Musculoskeletal pain represented as a common occupational problem it may affects younger population like school and university students who have not yet entered their working life. Moreover, previous studies have demonstrated a higher prevalence of MSP among medical and dental students compared to other university students. Several studies investigated the prevalence and factors associated with MSP among medical students. However, there are no previous studies have been conducted among medical students in Saudi Arabia. The authors aim in this study to measure the prevalence of this health problem among medical students in Umm Al-Qura University, College of Medicine (UQU Med) in Saudi Arabia, compare it with other investigated risk factors in literatures, and look for other possible factors that may contribute to MSP.

Method:-**Data Collection:-**

An observational quantitative cross-sectional study was conducted among medical students at UQUMed. A self-administered questionnaire was personally distributed to 520 medical students in each year. Questionnaires were distributed and collected over the second semester of the academic year 2016. The questionnaire included participants' demographic information (gender, academic year, height, and weight), social life characteristics (including time spent studying, using computer, watching television, exercise, coffee drinking, and smoking), co-existing medical illnesses, history of trauma, family history of MSP. The participants also were invited to Nordic questionnaire of musculoskeletal pain considering lower back, shoulders, hand, neck, knee, upper back elbow, hip and feet. In total, 849 out of 1160 medical students participated in the study (response rate: 73.31 %).

Data analysis:-

Data were obtained from the questionnaire forms and then entered into an SPSS spreadsheet (SPSS 21). Percentages, mean and standard deviation (SD) were used as descriptive statistics. Chi-square test was used to observe the association between the categorical and outcome variables. A p value of <0.05 was considered as statistically significant.

Result:-

Out of 1160 medical students at UQU, 849 medical students responded and returned the filled-up questionnaire forms with a response rate of 73.31%. Of these participants, 489 (57.6%) were female. The mean height and weight for this study were 163.63 cm (SD 11.63) and 64.74 kg (SD 16.68) respectively. History of previous trauma was positive in 28.64% of the participants and 35.93% had a positive family history of MSK pain. The majority spend between two to three hours in each of studying, using computer, and watching television every day. Table 1 shows the distribution of demographic and lifestyle variables of participants.

More than half of the respondents (n=596, 58%) were students in clinical years. The self-reported Nordic musculoskeletal pain level demonstrated prevalent of pain of low back among 291 (50.1%) medical students, followed by upper back pain in 249 (43%), and neck pain in 242 (40.8%) medical students Table 2. In the past year, the prevalence of MSK pain was significantly higher among the clinical year students compared to preclinical years (P .001). However, there is no statistically significant difference in MSK pain in past week among clinical and preclinical year students.

The gender of medical students is statistically significantly associated with history of MSK pain in past week and past year. Female medical students have higher MSK pain history than male medical students (P<.01). Moreover, those with history of prior trauma to neck, shoulder, or back has higher reported MSK pain than students with no prior history of trauma (P<.01). The medical students, who were studying in low tables, were suffering with MSK pain in the past week and past year, which is statistically significant Table3.

Discussion:-

The study displayed a high prevalence of MSK pain in different anatomic regions among medical students at Umm Al-Qura University. Similar to previously published researches, women population has a higher prevalence of MSK pain compared to men [1-3]. The most prevalent painful sites were lower back, upper back, and neck respectively. Similar to previous studies, lower back pain (LBP) was the most prevalent site where almost half of the students complained of lower back pain in the past week.

A cross-sectional study in an Indian medical college revealed a LBP prevalence of 48% in medical students which is very close to the 43% rate reported for medical students of the University of Colorado in the U.S. and a 53% rate reported for medical students at Paracelsus Medical University in Austria. Similar to previous studies, lower back pain (LBP) was the most prevalent site where almost half of the students complained of lower back pain in the past week [5].

Several studies show that there are other different factors which can affect the musculoskeletal pain among medical and dental students like age, gender, smoking, alcohol consumption, average weight and height and body mass index (BMI) [6]. A retrospective analysis of MSP among Chinese medical students shows more female than male in the MSP reporting group (55% vs. 45%). Similarly, this study show a higher significant prevalence of MSP among

female medical students compared with male medical students with p value >0.01 . There were 33.7% male medical students suffering from MSP in the past week compared to 66.3% female medical students in the past week. Also, MSP among the female group in the past year was higher with a p value >0.01 .

Previous history of trauma was significantly associated with a higher reports of MSP in the past week and year with P value 0.001, and >0.001 respectively. The MSP is also reported significantly with those with family history of MSP. This proves the multifactorial cofactors that may contribute to MSP which includes both acquired and inherited factors [1].

High Body Mass Index (BMI) was found to be a major factor of MSP. The risk of MSP is about two folds higher when BMI >24 [7]. Also, higher BMI is associated with a higher incidence of osteoarthritis which may affect and limit mobility in the future. In this study, higher BMI was also associated with a higher prevalence of MSP among medical students.

Limitation:-

This study is limited by the fact that it represents only one medical school in Saudi Arabia among 28 medical schools. Also, the ergonomic factors in medical school were not measured to look for possible other factors contributing to MSP. For these reasons, the results cannot be generalized to all medical schools in Saudi Arabia.

Table 1:- The distribution of demographic and lifestyle variables of participants

	Male n=360 (42.4%)	Female n=489 (57.6%)
Academic Year		
• Second	62 (17.2%)	111 (22.7%)
• Third	64 (17.8%)	16 (3.3%)
• Forth	91 (25.3%)	183 (37.4%)
• Fifth	54 (15.0%)	66 (13.5%)
• Sixth	89 (24.7%)	113 (23.1%)
History of trauma in the neck, shoulder, back, lower or upper limb		
• Yes	84 (23.3%)	105 (21.5%)
• No	276 (76.7%)	384 (78.5%)
Family history of MSP		
• Yes	116 (32.2%)	188 (38.4%)
• No	301 (61.6%)	545 (64.2%)
Exercise		
• Regularly	85 (35.6%)	87 (37.5%)
• Not regular	141 (59%)	141 (60.8%)
• No at all	13 (5.4%)	4 (1.7%)
Smoking		
• Yes	87 (24.2%)	69 (14.1%)
• No	273 (75.8%)	420 (85.9%)
Height	171.81 cm (9.02)	157.60 cm (9.44)
Weight	75.29 Kg (17.36)	56.97 Kg (10.92)
Hours of computer use/day	3.5hr (SD 2.4)	3.6hr (2.4hr)
Hours of study /day	3.05hr (2.03)	3.4hr (2.1hr)
Hours of TV watching/day	2.01hr (1.42)	2.3hr(1.98hr)

Conclusion:-

The study demonstrates a very high prevalence of musculoskeletal pain medical students which may affect the lifestyle and academic performance in medical schools. More interventions are needed to alleviate MSK pain among medical students and further improve the study environment. Exercises, appropriate study environment, and weight reduction can optimize the academic performance and wellbeing of medical students.

Abstract

Japanese Encephalitis Virus (JEV), is a mosquito-borne pathogen, which causes Japanese Encephalitis (JE); a neurotropic disease with high mortality and can be accounted to be the main player in the increasing global trend of viral encephalitis with prime concern on general public health. JE was initially documented in the East Indian state of West Bengal in the year 1973. From that point forward it is being reported every year consistently from various regions of the state, although the vaccination programme has already being procured. In this way, it shows that there may be either an incomplete coverage of the vaccination approach or the gradual rise of transformed new strains of JEV. Considering this reality, to comprehend the frequency of JEV dissemination and its endemicity in the region, we apprehended a pilot scale epidemiological study on an aggregate of 159 positive patient samples gathered from the 533 clinically presumed patients with Acute Encephalitis Syndrome (AES), admitted in the different district health centres and hospitals of West Bengal, India, 2015-2016.

Introduction:-

Japanese Encephalitis (JE) is a well-known mosquito borne viral disease. Currently it is one of the most dreaded and intriguing viral infections concerning the Indian health scenario. It is one of the leading varieties of viral encephalitis globally, mostly prevalent in south-eastern Asia, covering an area with a few billion population (1). Most JE infections are asymptomatic in nature, but if clinical symptom builds up rapidly it naturally effects with significant mortality and morbidity. Though not officially well documented but it can be estimated that, JEV causes approximately 50,000- 55,000 cases and 12,000-15, 000 deaths annually. Japanese Encephalitis is a disease with severe epidemic potential and high fatality rate and hence monitoring its prevalence status is considered to very important especially in countries like India. JEV mainly affects young adults and children areas with high endemicity. Japanese Encephalitis Virus (JEV) is a member of the Flaviviridae family and Flavivirus genus (2). The JEV virion is made up of three structural proteins - nucleocapsid, glycosylated envelope protein and non-glycosylated membrane protein as well as seven non-structural (NS) proteins. JEV exists as a zoonotic pathogen with mosquitoes and pigs as hosts (3). This deadly virus is accounted for severe neurotrophic disease with fever, acute flaccid paralysis, aseptic meningitis and meningo-myeloencephalitis in humans (4, 5). This virus has spread worldwide at an alarming rate and currently it has established itself as a major health concern in India.

Approximately 30% of the infected patients die and about 50% of the surviving individuals suffer from severe neuropsychiatric sequelae (6, 7). In West Bengal, the first major outbreak of JEV infection took place in 1973 in the districts of Burdwan and Bankura where more than 700 cases and 300 deaths have been reported (8). Since then many outbreaks have been reported; every year sporadic cases are continuously being reported from different districts of West Bengal (9,10). This article presents a comprehensive analytical profile of JE cases from 2015-2016 and intends to specifically establish the current status of JEV endemicity in West Bengal.

Materials and methods:-

Sample collection:-

Different district hospitals, medical colleges and ID & BG Hospital in Kolkata, West Bengal, were selected for this study from 2015–2016. Patients admitted with AES, having high grade fever ($\geq 39^{\circ}\text{C}$) for 2–15 days with any two of the following symptoms: headache, vomiting, unconsciousness, convulsions, abnormal movements, stupor, delirium, altered sensorium, neck rigidity, presence of Kernig's sign, aphasia, drowsiness and rigor, were considered for this study. Details of the clinical event, investigations, treatment given and the prognosis of the patients during hospitalization were provided by the concerned clinicians. A short case history along with the results of CSF study of each case was recorded. Most of the patients had moderately high sugar levels (45–65 mg/dL), slightly higher protein levels, varying from 50–70 mg/dL, and a white blood cell (WBC) count of $\geq 6 \times 10^6/\text{L}$. Cerebral malaria and bacteriological etiology were ruled out by the hospitals concerned. Informed consent was obtained before the collection of samples. A total of 533 blood samples were collected from the clinically suspected AES cases in sterile gel-line vacutainers (Becton Dickinson, Franklin Lakes, NJ, USA) and also in sterile test tube (Gujarat Borosil Ltd., Bharuch, Gujarat, India) by vein and transported on dry ice to the Indian Council of Medical Research (ICMR) Virus Unit, Kolkata, where the serum was separated and both the serum and CSF were stored at -80°C till tested.

Cell and virus strain culture:-

JEV P20778 strain (GenBank Accession No. **AF080251**) was obtained from the National Institute of Virology (NIV), Pune, and was used as a positive control throughout the study. The virus was reconstituted and inoculated on *Aedes albopictus* C6/36 mosquito cell lines obtained from National Centre for Cell Science (NCCS), Pune in minimal essential medium (MEM; GIBCO BRL-Invitrogen, Grand Island, NY, USA) supplemented with 10% fetal bovine serum (FBS; GIBCO BRL-Invitrogen) and penicillin streptomycin antibiotics (PenStrep; GIBCO BRL-Invitrogen) in 75 cm² tissue culture flask (Nunc, Roskilde, Denmark). The flask was incubated at 28°C in an incubator under 5% carbon dioxide concentration. It was observed regularly for the appearance of cytopathic effect (CPE) up to 7–8 days. On appearance of the CPE, the tissue culture fluid was centrifuged at 1000 g for 5 minutes and the supernatant was used as positive control for RT-PCR or stored at -80°C .

Isolation of virus:-

Attempts were made to isolate the virus using C6/36 cell lines. For this purpose, only IgM negative to JEV samples with a history of ≤ 3 days fever along with any two of the symptoms stated earlier, were selected. 200 μl of selected serum samples were spread over the monolayer of C6/36 cell line and allowed to adsorb for 120 minutes in an incubator at 28°C under 5% CO₂ concentration. After adsorption, the excess sample materials were discarded and 1 ml MEM supplemented with 2% FBS and PenStrep were added in 24 well tissue culture plate (Tarsons Products Pvt. Ltd., Kolkata, West Bengal, India) and were incubated again at 28°C under 5% CO₂ concentration. It was observed regularly for the appearance of cytopathic effect (CPE) up to 7–8 days. For those samples which did not produce CPE, the tissue culture fluids were again passaged up to five times to facilitate the isolation of the virus, if any. After the appearance of CPE, the tissue culture fluid was collected by centrifugation at 1000 g for 5 minutes and the supernatants were kept in aliquots at -80°C till isolation of RNA, followed by RT-PCR test. Non-infected C6/36 cell culture was used as a negative control.

Serology:-

For the detection of JE IgM antibody in the collected samples, ELISA tests were performed with the kit, obtained from the NIV following the prescribed protocol.

RNA extraction:-

Those serum samples that produced prominent CPE and the JEV P20778 strain (used as the positive control throughout the study), were subjected for RNA isolation, using 140 μl of tissue culture fluid. The QIAamp® RNA viral kit (Qiagen, GmbH, Hilden, Germany) was used, following the manufacturer's protocol.

Reverse transcriptase PCR for envelope gene of Japanese encephalitis virus:-

For the detection of JEV by RT-PCR method, both serum and CSF samples with a history of ≤ 3 days fever were selected. Qiagen one step RT-PCR kit (Qiagen) was used according to the manufacturer's protocol, using RNA (50 pg to 1 g) and 0.6 M of primer pairs; forward primer: JEnvF (w) 942-ACCATCCTCCTGCTGTTGGTCGCT-965 and reverse primer: JEnvR (w) 2506-CTTGTGATGTCAATGGCACATCCAGTGTCA-2477 which anneal to the conserved region of structural envelop protein (E) specific for Japanese encephalitis virus.

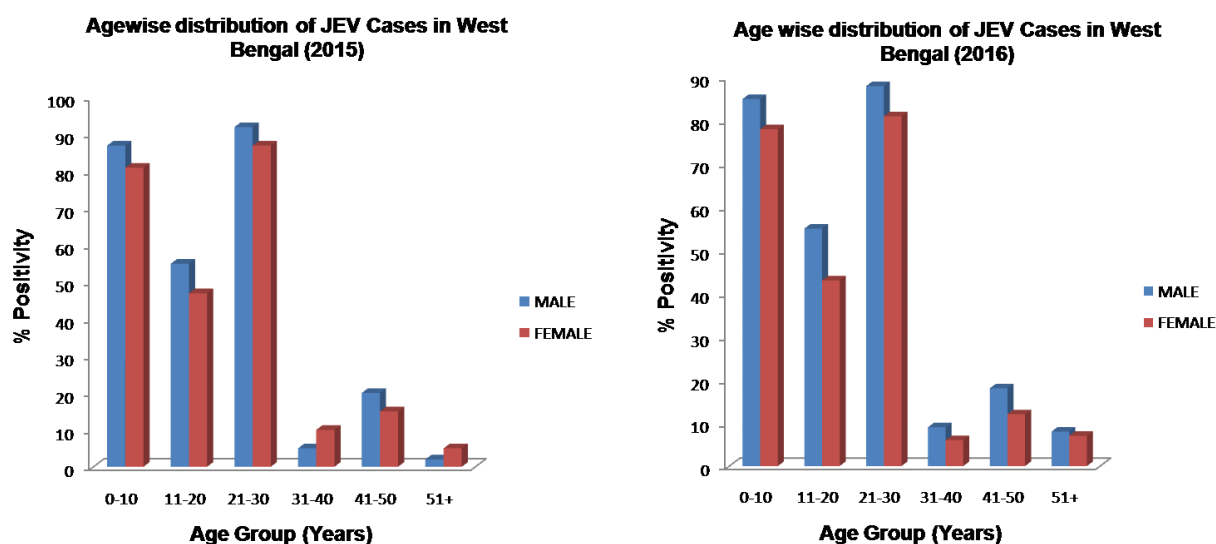

Results:-**Figure 1****Figure 2**

Figure 3

Discussion:-

As most JEV infections are subclinical in nature, a major portion of them remains undiagnosed (11,12). This study was particularly aimed to accurately identify the variable JE cases among the patients with Acute Encephalitis Syndrome (AES) in the East Indian state of West Bengal and to understand the current status of JEV in the state (13,14). JEV infection can be detected either directly or indirectly with the aid of several techniques. The conventional IgM specific capture ELISA is the approach for analysis of many infections including JEV as the primary screening test (15). The ELISA negative samples which had been amassed in the early clinical phase were additionally subjected to the reverse transcriptase (RT)-PCR for the identification of the virus (16). To fulfil this purpose, the collected clinical samples were preserved without disrupting the cold chain. In the present study, serum and CSF were chosen as the clinical specimens for serological and molecular diagnosis of JEV infection in the suspected cases. In India, JEV is a severe public health issue and mainly affects the young and adults up to the age of 30 years. In the present study, out of 533 samples tested in the two years, only 159 (29.8%) were positive to JEV. Percentage positivity of males during this time span was 31.68 % and females were 26.45%. All JEV positive patients had a history of illness for ≥ 10 days, indicative of active immune response at this stage of illness. This observation is proof of infection in the immediate past. Although, JE cases have been observed from all age groups, the highest numbers of positive cases have been recorded in the age group 21-30, followed by 0-10, in both male and female individuals almost identically (Figure 1) during 2015-2016, which almost corroborates with earlier studies. Only a few cases were detected in the age groups above 21-30 (elderly/higher age groups). The highest number of cases was observed in the 21-30 age groups of both male individuals and female individuals which are most likely because people from this age group actively take part in the cultivation of crop fields in rural areas. The vector usually breeds in the stagnant water in the cultivation fields and hence the majority from this age group are directly exposed to the vector. The next higher numbers were observed for the age group 0-10 mainly due to their underdeveloped immunity. The low number of JE cases in the higher age group is possibly due to the development of effective immunity, either by sub clinical infections or due to earlier vaccination. During both the years the maximum number of cases was reported during the months of July to September which corroborates with the warm, rainy season in West Bengal, an ideal environment for the growth of mosquitoes and disease spread (Figure 2). The major cases were observed from the districts of North 24 parganas, South 24 parganas, East Medinipur and West Medinipur (Figure 3). The reason may be due to the fact that these are sea connected and bordered districts with major chances of immigration carrying infected individuals through ports, as well as huge abundance of migratory birds which carry the virus with them. As males and females have been equally affected in almost all the cases it suggests that JEV does not have any sex preference.

Conflict of interest:-

There exists no conflict of interest among the authors.

Abstract

Interest in ecologically friendly, wet-processing textile techniques has increased in recent years because of increased awareness of environmental issues throughout the world. With more stringent controls and more demand in environmental friendly product expected in the future, it is essential that control measures be implemented to minimize effluent problems. The textile dyeing industry consumes large quantities of water and produces large volumes of wastewater from different steps in the dyeing and finishing processes. Wastewater from printing and dyeing units is often rich in color, containing residues of reactive dyes and chemicals, and requires proper treatment before being released into the environment. The goal of this research was to study the performance of the integrated chemical (coagulation-flocculation)-biological (activated sludge) process and to develop a potential textile industry's wastewater treatment system for reuse. The results show that coagulation-flocculation process (optimum coagulant of 10 mg/l FeSO₄) was effective enough in removing color while activated sludge process effective in removing other organic materials contain in the effluent. Integrated chemical-biological process to treat textile effluent was able to remove organic with an efficiency of 71 - 91 %. Re-use of this kind of wastewater than to discharge it after treatment are preferably due to increase in the costs of chemicals, energy and water consumption.

Background:-

The textile and clothing industry in Indonesia played a significant role in the national economy. In 2006, this industry contributes 11.7% to the total national exports, 20.2% of the national trade surplus, and 3.8% to the formation of Gross Domestic Product (GDP). This industry employs about 1.84 million workers and the lives of many Indonesian families are connected with the textile industry (agriculture, trade and services). Until year 2006, the number of Indonesian textile industry reached 2,699 companies, with a total investment of 135.7 trillion rupiah. This number is only slightly increases over the previous year, amounting to 2,656 companies. Textile industry is concentrated in West Java (57%), Central Java (14%), and Jakarta (17%). The rest are scattered in East Java, Bali, Sumatra and Yogyakarta [1]. The textile industry consumes large quantities of water and produces large volumes of

wastewater from different steps in the dyeing and finishing processes. These problems may occur during the production processes which usually require the input of a wide range of chemicals and dyestuffs, which generally are organic compounds of complex structure. Because all of them are not contained in the final product, they became waste and require proper treatment before being released into the environment. Major pollutants in textile wastewaters are high suspended solids, chemical oxygen demand, heat, color residues of reactive dyes and chemicals, acidity, and other soluble substances [2]. Effective and economic treatment of a diversity of textile effluents containing color has become a problem. No single treatment system is adequate for degrading the various dye structures. Currently, much research has been focused on chemically and physically degrading color dyes in wastewaters. These methods include chemical oxidation, which uses strong oxidizers such as hydrogen peroxide or chlorine dioxide. Chemical oxidation is sometimes coupled with UV light exposure to increase the color removal. Other techniques involve electrochemical or wet oxidation, activated carbon adsorption, reverse osmosis, or coagulation/flocculation. Many of these technologies are cost prohibitive, however, and therefore are not viable options for treating large waste streams [3]. To ensure the safety of effluents, proper technologies need to be used by treatment facilities when degrading fiber-reactive dyes. Many research efforts have focused on various biological, chemical, and physical techniques for treating dye wastes. There is evidence that all three areas have potential for remediating textile industry wastes. However, chemical treatment is often cost and application limited, while physical removal can lead to extra solid wastes and increased overhead. Biological treatment has been effective in reducing textile industry effluents, and when used properly has a lower operating cost than other remediation processes. Combinations of chemical and biological or physical and biological treatment have also proven to be effective. The primary objective of this study was to determine the best way to increase the color-reducing efficiency of the textile industry's effluent and to develop a potential textile industry's wastewater treatment system for reuse.

Materials and Methods:-

Wastewater used in this research was obtained from a synthetic textile dyeing factory located in the Nanjung industrial complex in Bandung, West Java. The characteristics of textile wastewater are showed in **Table 1**. Its average BOD, COD, pH, Ammonia, Oil&Grease and conductivity were 160 mg/l, 314 mg/l, 7.81, 4.46 mg/l, 16 mg/l and 5060 umho/cm, respectively. The combined process for textile wastewater treatment consists of chemical coagulation and flocculation pre-treatment followed by biological activated sludge treatment. Biological treatment was conducted in a 15 l reactor (10 l working volume) as described in **Figure 1** and 2000 mg/l of mixed liquor suspended solids (MLSS) were inoculated into the reactor. This reactor was equipped with a diffused aeration device at the bottom of the reactor. The wastewater was continuously fed to the reactor using peristaltic pumps with a desired flow rate. Chemical coagulation and flocculation were conducted in batch mode act as pre-treatment before biological treatment step. Jar-test at the laboratory scale was carried out in order to choose the adequate coagulant and the reaction condition (pH, dosage). $\text{Al}_2(\text{SO}_4)_3$, poly-aluminum chloride (PAC), FeSO_4 were tested as chemical coagulant candidates. One normal H_2SO_4 , NaOH solution was added to adjust pH of the solution to the desired value. Chemical coagulant was added and mixed for 2 min under rapid mixing condition (200 rpm) and the solution was mixed at slow flocculation (40 rpm) for 15 min after rapid mixing. And then, COD, SS, and pH of supernatant were measured after settling for 30 min. Standard methods [4] were used for the estimation of MLSS, COD, H_2S , Ammonia.

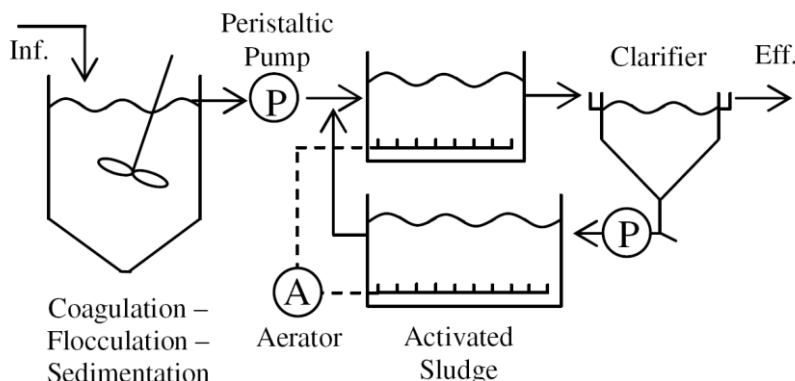

Figure 1 :- Reactor configuration schematic.

Results and Discussion:-

The raw textile wastewater samples were obtained from a large synthetic textile dyeing factory located in the Nanjung industrial complex in Bandung, West Java. The textile products processed in this plant were made primarily of cotton, linen and polyester fibers and small quantity of silk. According to the operational personnel, no less than 10 different kinds of dyes were used in the dyeing and finishing mill during the half-year period of this experimental study. Therefore tracking of the kind of dyes employed every day was virtually impossible because no record was kept at the mill. In general, the wastewaters had a BOD within the range between 125 and 172 mg/l, while COD within the range 281 and 315 mg/l. BOD:COD ratio of these wastewater within the range between 0.4-0.5 are quite biodegradable to biological process.

Table 1:- Characteristics of textile wastewater.

Parameters	Unit	Sample 1	Sample 2	Sample 3	Standard*

Conclusion:-

Studies on the effects of the optimum coagulant, dosage and pH are conducted in order to investigate the sorption capacity of coagulant in flocculation process. Since the Chemical Oxygen Demand (COD) level in wastewater from textile industry is considered as the most important parameter, so it has been used as the indicator on the sorption capacity of coagulant in these experiments by supporting with other parameter which is turbidity as total suspended solid/TSS. The jar test results showed that among others coagulant, FeCl₃ was the best coagulant for reducing organic in wastewater tested (performance data for Al₂(SO₄)₃ and PAC not shown in this report). FeCl₃ performance were presented in **Figure 2(a)** which showed the effects of coagulant (FeCl₃) dosage on COD level and the percentage of COD levels reduction. While **Figure 2(b)** showed the effects of coagulant dosage on turbidity levels and the percentage of turbidity levels reduction. From the jar test experiment, the curves for the both graphs were in the U-shape form for the condition of COD level and turbidity level versus coagulant dosage.

Figure 2 :- Effect of FeCl₃ dosage on (a) COD level (open circle) and the percentage (open square) of COD level reduction, (b) turbidity level as TSS (open circle) and the percentage (open square) of TSS level reduction

In wastewater treatment using metallic coagulants, pH plays a very important role in determining coagulation efficiency. Therefore, experiments were designed to determine the optimum pH for textile wastewater that allowed for maximum COD reduction and de-colorization. The effect of pH on the treatment efficiency was examined using optimum amount of coagulant at various pH conditions (4, 6, 8, 9, 10, 11, and 12). Lime and H₂SO₄ was used to adjust the desire pH. It is well known that pH affects the molecular structure of the dyes, which changes the absorbance of the solution. Optimum pH for COD reduction and de-colorization found within the range between 6 to 9. The optimum conditions for chemical coagulation flocculation process for pretreatment of textile wastewater are as follows: FeCl₃ coagulant with 120 mg/l dose with pH value 6-9. Pre-treated textile wastewater (with chemical coagulation process) then use as influent for biological (activated sludge) process for further treatment of wastewater (**Figure 1**). During operation, the DO concentration in the reactor was kept at 3 to 4 mg/l, MLSS was maintain at 2000-3000 mg/l and stable COD reduction were achieved after 2 d. In this case, about 72.9% of COD was removed. Other waste constituents like ammonia were reduced to 84%, phenol was reduced to 92% and oil&grease was reduced to 74% (**Table 2**). In addition, the result of COD removal capability in this study was compared with other similar combined processes for textile wastewater treatment as shown in **Table 3**. Two treatment operations comprised coagulation and activated sludge process, while the other comprised activated sludge followed with coagulation process.

Table 2:- Characteristics of textile wastewater after treatments

Parameters	Unit	Influent	Coagulation eff.	Activated sludge eff.	Removal efficiency
BOD	mg/l	152.3	70	36	76.3 %

694	391	236	65.9	
303	Chemical coagulation 165	Activated sludge 82	72.9	This study

The characteristic of wastewater discharged from textile industrial activities was strictly controlled by government. This was basically due to the wastewater from textile industry was contaminated with a complex set of oxygen demanding materials and poses a great problem to natural environment. As a result, the wastewater from textile industry was treated by using chemical via coagulation and flocculation processes followed with biological activated sludge for further treatment of textile wastewater. The goals of this study are multifold. It aims at enabling the textile industry to treat and reuse the wastewater from its operations using a simple and feasible technology (best available technology). It also aims at preventing the pollution that results from textile industries to the receiving water body and saving significant quantities of water for other domestic uses. In this point of view, the choice of studied technologies was kept to the simplest level to make it easy for the textile industry to accept and implement it.

Abstract

Allophylus serratus is a local medicinal plant used traditionally for the treatment of diarrhea, inflammation, ulcer, elephantiasis and gastro intestinal disorders. The leaf extracts of this plant were assessed for *in vitro* anti-inflammatory and antibacterial activities. The *in vitro* anti-inflammatory activity assay of leaf extracts of *Allophylus serratus* were evaluated by Human Red Blood Cells membrane stabilization, inhibition of protein denaturation and protease inhibition methods. The anti microbial activity of leaf extracts were evaluated by agar well diffusion method against four bacterial and two fungi species. The membrane stabilization anti inflammatory test showed that, the methanolic leaf extracts exhibited highest membrane stabilizing activity of 77.64 ± 0.78 and 74.77 ± 0.66 , compared to that of standard Diclofenac sodium which exhibited 92.65 ± 0.56 % and 89.73 ± 1.18 at 1000 $\mu\text{g/ml}$ and 800 $\mu\text{g/ml}$ concentrations respectively. In inhibition of protein denaturation, 400 $\mu\text{g/ml}$ methanolic extract showed maximum protection 70.73% and standard drug provided 93.50 % protection. But at 1000 $\mu\text{g/ml}$ the percent inhibition of protein denaturation increased to 95.93%. More over protease inhibition test showed maximum inhibition (67.63%) at 100 $\mu\text{g/ml}$ concentrations by ethyl acetate extract. In anti inflammatory test, all extraction showed concentration dependent response. In anti microbial activity test the water, methanolic and ethyl acetate extracts were more effective against *Escherichia coli* and *Staphylococcus aureus*. Ethyl acetate extract also showed high activity against *Bacillus subtilis* ($20 \pm 0.00\text{mm}$). Chloroform and petroleum ether extracts showed high zone of inhibition (20 ± 0.17 and 22 ± 0.09 mm respectively) against *Pseudomonas aeruginosa* but no activity against the rest tested bacterial strains. All the extracts did not show any activity against tested fungal species. The results of this study therefore revealed that leaf extracts of *Allophylus serratus* possess anti inflammatory and anti bacterial activity which justify the use of this plant in the treatment of bacterial infections and inflammation.

Introduction:-

Plants are the main sources of therapeutic agents for treatment of various ailments and diseases since ancient time. For example, in Africa, about 80% of the population depends on medicinal plants in managing various endemic

forms of infections (Agyare *et al.*, 2009). Over the past years, many medicinal plants have been proved to be a remarkable source of therapeutic agents and have therefore given attention in most research centers in the world (Iwu *et al.*, 1999; Agyare *et al.*, 2013). The advantage of using medicinal plants is that they are natural and have no side effects. According to World Health Organization, medicinal plants would be the best source of a variety of important drugs. Therefore, to better understand their efficacy, safety and properties, such plants should be properly investigated (Nascimento *et al.*, 2000). There are many reports on the use of medicinal plants as anti inflammatory and anti microbial agents. This is due to the presence of chemical compounds in plants that suppress inflammatory reactions and the reproduction and growth of micro organisms.

Inflammation and pain are our body's natural reaction to injury caused by infectious agents, burn, toxic or physical, chemical or traumatic damages (Battu *et al.*, 2011). The reaction comprises systemic and local responses (Mohamed *et al.*, 2011). One purpose of inflammation is to limit or eliminate the spread of injurious agent and protect the body site of an injury. There are different components to an inflammatory response such as a complex array of enzyme activation, mediator release, cell migration, tissue breakdown and repair. These responses are aimed at host defense and usually activated in most disease condition.

Modern drugs such as narcotics (e.g. opioids), non-narcotics (e.g. salicylates) and corticosteroids (e.g. hydrocortisone) which are in use presently for the management of inflammatory conditions are toxic and have well known side effects such as gastric ulcers and redistribution of body fat. In addition, these drugs are very expensive. On the other hand many medicinal plants had been used since long time as anti inflammatory without any side effects. At present, much attention has been given in the searching of medicinal plants with anti-inflammatory activity which is not only without side effects but also cheap. These medicinal plants used as anti inflammatory activity may lead to the discovery of new therapeutic agent that is not only used to suppress the inflammation but also used in diverse disease conditions where the inflammation response is amplifying the disease process.

Microorganisms such as bacteria and fungi cause various diseases in humans. To treat these microbial infections, various antimicrobial drugs have been discovered. Due to the indiscriminate use of these commercial antimicrobial drugs, resistance to these drugs by microorganisms has been developed and increased day by day (Davis, 1994; Ahamad, 1998; Karupiah and Mustaffa, 2013). The number of resistant microorganisms to these antimicrobial agents is increases exponentially. Therefore it is very important to understand the genetic mechanisms of resistance, to screen medicinal plants for the identification and development of newer and cost effective anti microbial agents to treat infections caused by resistant microorganisms. Medicinal plants have also been used as anti microbial agents. Many medicinal plants have been used to treat microbial infections because of their antimicrobial properties, which are due to compounds synthesized in the secondary metabolism of the plant. Therefore, such plants should be investigated to better understand their properties, safety and efficiency (Doughari *et al.* 2008).

Allophylus serratus (Roxb.) Kurz, (Synonym *Allophylus cobbe* Raeuschel; *Allophylus edulis* Radlk) (Dharmani and Palit, 2005), commonly known as Tippi in Hindi, belongs to the family Sapindaceae. It is a small tree or shrub found all over different parts of India. Traditionally this plant carries a strong ethno-pharmacological background and has been used as anti inflammatory, anti ulcer, to treat elephantiasis, oedma, and fracture of bones and gastrointestinal disorders such as diarrhea, anorexia and dyspepsia (Umashanker *et al.*, 2011; Gupta and Tandon, 2004). Dharmani *et al.*, (2005) and Kumar *et al.*, (2010), reported that the ethanolic extract of *Allophylus serratus* has potential anti ulcerogenic and anti osteoporotic activities respectively. The leaves are used to reduce fever, to relieve rashes, promote lactation, to treat colic to relieve stomach aches, as antiulcer and to reduce piles (Umashanker and Shruti, 2011; Devi *et al.*, 2013). The roots of this plant contain tannin and are considered astringent and used for treating nose bleeding, diarrhea and rheumatic pains (Umashanker and Shruti, 2011).

The presences of different phytochemicals such as steroids, glycosides, flavonoids, alkaloids and phenolics in this species have been reported (Sanmuga *et al.*, 2012). Phytochemical screening and Pharmacognostic studies of *Allophylus serratus* showed the presence of various chemical compounds in different parts of the plant. Leaves of the plant contain β -sitosterol. They also contain phenacetamide, a chemical known for its antiulcer activity (Rastogi and Mehrotra, 1995). The presence of Quercetin, Pinitol, Luteolin-7-O-B-D-glucopyranoside, rutin, apigenin-4-O-B-D-glucosid also reported by Kumar *et al.*, (2010). The aim of present study is to evaluate the *in vitro* anti-inflammatory activity and antimicrobial efficacy of leaves extracts of *Allophylus serratus*.

Materials and Methods:-

Plant material:-

Leaves of *Allophylus serratus* were collected between September and December 2015, from Andhra University, Visakhapatnam, India. The plant was identified and authenticated by Dr. Bodaih Padal, taxonomist, Department of botany, Andhra University, Visakhapatnam. The voucher specimens (21921) were deposited in the herbarium, College of Science and Technology, Department of Botany, Andhra University, India.

Preparation of plant leaves extracts:-

The leaves of *Allophylus serratus* were washed with distilled water and shade dried in dark for three weeks to a constant weight. The dried leaf samples were then ground into powder using a clean electric blender. 100 g of the powdered materials were extracted with water, methanol, ethyl acetate, chloroform and petroleum ether separately using soxhlet apparatus. The extracts were concentrated by evaporating the solvent in rotary evaporator. The yield was found to be 11.30 %, 15.40%, 9.80%, 6.90% and 6.20% w/w respectively with reference to the air dried plant.

Anti inflammatory activity:-

To test the anti inflammatory activity of leaf extracts of *Allophylus serratus* three *in vitro* methods (Human Red Blood Cells stabilization Method (HRBC), inhibition of protein denaturation and protease inhibition) were selected. There reason why these assay methods selected was due to ethical challenges and the nonexistence of rationale to use animals for pharmacological research of new chemical compounds (Bouhlali *et al.* 2016).

Human Red Blood Cells stabilization Method (HRBC):-

HRBC stabilization evaluation of the leaf extracts was carried out according to the Gandhisan *et al.*, (1991), Murugan and Parimelazhagan, (2014) and Bouhlali *et al.* (2016) methods with some modifications. Whole human blood was collected from volunteers (who had not taken any NSAIDS for 2 weeks prior to the experiment) and mixed with equal volume of Alsever's solution which was prepared by dissolving 2% dextrose, 0.80% sodium citrate, 0.05% citric acid and 0.42% sodium chloride in sterilized double distilled water. The collected blood was mixed with equal volume of sterilized Alsever's solution. The mixture was then centrifuged at 3000 rpm and washed with isosaline. The blood was reconstituted with isosaline and a suspension in 10% (V/V) was made. The assay reaction mixture which is 4.5mL consists of 1 mL phosphate buffer(0.15M, PH=7.4) , 2 mL hyposaline (0.36%), 1 mL of leaf extracts (1 mg/mL of respective organic solvents) and 0.5 mL RBC (10% v/v Red blood cells in isosaline) suspension (Sadique *et al.*, 1989 and Saket *et al.*, 2010). The reaction mixture without the extract was served as a control. The assay mixtures were incubated at 37°C for 30 min and centrifuged and the supernatant solution was estimated using UV analysis at 560 nm. Diclofenac sodium (100 and 200 µg/ml) was used as the reference drug. The control which was prepared by omitting the extract represents 100% HRBC lysis. Percent membrane stabilization activity was calculated by the formula (Sakat *et al.*, 2010; Reshma *et al.*, 2014)

$$\text{Percent protection} = 100 - \frac{Ab_1}{Ab_2} \times 100$$

Where Ab_1 is the absorbance of the sample, and Ab_2 is the absorbance of the control.

Inhibition of Protein denaturation:-

Inhibition of protein denaturation was evaluated according to the method of Mizushima and Kobayashi (1968), Sakat *et al.*, (2010), Rashma *et al.*, (2014) and Bouhlali *et al.* (2016) with some modifications. 0.5ml of bovine serum albumin (1% aqueous solution) was mixed with 0.1 mL of distilled water. pH was adjusted at 6.3 using 1 N HCl. 0.1 ml *Allophylus serratus* leaf extracts (mg/ml of respective organic solvents) was added to the reaction mixture. The mixture was then incubated at 37°C for 30 min and then heated at 51°C for 10 min. After cooling the samples to room temperature, 2.5 mL of phosphate buffer solution (PBS) was added. The absorbance was measured spectrophotometrically at 660 nm. For negative control 0.1 mL distilled water and 0.5 mL of bovine serum albumin were used. Acetyl salicylic acid was used as standard. The percentage inhibition of protein denaturation was calculated using the following formula.

$$\text{Percent inhibition} = \frac{Ab_1 - Ab_2}{Ab_1} \times 100$$

Where Ab_1 is the absorbance of the control, Ab_2 is the absorbance of the sample. The control represents 100% protein denaturation. The results were compared with acetyl salicylic acid (400 µg/ml) treated samples.

Protease inhibition Assay:-

The Inhibition of protease (trypsin) was evaluated by the previously reported method of Reshma *et al.*, (201 and Sakat *et al.*, (2010) with some modifications . To 100 ml of bovine serum albumin 100 µL of each leaf extract was added. The mixtures were incubated at room temperature for 10 minutes. 250 µL of trypsin was added to the mixtures to inhibit the reaction. Then the mixtures were centrifuged at 3000rpm for 5 minutes. The absorbance of the supernatant of each was measured at 210 nm. Acetyl salicylic acid was used as a positive control. Each experiment was done in triplicates and percent inhibition of protease was calculated by the following formula.

$$\text{Percent inhibition} = \frac{\text{Ab}_1 - \text{Ab}_2}{\text{Ab}_1} \times 100$$

Where Ab_1 is the absorbance of the control, Ab_2 is the absorbance of the sample.

Antimicrobial activity:-

The extracts were dissolved in DMSO to obtain different concentrations (10mg/ml, 50 mg/ml, 100mg/ml) The assay was performed in triplicate. DMSO (10% in water) was used as negative control. The bacterial strains used for the test were *Staphylococcus aureus* (*S. aureus*), *Bacillus subtilis* (*B. subtilis*), *Escherichia coli* (*E. coli*) and *Pseudomonas aeruginosa* (*P. aeruginosa*) and the fungal species used were *Aspergillus fumigatus* (*A. fumigatus*) and *Candida albicans* (*C. albicans*).

Four strains of bacteria were procured from microbial culture collection and loops full of all the bacterial cultures were inoculated in LB broth (Luria Bertani broth) (HiMedia) and were incubated at 37°C for 24 h. Fresh bacterial cultures were taken and spread on the LB agar (Luria Bertani agar) plates using glass rod to cultivate bacteria. Six millimeter diameter wells were made on agar plate with the help of gel puncture. Twenty micro liters of leaf extracts and DMSO (as control) were inoculated to the well, and then the plates were incubated in incubator at 37 °C for 24 h. The antimicrobial activity was measured based on the inhibition zone around the wells. The formation of clear inhibition zone of ≥ 7 mm diameters around the wells was regarded as significant susceptibility of the organisms to the extract (Okwori *et al.* 2007).

Statistical analyses:-

All the experiments were done in triplicates and the results were expressed as Mean \pm SD. The data were statistically analyzed using one way ANOVA followed by Duncan's test. Mean values were considered statistically significant when $p > 0.05$.

Results and discussion:-**Human Red Blood Cells stabilization Method (HRBC):-**

HRBC membrane stabilization method was used to investigate *in vitro* anti inflammatory activity of *Allophylus serratus* leaf extracts. The inhibition of hypotonicity induced HRBC membrane lysis (which is the response of inflammation) stabilization was taken as a measure of the anti inflammatory activity. HRBC membrane may be considered as a model of the lysosomal membrane which plays an important role in inflammation (Weissmann *et al.*, 1969). Lysosomal membrane stabilization is important in limiting the inflammatory responses. The mechanism is by the release of lysosomal constituents of activated neutrophil such as bactericidal enzymes and proteases which cause further tissue inflammation and damage upon extracellular release (Murugasan *et al.*, 1981). HRBC membrane stability test is based on the finding that non-steroidal anti-inflammatory agents inhibit heat induced lysis of erythrocytes, most likely by stabilizing the membrane of the cell.

Compounds in medicinal plants which prevent the lysis of HRBC membrane caused by the release of hydrolytic enzymes contained within the lysosomes may relieve some symptoms of inflammation (Hess and Milonig, 1972). When the HRBC is subjected to hypotonic stress, the release of hemoglobin from cells will be prevented by anti-inflammatory compounds in plant extracts due to membrane stabilization. This indicates that some compounds in medicinal plant extracts used as anti inflammatory drug, have the ability to exert anti inflammatory activity (Olajide *et al.*, 2000). The mode of action for membrane stabilization of the plant extracts, may be due to the binding of phytochemical compounds to the HRBC membranes and changing the charges of the surface of the cells (Oyedapo *et al.*, 2010) or according to Shinde *et al.*, (1999) through a deformation of cells by interacting with membrane proteins or other compound in the erythrocyte membranes. This interaction may later provoke alteration of the surface charges of the cells (Oyedapo *et al.*, 2004). Chopade *et al.*, (2012) reported that membrane protective effect of plant extract may be due to their ability to adjust the intracellular concentration of calcium into the erythrocytes.

For example tannins and saponins show membrane stabilizing effects by binding cations and other biomolecules (Oyedapo *et al.*, 2001).

The percentage of HRBC membrane stabilisation test for leaf extracts and positive control Diclofenac sodium were carried out at concentrations of 100, 200, 400, 800, 1000 $\mu\text{g/ml}$. The percent membrane stabilization and membrane protection of HRBC membrane by *Allophylus serratus* leaf extracts at different concentrations and positive control Diclofenac sodium are given in Figure 1 and 2. *Allophylus serratus* leaf extracts at different concentrations showed significant HRBC membrane stabilization. It was observed that methanolic extract of *Allophylus serratus* leaves exhibited highest membrane stabilizing activity of 77.64 ± 0.78 and 74.77 ± 0.66 compared to that of standard Diclofenac sodium which exhibited 92.65 ± 0.56 % and 89.73 ± 1.18 at 1000 $\mu\text{g/ml}$ and 800 $\mu\text{g/ml}$ concentrations respectively. The HRBC stabilizing activities of the extracts were concentration dependent, the membrane stabilizing activity increases with increasing concentration. This result is in line with previous report by Nagaharika *et al.* (2013) who revealed the anti inflammatory activity of leaves of *Jatropha gossypifolia* which increased with increasing concentration. Murugan and Parimelazhagan, (2014) also reported that methanol extracts of *O. parvifolia* at a concentration of 1 mg/ml significantly protected the lysis of erythrocyte membrane induced by hypotonic solution which is comparable to the standard Diclofenac sodium.

Figure 2:- Percentage of membrane protection of leaf extracts of *Allophylus serratus*.

Inhibition of Protein denaturation:-

The body response to infection, injury or destruction is what we call inflammation. Inflammation is characterized by pain, swelling, redness and disturbed physical functions. It is a normal body protective function against injury and

infection. One of the well documented causes of inflammation is protein denaturation. This is because, most biological proteins lose their function when denatured. The inhibition of protein denaturation by *Allophylus serratus* leaf extracts were studied by inhibition of protein denaturation method as anti inflammatory activity. The results of inhibitory effect of different extracts of *Allophylus serratus* leaf on protein denaturation are given in Fig 3 and Table 1. Among the different extracts, methanolic extract at concentrations of 200-1000 $\mu\text{g/ml}$ showed significant percent inhibition which was comparable to the standard Acetyl salicylic acid (93.50 %) at 400 $\mu\text{g/ml}$ (Fig 3). The methanolic extract showed the highest percent inhibition (70.73%) at 400 $\mu\text{g/ml}$ concentration. More over at 1000 $\mu\text{g/ml}$ the percent inhibition of protein denaturation increased to 95.93%. The results are in agreement with Murugan and Parimelazhagan, (2014) who reported that methanol extracts of *O. parvifolia* at a concentration of 1 mg/ml significantly protected the albumin from denaturation which is comparable to the standard Acetyl salicylic acid. The inhibitory effect was concentration dependent which increases with increasing the concentration of extract from 100 $\mu\text{g/ml}$ to 1000 $\mu\text{g/ml}$. Other studies also revealed that several anti inflammatory drugs also have shown dose dependent inhibition of protein denaturation (Grant *et al.*, 1970; Mizushima and Kobayashi, 1968). The ability of *Allophylus serratus* to inhibit protein denaturation is presumably due to its anti inflammatory activity.

Table 1:- Percent inhibition of protein denaturation by *Allophylus serratus* leaf extracts. Each value represents the mean \pm SD (n=3). ASA= Acetyl salicylic acid

Concentration ($\mu\text{g/ml}$)	% inhibition					
	Water extract	Methanol extract	Ethyl acetate extract	Chloroform extract	Petroleum ether extract	Acetyl salicylic acid
100	4.07	31.71	5.69	13.82	8.94	
200	8.13	41.46	10.57	16.26	18.70	
400	12.20	70.73	13.01	20.33	17.89	93.50
800	44.72	91.06	30.08	55.28	35.77	
1000	69.11	95.93	58.54	65.85	58.54

Protease inhibition Assay:-

During inflammation leukocytes protease enzymes play an important role in tissue damage. Protease inhibitors provide significant protection against this tissue damage developed by proteases during inflammatory reactions (Das and Chatterjee 1995). Phenolic compounds, tannins and flavonoids that are found in medicinal plants have been reported to have anti-inflammatory properties (Amarowicz, 2007). These compounds have the ability to inhibit protease and prevent tissue damage. In the present study *Allophylus serratus* leaf extracts were tested for their anti inflammatory activity by protease inhibition assay method. The result of this study showed that ethyl acetate extract has the highest protease inhibition activity compared to other extracts. The ethyl acetate extract produced the highest percentage inhibition (67.63%) at 100 $\mu\text{g/ml}$ concentrations. The protease inhibitory action was dose dependent with

the greater inhibitory effect of 81.02 % at 1000 µg/ml. Chloroform and methanol extracts at 1000 µg/ml also showed significant protease inhibitory activity 76.39 % and 75.42 % respectively Fig 4.

Figure 4:- Percent protease inhibition by *Allophylus serratus* leaf extracts Each value represents the mean \pm SD (n=3)

The anti inflammatory activity assay of different solvent extracts of *Allophylus serratus* leaf by HRBC membrane stabilization, inhibition of protein denaturation and protease inhibition produced promising results. The possible reason for the anti inflammatory activities of the plant is the presence of Phenolics, flavonoids, tannins and saponins which have anti inflammatory activity (Oyedapo, 2001). The in vitro anti-inflammatory effect of plant material may be due to synergistic effect rather than single constituent of their polyphenols contents (Bouhlali *et al.* 2016). This study also showed that the type of solvent used in extraction is important to find polyphenolic compounds from plant extracts. Comparison of these five solvents revealed that, they produce different anti inflammatory activities. Overall, methanolic extract, water extract and ethyl acetate extract were found to be good in obtaining anti-inflammatory substances from the extracts than the others.

Antimicrobial activity:-

An agar well diffusion assay method was used to determine the antimicrobial effects of the extracts of the leaves of *Allophylus serratus* against four strains of bacteria (*E. coli*, *B. subtilis*, *S. aureus* and *P. aeruginosa*) and two strains of fungi *A. fumigates* and *C. albicans*. The results of antimicrobial activity test are given in Table 2 and Fig 5. The results revealed variability in the inhibitory effect of each extracts against tested bacteria and fungi.

Table 2:- Antimicrobial activity of the different extracts of the leaves of *Allophylus serratus* on selected bacterial and fungal species

Microbial strain	Zone of Inhibition (mm)					
	Water extract	Methanol extract	Ethyl acetate extract	Chloroform extract	Petroleum ether extract	Control
<i>E. coli</i>	18 \pm 0.01	14 \pm 0.12	15 \pm 0.04	-	-	-
<i>S. aureus</i>	23 \pm 0.23	18 \pm 0.25	13 \pm 0.01	-	-	-
<i>B. subtilis</i>	-	-	20 \pm 0.00	-	-	-
<i>P. aeruginosa</i>	-	-	-	20 \pm 0.17	22 \pm 0.09	-
<i>A. fumigates</i>	-	-	-	-	-	-
<i>C. albicans</i>	-	-	-	-	-	-

The water, methanol and ethyl acetate extracts displayed low activity against the *B. subtilis* and *P. aeruginosa* except the ethyl acetate extract which showed high activity against *B. subtilis* (20 \pm 0.00mm). The water extract displayed high activity against *S. aureus* (23 \pm 0.23mm). The water extract, methanol extract and ethyl acetate extract were

slightly more active against *E. coli* (18 ± 0.25 , 14 1st and 15 mm respectively). Chloroform and petroleum ether extracts inhibited the growth of *P. aeruginosa* (20 ± 0.17 and 22 ± 0.09 mm respectively) but no activity against the rest tested bacterial strains (Table 2). Under the concentrations and conditions tested, Chloroform and petroleum ether extracts were active against Gram-negative bacterial strain (*P. aeruginosa*). On the other hand no any extract of *Allophylus serratus* showed anti fungal activity against tested strains of fungi (*A. fumigates* and *C. albicans*).

Figure 5:- Antimicrobial activity of *Allophylus serratus* leaf extracts. -vc= negative control, +vc= positive control, WE= water extract, ME= methanol extract, EAE= Ethyl acetate extract, CE= Chloroform extract, PEE= Petroleum ether extract.

The antibacterial activity of plant extracts as recorded in previous studies is attributed to the phytochemicals such as flavonoids, alkaloids and tannins present in plants. For example flavonoids in plants have antimicrobial (Maria Lysete *et al.*, 2009) and antiviral (Mehrangiz *et al.*, 2011) properties. Alkaloids isolated from plant are also found to have antimicrobial properties (Ahmed *et al.*, 2010). Tannins have antibacterial activity and kill bacteria by damaging its cell membrane (Mohamed Sham *et al.*, 2010). (Arokiyaraj *et al.*, (2009) reported that seeds extracts of *Vitex agnus-castus* has antimicrobial activity due to the presence of alkaloids, saponins, tannins, flavonoids, and glycosides contents.

Allophylus serratus as reported in previous studies also contain phytochemicals such as saponins, tannins, flavonoids and glycosides (Sanmuga *et al.*, 2012). There for the antibacterial activity of *Allophylus serratus* leaves extracts may be attributed to the presence of the phytochemicals reported to be present in it.

Conclusion:-

The anti inflammatory activity assay of *Allophylus serratus* leaves extracts exhibited membrane stabilization hypotonicity induced lysis of erythrocyte membrane, protein denaturation and protease inhibition effects. The plant extracts also showed significant anti bacterial activities against different bacterial strains. This implies that the extracts have significant anti inflammatory and anti bacterial activity compared to the standard medicines. The presence of various phytochemicals such as alkaloids, polyphenols tannins, saponins and flavonoids may be responsible of these activities. Therefore the results of this study provides scientific base for the traditional use of this plant as anti inflammatory and antibacterial agent. These results also showed that *Allophylus serratus* could be a potential natural source of compounds which have greater importance as therapeutic agent in inflammation related disorders and bacterial infections. Further studies are required to identify and isolate the active components of the extracts responsible for their anti-inflammatory properties and their mode of action.

Abstract

According to presence or absence of antigens, human blood can be divided into different blood groups. Rh blood group is one of the most complex blood groups in humans. Rh positive has D antigen while Rh negative lacks the D antigen. This one year study was done in which 600 blood donors were tested for Rh blood group in the blood-bank laboratory by test-tube method. 300 blood donors were from high altitude areas (above 5500ft the sea level), while the 300 blood donors were from plain areas, of Jammu And Kashmir State, India. In high altitude blood group donors 87% were Rh positive while 13% were Rh negative. In plain area blood donors 93% were Rh positive while 7% were Rh negative. Thus there is a high incidence (13%) of Rh negative donors in high altitude donors as compared to plain areas.

Introduction:-

Humans contain a series of glycoprotein's and glycolipids on the surface of RBC's which constitute the blood group antigens. According to presence or absence of antigens human blood can be classified into different blood groups like ABO blood group, MNS blood group, Rh blood group Etc. The international society of blood transfusion definition of the blood group system is where one or more antigens are controlled at a single gene locus or by two or more very closely linked homologous genes with little or no observable recombination between them (1). The Rh blood group is one of the most complex blood groups known in humans. It was named after Rhesus monkey. With 49 antigens so far described, it is largest of 29 blood group systems. Rh antigens are located on two Rhesus proteins RHD and RHCE. Rhesus proteins are expressed only in membranes of red blood cells (2).

ABO blood group system were discovered by Austrian pathologist Karl Landsteiner (3).

Following discovery of ABO, blood group, Rh antigen was discovered by Levine and Stetson in 1939 (4).

Among the Rh antigens D,C,c,E and e are most important which are encoded by two adjacent gene loci, the RHD gene which encodes the RHD protein with the D antigen and variants(5).

Address:- Additional Professor, Pediatric Hematology and Head Transfusion Medicine, SKIMS, Srinagar, Jammu and Kashmir, India.

The RhCE gene which encodes RhCE protein with the C,E,c and e antigens and variants. Gene for Rh system is located on chromosome 1 (6).

Rh positive and Rh negative refer to D antigens only. Rh positive has D antigen and Rh negative does not have D antigen.

Incidence of Rh blood groups varies in different parts of world. Factors attributed to such difference include racial differences, geographical variation, external environment and genetic makeup (7,8,9).

The Caucasians of European descent have highest incidence of Rh negative phenotype (15-17%). It is less common in Africans, in Asians it is less than 1% (10).

Rh antigens, especially D are highly immunogenic. They have been implicated in hemolytic disease of newborn and hemolytic transfusion reactions. The knowledge of distribution of Rhesus blood group at local and regional levels is helpful in the effective management of blood banks and safe blood transfusion service (11).

Materials and methods:-

This prospective one year study was conducted from Nov 2015 to Nov 2016 in the department of blood bank of Sher-i-Kashmir Institute of Medical Sciences, Srinagar, India which is a deemed university, super specialty hospital of north India. This study was done to find out incidence of Rh negative blood group among donors belonging to high altitude areas (5500ft above the sea-level) of Jammu and Kashmir (sample size 300). This was compared with incidence of Rh negative blood group among donors belonging to plain areas (sample size 300). Both voluntary and replacement donors were included in the study. Donors were selected strictly as per AABB's (American association of blood bank) recommendation.

Procedure:-

Three methods are available for detecting Rh antigens, e.g. slide method, tube method and micro-plate or micro-well method. We selected test-tube method for our study, as it is simple, reliable, cost effective method. It allows for long incubation without any drying, unlike slide method which causes drying, of blood giving at times false impression of agglutination. The tubes can further be centrifuged to enhance antigen-antibody reaction.

Requirement & Material:-

- 75x 10mm tubes
- Test serum Igm monoclonal Anti D/ saline Anti D
- Test red cells
- Rh positive and Rh negative control cells (for monoclonal Anti D)

Methods:-

A detailed history and physical examination of donors was done. Their residential address, age and sex was noted. After taking informed consent of donors, blood samples were collected under all aseptic precautions. 300 blood samples were collected from high altitude areas donors (5500ft above the sea level). 300 blood samples were collected from non hilly areas or plain areas .

2-4% washed red cell suspension of test sample was prepared. To one drop of 2-4% red cell suspension 2 drops of anti D serum was added and was mixed by gently shaking the tube. The test tube was incubated at room temp for 60 minutes. Agglutination was seen against a well-lit background. Results, were recorded. All negative results were checked using a microscope. Relevant data was collected using a proper proforma form.

Result:-

1. A total of 600 donors , 300 each from high altitude areas (above 5500ft) and plain areas were screened for Rh typing.
2. Out of 300 donors of high altitude areas 291(97%) were males while as 9(3%) were females. In plain areas donors 288(96%) were males and 12(4%) were females.
3. In high altitude group donor , the age group of 18-30 years comprised 65% of the total donor. In plain area donors, this age group comprised 51% of total donors.

4. In high altitude group donors 261 donors (87%) were Rh positive while as 39(13%) were Rh negative. In plain area group donors, 279(93%) were Rh positive while as 21(7%) donors were Rh negative. Thus there is a high incidence of Rh negative group in high altitude area donors (13%), which is the salient feature of this study.
5. In high altitude area donors, of 291 males, 252(86.6%) were Rh positive and 39(13.4%) were Rh negative. Among females all 9 (100%) were Rh positive with no Rh negative females, were found.
6. In plain area donors out of 288 males, 267(92.7%) were Rh positive and 21(7.3%) were Rh negative. Among females all 21(100%) were Rh positive with no Rh negative females, were found.
7. In high altitude area donors the most common blood group was found to be B+ve (35%), while as in plain area donors two blood group were commonest. It was found to be B+ve (33%) and O+ve also (33%).
8. In high altitude area donors, the least common blood group was found to be AB-ve (1%), while in plain area donor group no AB-ve donor was found (0%).

Discussion:-

Blood groups are genetically determined. The incidence of ABO and Rh genes and their phenotypes vary widely across races and geographical boundaries. The resultant polymorphism remains important in population genetic studies, estimating the availability of compatible blood, evaluating the probability of hemolytic disease in new born, resolving disputes of paternity/ maternity and for forensic purposes.

In the present study among high altitude donors 87% were Rh positive and 13% were RhD negative. Among donors of plain areas 93% were RhD positive and 7% were RhD negative. Incidence of RhD antigen in most parts of India varies from 91-98% for RhD positive and 2-9% for Rh D negative. In Britain and U.S.A, the distribution of RhD positive is 83% and 85% respectively with RhD negative of 17% and 15% respectively (12).

It is postulated that ancestors of high altitude area donors, of Jammu and Kashmir state, India have migrated from central and south east Asia the erstwhile silk route which have a similar pattern of distribution.

In six muslim dominated districts of Aligarh, Uttarpradesh, what surfaced as a contrast was 15% incidence of Rh negative blood groups. It supports the ancestry background from middle east.

The comparison of frequency and distribution of Rh blood groups in blood donors of high altitude population and plain regions of Jammu and Kashmir, India with the studies carried out at national and international level is given in table 1 and table 2.

Table no 1:- Comparison of present study with Indian studies (in percentage).

RH D	Rh positive	Rh negative
Present study		
• High altitude areas	87%	13%
• Plain areas	93%	7%
Bangalore (13)	94.2%	5.79%
Chittoor (14)	90.6%	8.42%
Vellore (15)	94.5%	5.47%
Shimoga- Malnad(16)	94.9%	5%
Davangere(17)	94.8%	5.5%
Eastern ahmedabad (18)	94.2%	5.8%
Punjab (19)	97.3%	2.7%

Table no 2:- Comparison with studies outside India (in percentage).

Study	Rh D Positive	Rh D Negative
Present study		
• High altitude	87%	13%
• Plain area	93%	7%
Pakistan (20)	89.1%	10.9%
Nepal (21)	96.7%	3.3%
Britain (22)	83%	17%

USA (23)	85%	15%
Niger Delta(24)	93.9%	6.1%

The knowledge of distribution of Rh D negative blood groups is essential for the effective management of blood bank's inventory. The study data would help in establishment of more efficient blood transfusion service that would meet the increasing demand for Rh D negative blood groups. Voluntary blood donation camps can be organized in high altitude areas, so that resources for Rh negative bloodgroups, can be tapped. For this the general public of the area need to be motivated.

Conclusion:-

The study showed high incidence of Rh D negative blood group (13%) in population of high altitude areas (5500ft above sea level) , of Jammu and Kashmir state, India. This incidence was almost double (7%) as compared to the plain areas in studied area. It is hoped that the study data generated will help in establishment of more efficient functioning blood transfusion service especially the need for negative blood groups. It could also help formulate robust marrow registries in India a process in infancy yet.

Abstract

This study was carried out to measure serum levels of the calcium, magnesium, potassium and PH in patients with type 2 DM. Sixty samples were collected from patients in period between October to November 2016, chosen randomly from Military hospital and Sixty apparently, healthy individuals as controls, to assess the levels of calcium, magnesium, Potassium and pH in type2 D M.

Serum calcium and magnesium were measured by using automation, Mindray380, potassium by using easylyte and pH by using Cobas b 221, and results were analyzed using statistical of package social science (SPSS), computer program.

The study showed that, the serum levels of magnesium and potassium were significantly decreased, (p-value =0.00) in diabetic patients compared to control group. While the level of PH was significantly increased, (p-value= 0.000) and there was no significant difference between the mean of calcium level in patients and control group. Mean \pm SD cases versus control. (1.43 \pm 0.26versus2.10 \pm 0.29) For magnesium. (3.1 \pm 0.39versus4.10 \pm 0.48) for potassium. (7.99 \pm 0.06 versus 7.40 \pm 0.02) for PH.

(8.77 \pm 1.00 versus 8.79 \pm 0.80, p-value =0.997) for calcium.

There was insignificantly weak positive correlation between serum magnesium in patients used insulin and diabetic patients not used insulin (r= 0.1 / p= 0.627) , while there were no correlations between serum calcium, potassium and PH in diabetic patients used insulin and diabetic patients not used insulin.(r=0.073, p- value= 0.70),(r=0.027 , p- value= 0.888) ,(r=0.08, p-value=0.676) respectively.

It is concluded that; the levels of magnesium and potassium are significantly decreased in patients with type 2 DM, and the level of PH is significantly increased and there is no significant difference in the level of calcium in type 2 diabetic patients compared to control group.

Introduction:-

Diabetes mellitus is characterized by hyperglycemia due to absolute or relative deficiency of insulin⁽¹⁾, leading to impaired metabolism of carbohydrates, proteins, fats, water and electrolytes. The persistence of these metabolic disturbances lead to permanent and irreversible functional and structural changes in the cells of the body which in

Corresponding Author:- Nuha Eljaili Abubaker.

Address:- College of Medical Laboratory Science, Sudan University of Science and Technology. Head department of clinical chemistry.

turn lead to the development of “diabetic complications”, characteristically affecting, the cardiovascular system, eye, kidney and nervous system mainly⁽²⁾. A relationship between DM and minerals is frequently reported. Alteration in the metabolism of trace elements like calcium, magnesium is associated with DM⁽³⁾. Trace elements are accepted as essential for optimum health, because of their diverse metabolic characteristic and functions⁽⁴⁾. Trace elements participate in production of reactive oxygen species (ROS), which contribute to oxidative stress. Oxidative stress contributes to the pathogenesis of many diseases including DM. Chronic complications of diabetes mellitus can be divided into vascular and nonvascular complications. The vascular complications of DM are further subdivided into micro vascular (retinopathy, neuropathy, nephropathy) and macro vascular complications coronary artery disease, peripheral arterial disease, cerebrovascular disease⁽⁵⁾. Several of the complications of diabetes may be related to increased intracellular oxidants and free radicals⁽⁶⁾.

Magnesium, calcium and potassium are an essential element involved in glucose homeostasis. It is a cofactor for various enzymes in carbohydrate metabolism. It is also involved at multiple levels in insulin secretion, binding and activity. Reduced level of magnesium has been documented in type 2 DM^(3, 4,7 and 8). Hypomagnesaemia may have negative impact on glucose homeostasis and insulin sensitivity in type 2 DM patients⁽⁹⁾. Hypomagnesaemia may also have some effect in the development of diabetic complications with other risk factors⁽¹⁰⁾. The present study was designed to evaluate the serum levels of potassium; magnesium and calcium in type 2 DM.

Material and methods:-

Study Population The study was carried out at College of Medical laboratory Science and the subjects were recruited from military hospital in Khartoum from period between October to November 2016. A total of 60 type 2 DM and 60 apparently, healthy individuals as controls were enrolled in this study. The study was approved by hospital's ethics committee. Informed consent was obtained from patients before blood sampling.

Inclusion criteria:-

Sudanese patients with type 2 DM and apparently healthy volunteers (matches age and sex with the cases) were included.

Exclusion criteria: patients with hypertension, renal disease, heart disease and other disease related to pH imbalance were excluded.

Blood sample and analysis:

About 2ml of venous blood was collected from the antecubital vein by taking aseptic precautions. Care was taken to prevent venous stasis during the sample collection. The blood was allowed to clot and the serum was separated by centrifugation. The estimation of the parameters was carried out within 4-6 hrs. The samples were analyzed for serum calcium and magnesium by using automation, Mindray 380⁽¹¹⁾, potassium by Electrolyte analyzer (easlyte) and pH by using Cobas b 221⁽¹²⁾. The internal control sera of two different levels were used to calibrate the instruments.

Data was analyzed using SPSS computer program, the mean and standard deviation were obtained and the independent 't.test' used for comparison (p value of ≤ 0.05) was considered significant.

Results:-

In comparison with the controls, diabetic patients (type2) had significantly lower in means serum magnesium and potassium (1.43 ± 0.26 versus 2.10 ± 0.2951 mg/dL), (3.1 ± 0.39 versus 4.10 ± 0.48 mmol/L) p value < 0.05 respectively. There was significant increase in mean of PH in type 2DM compared to control group (7.99 ± 0.06 versus 7.40 ± 0.02) p value < 0.05 . There was insignificant difference in mean serum calcium compared to control group (8.77 ± 1.00 versus 8.79 ± 0.80 , p-value = 0.997) p-value ≥ 0.05 as in table 1.

Table (1):- means comparisons of serum calcium, magnesium, potassium and PH in type 2 diabetes mellitus compared to control group.

Variable	Patients (mean \pm SD) N=60	Control (mean \pm SD) N=60	P-value
Calcium (mg/dL)	8.77 \pm 1.00	8.79 \pm 0.80	0.997
Magnesium(mg/dL)	1.43 \pm 0.26	2.10 \pm 0.29	0.000
Potassium (mmol/L)	3.10 \pm 0.39	4.17 \pm 0.48	0.000
PH	7.99 \pm 0.06	7.40 \pm 0.02	0.000

Figure (1):- A scatter plot shows the correlation between calcium level in diabetic patients used insulin and diabetic patients not used insulin ($r=0.073$, $p\text{-value}=0.703$).

There is no correlation between calcium level in diabetic patients used insulin and diabetic patients not used insulin.

Figure (2):- A scatter plot shows the correlation between magnesium level in diabetic patients used insulin and diabetic patients not used insulin ($r=0.092$, $p\text{-value}=0.627$).

There is weak positive correlation between magnesium level in diabetic patients used insulin and diabetic patients not used insulin.

Figure (3):- A scatter plot shows the correlation between Potassium level in diabetic patients used insulin and diabetic patients not used insulin ($r=0.027$, $p\text{-value}=0.888$).

There is no correlation between potassium level in diabetic patients used insulin and diabetic patients not used insulin.

Figure (4):- A scatter plot shows the correlation between pH level in diabetic patients used insulin and diabetic patients not used insulin $r=0.080$, $p\text{-value}=0.676$).

There is no correlation between pH level in diabetic patients used insulin and diabetic patients not used insulin.

Discussion:-

A relationship between DM and minerals is frequently reported. Alteration in the metabolism of trace elements like calcium, magnesium potassium is associated with DM⁽³⁾. Trace elements are accepted as essential for optimum health, because of their diverse metabolic characteristic and functions⁽⁴⁾. Trace elements participate in production of reactive oxygen species (ROS), which contribute to oxidative stress. Oxidative stress contributes to the pathogenesis of many diseases including DM.

Results in this study found that, the serum levels of magnesium and potassium were significantly decreased in diabetic patients compared to control group. This results agree with another results carried by many authors^(13, 14), which finding confirmed that, there were significantly decreased in mean of serum magnesium and potassium in diabetic patients compared to control group, ($p\text{-value} = 0.00$). Also this study was in agreement with another study done by (Puri *et al.*, 2013), which showed hypomagnesaemia and hypokaleamia in diabetic patients and this may be a possible risk factor in development and progress of diabetic complications.

Also the results agree with another result which showed, Hypomagnesemia has been reported to occur at an increased frequency among patients with type 2 diabetes compared with their counterparts without diabetes⁽¹⁵⁾. Hypomagnesemia has been linked to poor glycemic control, coronary artery diseases, hypertension, diabetic retinopathy, nephropathy, neuropathy, and foot ulcerations. This study in agreement with another study, which finding confirm that, hypokalemia may reduce $\text{Na}^+\text{-K}^+\text{-2Cl}^-$ co-transport activity, the associated potassium extrusion through the potassium channel ROMK, and resultant diminution of the favorable trans membrane voltage that is required for paracellular Mg reabsorption. In addition, there is evidence to suggest that cellular potassium depletion may diminish Mg reabsorption at the DCT by yet unclear mechanisms.⁽¹⁶⁾

The result showed, the level of PH was significantly increased ($p\text{-value} < 0.05$) and there was no significant difference between the mean of calcium level in patients and control group ($p\text{-value} > 0.05$).

This result disagreed with another result, which showed Diabetes Mellitus is known to have its effect on almost all body system through alterations in structural and biochemical changes in tissues, alteration in calcium flux may adversely affect the insulin secretion as it is a calcium dependent process.⁽¹⁷⁾

There was insignificantly weak positive correlation between serum magnesium in diabetic patients used insulin and diabetic patients not used insulin ($r = 0.1$, $p = 0.627$). This result in agreement with result carried by researchers at the Institute of Internal Medicine, University of Palermo wrote, "Intracellular magnesium concentration has also been shown to be effective in modulating insulin action (mainly oxidative glucose metabolism). A poor intracellular Mg concentration, as found in noninsulin-dependent diabetes mellitus (NIDDM) and in hypertensive patients, may **result in a defective tyrosine-kinase activity at the insulin receptor level.**"⁽¹⁸⁾ There were no correlations between serum calcium, potassium and PH in diabetic patients used insulin and diabetic patients not used insulin. ($r = 0.073$, p -value = 0.70), ($r = 0.027$, p -value = 0.888), ($r = 0.08$, p -value = 0.676) respectively.

Abstract

This prospective study was conducted to evaluate the usefulness & accuracy of the modified Alvarado score in the preoperative diagnosis of acute appendicitis. The study included one hundred & fifty patients of different age groups & from both genders with provisional diagnosis of acute appendicitis presented to the emergency department of AL- Yarmouk Teaching Hospital over eighteen months period. All patients were evaluated on admission & given specific scores according to the variables of Modified Alvarado Score. In adult male patients acute appendicitis was confirmed in (40) of (42) patients giving sensitivity rate of (88.8%) & specificity rate of (91.6%), in adult female, it was confirmed in (25) of (28) patients with sensitivity rate of (80.6%) & specificity rate of (89.6%), while in children acute appendicitis was confirmed in (7) of (9) patients giving a sensitivity rate of (53.8%) & specificity rate of (75%). The overall sensitivity rate of Modified Alvarado Score was 80.9% & its specificity was 88.5%. Total negative appendectomy rate was 15.2%. The Modified Alvarado Score is simple, easy to apply & cheap complementary aid for supporting the diagnosis of acute appendicitis especially for junior surgeons.

Introduction:-

The Alvarado Score was described in 1986.⁽¹⁾ & has been validated in adult surgical practice.⁽¹⁾ The Modified Alvarado Score is a simplified modification of the original Alvarado Score after the omission of one of its parameters by Kalan *et al.*⁽²⁾ Since 1886 when the classical signs & symptoms of acute appendicitis were first reported by Fitz.⁽¹⁾ Acute appendicitis has remained the most common surgical emergency.⁽³⁾ & surgery for acute appendicitis is the most frequent operation performed (10% of all emergency abdominal operations).^(5,6) Approximately 6- 7% of population will suffer from acute appendicitis during their life time .⁽⁷⁾ With early diagnosis & intervention the mortality rate from non complicated acute appendicitis is less than 0.1- 0.6% when there is gangrene, & 5% for perforated cases .⁽⁸⁾ The diagnosis of acute appendicitis is purely based on history, clinical examination & some simple laboratory investigations like white blood cells count. Recently the attempt to increase the diagnostic accuracy in acute appendicitis by imaging, laparoscopy & even radioactive isotope imaging have been included, however these techniques involve additional costs & are either complex or not easily available when they are most needed. A negative appendectomy rate of 20- 40% has been reported in literatures & many surgeons would accept rate of 30% as inevitable .⁽⁹⁾ The Modified Alvarado Score was designed to reduce the negative appendectomy rate without increasing the morbidity & mortality.⁽¹⁰⁾ At present many scoring systems for

3-Investigation			
A-Leucocytosis			2
TOTAL SCORE			9

The application of the score is based on the above variables (3 symptoms, 3 signs, 1 test). Patients with score 1- 4 are considered unlikely to have acute appendicitis, those with a score of 5- 6 have possible diagnosis of acute appendicitis not convincing enough to have urgent surgery, & those with score 7- 9 are regarded as probable acute appendicitis & underwent an appendicectomy.

Aim of the Study:-

1. To evaluate the usefulness & the validity of Modified Alvarado Score in the preoperative diagnosis of acute appendicitis.
2. To evaluate the accuracy of Modified Alvarado Score in relation to differences in age group & gender.
3. To compare the results of negative appendicectomy rate in those who were evaluated by Modified Alvarado Score with clinical literature figures.

Patients & Methods:-

This study was conducted on (150) patients admitted from the emergency department at Al- Yarmouk teaching Hospital with the clinical diagnosis of acute appendicitis during the period from June 2004 to December 2005. They were (79) males & (71) females with their age ranging from 8- 65 years, however, 21 of them were children (age < 12 years). All included patients were prospectively evaluated using the Modified Alvarado Score to determine whether they had acute appendicitis or not.

Following admission, initial assessment & baseline investigations, a specially designed forma was filled for each patient. This forma had general information about the patient plus seven variables based on the Modified Alvarado Score & information regarding the final outcome of each patient which was filled later on.

The admission of the suspected cases, evaluation & the decision to operate was made by the surgical, on call team, on the bases of one weekly duty for the eighteen months during which this study was conducted.

The sum of all variables were calculated for each patient & based on the results, patients were divided into:

Group one:- With score of > 7 (emergency surgery group).

They were (79) patients comprised of (42) male, (28) female & (9) children, these patients were prepared & underwent appendicectomy.

Group two. With score of (5- 6) (observational group). They were (71) patients comprised of (27) male, (32) female & 12 children. They were admitted & kept under observation with frequent assessments & re evaluations of the clinical data & their score, every 4- 6 hours. Abdominal ultrasonography was performed in 12 doubtful cases leading to the diagnosis of (2) cases of right ovarian cysts & (2) cases of right ureteric stones, while the condition of (41) patients were improved as shown by the decrease in the intensity of the symptoms & decrease in their score, & they were discharged with instructions that they should come back if their symptoms persist or increase in intensity. However, (26) patients of this group underwent appendicectomy for either persistence or increase in their symptoms, or increase score on subsequent reevaluation. Any patient presented with score of < (4) was not included in this

study as they were considered unlikely to have acute appendicitis & so they were discharged after initial symptomatic treatment with the instructions to come back if symptoms persist or increase in the intensity. Acute appendicitis was confirmed either peroperatively in those patients with macroscopical evidence of acute inflammation or by histopathological examination for those with macroscopically normal looking appendix

Results :- This study included (150) patients with clinical features suggestive of acute appendicitis. Among those patients (79) were male (52.7%), & (71) were female (47.3%). The age of the patients included in this study range from 8 year to 65 year, **The frequency distribution of the patients according to the results of Modified Alvarado Score demonstrate that the highest frequency was in those patients scored 5 (40 patients, 26.7%) & the lowest frequency in patients scored 9 (20 patients, 13.3),** However, from (150) patients (79) patients (52.6%) had score of (7) or more, comprised of (42) adult male, (28) adult female & (9) children, While (71) patients (47.4%) had a score of less than (7), (5- 6), comprised of (27) adult male, (32) adult female & (12) children. Another (41) patients with score of (5- 6) were discharged home as clinical improvement & decreased score was shown in subsequent reevaluation, & were instructed to come back if the symptoms persist or increase in intensity, while appendicectomy was performed in (26) patients with score of (5-6), they were (9) adult males, (10) adult females & (7) children.

Acute appendicitis was confirmed in (17) patients (false-ve) comprised of (5) adult male, (6) adult female & (6) children giving a specificity rate of (91.6%), (89.6%) (75%) respectively. **The overall sensitivity rate & specificity rate of Modified Alvarado Score were (80.9%) & (88.5%) respectively. The validity of Modified Alvarado Score for the (150) patients with provisional diagnosis of acute appendicitis.** All patients with score of (7) or more ((79) patients) underwent appendicectomy. Acute appendicitis was confirmed in (72) patients (true +ve), among them (40) patients were adult male out of (42) giving sensitivity rate of (88.8%), (25) adult female out of (28) giving sensitivity rate of (80.6%) & (7) children out of (9) giving sensitivity rate of (53.8). All patients with score of (5- 6) (71 patients) were admitted for observation & re evaluation. Abdominal ultrasonography was done for (12) patients leading to the diagnosis of (2) right ovarian cysts & (2) ureteric stones, & they were referred to the gynaecological & urological departments respectively following clinical improvement. Another (41) patients with score of (5- 6) were discharged home as clinical improvement & decreased score was shown in subsequent reevaluation, & were instructed to come back if the symptoms persist or increase in intensity, while appendicectomy was performed in (26) patients with score of (5-6), they were (9) adult males, (10) adult females & (7) children. Acute appendicitis was confirmed in (17) patients (false-ve) comprised of (5) adult male, (6) adult female & (6) children giving a specificity rate of (91.6%), (89.6%) (75%) respectively. Another (41) patients with score of (5- 6) were discharged home as clinical improvement & decreased score was shown in subsequent reevaluation, & were instructed to come back if the symptoms persist or increase in intensity, while appendicectomy was performed in (26) patients with score of (5-6), they were (9) adult males, (10) adult females & (7) children. Acute appendicitis was confirmed in (17) patients (false-ve) comprised of (5) adult male, (6) adult female & (6) children giving a specificity rate of (91.6%), (89.6%) (75%) respectively The overall sensitivity rate & specificity rate of Modified Alvarado Score were (80.9%) & (88.5%) respectively The total number of patients who underwent appendicectomy was (105) patients (70%) out of (150), among them acute appendicitis was confirmed in (89) patients (84.8) comprised of (72) patients with score of > 7 (true +ve) & (17) patients with score of < 7 (false -ve), among them (8) had perforated appendices, (10) patients had gangrenous appendices & (4) had appendicular mass, there was no operative findings of perforated, gangrenous appendices or appendicular mass in those patients with score <7. While normal appendix was found in (16) patients, (7) patients of them with score of > 7 (false +ve) comprised of (2) adult male, (3) adult female & (2) children. However, other surgical corrected pathology was found in (1) adult male with Meckel's diverticulitis & (2) adult female one with ruptured right ovarian cysts & the other with ruptured right tubal pregnancy. While in the remaining (4) patients no obvious other surgical pathology was identified. The other (9) patients with normal appendices were with score of < 7 (true -ve) comprised of (4) adult male, (4) adult female & (1) child, & other surgically corrected pathology was identified in (2) adult female only, one with ruptured right ovarian cyst & one with right ovarian endometriotic (chocolate) cyst, while in the remaining (7) patients no obvious surgically corrected pathology was identified. So the total (-ve) appendicectomy rate was (15.2%) & the adult male, adult female & children (-ve) appendicectomy rates were (11.7%), (18.4%) & (18.7%) respectively. The positive predictive value of the Modified Alvarado score was 91.1% & for adult males, adult females & children were 95.2%, 89.3% & 77.8% respectively.

Discussion:-

Acute appendicitis is undoubtedly, the most common surgical emergency, & the diagnosis of acute appendicitis is essentially & largely made on clinical grounds, but even then different possibilities are there. The prevalent age group in our study was from (11) to (30) years (71.4%) & the lowest rate were encountered in children & the elderly. These results are comparable with the results of a study done in Nineveh, Iraq, 1998.⁽¹²⁾ & also with a study done in Pakistan at 2003.⁽¹³⁾ The frequency distribution of the patients included in our study according to Modified Alvarado Score demonstrate that the highest frequency was encountered with those who scored (6) (40 patients, 26.7%) & the lowest frequency was in those scored (9) (20 patients, 13.3 %). However, (79) patients (52.6%) of the total (150) patients included in this study were with score of (7) or more & (71) patients (47.4%) were with score of less than (7) (5-6). These results are comparable to the results shown by a study done in Nineveh, Iraq, 1998.⁽¹²⁾ & also with the results of a study done in Pakistan at 2003.⁽¹³⁾

Initial assessment of the patients can be improved by clinical scoring system.^(14,15) & in the past few years various scores have been developed to aid the diagnosis of acute appendicitis.^(16,17,18) However, most of them are complex & difficult to implement in clinical situation.^(19,20,21) Our findings demonstrate that Modified Alvarado Score carries results which may vary according to the age group (adult versus children) & gender. For adult male patients with suspected acute appendicitis, the Modified Alvarado Score gives a sensitivity rate of (88.9%) while in adult female & especially those at child bearing age Modified Alvarado Score gives a sensitivity rate of (80.6 %) with a false (+ve) rate of (10.7). These findings are similar to the results of a study done in Nineveh, Iraq, 1998 & also similar to the conclusions of a study done by Owen *et al.*⁽¹²⁾ However, they are not similar to the results of a study done in Southern Region, Kingdom of Saudi Arabia (sensitivity male 56.4%, sensitivity female 48%). Our study also revealed that Modified Alvarado Score is more helpful in adult male than adult female patients by showing lower (-ve) appendectomy rate & higher (+ve) predictive value in adult male as compared to adult female patients, as the (-ve) appendectomy rate for adult male were (11.7%) while, in adult female it was (18.4%) & the (+ve) predictive value were (95.2%) & (89.3%) for adult male & female respectively. These results are comparable to a study done in Pakistan, 2003, also these results are supported by literature figures.^(23,24,25) Literatures show that if (-ve) appendectomy rate is less than (10- 15%), then the surgeon is operating too few patients thus increasing the risk of complications.^(26,27) In children with acute appendicitis the sensitivity rate of Modified Alvarado Score in our study was very low (53.8%) & its specificity rate was (75%) with a false (+ve) rate of more than (22%), & to be useful, a scoring system must be both sensitive & specific. These findings are comparable to the results of a study done in Nineveh, Iraq, 1998 & is also similar to the results of a study done by Macklin CP.⁽²⁰⁾ The (+ve) predictive value for the children included in our study was (77.8%). Studies evaluating the usefulness of Alvarado scoring system in paediatric age group show that it is accurate in children with (+ve) predictive value up to (85.7%).^(28,29,30) The overall sensitivity & specificity of our study were (80.9%) & (88.5%) respectively. These results are comparable to the results of a study done in Nineveh, Iraq, 1998 & is also comparable to the results of a study done by Fenyo G, but our results are not similar to the results of a study done in Southern Region, Kingdom Saudi Arabia. Our study revealed a total negative appendectomy rate of (15.2%) with a (-ve) appendectomy rate of the adult male, adult female & children of (11.7%), (18.4%), & (18.7%) respectively. These results are comparable to the results of a study done in Pakistan at 2003, & are also similar to the results of a study done by Fenyo.⁽³¹⁾ & is comparable to the figures shown in literature (15.62%).^(32,33) Our study showed a low incidence of perforation (7.6%) which can be explained by the fact that perforation in acute appendicitis is clearly more common in children & elderly people.^(34,35) The percentage of both of these groups is low in our study, as well as, the more accurate diagnosis depending on the application of Modified Alvarado Score. These results are comparable to the results of a study done in Nineveh, Iraq, 1998 & is also comparable to the results of a study done in Pakistan at 2003.

Conclusions & Recommendation:-

1. Modified Alvarado Score is a non invasive, safe diagnostic procedure which is simple, fast, reliable & repeatable tool to apply in emergency departments to role in acute appendicitis. It allows observation & critical reevaluation of the evolution of the clinical picture. We suggest its application in order to increase the diagnostic certainty of clinical examination in diagnosis of acute appendicitis especially by junior surgeons.
2. Modified Alvarado Score appeared to be effective in adult male patients, while in adult female patients specially those in child bearing age, additional investigations may be required, so we suggest the provision of (24) hours ultrasound facility to confirm or exclude the possibility of other pathologies in doubtful cases. In pediatric age group it was not successful enough to be useful complementary method in the diagnosis of suspected cases & because our study included only a small number of children we suggest a prospective study

to be conducted purely on patients within pediatric age group to assess precisely the validity of the Modified Alvarado Score in these cases.

3. Our study demonstrates comparable results of negative appendectomy rate with that of literature figures, which signifies that the application of Modified Alvarado Score improves the diagnostic accuracy & consequently reduces the negative exploration & complication rates.

CD4+CD25+, T regulatory cells, Breast cancer

Abstract

Treg cells have an important role in cancer, enabling tumors to elude host anti-tumor immune response. CD4+CD25+ Treg cells constitute 5–10% of peripheral blood CD4+ lymphocytes. Also, CD8+CD25+ cells have been shown a suppressive effect and share phenotypic and functional features with CD4+CD25+ Treg cells.

Aim of the work: This work was done to evaluate the frequency of expression of different Treg cells in the peripheral blood of breast cancer patients and to elucidate their impact on clinical and laboratory parameters.

Patients and Methods: This study included forty-seven Egyptian breast cancer patients (30 de novo patients and 17 after surgery patients) and 13 healthy controls and 18 benign breast patients. They were tested by Flow Cytometry

Results: CD4+CD25+ Treg cells were significantly higher in the de novo compared to the healthy controls and in the after-surgery group compared to the healthy controls and benign breast groups ($P < 0.0001$), while CD4+CD25hi were significantly higher in both de novo and after surgery patients as compared to healthy controls ($P < 0.0001$).

Conclusion: some Treg cells as CD4+CD25+ cells are predominant in breast cancer patients.

Introduction: -

Breast cancer is the most frequently diagnosed cancer and the leading cause of cancer deaths among females worldwide, accounting for 23% of the total new cancer cases and 14% of the total cancer deaths in 2008 (Jamal et al. 2011). Breast cancer patients have immune system functional deviations, that affect immune cells that infiltrate the tumor, but also cells from the blood compartment, even in the absence of a metastatic disease (Pinho et al., 2016).

Regulatory T-cells (Treg cells) are a variety of cells that display the capacity to suppress T-cell proliferation in vitro and prevent immune pathology in vivo. Treg cells have an important role in cancer, enabling tumors to elude host anti-tumor immune response (Maggiet al., 2005).

CD4+CD25+ Treg cells constitute 5–10% of peripheral blood CD4+ lymphocytes (Maggiet al., 2005). They express CD25 (the alpha chain of the IL-2 receptor), cytotoxic T lymphocyte-associated antigen-4 (CTLA-4), a glucocorticoid induced TNF receptor (GITR), and a novel member of the fork head transcription factors (Foxp3) (Zhang et al., 2007).

CD8+CD25+ cells have been recently shown a suppressive effect. CD8+CD25+Treg cells share phenotypic and functional features with CD4+CD25+ Treg cells (Cosmi et al., 2003).

The aim of this study is to evaluate the frequency of expression of different Treg cells in the peripheral blood of Egyptian breast cancer patients and compare their expression with healthy controls and benign breast patients. In addition, to study the relationship between different Treg cells and clinical and laboratory findings and response to treatment in such patients.

Patients and Methods: -

Forty-seven breast cancer patients, 30 de novo patients (before surgery) and 17 after surgery patients, 13 benign breast disease patients, and 18 apparently healthy volunteering females as a control group were included in this study. The patients were presented to the outpatient's clinic at the National Cancer Institute (NCI), Cairo University over a period of consecutive 11 months. Malignancy was confirmed by histopathological examination. Written informed consent was obtained before enrollment into the study according to ethical committee. Investigations performed included routine hematological and biochemical investigations, and CEA and CA15.3 evaluations.

Methods: -

Flow cytometric analysis of Treg cells: -

Isolation of mononuclear cells and cell culture: -

Three to four ml of heparinized blood from each sample was added to 15 ml centrifuge tube and diluted 1:1 with sterile PBS without Magnesium or Calcium salts (*Biowest, France catalog no: L0615*) under sterile conditions. Ficoll-Hypaque media of density 1.077 gm/ml (*Lymphosep, Lymphocyte Separation Media- Biowest, France Catalog no: L0560*) was used to separate the PBMCs. The mononuclear cells were washed and re-suspended under sterile conditions in 3 ml RPMI 1640 with L-Glutamine medium (*Biowest, France catalog no: L050*) containing 10% Fetal Bovine Serum (*Biowest, South America catalog no: S1810*) and 2 % Antibiotic-Antimycotic 100x (*Biowest, France catalog no: L0010*) which contains Penicillin G, Streptomycin Sulfate & Amphotericin B. Two ng/ml IL2 (*Sigma, catalog no: 151342*) were added for T cell activation. The cells were incubated at 37°C, 5% CO₂ for 48 hours.

Monoclonal Antibodies: -

Fluorescent labeled mouse monoclonal antibodies anti-Human CD4-FITC (*Catalog no: F0766, Clone MT310*), CD8-PE (*Catalog no: R0806, Clone DK25*), CD25-FITC (*Catalog no: F0801, Clone ACT-1*), CD25-PE (*Catalog no: R0811, Clone ACT-1*) and CD3-RPE-Cy5 (*Catalog no: C7067, Clone UCHT1*) were obtained from DakoCytomation, Denmark.

Flowcytometric analysis: -

CD4+CD25+ Treg cells were studied with triple staining of anti-CD4 FITC, anti-CD25 PE and anti-CD3 RPE-Cy5, and CD8+CD25+ Treg cells were studied with anti-CD25 FITC, anti-CD8 PE and anti-CD3 RPE-Cy5 using COULTER® EPICS® XL™ Flow Cytometer instrument. To determine the percentage of CD4+Treg cells, lymphocytes were gated by plotting forward versus side scatter followed by gating on CD3+CD4+ T cells. These cells were then analyzed for CD25 expression; CD4+CD25hi were also identified as a tail from the major population of CD4+CD25 cells (Baumgartner and McCarter, 2009). CD8+ Treg cells were detected as percentage of CD8+CD25+ population gated from CD3+ lymphocytes (Fig 1).

Statistical analysis: -

Data management and analysis were performed using the Statistical Analysis System (SPSS) version 17 software. Comparison of groups with respect to numerical variables was done using the Mann-Whitney test. The Kruskal Wallis test was used to compare medians of 3 or more independent groups. Spearman's rank correlation was used to measure the strength of association between 2 numerical variables. All p-values were two sided, P-values ≤ 0.05 were considered significant.

Results: -

Characteristics of the de novo, after surgery & benign patients' groups are shown in (Table 1.a & 1.b).

CD4+ lymphocytes % were higher in normal controls and de novo patients compared to the after-surgery patients (P=0.04) (Table 2).

CD4+CD25+ Treg cells were significantly higher in the de novo compared to the healthy controls and in the after-surgery group compared to the healthy controls and benign breast groups ($P < 0.0001$), while CD4+CD25hi were significantly higher in both de novo and after surgery patients as compared to healthy controls ($P < 0.0001$) (Table 2).

A significant positive correlation was detected between CD4+CD25+ and CD4+CD25hi Treg cells in both de novo and benign patients' groups, while a significant negative correlation was detected between CD4+CD25 and CD8+CD25+ Treg cells in the after-surgery group (Table 3).

CD4+CD25+ Treg cells showed significant negative correlation with age in both de novo and after surgery groups ($P = 0.038$, $r = -0.388$ & $P = 0.012$, $r = -0.612$ respectively), and significant positive correlation with CEA in the benign group ($P = 0.005$, $r = 0.722$). CD8+CD25+ Treg cells showed significant positive correlation with age in the after-surgery group ($P = 0.048$, $r = 0.487$) (Table 4).

CD4+CD25+ and CD4+CD25hi Treg cells were higher in premenopausal compared to postmenopausal de novo breast cancer patients ($P = 0.017$ and 0.051 respectively). CD4+CD25hi Treg cells were significantly higher in the non-metastatic compared to the metastatic patients in the de novo group ($P = 0.041$), while CD4+CD25hi Treg cells were higher in grade III compared to grade II patients in the after-surgery group ($P = 0.011$) (Data not shown)

Discussion: -

In Egypt, breast cancer ranked the first, constituting 17.50% of total malignancies in females (Meloni et al., 2006).

Although T cells represent the most important immunological response in tumor growth, they become suppressive CD4⁺ and CD8⁺ Treg cells after chronic stimulation and interactions with tumor cells, thus promoting rather than inhibiting cancer development and progression (Mokhtar et al., 2007).

In this study, CD4+ lymphocytes were predominant in peripheral blood of de novo breast cancer patients and healthy controls groups compared to the after-surgery group ($P = 0.04$).

Mozaffari et al. (2007) reported the same predominance of absolute number of CD4+ lymphocytes although it was statistically non-significant. Leong et al. (2006) showed that CD4+ lymphocyte % was the 2nd predominant subset (after CD8+) in the tumor microenvironment. Different sample analyses and different sample sizes may be the contributing factors for this discrepancy.

Tumor cells commonly participate in the generation of Treg cells, which provides an explanation for the observation that elevated numbers of Treg cells have been found in many types of cancer. It appears that TGF- β , secreted by the tumor itself or tumor-stimulated myeloid cells, plays a central role in tumor-mediated development of Treg cells by converting naïve T cells into Treg cells (Perez et al., 2007).

As regards CD4+CD25+ and CD4+CD25hi, they were significantly higher in the de novo and the after-surgery cancer patients compared to the healthy controls and the benign patients' group.

Our result is consistent with Wang et al. (2011) who found the same result in their study on peripheral blood of de novo breast cancer patients.

In our study, CD4+CD25hi subset was higher in the after-surgery patients compared to the de novo patients ($P = 0.04$) and this was in accordance with the finding of Mozaffari et al (2007).

CD8+CD25+ Treg cells share phenotypic and functional features with CD4+CD25+ Treg cells (Cosmi et al., 2006). We detected that the benign patients group had the highest percentage of CD8+CD25+ Treg cells subset, followed by the after-surgery group. The de novo breast cancer patients and healthy controls group were almost the same, the differences were non-significant. Mozaffari et al. (2007) reported a significant increase in CD8+CD25hi Treg cells in breast cancer patients after receiving adjuvant therapy compared to the de novo patients. Consistently, Shao et al. (2017) reported that the proportion of regulatory T cells (Treg) after chemotherapy in the disease control patients decreased significantly compared with that of the progressive patients and this difference affected

significantly the overall survival. Pinho et al (2016) found that breast cancer patients have higher percentage of effector CD8+ T cells compared to healthy donors.

T-reg cells can offer a new insight into improving cancer therapies. Combined chemotherapeutic and immunomodulatory agents that showed their effect on T-reg can lead to marked suppression of tumor growth and prolongation of survival time (Xia et al., 2017 and Hekim et al., 2017).

A significant positive correlation was detected between the CD4+CD25+ % and the CD4+CD25hi % in the de novo breast cancer patients group ($P < 0.0001$, $r = 0.673$) and in the benign group ($P = 0.002$, $r = 0.79$), while there was a significant negative correlation between the CD4+CD25+ % and CD8+CD25+ % in the after-surgery patients group ($P = 0.018$, $r = -0.583$).

In agreement with our results, Zhu et al. (2015) and Leong et al. (2006) have demonstrated an insignificant negative correlation between the CD4+CD25+ cells and CD8+CD28+CD25+ obtained from TILs of breast cancer patients. They also found a significant positive correlation between CD4+CD25+ and CD8+CD28- subsets. In that study, CD8+CD28+CD25+ were defined as effector T cells and CD8+CD28- subset as Treg cells.

In our study, the observed negative relationship may be explained by the finding that not all CD8 + CD25+ population are Treg cells (Bisikirska et al., 2005).

Correlating CD4+CD25+ % and CD8+CD25+% with some of the prognostic factors of breast cancer revealed a significant negative correlation between the CD4+CD25+ % and the age in the de novo and after surgery groups. However, a significant positive correlation was found between CD8+CD25+% and age in the after-surgery group.

Similarly, Chui et al. (2004) reported that CD4+ Treg cells were higher in the blood of breast cancer patients < 65 years in age. Tsaknaridis et al. (2003) also demonstrated that the suppressive activity of human CD4+CD25+ T cells declines with age in his study done on normal subjects. In contrast, Leong et al. (2006) found a significant positive correlation with age (> 50 years old).

This diversity of results may be due to differences in sample size or ethnic diversity.

Regarding tumor markers, a significant positive correlation was detected in the benign patients between CD4+CD25+ % and CEA ($P = 0.005$, $r = 0.722$), while CA15.3 didn't show any significant results. In contrast, Abo-Elainen et al. (2008) reported a significant positive correlation between CD4+CD25+% in the peripheral blood of 30 female breast cancer patients and CA15.3 ($P = 0.880$, $r = 0.001$). This may be explained by the different stages of breast cancer patients enrolled in both studies.

CD4+CD25hi % was significantly higher in the non-metastatic group compared to the metastatic group in de novo patients ($P = 0.041$). Many studies have demonstrated that a higher Treg cells number within the tumor microenvironment or in peripheral blood would imply a worse prognosis and reduced survival (Wilke et al., 2010).

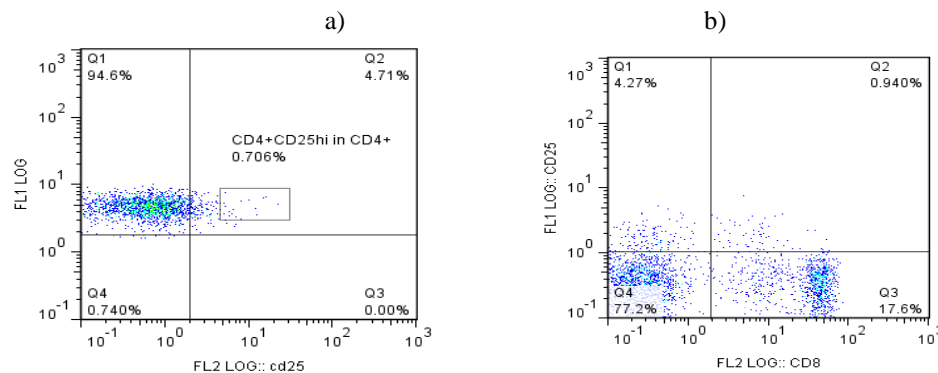

Significant higher percentage of CD4+CD25hi in the after-surgery group was detected in grade III compared to grade II ($P = 0.011$). This was inconsistent with Leong et al. (2006).

We didn't find any significant relationship between CD4+CD25+ % or CD4+CD25hi % and the tumor stage, ER, PR or Her2neu status in both the de novo and the after-surgery patients groups. Our results are consistent with Song et al (2015) but different from Perez et al. (2007). Also, Mahmoud et al. (2011) and Bates et al. (2006) found significant correlations between Treg cells infiltration and ER negativity in breast cancer patients. Liu et al (2014) found that CD4+CD25+FOXP3+ regulatory TILs are a poor prognostic indicator in ER+ breast cancer, but a favorable prognostic factor in the HER2+/ER-ve subtype. Leong et al. (2006) found a significant positive correlation between CD4+CD25- T subset of TILs in breast cancer patients and ER. Estrogen has been reported to play a role in regulating the activation of human T cells particularly CD4+ and CD8+ T cells. The importance of ER- α in regulating the immune system is further supported by an in vivo murine model, where a high frequency of immature double CD4+CD8+ thymocytes was found in ER- α -negative mice as compared to the ER- α positive mice (Erlandsson et al., 2001).

This discrepancy between results may be attributed to the predominance of ER positivity in our studied population, different ethnic groups or menopausal status of the studied population.

In conclusion, some Treg cells as CD4+CD25+ cells are predominant in breast cancer patients, and show negative correlation with age and with CD8+CD25+ lymphocytes, which are predominant in the benign patients and after surgery patients.

Treg cells may play a role in modulation of effector T cell responses against breast tumors. Some Treg cells such as CD4+CD25+ cells maybe increased in cases of malignancy, while others, as CD8+CD25+ lymphocytes seem to play a protective role against malignancy. Further studies and larger sample sizes are needed to clarify the diagnostic and prognostic role of Treg cells in breast cancer progression. Treg can act as an immune-modulator in the therapeutic treatment of breast cancer patients weather alone or in combination with therapeutic vaccines and cytokines.

(Fig 1) a):- Positive expression of CD4+CD25+ and CD4+CD25hi subsets gated from CD4+ lymphocytes in a de novo patient. b) CD8+CD25+ subsets histogram from CD3+ lymphocytes gate in an after-surgery patient.

Table (1.a):- Clinical data of the de novo, after surgery and benign patients.

Abstract

The study was carried out from February, 2013 to May, 2013 in Jimma to assess the common spoilage fungi from infected fruits of tomato (*Lycopersicon esculentum*) and orange (*Camellia sinensis*) in Jimma town (Agip, Kochi and Bishishe) market sellers. Mycological investigation on spoilage fungi from 40 (20 from each) apparently infected *C. sinensis* and *L. esculentum* was carried out. Potato Dextrose Agar was used for fungi isolation and purification following standard procedures. Pure cultures were identified morphologically to the genus level. A total of 56 spoilage moulds were isolated from the two different types of deteriorating fruit samples, from which 52 (92.85 %) isolates were identified and the remaining 4 (7.15 %) were unidentified. The fungal species *Aspergillus* spp., (13.46) *Penicillium* spp., (19.2) *Rhizopus* spp., (1.92) *Mucor* spp., (5.76) *Fusarium* spp., (3.84), *Byssoschlamy* spp. (3.84) and *Cladosporium* spp. (1.92) were found to be associated with deterioration of orange. The fungal isolates associated with the spoilage of tomato were *Aspergillus* spp., (7.69) *Penicillium* spp., (9.61) *Rhizopus* spp., (7.69) *Mucor* spp., (9.61) *Fusarium*, (9.61) and *Monilia* spp. (5.76). Generally, of all isolated moulds *Penicillium* spp. was the dominant isolate 15 (28.81%), followed by *Aspergillus* spp. 11 (21.15). *Byssoschlamy* spp. And *Cladosporium* spp. were the least encountered 2 (3.84%) and 1 (1.92%), respectively. The results of this study indicate that fruits sold at Agip, Kochi and Bishishe were massively infected with spoilage fungi due to lack of selling parameters of fruits found in Jimma town market sellers. So, appropriate measurement must be taken by responsible bodies to reduce the fungal load and to enhance the quality of fruits sold in Jimma town.

Introduction:-

Fruits and vegetables are very important and have high dietary and nutritional quality. Fruits play a vital role in human nutrition by supplying the essential growth factors such as vitamins and essential minerals to the regular diet, which is necessary for the good and normal health. Consumption of fruit and vegetable products has dramatically increased by more than 30% during the past few decades (Barth et al., 2009). Fresh fruit and vegetable consumption increased by 25.8 and 32.6% respectively and far exceeded the increases observed for processed fruit and vegetable products. Fruits and vegetables are a major source of macronutrients such as fiber and micronutrients such as

minerals and vitamin C, thiamin, riboflavin, B-6 niacin, folate, A and E (Rickman et al., 2007). The fruits of tomato are popular throughout the world and are used in all kind of stews, soups and also eaten raw in salads. Ripe tomato fruits have high nutritive values, being a good source of vitamin A, B, C and minerals (Elsayed and Edrees, 2014). According to Wada and Ou (2002) fruits and vegetables are well known for their antioxidants compounds that protect against oxidative damage caused by free radicals, and they have been shown to be effective in helping to prevent retinal disease such as muscular degeneration. And also tomato plant contain antioxidant phytochemicals such as the carotene and lycopene (Wogu and Ofuase, 2014; Sravanthi and Gangadhar, 2015).

Traditional varieties of fruits like avocado, banana, orange and papaya are affected by a wide array of microorganisms. Spoilage refers to any change in the condition of food in which the food becomes less palatable, or even toxic: these changes may be accompanied by alteration in taste, smell, appearance or texture (Akinmusire, 2011). One of the limiting factors that influence health and economic values of the fruit is the relatively short lifespan. Fruits deteriorate rapidly after harvest and in some cases do not reach consumers at optimal quality after transport and marketing. The main causes of fruit deterioration are dehydration, weight loss, color change and microbial spoilage. However, deterioration rate is affected by different factors like temperature, relative Humidity and storage atmosphere condition (Sherratt et al., 2006).

Fungal fruits infection may occur during the growing season, harvesting, transport and post-harvest storage and marketing transport and post-harvest storage and marketing conditions, or after purchased by the consumer. The important post-harvest disease causing fungi include *penicillium*, *Aspergillus*, *Alteranaria species*, *Botrytis cinerea*, *Molniliinia lax* and *Rhizopus stolonifer* (Ogawa et al., 1995). Fruits particularly tomatoes and orange are eaten raw and tomatoes are also eaten cooked. Spoilage fungi that typically produce more diverse and greater amounts of extracellular depolymerases successfully attack both fruits (Barth et al., 2009). And also an abundance of extracellular pectinases and hemicelluloses produced by the fruits are important factors for fungal spoilage (Miedes and Lorences, 2004).

Although available literatures revealed that the importance of fruit is increasing daily, the incidence of microbial attack on this fruit demands attention. Janisiewicz and Korsten (2002) also remarked the exploration of plant extracts have shown to be great potential and may be used as alternative to synthetic fungicides. The purpose of the current investigation was to isolate and characterize some fruit spoilage fungi.

Materials and Methods:-

Description of study area:-

This research was conducted in Jimma town, which is the largest city in Southwestern Ethiopia. Jimma town is located 353km southwest of the capital city of Ethiopia, Addis Ababa. And the city is located between 1,500 - 2,400 m above sea level and the total population was about 120, 969 in 2007. It lies in a climatic zone locally known as Woyna degas which is ideal for agriculture as well as human settlement. The town is characterized by warm climate with a mean annual maximum temperature of 30°C and minimum of 14°C. The laboratory based study was conducted at microbiological Laboratory of Department of Biology, Jimma University during the period from February, 2013 to May, 2013.

Fruit source:-

Fruits of orange and tomato which were found with symptoms of fungal infection were purchased from Agip, Kochi and Bishishe market sellers in Jimma town.

Sample size determination:-

Purposive sampling technique was used to determine the sample size and assess the common fungal pathogens from infected orange and tomato, from Jimma town market sellers. A total of 40 samples comprising 20 samples from each fruit were collected randomly from Agip, Kochi and Bishishe markets. Ten of the samples (5 orange and 5 tomato) were collected from Agip market, the other 10 samples consisting 5 samples from each fruit were collected from Kochi market and the rest 20 samples comprising 10 samples from each fruit were collected from Bishishe market this is because Bishishe Market in Jimma town serves as the main depot where the major fruit dealers and suppliers sell to petty traders who in turn distribute to other local markets (Agip and Kochi) and cafeterias throughout the town. The fruits were sourced from areas like Mizan, Tepi, Addis Ababa and neighboring woredas within the Jimma zone itself. All of the 40 fruit samples were purchased from different vendors, so 40 fruit vendors were visited to collect all the samples.

Collection of infected fruit:-

Fruit types of orange and tomato with the common post-harvest disease symptoms were collected using sterile polyethylene bag from Agip, Kochi and Bishishemarkets in Jimma town. A total of 40 samples comprising 20 samples from each fruit were collected randomly from the venders and it was transported aseptically to the laboratory of microbiology, department of Biology, Jimma University for further analysis.

Isolation of fungi:-

Potato dextrose agar medium was prepared using distilled water and it was sterilized within an autoclave. The petridishes were also sterilized to kill any microbial contamination. In order to suppress bacterial growth, chloramphenicol of 35-100mg 100ml⁻¹ of PDA was poured on the already sterilized petridishes and it was left open for a few minute inside a laminar flow to be solidify, then the petridishes were closed to prevent other contamination. Fruits of orange and tomato were surface sterilized by exposing them in 90% ethyl alcohol for 1 min and 3 min to 1% sodium hypochlorite and then, it was rinsed three times in sterile distilled water. Segments (3-5cm), which cut with a sterilized scalpel was placed on previously prepared potato dextrose agar (PDA in case of both orange and tomato) in petridishes and they were incubated at 21°C for 5 to 7 days. After incubation, the colonies were observed. To get a pure culture, each of the emerging mycelium was transferred to fresh solid medium. The pure culture of each colony on different plates were obtained and they were prepared for characterization

Characterization of the isolates:-

The pure isolated fungi were identified using cultural and morphological features according to the most documented keys in fungal identification (Domsch *et al.*, 1993; Klich, 2002; Samson and Varga, 2007). The identification of fungal isolate was based on colony characteristics and conidial features of the isolates within genus level. The isolates were also identified by comparing their characteristics with those of known taxa, as described by Jolt *et al.* (1994) and Oyeleke and Manga (2008). To apply this, slide cultures were prepared for each of the isolates. The identified fungi were smoothly caught (2-3cm) with sterilized scalpel and they were placed on slide.

The technique of James and Natalie (2001) was applied for identification of the unknown isolated fungi using cotton blue in lacto phenol stain. The identification was achieved by placing a drop of the stain on clean slide with the air of mounting needle, where a small portion of mycelium from the fungal culture was removed and place on a drop of lacto phenol. The mycelium spread very well on the slide with the aid of the needle. A cover slip was gently applied with little pressure to eliminate air bubbles. The slides were mounted and observed under compound light microscope with magnification power of x10 and 40 objective lenses, respectively.

Results:-

Isolation of spoilage moulds from fruits:-

In this study, a total of 52 fruit spoilage moulds were isolated from 40 samples of deteriorating Orange (*Citrus sinensis*) and Tomato (*Lycopersicon esculentum*) fruits purchased from Kochi, Agip and Bishishe markets of Jimma town (Table 1). Of the total isolates, 26(50%) of the spoilage fruits were isolated from Orange (*Citrus sinensis*) and the remaining 26(50%) of the spoilage fruits were isolated from Tomato (*Lycopersicon esculentum*).

Table 1:- Total number of spoilage moulds isolated from deteriorating fruits sold at Kochi, Agip and Bishishe markets, Jimma town.

Fruits	No of samples	No of isolates	Isolates Proportion (%)
<i>C. sinensis</i>	20	26	50%
<i>L. esculentum</i>	20	26	50%
Total	40	52	100%

Characterization of the isolates

Physically observation of the diseased fruits revealed brownish, necrotic patches on the skin of the orange and tomato fruits. Table 2 shows that the colonial and morphological characteristic of the isolated spoilage moulds of fruits.

Table 2:- Colonial and morphological characteristics of moulds associated with the spoilage of fruits.

Isolates	Colonial characteristics	Microscopic morphology	Suggested Genus
JUO 01-02 JUT 03-07	Cottony, pink, purple, brown colonies.	Extensive septet mycelium and conidiophores simple or branched with ovoid to elongated conidia of variable size. Septate fusiform, slightly curved and pointed at both ends.	<i>Fusarium</i> spp.
JUO 08-17 JUT 18-22	Greenish or blue green colonies.	Conidia in long chains on repeatedly branched conidiophores resembling a brush like head (penicillus). Conidiophores smooth, relatively short. Penicillia mycelia arranged very irregular and asymmetrical with branches of various lengths.	<i>Penicillium</i> spp.
JUO 23-29 JUT 30-33	Colonies with loose white to yellow mycelium rapidly becoming dark brown to black on the development of conidia. Colonies light green-yellow.	Black, brownish black, purple brown Conidiophores and yellow to green conidia with dark sclerotia. Microscopically conidiophores arising from a foot-cell, catenate (basipetal) conidia on phialides (1or 2 series) on vesicle.	<i>Aspergillus</i> spp.
JUO 34 JUT 35-38	White to dark grey colonies, fast growing and filling the petri dish with dense cottony mycelium, producing mass of sporangia.	Nonseptate mycelium with root like rhizoids; black columellate, sporangiophores, in clusters and dark sporangia containing dark to pale spores.	<i>Rhizopus</i> spp.
JUO 39-41 JUT 42-46	Nonseptate hyphae, cottony colony, Smooth, non-striated Sporangiophores and Produce no rhizoids	Nonseptate or sparsely Septate, broad hyphae, sporangiophores, Sporangia and spores are visualized. Apophysis, rhizoid and stolon are absent.	<i>Mucor</i> spp.
JUO 00 JUT 47-49	Pink, gray, or tan conidia	Asterisk-like shape of the colony. Type "S" colonies grew slowly and stopped after days entirely.	<i>Monilia</i> spp.
JUO 50-51 JUT 00	Cottony colony Absence of ascocarps, asci in open clusters	Phialides with cylindrical bases that taper abruptly into long cylindrical necks and produce catenate conidia.	<i>Byssoschlamys</i> spp.
JUO 52 JUT 00	Thick, velvet colony, green, olive green, darkblue, black or brown colony and some lemon shaped conidia variously branched	Hyphae are Septate and brown in color. Conidiophores are brown and often Septate. Conidiophores are erect, straight or flexuous, unbranched or branched only in the apical region	<i>Cladosporium</i> spp.

Legend: O= Orange; T= Tomato; n= Code no of isolates

Occurrence of Fungi Isolates Associated with the Spoilage of Fruits:-

Of the total 56 spoilage moulds isolated from the two different types of deteriorating fruits (*C. sinensis* and *L. esculentum*), 52(92.85 %) isolates were characterized and identified as *Aspergillus*, *Fusarium*, *Penicillium* and *Rhizopus*, *Mucor*, *Monilia*, *Byssoschlamys* and *Cladosporium*spp. The remaining 4(7.15) were uncharacterized since

they were totally contaminated with bacterial growth. Generally, of all isolated moulds *Penicillium* sp. was the dominant isolate 15(28.81%), followed by *Aspergillus* sp. 11(21.15). *Byssoschlamys* and *Cladosporium* spp. were the least encountered 2(3.84%) and 1(1.92%), respectively (Table 3). In addition, most of the spoilage fungi were wide spread among all examined fruits. However, no *Monilia* was isolated from orange and no *Byssoschlamys* and *Cladosporium* spp. were isolated from tomato (Table 3).

From this outcome, it can be concluded that, *Penicillium* was the most spoilage fungi of orange and tomato than other fungal species. Next to *Penicillium*, *Aspergillus* was the dominant one for the spoilage of orange. And *Monilia*, *Byssoschlamys* and *Cladosporium* were found in small percentage compared to others.

Table 3:- Prevalence of spoilage moulds isolated from deteriorating fruits sold at Kochi, Agip and Bishishe, Jimma town, 2011/12.

	Orange (No of samples 20)	Tomato (No of samples 20)	
	No of isolates	No of isolates	Total
<i>Fusarium</i> sp.	2(3.84)	5(9.61)	7((13.45)
<i>Penicillium</i> sp.	10(19.2)	5(9.61)	15(28.81)
<i>Aspergillus</i> sp.	7(13.46)	4(7.69)	11(21.15)
<i>Rhizopus</i> sp.	1(1.92)	4(7.69)	5(9.61)
<i>Mucor</i> sp.	3(5.76)	5(9.61)	8(15.37)
<i>Monilia</i> sp.	-	3(5.76)	3(5.76)

<i>Cladosporium</i> sp.	1(1.92)	-	1(1.92)
al	26(50)	26(50)	52(100)

Note: Values in parenthesis are percentages of the isolated moulds.

Discussion:-

The findings of this study showed that *Aspergillus*, *Fusarium*, *Penicillium*, *Rhizopus*, *Mucor*, *Monilia*, *Byssoschlamys* and *Cladosporium* spp. were isolated from fruits sold in main markets of Jimma town (Kochi, Agip, and Bishishe). All the post-harvest spoilage moulds except *Monilia* spp. were found to be associated with spoilage or deterioration of orange (*Citrus sinensis*). Similarly, Al-Hindi et al. (2011) have reported that *A.niger*, *P. digitatum* and *R. stolonifer*, *Byssoschlamys* spp., *Cladosporium* spp. and *Mucor* were implicated in spoilage of *Citrus sinensis*. Tournas and Katsoudas (2005) also reported that *Fusarium* spp. were the most common fungi in citrus fruits. Bukar et al., (2009) also revealed that, the most predominant fungus isolated from the orange (*Citrus sinensis*) were, *Aspergillus* sp; others include *Mucor* sp, *Penicillium* sp, *Rhizopus* sp *Fusarium* sp, and *Alternaria* spp. A study conducted by Oviasogie et al., (2015) also confirmed that the fungal pathogens associated with the spoilage of orange (*Citrus sinensis*) were *Aspergillus* spp. *Penicillium* spp. *Mucor* spp. *Rhizopus* spp. *Candida tropicalis* *Saccharomyces cerevisiae* and *Alternaria* spp. in which *Aspergillus* spp. was the predominant fungal pathogen.

In the case of tomato fruits (*L. esculentum*), *Aspergillus*, *Penicillium*, *Rhizopus*, *Fusarium*, *Mucor* and *Monilia* spp. were implicated in its spoilage. In line with this, Mitra (1997) has discovered that the species of fungi associated with the spoilage of *Citrus sinensis*, *Asiminatriloba* and *L. esculentum* fruits include species of *Aspergillus*, *Fusarium*, Yeast, *Penicillium*, and *Rhizopus*. *A. flavus* and *A. Fumigatus* caused *L. esculentum* spoilage were also investigated by Al-Hindi et al. (2011). Seven fungal pathogens were associated and responsible for fruit rotting of *L. esculentum* caused by *Fusarium equiseti*, *A. flavus* and *A. niger*. Akinmusire (2011) also reported that fungi affecting *L. esculentum* includes *Fusarium oxysporum*, *Fusarium moniliforme*, *Aspergillus niger* and *Rhizopus stolonifer*. Ugwu et al. (2014) also discovered that the responsible fungal pathogens for the spoilage of tomato were *Candida tropicalis*, *Penicillium notatum*, *Aspergillus niger*, *Fusarium oxysporum*, *Absidia corymbifera*, *Rhizopus stolonifer*

In the current study *Penicillium* spp. was the most spoilage fungi of orange and tomato than other fungal species and this result is in agreement with the study conducted by Mbajiuka and Enya (2014) in which abundant presence of *Penicillium nalgiovense*, *Penicillium notatum* and *Penicillium expansum* were found among other fungi species involved in deterioration of tomatoes fruit.

The diseased fruits sampled from Kochi, Agip and Bishishe market were found to be massively infected with eight genera of fungi namely *Aspergillus*, *Fusarium*, *Penicillium* and *Rhizopus*, *Mucor*, *Monilia*, *Byssoschlamys* and *Cladosporium* spp. and four other uncharacterized spoilage moulds. The prevalence of fungi as the spoilage organism of fruits is due to a wide range of factors which are encountered at each stage of handling from pre-harvest to consumption and is related to the physiological and physical conditions of the produce as well as the extrinsic parameters to which they are subjected (Effiuvwevwe, 2000). Damage inflicted on produce at the time of harvest is a major cause of infection since most of the spoilage microorganisms invade the produce through such damage tissues; similarly, the extent of deterioration is influenced by the depth of the wound. Furthermore, the incidence of infection is worsened by poor sanitary practices such as cross-contamination, contact infection during the transportation of fruits (Effiuvwevwe, 2000).

Akinmusire (2011) also remarked that the contamination of fruits by fungi could also be as a result of poor handling practices in food supply chain, storage conditions, distribution, marketing practices and transportation. From personal observation at Agip, Kochi and Bishishe, the poor hygienic conditions of the vending house/store, the venders and the utensils used for keeping and weighing the fruits were responsible factors for mixing the deteriorating fruits with the healthier one and many other factors aggravate prevalence of fungi as the spoilage organism of fruits. In addition, the overall weather conditions of Jimma town, especially the high moisture content favours the growth of spoilage moulds on fruits and vegetables vended at Agip, Kochi and Bishishe. According to Alemu et al. (2011) from a climatic point of view, abundant rainfall makes this region one of the best watered of Ethiopian highland areas, conducive for the growth of post-harvest fruit spoilage moulds.

The overall analysis of the isolation and identification process implied various causes for the growth of the moulds on fruits. As clearly described by Korsten (2006), postharvest losses of fruits is a serious problem, because the values of fresh product significantly increase while passing from the farm to the consumers table and due to overpopulation the demand for fruits increases in the world. Fungal pathogens are mainly responsible for postharvest losses of fruits (Korsten 2006).

Conclusions:-

This study detected the profile of spoilage fungi involved in the deterioration of orange and tomato sold in main markets of Jimma town (Agip, Kochi and Bishishe). It showed that, fungi were involved in the spoilage of fruits. *Fungal flora of orange and tomato* samples found from February 2013 to May 2013 were dominated by moulds of *penicillium*, *Aspergillus*, *Mucor*, *Fusarium*, *Rhizopus*, *Monilia*, *Byssoschlamys* and *Cladosporium*. Generally, of all isolated moulds *Penicillium* spp. was the dominant isolate 15(28.81%), followed by *Aspergillus* spp. 11(21.15). *Byssoschlamys* and *Cladosporium* spp. were the least encountered 2(3.84%) and 1(1.92%), respectively.

The results of this study indicate that fruits sold at Agip, Kochi and Bishishe were massively infected with spoilage fungi due to several factors as poor hygienic conditions of the vending site/store, venders and vending utensils. In addition, the high humid content of the vending site also contributes for the spoilage. Mechanical injuries of fruits such as bruises or cuts was occur during harvesting or post harvesting, provide infection site for spoilage of fruits. The high moisture content of fruits and vending/storing site will be a serious limiting factor in their preservation. Since the fruits used in this study are produced in the neighboring woredas of Jimma town, thus, they are transported to the city in locally woven baskets and sacks under weather conditions that encourage the incubation of these contaminating fungi. Generally it can be concluded that, fruit spoilage fungi are caused due to the lack of occurrence of safety fruits within market sellers of Jimma town.

The high prevalence of the spoilage fungi demand that appropriate control measures against infection, should be employed if farmers expect good performance of their produce. Adequate mycological knowledge and handling practices of these produce would therefore help minimize wastes due to deterioration and unacceptability. It is therefore important that both the farmer who harvests the fruits into bags for transportation, the marketers and consumers take necessary precaution in preventing contamination and also try to create an environment that will not encourage the growth or multiplication of spoilage fungi. In addition, the hygienic conditions of vending/storing site, the venders and vending utensils should have to be improved in order to provide fresh and quality fruits for the consumers. This will help in providing fresh and quality fruits for the consumers as well as in preventing the consumption of contaminated fruits thereby reducing the risk of health problems which are produced by these fungi that have been isolated in this study.

This research pointed out the common fungi which spoil fruits of orange and tomato, which are sold in Jimma town market sellers. Thus proper handling of these fruits should be practiced to reduce the fungal genera. The majority of analyzed samples showed the presence of different fungal genera in fruits of orange and tomato. This indicates that the lack of selling parameters of fruits found in Jimma town market sellers. So, appropriate measurement must be taken by responsible bodies to reduce the fungal load and to enhance the quality of fruits sold in Jimma town.

In most unorganized markets, fruits were available in local retain shops without appropriate temperature control and unsuitable storage. This is purchased by households, this leads to the disturbance of the health of the people. So, inhibition of fungal growth by lowering storage temperature through storage under refrigeration and use of fungicides must be applied.

The hygienic and sanitary conditions observed in fruit sellers were not very satisfactory. Thus, they should improve the sanitary condition of fruit markets. In order to improve the quality of fruits, it is better to give awareness for consumers as well as sellers and to all others who have access these fruits must understand about the following critical control points;

Since molecular characterization of the isolates reveals the true diversity of spoilage fungi associated with fruits than the traditional morphological characterization, molecular technique is recommended. This would be the delimitation/drawback of this study.

Abstract

Chronic kidney disease (CKD) is one of the major health problems in modern world. Peripheral neuropathy is considered to be an important complication in these patients. It can cause foot ulcers and may lead to circulatory problems. Regular and timely screening has the potential in reducing the incidence of complications due to peripheral neuropathy. The present study is conducted to measure the frequency of peripheral neuropathy among patients with CKD being treated with hemodialysis.

Objectives:- To measure the frequency of peripheral neuropathy among patients with chronic kidney disease.

Methods:- The current study was conducted in Al-Jabar Kidney Center under the Ministry of Health in Al-Ahsa region, Eastern province, Kingdom of Saudi Arabia. Peripheral neuropathy was evaluated clinically in patients included.

Results:- About 62.5 % patients of CKD were found to have peripheral neuropathy clinically. Out of these 78 % were diabetics while 94 % were hypertensive.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Chronic kidney disease (CKD) is a common disease that is characterized by pathological kidney abnormalities with persistent proteinuria. CKD is divided into 5 stages, based on glomerular filtration rate (GFR). In stage 1 and stage 2, GFR is near normal with functional and structural defects (e.g. hematuria and persistent proteinuria). Stage 3 has low risk of progression to kidney failure, the GFR being 30-59 mL/min. While in late stages, like 4 and 5, there is loss of significant renal function. The last stage (stage 5), called renal failure or end stage renal disease (ESRD), patients need dialysis or kidney transplant. End stage renal disease (ESRD) is the last stage of chronic kidney disease. It is irreversible condition of impairment of renal function when the kidney is unable to detect the balance of fluid and electrolytes, and unable to excrete waste product so, the patient develops uremia. The ESRD has more prevalence among diabetic and hypertensive patients, and is associated with various complications; like cardiac abnormality, neuropathy, hyperlipidemia, anemia and metabolic bone disease. Neurological complications are common in patient with ESRD, secondary to uremic state, affecting nervous system at any level; central and peripheral. So, patient may suffer from prolonged disability, weakness, loss of sensations, and alteration of mental state. Uremic peripheral neuropathy is symmetrical distal polyneuropathy with slowly progressive sensorimotor axonal neuropathy. The presentation of uremic peripheral neuropathy varies from patient to patient. Patients may present by sensory manifestations insidiously, which may consist of tingling and prickling sensation in the lower

extremities, paresthesias, loss of touch, pain and temperature sensations. The rationale of this study is, if there is high frequency of involvement of peripheral neuropathy (loss of position, vibration, pain and touch) in ESRD patients on frequent hemodialysis; then screening for this should be among the routine clinical examination of patients with CKD.

Material and methods:-

The study aims to first determine the frequency of peripheral neuropathy in hemodialysis patient and plan for treatment and prevention if found. The setting was in hemodialysis department, the duration of the study was: 5 months. We used Cross-sectional Study design. Sample size of 80, of which 42 were females and 38 were males, the age group was from 30 to 60 years. Purposive non-probability sample technique. We selected all patients of 30 to 60 years of age, who had ESRD and were on hemodialysis. They varied from medical illness free to patient with hypertension or diabetes. We excluded patients who were previously diagnosed with Peripheral neuropathy.

Data collection procedure:-

After taking clinical history, 80 patients were included in the study with clinical features of renal failure; all patients were on hemodialysis, in department of dialysis, at Al-Jabar Nephrology center in Al-Ahasa. Informed consent was taken from each patient.

Detailed history was obtained. Frequency of neuropathy was detected by clinical examination of the sensations (touch, pain, position, vibration) supervised by consultant. Then according to data, we categorized patients according to age, gender, HTN, DM, the presence of peripheral neuropathy and the affected sensations. Data was entered using excel. Frequency and percentage of neuropathy was calculated with proportions of presence or absence of involvement of clinical symptoms.

Discussion:-

Neuropathy is the late complication occurring in the uremic nephropathy. It has also been resulted from nutritional deficiency, chronic kidney disease and diabetic nephropathy. It's outcomes generally not tolerated, and its main effect regarding sensations include pain, paraesthesias, amputations and disabilities (vagner, 2011). Hot feet sensation a less complications reported in 42% of cases. However, neuropathy is associated with Autonomic dysfunction. In patients with ESRD, sensory ataxia is an important complication. Physiotherapy is the main stay to prevent this ataxia. However, physiotherapy contribute to maintain independence as possible and insure easier mobility. Sensory neuropathy may cause an increased susceptibility to foot ulcer including infections, gangrene, amputations. The literature reveals many reported instances of amputations associated with uremic neuropathy, as well as report of amputations in CKD (PAUL, 1999). The national institute of neurological disorders (NINDS) recommends adapting self-care exercise. In some other studies, more complex treatments recommended with systemic diseases. Although our patients had renal failure, given the irreversible nature of disease with dialysis, uremia toxicity prevention recommended by American family physician (AFP) is kidney transplant. Reported that patients with renal failure who were complicated with neuropathy, had increase chance of morbidity. The median overall morbidity rate was 13% (hari, 2013). Our patients had significant loss of sensations clinically but further evaluation by nerve conduction studies, could not be performed. However, under clinical findings, neuropathy was confirmed by examination. In study we focused on peripheral neuropathy, but there are other studies (Doreen, 2011) on primarily axonal sensorimotor polyneuropathy and they noted that peripheral neuropathy occurs in 50–60% of patients who require hemodialysis. In our patients, we use clinical examination to detect peripheral neuropathy, and we found 50 of 80 patients were having peripheral neuropathy (62.5%), of which 39 were diabetics (78%) and 47 were hypertensive (94%), and we found similar results in other studies (Aggarwal, 2013)

Result:-

Peripheral neuropathy was diagnosed using the previously mentioned methods and the results came as the following:

Details	Number of all patients	Affected
Number of Male	38	21
	48%	42%
Number of Female	42	29
	53%	58%
Total	80	50
		62.50%
Details	Number of patients	

Number of all patients have DM (out of 80)	47
	58.75%
Number of affected patients have DM (out of 50)	39
	78%
Number of all patients have HTN (out of 80)	72
	90%
Number of affected patients have HTN (out of 50)	47
	94%

Type of lost sensation	Number of patients
vibration	19
position	20
pain	6
Touch	22
All	11

Out of 80 patients of renal failure, which were on hemodialysis, 50 patients were having peripheral neuropathy (62.5%) , of which 39 were diabetics (78%) and 47 were hypertensive (94%). Out of 42 female patients, 29 were affected (58%) and out of 38 male patients 21 were affected (42%). Out of the whole 50 affected patients, the fine touch sensation was affected in 22 of them (44%), position sensation was affected in 20 of them (40%) , and vibration was affected in 19 of them (38%), while pain was affected in only 6 of them (12%). We found total impairment of all sensations in 11 of them (22%) and all of these were diabetics for more than 10 years.

This reflects the affected tracts of sensory pathway, as the fine touch and proprioceptive sensation and vibration are the most affected sensations, this indicates that the neuropathy has more impact on the dorsal Column-Medial Leminiscal Pathway, and the least affect is on the lateral spinothalamic tract; which carries the pain sensation.

We also found that the duration of hemodialysis doesn't correlate with the progression of neuropathy, as many patients were affected in all of examined sensations while they just started hemodialysis, but it is correlated with other factors such as the control of the other co-morbidity in which here is diabetes, and the intensity of the hemodialysis and the progression of the underlying pathology of the kidneys.

Conclusion:-

Patients with end stage renal disease in Al-Ahsa have high frequency of peripheral neuropathy, which is more observed in patients with underlying diabetes. Control of diabetes and improved uremic control by frequent hemodialysis improve uremic neuropathy.

Limitations:-

- patients' education level sometimes affects the understanding and the perception of the clinical examination as the examination is subjective to what they feel or think.
- Patients' psychological status at time of examination affects the result either by exaggeration because of depression or denying because of fear.
- couldn't assess the nerve conduction velocity studies and get more accurate results because of lacking of facilities and access to the NCVS.
- no assessment of the crude touch and temperature sensations.

Gastroesophageal Reflux Disease, chronic cough, asthma.

Abstract

Introduction: Gastroesophageal reflux disease (GERD) can cause several esophageal complications, as esophagitis, ulceration, stricture, hemorrhage, and Barrett's esophagus. Though, the associated problems with GERD have expanded to extra esophageal sites. Chronic cough and asthma are two clinical problems caused or triggered by GERD. Spirometric changes among GERD associated cough and asthma still a topic of ongoing research.

Aim of the study: to assess the spirometric parameters of GERD associated cough and asthma patients in relation to different clinical aspects of the disease including body mass index (BMI), disease duration, presence or absence of symptoms as well as endoscopic findings.

Patients and methods: 90 subjects of either sex with a mean age of 40.5±12 year are included in the study, 55 GERD associated cough and asthma patients served as test group while the remaining 35 subjects served as control group, each patient, each patient underwent spirometry and gastric endoscopy during the period from September 2015 to March 2016.

Results: Spirometric data of the control group were within the normal predicted range (80-120%) thus excluding the possibility of any asymptomatic obstructive airway disease. Whereas, the measured spirometric parameters (forced vital capacity (FVC), forced expiratory volume in 1 second ratio (FEV1%), peak expiratory flow (PEF), and forced mid expiratory flow (FMF) are significantly reduced in the test group with a clear restrictive pattern among the overweight subjects. Furthermore, neither the presence nor duration of symptoms affected the spirometric picture of the GERD associated cough and asthma subjects, unlike those with positive endoscopy findings who revealed significant obstructive pattern when compared to those with negative endoscopy findings.

Conclusions: GERD associated cough and asthma patients with positive endoscopy findings showed obstructive pattern of spirometry irrelevant to the presence or absence of symptoms or duration of the disease.

Introduction:-

Gastroesophageal reflux disease (GERD) is a condition that develops when the reflux of stomach contents causes troublesome symptoms and/or complications (1). The true prevalence of GERD in the population is underestimated and the disease is often misdiagnosed. Approximately 20–40% of the adult populations in Western countries suffer from heartburn and/or regurgitation that have a negative impact on the patient's daily activities, sleep and working life, irrespective of the presence or absence of esophagitis (2, 3). According to the Montreal Definition of GERD, concomitant gastroesophageal reflux symptoms is “aggravating factor” to extraesophageal symptoms and lesions like reflux cough, reflux laryngitis and viewed as an reflux asthma (4). Gastroesophageal reflux is a potential trigger of asthma. Approximately 77% of asthmatics report heartburn (5). There is a cause effect relationship between asthma and gastroesophageal reflux which can turn into a vicious cycle (6).

The basic motivation behind conducting the present work was an attempt to answer the questions: Can GERD cause an abnormal spirometry test? An issue of ongoing research.

Patients and Methods:-

Ninety adult patients of either sex aged 40.5 ± 12 years (19– 65years) included in this study, from whom a written consent plus data sheet, including all necessary personal and health information were obtained.

They were classified as:-

(A) Control group: included 35 apparently healthy subjects recruited from patient companions, relatives, and friends in addition to hospital health staff workers after fulfilling the following criteria:

1. Never smokers.
2. No history of any significant pulmonary or cardiac diseases.
3. Clear chest on physical examination.
4. Absence of any musculoskeletal, neuromuscular disorders, or any other condition which could affect spirometry test.

(B) Test group: included 55 patients with gastro-esophageal reflux disease associated cough and/or asthma approved by history, clinical examination and other necessary investigations.

Patients were selected from outpatient subjects referred to the Endoscopy Unit and Pulmonary Function Units, during the period from September 2015 to March 2016.

Table 1, shows the distribution and clinical data of the test group.

Table 1:- Distribution and clinical data of the test group.

BMI		GERD Symptoms		GERD duration		Endoscopy	
Normal body wt BMI (19-25)	Over body wt BMI > 25	Present	Absent	< 3 months	> 6 months	Negative	Positive
N=14	N=41	N=40	N=15	N=21	N=34	N=18	N=37

Anthropometric measurements: Height, weight were measured using standard techniques as follows: height to within 0.5 Cm, without shoes; Weight to within 100g, without heavy clothing (table 2). Body mass index (BMI) was calculated by the following

Formula:-

$$\text{BMI} = \text{Weight (kg)} / [\text{Height (m)}]^2 \text{ (7)}.$$

Table 2:- Demographic and anthropometric data of the studied groups.

Parameter	Control group (N=35)			Test group (N=55)		
	Minimum	Maximum	Mean \pm SD	Minimum	Maximum	Mean \pm SD
Age (year)	19	58	39 ± 11	20	65	42 ± 13
Height (m)	1.6	1.86	1.68 ± 0.06	1.47	1.80	1.64 ± 0.08
Weight (Kg)	49.5	98.5	75.3 ± 13	52.8	117.5	87.7 ± 19.45
BMI	18.6	33	24.2 ± 5.27	17.9	42	28.2 ± 6.14

Spirometry: percent predicted forced vital capacity (FVC), forced expiratory volume in 1 second (FEV1 %) ratio, peak expiratory flow (PEF), and the forced mid expiratory flow (FMF) were measured using computer based spirometer. Standard procedure was adopted following the recommendations of the American Thoracic Society (ATS) (8).

The forced expiratory vital capacity procedure was described and demonstrated to the subjects before the test while encouraging breathing out as long and forcefully as possible. The best of three technically satisfactory maneuvers was recorded.

Statistical analysis: The data obtained in the study were analyzed using the SPSS statistics for data analysis. Standard statistical methods were used to determine the mean and standard deviation. Descriptive data analysis was used to describe different variables in addition to the Independent Sample T-test to compare different means.

Results:-

The percentage predicted spirometric values of the control and test groups shown in (table 3). The healthy control group is within the normal predicted range (80–120%) regarding all measured spirometric values, unlike the test group who showed highly significant reduction in the FEV1%, PEF and FMF ($p < 0.01$) revealing a clear obstructive airway pattern in addition to a significant reduction in FVC (restrictive index, $p < 0.05$).

Table (4) compares the percentage predicted spirometric parameters between normal body weight and overweight groups. The overweight group showed significant reduction in the FVC as compared to the normal weight group ($P < 0.05$) while other spirometric parameters (FEV1%, PEF and FMF) does not show significant difference.

Table (5) compares the percentage predicted spirometric parameters between asymptomatic and symptomatic GERD groups. All measured spirometric parameters (FVC, FEV1%, FPEF and FMF) were not found to be significantly different between the two groups.

Table (6) shows the percentage predicted spirometric parameters when compared between the test groups with short duration of GERD symptoms, less than 3 months and those with longer than 3 months duration of GERD symptoms. No significant differences were found between the two groups regarding again all measured spirometric parameters.

Table (7) shows the spirometric parameters within the test group with negative endoscopic findings as compared with those of positive endoscopic findings for GERD. No significant difference was observed regarding the FVC while there is a statistically significant reduction in the FEV1%, FMF ($p < 0.01$) and PEF ($p < 0.05$) among the group with positive endoscopic finding.

Table 3:- Comparison of the spirometric parameters between test and control groups.

Parameter (% predicted)	Mean \pm SD (minimum-maximum)		P value
	Control group (n = 35)	Test group (n = 55)	
FVC	99.76 \pm 9.35 (80.8-115.5)	93.66 \pm 15.44 (50.1-101.0)	<0.05
FEV1%	89.56 \pm 8.51 (82.3-116)	78.19 \pm 11.86 (49-84.9)	<0.01
PEF	96.69 \pm 11.84 (84.7-118.8)	82.22 \pm 17.41 (41.5-91.08)	<0.01
FMF	90.11 \pm 10.21 (82.8-119.9)	68.93 \pm 18.86 (41.2-83.02)	<0.01

FEV1%	74.96 \pm (11.62)	72.73 \pm (9.71)	NS
PEF	85.50 \pm (17.04)	78.55 \pm (14.05)	NS
FMF	65.00 \pm (12.05)	63.72 \pm (14.65)	NS

Table 7:- Spirometric values of test group in respect to endoscopic findings.

Parameter (% predicted)	Mean \pm SD		P value
	GERD (negative endoscopy) n=18	GERD (positive endoscopy) n=37	
FVC	94.03 \pm (18.06)	93.38 \pm (13.37)	NS
FEV1%	84.79 \pm (8.95)	73.07 \pm (11.39)	P < 0.01
PEF	87.25 \pm (18.01)	78.32 \pm (16.15)	P < 0.05
FMF	84.07 \pm (18.51)	57.21 \pm (7.23)	P < 0.01

Discussion:-

When spirometric measurements were compared between the age and height matched studied groups (table 2), the GERD associated cough and asthma group with an overweight BMI (table1) showed significant reduction in all measured spirometric variables, signifying the growing body of evidence relating overweight and obesity with a wide range of health conditions including chronic obstructive lung disease (COPD) and asthma (9,10,11). While the test group further subgrouped on the basis of BMI in an attempt to rationalize the restrictive pattern, the results revealed significant reduction in the percentage predicted FVC ($p < 0.05$) among the overweight group in respect to those with normal weight group (table 3); this finding has two implications, first, it could further confirm the fore mentioned relation between overweight and obstructive spirometric pattern, second, it can reinforce the role of gastroesophageal reflux in chronic cough and asthma(12).

Concerning the link between gastric acid reflux and respiratory symptoms (cough, dyspnea and wheezes), the test group was classified according to the presence of symptoms (symptomatic and asymptomatic) and to the duration of reflux symptoms into short duration (< 3 months) and long duration subgroups (> 3 months) (table 4 and 5). The obtained data (tables 4 and 5) of the nonsignificant differences in all measured spirometric values, revealing that neither the presence nor the duration of GERD symptoms could affect spirometry. These findings might be attributed to the control of acid reflux with medications for example, a proton pump inhibitor.

Consequently, the obstructive spirometric pattern (table 6) in the GERD subjects with positive endoscopic finding could be due to the effect of the acid reflux on the respiratory passageways. Though the cause-effect relationship between asthma and acid reflux isn't clear why, acid reflux can worsen asthma and asthma can worsen acid reflux (6). However, Chan WW and co-workers, 2011 claimed that gastroesophageal reflux disease occurs frequently among patients with asthma, despite that the therapy with proton pump inhibitors to improve asthma control remains controversial (13). Moreover, two proposed mechanisms involved in the pathogenesis of GERD associated cough: (1) acid in the distal esophagus stimulating an esophageal-tracheobronchial cough reflex, and (2) micro or macroaspiration of esophageal contents into the larynx and tracheobronchial tree. Dual-probe esophageal pH testing

with pH electrodes in the proximal and distal esophagus, esophageal acid infusion studies, and evaluation of agents inhibiting cough have added significantly to the understanding of GERD-associated cough (12).

Conclusion:-

The study concludes that Gastroesophageal reflux associated cough and asthma patients showed an obstructive spirometric pattern irrelevant to the presence or absence of symptoms or duration of the disease. On the other hand, the same obstructive spirometric pattern was reported in those with positive endoscopic findings when they were compared with subjects with negative findings.

Smoking, Dental Health Attitude, Prevalence.

Abstract

Background: Smoking is one of the major causes of death in the world. There is variability in the prevalence of smokers around the world.

Objectives: The aim of this study was to compare the prevalence and attitude of smoking among dental, pharmacy, and nursing students in Umm Al-Qura University.

Methods: The present study was a cross-sectional study, 850 students who are in the 2nd to the 6th year were participated in this study. Hard copy questionnaire were distributed among the students during lecture times. The questionnaire was composed of two sections. Section one included three demographic questions including age, college, and gender. Section two included 17 questions asked about (the reasons behind smoking habit, the role of the college to prevent smoking, the awareness of those smokers with the damaging effect of smoking, the reasons for failing to stop smoking and whether there are any members of his/her family smoke). The questionnaire take around 5 minutes to be answered.

Results: A total of 700 students answered the study questionnaires (82.35% of the distributed questionnaires). Smoking prevalence was 8%, the high percent of smokers was male students(73.3%) while female students were(26.7%). The prevalence of smokers among dental students was higher than pharmacy students (11% vs 9%) and found to be zero among nursing students. Most smokers exercised in order to avoid the pressure (44.6%) and get a relaxed feeling(60.8%) and the most smokers want to quit it(87.5%). A large percentage of students were dissatisfied with the role of their college awareness towards this habit (47.6%).

Conclusions: The prevalence of smoking was high among dental and pharmacy students, the health colleges should do more efforts to prevent smoking among their students.

Introduction:-

According to the World Health Organization (WHO) Smoking is one of the major causes of death in the world. Each year more than a million people die due to smoking and each year this percentage is unfortunately increased. Smoking has been classified by the WHO as an epidemic because of its fast spread among peoples and also its dangerous effect on human (Tjandra, 2002 and WHO, 2003). More than 80% of those who practiced smoking are low-income peoples (WHO, 2013).

There is variability in the prevalence of smokers around the world. For instance, the prevalence of smoking in the Indonesia was 76.2% (the highest prevalence rate), 70.2 % in Jordan, 60% in Sierra Leone, 57.5% in Georgia, 48.8% in Bahrain, 32.4% in Germany, 20.4% in Sweden, 19.5% in United States of America and the lowest prevalence rate 13.1% in Ghana and Barbados (WHO, 2015).

In Saudi Arabia, for the general population many studies investigated the prevalence of smokers. These studies indicated that the prevalence of current smoking in Saudi Arabia ranged between (9-35%), and among school students the smoking prevalence was 16.5%, in university students 13.5%, among adults 22.6%, elderly peoples 25%, and males 26.5% while in females 9%. (WHO, 2015; Bassiony, 2009; Alnohair, 2011; and Hashim, 2000).

In fact, some studies investigated the prevalence of smokers among Saudi universities and colleges students in general, which found to be 14.5% (Mandil, 2011). Other studies focused on students who study in the health colleges (such as medicine and dentistry), and found the prevalence to be 16%, which considered to be higher than the previous percentage, and when it compared male students in different health colleges on a national scale in Saudi Arabia as (Central: King Saud University, King Fahad Medical City, Qassim university; North: Aljouf university, Hail university, Tabuk university; South: Najran university, Jazan university, King Khalid University; East: Dammam university; and West: King Abdulaziz University and Taibah university) and indicated that dental students smoke more than medicine students (Alrashedi et al, 2012). As the prevalence among dental students was 18% compared to medical students with a prevalence of 14%. However, this study did not include females, and did not consider Universities of Makkah city, despite the fact Makkah is considered one of the major cities nationally. Furthermore, a recent study was conducted in Najran university among health college students and found that the prevalence of smoking in male and female students (30.1 %, 0.5%) respectively, the students at the college of applied medical sciences had the highest prevalence of smoking 34% followed by the students at colleges of pharmacy (15%) and dentistry (9%), and the lowest prevalence (4%) was at the college of medicine. (Alqahtani, 2017).

There is a study to measure the prevalence of smokers in the Umm al-Qura in college of medicine among male students and found that the prevalence of smoking was 30% (Alqarni et al, 2015). According to our knowledge there was no previous studies carried out to investigate smoking among undergraduate students of dental, pharmacy and nursing colleges in Umm Al-Qura University. Thus, the aim of the present study is to compare the prevalence and attitude of smoking among dental, pharmacy, and nursing students in Umm Al-Qura University.

Aims:-

The aim of the present study is to compare the prevalence and attitude of smoking among dental, pharmacy, and nursing students in Umm Al-Qura University.

Methods:-

This study is a cross-sectional survey, investigated students in colleges of dentistry, nursing, and pharmacy, Umm Al-Qura University, Saudi Arabia. Only students who are in the 2nd to the 6th year were included in this study. Students in the 1st (preparatory year) and interns were excluded from this study. A hard copy questionnaire was distributed among 850 (316 male and 534 female) students. The questionnaire was disseminated to the students during lecture times by the assistance of the academic office in each college, and after the permission of lecturers, to be filled after the lecture time. The data collector was available to answer any question raised by students. After students fill the questionnaires, they were taken back.

The questionnaire was composed of two sections. Section one included three demographic questions including age, college, and gender. Section two included 17 questions asked about (number of smoking times per day, the reasons

behind smoking habit, the role of the college to prevent smoking, the awareness of those smokers with the damaging effect of smoking, the reasons for failing to stop smoking and are there any members of his/her family smoke).

The questionnaire was tested on a pilot group, and was adjusted before achieving the final version. This pilot study was conducted on 12 students from dentistry, nursing and pharmacy colleges. The participants included in the pilot study were excluded from the study. The questionnaire takes around 5 minutes to be answered. This study was approved by the institutional review board at the college of dentistry, Umm Al-Qura University.

Statistical analysis:-

Data was statistically analyzed using SPSS v.17. Descriptive statistics were generated using frequency tables. Chi-square test was used to compare the prevalence of smokers among different colleges and between male and female smokers. A p-value ≤ 0.05 was considered statistically significant.

Results:-

700 students out of 850 answered the study questionnaire, with a response rate of 82.35%. The mean age of the participants was 21.30 ± 1.40 years old. There were 268 male (38.3%) and 432 (61.7%) female students. There was a significant difference in the number of male smokers (41 smokers and 227 non-smokers) compared to female smokers (15 smokers and 417 non-smokers), with a $p < 0.001$ (Chi-square test). The prevalence of smokers among different health colleges is presented in table 1, the overall students experience to smoking is illustrated in table 2, the attitude and behavior among smokers only are presented in table 3 and the attitude of the health colleges in dealing with smokers is illustrated in table 4.

Discussions:-

A series of studies set up to determine the prevalence of smokers among the population of the Kingdom of Saudi Arabia but there is no studies carried out on health colleges of Makkah city. The findings of the present study indicated that, the percentage of smokers among students of health colleges is only 8% (table 1). The low percentage of health care students who smoke may be due to the greater awareness of them with respect to tobacco, to being health care professionals and being able to see its pernicious effects directly in their daily clinical practice. These results were agreed with previous study which shown that the prevalence of smokers among dentists is considered a small percentage compared with the general public (Peidró et al 2006).

The proportion of smokers among male students is higher than female students. There were no smokers in the college of nursing (Table 1) and the main reason is the advices provided by the college for female students where there are a large percentage of them satisfied about their college advices compared to other colleges (Table 4).

The results of the present study showed that, the main reason for smoking is the pressure and simulation of their friends practiced smoking. Some practiced it for their sense of comfort and escape from the pressure, and a large percentage of them wish to quit smoking (Table 3).

Given the evidence of the action of health care students in tobacco use prevention and cessation, specific strategies should be developed to motivate and support oral health professionals in training for topics relative to tobacco use prevention and cessation in the health colleges as part of their routine clinical practice.

It is necessary to assess attitudes of health care students with regard to the regular establishment of advices on smoking prevention in their colleges in order to, if appropriate, prepare campaigns suited to these professionals ,both educational and with regard to the distribution of support materials for this activity.

Conclusions:-

The prevalence of smokers among dental students is higher than pharmacy students and found to be zero among nursing students. The smoking was more prevalent for male students than female. However, the prevalence of smoking among the health faculties in Saudi Arabia considered lower than the general population. Health colleges are recommended to do more efforts to coup with smoking among the students.

Dentigerous cyst, mucoepidermoid carcinoma, impacted tooth.

Abstract

Mucoepidermoid carcinoma of the jawbones is an extremely rare malignant tumour involving maxillary sinus. We report a case of mucoepidermoid carcinoma of the maxillary sinus in a 10-year old male patient developing from a previously diagnosed dentigerous cyst. An excisional biopsy was performed and the histopathological features confirmed mucoepidermoid carcinoma. The origin of central mucoepidermoid carcinoma could be suggested to be from the epithelial lining of previously diagnosed dentigerous cyst. Thus, emphasizing the need for careful examination of the entire excision specimen to rule out such neoplastic transformation of epithelial lining of odontogenic cyst and provide appropriate and effective treatment.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Dentigerous cyst is a most common developmental odontogenic cyst that originates by separation of dental follicle around the crown of unerupted tooth. Usually asymptomatic and associated with dentigerous cysts unless there is secondary infection. Any tooth may get involved, but most commonly mandibular third molar is involved (Neville et al.2006). The age range varies widely, from 5 to 57 years (Shear 2007). The highest incidence of dentigerous cyst occurs during second and third decades of life and rarely seen during childhood. According to Browne et.al¹ the sex predilection of dentigerous cyst is 1.6:1(male: female). Sometimes, lining of dentigerous cysts may transform into malignancies like squamous cell carcinoma(SCC)^{2,3,4,5,6} (50%), mucoepidermoid carcinoma(MEC)^{7,8} (50%), ameloblastoma⁹ (14.6%) and adenomatoid odontogenic tumour(AOT)¹⁰ (73%).

Malignant tumors of the paranasal sinus are uncommon, constituting less than 1% of all malignancies¹¹ and 3% of all head and neck cancers and in that malignant transformation of odontogenic cysts into mucoepidermoid carcinoma is estimated to be between 0.13% and 2%, with most of the cases involving the mandible¹². Mucoepidermoid carcinoma accounts for 13% of all malignancies occurring in maxillary sinus¹³. 7 cases of mucoepidermoid carcinoma which was transformed from dentigerous cyst have been reported in children younger than age 16 of which 4 cases involved mandible and 3 cases involved maxilla^{14,15}.

We report a case of mucoepidermoid carcinoma of maxillary sinus arising from previously diagnosed case of dentigerous cyst involving impacted permanent maxillary canine in a 10 year old male child.

Case Report:-

A 10 year old boy reported to GITAM Dental College and Hospital with a painful swelling in the right upper posterior region producing a feeling of dullness in the right maxillary sinus region. It has been present for about 3 months. Pain was continuous, radiating, aggravated on slight touch, during mouth opening and on lying down position and relieved by itself. There was no significant past medical history, family history or personal history. On general examination, patient was moderately built, nourished, co-operative and responsive. No rise in temperature and vitals were normal.

Extra-orally, on inspection, gross asymmetry on right side of the face was noticed (Fig.1). Swelling was irregular measuring about 2x3 cm, with obliteration of nasolabial fold. It extends from lateral wall of nose anteriorly to tragus of the ear posteriorly. It extends from 1cm above the ala-tragal line superiorly to 1cm below the ala-tragal line inferiorly. On palpation, swelling was very tender, firm, non-mobile, non-compressible, non-reducible, non-fluctuant, no sinus openings over the swelling.

Intra-orally, a swelling was seen on buccal and palatal portion of maxillary posterior region. Swelling was irregular extending from 53 to 16, completely obliterating the buccal vestibule (Fig.2).

Fig. 1:- Facial asymmetry

Fig. 2:- Swelling.

On palpation, swelling was very tender, firm, non-fluctuant, non-mobile, non-compressible, non-reducible. Teeth with tender on percussion were 53, 54, 55 and 16. The swelling was seen as an ill-defined bony mass, hard in consistency, erythematous surrounded by pinkish red area.

Panoramic radiograph revealed a massive radiolucent lesion from 53 to 16 involving maxillary sinus. The radiolucency was regular, well defined, trabecular pattern of alveolar bone was completely lost and lesion was invasive. Impacted canine (13) was displaced by the cyst to the roof of maxillary sinus. (Fig.3)

Fig. 3:- OPG: Unilocular well defined radiolucency.

Provisional diagnosis was dentigerous cyst and incisional biopsy was done. Histopathology revealed a 3-4 layered thick stratified squamous non-keratinized epithelium with fibrous connective tissue wall and few inflammatory cells suggestive of dentigerous cyst. A surgical approach was planned immediately after investigating blood reports. The standard treatment for dentigerous cyst of the maxilla involving the sinus is enucleation and extraction of the associated teeth via Caldwell-Luc procedure under general anaesthesia, which was followed for the present case (Fig.4). A crevicular incision was given from 21 to 16 region with an anterior releasing incision and the mucoperiosteal flap was reflected. The extraction of 53, 54, 55, 14, 15 and 16 followed by cystic enucleation and then by the extraction of 12 and 13 was done. There were no post-operative complications and the wound healed uneventfully. The excisional biopsy that was performed intraorally consisted of a bit of soft tissue specimen measuring about 2.5cm x 2cm x 1cm (Fig.5) which was grayish white in color and firm in consistency has been taken for processing. The H&E stained soft tissue section shows cystic lining epithelium with underlying connective tissue.

Fig. 4:- Surgical approach.

Fig 5:- Specimen.

Epithelial lining showed 3-4 layer reduced enamel epithelium. Cystic epithelium is transforming into hyper-proliferative epithelium with characteristic clear cells, intermediate cells and epidermoid cells arranged in nests pattern Fig 6 (a), (b). These cells are also present in connective tissue interspersed with chronic inflammatory cells. The findings were suggestive of Mucoepidermoid carcinoma arising from the lining of the dentigerous cyst. The radiographic evidence of lesion involvement of maxillary sinus along with histological features of clear cells, intermediate cells and epidermoid cells made us suggestive of “Dentigerous cyst transforming in to Mucoepidermoid carcinoma”. 2weeks post-operatively, a temporary obturator was given. Patient was on regular follow-up for the last 18 months without any evidence of recurrence.

Discussion:-

Dentigerous cyst can be defined as one which encloses the crown of an unerupted tooth and is attached at the cemento-enamel junction. It is a cyst arising by separation of follicle from the anatomical crown of an unerupted tooth within the jaws. The substantial majority of dentigerous cyst involves the mandibular third molars and the maxillary permanent canines, followed by mandibular premolars, maxillary third molars and rarely third molars¹⁶.

Fig. 6:- (a) H&E stained photomicrograph showing cystic spaces & mucous cells at 40x

(b) H&E stained photomicrograph showing cystic spaces, mucous cells & epitheloid cells at 40x

Unlike other odontogenic cysts, epithelial cells that line the lumen of dentigerous cyst arise from reduced enamel epithelium origin and possess an unusual ability to undergo metaplastic transition into other epithelial cell types such as SCC, MEC, AOT and ameloblastoma. Radiographically, the dentigerous cyst presents as a well-defined unilocular radiolucency, often with a sclerotic border. Since the epithelial lining is derived from the reduced enamel epithelium, this radiolucency typically surrounds the crown of the tooth.

Malignant tumors such as mucoepidermoid carcinoma (MEC) of the paranasal sinuses are uncommon, constituting less than 1% of all malignancies. MEC is a malignant epithelial neoplasm composed of both mucus secreting cells and epidermoid type cells in varying proportions. It was first studied and described as a separate entity by Stewart et.al in 1945 (Rajendran et al¹⁷). Central mucoepidermoid carcinoma is an uncommon lesion in children and only 7

cases in patients younger than 16 years were reported according to the literature revealed. After a systematic review of its histology and degree of differentiation, the WHO Classification in 1991 recommended that the term “mucoepidermoid tumour” be changed to ‘mucoepidermoid carcinoma’. It comprises 5-10% of all salivary gland neoplasms and accounts for 13% of all malignancies occurring in the maxillary sinus.

The criteria for diagnosis of intraosseous mucoepidermoid carcinoma are the following:

- (1) Presence of intact cortical plate
- (2) Radiographic evidence of bone destruction
- (3) Histologic confirmation
- (4) Positive mucin staining
- (5) Absence of a primary lesion in the salivary gland and
- (6) Exclusion of an odontogenic tumor.

The pathogenesis of this tumor is still unknown. Four possible origins have been considered:

- (1) Entrapment of retro-molar mucous gland within the mandible, which later undergoes neoplastic transformation;
- (2) embryonic remnants of the submandibular and sublingual glands trapped within the mandible during development;
- (3) neoplastic transformation and invasion from the lining of the maxillary sinus; or
- (4) neoplastic transformation of mucous-secreting cells from the epithelial lining of dentigerous cyst associated with impacted teeth^{16,17}.

MEC arising in the maxillofacial region can have its origin from maxillary sinus lining or central MEC arising from within the bone or from the minor salivary gland. In this case, histological picture is suggestive of MEC arising from the cystic lining of dentigerous cyst. Maxillary sinus malignancies are very difficult tumours to treat and traditionally have been associated with poor prognosis with the main reason being the close anatomic proximity of the nasal cavity and paranasal sinuses to the vital structures such as skull base, brain, orbit and carotid artery. This complex location makes complete surgical resection of sino-nasal tumours a challenging task.

Conclusion:-

The prognosis for most histo-pathologically diagnosed dentigerous cysts transforming into mucoepidermoid carcinoma is excellent as it is in early stage; also recurrence is a rare finding. It can be therefore suggested that after thorough enucleation of dentigerous cyst, microscopic examination of the entire specimen by the pathologists must be done to determine transformation into mucoepidermoid carcinoma though rare, still possible.

Abstract

The United Nations being a humanitarian organization demonstrates its love and care for children by observing Children's day in October each year. It is also the day of the declaration of the rights of children. Islam however, had drawn attention towards children's affairs over fourteen hundred years ago. Even before a child is born, its rights are given to it by Islam. At several places in the Quran and Sunnah, Allah and his Prophet (Peace Be Upon Him) have talked and acted lovingly towards the children, it thus leaves no possibility of Islam not paying particular attention to clearly charting out the rights of children. The following article brings out references from the Quran and Sunnah to highlight these very rights and collects them in one script of writing.

Introduction:-

The United Nations demonstrates its care and love for children by observing Children's Day in October each year; it is also the day of the declaration of the rights of children.

On its part, Islam had aroused attention to children's affairs over fourteen hundred years ago. Even before the child is born, its right are given to it by Islam.

Islam draws the picture of childhood as a lovely world with happiness, beauty, dreams, love and amazing experiences. The verses of the Qur'an disclose Allah's love for children, for instance:

لَا أَقْسِمُ بِهَذَا الْبَلَدِ وَأَنْتَ حَلٌّ بِهَذَا الْبَلَدِ وَوَالِدٍ وَمَا وَلَدَ.

"I swear by this city. And you are a dweller in this city. And by the begetter and that which he begets" (90:1-3)
(The Urdu has..... by the parents and the child.) Children are mentioned as glad tidings.

يُزَكِّرُنَا إِنَّا نُبَشِّرُكَ بِغُلَامٍ اسْمُهُ يَحْيَى.

"O Zakariyya! We give you the glad tidings of a son. whose name is Yahya." (19:7)

They are described as joy to the eyes:

رَبَّنَا هَبْ لَنَا مِنْ أَزْوَاجِنَا وَذُرِّيَّتِنَا قُرَّةَ أَعْيُنٍ.

"Our Lord! Grant us coolness of eyes from our wives and our offspring". (25:74)

They are ornaments of the world's life

الْمَالُ وَالْبَنُونَ زِينَةُ الْحَيَاةِ الدُّنْيَا.

"Wealth and sons are an adornment of the life of this world". (18:46)

Allah's Messenger □ presented a child before us as if it was paradise. He said:

الاطفال دعاميص الجنة.

Children are butterflies of Paradise:-

The Prophet ﷺ also said "If infants were not fed mother's milk, old people did not bow down in worship and animals did not graze in the open fields then surely you would be seized with a severe chastisement."

He was delivering the sermon one Friday when Sayyidi-na Hasan and Husayn (may Allah be pleased with them), his two grandsons came running towards him — now stumbling, now checking them- self! — He paused and descended from the pulpit and lovingly picked them up. Returning to the pulpit, he continued his sermon, saying, "O people! Your wealth and your children are mean of your madness. I saw my two children fall and stumble as they scampered to me and could not restrain myself, so got down and carried them in my arms." (1)

He crawled on all fours once having placed Sayyidina Hasan (may Allah be pleased with him) on this back. Someone remarked, "Son, you are riding the best of transport." The Prophet ﷺ remarked, "The rider too is the best of riders!" (2)

If, during the salah he led, he heard a child weep, he would shorten the salah. He would remark, "I do not like to cause distress to its mother."

As he was passing by Sayyidah Fatimah's (may Allah be pleased with her) house one day, he heard Sayyidina Husayn (may Allah be pleased with him), crying. He was moved on hearing him cry, so went into the house and reprimanded Sayyidah Fatimah ﷺ: "Do you not know that I am pained when he weeps?"

He stressed the importance of teaching and training children, saying:-

لأن يؤدب الرجل ولده خير من أن يتصدق بصناع.

"A man's training his child is better than giving a sa' in charity." (3)

The Prophet & said:

ما نحل والد ولدا من نحل أفضل من ادب حسن.

"No father has given his children anything better than good manners" (4)

A child will be brought up according to the training the head of the family imports to him. Training a child is to groom him practically on how to live his life and to learn this in the household atmosphere.

Someone has said very rightly:

إذا كان رب البيت بالطبل ضاربا فلا تلم الا ولاد على الرقص.

"When the Lord of the house beats the drum then blame not the children if they dance." (5)

We must act as we want our children to do because their hearts are like mirrors that reflect our actions. (6)

ينسأه إذ قلبه كالجواهر الصافي
فسوف يأتي به من حفظه وافي

والطفل يحفظ ما يلقي اليه ولا
فانقش على قلبه ما شئت من خير

If a father does not train his children well then they cannot be trained all their lives. Sayyidina Umar Ibn Khattab (may Allah be pleased with him) said:

من لم يؤدونه الشرع الا ادبه الله.

"If anyone does not train the child according to Shari'ah then Allah also does not train him". (7)

Children's livelihood as outlined by the Qur'an:-

In pre-Islamic days, it was common to kill children. Poverty and want drove men to eliminate their children. It is more commonly believed that people killed their daughters, but the truth is that they killed all their children because they could not feed them. The Qur'an forbid people to do this repulsive thing. It said in very clear terms:

وَلَا تَقْتُلُوا أَوْلَادَكُمْ مِنْ إِمْلَاقٍ نَحْنُ نَرْزُقُكُمْ وَإِيَّاهُمْ.

"And slay not your offspring for (fear of) poverty. We provide sustenance for you and for them". (6:151)

وَلَا تَقْتُلُوا أَوْلَادَكُمْ خَشْيَةَ إِمْلَاقٍ نَحْنُ نَرْزُقُهُمْ وَإِيَّاكُمْ إِنَّ قَتْلَهُمْ كَانَ خِطْئًا كَبِيرًا.

"And slay not your children for fear of poverty we provide for them and for you. Surely the slaying of them is a great sin" (17:31)

The Qur'an instructs man not to appropriate to himself the duty of apportioning to sustenance. Instead, he must behave as Allah's slave. He had been like that child, helpless but the Provider of sustenance fed him he grew up to the age when he considers his children a burden. He still gets his provision. Then why should he forget the Provider and present himself as one.

This also rejects the ideas of family planning. The propagators are worried about population growth, who kill children of other people that their own bellies should be full. They collect large sums of money from western, irreligious forces on the pretext of promoting family planning. They inspire fear of having to spend on children but put down the drain millions of rupees on advertisement in newspapers and television. They could instead spend this money on the poor people's children.

Their falsification:-

The promoters of family planning have made bold to distort verses of the Qura'n in their book, Islam mein bachchon ki nighaydasht sponsored the ladarah Itfal Aqwaam Muttahidh, Pakistan. The writer has cited the verses 29 of an-Nisa; 151 of al-An'um, 32 of al-Ma'idah. He has presented only that piece of verse 151 of al-An'um as serves his purpose: **وَلَا تَقْتُلُوا أَوْلَادَكُمْ** (slay not your children). The words following it are a slap on the face of family planning **خَشْيَةَ إِمْلَاقٍ** (for — Fear of — porverty). The words following that are also dropped **نَحْنُ نَرْزُقُهُمْ وَإِيَّاكُمْ** (We provide sustenance for you and for them).

If they had not imitated the Jews and Christians in concealing the words of the Qur'an, they would have lost tens of thousands of dollars. Instead of a pat on the back, they would have faced the anger of their bosses. May Allah protect us! Aameen.

Children's live hood as outlined by the Hadith:-

Hadith is really a commentary and an explanation of the Qur'an. The Prophet ﷺ was asked once, "Which sin is the greatest?" He said: "That you ascribe partner to Allah although He has created you." The man asked, "What is the next great sin?" The Prophet ﷺ said:

ان تقتل ولدك خشية ان ياكل معك.

"That you kill your son for fear that he will share your food with you" (8)

So we see that right from the pre-Islamic days, people killed their children lest they become an economic burden. The Qur'an and Hadith state that people killed their children for food because the father is responsible for it and he shuns that responsibility and commits the crime of killing children.

Mother's love lauded:-

Allah has created love of children in His creatures so that they become active to raise them. In the field of maintenance, Allah has given excellence to offspring alike of men and animals that parents are made responsible for their feeding, and this carries on till they grow up. As they gain adulthood, parents let them earn their own livelihood; examples of this are seen in all creatures from birds to men. The Prophet is quoted in a Hadith:

**جعل الله الرحمة في مائة جزء فامسك عنده تسعة جزء، وانزل في الارض جزء واحد
فمن ذاك الجزء يتراحم الخلق حتى ترفع فرس حافرها عن ولدها خشية ان تصيبه.**

"Allah has divided mercy into a hundred parts, but retained ninety-nine of them with himself. He has sent one on earth because of which the creatures show mercy to each other so that even the mare lifts up her hoof away from her young colt lest she should trample on it" (9)

"The Prophet ﷺ demonstrated this mercy to his Sahabah. Sayyidina Umar (may Allah be pleased with him), reported that some captives were brought to the Prophet ﷺ, a woman among them. Her breasts were full with milk which overflowed. She ran till she found a child among the captives. She picked it up and suckled it. The Prophet ﷺ said, "Do you suppose that she would throw her child in fire?" They replied. "No. As long as she can, she will not throw her child in the fire." He said, "Allah is more Merciful to His slaves than this woman is to her son. (10)

These Aha'dith show us how a mother loves her children instinctly.

Equal division among offspring:-

The Prophet ﷺ also taught us that we should not discriminate among our children causing distress to the deprived. All our children have equal rights. If we prefer one over the others, they will suffer from inferiority complex. Sayyaidina Nu'man Ibn Baheer's (may Allah be pleased with him) father gave his son a slave as a gift and requested the Prophet ﷺ to bear witness for that. He asked him if he had given a similar gift to all his children to which he said that he had not. The Prophet ﷺ said to him, "Take back your gift." (11)

Some ulama' in their commentary on this Hadith have said that it is mustahab to show equality to all children. equality must be shown in the love bestowed on them, too. Sufyan Thawri رحمه الله عليه said that in bestowing them,

too Sufyan Thawri رحمه الله عليه said that in bestowing gifts, sons and daughters are equal. They are not treated as in inheritance but some maintain that, like inheritance, gifts will also be divided in the ratio 2:1 between sons and daughters, this is what imam Ahmad and Ishaq said.(12)

Initial upbringing:-

For the first two years a new-born is fed mother's milk. Allah has given this command and the duties of parents in the Qur'an. He says:

وَالْوَالِدَتُ يُرْضَعْنَ أَوْلَادَهُنَّ حَوْلَيْنِ كَامِلَيْنِ إِمَّا أَرَادَ أَنْ يُنْتَمِ الرِّضَاعَةُ ۖ وَ عَلَى الْمَوْلُودِ لَهُ رِزْقُهُنَّ وَ كِسْوَتُهُنَّ بِالْمَعْرُوفِ ۖ لَا تُكَلَّفُ نَفْسٌ إِلَّا وُسْعَهَا ۚ لَا تُضَارُّ وَالِدَةٌ بَوْلِدًا ۚ وَلَا مَوْلُودٌ لَهُ يَوْلَدُهُ ۖ * وَ عَلَى الْوَارِثِ مِثْلُ ذَلِكَ ۚ فَإِنْ أَرَادَا فِصَالًا عَنْ تَرَاضٍ مِنْهُمَا وَ تَشَاوُرٍ فَلَا جُنَاحَ عَلَيْهِمَا ۚ وَإِنْ أَرَدْتُمْ أَنْ تَسْتَرْضِعُوا أَوْلَادَكُمْ فَلَا جُنَاحَ عَلَيْكُمْ إِذَا سَلَّمْتُمْ مَا اتَّيْتُمْ بِالْمَعْرُوفِ ۚ وَ اتَّقُوا اللَّهَ وَ اعْلَمُوا أَنَّ اللَّهَ بِمَا تَعْمَلُونَ بَصِيرٌ

And mother shall suckle their children for two whole years, for one who desires that (he suckling be completed. It is upon the father to provide them their maintenance and clothing according to known fair manner. No one is burdened save to his capacity. A mother shall not be made to suffer on account of her child. Nor a father on account of his child. A similar duty to wean (the child) by mutual consent and consultation, there is no blame on them. And if you wish to have your children nursed, there is no blame on you provided you hand over according to known fair manner what you settled to offer (the fostering mother). And fear Allah, and know that Allah is seer of what you do.] (2:233)

The commands in the verse for the newborn are:-

1. Mother should suckle their babies for up to two years, parents can stop that before this period.
2. If mother's milk is not enough then the parents may feed the child other milk or nourishment. The father will bear the expenses.
3. It is a grave sin to stop feeding the child mother's milk without any reason or out of stubbornness (with-in the period).
4. It is wajib for a mother to suckle her child without remuneration as long as she is married to its father or, if he has divorced her, as long as she observes the iddah. It is unlawful to claim wages from her husband while she gets maintenance from him.
5. Maintenance of the wife, or expenses towards the iddah, is wajib on the husband. If she is divorced and the period of waiting (iddah) is over and the child's suckling period is not yet over then the mother can demand a reasonable remuneration for suckling the child. If she feeds milk to the child without charging wages then it is better and there is a reward in that for it because it is an obligation on her as its mother.
6. The maximum period of suckling according to Shari'ah is two years. It is a sin to exceed that period without reason.
7. When there is an excuse that is exempted.
8. In exceptional cases when a child does not take other nourishment or there is risk of his becoming seriously ill, there is permission to feed milk for two and a half years. This is one report from Imam Abu Hanifah.
9. It is allowed if father and mother agree to wean their child before two years are over provided that is beneficial to the child, or, at least, it is not harmful to it.
10. If the child would suffer if he is weaned before two years are over.
11. All other expenses, besides milk, like medical treatment, etc. are the father's responsibility.
12. When the child's mother is divorced, the father's responsibility for the child does not cease with wages for milk but he is responsibility for all other expenses of the child.
13. According to sharp ah, the mother has the right to raise up the child after she is divorced.
14. A boy of seven years or a girl of nine years must remain in their mother's care. If their mother marries a stranger and he is not willing to raise her children then the maternal grandmother or great grandmother has the right to raise them.
15. If they are not there then the right lies with the paternal grandmother, then paternal aunt and then maternal aunt. But, mother's right is foremost. "A mother shall not be made to suffer on account of her child, nor a father.(13)

The period of suckling:-

The authorities differ on the limit of suckling period. Most of them regard it as two years among them Abu' Hanifah رحمه الله عليه and Abu' Yusuf رحمه الله عليه. Imam Maalik رحمه الله عليه puts it at two years and two months, but many views are attributed to him including as much time after two years "as the child needs to accustom to another diet. (14)

Imam Abu Hanifah رحمه الله عليه puts it at two and a half years. Imam Jafar رحمه الله عليه holds that the total period of suckling is three years. (15)

Most go by the command of Allah:-

وَالْوَالِدَتُ يُرَضِّعْنَ أَوْلَادَهُنَّ حَوْلَيْنِ كَامِلَيْنِ (آيت: ٢: ٢٣٣)

Sayyidina Ibn Abbas (may Allah be pleased with him) reported:

قال رسول الله صلى الله عليه وسلم لارضاع الا ما كان فى الحولين. (16)

Imam Abu Hanifah رحمه الله عليه said about:-

وَالْوَالِدَتُ يُرَضِّعْنَ أَوْلَادَهُنَّ حَوْلَيْنِ كَامِلَيْنِ.

That it is not necessary that “حولين” stops suckling after that. He argues that “فان” in the following phrase فَاِنْ أَرَادَ فِصَالًا عَنْ تَرَاضٍ مِنْهُمَا وَتَشَاوُرٍ فَلَا جُنَاحَ عَلَيْهِمَا hints at the post-period of Hence, “حولين” this verse does not mean to limit the period of suckling but specifies that the maintenance of the woman who breast-feeds is wajib on the father for up to two years, not more than that.

Many deduce from the following verse too:-

وَحَمْلُهُ وَفِصَالُهُ ثَلَاثُونَ شَهْرًا.

“And the bearing of him and the weaning of him is thirty months” (45:15)

The minimum pregnancy period is six months, the remaining twenty-four months is of weaning. (17)

Imam Abu Hanifah رحمه الله عليه also bares his argument on this verse.

The outlier of Hidayah states that Allah has mentioned two things in this verse that pregnancy and weaning are over a period of thirty months.

كالاجل المضروب للدينين.

However, there is a drawback against pregnancy period. Sayyidah Ayshah (may Allah be pleased with her) said:-

لا يكون الحمل اكثر من سنتين قدر مايتحول ظل المعزل. (18)

This means that the maximum period of pregnancy is two years.

However, Mawlana Anwar Shah Kashmiri رحمه الله عليه said:

وما اجاب به صاحب الهداية ههنا فهو ركيك جداً.

The saying of Sayyidah Ayshah (may Allah be pleased with her) necessitates abrogation of the verse which is not correct. Hence, the correct answer is what Allamah Nusfa has suggested, "The meaning of حمله is to carry in the arms." Thus, the verse implies that the period of suckling is thirty months which is also the time during which the infant is carried in the arms. If an objection is vaied that the verse 46:15 ووضعتها كرها clearly refers to carrying the child in the womb, so حمله وفصاله would also refer to the same thing, then our contention is that the verse describes the different stages of hardship the mother undergoes for the sake of her child they are:

حملته امه كرهاى فى البطن (carrying it with hardship in her womb).

ووضعتها كرها (and brings it forth with hardship).

وحمله على الايدى (and carries it in the arms)

وفصاله (and weans it).

However, there is no doubt that the majority opinion is preferable.

Allamah Ibn Nujaym writes: (19)

ولا يخفى قودة دليلهما.

This is because the words:

وَالْوَالِدَتُ يُرَضِّعْنَ أَوْلَادَهُنَّ حَوْلَيْنِ كَامِلَيْنِ.

Continues to the verse:

لِمَنْ أَرَادَ أَنْ يُتِمَّ الرَّضَاعَةَ.

Which indicate that there is no sucking once (two years are over. However, someone might put forth the words:

فَاِنْ أَرَادَ فِصَالًا عَنْ تَرَاضٍ مِنْهُمَا وَتَشَاوُرٍ فَلَا جُنَاحَ عَلَيْهِمَا.

Indicate that weaning is subject to mutual constant after “حولين” so that if consent is not forthcoming suckling might carry on even after “حولين” (two years). The answer to this is that the consent is required within two years (to wean.). It is not needed thereafter when it is specified that breast-feeding will cease.(20)

Maintenance of child after two years:-

The father is responsible to arrange for the child's nourishment when he is able to subsist on that. Hence, he labours all day to earn that and at night lends a hand to the child's mother in looking after it and coaxing it to go to sleep. He wards off flies and mosquitoes from the child.

ويخشى عليه الثقل من وطاة الذر

and he even fears the ants on its account lest they bite the child. The father and mother say:

اكبادنا تمشي على الارض

وانما اولادنا بيننا

لامتنعت من الغمض

لو هبت الريح على بعضهم

(Our children. Our beloved walk on the earth among us. If the wind blows over any of them, my eye lashes will stop flickering.) (21)

This is a natural love that Allah has put into His creatures. The father is driven by those sentiments to see that his children have the best possible nutrition. However, that is not all. For, Islam has made it mandatory on the father to provide maintenance to his children who are minors. Allamah Ibn Nujaym رحمه الله عليه has written:

ولطفله اى تجب النفقة والسكنى والكسوة لولده الصغير الفقير.

“It is wajib on the father to provide maintenance to his minor and needy children” (22)

This maintenance is wajib for the father singly. No one else will share his responsibility for that. The Arabic word طفل (minor children) means a child from birth to end of adulthood. The qualification of فقير (poor) implies that if the child is rich then its maintenance is not wajib on its father, even if his property is a piece of land, sheets of cloth or drapery, etc. The father can sell those things and spend on the child. If both father and son are poor then according to Khassaf, the father will beg of people to meet the expenses of his child (ren). Or, the Bayt al-Maal is responsible for such people. (23)

It is stated in the marginal notes to al-Bahr-ur-Ra'iq by Allamah Ibn Aabidayn Shami رحمه الله عليه that the father will not compel his daughter to earn a livelihood. (24)

وليس له في الأنثى ذالك.

And Ramli has said that if the girl can sew or spin yarn and earn therefrom then it is not wajib for the father to provide them maintenance on condition that they earn according to their need. If their earnings fall short of their needs then it is wajib on the father to make good the short fall. (25)

Inheritance for children:-

Sometimes, a man has good intentions in protecting his legacy for his children through a waqf, or endowment. However, very soon the family grows, there are more children and relatives. Supervisors and guardians then quarrel with each other. This intensifies into rivalry and enmity. Many Muslim countries have therefore, abolished family endowments. Allah alone knows what His slaves require and what is good for them. The shares of inheritance are defined and Shari'ah has taken upon itself the responsibility of its apportioning because the rightful should get his right and people might not go to the courts and antagonize each other after death in their family member.

Allah, the Majestic, the Glorious has said:

يُوصِيكُمُ اللَّهُ فِي أَوْلَادِكُمْ لِلذَّكَرِ مِثْلُ حَظِّ الْأُنثِيَيْنِ ۚ فَإِن كُنَّ نِسَاءً فَوْقَ اثْنَتَيْنِ فَلَهُنَّ ثُلُثَا مَا تَرَكَ ۚ وَإِن كَانَتْ وَاحِدَةً فَلَهَا النِّصْفُ.

“Allah enjoins you concerning your children, for the male is the share equivalent of that of two females: but if there be more than two (or two) females only (and no male child) them for then are two thirds of what (the deceased) left, and if there be only one female child (and no male child), for her is the one half” (4:10)

Orphaned grandson's share:-

The family laws in our country have apportioned a share for an orphan from the legacy of his paternal grandfather. But, it is not reasonable that the right of other heirs is taken away to accommodate the orphan by force. This is altering the laws of Allah and His Prophet ﷺ. Rather, the options indicated by Allah and His Messenger ﷺ for the orphan must be observed. The laws of Shari'ah for maintenance must be enforced. To set aside a share for the orphan in the legacy of a paternal grandfather is not the solution of his problems because everyone does not leave behind a legacy when he dies. Also, it is not normally so abundant as to support an orphan. But, if the laws of maintenance are enforced then every helpless and poor orphan will have his difficulty removed. The Qur'an, the

Ahadith and the scholars have explained exhaustively the issues of maintenance. We present some here. A similar duty is upon the heir). (2:233)

وَعَلَى الْوَارِثِ مِثْلُ ذَلِكَ.

Thus, if a father dies then it is as wajib on the child's heirs to provide maintenance to his mother or wet-nurse during his suckling period. They are also responsible for the child's maintenance. (26) Imam Abu Bakr Jassas Razi (d. 370 A.M.) has written in explanation of this verse:

وعلى الوارث مثل ذلك: يعنى النفقة والكسوة وان لا يضاره اذا كانت المضارة قد تكون فى النفقة كما ذالك فى غير ما قل عطفاً على ذالك وعلى الوارث مثل ذالك كان ذالك موجباً على الوارث جميع المذكور وقد روى عن عمر وزيد بن ثابت والحسن وقبيصة بن ذؤيب وعطاء وقتادة فى قوله تعالى وعلى الوارث مثل ذالك، النفقة على الرجال والنساء على قدر مواريثهم وهو قول اصحابنا.

“Feeding and clothing are the responsibilities of heir. He should not cause hardship to women which is through maintenance or otherwise. Since Allah has placed it on the heir then it is necessary for him to observe all that Sayyidina Umar □, Zayd Ibn Thabit □, Hasan □, Qabeesah Ibn Zuwayab عليه رحمة الله and Qatadah عليه رحمة الله explain the verse as speaking of maintenance. Zayd Ibn Thabit □, said that maintenance is wajib on men and women according to inheritance. This is what our (Hanafi) ulama' say. (27)

Imam Fakhruddin Razi رحمه الله عليه has written in his Tafseer (exegetes):-

المراد وارث الاب يجب عليه بعد موت الاب كل ما كان واجباً على الاب ولهذا قول الحسن وقتادة وابى مسلم والقاضى.

“It means the heir of the orphan's father. All that was wajib on the father (in the favour of the orphan) will become wajib on him after the father's death. (28)

Allamah Mahmood Aaloosi رحمه الله عليه has written:-

والمراد بالوارث وارث الولد فانه يجب عليه مثل ماوجب على الاب من الرزق والكسوة بالمعروف ان لم يكن للولد مال وهو التفسير المأثور عن عمرو ابن عباس وقتادة ومجاهد وعطاء وابراهيم والشعبى وعبدالله بن عتبة وخلق كثير.

“The heir refers to the child's heir because all that is wajib on him which is wajib on father. It is feeding and clothing according to law provided the child does not have his own wealth. The exegesis of this verse is known from Sayyidina Umar □, Ibn Abbas □, Qatadah عليه رحمة الله, Mujahid عليه رحمة الله, Ata عليه رحمة الله, Utbah عليه رحمة الله, and many other authorities”

We learn of the following things from the verse and its exegesis by the scholars:-

1. After the death of the father, the heirs will shoulder every responsibility concerning the orphan.
2. The heirs are bound to give the orphan a proper education and training.
3. It is wajib on his paternal grandfather, paternal uncle and elder brothers to give him maintenance for all his needs.
4. His needs for food, clothing and other essentials will be determined according to dictates of Shari'ah in every circumstance. (30)

Maintenance of homeless children:-

Those children who are heirless will be provided maintenance from the Bayt al-Maal. This is what was done also in the initial days of Islam with a child without father or a child found on the thoroughfare. It was brought to Sayyidina Umar □ who would allocate for it a hundred dirham and whatever was needed for its sustenance and other essentials. The child's guardian would collect its stipend every month while the Ameer ul Mumineen would go every year and examine the progress of the child. He would also give instructions for kind treatment to it. (31)

The author ofai-Bahr has defined such a child thus:-

هو فى الشريعة اسم الحى مولود طرحه اهله خوفاً من العيلة او فرار من تهمة الزينة مضية آثم ومحزره غام.

“In Shari'ah, a laqeet is a living child whose people have abandoned it lest they have to raise it or from fear of being scandalized. Those who abandon it are sinners while those who protect it are sinners while those who protect it are worthy of reward” (32)

Such children are the responsibility of the state. This is also confirmed by Sayyidina Umar □ and Sayyidina Ali □ for the Laqeet is a Muslim who is unable to earn a livelihood and neither owns anything nor has relatives. His maintenance is from the state treasury.

ونفقته فى بيت المال، وهو المروى عن عمر وعلى ولاته مسلم عاجز عن الكسب، لا مال له ولا قرابة فاشبه المقعد الذى لا مال ولا قرابة. (33)

“Though it is the responsibility of the state to pick up abandoned children, if anyone does it in his individual capacity then he will earn reward.

ندب التقاطه لما فيه من احبائه وهو من افضل الاعمال.

“It is commendable to pick up such children because their life depends on it. It is the best of deeds (to let someone live).” (34)

In this connection, the very well-known social worker who has devoted himself to service to humanity, Abdus Sattar Edhi performs praiseworthy Tasks. At the Same time as doing other tasks for the common people, he has made reasonable arrangements to bring up heirless, homeless children and to give them maintenance. Innumerable children have been saved from destruction through his efforts.

Abstract

INDIA is a country that's more prone to natural Calamities & disasters [UNESCO Bangkok, 2007.] .No city in the India can be said to be free from Risk and Hazard of facing such acts.

Disaster is a serious public health issue and one of man's oldest concerns, and we have no control over when and where they happen, but with proper preparedness and planning for all phases of disaster, we can minimize the consequences of any disaster.

In last few decades frequency and intensity of various disasters have been significantly increasing all over the world.

Emergency physicians are main players in disaster responses but their knowledge levels of disaster medicine and their psychosocial status are not readily available. This study aimed to evaluate psychosocial preparedness levels and training needs of disaster medicine among potential disaster responders and presented a necessity to popularize disaster medicine education

Methodology: This study is a survey based descriptive study, to fulfill this purpose a questionnaire was developed and a pilot study was done to validate the questionnaire. A web link for this survey sent through email, to Emergency department directors of various multispecialty hospitals with accredited emergency department, requesting them to circulate this link among their consultant / postgraduate trainees and residents.

Results: 124 participants from 16 states of India completed this survey over a period of 6 months. Majority of emergency physicians agreed hospitals in India are inadequately prepared to handle various kinds of disasters, whereas around 50% emergency physicians are not aware of either stockpiles of PPE of their hospitals or their adequacy. Where about 44% respondents did not know the access to resources in case of emergency events. Interestingly, in the study; around 83% of Emergency physicians were ready for being trained in the form of classroom teaching despite their busy schedules, which needs to be appreciated properly.

Conclusion : The study results show that there is enormous scope of further improvement in various aspects of disaster preparedness.

Corresponding Author:- Dr. Sajid Nomani.

Address:- Consultant, Dept of Emergency Medicine, AMRI Hospital Bhubaneswar.

Though in certain areas the result were satisfactory, majority of the results demand improvement. In the current scenario there is a need for an organized effort for the spread of disaster preparedness amongst the Emergency physician in India. As per the outcome of this study ,it can be concluded that perception of disaster preparedness among Emergency physician in India is still an iceberg phenomenon. Thereby emphasizing upon the fact that hospital administration authorities, government and nongovernmental agencies should take a serious note on it and take measures to inculcate awareness among EPs and should treat finding of this study with seriousness and treat it as a base for further studies for improvement in this field.

Introduction:-

Disaster is a serious public issue and one of man's oldest concerns, and we have no control over when and where they happen, but with proper preparedness and planning for all phases of disaster, we can minimize the consequences of any disaster.

In last few decades frequency and intensity of various disasters have been significantly increasing all over the world.

Floods, drought, hurricanes and other disasters in last few decades have caused severe environment disruption as well as huge economic losses.

Emergency physicians are main players in disaster responses but their knowledge levels of disaster medicine and their psychosocial status are not readily available. This study aimed to evaluate psychosocial preparedness levels and training needs of disaster medicine among potential disaster responders and presented a necessity to popularize disaster medicine education.

The term DISASTER originated to the French word "Desastre" which is a Combination of two words 'des' meaning bad and 'aster' meaning star. Thus the term refers to 'Bad or Evil star'.¹

Disasters usually defined as "A serious disruption in the Functioning of the community or a society causing wide spread material, economic, social or environmental losses which exceed the ability of the affected society to cope using its own resources"^{1,2,3}

A disaster is a result from the combination of hazard, vulnerability and insufficient Capacity or measures to reduce the potential chances of risk.³

If we think back around 25-30 years, we rarely heard about a major disaster happening, now think in the present context, today it seems like every time we turn around there has been another major disaster.

As an aftermath of the 9/11 World Trade Center, USA event, Attack on Indian parliament on December 13, Indian Ocean tsunami on 24th December 2004 ,Mumbai attack 2009 & Recent Tsunami in Japan , and several incidence like that around the world and in India, has given a new management of disasters on a large scale, hence the importance of disaster management and disaster preparedness become quite evident even to the layperson.

India is one of the most disaster prone countries of the world^{4,5}.

It has had some of the world's most severe droughts, cyclones, chemical disasters, mid-air head-on air collisions, and earthquakes, rail and road accidents. India is also one of the most terrorist prone countries.

According to EM-DAT (2011) report Indian subcontinent acquired fourth position in term of reported disaster, after Philippines, USA, and China.

India is a huge country and it holds as many variations in religion, language, customs, art and cuisine as it does in topography and hence the disasters vary in their type and magnitude as well.

Disasters are typically viewed as low probability yet high impact events. Although various definitions have been used, a disaster is frequently viewed as a situation in which the number of patients presenting to the medical facility within a given time period exceed the ability of the hospital to provide care without external assistance. As such, the definition is institution specific, and therefore preparedness must be likewise institution specific.

The term “hospital preparedness” is a catch-all phrase, covering a multitude of inter-related areas of medical and non-medical disaster management. Although the Joint Commission on Accreditation of Healthcare Organizations (JCAHO) mandates specific standards for hospital preparedness, in many institutions these standards never extend beyond the written page. Hospital preparedness is focused on either natural or unintentional man-made mass casualty events such as accidents, earthquakes, tornadoes, commercial building collapse, and airline or school bus accidents.^{5,6}

Almost 85% of India’s area is vulnerable to one or multiple hazard. Of the 28 states and 7 union territories, 22 are disaster-prone. It is vulnerable to wind storms spawned in the Bay of Bengal and the Arabian Sea, earthquakes caused by active crustal movement in the Himalayan mountains, floods brought by monsoons, and droughts in the country's arid and semi-arid areas. India has also become much more vulnerable to tsunamis since the 2004 Indian Ocean tsunami.⁷

The size and location of our country gives us:

- i. 57% of landmass prone to earthquakes (high seismic zones III–V)
- ii. 68% of the total area are vulnerable to drought.
- iii. 12% to floods.
- iv. 8000 kilometers’ long coastline with an average of two cyclone seasons.

India is a country that’s more prone to natural Calamities & disasters [UNESCO Bangkok, 2007.] .

There is no city or district or village in India can be said to be free from Risk and Hazard of facing such events, hence the responsibility of the people functioning with government as well as private organizations increases manifold.

Beside as citizen of a country which has high risk of both natural and manmade disaster, we all have a certain amount of responsibility for facing and overcoming the socioeconomic as well as psychological impact of these incidents.

The medical impact of any major disaster is felt by the emergency physician and associated staff located within the geographical zone facing the event; they are first people to deal with victims of any disaster, especially Emergency Physician who has to lead a team in such kind of event and facing all challenges along with playing an important role in all phases of disaster, pre-disaster, in-disaster, and post-disaster.

Emergency medical services and emergencies physician should play a leadership role in preparedness activities such as training and education, development of performance metrics, establishment of memorandum of understanding (MOUs), and others planning.

So it is very important that most of the physicians have a good understanding about disaster preparedness. This study aimed to understand what is the current perception about disaster preparedness amongst the Emergency physicians of India.

Literature Review:-

Online databases were used to identify relevant studies for this Literature review,

The search was limited to human and English language. Search was restricted between the years 1995 to 2015 in order to provide only recent evidence. No previous study was identified on Emergency Physician's perception about disaster preparedness in India. Though no similar study was identified in the Indian context, the above search identified about 6 trials on nurse's perception, physician perception and preparedness done globally in last two decades, that was relevant to our topic. Also some textbooks and material from the internet were studied for the purpose.

A study was done to investigate Emergency Physicians' knowledge about the Superfund Amendments and Reauthorization Act (SARA) Title III legislation, passed by the United States Congress in 1986, and to determine the factors contributing to their level of preparedness in dealing with patients exposed to toxic chemicals. In this study, author found that out of 187 directors of EDs in New York, only 33% of the directors had heard about SARA. Despite the finding that some emergency physicians are involved in community preparations, two main problems persist in planning a medical response to environmental emergencies. First, the ED directors generally are unaware of the legislation that mandates these preparations and are not interacting with community planners. Second, there is not full involvement by the local EDs in the Local Emergency Planning Committee's planning efforts.⁸

A review of literature suggests that nurse's response to working during a bioterrorism event is not well described. The limited number of studies regarding nurses' concerns, fears, and anxieties is focused on nurses' experiences in natural disaster or war situations. Additional studies are needed to validate the appropriateness of applying findings from disaster response studies to bioterrorism events. During bioterrorism events, nurses will be expected to provide physical care and emotional and psychological support for victims and victims' families. Realistic bioterrorism plans should incorporate strategies to support nurses and address their physical, psychological, and emotional issues. Strategies to optimize safe working conditions and minimize psychological trauma such as technical training regarding bioterrorism agents and debriefing opportunities should be included.⁹

In another study author ranked nurses higher than physicians regarding their knowledge and skills in dealing with mass casualty events involving children, but the level of knowledge for mass casualty events involving children was low in both.¹⁰

Another study supported the above by concluding that considerably more training and information are needed to enhance preparedness for frontline healthcare workers (nurses) as important members of the disaster response community.¹¹

The importance of physician involvement and leadership in crisis preparedness is recognized by Uddin *et al* (2008). Their literature also suggests that few physicians are adequately trained to practice effectively in a large-scale crisis situation.¹²

In a recent pilot study on disaster training program to improve emergency physicians' preparedness. They concluded that Disaster preparedness is an essential area of clinical competence for EPs. Participation in a yearlong pilot training program demonstrated a statistically significant increase in cognitive competence among a pilot sample of Emergency Physicians.¹³

The above literature review clearly identifies that, very few physicians are adequately trained to practice effectively in a large-scale crisis situation.

Methodology:-

Participants:-

Participants for this study was consultants Emergency department, emergency department residents, and postgraduate trainees of emergency medicine from varies multispecialty, tertiary care level hospitals of India which have a fully functional Emergency department.

Those doctors who were working other than emergency department were excluded from this study.

Questionnaire:-

This study is a survey based descriptive study, to fulfill this purpose a 13 items questionnaire was developed including three demographic questions,(from question 1 to question 3) which included participant's gender, age, their professional role, residing state, contact number, and their emails.

Question 5 to question 10 had multiple sub-questions under their heading.

The questionnaire was divided in two part for understanding the following

1. Familiarity regarding specific term and activities in different emergency preparedness categories.
2. Participant's experience and training.

Survey:-

This survey was conducted through a web based survey site <https://www.surveymonkey.net>, a web link <https://www.surveymonkey.com/s/SK3BPRK> sent through email, to Emergency department directors of varies multi specialty hospitals with accredited emergency department, requesting them to circulate this link among their consultant / postgraduate trainees and residents. A multi stage sampling method was use to fulfill the objective of this survey. Apart from web based collection, some sampling was done through printed questionnaire, which was manually entered in website for proper analysis.

Questions Wise Result:-

124 participants from 16 states of India completed this survey over a period of 6 months.

99 respondents participated through an online survey tool and 25 participants were directly administered printed questionnaire.

An accurate estimate of the response rate is difficult to assess, as it was not possible to ascertain, what proportion of emergency physician have indeed been exposed to the email invitation to participate in this survey.

We excluded 10 responses from the final analysis as these were incomplete.

Key demographic characteristics (Q.No.1-3) of the respondents are detailed in following tables.

Table 5.1:- Representing gender distributions.

Gender			
Answer Options	Male	Female	Response Count
Numbers of respondents	86	28	114

Table 5.2:- Representing distributions of participant's age group

Age(in years)							
Answer Options	25-30	30-35	35-40	40-45	45-50	>50	Response Count
Number of participants	55	15	16	12	9	7	114

Table 5.3:- Showing distributions in work experience

Work Experience in Emergency department(in years)						
Answer Options	0-1	1-5	5-10	10-15	>15	Response Count
Number of respondents	31	46	25	12	0	114

Table 5.4:- Distributions in professional role

Professional role						
Answer Options	Consultant	Associate Consultant	Junior Consultant	PG Student	EMO	Response Count
Number of participant	24	8	9	69	3	113

Table 5.5:- Distribution of states

States	A.P	Asm	Bh	DL	chg	Jh.	Kar	krl	MP	MH	OR	PN	RJ	TL	UP	WB	RC
NOR	6	4	4	18	7	1	11	8	2	9	1	2	2	9	3	27	114

A.P-Andhrapradesh;Asm-Assam;Bh-Bihar;Chg.-Chandigarh;Del-Delhi;Jh.-Jharkhand;Kar-Karnatka;krl-kerala;MP-MadhyaPradesh;MH-Maharashtra;OR-Orisha;PN-Punjab;RJ-Rajsthan;TL-TamilNadu;UP-UttarPradesh;WB-WestBengal

RC-Response Count;NOR-number of respondents

Among the respondents 76.11% (86) were male and 23.89% (27) were female.

48.67% (56) were aged between 25-30 years,

5.31% (6) were aged more than 50 years, rest of the respondents were aged between 30 to 50 years.

Of the 114 respondents, majority 61.06% (69) were postgraduate emergency medicine residents, while 21.24 % (24) were working as consultant(s) in emergency department. and a small portion of respondents were working as junior consultants 7.96%(9), Associate consultant 7.08%(8) and 2.65%(3) working as emergency medical officer.

Majority of respondents 40.35% (46) had working experience (in the emergency department) between 1-5 years. 33.67%(33) had only 0-1 year working experience; while there is 13.27%(13) respondents had 5-10 years of experience, and only 4.27%(4) had more than 10 years of working experience in the emergency department .

Q.4: Familiarity with Emergency Preparedness Terms & Activities.

Table 5.6:- showing details percentage of familiarity with term and activities of emergency preparedness.

Answer Options	Not familiar	Somewhat familiar	Familiar	Very familiar	Rating Average	Response Count
Familiarity with triage in large scale emergency event	2	33	49	30	2.94	114
Assess and Respond to site safety issue for self, co-worker,& victim during a emergency event	10	26	49	27	2.83	112
Please provide an assessment of your overall familiarity with response activity/preparedness in the case of a large scale emergency event	7	36	60	11	2.66	114
Your hospital preparedness for responding to a large scale emergency event	10	40	50	14	2.60	114
Overall familiarity with sign/symptoms of exposure to different biological agent/contagious disease outbreak	18	38	47	8	2.41	111
Familiarity with emergency operations plan(EOP) in your hospital	19	56	32	6	2.22	113
Familiarity with incident command system(ICS)	27	26	36	24	2.50	113
Familiarity with rapid assessment of victim of emergency event	4	15	56	38	3.13	113
Familiarity with your facility's/community quarantine process	31	50	24	7	2.06	112
Use of all type of communication devices(fax/email/satellite ph.)	6	27	22	59	3.18	114
answered question						114
skipped question						0

The first question in this section was on *familiarity with triage in a large scale emergency event*. 42.98% (49) showed that they are familiar with triage, and 28.95% (33) respondents denoted that they are somewhat familiar ,26.32%(30)respondents replied that they are very familiar with triage in large emergency event while, only 1.75%(2) were not aware about triage in large emergency event.

Out of 114 respondents 43.75 %(49) denoted that they are familiar with *self safety and site safety issues*, 24.11%(27) think that they are very familiar with safety issues and a small percentage 8.93%(10) said that they are not familiar with site safety issue for self and co-workers during emergency events.

When asked about *familiarity with sign and symptoms of exposure to different biological agent/contagious diseases outbreak*, 42.34%(47) said that they are familiar, and 34.23% (38)replied “somewhat familiar”, while 16.22%

(18) were not familiar and only a small group of respondents 7.21% (8) were confident and very familiar with this issue.

Majority of respondents 49.56% (56) said that they are somewhat familiar with their hospitals emergency operation plan (EOP), 28.32% (32) respondents think that they are familiar, and 16.81% (19) respondents denoted that they are not familiar with their hospital's EOP. Only 5.31% (6) were confident in their knowledge regarding hospital EOP.

In assessment of another important component of emergency preparedness the *Incident Command System (ICS)* we looked at familiarity with this concept and found that 31.86% (36) respondents were familiar with ICS, and only 21.24% (24) of total participants said that they are very familiar with ICS, while a significant percentage of 23.89% (27) of the respondents denoted that they do not know about ICS. When asked about *familiarity with communication devices*, majority of 51.75% (59), shows that they are very familiar with use of the all kind of communication devices.

Q.5: Rate your responses to your hospitals preparedness.

Table 5.7:- details percentage of hospital preparedness to various kind of emergency events.

Answer Options	No Preparedness	Inadequately Prepared-ness	Adequately Prepared-ness	Do not know	Rating Average	Response Count
Do you think hospitals in India are prepared for disaster	17	87	6	4	1.97	114

This section deals with hospital preparedness to various kind of emergency events.

Majority of respondents 76.32%(87) agreed that hospital in India are inadequately prepared to handle disasters; 14.91% (17) said that there is no preparedness amongst Indian's hospital to face large scale emergency events; while a small percentage 5.26%(6) of respondents think that hospital in India are adequately prepared for disasters.

When asked about participant's hospital disaster preparedness majority 59.29%(67) agreed that their hospital is inadequately prepared to face large scale emergency events, and 25.66%(29) of respondents think that their hospital is adequately prepared, while only 9.73% (11) think that their hospital is not prepared for facing disasters.

Majority of 63.16 % (72) and 62.28 % (71) emergency physician thinks that their hospital is not prepared for bioterrorism activities and radio/nuclear incident respectively, and only a small percentage 5.26 % (6) respondents said that they are adequately prepared for both events.

44.74 % (51) emergency physicians think that their hospitals are adequately prepared for flood/cyclone and 42.98%(49) replied that their level of preparedness is adequate for earthquakes.

Q. 6: Rate your responses to Accessing critical resources & Stockpiles.

Table 5.8:- Represents emergency physicians knowledge about availability of various stockpiles in their hospital

Answer Options	No	Yes	Don't know	Rating Average	Response Count
Do you know about your hospital's stockpiles of personal protective equipments?	58	35	21	1.68	113
Do you know about your hospital's stockpiles of personal protective emergency medication/antidotes?	54	42	18	1.69	113
Do you know about your hospital's stockpiles of oxygen/electricity backup?	39	47	27	1.89	113
Do you think your hospital has adequate stockpiles?	33	25	56	2.21	113
Do you know that, during an event, where to quickly access up-to-date resources about specific (Radiological, Chemical, Nuclear, Biological, and Explosive) agents	51	32	31	1.83	113
answered question					114
skipped question					0

Large number of emergency physician 50.44%(58) and 46.90% (54) are not aware about stockpiles of personal protective equipments (PPE) and emergency medication/antidotes respectively in their hospital, while 30.97% (35) and 37.17%(42) said they know about stockpiles of PPE and medication of their hospital.

When asked whether available stockpiles is adequate or not most emergency physician 49.56%(56) has no idea about this as they replied they do not know, and 28.32% (33) responded that the available stockpiles is not adequate and 22.12%(25) emergency physician thinks that their hospital has adequate stockpiles of PPE and emergency medications. Out of 114 respondents 44.25% (51) replied that they don't know, from where to quickly access up-to-date resources about specific agent (radiological/chemical/biological /explosive) and 28.32 % (32) people know about this, while 27.43 % (31) of emergency physician has no idea about this as their answer was "do not know".

Q. 7: Do you feel adequately equipped to work during various kinds of disaster?

Fig 5.1:- percentage of emergency physician's perception about how well they are equipped, working in different type of disaster.

In this section we tried to access that how well Emergency physicians are equipped working in different type of disaster.

A majority of 63.72% (72) thought they are not equipped to work in case of bioterrorism event, while 20.35% (23) thinks inadequately equipped and only 1.77% (2) respondents replied that they feel adequately equipped.

39.82% (45) thought that they are adequately equipped to work in a earthquake event, and 41.59% (47) replied that they are adequately equipped for flood/cyclone.

In case of bomb blast injuries 45.54% (51) and 29.46% (33) of the participants replied that their hospital(s) were 'inadequately equipped' and 'not equipped' respectively, while 16.07% (18) replied that they were adequately equipped. Only 7.96% (9) respondents think that they are adequately equipped to face any bomb blast event.

When asked about an infectious outbreak 41.96% (47) emergency physicians said that they are adequately equipped for working in an infectious outbreak, and 37.50% (42) replied that they are inadequately equipped. A major number of respondents 43.36% (49) replied that they are not equipped for working in a chemical accident, while 38.94% (44) said they are inadequately equipped.

Q.8 : Do you feel adequately trained to work during various kinds of disaster?**Fig5.2:-** shows emergency physician's formal training on different kind of Disasters

Majority of the responding emergency physicians 64.91%(74) and 36.94%(41) have stated that they are not trained for working during bioterrorism and chemical accident respectively. While 26.32% (30) and 49.55%(55) denoted that they are inadequately trained for working in event of bioterrorism and chemical accident.

A small percentage of 7.89 % (9) and 11.71% (13) said they are adequately trained for working during such events. Majority of emergency physician 51.75% (59) said they are inadequately trained for working in a case of bomb blast event, and 28.95% (33) confirmed that they are not trained for working in bomb blast event(s), while 17.54% (20) were confident about the adequacy of their training for working on an event of bomb blast. Regarding training for working during earth quakes and flood/cyclone 46.49%(53) and 43.36%(49) respectively stated that they were not adequately trained.

35.40% (40) emergency physician stated that they are adequately trained for working during flood/cyclone, and 30.70% (35) confirmed their adequate training for working during an earth quake.

46.49 % (53) respondents were confident about the adequacy in their training for working during an infectious disease outbreak.

A significant number of emergency physician 32.46% (37) denoted their training was inadequate for working during an infectious outbreak; while 19.30 % (22) stated that they are not trained for working in such a scenario.

Q. 9 : Rate your responses to your experience & training.**Table 5.9:-** details of emergency physician's work experience in disastrous events and hospital's disaster plan and policies

Answer Options	No	Yes	Rating Average	Response Count
Have you had any training in disaster medical response?	39	75	1.66	114
Have you had any experience in working during mass casualty event?	38	76	1.67	114
Have you had any experience in working during mass infectious disease outbreaks?	75	39	1.34	114
Do you know in case of a disaster who commands the disaster response in your hospital?	42	72	1.63	114
Does your hospital have a plan and policies to respond to a large scale mass causality incident?	35	77	1.69	112
Did your hospital have a fire/disaster drill?	15	97	1.87	112
Have you had any experience in working during mass casualty event?	40	71	1.64	111
Have you been trained on the disaster plan?	47	64	1.58	111
As an emergency physician do you think that you will be legally liable by the Indian legal system for practicing altered level of care because of limited supply of resources, excessive loads of patients, as usually happens during disasters?	50	63	1.56	113
answered question				114
skipped question				0

This section deals with Emergency physician work experience in disastrous events and hospital's disaster plan and policies.

Majority of the respondents 65.79%(75) stated that they have received formal training for working during an external disaster; while 34.21% (39) were untrained.

66.67% (76) emergency physicians had experience working in a mass causality event.

When asked about their experience of working during infectious disease outbreak, majority of 65.79% (75) of the emergency physician stated that they have never worked in an infectious outbreaks.

when inquire about their hospital's plan and policies of mass causality events and incident commander of their hospital 68.75% (77) and 63.16% (72), respectively said that they know about these while 31.25%(35) and 36.84% (42) emergency physicians stated that they are unaware about their hospital's disaster plan and policies and incident commander of their hospital.

A large number of emergency physician 86.61%(97) agreed that their hospital conducts simulation/disaster/fire drill, and 13.39%(15) replied 'NO'. to this question.

Majority of respondent 57.66% (64) had training on hospital disaster plan in their hospital and but a significant percentage 42.34% (47) of emergency physician did not receive any formal training on disaster management plan.

55.75% (63) emergency physician thinks that they are legally liable by "Indian legal system" for practicing altered level of care in emergency events because of limited supply and excessive loads of victims. While 44.25% (50) said they are NOT legally liable.

Q.10 : How far would you be willing to travel if a disaster occurred today?

Fig 5.3:- -explaining about willingness of travel to work in case of disaster.

Only 39.50% (45) emergency physician agreed to travel nationwide to work in disastrous event, and 38.60% (44) said they can travel only locally. While a small number of 2.63% (3) respondents were not keen to travel to work in disaster.

Q.11 : How many times in a year your hospital/organization conducts fire drill/simulation drill ?

Fig 5.4:- Explaining about simulation drills at participant's hospitals.

Q.12: When did you last seek information on disaster medical response?**Fig.5.5:-** Participant's last gathered information on disaster medical response.**Q. 13 : Your preferred methods to receive emergency preparedness training?****Fig 5.6:-** Emergency physician's preferred method of training

A significant number of 41.23%(47) participants agreed that they never sought information regarding medical disaster response.(fig 5.5)

82.90% emergency physicians are ready to take training on disaster response by traditional face to face method, while others are interested in others methods like web based courses, CV/DVD, or pocket reference books.(fig.5.6)

Discussion:-

Emergency medicine is a broad specialty comprising of disaster medicine as one of its vital branches.

The knowledge of disaster medicine is a paramount importance among the emergency physicians playing the responsibilities of dealing with different kinds of calamities occurring in society.

Natural and human-induced disasters have significantly increased in last few decades which inturn called attention to the fact that emergency physicians play pivotal role in disaster planning.

Though emergency physician are involved in planning, mitigation, response, and recovery aspects of disasters as well as actively participating in actual disaster events, mock drills and further educational opportunities, specific to disaster preparedness; data regarding their knowledge level are not readily available.

This has led to the essence of a pioneer research work to assess **“Perception of disaster preparedness among emergency physician in India”**

This unique analysis of perception of disaster preparedness amongst the working emergency physician was conducted on pan India basis among 16 states over a period of 6 months, with a total 124 participants. The study questionnaires were divided in to several subsections which covered various aspects and facts of disaster preparedness.

The result has revealed several interesting findings. The salient features are as follows.. 26% of emergency physicians were found to be familiar with triage in large emergency event and a significant percentage of them,(around 24%) did not know about ICS ,an important aspect of disaster preparedness. This is the grey zone with enormous scope of improvement.

Majority of emergency physicians (around 76%) agreed that hospitals in India are inadequately prepared to handle various kinds of disasters, whereas around 50% emergency physicians are not aware of either stockpiles of PPE of their hospitals or their adequacy. Where about 44% respondents did not know the access to resources in case of emergency events. Thereby emphasizing upon the fact that hospital administration authorities should take a serious note on it and take measures to inculcate awareness among EPs.

On the other hand, Only 5.26% emergency physicians thought that their hospitals were adequately prepared to handle a bioterrorism activity as well as radio/nuclear incidents, while around 63% had an opposite view on the same.

When we tried to gather information that whether they are adequately equipped or not to work in various disastrous events, majority of emergency physicians (around 64%) stated that their hospitals were not equipped to work in case of bioterrorism event, while around 40% and 42% thought that they are adequately equipped to work in earthquake and flood/cyclone respectively. Only a small percentage ,around 16% emergency physicians thought that their hospitals were adequately equipped to work in case of bomb blast injuries. On the contrary, other participants replied that either they are inadequately equipped or not equipped. The reason for such differences in views should be sorted out in a systematic way and should be addressed in a proper way accordingly. Thus opening an opportunity for further scientific study on the topic.

When enquired about their formal training dealing with various kinds of disasters, only around 8% and 12% were adequately trained in bioterrorism and chemical accident management respectively, where about only 18% were confident about adequacy of their training for working in bomb blast scenarios. Most of these participants were either working as consultant or having 5-10 years of working experiences in Emergency Medicine.

In due course, around 42% of Emergency physicians revealed that they did not receive any formal training on the hospital disaster management plan.

When asked, around 40% Emergency physicians were prepared to travel nationwide to contribute in the management of disastrous events.

Interestingly, in the study; around 83% of Emergency physicians were ready for being trained in the form of classroom teaching despite their busy schedules, which needs to be appreciated properly.

Limitations:-

This study is limited to those who have access to internet because this is a questionnaire based survey .

This survey was limited to major cities of India. There are emergency physicians working peripherally in the interiors of India ,who are possibly working in more ouster conditions and facing natural calamities more closely .It would be really interesting to know their perception on disaster preparedness.

Conclusion:-

Emergency physicians are forefront for dealing with disasters its consequences; they are important cadre of any hospital and society, as they play important role in all phases of disaster.

The study results show that there is enormous scope of further improvement in various aspects of disaster preparedness. Though in certain areas the result were satisfactory ,majority of the results demand improvement. In

the current scenario there is a need for an organized effort for the spread of disaster preparedness amongst the Emergency physician in India. The administrative authorities should treat these results with seriousness and treat it as a base for further studies for improvement in this field.

As per the outcome of the study, it can be concluded that the perception of disaster preparedness in Emergency Physicians of India is still showing an iceberg phenomenon. The level of understanding is still at primordial level, which needs proper standardization to meet the requirements of international standards. This is only feasible by following a proper scientific method to raise awareness among the Emergency Physicians of India & organizing regular mock drills as well as workshops for the expansion of the horizon of their perception about importance of disaster preparedness in India.

 2020.

Abstract

Promoted since the early sixties as a priority sector in the strategy of socio - economic development, the Moroccan tourism sector, in view of the achievements and the great potential of tourism of the country and of the important growth of world tourism Will undergo a radical change after the Year 2000 in its development policy by moving from a tourism policy mainly promotional by state to the era of strategy in the framework of ambitious, voluntarist and integrated development visions based on contractualization and public-private partnership. These new visions placing tourism as a driving force in the development of the country have focused on strengthened governance to ensure the steering of the strategy and ensure the effective implementation of strategies and action plans.

The purpose of this article is to present an analytical reading of the new model of tourism governance in Morocco in order to characterize it and to analyze its effectiveness and the main limitations to its operational implementation. On the methodological level, we have mobilized the theories and models of strategic management and the governance of tourist destinations and a documentary analysis backed up by a qualitative study by semi-directive interviews with the main actors of the sector.

Introduction:-

Depuis que le tourisme s'est confirmé comme un secteur très important pour le développement socio-économique des pays et au vue des perspectives prometteuses de son développement futur les questions du management, de la compétitivité des destinations touristiques a retenue l'attention tant des chercheurs, des professionnels, des gouvernements que des organismes internationaux. L'environnement turbulent (Graulier2000) et concurrentiel (Chazaud, 1999) mais aussi indifférencié (Rauche, 2000) dans le quel s'inscrivent les destinations touristiques ont remis en cause les politiques touristiques classiques basées sur des logiques de promotion et de commercialisation tout azimut et ont imposé aux acteurs et destinations touristiques de réfléchir et de mettre en place de nouvelles stratégies tenant compte de leurs attributs attractifs et des lourdes mutations qui s'opèrent sur le marché. De même, les destinations touristiques étant un complexe d'acteurs autonomes et indépendants du point de vue organisationnel mais en principe fonctionnellement interdépendants dans la chaîne de valeur de production touristique, leur management repose sur une nécessaire mobilisation et coordination d'acteurs à logiques et intérêts divergents. Cette particularité conduit ce management à s'étendre pour s'insérer dans un contexte de gouvernance de la destination (Zhang et Zhu, 2014). Le concept de gouvernance des destinations touristiques malgré sa jeunesse a donné lieu à

Corresponding Author:- Achaba Allal Et Bendou Abdelaziz.

Address:- Enseignants Chercheurs à l'Ecole Nationale de Commerce et de Gestion Agadir, Université Ibn Zohr (Maroc) .

une importante littérature visant à explorer son champ, ses logiques et dimensions (Gerbaux, Boudières et Marcelpoil, 2004; Gerbaux et George-Marcelpoil, 2004; Gerbaux et Moreau, 1996; Gerbaux et Paillet, 1999, François et Marcelpoil, 2006; Marcelpoil, Marcelpoil et Langlois, 2006 ; Bensahel et Vles, 2007). De même, qu'il a donné lieu à des modèles théoriques cherchant à proposer des schémas d'organisation et du management de la gouvernance des destinations touristiques.

Au Maroc le tourisme représenté un secteur fondamental dans la dynamique de développement socioéconomique du pays. Depuis l'année 2000 ce secteur va être érigé en locomotive de développement et une ambitieuse stratégie de développement va lui être consacrée rompant avec les politiques basées sur la seule promotion étatique engagées depuis le milieu des années 60. Cette nouvelle stratégie baptisée l'ère des visions (Vision 2010 et Vision 2020) va miser sur la gouvernance comme pilier du pilotage stratégique et de la mise en œuvre des stratégies et des plans d'action territoriaux qui en découlent.

Notre propos dans cet article est de mener une recherche exploratoire pour tenter d'une part, d'analyser et de caractériser le nouveau modèle de gouvernance des destinations touristiques au Maroc et d'autre part, de jauger de son opérationnalisation et de ses limites à quatre années de l'horizon stratégique retenu. Pour ce faire nous avons d'une part mobilisé les principales théories et les principaux modèles du management stratégique et de gouvernance des destinations touristiques et sur le plan empirique nous avons allié pour la collecte des données l'exploitation de nombreux documents officiels de ce nouveau modèle de gouvernance et les données publiées sur sa mise en œuvre (statistiques, CPN, CPR, PDRT, études, articles de presse et publications dans les sites web des organismes touristiques nationaux et régionaux et bibliographie), une étude qualitative par entretiens semi-directifs, en face à face, auprès d'acteurs du secteur, les rapports des ateliers que nous avons animés au profit de l'AIH et enfin la participation active à diverses réunions, séminaires et manifestations publiques ou privées organisées par les acteurs au niveau national et régional.

La politique touristique au Maroc : des programmes aux Visions:-

Evolution de la politique touristique au Maroc:-

L'analyse du système de management et de gouvernance du tourisme dans la destination Maroc nous oblige à revenir sur l'évolution de la politique touristique dans le pays et sa caractérisation. La Politique touristique est une expression générique qui donne lieu à diverses interprétations. Avec l'évolution du tourisme cette expression a connu aussi une nette évolution dans son contenu. Bécherel (2001) distingue quatre étapes différentes dans la formulation de la politique touristique. Au cours de la première étape, la politique touristique était orientée vers la «promotion» à travers la mise en place d'attractions publicitaires par les autorités touristiques. Avec l'affirmation du secteur touristique comme secteur économique significatif et porteur, la politique touristique s'est orientée plus vers l'optimisation du potentiel de production en multipliant les investissements dans l'offre d'hébergement et dans les infrastructures de bases et les actions de marketing et de promotion. Ces actions étaient généralement portées par les autorités nationales, régionales et locales faute d'un secteur privé fort ou à cause de son désintéressement. Dans cette deuxième étape, la politique touristique s'est orientée ainsi plus vers «la promotion et le produit». L'intensification de la concurrence sur le marché touristique mondial a amené les concepteurs de la politique touristique se concentrer sur la recherche de l'amélioration de la compétitivité du secteur en créant un cadre statutaire destiné à gérer, contrôler et améliorer la qualité et l'efficacité du secteur et à protéger les ressources. Actuellement, dans un marché touristique hyperconcurrentiel (Chazaud, 1999) et très évolutif tant de point de vue de l'offre que de la demande, la seule politique touristique basée sur la paire «promotion et produit» n'est plus suffisante pour assurer la compétitivité touristique. La stratégie et la planification stratégique deviennent des éléments clés de la politique touristique. Dans cette quatrième étape, les destinations doivent réfléchir en termes de stratégie, la politique doit être conçue de manière à attirer les marchés identifiés, à créer de la valeur à travers l'innovation, à encourager les partenariats entre les acteurs et à coordonner les actions et les initiatives. En outre, de nos jours, les parties intéressées et impliquées dans la gestion du secteur sont nombreuses et le sujet est bien plus vaste. «Compétitivité», «Viabilité» et «Durabilité» sont devenues les mots-clés de la vision moderne de développement du tourisme. Dans ce sens, La politique touristique a un double objectif : apporter un maximum de bénéfices aux intéressés d'une ville, d'une région ou d'un pays, tout en minimisant les impacts négatifs. Dans ce registre, Goeldner, Ritchie et McIntosh (2000) nous proposent une définition satisfaisante de l'expression «politique touristique»: «un ensemble de réglementations, règles, directives, objectifs de développement/de promotion et stratégies permettant de définir le cadre dans lequel sont prises les décisions collectives et individuelles qui affectent directement le développement du tourisme et les activités quotidiennes pour une destination donnée ». Ainsi, pour ces auteurs, le rôle le plus important de la politique touristique est de s'assurer qu'une destination a une idée claire de ce vers quoi elle se dirige ou de ce

qu'elle cherche à devenir à long terme. En parallèle, elle doit avoir l'ambition de créer un climat favorable à la collaboration entre les nombreux acteurs du secteur touristique. Cela sous entend qu'une politique touristique efficace se doit de viser à offrir aux visiteurs des expériences de qualité, profitables aux parties intéressées de la destination tout en évitant de compromettre son intégrité sociale, culturelle et environnementale. Bécherel, sur la base de ces nouveaux enjeux a déterminé cinq domaines propres à la politique touristique de ce «nouvel âge» du tourisme : La politique de communication, la politique de produit, la politique environnementale, la compétitivité : qualité et efficacité, la stratégie: positionnement et ciblage.

La politique touristique marocaine n'a pas échappé aux mêmes règles d'évolution développées ci-dessus. En effet, l'activité touristique au Maroc a débuté certes sous le protectorat français mais c'est après l'indépendance du royaume que le secteur, sous l'impulsion des organismes internationaux (BM, ONU), va être retenu comme priorité de développement socioéconomique du pays. La politique touristique marocaine va connaître deux principales phases dans son développement : la phase dites des programmes, allant de 1965 à la fin des années 90 caractérisée par au début un engagement total de l'Etat assurant le leadership du secteur et ensuite par son désengagement au profit du secteur privé tout en maintenant le rôle d'orientation. Et la phase dite des «visions» à partir de l'année 2001. En effet, l'attrait touristique du Maroc et ses caractéristiques géographiques, historiques et culturelles ainsi que le succès du tourisme international dans certains pays du pourtour de la Méditerranée vont être à la base de l'importance accordée au tourisme dans la stratégie de développement du pays au milieu des années soixante. C'est ainsi que le secteur va être érigé en priorité national dans les plans de développement successifs allant de 1965 à la fin des années 90. Cette période a été marquée par une politique touristique active, où le secteur public jouait un rôle dynamique en investissant massivement dans le secteur et en le réglementant. L'effort d'investissement et d'aménagement va se concentrer en premier lieu sur des zones prioritaires choisies en fonction de leur forte attraction touristique (Tanger, Al Hoceima, Restinga, Smir et Agadir) pour lesquelles des sociétés d'aménagement spécialisées vont être créées, puis sur les villes impériales disposant d'un patrimoine culturel ancestral (Marrakech, Rabat, Fès et Mekhnès). Cet effort va s'accompagner aussi par une action massive en matière de promotion. Les pouvoirs publics vont aussi par le biais d'organismes publics et semi-publics, tels que l'Office National Marocain du Tourisme (ONMT) et la Caisse de dépôt et de gestion (CDG), procéder à la création des premières unités d'hébergement dans les régions sous-équipées ou déshéritées. Un effort considérable a été aussi accordé à la variable ressource humaine avec la création des établissements de formation professionnelle dédiés au secteur. Les années 70 ont encore marqué cette orientation en instituant un code d'investissement spécifique au secteur dans lequel l'Etat a mis en place un dispositif de mesure incitant le privé à investir dans le secteur (prise en charge et garanti sous forme d'exonérations fiscales et de facilités de financement par le Crédit Immobilier et Hôtelier (CIH) jusqu'à près de 75 % du coût des investissements des opérations à caractère touristique). La décennie 80 va connaître, dans un contexte d'application du programme d'ajustement structurel, une orientation vers le développement des équipements hôteliers de catégorie moyenne de façon à répondre à la diffusion du tourisme de masse et une recherche de la diversification de l'offre et des produits par l'intégration de certains type de tourisme jusqu'alors marginalisés, tels que le tourisme familial, le tourisme de montagne et de sports d'hiver, le tourisme rural, le tourisme de nature, etc...

Le début des années 90 a été marqué par une crise d'essoufflement du tourisme (crise du golf, attentas terroriste de Marrakech). Dans ce contexte, une importante étude portant sur l'analyse du secteur et la mise en place d'une stratégie nationale d'aménagement touristique a été réalisée par le ministère. Cette étude, constatant le caractère vétuste du produit Maroc et la faiblesse de la qualité de service dans la grande majorité des établissements d'hébergement et son incapacité à rivaliser avec les nouvelles destinations touristiques va tracer les grandes lignes d'une stratégie de développement du tourisme au Maroc pour les années 1995-2010 et suggérer un programme d'action qui devraient l'accompagner. La mise en application des premières mesures du plan d'action de l'étude de la stratégie nationale d'aménagement touristique va rapidement donner ses fruits et l'année 2000 s'est soldé par des résultats forts encourageants (près de 4 300 000 non résidents dont 2 275 000 touristes étrangers de séjour, sans compter les croisiéristes, 22,3 millions de nuitées dont 50 % dans les hôtels classés). En 2001, la Fédération du tourisme, membre de la Confédération générale des entreprises du Maroc (CGEM), et le gouvernement adoptent une stratégie de développement touristique sous la forme d'un contrat-programme 2001-2010, « le tourisme : une vision, un défi, une volonté », qui actualise et développe la stratégie de développement 1995-2010. Cette nouvelle stratégie va rompre avec la politique touristique jusqu'alors poursuivie et va faire entrer le pays dans une nouvelle ère de stratégie de développement touristique baptisée l'ère des visions.

Les visions « 2010 » et « 2020 » de développement touristique : une lecture croisée:-

Au vue de l'importante croissance que connaissait le tourisme mondial et possédant des atouts naturels importants et un patrimoine culturel riche et diversifié et conscient du rôle déterminant du secteur dans le développement économique du pays, le secteur touristique au Maroc va, à partir de l'année 2001, connaître un grand changement dans sa politique de développement et de promotion à travers le délaissement des politiques promotionnelles ponctuelles en faveur de la mise en place d'une vraie stratégie de développement touristique volontariste susceptible de déclencher une dynamique de développement durable et intégrée. Cette nouvelle ère baptisée l'ère des « Visions » va marquer clairement le point de rupture avec le passé en matière de politique touristique marocaine en érigeant le tourisme en priorité économique nationale et en dotant le secteur d'une stratégie prospective avec une vision à long terme confortée par des contrats programmes chiffrés et détaillés. La première vision dite « Vision 2010 », lancée lors des premières assises du tourisme tenues à Marrakech le 10 janvier 2001 et marquée par la signature de l'Accord Cadre entre le Gouvernement et la Confédération Générale des Entreprises Marocaines (CGEM) et par la suite de la signature de son Accord d'Application, contractualisant ainsi l'engagement des deux parties (publique et privée) de mettre en œuvre le dispositif stratégique de la nouvelle politique touristique, a défini des objectifs très ambitieux aussi bien en termes quantitatifs que qualitatifs.

Source : Vision 2010, Ministère du tourisme marocain.

Cette vision a permis une grande avancée dans le secteur touristique national et a pu insuffler une grande dynamique surtout en matière d'investissement et de réalisation de stations touristiques. Toutefois les objectifs en matière d'arrivées touristiques et de taux d'occupation n'ont pu être pleinement atteints. Cela est dû à la conjugaison de plusieurs facteurs d'ordre conjoncturel et structurel (MEF-DÉPF, 2011, p:12). Sur le plan conjoncturel, le secteur touristique national a subi de plein fouet les effets négatifs de la crise économique qui a affecté les principaux pays émetteurs depuis 2008. Sur le plan structurel, malgré les réalisations physiques en matière d'investissement touristique, l'offre touristique marocaine reste peu diversifiée et spatialement concentrée dans quatre grandes villes (Marrakech, Agadir, Casablanca et Tanger) qui concentrent à elles seules plus de 65% de la capacité totale d'hébergement. De plus, l'offre balnéaire demeure prépondérante dans la palette touristique globale avec une part de 23%, ce qui place le Maroc en concurrence directe avec les pays compétitifs du pourtour méditerranéen.

A la vue des résultats optimums de la Vision 2010, le pays a décidé de reconduire sa stratégie touristique à travers la « Vision 2020 », qui mise sur un développement touristique plus équilibré et diversifié, capable de renforcer l'offre de chaque région et qui serve de mécanisme de croissance pour ces dernières. En effet, en construisant sur les acquis et les enseignements de la Vision 2010, ainsi que sur les perspectives d'évolution du marché touristique mondial de la prochaine décennie, le but central de la Vision est d'assurer le rôle du tourisme comme moteur et levier principal du développement du pays. Pour cela la vision a défini comme ambitions de hisser la destination Maroc en 2020 parmi les 20 premières destinations touristiques mondiales tout en la positionnant comme une destination de référence en matière de développement durable sur le pourtour méditerranéen.

- | |
|--|
| <ul style="list-style-type: none"> - Doubler les capacités d'hébergement, avec la construction de 200.000 nouveaux lits. - Atteindre la barre des 20 millions de touristes issus de différents marchés émergents - accroître les recettes touristiques pour atteindre environ 140 milliards de dirhams en 2020 - accroître de deux points la part du PIB touristique dans le PIB national, - Porter la part du tourisme interne à 40% des nuitées. - Créer 470000 nouveaux emplois - et monter à la 20ème destination touristique mondiale. |
|--|

Source: Vision stratégique de développement touristique « VISION2020 », Contrat- programme 2011-2020, 30 Novembre 2010.

Comme feuille de route pour la réalisation de cette ambition et de ce positionnement, la vision cherche à offrir aux touristes des expériences variées, authentiques, d'un niveau de qualité répondant aux meilleurs standards internationaux, qui valorisent les ressources naturelles et socioculturelles du pays à leur juste potentiel, qui permettent aux populations locales de participer pleinement à l'activité touristique et qui soient respectueuses de leur environnement et de leur qualité de vie. Pour ce faire, aux deux principaux pôles d'activité que sont Marrakech et Agadir, sont venus s'adjoindre plusieurs nouveaux pôles touristiques, dont la montée en charge devrait permettre d'intéresser de nouveaux segments de touristes, de rééquilibrer l'activité touristique et d'en diffuser les bénéfices économiques sur l'ensemble du territoire. La Vision 2020 s'est appuyée ainsi sur une démarche volontariste et intégrée d'aménagement territorial visant d'une part à permettre la mise en valeur des potentialités de chaque région et d'autre part à exploiter toutes les synergies possibles entre les régions, afin que dans leur ensemble, les régions du pays soient plus compétitives et plus visibles sur les marchés internationaux. Cette démarche devrait être rendu possible grâce au concept de territoire touristique (la vision a retenu huit territoires touristiques) défini comme une zone géographique présentant une offre touristique complète, une forte cohérence et identité propres qui en font son originalité, et une masse critique en termes de capacités d'hébergement, de ressources touristiques et de desserte internationale (CPN- Vision 2020, P:11). Pour opérationnaliser la mise en œuvre de cette stratégie, la vision a prévue de manière détaillée et chiffrée un plan de mise en marche de six programmes d'actions **structurants pour un portefeuille diversifié de produits adossé à un dispositif intégré de développement d'un tourisme durable, une promotion et une desserte aérienne en adéquation avec l'ambition des territoires, des mesures de soutien pour une dynamique d'investissement soutenue et durable, un plan de valorisation du capital humain et de formation d'excellence, une stratégie pour la compétitivité du secteur et la professionnalisation des acteurs de la chaîne de valeur touristique et un système de gouvernance claire et adéquat.**

La dynamique créée par ces deux visions a pu rapidement donner ces fruits en permettant des performances remarquables. En effet, les données actuelles montrent une nette progression et amélioration de tous les indicateurs du secteur en perspective de la réalisation des objectifs retenus malgré un environnement géopolitique mondial et régional marqué par les risques et l'incertitude. Ainsi, grâce aux efforts déployés dans les deux visions, le Maroc est classé comme la 26ème meilleure destination mondiale et l'objectif retenu pour 2010 a été atteint à hauteur de 93% (9.3 millions en 2010 de touristes internationaux contre 4.4 millions en 2001) avec une croissance annuelle moyenne de 8.7%, très supérieure à la moyenne mondiale. Cette croissance a continué pour atteindre 10,282 944 millions de touristes internationaux à fin 2015 avec une progression de +2,4% par rapport à 2014. Le secteur a aussi été d'une contribution décisive aux grands équilibres macro-économiques. En effet, entre 2001 et 2010, les recettes touristiques (hors transfert des Marocains Résidents à l'Etranger) sont passées de 29 à plus de 56 milliards de dirhams, soit un taux de croissance de 7.5% par an. Les revenus issus du tourisme sont ainsi devenus la première source de devises du pays, devant les transferts de MRE, et loin devant les autres secteurs de l'économie (phosphate, textile, ...). En 2015, ces recettes en devises générées par les non-résidents ayant séjourné au Maroc (hors transport international) se sont élevées à près de 57,2 milliards de dirhams représentant près de 29% des exportations des biens et services et le solde de la balance des voyages a couvert 24% du déficit de la balance commerciale en 2015. Le secteur représente aussi actuellement le deuxième contributeur au PIB national. En effet, le Produit Intérieur Brut du secteur du tourisme a connu entre 2001 et 2010 une croissance annuelle moyenne de 7.6%, supérieure à celle de l'économie dans son ensemble et a pu gagner 2 précieux points dans le PIB national (8% contre 6% au début de la décennie). En 2015, cette croissance s'est encore confirmée et la part du secteur est passée à 12% du PIB confirmant ainsi l'importance du secteur. Cette dynamique qu'a et que connaît le secteur a eu un impact socio-économique important, puisque le secteur représente désormais près de 450.000 emplois directs, avec une hausse de 40% du nombre d'emplois durant la décennie. Tendance qui s'est confirmée à fin 2015 puisque le nombre d'emplois a dépassé la barre de 500000 emplois directs soit près de 5% de l'emploi dans l'ensemble de l'économie faisant du secteur le deuxième contributeur d'emplois dans le royaume.

Dans le registre de l'hébergement et suite aux efforts entrepris et aux réalisations des deux visions 2010 et 2020, la capacité hôtelière va connaître une nette évolution depuis l'année 2000. Ainsi d'une capacité de près de 93000 lits à la fin des années 90, la capacité litère classée a atteint plus de 230 628 lits à fin 2015.

Tableau n°3:- Chiffres clés du secteur touristique marocain (2015).

Part dans le PIB	Nb. d'emplois	VA	Taux de croissance	Capacité d'hébergement	Croissance des recettes de voyage
12%	1200000 (500000 emplois directs soit près de 5% de l'emploi dans l'ensemble de l'économie.	8%	4%	230 628 lits	5,2%

Source : Ministère du tourisme marocain, 2015.

Somme toute, le tourisme occupe une place de choix dans la structure économique et financière du pays et représente un levier considérable pour l'accélération de la croissance socio-économique. Véritable moteur de croissance, le tourisme impacte pratiquement tous les domaines de l'activité économique du Maroc et exerce ainsi une grande influence sur les autres secteurs de l'économie. Toutefois, malgré ces réalisations, la grille de lecture du secteur touristique marocain manifeste encore quelques retards par rapport aux objectifs et ambitions annoncés et notamment un flagrant manque dans la capacité d'hébergement comparativement aux principaux pays et destinations concurrentes.

Cadre théorique et conceptuel:-

Du management à la Gouvernance des destinations touristiques:-

Comme le rappelle Lozato-Giotard (2003), la filière tourisme est constituée de la production de divers secteurs d'activité constituant une chaîne de fonctions, base de la chaîne de valeur associée au produit touristique. Une destination touristique ne constitue pas, ainsi, une organisation intégrée, mais le regroupement d'un ensemble de professionnels, simultanément autonomes et indépendants. Le management étant défini comme: «la manière de conduire, diriger, structurer et développer une organisation... l'animation d'un groupe d'hommes et de femmes qui doivent travailler ensemble dans le but d'une action collective finalisée » (Thietard et al. 1999), celui de la destination touristique relève des mêmes considérations et suggère ainsi l'analogie entre une destination et une entreprise. Toutefois, compte tenu des caractéristiques des destinations touristiques, ce management présente certaines particularités. La première particularité du MDT provient même du fait de l'existence d'un grand nombre d'acteurs autonomes, privés et publics aux poids, objectifs et intérêts divergents. La deuxième principale particularité réfère à la nécessité de prendre en compte de nombreux autres acteurs animant le territoire de la destination et qui agissent de manière intentionnelle ou non sur de multiples composantes constituant des ressources pour le tourisme et l'attractivité de la destination et donc une grande part du service touristique global lui-même, ou du "bien support" du service touristique, au sens de la théorie des services (Eiglier et Langeard, 1987). Ces acteurs doivent ainsi être sensibilisés et mobilisés pour la réussite de ce management. Ainsi, le MDT exige la prise en compte de la façon la plus opérante de nombreux acteurs fonctionnellement interdépendant mais souvent indépendants du point de vue organisationnel, avec des logiques propres et d'autres parties prenantes souvent non intéressés par l'activité touristique et ainsi dépasser la simple gestion d'une activité économique dans ses fonctions les plus génériques pour embrasser d'autres fonctions liées à la mobilisation, la coordination et l'implication. De ce fait, compte tenu de la grande multiplicité et l'importance des différentes parties prenantes présente sur le territoire de la destination et influençant son développement, le management de la destination n'impliquant que les acteurs touristiques, doit intégrer la dimension coordination entre tous les acteurs et ainsi ce management doit s'étendre pour s'insérer dans un contexte de gouvernance de la destination; celle-ci impliquant tous les acteurs au sein de la destination (Zhang et Zhu, 2014).

De la gouvernance des destinations touristiques:-

Concept ancien (Stoker, 1998), la notion de gouvernance, issue de l'économie institutionnelle, dans les années 1930 où elle désignait le comportement de l'organisation face à un environnement complexe, elle est devenue, depuis les années 1980, une expression qui s'insère dans les sociétés et les économies d'une façon controversée: à la fois une notion instable et en évolution, elle est aussi une pratique managériale (Paquet, 2008), un outil mobilisateur des acteurs (Letourneau, 2009) pour les territoires et les organisations confrontés aujourd'hui à une féroce compétition internationale. Repris d'abord par les politologues le concept de gouvernance exprime l'idée d'une transformation de l'action publique faisant intervenir de nouveaux acteurs et recourant à de nouvelles modalités de coordination (Borraz et Le Galès, 2001), il va connaître une grande évolution en termes des disciplines qui l'étudiaient, telles que

les sciences politiques, le management des organisations (Ruhanen et al., 2010) et la géographie (Leloup et al., 2005) et un foisonnement d'études et de recherches vont lui être consacrées pour en cerner le sens, les caractéristiques et les dimensions. Parmi les nombreuses définitions données à ce concept, celles les plus citées nous retenons la définition fournie par P. Le Gales (1995) qui considère la gouvernance comme « l'ensemble des arrangements et relations, formelles et informelles entre intérêts publics et intérêts privés, à partir desquels sont prises et mises en œuvre des décisions. » et celle de Benko (1992) pour qui « la gouvernance renvoie à des formes intermédiaires de régulation, ni marchandes, ni étatiques, qui articulent intérêts privés et publics, aspects sociaux et économiques. ». En sciences de gestion, la gouvernance a été définie comme « l'ensemble des mécanismes qui ont pour effet de délimiter les pouvoirs et d'influencer les décisions des dirigeants, autrement dit, qui 'gouvernent' leur conduite et définissent leur espace discrétionnaire » (Charreaux, 1997 in Charreaux et Wirtz, 2006), ce que Pérez (2003) résume par « le management du management ». Les systèmes de gouvernance sont alors supposés influencer le processus de création de valeur par le biais, notamment des décisions d'investissement et de répartition de la richesse créée. Dans ce domaine, le cadre théorique dominant la recherche en gouvernance est fortement inspiré des théories contractuelles de la firme, en particulier la théorie de l'agence, la théorie des coûts de transaction et théorie des parties prenantes.

Le tourisme approché comme une filière liant une grande multitude d'acteurs indépendants mais aussi très interdépendants constitue un contexte intéressant dans l'étude de la gouvernance de la destination (Ruhanen et al. 2010). Toutefois, malgré la multiplication d'approches n'a pas pu jusqu'alors aboutir à une définition universelle de la gouvernance des destinations et à un corpus théorique propre bien établi. Cela est dû en grande partie à la diversité des champs de recherche des chercheurs et du caractère des études consistant en grande partie en des études de cas qui ne tiennent compte que des dimensions appropriées au contexte de l'étude en question (Beritelli et al. (2007). De nombreux autres auteurs se sont intéressés à l'étude de la gouvernance des destinations touristiques (Beritelli et al, 2007, Ruhanen et al, 2010, Laws et al. 2011, Zhang et Zhu, 2014). En se basant sur les meilleures micro-théories de la gouvernance (théorie des coûts de transaction, théorie des droits de propriété, théorie d'agence, théorie des réseaux), Beritelli et al. (2007) ont pu identifier six dimensions principales de la gouvernance de la destination: « coût de transaction », « asymétrie du pouvoir », « interdépendance », « confiance/contrôle », « connaissance » et « relations personnelles informelles ». Pour mieux opérationnaliser leur analyse, ces auteurs ont retenu d'autres dimensions non moins importantes, notamment : l'histoire de la destination et son développement, la taille de la destination, les performances de la destination, l'existence d'un groupe privé dominant, le rôle de la commune et de l'organisme du management de la destination (DMO), les facteurs d'attractivité, le comportement de coopération, la confiance mutuelle et le climat interne.

De leur côté et sur la base d'une recherche menée sur 53 articles traitant de la gouvernance dans deux disciplines majeures à savoir les sciences politiques et les sciences de management Ruhanen et al. (2010) ont cherché à relever les dimensions de la gouvernance de la destination les plus citées et utilisées. Ainsi, sur une base de 40 dimensions soulevées et en ciblant celles qui étaient citées au moins une dizaine de fois dans ces articles, ces auteurs ont pu retenir les principales dimensions suivantes : imputabilité, transparence, implication, structure, efficacité et pouvoir. En ne contentant uniquement d'énumérer ces dimensions sans pour autant montrer leur importance eu égard à la gouvernance de la destination, ces auteurs concluent que malgré l'existence d'un cadre théorique relativement construit, le concept de la gouvernance de destination reste multidimensionnel. Cette multi-dimensionnalité nous pousse à considérer la destination comme un système constitué par plusieurs acteurs et dans lequel chaque acteur exerce une certaine influence et est influencé par ledit système. D'où la nécessité de faire appel à l'approche systémique pour analyser la gouvernance de la destination (Laws et al. 2011:10). Cette conclusion est confortée par celle de Zhang et Zhu (2014 :125-126) qui affirment que la gouvernance de la destination se caractérise par la complexité due à l'interaction entre les secteurs public et privé, lesquels sont interdépendants en termes de ressources. Pour ces auteurs, complexité, interdépendance sur les ressources et relations entre le public et le privé sont les trois principaux aspects qui caractérisent la gouvernance de la destination.

Somme toute, les différents travaux ayant touché à la gouvernance des destinations attestent de sa grande complexité et de la difficulté de saisir toutes ses dimensions voir encore de juger de son efficacité. Sur cette base plusieurs modèles du management et de la gouvernance des destinations touristiques ont été développés et discutés sur la base d'expériences en vogue dans les pays du nord notamment aux Etats Unis et en Europe. Dans le point suivant nous exposerons les modèles les plus importants et nous discuterons de leur pertinence et efficacité.

Les modèles de Management et de la gouvernance des destinations touristiques:-

Avec l'importance de plus en plus grandissante du tourisme dans les économies et dans les stratégies de développement des pays ces trois dernières décennies, la question du management et de la gouvernance des destinations touristiques a retenue l'attention tant des chercheurs, des professionnels, des gouvernementaux et des organismes internationaux (OMT, OCDE). Dans ce registre plusieurs modèles de Management de destination touristique ont été proposés. L'un de ces modèles qui reste le plus répandu et le plus cité est celui développé par les deux fameux auteurs américains Crouch et Richie (Crouch et Ritchie, 1999; Ritchie et Crouch, 2000). En prenant comme référence les travaux développés par M. Porter sur la compétitivité, ces deux auteurs ont élaboré un modèle présentant les éléments constituant la destination touristique et les principales fonctions que le ou les organes de gestion de la destination (DMO) doivent accomplir pour lui assurer réussite et compétitivité. Pour ces auteurs, les organes responsables de la gestion de la destination touristique ont à leur charge deux types de fonctions : celles dites du «management simple» (gestion des ressources, marketing, organisation...) et celles dites «politiques» ou de «management stratégique» (délimitation du système, élaboration d'une vision partagée, définition d'un positionnement, définition des choix stratégiques de développement et des choix de coopération-compétition, définition procédés de diagnostic, et de contrôle-évaluation). En empruntant la voie à ces deux auteurs, Flagestad et Hope (2001) vont développer un autre modèle aussi important et aussi répandu que celui de Crouch et Richie. Considérant la nature et les spécificités des destinations touristiques caractérisées par leur complexité et l'existence de nombreux intervenants et acteurs à intérêts divergents référant à un jeu entre des forces ayant pour objectifs prioritaire la satisfaction des résidents (collectivités publiques) et celles d'autres orientées vers la satisfaction d'objectifs économiques (les entreprises), ces deux auteurs ont tenté d'articuler, malgré leur rivalité, les grandes approches de la stratégie que sont celle du positionnement, celle des ressources et compétences, et sur d'autres plans, celle de la chaîne de valeur de Porter pour mettre en exergue la difficulté d'aboutir à un système de management concerté et coopératif entre les acteurs de la destination. Sur ce, les deux auteurs vont dans le sens de proposer un système de management de la destination hybride (dit aussi d'organisation en réseau) se situant entre celui hiérarchique (dominance d'un acteur fort) et celui du marché. Leur modèle va retenir l'attention de nombreux autres auteurs qui l'ont enrichi et élargi via l'intégration de la théorie des parties prenantes en proposant la prise en compte des autres acteurs opérants dans le territoire de la destination et leur nécessaire mise en réseau dans une vision politique du système (Gundolf, Jaouen et Loup, 2006, Dredge, 2006).

Les deux modèles proposés par Crouch et Richie et Flagestad et Hope ont été à la base d'une florissante littérature sur les modes d'organisation, du management et de gouvernance des destinations touristiques qui va permettre de générer et de développer, sur fond de deux théories qui se présentent rivales dans la littérature mais d'apparence complémentaires dans la réalité : les théories contractuelles et la théorie des parties prenantes, deux principaux corpus théoriques présentant modèles extrêmes du management et de la gouvernance des destinations à savoir le Corporate model et le Community model, entre les quels plusieurs situations peuvent se présenter.

Le **corporate model** (ou modèle entrepreneurial ou modèle d'entreprise) est celui le plus fréquent dans l'Amérique du Nord et repose sur les principes et les postulats des théories contractuelles. Ce type de modèle épouse le schéma d'une «business corporation» selon Flagestad (2001) et considère la destination touristique comme une entreprise dominée par une grande firme ou un groupe privé qui cherche à atteindre des objectifs d'efficience et de profit. Agissant au nom de la communauté locale et détenant le pouvoir politique et de décision sur les modalités de développement et d'exploitation de la destination, la firme dominante applique une gestion de type intégrée pour la destination sous fond d'une logique de profit avec une stratégie orientée marché et l'intégration des entreprises de services soit par incorporation dans le groupe soit par contractualisation. Plusieurs avantages sont associés à ce type de modèle. D'une part, la recherche de la maximisation du profit étant l'objectif principal, malgré la présence d'autres petites et moyennes entreprises agissant indépendamment de la grande entreprise, c'est cette dernière qui détermine l'orientation stratégique ainsi que les objectifs principaux de la destination et son pouvoir et sa capacité de mobiliser les ressources nécessaires et de solidifier le réseau d'entreprises incorporées ou liées permet de minimiser et de maîtriser les coûts et de réaliser des performances importantes pour toute la destination et d'assurer ainsi le rôle de leader pour les autres acteurs de la destination. (Flagstad et Hope 2001, p. 451-453) D'autre part, en rappelant l'hypothèse émise par Powell (1990) selon laquelle les entreprises hiérarchiquement organisées sont plus susceptibles d'entreprendre des actions (R&D, Investissement,...) impliquant une incertitude quant à leur résultat et qui nécessitent un investissement substantiel de ressources (argent, temps et énergie), ce type d'organisation permet le développement de l'apprentissage organisationnel nécessaire au renforcement de la position de l'entité et plus important encore pour le processus d'innovation dans la destination étant donné que les investissements dans les innovations de produits, de marchés et de procédés sont un aspect essentiel pour maintenir la compétitivité d'une

destination. Un autre avantage certain de ce type de modèle, mentionné par Powell (1990), est celui relatif à la question de l'opportunisme. Cet auteur note, en effet, que l'opportunisme des acteurs est atténué par le pouvoir d'autorité exercé par la grande firme. Il avance aussi que les différentes parties ont tendance à développer une identité plus forte quand elles sont regroupées ou liées au sein d'une même société. Ainsi, pour le cas des destinations touristiques gérées dans le cadre du Corporate Model cela se traduit par une diminution du risque d'être affaibli par les comportements opportunistes et déloyaux des acteurs et prestataires et une plus grande identification des acteurs individuels avec une entreprise fortes renforce l'identité de toute la destination. Et cette forte identité permet à tous les acteurs de développer des comportements cohérents qui auront un impact positif sur l'expérience du visiteur et par conséquent sur la compétitivité de la destination.

Le principal inconvénient associé à ce modèle réside dans le risque que la société dominante elle-même tend à agir de manière opportuniste en tirant parti du déséquilibre de pouvoir existant entre elle-même et les petites entreprises indépendantes et les autres acteurs dans la destination. En effet, la recherche de la maximisation du profit pourrait pousser cette société ou groupe dominant à exploiter son pouvoir et son influence pour ne servir que ses propres intérêts ou ne pas remplir ses obligations envers la communauté.

A l'opposé le modèle dit communautaire (**community model**) très spécifique à l'Europe repose sur la théorie des parties prenantes. Ce modèle considère que la destination touristique est très fragmentée et est constituée d'un grand nombre d'unités de productions de tailles et d'activités différentes, indépendantes, opérant dans une démarche décentralisée, sans pouvoir de domination mais aussi d'autres parties prenantes dont les acteurs publics, les collectivités territoriales et d'autres groupes d'intérêts distincts opérant dans le territoire. Ce modèle, se caractérise donc par la présence de nombreuses parties prenantes qui doivent pour une meilleure gestion parvenir à de fréquents compromis en raison de leurs divergences d'intérêts. Contrairement au premier modèle, le modèle communautaire ne reconnaît pas la dominance d'une unité ou d'un acteur sur les autres et le management stratégique des destinations ayant ces caractéristiques posent la problématique de la gouvernance de ces différentes parties prenantes. En général, au vue de la grande multitude des intervenants, la réglementation de ce modèle s'effectue de manière décentralisée, en vertu de laquelle l'organisation locale de gestion des destinations est responsable de la coordination des membres individuels, du marketing et de la formulation de l'orientation stratégique. Cependant, l'influence de cette organisation sur les mesures réelles dans la destination et son pouvoir décisionnel sont limitées. La caractéristique d'une destination communautaire est le fait que ni une entreprise dominante ni l'organisation de gestion ne contrôlent les unités d'affaires de manière hiérarchique.

Comme le font remarquer Flagestad et Hope (Flagestad et Hope 2001, p. 452) dans un tel système les forces politiques sont plus fortes que la vision économique. Et l'organisation du management de la destination dépend plus du comportement coopératif des entreprises indépendantes et des acteurs de gouvernance locale.

Caractérisant deux systèmes différents, ces deux modèles donnent l'apparence qu'ils sont exclusifs. Certes, chacun des deux modèles apporte des éléments d'analyse importants : le corporate modèle mis plus l'accent sur l'importance de l'existence d'un groupe privé fort tant sur le plan financier que sur le plan de la culture d'entreprise adoptant une logique de gestion d'entreprise comme moyen pour assurer la performance et la compétitivité de la destination alors que le modèle communautaire introduit le rôle fondamental des collectivités locales à coté des autres prestataires de services touristiques et la nécessité d'un bon système de gouvernance pour assurer la compétitivité de la destination. Cependant à la question centrale « quel modèle est le plus pertinent en termes de stratégie et de compétitivité ? », la réponse ne peut en aucun cas être à l'absolu. Et pour cause, en retenant la conclusion fondamentale d'Arvid Flagestad (2001) qui statue sur l'existence d'un continuum de situations entre le corporate model et le community model et qu'il ne s'agit pas de se placer dans l'un ou l'autre de ces deux modèles. Dans les destinations caractérisées par la présence de nombreuses entreprises à finalité économique et commerciale et sans réelle domination et de plusieurs acteurs territoriaux gérant les biens publics et garants de l'intérêt général, aucun des deux modèles ne peut être appliqué totalement. Ainsi, dans ces types de destinations, le système d'organisation et de management est à bâtir dans une logique de coopération et de partenariat entre les unités économiques et le pouvoir politique local. En effet, les premiers étant incapables d'assurer le leadership total dans la destination et les second aussi à eux seuls ne peuvent pas non plus assurer la dynamique économique de la destination, une nécessaire coordination et collaboration doit être développée et mise en œuvre entre ces deux sphères publique et privée pour pouvoir mettre en place un système de management et de gouvernance adapté et efficace. Ainsi, compte tenu de ces considérations, il est peu probable que les systèmes d'organisation et de management des destinations observables dans la réalité soient une forme extrême. De ce fait, entre ces deux

modèles tout un ensemble de situations hybrides est possible et chaque destination doit définir son modèle en fonction de ses spécificités et de la complexité ou non de son contexte et de sa situation.

Analyse du modèle de gouvernance des destinations touristiques au Maroc:-

L'analyse du système de gouvernance touristique des destinations touristiques au Maroc dans le cadre de la nouvelle stratégie de développement touristique sera menée en deux temps. Dans un premier temps nous tenterons de caractériser le modèle promu à travers sa présentation selon le CPN. Dans un deuxième temps nous procéderons, à une lecture de son opérationnalisation à travers l'analyse de son processus de mise en œuvre et son état actuel à quatre années de l'horizon 2020.

Présentation et caractérisation du nouveau modèle de gouvernance des destinations touristiques au Maroc:-

Jusqu'à l'avènement de la nouvelle stratégie touristique, que nous avons qualifié de l'ère des visions, le secteur touristique était géré en grande partie par les pouvoirs publics dans le cadre de plan de développement dont l'Etat définissait la politique et les plans d'action et en assurait la mise en œuvre, le suivi et la régulation sur le plan national et régional. C'est avec la vision 2010 que les premiers jalons de la gouvernance touristique vont être posés à travers une démarche de conception et de mise en œuvre basée sur la concertation et le partenariat comme cadre et principes fondateurs. Cette volonté d'asseoir une meilleure gouvernance s'est traduite aussi dans le cadre de cette vision par la modernisation de certaines structures publiques et la création d'autres. Ainsi, dans le cadre de cette vision, l'Etat a procédé à la modernisation de l'Office National Marocain du Tourisme (ONMT) par son recentrage sur son métier de promotion nationale et du marketing et en le dotant de moyens conséquents, la création par le Ministère du Tourisme de la Société Marocaine d'Ingénierie Touristique (SMIT), en remplacement de la Direction des Aménagements et des Investissements (DAI) pour soutenir et orienter le développement de l'offre, assurer également le suivi des grands projets de la Vision 2010, la création des Conseils Régionaux du Tourisme (CRT), instances regroupant les professionnels privés, les élus et les autorités locales, pour poser les premières bases d'une gouvernance locale, la création de l'Observatoire du Tourisme, pour professionnaliser la publication de statistiques et d'études et la tenue annuelle des Assises du Tourisme pour effectuer le bilan des réalisations et débattre des priorités à venir. Dans cette foulée, l'Etat a aussi procédé, à partir de l'année 2002, à la création des Centres Régionaux d'Investissement (CRI) dont la mission est principalement de centraliser et de simplifier les démarches administratives permettant la création des entreprises et de soutenir et d'accompagner les investisseurs au niveau régional. Concernant le privé, la FNT, acteur majeur représentant le secteur privé, visait d'une part le regroupement en son sein de l'ensemble des professions touristiques et d'autre part le renforcement des structures des différentes professions pour plus d'efficacité et de participation aussi bien au niveau régional que national (FNIH, FNAVM, FNR, STT, ALASCAM et FNAGAM). Malgré cela nous pouvons souligner que la gouvernance est restée le parent pauvre de cette vision. Et pour cause les efforts étaient plus concentrés sur l'accentuation de la réalisation des investissements programmés dans le cadre du Plan Azur (programme de réalisation des stations balnéaires) et sur le développement de l'offre culturelle. Ainsi, les efforts étaient plus centrés sur le développement de l'offre en matière de produits (balnéaire et culturel) et sur ce plan l'Etat a pu en grande partie gagner le pari au vu des réalisations physiques enregistrées et a pu ainsi mobiliser les investissements et les acteurs et créer une dynamique positive dans le secteur. Dans son rapport publié en mai 2008, intitulé « Bilan stratégique de la vision 2010 » la FNT, atteste que globalement le chantier "organisation institutionnelle" a accusé beaucoup de retard avec un déficit de gouvernance et faiblesse des organes de pilotage ainsi qu'une faiblesse des capacités de gestion des associations du secteur (CRT, Fédérations, Associations professionnelles,...).

C'est avec la vision 2020 que l'on peut parler d'un véritable système de gouvernance dans le tourisme marocain. En effet, reconnaissant la nature transversale du tourisme et son importance à l'échelle nationale les concepteurs de la vision ont cherché à asseoir un fort leadership et une gouvernance renforcée afin d'une part de renforcer la légitimité institutionnelles du secteur (vue la multiplicité des acteurs) et de faciliter les prises de décision au niveau national et régional à travers un pilotage national stratégique de la vision et la garantie de la bonne exécution des stratégies et plans d'actions territoriaux (CPN, p :30). En sous-jacent à cette logique, l'objectif est de mettre en place des mécanismes et des moyens de pilotage adaptés, mieux partagés et plus synthétiques pour éviter un nombre d'acteurs trop importants (FNT, 2008, p28). Pour ce faire, de nouvelles structures programmées dans le cadre de cette vision se sont venues s'ajouter aux autres structures nationales, régionales et locales déjà en place. Il s'agit principalement de la Haute Autorité du Tourisme (HAT) (dénommée initialement : Conseil National du Tourisme) et des Agences de Développement Touristique (ADT). D'après la Mesure 37 du CPN (CPN-Vision 2020 ; p : 30), la HAT est une instance nationale de pilotage, réunissant dans un partenariat renouvelé l'Etat, les régions et le secteur privé qui aura pour principales missions de s'assurer de la cohérence de la vision à long terme et du suivi de son exécution, de

suivre et évaluer l'action des différents acteurs clés publics et privés de la gouvernance du tourisme ainsi que de suivre et évaluer l'exécution des feuilles de routes régionales en veillant en particulier à un pilotage coordonné de tous les paramètres clés de l'équation touristique, à la régulation dynamique des capacités hôtelières et de formation des ressources humaines; d'assurer le suivi des efforts des autorités concernées pour une adéquation entre les capacités aériennes et les capacités littorales et de proposer les ajustements nécessaires à la mise en œuvre de la Vision et le cas échéant à la révision de ses paramètres stratégiques. Véritable organe de pilotage et de gouvernance du secteur au niveau national la HAT, dont la mise en place était prévue pour au plus tard à la fin de l'année 2011, est composée, sous la tutelle du Ministère du Tourisme, qui en assure le Secrétariat Général, une dizaine d'autres ministères, la CGEM et 5 représentants du secteur privé (représentants des fédérations professionnelles). Pour accompagner et réussir la régionalisation touristique retenue dans la vision 2020 et de s'assurer de la mise en œuvre des stratégies territoriales (CPR), la HAT sera reliée sur le plan régional par les ADT qui devraient être progressivement créées dans les 8 territoires touristiques retenus (4 agences à fin 2011 et 4 agences à fin 2012). Ces agences, d'après la mesure 38 du CPN (CPN-vision 2020 ; p : 31), devraient avoir pour principales missions de garantir la bonne exécution des Contrats Programmes Régionaux (CPR) de leur territoire respectif pour en favoriser un développement touristique harmonieux, rapide, pérenne et rentable et ce à travers, outre la déclinaison des missions de la HAT au niveau régional, de développer l'attractivité globale des territoires, en direction des investisseurs et grands acteurs du secteur, de développer la compétitivité des territoires via la coordination, d'assurer la promotion, la commercialisation et l'accompagnement du développement de la desserte aérienne de leur territoire respectif auprès des marchés ciblés, d'assurer le contrôle de la qualité sur l'ensemble de la chaîne de valeur et au sein de l'environnement touristique, d'assurer le suivi et l'orientation des projets stratégiques et d'orienter les professionnels locaux du secteur en fonction des tendances du marché mondial ainsi qu'une diffusion des meilleures pratiques et des démarches novatrices.

Ainsi, dans cette nouvelle configuration, les ADT assureront le rôle du principal interlocuteur des acteurs publics et privés pour toutes les questions liées au tourisme, et constitueront une plateforme d'échange et de concertation au niveau de leur territoire. Dans ce schéma les structures actuelles, notamment la Délégation Régionale du Tourisme, les Conseils Régionaux du Tourisme (CRT) et les Conseils Provinciaux du Tourisme (CPT) seront remplacés progressivement par les ADT des territoires concernés. En matière de gestion et de fonctionnement, ces ADT, étant des établissements publics sous la tutelle du Ministère du Tourisme, seront pilotés par un Conseil d'administration, composé de représentants des secteurs public et privé (MT, les représentants des Ministères, les élus et les représentants des associations professionnelles régionales relevant du territoire) et opéreront par des «contrats de performance» pluriannuels validés et suivis par la HAT. Dans leurs activités opérationnelles les ADT auront la tâche d'une part, en collaboreront avec les centres régionaux d'investissement (CRI), de développer de l'offre produit local en cohérence avec la stratégie nationale, d'orienter et d'accompagner les investisseurs spontanés et de piloter et d'assurer le suivi des projets planifiés. Et d'autre part d'élaborer et de mettre en œuvre une Stratégie Intégrée de promotion et de Marketing Territorial en parfaite cohérence avec la stratégie de marque nationale.

En référence aux modèles théoriques présentés auparavant, et en plaçant la gouvernance basée sur le partenariat public-privé comme pilier fondamental de la mise en œuvre et de la réussite de la nouvelle politique touristique, le système de management et de gouvernance touristique marocain s'apparente plus à un modèle hybride entre le corporate modèle et le community modèle avec un rapprochement de ce dernier. En effet, en misant sur les ADT comme organe de management et de territorialisation de la mise en œuvre de la stratégie de développement touristique le modèle marocain va dans le sens de l'émergence d'un acteurs collectif au sens de Gerbaux (Gerbaux 2003) ou d'acteur stratégique (Gerbaux et Marcelpoil, 2003) composé de différentes parties prenantes, publiques et privées et qui est propres aux destinations organisées de façon communautaires. Toutefois dans un environnement rapidement évolutif caractérisé par le déplacement des barrières entre acteurs publics et privés ce modèle de gouvernance ne pourrait réussir que si trois principaux éléments sont réunis : la capacité d'agir, l'existence d'acteurs et d'intérêts organisés et des relations entre acteurs afin d'agir ensemble (Le Galès, 1995, pp. 81-82). Pour cet auteur, l'existence d'une réelle coalition d'acteurs publics et privés est la condition nécessaire pour définir et mettre en place des politiques efficaces. Cette avancée est toutefois minimisée par Lorrain (2000) pour qui l'existence d'une coalition n'est pas suffisante pour faire émerger et réussir un acteur stratégique, du fait que gouverner un territoire suppose, selon lui, de parvenir à des compromis entre des intérêts potentiellement divergents, sur un horizon temporel lointains dont les résultats sont aléatoires. Pour cet auteur, ni les institutions politiques en raison des contraintes électorales ni les acteurs privés évoluant dans un environnement de plus en plus concurrentiel et mutant ne sont disposés à s'engager sur ces horizons lointains aux résultats incertains. Ces contraintes risquant de compromettre la mission de l'acteur stratégique l'auteur privilégie la thèse de l'acteur réactif à celle de l'acteur

stratégique. C. Van Der Yeught (2009) de son côté avance que l'émergence d'un acteur stratégique collectif exige la réunion de trois conditions fondamentales relevant de la gouvernance des destinations à savoir l'hybridation des modes de coordination déployés, la relative indépendance politique de l'équipe dirigeante et sa forte légitimité.

L'hybridation des modes de coordination consiste en le déploiement d'un dispositif de gouvernance permettant d'assurer la coordination des nombreuses parties prenantes impliquées dans le projet productif, de doter le groupe d'une intention stratégique et de maintenir le cap fixé à long terme, indépendamment des jeux de pouvoir et des aléas du calendrier électoral. L'indépendance politique de l'équipe dirigeante est la seconde condition favorisant l'émergence d'un acteur stratégique. Cette indépendance est nécessaire pour ne pas compromettre et entraver le déroulement des projets à long terme. Quand à la légitimité de l'équipe dirigeante elle repose soit sur l'existence d'une réglementation claire ou sur une volonté collective des parties prenantes basée sur des valeurs partagées et une confiance mutuelle. Cette analyse montre que l'émergence d'un acteur stratégique collectif au sein d'une DT ne va pas de soi, mais dépend plutôt de la structure de gouvernance déployée. Qu'en est-il dans le cas du modèle marocain ? Les ADT prévues dans le cadre du CPN seront des établissements publics sous la tutelle du MT, constituées par la fusion des Délégations Régionales du Tourisme, des CRT et des CPT. Or la délégation est une administration alors que les CRT et les CPT sont des associations professionnelles avec l'autonomie budgétaire. Cette nouvelle structure abritera en son sein ainsi des fonctionnaires et des professionnels et sera régie par les règles du droit administratif et des finances publiques. Au regard des trois exigences d'une gouvernance efficace énoncées ci-dessus il paraît très difficile que les ADT deviennent l'acteur stratégique collectif au sens de Van Der Yeught. Une faible légitimité étant donné la faible représentation de la sphère privée pierre angulaire de la mise en œuvre de la vision, une faible indépendance de l'équipe dirigeante à cause de prédominance de la sphère publique et politique dans la gestion et le financement et un problème de gestion étant donné les divergences des visions et des compétences en matière de gestion et de prise de décision entre les fonctionnaires et les gestionnaires issus des structures fusionnées et par conséquent un risque majeur d'émergence de problèmes de coordination et d'adhésion de tous les acteurs aux intérêts divergents.

Après avoir présenté et caractérisé le modèle de gouvernance des destinations touristiques marocaines dans le cadre de la nouvelle stratégie de développement nous allons dans le point suivant comment cette nouvelle gouvernance s'est traduite dans la pratique après pratiquement 6 années de son adoption et à 4 années de l'horizon des objectifs tracés.

La gouvernance des destinations touristiques marocaines à l'épreuve de la mise en œuvre et de l'opérationnalisation:-

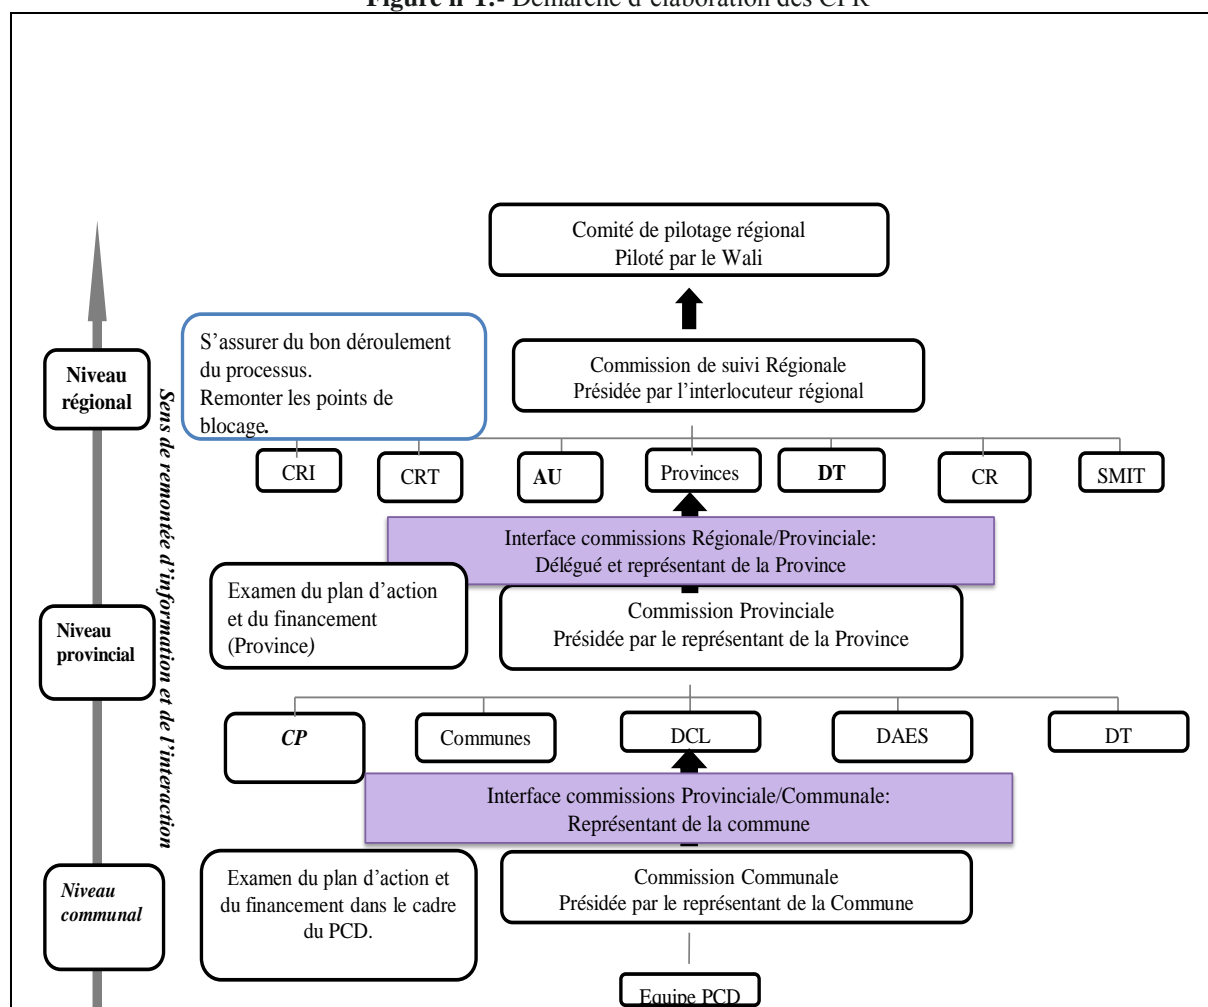

Notre étude de la gouvernance des destinations touristiques marocaines dans le nouveau modèle de développement touristique a été opérée en deux principaux temps. L'analyse de la gouvernance dans le processus de mise en œuvre de la nouvelle stratégie touristique à travers une lecture documentaire et son opérationnalisation effective sur la base des résultats de notre étude terrain.

En retenant qu'un processus de gouvernance est un «ensemble défini d'activités qui sont effectuées dans le cadre de la gouvernance pour permettre la définition cohérente, l'application et, au besoin, la modification des règles qui organisent et régulent les activités des participants pour mettre en œuvre les politiques énoncées» nous chercherons à caractériser la gouvernance dans le processus de mise en œuvre de la gouvernance dans la nouvelle politique touristique marocaine. Ce processus dans le cas du Maroc à connu trois principales phases. La première phase caractérisée par une implication et participation limitée des acteurs dans le cadre de l'élaboration du CPN et une deuxième phase marquée par une forte implication et participation des acteurs selon une approche up-top dans le cadre de l'élaboration des CPR. La troisième étape, compte tenu du retard accusé dans la mise en place des structures prévues (ADT), est caractérisée par un scénario secours donnant le pilotage régional des contrats.

D'après les données disponibles, c'est en 2009, au vu du bilan provisoire de la vision 2010, que les acteurs concernés (MT et FNT) avec l'aide de bureaux d'études étrangers ont entamé les réflexions et les travaux pour l'élaboration des orientations stratégiques qui devraient aboutir à la vision 2020. Ces travaux qui vont durer près de trois ans n'ont pas été marqués par une implication et participation de tous les acteurs du secteur. L'urgence de présenter la nouvelle stratégie dans les assises du tourisme de 2010 a fait que l'implication et la concertation ce sont plus limitées à l'information des acteurs. Pour nombre de professionnels cette approche n'a pas respecté les principes d'une bonne gouvernance et s'apparente plus à une approche top-down masquée par une tentative d'implication ad hoc des acteurs.

La vraie démarche de concertation et d'implication de tous les acteurs et donc de gouvernance n'a pu se concrétiser que dans le cadre de l'élaboration des CPR. En effet, si l'élaboration du CPN n'a pas connu, à l'avis de tous et plus particulièrement des professionnels, une réelle concertation et participation, c'est l'élaboration des CPR qui a connu la collaboration et la coordination des différents acteurs impliqués sur les plans local, régional et national selon une approche bottom-up. En effet, le CPN stipule (Mesure 1, CPN p :13), comme l'une de ses recommandations principales pour la mise en œuvre de la vision 2020, que chacun des 8 territoires (ou destinations touristiques) identifiés par la Vision 2020 élabore son Contrat Programme avec des objectifs fixés à partir des potentialités naturelles de chaque région, des pistes de financement pour la construction d'infrastructures et d'une offre touristique spécifique pour accueillir les touristes dont le nombre potentiel est aussi déterminé pour chaque destination. Ces CPR constituent, ainsi, des feuilles de routes précises qui doivent s'élaborer en étroite concertation avec l'ensemble des acteurs locaux: élus, professionnels, société civile et acteurs publics de chaque territoire. La démarche générale d'élaboration des CPR est présentée dans le schéma suivant :

Figure n°1:- Démarche d'élaboration des CPR

Source : élaboré par les auteurs sur la base du processus décrit dans le CPN.

Suivant une démarche interactive l'élaboration des CPR a débuté par la consultation du niveau local (communes) à travers le listage des projets touristiques retenus dans les plans communaux du développement (PCD) puis leur filtrage au niveau de chaque province en présence du représentant du Ministère (Délégué) et leur validation au niveau régional pour leur mise en œuvre sous forme du programme. le programme validé sur le plan régional est enfin remonté au niveau national pour un dernier filtrage visant à vérifier la concordance et la convergence des projets avec le positionnement du territoire d'implantation tel que prévu dans la vision 2020.

Si la démarche voulue a été globalement respectée plusieurs limites sont à soulever et qui entravent le processus de gouvernance mais aussi la réalisation des objectifs de la vision 2020. En premier, il ya lieu de noter la grande problématique de non concordance entre les découpages administratif et touristique et leurs mutations dans la période d'élaboration et de mise en œuvre des CPR. En effet, en cherchant à développer une expérience touristique beaucoup plus diverse, tant en termes de nombre de destinations que de variété de l'offre au sein de chacune de celles-ci, la vision 2020 s'est construite sur un découpage, qui transcende les barrières administratives à fin de permettre à chaque région de tirer profit de l'ensemble de ses potentialités et ainsi huit territoires touristiques en été retenus. Toutefois, le découpage administratif de l'époque était composé de 16 régions. Ainsi, 16 CPR étaient prévus pour huit territoires touristiques. D'autant plus que depuis 2011 l'organisation administrative du pays a connu un changement notable en limitant le nombre des régions administratives à seulement 12 régions (régionalisation avancée dont le projet de décret a été adopté par le conseil de gouvernement en février 2015). Dans ce contexte de mutation et du retard de mise en œuvre de la régionalisation avancée et des structures de gouvernance touristique notamment les ADT, chargées de la mise en œuvre territoriale de la vision, confrontés à l'horizon de réalisation des objectifs de la vision, l'élaboration des CPR a été l'œuvre de sous-commissions créées aux différents échelles régionales. Ainsi, encore une fois c'est le découpage administratif et non touristique qui a prévalu étant donné que pour outrepasser les problèmes et les tensions entre territoires et entre acteurs en jeu, c'est à l'échelle des provinces que les projets ont été filtrés pour leur simple validation au niveau de la région. Dans ce processus qui a pris au moins trois années pour l'élaboration des CPR pour toutes les régions nous pouvons ainsi relever la prédominance du politique sur les autres acteurs étant donné que le comité régional est présidé par le wali de la région. Cette situation montre que la régionalisation touristique n'a pas été respectée, ni dans sa dimension territoriale ni dans sa dimension gouvernance, et les CPR, s'apparentent plus à une collection de contrats-programmes provinciaux loin de la logique d'une réelle régionalisation touristique supposant une vraie appropriation du territoire par tous les acteurs comme espace permettant la résolution de leurs problèmes identifiés comme communs. En effet, les retards accusés dans l'opérationnalisation de la régionalisation avancée et de la régionalisation des structures de gouvernance touristique ont fait que les différents acteurs ont adopté la voie de la collaboration et de la coordination en se référant au territoire administratif et non au territoire touristique.

En second, un autre aspect important de la défaillance de la gouvernance touristique lors du processus d'élaboration des CPR réside dans la manière avec laquelle les projets ont été proposés et adoptés. En effet, alors que la démarche prévoyait donner la priorité aux acteurs locaux pour la proposition des projets pour faciliter leur territorialisation et leur appropriation il n'en été rien dans la réalité, lors des concertations, les représentants régionaux du ministère du tourisme se sont déplacés aux communes avec une banque de projets conçus à l'avance et concordants avec la vision 2020 pour chaque territoire. Cette procédure à faciliter l'alignement de ces communes qui se sont appropriées ces projets et les ont intégré dans leur propres programmes communaux de développement au lieu de l'inverse. Ainsi, la remontée de l'information, le filtrage et la validation des projets et du CPR se sont trouvés faciliter sans réelle concertation et implication de tous les acteurs territoriaux et sans réelle vraie territorialisation des projets.

En troisième, la question de la gouvernance dans le contexte actuel est vécue différemment par les deux sphères publique et privée et les départage. Du côté de la sphère publique la course vers la réalisation des objectifs de la vision 2020 est vécue comme une contrainte majeure et conduit à une sorte de gouvernance de la crise. En effet, après plus de trois ans de l'adoption des CPR et le retard très important accusé dans la concrétisation de la grande majorité des projets d'investissement retenus, une simple analyse de l'agenda des comités du pilotage régionaux, montre la grande priorité consacré au suivi de l'état d'avancement des projets et à la recherche de l'élimination des facteurs de blocage à leur réalisation et à la recherche d'investisseurs preneurs et de financement et les questions du management et de la gouvernance des destinations dans leur aspect promotionnel et marketing sont reléguées au second ordre. Du côté de la sphère privée, la situation est différente. En effet, les professionnels du secteur, acteur majeur dans la mise en œuvre de la vision et des CPR, touchés pour leur grande majorité par la conjoncture difficile que travers le tourisme national, sont plus préoccupés par la situation économique de leurs unités en grande majorité en difficulté. Malgré, qu'ils avancent adhérer sans faille aux politiques et décisions prises (une sorte d'adhésion de façade ou sous silence), ils sont plus demandeurs de mesures de soutien et d'actions orientées vers la promotion de la destination et de la recherche de marchés et marginalisent les préoccupations majeurs des acteurs publics plus orientés vers l'accélération de la concrétisation des programmes retenus dans les CPR. Au sein même de cette sphère privée les avis sont très disparates. Dans presque toutes les destinations du pays compte tenu de la conjoncture difficile que travers le tourisme, nous assistons à une structure à double palier. Alors que les grandes structures hôtelières et plus particulièrement celles appartenant à des chaînes internationales se comportent bien la grande majorité des structures indépendantes sont en difficultés et sont plus préoccupées par la recherche de

solutions commerciales ou économiques à leur problèmes. Dans ce contexte, pour ces acteurs, parler de gouvernance, de collaboration et d'adhésion relève presque de l'impossible.

Somme toute, à quatre années de l'horizon 2020, en mettant de côté les trois seuls points vraiment lumineux dans cette nouvelle politique consistants en le partage de l'ambition par tous et la validité du modèle de gouvernance promu et une forte tendance tant de la sphère publique que celle privée vers une vraie régionalisation de la gestion et de la gouvernance des programmes et des projets touristiques, nous sommes en droit, au vue des grands retards accusés tant dans la mise en place de la régionalisation avancée, des structures de gouvernance touristiques régionales et des projets et programmes retenus, de se poser des questions sur la validité des objectifs retenus et aussi de se poser la question légitime de savoir s'il s'agissait d'une véritable stratégie pour laquelle on s'est donné réellement et concrètement les moyens de sa mise en œuvre et réussite ou simplement d'une période transitoire à l'apprentissage du management et de la gouvernance du tourisme dont il faudra tirer les enseignements nécessaires et enclencher les mesures et actions efficaces pour bâtir le vrai cadre d'un management stratégique et de gouvernance efficace de nos destinations touristiques.

Conclusions:-

En posant la problématique de la gouvernance des destinations touristiques marocaine nous avons cherché à placer le modèle de gouvernance promu dans le cadre de la nouvelle stratégie de développement touristique du pays dans le référentiel théorique mais aussi à le questionner dans le processus de sa mise en œuvre et opérationnalisation. En plaçant la gouvernance basée sur le partenariat public-privé comme pilier fondamental de la mise en œuvre et de la réussite de la nouvelle politique touristique, le système de management touristique marocain s'apparente plus à un modèle hybride entre le corporate modèle et le community modèle. Toutefois, si le schéma institutionnel de la gouvernance tel que décrit dans le CPN semble respecter les principes d'une bonne gouvernance des destinations touristiques, sa traduction dans le terrain a connu des limites. Les réformes territoriales et organisationnelles n'étant pas encore achevées conjuguées à la conjoncture difficile que traverse le tourisme national ne doivent pas pour autant entrainer les acteurs dans un scénario de gestion de la crise mais plutôt d'appréhender et de voir en cette situation une occasion d'apprentissage pouvant engendrer une dynamique positive susceptible d'entrainer des améliorations dans leur manière de percevoir les logiques du secteur et son organisation pour un meilleur management et gouvernance. Chaque destination étant spécifique et ayant son contexte territorial et d'acteurs particulier, seule une gouvernance basée sur le partage d'objectifs communs, la coordination et la concertation de tous les acteurs dans un climat de participation, de cohérence, de confiance, d'ouverture, de responsabilité et d'efficacité peut assurer les bases d'une meilleure compétitivité des destinations touristiques marocaines. Le tourisme est et restera encore et pour toujours un pilier de l'économie marocaine, ré-ouvrir, ainsi, le chantier de la gouvernance, le rediscuter et le réussir à l'échelle territoriale pertinente semble être la voie prometteuse pour asseoir un management stratégique performant pour asseoir la compétitivité et la durabilité des destinations touristiques marocaines.

Abstract

The system assists people specially travelers to find their paths while travelling in English speaking countries without language barrier. Sign Board helps travelers to complete their journey with ease. But, understanding sign boards in English will be difficult for travelers who don't know English. To solve this, we are using text retrieval and translation from English to Marathi from sign boards. Text retrieval can be performed by using methods like Optical Character Recognition, Maximally Stable Extremal Region etc. Text translation can be performed by using various free API services available from organizations like Google, Microsoft, Yandex etc. For text retrieval, we found Optical Character Recognition as the best technique and for translation API services available from Google are the best.

Introduction:-

Sign boards provide route guidance using short and precise information. It conveys information that helps common people to take decisions while travelling. The language barrier among different English speaking countries is one of the major difficulties faced while travelling. The reason being tourists are unable to understand sign boards in the native language of the region. They may suffer consequent loss of important information which may lead to misguidance. The sign boards may also convey some warnings or hazards. The gaining momentum of internet and portable mobile phones makes it easy to drift from traditional dictionary translation to a better web app which is user friendly. The world is moving towards image records and retrieval of information from the same. In this sense, it is expected that a high percentage of the world population will own a smart phone with an embedded camera and an internet connection, which is our system's requirement.

Various techniques are used to retrieve text from an image. One of them is Optical Character Recognition (OCR)[1]. OCR is the process of converting a scanned document image into machine encoded format. The scanned document image may include photograph of a document, image of sign boards and billboard from a landscape photograph. OCR finds its applications in the fields of pattern recognition, artificial intelligence, handwriting recognition, etc. Although OCR works efficiently with digital images, it doesn't work well with natural scene images [2].

Another image processing technique is Maximum Stable Extremal Region (MSER). It is a technique used to detect blobs in images. Blobs are regions which differ in properties like brightness or color. MSER is useful while detecting text from a natural scene image. It also provides great results for images which are captured blur or of varying region density and size.

For taking pictures of the sign boards, we are using a mobile phone camera of a good quality so that we can get clear and stable pictures of the sign boards. Quality of a camera is going to affect the quality of the image of a sign board.

So, we should take care of that while selecting the camera. Each of the methods of a text retrieval has some advantages and also some drawbacks. The next section i.e. Section 2 gives us the detailed idea about these methodologies used to retrieve the text and translate the text from sign board images. Section 3 gives us comparison between these methodologies. Section 4 gives us the conclusion of this survey.

Related Work:-

The system of text retrieval and translation from sign board images works in two phases i.e. text retrieval and text translation.

Text retrieval:-

It is the process of detecting & retrieving of the text from the images. There are two popular methods of text retrieval.

OCR- optical character recognition:-

The Optical Character Recognition(OCR) is considered as machine replication of human reading. Today's most common way of inputting the data into computer is by using the keyboard but, it is time consuming and it requires human efforts [3]. OCR provides a desirable way to extract the text from the images. So, that we can efficiently input the data to the computer. OCR is considered as mechanical or electronic conversion of scanned image where image can contain handwritten or typewritten text. OCR is the process of digitizing the printed text so that it can be used electronically in various machine processes. OCR is the process of converting a scanned document image into machine encoded format. The scanned document image may include photograph of a document, image of sign boards and billboard from a landscape photograph. OCR finds its applications in the fields of pattern recognition, artificial intelligence, handwriting recognition, etc.

Nowadays, many institutions and organizations are moving towards OCR to eliminate the human interference and increase the efficiency [5]. OCR is of two types and they are offline recognition and online recognition. In offline recognition either an image or scanned form of image is considered. In online recognition, successive points are chosen as function of time and order of strokes are also available. The OCR methodology has the following features:

- ❖ No more retyping
- ❖ Edit text.
- ❖ Save space.
- ❖ Quick digital searches

Steps of a OCR are as follows:-**Pre-processing:-**

OCR software often "pre-processes" images to improve the chances of successful recognition. Here input image is taken and it is converted to the gray scale image. The gray scale image is finally converted into binary image. This process is known as binarization of the image. Scanned image from the scanner may contain some noise due to the unnecessary details present in the image. This noise should be removed from the image for the proper application of OCR. Some algorithms are used to denoise the image and this denoised image should be referred for the further use in the system. Other operations that are performed in the pre-processing of the image are: Deskew, Despeckle, Fragmentation, Line removal, layout analysis.

Character Extraction:-

Preprocessed image is provided as input to this step to extract each and every character from text which is obtained from the given image.

Character Recognition:-

The image from the extraction stage is correlated with the templates which are preloaded into the system. Once the correlation is done, the template with maximum correlated value is declared as the character present in that image. There are two basic types of core OCR algorithm, which may produce a ranked list of candidate characters. Matrix matching involves comparing an image to a stored glyph on a pixel-by-pixel basis; it is also known as "pattern matching" or "pattern recognition". This relies on the input glyph being correctly isolated from the rest of the image, and on the stored glyph being in a similar font and at the same scale. This technique works best with typewritten text and does not work well when new fonts are encountered. This is the technique the early physical photocell-based OCR implemented, rather directly.

Post Processing:-

After the character recognition, if there are still unrecognized characters in the image then that characters are given their meaning in post processing step. Some extra templates can be added for providing wide range of compatibility checking in the system database. The Levenshtein Distance algorithm has also been used in OCR post-processing to further optimize results from an OCR API.

Block Diagram of OCR

We can face some challenges while implementing the traditional OCR on mobile devices. These challenges are-

- 1) Non-contact nature of digital cameras in mobiles.
 - 2) Poor quality of images.
 - 3) Processing speed and memory are not that sufficient to run the desktop OCR algorithms on mobile devices.
 - 4) Mobile devices don't have Floating Point Unit(FPU) which is required for floating point arithmetic operations.
- Hence, we are using computationally efficient and light weight OCR in our system which will run smoothly on the mobile devices.

MSER- Maximally Stable Extremal Regions:-

MSER denotes a set of distinguished regions, which are defined by extremal property of its intensity function in the region and on its outer boundary [10]. In computer science, Maximally Stable Extremal Regions(MSER) are used for blob detection in scanned images. This technique was suggested by Matas et al. to find correspondences between image elements from two images with different perspectives. This method of extracting a ample number of analogous image elements contributes to the wide-baseline matching, and it has led to better stereo matching and object recognition algorithms. Extremal regions in this context have two important properties, they are as follows:

- 1) Continuous transformation of image coordinates. This means it is affine invariant and it doesn't matter if the image is warped or skewed.
- 2) Monotonic transformation of image intensities. The approach is of course sensitive to natural lighting effects as change of day light or moving shadows.

Advantages of MSER are-

- 1) Invariance to affine transformation of image intensities.
- 2) Stability: only regions whose support is nearly the same over a range of thresholds is selected.
- 3) The set of all extremal regions can be computed in worst-case $O(n)$, where n is the number of pixels in the image.

For region detection invariance transformations that should be considered are illumination changes, translation, rotation, scale and full affine transform (i.e. region should correspond to same preimage for different viewpoints. View point changes can be locally approximated by affine transform if assuming locally planar object and orthographic camera, that is perspective effects ignored). Region detection should be repeatable, stable and capable of discriminating between regions.

MSER is the method of blob detection in images. The MSER algorithm extracts from an image a number of co-variant regions called MSER. MSER is a stable connected component of gray level set of images. MSER is based on the idea of taking regions which stay nearly the same through a wide range of thresholds. All the pixels below a threshold are white pixels and all those above or equal are black pixels. If we are shown a sequence of threshold images I_t with frame t corresponding to threshold t , we would see first a *black* image, then *white* spots corresponding to local intensity will appear then grow larger. These *white* spots will eventually merge, until the whole image is *white*. The set of all related components in the order is the set of all extremal regions. Elliptical frames are attached to the MSERs by fitting ellipses to the regions. Those regions descriptors are saved as features. The word *extremal* refers to the property that all pixels inside the MSER have either higher (bright extremal region) or lower (dark extremal region) intensity than all the pixels on its outer boundary.

The operation can be accomplished by sorting all pixels by gray value and incrementally adding pixels to each connected component as the threshold is changed. The area is monitored. Regions such that their variation w.r.t the threshold is minimal are defined maximally stable.:

Let's make all the pixels below a threshold, white and all others, black. Considering a sequence of threshold images with increasing thresholds sweeping from black to white we pass from a black image to images where white blobs appear and grow larger by integration, up to the ultimate image. Over a enormous range of thresholds the native binarization is steady and shows some invariance to affine transformation of image intensities and scaling.

Text Translation:-

Our system is mainly divided into two parts, first one is text detection phase and second one is text translation phase. In text detection phase, we are using OCR and MSER together. In text translation phase, we are using text translation API. There are various free APIs available in market for the translation purpose like Microsoft Translator API, Google Translator API, Yandex Translator API, Frengley Translator API etc. Out of these APIs, some APIs are free and some APIs are paid. We have used the free API for the translation purpose in our System.

Microsoft Translator API:-

Microsoft Translator Text API [13], part of the Microsoft Cognitive Services API collection, is a cloud-based machine translation service supporting various multiple languages. This Translator can be used to build various applications, websites, tools, or any solution requiring multilanguage support.

It is Built for business. Microsoft Translator is a proven, customizable, and scalable technology for machine translation. Microsoft Translator technology powers translation features across Microsoft products, including Office, SharePoint, Yammer, Visual Studio, Bing, and Skype. By simply integrating translation into web, desktop, or mobile applications, the Translator API provides a rich functionality set for any developer. The features of Microsoft Translator API are- it is built for enterprise, customizable, effectively scalable.

Yandex Translator API:-

The Yandex Translator API [12] gives access to the Yandex online machine translation service. It provides support for more than 70 languages and can translate separate words or complete texts. The API makes it possible to use Yandex Translate in a mobile apps or web services for end users Or to translate large quantities of text, such as technical documentation. We can use any of the following interfaces for accessing the Yandex Translate API over HTTPS:

- ❖ XML interface (The response is an XML document).
- ❖ JSON interface (The response is JavaScript objects with the same names and semantics as the XML elements).
- ❖ JSONP interface (The response as JavaScript objects wrapped in a callback function with the specified name).

All the interfaces have the same functionality and use the same set of input parameters.

Yandex Translate is a statistical machine translation system. This system translates words, complete texts, and web pages into the desired language. It is available as a web service and mobile application, and is also used in other

products, such as translating web pages in Browser. Yandex Translate has an automated dictionary that sets it apart from the limited number of similar existing services. The technology, developed by a Yandex team of linguists and programmers, combines current statistical machine translation approaches with traditional linguistic tools.

Py-translate:-

Py-translate is a translation tool for humans. Its end goal is to translate text from one language to another. Translation is done in terminal using command line arguments. It is so good that it can translate a book in mere 5 seconds. It was made for python 3 but still it works on python2. It is fast & easy to install. It is easy to use & handle. It supports translation from any language. It is having highly composite interface, the power of Unix pipes & filters. It is having a simple API.

Comparison:-

Comparison of OCR and MSER

	OCR	MSER
Font Size	Fixed	Variable
Robustness	Less	More
Usability	Easy	Hard
Reliability	More	Less
Flexibility	Less	More
Time Complexity	Fast	Slow
Space Complexity	More	More

Comparison of Google API, Microsoft API and Yandex API

	Google Translate API	Microsoft Translator API	Yandex Translate API
Supported Request Format	Atom, GData	SOAP, XML, URI Query String/CRUD, JavaScript, HTTP POST, GET	XML, JSON, JSONP
Supported Response Format	GData, Atom, XML	XML, JSON, SOAP	XML, JSON
Is this Hypermedia API?	No	Yes	No
Languages Supported	100+	60	46
Functionality	Cloud Based API	Cloud Based API	Statistical Machine Translation

Conclusion:-

This paper focuses on the various methodologies that are used for text retrieval and translation from the images of the sign boards. By referring to the above sections, we can conclude that for the text retrieval, Optical Character Recognition(OCR) is better than any other methods for the digital images & Maximally Stable Extremal Regions(MSER) is best for natural scene images. As they produce the desired output with high accuracy. For the text translation, API services which are available from the Google are the best.

Future work aims at the development of a such system that performs text retrieval by using above methods and translation of that text from one language to another for the sign board images.

Dentine hypersensitivity, Dakshina
Kannada.

Abstract

The aim of the survey was to study the prevalence, common causes, aggravating factors and awareness about dentine hypersensitivity in urban and rural patients of Dakshina Kannada population. A total of 1000 patients were randomly selected, who reported at the A. B. Shetty Memorial Institute of Dental Sciences, Nitte University and Satellite Rural Centres. Dentine hypersensitivity was evaluated by questionnaire, oral and clinical examination. On analysis of data, it was found that the prevalence of dentine hypersensitivity was 19.2%. Cold was the most common (68.2%) aggravating factor and the most common cause was gingival recession (47.9%), followed by caries (24%). Most common age group affected by dentine hypersensitivity was between 21-30. It was also noted that population had limited awareness about the causes, symptoms and treatment modalities of dentine hypersensitivity.

Introduction:-

Dentine hypersensitivity (DH) has been defined as a short, sharp pain arising from exposed dentine as a response to stimuli typically thermal, evaporative, tactile, osmotic or chemical and which cannot be ascribed to any other form of dental defect, disease or pathology [1, 2]. DH is a very common condition that is frequently encountered in clinical dental practice. It is a clinical condition in permanent teeth caused by dentin exposure to the oral environment as a consequence of loss of enamel and/ or cementum [3]. Several theories have been proposed to explain the mechanism of dentine sensitivity. Of these the most widely accepted theory is called hydrodynamic theory of sensitivity. This theory postulates that rapid shift in either direction of the fluid within the dentinal tubules following stimulus application, results in activation of sensory nerves in the pulp/inner dentine region of the tooth [4, 5]. Several studies indicate that DH was found in adult populations, with prevalence of more than 40% worldwide, 4 to 74% in India and 26% in southern India [6]. The rural population may have a lot of barriers preventing them to attend the dental clinics/institutes which are mainly situated in urban settings. A number of people with mild tooth sensitivity do not visit the dentist. Therefore, it may be difficult to get the actual prevalence of dentine hypersensitivity in the population. Patients usually do not report this painful condition to their dental practitioners and when they do, they report experiencing sharp pain after a number of stimuli's [7]. DH may occur also as a result of history of any dental treatment as well. DH may even result in emotional changes that alter

behaviour, in extreme cases [8]. The purpose of this cross sectional study was to evaluate the prevalence, common causes, aggravating factors, association with previous dental treatment and patients' awareness about dentine hypersensitivity among the urban and rural patients of Dakshina Kannada population.

Materials and Methodology:-

The study was conducted on a total of 1000 patients over a period of 3 months from June to August 2016, after obtaining written consent, out of which 500 were examined from the Out-Patient section of Department of Conservative Dentistry and Endodontics and rest 500 were examined in Satellite Rural Centres of A. B. Shetty Memorial Institute of Dental Sciences, Nitte University, Deralakatte, Mangaluru.

Inclusion criteria:-

- Patients between the age of 15-70 years
- History of dentine hypersensitivity

Exclusion criteria:-

- Teeth with prosthodontic crowns
- Patients consuming analgesic drugs, anti-psychotic drugs or mood altering medications

Data obtained was entered in M S Excel spreadsheet and statistical analysis was done using the Statistical Package for the Social Sciences (SPSS 22). Difference between variables were analyzed using Pearson Chi-Square test.

Results:-

Out of 1000 patients, 192 patients showed a positive response to dentine hypersensitivity (prevalence is 19.2%). The prevalence was highest in the age group of 21-30 years (32.3%) [Fig.2]. Males (59.9%) were more affected than females (40.1%) [Fig.1]. Most common aggravating factors for DH is cold (68.2%), followed by sweet (27.6%) and hot (4.2%) [Table.1]. Most common causes found were gingival recession (47.9%), caries (24.0%), and tooth abrasion (19.8%) [Fig.3]. Out of the 192 cases that presented hypersensitivity, 75 cases (39.1%) had history of regular soft drinks consumption ($p=0.013$). Out of 1000 patients, only 38 cases reported of any recent history of dental treatment and 39.4% of them had undergone oral prophylaxis/root planing, 36.8% underwent orthodontic treatment including proximal stripping.

Figure 1:-
Gender distribution of hypersensitivity

Figure 2:-
Association of DH with age

Figure 3:- Causes of DH.

Table 1:- Aggravating factors of DH.

Factors	Frequency	Percent
Hot	8	4.1
Cold	131	68.2
Sweet	53	27.6
Total	192	100.0

Discussion:-

According to the results of the questionnaire and clinical examination, the present study showed that the prevalence of dentine hypersensitivity was overall 19.2%, which is similar to the previous study done by the Hegde et al 22.5% [9] and Dhaliwal et al 25% [10]. Some studies that have been carried out with questionnaires had reported values of more than 50% or less than 20% [11, 16]. There are studies from dental practices which have reported prevalence values from 4-15% [12, 19]. The differences may be due to the type of sample and methods used in the studies. It could also be due to the variation in the geographical locations with different dietary habits and oral hygiene practices.

In the present study, dentine hypersensitivity is more prevalent in males than females as against studies done by Rees JS, Addy M [13], Hsin Cheng Liu [14] and N A Chrysanthakopoulos [15] which may be due to their overall healthcare and better oral hygiene awareness while the study done by Chabanski M B [17] is in accordance with this study.

In the present study dentine hypersensitivity is more prevalent in age group of 21-30 years and least above the age of 60. This particular age distribution may be because of more frequent and aggressive oral hygiene regimen adopted. A reduction of DH in seniors could be plausible due to the development of secondary or reparative dentine and subsequent sclerosis of the dentinal tubules accompanied by reduced sensitivity. Maxillary teeth seem to be more affected than mandibular teeth with 122 of the 192 patients affected by hypersensitivity complaining of the same in maxillary teeth compared to the 70 others who had hypersensitivity in the mandibular teeth. This is in accordance with study done by Addy M et al [18].

Several possible etiologic and predisposing factors for dentine hypersensitivity have been proposed [19]. In this study, gingival recession was seen to be the leading cause of dentinal hypersensitivity (52%). Dentine tubules may become exposed as a result of enamel loss from attrition, abrasion, erosion (acid dissolution) or abfraction (cervical stress lesion) [20], but dentin exposure often may be a result of gingival recession and cementum loss from root surfaces, most frequently in canines and premolars [21]. Aggressive or frequent tooth brushing [22] and periodontal treatment (such as scaling and root planning [23]) could also result in elevating DH.

Soft drinks had a direct association with dentine hypersensitivity in the present study, with 39.1% of the positive respondents to DH having a habit of regular consumption of soft drinks. The study had similar findings with Colak et al study among students in Turkey [8]. Soft drinks are carbonated that leads to tooth wear by erosion of enamel

surface and then dentine, leading to DH. According to studies done by S. Wongkhantee [24], ME Barbour [25] and Vanuspong W [26], acidic beverages and cola drinks depending on pH, temperature and frequency of exposure are responsible for softening of dental hard tissues and restorative materials that are exposed.

Cold was the most common factor which initiated the pain as experienced by most of the patients (68.2%). This result was similar to the studies done by Rees JS et al & Tan CS et al [27]. Sweet stimulus was the second most common aggravating factor (27.6%), which was in accordance with study done by J.S Dhaliwal et al [10] but not in agreement with studies done by Fischer et al [3], Rees JS et al [13], Flynn J et al [28] where heat was found to be the second most common aggravating factor for DH as pain from heat takes longer to develop than pain from cold, because heat causes inward movement of tubular fluid while the outward movement caused by cold develops more rapidly.

Conclusion:-

The prevalence of dentinal hypersensitivity among Dakshina Kannada population is 19.2%. Dentine hypersensitivity is a clinically relevant and worldwide problem that may affect about a quarter of the adult population. Even though dentine hypersensitivity may not be considered a fatal or severe problem, it affects the quality of life of patients and, therefore, it should be properly addressed in research, dental education, prevention, and treatment.

Abstract

Modern technological development in automobile industry has drastically improved people's way of living; therefore there is a need for monitoring of vehicles to heighten its longevity. Mortality rate is also on the rise due to the lack of timely and proper medical attention. Continuous health monitoring of patients using wearable and implantable body sensor networks will increase detection of emergency conditions during health crisis. By integrating vehicle tracking and continuous wireless patient monitoring system; we can enhance safety during travel. This system is user friendly, easily installable, easily accessible and economically viable. The conventional system of tracking using battery operated radio frequency identification (RFID) is only suitable for small range. To overcome this, GPS and GSM technologies are used which will receive the location coordinates and provides real-time information which can be observed from any other remote location. The established health monitoring system is not compact and understanding the output analog signals is a tedious task. Hence, in the designed health monitoring system patient's physiological signals are acquired by the sensors attached on the patient body; if there are any abnormalities then a notification is sent and the vehicle is turned OFF using relay.

Introduction:-

Advanced ingenuity has proved that we are living in the golden era of science where for any anomaly some kind of solution exists. Transportation is a vital activity in everyone's life; we can't avoid it just because of the fact that daily 400 accidents occur. However, the issue that's not getting any attention is the growing number of people having heart attacks while driving. According to a Times of India article published in the year 2016 India is witnessing two million heart attacks in a year, one person for every 33sec dies of cardiac arrest and majority of them are youngsters. An ambulance must be called within five minutes after the patient collapses as part of an emergency treatment. Although it seems like an easy thing to do many obstacles are there the main being lack of surveillance of

Address:- Assistant Professor, Electrical and Electronics Department, Velammal college of Engineering and Technology, Viraganoor.

the patient's heartbeat (pulse rate). Health monitoring technology has been flourishing proficiently in recent years, due to its ubiquity, accessibility and ease to use. However, quality and affordability of the health care systems are a major cause of concern around the globe. A large number of people with low income facing health issues with the high cost of healthcare system. Between 2004 and 2014 medical expenditure per hospitalization for urban patients increased by about 176%. Early detection can always prevent long term hospitalization in order to this we need to use a device such as cell phone that has become a part of everyone's identity so that it is affordable for everyone be it people in rural or urban area. That is why in our proposed system mobile healthcare monitoring system was developed.

Wireless Technologies is all the hype due to the invention of low-power electronics, internet of things (IOT) and wearable sensor systems. A heartbeat sensor is a great tool giving you clear indication and evaluation of the condition of your cardiovascular system. There are many devices used by doctors to monitor patient's vital parameters such as electrocardiography, Holter Monitor, long term ambulatory monitors and pulse rate oximeters. Though they are proficient they can't be put to daily use since it restricts mobility of person and can't be possibly bought by an average person. This is the main reason why we use heart beat sensors because they are efficient, cost-effective and doesn't affect movement.

In the last decade, we observe the drivers fatigue driving and vehicle theft activity has exponentially increased which causes social real time problem, accidents and many more hazards conditions. These incidents are widely prevalent and have affected our day to day activities causing security concerns. So there is a need for monitoring and tracking the vehicle and also storing and updating database with relevant information which can have future impact. In our proposed system, there is prevention of occurrence of accident due to sudden health crisis and to develop a remote control mechanism that will avoid loss of control of vehicle when the driver collapses. A driver of any kind of vehicle is responsible to not lose control of his vehicle and cause harm to innocent passersby. However, what if a driver causes personal injuries to others because of unconsciousness due to cardiac arrest that is why a relay control is used which automatically turns down the engine when a turn OFF command comes from the command centre as soon as the drivers pulse rate deteriorates.

Problem Statement:-

In conventional system, Radio Frequency Identification (RFID) was predominantly used. It is a small electronic device that consists of a small chip and an antenna. This device serves the same purpose as a code on the back of a credit card or ATM card; it provides a unique identifier for the object. And, just as a code must be scanned to get the information, the device must be scanned to retrieve the identifying information and used in short range and less effective. Since this system make use of the electromagnetic spectrum, they are relatively easy to jam using energy at the particular frequency. Reader collision occurs when the signals from two or more readers overlap. Tag collision occurs when many tags are present in a small area; since the tags can be read without being swiped or obviously scanned like a code, anyone with this tag reader can read the tags embedded in your clothes and other consumer products without your knowledge. For various reasons, the reader/tag systems are designed so that distance between the tag and the reader is kept to a minimum to prevent tag collision. However, a high-gain antenna can be used to read the tags from much far away, leading to privacy problems.

The conventional health monitoring requires large equipment which are costly and causes loses of mobility of patients. Monitoring of vital parameters needs various devices and can include measuring blood pressure and heart rate, and preferably also pulse oximetry and respiratory rate. Multimodal monitors that simultaneously measure and display the relevant vital parameters are commonly integrated into the bedside monitors in critical care units, in rooms. So, this leads to high expenditure of money and extreme consumption of space. Patients are not satisfied with the treatment which doctors normally use for finding the heartbeat count. There are instruments available in the market to track internal body changes, but there are some limitations due to their heavy cost. Conventional monitoring of cardiac activity is performed in a clinical setting in real-time during a visit, by recording electrocardiograph (ECG) signals. Monitoring the heart activity with ECG signals is a very common technique, performed by placing at least three electrodes on the skin to measure the electrical activity of heart. Traditionally, Holter monitors were used for ambulatory monitoring during the recovery period after cardiac surgeries Although Holter monitors are capable of providing continuous monitoring, the central unit of the monitors is bulky and each electrode is connected to the central unit with wires. Therefore, the use of the these monitor interrupts the daily routine of the patient and is not feasible for continuous monitoring. Over the few years, with the advancement in wireless technologies, these monitors have been miniaturized and evolved into complete wire-free monitoring

devices. Although ambulatory wire-free devices look for promising continuous monitoring, there is a still need for development of such devices.

Usage of other controller will lead to difficulty in manipulation which is not user friendly. ARM chip is RISC processors that were created by Acorn and the design now owned by ARM Limited. They license the design to manufactures to add on to their own chips to create “systems on a chip” that contain many features on one chip, and with the ARM design which is able to include the CPU as well. The ARM is very prevalent in low power embedded applications. They are designed for low power consumption, a laptop using an ARM processor which is going to possibly have better battery life than an x86 based laptop.

The disadvantage of the ARM processor is that it is not binary compatible with x86. For the little cost, the Raspberry Pi is powerful, but it has some limitations. Although you probably use it as a desktop computer, its power is closer to a mobile device (like a tablet) than a modern desktop PC. Even though Raspberry Pi can perform different tasks, there are some limitations due to the hardware. Because of its processor, it cannot run X86 operating systems. Some common area like Windows and Linux is not compatible. In addition, some applications which require a high demand on CPU processing is off-limits. The memory of the Raspberry Pi is more limited than the usual one, with just 512MB or 256MB available. You can't expand that with extra memory as the desktop PC.

Mechanism Used:-

Vehicle Tracking using GPS&GSM:-

In **GPS tracking system** the location of vehicle is sent to remote place and it is indicated by GSM modem. Global Positioning System (GPS) modem requires minimum 3 satellites to calculate the exact location. This modem communicates only in one way with 8051 microcontroller. This means that it can only transmit data to microcontroller. GPS Modem will not receive any data from microcontroller. At the same time GPS modem does not send any data to Satellite, it only receives signal from satellites. GSM modem is used to send this information via SMS. SMS will be sent to the owner of the vehicle.

It would be time consuming to track location on maps. But now various websites and apps are available on internet which shows online map. Google maps are one of the main and website. You can use any one of these websites to track the location of vehicle. You can track the location using Longitude and Latitude received in SMS. Using these maps you can track vehicle and get the exact location as well as directions. All you need to do is copy the contents of Text SMS received from SMS based Vehicle tracking system using GPS into the Google map.

GPS based Vehicle tracking system is required in many arena, like in case of car theft detection. Car tracking using GPS will be useful when our car is stolen. Also if somebody wants to track school bus of their children, it will be helpful to find out the location of their kids. One more situation is when some company wants to track the location of the cab or transport bus of employee then in that case, this vehicle tracking system will be very useful. This is a cheaper solution than a two-way GPS communication system where the communication is done in both ways with GPS satellites, GSM modem with a SIM card used here implements the same communication technique as in a regular cell phone.

Measurement of vital parameters using heartbeat sensors for health monitoring:-

The adoption of mobile health-care technology is a promising one to enhance the quality of life of patients and the elderly. Furthermore, it offers the potential to alter the current health-care system by enabling out-patient care and preventing hospitalisations. Designing a telemetry system for health monitoring is very cumbersome task. There are many key issues to be addressed, including: designing sensors; ensuring the transmission of vital sign data; providing privacy and security of an individuals. The system Heart Attack Detection by Heart Rate Monitoring helps to inform if a person is about to have a heart attack. This system is done by detecting the heart beat level and informs as soon as the heart beat level fall within the permissible limit. Thus this system can be used to save the life of many people as it alerts the doctor about the patient's heart beat level. For this the system has two circuits. One is the transmitting circuit which is the patient's one and the other is the receiver circuit which is being supervised in the control room.

The heartbeat sensor is based on the principle of photo phlethysmography. It measures the changes in volume of blood through any organ of the body which causes a change in the light intensity in that particular organ. In case of applications where heart pulse rate is to be monitored, the timing of the pulses is important. The flow of blood volume is decided by the rate of heart pulses and as the light is absorbed by blood, the signal pulses are equivalent to the heart beat pulses. The basic heartbeat sensor consists of a light emitting diode and a detector. The heart beat pulses causes a variation in the flow of blood to different parts of the body. When a tissue is illuminated with the light source, the light emitted by the led, it either reflects or transmits the light. Some of the light is absorbed by the blood and one which is transmitted or the reflected light is received by the light detector. The amount of light absorbed depends upon the blood volume in that tissue. The detector output is of the form of electrical signal and is proportional to the heart beat rate. The signal is actually a DC signal relating to the tissues and the blood volume and the AC component is in phase with the heart beat. Thus the major requirement is to isolate the AC component.

Control of vehicle using relay driving circuit:-

One easy way to increase system reliability and performance is by using relays to switching devices (lights, fuel pumps, fans, etc.). A relay is an electro-mechanical switch. An electro-magnet is used to pull a set of contacts, or pins. The relay uses a tiny amount of current to trigger the larger switch in the relay, which is far efficient and safer. A perfectly wired relay will provide the shortest electrical path between the battery and the device which is controlled by the relay. Combined with the proper gauge wire, this will minimize the voltage drop between the battery and the device, allowing it to function at a peak performance levels. Relays, allow you to control a number of devices with a single switch (a master ignition switch on a race car). Having only one switch to turn off is safer in an emergency and it's more convenient as well.

System Specification:-

Relay:-

A relay coil is an electromagnet and is also an inductor. When power is applied to the coil the current in the coil builds up and levels at its rated current (depends on the DC coil resistance, $I = V/R$). Some of the remaining energy is now stored in the coil's magnetic field ($E = 0.5LI^2$). When the current flowing in the coil is turned off this stored energy needs a way out. The voltage across the coil quickly increases to keep the current in the coil flowing in the same direction ($V = Ldi/dt$). This voltage spike can reach high range of volts and can damage electronic parts.

Fig 2:- Experimental setup of Proposed System.

By the addition of a fly back diode the current has a path to flow through coil until the stored energy is used up. The voltage across the coil is clamped to about 0.7V protecting the electronics. The stored energy dissipates at a fast rate in the diode ($E = V \cdot I \cdot t$). The current flow is interrupted and the relay is turned off. The diode should be able to deal the coil current for a short time and switch relatively fast. A resistor or zener diode is connected in series with the diode to dissipate the stored energy quicker. This result in the increase of amplitude of the voltage spike above 0.7V but the energy is used up quicker (i.e. the voltage spike is short lived).

Mc78xx/Lm78xx/Mc78xxa:-

This type employs internal current limiting, thermal shut down and safe operating area protection, making it durable. If tolerable heat sinking is provided, 1A output current can be obtained. Although initially it was designed to be as fixed voltage regulators, these devices can be used with external components to obtain adjustable voltages and currents.

GPS:-

GPS is the space-based satellite navigation system which provides location and time information in all weather conditions, anywhere on the Earth. GPS receivers are popularly used for navigation, positioning, and other research purposes. The GPS consists of satellites which orbits the earth. These satellites are geosynchronous with an orbital period that is the same as the Earth's rotation period. So they maintain exactly the same position with respect to the earth. All the GPS satellite transmits radio signals, which are then captured by the GPS receiver and used to calculate its geographical position. The minimum number of four satellites may be required to compute the four dimensions of X, Y, Z (latitude, longitude and elevation) and time. GPS receiver converts the received signals into position and estimates time and some information depending on the application and requirements. GPS determines the distance between a GPS satellite and the GPS receiver by measuring the amount of time taken by a radio signal to travel from the satellite to the receiver. To obtain accurate information, the satellites and the receiver uses very accurate clocks, which are synchronised so that they generate the same code at exactly the same time

GSM:-

The overall system definition for GSM describes not only the air interface but also the network. By adopting this approach it is possible to define the operation of the whole network.

GSM cellular technology has 200 kHz RF channels. These are time division multiplexed to enable up to eight users to access each carrier.

- It has good subjective speech quality
- It should have a low or terminal cost
- Terminals should be able to be handheld
- The system is to support international roaming
- It should offer good spectral efficiency
- The system should offer ISDN compatibility

The base transceiver station is organized into small groups, controlled by a base station controller which is typically co-located with one of the BTS. The BSC with its associated BTSs is termed the base station subsystem.

Further into the core network is the main switching area. This is known as the mobile switching centre. Associated with it is are the location registers, namely the home location register and the visitor location register which track the location of mobiles and enable calls to be routed to them. Additionally there is the Authentication Centre, and the Equipment Identify Register that is used in authenticating the mobile before it is allowed to the network and for billing.

Often termed the mobile equipment, this is the one which end user sees. One important feature that was first implemented on GSM was the use of a Subscriber Identity Module. This card carries with it the user's identity and other information to allow the user to upgrade a phone, while retaining the same identity on the network. It was also used to store other information such as "phone book" and other items. This item allows people to change phones very easily, and this has fuelled the phone manufacturing industry and enabled new phones with additional features to be launched.

Speech or voice calls are obviously the primary function for the GSM cellular system. To achieve this speech is digitally encoded and later decoded. A varieties of coders are available for use, being aimed at different sectors.

In addition to the voice services, GSM cellular technology supports a variety of other data services. A variety of data services were supported with user data rated up to 9.6 kbps. Services including Group 3 facsimile, videotext is also been supported.

One service that has grown at a rapid rate is the short message service. Developed as part of the GSM specification, it has been added into other cellular technologies. This service has become particularly popular.

Arduino Uno Controller:-

Arduino Uno is a microcontroller board based on the ATmega328. It has 14 digital input/output pins, 6 analog inputs, a 16 MHz quartz crystal, a USB connection, a power jack, an ICSP header and a reset button. It contains everything needed to support the microcontroller; simply connect it to a computer with a USB cable or t with a AC-to-DC adapter or battery to get started. The Uno board and version 1.0 of Arduino Software (IDE) were the reference versions of Arduino, now evolved to newer releases. The Uno board is the first in a series of USB Arduino boards, and the reference model for the Arduino platform for an extensive list of current, past or outdated boards see the Arduino index of board.

Working Principle:-

This project has a different approach. Arduino is used for controlling whole the process with a **GPS Receiver and GSM module**. GPS Receiver is used for detecting coordinates of the vehicle, GSM module is used for sending the coordinates to user through SMS. And an optional 16x2 LCD is also used for displaying status messages or coordinates. We have used GPS Module SKG13BL and GSM Module SIM900A. When hardware is ready then after programming, we can install it in our vehicle and power it up. This system has Global Positioning System (GPS) which will receive the latitude and longitude coordinates from the satellites among other c information. These co-ordinates are sent to the Arduino controller.

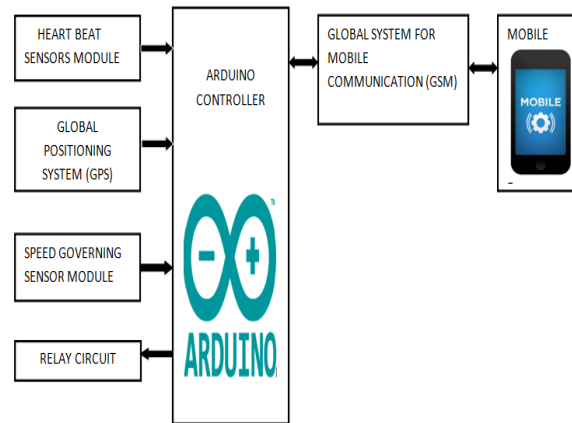

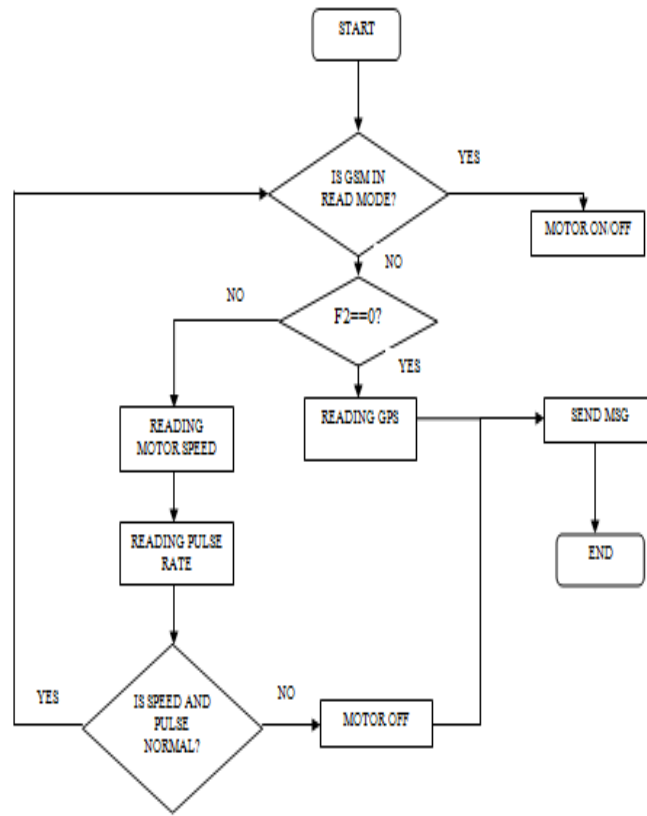

Fig 3:- Block Diagram Of Proposed Model.

This proposed model consists of two sensor modules namely, heartbeat sensor and speed governing sensors. The driver is provided with the wearable device which is used to monitor the driver's health conditions which consists of a heartbeat monitor sensors which can be used to measure the driver's pulse rate and blood pressure level during various conditions. So in order to detect the pulse we will pass LED from one side of the finger and measure the intensity of light received on the other side using a Light Dependant Resistor. As a result the value of resistance of the LDR increases. This variation in resistance is converted into voltage using a signal conditioning circuit usually an OP-AMP. On the other hand, the speed governing sensor module senses the speed of the vehicle and transmits it to the controller using the IR sensor. IR Sensors work by using a specific light sensor to select light wavelength in the Infra-Red spectrum. By using an LED which produces light at the same wavelength as the sensor is, you can look at the intensity of the received light. When an object is close to the sensor, the light from the LED bounces off the object back into the light sensor. This results in a large jump in the intensity that can be detected using a threshold. An infrared sensor is an electronic device that emits in order to sense some aspects around the surroundings. An IR sensor can measure the heat of an object as well as detects the motion. Usually in the infrared spectrum, all the objects radiate some form of thermal radiations. The emitter is simply an IR and the detector is simply an IR photodiode which is sensitive to IR light of the same wavelength as that emitted by the IR LED. Whenever the IR light falls on the photodiode, the resistances and these output voltages, change in proportion in accordance to the magnitude of the IR light received.

Arduino's Analog to Digital Converter converts them to the digital form. This digital data is transmitted to the cellular device through the Global System for Mobile Communication (GSM). The cellular device gets a Short Messaging Service (SMS) which comprises of position, speed of vehicle and driver's psychological data like pulse rate and blood pressure level. By monitoring this data, we can ensure the safety of the vehicle and the passengers. In case of abnormal pulse rate or blood pressure the control centre is given a alert message and the vehicle can be brought to halt using a relay connected to the engine. Relays are switches that open and close circuits electromechanically or electronically. Relays control one electrical circuit by opening and closing contacts in another circuit. A relays useful life depends upon its contacts. Once contacts burn out, the relays contacts or the entire relay has to be replaced. Thus by implementing this system we can tremendously reduce the human loss and material loss

Fig 4:- Arduino Coding.

An emergency notification system refers to a collection of methods that facilitate the one-way dissemination or broadcast of messages to one or many groups of people with the details of an occurring or pending emergency situation.

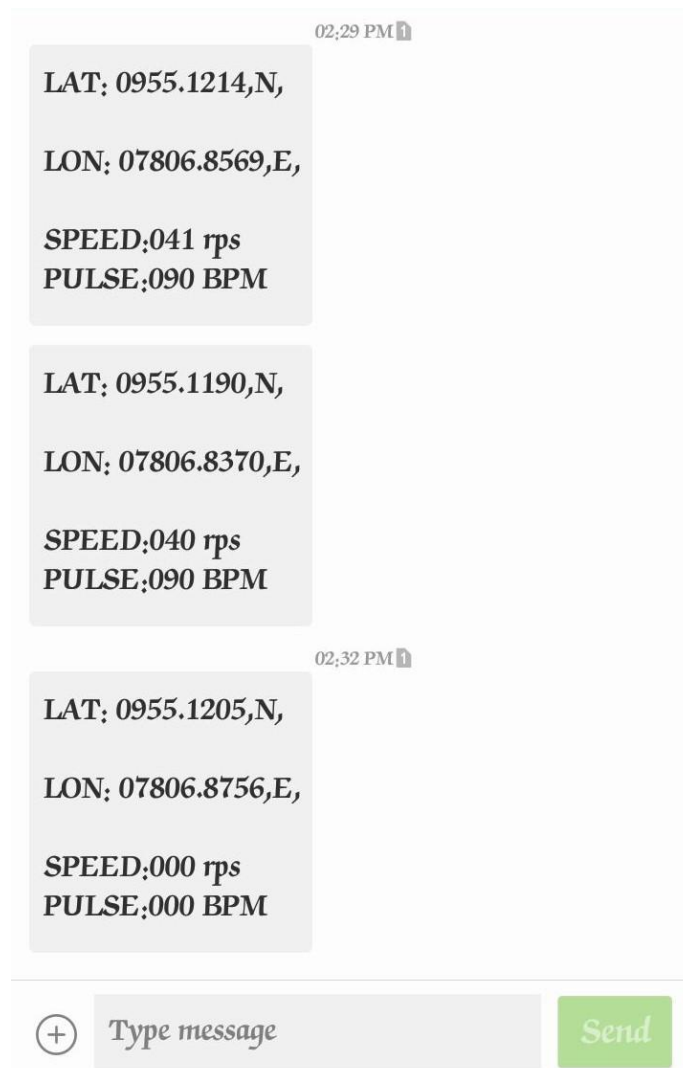

Fig 5:- Screenshot of the Message Received.

Conclusion:-

Our proposed system has the following features:-

- You can locate your stolen vehicle easily using your mobile without any extra cost.
- It can be used for vehicles carrying valuable goods, to keep track of the status of delivery and location
- You can also use it to keep tab on your driver. It reduces vehicle abuse and ultimately results in significant cost-savings for individuals, fleet owners and the like.
- Inform the location and route travelled by a vehicle using Global Positioning System (GPS) and Global System for Mobile Communication (GSM).
- Remotely monitor various vital parameters such as heartbeat rate and blood pressure level using sensors.
- Prevents occurrence of accident due to sudden health crisis.
- A remote control mechanism that will avoid loss of control of vehicle when the driver collapses.
- It is user friendly as it is easily available in human platform for anytime usage.
- GPS and GSM technology is suitable for long range communication. Using cellular device for transmitting purpose neglects the usage of RFID tags

Later Innovation:-

- Use of the advanced technology can be further enhanced by the use of camera and by developing a mobile based application.
- For diabetic patients, an artificial pancreas which is a device designed automatically adjusts blood sugar level.

Abstract

Digital Breast Tomosynthesis (DBT) is performing in high resolution limited angle tomography at radiographic dose levels. Advanced system facilitates the DBT along with 2 view Full Field Digital mammography (FFDM). The objectives of this study were to compare the Average Glandular Dose (AGD) of DBT and FFDM and to calculate the percentage of radiation dose reduction when using DBT with compare to FFDM. The study was carried out using data base of DBT system in a private hospital. In the investigation we analyzed dose of 251 patients who underwent mammographic examinations of both FFDM and DBT. All data analyses were done using IBM SPSS statistical software version 20.0. P-value 0.05 was considered as statistically significant. The explanatory variables were age, breast thickness, kVp, mAs, target/filter combination, and AGD values of DBT and FFDM. Mean values for the patient age and compressed breast thickness were 50 years and 49 mm (± 11.9 SD) respectively. The majority of the images were acquired using W/Rh target/filter combination and 51% patients came for the diagnostic mammograms and 49% for screening mammograms. A wide kVp range was observed for DBT than FFDM while mAs range was lower in DBT. According to the results total average glandular dose (TAGD) from FFDM and DBT for diagnostic was 4.21mGy (± 1.46 SD), for screening 4.04 (± 1.31 SD) and there was a statistically significant difference between mean values of TAGD. Mean AGD for Mediolateral Oblique (MLO) view in DBT was 2.05mGy (± 0.60 SD), in FFDM 2.73mGy (± 1.02 SD). AGD for Craniocaudal (CC) view in DBT was 1.63mGy (± 0.36 SD) and for FFDM it was 1.83mGy (± 0.66 SD). AGD to the breast from DBT was significantly lower than that for FFDM while range was lower in FFDM than DBT. There was a significant difference between mean values of CC and MLO views in DBT and FFDM ($P < 0.05$). It was evident that AGD from DBT was lower than that for FFDM further AGD was reduced by 55.3% by using DBT with compared to TAGD,

using both FFDM and DBT together for same patient and AGD was reduced 19.19% by using DBT with compared to AGD from FFDM.

Introduction:-

Mammography is considered to be the most effective method for the early detection of breast cancer^[1]. Although mammographic process is using low energy x-rays to examine the human breast the use of ionizing radiation implies the risk of inducing fatal breast cancer^[2]. Minimizing radiation risk is important in general as manifested by the as low as reasonably achievable (ALARA) principle.^{[3][4]}

As glandular tissue is radiosensitive organ, the average glandular dose (AGD) to the breast is the most important quantity to estimate the risk of radiation-induced carcinogenesis from mammography. AGD is currently accepted as an estimation of the patient dose in mammography.^[4]

Digital Breast Tomosynthesis (DBT) is a FDA approved radiological imaging method for breast imaging^[1]. It performs high resolution limited angle tomography at radiographic dose levels^{[5][6]}. DBT allows the detection of a greater number of expansion lesions and a better morphological analysis of masses and architectural distortions^[7]. Advanced system facilitates the DBT along with two view Full Field Digital mammography (FFDM)^{[8][9]}. Therefore the purpose of the study was to compare the Average Glandular Dose (AGD) of DBT and FFDM and to calculate the percentage of radiation dose reduction when using DBT with compare to FFDM.

Methodology:-

The study was carried out using data base of Digital Breast Tomosynthesis system at a private hospital, Colombo. This was a quantitative, retrospective research project. The study sample was included 251 patients exposure parameters. Data was collected through machine storage in the period of 01.01.2016 to 01.04.2016. KV, mAs, thickness, age, force, view, AGD, ESD, Exposure Index (EI) was recorded for each individual subject in to excel sheet. The data was analyzed by SPSS 20.0 software with $P < 0.05$ indicating level of significance and using descriptive statistics.

Results:-

Below table, contain the variable measurements of Full field digital mammography (FFDM/2D imaging) and Digital breast tomosynthesis (DBT/3D imaging).

	Variables	Mean	Standard deviation	Minimum	Maximum	Range
FFDM/2D imaging	Age	50.492	9.720	32.000	87.000	55.000
	HVL	1.083	1.690	0.486	559.000	558.514

Total average glandular dose (TAGD) from FFDM and DBT for diagnostic was 4.21mGy (± 1.46 SD), for screening 4.04(± 1.31 SD) and there was a statistically significant difference between mean values of AGD. Mean AGD for

Mediolateral Oblique (MLO) view in DBT was 2.05mGy (± 0.60 SD), in FFDM 2.73mGy (± 1.02 SD). AGD for Craniocaudal (CC) view in DBT was 1.63mGy (± 0.36 SD) and for FFDM it was 1.83mGy (± 0.66 SD). AGD to the breast from DBT was significantly lower than that for FFDM while range was lower in FFDM than DBT. There was a significant difference between mean values of CC and MLO views in DBT and FFDM ($P < 0.05$).

Relationship of average glandular dose with breast thickness for FFDM and DBT

Figure 1:- AGD Vs Breast thickness in FFDM(2D imaging).

Figure 2:- AGD Vs Breast thickness in DBT(3D Imaging)

The above graphs show positive linear regression between AGD and thickness for DBT and FFDM in both views

Relationship of average glandular dose with age for FFDM and DBT

Figure 3:- AGD Vs age in FFDM (2D imaging).

Figure 4:- AGD Vs age in DBT (3D Imaging).

The above graphs show negative linear regression between AGD and age for both DBT and FFDM in both views.

Discussion:-

Ionizing radiation such as x-rays widely used in radiological examination. Hence there should be a special concern on radiosensitive organs which are exposed to direct x-ray beam. In mammography average glandular dose should be kept minimum due to high radiosensitivity of mammary glands. Chevalier M et al states that TAGD was 3.8mGy and it slightly lower than TAGD from current study. Further mean age and thickness from both study were similar.^[9] In both study AGD from CC view was lower than MLO due to thickness of the CC view lower than MLO.

Total average glandular dose (TAGD) from FFDM and DBT for diagnostic was significantly higher than that for screening owing to dose is directly proportional to mAs and screening category has much lower mAs value than diagnostic^[1]. And it was ensure that negative linear regression between AGD and age for both DBT and FFDM of screening and diagnostic categories due to the fatty tissue of the breasts may become more prominent than the glandular tissue as women ages.

According to the results mean average glandular dose to the breast from DBT was significantly lower than that for FFDM. It was evident that AGD from DBT was lower than that for FFDM. Which is similar to the study of Svahn TM et al but controversial to the study of Olgar T et al^[3]. Further AGD was reduced by 55.3% by using DBT with compared to TAGD, using both FFDM and DBT together for same patient and AGD was reduced 19.19% by using DBT with compared to AGD from FFDM.

Conclusion:-

The dose values delivered in breast DBT(3D imaging) were lower than in FFDM (2D imaging) mode. Hence DBT (3D imaging) has superior AGD reduction to that of FFDM(2D imaging) in the diagnostic and screening settings. DBT (3D imaging) only can use for screening programme in order to minimize the AGD.

Abstract

The multipotent capability of bone marrow cells gave an impelling reason to study the effect of bone marrow cells in diabetic wound healing. Diabetes is characterized by delayed and poor wound healing. The goal of this study was to evaluate the efficiency of systemic versus intralesional injection of bone marrow cells on buccal wound healing in diabetic rats. Sixty four adult male albino rats were used in the study and divided randomly into four groups. All groups were subjected to buccal wound induction. Group I; non-diabetic group (negative control) and group II; diabetic group (positive control) and did not receive any treatment. The groups III and IV diabetic groups received intralesional and intravenous injection of whole bone marrow cells respectively two days following wound induction. Specimens were obtained after 3, 7 and 12 days following wound induction and were processed to be immunostained with mouse monoclonal antibody PCNA. Immunohistochemical results revealed marked expression of PCNA in treated groups III and IV at day 3 compared to non-treated groups I and II, although there was no significant difference between the treated groups. Our results reported that intralesional injection of whole bone marrow cells showed faster healing than intravenous injection and display a more mature histology. In conclusion, Injection of the whole BMCs intralesional is more efficient compared to intravenous route in accelerating the diabetic oral wound closure and enhancing the wound healing quality. The use of whole bone marrow cells appears to be beneficial in the treatment of diabetic oral wounds.

Introduction:-

Diabetes is the disease that compromises the body's ability to heal wounds and injuries. Wound healing in diabetic patients is a complex and multifactorial process due to dysregulated molecular interactions and signal transductions that delay wound healing (Fekrazadet al., 2015). Diabetic patients may have problem in the process of wound healing because they suffer from impaired vascularization, anti-inflammatory and antioxidant response, damage from reactive oxygen species and advanced glycation end products. Moreover, growth factor production and

collagen synthesis are impaired in diabetes (**Brem and Tomic-Canic, 2007; Enoch et al., 2008; Yadollah-Damavandi et al., 2015**). In dental sciences, the issue of delayed healing of oral wounds and periodontal lesions in diabetic patients has raised great controversy. The delayed healing may cause pain, infection, discomfort and even affect the prognosis of the patient, leading to the failure of the treatment and the need for repeated therapies (**Fekrazadet et al., 2015**). Optimum healing of oral wound requires a well-orchestrated integration of the complex biological and molecular events of cell migration and proliferation.

Extending the hypothesis that cell therapy may be required to recondition chronic wounds and accelerate their healing leads to the conclusion that bone marrow cells may offer even greater advantages. Previous studies demonstrated that re-epithelialized mucosa of grossly “regeneration” experimental ulcers has prominent histological and ultrastructural abnormalities: Reduced height, increased connective tissue and a disorganized microvascular network. These prominent abnormalities may interfere with the mucosal defense and cause ulcer recurrence when ulcerogenic factors are present. Therefore, the quality of mucosal structural restoration may be the most important factor in determining the future ulcer recurrence (**Tarnawski et al., 1990; Tarnawski et al., 1991**). In some situations, such as for chronic non-healing wounds, the objective of cellular therapy is to reverse those cellular and vascular events that compromise repair (**McFarlin et al., 2006; Dash et al., 2009**).

Whole bone marrow cells (BMCs) participate in tissue repair processes and may have a role in wound healing. One role based on the capacity of bone marrow cells to secrete a variety of growth factors and cytokines that are required to orchestrate tissue repair and regeneration. This mechanism would regulate cellular processes such as chemotaxis, cell proliferation, angiogenesis, extracellular matrix production and remodeling. Another role for bone marrow derived cells is to differentiate into multiple cell types including fibroblast and myofibroblasts after migrating to the injury site (**Yamaguchi et al., 2005**). A recent study has shown that whole bone marrow is more efficient compared to bone marrow cultured cell and mesenchymal stem cell in reducing wound size in a murine model of delayed wound healing. They demonstrate that mixed bone marrow cell preparations may be superior to more purified stem cell formulation in stimulating wound healing (**Rodriguez-Menocal et al., 2015**).

Currently, there are two basic delivery methods: Systemic infusion of cells into the vascular circulation and direct application of therapeutic cells to wound sites (**Sorrell and Caplan, 2010**). Therefore the purpose of this study was directed toward the comparison of the efficacy of systemic versus intralesional injection of whole BMCs in regeneration of diabetic oral wound.

Material and methods:-

Sixty-four adult male Albino rats weighing (200-250g) were used in this study; they were housed in the laboratory of Nile Center for Experimental Researches under controlled condition, with constant temperature and humidity. Animals were divided randomly into four groups (n=16).

Group I (negative control): subjected to buccal wound followed by injection of Hank's balanced salt solution (HBBS)/bovin serum albumin after two days. Group II (positive control): induced for experimental diabetes, subjected to buccal wound after one week of diabetic induction followed by injection of (HBBS)/bovin serum albumin after two days. Group III: subjected to experimental diabetes and buccal wound followed by intralesional injection of 1×10^6 suspended in HBBS/bovine serum albumin of bone marrow cells after two days. Group IV: subjected to same procedure in group III and received Intravenous injection of 1×10^6 of bone marrow cells suspended in HBBS/bovine serum albumin of bone marrow cells after two days.

Streptozocin- induced diabetes:-

Diabetes was successfully induced in rats of groups II, III, IV, via single intraperitoneal injection of freshly prepared streptozotocin (STZ) (Sigma, St. Louis, MO, USA) dissolved in 0.1ml citrate buffer (pH 4.5) at a dose of 45 mg/kg as described previously (**Rajasekar et al., 2014**). Diabetes was assessed by measuring the blood glucose level in rat's tail blood using a glucometer (B. Braun, Seoul, Korea) 7 days after injection of STZ. Rats whose blood glucose level exceeded 300mg/dl were considered diabetic and were included in this study (**Hie et al., 2007**). Serum blood glucose was checked daily using ACCU-check advantage strips and 1 unit of Insulin therapy was administered if the animal had high glucose readings. High glucose reading were indicated on the glucometer as high (**O'Loughlin et al., 2013**).

Wound induction:-

All rats were anesthetized with 30 mg/kg ketamine and 10 mg/kg xylazine intraperitoneally (Fekrazad et al., 2015). Wound measuring 4 mm in diameter was made at buccal mucosa opposite to molar teeth midway between mandibular and maxillary teeth using a standard punch biopsy technique. The day of wound induction was considered as day zero.

Isolation of whole BMCs:-

Bone marrow was harvested from albino rats weighing (100-140g). In order to prevent diabetic cellular dysfunction (because of glycosylation and other mechanisms) from adversely affecting wound healing, we isolated the BMCs from non-diabetic albino rats (Lin et al., 2008). Briefly, the rat BMCs were flushed from tibias and femurs with cold HBSS and 0.5% bovine serum albumin. The suspension was then strained through a 70- μ m nylon filter and washed twice with HBSS/bovine serum albumin. The concentration of the cells was adjusted to 10^5 viable cells/ μ l. The viability of BMCs was checked using Trypan Blue with an average of 95% viability before injection. Cell-free extract was prepared by subjecting the BMCs to three freeze-thaw cycles using an ethanol/dry ice bath, followed by microcentrifugation at 14,000 rpm to remove insoluble material (Yeghiazarians et al., 2009).

Bone marrow cells transplantation:-

Two days after wound creation, all rats were anesthetized and treated as follows: rats of Group III (n=16) were treated once by intralesional injection (at two points around the wound) of 1×10^6 BMCs suspended in 10 μ l HBSS/bovine serum albumin; rats of group IV (n=16) were treated once by intravenous injection via tail vein with BMCs at a dose of 1×10^6 /10 μ l HBSS/bovine serum albumin (Yeghiazarians et al., 2009), while rats of groups I (n=16) and group II (n=16) were received 10 μ l HBSS/bovine serum albumin only.

Tissue preparation:-

Following sacrifices of rats at 3, 7 and 12 days post wounding, tissue specimen containing the wound was dissected out from each rat, fixed in a 10% buffered formalin solution and paraffin embedded, sectioned into 4 μ m-thick slice and prepared for routine hematoxylin and Eosin staining and immunohistochemical staining.

Immunohistochemical analysis:-

Immunohistochemistry was performed using mouse monoclonal antibody PCNA as a cell proliferation marker (Thermo Scientific, Fremont, USA). Each slide was screened microscopically and the area with the most intense PCNA staining were selected for quantification. Slides were photographed using Olympus[®] digital camera installed on Olympus[®] microscope with 1/2 X photo adaptor, using 40 X objective. The resulted images were analyzed on Intel[®] Core I3[®] based computer using Video Test Morphology[®] software (Russia) with a specific built-in routine for immunohistostain analysis and stain quantification. Five images for each slide were taken for analysis.

Statistical analysis:-

Data analyses were performed using IBM Statistical Package for Social Sciences (SPSS) software package version 20.0. The description of data presented in the form means (+/-) standard deviation (SD) for quantitative data. The statistical comparison between the different groups and the significance of difference was tested using one way ANOVA and repeated measure ANOVA tests followed by Post Hoc test for pairwise comparisons.

Results:-**Histological analysis:-**

Examination of H&E stained sections of Group I showed wound area filled with granulation tissue, intense inflammatory cells infiltration and disorganization of the epithelium with mitotic activity at the wound edges at day 3 (Fig.1A) while in group II showed less mitotic figures than group I (Fig.1B). In comparison to group III and group IV, the epithelia showed increase in mitotic activity (Fig.1C, D). At day 7; group I revealed moderate inflammatory cells infiltration in the granulation tissue and more mitotic activity in the epithelial edges compared to day 3 (Fig.1E) while Group II showed intense inflammatory cells infiltration in the granulation tissue with less mitotic activity within the epithelium (Fig.1F). Group III showed advanced healing process. The wound area was covered with epithelia with little irregularity in the basement membrane and the lamina propria revealed well-formed new blood vessels (Fig.1G). Group IV revealed epithelial migration into the wound bed and the epithelial cells showed mitotic activity (Fig.1H). At day 12; the wound area in group I was covered by thin epithelium with irregular basement membrane and shallow rete ridges. Lamina propria showed newly formed blood vessels with few inflammatory cells infiltration (Fig.1I) while in Group II, the granulation tissues showed intense inflammatory cells infiltration and the

Epithelia at the wound edges showed increase in the mitotic activity (Fig.1J). The epithelium showed marked re-epithelization and complete healing with obvious mitotic figure in group III (Fig.1K). However, the wound area covered with thinner epithelium in group IV (Fig.1L).

Immunohistochemical observations:-

The expression of PCNA was detected within the epithelial cells;

Group I revealed moderate expression (3.901 ± 0.001) at day 3, intense expression (6.5 ± 0.45) at day 7 and mild expression (2.4 ± 0.84) at day 12. Group II revealed moderate expression (3.8 ± 0.82) at day 3 which increased slightly at day 7 (4.2 ± 1.03) while showed mild expression at day 12 (2.8 ± 0.68). Group III showed intense expression (7.2 ± 1.61) at day 3, moderate expression (3.4 ± 0.47) at day 7 and less expression of PCNA at day 12 (2.2 ± 0.59). Group IV showed intense expression (6.068 ± 0.824) at day 3 which began to decrease at day 7 (4.2 ± 1.06) and became less at day 12 (3.4 ± 0.51). (Fig. 2)

Statistical analysis results:-

Descriptive statistics of the PCNA expression were represented by the mean \pm SD for all groups. The highest mean value was in group III at day 3. One way ANOVA followed by Post Hoc test revealed statistical significant difference between the different groups represented in table 1 and Figure 3.

Repeated measures ANOVA revealed significant difference among different days in group II, III and IV ($p < 0.05$) while a highly significant difference in group I ($p = 0.005$). (Fig.4)

Discussion:-

Cell therapy has come into attention in all medical fields as a new paradigm for future medicine. Whole bone marrow cells participate in tissue repair processes and may have a role in wound healing. Wound healing is a complex process that is regulated by cytokines and growth factors and modulated by systemic conditions such as diabetes (Rai et al., 2005). A serious complication of diabetes is impaired healing. Optimum healing of oral wound requires a well-orchestrated integration of the complex biological and molecular events of cell migration and proliferation. When the normal biological process fails for any reason, this healing process can stall resulting in chronic wounds (Giles et al., 2015).

Siqueira et al., 2010 stated that a critical component of a vigorous healing response is a generation of a sufficient number of cells to participate in repair. Recently, Garget et al., 2014 has been reported that BMCs could home to site of injury or inflammation, play a direct role in vasculogenesis and modulate epithelial regeneration. A current problem is the development of strategies that ensure that these cells reach wound beds in a timely fashion and in sufficient numbers to maximize their therapeutic benefits. The aim of our study was directed toward the comparison of the efficacy of systemic versus intralesional BMCs in regeneration of diabetic oral wound.

In the present study, STZ induced diabetic rats were used as a model to study the healing efficiency of bone marrow cells. The significance of diabetes is that delayed wound healing and thus, acceleration of healing is crucial in oral and maxillofacial surgery. Rees & Alcolado, 2005 stated that STZ induced diabetes in rodents is considered to be a model of insulin-dependent diabetes mellitus and is widely used in the study of insulinopenia and hyperglycemia. Also, Papaccio et al., 2000 reported that STZ selectively destroys beta cells, inhibits the synthesis and release of insulin and causes the onset of diabetes mellitus.

A study done by Roriguez-Menocal et al., 2015 demonstrated that the whole BMCs appeared to stimulate a greater healing response than bone marrow mesenchymal stem cells in a radiation induced delayed wound healing animal model. The whole BMCs have a greater mixed population of cell types thus they were capable of producing a more wide-ranging cytokine profile that more closely resembled that seen in healing wounds. The results of the previous study support the use of a mixture of cell types in designing clinical approaches to wound healing. Based on the previous statement, the whole BMCs were used in the present study.

In hematoxylin and eosin results the wound area in group I (negative group), at day 7 showed slight proliferation of covering epithelia with moderate inflammatory cells infiltration within granulation tissue while after 12 days the wound area was covered by thin epithelium which showed irregular basement membrane and shallow rete ridges. These results are consistent with Karavana et al., 2011 who reported that oral mucosal ulceration in animal model showed complete healing on the 12th day post ulceration.

In the present study, the results in group II (positive group) at day 3 showed prolonged excessive inflammatory cells infiltration, loss of attachment and decreased mitotic activity within epithelia and connective tissue. This is in accordance with **You & Han, 2014** who reported that one of main contributing factors for the non- or delayed healing wound is decreased function (mitotic activity, extracellular matrix and growth factors synthesis) of the key cells for wound healing including fibroblast and keratinocytes. Therefore, the wound remains open for long period of time which leads to infection.

The wound area in Group III (intralesional group) at day 3, showed granulation tissue formation with dense inflammatory cells infiltration, increased dilated blood vessel and mitotic activity increased at the epithelial edges of the wound, while at day 7, the wound area was covered with epithelia. These results are in many respects to those of **Lin et al., 2008** who demonstrated that topical subcutaneous transferring bone marrow progenitor cells into full thickness excisional dorsal cutaneous wound in diabetic mice significantly improves diabetic wound healing. The authors hypothesized that these progenitor cells will differentiate into endothelial cells, increase wound vascularity and improve wound healing.

The wound area in group IV (intravenous group), at day 7 was partially covered by epithelium, while at day 12 healing process was evident and the wound area covered with thin epithelia. This is in agreement with **Roríguez-Menocal et al., 2015** who explained that whole BMCs were able to achieve higher new blood vessel formation because it stimulates endothelial cells and angiogenesis in tissue repair.

Detection of proliferating cells in tissue sections can be achieved by a number of methods, **Hall & Woods, 1990** and **Muskhelishvili et al., 2003** reported that immunohistochemical methods of assessing cell proliferation have particular advantages over the other techniques because of maintenance of cellular and tissue architecture, the relative simplicity of methodology and rapidity of results. In order to identify the efficiency of intralesional and intravenous injection of BMCs on cellular proliferation, PCNA was used as a cell proliferation marker.

In the current study, PCNA expression appeared obvious mainly in basal cell layer of all groups. This result could be explained by **Ishii et al., 2014** who mentioned that the cells proliferation occurs principally in the basal layer of the epithelium in which keratinocytes undergo terminal differentiation as they migrate to the surface. Also, **Yue et al., 2005** stated that the basal layer of the stratified squamous epithelium consists of a heterogenous population of proliferative and differentiating cells.

In addition, PCNA expression was obvious in the marginal epithelia in group III and group IV, at day 3 specifically, (7.2 ± 1.61 and 6.068 ± 0.824) respectively. These findings imply that the wound healing is provoked not only by the proliferation and differentiation of basal cells but also by supplying cells from the wound margin to the epithelial outgrowth as mentioned by **Takaichi et al., 2014**.

In group II, there was moderate expression of PCNA at day 3 and 7 days (3.8 ± 0.82 and 4.2 ± 1.03) respectively while mild expression at day 12 (2.8 ± 0.68). This is consistent with **McLaughlin et al., 2013** who reported that initial delays in cell proliferation following wounding in diabetic rats were related to changes in DNA synthesis rates in basal epithelial cell layers.

In the present study, immunohistochemical results showed marked expression of PCNA in groups III and IV (treated groups) after 3 days (7.2 ± 1.61 and 6.068 ± 0.824) respectively compared to groups I and II (non-treated groups) (3.901 ± 0.001 and 3.8 ± 0.82), although there was no significant difference between treated groups. These findings is in agreement with **Isakson et al., 2015** who mentioned that both topical and systemic delivery methods have been shown to be effective in chronic wound healing. Moreover, these results are in analogues in many respects to those of **Borue et al., 2004** who found that transplantation of whole bone marrow cells in wound environment, allow the progenitor cells enter the wound area and fuse with the damaged epithelial cells, thereby taking on keratinocytes properties.

Also, these results are supported by the findings of **Paradells et al., 2015** who mentioned that BMCs could help to enhance local endogenous proliferation and probably stimulate proliferation and subsequent migration from surrounding zones. Moreover, **Rodríguez-Menocal et al., 2015** reported that the whole bone marrow cells were able to achieve higher new blood vessel formation compared with mesenchymal stem cells. This implies a potential significant advantage for whole bone marrow to stimulate endothelial cells and angiogenesis in tissue repair.

To date, experimental studies have not presented definite answers regarding the role of BMCs and related mechanisms. However, several hypotheses have been proposed. First, **Liu et al., 2006** and **M. Isakson et al., 2015** stated that BMCs have the capacity to secrete a variety of growth factors and cytokines. The production of growth factors by BMCs potentially plays a role in coordinating and regulating the cellular processes, such as chemotaxis, inflammation, cell proliferation, tissue granulation, and wound remodeling which are critical for the efficient wound healing. In addition to the cells themselves participating in the process of wound healing, ultimately differentiating into the cell types required for closure of the wound. Second possibility relates to the tremendous plasticity and the ability of BMCs to differentiate into a variety of cell types and integrate into tissues. Therefore, BMCs may facilitate wound healing as mentioned by **Liu et al., 2006**. Third, **Vaananen, 2005; Aly et al., 2014** mentioned that BMCs release paracrine factors and thereby induce the proliferation of specific cells in the damaged tissue or contribute to making the microenvironment more appropriate for the repair of injury by maximally inhibiting the tissue injury. In the present study, group III (Intralesional injection) showed faster healing and more organized re-epithelization than group IV (intravenous injection) although there was no significant difference between the two groups in PCNA expression. These results are consistent with **Kwon et al., 2008** who attributed that the differences in efficacy of systemic versus local BMCs therapy in wound healing, to the decrease in number of BMCs migrating to the wound after systemic administration. Also, he thought that the decrease in migration of BMCs to the wound treated systematically may be due to arterial-venous shunts in diabetic skin. In addition, **Karp & Leng, 2009** stated that during vascular transit, BMCs risk being taken out of circulation, and going to other organs such as the lungs, spleen and liver. This may reduce the numbers of cells that finally appear at a target site.

Another study done by **Sorrell & Caplan, 2010** revealed that the topical delivery of cells allows for concentrated doses of cells to be delivered to a wound and not become trapped in other sites in the body. Also, it was hypothesized by **Chung et al., 2011** that applying cells topically may promote neovascularization from inside the wound not only from the wound periphery.

All of these findings demonstrated that BMCs can contribute to wound repair in diabetic rats and may provide the cell source for regenerative therapy. Despite the current limitations to widespread clinical use, BMCs are highly promising cell sources for the treatment of diabetic wounds either via intravenous or intralesional route. However, further studies are necessary to study the critical factors that make up the microenvironment that supports the survival and differentiation of these cells.

Conclusion:-

Our findings proposed the intralesional injection of BMCs directly to improve the healing of oral diabetic wound, in an attempt to overcome both decrease in number of BMCs and impaired homing to the site of wound via intravenous route.

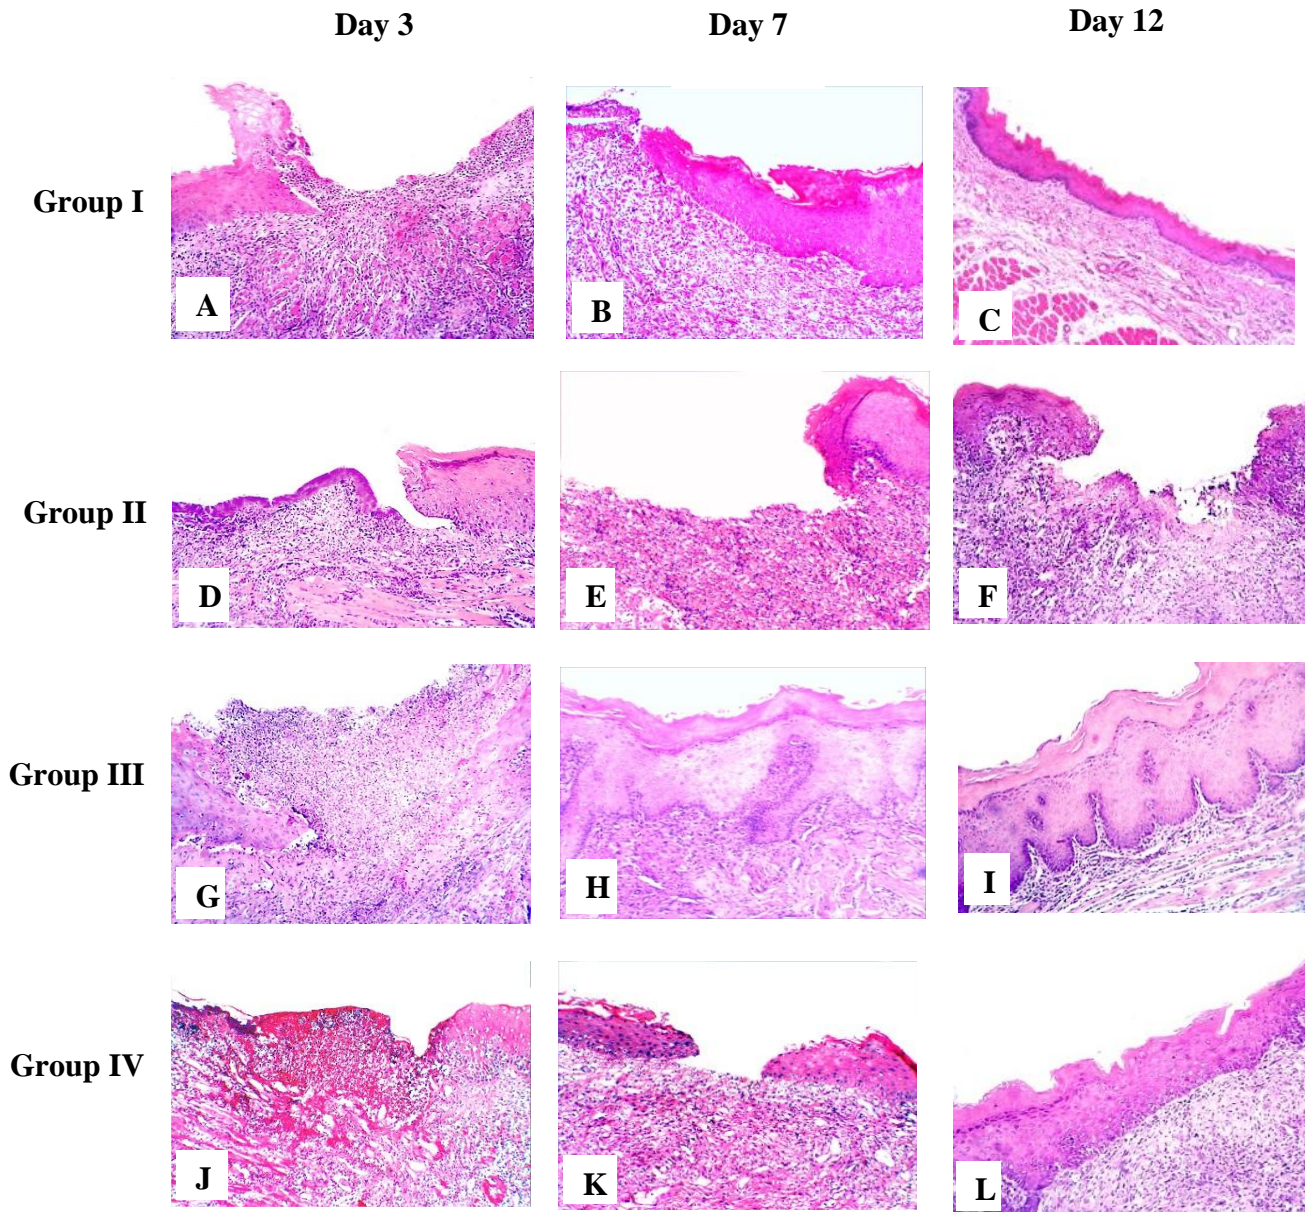

Figure 1. Histological observations of oral mucosa sections in different studied groups (I, II, III and IV) at day3, 7 and 12 (H&EX100). **At day 3** shows the wound area filled with granulation tissue with intense inflammatory cells infiltration (A, G and J), moderate inflammatory cells in (D). **At day 7** shows slight proliferation of covering epithelium (B), intense inflammatory cells infiltration within the granulation tissue (E), epithelium covering wound area with irregular basement membrane and fibrous lamina propria (H), epithelial migration of wound edges and granulation tissue with moderate inflammatory cells infiltration (K). **At day 12** shows thin epithelium with irregular basement membrane covering the wound area over fibrous lamina propria (C), discontinuity of the epithelium with intense infiltration of inflammatory cells (F), marked epithelization with deep rete ridges and initial organization of collagen fibers in the underlying connective tissue (I), thin epithelium covering wound area with short rete ridges (L).

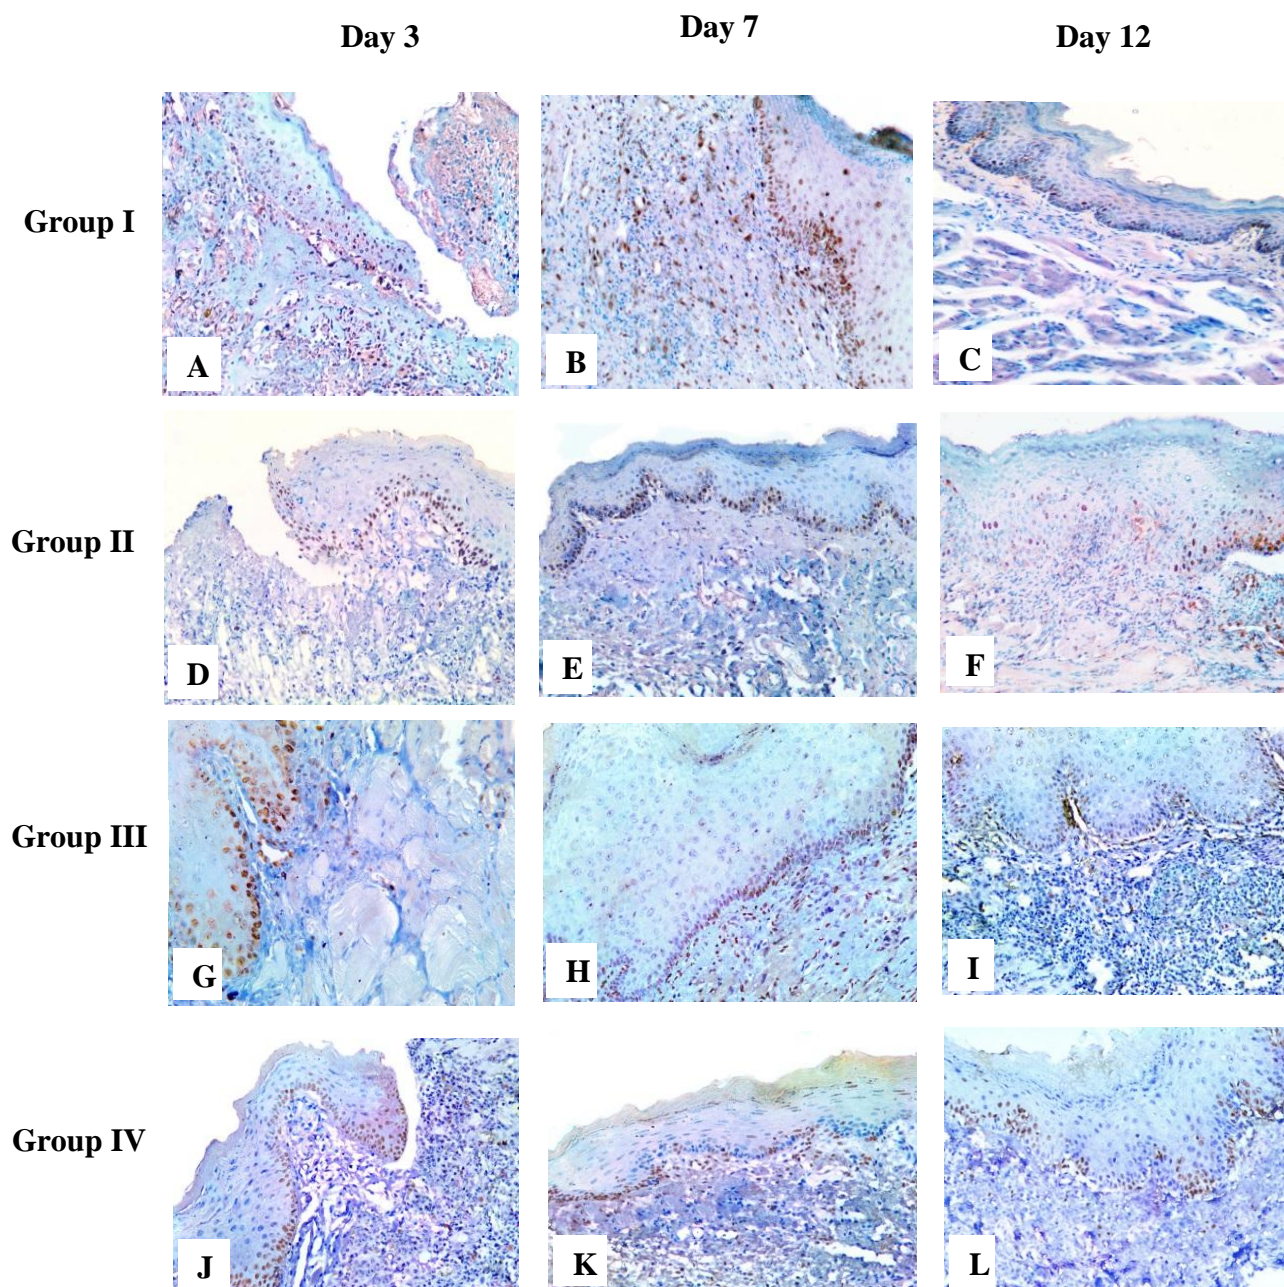

Figure 2.Immunohistochemical expression of PCNA during wound healing in different studied groups (I,II,III and IV) at day 3, 7 and 12 (IHC staining, PCNA X200).At day 3 shows moderate expression in group I and II (A, D) and intense expression in group III and IV (G, J).At day 7shows moderate expression in group II, III and IV (E, H, K) and intense expression in group I (B).At day 12shows mild expression in all studies groups (C, F, I, L)

Key words:-

Breast lump, FNAC, Mammography,
Triple assessment, Ultrasound.

Abstract

Background: Breast lump is a very sensitive issue and cause of great worry and anxiety to the patient, so a reliable, preferably non-invasive and prompt diagnosis is required. Breast lump should be managed effectively and confidently with a proper protocol plan, ensuring early and best possible treatment for every patient. Triple test assessment was a major breakthrough in this direction, which streamlined the management of palpable breast lump. When all the components of triple test assessment which are Clinical Examination, FNAC, Mammography point to one possibility (are concordant) then the diagnosis is almost certain and management can be confidently planned in such a situation. But if there is discordance among the components of triple test, then what should be the next step in the management plan is the question to be answered. This is where triple test score shows us the path.

Objective of the Study:

- To perform Triple Test Score in patients with breast lump.
- To perform Histopathological Examination (HPE) of the breast lump resected.
- To evaluate the efficacy of TTS in comparison with HPE.
- To develop a standard protocol for management of breast lump especially when discordant results are obtained from triple assessment.

Materials and Methods: Study was conducted on 200 patients presenting with breast lump to the department of General Surgery at Tertiary Care Teaching Hospital, during the period from January 2012 to Dec 2016.

It was a prospective study. Women presenting for evaluation of palpable breast lump underwent assessment by clinical examination, mammography and FNAC and got the Triple Test Scoring done.

All patients who underwent a complete TTS at our institution were entered into the study.

All patients were subjected to necessary surgery, post TTS and followed up with Histopathology of the specimen.

Address:- Dr B Anil Kumar ,Professor, General Surgery, Dr.Pinnamaneni Siddhartha Institute Of Medical Sciences & Research Foundation, Chinaoutapalli, Krishna Dist, Andhra Pradesh, India.

A structured proforma was used to collect relevant information from each patient selected.

Results: In our study the mean age of the patients was found to be 46.12 ± 1.48 years, most of the patients were in the age group of 35-45 years (60%). Positive family history was found in 17%. Patients on an average took 6 months to seek medical help after recognition of the breast lump. Most common location of breast lump was upper outer quadrant. 38 cases were malignant and 148 were benign 14 were intermediate group commonest lump was fibroadenoma, Histopathology was 100% specific in both the groups of study conclusions were made based on clinical radiological and pathological assessment.

Conclusion: The study clearly demonstrates the superiority of TTS over other components of triple assessment or all of them put together. A ITS of ≤ 4 is consistent with a benign lesion; a TTS of ≥ 6 indicates malignancy. Only in patients in whom TTS score is 5, biopsy is recommended to obtain a definitive diagnosis. Thus a standard protocol can be developed, for the management of breast lump even with discordant results obtained via triple test assessment, which can be followed universally, thus empowering surgeon to go ahead in managing breast lump effectively and confidently.

..... Introduction:-

"He will manage to cure best who has foreseen what is to happen from the present state & matters"

Hippocrates:-

The frequency of breast diseases, their recognition and the attempts at primeval cures by various cultures and societies historically antedate the therapy of diseases of other solid organs. Diseases of breast, with their uncertain causes and confusion of treatments, have intrigued physicians and medical historians throughout the ages. Despite centuries of theoretical meanderings and scientific enquiry, cancer of the breast remains one of the most dreaded of human ills. Although primarily thought of as a disease of women, it may occasionally afflict men with results just as lethal. The breast as a paired organ further increases its exposure to disease. As appendage of the skin it usually reveals its disorders to touch or sight.

A breast mass can be a difficulty at times. It may be difficult for the patient because of the anxiety associated with her underlying fear of a breast malignancy and it may be difficult for the physician to feel confident that what he or she is palpating is truly a mass rather than a variation of normal breast parenchyma. Breast symptoms and signs are common problems in clinical practice. Majority of breast symptoms or lesions will prove to be of a benign etiology. Physical, psychological and financial costs of investigating benign breast disease, primarily to exclude malignancy are substantial. Much concern is given to malignant lesions of the breast because breast cancer is the most common malignancy in women; however, benign lesions of the breast are far more frequent than malignant.

Because the majority of benign lesions are not associated with an increased risk for subsequent breast cancer, unnecessary surgical procedures should be avoided. It is important for pathologists, radiologists, and oncologists to recognize benign lesions, both to distinguish them from in-situ and invasive breast cancer and to assess patient's risk of developing breast cancer, so that the most appropriate treatment modality for each case can be established.

The first step in evaluation of breast lump is the clinical assessment. Although many a times clinician can confidently make the diagnosis of benign or malignant lesion, the possibility of mistake is always there even in experienced hand. This is where triple assessment has played a significant role in breast lump management.

The triple assessment for breast diseases involves,

1. Clinical assessment
2. Imaging modality — Mammography
3. Fine needle aspiration cytology

Clinical diagnosis of breast cancer is of higher sensitivity than specificity and has high diagnostic error. Mammography and FNAC respectively have lower sensitivity than specificity but have high positive predictive values.

When combined in the triple assessment, a definitive diagnosis can be made when the diagnoses concur, suggesting that the triple assessment has a high sensitivity, specificity, positive predictive value and negative predictive value with minimal error and excellent Kappa statistic. The output of the triple assessment is reproducible, making it a valid and reliable diagnostic approach to diagnosis of breast cancer.

With increasing prominence and greater visibility in country specific health profiles around the world, breast cancer and its prevention, detection and treatment will continue to emerge as a major priority and challenge, for the health system in the near future.

Need For The Study:-

Breast lump is the clinical presentation of numerous breast diseases ranging from innocent benign cysts to malignant lesions. Distinction of benign from malignant is of paramount importance for patient care and proper management. Breast cancer is the most common site specific cancer in women and is the leading cause of death from cancer for women of age 40 to 44 year¹. It accounts for 33% of all female cancers and is responsible for 20% of the cancer related deaths in women².

Presently a wide range of diagnostic modalities are available for the evaluation of breast lump. Conventional open biopsy, considered to be the gold standard for confirming diagnosis, has significant morbidity, is costly and time consuming. All of these cause significant trauma to the patient and are not patient friendly.

Mis-diagnosed breast cancer accounts for the greatest number of malpractice claims for errors in diagnosis. Litigation often involves younger women whose physical examination and mammography may be misleading². Two techniques that are currently available with excellent patient tolerability are mammography and fine needle aspiration cytology. However if employed alone the reliability of mammography and FNAC is only around 82% and 78% respectively³.

There are numerous reports that if the results of clinical assessment, mammography and FNAC are all combined, the accuracy of diagnosis reaches 100%⁴. Furthermore these techniques provide information on tumor size, number, extent and grade pre-operatively⁵.

There is a direct need for evolving a method for establishing the diagnosis pre-operatively, which is cost effective, least invasive and least disturbing to the patient, with accuracy comparable to open biopsy. An efficient evaluation and prompt diagnosis is necessary to maximize cancer detection and minimize unnecessary testing and procedures. A thorough Clinical Breast Examination (CBE), Imaging (Mammography), and Tissue sampling (FNAC) are needed for definitive diagnosis².

The triple test assessment is the combination of results from CBE, imaging, and tissue sampling. When the three assessments produce concordant results (point to the same possibility), the triple test diagnostic accuracy approaches 100 percent⁶⁻⁸. But, in discordant results, there is no clear cut protocol to follow and it is in such situations that triple test scoring will be the next step forward. Discordant results are seen in 40% patients, who are subjected for open biopsy for the confirmation of diagnosis⁹.

The Triple Test Score (TTS) was developed to help clinicians interpret discordant triple test results.⁶⁻¹⁰ A three-point scale is used to score each component of the triple test (1 = benign, 2 = suspicious, 3 = malignant). A TTS of ≤ 4 is consistent with a lesion; a TTS of 5 indicates malignancy. Only in patients in whom TTS score is 5, biopsy is recommended to obtain a definitive diagnosis. Thus a standard protocol can be developed, for the management of discordant results in triple test assessment, which can be followed universally.

The scope of improvement in arriving at correct and confident diagnosis of the breast lump is still enormous when we keep cent percent perfect diagnosis as our goal. This study is an attempt to travel part of that journey towards the goal.

Materials and Methods:-**Source Of Data:-**

Study conducted on 200 patients presenting with breast lump to the department of surgery in Tertiary Craae Teaching Hospital during the period from January 2012 to December 2016.

Inclusion Criteria: Patient aged ≥ 35 years, presenting with palpable breast lump.

Exclusion Criteria: Obvious malignant lesions (fungation, ulceration).

Method of collection of data:-

It being prospective study, women presenting for evaluation of palpable breast lump to the department of surgery at Tertiary Care Teaching Hospital underwent assessment by clinical examination, mammography and FNAC and Triple Test Scoring was done.

All patients who underwent a complete TTS(Triple Test Scoring) at our institution were entered into the study.

All patients were subjected to necessary surgery, post TTS and followed up with histopathology of the specimen.

A structured proforma was used to collect relevant information from each patient selected. Each component of the triple assessment was compared with the gold standard histopathology, so also TTS was compared with histopathology and findings were analyzed.

All of patient details and relevant information was entered into the proforma.

Analysis:-

All the three components of triple test i.e., physical examination, mammography and FNAC findings were categorized as benign, suspicious and malignant. The Triple test (TT) was considered concordant if all the elements indicated a malignant condition or all indicated a benign condition, otherwise TT was considered non-concordant.

Sensitivity is defined as percentage of cases in which biopsy proven cancer was correctly diagnosed by the test.

Specificity is defined as percentage of cases in which biopsy proven benign lesion was correctly diagnosed by the test.

The values were determined by the following formula:

Sensitivity = $TP / TP + FN$; Specificity = $TN / TN + FP$

TP - true positive,

TN - true negative,

FP - false positive

FN - false negative

Further, triple test score (TTS) was given; physical examination, mammogram and FNA were each assigned a score of 1, 2 or 3 for benign, suspicious or malignant results; TTS is the sum of these scores. TTS has a minimum score of 3 (concordant benign) and a maximum score of 9 (concordant malignant).

Results:-

A total of 200 patients who satisfied the inclusion criteria were enrolled into the study, all the patients were subjected to clinical examination followed by mammography and FNAC, individual scores were given and the triple test score was calculated. All the patients were subjected to the appropriate surgery and the specimen sent for histopathology.

In our study the mean age of the patients was found to be 46.12 ± 1.48 years, most of the patients were in the age group of 35-45 years (60%). Positive family history was found in 17%. Patients on an average took 6 months to seek medical help after recognition of the breast lump.

Figure 1:- Age-wise distribution of patient**Figure 2:-** Location of breast lump

Most common location of breast lump was upper outer quadrant (Figure).

Among the 200 cases which had histopathologic correlation 156 were benign disease and 44 malignant.

Table 1:- Comparison Of Clinical Assessment With Histopathology

CLINICAL ASSESSMENT	HISTOPATHOLOGY		Total
	Benign	Malignant	
Benign	146	2	148
(%)	91.1%	4.5%	53.0%
Suspicious	10	4	14
(%)	8.9%	9.1%	9.0%
Malignant	0	38	38
(%)	0.0%	86.4%	38.0%
Total	156	44	200
(%)	100%	100%	100%

Specificity: 100 %

Positive Predictive value: 100 %

Negative Predictive Value: 96.23 %

Accuracy: 97.80%

The scoring for clinical examination revealed a score of 1, 2 and 3 in 53%, 9% and 38% respectively. The clinical diagnosis of benign and malignant was comparable with HPE.

Figure 3:- Comparison of clinical assessment with histopathology

Out of 14 cases with suspicious interpretation in clinical diagnosis: 10 were diagnosed to be benign and 4 were diagnosed as malignant. 4 cases which were diagnosed clinically as benign turned out to be malignant on HPE.

Table 2:- Comparison Of Fnac With Histopathology

FNAC SCORE	HISTOPATHOLOGY		Total
	Benign	Malignant	
Benign	152	1	153
(%)	96.4%	2.3%	55.0%
Suspicious	4	3	7
(%)	3.6%	6.8%	5.0%
Malignant	0	40	40
(%)	0.0%	90.9%	40.0%
Total	156	44	200
(%)	100%	100%	100%

The scoring for FNAC revealed a score of 1, 2 and 3 in 55%, 5% and 40% respectively. The clinical diagnosis of benign and malignant was comparable with HPE.

Sensitivity: 97.56 %

Specificity: 100 %

Positive Predictive value: 100 %

Negative Predictive Value: 98.18 %

Accuracy: 98.94%

Figure 4:- Comparison of FNAC with histopathology.

Out of 7 cases with suspicious interpretation in FNAC: 4 were diagnosed to be benign and 3 were diagnosed as malignant. One case which was diagnosed as benign turned out to be malignant on HPE.

Table 3:- Comparison Of Mammography With Histopathology

MAMMOGRAPHY	HISTOPATHOLOGY		Total
	Benign	Malignant	
Benign	156	3	159
(%)	100%	6.8%	59.0%
Suspicious	0	6	6
(%)	0.0%	13.6%	6.0%
Malignant	0	35	35
(%)	0.0%	79.5%	35.0%
Total	156	44	200
(%)	100%	100%	100%

The scoring for mammography revealed a score of 1, 2 and 3 in 59%, 6% and respectively. The mammography diagnosis of benign and malignant was comparable with HPE.

Sensitivity: 92.11 %

Specificity: 100 %

positive Predictive value: 100 %

Negative Predictive Value: 94.92 %

Accuracy: 96.80%

Figure 5:- Comparison of Mammography with histopathology

Out of 6 cases with suspicious interpretation in mammography all were diagnosed as malignant. Three cases which were diagnosed as benign turned out to be malignant on HPE.

Table 4:- Comparison Of Triple Test Score With Histopathology

TRIPLE TEST SCORE	HISTOPATHOLOGY		Total
	Benign	Malignant	
Benign	155	0	155
(%)	100%	0.0%	52.0%
Suspicious	1	0	1
(%)	1.8%	0.0%	4.0%
Malignant	0	44	44
(%)	0.0%	100.0%	44.0%
Total	156	44	200
(%)	100%	100.0%	100%

All the cases diagnosed as malignant with TTS were proved malignant by HPE, all cases diagnosed as benign were proved benign on HPE, one case with TTS of 5 required a further test in form of biopsy for confirmation, it turned out to be benign,

Sensitivity: 100 %

Specificity: 100 %

Positive Predictive value: 100%

Negative Predictive Value: 100 %

Accuracy: 100 %

Figure 6:- Comparison of TTS with histopathology**Table 5:-** concordant v/s discordant results in triple assessment.

CONCORDANT	DISCORDANT
178	22

Figure 7:- Depicting the ratio between concordant and discordant results

Among the 22 discordant results, score of 7,6 and 5 were seen in 14,6 and 2 patients respectively.

Table 6:- Results Derived From Various Modalities Used In Breast Lump Analysis

Diagnosis	Clinical	FNAC	Mammography	Triple test	HPE
Benign	148	153	159	155	156
Intermediate	14	7	6	1	0
Malignant	38	40	35	44	44

Diagnostic Modality	Kappa value	P value
Clinical Examination	0.795	<0.01
FNAC	0.884	<0.01
Mammography	0.758	<0.01
Triple test	0.903	<0.01

Discussion:-

Prospective analysis of TTS on 200 patients and confirming the results with histopathological finding showed to be highly sensitive and specific. In the present study 100 patients with age ranging from 35 years to 90 years with a mean age of 46.12 \pm 11.48 years who presented with complaint of breast lump were evaluated. The mean age here was considerably less than that seen in the western population (57 years) ⁹ and comparable to study done at Nepal (48 years). 60% of the patients belonged to age group between 35-45yrs. Benign diseases were more common than malignant. Fibroadenoma being the most common benign lesion and Infiltrating ductal carcinoma being the most common malignant lesion. Most of the patients aged above 55 years with breast lump were diagnosed with a malignant lesion reinforcing the fact that age is an important risk factor in carcinoma breast. The lesion was found to be present commonly in upper outer quadrant (39%). Women on an average sought medical help with a delay of 6 months after realizing the presence of breast lump, thus delaying the treatment which in cases of malignancy carry bad prognosis, thus emphasizing the need of better education of the mass at large.

In our study, clinical diagnosis (physical examination) showed a sensitivity of 95%, a specificity of 100% and positive predictive value of 100%, negative predictive value of 96.23 with an overall accuracy of 97.80% . Other studies showed that clinical examination could diagnose accurately only 70% of cases of carcinoma. Egan recorded an accuracy of 65% detection by physical examination ¹¹. Our study showed an accuracy of 97.80% by clinical examination. This relatively high accuracy in detecting malignancy by clinical examination is due to the fact that our patients rarely present early in the course of the disease. Breast lump in our patients on an average was about 4x3 cm on presentation. Out of 9 cases with suspicious interpretation, in clinical 5 were diagnosed to be benign and 4 were diagnosed malignant. Two cases which were diagnosed clinically as benign turned out to be malignant on HPE .

In examining the triple test elements individually, we noted that FNAC is typically more accurate than physical examination or mammography . This agrees with the study of Morris et.al. and Vetto et. Al ¹²⁻¹⁸. In our study, the sensitivity of FNAC was 97.56%, the positive predictive value was 100%, specificity was 100%, and the negative predictive value was 98.18% with no false positives, but 1 false negative . These results are in accordance with those of Morris et.al. Vetto et. Al ¹²⁻¹⁸. reported a sensitivity of 96% for FNAC, with a specificity of 100%, and a positive predictive value of 100%. Rubin and Joy concluded that FNAC is the first reliable diagnostic step in detection of breast carcinoma. They reported a positive predictive value of 100%, a specificity of 100%, a sensitivity of 87%, and a negative predictive value of 89%.

The widespread use of mammography has helped in better management of breast lump. In our study, the accuracy of mammography was 96.80%, the sensitivity 92.11%, the specificity 100%. The positive predictive value was found to be 100%. There were 3 false positives and 6 cases were inconclusive . In a Dutch study of breast cancer screening, Romback found that if mammography alone has been used the sensitivity of breast cancer diagnosis would have been 95%. Rodes et.al. reported that mammography was the sole detection modality in 56% of cases. When combined with Physical examination, an additional 30% were detected, while physical examination alone detected 14% of cases.

In our study, the best results was got by TTS, it showed sensitivity of 100%, the positive predictive value was 100%, specificity was 100%, and the negative predictive value was 100% almost in perfect alignment with that of histopathology. In one case where the TTS was 5 an additional test in the form of biopsy was required.

In our study, when all three components showed malignancy, the sensitivity and specificity were 100%. Kaufman et al described a sensitivity of 100% and a specificity of 57% for the triple test and a negative predictive value of 100% in concordant cases. Clinical examination remains indispensable for detection of different breast lesions. Mammography remains the method of choice in radiology of the breast. FNAC has proved to be a very effective diagnostic aid. It is an easy technique, safe and very acceptable to patients. TTS outweighs all of these components and also helps us proceed further even in difficult scenarios of discordant results with triple assessment, thus reducing the fall back on the option of open biopsy which carries with it a number of disadvantages.

The use of the triple test score (with highest kappa agreement-0.903) has proved itself to be a reliable tool for the accurate diagnosis of palpable breast lump. Triple test score when implemented streamlines the management of breast lump, more so when triple assessment can't come to a definitive diagnosis and thus biopsy which usually is resorted to in such a scenario can be avoided, saving the patient from anxiety, repeated operative procedure, financial burden, undue delay in treatment and also providing the surgeon a platform to base his further management.

Summary:-

This prospective study was done to evaluate the efficacy of triple test score in management of palpable breast lump and to develop a standard protocol for management of breast lump especially when discordant results are obtained from triple assessment.

A total of 200 women with complain of breast lump presenting to the department of surgery at Tertiary Care Teaching Hospital, underwent assessment by physical examination, followed by mammography and FNAC. Triple Test Scoring was done for each component and the total score calculated. Patients were subjected to appropriate surgery and the specimen sent for histopathology. Each component was analyzed and compared with histopathology, the parameters sensitivity, specificity, positive predictive value, negative predictive value, accuracy were calculated and it was found that triple test score was best in predicting the nature of the breast lesion compared with any of the individual components of triple assessment or all of them put together.

The real value of triple test scoring was better appreciated when there was discordant results among the components of triple assessment. As no proper guidelines exist in managing such cases, it was here that triple test score can provide us something concrete on which we can base our definitive management effectively and confidently. Being a non-invasive, cost effective method it gives us the result without any undue delay and helps to manage patient in a better than managing such cases as per individual surgeon's choice.

Triple test score when implemented streamlines the management of breast lump, more so when triple assessment can't come to a definitive diagnosis and thus biopsy which usually is resorted to in such a scenario can be avoided, saving the patient from anxiety, double operative procedure, financial burden, undue delay in treatment and also providing the surgeon a platform to base his further management.

Conclusion:-

Triple test score can be safely used as an accurate and least invasive diagnostic test and based on its interpretation, definitive treatment can be initiated which would reduce the need for unnecessary biopsies. The strength of TTS seems to lie in its ability to reliably predict benign lumps and thus avoid major surgeries. Given the increased incidence of malignant lumps in elderly females and the tendency to hide asymptomatic lumps, we need more awareness programs targeting this age group.

When patient presents to us with breast lump, it has been the usual practice to do a thorough clinical assessment, reaching a provisional diagnosis, which is then confirmed by using FNAC. With triple assessment gaining popularity mammography too was included into the scheme of breast lump evaluation for more apt diagnosis thus leading to better management of the patient.

When all the components of triple assessment are concordant, that is agree on common grounds the diagnosis is easily reached and patient is managed accordingly. When the components are discordant, that is differ in their interpretation of the breast lump, what would be the next step forward is the area which needs more light to be shed upon. It is precisely in this area where triple test score can be the answer to this dilemma. TTS being non-invasive and economical, with certain diagnosis in most of the cases (except in score of 5) can be relied upon as an effective test for further management of the patient.

dissolved oxygen, Nigeenlake, Nitrate, Phosphorus

Abstract

A study of the water quality changes of NigeenLake was conducted for 6 months, which began in August 2010 to February 2011. Three sampling stations were selected representing the different areas in the lake. A total of 11 water quality parameters were measured. The physical and chemical variables were temperature, dissolved oxygen, conductivity, pH, total dissolved solid, turbidity, ammonia-nitrogen, nitrate-nitrogen and ortho- phosphate

. Due to siltation, encroachment and pollution the lake has become shallower and the lake shore has turned into marsh at various places. The higher ranges for Sp. Conductance ($192-560 \mu\text{Scm}^{-1}$ @ 25°C), Total-Alkalinity ($106-435 \text{ mgI}^{-1}$), Calcium ($29.6-44 \text{ mgI}^{-1}$), Nitrate-Nitrogen ($275-931 \mu\text{gI}^{-1}$), Ammonical-Nitrogen ($38-360 \mu\text{gI}^{-1}$), Total-Phosphorus ($122-722 \mu\text{gI}^{-1}$) which exceed the permissible limits is a cause of concern. Hence, the water quality is found to be poor due to increased anthropogenic pressures from the catchment area.

Introduction:-

Dal lake ($34^{\circ}-06'N$, $74^{\circ}-45'E$; altitude 1583 m) is a post glacial lake with a shallow depth, bounded on the south-west by the capital city Srinagar and encompassed on the other sides by terraced gentle slopes at the base of the precipitous mountains. The Dal lake and its adjunct Nigeen has remained at the focal point of Kashmir's illustrious history, culture and tourism. Situated against the backdrop of Zabarwan, Shankaracharya and KohiMaran, the serene and placid waters have bestowed unparalleled beauty and magnificence, attracting the tourists from all over the world. The Nigeenlake offers a novel attraction to tourist because of its calm, placid and serene waters, water sports like skiing, swimming and staying in houseboats. The lake ecosystem of varied cultural ethos offers recreation to tourists who want to fish in its waters or indulge in bird watching. The sunset in Nigeenlake when the entire body of the Nigeen looks like a sparkling jewel to which the word 'Nigeen' is related.

Although extensive research has been conducted on Dal lake but the aim of present study is to provide the status of the Nigeen lake (which is an important basin of Dal lake) on the basis of physico-chemical analysis of water.

Methodology:-

The water sampling at the desired sites and depths were taken by Ruttner's sampler. The sampling was done usually between 10:00 to 11:00 hours. The samples were immediately transported to the lab. for detailed analysis. The water analysis was carried out using the methods outlined in APHA, AAWA, WPEF (1997), Golterman and Clymo (1969) and Mackereth (1963), P. K. Gupta (2004).

Results and Discussion:-

The monthly air temperature (fig 2) ranged between 6.5°C (Jan, 2011) to 30°C (Aug, 2010) at DN1 & DN3) with an overall average of 16.5°C during the investigating period.

Fig. 2:- Monthly variation in Air Temperature (°C) at various sites of Nigeen Lake.

The monthly water temperature (Fig.3) ranged from 2.8 °C (Nov, 2010 at DN1) to 25.0 °C (Aug, 2010 at DN3) with an overall average of 11.9 °C during the study period.

Fig. 3:- Monthly variation in Water Temperature (°C) at various sites of Nigeen Lake.

The monthly transparency measured at the study sites of Nigeen Lake is given in Fig 4. The value for transparency ranged from 0.6m (Sept,Oct, 2010 at DN1) to 2.7m (Jan, 2011 at DN2'S') with an overall average of 1.3m during study period.

Fig 4:- Monthly variation in Transparency(m) at various sites of Nigeen Lake.

The monthly pH measured at the monitoring sites of Nigeen Lake is given in table (05). The value for pH ranged from 7.6 (Jan, 2011 at DN1) to 8.5 (Aug, 2010 in surface water at DN2) with an overall average of 7.8 during the study period.

The pH of water ranged between 7.5 to 8.5 during the study period and depicted alkaline nature of the water. No major shift has been recorded in pH concentration when compared with earlier records (table 1). The waters of Nigeen lake are thus well buffered which is in conformity with the findings of Edmodson and Hutchinson (1939), Zutshi (1968) and Kundangar and Adnan (2006).

Fig 5:- Monthly variation in pH values at various sites of Nigeen Lake.

The monthly specific conductivity measured at the study sites of Nigeen Lake is given in Fig (06). It ranged between 192 μS (Aug, 2010 in surface water at DN2 & DN3 respectively) to 560 μS (Aug, 2010 in bottom water at DN2) with an overall average of 302.25 (μS at 25°C) during the study period.

The specific conductance of Nigeen water ranged from $192\mu\text{Sm}$ at 25°C to $560\mu\text{Sm}$ at 25°C which is higher than earlier records. Zutshi (1987) observed moderate conductivity value in Dal lake during 1980-1982 while as Kundangaret al.(1992-93) and Kundangar and Adnan(2006) reported progressive increase in conductivity values of Nigeen waters. Mathew and Vasudevan(2000) attributed the higher values of sp. conductivity to the mineral inputs while Agarwal and Kanan (1996) hold the concentration of particular ions, TDS and Electrical conductivity when keep rising, water quality may deteriorate. Nararian et al(1995) Jain et al.(1998) are of the view that rising electric conductance will deteriorate the physico-chemical and bacteriological status of the waters to a greater extent.

Fig 6:- Monthly variation in Sp. Conductivity (μSm at 25°C) at various sites of Nigeen Lake.

The monthly dissolved oxygen (mg l^{-1}) measured at the monitoring sites of Nigeen lake is given in Fig. 7. The value for dissolved oxygen ranged between 5.5mg l^{-1} (Oct, 2010 at DN1) to 12.0mg l^{-1} (Sept, 2010 at DN3) with an overall average of 6.4mg l^{-1} during the investigating period. The oxygen content in Nigeen waters ranged from 4.0 to 12mg l^{-1} and no major shift was observed than the earlier records where the oxygen content was recorded between 5.9 to 13mg l^{-1} Kundangaret al. (1992-93). However the oxygen depletion was observed in the bottom waters which can be attributed to summer stratification. These findings are in agreement with those of Zutshi(1987).

Das and Pande(1982) attributed the depletion of oxygen content in the bottom waters to anaerobic bacteria who take over the process of decomposition of biological organic matter releasing foul smelling hydrogen, methane and ammonia(aerobic bacteria evolve only CO_2 when organic matter is decomposed in presence of oxygen) these gases not only deplete oxygen in water but are toxic, killing most of the plankton, algae and zooplankton in the lake. A difference of 8mg l^{-1} of oxygen content was recorded by Kundangaret al. during (1992-93). According to Vass (1980) Nigeen shows a positive heterograde along with clinograde type of oxygen curve, which according to the author was biogenic. Kundangar and Adnan(2006) observed the depletion of oxygen content in the bottom waters of Nigeen throughout the year which according to authors depicted the shift in oxygen regime.

Fig. 7:- Monthly variation in Dissolved oxygen (mg l⁻¹) at various sites of Nigeen Lake.

The monthly total alkalinity measured at the study sites of Nigeen Lake is given in Figure 8. The value for total alkalinity ranged between 106 mg l⁻¹ (Aug, 2010 in surface water at DN2) to 435 mg l⁻¹ (Jan, 2011 in surface water at DN2) with an overall average of 226 mg l⁻¹ during the investigating period.

The total Alkalinity of the waters in Nigeen ranged between 106 to 435 mg l⁻¹ which was comparatively much higher than the earlier records of Kundangaret *et al.* (1992-93). The alkalinity was of bicarbonate type which is in conformity with Freiser and Ferriande (1996) who stated that when total-alkalinity is higher, the carbonate system persists and p.H usually remains alkaline.

Fig 8:- Monthly variation in Total Alkalinity (mg l⁻¹) at various sites of Nigeen Lake.

The monthly calcium measured at the investigated sites of Nigeen Lake is given in Figure (9). The value for calcium ranged from 29.6 mg l⁻¹ (Nov, 2010 in surface water at DN2) to 44.0 mg l⁻¹ (Aug, 2010 at DN3) with an overall average of 36.3 mg l⁻¹ during the investigating period.

Fig 9:-Monthly variation in Calcium (mg l⁻¹) at various sites of Nigeen Lake.

The monthly magnesium measured at the monitoring sites of Nigeen Lake is given in Figure 10. The value for magnesium ranged from 0.9 mg l⁻¹ (Feb, 2011 at DN1) to 6.0 mg l⁻¹ (Aug, 2010 at DN3) with an overall average of 4.0 mg l⁻¹ during the study period.

The calcium content during the study period was recorded between 29.6 – 44 mg l⁻¹ which shows the lake water is basically a marl lake and the water is rich in calcium, similar observation were made by Kundangar *et al.* (1992-93) and Kundangar and Adnan *et al.* (2006). The values of calcium are much higher than those of Zutshi and Khan (1988). According to Kundangar and Adnan (2006) the high levels of calcium in water and presence of marl on the leaves and stems of the macrophytes in all the basins of Dal lake may adsorb liable organic substance and thereby limits the plankton growth.

The direct relationship between bicarbonates and calcium has been observed by Pearsall (1923) and Zaffar (1964), whereas the inverse relationship between carbonates and bicarbonates has been noted by Ganapati (1940). Average Magnesium content in the lake water with high dissolved organic content are alkaline in nature and magnesium salts are more soluble in them which is in conformity with the finding of Adnan and Kundangar (2008) while studying the ecological status of some flood plains lakes with Jehlum river basin of Kashmir.

Fig 10:- Monthly variation in Magnesium (mg l⁻¹) at various sites of Nigeen Lake.

The monthly nitrate-nitrogen measured at the investigated sites of Nigeen Lake is given in table (13). The value for nitrate-nitrogen ranged from 275 $\mu\text{g l}^{-1}$ (Dec, 2010 in surface water at DN2) to 931 $\mu\text{g l}^{-1}$ with an overall average of 483.42 $\mu\text{g l}^{-1}$ during the investigating period.

Fig 10:- Monthly variation in Nitrate-Nitrogen ($\mu\text{g l}^{-1}$) at various sites of Nigeen Lake.

The nitrate-nitrogen and Ammonical-nitrogen content in the Nigeen waters ranged from 275-931 $\mu\text{g l}^{-1}$ and 36-360 $\mu\text{g l}^{-1}$ respectively which is comparatively much higher than the earlier records of Vass(1980), Zutshi and Khan(1988), Kundangar *et al.* (1992-93) and Kundangar and Adnan(2006). Besle and Suckling(1944) have attributed the nitrogen richness of a fresh water body to the pollution of animal origin.

The monthly Ammonical nitrogen, measured at the monitoring sites of Nigeen Lake is given in figure 11. The value for Ammonical nitrogen ranged from 38 $\mu\text{g l}^{-1}$ (Aug, 2010 in surface water at DN2) to 360 $\mu\text{g l}^{-1}$ (Jan, 2011 in bottom water at DN2) with an overall average of 133.57 $\mu\text{g l}^{-1}$.

Fig 11:- Monthly variation in Ammonical-Nitrogen ($\mu\text{g l}^{-1}$) at various sites of Nigeen Lake.

The monthly ortho- phosphorus measured at the study sites of Nigeen Lake is given in fig. 12. The value for ortho-phosphorus ranged from $34 \mu\text{g l}^{-1}$ (Nov, 2010 at DN1) to $432 \mu\text{g l}^{-1}$ (Nov, 2010 in bottom water at DN2) with an overall average of $132.13 \mu\text{g l}^{-1}$ during the study period.

Fig 12:- Monthly variation in Ortho- Phosphorus ($\mu\text{g l}^{-1}$) at various sites of Nigeen Lake.

The Phosphorus content in the Nigeen waters ranged between $122\text{--}722 \mu\text{g l}^{-1}$ the values are much higher than those of earlier records. The higher Phosphorus content in the lake water can be attributed to the influx of raw sewage entering the lake through surface drains. Hutchinson (1957) also reported the increase of Phosphorus as a result of sewage contamination. Schindler *et al.* (1971) singled out phosphorus for attention because it is believed to be nutrient frequently controlling Eutrophication.

Lund (1965) and Einsele (1936) support the view that phosphorus play a major role in eutrophication as well as in production. Wetzel (1975) holds in the view that number of bacteria increase with increasing productivity and concentration of organic and inorganic compounds in lake.

In case of Nigeen waters Nitrogen and Phosphorus can be considered as two major elements responsible for pollution and limiting primary production. In this lake phosphorus is expected to be released in water from bottom mud during the oxygen deficiency in the bottom waters during the summer months. The water quality is found to be poor due to increased anthropogenic pressures from the catchment area.

Conclusion:-

The observation recorded during the study period reveal that the Nigeenlake has undergone marked change in morphometry including the depth. Due to siltation the lake has become shallower and the lake shore has turned into marsh at various places. The excessive inflow of nutrient rich effluents from the immediate catchment and also due to sedimentation the lake bed has not only become shallower but has resulted in serious weed infestation.

The unabated encroachments by way of extension of floating gardens beyond legal titles coupled with fertilizing method of using lake mud and weeds which eventually reaches to the bottom of the lake transforms floating gardens into permanent dry lands. Over a period of time such practices have continued and encroaching of open water body has become an unending problem.

The drainage, natural sedimentation and continued reclamation of the lake basin to provide vegetable growing land besides enormous increase in the area of floating garden have combined with natural process to reduce the area of open water within the basin. On assessment of physico chemical parameters, The lower values are recorded in dissolved oxygen content reaching to an anoxic condition at certain times which lead to algal blooms and fish kills. The pH has remained throughout alkaline indicating buffered nature of lake waters. The population explosion in the immediate catchment of Nigeen and increasing sewage loads has aggravated the ecological problems of the Nigeenlake. The changes in the water quality over a period of time must have brought insignificant changes in the biodiversity of the lake.

The laying of garland sewer for pollution abatement though initiated has not yet been completed, the construction of sewage treatment plants and their doubtful working have jeopardized the entire sewage scheme. The sewage treatment and solid waste management of the houseboats has remained an unaccomplished job till date and has become a matter of grave concern. The program of lake conservation for last three decades has been very slow and more of engineering nature rather than scientific.

The higher ranges for Sp. Conductance ($192-560 \mu\text{Scm}^{-1}$ @ 25°C), Total-Alkalinity ($106-435 \text{ mgI}^{-1}$), Calcium ($29.6-44 \text{ mgI}^{-1}$), Nitrate-Nitrogen ($275-931 \mu\text{gI}^{-1}$), Ammonical-Nitrogen ($38-360 \mu\text{gI}^{-1}$), Total-Phosphorus ($122-722 \mu\text{gI}^{-1}$) which exceed the permissible limits are worrisome as the lake waters are used for portable purpose by the PHE Deptt. Since the conventional treatment plants cannot remove the Nitrate-Nitrogen and Total Phosphorus content of the water, thus putting the health of thousands of consumers at stake.

Abstract

Companies are trying to position ourselves and try to have a sustainable competitive advantage, by leveraging the strength to exploit opportunities and neutralize threats, and can avoid or fix vulnerabilities that exist in the company. The gain the competitive advantage is the influenced by two factors, there are Internal environment and the external environment. Internal environment are important elements in the company. The Analysis of internal environment beneficial for the company, especially the resource analysis. This analysis is done for internal resource can be strength of the company, but also can be a source of weaknesses. Terms of resources can be a force if these resources are managed and empowered well, but on the contrary, if internal resources are not managed and controlled properly it will be the weaknesses of the company. Companies can achieve competitive advantage through resource, resources the company has four criterion the namely of Valuable, Rare, Low Inimitable Non- substitute (VRIN). However, based on this study Authors to identified resource from VRIN into EXSTRIM. The resources EXSTRIM that means of: Excellent, Not Substitute, Not Trade, Rare, Not Imitable, Mover & Modification can be the strategic resource configuration in the company to creating a sustainable competitive advantage (SCA).

Introduction:-

Strategies management become indispensable in managing fluctuating environmental conditions, the environment can affect to the performance and company's goals. The company's strategy is formulated at three levels: operational level, functional level and strategic level, in the context of industry competition, the main concern is the strategic level. Each level of the strategy in general in order to create a competitive advantage that includes; cost leadership, focus and strategy that differentiate it from other companies Porter (1991). A business manager should be able to analyze the environment to understand opportunities and threats facing. Organizations need to build strength and improve weaknesses; this process is not just a single step, but a process that includes various steps. One of them is the scanning, the business situation, which, according to Albright (2004) scanning is an internal communication to get information relevant external information on the Issues of potential influence on corporate decision-making process in order to face the competition. The company may face competition when companies that have a sustainable competitive advantage by harnessing the power companies to exploit opportunities and neutralize the threat while avoiding or fixing a weakness or so-called analysis 'SWOT'. Porter's Five Force Model, Porter conducted an analysis of the competitiveness of the industry, which is affected by the five forces that emphasizes analysis of existing industrial structures. The Five forces such as; bargaining power of suppliers, bargaining power with customers, the strength of the threat of new entrants, as well as the strength of the threat from competitors as

well as existing industry. While Porter framework has provided many useful insights both practitioners and researchers to concentrate on external analysis 'OT' nevertheless still experiencing some significant problems. The same thing Porter (1991), Valentin (2001) the SWOT analysis is an analytical tool for the environment that identify strengths weakness opportunities and threat for the company. The business strategy is a way to master the wide expertise and managing a company's profit with its surroundings. To realize that all companies should determine the factors which might be in the face of competition once expected to be used to win the competition? One factor that can be used to win the competition is a strategic resource company. Determine the combination of the company's strategic resources is not easy, but if it is done well and seriously then the combination can be achieved with either. The company's strategic resource that can be used to win the competition must be resources that have a competitive advantage compared to the resources owned by other companies.

Understanding Resources:-

Many definitions of resources raised by the experts which is according to Barney (1991) Barney define resource company covers all assets, capabilities, organizational processes, firm attributes, information, knowledge, which is controlled by the company. According to Anderson (2007) the resource can be divided into internal and external resources, external resources consist of relations with actors outside the company; customers and suppliers as well as its reputation. Javad & Carlos (2010) introduced the idea that the company should be analyzed in terms of resources, not only in terms of its products alone. According to resources based view (RBV), resources are defined as: anything that can be regarded as a strength or weakness of a particular company. Resource companies as a factor in the company and are owned or controlled by the company. The resource is generally defined as "all assets, capabilities, organizational processes, firm attributes, information, and other knowledge that can be controlled by the company, resource as an asset or an input to production tangible or intangible owned by an organization and can be controlled, or in access to a semi-permanent.

Resources Advantage:-

According to Anderson (2007) special ability to create such varied resources management, entrepreneurial and dynamic capability has been used to describe the ability to generate strategic resources. Furrer at.al (2008) indicates that the resource-based grouping took the example of a bank that explains differences in corporate performance better than the market grouping based products. However, market-based group still provides explanations of the significance of the difference in performance in two of the three performance measures used. Meanwhile, according to Grant (1991) by using the difference between the resources and capabilities, resources are tangible or intangible assets, and capabilities are the ability generated from these assets. Anderson (2007) the resources can lead management capabilities such as the ability of the market, production capabilities, and the ability of innovation. To obtain optimal composition, the researchers suggest that the fit between the available resources of the company and the requirements of the product-market activity in terms of concepts such as generic strategies should be carried out it is appropriate revelation (Furrer at.al 2008). Resources Strategic Change, and Organizational Performance The concept of strategic Resources by Kraatz & Zajac (2001) the resource that has an advantage can influence strategic changes to the company, the company can emphasize how resources can hinder or may lead to organizational learning in order to adapt. According to the opinion Banrey (1991) the latest research is a strategic resource is a resource company that is difficult to replicate. Meanwhile, according to Chaharbaghi & Lynch; (1999) indicates that strategic resources are not the only applications that efficiently and effectively to provide the level of high competitiveness and ability to generate profits, but more important than that is how to make resources the mutual synergy so really widened superior resources and strategies for the company in realizing a sustainable competitive advantage. One way to the competitive advantage if the company has the dynamic strategic resource. The dynamic the resources within the company the combination of resources within the organization based on the time dimension will always be changing its composition, therefore, according to the authors' opinion that in order to realize the resource made resources that strategic managers must be able to combine existing resources in the company. According to Großler (2007) that resources are located will affect the performance capability of the organization / company (if not, they will not be located) there is a reciprocal process: the company's performance also affects resource and capability. Großler (2007) exemplifies the relationship between the ability to produce products with high quality and sales revenue as a performance indicator. Producing high quality (among other factors) affects the sales, which determines the sales revenue. Indicator of the understanding of strategic resources and its relation with the ability to improve the performance of the company. As Großler (2007) Barney (1991) found a strategic resource must have at least four major characteristics, namely: Durable, has a positive long-term effect on the company's strategic position; Non-tradable, it is impossible for competitors to easily afford; Non-applicable, it is impossible for

competitors to easily duplicate or copy them; Non substitutable, it is impossible for competitors to easily find a replacement.

Meanwhile Barney (1991) that a strategic resource that can create competitive advantage and sustainability performance is a resource that has the following criteria: Valuable (V): Resource-value, the resource company that has a value that is able to set up the company in creating market opportunities and can reduce the challenges that exist in the market. Rare (R): The resources are scarce (unique), whose existence is difficult to find the resources and these resources are unique and not shared with other companies. Imperfect imitation (I): The resource that is difficult to imitate, this resource is difficult to imitate by other companies. Non-substitutability (N): The resources irreplaceable, resources in the other companies are difficult replacement to match.

Based on several definitions of strategic resources there is a difference between an expert opinions with another expert opinion, the difference is due to the perspective and different educational backgrounds. Therefore, the author tries to back describe strategic resources to get a thread or a new definition of the strategic resources. But before describing the author or authors redefine about strategic Resources will provide an overview of some of the definitions neighbor Strategic resources being addressed by some experts that will be displayed in the following table.

Table :- Definition of Strategic Resources

No	Author	Definition
1	Banrey (1991)	Business resources and difficult to imitate
2	Black and Boal (1994)	Identify how the performance of the company and its sustainability depends on the uniqueness, rarity.
3	Chaharbaghi & Lynch (1999)	Strategic resource not only the application of efficient and effective to provide the level of high competitiveness and ability to generate profits, but more important than that is how to make resources the mutual synergy that really widened resource excellence and strategic for the company in realizing SCA
4	Kraatz & Zajac (2001)	Resources that have the advantage may affect strategic change in the company, the company can emphasize how resources can hinder or may lead to organizational learning in order to adaptation
5	Anderson (2007)	Special ability to create such varied resources management, entrepreneurial and dynamic capability has been used to describe the ability to generate strategic resources.

Based on Banrey (1991) the identification of the resources are: V: Valuable, R: Rare, I: Not Inimitable N: Not Substitute, Black and Boal (1994) identification of the resources are VRIO that mean are V: Valuable, R: Rare, I: Not Inimitable, O; Organization Orientation, they are differences existing definition. So the Author can the conclusion of the strategic resources is "The unique resource obtained through a process that is adaptive and proactive to spearhead (guns) as a means to win the competition and excellence continuous competitiveness. This resource should have the first criteria; excellent namely resource superior or resources are: Excellent, Second: Not Substitute are resources that not be replaced, Third: Not Trade resources that are not easily assessed by monetary or not be traded, Fourth: rare is a scarce resource that is difficult to obtain, Fifth: Not Inimitable that the resources that are difficult to imitate by other companies, Sixth: Mover & Modification is easy to be adapted to the dynamically changing environment, means that in the past, now becoming a strategic resource, but not necessarily in the future come can be a strategic resource back. Therefore, if the company to gain a sustainable competitive advantage the company must make resource adaptive, proactive and reactive to the environment. Based on the above, the Authors refer to as strategic resources are: EXSTRIM or the means of: Excellent, Not Substitute, Not Trade, Rare, Not Inimitable, Mover & Modification.

Anderson (2007) The ways to realize the strategic resource contribution-based view of research taking the difference in the configuration of resources between companies, if there is a description of how these strategic resources are developed, the discussion usually focuses on direct investments as a way to obtain strategic resources. However, differences in the configuration of resources between companies can also be explained by factors other than the difference in making investment decisions. Usually the activity that takes place within the company in terms of

organizational processes and activities carried launching products in the market and can also develop resources in order to obtain strategic resources. Thus, a strategic resource can be obtained in three ways:

1. Through direct investment;
2. Through the process of organization, and
3. Through the activities undertaken in the product markets.

Barney (1991) identifies the barriers that used to barrier process of imitation, the things that will be used when analyzing barriers to imitation are:

1. The social complexity;
2. Ambiguity causal,
3. Conditions unique history

Social complexity refers to the intangible factors such as social and cultural relations, while the causal ambiguity exists when the relationship between resources and competitive advantage is unknown. Conditions unique history confirms that each company is a unique entity and that the possibility of acquiring the resources depending on the time point, where and when to get those resources.

Strategic Concept advantage:-

According to Barney (2002) the company will gain a competitive advantage if the company's strategy and values which not be done by the company's competitors. Strategic advantage, on the other hand, covers a broader perspective in which this matter, so Chaharbaghi & Lynch (1999) include the following:

1. Provide the organization with a unique ability to develop strategic directions that create new opportunities and future competitive environment.
2. Is a source of leadership resources in one or more of the products on the market.

Sustainable competitive advantage (SCA) is a process that needs to compete today without compromising the ability of organizations to meet the requirements to compete in the future. Chaharbaghi & Lynch (1999) the process of developing such an organization as a dynamic concept, which covers the basics of the following:

1. Sustainable Competitive Advantage is a conservation-oriented as the organization does not have unlimited resources. Given these limitations, conscious management of existing resources is needed.
2. Sustainable Competitive Advantage is based on the needs of the organization in which economic activities should be concerned with the needs of the market for goods and services resulting from economic activity.
3. Sustainable Competitive Advantage is future-oriented, placing itself outside day-to-day management of long-term development resources to bring strategic advantages
4. A Strategic Advantage is the standard for corporate renewal, it is very dependent and influenced by, the development and timely introduction to strategic resources.

Based on the results from the description above one of the factors that can be used to create a sustainable competitive advantage SCA is a resources firm. Configuration was good between resources is expected to be decisive to the sustainable competitive advantage.

Conclusion:-

Based on the discussions that have been submitted at the beginning to the end that was found disagreement among experts on the categorizing of corporate resources is generally grouped into three categories, namely: physical, tangible resources, intangible resources and human resources. A good combination between the three elements contained in these resources is expected to establish a sustainable competitive advantage SCA. For the competitive advantage for the company to be created in earnest with how to configure the use of the existing resources within the company to the optimum. Appropriate combination or selection of the resources for the company is the main capital in determining the level of a sustainable competitive advantage. The resources based view RBV has contributed much to the formation of a strategic resource in promoting a sustainable competitive advantage. Resources that have a sustainable competitive advantage if they meet the criterion VRIN namely; Valuable, Rare, Non Imitable and Non Substitute. Meanwhile, according to the Authors that strategic Resources should have the criterion: first Excellent is the resource superior or resources excellent, Second: not Substitute is the resources that not be replaced, Third: Not trade is the resources that are not easily assessed by monetary or not be traded, Fourth: Rare is the resource that is difficult to obtain, Fifth: Not Imitable is the resources that is difficult to imitate by other companies, Sixth: Mover & Modification is easy to be adapted to the dynamically changing environment, means

that in the past, is now becoming a strategic resource, but not necessarily in the past that will come can be a strategic resource back. Based on the above, the Authors refer to as a resource to resource strategic are the EXSTRIM resources criterion.

Recommendation:-

The first performed by the expert company strategy is the identification of all the factors that may affect its business. In this process, that important to know and to do is the related to internal activities involved in the business, this includes all the systems of internal structure, strategies used, and the culture of the organization. The company's activities will interact with the environment components outside the company such as customers, competitors, and supplier; in addition it includes all parties (stakeholders) such as trade unions, media, and government. Competition has entered a new era with the constant changes. The infrastructure problems that disrupt the organization can't be solved effectively without resource-based strategy is therefore necessary to incorporate the following principles:

1. Strategic resources must be regenerated more quickly than those used by other companies
2. The resources must be used more quickly excel
3. Basis of resources should be considered to be invested faster than the rate of acceptance of the environment (adaptive) and proactive to realize resource from VRIN criterion to E X S T R I M to targeting in the sustainable competitive advantage (SCA).

Abstract

This paper consists of a distributed cable harness tester. It has a few functions such as connection and detection of a wire, proper connections of wire etc. In this project, application is designed in order to improve the tester's performance, and the software design of upper computer and the framework of hardware of tester nodes are introduced in details. The tester is designed to ensure quality and reliability of cable harness. In detection process early failure products such as breakage circuit, short circuit can be rejected. We can also print the data regarding the Harness. It improves the efficiency of system, decreases the length of cable, the cubage and weight of the equipment and makes the test and maintenance convenient and fast.

Introduction:-

A cable harness, also known as a wire harness, cable assembly, wiring assembly or wiring 100m. It is an assembly of cables or wires which transmit signals or electrical power. A wiring harness can be very small in size such as a small group of wires found in your computer or car. A wiring harness can also be very huge such as some of the ones that Interconnect manufactures for aircraft. These huge wiring harnesses may have thousands of wires in them and hundreds of connectors. Wiring harnesses have many different names including: electrical wiring harnesses, looms, cable assemblies, coax cables, RF cables, injection molded cable assemblies, fiber optic cables, and many times are simply called harnesses. It is much easier and faster to route a group of wires already bundled together than routing them individually.

A cable harness tester it has a few functions such as connection detection of a wire, diode orientation testing and resistor's etc. The application is designed in order to improve the tester's performance, and the software design of upper computer and the framework of hardware of tester nodes are introduced in details. The tester is designed to ensure quality and reliability of cable harness. In detection process early failure products such as breakage circuit, short circuit and wrong conductor arrangement can be rejected. It improves the efficiency of system, decreases the length of cable, the cubage and weight of the equipment and makes the test and maintenance convenient and fast.

Faulty End Recognition tool identifies wiring faults and their physical location of the product. This tester is fast, accurate and easy to use and saves a lot of time involved in manual checking. Harness testers have a unique, patented graphic display to pin-point problems when wiring errors are detected, and offer one second pass/fail testing for production environments. Quickly locate intermittent-connection and identify their position in the cable.

Harness Testers are commonly used in automobiles, as well as construction machinery, cable harnesses provide several advantages over loose wires and cables. For example, many aircraft, automobiles and spacecraft contain many masses of wires which would stretch over several kilometers if fully extended. By binding the many wires and cables into a cable harness, the wires and cables can be better secured against the adverse effects of vibrations, abrasions, and moisture. By constricting the wires into a non-flexing bundle, usage of space is optimized, and the risk of a short is decreased. Since the installer has only one harness to install (as opposed to multiple wires), installation time is decreased and the process can be easily standardized. Binding the wires into a flame-retardant sleeve also lowers the risk of electrical fires. Perform high speed electrical interconnect testing on cables and harnesses for wiring correctness and insulation quality.

Block diagram:-

Figure 1: Block diagram of Harness Tester

Working: The wires are first cut to the desired length, usually using a special wire-cutting machine. The wires may also be printed on by a special machine during the cutting process or on a separate machine. After this, the ends of the wires are stripped to expose the metal (or core) of the wires, which are fitted with any required terminals or connector housings. The cables are assembled and clamped together on a special workbench, or onto a pin board (assembly board), according to the design specification, to form the cable harness.

LPC2148 Controller has limited i/o pins, but we needed large no. of i/o pins, so we can use the i/o cards. Which is extended the i/o pins. That is depends on the how many inputs or cables can be checked. i/o cards are use for expanding the input output connections.

These are four points for checking the wires/cables like A, B, C, D. In first case: If A point connected to C point and B point connected to D point then the message displayed is "harness is OK" on LCD. In second case: If A point connected to D point and B point connected to C point then the message displayed is "harness is EXCHANGED" on LCD. In third case: If A point connected to C point & B point is not connected to D point then the message displayed is "harness is OPEN" or no connections between B & D.

In this project we can use barcode scanner, which is used for scanning the barcode of product and they display the specifications or any other information of that product.

Ethernet is used in LAN connection, it means as earlier one man use to supervise going to every machine, now it can be supervised on one PC connected to other PC's on other machines. Printer is used in order to print any data of the product needed on papers. Thus we are reducing man power and making task earlier by having many functions on one device.

Figure 2: Digital Harness Tester

Results:-

There are many results we can display on LCD as follows:

1. Firstly the options are displayed on LCD that are, TEST WIRE, SET RTC, TIME/DATE, SEND HRN(Harness)DATA.

2. In second case we can check the points. Suppose two points are open then it will display that as OPEN POINT. In below picture point 1 13 are opened.

3. In third case we can check the faulty points. Suppose some faults occur in harness then it will display that as FAULTY POINTS. In below picture point 4 16 are faulty.

4. In fourth case we can check the interchange connections. Suppose point 1 is connected to point 15 and point 2 connected to point 16 then there is interchange between that points. But in below picture all points are connected to correct points so there is NO INTERCHANGE.

5. In fifth case suppose some connections are required between points then it will display REQUIRED POINTS. Shown as below.

6. In sixth case we can check the harness. If data is not passed through harness then it will display HARNESS FAIL. Shown as below

7. In seventh case we can check the harness and if harness is ok or good then it will display HARNESS PASS. As shown below.

Advantages:-

1. All functions are available in one device.
2. Less time consumption.
3. Reduced man power.
4. Accuracy.

Applications:-

1. Complex wiring testing (open circuit, wrong connection, wire interchange)
2. Electronic devices. (oven, fridge, washing machines etc.)
3. Automobile Industries. (vehicles etc.)
4. Aircrafts.

Conclusion:-

Hence in this project we solved the problems of time consumption, man power etc. which occurred in earlier projects of Harness tester. Harness Tester is designed to test a harness by Checking each point with each other point. IT learns the harness and Compare with the already stored harness information and locates open points, extra points, group short. Cable Harness Tester facilitates two modes of testing (auto / manual) harnesses. Testing speed of harness is high .It also facilitates indirect saving of space by accommodating different types of harnesses on rig.

Diabetes Mellitus, Heart Rate Variability, Premenopausal and postmenopausal ageing, estrogen.

Abstract

Back Ground: Diabetes mellitus mainly type II is mainly due to insulin resistance. The hyperglycemia caused by diabetes lead to micro and macrovascular complication that endangers with life. Premenopausal women with diabetes had the risk similar to that of men with diabetes. Postmenopausal diabetic women had additional risk due to estrogen hormone deficiency.

Aim And Objective: To compare the Frequency Domain Analysis of Heart Rate Variability between premenopausal and postmenopausal known diabetic females.

Materials& Methods: 100 Type II diabetic females around the age of 40-65yrs (both pre and postmenopausal) from diabetic OPD were recruited from Stanley Medical College Hospital. Institutional Ethical committee approval was obtained. After obtaining written and informed consent from the subjects. ECG(LEADII) was recorded for five minutes in supine position using RMS Digital Polyrite. HRV analysis was done using Frequency domain methods using RMS Digital Polyrite software version 2.1.

Results: Our study states that there is a lower HRV in postmenopausal known diabetic females when compared to that of premenopausal known diabetics. Further, decline in estrogen level and diabetes gives a additional risk of increased sympathovagal balance in postmenopausal diabetic women.

Conclusion: Type II postmenopausal diabetic females have increased level of autonomic dysfunction. Hence they require hormonal replacement therapy, regular periodic evaluation of cardiac autonomic status in order to prevent future cardiovascular morbidity and mortality.

Introduction:-

Diabetes Mellitus is a group of common metabolic disorders that share the phenotype of uncontrolled blood sugar levels (hyperglycemia). The metabolic abnormalities associated with diabetes mellitus causes secondary pathological changes in multiple organ system that impose a tremendous burden on the individual with diabetes and on the health care system¹. With evolving trend across worldwide, Diabetes Mellitus will be a leading cause of mortality and morbidity. The worldwide prevalence of Diabetes Mellitus has risen drastically over past two decades, from an

Corresponding Author:- Dr. P. Shanmuga Priya.

Address:- Assistant Professor, Madurai Medical College.

estimated 30 million cases in 1985 to 285 million in 2010. In individuals aged more than 65 years, the prevalence was 26.9%. Worldwide estimates project that in 2030 shows that the greatest number of individuals with Diabetes will be aged 45-64 years¹. Diabetic Autonomic Neuropathy (DAN) is among the most recognized and silent complications of diabetes, in the face of its significant harmful impact on survival and quality of life in people with diabetes². DAN may be either clinically evident or subclinical³. Reduced heart rate variability is the earliest indicator of CAN⁴.

Materials & Methods:-

100 Type II Diabetic females around the age of 40-65 yrs (both pre and postmenopausal) from diabetic OPD with duration of diabetes of 5-15 yrs with Random Blood Sugar ≥ 200 mg/dl or Fasting Blood Sugar ≥ 126 mg/dl were recruited from Stanley Medical College Hospital. Institutional Ethical committee approval was obtained. After obtaining written and informed consent from the subjects ECG (LEAD II) was recorded for five minutes in supine position using RMS Digital Polyrite. HRV analysis was done using Frequency Domain methods using RMS Digital Polyrite software version 2.1.

Exculsion Criteria:-

Subjects with a history of Asthma, Hypertension, Cardiovascular Disease and those on Chronic Medication.

Experimental Protocol:-

The short term Heart rate variability recording is usually performed for research, clinical investigations and followed the procedure given in the Task-Force report on Heart Rate Variability. Subjects were instructed to avoid heavy physical activity and also instructed to refrain from all caffeinated beverages for 12 hours prior to research activity. All the study subjects and controls have a prestructured proforma completed. Subjects were screened after measuring height, weight, blood pressure. The basal recording of blood pressure was done using sphygmomanometer by standard Riva Rocci method. Ask the subjects to lie down comfortably in the supine position in the Neurophysiology lab, Department of Physiology, Stanley Medical College. (5 mins rest). Placed the ECG electrodes on the limbs of the subjects and connect the leads to the machine for lead II ECG recording. Transfer the data from RMS Polyrite to window based PC loaded with software for Heart rate variability. Removed ectopics and artifacts from the recorded ECG. Extracted the R-R tachogram from the edited 256-second ECG using the R wave detector in the Acq Knowledge software and saved it in the ASCII format which is later used offline for short-term HRV analysis. Performed HRV analysis using the HRV analysis software version 2.1 (Biosignal Analysis group, Finland). Mean R-R is measured in second(s). Variance, defined as power in a portion of the total spectrum of frequencies, is measured in milliseconds squared (ms²). Mean R-R is measured in seconds.

Parameters Studied:-

Spectral indices (LF ms², HF ms², LF/HF ratio) are calculated.

Statistics:-

Data are expressed as mean \pm SD. Data between the study groups were compared using unpaired Student t-test. Differences were considered statistically significant at ($P < 0.05$). The collected data was analysed with SPSS 16.0 version. Data were normally distributed based on the Kolmogorov-Smirnov Z test for normality. To describe about the data mean and S.D was used. To find the significant difference between the Patients and controls Independent t-test was used.

Results:-

Table 1:- Subjects Characteristics, Anthropometric Measures.

Compared to premenopausal diabetics, postmenopausal diabetics had lower HF, Higher LF and high LF/HF ratio.

Discussion:-

Diabetes Mellitus is characterized by hyperglycemia mainly in Type II diabetes due to reduced action of insulin (Insulin resistance)¹. It is the major cause for cardiovascular morbidity and mortality. The main advantage of using frequency domain analysis of Heart rate variability is that one can study the signal's frequency-specific oscillations. Thus both the amount of variability and the oscillation frequency (number of heart rate fluctuations per second) can be obtained. Spectral analysis involves decomposing the series of sequential R-R intervals into a sum of sinusoidal functions of different amplitudes and frequencies by the FFT algorithm. The LF fluctuations are predominantly under sympathetic control with vagal modulation, whereas the HF fluctuations are under parasympathetic control². Three main spectral components are distinguished in a spectrum calculated from short-term recordings of 2 to 5 minutes^{6,7,8,9,10}: VLF, LF, and HF components. Frequency domain analyses contributed to the understanding of autonomic background of RR interval fluctuations in the heart rate record.^{11,12} Silent ischemic heart disease or cardiac arrhythmias have both been invoked as contributors to sudden death. In Asymptomatic Diabetics (DIAD) study of 1123 patients with type 2 diabetes, cardiac autonomic dysfunction was a strong predictor of ischemia. Results from the European Diabetes Insulin-Dependent Diabetes Mellitus (IDDM) Complications Study showed that patients with impaired HRV had a higher corrected QT prolongation than without this complication. Cardiac autonomic neuropathy (CAN), which can be documented by abnormal heart rate variability (HRV), occurs commonly in patients with diabetes and is associated with silent myocardial ischemia⁶ and increased mortality⁷. In a recent large meta-analysis, Maser et al. reported that the presence of cardiac autonomic neuropathy was associated with a greater than threefold increase in mortality and sudden death⁷. Autonomic imbalance between the sympathetic and parasympathetic nervous systems regulation of cardiovascular function contributes to metabolic abnormalities and significant morbidity and mortality for individuals with diabetes.⁸⁻¹⁰ The presence of CAN was associated with a greater than threefold increase in mortality and sudden death. Silent ischemic heart disease or cardiac arrhythmias have both been invoked as contributors to sudden death. Meta-analyses of published data demonstrate that reduced cardiovascular autonomic function as measured by heart rate variability (HRV) is strongly associated with an increased risk of silent myocardial ischemia.^{9,15} Regular HRV testing provides early detection and thereby promotes timely diagnostic and therapeutic interventions. HRV was found to be an independent predictor of all-cause mortality during a period of 9 years, in a population-based study using Cox proportional hazard models. Moreover, the Hoorn study by Gerritsen et al demonstrated that impaired autonomic function is associated with increased all-cause and cardiovascular mortality and that CAN in patients already at risk (diabetes, hypertension, or history of CVD) may be especially hazardous. Clinical manifestations of cardiovascular autonomic dysfunction (e.g., exercise intolerance, intraoperative cardiovascular liability, orthostatic tachycardia and bradycardia syndromes, silent myocardial ischemia) can result in life-threatening outcomes¹⁰⁻¹⁴.

Results:-

Compared to premenopausal diabetics, postmenopausal diabetics had lower estrogen level, lower HF and high LF/HF ratio. Further, decline in estrogen level and diabetes gives an additional risk of increased sympathovagal imbalance in postmenopausal diabetic women.

Conclusion:-

The postmenopausal women had a significantly reduced overall fluctuation in autonomic input demonstrated by lower HF, increased LF, HF ratio in postmenopausal diabetic suggests that more sympathetic dominance. Therefore my study suggests that decline in levels of estrogen from pre to postmenopausal makes shift of autonomic balance towards the sympathetic dominance. Type II postmenopausal diabetic females have increased level of autonomic dysfunction. Hence they require hormonal replacement therapy, regular periodic evaluation of cardiac autonomic status in order to prevent future cardiovascular morbidity and mortality.

Abstract

Introduction: Dengue fever is one of the most important emerging vector-borne viral diseases. There are four serotypes of dengue viruses, each of which is capable of causing self-limited dengue fever or even life-threatening dengue haemorrhagic fever and dengue shock syndrome. The aim of this study was to evaluate the role of sonographic findings as early diagnostic modality in children with dengue fever.

Materials & Methods: This cross-sectional observational study was carried out in the department of pediatrics of a tertiary care hospital. A total of 88 patients who were clinically and serologically (NS1 antigen/ IgM/ IgG antibody) diagnosed as dengue positive were included in this study. These patients also underwent USG abdomen and chest within the first week of the illness.

Results: Out of the 88 confirmed dengue cases, 56 (63.6%) cases were males. All the cases had fever (100%). Other clinical symptoms were vomiting in 64.8%, abdominal pain in 62.5%, bodyache 53.4%, Shock in 28.4%, headache in 48.9% and rashes in 23.9%. The USG findings were hepatomegaly (39.8%), gall bladder thickening (53.4%), splenomegaly (20.5%), pleural effusion (38.6%) and ascites (30.7%). Overall 65 (73.8%) out of 88 cases had one of the positive finding in ultrasonography.

Conclusion: Ultrasonography can be used as a first-line imaging modality in all patients with suspected dengue fever to detect early signs suggestive of the disease.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Dengue fever is an acute febrile infectious disease in subtropical and tropical areas that is progressively making its way from being "one of the great neglected diseases of mankind" [1] towards being acknowledged as one of the world's major infectious diseases [2]. In the last 50 years, incidence of dengue has increased 30-fold with increasing geographic expansion to new countries and from urban to rural settings. An estimated 50 million dengue infections occur annually and approximately 2.5 billion people live in dengue endemic countries [3].

Corresponding Author:- Dr. Sujit Mulay.

Address:- Junior Resident, Department of pediatrics, Bharati vidyapeeth university medical College and Hospital, Sangli.

The etiologic agents include all four serotypes which belong to the genus *Flavivirus* in the family *Flaviviridae*. The principle vector is mosquito, *Aedes Aegypti*, which breeds largely indoors in clean waters mainly in artificial water containers, and feeds on humans in daytime [4].

The clinical manifestations of dengue vary with the age and immunity of the patient. It can present as 1) In apparent infection 2) non-specific febrile illness, 3) classic dengue fever, 4) dengue hemorrhagic fever, 5) Dengue shock syndrome (DSS) and 6) encephalopathy and fulminant liver failure [5,6].

Guzman et al. studied to show that most cases present as classic dengue fever (DF) with high fever, retro-orbital pain, severe myalgia/arthralgia, and rash. However, in some cases, illness progresses to life-threatening dengue hemorrhagic fever/dengue shock syndrome (DHF/DSS), characterized by vascular leakage leading to hypovolemic shock and a case fatality rate up to 5% [7,8].

Hammond et al. [9] studied to show that preschool children and infants have rather more often nonspecific febrile illnesses while preadolescent children often develop fever and moreover younger children with DHF are known to experience more severe clinical outcome (e.g. higher case fatality ratio) than adults.

Early identification of patients at risk of developing severe dengue is critical to provide timely supportive care, which can reduce the risk of mortality to < 1% [10]. Distinguishing dengue from other febrile illnesses (OFIs) early in illness is challenging, since symptoms are non-specific and common to other febrile illnesses such as malaria, leptospirosis, rickettsiosis, and typhoid fever in dengue-endemic countries [11].

Positive serology (anti dengue antibody) is the mainstay in the diagnosis of DF. But serology takes approximately 7 days to give a positive result [12,13]. The diagnosis of DF is often delayed owing to time taken for availability of serology test results [14]. Ultrasonography (USG) is a cheap, rapid and widely available non-invasive imaging method [15,16]. Some authors concluded findings of hepatomegaly, pericholecystic edema, thickened gall bladder, ascites, pleural effusion (right sided/ both) and splenomegaly are early and significant markers of dengue, which can be confirmed by serology later on [17,18]. Several studies concluded that ultrasonography of the chest and abdomen can be an important adjunct to clinical profile in diagnosis DF and diagnosis can be made early in the course of disease compared with other modes of diagnosis [14]. It can be used as a first-line imaging modality in patients with suspected dengue fever to detect early signs suggestive of the disease prior to obtaining serologic confirmation test results, especially in a dengue fever epidemic area [17].

These findings may also occur in other viral infections and enteric fever but in other viral infections the historical profile, symptom complex evolution and physical findings do not mimic those of dengue fever [14]. Thus, the aim of present study was to evaluate the sonographic findings of dengue fever which may be useful as an early diagnostic tool.

Materials and Methods:-

Study Type & Area:-

A prospective observational study was conducted at Department of Paediatrics of a tertiary care centre during July 2014 to August 2016.

Inclusion Criteria:-

1. Patient between the age group of 0 – 18 years.
2. Patients with confirmed diagnosis of dengue fever (positive test for NS1 antigen/IgM dengue/IgG dengue).

Exclusion Criteria:-

1. Patient with serological test negative for dengue.
2. Patients having fever of more than 2 weeks duration.

Sample Size:-

Consecutive type of non-probability sampling was used for the selection of study subjects. A total of 88 diagnosed pediatric patients of Dengue fever admitted in our hospital were taken for study after informed consent from parents.

Study Methodology:-

All patients were admitted and treated as indoor patients. On admission, detailed history and complete physical examination findings were recorded. The vitals (temperature, pulse, respiration, blood pressure) of the patients were recorded on admission and thereafter till discharge. In all patients, complete blood count and serological tests for dengue (NS1 antigen/ IgM dengue/ IgG dengue) were carried out depending on duration of fever on presentation.

Following laboratory investigations were done in all patients on admission:-

1. Dengue NS1 antigen test/ IgM dengue antibody/ IgG dengue antibody- depending on duration of fever on presentation. All the three tests will be done by the ELISA (enzyme linked immunosorbant assay) technique.
2. Complete blood count (CBC) including platelet count.
3. Coagulation Profile
4. USG abdomen

Other investigations like liver function test, renal function test, S. electrolyte, X-ray chest/abdomen, blood culture, peripheral smear for malarial parasite were performed based on the clinical presentation.

Based on the investigation results, patients were classified into 3 categories as per WHO guidelines: Dengue fever, Dengue Hemorrhagic fever and Dengue shock syndrome. All patients will be treated as per WHO guidelines- Dengue guidelines for diagnosis, treatment, prevention and control [19].

Results:-

Out of the 88 confirmed dengue cases, 56 (63.6%) were males while 32 (36.4%) were females. Fever was present in all the cases, while other features were: vomiting (64.8%), abdominal pain (62.5%), bodyache (53.4%), shock (28.4%), headache (48.9%) and rashes (23.9%) (Table 1). Investigations revealed thrombocytopenia in 78.4%, hemoconcentration in 48.9%, raised liver enzymes in 68.2% while raised creatinine levels in 2.3% patients (Table 2). The ultrasonographic findings showed hepatomegaly in 35 (39.8%) cases, gall bladder thickening in 47 (53.4%) cases, splenomegaly in 18 (20.5%) cases, pleural effusion in 34 (38.6%) cases while ascites was seen in 27 (30.7%) cases (Table 3). Overall 65 (73.8%) out of 88 cases had one of the positive finding in ultrasonography. Final Diagnosis of Dengue was given in 15.9% cases while diagnosis of dengue with warning signs and severe dengue was given in 55.7% and 28.4% cases respectively (Table 4). Out of total 88 patients, 2 (2.27%) patients expired who were suffering from severe dengue.

Table 1:- Distribution of patients according to presenting complaints.

Presenting Complaints	N	%
Fever	88	100%
Headache	43	48.9%
Bodyache	47	53.4%
Rash	21	23.9%
Vomiting	57	64.8%
Abdominal Pain	55	62.5%
Shock	25	28.4%

Table 2:- Distribution of patients according to laboratory findings.

Lab Findings	N	%
Thrombocytopenia	69	78.4%
Hemoconcentration	43	48.9%
Raised Liver Enzymes	60	68.2%
S. Creatinine (> 1.2 mg%)	2	2.3%

Table 3:- Distribution of patients according to sonographic findings.

USG Findings	N	%
Hepatomegaly	35	39.8%
GB wall Thickening	47	53.4%
Splenomegaly	18	20.5%
Pleural Effusion	34	38.6%
Ascites	27	30.7%

Table 4:- Distribution of patients as per Final Diagnosis.

Diagnosis	N	%
Dengue	14	15.9%
Dengue with warning signs	49	55.7%
Severe Dengue	25	28.4%
Total	88	100.0%

Discussion:-

Dengue has become a major international public health concern in recent years [20]. It is emerging as one of the most important mosquito borne diseases in India. *Aedes aegypti* mosquitoes that transmit the disease breed in man-made containers such as tanks, pitchers, discarded containers etc. in which water has stagnated for over a week. Thus, the success of control measures have become a reflection of sanitation and hygienic practices achieved. The cases of dengue peak in the monsoon season in most parts of the country but have become perennial in the southern states and Gujarat [21,22].

Dengue has myriad clinical manifestations with unpredictable evolution and outcome. The disease typically begins with an acute febrile phase lasting 2-7 days and is accompanied by flushing, generalized body ache, myalgia, arthralgia and headache. Increased capillary permeability reflected by progressive increase in hematocrit heralds the beginning of critical phase at around 3-7 days of illness. Severe hemorrhagic manifestations and shock secondary to plasma leakage may occur at this stage. Leukopenia and declining platelet counts are also seen preceding this stage [23]. Serological diagnosis is confirmatory of dengue and includes direct methods such as virus isolation and NS1 antigen detection and indirect methods such as IgM and IgG antibody detection [24]. As serological diagnosis is not available in most of the places in a resource scarce country like India, sonography has an increasingly important role. Sonography is a readily available and cost-effective method for the diagnosis, which impacts the management of patients of dengue. The aim of present study was thus to evaluate the role of sonographic findings as early diagnostic modality in children with dengue fever.

In present study, male predominance was seen with 63.6% male cases to 36.4% females with male to female ratio of 1.74:1. In a study by Hema M et al. [25], the sex ratio of male to female was 1.32: 1, while in that of Srinivasa et al. [26], it was 1.13:1. The sex distribution is also consistent with previous study findings that dengue fever occurs more in male sex [22,24,27].

In present study, fever was present in all the cases, while other features were: vomiting (64.8%), abdominal pain (62.5%), bodyache(53.4%), shock (28.4%), headache (48.9%) and rashes (23.9%). In the study by Srinivas et al. [26], fever and vomiting were the most frequent symptoms. Similar observation was also seen in earlier studies [14,28,29]. Srinivasa also observed rashes in 10.5% cases while Ahmed FU et al [30] noted rashes in 12% of children.

We also observe thrombocytopenia in 78.4% cases while hemoconcentration and raised liver enzymes were observed in 48.9% and 68.2% cases respectively. In the study by Mittal Hema et al. [25], thrombocytopenia and hepatic enzyme derangement was present in 92.6% and 60% of the cases respectively. In the study by Narayanan M. et al. [31], serum SGPT levels were elevated in 59.7% of the total patients in whom the test was performed. Serum SGPT levels were elevated in 65% of DF, 63.6% of DHF and 66% of DSS patients. In the study by Aggarwal Anju et al. [32], serum SGPT levels were elevated in 57% of the patients in whom the test was performed.

The ultrasonographic findings showed hepatomegaly in 35(39.8%) cases, gall bladder thickening in 47(53.4%) cases, splenomegaly in 18 (20.5%) cases, pleural effusion in 34(38.6%) cases while ascites was seen in 27(30.7%) cases. Overall 65 (73.8%) out of 88 cases had one of the positive finding in ultrasonography. This clearly shows that Ultrasound can be used as an early, non-invasive and economical diagnostic tool.

In the study by srinivasa et al. [26], 72% of the cases had ultrasound findings in the form of either hepatomegaly or gall bladder wall thickening. The ultrasound findings showed gall bladder wall thickening in 30.5%. In a study by Quiroz-Moreno et al. [33] gallbladder thickening was seen in 86% of the patients, Sai et al. [14] observed in 56% patients while Thulkar et al. in 35.1% [34]. Setiawan et al. attempted to investigate whether gall bladder wall thickening measured by ultrasonography can be used to predict the onset of severe dengue fever. It is found that a

thickness of 5mm is useful as a criterion for identifying DHF patients at high risk of developing hypovolemic shock [35].

In our study pleural effusion or ascites was apparent on clinical examination in some of the cases. But sonography helped in diagnosing all of them. Similarly 15 cases of hepatomegaly and 11 cases of splenomegaly could not be diagnosed by clinical examination but were diagnosed correctly by ultrasonography. So this study clearly demonstrates the importance of ultrasonography in the accurate and complete clinical evaluation of dengue fever. All the cases which went into hypotension and shock showed gall bladder wall thickening, with moderate to severe pleural effusion and ascites.

Conclusion:-

Abdominal USG should be used as a first-line imaging modality in all patients with suspected dengue fever to detect early signs suggestive of the disease along with obtaining serologic confirmation tests.

Abstract

A research trial was carried out in the experimental field of Department of Horticulture, Khalsa College, Amritsar during the year 2015-2016 to evaluate some strawberry cultivars in sub tropical region of Punjab. The runners of five strawberry cultivars i.e.. Chandler, Tioga, Fern, Selva and Blackmore were planted at 30x40 cm apart on the raised beds at three planting times of mid October, end October and mid of November respectively. The design of experiment was Randomised block design (RBD) with factorial arrangement. The results of the study indicated that out of the cultivars tried, the strawberry cv. Chandler proved to be the best in producing maximum number of shoots, leaves, runners and flowers along with yield parameters while strawberry cv. Selva was the least among all these parameters. Out of the times of planting, middle of October proved to be the best in all the parameters.

Introduction:-

The modern cultivated strawberry (*Fragaria x ananassa* Duch.) is a hybrid of two largely dioecious, octoploid species, *Fragaria chelonensis* Duch and *Fragaria virginiana* Duch. Basically, it is herbaceous perennial and short day plant grows predominantly in the temperate climate. Strawberry is known for its pleasant aroma. It is amongst the few crops, which gives quick and very high returns per unit area on the capital investment, as the crop is ready for harvesting within six months of planting (Bakshi *et al.* 2014). It is a crop cherished by the growers of sub-tropical and temperate regions of the world due to its low cost of growing and high returns per unit area. It is widely, adapted in geographically diverse areas in world (Biswas *et al.* 2009). It can also be cultivated successfully under subtropical climate of Punjab (Dhillon, 2005). It is cherished in gardens and commercial fields with glamorous red, delicious with a unique shape, highly perishable fruit with a pleasant flavor. It is refreshing, nutritious soft fruit having a distinct tantalizing aroma (Sharma and Yamdagni, 2000). It is highly nutritious having a rich source of vitamins A, B, C and niacin, minerals like phosphorus, potassium, calcium and iron (Karkara and Dwivedi, 2002). It is utilized for the production of purees, juice concentrate, jams, preserves and rose red wine. Medicinally, strawberries have been known to kill certain viruses like polio, herpes and these may block the formation of nitrosamines, which can cause cancer, furthermore these contain relatively high quantities of ellagic acid, which has a wide range of biological activity only recently discovered (Rieger, 2006). The wide diversity of strawberry plant gives an idea of its potential for selection work. Choice of cultivars is of paramount importance for successful strawberry cultivation (Asrey and Singh, 2004; Ahsan *et al.* 2014). Selection of new stable strawberry cultivars for field condition can ensure better yield and quality. Considering above facts the present study work was undertaken with a view to determine the performance of different strawberry cultivars.

Materials and Methods:-

The present experiment was conducted in the nursery of Horticulture Department, Khalsa College, Amritsar during 2014-15. The runners of strawberry cv. Chandler, Tioga, fern, selva and Blackmore were planted. A unit of 10 runners comprising a treatment was planted in each plot, 30 cm apart on the raised ridges at three times of planting i.e. mid of October, end of October and mid of November taking care that the crown of the runners lies just at the surface of soil. The experiment was laid out according to randomized block design with factorial arrangement with three replications. The observations were recorded on vegetative, floral characteristics and yield parameters. The pooled data of both the years were analysed statistically.

Results and Discussion:-

Maximum shoot number plant⁻¹ (7.94 during first and 8.34 during second season) was counted in strawberry planted on end of Oct (T₂) during both the cropping seasons, it was followed by mid of Nov (T₃) and mid of Oct (T₁) in the first season which recorded 7.51 and 5.67 shoot number respectively and mid Oct (T₁) and (T₃) times in the second cropping season with 7.87 and 5.56 shoots respectively. The differences were found to be statistically significant. Maximum shoot number plant⁻¹ (8.05) was observed in cv. Chandler during first cropping season, it was followed by cvs. Tioga (7.95) and Blackmore (7.52) while the cvs. Fern and Selva recorded 5.95 and 5.73 shoot number respectively. In the second cropping season of study maximum shoot number plant⁻¹ (10.35 each) was counted in cvs. Chandler. It was followed by cvs Tioga, Blackmore and Fern with 8.10, 7.77 and 6.58 shoot number plant⁻¹ which was found to be at par with the former two cultivars and minimum shoot number per plant to the tune of 6.01 was recorded in cv. Selva. The differences were found to be statistically significant. The interaction between the time of planting and type of cultivars were also found to be statistically significant during both the years of study. In the first year maximum shoot number plant⁻¹ (9.11) was counted in cv. Blackmore planted during end of Oct (T₂) in the cropping season it was 10.00 in cv. Chandler planted on mid of Oct (T₁) and minimum (5.09) in cv. Fern planted on mid Nov (T₃). The varying shoot number may be due to the temperature variation, changing weather conditions which affects growth of plants. The variation in shoot number in different varieties may be due to the particular varietal character and their growth habits.

The time of planting and type of cultivars exerted significant effect with respect to the number of leaves per plant. Maximum leaf number plant⁻¹ (19.71 during first and 21.02 during second cropping season) was recorded in planting time of mid Oct (T₁), it was followed by end Oct (T₂) and mid Nov (T₃) planting time which recorded 19.46 and 18.69 leaf number during first season, 19.52 and 18.63 leaf number per plant respectively during the second cropping season of study. In the first year the differences during all the three times were found to be statistically at par with each other while in the second year of study the time T₃ showed statistically non significant differences. Maximum number of leaves (23.78 in first and 24.15 in second cropping season) were counted in cv. Chandler followed by cv Tioga (23.62 in first season and 23.84 in second cropping season) and cv. Blackmore (23.01 in first and 23.38 in second cropping season), while minimum leaf number (10.11 in first and 10.45 in second cropping season) was recorded in cv. Fern during both the cropping seasons. The differences were found to be statistically significant. The interaction between cultivars and the planting time were found to be statistically significant with regard to the leaf number plant⁻¹ during both the cropping season of investigation. Maximum leaf number plant⁻¹ (24.75 during first and 25.92 during second cropping season) was recorded in cv. Chandler planted on mid Oct (T₁) as against minimum (9.00 during first and 8.20 during second cropping season) in cv. Fern planted on end Oct (T₂) during both the cropping seasons.

The maximum leaf area 94.17 cm² during first cropping season was measured in runners planted on end Oct T₂ but during second cropping season it was 93.51 cm² in T₁. Leaf area produced by T₂ planting time remained at par with its following time of planting during both the cropping seasons and the differences were found to be statistically significant. Different cultivars also found effective in altering leaf area in both the cropping seasons of study, cv. Blackmore produced maximum leaf area (110.97 cm² during first and 110.35 cm² during second cropping season), it was followed by cv. Chandler with 107.86 cm² and 107.38 cm² leaf area in the first and second cropping seasons. Minimum leaf area was obtained in cv. Selva during both the years of study. The differences were found to be statistically significant during both the cropping seasons of study. The interactions between planting time and strawberry cultivars exhibited significant effects in both the years of investigation where the maximum leaf area 112.25 cm² and 110.38 cm² were produced by cv. Blackmore in end Oct (T₂) planting time. Variation in leaf area among different strawberry cultivars could be attributed to the fact that different progenies may have reacted differently to photoperiod, light, temperature and status of media (Darrow, 1966 and Tanaka and

Mizuta,1974).Hence, it seems that a negative correlation between these two character variable between these two variables coexists. According to Dhillon (2005) plant condition or environment or both affect these two variables differentially or independently.

In the first cropping season runners of T_1 planting took 177.0 days for runner formation which is significantly higher than the T_2 and T_3 plantings which took 164.0 and 155.0 days for runner formation. During the second cropping season significantly more (176.0) days were taken by runners of T_1 planting than T_2 and T_3 plantings which registered 164.0 and 156.0 days for runner formation. During both the cropping seasons cv. Chandler took minimum days (154.0 days during first and 152.0 days during second cropping season) for runner formation followed in line by cvs. Blackmore, Fern, Selva and Tioga which registered 162.0, 165.67, 170.0 and 175.0 days during first cropping season and 159.0, 164.4, 172.0 and 180.0 days for runner formation respectively. The interaction between time and cvs. were found to be non- significant statistically. The vast differences in the time of runner formation, runners plant⁻¹ in the various cultivars may be ascribed either a varietal character or genetic make up of the plants or both which affect the plants to react differently under the same agro-climatic conditions. The temperature of the site also affected the runner formation. These results are in line with the findings of Dhillon 2005 respectively.

Time of planting influenced number of runners emerged per plant significantly. Maximum number of runners (4.92) were counted in T_1 planting followed by T_2 and T_3 plantings which gave 4.51 and 3.33 runners plant⁻¹ respectively in the first cropping season and in the consecutive season, T_1 was also able to produce maximum (5.36) runners followed by T_2 and T_3 timings with 4.72 and 3.52 number of runners plant⁻¹. The difference during both the cropping seasons were found to be statistically significant. All the cultivars showed a great variation with respect to number of runners plant⁻¹ among each other. Maximum number of runners plant⁻¹ (6.25) were obtained in cv. Chandler, it was closely followed by the cvs. Blackmore and Fern during the first cropping season which gave 6.03 and 4.26 number of runners plant⁻¹ while cv. Tioga registered minimum (1.30) runners plant⁻¹. During the second season cv. Chandler produced 6.80 runners plant⁻¹ followed by cvs. Blackmore, Fern and Selva with 6.22, 4.42 and 3.73 runners plant⁻¹ while cv. Tioga registered minimum runners. Similar results have been reported by Athwal (1976), Singh (1979) and Singh (1982) under Punjab conditions which further confirms the results of the present study. The interaction of planting time and different cultivars were found to be statistically non- significant .

The data with regard to the number of days taken for flower initiation depicted that during first cropping season minimum average days taken for flower initiation were in the planting of T_3 (121.54 days) while the planting of T_2 and T_1 times taken little more time i.e. 122.14 and 122.61 days for flower initiation, but the differences were found to be statistically non-significant. During the second cropping seasons, time of planting T_3 also recorded minimum 121.73 days taken for flower initiation followed by T_2 and T_1 planting times which took 122.55 and 122.83 days. During both cropping season the difference were found to be statistically significant. It is obvious from the data that different cvs. showed appreciable differences in respect of number of days taken for flower initiation and the differences were found to be statistically significant during both the cropping season of study. In the first cropping season cv. Fern took minimum (120.53) number of days for flower initiation followed in ascending order by cvs. Blackmore, Tioga, Chandler and Selva with 121.34, 121.55, 121.79 and 125.31 days respectively. In the second cropping season again cv. Fern took minimum (120.68) days for flower initiation followed in ascending order in cvs. Tioga, Chandler, Blackmore and Selva with 121.41, 122.02, 122.15 and 125.61 days respectively. It was noted that during both the cropping seasons cv. Selva took maximum number of days flower initiation. The interaction between time of planting and cultivars was found to be non-significant statistically during both the cropping seasons.

The saplings planted during mid Oct (T_1) time took maximum days for flowering (118.88 days during first and 115.81 days during second cropping season) followed by end Oct times of planting with 97.16 days during first, 98.51 days during second cropping season while the time of planting T_3 registered 82.19 days during first, 87.22 days during second cropping season. The differences were found to be statistically significant during both the cropping seasons. In the first cropping season cv. Selva remained in flowering for 105.75 days followed by cv. Fern and Blackmore with 103.29 and 100.54 days of flower duration respectively and these three remained at par with each other while the cv. Tioga and Chandler recorded minimum 93.93 and 93.55 days duration of flowering. In the second year of study cv. Selva remained successive with having 103.81 days of flower duration and it was followed by cv. Fern and Blackmore with 102.51 and 102.41 days duration in flowering and likewise the former season of study these were also remained at par with each other and minimum duration of flowering was noted in cvs. Tioga and Chandler with 100.26 and 93.57 days respectively. The results of the present study are collaborated by the findings of Dhiman (2003). However, Dhaliwal and Singh (1983) while working on strawberry in Ludhiana

conditions, Beniwal *et al.* (1989) and Kidmos *et al.* (1996) in Denmark conditions recorded similar type of observations which confirms the findings of present study. The interaction between planting time and cultivars were found to be non-significant statistically during both the years of study.

The maximum number of flowers were registered during the mid Oct (T_1) planting time which was followed by end Oct (T_2) and mid Nov (T_3) during both the years. During the first cropping seasons planting time T_1 , T_2 and T_3 recorded 13.37, 13.27 and 13.15 number of flowers plant⁻¹ respectively and during the second cropping season the times of planting T_1 , T_2 and T_3 registered 13.41, 13.25 and 13.22 flower plant⁻¹ respectively, but the differences only in the first cropping season were found to be statistically non-significant. The kind of cultivar showed statistically significant differences with regard to number of flowers plant⁻¹ during both the cropping seasons. The cvs. Chandler, Blackmore, Tioga, Fern and Selva recorded 15.22, 15.14, 13.68, 11.18 and 11.08 number of flowers plant⁻¹ during the first and during the second cropping season, these were 15.35, 15.05, 13.73, 11.16 and 11.17 respectively, same pattern in the orderliness was noted with regard to the variation in the cultivars during both the cropping seasons. The interactions between time of planting and type of cultivars were found to be non-significant statistically during both the cropping seasons.

During both the seasons T_1 time of planting registered maximum number of fruit set plant⁻¹ (11.21 during first and 11.18 during second cropping season) followed by T_2 (10.79 during first and 10.83) during second cropping season and T_3 (10.53 during first and 10.56 during second cropping season). Significant differences were observed on number of fruit set plant⁻¹ due to the type of cultivars. During the cropping season number of fruit set plant⁻¹ were maximum in cv. Chandler followed by cvs. Black more and Tioga with 13.41, 12.43 and 10.31 number of fruit set plant⁻¹ while the minimum (8.73) number was recorded in cv. Selva, Same pattern of number of fruit set plant⁻¹ was observed during the second cropping season where the cvs. Chandler, Blackmore, Tioga, Fern and Selva registered 13.47, 12.40, 10.35, 9.31 and 8.74 of fruit set plant⁻¹. It was noted that the fruit set per cent was reduced with the planting time as the early planted saplings received the favourable climatic conditions but the saplings planted in the mid Nov faced the low chilling temperature rising temperature at the fruit set time which resulted in the complete necrosis of the developed fruit or the flower. Per cent fruit set of strawberry depends upon the agro-climatic field conditions of the place of there cultivation. Different research workers reported variability in the per cent fruit set of various varieties depending upon agro-climatic conditions of the area of cultivation. Singh (1982) reported maximum per cent fruit set of Pusa Early Dwarf followed by cv. Tioga under Ludhiana agro climatic conditions of Punjab. The variability in the per cent fruit set under Amritsar's prevailing agro-climatic conditions may be due to the effect of temperature and humidity of the area. The interaction between time of planting and type of cultivars was found to be statistically non significant.

The early plantation resulted in maximum yield then it showed descending trend with the late plantations during both the cropping seasons. In the first cropping season planting times T_1 , T_2 and T_3 registered 115.71, 104.32 and 83.34 g yield plant⁻¹ respectively and in the second cropping season it was 117.98, 103.35 and 81.05 g plant⁻¹ respectively and differences were found to be significant statistically during both the cropping seasons. It is also evident from the data that statistically significant differences were observed in the yield plant⁻¹ of different cultivar. The maximum yield plant⁻¹ to the tune of 137.15 g on average basis was obtained in cv. Chandler, cv. Blackmore with a yield of 116.47 g plant⁻¹ stood runner up, followed in line were cvs. Tioga, Fern and Selva with 109.18, 86.91 and 55.91 g plant⁻¹ yield respectively while during the first cropping season. During the second cropping season cv. Chandler registered 134.94 g plant⁻¹ yield followed by cvs. Blackmore, Tioga, Fern and Selva with 117.00, 106.25, 85.65 and 60.22 g plant⁻¹ fruit yield. Sharma and Yamdagni (2000) also reported cv. Chandler as high yielding cultivar amongst other cultivars and mentioned variability in the yield and marketable yield of strawberry fruits of different cultivars. The yield plant⁻¹ also decreased with the planting time. Similar observations on yield plant⁻¹ have been reported in different cvs. of strawberry by Singh (1982) and Sharma and Badiyala (1980). These results are in accordance with the findings of several research workers (Bedarad *et al.*, 1971; Lal and Seth, 1980; Hancock *et al.*, 1983). They found a strong correlation with fruit number per plant and weight with total fruit yield but in contrast Dhaliwal and Singh (1983) reported that higher yield of strawberry cultivars was due to number of fruits per plant which may be smaller and lighter in size. The interaction between cvs. and the planting time were found to be non significant during both the seasons of study.

The yield attributes of marketable yield were influenced significantly with the advancement in time of plantation during both the cropping seasons. The time of planting T_1 , T_2 and T_3 yielded 114.00, 103.18 and 81.26 g plant⁻¹ marketable yield respectively in the first cropping season and 117.33, 102.69 and 80.72 g plant⁻¹ marketable yield

during the second cropping season and differences were found to be statistically significant during both the seasons of cropping. The type of cultivars also showed their effect on the marketable yield of strawberry fruits during both the cropping seasons. The cv. Chandler yielded maximum marketable fruits to the tune of 135.71g plant⁻¹ and 133.31g plant⁻¹ during first and second cropping seasons. The cvs. Blackmore, Tioga, Fern and Selva followed the cv. Chandler by registering 114.65, 106.26, 83.46 and 57.31 g plant⁻¹ (minimum) marketable yield respectively during the first cropping season and in the second season these were 116.47, 106.68, 85.59 and 59.19 g plant⁻¹ (minimum) marketable yield respectively and the differences were found to be statistically significant. The interaction between the time of planting and different type of cultivars were found to be statistically non-significant during both the cropping seasons.

Table 1: Effect of planting time and cultivars on shoot number plant⁻¹ of strawberry.

Cultivar	2014-15				2015-16

genetic malformation, tumor.

Abstract

Introduction: Congenital abnormalities of the kidneys and urinary tract represented a spectrum of malformations often grouped under the acronym for CAKUT. Normal development of the kidneys and urinary tract is the result of the precise interaction, spatially and temporally coordinated, between two structures, the metanephric mesenchyme (which originates from the nephrogenic cord) and the ureteric bud (which originates from nephric duct or Wolff). Any alteration, it's genetic, environmental, or stochastic, which influence this process can result in kidney malformations and streets urinariedel present study is to evaluate in relation to clinical attention the incidence of risk in neoplastic 'association cancer and malformation. in adults

Materials end Methods: Male patient of 75 suffering from gross hematuria and hernia inquinal sn accompanied by dysuria symptoms, in heavy smoker instrumental ultrasound examination of the urinary tract showed a solid lesion in the posterolateral wall sn aggettante in the bladder lumen The uro-CT examination showed a " abnormality of the urinary tract development with ectopia crusade and merger of the two kidneys located alongside sn (fot, 3.4) of the renal pelvis are addressed before the district complete with double ureteral sn .In at the urethral meatus will highlight a focal thickening protruding into the lumen wall to finely irregular margins, with enhancement after contrast medium. (photo 5.6) the CT examination conducted in the chest (photo 7) confirmed the marked signs of emphysema, the anterior segment of the left upper lobe, in close relationship with bronchus and vessels segmented solid training in margins lobed (29x20 mm axial diameter approximately). At PET-CT accumulation of the tracer in the upper field of the left lung in the paramedian attributable to non-specific reactive process .Fig (8.9), then he performed genetic test that confirmed mutations in the PAX2

Results: The UroCT is the imaging examination with greater sensitivity and specificity. The limit lies in the poor ability to detect flat lesions non-invasive muscle. The urography has been almost entirely supplanted by UroTC. The current biomarkers do not have a sensitivity and specificity greater than urinary cytology, and The aromatic amines, NAT2 and NAT1 of tobacco smoking products, are considered the

main cause of the vesicula flexible cystoscopy cancer (Narrow Band Imaging) is being promoted as first-invasive test to be practiced in the patient suspected of having a bladder tumor. Uro-RM, similarly to what happens with the urography and CT, it is possible the study of the urinary tract, in order to seek sincrone. l'associazione urothelial lesions and tumors in malformations has prompted our research towards an evaluation genetics through genetic testing the result of which was the presence of a mutation in the PAX2,

Discussion: Renal abnormalities, according to the classification of Ridson, are divided into: number of anomalies, seat of anomalies, anomalies of form, abnormalities of differentiation, The presence of a double district pyelo-ureter. Observed in the patient was incomplete, with the two ureters who join before leading into the bladder through a common orifice, Figure 3 also the duplicity era asymptomatic, and was accompanied by a fusion anomaly: a horseshoe kidney. It was also present malrotation renaleuna genetic evaluation by performing genetic tests given to the search for possible correlation between cancer and malformation with oncological risk assessment identifies a heterogeneous set of tests designed to identify changes in the DNA sequences of the germline or of the products that are derived directly from the modification of transmissible genomic sequences .. the geographical correlation allows altresì to compare health risk levels allows you to answer the question whether there is a relationship between risk of death or birth defects as evidenced by numerous studies there is a risk increased cancer and malformations in the presence of high socioeconomic deprivation With increasing environmental pressure has been a steady trend in the health risk

Conclusions: Genetic testing can predict with great accuracy the future development of the health of a single individual in the presence of defects is necessary to provide genetic testing for the purpose of assessing the health of the individual. You can assume the major socio-ethical-legal implications for presymptomatic testing, the only genetic tests that can predict with certainty and in the future occurrence of a disease tests for clinical purposes provide information on the health status of subject. Those carried out for research purposes usually generate information that is not indicative of health status or genetic risks of the subject, but it is useful for the purposes of statistical or scientific research:

..... Introduction:-

Congenital abnormalities of the kidneys and urinary tract represented a spectrum of malformations often grouped under the acronym for CAKUT (Congenital Anomalies of the Kidney and Urinary Tract). These malformations can affect one or more urinary structures (kidney, ureter, bladder) and can occur in isolation or in various combinations in the same family or even in the same individual, the CAKUT includes alterations of the renal parenchyma, such as agenesis kidney or hypodysplasia (RHD), and ureteriche abnormalities, such as obstructive stenosis of the joint ureteropelvic junction (UPJO), duplication of the excretory system (DCS), the megaureter congenital stenosis of the joint uretero vaginal bladder (UVJO) and reflux ureteral vesicles (VUR) (1, 2,3,4). This anatomical classification is often not informative .The malformations of the urogenital tract are present in more than 20% of birth defects [5] and can be observed in greater than 1% of live births (6,7). The application of routine ultrasonography during pregnancy has led to an increase of CAKUT diagnosis in pre-natal period. when it occurs at birth or within the first year of life [8]. Children who survive have a mortality rate 30 times higher than children of the same age. Normal development of the kidneys and urinary tract is the result of the precise interaction, spatially and temporally coordinated, between two structures, the metanephric mesenchyme (which originates from the nephrogenic cord) and the ureteric bud (which originates from nefrico duct or Wolff). . Any alteration, it's genetic, environmental, or stochastic, which influence this process can result in kidney and urinary tract malformations. In family forms of

CAKUT, accounting for about 20-30% of cases, the disease segregates in an autosomal dominant form in this case the genetic model that agrees more with the epidemiology is attributable to mutations that give loss-of-function or isomorphic to alleles that produce moderate malformations without significant an impact reproductive fitness. In point monogenic forms an important role in the pathogenesis mainly due to malformations of the kidneys and secondary urianarie ways to mutations in the PAX2, TCF2, SALL1, WT1, SIX1, EYA1 and other genes [9]. These diseases are frequently diagnosed by extra-renal manifestations, which led to the re-evaluation of extra-renal disease of patients with these mutations, resulting in an improvement of the clinical treatment. The degree of clinical variability can in fact be partially explained by the interaction at the expense of three or more of the BBS loci. In fact, it is well recognized that individuals carrying the PAX2 gene mutations may have different phenotypes. This phenotypic variability is due to the fact that all of the urinary components derived from two embryological tissue, the metanephric mesenchyme and the ureteric bud, As a consequence, individual defects in each of these compartments may have a pleiotropic effect on the development of the entire section urinary. The determination of PAX2 [10]. it is also very important for the high risk of the association observed in 20% of patients with congenital anomalies of the kidney and urinary tract diseases and the neurocognitive development, recognition in utero of congenital malformations of the kidneys and urinary tract, give kidney and urinary tract the sentinel role for an early diagnosis can optimize and customize treatment strategies in children with risk of development of other disorders also involving the central nervous system. Finally. Other abnormalities include unilateral or bilateral renal malposition, duplication of the pelvis or ureters (double kidney district) and bladder cancers aim of this study is to evaluate in relation to clinical attention the incidence of risk in neoplastic 'association cancer and malformation . in adult.

Materials and Methods:-

December 2013 to January 2017 at the II Clinical Surgery and digestive surgery department of general surgery and specialized company Polyclinic II University of Catania presents to our patient observation CS male of 75 suffering from gross hematuria and hernia inquinaal sn accompanied by symptoms dysuria, in heavy smoker .The patient was subjected to study and instrumental diagnostic ultrasound of the urinary tract showed a solid lesion in the posterolateral wall sn contained in the bladder lumen size of about 19mm. (Fig 1 2)

Fig 1:- bladder neoplasm

Fig 2:- side elevation

The uro-CT scan showed an "abnormality of the urinary tract development with ectopia crusade and merger of the two kidneys located alongside sn (fot, 3.4) of the renal pelvis are addressed before the district complete with double ureteral

At PET-CT accumulation of the tracer in the upper field of the left lung in the paramedian attributable to non-specific reactive process .Fig (8.9), then he performed genetic test that confirmed mutations in the PAX2,

Results:-

Although there is no evidence to recommend a screening of the first level in the event of gross hematuria, during the consensus conference, the prevailing view (91%) is in favor of 'ultrasound. The sensitivity and specificity may reach 95% without exposing the patient to the risk of ionizing radiation, however, in the absence of scientific evidence about it, the prevailing view (94%) is that the outpatient preoperative cystoscopy in case of positive ultrasound can be omitted . The UroCT is the imaging examination with greater sensitivity and specificity. The limit lies in the poor ability to detect flat lesions non-invasive muscle. The urography has been almost entirely supplanted by UroTC. The current biomarkers do not have a sensitivity and specificity greater than urinary cytology, and The aromatic amines, NAT2 and NAT1 of tobacco smoking products, are considered the main cause of bladder cancer. THE observed patient is a heavy smoker with two neoplastic lesions in different venue. The recent introduction of multidetector CT equipment, has made possible one urinary multiphasic study, executable with higher resolutions both spatial and contrast, allowing the simultaneous evaluation of the renal parenchyma, vascular structures and the urinary tract, as well as all remaining surrounding abdominal structures. In fact it can be a method of imaging "one-stop-shop" that allows you to diagnose the possible cause of hematuria and, in the context of a bladder tumor, and perform an accurate local and remote staging. A methodology of rigorous study of the urinary tract includes at least four phases of acquisition (in basal conditions and in the arterial phase, venous and urographic, after intravenous injection of at least 120-150 ml of iodinated contrast material, with a flow rate of about 2 , from 5 to 3.5 ml / sec), a thin layer (layer thickness of 1-2.5 mm, with reconstruction interval of at least 0.6-2 mm) Fundamental, is also the integration of axial images with reconstructions two- and three-dimensional images, which represent the real added value of multidetector CT, allowing to overcome the inherent limitations axial imaging. (11,12) It is still in the process of validating the utility of virtual cystoscopy in the diagnosis of bladder cancer, which, however attractive method,

does not have to date a real added value in diagnostic terms, except in specific conditions (13,14), it could in fact be performed even in cases where the traditional cystoscopy is contraindicated or in the case of disease localized in a diverticulum. With Uro-MRI techniques, similarly to what happens with the urography and with CT, it is possible study of the urinary tract, in order to seek synchronous urothelial lesions. In this regard, the first developed technique is called "pyelography RM", in which the high weighing sequences in T2 provide imaging of a static fluid, which urine excretory renal axis, without the use of means of intravenous contrast. With these sequences, obtained both in inspiratory apnea with breath synchronization, the urine signal is enhanced by providing an image cast of the lumen of the urinary tract, while the consensual reduction until complete cancellation, the signal from the parenchyma and from the surrounding tissues, it helps to further maximize the signal. It is the ideal method for obstructive uropathy study with varying degrees of dilatation of the urinary tract. Subsequently, there was also the so-called "excretory urography RM", in which the visualization of the renal excretory tract is made possible thanks to the renal excretion of the paramagnetic contrast agent, in a manner entirely analogous to what occurs in conventional urography and in uroTC. As for the CT urography, the two- and three-dimensional reconstructions are performed for complete visualization of the urinary tract. It is a method to be considered as a valid alternative conventional or all uroTC urography for the evaluation of the urinary tract, even in the absence of dilation of the same and for the possibility to study the lesions even without use of contrast medium and in the absence of exposure to ionizing radiation the spread of flexible cystoscopy (Narrow Band Imaging) is being promoted as a first-invasive test to be practiced in a patient suspected of having bladder cancer. In the most recent literature is applied a new technique to Flexible cystoscopy: the NBI. The narrow band of light (narrow-band) is strongly absorbed by hemoglobin and penetrates only on the surface of the fabric, increasing the visibility of capillaries and other delicate surface structures through an auto resection of the bladder tumor, which was followed by a typing of lung lesion with a needle biopsy CT guided whose outcome he called a borderline malignancy (cancer) which resulted in correlation to patient age implementing a radiation therapy.

Discussion:-

renal abnormalities, according to the classification of Ridson, are divided into: number of anomalies, seat of anomalies, anomalies of form, abnormalities of differentiation, The presence of a double district pyelo-ureter. Observed in the patient was incomplete, with the two ureters who join before leading into the bladder through a common orifice, Figure 3 also the duplicity era asymptomatic, and was accompanied by a fusion anomaly: a horseshoe kidney. It was also present malrotation renale. fig 4 lower poles of the two kidneys are fused, before the aorta, to left over an isthmus formed by fibrous or kidney parenchyma tissue. The etiology is probably naturally from the union of the two early research nephrogenic blastema during migration. Kidney fused masses showed two excretory systems and two ureters, therefore the malformation was totally asymptomatic, occasionally diagnosed in the presence of haematuria. Capricious. combine is also the seat of anomalies such as renal malrotation a malformation asymptomatic, relative-frequent mind, caused by a partial rotation of the kidney during the medialisation process. The kidney took the form of an ellipse with goblets oriented medially. finally to complete the clinical picture was present also the ectopic kidneys, relatively frequent anomaly. asymptomatic and is manifested only if the renal parenchyma undergoes infections or compressing an abnormal blood vessel dilates the urinary tract. In this uniqueness it is associated the presence of a dual solid education on both the superior lobe closely related bronchus and vessels Fig 7,8,9 and another in the bladder trigonal fig 1,2,5,6. In presence of this association we have performed a genetic evaluation through the execution of genetic tests aimed to research the possible link between cancer and malformation with the cancer risk assessment. With genetic testing expression identifies a test diverse set designed to identify changes in the DNA sequences of the germ line or products which are derived directly from the modification of transmissible genomic sequences. often sick children have inherited the syndrome from parents who, being affected in less severe form, I'm not aware of. Genetic diseases are localized Sui chromosomes, or inside the cell nucleus, and are lined up and organized the genes. (15,16,17,18) A small proportion of genes is extranuclear, as present in the mitochondria (cellular organelles that are inherited from the mother). (19,20,21,22) The alterations of mitochondrial and nuclear genes and, often, the interaction with environmental factors, contribute to identify five main groups of hereditary diseases. a) Chromosomal. They originate from a change in the number or structure of chromosomes. b) Genomic. They are due to the loss or acquisition of a number of genes (often whole segments of DNA, DeoxyriboNucleic Acid, containing tens or hundreds of genes) from a specific chromosomal region. c) Single gene or Mendelian. Due to the mutation of a single gene. They are classified into autosomal diseases, when the gene is not located on the sex chromosomes, and X-linked, in the case in which the disease gene is localized in the female sex chromosome. (23,24,25,26) They are also divided into dominant and recessive diseases, depending on which is sufficient only one copy or two copies of the mutated gene to determine the disease. d) multifactorial or complex. They are due to the additive effect of genes and environment. e) Mitochondrial. They originate from the small

circular chromosome mutation present in multiple copies in the mitochondria. It is a relatively small number of diseases, mainly of neuromuscular interest. In asymptomatic family members, taking into account the psychological and legal implications, as well as medical, accompanying the presymptomatic diagnosis of hereditary diseases, it is necessary that the adoption of a special protocol, which provides for the implementation of an interview in the presence of the geneticist and psychologist.(27,28,29,30) of meetings with the patient and with the help of other specialists reflected on the benefits and risks arising outcome survey genetics, in particular effects on the reproductive and career choices. In order to ensure the autonomy of individual choice, in carrying out predictive testing, it is useful to program only in people older. During the counseling is important that we provide the most accurate information on the natural history of the disease and about the advantages and disadvantages of the tools available for the risk reduction, in order to help the patient to make the most appropriate choices in his case. (31,32,33,34) On the basis of personal and family history, or the finding of a mutation prognosis. Special attention is paid to predictive testing, targeted at asymptomatic relatives of patients with an inherited malformation. The first mutational event (M1), which predisposes to the development of the tumor and / or malformation, is due in most cases to truncating mutations: nonsense mutations or deletions / insertions frameshift, located in exons of the gene. genotype-phenotype correlation studies have shown that usually individuals with large deletions of the gene develop a milder phenotype, compared to individuals with other types of mutation with total loss of protein function.(35,36,37,38) The second mutational event (M2) is represented by mitotic recombination (50%) 16, non-disjunctions, with or without duplication (about 40%), microscopic and submicroscopic deletions, point mutations, and inactivation of the gene (10%). The second mutation occurs more frequently than the first 94, and is more sensitive to environmental factors, especially those that determine chromosomal rearrangements, such as ionizing radiation. correlation between the clinical features and the parental origin of the deletion Genetic counseling as part of hereditary diseases or defects, is set up as a communication process, which aims to bring home to patients and their families, the information relating to the characteristics of disease, methods of transmission, the risk of recurrence and possible therapies, including reproductive options, which are relevant to their condition.(39,40,41,42) Key Features of genetic counseling is to not be directed to the whole family, and not having in any way influence the decisions of family members. (43,44,45,46) The identification of the mutation allows you to extend the analysis to other family members and therefore identify, in a short time, those who are at risk of developing the disease and pass it on to their offspring. In cases where the molecular analysis does not identify a constitutive mutation in the gene it should emphasize the need for close monitoring. The geographical correlation allows also to compare health risk. It allows to answer the question levels if there is a relationship between risk of death or birth defects as evidenced by numerous studies, there is an increased risk of cancer and malformations in the presence of high socioeconomic deprivation. With increasing environmental pressure has been a steady trend in the health risk. The risk of congenital malformations, respectively increases, by 54%, and 83% significantly higher. The correlation study also shows that the total mortality grows on average about 2%, in both sexes, from a more environmental pressure category to the next in higher pressure with a statistically significant trend showing an increase of excesses of congenital malformations with increasing hazard (47,48,49,50)) the clinical diagnosis therefore can be confirmed by molecular examination in 75% of patients. They are reported genotype-phenotype correlations in the field of clinical expression of patients with mutations in specific genes. Some genetic disorders can have partially overlapping clinical manifestations and can then ask for differential diagnosis in the diagnostic process underway. Many human hereditary characters are distributed in families proportionally different from those expected by Mendelian characters.(51) As the patient examined the interaction between genes and the interaction between genes and environment have changed the expression of a phenotype. (Heavy smoker, birth defects, presence of mutation, economic deprivation) Some human diseases have a polygenic inheritance and / or multifactorial. In these cases the hereditary transmission is not easily recognizable family tree. Many birth defects and many common adult diseases are inherited as discontinuous multifactorial traits. The susceptibility factors to a discontinuous multifactorial phenotype in the population are distributed according to a normal curve, which predicts that only a few subjects have a small number or, respectively, high susceptibility factors, while the majority has an average number of factors. The discontinuous phenotype occurs only when the number of susceptibility factors exceeds a threshold value empirically defined. At the manifestation of the phenotype contribute genetic and environmental factors. The relatives, who share with people with a number of genetic susceptibility factors is proportional to the degree of consanguinity, have a relatively higher risk of developing the same phenotype. The assessment of the risk of recurrence is more complex than the illnesses.

Conclusions:-

Genetic testing can predict with great accuracy the future development of the health of an individual. They concern both the subjects in good health as those with symptoms of a disease, and may have profound repercussions for relatives of the person who is subjected to a test. Therefore, it is important to provide an adequate level of support for the patient and his family before proposing a genetic test and to communicate the results. With the progress of scientific knowledge on the complex genetic traits and their influence on the phenotype, genetic tests are undergoing an evolution that tends to shift their scope from traditional medicine to the molecular. They always cover the most complex traits rather simple, and their sphere of relevance will move from the family to the individual; for diagnostic and preventive services that will be in addition to those of the risk determination and the predictive; the methodology will shift from the analysis of chromosomes and genes to the genome; the genetic research clinical protocols will be oriented more clearly towards complex diseases. In the presence of defects it is necessary to provide genetic testing for the purpose of assessing the health of the individual. You can assume the major socio-ethical-legal implications for presymptomatic testing, the only genetic tests that can predict with certainty and in the future occurrence of a disease tests for clinical purposes provide information on the health status of subject. Those carried out for research purposes usually generate information that is not indicative of health status or genetic risks of the subject, but it is useful for the purposes of statistical or scientific research. Understanding the reasons for the functioning of our body with the understanding of the mechanisms of disease does not lead directly to a cure, but produces useful materials in studies focused on therapeutic perspectives. To understand well the role of the environment, complementary to that of the genes

Abstract

Hydroquinone has been used for decades as a skin lightening agent. However the use of excessive concentration of hydroquinone in cosmetics poses skin problems hence was banned. Four cosmetics samples were sampled from the local market of Sangamner Tehsil, District Ahmednagar (M.S.), India. The labels on the packages did not indicate the presence of hydroquinone.

Hydroquinone can be quantitatively oxidised using mild solution of H_2O_2 in presence of catalytic amount of Fe^{+3} and the quinone is quantitatively estimated using Systronics Visible Double Beam Spectrophotometer Model-1203 at 363 nm. The samples are found to contain 0.08641% to 0.11666% w/w hydroquinone and are said to be safe.

Introduction:-

Tyrosine is the precursor for the synthesis of melanin. Tyrosinase is the key and rate-limiting enzyme responsible for the conversion of tyrosine into melanin by melanocytes in human skin^{1,2}. Many compounds that bind to the tyrosinase active site and inhibit melanin synthesis have been developed as agents to lighten skin color, including hydroquinone³. Hydroquinone is indicated clinically as a 2-5% ointment for the gradual bleaching of hyper-pigmented skin in conditions such as melasma, freckles and senile lentigines as well as chloasma⁴. Hydroquinone based products could be potential carcinogens as most of the benzene metabolites and derivatives are health hazards⁵. The U.S. Environmental Protection Agency has not established a reference dose (RFD) for hydroquinone. However EPA has calculated a provisional RFD of 0.04mg/Kg/d, hence there is no occurrence of chronic, non cancer effects of this dose but as the amount and frequency of exposure exceeding the RFD increases, the probability of adverse health effects also increase⁶. So it has been recommended to ban in cosmetics. Several analytical methods for the determination of hydroquinone in skin preparations (cosmetics) are described, including High Performance Liquid Chromatography⁷⁻¹⁰, Capillary Electrochromatography¹¹ and other Spectrophotometric techniques¹²⁻¹⁶.

The aim of the present study is to quantify the hydroquinone in some popular kinds of whitening creams in local market of Sangamner tehsil, District Ahmednagar, (M.S.) India.

Materials and Methods:-

Instrument:-

The absorbances were measured using Systronics Visible Double Beam Spectrophotometer Model No.1203 with 1cm rectangular quartz cells.

Corresponding Author:- Bharati Kiran Tukaram.

Address:- S. N. Arts, D. J. M. Commerce & B.N.S Science College, Sangamner-422 605 India .

Chemicals and Reagents:-

All the chemicals used were of analytical reagent grade. Distilled water was used for the preparation of all solution. 100 ppm Standard solution of hydroquinone was prepared in water. 10 ppm aq. Fe^{+3} in the form of FeCl_3 were used as a catalyst and 0.6 % solution of H_2O_2 was used as mild oxidising agent.

Procedure for Spectrophotometric Determination of Hydroquinone:-

2, 4, 6 & 8 ml of 100 ppm hydroquinone were added into a series of labelled test tubes. To each tubes, 5 drops of Fe^{+3} and mild solution of 2 ml H_2O_2 were added. The contents were mixed well and heated in water bath at 100°C for 20 minutes. The solutions were cooled at room temperature and diluted to 25 ml using distilled water. The absorbances were measured within the stability period of 3 hrs at 363 nm against reagent blank (Table 1). A calibration plot was obtained by plotting Absorbances versus ppm of Hydroquinone.

Estimation of Hydroquinone in Cosmetics Creams:-

2 g. of each sample was boiled with distilled water and contents were filtered through Whatmann No.42. This filtrate was diluted to 25 ml with distilled water. Into a series of labelled test tubes; 2, 4, 6 & 8 ml of diluted sample solution was added. To each tube, 5 drops of Fe^{+3} and mild solution of 2 ml H_2O_2 were added. The contents were mixed well and heated in water bath at 100°C for 20 minutes. After heating, the solutions were cooled at room temperature and diluted to 25 ml using distilled water. The absorbances were measured within the stability period of 3 hrs at 363 nm against reagent blank (Table 2).

Results:-

The hydroquinone content of each sample was deduced by extrapolation at corresponding Absorbance from Standard Curve (Table 3). The results of spectrophotometric analysis confirmed the presence of hydroquinone in four samples having varying levels. All the four samples contained less than 2% hydroquinone which is permissible limit given by WHO.

Table 1:- Absorbances for oxidation product at different concentration of HQ (Standard solution)

Sr.No.	mL of 100 ppm HQ	Drops of Fe^{+3}	mL of H_2O_2	Dilution (mL)	Absorbance
1	2	5 drops	2	25	0.044
2	4	5 drops	2	25	0.166
3	6	5 drops	2	25	0.296
4	8	5 drops	2	25	0.311

Table 2:- Absorbances for oxidation product at different concentration of HQ (Sample solutions)

mL of sample	S_1	S_2	S_3	S_4
2	0.115	0.075	0.066	0.077
4	0.158	0.206	0.102	0.135
6	0.162	0.249	0.175	0.327
8	0.219	0.293	0.212	0.407

Table 3:- HQ content of samples deduced from Standard Curve

Sample	HQ in Working solution (ppm)	HQ in Sample (% w/w)
1	72.72	0.0909
2	93.33	0.1166
3	69.13	0.0864
4	86.15	0.1076

Conclusions:-

1. In the present study, we developed a new method for quantitative estimation of hydroquinone in cosmetics samples. Mild solution of H_2O_2 was used for oxidation of hydroquinone to quinone in presence of catalytic Fe^{+3} .
2. Although there is no adequate warning on product labels about the levels of hydroquinone present, this work revealed that the four collected samples of beauty creams from the study area contain 0.08641 % to 0.1166 % w/w of hydroquinone and hence are said to be safe.

Acknowledgment:-

We are thankful to Principal Dr K.K.Deshmukh for providing the facilities and motivation.

Key words:-

Parental choice, quality education, discipline, safety, public and private school

Abstract

In recent times the number of public and private schools has flourished in all the states of the country, including Uttarakhand and thus the idea of school choice between government schools vis-a-vis public/private schooling has received considerable attention in the minds of the parents. Consequently the trend to send children- son and daughter towards English speaking private schools has grown significantly amongst middle and lower-middle income group families. This has mainly arisen due to the growing awareness on the quality aspect of education. Since private schools are expensive, therefore, cost of schooling does influence girl's schooling in India. The gendered nature of parental choice in the context of schooling is known to play some role; this aspect has not been considered in any of the studies undertaken in this region of the country. Hence a field study/survey has been undertaken in rural areas of Almora district in Uttarakhand comprising, four selected blocks, focusing on some case studies, with a view to understand the attitudinal change of parents on the choice of schooling for their daughters irrespective of their family status like identity and financial conditions, parental education, caste and gendered nature particularly in reference to their daughters.

This study reports a current growing concern not only among urban parents but also amongst parents in rural areas who realise the importance of quality education for their children. Appropriately, a growing trend has emerged to send their children, including daughters to private schools. A close analysis of interviews with students, parents and teachers reveals that educational choice exercised in these middle or lower middle income group are connected with issues of marriage, self dependent (job), or gendered norm of conduct (like discipline, honesty). Apart from considerations of costs, gendered ideas of school proximity, quality education, security and disciplines are of prime significance in their choice of high school for children and particularly for daughters.

Introduction:-

'Choice' is a relative term and at times be deceptive. Choice is generally exercised keeping in mind several thoughts and/or constraints in actual situations. Hence it is used as a tool to examine the complex dynamics of social life (Goswami, 2015). The idea of school choice between government schools vis-a-vis public/private schooling is changing in the minds of the parents. The conception of the social space in which parental choice of school is generally exercised has been questioned. At the same time framing of issues in individualistic terms of consumptions at the expense of social process of choice can be debated. On the other hand some scholars have pointed out how the capacity of, and the inclination towards, making choice vary with class based and gendered practices of parenting (Bowe et al. 1994; Reay, 1996, 1998; Ball and Vincent, 1998; Sarangapani and Winch, 2010).

It must be mentioned that relatively few studies have been conducted in India on the class and gendered nature of parental choice in the context of school market expansion (Goswami, 2015). It has been reported that a larger proportion of boys as compared to girls attend private schools, since private schooling involves higher investment (De et al., 2011). Although the cost of schooling do influence girl's schooling in India, nevertheless, it does not give a full account of the multifarious ways in which class, gender and community identity is reflected in specific situations (Goswami, 2015). Some studies have, however, examined family strategies of schooling across class and presented situations where girls, instead of boys, are sent to high cost private schools (Chopra, 2005; Nambissan, 2010).

The concept of choice needs to be examined in a social context which necessarily is interaction of class, caste and gender (Goswami, 2015). Debates on school choice have gained attention in the South Asian context in recent years, especially in reference to the category of the urban poor (Alderman et al., 2001; Tooley, 2009). Expansion of private school in urban India has occurred in recent times and some scholars have presented evidences that indicate acts of resistance by the poor against the state controlled bureaucratic education system that generally fails to deliver quality education (Tooley et al., 2007; Tooley, 2009). In this context, some studies have highlighted the need to understand the social context of schooling in South Asia and have found flaws with the quality of low-cost private schools (Sarangapani, 2009; Sarangapani and Winch, 2010). Further, some scholars have also focused on the class strategies made by relatively well off group of people to convert their economic capital into cultural capital. Although Nambissan (2010) has reviewed the reproduction of educational advantages produced by middle classes in India, however, while highlighting the class aspect of family strategies, many of these have tended to over look the fact that the schooling process itself is shaped by and is constitutive of gender relations in a family setting (Goswami, 2015).

Low-cost private schools appear to provide the necessary numbers, quality and security to parents concerned about girls' education (Tooley, 2009). While providing an account of private schools for the poor in Kenya, China and India (Hyderabad), he documents narratives of parents concerned about quality education and safety of their daughters, and mentioned that parents relied more on low-cost private school for these reasons. These narratives of *parental* choice for girls' education show them simply as urban poor devoid of any history and social identity (Tooley, 2009). Another aspect which requires attention when analysing the parental preference is to examine the dynamic of class, caste ethnicity and gender in a particular social setting. While examining the girls' education in a village in Rajasthan (Hill et al., 2011) the issue of parental choice beyond that of an expanded school market was envisaged through a study of class and caste relations in a village. However, in this study by Hill et al. (2011) the gender issue was examined based on only cost of school and attempt to address the variation in gender norms by class and caste groups was not made. Further, only limited studies have attempted to examine the schooling patterns in light of the advances made in feminist scholarship in family and kinship studies (Chanana, 1993). Gender concerns regarding schooling in India are often expressed through macro indicators of gender gaps in dropouts and enrolments of students from various categories (Govinda and Bandopadhyay, 2012). However, as mentioned by Goswami (2015), nuanced investigation of gendered process implicated in the schooling process and situated in family context is rare.

Family aspects also play an important role in schooling. Thus at the family level, decisions regarding the future roles of children are deeply influenced by hierarchies of sex and age, and ideologies of conduct which shape gendered identities of young men and women. These identities are reflected differently in a plural society where different communities have their own ways of preparing young generation for adult roles (Goswami, 2015). In South Asian societies, the upbringing of children is marked by gender ideologies of seclusion and segregation (Dube, 1997). In the Indian context, Chopra (2005) provided the linkage of educational choices with particular acts of feminine

identity constructions to gain access to globalised marriage market among land owning caste families in agrarian Punjab. Further, linkage between family structures, gendered norms of marriage and girls' schooling have been reported by several workers (Chanana, 1993; Seymour, 1999; Manjarekar, 2003; Hasan and Menon, 2005). However, the implications of linkages between ideologies of sexual segregation and educational choice have not been examined in the context of the expansion of school market in recent years (Goswami, 2015).

In this article a survey has been undertaken to understand the attitudinal change of parents for the choice of schooling for their daughters irrespective of their family status like income, parental education, caste and gendered nature. The first part of the article reviews/discusses on preference of schools, i.e. school choice; the second part describes the study/field site and the methodological approach adopted for the empirical study involving a set of students and their parents located in the rural area in Almora. The third part dwells with the various cases studies, focusing on the gendered nature of choices and constraints, regarding schooling options negotiated by parents and children at different stages during schooling.

Methodology and Field area:-

Over the past few decades the number of low cost private schools in the country has markedly increased. Studies have indicated that even lower income group families are moving away from government schools to private schools in rural areas (Hill et al., 2011). But one must acknowledge the fact that there is a wide category of private schools which widely vary in their human and physical resources and in their degree of independence from the state (Goswami, 2015). In the hilly areas of this country the number of private schools could be noticeable right from the time of post-independent days but these were for mostly upper class families. But in recent times large number of low costs private schools have flourished. In rural areas of Uttarakhand too, many private schools both at the primary and secondary levels, are growing very quickly in number. Consequently the trend to send children- son and daughter towards English speaking private schools has grown significantly amongst middle and lower-middle income group families.

The study was conducted in the state of Uttarakhand where the literacy rate increased from 71.62% in 2001 to 78.82% in 2011, with 87.40% for male and 70.00% for female. The overall literacy rate of 78.82% is higher than the national rate of 74.04% (in 2011). The field survey was conducted during September 2013 to May 2014 in Almora district, Uttarakhand which comprises of 11 blocks (Bhasyia-chhana, Bhikyasen, Chaukhutiya, Dhaula Devi, Dwarahat, Hawalbagh, Lamgarah, Saalt, Syalde, Takula and Tarikhet) and the corresponding forest area. Based on the female literacy rate, the blocks were arranged into two categories, i.e. high and low (source: Vikas Bhawan, Almora, Govt. of Uttarakhand; based on Census of India, 2011). Since the female literacy rate in rural areas of Almora district is 67.88%, blocks with literacy rate up to 67.88% were categorized under 'low level' while the blocks with literacy rate of above 67.88% were placed under 'high level' of literacy. Thus from each of these categories, two blocks each, i.e. with lowest and highest literacy rates, comprising a total four blocks, namely, Dhaula Devi (60.67% literacy rate; 35 km from Almora), Lamgarah (64.09%; 33 km from Almora), Hawalbagh (73.69%; 14 km from Almora), and Tarikhet (74.04%; 56 km from Almora) were chosen. The location of these sites (in map) and their geographical position, area, population, literacy rate, etc. in these four different blocks selected for the study have been detailed earlier (see Nandi and Joshi, 2015).

The principal occupation in the rural areas of Almora district is cultivation, cattle rearing, poultry farming, small scale business, and wage labour. More recently there has been an expansion of economic opportunity in the informal service sector like semi-skilled labour or driving. Most of the families are nuclear but vary in size according to number of children. In some of the families, the mother also worked to supplement the family income. Most families relied on wage work combined with seasonal cultivation and cattle farming to supplement their income. Majority of the parents had basic literacy education through primary or secondary schooling. In a few cases (particularly fathers) were found to possess higher secondary and above, while in some mothers never attended any school.

Information relating to geographical position, area, population, literacy rate and number of school/college of under different blocks/sites in Almora district selected for the study has been provided earlier (Nandi and Joshi, 2015). A brief description of the four blocks is given below:

Lamgarah Block:-

Lamgarah block head quarter is located about 33 km from Almora town. Most of the area is situated in a hilly mountainous area (Figure 1) and the overall economic condition of the people residing is quite poor with a number

of people living below poverty line. Majority of the people living in this block, work as daily wage labourers. Lamgarah block is an under developed area; when the male and female literacy rate is compared, female literacy rate is much low (64.09%).

Hawalbagh Block:-

Hawalbagh, the block headquarters, nearest to the Almora town among all of the selected blocks, situated about 14 km from Almora town, is a relatively developed block with a population of 67,447. River Kosi, the main source of water for Almora town runs just below the area; the forest area is relatively less and with small scattered habitation. The people are mainly engaged as daily wage labour or carry out small business. It is well connected and walking distance from the Almora-Kausani and Almora-Ranikhet highway. The overall literacy rate of this block is good and the female literacy rate (73.69%) is well above the district's female literacy rate (69.93%).

Dhaura Devi Block:-

Dhaura Devi block is situated about 35 km from Almora town on way towards Jageshwar temple, historically an ancient temple of Lord Shiva; also called one of the twelve Jyotirlinga temples. The block has a population of 60,620 with a total literacy rate of 73.01%, and a female literacy rate of 60.67% which is lowest in rural Almora. Thick forest with small habitation is scattered in the block (Figure 2). The block has the largest area of 324 sq km among the four selected blocks but is most back ward as far as the female literacy rate is concerned.

Tarikhet Block:-

Tarikhet, a well developed block as far as literacy rate is concerned, is situated about 56 km away from Almora town. It is well connected to most of the important places of the state but is far away from Almora town (Figure 3). It has highest female literacy rate of 74.03% among the selected four blocks in rural areas. The well known Dwarahat Engineering College (now Bipin Tripathi Kumaun Institute of Technology) is located about 43 km away. The Army Cantonment area, based in Ranikhet town, is only 14 km away. The remarkable literacy rate of 88.75% can be attributed to the presence of the institution (Army base) and several schools in the area.

The criteria for selection of respondents was only the girl children aged between 6 to 18 years (excluding married, widow and divorce) with their parents (without any caste, race or creed) in order to get a complete range of information. The sample is representative of various variables like age, standard or class, family, financial condition, parental education, and parental attitude of the respondents. The sample consisted of only school going students of various types of school (Government, Private and Under schemes).

Information was gathered through in-depth interview and conversation with students, some parents and teachers. It comprised of questions on socio-educational and demographic characteristics as well as on various aspects related to educational choices in these families. For parents, apart from expenditure, considerations of proximity, security, discipline and quality education (mostly English medium) are of prime significance while discussing their choice of school for children.

All the interviews were basically conversation of educational patterns and their future plans of their children. In order to gain rapport with the respondents I gave a brief introduction of myself and explained the actual purpose of the study. I also assured them about the importance of their contribution and promised them to maintain confidentiality. In order to make the interviews more efficient they were conducted in a lonely place where no other person was present. Initially interviews started with common general talk and when the respondents were comfortable then proceeded to the actual questioning. Despite the initial inhibition, the girls gradually adjusted to the interview situation and appeared to enjoy talking and sharing their experiences.

The interviews were conducted in Hindi depending on understanding of the respondents (all dwellers of the block) and on weekdays in the afternoon, except interview with the male teacher and office staff of G.I.C in Tarikhet blocks. Later I translated the interviews in English. This study draws primarily on data collected from a set of students and their parents; it also relies on the secondary data from state government office and case studies undertaken in four blocks.

Field experience and case studies

In order to understand the reasons why the parents exercise a choice of schooling in different blocks undertaken in the study, several criteria emerged from the discussion. Three themes, as observed by Goswami (2015) in a recent

study in Assam, also emerged from the interviews of this investigation; these are costs, security and discipline. Therefore the case studies are broadly grouped under these 3 groups.

1. Cost of schooling:-

In the given familial context, strategy about school may be conceived of as consisting of a range of actions regarding beginning continuing switching and discontinuing school attendance. Some of these identified limited resources in terms of net income and provision of low-cost schooling. It is important to note that in many families, expansion of educational provision through the government seems to have made the choice of schooling much easier for the present generation of children as compared to their parents. The majority of the parents said they themselves did not have as many facilities such as free meals, uniform, and books; moreover even the school infrastructure was reported to have been very poor, and they had to sit on a mat and the roof was not 'pucca'. The costs of the schooling of children continued to be a common concern within family. The costs included not only school fees, but many other expenses like transportation, stationery requirements, uniform other items (Goswami, 2015). However, the time and situation has gradually changed in the last two decades. The parents are quite concerned about not only education, but also the quality of education for their children, equally for both sons and daughters. When it comes to schooling decisions within a family, costs are not merely calculated in monetary terms, and even when they are, the calculations are not same for every child in the family. The small family with stable income are more interested about quality higher education for their children. Besides the formal school education they want their children be smart, disciplined, honest, and able to speak English. Therefore, they are extremely selective about the choice of schooling for their children, not only for boys but equally for their daughters. They have felt that they would not be able to fulfill their desire through government schools. These experiences made them attracted towards private or public schools. The following cases from the different categories of family with contrasting experiences somewhat reveal these complexities.

Case 1 (Lamgarah block):-

I interviewed Sri Madan Singh Bisht, a resident of Lamgarah. A home maker wife with two sons and three daughters, Sri Bisht is an owner of small grocery and stationery shop cum tea stall. With a monthly income ranging between Rs. 5000-7500 (Lower middle income group) he takes sufficient care of his children in education. Due to lack of degree colleges in the area both the first and second daughter are enrolled as private students studying Bachelor of Arts (1st year and 3rd year, respectively). Although a new degree college has started recently but due to insufficient number of teachers, the student enrolment is quite less. The third daughter (a student of class 10) attends a nearby Government Inter college. In contrast, his two sons have been admitted in a nearby private school (Upper primary). During survey it was noted that there are a few other private schools in Lamgarah block. He said that due to financial constraint he cannot afford to support the third daughter to private school due to higher school fees, nevertheless, he has arranged private tuition for her. He highlighted that his wife completes domestic work on her own and occasionally, if required absolutely, calls her daughters in helping her. Sri Bisht and her wife want that all their daughters continue studies up to graduate level and above, and dreams that after completion of daughter's education they will take up jobs and enjoy their independence.

While discussing about the quality of education, he indicated that although there are a number of Government Junior schools in the block but student enrolment is very less compared to private schools. The number of student is around 50 in a government school while it is 300-400 in private schools. He also mentioned that presently there has been a growing trend among parents to send their children to private schools where children are taken care and given more attention. In general, it was understood that parents do send their children (of both government & private schools) weak in studies, for private tuition to local teachers who charges fees between Rs 200-250 per month.

Thus it is clear that there has been a gradual change in the attitude of parents who pay sincere effort to educate their children thus fostering educational development.

Case 2 (Hawalbagh Block):-

The survey revealed that people of this block are quite serious about education and ensure that every child goes to school. During interview in one of the villages of the block, i.e. in village Mahetgaon I met Mrs Seema Negi (B.A.), a primary school teacher of a private school located in Gwalakot village (Figure 4). The school, run by an NGO, is Upper Primary (up to 8th standard) and 10 km away. Mrs Negi is mother of two children- a son (3 years old) and a daughter (6 years old) who are students of LKG and class 1, respectively in the same school. She and her children have to put in some effort since they live at the top of the hill, about 2 km from the main road. Both the children

accompany her in a school bus owned by the same NGO. She appreciated the bus facility and said that without transport it would have been very difficult for her going to school with two little kids. The bus service provided by the school makes easy for her and many students of that area. She is a caring mother with no mental bias between her son and daughter, and therefore has admitted both of them to the same private school. Education, according to her is the right of a child and duty of parents is to provide good education to their children; whatever demands the children put forth, efforts must be made to fulfill it. Mrs Negi lives in a nuclear family and is of the opinion that one can take care of the family in better manner than a large family. She said that as proper upbringing of children is extremely important, therefore, the number of children should be restricted. Another girl student (of class 2) of the same village is being escorted by Mrs Negi in the same school bus (Figure 4).

Case 3 (Hawalbagh Block):-

While discussing with Mrs Negi it was noticed that a person was listening to our conversation very carefully. On interacting with him, Sri Surinder Singh Mehta, owner of small road side tea shop has a different story to tell. He informed that with a monthly income of little more than Rs 5000 (Lower middle income group) he is making sincere efforts to make a decent living. His two children, a son (15 years old & student of class 9) and one daughter (17 years old & student of class 11), attends Government Inter College located in Chaura, about 3 km walking distance from his home. He said that his daughter wants to join Polytechnic after completion of her intermediate studies.

According to him expenditure in a private school is much higher than in government school. In general most villagers want to send their children to Private school since personal attention to students is lot better and facility like school bus is also available. He mentioned that student enrolment in private schools has increased considerably. However, he admitted that with little income he can't afford to send his children to a private school. Since the government school has no bus facility, his children has to walk a distance of 3 km which results in daily loss of 2-3 hours, without proper reason, and he felt sorry for this wastage of time.

Education, according to him, is very crucial in this modern age and education of woman is even more important because it can be used as a tool at the time of crisis in terms of widowhood, desertion and also for economic upliftment. Sri Mehta also said that he cannot afford to give any dowry for his daughter's marriage but is of the opinion that if he educates his daughter who then gets a job, it will be a gift more than a dowry. Besides he said that only educated woman can bring up a generation of enlightened citizens. On the number of children in a family, he mentioned that "Poor people like us cannot afford to have too many children in today's expensive era". According to him, more teachers need to be appointed for improving the quality of education in government schools. He categorically mentioned that Government should pay more attention and the various educational schemes that are launched must be monitored and assessed for their success/failures. Moreover, more High schools and Degree colleges need be established in nearby areas so that poor students can study and fulfill their dreams.

2. Quality and strict schools around:-

In recent times preference for a good quality education and strict school selected by parents for their children, not just for son but also for their daughters, is a rising demand and plays an important role in working middle class family's decisions about school choice. Studies by Reay and Ball (1998) on parents from varying class position suggested that 'for many working class families, locality and community represent security belonging and connection; places and spaces to feel (relatively) safe and comfortable in' (Gewirtz et al., 1995 as cited by Reay and Ball, 1998). Thus in ethnically diverse setting the conception of safe and comfortable spaces for working class parents will actually vary. Moreover, the sense of varied types of threat may arise quite often during conversation with mothers mainly with reference to their daughter's safety. However, such consciousness does not surface in the case of each and every school, and parents generally negotiate their community identity in their concerns about school quality (Goswami, 2015).

In this study, experiences and views of parents and children of desirable schools from a given range of options available to them were obtained. The choice expressed was mainly based on quality of education and discipline in the schools compared to other government schools on various attributes. Many parents ignored the distance of school and admitted their daughters in private schools only on the basis of quality education. Such parents also dropped their children (son and daughter) to school bearing own responsibility, ensuring maximum security for their children, particularly daughters. It emerges on various occasions that the proximity of school location is expressed not simply in terms of physical but also in terms of status. Further, a striking pattern among the majority dwellers in the rural area has been in their preference for the English medium private schools for their children, both son and

daughter. In families with more than one child, the parents were inclined to send the younger sibling to same school as the older child.

During discussion with Principal of a popular English medium private school in Hawalbagh block several facts emerged as to why parents send their children (son and daughter) to private school even if nearby government school are available. The Principal indicated that currently there is a growing trend amongst parents to send their children (both son and daughter) to private school, even if the school is situated far away from their locality as the parents can be assured of their children's safety in this school compound. The children cannot bunk school and roam in school uniform; if someone is identified outside the school campus, the matter is reported to the Principal and the students is likely to be thrown out of school. But in government school the situation is different. The first and foremost point the parents prefer is safety of their daughters and thus choice of a private school over a government school can be seen. Moreover, quality of education, discipline and attention to every individual student is given; Parent-Teacher meetings are regularly conducted, and the performance of the students are reflected in the Report card handed over to students in the presence of parents. Thus such methods not only help in maintaining discipline but also improve the performance and quality of students. Moreover, parents can be made aware of the performance (good or bad) of their wards. In this way the parents, teacher and Principal are fully engaged in maintaining the well being of the students. The Principal also mentioned that at times parents complain about the excessive home work and indicate that their daughters would fall sick completing the burden of assignments. The Principal made it clear that all students compulsorily need to complete their home work and there is no excuse; however, in case due to some reason a student cannot complete, she/he may be allowed to complete it in school, prior to the morning assembly/prayer time, with the permission of class teacher. The Principal stressed that only through hard work and dedication can students achieve the target result. Thus the resultant effort of hard work of teachers and students this school is well known for good performance in High school results.

It is important to indicate that the above said school was founded in 2006 with an aim to start an English medium school in rural area of Hawalbagh block. The number of students getting admitted has grown rapidly each year, particularly in Nursery and K.G. classes. Currently student enrolment is more than 350, indicating a growing demand of this Private school by parents of younger generation. The school, situated near Kosi market and on the Kosi-Almora main road has about 16 teachers along with 10 support staff. While the school is well known for maintaining a strict discipline citing a particular case (below) is worth mentioning.

On a Monday morning when I started the field activity at 9.00 O'clock, I observed that a group of four students (in school uniform) of the above mentioned private school are standing in front of a 'Barber shop'. This group included three boys and one girl. Quite surprised, I enquired the reason for their waiting near the shop? One of them replied that every Monday is a 'checking day' by the class teacher; short hair for boys, white hair ribbon for girls, nails be cut, clean uniform, shoes polished, etc must be maintained by all students, otherwise they will be punished. So the boys were having a haircut in the shop. The girl replied that she has forgotten to bring her class test copy and hence requires purchasing a new one. They also added that for every subject class tests are held weekly and the class test copy should be brought; the marks of these class tests are important as they are included in the 'Annual Report card'. The combination of careful attentive teachers and disciplined environment is what convinces the parents to send their children to a quality Private school with confidence.

Case 4 (Hawalbagh Block):-

Amrita Pathak and Deepika Mehta, two students of class 10 attending the above said school in Hawalbagh block were also interviewed. Both of students are very intelligent compared to other students of the class and compete with each other during exams to attain position in the class. They indicated that they loved their school extremely and attend classes every day without being absent. Both the girl's parents belong to Upper income group (above Rs 10000).

Amrita's father is a rich business man, educated up to 12th standard, while her mother, class 10 pass, is a homemaker. She has a brother who studies in 9th standard in the same school. They live in Shitlakhet and travel to school every day by their own car covering a distance of 22 km (one way) spending about 2-3 hours every day. After reaching home after school every day she feels very tired but when she thinks about fulfilling her dreams then she recharges herself. She is quite good in English and has a passion for the subject, thus aims to be a journalist cum English writer. She not only wants to be independent but also wishes to make an identity of herself. According to her, a girl should acquire as much education as she can. The main objective of education according to her is to gain

knowledge but she also mentioned about the other benefits of education as well. Besides gaining knowledge, her formal education can contribute in various ways in her future life, i.e. to fetch a job, a good match, keeps her tuned to the new developments that are unfolding virtually every day, she can enjoy high status, economic independence and respect in society. She said that in order to fulfill her dreams she gets every possible support from her parents who are more serious about her future than her. Since she belongs to a joint family she noticed that it was very difficult for her mother to take care of her every essential need, but she (her mother) always tried to solve her problems related to studies or personal matters. In order to assist her in studies, her parents also appointed a private lady teacher. When asked about the age of marriage, she mentioned that between 25 to 30 years is perfect age. Since a person needs time to settle them, Amrita was of the view that now a day not only men but also women should first take time to settle down and then marry. Whenever she gets spare time she loves to watch TV programmes because she thinks that through TV she can obtain quick information on what's happening in the modern world.

Like Amrita, Deepika Mehta is also a student of class 10 of the same school. Her father is a government employee while mother (educated up to class 8) a homemaker. She has a younger brother who is also a student of class 5 in the same school. They live in Mahetgaon which is about 3 km (one way); they travel to school using public transport. She is a very intelligent girl and her dream is to become an Environmentalist. According to Deepika education is a basic necessity of life in today's modern era and without education it's not possible to keep pace with the fast moving world. She lives in a joint family and she always noticed that her mother has no role in decision making; on the other hand seniors in the family, particularly her grandparents take all the decisions. There is no gender biasness in her house. Her family give equal facilities both to her and her brother. Deepika rarely enjoyed any leisure time because of burden of school home work, and likes to help her mother whenever she finds time, particularly in light domestic work like chopping vegetables, washing lentil, etc.

Both the students agreed that the atmosphere of the school is extremely suitable and strict discipline maintained helps to generate quality students. The attitude of most of the teachers towards students are very caring, friendly and helpful, nevertheless, are very strict. If any student is not able to complete home work the teacher ensures to get it completed within the school working hour. All class work is finished otherwise teachers help to complete their work after the school hour. They had a high praise for their school.

Case 5 (Hawalbagh Block):-

One fine sunny day I reached Katarmal village, close to the famous Sun temple. I met the Gram-Pradhan of this village. She has been living in this village since the 8-10 years along with her husband, who works in a nearby government office. She holds a Post Graduate degree and a mother of two kids, a son (8 years) and a daughter (2 years). The son is a student of class 3 in a nearby private school. When asked why they did not admit their son in a nearby Government Primary School (Junior Basic; up to class 5) situated close to home, she mentioned that she was not very satisfied with the quality of education in this school, and because this school has around 25-30 students of varying classes with only one teacher. It is difficult for the teacher to teach properly and at the same time take care of the students alone; in addition she has to perform other school duties including assigned Government work. The Gram-Pradhan also added that after lots of effort, another teacher was appointed. In addition, there is a Government Senior Basic School (up to class 8) where the quality of education is relatively better than in the Government Primary school, and sufficient number of teachers is present. When enquired about the quality of education, she wasn't satisfied with the standard and quality in the Government Primary School in the village; improvement is needed. She mentioned that at present there is a trend amongst all parents (belongings to all categories) to send their children to private school where teachers pay more attention and quality of teaching is also better. Being not fully satisfied with the educational standard of girls in her own village she narrated that they have to put in lot of hard work to compete with their counter parts of Almora town. She also added that extra educational schemes are necessary for promoting girls' education in this village.

I had an opportunity to conduct a *Group discussion* with villagers and parents of village Katarmal, to learn about the educational situation of their daughters. There are two Government schools (one up to class 5 and other up to 8) in the village where free education, mid-day meal and dress are provided. This has been very encouraging and excellent facility, particularly for the poor villagers, who mainly work as daily wage labourers. It was found out that presently there are no drop-out girls in their village; all girls are enrolled. Some parents expressed the desire to send their children to English medium private school but due to financial constraint unable to do so. They certainly felt that some expenditure has to be incurred to get quality education that can be obtained in Private school. Nevertheless, some parents of the village do send their children to a nearby low-cost Private school located 2 km

away in GBPIHED Campus (up to class 5) where the quality is better. In general, all the villagers expressed that the quality and standard of the teaching in government primary school is comparatively poor than in the private school.

Case 6 (Dhaura Devi Block):-

A survey and interaction with several girl students and their senior English teacher of a co-educational Intermediate College (semi-Govt) in Panuanaula was of the opinion that due to limited interest and financial problems literacy rate in that area is low but currently parents, students and also teachers are trying to overcome this situation. The student enrolment in this school is nearly seven hundred with about 70% girl students. He indicated that in the year 2015, there was no drop out case in the school. In general, after completing intermediate studies the students take admission in Kumaun University situated in Almora town. The attendance of girl students is better than other schools and they are relatively serious in studies; moreover the performance of girls is better than boys. Most students walk to school daily covering about 4-5 km (one way); while some live on top of the hill others stay down the road side. On the quality of education, he responded that in general it is good but some important aspects were missing out, i.e. out-knowledge, communication with modern world and exposure; these need to be improved for their betterment. He said that the people of the area, particularly the teen agers are very simple, unlike city dwellers they do not know what is happening around them. So he mentioned the urgent requirement of counseling and guiding the students of his school by some educated personalities (professors, scientists, doctors, and others). Various extracurricular activities (games, dance, drama, arts & NCC) are also taken up by the students; it was observed during the interview that both boys and girls were undertaking NCC training. He also said that NCC camps are being organized every year where both girls and boys participate. At present most parents are serious and particular about their children's education, providing equal treatment to their sons and as well as daughters.

During conversation we met three girl students of the above said Intermediate College. They live in a nearby village called Gunja. They narrated a similar tale, living a distance of about 4 km away (one way) which takes more than 2-3 hours every day. Daily they attend school, and try not to be absent. One student, named Kiran Negi (a student of class 12) said that "My father does nothing, every day he drinks and beat my mother, brother and me; it's a daily drama". Her mother works as domestic help in a nearby house, earning some money to support family, including their education. Thus despite many obstacles at home Kiran attends school daily with lot of hope that those good days will arrive one day when she and her brother will obtain a job after completing education. Her brother is also a student of class 9 in this same school. Kiran wants to study up to Bachelor's level and then would try getting a job as she desires to help her mother in sharing house hold expenses. She also added that since her father has no job and daily drinks alcohol, hence once she begins to earn she will take up the responsibility and then his father's mental situation will change. When asked about the age of her marriage, she quickly replied that for her it is a sort of problem, and has no time to think of marriage at present. Hence, she would complete her study first and then she would try to solve family's financial problem. She said at the end "my first duty is my home".

Case 7 (Tariket Block):-

Tarikhhet block has several schools within close proximity to the block headquarters. The Jawahar Navodaya Vidyalaya (Boys only) an important government school, and a girls' college, i.e. G.G.I.C. are located within 100 metres of the block headquarters. Two students of class 8 studying in G.G.I.C. were asked about their opinion for improvement in their life, they expressed that they would first like to complete schooling and subsequently higher studies (Graduate, PG, etc). They attended school daily and were not absent; but the most serious problem they faced every day was shortage of public transport (bus, small van, jeep, etc). The government schools have no facility of transport and some of them stayed in remote rural area about 5-6 km (one way) from their school. Moreover, according to the students after reaching home nearly most of them performed some domestic work. Following that they have to also complete school assignments. Thus they argued that it was difficult for them to perform well and attain good result like the students of English medium private schools as they reach home quickly because of school bus service and after schooling they can also take tuition. These students of private schools also take part in extracurricular activities. On the other hand the girl students of G.G.I.C. waste their precious time waiting for public transport. At times due to shortage of public transport they do not find seat in public transport (bus, small van, jeep, etc.) and have to travel in a pick-up van. During survey such a situation was observed and was disappointing for me to watch. Thus they strongly suggested that all government schools should try to provide vehicle facilities for children who live in distant locations like them.

Further, during this survey exercise I visited G.G.I.C. and discussed with two school officials about their school. Currently the total student enrolment is 315 (from class 1 to 12). It can be appreciated that 75 students (from class 1

to 8 class) are being provided with nutritious free lunch daily under the 'Mid-day meal' scheme. On enquiring about the performance of the students, they mentioned that they did extremely well. However, there is a gradual decrease in the number of girl students in their school and other government schools due to increasing trend among most parents to admit their children (son or daughter) in English medium private schools. It was observed that there are several private schools (mostly English medium) in that area.

3. Disciplining daughters through school:-

Parental perceptions of discipline and strictness of a school emerges as an overarching theme cutting across community affiliations, especially in reference to the daughters' education. A common yardstick of discipline in schools is to keep daughter safely in check within the school premises. A lack of supervision of students and/or lack of exposure, however, may be enough to earn the school a poor reputation, as observed in case of students of a semi-Government schools, that during interview they were not confident, initially getting quite nervous and were hesitating to give answer.

The parents wanted their daughters must go to school but should also be safe throughout the total travelling period for school. Thus it can be observed that in Case no. 4, the parents drop their daughter with their own responsibility. The anxieties and tensions about women's sexuality are ever strongly expressed with a consciousness of changing times, when the material cultural symbols are rapidly changing across class. Therefore, in an age when the daughters may have access to mobile phones, which not only opens up channels of communications but may also raise awareness about ones sexuality, the selection of a strict school is particularly significant (Goswami, 2015).

These anecdotal references to the disciplinarian measures of the school, gathered from girls and their family, added to the schools reliability in taking custody of girls in their growing age. The concern for safety and security of their girls cut across community line led to the selection of either a private school in the neighbourhood or a strict school at a distant location

Case 8 (Hawalbagh block):-

I met Meena Bisht, a 17 year-old class 11 student of a English medium private school; she has a younger brother Vijay of 13 years, a student of class 8 studying in the same school. The school is situated around 3 km away and so her father drops and brings both of them in his motor bike. Her father is a rich business man (studied up to 10th standard) and owner of famous sweet shop. Her mother is a homemaker who studied up to 8th class. While talking it was mentioned that she is an adopted daughter, they are not biological parents; she was only three years when they adopted her and brother Vijay was born the following year. Her parents are extremely nice and not biased at all; they love her more than Vijay and always fulfill her necessary desires as per her demands. They want that Meena must study up to the level she wishes. After finishing her studies in school, Meena wants to join Hotel Management course in Almora town. Her main intention is to enlarge her father's business and open a modern hotel. According to her these days tourism sector is much popular in the Hills; however, number of hotels with modern facilities is few, particularly in rural areas.

Case 9 (Tarikhet block):-

Ananya Negi, a student of class 6 (12 years old) and her 7 year-old younger brother (reads in class 2) are students of a local Government High School. On enquiring about her family, it was found that her father is an employee in a Government office and is in a transferable job. Earlier they lived in Rudrapur but recently (six months ago) have come here. In Rudrapur she studied in an English medium school but in her village there is no such good English medium school, thus they were forced to take admission in this school. Since the school is close to their house her mother drops them to school regularly. Ananya said swinging her head and turning her eyes that "We are very small, so our mother comes with us". She also said that her father promised them that in the following year they will be surely admitted to a good English medium school which is a bit far from their village. Ananya is pretty and sincere girl; she added that she loves to study and at the same time much fond of dancing. Dance is her passion. In her previous school in Rudrapur, she performed a dance programme in the Annual Day when all teachers, parents and students appreciated. She said that on completion of her intermediate study she would take a course in Dance and like to become a traditional dancer. Her mother said that she will give support in her capacity.

Case 10 (Tarikhet block):-

After completing the day's interviewing schedule while standing near a bus stop, I observed a Maruti van stop and a 16 years old girl student, wearing a clean school uniform and proper school shoes come out. She then went straight

in to a stationery/book shop and purchased two note books and a bundle of large white glazed paper. I introduced myself and wanted to know about her. She also gave her introduction; her name is Sunita Salal (studies in class 10). She is the only daughter with two brothers; one is elder, a student of class 12 and the younger, a student of class 6. They all study in the same English medium private school (co-educational) which is situated around 12 km from their home. Since her father is a retired army personnel, he drops them daily in their own vehicle. Some children of same school and of their own village, also join them in their vehicle. She said her father is very serious about her study and gives all support whatsoever she demands. She showed me that she purchased the glazed sheets for preparing a Science Project which needs to be submitted within two days.

She admired her father and told me that her father stopped the van to purchase stationery items although they have been quite late and have to travel another 10 km from here; they will reach home late when the sun has set. When asked why they did not take admission in a nearby school then she replied “My father will never compromise with quality of studies and discipline in school; it is his children’s future and hence admitted us in a good school. My father is so concerned about my studies that he participates regularly in Parent-Teacher meetings. He discusses regularly with our Principal on minor issues related to my study”.

She also indicated that after completing her intermediate she will write the entrance test for joining an Engineering College; she is interested to join the Engineering College in Dwarahat and become a Civil Engineer. According to her these days there is frequent occurrence of disasters and extreme events, like earthquakes, flash floods, cloud bursts, heavy rainfall, hailstorms, etc. She is of the opinion that by obtaining a degree in Civil Engineering she would be able to assist in solving these problem with her department. She would also help in construction of earthquake proof buildings and dams, good roads and bridges. This would help in reducing disaster and improving safety, and consequently better the living conditions of the hill people of Uttarakhand.

Figure 1: A panoramic view of a village and hilly terrain in Lamgarah block.

Figure 2: A panoramic view of some villages close to village Panuanaula, Dhaula Devi block; nicely terraced land for cultivation is seen in the foreground.

Figure 3: A panoramic view of some villages in Tarikhet block.

Figure 4: Students and a mother (teacher) returning home after attending a private school located in Gwalakot village, Hawalbagh block.

Conclusions:-

This study mainly focused on the objective of school choice among a set of different income-group families from four development blocks in rural areas of Almora district; while discussing the process of school choice one must take into account social and economical aspect and cultural discourses which in all manner of ways structures experiences of people located in a particular setting. In all these accounts it is the overarching concerns of costs, discipline and quality through which a deeply gendered choice is exercised by these parents. In this study, costs of schooling did differentiate on the decisions but it varied within a family and between son and daughters (Lamgarah block). Moreover, in some case there was no difference made between son and daughter (Hawalbagh block).

During interviews a significant and quick change in the people's attitude (including parents, girls, villagers, teachers etc.) was observed in the rural area in Almora, and this could be noticeable throughout the whole interviewed sequence. The socio-educational profile of school going girl children indicates that a remarkable changing scenario is going through education and now the confident girl children in different age groups with different economical category are the product of different educational effort.

The present study also attempts to profile the educational and sociological status of the girls in rural Almora District. Relevant information has been gathered from the respondents, particularly on their educational condition, choice of schooling, cause of choice schooling, and from other stakeholders like parents, Gram-Pradhans, teachers and school officials. The data for the study was collected through in-depth interview schedule. It was collection of questions on socio-educational and demographic issues. The empirical data gathered demonstrates that education has contributed significantly in raising the status of girl children in rural Almora. All the girls aged between 6 to 18 years were found to be enrolled in schools. The number of drop out students is negligible, indicating that at present the parents are aware about the importance of education. It can be also noted from the educational status of the parents that new generation of parents had greater levels of education than the older ones and was found to influence respondents' education, i.e., higher the education of the parents, higher was the educational level of the girl children. The parents formed the source of encouragement for higher education of their daughters. The nature of encouragement from parents is indicative of the high practical value they had for higher education which contrast with a number of stereo-typed notions about girls' education in rural areas. Although girl students studying in higher classes (10 and 12) have moderate percentage of illiterate parents, nevertheless, due to changing trend and importance of education such parents do encourage their daughters to get educated. Better income of parents was likely to place the children in a better educational position. Parents whose children were sent to a private school for acquiring quality education believed that their children would obtain quality education and give good performance, did not really consider the

school fees or the distance of the school (Hawalbagh & Tarikhet block). It must be mentioned that the parents with poor financial background were also found to influence the daughter's accessibility to education.

The present study also suggests that now a day there has been a trend among parents to send their children to private school. It also reveals that, according to parents, the quality of education and caring for students in private school are better than in government schools. Moreover, vehicle facilities are available in most private schools (in Hawalbagh and Tarikhet block). The expansive growth of private schools in the country due to fact that government schooling has not been able to provide quality education has also been reported in earlier studies (Nambissan, 2003; Balasundran, 2005). It was observed that majority of the girl children goes to school with neat and clean uniform, proper school bag, and maximum students carried drinking water. In addition, a number of the parents themselves escorted their children to school and brought them back to home (Figure 4).

In general, the parents were of the opinion that the quality of education in government schools is just satisfactory, and not comparable with the private schools, and this is reflected in unsatisfactory level of education standard of girls. The girl students in rural areas are quite simple, and unlike their city counterparts, some important facets were missing in them, particularly out-knowledge, exposure and communication with the modern world (in Dhaula Devi block). Further, more attention in studies need to be given by the girl children at home.

India has the second largest education system (World Bank, 2003) and largest number of children out of school in the age group 6-10 years (Huebler, 2007). But over the last few decades there has been considerable change in status of girl's education in hilly areas of Uttarakhand. The situation has improved considerably following the formation of Uttarakhand state since currently the drop out girl students of 6-17 years age form only a very small proportion, i.e. 2.9% in rural Almora and 0.5% in urban Almora (Annual Health Survey 2011-12. Fact sheet- Uttarakhand. <http://www.censusindia.gov.in>. Retrieved on 10th May, 2014). Hence, it can be concluded that a gradual change is occurring in rural areas and going to change further; the rural parents now want to give an opportunity to their daughters to live a hazard-free, open and enjoyable life.

The present study has depicted the 'role of education for all' changing the status of girl children in rural Almora. The status of girl children in rural areas needs to be examined further. Moreover, several challenges would come their way but the girls have to overcome them. They need to study seriously, improve their skills, and establish themselves in the competitive world. They need to first love, care and value themselves, increase their self esteem, then only can they understand the value of others; they should become good citizens and good human beings. Their aim must be not only to become a working and independent woman but also a caring and loving mother in their future.

Acknowledgements:-

The author is grateful to Dr. H.C. Joshi, Department of Economics, Kumaun University, SSJ Campus, Almora for initial guidance and all the respondents (students, teachers, officials, parents, gram-pradhans & villagers) for their help and cooperation. The name of the respondents has been deliberately changed to hide their actual identity. The study is based on the survey conducted and views/perceptions of the respondents; the conclusions thus drawn are fully based on their opinion and by no means the author's personal view in favour or against any type of school.

Tool construction, Standardization, mental maturity, pre-service teachers.

Abstract

The present study is designed to construct the mental maturity scale for pre-service teachers. The Mental maturity scale was developed and standardized by administering it on 55 randomly selected pre-service teachers of Madurai district and conducting item analysis to eliminate the inconsistent items in a tool. The final form of mental maturity scale consists of 42 items classified into 7 sections namely mental health, self-awareness, problem solving, cognitive self management, multiple intelligence, social attitude and emotional maturity. All the items of mental maturity scale are Likert type with five point rating.

Introduction:-

Maturity implies putting away of childish things and regarding oneself as an adult ready to shoulder responsibilities that develop upon one in general in worldly affairs. It is related to the kind of personality one has developed. It is also concerned with the extent to which one is able to think act for oneself. A mature person is highly socialized and independent. He has built up a set of values for himself which guide his actions and behavior consistently. Emotional stability, intensity, social adjustment, professional interests and life aspirations go on increasing with the process of attaining maturity. A mature person is expected to understand things of importance and be aware of his rights and duties. A mature person does not act impulsively and does not waste time in the world of his own imagination.

Mental maturity is generally believed that a person with average intelligence acquires mental maturity between 13 and 15 years of age and a brilliant one gets it within 16 and 25 years of age. By the term mental maturity we mean mature ideas. The criteria of mental maturity are:

- The power of independent judgement without being guided by one's caste, class, traditions, or some influential person.
- Readiness to fulfill one's responsibility and duty.
- To analyse a situation objectively without being influenced by one's sentiments.
- To reach a right decision when confronted with complex situations.
- To decide issues with a spirit of give and take and not to overlook future consequences when overpowered by emotions.

The ultimate aim of teacher education is to prepare effective teachers who are capable of bringing about the desired behavioural changes in pupils. The quality of teaching is determined by the quality of teaching learning process

Address:- Research Scholar, Lecturer, DIET, T.Kallupatti, Madurai-625702 .

made in the classroom situations. So the pre-service teachers must improve mental maturity. Then only they can improve the quality of school education. So the investigator decided to construct and standardize the mental maturity scale for pre-service teachers.

Objectives:-

- To construct the mental maturity scale for Pre-service teachers.
- To standardize the mental maturity scale for Pre-service teachers.

The Mental maturity scale was constructed to measure the skill of mental maturity of Pre-service teachers. The steps followed for its construction and standardization are as follows:

1. Planning
2. Preparation of Preliminary form
3. Pre-tryout
4. Editing
5. Pilot study
6. Item Analysis
7. Preparation of final form

Planning:-

During planning it was decided to prepare the statements with reference to mental health, self-awareness, problem solving, cognitive self management, multiple intelligence, social attitude and emotional maturity.

Preparation of Preliminary form:-

The investigator developed the preliminary form of mental maturity scale for pre-service teachers with 70 simple, clear and concise statements for better understanding. Care was taken to avoid ambiguity and repetition in the statements. At the end of each statement, five graded options were given namely. "Strongly agree", "Agree", "Undecided", "Disagree" and "Strongly disagree" having scores 5,4,3,2 and 1 for positive statements and 1,2,3,4 and 5 for negative statements. The investigator classified the statements of preliminary form of mental maturity scale under different sections namely mental health, self-awareness, problem solving, cognitive self management, multiple intelligence, social attitude and emotional maturity.

Pre-tryout:-

The Preliminary form of mental maturity scale for pre-service teachers was given to 10 teacher educators for their observation and criticism regarding the clarity of statements, appropriateness of the language and the pattern against each statement. Based on their suggestions, the developed research tools were further edited.

Editing:-

Soliciting the responses of the teacher educators approached at the pre-tryout stage, the editing of the developed research tool was completed. On the basis of criticisms and suggestions of the experts involved, 5 statements were rejected and 65 statements were retained.

Pilot study:-

For the standardization of the constructed tool, the investigator conducted a pilot study. The constructed tool was administered on 55 randomly selected pre-service teachers studying in DIET, Madurai district. The pre-service teachers were instructed to mark their responses for all the statements of mental maturity scale. Further, they were given assurances that their responses would be used only for research purpose. They were also convinced that their responses would be kept confidential. There was no time limit, but the pre-service teachers took 40 to 50 minutes for giving responses to all the statements of the tool. The responses of pre-service teachers were scored according to the positive or negative nature of statements.

Item Analysis:-

The investigator used item whole correlation to find out 'r' values. The item having 'r' values between 0.35 and 0.65 were retained and the other items were rejected. In the final mental maturity scale, 42 items were retained with positive (32) and negative (10) items.

Table 2:- Section-wise Distribution of Items of Mental maturity Scale.

Sl. No.	Dimensions	Item number in mental maturity scale	Positive items	Negative items	Total number of items
1.	Mental health	1-8	1,5,6	8	4
2.	Self-awareness	9-18	9,10,13,14,15	18	6
3	Problem solving	19-23	19,20,21,22	23	5
4.	Cognitive self-management	24-29	24,25,27,28	26	5
5.	Multiple intelligence	30-38	30,34,37,38	35	5
6.	Social attitude	39-54	39,40,41,42,43,44,45,	46,50,54	10
7.	Emotional maturity	55-65	55,56,59,60, 65	62,63	7

Preparation of the final form:-

After item analysis the final form of mental maturity scale for pre-service teachers was prepared with 42 retained items.

Reliability and validity of the tool:-

Split-half reliability coefficient of mental maturity scale was determined on the basis of scores of 55 randomly selected pre-service teachers. In the split-half method, the tool was divided into two equivalent halves and for these two halves half-test reliability coefficient was found using Karl Pearson's coefficient correlation formula. From the half-test reliability coefficient, whole-test reliability coefficient was estimated by using Spearman Brown Prophecy formula.

Whole-test reliability coefficient, Split half-test and Guttman Split-Half Coefficient of mental maturity scale for pre-service teachers were 0.797, 0.754 and 0.744 respectively. Hence the developed tool was reliable.

On the basis of opinions of experts the items of mental maturity scale were structured. Hence the developed tool has face validity and content validity.

Conclusion:-

The education of the students largely depends on their teachers. It is important that pre-service teachers who are the future teachers of the country must possess the skill of mental maturity. This will inculcate the pre-service teachers to be efficient. The great teacher should be necessarily equipped with knowledge, skills and competencies. The teacher should be properly enlightened, educated through proper training and develop sense of responsibility and love towards his profession and with rapid expansion of primary education both in number and extent, the teacher must come out of teacher educational institutions with great perfection in teaching competencies and allied aspects.

Abstract

Objectives:-

1. To determine the compliance and satisfaction to doctor's prescription among general population in Eastern Province of Saudi Arabia by type of health facility used, age, gender, and education.
2. To determine the reasons for non-compliance, and opinions on how to improve compliance.

Materials and Methods:-

Cross-sectional study conducted for public in eastern province. Data Collected using web-based self-administered questionnaire to fill online through newspaper, and social media like Facebook, Twitter, etc. for 6 month and periodically repeated throughout the study period, SPSS 17.0 used for data analysis. Chi-square or Fisher's Exact test used to test for statistical significance by gender, age, and education.

Background:- Compliance in healthcare is defined as the extent to which a patient's behavior coincides with the healthcare provider's recommendations for health and medical advice, we conduct unique study to involve the public instead of narrow spectrum of patient and diseases.

Results:- Total of 587 participants 62.9% were Satisfied during last visit to their physician. 32.2% stop taking medication if they feel better, 31.7% always committed to treatment. The reasons of non-compliance with medication mainly 35.6% due to large number of drugs, 28.3% due to Inappropriateness of drug, 20.8% do not Know the function of drug. the more acuteness of illness more noncompliance, avoiding reading the patient file and lack of knowledge. More than half of participant said doctor misbehavior affect their trust about prescription. Private hospital showed to have more regular visit and satisfaction and governmental hospital showed less satisfaction. 58.8% said that nearby health centers would not affect their compliance. 78% of the Health Centers lack communication with patient outside health facility. The best option to overcome non- compliance showed to be follow-up by social media.

Conclusion:- Males and people at age of 30 are more compliance to drugs and more satisfied. Side effect and accumulated drugs are common cause of non-compliance, best option to overcome non-compliance are follow up by social media and explain side effects of drugs , people less satisfied with governmental hospital and more compliance to PHC so high qualified health system, patient -centered relationship, health education are needed.

..... **Introduction:-**

Compliance in healthcare is defined as the extent to which a patient's behavior (in terms of taking medication, executing the lifestyle changes, undergoing medical tests or keeping appointments with the physicians) coincides with the healthcare provider's recommendations for health and medical advice. [1] Non-compliant patients are those whose health-seeking or maintenance behaviors lack congruence with the recommendations prescribed by a healthcare provider. [2]

Patient non-compliance is a serious healthcare concern that poses a great challenge to the successful delivery of healthcare. This is widespread and has been reported from all over the world.

Previous research of specific communication variables indicates that patient-centered encounters result in: (1) the duration of the office visit remaining the same [3], [4] (2) better patient satisfaction, [5] (3) higher physician satisfaction, and (4) fewer malpractice complaints.

Medication management outcomes can be improved by adopting more client-centered approaches. To examine the implications of a client-centered relationship this reviews regarding client involvement in: (1) identifying treatment goals; (2) choosing from regimen options; (3) monitoring symptoms and evaluating regimens; and (4) self care with nonprescription pharmaceutical products. , A compliance study conducted in Saudi Arabia for those on short-term medication found 67.8% compliance.

However, compliance of patients tends to decrease with time being lower in patients on long-term medication than in those on short-term medication. [6] Another study done in Saudi Arabia found an overall 65.8% non-compliance in patients suffering from hypertension. [7] The noncompliance to long-term therapy severely compromises the effectiveness of treatment and adversely affects the patient's condition. [8]

Materials and Methods:-

Study population and area:- Population of Eastern Province.

Study design:- Cross-sectional study

Study period:- Six months until 12-1- 1438 H

Data Collection:- Data Collected using web-based self-administered questionnaire. The information collected included demographic data, type of health facility visited, satisfaction with last visit to physician, compliance to doctor's prescription, use of medicine without doctor's prescription, questions related to reasons for non-compliance, and suggestions to improve compliance to doctor's prescription.

The public in the study area was informed about this survey (along with the web link) and requested to fill the online questionnaire through newspaper, and social media like Facebook, WhatsApp, Twitter, etc. This was periodically repeated throughout the study period

Data Analysis:- SPSS 17.0 used for data analysis. Descriptive statistics included frequency and percentages for categorical variables. Chi-square or Fisher's Exact test, as appropriate, used to test for statistical significance by gender, age, and education. The sample size using Epi info version 3 with confident level 97% is 471. The results were expressed as mean values \pm SD. A P value of < 0.05 was considered significant.

Results:-

Total of 587 participated in this study, 79.5% of the participants were from the Alhasa and Dammam and Qatif. Majority of participants their age Found to be between 21-30 years (SD=1.11) and about two third of them were females (74.7%). All the participants were educated (100%, n = 587).

The demographic characteristics of the participants are summarized in Table 1 and Geographic distribution in figure 1

Table 1:- Demographic characteristics of the study population.

Characteristic	Number	Percentage
Gender		
Male	148	25.2
Female	439	74.8
Age (Years)		
≤ 20	126	21.5
21-30	259	44.2
31-40	103	17.6
> 40	99	16.9
Education		
High school or less	126	21.4
College or higher	461	78.5
Nationality		
Saudi	574	97.8
Non-Saudi	13	2.2

Figure 1 :Geographic distribution

According to geographic distribution as shown in figure 1, 29% of participants from Qatif , 28% from Alhasa , 23% from Dammam , 7% from Saihat , 7% from Alkhobar , 3% from Dhahran , 3% others.

Figure 2:Satisfaction during last visit to the doctor by gender

According to satisfaction during last visit to doctor by gender as shown in figure 2, 14.18% of male and 13.34% of female are fully satisfied while 61.4 of male and 63.3 of female are satisfied and 24.32% of male and 23.23% of female are not satisfied.

Figure 3:- percentages of compliance to drugs the doctor prescribed by gender.

According to compliance to drugs the doctor prescribed by gender as shown in figure 3, males more committed 47.29% than females 26.4% and 15.54% of males and 26.4% of females said they committed to some extent and 33.1% of males and 31.89% of females said they stop taking medication when they feel better and females more not committed 15.26% compared to males 4%, this comparison chart are statistically significant ($p < .001$).

Figure 4:- The opinion of participants of what are the reasons which may lead to failure in compliance with medication by gender.

According to opinion of participant of what are the reasons which may lead to failure in compliance with medication showed that females are more non-compliance to treatment due to large number of drugs 38.3% compare to males 27.7% ($p < .012$) also due to inappropriateness of drugs 29.4% compared to males 25% , 29.1 % of males said that lack of knowledge about function of drugs contribute to their non-compliance to drugs compared to 18% of females ($p < .04$), side effects contribute to non-compliance in 41.9% of males compared to 51% of females ($p < .03$), distrust of doctor prescription contribute to non-compliance in 18.9% of males compared to 16.6% of females , high cost of drugs contribute to non-compliance in 14.2% of males and 10.3% in females.

According to above figure 5 showed that 65.9% of participants said that cold and flu in the top of diseases that they left treatment for followed by Acne 34.8 % ($p < .002$), wounds and minor injuries 23.5%, back pain 20.3%, skin allergy 16.7%, dental caries 15%, food poisoning 15%, weak vision 13.6% ($p < .029$), eye illnesses 8%, diabetes 3.9%, hypertension 3.7%..

Figure 6:patients' opinion regarding the possible solutions to overcome the non-compliance with medication

According to patients' opinion regarding the possible solutions to overcome the non-compliance with medication in figure 6 showed to be follow up by social media 67.6% followed by clarification of side effects 60.1%, give chance to talk 59.1%($p<.01$, more in males), provide more family physician 42.1% , reduce the number of doses who have multiple diseases 39.5%($p<.001$, more in females) , reduce the prices of drugs 31.7%($p<.04$, more in females), provide more health centers 29%.

According to satisfaction by health facility in figure 7 showed that the most fully satisfied health facility is PHC (primary health care center) 16.2% followed by governmental hospital 15% ,private clinic 12.2% , private hospital 11.2% and the most satisfied health facility is private hospital 67.1% followed by private clinic 65.6%, PHC 62.8% , governmental hospital 55.8%, the most not satisfied health facility is governmental hospital followed by private clinic 22.1%,private hospital 21.7%, PHC 20.9%.

According to compliance by health facility as shown in figure 8, participants are more compliance to PHC 38.5% followed by governmental hospital 35.4%, private hospital 28%, private clinic 24.4 and participants stop taking medication prescribed by doctor more in private clinic 41.2% followed by private hospital 33.5%, PHC 27.7%, governmental hospital 27.5% and participants committed to some extent to drugs more in PHC 25.7% followed by private clinic 27.5%, private hospital 26.1%. governmental hospital 15.6% and the health facility that have high rate of noncompliance to drugs found to be governmental hospital 21.8% followed by private hospital 12.4%, PHC 8.1%, private clinic 6.9%, this comparison chart are statistically significant ($p < .001$).

According to compliance by age we found that people more than 30 years old are the age group with more compliance rate compared to other age groups ($p < .001$)

Also that particular age group had the higher rate of satisfaction compared to other age groups ($p < .002$)

Table 2:- Participants perception toward compliance to medication.

	Number	Percentage	P value
1- Do you think that the mishandling of the doctor may be a reason not to trust the physician medical advice and leave taking medication?			
Yes	302	51.4%	<.01*
No	55	11.2%	
To some extent	219	37.3%	
2- Which of the following age groups noticed his lack of medication compliance or rejected?			
Children	268	45.7%	<.1
Teens	258	44%	
Adults	221	37.6%	
Elderly	235	40%	
3- lack of medication compliance may worsen my health status?			
Yes	245	41.7%	<.02*
No	62	10.6%	
To some extent	280	47.7%	
4- I think that my commitment to the drug may bring me and other health problems?			
Yes	212	36.1%	<.3
No	375	63.9%	
5- Which of the following health centers commitment to taking the medication out more?			
PHC	78	13.3%	<.09
Government	198	33.7%	
Special	115	19.6%	
Teaching	36	6.1%	
Private Clinic	160	27.3%	
6- Which health facility you visit usually?			
PHC	148	25.2%	<.01* Male more in PHC
Private Clinic	131	22.3%	
Government	147	25%	
Special	161	27.4%	
7- What types of follow-up used by the health facility that you visit to complete your follow-up?			
Telephone	101	17.2%	<.001*
Email	11	1.9%	<.1
Doctor visit me	30	5.1%	<.3
Internet & New social media	52	8.9%	<.001*
No communication outside health facility	458	78%	<.001*

*: statistically significant

Figure 9 :The reasons that brings health problems despite adherence to medical prescription by gender

According to the reasons that brings health problems despite adherence to medical prescription as figure 9 showed, we emphasized significant value which is giving overdoses ($p < .002$, more in females) and poor manufacturing quality of medication ($p < .03$, more in males)

Table 3: Other related questions for drug compliance .

	Number	Percentage	P value
1- Do you buy drugs from pharmacy without doctor prescription?			
Yes	472	80.4%	<.005*
No	115	19.6%	
2 -The presence of health centers near the residential neighbourhood may reduce non-compliance to drugs?			
yes	99	16.9%	<.01*
no	345	58.8%	
to some extent	143	24.4%	
3- Lack of a commitment with medication are widespread in the city?			
Yes	245	41.7%	<.1
No	62	10.6%	
To some extent	280	47.7%	
*: statistically significant			

Discussion:-

Effects of Compliance: adherence is a very important issue in medical field for many causes so as we know that non-compliance to treatment imposes a considerable financial burden upon health care systems.

Doctor – patient Relationship:-

A paternalistic approach to be avoided because the doctor patient relationship, And communication and shared decision-making are important factors affecting compliance as shown in our survey that %51.4(n=302) will not committed to medication if they face misbehavior from their physicians that will affect the relationship between them also Knowing each patient's health beliefs and physician plan are the key feature of the new doctor patient encounter.

Doctor-patient decision Making:-

We have to discuss the treatment plan where both patient and doctor can adhere, as we know a lot of people in KSA use new social media in communication recently so as we found according to survey that the best option to resolve a medical non- compliance regarding participant opinions showed Good following up between doctor and patient by mean of modern social media 67.6% (n= 397) followed by Explain the benefits and the side effects of medications to patients 60.1% (n= 353), Good behavior between doctor and patient and give the patient chance to talk 59.1% (n= 347) and other causes as mentioned in results, so as we can see the great role of patient in making decision about their treatment the thing that will decrease patient non-compliance , we need to review our style of communication and provide special office only for patient relationship and communication outside health facility because as we see in the result that more than 70% of health facilities lack these services .

Satisfaction:-

We need to study "seeing the same physician" as in case of family physician and its influence on patient satisfaction, that reflect the need of family physician in our health system as shown in our study that one of the most important thing to overcome noncompliance is Provide more family physicians 42.1% where the patients can follow again and again the same physician to complete their health issues and get maximum benefits.

Role of neighbor PHC:-

According to survey showed that %58.8 said that availability of neighbor primary health center have no effectiveness in decrease non- compliance , and we conduct study to show which health care facility have more rate of compliance and the result showed that %33.7 which mean more than 1/3 of participants are more compliant toward governmental hospital followed by private clinic(%27.3) , private hospital (%19.6), PHC(%13.3) , teaching hospital , as we can see governmental hospital goes with highest rate of compliance but we recommended other study to be conducted to see what factors affect compliance in these health facilities.

History of PHC:-

There was study that have explanation on why PHC it occupies middle place in patient adherence, By the year 1987 the Ministry of Health in Saudi Arabia had established 1477 Primary Health Care centers all over the kingdom, Saudi study done 3, June 1993 [9] was to assess the satisfaction of patients with different aspects of Primary Health Care services in Riyadh, the results showed that the patients are generally moderately satisfied with the services. They are most satisfied with the effectiveness and humaneness aspects of care.

Compliance of general population:-

Regarding compliance to medication of general population , many research done in KSA but did not mentioned the compliance of general population and most of their research confined to certain group of patient with certain disease , so in our study we have conducted a study to involve the public and we found that most of responses 32.2% said they stop taking medication if they felt better , while 31.7% said they always committed to the drugs that prescribed by the doctor, 23.7% said Sometimes , 12.4% will never committed to the drugs that prescribed by the doctor, so here we can see that more than 1/3 of participants stop taking medication if they feel better that indicate poor knowledge about side effect of some drugs like antibiotics and the risk of development of bacterial resistance as result of that ,as we consider our participants highly educated despite we found higher rate of non-compliance to treatment the thing that imposes serious attention. According to our study %65.5 stop taking medication in flu and cold (that sometimes may need antibiotic prescribed by GP).

Relationship between education level and compliance:-

As we mentioned before that higher educational levels of participants were found to be %32.2 stop when they feel better, Several studies have found association between higher education level and compliance,[10] while some studies have found no such association, A study conducted in the UK has shown that patients with a lower level of education have better compliance.[11,12] It may be presumed that patients with a lower educational level may have more trust in the physician's advice. However, these results show that education may not be a good predictor of therapeutic compliance.

Causes of non-compliance among general population of eastern province:-

Our study and other studies shown many causes of non-compliance, in our study we found many causes e.g., the large number of drugs that must be taken, Inappropriateness of medication, lack of knowledge about the function of drugs, Side effects, lack of trust in doctor prescription, high cost of medications and other studies conducted in KSA shown other causes [13], Those patients who did not get adequate information on what to do in the event of their missing a dose, or if they experienced any side effects of the medicine, were more non-compliant.

Numerous researches involving:-

Various diseases have evaluated the effect of the patient- physician relationship on patients' compliance, and has found it to be another strong factor in favor of patient compliance. [14-16], Compliance to treatment advice was good when the physicians were supportive, supplied vital information, and listened patiently to patients [17].

Suggested solutions to overcome non-compliance among general population of eastern province:

The best option to overcome medical non-compliance regarding participants opinions showed to be following up between doctor and patient by modern social media 67.6% (n= 397), Explain the benefits and the side effects of medications 60.1% (n= 353), Good behavior between doctor and patient and give the patient chance to talk 59.1% (n= 347), Provide more family physicians 42.1% (n= 247), Reduce the doses of patients who have a lot of diseases 39.5% (n= 232), Reduce the prices 31.7% (n= 186), provide more Health Centers 29% (n= 170).

Conclusion:-

The findings show that males and people at age of 30 more compliance to drugs and more satisfied, side effect and accumulated drugs are the common cause of non-compliance, best option to overcome non-compliance found to be follow up by social media and explain side effects of drugs, people less satisfied with governmental hospital and more compliance to PHC so there are a definite need for Hight qualified health system, patient-centered relationship, health education and to improve patient-doctor communication and health services.

Abstract

In the 21st century, use of automobiles have not only revolutionized transport system across the globe, but have changed the lifestyle of human beings. The chief drawback of this gift is increase in cases of accidents. Most of accidents associated with polytrauma involve pelvis. In pelvic injuries, acetabular fractures and fracture dislocations of hip joint are common. The radiological evaluation of hip and acetabulum has been revolutionized by development of computed tomography because of its fine definition of sectional anatomy and accurate evaluation of pelvic trauma. The study included 30 polytrauma cases, attending the Radiodiagnosis Department of Rajindra Hospital Patiala.

Introduction:-

Acetabular fractures constitute between 20% and 25% of all pelvic fractures in adults. CT is the modality of choice for evaluating these injuries. Axial images should be performed with contiguous slices no thicker than 3mm. Sagittal and coronal reconstructions and three dimensional images are often helpful to conceptualize the fracture pattern before surgery (2). CT is helpful in delineating the extent and configuration of fractures of the acetabulum as the acetabular fractures and fracture dislocations of the hip joint are frequently complex and routine radiographs do not easily demonstrate the precise pathological anatomy. Intraarticular bony fragments, joint space incongruity and femoral head fractures may also be revealed by CT examination (3). Unconventional radiography, in addition to standard AP view of pelvis, 45 degree oblique view, iliac oblique view, inlet and outlet views are taken which provide only means whereby spatial relationship of bones of pelvic ring can be assessed (5). There is no significant difference between plain radiography and computed tomography in detection of fractures of the iliac wing, anterior pelvic column, posterior pelvic column and pubic rami. However computed tomography is more sensitive than plain radiography in detecting pelvic fractures involving sacrum, quadrilateral surface, acetabular roof, posterior acetabular lip and primary loose bone fragments (6). In present study, the significance of computed tomography in diagnostic evaluation and management of the pelvic trauma patients was assessed. The computed tomographic findings in diagnosis and management of acetabular fractures were also compared.

Figure 1:- Anteroposterior (AP) radiograph of the pelvis. The iliopectineal (or iliopectic) and ilioischial lines serve as landmarks for the anterior and posterior columns, respectively. The larger and more lateral posterior wall is visualized more easily than is the smaller, more medial anterior wall. The acetabular tear figure is a composite shadow of the inferomedial structures that compose the acetabulum. The ilioischial line should pass through the teardrop on a true AP view of the pelvis.

Figure 2:- Anteroposterior radiograph shows iliopectineal line (green), ilioischial line (blue), anterior acetabular wall (yellow), posterior acetabular wall (pink), and obturator foramen (O).

Classification Of Acetabular Fractures:-

The classification of acetabular fractures described by Letournel and Judet is most widely accepted (1,18). They divided acetabular fractures into two basic groups: elementary fractures and associated fractures.

Elementary Fractures comprise fractures in which a part or all of one column of acetabulum has been detached. There are five elementary forms:-

1. Fractures of posterior wall of acetabulum
2. Fractures of posterior column of acetabulum
3. Fractures of anterior wall of acetabulum
4. Fractures of anterior column of acetabulum
5. Transverse Fracture

Posterior column and posterior wall fractures account for nearly 30% of all acetabular fractures, most common and are often as a result of posterior hip dislocation.

Anterior column and anterior wall fractures account for 6 to 7% of acetabular fractures, result in a separation of the articular surface together with the corresponding segment of iliopectineal line and mostly a fragment of anterior column is separated from rest of the innominate bone.

Transverse Fractures:-

Account for 8% to 10% of acetabular fractures, are axially oriented, separate the innominate bone into superior and inferior fragments usually at the level of acetabular roof. They are often associated with central fracture dislocation.

Associated Fractures:-

Include at least two of the elementary fracture forms from above. There are five principal associations.

1. T-shaped fractures.
2. Fractures of the posterior column and posterior wall.
3. Transverse and posterior wall fractures.
4. Fractures of anterior column or anterior wall associated with a hemi transverse fracture posteriorly.
5. Fracture of both the columns.

Figure 3:- Acetabular fracture classification system. Judet and colleagues (1964) described the classification scheme that is most commonly used today. Of the 10 types, 5 are elementary fractures (top row), and 5 are associated fractures (bottom row). Elementary types involve 1 primary fracture plane. Associated types involve more than 1 fracture plane

Materials and Methods:-

Study Design:-

Hospital based prospective correlative and comparative study. Source of data: 30 patients with clinically suspected or known hip fractures referred to department of Radiodiagnosis, Rajindra Hospital Patiala.

Protocol:-

A detailed history regarding mode of trauma and other sites of injuries besides pelvis were noted. Basic haematological investigations- Hb, TLC, DLC and other biochemical investigations like renal function tests, liver function tests were done if indicated. Conventional radiographic evaluation was done which included Antero-posterior views of pelvis including the area extending from iliac crest to the lesser trochanter of femur including both hip joints and sacroiliac joints. Oblique –lateral views of injured hip were done specially in cases in which dislocation of femoral head was suspected or evident on AP view. The plain radiographs were studied in detail and fracture lines were traced. Observations were recorded in the performa in all the cases. CT examination was done after initial radiographic

CT protocol:-

Patients were scanned with High Resolution Siemens Somatom Emotion, in supine position with 6mm to 8mm sections. 3D reconstructions were done from axial images using surface imaging technique in cases asked by the Orthopaedician, especially in patients with comminuted fractures. Clinical and imaging findings were recorded as per performa.

Radiographic Anatomy Of Acetabulum:-

Computed tomography has revolutionized diagnostic imaging of acetabular trauma as the three dimensional pictures of the fracture are vital for the diagnosis and treatment of these injuries. Crucial to interpretation of the axial computed tomography is an understanding of the normal cross sectional anatomy of acetabulum. The acetabulum can be described as an incomplete hemispherical socket with an inverted horseshoe shaped articular surface surrounding the non articular cotyloid fossa. The acetabulum is formed by anterior and posterior columns of bone which join in superior acetabular region (1,8,9). The anterior and posterior walls extend from each respective column and connect to axial Skeleton through a strut of bone called sciatic buttress. The anterior column represents larger portion which extends superiorly from superior pubic ramus into iliac wing. The posterior column extends superiorly from ischiopubic rami as ischium towards ilium. The anterior and posterior column of bone will unite to support the acetabulum. In turn sciatic buttress extends posteriorly from anterior and posterior column to become articular surface of sacroiliac joint which attaches column to axial skeleton. On radiograph, iliopectineal line represents border of anterior column and ilioischial line represents posterior column. The fractures which traverse the anterior column disrupt the iliopectineal line, whereas fractures which traverse the posterior column disrupt ilioischial line. The column concept is used in classification of these fractures and is central to the discussion of fracture patterns, operative approaches and internal fixation.

Observations:-

Distribution of patients according to age:-

The maximum number of patients were in the age group of 20-40 yrs. Only three patients included in the study were above 60 years of age

Distribution of patients according to sex:-

Males were seen to be frequently involved in pelvic trauma as compared to females. Males were 83.3%. Only five females (16.7%) were seen in the study.

Mode of injury:-

The patients who sustained pelvic trauma due to roadside accident were 28 patients (93.3%). Only 2 patients (6.7%) had a positive history of fall from the height leading to pelvic injury.

Acetabular fractures detected on pelvic skiagram:-

In 26 patients (86.7%), definite acetabular fractures were seen, however in 13.3% of cases, no obvious fracture of acetabulum was detected on pelvic skiagrams.

Pattern of acetabular fractures detected on pelvic skiagramsview:-AP

Out of total 30 cases, comminuted fracture of acetabulum was seen in 16 patients (53%), whereas linear fracture was noted in 10 patients (34%). In 04 patients, definite fracture line was not seen on X rays, however there was high index of suspicion on account of associated fractures of pelvic bones.

Dislocation of femoral head detected on pelvic skiagram AP view:-

Dislocation of femoral head was seen in 14 cases (46.6%), whereas in the remaining (53.3%) patients, no associated dislocation of femoral head was seen.

Disribution of acetabular fractures on pelvic skiagrams:-

Most common acetabular fractures in our study were those in the roof, anterior and posterior column seen in 08 patients (31%). Posterior wall fracture was seen in 08 patients. Fracture of quadrilateral plate was seen in 03 patients.

Figure 4:- Distribution Of Acetabulum Fractures On Pelvic Skiagram.s

Unilateral or bilateral acetabular fractures seen on computed tomography:-

Unilateral acetabular fracture was seen in 26 patients and bilateral acetabular fracture was seen in three patients on CT while on conventional radiographs it was seen in only one case.

Pattern of acetabular fractures as detected on computed tomography:-

Acetabular fractures were seen in 29 patients on CT. Out of these 29 patients, pattern of comminuted fracture was seen in 18 patients and 11 patients had linear pattern. In one patient, no acetabular fracture was detected on CT.

Dislocation of femoral head as detected on computed tomography:-

Out of 29 positive cases of acetabular fractures, associated dislocation of the femoral head was seen in only six cases. Most of the patients with dislocation underwent reduction of the dislocated hip prior to CT examination.

Type of dislocation of femoral head detected on computed tomography:-

Acetabular fractures were associated with dislocation of the femoral head in six cases. Out of these, posterior dislocation of the femoral head was seen in four cases, central dislocation in two cases whereas none of the cases had anterior dislocation.

Distribution of acetabular fractures on computed tomography:-

Most commonly involved segment of the acetabulum on CT was roof seen in 18 cases (62%) and quadrilateral plate seen in 12 cases (41.4%). Involvement of the posterior wall, anterior wall, anterior and posterior column was seen in 9 cases (31%). Fracture involving the anterior wall was seen in 3 patients (10.3%).

Figure 5:- Distribution Of Acetabular Fractures On Computed Tomography.

Associated fractures of pelvic bones seen on computed tomography:-

Along with acetabular fractures, the fractures of the pelvic bones were detected. Fractures involving the pubic bone were seen in 14 cases (27.5%), fracture of sacrum was seen in 5 cases (17.2%) and fracture of femoral head was seen in 3 cases (10.3%).

Figure 6:- Associated Fractures Of Pelvic Bones Seen On Computed Tomography (N=29)

Combination of pelvic fractures as detected on computed tomography:-

In some patients, more than one segment of acetabulum was fractured. The most common combination was seen in fracture of roof and quadrilateral plate of acetabulum seen in 7 cases (24%), next common combination was fracture involving both columns (13.7%).

Number of intra-articular bony fragments detected on computed tomography:-

Intra-articular bony fragments were seen in 7 (24%) of patients on CT. Single bony fragment was seen in 4 cases (57%). Multiple bony fragments were seen in 3 cases (43%).

Figure 7:- Intra-Articular Bony Fragments Detected On Computed Tomography.

Discussion:-

In our study, the maximum number of patients were in the age group of 20-40 years (60%) with mean age of 36.26 yrs and median age of 30. This reflects the most active age in life, especially with regard to travelling. Our results were comparable with those of Adam et al (4). In their study of thirty patients, the age of patients ranged from 17-73 yrs with mean age of 34.5 yrs.

Roadside injury due to motor vehicle injury was the leading cause of pelvic trauma in 28 patients (93.3%), whereas fall from height accounted for 2 patients (6.6%). High incidence of pelvic trauma (93.3%) caused by motor vehicle accidents is comparable to the study of Snohiadski et al (13) who reported traffic accidents as a cause of acetabular fractures in 84% of patients.

CT is superior to plain radiography in not only confirming or excluding the fractures but also clearly demonstrating whether the fractures are unilateral or bilateral. Bilateral involvement of acetabulum on conventional radiography was noted only in one case while on CT, bilateral involvement was seen in 3 patients. There were two cases where bilateral involvement was missed on X-ray.

Hip dislocation was detected in 14 patients (46.6%) on radiography whereas it was seen in only 6 cases (20%) on CT examination. This discrepancy could be attributed to the fact that most of these patients were subjected to CT examination after post reduction of the dislocated hip. The incidence of dislocation of femoral head associated with acetabular fracture in our study was comparable to that of Sauser et al (11). In their study 53% of patients had

associated dislocation of femoral head as compared to 46.6% in our study. High incidence of posterior dislocation (78.5%) in the present study was comparable to that of Brown et al (12) who also reported 14 patients of posterior dislocation out of 17 patients included in their study.

According to Harley et al (6), the sensitivity of CT is more in detection of fractures of quadrilateral plate and roof as transverse axis of the CT images allows the precise characterization of the abnormality of this structure, which is not possible with conventional radiography. In their study of 26 patients of pelvic trauma, the authors reported 100% sensitivity of CT in detecting fractures of roof and quadrilateral plate compared to 73% for conventional radiography. The overall sensitivity of X-ray in detection of acetabular fractures was 26/29 (89%) and overall sensitivity of CT was 100%. Authors also observed that there was no significant difference between plain radiography and CT in detecting fractures of anterior column, posterior column and posterior wall. This can be attributed to the fact that these structures are so oriented that are quite well seen on conventional radiography. We also found almost equal sensitivity of CT and conventional radiography in detecting fractures of anterior column (89%), posterior column (89%) and posterior wall (78%) on conventional radiography and 100% on CT for all the segments of acetabulum. Martinez et al (1) also illustrated the above fact in their study.

Sensitivity of CT in detecting intra-articular fragments in present study compares well with the other authors. The intra-articular fragments were detected on CT in 7 patients, while on conventional radiography of pelvis, intra-articular fragments were not seen in even a single patient. Harley et al (6) detected intra-articular bony fragments in 18 out of 26 patients with acetabular fractures, whereas plain radiography showed no intra-articular bony fragment. Sauser et al(11) did not detect any bony fragment on plain skiagrams as compared to CT in which bony fragments were seen

In 3 patients. Adab et al (4) also emphasized superiority of CT in detection of any intra-articular bony fragment as compared to conventional radiography as they detected one or more loose bodies in 33% of patients included in their study whereas only one loose body was apparent on conventional radiography.

The use of 3D surface reformations of complex anatomical structures from sets of contiguous axial CT sections had been discussed by Guy et al (7), Magid et al (17), Fishman et al(15) and Rommense et al (16). Guy et al(7) observed that fracture lines demonstrated on plain radiographs and axial scans are not always apparent on 3D reconstructions, hence according to authors, 3D is complementary and not a substitute to good quality plain radiographs and axial computed tomographic sections. In our study, all the axial sections of CT scan were superior to the reconstructed images in the detection of acetabular fractures. 3DCT did not alter the initial radiological diagnosis but it did provide the best and most easy interpretation of overall assessment of the fractures.

The comparison between CT and plain radiography shows that CT is more sensitive than conventional radiography in detecting linear, undisplaced fractures of acetabulum, detecting fractures involving quadrilateral plate and acetabular roof. In addition, abnormalities of the hip joint space like loose bony fragments were detected more often on CT. Hence CT has been advocated as an adjuvant to conventional radiography in the evaluation of acetabular fractures of the pelvic bones.

Figure 8:- Axial and 3D Reformatted CT images showing T shaped fracture of Left Acetabulum with Posterior Dislocation of Left Femur.

Figure 12:- X ray showing disruption of iliopectineal line and fracture of both superior and inferior pubic rami.

Figure 13:- Axial and 3D Reformatted CT images showing Fracture of Anterior wall and Anterior Column of Right Acetabulum.

Summary and Conclusion:-

The radiological evaluation of hip and acetabulum has been revolutionized by development of computed tomography because of its fine definition of sectional anatomy and accurate assessment of pelvic trauma. CT is superior to plain radiography in not only confirming or excluding the fractures but also clearly demonstrate whether the fractures are unilateral or bilateral. The overall sensitivity of X-ray in detection of acetabular fractures is 86% (26/29) and overall sensitivity of CT is 100%. From the present study, we conclude that computed tomography is superior to conventional radiography in detecting acetabular fractures, involvement of specific segment of acetabulum, associated fractures of pelvic bones and in detection of intra-articular fragments. CT displays the better anatomy of acetabulum in axial plane, thereby providing the missing pieces of information and greatly facilitating the classification of acetabular injury.

Abstract

India is the fourth-largest consumer of tobacco in the world and the third-largest producer of tobacco after China and Brazil. There are about 250 million tobacco users in India who account for about 19% of the world's total 1.3 billion tobacco users. India's tobacco problem is made more complex by the fact that tobacco is used in various forms in different parts of the country. Where research once concentrated on tobacco-related diseases and their treatments, emphasis has been shifting toward examining underlying behaviors. Understanding risk profiles helps determine where and how treatment should be focused and which therapies are most effective. It is for this reason that oral health team members are in an ideal position to give their patients specific, authoritative information concerning the adverse oral effects of tobacco use and the means to tackle it. Optimizing the implementation of routine tobacco cessation intervention in general dental practice remains a key aim in the delivery of dental care.

Introduction:-

Tobacco use can lead to death, as it is one of the causes for chronic diseases. Such deaths are preventable. In 2005, tobacco use was responsible for more than 5 million deaths around the world and this number is expected to rise to 10 million deaths annually by 2020. [1] India is the fourth-largest consumer of tobacco in the world and the third-largest producer of tobacco after China and Brazil. There are about 250 million tobacco users in India who account for about 19% of the world's total 1.3 billion tobacco users. [2]

India's tobacco problem is made more complex by the fact that tobacco is used in various forms in different parts of the country. The prevalence of all types of tobacco use among men is about 47% (11%–79% in different states) and, among women, smokeless tobacco use varies between 0.2% in Punjab and 61% in Mizoram (Where the prevalence of women's smoking reaches a high of 22%). Among school-going children in grades 8 through 10, current tobacco use varies from 2.7% in Himachal Pradesh to 63% in Nagaland. [3]

In India, at least 800,000 deaths every year are related to tobacco use (700,000 of them due to smoking). Conservative costs of treating selected tobacco-related cancers, heart and lung disease amounted to Rs 30,833 crores (US\$ 7.2 billion) in 2002–2003. [2]

Over the past few years, India has demonstrated a resolve to deal with the issue of tobacco use. In 2003, the Indian Parliament passed the Tobacco Control Act and in 2004 it ratified an international treaty—the World Health Organization's Framework Convention on Tobacco Control (WHO-FCTC). Efforts are urgently needed at the implementation level to reduce the current and projected harm caused by tobacco. [4]

Tobacco And Oral Health:-

Since the early 1970s, dental professionals have become increasingly aware of the damage that smoked and smokeless tobacco causes to tissues in and around the oral cavity.[5] Doubts about tobacco's adverse effects on oral health are evaporating in the face of evidence from a large and growing body of scientific literature that establishes it as an underlying cause of numerous diseases.

Ranging from mild to life-threatening, the following tobacco-related oral conditions may develop: halitosis, hairy tongue, dental calculus, periodontal disease, acute necrotizing ulcerative gingivitis, abrasion, discoloration of teeth and restorative materials, miscellaneous tissue changes, delayed wound healing, sinusitis, leukoplakia, and oral cancer. [6] Additionally, tobacco use increases and complicates treatment risks by compromising the prognosis for periodontal and other oral diseases and increasing the likelihood of the occurrence and reoccurrence of mouth cancers.[7]

Indeed, in light of current knowledge, mechanical and pharmaceutical treatment of oral diseases without addressing patient smoking is akin to medicating and binding a sliver in the hand but not removing it. The source of the problem must be managed. For e.g., treating tobacco use and dependence is as important to success in caring for periodontal disease as are restorative measures for dental caries, and preventing initiation of tobacco use by youths is as fundamental to the prevention of periodontal disease as providing fluoride and sealants are to caries prevention.[8] Where research once concentrated on tobacco-related diseases and their treatments, emphasis has been shifting toward examining underlying behaviors. Understanding risk profiles helps determine where and how treatment should be focused and which therapies are most effective. [9]

It is for this reason that oral health team members are in an ideal position to give their patients specific, authoritative information concerning the adverse oral effects of tobacco use and the means to tackle it. [10] Moreover, dentists who implement an effective smoking cessation program in their practices can expect to achieve quit rates up to 10-15 percent each year among their patients who smoke or use smokeless tobacco.[11]

These rates will rise further if additional help is harnessed for smoking cessation counseling by referral to smoker's clinics and by appropriate use of pharmacotherapy. Thus, optimizing the implementation of routine smoking cessation intervention in general dental practice remains a key aim in the delivery of dental care. [12]In this regard, the 1996 clinical practice guideline Smoking Cessation recommended methods based on more than 3,000 clinical studies in several countries that had been published in peer-reviewed journals over a fifteen- year period. [13]

The guideline became the most successful of a long series produced by the Agency for Health Care Policy and Research (now the Agency for Healthcare Research and Quality), and in four years, more than 1 million copies were distributed worldwide. The 1996 guideline focused primarily on individual patient encounters. With rapid advances in the science of tobacco treatment, the 3,000 studies initially available had expanded to more than 6,000 by 1999.[14]

The 2000 guideline, *Treating Tobacco Use and Dependence*, placed an emphasis on regarding tobacco use as a chronic disease. Repeated care is needed to manage the long-term effects and the slow, partial recovery process. Relapse is almost inevitable during recovery, so clinician monitoring and reinforcement are needed just as is done when treating periodontal diseases, diabetes, hypertension, and other conditions requiring sustained management.[15]

The new guideline addresses issues commonly confronted, such as triage, care of special patients, and the special conditions, policies, and procedures needed to nurture effective patient cessation and maintenance services. Key recommendations in the current guideline are as follows:

1. Tobacco dependence is a chronic condition that often requires repeated intervention. However, effective treatments exist that can produce long-term or even permanent abstinence.
2. Because effective tobacco dependence treatments are available, every patient who uses tobacco should be offered at least one of these treatments:
 - a. Patients willing to try to quit tobacco use should be provided with treatments identified as effective in the guideline.
 - b. Patients unwilling to try to quit tobacco use should be provided with brief interventions designed to increase their motivation to quit.
3. It is essential that clinicians and health care delivery systems (including administrators, insurers, and purchasers) institutionalize the consistent identification, documentation, and treatment of every tobacco user seen in a health care setting.
4. Brief tobacco dependence treatment is effective, and every patient who uses tobacco should be offered at least brief treatment.
5. There is a strong dose-response relationship between the intensity of tobacco dependence counseling and its effectiveness. Treatments involving person-to-person contact (via individual, group, or proactive telephone counseling) are consistently effective, and their effectiveness increases with treatment intensity (i.e., minutes of contact).
6. The following three types of counseling and behavioral therapies were found to be especially effective and should be used with all patients attempting tobacco cessation:
 - a. Provision of practical counseling (problem solving/skills training);
 - b. Provision of social support as part of treatment (intra-treatment support);
 - c. Help in securing social support outside of treatment (extra-treatment social support).
7. Numerous effective pharmacotherapies for smoking cessation now exist. Except in the presence of contraindications, these should be used with all patients attempting to quit smoking.
 - a. Five first-line pharmacotherapies were identified that reliably increase long-term smoking abstinence rates: bupropion SR, nicotine gum, nicotine inhaler, nicotine nasal spray, and nicotine patch.
 - b. Two second-line pharmacotherapies were identified as efficacious and may be considered by clinicians if first-line pharmacotherapies are not effective: clonidine and nortriptyline.
 - c. Over-the-counter nicotine patches are effective relative to placebo, and their use should be encouraged.
8. Tobacco dependence treatments are both clinically effective and cost-effective relative to other medical and disease prevention interventions. As such, insurers and purchasers should make sure that:
 - a. All insurance plans include as a reimbursed benefit the counseling and pharmacotherapeutic treatments identified as effective in the guideline; and
 - b. Clinicians are reimbursed for providing tobacco dependence treatment just as they are for treating other chronic conditions.

Role Of The Dentist ^[16]

In the clinic, dentists have an important role in helping patients quit tobacco and, at the community and national levels, to promote tobacco prevention and control strategies.

Dentists in the clinics:-

Can check for the harmful effects of tobacco in the oral cavity, they are in an ideal position to counsel patients, can target young children and youth as patients and can influence them to adopt a tobacco-free lifestyle, Can treat women of childbearing age and can inform them of the dangers of tobacco use during pregnancy. They spend more time with patients than other clinicians and use this time to counsel tobacco users to quit and reinforce messages given to patients by physicians and other caregivers about the dangers of tobacco use and the need to quit.

Dentists in community and nation:-

They can act as role models by not using tobacco or by quitting successfully. Tobacco use by dentists is a significant barrier to tobacco cessation counseling. They are also in a position to speak with authority in the community about the dangers of tobacco use; for example, the need to curb tobacco use in public and educate children about the dangers of tobacco use. Thus, they can be effective advocates for tobacco control in the community.

Behavioral Counseling:-

Counseling is a collaborative process in which the counselor assists the client in facilitating behavior change, enhancing coping skills, promoting decision making and improving relationships. [17] Tobacco use decreases when

patients receive counseling from a health care provider. Physicians and other primary health care personnel are valuable and effective in the management of individuals with tobacco cessation. The physician has the influence, as a credible expert in a position of authority, to suggest and advise patients to quit tobacco use. [18]

Patients, who are willing to quit tobacco, should be provided with treatments identified as effective. However, for those who are unwilling to try and quit tobacco, interventions should be designed to increase their motivation to quit. [19] Under these circumstances, patients undergo a series of stages of willingness and preparedness to quit. At each stage a person is thinking and feeling differently about the tobacco use habit. These 5 stages are described below which can be categorized as: [20]

Stage-1) Pre-contemplation

Here a person is not thinking about quitting, they are not interested in change. This is because:

- i) They do not see their smoking habit as a problem.
- ii) They think that Tobacco is infact helpful and beneficial, that it helps them in concentration, in digestion, or for relaxing.
- iii) They may be fully aware of the risks but may value tobacco use for other reasons that thus do not wish to stop.
- iv) Unaware of help available and previous failed attempts at changing make them believe they cannot stop.

Stage-2) Contemplation

Here the patient knows the risks and problems, but is undecided and is unaware of the benefits on quitting smoking. In this stage the person is torn two ways, i.e., aware that he ought to stop but still feeling attached or drawn to smoking.

Stage-3) Preparation stage

Here the patient expresses a desire to quit. Those in preparation stage are planning to take action soon. They are beginning to make small changes and trying out different ways of behaving. They may tell others about their intention to stop and make clear plans on how they are going to do it.

Stage- 4) Action stage

Here patient makes visible changes and puts considerable effort for leaving the habit. This is often the time when they seek professional help.

Stage-5) Active period

During this stage, quit status is continued and strengthened, temporary stoppage becomes part of a more settled pattern. Unless this takes place the person may move into relapse, and return from there to pre-contemplation or contemplation stage.

It may be noted that a person may move from one stage to another in the forward or backward direction and may require continuous effort to move towards the direction to quit smoking. The emphasis of all the above points is to make the patients aware that tobacco use is affecting their physical health, family and social life. The guiding principle here should be to involve the patient in discussion and providing information on the consequences and risks of tobacco use.[21]

Barriers to tobacco cessation:-

A number of barriers to the provision of tobacco cessation services at a dental clinic have previously been reported. These include practitioner opinions, attitudes and perceptions toward tobacco cessation counseling.[13] Other reported barriers include lack of time, and concern about upsetting the patient¹⁵⁰ and lack of reimbursement. [22] Although, the most significant barrier still remains a lack of education of dentists and hygienists on cessation activities during their formative years of training. [23]

Nevertheless, there are a number of important activities that could hamper this: [24]

1. Training of more dental students, dental hygienists, and dental practitioners to provide tobacco cessation counseling;
2. Increase in the number of dental practices routinely monitoring tobacco use and providing tobacco cessation programs;

3. Increase in the utilization of the available procedures for tobacco cessation, (whether it is a covered service or not) so as to familiarize insurance companies with this practice; and
4. Stimulating the demand for more tobacco cessation coverage by employees. Such activities could go a long way towards encouraging employers to cover tobacco cessation without any differentiation by provider, as long as the outcomes are reasonably successful.

Conclusion:-

Tobacco imposes a colossal burden of disease and death leading to catastrophic health, social, economic and environmental effects. Prevalence and practices of tobacco use in India are varied and disparate. Tobacco consumption continues to grow at 2–3% per annum, and by 2020 it is predicted that it will account for 13% of all deaths in the country. [25] Tobacco dependence displays many features of a chronic disease. Only a minority of tobacco users achieve permanent abstinence in an initial quit attempt. The majorities of users persist in tobacco use for many years and typically cycle through multiple periods of remission and relapse. A failure to appreciate the chronic nature of tobacco dependence impedes clinicians' consistent assessment and treatment of the tobacco user over time. [26]

Effective interventions exist that can produce long-term cessation at up to double the rate achieved by smokers without treatment. It is important for clinicians to know that assessing and treating tobacco use generally leads to greater patient satisfaction with health care. Members of the dental profession have a unique opportunity to influence tobacco use by their patients.[27]

Dentists are obligated to help patients quit because tobacco use is the most common underlying cause of periodontal and many other oral diseases and conditions, apart from the risks to quality of life and to life itself. [28]Evidence is overwhelming that tobacco damages oral health and that clinical cessation methods work in dental practice. Although not specifically addressed in any guideline, professional education institutions, including dental and dental hygiene schools, need to identify tobacco use among all patients.[29]

The time that the dental team spends with patients usually exceeds that occurring in medical practice. The very brief (i.e., less than three minute) intervention clinicians should use to advise and assist patients need not be dedicated time but can be easily woven into other diagnostic and treatment services. As with other chronic diseases, repeated assistance is useful. Unlike treatment of other conditions, such support is particularly important to counter incentives by a powerful industry that constantly attempts to encourage previous users to relapse. [30]

Patients who quit must learn how to cope with environmental triggers. Resisting the rituals surrounding tobacco use, resisting offers of tobacco and encouraging support from those who live, work, and play with the patient are at least as important as using pharmacotherapy's for reducing discomfort associated with withdrawal and recovery. Human interaction with a respected health care provider has a powerful influence and can be tailored to individual patient interests, conditions, and culture. Pharmacotherapy should be reinstated as often as needed, that is, as often as relapsing patients are willing to make another attempt to quit, because tobacco dependence is a chronic, relapsing condition that usually requires multiple attempts before long-term abstinence is achieved. [31]

Repeated contacts and a longer duration of contact are often more easily provided in dental practice than in many medical care environments. Compensation for cessation services in dental practice may be by patient payment, by integration into another dental service, or as part of a reimbursement program. [32] Effective interventions exist that can produce long-term cessation at up to double the rate achieved by smokers without treatment. It is important for clinicians to know that assessing and treating tobacco use generally leads to greater patient satisfaction with health care. Members of the dental profession thus have a unique opportunity to influence tobacco use by their patients.

Key words:-

Antimicrobial efficacy, Agar disk diffusion test, S.mutans, L.acidophilus.

Abstract

Aim and Objective: To evaluate the antibacterial potential of herbs and spices extracts in efficiently reducing cariogenic pathogens in oral cavity, thereby incorporating them into various dentifrices and topical preparations which are safe, economical, free from side effects and could act as the new source of antimicrobial agents.

Methods: Ethanolic extracts (10% each) of ginger, garlic and cinnamon were prepared and subjected to microbiological assay along with 0.2% chlorhexidine gluconate (CHX), to determine its zone of inhibition at volumes of 10 µl, 20 µl, and 30µl each using Agar disk diffusion test against Streptococcus mutans (S.mutans) and Lactobacillus acidophilus (L.acidophilus). One-way ANOVA test and Post hoc test were used to compare the antibacterial potential of herbs and spices extracts in efficiently reducing cariogenic pathogens in oral cavity by incorporating them into various dentifrices using SPSS software version 14. The significance level for all the statistical tests utilized in this study was set at $p < 0.05$ %.

Results: There was a significant correlation between the control and experimental groups. The highest antimicrobial efficacy was observed in positive control group and by 10% ethanolic Cinnamon extract in comparison to 10% ethanolic extracts of Ginger and Garlic.

Conclusion: The plant extracts such as Cinnamon extracts in 10% concentration could be used as an alternative antibacterial compound for effective reduction of cariogenic pathogens in oral cavity.

Introduction:-

Dental caries is one of the most common infections of all oral diseases. Cariogenic micro-organisms, especially *S.mutans* plays an essential role in the pathogenesis of dental caries. Other microbes such as *Lactobacillus* species are also associated with dental caries by fermenting sugars into lactic acid and grow readily at low pH values. Among the chemotherapeutic agents, CHX is the “gold-standard” but has side effects like brown discoloration of the teeth, oral mucosal erosion, dryness, burning sensation and undesirable taste.¹ Thus there is a need for an alternative, safe, efficacious and cost effective treatment options and biologic products for oral diseases.

Natural products such as herbs and spices have been used since ancient times as antimicrobial agents that have fewer side effects, better patient tolerance, cost effective and readily available.^{2,3} Some common herbs such as cilantro, basil, ginger, turmeric, garlic, cinnamon etc., offer great health benefits by virtue of their powerful phytochemical and antioxidant properties.⁴

Thus, the aim of this study was to comparatively evaluate the antimicrobial potential of 10% ginger, 10% garlic and 10% cinnamon extract against *S.mutans* and *L.acidophilus*. To the best of our knowledge no study has been carried out to compare the antimicrobial potential of ginger, garlic and cinnamon extract against *S.mutans* and *L.acidophilus*.

Methods:-

The study was carried out in four steps:-

Phytochemical Standardization:-

According to the WHO guidelines⁵ the phytochemical standardization of the herbal drugs were performed by the Department of Pharmaceuticals, Rajiv Academy for Pharmacy, Mathura (U.P)

Preparation of Ethanolic Extracts:-

Fresh ginger, garlic and cinnamon (500 grams each) was procured from the local market and cleaned using distilled water, minced into fine pieces and suspended in sterile jars containing 1000ml of 70% ethanol each. They were subjected to the process of cold maceration for 48 hours in a sterile jar after which the process of filtration using sterile muslin cloth was done. The filtrates obtained were placed over steam bath apparatus for 5 days to facilitate evaporation of ethanol content. After 5 days, 25g of ginger, 25g of cinnamon and 28g of garlic extracts were obtained.

Preparation of 10% Ethanolic Extracts:-

For the preparation of 10% stock solution of ethanolic extracts, 10 grams of obtained extracts were dissolved in 100ml of dimethyl sulfoxide to obtain 10% ethanolic extracts of ginger, garlic and cinnamon respectively.

Determination of Zone of Inhibition:-

The stock solution of 10% ethanolic extracts prepared were subjected to agar disk diffusion test along with a positive control (0.2% CHX) at volumes of 10 µl, 20 µl and 30 µl each to determine the zone of inhibition against *S.mutans* and *L. acidophilus* respectively. Interpretation of diffusion results were carried out by the presence or absence of zone of inhibition. The standard strains of microorganisms used in this study were: *S.mutans* (Microbial Type Culture Collection-MTCC NO. 890) and *L. acidophilus* (MTCC NO. 10307, Chandigarh, India).

Statistical Analysis:-

One-way ANOVA test and Post hoc test were used to compare the antibacterial potential of herbs and spices extracts in efficiently reducing cariogenic pathogens in oral cavity by incorporating them into various dentifrices using SPSS software version 14. The significance level for all the statistical tests utilized in this study was set at $p < 0.05$ %.

Result:-

Line diagram 1 showed the comparison of mean zone of inhibition values of 10% ethanolic extracts of ginger, garlic, cinnamon and 0.2% CHX at 10 µl, 20 µl, and 30 µl volume measured against *S.mutans*. The highest zone of inhibition was seen in 0.2% CHX followed by 10% ethanolic extracts of cinnamon and lowest by garlic extracts. Also, the zone of inhibition increased when the volumes of the extracts increased.

Line diagram 2 showed the comparison of mean of zone of inhibition values of 10% ethanolic extracts of ginger, garlic, cinnamon and 0.2% CHX at 10 μ l, 20 μ l and 30 μ l volume measured against *Lactobacillus acidophilus*. The highest zone of inhibition was seen in 0.2% CHX followed by 10% ethanolic extracts of cinnamon, and lowest by ginger extracts. An increase in inhibition zone was observed as the volumes of extracts increased.

Line Diagram 1:- Shows the comparison of mean values of disk diffusion test against *S. mutans*.

Line Diagram 2:- Shows the comparison of mean values of disk diffusion test against *L. acidophilus*.

Discussion:-

Initiation of dental caries and the microbial composition of plaque involves *S. mutans* or *Lactobacilli*. A prevalence of 87.4% and 36.7% were recorded for *S. mutans* and *L. acidophilus* for dental caries⁶ hence, these bacterial isolates were selected for this research work. Currently, CHX is the most potent chemotherapeutic agent against dental caries but due to its various side effects, it discourages patient to use as a mouth wash.⁷ The use of natural products such as ginger, garlic and cinnamon could be considered as a potential source of novel antimicrobial agents, used extensively for the treatment of cold, nausea, diarrhea and dental infections.⁸⁻¹¹

The purpose for this research was to compare and evaluate antimicrobial efficacy of 10% ethanolic extracts of ginger, garlic and cinnamon each with 0.2% CHX (positive control) at various volumes (10 μ l, 20 μ l, 30 μ l) using agar disk diffusion test. Dissolution of solvent based extracts was done in dimethyl sulfoxide (DMSO) which acts as a surfactant and easily gets penetrated in the agar. It is an oxidizing agent that neutralizes the antiseptic effect of ethanol and showed no antibacterial activity in the agar diffusion test.¹²

The results showed that maximum antimicrobial activity was exhibited by 0.2% CHX and 10% Cinnamon extract and least by 10% ethanolic extracts of Ginger and Garlic against both bacterial isolates but their effectiveness

varied. A mean zone of inhibition value showed by 0.2% CHX against *S.mutans* at 10 µl, 20 µl and 30 µl was 14.5 mm, 19.5 mm and 23 mm whereas against *L.acidophilus* it was 8.5 mm, 13 mm, and 15.5 mm respectively. The zone of inhibition was found to increase as the volume of extracts increased; this was in accordance with the findings of Nanasombat S.¹³

The mean zone of inhibition values of 10% ethanolic extract of Cinnamon against *S.mutans* was found to be 9.5mm, 15.5mm, 18.5mm at 10 µl, 20 µl and 30 µl and against *L.acidophilus* it was found to be 7 mm, 8 mm and 9.5 mm respectively. The inhibition value was not significantly lower than 0.2% Chlorhexidine. Mechanisms, where by Cinnamon extract inhibit growth of *S. mutans* are still unclear. The antibacterial effect of cinnamon were related to the inhibitory effect of its hydrophobic essential oils (cinnamaldehyde, eugenol and carvacrol) that enable them to partition the lipids of the bacterial cell membrane, disturbing the cell structures and rendering them more permeable. Extensive leakage of critical molecules and ions from bacterial cells leads to its death.¹⁴ Asmi OH et al also proved that cinnamon had showed the highest antimicrobial effect at maximum concentration on the growth of bacterial strains followed by garlic, ginger and turmeric.¹⁵

The highest mean zone of inhibition values of 10% ethanolic extract of cinnamon when compared to 10% ethanolic extracts of ginger and garlic against *S.mutans* and *L.acidophilus* could be attributed to the presence of phytochemicals like alkaloids, saponins and tannins in abundance as observed in the phytochemical screening of the spices. The results of this study showed that although the extracts were less potent than Chlorhexidine, still they were relatively effective in inhibiting the growth of oral bacteria. Hence, 10% ethanolic extract of cinnamon extracts could be used in the form of a natural dentifrices as an alternative for patients who wish for natural, economic products without artificial preservatives, flavors and colors. The evaluation of toxicity and allergic potential of these plant extracts was not included in this study. Hence, a conclusive comment on the toxicity and allergic potential of these plant extracts cannot be made.

Conclusions:-

The highest antimicrobial efficacy was shown by 0.2% Chlorhexidine followed by 10% ethanolic Cinnamon extract and lowest by 10% ethanolic Ginger and Garlic extracts at 10 µl, 20 µl and 30 µl against *S.mutans* and *L.acidophilus*. The antimicrobial efficacy increased with increase in volume. Thus, use of 10% ethanolic extract of cinnamon as an alternative antibacterial compound for effective reduction of cariogenic pathogens in oral cavity would not only reduce the clinical burden of drug resistance development but also lessen the side effects and cost of the treatment with allopathic medicine.

defenders' strategy, prospectors' strategy, analysts' strategy, respondents' strategy, and competitive intelligence.

Abstract

This study aims to identify the compatibility between a numbers of business alignment strategies related to the (Miles & Snow) model that represented by (defenders, prospectors, analysts, respondents) with competitive intelligence, represented by (planning and focus analysis, collection, communication, structure and processes, and organisational culture and awareness). The study population is two soft drinks company (Hayat Company for soft drinks and mineral water, Ltd. under license from PepsiCo Inc., and CC Company for the drinks industry, Ltd. under license from Coca-Cola) in the city of Erbil. The study pursues a descriptive analytical approach, along with examine a set of hypotheses for the purpose of achieving the goals of the study and its problem that have been tested by multiple statistical tools using statistical analysis software program (SPSS 20). A survey questionnaire prepared and distributed to managers and their assistant in addition to supervisors in the different units such as production, distribution, marketing and management, and in the various branches in the city of Erbil. The study sample numbered (63) managers. The study found a number of results based on the analysis of respondents' answers such as the both company have high-level rates of compatibility strategies comparable with excellence for Coca-Cola and comes second Pepsi. Based on the results the study presents a set of recommendations and suggestions to organizations.

Introduction:-

Nowadays, markets which organizations operate characterized by a high degree of complexity and intense competition, which led to the emergence of many of the challenges that organizations have to adapt. Organizations become obligatory upon perception and analysis associated with the dimension of the competitive aspects in the markets that they were operates after becoming its survival and continuity in such markets depend on the ability of

its managers to hire and direct available resources to have the greatest possible efficiency. Since helping that organizations to identify priorities and timing of strategic moves that should be completed in their activities efficiently in order to enhance its competitiveness and support along with take advantage of what has been waving profit from market opportunities (Hamwi and Abdullah, 2012, 886).

Competitive intelligence is not limited to the collection of intelligence information with pre-emptive nature of the competitors and their activities. It becomes recently extends to the external environment as a whole and analyzed after classified it, and then interpret and inference it on the various strategic decisions making that geared the future course of business organizations towards attaining strategic objectives to the extent that it is expected to rise competitive intelligence structure to a level of ability of these organizations in the future (Ismail and Jamil, 2016, 165).

Based on the above the present study will analysis the role of strategic alignment of business strategies related to the (Miles & Snow) model on competitive intelligence. This study has been divided into four sections, the first section deals with the scope of the study and its methodology. The second section will address the concept of strategies alignment to business strategies related to the (Miles & Snow) model, as well as the concept of competitive intelligence along with describes their characteristics and dimensions. Section three illustrates the results and determines the relationship between the two variables along with examines the impact of strategic alignment of business strategies on competitive intelligence. Finally, the fourth section will clarify the most findings and presents a set of recommendations.

Section one: the scope of study and Methodology:-

The scope of study:-

Study problem:-

In the era of globalization and rapidly changes along with the emergence of new environmental challenges constantly in all the areas of science made contemporary organizations face the competitive challenges. This organization cannot on its current based gain competitive advantage, strengthen and durability its survival. In addition to thinking to adopt more of a strategy or several strategies and compatibility between them to be able to acclimatize to these continuous and rapid changes and with different environments. In particular those environments that are dynamic, undependable, and intense competitive since competitors face the threats is a difficult subject. As a result, this organization requires to increased attention to competitive intelligence activities and to strengthening its dimensions to achieve competitive intelligence.

Based on the above, present study aims to identify the compatibility between a numbers of business alignment strategies related to the (Miles & Snow) model that represented by (defenders, prospectors, analysts, respondents) with competitive intelligence, represented by (planning and focus analysis, collection, communication, structure and processes, and organisational culture and awareness), along with testing the correlation in soft drinks company in Iraqi Kurdistan region Erbil city. In this regard the most important question that this study attempts to find proper answer may explains as following:

- Is there a strategic alignment of competitive business strategies followed by the organization and competitive intelligence?
- Is there is a correlation between strategic alignments of business strategies related to the (Miles & Snow) model and competitive intelligence?
- Is there is an impact of strategic alignments of business strategies related to the (Miles & Snow) model on competitive intelligence?

The significance of Study:-

The significance of the study can be explains under two aspects as following:-

- **The theoretical side:** the importance of this study embodied in enriches academic libraries in Iraqi Kurdistan region in particular, as well as Iraqi libraries in general. This study is an attempts to illustrates the theoretical concepts and conceptual framework of the role of strategic alignment of business strategies related to the (Miles & Snow) model on competitive intelligence at sample study that represent soft drinks organizations.
- **Applied side:** to clarify the relationship and the impact of of strategic alignment of business strategies related to the (Miles & Snow) model on competitive intelligence. Furthermore, directing the two organizations to research the importance of strategic alignment of business strategies and its role in improving the organizational performance thus improve the competitive intelligence.

The objectives of study:-**This study is an attempt to achieve the following objectives:-**

- To explain and describe the role of strategic alignment of business strategies on competitive intelligence in sample study.
- To clarify the correlation between strategic alignment of business strategies dimensions and the dimensions of competitive intelligence.
- To examine the impact of strategic alignment of business strategies dimensions on the dimensions of competitive intelligence.
- To illustrate the importance of strategic alignment of business strategies and the competitive intelligence to managers in all levels and to their organizations along with identify the benefits of this application.

Theoretical study Framework:-

The model (figure 1) illustrates the theoretical study framework. The model assumed a correlation and an impact of strategic alignment of business strategies related to the (Miles & Snow) model on competitive intelligence. In this study, strategic alignment of business strategies related to the (Miles & Snow) model is independent variable represents by four dimensions (defenders strategy, prospectors' strategy, analysts' strategy, and respondents' strategy). On the other hand, competitive intelligence is dependent variable represents by six dimensions (planning and focus analysis, collection, communication, structure and processes, and organisational culture and awareness).

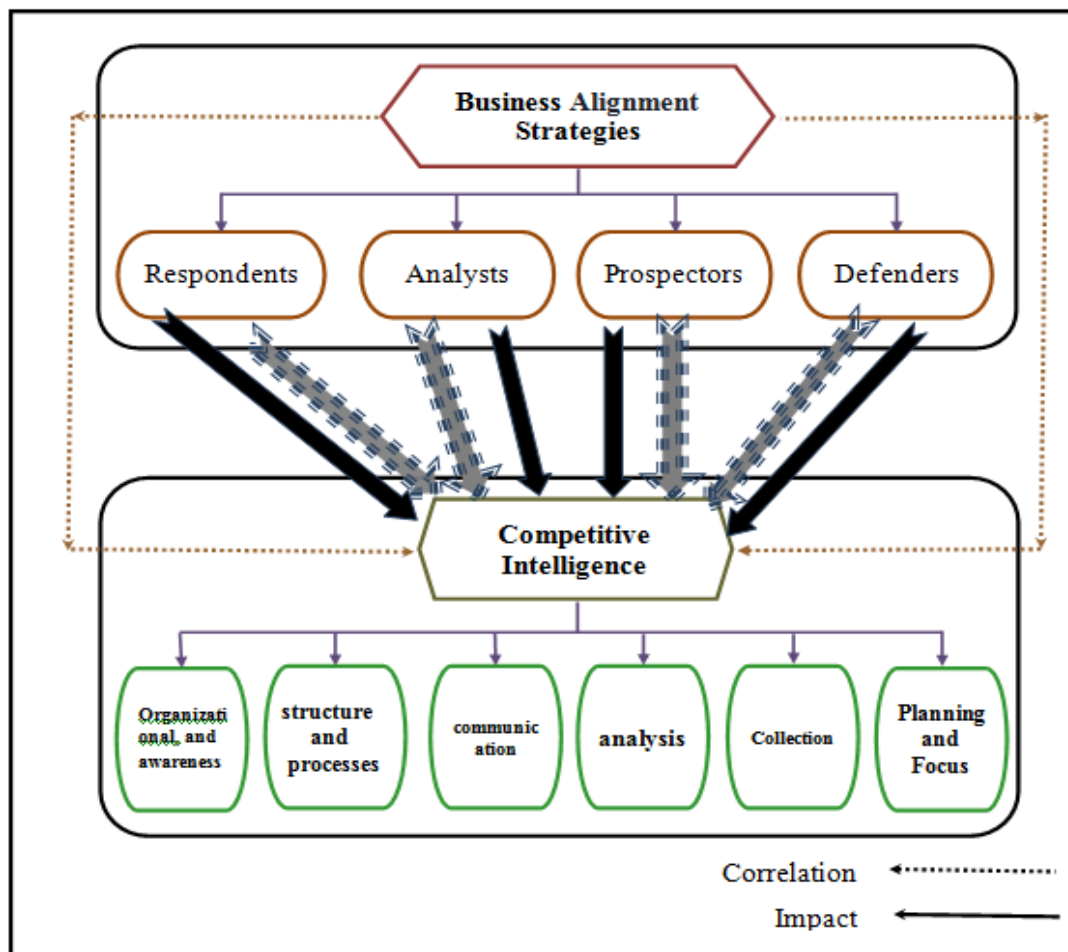

Figure 1:- Theoretical Study Framework "Source: prepared by researchers"

Research Hypothesis:-

To achieve the objectives of this study and testing the theoretical framework of the study, a number of hypotheses administrated and as following:

The First Hypothesis:-

There is a measurable positive correlation between strategic alignments of business strategies related to the (Miles & Snow) model and competitive intelligence.

From the first main hypothesis there are four sub-hypothesis as follows:-

- There is a measurable positive correlation between defenders strategy and competitive intelligence.
- There is a measurable positive correlation between prospectors' strategy and competitive intelligence.
- There is a measurable positive correlation between analysts' strategy and competitive intelligence.
- There is a measurable positive correlation between respondents' strategy and competitive intelligence.

The Second Hypothesis: there is statistically a significant impact of strategic alignments of business strategies related to the (Miles & Snow) model on competitive intelligence.

From the second main hypothesis there are four sub-hypothesis as follows:

- There is statistically a significant impact defenders strategy on competitive intelligence.
- There is statistically a significant impact prospectors' strategy on competitive intelligence.
- There is statistically a significant impact analysts' strategy on competitive intelligence.
- There is statistically a significant impact respondents' strategy on competitive intelligence.

Methodology:-**Study population and sample:-**

The study population is all managers in the two soft drinks companies in the city of Erbil that numbered (71) managers and assistant managers. The questionnaire distributed to all managers, their assistants, and supervisors in the units of production, distribution, marketing, and management and in various branches of the two soft drinks companies. 63 questionnaires returned and thus, the research response rate was (88.7%).

Study approach:-

In order to achieving the objectives of this study, descriptive and analytical approach was adopted. Since this approach describes theoretically study variables and then statistically analyzed in order to reach the objectives of study.

Data collection methods:-**In this study, data collected through secondary data and primary data as following:-**

- **Secondary data:** in this study various available source used to collect secondary data such as: books, scientific studies and research, theses and dissertation that relevant to present study in order to illustrates and explain to the theoretical framework of study variables.
- **Primary data:** the researchers relied on the survey questionnaire to achieve the study objectives through testing hypotheses and access to their results. The questionnaire consists of three sections. Section one presents the personal Characteristics of respondents such as: gender, age, level of education, years of experience, and position. Section two presents 20 items related to independent variable "strategic alignment of business strategies related to the (Miles & Snow) model". Finally, section three that presents 30 items on competitive intelligence, the table below gives more details about the instruments of the questionnaire

Table 1:- Questionnaire Instruments

Study Variables	Sub variables	No. of Items	Items	Sources
General Data	Personal data	4	4	Prepared by researchers
Strategic business alignment (Miles & Snow) model	Defenders	20	X1–X5	(Kess, Isoherranen, 2014), (Al-Lami, 2007), (Suleiman, 2010)
	Prospectors		X6–X10	
	Analysts		X11–X15	
	Respondents		X16–X20	
Competitive intelligence	Planning and focus	30	Y21–Y25	(Ismail and Hussein, 2015), (Srouf, and Mohammed, 2013)
	Collection		Y26–Y30	
	Analysis		Y31–Y35	
	Communication		Y36–Y40	
	Structure and processes		Y41–Y45	
	Organisational culture and awareness		Y46–Y50	

"Source: prepared by researchers"

The reliability of the questionnaire:-

Reliability means the measure's ability to show the same results when they are re-applied to the individuals themselves again. The reliability of this study tested through the use of scale (Cronbach's alpha), the total alpha coefficient was (94.7%) and this percentage is high for the purposes of the study.

Methods of data analysis:-

This study relied on a set of statistical tools as following:-

- Means, standard deviations, rate of agreements and the coefficient of variance in order to describe the study variables, analysis, and discussion the results.
- Simple correlation coefficient (Pearson) for the purposes of measuring the strength of the correlation between the two variables.
- Multiple linear regressions in order to measure the independent variable on dependent variable.

Section Two: Literature Review

Strategic alignment of business:-

There are a number of models concerning strategic behavior and competition. In this area, many academics and researchers presented several models that contribute the efforts of them, such as: Anderson & Paine, 1978 model, Miles & Snow, 1978 model, Burgelman, 1984 model, and Ansoff, 1987 model. In this regards, Miles & Snow, 1978 model is consider one of the most important, common and widely used in research and studies (Al- Qadu et al., 2007, 55). Thus, the present study will rely on (Miles & Snow) model for its compatibility with the study problem and objectives along with the theoretical side. Furthermore, it complies with the applied side, which is the soft drink company in the city of Erbil.

The (Miles & Snow) Model:-

Gimenez (1994, 4) and Musa (2014, 67) indicates that the strength of this model being concentrated in defining the relationship between organizational structure, work processes and technology in a way that allows organizations to interact with their surroundings. Moreover, it is effective in diagnosing some of the strengths and weaknesses as well as estimate what the organization could face by competitors actions. In addition, the model is characterized by providing a classification of strategies at the business level along with at the corporate level. The model assumed that organizations reasonably develop and adopt a different strategic behavior in order to achieve excellent compatibility with its surroundings. In his part, Daft (2001, 60) states that this model based on the idea that managers are annoying to formulate the four strategies to adapt to with the external environment and organizations seeking to achieve compatibility between the internal characteristics, strategies, and the external environment.

Miles & Snow (1978) presented four strategies to organizations on the level of business units in their study that included four fields: Printing, food, health care, and electronics. (Sultan & Akkar, 2013, 81). This classification based on the Organization's response to the three main elements: the investor problem in product and market, the engineering problem, and administrative problem (Miles et al, 1978, 546), (Girmenez, 1994, 4), (Boyne & Walker, 2004, 233), (Al-rukabi, 2004, 256), (Simon, et al., 2005, 24), (Isoherranen & Kess, 2011, 575), (Walker, 2015, 202).

Defenders:-

Are those organizations that provide a particular good or service and trying to stick them in terms of price, quality and service (Kess, Isoherranen, 2014, 1115). Furthermore, this organizations seeking more to focus on limited markets and do not tend to look for new opportunities outside their marketing respective fields. As a result of this focus, it is rarely such organizations need to make significant changes in its structure or the technology that it owns or methods of operation. Nevertheless they always seeking to improve current efficiency and it is characterized by relatively stable surroundings as this strategy is slow to change, so the defenders often resort to long-term planning (Musa, 2014, 67). Moreover, the defenders strategy is distinctive by the following characteristics (Al-Yasri, 2005, 52):

- Interest in the current market, they are trying to maintain existing customers without expanding into new markets.
- Focus on providing services and products relatively constant.
- Do not tend to creativity and innovation or expansion in research and development.
- Avoid engaging in high-risk business.
- Depends on internal efficiency and standard procedures for operations to provide high quality products to customers.
- Depend on central management style in the planning and control.
- Characterized by stability and adapt to environmental changes.
- Compete on the basis of low cost, whenever possible, delivery times and efficient service.

Prospectors:-

Organizations that follow the prospectors strategy dealing with unstable environments and more dynamic compared to other types of organizations in the same industry (Al-Qadu et al, 2007, 56), (Isoherranen & Kess, 2011, 577). This strategy follows the opposite strategy to the defenders that search for new products and new markets (Aragón-Sánchez. & Sánchez-Marín, 2005, 290). The management of this strategy focused on innovation and on two types of it firstly provide new product and secondly development of existing products. Since management offering these products on the market quickly to exploit the available opportunities. To implement this strategy it requires from management the ability to examine constantly the environmental conditions as well as the ability to predict events (Robbins, 1990, 131). Furthermore, the prospectors' strategy is distinctive by the following characteristics (Al-Yasri, 2005, 51):

- Looking for new opportunities for production and expansion of the range of goods and services.
- Looking for new markets and techniques characterized by modernity and flexibility.
- Focus on creativity, innovation and care about activities, research and development.
- Avoid entering into long-term commitments.
- It willing to face the risk.
- Depends on decentralized management style in the planning and control.
- Calls for Learning Orientation that is associated with the flexibility to face the prospect rapid changes.

Analysts:-

it is organizations that are seeking to bring a mix between the philosophy of defenders and prospectors as they work under the stable and unstable markets in order to monitor the behavior of competitors (Hamdi, 2015, 87), (Isoherranen & Kess, 2011, 578). This strategy is based on maintaining the current business and the efficiency of the work and defends on it as well as searching for new opportunities and markets across the behavior of prospector (Sultan & Akkar, 2013, 83). This strategy takes advantage of the opportunity on the basic product range and remains unchanged (Habtoor, 2007, 114). In addition, the analysts' strategy is characterized by the following characteristics (Al-Yasri, 2005, 51):

- Organization works routinely and efficiently through the formal structures and processes to retain existing customers.
- The organization works to monitor competitors along with adoption of innovation and new ideas in production to achieve growth.
- Organization relies on centralization and decentralization style to meet the requirements of its stable and changeable.
- The organization achieve a balance between efficiency that is characterized by defenders organizations and learning that is characteristic by prospectors organizations as it attempts to find a balance between stable or fixed technology requirements and flexible technologies requirements.
- Organization is thinking before entering into new business to make sure their profitability and ensuring its ability to maintain its current market share.

Respondents:-

Organizations adopt this strategy when they do not have the capacity to harmony and stability with the characteristics of the above three strategies (Robbins, 1990, 132), (Aragón-Sánchez. and Sánchez-Marín, 2005, 290). They are organizations that are trying to respond to the market in the light of possible fluctuations or achieve the reaction to the actions of the other competitors in the market (Al-Hamdi, 2015, 87). The respondents' strategy is distinctive by the following characteristics (Habtoor, 2007, 114), (Sulaiman, 2010, 72):

- The lack of a clear formulation of the organization's mission.
- Failure in the formation of strategies, policies and needed plans to develop the organization's mission into practice.
- The existence of unsuccessful attempts to modify or develop strategies appropriate to the nature of the organization environment in which it operates.
- The need for huge changes in the organizational structure that make enormous efforts to develop a strategy to cope with environment changes.
- Managers realize continuously change and the status of unsure that occur in organizational environments. However they are unable to respond to it effectively.
- The organization operates without a plan to respond to threats or when exposed to environmental stresses and thus behave randomly.

Competitive intelligence:-

In the world of business complex and permanently changing the competitive intelligence along with understanding the plans of competitors is a well-established base in the field of strategic decision-making that offers a distinctive competitive position to organizations. Moreover, identifying the competitive needs is the actual beginning of the competitive intelligence cycle that determine the priorities of the intelligence requirements for organizations that complete by the competitive intelligence path process in terms of planning, collection, analysis and dissemination of information (Abulqader, 2013, 25).

Jain (1997, 79) defines competitive intelligence as the available public information about existing or potential competitors which are used as inputs to the task in the operation of the marketing strategy of the organization. Moon (2000) states that competitive intelligence is a process of monitor and control of the competitors and their intentions in a legal and ethical ways as well as analyzed it according to the sequence of steps starts with planning and then selecting competitors then the definition of intelligence requirements and the ability to diagnose and analysis of competitors then find the two-way communication process (Al-Azawi, 2012, 10). Parker & Nites (2006, 44) confirms that competitive intelligence is the process of gathering knowledge about the external environment and turn them into competitive intelligence that provides actual assistance to the management organization in a good strategic selection. On his part (Qasim, 2011, 23) pointed out that competitive intelligence is a organized process to obtain general information about competitors and analysis it in order to distinguished targeting them in the market. Ismail & Hussein (2105, 161) concluded that competitive intelligence is a systematic ethical process for data collection and managing external information, analyzed it, and used to make decisions and formulate appropriate strategy for the organization along with strengthen its competitive advantages.

Competitive intelligence Models:-

There are three main models that presented competitive intelligence process as following (Salih et al, 2010, 360):

- Kahaner (1996) model.

- The model of professionals association.
- Calof & Dishman (2002) model.

This study will depend on Calof & Dishman (2002) model due to its comprehensiveness and the possibility of its application in the field as well as compatibility with the nature of the study problem. The model consists of six stages and they planning and focus analysis, collection, communication, structure and processes, and organisational culture and awareness (sewal, 2000, 3), (Salih et al, 2010, 362), (Hamwi & Abdullah, 2012, 893), (Ismail & Hussein, 2015, 161) and the figure below (figure 2) illustrates Calof & Dishman, 2002 model that call competitive intelligence cycle or competitive intelligence operations.

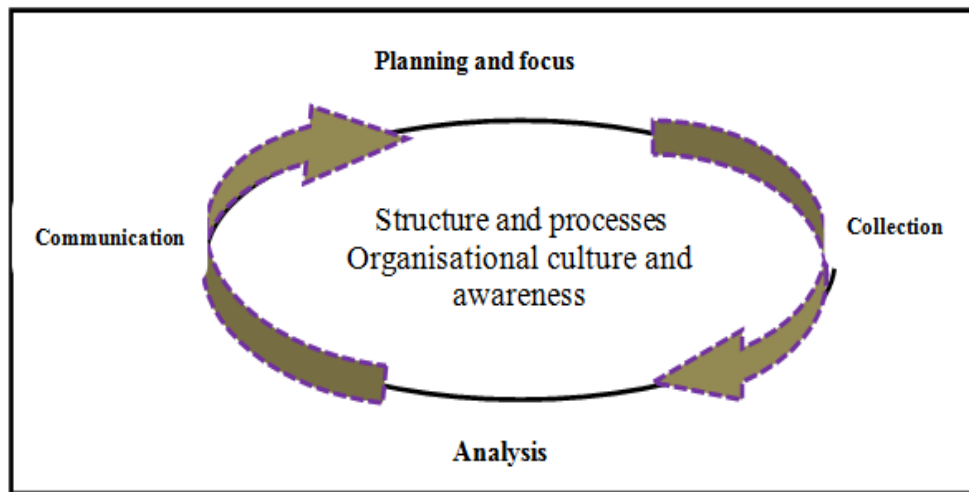

Figure 2:- competitive intelligence tool "Source: Sewall, R. (2004)"

Planning and focus:-

This stage includes identifying the information needs and bring these needs to the key intelligence topics along with giving priority to top management in that process including intelligent decision makers requirements (Ismail & Jamil, 2016, 170). This focus means that the concentration of competitive intelligence is only on the critical aspects and extremely important for the organization such as the activities and plans of competitors, the culture that competitors use, market trends, and demand (Ismail & Hussein, 2015, 162).

Collection:-

Information is the basis of competitive intelligence. In this stage information is gathering from a variety of different sources that published and unpublished legally and ethically from all possible sources. The collected data sources are storage and then tested to determine the degree of reliability and credibility (Salih et al, 2010, 365). The most important functions in this stage can be explains as following: (Srou and Mohammed, 2013, 376)

- Distribution the roles and tasks on the competitive intelligence team.
- Identify information sources.
- Determine the methods of competitive intelligence team work.

Analysis:-

This stage consider as the essence of the competitive intelligence process since at this stage the information will be analysis and interpretation by using many methods such as business environment analysis PEST (Policy, Economic, Social, Technology), and SWOT analysis (Strength, Weakness, Opportunities, Threats) (Ismail & Jamil, 2016, 171). Furthermore, this stage includes the following steps (Srou and Mohammed, 2013, 377):

- Determine the degree of reliability to the various sources of information.
- Determine the degree of accuracy of information sources.
- Connect between information and targets of competitive intelligence.
- Coordination between the various sources of information.

Communication:-

Is the process of transfer information from a person to another that the receiver can understand this information (Weihrich & Kootz,1993,712). It is transfer of meaningful information to relations' individuals (Byers & Rue,2004,13). Communication is the final results of the process of competitive intelligence as in this stage the information will be used along with present the results to decision-makers in the form of a report or in a meeting because the results of the competitive intelligence process must delivery to those individuals that owns authority and responsibility in order to interpret or converted it to final results. Furthermore, communication that link to intelligent can be done also by (E-mails, presentations, briefings, rival files, and private memoranda) (Salih et al, 2010, 367).

Structure and processes:-

Competitive intelligence requires appropriate policies and procedures as well as formal and informal infrastructure enable workers to contribute effectively to the competitive intelligence system as well as gaining benefits resulting from it (Salih et al, 2010, 367). There must be some kind of integration to the components of generating competitive intelligence process in order to not rely entirely on the technical side and ignoring the role of the human element. Since generating competitive intelligence process that not include human element cannot be able to provide managers the competitive knowledge-based on information that managers need and they expect (Hamwi & Abdullah, 2012, 895). While, operations are a mechanism that organization can accomplish its goals that include how managers address the problems of employees and problems of quality control operations (Ismail & Hussein, 2015, 162).

Organisational culture and awareness:-

In order to organization to successfully obtain benefiting from the efforts of competitive intelligence and the intelligence practice becomes a successful, organizations must support this culture within its organizing process that help it to establish in addition to the exchange of knowledge and ideas between individuals and departments within the organization. Moreover, organizations must have a high degree of organizational awareness to create a culture of competition since the high awareness of the organization environment competitive is consider being one of the basic rules of the organizational learning theory. Besides, instilling awareness / organizational culture must needs to apply the behavior and ethical standards. In order to happening this organizational must create a favorable environment for competitive intelligence that requires a continuous training to its employees. Moreover, one of the factors that helping to spread the culture of intelligence within the organization is the extent of the continuing demand of intelligence information of the various administrative levels in order to making decisions (Hamwi & Abdullah, 2012, 895).

Section Three: Results and Findings:

Section three presents a description of results and findings as the following:

Describe the personal characteristics of the study sample:-

Gender: table (2) shows the gender of the selected participants. The majority of the participants at Coca-Cola N=21 (77.8%) were male and N=6 (22.2%) were female. At the same time, the majority of the participants at Pepsi N=32 (88.9%) were male and N=4 (11.1%) were female.

Table 2:- Distribution of respondents- Gender wise.

		Coca-Cola		Pepsi

Age:-

The figure bellow (3) shows the age of the participants that have been categories within four groups. The majority of the participants at Coca-Cola N=15 with (55.6%) their age are between 31-40 years, N= 9 (33.3%) their age are between 21-30 years, finally N= 3 (11.1%) are between 41-50 years. On the other hand, the majority of the

participants at Pepsi N=24 with (66.7%) their age are between 21-30 years, N=10 (27.8%) their age are between 31-40 years, finally N=2 (5.6%) are between 41-50 years.

Level of Education:-

The figure bellow (4) shows the level of education of the participants that have been categories within six groups. The majority of the participants at Coca-Cola N=24 with (88.9%) are holding bachelor degree, and the rest N= 3 (11.1%) are holding technical diploma degree. Furthermore, the majority of the participants at Pepsi N=21 with (58.3%) are holding bachelor degree. Comes second N= 7 (19.4%) are holding technical diploma degree, N= 5 (13.9%) are holding high diploma degree, N= 2 (5.6%) are holding high school degree, and finally N= 1 (2.8%) is holding PhD. degree.

Descriptive Statistics of questionnaires variables:-

The following is the details to describe the questionnaires variables that consist of business strategies related to the (Miles & Snow) model and competitive intelligence. Statistical analysis software program (SPSS, V. 20) was used in order to find the means, standard deviations, rate of agreements, and the coefficient of variance for all the questionnaires items as the following:

Description the dimensions of business strategies related to the (Miles & Snow) model:-

The table below (7) explains the means, standard deviations, rate of agreements, and the coefficient of variance of the dimensions of business alignment strategies related to the (Miles & Snow) model. The dimensions of business alignment strategic have a high means for Coca-Cola and Pepsi (4.18) (3.988) respectively, along with the total standard deviation of (1.063) (0.894) respectively. The rate of agreement for both company Coca-Cola and Pepsi was (%83.6) (%79.76) respectively, with a small dispersion in the respondents' answers as the coefficient of variance was (22.42) and (25.43) respectively. This results means that most of the respondents agree with the dimensions of business strategies related to the (Miles & Snow) model since the results came at a high level rates of compatibility strategies comparable with excellence for Coca-Cola and comes second Pepsi.

Defenders strategy:-

The table below (7) explains the means, standard deviations, rate of agreements, and the coefficient of variance of the defenders strategy. Defenders strategy for Coca-cola has a total high mean (4.15) with standard deviation of (1.039) with a rate of agreement reached (%83). On the other hand, Pepsi has a total high mean (4.02) with standard deviation of (.908) with a rate of agreement reached (%80.4) with excellence for Coca-Cola comparing to Pepsi

company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment the defenders strategy relating to Coca-Cola company depending on the percentage of the respondents agreement is X2 which states that "our company is seeking to produce high quality products outweigh products of the competitors." that supports the values of mean and standard deviation of (4.48, 1.014) respectively. However, relating to Pepsi company X1 that states "our company adopts defensive technique to curb the actions of competitors in the markets." is the most elements that have contributed to enrichment the defenders strategy that supports the values of mean and standard deviation of (4.44, .735) respectively

Prospectors' strategy:-

prospectors' strategy for Coca-cola has a total high mean (4.20) with standard deviation of (1.065) with a rate of agreement reached (%84). In contrast, Pepsi has a total high mean (4.03) with standard deviation of (.940) with a rate of agreement reached (%80.6) with excellence for Coca-Cola comparing to Pepsi company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment the prospectors' strategy relating to Coca-Cola company depending on the percentage of the respondents agreement is X8 which states that "the basic philosophy of our company is to win new customers to provide a variety of products constantly." that supports the values of mean and standard deviation of (4.56, 1.013) respectively. On the other hand, relating to Pepsi company X6 that states "our company is looking for the environmental market opportunities constantly through the knowledge of the demand for their products trends." is the most elements that have contributed to enrichment the prospectors' strategy that supports the values of mean and standard deviation of (4.33, .894) respectively

Analysts' strategy:-

Analysts' strategy for Coca-cola has a total high mean (4.27) with standard deviation of (1.019) with a rate of agreement reached (%85.4). On the contrary, Pepsi has a total high mean (4.002) with standard deviation of (.817) with a rate of agreement reached (%80.04) with excellence for Coca-Cola comparing to Pepsi company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment the analysts' strategy relating to both Coca-Cola and Pepsi company depending on the percentage of the respondents agreement is X12 which states that "our company is interested by all systems that will achieve a reduction in the cost of their products." that supports the values of mean of (4.56, 4.47) respectively, along with standard deviation of (1.013, .560) respectively.

Respondents' strategy:-

Respondents' strategy for Coca-cola has a total high mean (4.12) with standard deviation of (1.131) with a rate of agreement reached (%82.4). On the contrary, Pepsi has a total high mean (3.90) with standard deviation of (.912) with a rate of agreement reached (%78) with excellence for Coca-Cola comparing to Pepsi company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment the respondents' strategy relating to Coca-Cola company depending on the percentage of the respondents agreement is X19 which states that "our company is interested in following up customers needs to identify their complaints as a prelude to respond to them at right time" that supports the values of mean and standard deviation of (4.30, 1.103) respectively. However, relating to Pepsi company X18 that states "our company attaches great importance to follow up the technological changes in order to respond to the changes of customers' needs." is the most elements that have contributed to enrichment the respondents' strategy that supports the values of mean and standard deviation of (4.08, .937) respectively.

Description the dimensions of competitive intelligence:-

The table below (9) explains the means, standard deviations, rate of agreements, and the coefficient of variance of the dimensions of competitive intelligence. The dimensions of competitive intelligence have a high means for Coca-Cola and Pepsi (4.21) (3.88) respectively, along with the total standard deviation of (1.003) (0.839) respectively. The rate of agreement for both company Coca-Cola and Pepsi was (%84.2) (%77.6) respectively, with a small dispersion in the respondents' answers as the coefficient of variance was (23.82) and (21.62) respectively. This results means that most of the respondents agree with the dimensions of competitive intelligence since the results came at a high level rates of compatibility strategies comparable with excellence for Coca-Cola and comes second Pepsi.

Planning and focus:-

This dimension for Coca-cola has a total high mean (4.11) with standard deviation of (1.040) with a rate of agreement reached (%82.2). On the contrary, Pepsi has a total high mean (4.01) with standard deviation of (.812) with a rate of agreement reached (%80.2) with excellence for Coca-Cola comparing to Pepsi company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment the planning and focus relating to Coca-Cola company depending on the percentage of the respondents agreement is Y5 which states that "our company owns a number of ways to provide the requirements of competitive intelligence plans." that supports the values of mean and standard deviation of (4.26, .984) respectively. On the other hand, relating to Pepsi company Y1 that states "our company is largely concerned with strategies to organizations that compete with them" is the most elements that have contributed to enrichment the planning and focus that supports the values of mean and standard deviation of (4.22, .637) respectively.

Collection:-

This dimension for Coca-cola has a total high mean (4.08) with standard deviation of (1.000) with a rate of agreement reached (%81.6). On the other hand, Pepsi has a total high mean (3.88) with standard deviation of (.885) with a rate of agreement reached (%77.6) with excellence for Coca-Cola comparing to Pepsi company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment this dimension relating to Coca-Cola company depending on the percentage of the respondents agreement is Y7 which states that "our company relies on efficient staff to work in the marketing intelligence system to collect data and information from competitors." that supports the values of mean and standard deviation of (4.26, .984) respectively. On the other hand, relating to Pepsi company Y6 that states " is the most elements that have contributed to enrichment this dimension that supports the values of mean and standard deviation of (4.14, .833) respectively.

Analysis:- This dimension for Coca-cola has a total high mean (4.17) with standard deviation of (.998) with a rate of agreement reached (%83.4). In contrast, Pepsi has a total high mean (3.87) with standard deviation of (.847) with a rate of agreement reached (%77.4) with excellence for Coca-Cola comparing to Pepsi company. This result shows a

high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment this dimension relating to Coca-Cola company depending on the percentage of the respondents agreement is Y12 which states that "our company adopts the analysis of strengths, weaknesses, opportunities and threats to identify the company's competitive situation." that supports the values of mean and standard deviation of (4.56, 1.050) respectively. On the other hand, relating to Pepsi company Y14 that states "our company is following the information published on the internet for the analysis of research and development programs of the competitors." is the most elements that have contributed to enrichment this dimension that supports the values of mean (4.17).

Communication:-

This dimension for Coca-cola has a total high mean (4.31) with standard deviation of (.997) with a rate of agreement reached (%86.2). On the other hand, Pepsi has a total high mean (4.05) with standard deviation of (.775) with a rate of agreement reached (%81) with excellence for Coca-Cola comparing to Pepsi company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment this dimension relating to both company Coca-Cola and Pepsi depending on the percentage of the respondents agreement is Y17 which states that "our company is seeking to develop an effective communications system to gain potential customers." that supports the values of mean and standard deviation of (4.48, 1.014) respectively for Coca-cola and (4.31, .668) for Pepsi.

Structure and processes:-

This dimension for Coca-cola has a total high mean (4.27) with standard deviation of (.993) with a rate of agreement reached (%85.4). On the contrary, Pepsi has a total high mean (3.71) with standard deviation of (.892) with a rate of agreement reached (%74.2) with excellence for Coca-Cola comparing to Pepsi company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment the structure and processes relating to Coca-Cola company depending on the percentage of the respondents agreement is Y25 which states that "our company depends on efficient teams to explore, develop, and improve our product portfolio and operations." that supports the values of mean and standard deviation of (4.37, 1.006) respectively. On the other hand, relating to Pepsi company Y21 that states "our company relies on a flexible organizational structure in line with contemporary developments in the field of competitive intelligence." is the most elements that have contributed to enrichment the structure and processes that supports the values of mean and standard deviation of (4.03, .810) respectively.

Organisational culture and awareness:-

This dimension for Coca-cola has a total high mean (4.32) with standard deviation of (.992) with a rate of agreement reached (%86.4). On the contrary, Pepsi has a total high mean (3.81) with standard deviation of (.827) with a rate of agreement reached (%76.2) with excellence for Coca-Cola comparing to Pepsi company. This result shows a high level of reliance to this dimension. Regarding to the items, the most elements that have contributed to enrichment the organisational culture and awareness relating to Coca-Cola company depending on the percentage of the respondents agreement is Y26 and Y29 which they states that "our company sees competitive intelligence as the core values of its culture." and "in our company beliefs encourages most of the activities related to competitive intelligence" that supports the values of mean (4.41). On the other hand, relating to Pepsi company Y27 that states "the organizational culture in our company based on the consideration to workers as customers and makes the satisfaction as their priorities" is the most elements that have contributed to enrichment the organisational culture and awareness that supports the values of mean and standard deviation of (3.94, .826) respectively.

Based on the above, table (10) illustrates the arranging of competitive intelligence for both companies Coca-Cola and Pepsi. Coca-Cola depends first on organisational culture and awareness, then communication, after that structure

and processes and finally collection. In contrast, Pepsi depends first on communication, then planning and focus, after that collection and finally structure and processes.

Table 10:- the arranging of competitive intelligence

Items	Pepsi					Coca-Cola				
	Mean	standard deviation	Rate of Agreement	Coefficient of variance%	Rank	Mean	standard deviation	Rate of Agreement	Coefficient of variance%	rank
Planning and focus	4.01	.812	80.2	20.26	2	4.11	1.040	82.2	25.30	5
Collection	3.88	.885	77.6	22.81	3	4.08	1.000	81.6	24.50	6
Analysis	3.87	.847	77.4	21.90	4	4.17	.998	83.4	23.93	4
Communication	4.05	.775	81	19.14	1	4.31	.997	86.2	23.13	2
Structure and processes	3.71	.892	74.2	24.06	6	4.27	.993	85.4	23.25	3

Testing the correlation between study variables:-

The first hypothesis states that there is a measurable positive correlation between strategic alignments of business strategies related to the (Miles & Snow) model and competitive intelligence. To test the correlation among the study variables, Pearson's correlation (r) was calculated. Table (11) illustrates that business alignment strategies related to the (Miles & Snow) model were positively correlated with competitive intelligence as the value of the correlation coefficient related to Coca-Cola was high (.927**) reached the value of significant at (0.000) and at the level of significance (0.01). Moreover, Table (11) illustrates that business alignment strategies related to the (Miles & Snow) model were positively correlated with competitive intelligence as the value of the correlation coefficient related to Pepsi company was above moderate (.631**) reached the value of significant at (0.000) and at the level of significance (0.01) based on managers respondents. Consequently, the first hypotheses accepted.

Table 11:- correlation between strategic alignments of business strategies related to the (Miles & Snow) model and Competitive Intelligence.

	Competitive Intelligence		
	Statistics	Pepsi	Coca-Cola
Strategic alignment of business strategies related to the (Miles & Snow) model	The correlation coefficient	.631**	.927**
	Potential value	.000	.000
	The sample size	36	27

**. Correlation is significant at the 0.01 level (2-tailed).

Source: prepared by researchers based on the results of SPSS software.

A number of sub-hypotheses is derived from the main first hypotheses that looking to test the correlation between dimensions of business alignment strategies related to the (Miles & Snow) model that represented by (defenders, prospectors, analysts, respondents) and competitive intelligence.

- **Coca-Cola:** table (12) shows that defenders strategy were positively correlated with competitive intelligence as the value of the correlation coefficient was high (.909^{**}). Table (12) shows that prospectors strategy achieved the highest positive correlation with competitive intelligence as the value of the correlation coefficient was high (.935^{**}). Furthermore, table (12) shows that analysts strategy were positively correlated with competitive intelligence as the value of the correlation coefficient was high (.903^{**}). Finally, respondents' strategy has the weakest positive correlation with competitive intelligence (.789^{**}). The value of significant for the four correlation reached at (0.000) and at the level of significance (0.01).
- **Pepsi:** table (12) shows that defenders strategy were positively correlated with competitive intelligence as the value of the correlation coefficient was bellow moderate (.463^{**}). The value of significant reached at (0.004) and at the level of significance (0.01). Prospectors strategy were positively correlated with competitive intelligence (.402^{*}). The value of significant reached at (0.015) and at the level of significance (0.01). In addition, table (12) shows that analysts strategy has the weakest positive correlation with competitive intelligence as the value of the correlation coefficient was below moderate (.391^{*}). The value of significant reached at (0.018) and at the level of significance (0.01). Finally, table (12) shows that Respondents' strategy achieved the highest positive correlation with competitive intelligence as the value of the correlation coefficient was high (.520^{**}). As a result, the four sub-hypotheses that derived from the main first hypotheses were accepted as well.

Correlation between the dimensions of business alignment strategies related to the (Miles & Snow) model and competitive intelligence

	Competitive Intelligence		
	Statistics	Pepsi	Coca-Cola
Defenders strategy	The correlation coefficient	.463 ^{**}	.909 ^{**}
	Potential value	.004	.000
Prospectors strategy	The correlation coefficient	.402 [*]	.935 ^{**}
	Potential value	.015	.000
Analysts strategy	The correlation coefficient	.391 [*]	.903 ^{**}
	Potential value	.018	.000
Respondents strategy	The correlation coefficient	.520 ^{**}	.789 ^{**}
	Potential value	.001	.000

^{**}. Correlation is significant at the 0.01 level (2-tailed).

^{*}. Correlation is significant at the 0.05 level (2-tailed).

Testing the impact hypotheses between study variables:-

This study conducted a multiple linear regression analysis in order to examine the impact of business alignment strategies related to the (Miles & Snow) model that represented by (defenders, prospectors, analysts, respondents) with competitive intelligence.

Coca-Cola:-

Table (13) demonstrates that business alignment strategies related to the (Miles & Snow) model illustrates 86% of the competitive intelligence as characterized by the (R^2). The significance value is 0.000 which is less than 0.05 at the degree freedom of (1, 25). Thus, the model is statistically significance in predicting how the business alignment

strategies related to the (Miles & Snow) model impacts on competitive intelligence. At 5% level of significance, the F calculated was 153.839 and it is greater than F tabulated (4.24), which explains that the overall model was significant.

Table 13:- the impact of business alignment strategies related to the (Miles & Snow) model on competitive intelligence (Coca-Cola)

	Competitive Intelligence				
	R ²	T		F	
		Tabulated	Calculated	Tabulated	Calculated
Strategic alignment of business strategies related to the (Miles & Snow) model	.860	2.78	12.403 (.000)	4.24	153.839 (.000)

Source: prepared by researchers based on the results of SPSS software.

Pepsi: table (14) shows that business alignment strategies related to the (Miles & Snow) model illustrate 39.8% of the competitive intelligence as characterized by the (R²). The significance value is 0.000 which is less than 0.05. Therefore, the model is statistically significant in predicting how the business alignment strategies related to the (Miles & Snow) model impacts on competitive intelligence. At 5% level of significance, the F calculated was 22.464 and it is greater than its F tabulated (4.24), which explains that the overall model was significant. Consequently, the second main hypothesis is accepted that states "there is a statistically significant impact of business alignment strategies related to the (Miles & Snow) on competitive intelligence".

Table 14:- the impact of business alignment strategies related to the (Miles & Snow) model on competitive intelligence (Pepsi)

	Competitive Intelligence				
	R ²	T		F	
		Tabulated	Calculated	Tabulated	Calculated
Strategic alignment of business strategies related to the (Miles & Snow) model	.398	2.42	4.740 (.000)	4.11	22.464 (.000)

Source: prepared by researchers based on the results of SPSS software

A number of sub-hypotheses is derived from the main second hypotheses that looking to test the impact of dimensions of business alignment strategies related to the (Miles & Snow) model that represented by (defenders strategy, prospectors strategy, analysts strategy, respondents strategy) on competitive intelligence.

Coca-Cola: table (15) shows that defenders strategy illustrates 82.7% of the competitive intelligence as characterized by the (R²). The significance value is 0.000 which is less than 0.05. At 5% level of significance, the F calculated was 119.469 and it is greater than its F tabulated (4.11). Besides, prospectors' strategy illustrates 87.4% of the competitive intelligence as characterized by the (R²) that consider being the strongest dimensional impact on the competitive intelligence. The significance value is 0.000 which is less than 0.05. At 5% level of significance, the F calculated was 173.617 and it is greater than its F tabulated (4.11). As well, analysts' strategy illustrates 81.5% of the competitive intelligence as characterized by the (R²). The significance value is 0.000 which is less than 0.05. At 5% level of significance, the F calculated was 110.197 and it is greater than its F tabulated (4.11). Finally, respondents' strategy illustrates 62.2% of the competitive intelligence as characterized by the (R²) that consider being the weakest dimensional impact on the competitive intelligence. The significance value is 0.000 which is less than 0.05. At 5% level of significance, the F calculated was 41.206 and it is greater than its F tabulated (4.11).

Table 15:- the impact of dimensions of business alignment strategies related to the (Miles & Snow) model on competitive intelligence (Coca-Cola)

	Competitive intelligence				
	R ²	T		F	
		Tabulated	Calculated	Tabulated	Calculated
Defenders strategy	.827	2.78	10.930 (.000)	4.24	119.469 (.000)
Prospectors strategy	.874	2.78	13.176 (.000)	4.24	173.617 (.000)
Analysts strategy	.815	2.78	10.497 (.000)	4.24	110.197 (.000)
Respondents strategy	.622	2.78	6.419 (.000)	4.24	41.206 (.000)

Source: prepared by researchers based on the results of SPSS software.

Pepsi: table (16) shows that defenders strategy illustrates 21.4% of the competitive intelligence as characterized by the (R²). The significance value is 0.004 which is less than 0.05. At 5% level of significance, the F calculated was 9.260 and it is greater than its F tabulated (2.42). In addition, prospectors' strategy illustrates 16.2% of the competitive intelligence as characterized by the (R²). The significance value is 0.015 which is less than 0.05. At 5% level of significance, the F calculated was 6.569 and it is greater than its F tabulated (2.42). Additionally, analysts' strategy illustrates 15.3% of the competitive intelligence as characterized by the (R²) that consider being the weakest dimensional impact on the competitive intelligence. The significance value is 0.000 which is less than 0.05. At 5% level of significance, the F calculated was 6.138 and it is greater than its F tabulated (2.42). Finally, respondents' strategy illustrates 27.1% of the competitive intelligence as characterized by the (R²) that consider being the strongest dimensional impact on the competitive intelligence. The significance value is 0.000 which is less than 0.05. At 5% level of significance, the F calculated was 12.617 and it is greater than its F tabulated (2.42). Consequently, the four sub-hypotheses that derived from the main second hypotheses were accepted as well.

Table 16:- the impact of dimensions of business alignment strategies related to the (Miles & Snow) model on competitive intelligence (Pepsi)

	Competitive intelligence				
	R ²	T		F	
		Tabulated	Calculated	Tabulated	Calculated
Defenders strategy	.214	2.42	3.043 (.004)	4.11	9.260 (.004)
Prospectors strategy	.162	2.42	2.563 (.015)	4.11	6.569 (.015)
Analysts strategy	.153	2.42	2.478 (.018)	4.11	6.138 (.018)
Respondents strategy	.271	2.42	3.552 (.001)	4.11	12.617 (.001)

Section four: Conclusions and recommendations

Conclusions:-

- The Coca-Cola Company focuses on analysts' strategy first then Prospectors after that defenders' strategy and finally respondents' strategy among the four available strategies alignment of business strategies related to the (Miles & Snow) model. On the other hand, Pepsi Company focuses on Prospectors' strategy first then both in the same level analysts' strategy defenders' strategy and finally respondents' strategy in response to the market in the light of possible fluctuations or achieves the reaction of the other competitors actions in the market which can be notice from the means of the four available strategies alignment of business strategies related to the (Miles & Snow) model.
- The results of answers respondents analysis in both companies was positive and they agree with strategies alignment of business strategies related to the (Miles & Snow) model and the dimensions of competitive intelligence. As the results of means for both companies have high-level rates of compatibility strategies comparable with excellence for Coca-Cola and comes second Pepsi.
- Among the companies sample study competitiveness for the exercise of its business. This is an indication of its ability to deliver varied products and services even though the existence of competition in the environment in the city of Erbil in Iraqi Kurdistan region in this area.
- Results of the analysis found a positive correlation between strategies alignment of business strategies related to the (Miles & Snow) model and competitive intelligence as well as between the four dimensions of strategies alignment of business strategies related to the (Miles & Snow) model (defenders, prospectors, analysts, respondents) and competitive intelligence.
- Results of the analysis found an impact of strategies alignment of business strategies related to the (Miles & Snow) model on competitive intelligence that have a reflection to the organizations help them able to conditioning potential according to the changes that occur in the environmental elements.

Recommendations:-

- Companies have operate to develop specialized units to environmental analysis attempts to examine and evaluate changes in environmental trends in general and competitive environmental in particular in order to cope with the changes that occur in the environment that have effects on its products and services along with its profit and survive.
- The need of the company's management in increased interesting in competitive intelligence in the context of being an integrated system since it has a positive impact in the organizations sample study.
- Organizations should gives more attention to environmental information and managing it along with directing efforts towards access to the requirement quality as it proves in the applied fields that have a huge impact in determining the future strategic direction for organizations through its contribution in defining business strategies alignment related to the (Miles & Snow) model.
- The need to focus on competitive intelligence within the standards, legal and ethical dimensions in order to complete the capabilities of this type of intelligence as it own the ability to seize opportunities and avoid environmental threats in addition to work according to data imposed by the competitive environment.
- Organizations should paying more attention to search about the customer's needs and desires about offered products and services and that offered by its competitors and their suitability for their desires along with the most important customer's notes as it has a role in discovery of competitors plans and take advantage of it in adopting strategies alignment of business strategies related to the (Miles & Snow) model in the future.

	Strategic alignment of business strategies related to the (Miles & Snow) model	Strongly agree (5)	Agree (4)	Uncertain (3)	Strongly Disagree (2)	Disagree (1)
Defenders Strategy						
1	Our company adopts defensive technique to curb the actions of competitors in the markets.					
2	Our company is seeking to produce high quality products outweigh products of the competitors.					
3	Our company keeps on its products unchanged.					
4	Our company directed its business in order to be a leader in specific areas of the market.					
5	Our company is seeking to offer a limited range of products to customers, compared with competitors.					

Prospectors strategy						
6	Our company is looking for the environmental market opportunities constantly through the knowledge of the demand for their products trends.					
7	Our company bears high risks to provide better products for customers.					
8	The basic philosophy of our company is to win new customers to provide a variety of products constantly.					
9	Our company develops its products through the schemes of providing the service by adopting modern techniques.					
10	Our company would like to reschedule competitive acts continuously.					
Analysts strategy						
11	Our company analyzes in-depth the analysis ways by the decision-making related to changing technologies to provide the product.					
12	Our company is interested by all systems that will achieve a reduction in the cost of their products					
13	Our company keep pace with the case of competition with similar organizations across align the prices of their products and the ability of customers to the acquisition.					
14	Our company adopts all available methods to obtain information about customers' attitudes toward its product.					
15	Our company adopts the means of analysis that contribute to the assessment of its competitive position compared to similar organizations.					
Respondents strategy						
16	Our company is interested in making a change in its product in response to the effects of environmental pressures.					
17	Our company is characterized by possessing the ability to reduce its product prices in response to a change in the prevailing market prices.					
18	Our company attaches great importance to follow up the technological changes in order to respond to the changes of customers' needs.					
19	Our company is interested in following up customers needs to identify their complaints as a prelude to respond to them at right time					
20	Our company put its products at competitive characteristics in order to respond to environmental change.					

Competitive intelligence		Strongly agree (5)	Agree (4)	Uncertain (3)	Strongly Disagree (2)	Disagree (1)
planning and focus						
1	Our company is largely concerned with strategies to					

	organizations that compete with them.					
2	Our company constantly monitoring the technology used by the competing organizations.					
3	Our company is interested to monitor and evaluate the activities and plans of competing organizations.					
4	Our company holds regular meetings with workers to explain the competitive intelligence plans.					
5	Our company owns a number of ways to provide the requirements of competitive intelligence plans.					
Collection						
6	Workers are back to the information base through computers to solve problems and discover opportunities.					
7	Our company relies on efficient staff to work in the marketing intelligence system to collect data and information from competitors.					
8	Our company is keen on updating its information continuously on the movements of competitors.					
9	Our company collects information about the administrative style adopted by competitors.					
10	Our company adopts in its decisions on strategic marketing intelligence.					
Analysis						
11	Our company is keen on a regular basis in the formulation of research and development and analysis of new products and plans of its competitors					
12	Our company adopts the analysis of strengths, weaknesses, opportunities and threats to identify the company's competitive situation.					
13	Our company analyzes the strategies and directions that competitors may adopt in the future.					
14	Our company is following the information published on the internet for the analysis of research and development programs of the competitors.					
15	our company analyze the information foundation that achieve the organization a competitive advantage					
Communication						
16	Our company provides information relating to the competitive intelligence to all employees in our company.					
17	Our company is seeking to develop an effective communications system to gain potential customers.					
18	Our company has effective staffs that communicate with customers and they deal with them.					
19	Our company is seeking to improve communication technology as a key to achieve superiority over its competitors.					
20	Our company is seeking to develop effective communications systems to gain potential customers.					
Structure and processes						
21	Our company relies on a flexible organizational structure in line with contemporary developments in the field of competitive intelligence.					
22	Our company depends on based organizational structure that enhances the performance of employees.					
23	The company provides requirement competitive intelligence operations to employees.					
24	Our company used technology operations to help the					

	understanding the relevant customer.					
25	Our company depends on efficient teams to explore, develop, and improve our product portfolio and operations.					
Organisational culture and awareness						
26	Our company sees competitive intelligence as the core values of its culture.					
27	The organizational culture in our company based on the consideration to workers as customers and makes the satisfaction as their priorities.					
28	The culture of our company encourages creativity based on competitive intelligence.					
29	In our company beliefs encourages most of the activities related to competitive intelligence					
30	Our company promotes a culture of teamwork and cooperation between workers in the field of competitive intelligence.

Introduction:-

Skin ulcers are defined by the loss of tissue that includes the epidermis and the dermis, at times affecting the adipose tissue and the muscle fascia. There is not spontaneous recovery and the tissue lesion many times results in a fibrous scar [1]. Skin ulceration is a clinical problem, with an incidence of 0.78 %. The financial cost of treatment of such wounds is enormous [2]. Several etiological factors are associated to the development of this condition, such as: chronic venous disease, peripheral arterial disease, neuropathy, physical trauma, hematologic disorders, skin infection, inflammatory diseases, neoplasia, nutritional and iatrogenic alterations. The healing process is dynamic and involves complex events that include hemostasis, inflammation, granulation tissue formation, epithelialization, neovascularization, collagen synthesis, and wound contraction. It involves a sequence of events that begin at the moment of injury and continue for several subsequent months and can be divided into three stages: inflammation, proliferation and remodeling [3]. Several experimental clinical studies have demonstrated the reduction of growth factors of chronic wounds. Platelet aggregation has the leading role in the process of skin healing since it is responsible for releasing growth factors, adhesion molecules and lipids, which regulate migration, proliferation and function of keratinocytes, fibroblasts and endothelial cells [4, 5]. The analysis of supernatant of chronic wounds compared to acute wounds revealed a considerable decrease of the growth factors in the former, observing a quick metabolism of the growth factors due to proteases found in the wound, of bacterial or cellular source. On the other hand, in diabetic ulcers and due to venous insufficiency, the decrease of the growth factors occurs due to a mechanism of sequestration by fibrin around the capillaries [6]. Therefore, biological stimulation of the wound with platelet rich plasma (PRP) (which drives the most important factors for skin and tissue repair) has been recently introduced as a possible alternative to complex surgical methods.

Autologous Platelet-rich plasma (PRP):-

The application of PRP has been documented first promoted by M. Ferrari in 1987 as an autologous transfusion component after an open heart operation to avoid homologous blood product transfusion.

PRP can be defined as the volume fraction of blood plasma contains high concentration of platelets, from a baseline serum level. PRP is mainly a platelet concentrate with minor proportions white blood cells and other blood components [10]. A concentration of 1,407,640 cells/ μ l (with a standard deviation of 320,100) has been suggested as ideal for the definition of PRP [10]. This number corresponds to a platelet count about 4-5 times higher than that contained in the blood, it usually ranges from 150,000 for the 350.000/ μ l (approximately an average value around 200.000/ μ l) [11].

PRP also called as platelet-enriched plasma, platelet-rich concentrate, autologous platelet gel, and platelet releasate [7]. Platelet rich plasma have been used to treat wounds since 1985 [9]. PRP serves as a growth factor agonist [10] and has both mitogenic and chemotactic properties [8,9]. PRP contains a high level of clotting and growth factors [7].

The mechanism of action for PRP is thought to be the molecular and cellular induction of normal wound healing response similar to that seen with platelet activation [12]. PRP accelerate all phases of wound healing (most prominent in angiogenesis) [12].

PRP used in the treatment of chronic skin and soft tissue ulcerations in addition to the use of PRP include dental and oral surgery faciomaxillary surgery orthopedic surgery and trauma], plastic and cosmetic surgery spinal surgery heart bypass surgery and burns surgery

Autologous PRP is a new biotechnology that has stimulation and acceleration of soft-tissue healing.

PRP provides as a surgical hemostatic agent that is biocompatible, safe, and effective. PRP enhances the hemostatic response to injury and accelerates epithelial endothelial and epidermal regeneration, stimulates angiogenesis, enhances collagen synthesis, promotes soft tissue healing, decreases dermal scarring and reverses the inhibition of wound healing caused by glucocorticoids. The high leukocyte concentration of PRP has antimicrobial effect. Since PRP is an autologous blood product, it carries no risk of transmitting infectious disease.

In PRP with chronic non-healing wounds, it has also been used as an anti angiogenic agent and as a carrier for growth factors. In surgical settings, PRP decreases the frequency of intraoperative and postoperative bleeding at donor and recipient sites, accelerates soft-tissue healing, supports the initial stability of grafted tissue at recipient sites as a result of its cohesive and adhesive nature, promotes rapid vascularization of healing tissue by delivering growth factors and, when used in combination with bone replacement materials, induces regeneration.

Growth Factors:-

PRP exerts effects via the degranulation of the alpha granules in platelets that contain growth factors. When the platelets in PRP are activated by thrombin, they release growth factors and serve to accelerate the wound-healing process by promoting cellular proliferation, matrix formation, osteoid production, connective tissue healing, angiogenesis, and collagen synthesis.

The active secretion growth factors begins within minutes of the start of the coagulation sequence and more than 90% are secreted during the first hour, remaining growth factors for the 7 days of their viability. . The rate of wound healing is determined by the number of platelets in the blood clot and PRP increases that initial number.

Methodology:-

This is a prospective randomized controlled study to test the efficacy of autologous platelet rich plasma versus normal saline dressing in chronic non-healing. This study was conducted in our medical college hospital for a period of one year from January 2015 to December 2015 in the department of plastic Surgery 20 cases were studied for chronic non healing ulcers with autologous platelet rich plasma and 20 cases for conventional method who received normal saline as dressing for chronic non healing ulcers. Patients were randomized according to random number table.

20 patients received autologous platelet rich plasma and 20 patients received conventional method (Wet normal saline dressing). The Inclusion criteria includes

Patients in the age group of 18 to 80 years with long standing non-healing ulcers (pressure sores, diabetic ulcers, venous ulcers, other non-specific ulcers),
Non-diabetic patients and patients with type 1 or type 2 diabetes mellitus,
Ulcer ≥ 4 weeks duration and ,
Ulcer $\leq 100\text{cm}^2$ in size,
Hb $\geq 10\text{ g\%}$.

PRP- 12 laks/cumm
Concentration factor 4 time

Study Design And Measurements:-

This study is designed as a prospective, randomized-controlled clinical study. Patients would be randomly assigned to two groups, A (experimental group, n = 20) and B (control group, n = 20). Detailed history was taken in all cases regarding the duration, mode of onset, progression, and associated symptoms. Also the etiological factor responsible was elicited in the history.

Ulcer examination was done in all this patients and wound was assessed of its characteristics and photographed. Ulcer was assessed by the investigator at the beginning of the study and at the end of the study; Size of the wound was charted by tracing the edge of wound over the graph on day 1, 7, 14, and 21 day.

Dressing Technique:-

After allotting the dressing with the help of random number table, the following procedure was performed.

For conventional Dressing:-

A chronic non healing ulcer with no active pus discharge and slough was cleaned with the 0.9% saline solution and was covered with pad and roller bandage

For Autologous Platelet rich plasma:-

Autologous platelet rich plasma was prepared from patients own blood and injected periphery and over the ulcer bed using insulin needle(26 G) after cleaning with 0.9% saline and dressing done using pad and roller bandage.

The dressing was changed every 3rd day; similar dressings done to all the patients to both the groups and the outcome is measured on 7th 14th day 21st day.

Wounds will be assessed and measured (length and width, using a metric tape). Outcome is measured in terms of wound reduction between the two groups. Other wound characteristics, i.e., presence or absence of granulation tissue, pain, color, edges, etc. will be documented. The end point of the study will be complete wound closure either surgery in the form of skin graft or spontaneous closure

Statistical analysis:-

Unpaired students "t" test and chi square tests were used to find out the statistical significance. A 'P'<0.05 was taken as significant

Results:-

This Study was conducted in Coimbatore medical college hospital Coimbatore and the findings are tabulated. During the study year from January 2015 to December 2015, 40 patients with chronic non healing ulcers were randomized into study (PRP) and control (normal saline) group. These groups were studied for the effect of conventional dressing versus PRP on epithelialization and wound reduction. A total of 40 patients satisfied the selection criteria, analysis was done by using students paired 't' test for continuous variables within the groups and unpaired 't' test for continuous variables between cases and controls.

The efficacy of PRP was compared with control group as the percentage of ulcer surface area covered by granulation tissue. In PRP group had 73.86% mean granulation tissue their ulcer. The control group had 49.1% mean granulation tissues. The Split Skin Graft uptake was much better in the PRP dressing group $84.789\% \pm 4.391$ than the normal saline dressing group $68.75\% \pm 5.718$ which was statistically significant. The mean hospital stay was also significantly lesser in the study group than the control group.

Discussion:-

Chronic wounds are a major health problem in developing countries like India, and these wounds lack the necessary GFs for healing, they are often difficult to heal and associated with super added infection. PRP contains various necessary growth factors for wound healing. In addition, the high concentration of WBC's present in PRP is also helpful in preventing infections.[13]

In the present study, an attempt has been made to establish better healing rates with use of PRP in chronic non healing ulcers. In this study the baseline characteristics such as age, sex and location of the ulcer were similar in the patients who received PRP dressing in study group and in patients who received control (NS) dressing.

In the present study the mean platelet count was 2, 00,000 in both PRP group and NS group but the PRP yield 3-4 times higher than baseline value of platelet counts.

In this study, initial area of the ulcer (in mm²) was similar between the two groups. However, the final area of the ulcer (in mm²) was significantly reduced in patients with PRP group as compared to the patients in NS group at the end of the study. The percentage reduction in the area of the ulcer was more in the PRP group as compared to the NS group and this difference was statistically significant.

A study conducted by Frykberg et al.[14] on 49 patients with 65 non healing ulcers showed that 63 of 65 ulcers responded with a reduction in area, volume of the ulcers in a mean duration of 2.8 weeks with 3.2 treatments.

Steen Voorde et al.[15] conducted a study on 12 patients with 13 wounds, showing that 7 of 13 wounds required more than 1 application, with a mean number of 2.2 applications and a mean treatment period of 4.2 weeks.

Kakudo et al.[16] treated five cases of intractable skin ulcer with autologous PRP, among which three ulcers healed completely within 4 weeks and epithelization of wound occurred within 6.6 weeks on average.

In our study, 20 patients were treated with PRP and the mean reduction of the ulcers was 30.56%(SD5.6) in three weeks. We also noticed increase granulation tissue of the wound around 73% in three weeks and reduced pain and infection

Till now there is no standard method of preparation of PRP in literature. According to Marx, the device must use a double centrifugation technique.[17] Regardless of the rate of centrifugation or the time of centrifugation, a single spin cannot adequately concentrate platelets, because the red blood cells will interfere with their fine separation. Currently, PRP was found to be useful in treating chronic leg ulcers.

Limitations of our study:-

1. Follow up is short to derive conclusion on long term healing of ulcers.
2. Need further controlled, randomized prospective clinical trials are necessary to definitively demonstrate its efficacy.
3. There is also a need for the development of a standard protocol for the preparation of PRP, as literature currently there is no standardization of the procedure.

Conclusion:-

We believe that the application of of AUTOLOGUS PLATELET RICH PLASMA (PRP) dressings in comparison with the control group (normal saline group) for the treatment of chronic ulcers of the lower limb, the following conclusions were derived

1. PRP showed faster and better healing rates among the study group.
2. Ulcer area reduction and percentage reduction of ulcer was better in PRP group.
3. Formation of granulation over the ulcer better with PRP group
4. Uptake of skin graft better in PRP group than NS group
5. Skin graft stability and compliance better in PRP group.
6. There were no adverse effects or reactions seen when autologous PRP was applied over the ulcer.

Abstract

Introduction: Serious orthopaedics injuries caused by high impact trauma due to road traffic accidents are more prevalent in Saudi Arabia. Fractures of posterior wall are the most common type of acetabulum fractures. The outcome after surgical management of acetabular fracture is primarily related to the quality of articular reduction. This management is the most challenging task for surgeons.

Methodology: A retrospective cohort study was conducted in a tertiary care hospital, Riyadh, Saudi Arabia. All patients who underwent internal fixation for posterior wall acetabular fracture from October 2013 to September 2015 were included in the study. Post-surgical outpatient evaluation was done clinically by Merle D' Aubigne Y Postel - hip functional evaluation score and radiological assessment using Ficat classification for staging of avascular necrosis of femoral head.

Principal results: With increase in age, the function of hip declined. The step in fixation was found significantly associated with avascular necrosis ($p = 0.020$) and nonunion ($p = 0.020$). The gap was found significantly associated with nonunion only ($p = 0.001$).

Conclusions: Delay in surgery should be avoided if surgical management is decided for posterior acetabular wall fracture. Adequate surgical reduction of fracture of posterior acetabular wall is necessary. Screw seems to be a better choice of implant until further new evidence is received. A randomized controlled trial is needed to evaluate and compare different management options for fracture of posterior acetabular wall and to set standard guidelines for future.

Introduction:-

The incidence of Acetabular fractures is increasing in developing countries because of rise in road traffic accidents (Robert S. Sterling, 2011). Acetabulum fracture counts about 0.5 to 8% of orthopaedic ward admissions (Grubor P, 2015) and out of this about 24 to 32 % have posterior wall involvement (Vincenzo Giordano et al., 2009). Currently about 1.5 million hip fractures occur every year (Robert S. Sterling, 2011). By the year 2050 the total number of hip fractures is expected to surpass 6 million worldwide (Robert S. Sterling, 2011).

Corresponding Author:- Dr. Rehan Zahid Hussain MBBS.

Address:- Department of Orthopaedics, King Saud Medical City Riyadh, Kingdom of Saudi Arabia.

Fracture of acetabulum is not very common being related to high impact trauma always. The most common cause of such trauma is a road traffic accident, dashboard injury or a fall from height. Fall is the second commonest cause of acetabulum injury occurring in about 10% (Grubor P, 2015).

Sciatic nerve is the thickest and longest nerve of the body which contains both sensory and motor fibres. The location of sciatic nerve is prone to injury when an acetabulum fracture occurs, especially with posterior dislocation of hip. The common involvement is of common peroneal part (Ebraheim NA et al., 2007). The head of femur receives its blood supply from an arterial anastomosis. In this anastomosis, compromise of medial femoral circumflex artery, a branch of profundafemoris artery is most important cause of avascular necrosis of the head of femur due to fracture acetabulum and especially in dislocation of hip. Although a small portion of femoral head has alternate blood supply from a branch of obturator artery that runs in the ligamentum teres (Birhane A et al., 2015).

Rationale:-

In Saudi Arabia, cars are the main mode of transportation with approximately more than 6 million cars on road (Farah A. Mansuri et al., 2015). 20% beds in Ministry of Health hospitals in Saudi Arabia are engaged by Road traffic accident victims (Farah A. Mansuri et al., 2015). In the past 2 decades, 86,000 casualties and 611,000 injuries have been recorded in Saudi Arabia in road accidents (Farah A. Mansuri et al., 2015). Out of these, 7% had ended in disabilities (Farah A. Mansuri et al., 2015). The economic effects of road traffic accidents in Saudi Arabia projected in terms of potential productive years life lost (PPYLL) were examined in a study that has reported a 31.6% increase in deaths due to RTA among males in 1997-2002 compared with a 1.3% increase in deaths due to RTA among females. In Saudi Arabia, road traffic accidents are the major cause of hourly consultation to the health care facilities (Farah A. Mansuri et al., 2015).

When compared to other arab countries, Saudi Arabia has the second highest casualty rate due to road traffic accidents. Globally it is the 23rd country to have high number of casualties due to road accidents. World Health Organization has reported that in Saudi Arabia, a car accident occurs every second; while on average 17 people are killed in crashes daily.

Aim:-

The aim of this study was to assess the outcome of acetabular fracture in Saudi population after the surgical fixation procedure. The main objective was to note the complications of acetabular fixation with special focus on avascular necrosis and nonunion.

Materials and Methods:-

The study design was a retrospective cohort study. All male patients, Saudi nationals, who underwent surgical fixation for fracture of posterior acetabulum wall due to any cause at King Saud Medical City, Riyadh, Saudi Arabia were included. The period of surgical intervention was from 1st October 2013 to 30th September 2015. This study was approved by the Institutional Review Board and informed consent was taken from all study participants.

The data collected from medical records included patient's age, nationality, sex, cause and duration of fracture prior to admission, date of admission and surgery, any delay in surgery, percentage joint involvement, side of fracture, presence of dislocation, type of implant used, any associated fractures and co morbidities. Radiological investigations including x-rays and CT scan of pelvis were reviewed in hospital-based PACs system. Patients are routinely followed six weeks after surgery in the outpatient department. At follow up in the orthopaedic research clinic, clinical assessment was done using Merle D-Aubigne Y Postel (hip functional) score (David J. Biau et al., 2009). Sciatic nerve function was assessed clinically. Conventional x-rays of pelvis and hip joint were reviewed for any presence of step and gap at the site of surgical fixation. CT scan of pelvis was requested if there was suspicion of nonunion or avascular necrosis on plain x-rays and Ficat classification (Jawad et al., 2012) was used to stage the avascular necrosis of femoral head.

Totally 36 patients underwent surgery for posterior acetabular wall fracture during the study period. Approximate duration of outpatient follow-up for all patients was between nine months to two and half years. 1 non-Saudi national patient and 2 females were excluded from the study according to pre-decided exclusion criteria. 2 patients were noted to have avascular necrosis & total hip replacement before the start of study and were therefore excluded. 6 patients had lost their follow up earlier and were not accessible. 3 patients had provided incorrect contact information and 10 patients refused to participate in the study. Finally evaluation was done for 12 patients.

Statistical Analysis:-

The software used for data analysis was SPSS 21 and the results are presented as descriptive Statistics: frequency, percentage, range, means, median, 95% confidence interval and the inferential statistics: student-t-test for independent samples. Pearson's coefficient of Correlation, one way anova and χ^2 were used for testing the statistical significance at 5% level with 5% type I error and 20% power of the study. (Betty R.K and Jonathan A.C.S, 2009)

Results:-

The baseline characteristics of the patients are given in **Table 1**. Age of patients ranged from 18 to 65 years with mean \pm SE (mean) of 37.0 ± 4.4 years. The fracture for eleven patients (91.7 %) was due to road traffic accident and one (8.3%) had a history of fall. The fracture of posterior wall of acetabulum was divided in three grades according to the percentage of damage. One patient (8.3%) had < 25percent, 5 patients (41.7%) had 25-50 percent and 6 patients (50%) had >50 percent joint involvement. Six (50%) patients had an additional fracture (Upper limb(1), Lower limb(1), Both limbs(2), Pelvis(1), Ribs(1)). 4 patients (33.3%) had co-morbid illness (Lymphoma(1), Wegner's disease (1), Diabetes Mellitus & Hypertension (1), Diabetes, Hypertension and Ischemic heart disease (1)).

The Merle D - Aubigne Y Postel score was ranging from 6 to 12 with a mean \pm SE of 10.17 ± 0.57 and Pearson's Coefficient of Correlation of this score with Age in years showed a statistically significant negative high magnitude with $r = -0.849$ ($P=0.000$) as observed in **Figure 1** with 95% confidence interval, but delay in surgery (days) did not show much correlation with the hip function score.

Based on Ficat classification, one patient (8.3%) was classified in category IIB, one patient (8.3%) in category IV and ten patients (83.3%) in category zero. Two patients (16.7%) had nonunion and two patients (16.7%) had developed avascular necrosis.

For the patient who had step, Sciatic Nerve was not involved after surgery and the radiological Ficat classification was observed to be IV with $\chi^2=12.0$ ($P=0.002$), experienced avascular necrosis, $\chi^2=5.45$ ($P=0.02$) and had nonunion $\chi^2=5.45$ ($P=0.02$).

Among 10 patients who had no gap, one patient (10.0%) had sciatic nerve involvement after surgery. One out of ten patients (10.0%) who had no gap, the Ficat classification was observed to be IIB, 1 patient (10.0%) had avascular necrosis. One patient (100.0%) who had step and 1 out of 11 patients (9.1%) without step had avascular necrosis. 2 out of 10 patients with gap had non-union. One patient (8.3%) had poor hip function score (<7), 2 patients (16.7%) had fair score (8), 1 patient (8.3%) with medium (9) and good score (10) in each group, and 7 patients (58.3%) had very good score (11-12).

Merle score was compared to all variables shown in the **Table 2**. It was seen significantly related to AVN ($p = 0.017$) and percentage of fractured wall ($p = 0.05$) only. Among the 11 patients who had road traffic accident as the cause of fracture, one patient (9.1%) had a poor score, 2 patients (18.2%) had fair score, 1 patient (9.1%) had good score and 7 patients (63.6%) had very good score and a significant $\chi^2 = 12.0$ ($P=0.017$).

Among 8 patients with dislocation, 1 patient (12.5%) had POOR Merle score, 2 patients (25.0%) had FAIR score and 5 patients (62.5%) had VERY GOOD score. Of 2 patients whose sciatic nerve was found injured, 1 patient (50.0%) had a POOR score and 1 patient (50.0%) had VERY GOOD score. There were 8 patients without systemic illness and their average Merle score was 9.87 ± 0.81 . One patient was diabetic & hypertensive with a score of 11 ± 0.0 . One patient with diabetes, hypertension and ischemic heart disease had a score of 9.0 ± 0.0 . One patient with lymphoma had a score of 12 ± 0.0 and one patient with Wegner's disease had a score of 11.0 ± 0.0 . There was an insignificant difference in the mean Merle scores $F=0.322$ (0.855).

Two patients had avascular necrosis and both had POOR Merle score. Of two patients with nonunion, 1 patient (50.0%) had a FAIR score and the other patient had GOOD score. Seven patients were implanted with plate. Of them 1 patient (14.3%) had a FAIR score, 1 patient (14.3%) had MEDIUM score, 1 patient (14.3%) had GOOD score and 4 patients (57.1%) had VERY GOOD score. Out of 3 patients who were implanted with both plate and screws, 1 patient (33.3%) had POOR score, 1 patient (33.3%) had FAIR score and 1 patient (33.3%) had VERY GOOD score. 2 patients who were implanted with screws, both (100.0) had VERY GOOD score with $\chi^2 = 6.204$ ($P=0.624$) and is given in **Figure 2**. There was no significant difference in the category of delay in surgery.

Figure 1:- Scatter Diagram for Merle Score.**Figure 2:-** Whiskers Box Plot for Merle Score.**Main findings of this study were:-**

1. Step in fixation was significantly associated with avascular necrosis ($p = 0.020$) and nonunion ($p = 0.020$).
2. The gap was significantly associated with nonunion only ($p = 0.001$).

Discussion:-

Being rare, fracture of posterior acetabular wall has not been studied extensively in past. There are no randomized controlled trials available comparing the management options. In literature we mostly have case reports or case series which have not comprehensively reviewed the complications of different management modalities. In an older

study the percentage of avascular necrosis was reported to range from 18 to 32% (Michael R. Baumgaertner, 1999). Another recent study showed 11.53% incidence of avascular necrosis (Magu NK et al., 2014) while in our study it was 17%. We, therefore, present new and recent data related to the complications of posterior acetabular wall fracture and their relation to surgical intervention.

Avascular necrosis and nonunion of posterior acetabular wall fracture are related to poor surgical reduction. As noted in our study that absence of step and gap after surgical fixation is related to higher hip function scores. Similarly post-fixation step and gap will provide poor hip function and possibility of nonunion. There is no recommended protocol for radiological evaluation other than conventional x-rays after surgical fixation but some surgeons recommend an immediate postoperative CT scan of hip before discharge, to observe the quality of reduction (P.V. Giannoudis and V.S. Nikolaou, 2008). It is already recommended to consider total hip replacement as primary procedure in patients who have comminute fracture of posterior acetabular wall (James L. Guyton and Edward A Perez, 2012). Until we have more data comparing post OP radiological assessment to no assessment; we suggest performing a confirmatory CT scan of hip soon after procedure. It will aid in earlier detection of potential complications.

The choice of implant used in surgery is based on fracture anatomy and surgeon's choice. In one review some benefits of different implants over each other i.e. plate, screws or both together have been postulated (Zhang Y et al., 2013). There are no RCT's comparing the two options and no recommendation of using one method over other. Nevertheless at times surgeon has to use screws to hold the broken bone pieces in addition to plate fixation, to achieve complete reduction. Also at times two plates should be used to achieve reduction (Ebraheim NA et al., 2007). In our study, the clinical outcome was compared to the type of implant used at the time of surgical fixation. As we can see that the screw is a better option when compared to plate or plate plus screw (Rosario Spagnolo et al., 2009). However the availability of implant and the learning curve of surgeon also play a role in choosing the type of implant.

The presence of dislocation has an impact on sciatic nerve function and avascular necrosis (Iselin LD et al., 2013) observed an average delay of seven days from trauma to surgery. Most of our patients were operated later than 7 days. We recommend early intervention for patients who are candidates for surgery as it will help in reduction of late complications.

Most of our patients were young drivers below age of 40 years. The accident rate cannot be controlled except efforts to be done at national level but appropriate and timely surgical intervention for such patients soon after fracture can prevent future complications. If they have to undergo hip arthroplasty after few years, it is associated with related complications. Careful selection of choice of intervention and proper complete follow up will markedly reduce permanent disability in our patients.

There is essential need of a randomized control trial to compare and evaluate different management options for fracture of posterior acetabular wall, types of implants used, best time for surgery and post-operative clinical and radiological assessment. The trial should follow the patients for longer duration to compare the long term complications among different groups - mainly avascular necrosis and nonunion.

Key words:-

Boerhaavia diffusa L, Abnormal cells, Mitosis

Abstract

In the present study the effects of various extracts of *Boerhaavia diffusa* L. on mitotic cells of *Allium cepa* L. is investigated. The concentrations are set as 0.05, 0.1, 0.15 and 0.2 using water, petroleum ether and ethyl alcohol extract of stem and leaves. The duration of the treatment is 30 minutes prior to mitotic peak. The mitotic index and index of various stages of mitosis are scored along with the number of abnormal cells. The mitotic index is found to be reduced after higher concentration of treatments while at lower concentrations there is an increase in the number of dividing cells. The percentage of abnormal cells is found to be increased with increase in the concentration of the treatment. The abnormalities showed a predominance of stickiness than fragments, bridges, unoriented and tropokinesis. The results indicated that the active toxic element is an ethyl alcohol soluble fraction as evidenced by higher frequency of abnormal cells. Thus it is recommended that excessive use of ayurvedic preparations like purnavasasa, a preparation made entirely from *Boerhaavia diffusa* L. may harm the epithelial lining of stomach and intestine.

Introduction:-

Boerhaavia diffusa L is a perennial creeping weed, prostrate or ascending herb, up to 1 m long or more, having spreading branches. The roots are stout and fusiform with a woody root stock. The stem is prostrate, woody or succulent, cylindrical, often purplish, hairy, arranged in unequal pairs, green and glabrous above and usually white underneath. The shape of the leaves varies considerably-ovate-oblong, round, or sub cordate at the base and smooth above. Margins of the leaves are smooth, wavy or undulate. The upper surface of the leaves is green, smooth, and glabrous, where as it is pinkish white and hairy beneath. Leaves are up to 5.5×3.5 cm² in area.

Flowers are minute, sub capitates, present 4-10 together in small bacteriolate umbels, forming axillary and terminal panicles. These are hermaphrodite, and white, pink, or pinkish red in color. Bracts are deciduous and involucre. A perianth is present in the place of a calyx and corolla, which is tubular in shape, the tube being short and narrow at the base and funnel. Shaped at the top and constricted above the ovary. There are five lobes, which are small and acute. Two or three stamens are present and are slightly exerted. The stigma is peltate. The achene fruit is detachable, ovate oblong, pubescent, five ribbed and glandular, anthocarpous, and viscid on the ribs (Thakur *et al.*, 1989). The seed germinate before the onset of the monsoon.

The plants grow profusely in the rainy season, and mature seeds are formed in October- November. Due to its sticky nature, the plant gets stuck on clothes of human beings and on the legs of animals, which helps in its dispersal from one place to another. It has a large root system bearing rootlets. The tap root is tuberous, cylindrical to narrowly fusiform to conical or tapering, light yellow, brown or brownish gray. Some workers have studied the regeneration of this plant through tissue culture. Bhansali *et al.*, (1978) reported induction of adventitious shoots using stem explants of *Boerhaavia diffusa* L. Roots were also regenerated from leaf segments of *Boerhaavia diffusa* L when cultured in vitro. These roots contained 0.15% alkaloid punarnavine. Increase in leaves of indoleacetic acid (IAA) in MS medium reduced the number of roots regenerate from the leaf segment, their length and alkaloid content (Shrivastava and Padhya, 1995).

In purulia (West Bengal), tribal eat this plant as vegetable. *Boerhaavia diffusa* L leaves are cooked and eaten in Assam, where it is commonly found in the markets. Its roots are used in the treatment of piles by the inhabitants of the Garhwal Himalaya (Uttaranchal). The root paste is used to cure bloody dysentery by the Bhils of the Jhabua district in Madhya Pradesh. The decoction of plant is given in the treatment of nodules in the body. The root juice is treating asthma, scanty urine, and internal inflammation disorders. *Boerhaavia diffusa* L is used for curing ailments such as leucorrhea, rheumatism, and stomach ache by the sahariya tribe in the Lalitpur district of Uttar Pradesh. This plant is also used by the tribes of Ambikapur district (Madhya Pradesh) for the treatment of elephantiasis. In the Indo-Nepal Himalayan terrain region, the tribal harvest this plant for medicinal purposes, mainly for flushing out the renal system, and to treatment seminal weakness and blood pressure (Mitra and Gupta, 1997).

The *Boerhaavia diffusa* L plant contains a large number of compounds as flavonoids, alkaloids, steroids, triterpenoids, lipids, lignins, carbohydrates, proteins and glycoproteins. Punarnavine $C_{17}H_{22}N_2O$, (Surange and Pendse, 1972), boeravinone A (Kadota *et al.*, 1989; Lami *et al.*, 1992), hypoxanthine 9-L-arabinofuranoside (Ahmad and Hossain, 1968), ursolic acid (Mishra and Tiwar, 1971), punarnavoside (Jain and Khanna, 1989), liiodendrin (Aftab *et al.*, 1996) and aglycoprotein having a molecular weight of 16-20 KDa have been isolated and studied in detail for their biological activity. Chopra *et al.*, (1923) reported that the plant contained large quantities of potassium nitrate, besides punarnavine. The herb and roots are rich in proteins and fats. The herb contains 15 amino acids, including 6 essential amino acids, while the root contains 14 amino acids. Seth *et al.*, (1986) isolated a new antifibrinolytic compound 'punarnavoside' from the roots of *Boerhaavia diffusa* L. Phytochemical screening of the roots from garden – grown in vivo plants of *Boerhaavia diffusa* L of different ages revealed that the maximum alkaloid content (2%) accumulated in the roots of 3 year old mature plants.

Biological Activity:-

As medicine in the traditional system: Different parts of the *Boerhaavia diffusa* L plants have been widely used by indigenous tribes in the traditional system of medicine. The roots have been widely used for treatment of dyspepsia, jaundice, and enlargement of spleen, abdominal tumors and cancers (Kirtikar and Basu, 1956). The root powder, when mixed with mamira (*Thalictrum foliolosm* DC), is used to eye diseases. It cures corneal ulcers and night blindness (Gupta *et al.*, 1962), and helps restore virility in men. People in tribal areas use it to hasten childbirth (Shah *et al.*, 1983). The juice of *Boerhaavia diffusa* L leaves serves as a lotion in ophthalmia. It is also administered orally as a blood purifier and to relieve muscular pain.

As medicine in the ayurvedic system: In old Indian books of medicine such as the Charaka Samhitha and Sushrita Samhitha, it mentioned that the Ayurvedic preparations made from punarnava – namely, punarnavastaka kvath, punarnava kshar, and punarnava taila – were used for the treatment of various ailments. The whole plant of *Boerhaavia diffusa* L is very useful source of the drug punarnava, which is documented in Indian pharmacopoeia as a diuretic (Chopra, 1969). The active principle contained in the herb is an alkaloid, known as punarnavane. The roots and leaves with flowers have been found to be highly potent (CSIR, 1988). In Ayurvedic medicine, different parts of this plant were reported to have various medicinal properties. It was used in renal ailments as diuretic (Anand, 1995); and to treat seminal weakness and blood pressure (Gaitonde *et al.*, 1974). It is also used in the treatment of stomach ache, anemia, cough, and cold, and as a diaphoretic, laxative, expectorant, and a potent antidote for snake and rat bites (Chopra *et al.*, 1956), in the treatment of nephritic syndrome (Singh and Udupa, 1972), hepatitis, gall bladder abnormalities, and urinary disorders (Cruz, 1995). The flowers and seeds are used as contraceptive (Chopra *et al.*, 1956).

Pharmacological and clinical properties: Pharmacological studies have demonstrated that punarnava possesses punarnavoside, which exhibits a wide range of properties- diuretic (Gaitonde *et al.*, 1974); anti-inflammatory (Bhalla *et al.*, 1968); antifibrinolytic (Jain and Khanna, 1989); anticonvulsant (Adesina, 1979); antibacterial (Olukoya *et al.*, 1993); antistress agent; antihepatotoxic, anthelmintic, febrifuge, antiscabies, and anti-asthmatic, antileprosy, and anti-urethritis and anti-nematodal activity. An aqueous extract of thinner roots of (*Boerhaavia diffusa* L) at a dose of 2 ml kg⁻¹ exhibited marked protection of various enzymes such as serum glutamic oxaloacetic transaminase, serum glutamic-pyruvic transaminase, and bilirubin in serum against hepatic injury in rats. Punarnava possesses diuretic and anti-inflammatory activities and the maximum activity was observed in samples collected in the rainy season. Due to the combination of these two activities, punarnava is regarded therapeutically as highly efficacious for the treatment of inflammatory renal diseases and common clinical problems such as nephritic syndrome, oedema, and ascites resulting from early cirrhosis of the liver and chronic peritonitis.

The plant is reported to be efficacious in abdominal tumors and cancers. The drug proved useful as a hematinic and as a growth in children fed with milk fortified with the drug. In the form of a powder or an aqueous decoction, the drug was found to be useful in the treatment of nephritic syndrome and compared well with corticosteroids. The drug decreased to albuminuria, the serum protein was increased and serum cholesterol level was lowered.

Singh and Udupa (1972) reported that dried root powder showed curative efficiency when administered orally for one month to children or adults suffering from helminths infection. The subjects became worm-free within five days of treatment. The drug singly or in combination with other drugs, was found to be effective in liver disorders, heart diseases (hypertension, angina, cardiac failure, etc), respiratory tract infections, leucorrhea, spermatorrhea, etc. The purified glycoprotein from *Boerhaavia diffusa* L exhibited strong antimicrobial activity against RNA (ribonucleic acid) bacteriophages with much of clinical research validating its long history of different uses in natural medicine; the commercial bulk of punarnava in India represents heterogeneous medicinal uses.

As food: The entire plant including the roots is eaten as vegetable, in curries and soups. The roots and seeds are added to cereals, pancakes, and other food stuffs. They are also served as bird feed or poultry feed. The plants are grazed by sheep, goats, and cows, and in West Bengal, it is believed that the plant enhances lactation period and also the amount of milk in cattle.

Significance of the Study:-

Boerhaavia diffusa L have been used in ayurvedic preparation for millennia. The scientific studies as well as the exploration of active principles are developed in recent years. In recent year of research have to reveal that many of such potent and effective during sources contain mutagenic or cytotoxic principles. This raises concern about the genotoxic hazards resulting from long term use of such plants. This is because of the fact that plant extract contains mainly alkaloids, glycoside, flavonoides, tannins etc. Because of the low cost of the ayurvedic preparations as well as its local availability, people can afford the long term use of such preparations. In view of these, the cytotoxic effect of the various fraction of *Boerhaavia diffusa* L is essential, and is attempted in this study.

Objectives of the Study:-

The present study is focused on to find out the effect of various fractions of extract of *Boerhaavia diffusa* L on mitotic index and variations in different phases of cell division in root meristem cells of *Allium cepa* L. This study also find out the nature and intensity of aberrations of dividing cells caused by various fractions of the extract of *Boerhaavia diffusa* L and the LC50 of the extract of *Boerhaavia diffusa* L with respect to the cell damage in *Allium cepa* L meristem.

Materials and Methods:-

The material:-

Boerhaavia diffusa L grown in wild condition were collected for the study. The plants were identified up rooted and bring to the laboratory.

Preparation of the plant material:-

The leaves of mature flowered twigs are separated and shade dried and oven dried at 60°C up to attaining a constant weight. The dried material was powdered and sieved.

Soxhlet extraction:-

The powdered material was extracted using petroleum ether, ethyl alcohol and water in a Soxhlet for 8 hours. The fractions were collected and dried.

The onion culture:-

Commercially available bulbs of *Allium cepa* L were used for the study well cleaned bulbs were sown in well ministered sterile sand, in a tray of size 30x26cm. The germinated bulbs with 0.5-1cm roots were selected and treated with different concentrations of extracts (0.05%,0.1%,0.15%,0.2%) of *Boerhaavia diffusa* L 5 bulbs were treated for each concentration.

Collection of root tip and storage:-

The root tip after treatment are cut out from the bulbs and washed well in distilled water. Transfer the root tip in to Carnoy's fixative (3 alcohol: 1 acetic acid) for 24 hours; and then stored at 4⁰C.

Squashing and staining:-

Stored root tips are hydrolyzed in 1N HCl for 3 minutes and washed well in water. Squash preparation of these root tips were made with 2% acetocarmine stain, and observed under microscope. Five slides are scored for evaluation. Three randomly selected fields are scored from each slide. Control is maintained for each treatment in distilled water.

Observations taken:-

The total number in cell in each field along with the number of dividing cells was scored. The total number cells pertaining to each phases of division was also noted.

The mitotic index were calculated rising the formula,

$$\text{Mitotic index} = \frac{\text{Number of dividing cells}}{\text{Total number of cells}} \times 100$$

Percentage distribution of normal and abnormal cells, percentage of various abnormalities met with are presented in Tables and compared with control.

Results and Discussion:-

A careful analysis of the data revealed that the treatment with aqueous extracts of leaves of *Boerhaavia diffusa* L on mitotic cells of the *Allium cepa* L showed an increase in mitotic index when compared to control. The increase was not depended on the concentration of the extract treated. The control posses of an index of 15.70% while in treated cells possess 24.51, 30, 33.3 and 21.67 percent of dividing cells after treatments with 0.05, 0.1, 0.15 and 0.2 percent of extract respectively. Similar concentrations of alcoholic extracts yielded 22.05, 20.56, 16.14 and 13.47percent of mitotic cells. The petroleum ether extracts of leaves of *Boerhaavia diffusa* L mitotic cells of the *Allium cepa* L yielded 11.13, 13.37, 13.12 and 14.09 percent mitotic index after treatment with 0.05, 0.1, 0.15 and 0.2 percent of extract respectively.

Table 1:- Mitotic index of root meristem of *Allium cepa* L after treatment with extract of leaves of *Boerhaavia diffusa* L.

Concentration of Treatment in percentage	Mitotic Index		
	Alcoholic Leaf extraction	Petroleum ether Leaf extraction	Water Leaf extraction
Control	15.70	15.70	15.70
0.05	22.05	11.13	24.51
0.1	20.56	13.37	30.00
0.15	16.14	13.12	33.30
0.2	13.47	14.09	21.67

Graph 1:- Mitotic index of root meristem of *Allium cepa* L after treatment with extract of leaves of *Boerhaavia diffusa* L.

The distribution of various stages of mitosis is also considered after treatment with various concentration of extract from leaves of *Boerhaavia diffusa* L. The distribution of dividing cells in control population is 80percent prophase, 4.87 percent metaphase, 7.80 percent anaphase and 7.30 percent of cells at telophase. After treatment with various concentration of ethyl alcohol extracts of leaves of *Boerhaavia diffusa* L this distribution is disturbed and resulting in 26.3 prophase, 47.36 metaphase, 10.52 anaphase and 15.79 telophase percentages treated with 0.2 percent extract. After treatment with 0.15 percent extract the distribution is found to be 54.83 prophase, 22.58 metaphase, 10.90 anaphase, and 9.60 telophase percents. After treatment with 0.1 percent extract the distribution is found to be 51.72 prophase, 31.03 metaphase, 17.26 anaphase and no percnages telophase at all. However treatment with 0.05 percent of extract of leaves of *Boerhaavia diffusa* L showed 82.22 percent prophase, 8.80 percent metaphase, 6.66 percent anaphase and 2.20 percent telophase.

With respect to the presence of abnormal cells the treatment with alcohol extracts of leaves of *Boerhaavia diffusa* L on *Allium cepa* L induces 63.15% after treatment with 0.15 extract, which forms the highest percentage of abnormal cells observed in the present study. The increase in the number of abnormal cells was not depended on the concentration of the extract treated. The percentage of abnormal cells observed after various concentrations of treatment is presented in Table. 3.

The percentages of various abnormalities produced by extract in different solvents as well as from leaves of *Boerhaavia diffusa* L are given Table.4. The most observed abnormalities observed were stickiness, fragment, unoriented, bridge and tropokinesis. Metaphase stickiness was found to be the most common anomaly (42.10 in alcoholic extract of leaves) this was followed by unoriented chromosomes in metaphase (22.58% in alcoholic extract of leaves), prophase stickiness (3.70 percent in petroleum ether extract of leaves), anaphase tropokinensis (10.34 percent in petroleum ether extract of leaves), anaphase bridge (9.67 percent in alcoholic extract of leaves), telophase stickiness (6.896 percent in petroleum ether extract of leaves). Apart from these metaphase fragments (2.86 percent) due to treatment with alcoholic extract of stem, telophase bridge (1.31 percent due to treatment with water extract of leaves) and telophase tropokinesis (1.18 percent) due to treatment with alcoholic extract of stems are also observed (Table 4).Other extract treatments results are also seen in Table 4.

In general, the mitotic index decreases with increasing distance from the root cap junction. Cells of the root cap protect the root and must be constantly replaced as they are damaged or scraped away. The apical meristem, just beneath the root cap, contains most of the root's dividing cells. Therefore, cells in this area must complete the cell cycle often. Some daughter cells become part of the root cap, others differentiate and elongate into primary tissues of the root. If we allow growing roots to take up a radioactive precursor of DNA, almost all of the labeled cells lie in the meristem.

The mitotic index can also be used to quantify differences in cell division when an environmental parameter is changed. Plants grown in space in microgravity had a greater mitotic index than control plants grown on the ground. In zero-gravity, the gravity sensing cells in the root cap are unable to send the proper orientation signals. These signals normally inhibit growth in cells that are more distant from the root cap junction, and direct elongation of the primary root. In the absence of these signals, cells begin dividing to produce secondary roots, leading to a greater number of cells in mitosis.

Table 2:- Distribution of percentage dividing cells at various stages of mitosis of *Allium cepa* L. after treatment with aqueous, alcoholic, petroleum ether extracts of leaves of *Boerhaavia diffusa* L.

Concentration of treatment in percentage	Percentages of dividing cells at											
	Prophase in leaves extraction			Metaphase in leaves extraction			Anaphase in leaves extraction			Telophase in leaves extraction

A- Alcoholic extraction of *Boerhaavia diffusa* L. leaves, PE- Petroleum ether extraction of *Boerhaavia diffusa* L. leaves, W- Water extraction of *Boerhaavia diffusa* L. leaves.

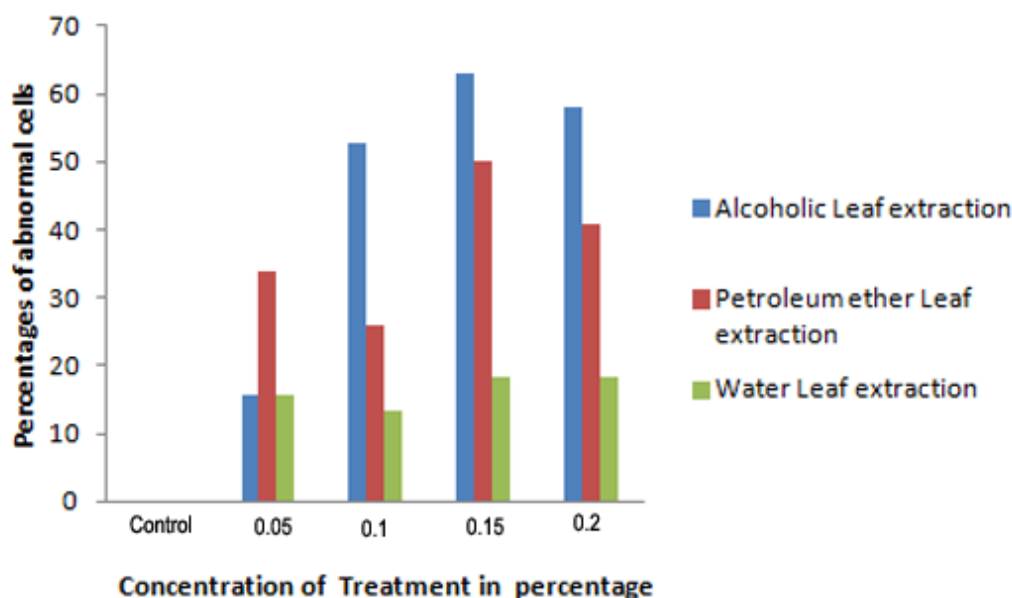

According to Badr and Ibrahim (1987) decrease of mitotic index level shows that experimental material had mitodepressive effect resulting in the inhibition of cells access to mitosis. It means that the treatment disturbs the normal cell cycle process by preventing biosynthesis of DNA and/or microtubule formation. Hence, this effect could be formed by decreased ATP level or suppression of the engine of energy production. Reduction in the mitotic activity could be due to inhibition of DNA synthesis or a blocking in the G2-phase of the cell cycle, preventing the cell from entering mitosis.

The common abnormalities are stickiness, fragment, unoriented chromosomes and bridges. Stickiness was seen in prophase, metaphase, anaphase and telophase. Fragment was seen in metaphase. Unoriented chromosomes were observed in metaphase and anaphase. Bridges was seen in anaphase and telophase. The types of abnormalities scored in this investigation resemble those reported by Somashekhar and Goda (1984). It has been suggested by them that stickiness is a type of physical adhesion involving mainly the proteinacious matrix of chromatin material.

Table 3:- Percentage of abnormal dividing cells at mitosis of *Allium cepa* L after treatment with various concentrations of aqueous, alcoholic, petroleum ether extract of leaves of *Boerhaavia diffusa* L

Concentration of Treatment in percentage	% of abnormal cells		
	Alcoholic Leaf extraction	Petroleum ether Leaf extraction	Water Leaf extraction
Control	0	0	0
0.05	15.78	33.87	15.78
0.1	52.63	25.92	13.33
0.15	63.15	50.00	18.45
0.2	57.89	40.74	18.46

The fragments may be a result of breaks since many reports point out that elevated frequency of aberrations is in the form of chromosomal breaks. The sticky bridges resulted from difficulty in anaphase separation due to adhesion or clumping of chromosomes or to depolymerization and cross linking of the DNA of the chromosomes. El-Ghamery, (2000) report that chromosome bridges may be due to the chromosomal stickiness and subsequent failure of free anaphase separation or may be attributed to unequal translocation or inversion of chromosomal segments leading to mutations.

Graph 3:- Percentage of abnormalities at various stages of mitotic division in *Allium cepa* L. after treatment with leaves extract of *Boerhaavia diffusa* L.

Conclusion:-

In the present study the effects of various extracts of *Boerhaavia diffusa* L. on mitotic cells of *Allium cepa* L. is investigated. The mitotic index is found to be reduced as the treatment concentration increases. But at low concentration there showed an enhancement in the number of dividing cells. The percentage of abnormal cells is found to be increased with increase in the concentration of the treatment. The common abnormalities observed are unoriented chromosomes at metaphase, fragments, tropokinesis, and bridges along with a predominance of stickiness. The results indicated that there exists a toxic principle in *Boerhaavia diffusa* L. and excessive use of its preparation may lead to anomalies in epithelial linings. Further studies are inevitable for understanding the component present in the extract which is responsible for cellular damage produced in root meristem of *Allium cepa* L. and prolonged use of *Boerhaavia diffusa* L. leaves as vegetable, good or badly affect epithelial linings of human.

Abstract

This study explores the efficacy of using Cooperative Learning (CL) in enhancing ethnic reconciliation among students while improving their L2 competency. According to Coelho (1994), students learn languages best when they are engaged in real interaction and CL is especially appropriate for multi-cultural classrooms. Sri Lankan education has its partly contribution to linguistic nationalism that gradually led to a disastrous ethnic conflict (Bannon 2003). Having understood that, recent research has found that English as a link language that binds cultures together can support reconciliation and greater economic prosperity throughout the country. Similarly, orienting students towards a new teaching-learning environment and fulfilling the objective of socializing with multicultural and multiethnic communities and respecting diversities, the English Language Teaching Unit of Sri Lanka Institute of Information Technology too conducts the L2 module of the Orientation 2016/17 for the new intake using cooperative learning activities. Thus, through this case study, it is aimed at providing students' and teachers' perceptions towards feasibility of CL for ethnic reconciliation. The students are divided into groups of 12 irrespective of their ethnicity or competency. The data gathered through questionnaires and interviews from a sample of 48 students and 3 teachers involved in the Orientation program highlight that CL in multiethnic ESL classroom encourages students' participation and promotes positive interactions between students. Further, as per the qualitative data, the interaction among students during cooperative tasks facilitates their L2 competency. In contrary, some groups of students gain attention more than others as some mostly focused on their individual performance despite collaboration among team-mates. However, the results indicate that CL allows each student to play an important role in doing the assigned tasks, resulting in enhancing team-spirit and ethnic reconciliation.

Introduction:-

This paper presents an overall evaluation on the integration of cooperative learning in the ESL classroom with special reference to the Orientation 2016/17 offered by Sri Lanka Institute of Information Technology (SLIIT), Malabe, Sri Lanka in order to uplift the ethnic reconciliation among the freshers from diverse backgrounds while improving their L2 competency.

After being exposed to a long period of civil war, the government of Sri Lanka is focusing on ways to develop the school curriculum to integrate multicultural education into its peace education curriculum in order to foster intercultural understandings⁽⁷⁾. In terms of the 2011 Lessons Learnt and Reconciliation Commission Report in Sri Lanka⁽⁶⁾, a National Youth Policy has been presented and one of its goals is to strengthen social interaction among youth. The Ministry of National Languages and Social Integration has taken measures to implement an action plan to recognize diversities in Sri Lanka promoting the Trilingual Sri Lanka National Plan which emphasized the importance of Sinhalese, Tamil and English proficiency to achieve ethnic harmony. As per the UNDP report, youth has been victimized due to the long lasted ethnic conflict and steps should be implemented to make youth not to be ethnic extremists, make wiser non-violent choices, and invest their energy in peace and reconciliation. When the medium of instruction has changed to vernacular languages in 1956, the schools were separated. In order to reverse this division, there is a necessity of promoting a common language among youth and English has been identified as the primary medium which clears ethnic or cultural separations.

As Gnanaseelan⁽⁵⁾ (2011) identifies English language education as a good method which has the potential to help overcome a wide variety of social and cultural tensions despite the controversial opinions emerging time to time. However, realizing the great need for students to be armed with English language proficiency, it has been understood by various studies that English language can empower binding cultures together. Having realized this, corresponding to the necessity of being fluent in two official languages in Sri Lanka (Sinhala and Tamil), English language has also been integrated in the school curriculum as the Second Language (L2) and even the English medium education has been promoted. When it comes to tertiary education, the medium of instruction in most of the modules is L2. Thus, almost all the tertiary educational institutes conduct ESL courses; thereby the students' L2 proficiency is enhanced. However, it is necessary to notice whether the measures taken so far have been complied with the emerging demands in the education in Sri Lanka i.e. to cater a group of students from multiethnic and multicultural backgrounds. Bannon⁽¹⁾ (2003) has identified that any curriculum should consider how diversity is represented in the context of teaching so that the ethnic harmony is spread. Thus, as I mentioned previously, the tool for this is the proper utilization of English language or lessons in ESL classroom where all the students in the institution are gathered despite their respective disciplines.

Moreover, it has been observed by the Faculty of Computing of Sri Lanka Institute of Information Technology that the undergraduates tend to form groups who share the same characteristics or perceptions without being mingled with other students from diverse backgrounds. As per the observations made by the researcher, most often, the students tend to form groups or 'clicks' on their own and sometimes, certain minorities are discriminated due to many reasons such as ego, wealth, religions, attitudes or the cultural influences. Yet, in order to achieve the aspirations of the country, the students should grow peace and harmony within them. When it considered the Orientation Program 2015/16, the faculty understood that teaching the students technical context or grammar and writing during their orientation had not generated expected unity among themselves as the students focused only on the lessons rather than making contacts or interactions within a diverse context. It was noticeable that the number of students attending classes dropped towards the end of the program and those who with keen interest in learning English and those who wanted to win the good will or the attention of the teachers came to the lectures and this lead to ruin the intended aim of the ESL unit. Further the ultimate goal of the degree should not be only producing a graduate with good scores but also a quality team-player who can succeed in the competitive markets. Thus, there emerged a necessity of implementing a new orientation program that caters the values and ethics to students while enhancing their soft skills and English language proficiency. The result of this was the introduction of the Orientation 2016/17 – 'Bootstrap', making it a boot to enhance students' achievements. The priority was given to ESL lessons throughout and the ESL work plan was woven around the objective of orienting students towards a new teaching-learning environment and fulfilling the objective of socializing with multicultural and multiethnic communities and respecting diversities while improving their L2 proficiency.

In fulfilling the above requirements, the popular methodology in language classrooms; the cooperative learning method was adopted to the proposed Orientation 2016/17.

The researchers consider cooperative learning as a method to help improve students' academic performance as well as it encourages student connections and promote literacy skills. The basic theory of cooperative learning in ESL classroom is to make them work cooperatively to strengthen language and personal bonds.

As per the Education Research Consumer Guide⁽³⁾ by the U.S. Department of Education, cooperative learning is, 'a successful teaching strategy in which small teams, each with students of different levels of ability, use a variety of learning activities to improve their understanding of a subject. Each member of a team is responsible not only for learning what is taught but also for helping teammates learn, thus creating an atmosphere of achievement'.

This definition is clearly covered by the cooperative learning strategies. Further as Coelho⁽²⁾ (1994) explains the students from different cultural backgrounds learn best through cooperative activities and such activities enhance the learning of all students. The students will be working in groups to achieve the task assigned to them. Felder and Brent⁽⁴⁾ (1996) have conducted in depth research on cooperative learning and proven that CL is effective in a variety of instructional settings. As they describe, when it compared to individualistic tasks, individual performances are better when cooperative methods are utilized in the classroom. It further results in a variety of cognitive and affective outcomes. The cooperative learning methodology has been greatly examined by Coelho (1994, *ibid*) in her book: 'Learning together in the multicultural classroom'. She argues that students learn best when they are in a multicultural setting. As she highlights, students spend a limited time in the ESL classroom within their timetable. Thus the group interaction for ESL students is important. When the students are in heterogeneous groups, it makes them cohesive and cooperative and it leads to better language acquisition. However, an ample of studies pertaining to cooperative learning has been conducted so far. Yet, there is a dearth of research related to achieving ethnic harmony through cooperative learning in tertiary ESL classroom in Sri Lanka.

Considering the above literature, understanding the urge for ethnic reconciliation in the country and realizing the requirements of the Sri Lanka Institute of Information Technology, the English Language Teaching Unit of SLIIT carried out the Orientation Program 2016/17 in order to fulfill the objective of socializing with multicultural and multiethnic communities and respecting diversities while improving their L2 competency and making it a lifetime experience for them.

This qualitative study is an evaluation of the said Orientation program which answers the research question; Will the utilization of cooperative learning in ESL lessons enhance ethnic reconciliation among students while improving their L2 competency?

Methodology:-

The students were divided into groups of 12 irrespective of their language proficiency, discipline, ethnic or cultural diversities. This division is done by the institution. Due to the large number of students enrolled in the first year batch and having considered the limited number of classrooms and time slots to occupy all the students, the number of members per group was made 12. The sample of this study was consisted of 4 groups (48 students) and 3 teachers who have experienced teaching in the previous Orientation program as well. The diversity of the student sample was as follows.

Ethnicity	Religion
Sinhala – 28	Buddhist – 22
Muslim – 11	Islam – 11
Tamil – 8	Hindu – 5
Other – 1	Catholic – 9
	Other – 1
Total – 48	Total – 48

Unlike the Orientation 2015/16 which focused on enhancing all four language skills through more individual tasks and classroom teaching, the new program was consisted of group activities improving social/ethnic interactions and active team-wise participation that would equally result in the improvement of four language skills.

It is vital to emphasize that the cooperative learning techniques presented by the researchers had been adopted and amended to suit the said Orientation program. The LOs were communicated to students properly at the beginning: socializing with multicultural and multiethnic communities and respecting diversities and enhancing L2 proficiency, so that they would know the expected outcome of the program and how the program was run.

This study focused on the data gathered based on four main activities conducted throughout the program. It is necessary to highlight that apart from the list below, mini cooperative learning activities were constantly conducted in the classroom leading to the following major activities.

Food Festival:-

The aim of this activity was to improve students' day-to-day conversational skills, negotiation skills and unity across different cultures. The student groups were supposed to put up a food stall selling both oriental and western food. There were sellers, buyers and students to welcome and greet the visitors to the stall. They were in costumes which reflect different cultures.

Tasks and skills: Practicing dialogues/ conversations – Speaking Writing invitations and posters – writing Searching and discussing about different food and reading recipes – reading and speaking

Post-activity (in-class) – Students were asked to discuss about the variety of food they consumed, different costumes/cultural symbols witnessed and their overall experience with their group members. The students were guided and observed by the relevant facilitator.

Literary Carnival of SLIIT:-

The aim of this activity was to improve students' presentation skills, ability to describe people, places or things using relevant vocabulary and sentence structures and also to make them carryout some research on various cultural/literary icons/figures to be demonstrated at the carnival. As a group, the students were asked to pick a cultural or literary figure and read about his/her background. Then they were asked to demonstrate the figures and do a presentation explaining them in a creative way with the participation of all the team-mates.

Tasks and skills: Searching and discussing about different costumes – speaking and reading Role-play – speaking Doing presentations – presentation skills Watching a video clip and answer the questions on the worksheet – listening, writing Post-activity (In-class) – Students were instructed to talk about different figures/icons they witnessed and to explain why they are unique. It made them to realize that every culture has its own uniqueness so that we should respect them. Further they were encouraged to actively participate in group discussions based on the demonstrations of figures at the carnival and raise their own thoughts. The students were guided and observed by the relevant facilitator.

The four corners:-

The aim of this activity was to enhance students' skills in giving opinions using relevant vocabulary and phrases and supporting and opposing ideas in an appropriate manner. The students were asked to listen to the statements on diversity, peace and tolerance read by the respective facilitator and run to the corners of the class which were labeled as Strongly agree, Agree, Disagree and Strongly disagree. Next they had to build up an argument justifying their point of view. All the group members were given a chance to present thoughts in front of the task and the cooperative effort is observed.

Tasks and skills: Listening to the statements – listening, comprehension Giving opinions using appropriate language – speaking, vocabulary Building up arguments – conversations, questioning and answering

Waving Flag:-

The aim of this activity was to prepare themselves for explaining and justifying facts while promoting the importance of unity and harmony among people. They were encouraged to discuss and correct their grammar and sentence structures in writing. The student groups were provided with stationary and asked to design a flag and write a poem or a prose for each group based on one of the themes: Peace, Tolerance and Diversity.

Tasks and skills: Discussing about each student's culture – speaking Poem, prose – writing, reading, comprehension Presentation of the flag and role-play – speaking, presentation skills.

Post-activity – the groups presented their flags to the class explaining its specific symbols and the theme. Further they recited the poem or read the prose and explained why they selected such a theme and a set of vocabulary. The facilitators guided the students so that each group member was not neglected.

After two months of activities, the students were given a semi-structured questionnaire as some students would not convey genuine feelings when they are interviewed in person. Some students and three teachers were interviewed in order to seek in depth views and attitudes of them towards the new Orientation program. The next section of this paper presents the feedback gained from the students and teachers and some data have been presented verbatim.

Discussion:-

The cooperative Learning has been a popular learning technique among many teaching/learning settings and the first part of this research discussion will focus on the effectiveness of cooperative learning towards ethnic reconciliation among students as it is the primary objective of this study. Next the students' and teachers' feedback on improving L2 will be discussed.

As per the questionnaire data, the students had indicated their level of agreement or disagreement with the statements as follows.

Table 1: Responses of the students on Cooperative learning in ESL classroom					
Statements	Strongly Disagree	Disagree	Neutral	Agree	Strongly Agree
1. When I work together in a mixed ethnic group I achieve L2 proficiency more than when I work individually.	10.41%	6.2%	12.5%	27%	41.6%
2. When I work with the group, it prevents me from demonstrating personal abilities in activities.	27%	25%	20.8%	10.41%	16.6%
3. Even though the students' cooperativeness is expected when doing activities, some students do not help each other.	27%	27%	14.5%	14.5%	14.5%
4. Cooperative learning helps me to socialise more and encourage me to take part in lessons.	10.41%	12.5%	12.5%	29.1%	35.4%
5. Some students always try to be mingled with their own ethnic groups only.	20.8%	22.9%	22.9%	14.5%	18.7%
6. Cooperative learning improves my attitude towards ethnic reconciliation.	12.5%	10.4%	6.2%	31.2%	39.5%

Moreover, most students have shown a positive attitude towards the new learning system they experienced after the school time as shown in Figure 1 below. .

Figure 1: Students' overall attitude towards the new Orientation Program

It is noticeable that 86% of the sample drew positive attitudes towards the new Orientation program which was consisted of cooperative learning activities. 10% of the students did not like the program and 4% of the students didn't either like or dislike the program.

The students who liked the program admitted that this was a new system than what they experienced in school. As per the qualitative data, the positive feedback gained was that they were so curious to follow the program as new and exciting activities had been arranged for them. For most of them it was the first time that they engaged in cooperative learning in the English class with a specific objective of enhancing ethnic reconciliation and enhancing English proficiency. Further, they have been impressed by the four main activities I mentioned in the methodology. They appreciated the fact that they were in mixed cultural groups so that they could make friends from different backgrounds and those friendships were seem to be everlasting.

Response 1: "I could build up many good relationships with my other ethnic friends."

Response 2: "I thought Sinhala people are proud. I didn't like them earlier."

The students admitted that the Waving Flag activity gave them a chance to get to know each other. As the final product of the making of Flag activity was followed by a series of cooperative learning tasks such as getting to know each other, discussing and understanding similarities between them, discussing and reading about their different cultures paved them the way to be exposed to a range of vocabulary and different speaking patterns which improved their desire to use English. One Tamil student emphasized that even though he didn't know English much, English was the only language that could be used as the medium of communication between each other and he was forced to do so. Finally it has taken off his fear of speaking English and now he does his best to speak in English as much as possible.

Response 3: "This is the first time I am working with friends from other races. It is a nice experience"

As observed by the teachers, initially the students had tried to get together with the same race, yet eventually they had mingled with the other students as well.

Response 4: "I didn't like Tamil people at all. But now I think I have found a best friend. He is Tamil."

This is a key response by a student in the sample as the expected outcome of ethnic reconciliation has been a success due to the fact that he has found his best from another ethnicity.

Response 5: "We are waiting to eat 'Watalappan' prepared by our Muslim friends. They made delicious Watalappan for the food fiesta. We want them to make more again."

One student explained that the Food Festival was a wonderful experience as he learnt many things engaging in cooperative learning activities such as searching about different food from different cultures which enhanced reading skills while growing respect towards different cultures, activities to practice small dialogues which drew him to use language, and writing posters and invitations for the Food Festival which enhanced their writing skills.

It is clear that certain misperceptions grew in students' minds had been changed due to the fact that that they experienced working with people with other religions or races. They seemed to have had certain prejudices and misconceptions on working together and being together with people from different ethnicities and the program has let them mould their attitudes and grow awareness on peace and harmony. Thus, when it considered the qualitative data, it is clear that overall the learning context and the cooperative learning integrated had been impressed those 88% of students.

However there were 10% of students who did not like the program. The major reason for this was that they were from different ethnic contexts and mingling together was a bit difficult task at the very beginning. Some said that they preferred to be with a group of students who speak the same language or who belong to the same ethnicity so that they would not feel uncomfortable or insecure.

Response 6: "I feel so insecure... I don't like others. They always talk in Sinhala."

Response 7: "I don't have anything to do with them. I like my friends only."

Response 8: "Whenever teacher gives an activity, only they do. I don't know what's happening. I have only two more Sinhala Speaking friends in the groups. Others always talk in Tamil. So we skip the lecture sometimes."

As per the above statements made by the students, some still have the idea that they should work with people who belong to the same category. The cooperative activities are a burden to them as they have to be socialized with other ethnicities in the group. This marginalization has created a gap between them. As per Table 1, it is evident that about 42% of students acknowledge that students tend to befriend with people from their own ethnicities and other students are neglected.

Response 9: “Sometimes one specific ethnic group only take the decisions and don’t give chance to do to activities to others.”

Response 10: “They make decisions. We do nothing. Just listening to them. And I am ok with it. But not always.”

Response 11: “Some people want to show-off. Or over act. A headache.”

As the sample suggested there were students who tried to draw attraction of the others towards themselves so that the expected LOs were not achieved. As it should be a cooperative learning task, other students found such actions to be unpleasant and a burden.

Response 12: “I learnt nothing from the program.”

Response 13: “I am not social. I don’t want to be. I like lonely...”

Response 14: “I don’t mind group works. But I like to work on my own.”

It is noticeable that there is an average of 15% of students (see Table 1) has neutral attitudes towards working in cooperative activities in ESL classroom and achieving expected outcomes. In further interview it is indicated that they are the students who are able to adjust themselves to any situation and remain unnoticed and unattended to a certain extent when any discrimination occurred or any cooperative task is assigned to them. They simply let others to be shown off and wear neutral attitude towards the tasks or objectives. This has been clearly stated by the teachers too at their interview. In addition, the teachers suggested there were certain students who make troubles and cause disciplinary problems. Yet, the teachers strongly acknowledged that such behavior can be settled if this cooperative learning system had been continued for some more time.

As per the teachers’ view, the integration of cooperative learning in the orientation program was an overall success even though there are minor shortcomings. The key responses made by the teachers have been presented in Table 2 below.

Table 2:- Responses of the teachers on Cooperative learning in ESL classroom

Positive comments	Negative comments
<p>The students are happy to be with diverse people.</p> <p>Students improve their social skills when engaged in cooperative learning.</p> <p>It enhances long lasting friendship among students</p> <p>It helps to improve their English language usage.</p> <p>The students build up ethnic harmony through cooperative learning.</p>	<p>Sometimes, cooperative tasks make disciplinary problems.</p> <p>Some students tend to use their vernacular language when doing cooperative tasks which make certain minorities uncomfortable.</p> <p>Some students try to draw attraction than others when doing activities.</p> <p>Some students do not actively engage in activities and sometimes skip lectures.</p> <p>Some students’ attitudes cannot be changed within a short period in the cooperative learning setting.</p> <p>Content is too big to be covered with a limited time.</p>

According to the teachers, the main positivity they had identified was that the energy and willingness of the majority of students to take part in cooperative learning activities designed for them. As per the first main activity of designing a flag and a poem, the students were enthusiastically speaking and discussing about their cultures in order to find one particular aspect or an agreement in common. On the contrary, certain students have tried to use either Tamil or Sinhala to communicate with each other from the same race which made others uncomfortable.

Response 15: “Students actively took part in the role play activities and four corners which made introverts to be turned into extroverts.”

This is important that the students have become more socialized which makes them to unveil their true opinions and be open making it a more strong and healthy relationship.

Response 16: “The students feel they are valued and not neglected.”

As per the research by Yahya and Huei⁽⁸⁾ (2002), cooperative language tasks are useful to upgrade students’ proficiency levels and further it allows each student to take an important part in doing the group’s assigned tasks. It shows that they are valued as each student’s expertise is taken into consideration when completing the group task. This has been clearly pointed out through the Food Festival. In order to make such a big event a success, each student’s contribution was a must. This activity involves more speaking/ conversations which improves their speaking and strengthens their relationships.

However, the teachers highlighted the fact that some students had skipped some lectures. As I mentioned earlier, this is due to the fact that those students were not willing to take part in discussion sessions very much due to their poor proficiency. Yet as some students suggested, they had realized cooperative learning environment as the ideal platform to improve their proficiency while helping each other. This further broadens unity among students.

Finally the students were questioned of their feeling to be a member of their respective ethnic groups. In spite of the 10% of the students who disliked the program, the rest was highly impressed to be in a diverse group and had realized the essence of ethnic reconciliation leading to peace and harmony.

All in all the teachers stated that the cooperative learning platform was a success as the student made friends irrespective of other cultures, races, languages or religions. Further they had started to communicate in English to their level best despite their fear for English, introversion or poor proficiency making the learning outcomes of the orientation program a success.

Conclusion and Recommendations:-

Coelho’s (1994) research study has proven that cooperative learning helps students in multicultural classrooms to develop more appropriate skills for their futures. The proper guidance and instruction by the teacher drive the students towards proper learning and working together.

According to the Orientation 2016/17 of Sri Lanka Institute of Information Technology, the students were expected to be united as one family while improving their English proficiency. As it was explained in Coelho’s book, these skills will lead the students to productive and quality graduates in the future broadening their capacity to work in any environment full of diversities.

As per the results of this study, majority of the students (88%) were highly motivated by the teaching learning through cooperative learning strategies. Further the grouping of the students by the institution before the commencement of the classes was a success as the students were given an opportunity to explore a new diverse learning environment and get to know new friends. If the grouping had been done by the students themselves, the expected outcome would not have been achieved.

As per the suggestions made by the students, a request for the same type of a cooperative learning setting for their semester studies as well had been made. This can be considered a positive feedback from students. Yet, as per recommendations, it is needed to notify certain drawbacks of the program highlighted by the students. 18% of students still emphasized that the students from the same ethnic group tend to form their own relationships with their respective comfort zones. Some find it really difficult to step out of their comfort zone even if they do have a desire to do so. Moreover, while other students are actively engaged in cooperative learning tasks, some are still neglected. These issues should be taken into consideration when conducting the semester classes. If certain students miss the opportunity to demonstrate their abilities due to other students’ behavior, the teacher should be attentive and strategic enough to identify such circumstances and conduct lectures giving equal opportunity to all of them. Thereby the team-spirit can be further enhanced.

According to the research data, more than 85% of the sample ensured that the overall program was a success as the expected learning outcomes are achieved. All the three teachers too stated that the overall program was a success as the majority of the students were able to attain the expected level of performance and attitudinal change. They confirmed this based on their class observations and discussions held with other students on the final day of the

class. Further this has been confirmed by the teachers as compared to their prior teaching experiences gained in 2015/16 or before working at SLIIT, students were more active and willing to do the tasks in order to be successful as a team.

Deviating from the monotonous style of teaching, cooperative learning provides a student friendly platform to perform in an interactive way while helping each other. As the teachers suggested, cooperative ESL tasks should be planned appropriately so that each individual is encouraged to involve in the lessons. When this methodology is applied in a multicultural setting, the reconciliation can be promoted as each student is involved in fulfilling tasks cooperating with the rest of the team-mates. As witnessed by the researcher, the Literary Carnival and the Food Festival were of an utmost success as the students' participation in activities was noteworthy and admired by the audiences. However, it is recommended that the teachers should have freedom to amend or adopt cooperative learning activities according to their own preferences and classroom settings in order to cater the best to the students.

In conclusion, Sri Lanka Institute of Information Technology offers degree programs in Computing, Engineering, Architecture, Quantity Surveying and Business which are of highly technical aspects and the students are lectured in English. Thus, apart from promoting ethnic reconciliation, to accomplish the aim of implementing English only speaking environment for students facilitating their L2 usage to be utilized in higher education, the said Orientation 2016/17 was a successful approach.

Acknowledgement:-

I express my sincere gratitude to Sri Lanka Institute of Information Technology, Malabe, Sri Lanka and specifically, Dr. Malitha Wijesundara, Dean – Education and Student Experience who came up with the wonderful thought to launch 'Bootstrap': the Orientation 2016/17, for the opportunity given for me to involve in the Orientation 2016/17 which led me to carry out this study. I thank my colleagues who provided insight and expertise that greatly assisted the research and my students for their support in order to produce a productive study that would benefit the upgrading of teaching and learning.

Published: March 2017

Key words:-

bladder outlet obstruction , curable illness , urinary tract symptoms.

Abstract

Aim:- To evaluate female patients of bladder outlet obstruction and find out common causes and clinical presentation of boo . To understand diagnostic modalities, treatment modalities and complications of boo in female. **Study Design:-** This is a prospective study of 50 female patients presented with bladder outlet obstruction in a single centre. including only female patients > 15 years age and excluding females with prior surgery of urinary tract / perineal surgery / spine surgery / known spine pathology .

Result:- According to age: the maximum number of cases (22%) is seen in the age group of 56 years to 65 years , body mass index(bmi) majority (52%) of the patients were in the bmi group of 26 - 29 kg/m². Symptoms in female boo majority (96%, n: 48) had sensation of incomplete emptying at the end of micturation. etiology most common causative pathology was urinary tract infection 28% (n: 14) surgical treatment offered 30% (n: 15) and received urethral dilatation/ urethrotomy.

Introduction:-

Bladder outlet obstruction (BOO) in females, a relatively uncommon condition has recently attracted more attention and has got better identified. The International Continence Society has defined BOO as a 'generic term for obstruction during voiding and is characterized by increased detrusor pressure and reduced urine flow rate.^{1,2}

The International Continence Society (ICS) states that: 'Normal voiding is achieved by a voluntarily initiated continuous detrusor contraction that leads to complete bladder emptying within a normal time span and in the absence of obstruction³.

The prevalence of Bladder outlet obstruction is unknown. Though, large retrospective review trials have estimated that, of the 19.4%~25.5% women who present with lower urinary tract symptoms, 6.5%~9.6% were classified as Female BOO. BOO may be induced by specific functional and anatomic causes, the resulting obstruction produces lower urinary tract symptoms (LUTS). Categorizing and understanding these symptoms and causes is crucial when proceeding with evaluation for specific diagnostic modalities to be used to fully delineate the degree of BOO.

The dynamics of voiding in females is more complex than in the males, presumably due to mobility of the bladder neck and proximal urethra as well as due to the action of pelvic floor movements and fasciae over the urethra. In addition, anatomic differences allow many women to empty their bladders by simply relaxing the pelvic floor, some augment voiding by abdominal straining.

Due to the diverse characteristics of Female Bladder Outlet Obstruction and the lack of Gold Standard in diagnosis the management of bladder outlet obstruction in females is perhaps as complex as its diagnosis.¹ However determining outlet obstruction in females still remains an intriguing proposition, requiring clinical studies and research⁴. Once the cause is determined, appropriate treatment will lead to resolution of symptoms in most patients.^{5,2}

Material and Method:-

This is a prospective study of 50 female patients presented with Bladder Outlet Obstruction. The study was conducted at Padmashree Dr. D.Y.Patil Hospital and Research Institute, Kolhapur from May 2012 to April 2015 at the Department of General Surgery.

Inclusion Criteria:-

Female Patients > 15 years age

Exclusion Criteria:-

Females with prior surgery of urinary tract / perineal surgery / spine surgery / known spine pathology.

Methods:-

All the patients were evaluated as per the proforma. Special attention to the voiding symptoms, associated gynaecological disorder, history of previous catheterization and operation were noted.

- Female patients presenting with lower urinary tract symptoms (LUTS) like increased frequency, urgency, nocturia, poor stream, hesitancy, straining, and incomplete voiding were screened..
- All relevant investigations (Routine hematological tests, urine for routine and cytology, culture and sensitivity, Renal Function Tests, Ultrasonography of abdomen and pelvis, Uroflowmetry and Cystoscopy) were done in these cases to establish the diagnosis.
- Maximum Flow rate (Qmax) of >15ml/second and voided volume of 150 ml is considered normal. Patients with Qmax<15 ml/second were suspected as a case of BOO.
- Depending on the findings and diagnosis, cases were considered for treatment accordingly.
- The proposed procedure was explained to the patient and relatives and a written consent was obtained prior to surgery. After appropriate anaesthesia Cystoscopy was carried out in the operation theatre. A rigid cystoscope (17 French) / Ureteroscope with fiberoptic light source and video camera fitted to it gently passed. Pan endoscopic examination was done from the meatus, urethra, bladder neck and the interior of urinary bladder. Appropriate procedures like Urethral dilatation, Otis urethrotomy, visual internal urethrotomy in stricture urethra, cauterization of pseudomembrane, bladder neck incision was done. Foley catheterization (No. 16 French) was done.
- Patients with no demonstrable cause and suspected to have neurogenic/ dysfunctional voiding were either subjected to Uro-Dynamic Studies or were prescribed medical management.
- Patients were advised regular follow up.
- A wide variation in prevalence from 2.7-46.4% is reported depending on the methodology adopted. This underlines the need for more reviews and research in this area.

Observations and Results:-

During this study a total of 50 female cases with Bladder Outlet Obstruction were studied. The following are the observations:

Age Distribution:-

The mean age of the patient in our study is 53.9 years (15years -85years). The maximum number of cases (22%) is seen in the age group of 56 years to 65 years.

Graph 1:- Graph depicting Age Distribution in Female BOO.**Body Mass Index(Bmi):-**

Majority (52%) of the patients were in the BMI group of 26 - 29 kg/m². The mean BMI was 25.2 Kg/m².

Lower Urinary Tract Symptoms in female BOO:-

Considering all the voiding urinary complaints, majority of the patients (96%, n: 48) had sensation of incomplete emptying at the end of micturition. Most of them had poor stream (92%, n: 46) or straining for micturition (66%, n: 33). Similarly, common symptom was day time or night time frequency (92%, n:46)

Table 1:- Distribution of Lower Urinary Tract Symptoms in female BOO.

Symptoms	No. of cases	Percentage %
Urgency	15	30
Nocturia	42	84
Frequency	46	92
Straining	33	66
Incomplete emptying	48	96
Poor stream	46	92
Hesitancy	24	48

Etiology in female Bladder Outlet Obstruction:-

The most common causative pathology was Urinary Tract Infection 28% (n: 14), followed by Distal Urethral Stenosis in 18% (n: 9), Vesical Calculi in 16% (n: 8), Dysfunctional voiding in 10% (n: 5) of cases. Rest formed 28% (n: 14) of the cases.

Graph 2:- Graph depicting distribution of Etiological Factors in Female BOO.**Organisms Isolated on Urine Culture in female Bladder Outlet Obstruction:-**

In our study, 41 (82%) patients out of 50 had Urinary Tract Infection. On urinary culture the most common organism found was *E. coli* in 82.9% (n: 34), followed by mixed cultures in 4 patients 9.7% (n: 4). *Proteus*, *Klebsiella* and *Pseudomonas* were found in one case each (2.4%).

Distribution of Maximum Flow Rate 'Qmax' at Uroflowmetry:-

The maximum urine flow rate (Qmax) at Uroflowmetry in our cases was less than 12 mL/sec in 92% of the cases. 4 patients (8%) had a Qmax in the range of 13-15 mL/sec.

Maximum Flow Rate (Qmax) mL/sec	No. of cases	Percentage %
4-8	12	24
9-12	34	68
13-15	4	8

Table 8:- Distribution of Maximum Flow Rate 'Qmax' at Uroflowmetry.**Uro-dynamic study:-**

In this study, urodynamic study was performed in 20% (n: 10) cases. The flow rate is <15 mL/sec. The detrusor pressures in underactive bladder are <16 cm H₂O.

In neurogenic bladder there is poor bladder compliance with large bladder capacity. In cases of diabetic cystopathy there is poor bladder compliance with large bladder capacity. While in dysfunctional voiding there is varied bladder compliance and bladder capacity. In the cases of dysfunctional the detrusor pressures are >35 cm H₂O.

Blood Urea Levels:-

In our study 96% of the cases had Blood Urea levels in normal range. While 4% (n: 2) had deranged Blood Urea levels.

Serum Creatinine Levels:-

96% of the cases in our study had Serum Creatinine levels in normal range. 4% (n: 2) had deranged levels Serum Creatinine levels.

Co- morbidities:-

In our study 20% (n: 10) cases of 50 had Diabetes Mellitus, 28% (n: 14) cases had Hypertension. 12% (n: 6) had both Diabetes Mellitus and Hypertension.

Treatment:-**Treatment modality offered:-**

In our study, 52% (n: 26) of the cases were treated surgically, 28% (n: 14) cases given medical line of management, and 20% (n: 10) cases required combined (medical and surgical) modality of treatment.

Table 3:- Distribution of treatment modalities offered in female BOO.

Type	No. of cases	Percentage %
Surgical	26	52
Medical	14	28
Combined	10	20
Total	50	100

Surgical Treatment offered:-

In our study, 30% (n: 15) cases received urethral dilatation/ urethrotomy, 16% (n: 8) required Cystolithotripsy, 4% (n: 2) required Trans-Urethral Resection of Bladder Tumour (TURBT), and in 8% (n: 4) Pelvic Organ Prolapse (POP) repair was done.

Table 4:- Distribution of surgical treatment modality offered in female BOO.

Treatment modality	No. of cases	Percentage %
Urethral dilatation/ Urethrotomy	15	30
Cystolithotripsy	8	16
TURBT	2	4
POP repair	4	8

Discussion:-

The study on clinical profile of Bladder Outlet Obstruction in females (BOO) when compared to the previous studies carried out throughout the world, in most of the aspects there was a wide range of difference.

Age Distribution in Female Bladder Outlet Obstruction:-

In our study of BOO in females, mean age of the patients is 53.9 which is similar to some but different from many other studies.

- Our study shows that Bladder Outlet Obstruction is common in the post-menopausal women. The reason being changes in the hormonal status and age related anatomical derangements. Nadir et al.⁶ in his case study of 221 patients has found, the mean age group associated with BOO was 51.8 years(range: 22–91), which correlates to our study.
- Oravanet al.⁷ in his study shows that, mean age of the study population was 53.7 ± 13.6 years. Nitti et al.⁸ showed in their study of 76 obstructed cases the mean age was 57.5 years. Metinet al.⁹ in his study found the mean age is 52.6 years.

Incidence of Bladder Outlet Obstruction in Females:-

The incidence of BOO in our study is 6.5%. 72 cases were found to be obstructed and labeled BOO on the basis of uroflowmetry and significant post-void residual urine. Which also is closely in the range of various previous studies. Groutz et al.¹⁰ conducted a large retrospective review of women with lower urinary tract symptoms (LUTS), and recognized BOO in 6.5% of the cases⁵ which is similar to our study.

Lower Urinary Tract Symptoms (LUTS) in BOO.

- In our study of **Lower Urinary Tract Symptoms**, more than 84% cases presented with nocturia, frequency, straining, incomplete emptying, poor stream
- **Urinary tract infection(UTI)** is the most common etiology observed in our study.78% Urinary tract infection was the sole cause attributed to BOO.

- **Distal Urethral Stenosis (DUS)** is the 2nd most common etiology found in our study affecting 18%(n: 9) of cases.
- **Urethral Stricture** was the cause in 6% (n: 3) of the cases. They underwent Urethral Dilatation to 30 Fr. with Otis urethrotomy.
- There were 6% cases (n: 3) of **Neurogenic bladder** and **Pelvic Organ Prolapse (POP)**.

Organisms at Urine Culture in cases of BOO:-

E. coli was predominantly found in 82.9 % (n: 34) of the cases.

Uroflowmetry in evaluation of female BOO.

- In our study the mean Qmax was 9.6 mL/sec (4-14mL/sec). 92% of cases in our study had Qmax <12 mL/sec. Therefore our study includes severely obstructed group. Axelrod et al.¹¹ identified bladder-neck obstruction in a group of women, using and Qmax of <12 ml/s as cutoff. Yong et al.¹² have defined female Bladder Outlet Obstruction as Qmax <15 mL/sec. on Uroflowmetry.

Uro-Dynamic Studies in female BOO:-

In cases where identifiable anatomical cause for BOO was not found, Uro-Dynamic Study (UDS) was performed. The studies showed: maximum flow rate (Qmax) <12 ml/s, detrusor pressure at maximum flow (pdet.Qmax) of >20 cm H₂O in dysfunctional voiding cases

Co-morbidities associated with female BOO:-

- ❖ Of the 50 cases 20 % (n: 10) of the total cases were diagnosed cases of diabetes mellitus and 28% (n: 14) of the cases were a known case of hypertension. 4 % (n: 2) of the diabetics were diagnosed with changes of Diabetic Cystopathy.

Post Void Residue Study:-

All the cases of Bladder Outlet Obstruction in females underwent Pre-void and immediate Post-void residual urine study by abdominal Ultrasonography. 54% of the cases (n: 27) had a Post Void urine residue of >100ml. The mean PVR in our study is 161.5mL.

- Patients with functional BOO had a mean PVR urine of 243mL, while those with anatomical BOO had a mean PVR urine of 141.1mL. It is observed that, the patients with Dysfunctional Voiding (DV) had post void residue of more than 210ml. The mean Post void residue of DV cases was 298.2 mL of urine in our study of Bladder Outlet Obstruction in females. Haylen et al.¹³ have concluded that postvoid residual volumes higher than 30mL are significantly associated with increasing age, higher grades of prolapse, and increased prevalence of recurrent Urinary Tract Infection, this is evident in our study.
- Nittiet al.⁸ found a mean post-void residual urine (157 versus 33 ml, p <0.0001) in their study which correlates the value in our study.

Treatment Of Female Bladder Outlet Obstruction:-

To summarize, the treatment was mainly surgical, medical and in some cases combined approach was utilized. 52% (n: 26) cases were treated surgically, 28% (n: 14) cases received medical line of management while 20% (n: 10) cases required combined modality of treatment approach.

In our study, surgical treatment included urethral dilatation/ urethrotomy in 30% (n: 15) cases, cystolithotripsy in 16% (n: 8) cases, Trans-Urethral Resection of Bladder Tumour (TURBT) in 4% (n: 2) cases, and in 8% (n: 4) cases of Pelvic Organ Prolapse (POP), POP repair was done.

Thorough evaluation of the cases enables identification of the cause of BOO and to determine the treatment plan. The most important part of its identification is a high index of suspicion. Once the cause is determined, appropriate treatment will resolve the symptoms in most of the patients.

method

Abstract

Graphene is a very huge and ultimate material for composite with metals, semiconductors and non metals in recent years, due to its has a unique atom-thick with two-dimensional (2D) structure, excellent physical properties like high conductivity and charge mobility, huge specific surface area, excellent mechanical, thermal and electrical properties. Thus, it has been regarded as an important component for functional materials, especially for developing a variety of catalysts and it has been considered widely as a prominent precursor and a starting material for the synthesis of this processable material. This work describes the synthesis of Graphene oxide (GO) by Modified Hummer's method and characterization of GO by Ultra violet visible spectroscopy (UV-Vis), UV-visible diffuse reflectance spectroscopy (UV-DRS), X-ray diffraction (XRD), Field emission scanning electron microscopy (FESEM) and Energy dispersive spectroscopy (EDX) analysis. The results obtained from the characterization techniques mentioned above is also explained in detailed and evaluation of catalytic application to environmental remedies, such as water purification of degradation of methylene blue under visible light irradiation.

Introduction:-

Graphene oxide (GO) represents an emerging field of interdisciplinary science that spans a variety of disciplines, including chemistry, physics, materials science, device fabrication, and nanotechnology [1-3]. The current graphene boom started in 2004 when Geim, Novoselov et al. published the deposition and characterization of single sheets of graphite on solid supports. Their groundbreaking experiments on graphene were honored with the Nobel Prize in Physics in 2010 [4-7]. Exceptional electronic, optical and mechanical properties were discovered in quick succession as a consequence of the experience gained from other carbon allotropes [8-9]. In particular, the high charge carrier mobilities, the electrical and thermal conductivity, combined with transparency and mechanical strength make graphene highly attractive for future high-tech applications [30].

The current status of graphene oxide with respect to prototype applications has been extensively reviewed.[10] Many graphene-based devices outperform reference systems, for example in high-frequency transistors, foldable and stretchable electronic or photodetectors,[11] capacitors,[12] transparent electrodes,[13] sensors,[14] H₂ generation,[15] pollution management,[16] energy applications,[17] biomedical applications and in composite materials [30].

Graphene is a two-dimensional (2D) carbon allotrope which can be viewed as both a solid and a macromolecule with molecular weights of more than $10^6 - 10^7 \text{ g mol}^{-1}$. In natural graphite, the graphene layers stick together through very pronounced π - π stacking interactions [30]. This noncovalent interlayer binding contributes significantly to the high thermodynamic stability of graphite. As a consequence, the wet chemistry of graphene is always concerned with overcoming these interactions. For example, a targeted exfoliation of graphite or the stabilization of solvent-dispersed graphene sheets always competes with reaggregation. It should be pointed out that a solid sample of graphene can only be stabilized on a support, such as a surface. A nonsupported graphene powder can not be expected to exist, since at least a partial restacking to graphite will take place! Another possibility of stabilizing individualized graphene is to “mask” the surface through chemical functionalization[18,30]. This paper we reported catalytic activity of graphene oxide (GO) under visible light irradiation and comparison the catalytic activity with graphite flake.

Properties of Graphene:-

Electronic properties:-

The electronic properties of graphene have received the most attention. Suspended graphene shows extremely high low-temperature charge carrier mobility, with a value approaching $200\,000 \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$ [19], making it an outstanding conductor of electricity. This excellent conductivity is due to the remarkable property of graphene that its charge carriers behave as mass less relativistic particles or Dirac fermions, and electrons can travel distances in the order of micrometers without scattering under ambient conditions [21]. This unique behavior has led to other phenomena in graphene. UV-DRS spectra revealed the graphene oxide has a zero-band gap 2D semiconductor due to its like as a semi metal, graphene exhibits a strong ambipolar electric field effect and the concentration of charge carriers can be as high as 10^{13} cm^{-1} , with room temperature mobilities of up to $15\,000 \text{ cm}^2 \text{ V}^{-1} \text{ s}^{-1}$ having been measured[22]. Moreover, an unusual half-integer quantum Hall effect (QHE) in graphene has been observed at room temperature[23,29].

Thermal properties:-

The thermal conductivity of suspended single-layer graphene at room temperature has been measured in the range $(4.84 \pm 0.44) \times 10^3$ to $(5.30 \pm 0.48) \times 10^3 \text{ W m}^{-1} \text{ K}^{-1}$ [24]. The superior thermal conduction property of graphene is beneficial for making graphene as an excellent material for thermal management [29]. The thermal conductivity of large-area, monolayer graphene grown by chemical vapor deposition (CVD) on a Au-coated SiNx porous membrane can reach about $2500 \text{ W m}^{-1} \text{ K}^{-1}$ at 350 K [25,29].

Mechanical Properties:-

According to Changgu Lee, Graphene is the strongest material ever tested, with a Tensile strength of 130 GPa and a Young's Modulus (defines stiffness) of 1 TPa [22,32]. Apart from this, Graphene is unbelievably light, weighing about only 0.77 mg/m². According to a Nobel announcement which illustrates that 1 m² of Graphene hammock would support a 4 kg cat, but would weigh only as much as one of the cat's whiskers [23,31].

Optical Properties:-

Graphene produces a highly opaque atomic monolayer in vacuum, as it has an ability to absorb approximately 2.3% of the white light. Adding another layer of Graphene increases the amount of white light absorbed by approx. the same value (2.3%) [24]. Once optical intensity reaches a certain threshold saturable absorption takes place [33]. Due to Graphene's properties of wavelength-insensitive ultrafast saturable absorption, full band mode locking has been achieved [34].

Experimental:-

Materials:-

Graphite Flakes (Sigma Aldrich), Sodium nitrate [NaNO_2], Potassium permanganate [KNO_3], Hydrogen peroxide 30% [H_2O_2], Sulphuric acid 98% [H_2SO_4], Hydrochloric acid 35% [HCl], Ortho phosphoric acid [H_3PO_4], Bismuth Nitrate [$\text{Bi}(\text{NO}_3)_3 \cdot 5\text{H}_2\text{O}$], Nitric acid [HNO_3 78%], Ammonium molybdate [$(\text{NH}_4)_6\text{Mo}_7\text{O}_{24} \cdot 4\text{H}_2\text{O}$] and Ammonium hydroxide [NH_4OH] and Methylene blue [$\text{C}_{16}\text{H}_{18}\text{ClN}_3\text{S}$]. All chemicals received from Merck India except Graphite flake received from Sigma Aldrich USA and used without further purifier.

Synthesis of Graphene Oxide by modified Hummer's method:-

Graphite flakes (2 g) and NaNO_3 (2 g) were mixed in 80 mL of H_2SO_4 (98%) and 10 ml of H_3PO_4 in a 1000 ml round bottom flask kept under at ice bath ($0-5^\circ\text{C}$) with continuous stirring. The mixture was stirred for 4 hrs at $0-5^\circ\text{C}$ temperature and potassium permanganate (12 g) was added to the suspension very slowly. The rate of addition was carefully controlled to keep the reaction temperature lower than 15°C . The mixture is diluted with very slow addition of 200 ml double distilled water, the ice bath was then removed and kept under stirring for 2 hrs at room temperature. The above mixture is kept in a reflux system at 90°C for 1h. After 1h, change the temperature to 30°C which gives brown colored solution. Again after 10 min, change it to 25°C , and maintain the temperature for 2 hrs. The solution is finally treated with 40 ml H_2O_2 by which color changes to bright yellow, 200 ml of water is taken in two separate beakers and equal amount of solution prepared is added and stirred for 1 hr. It is then kept without stirring for 3-4 hrs, where the particles settles at the bottom and remaining water is poured to filter. The resulting mixture is washed repeatedly by centrifugation with 5% HCl and then with distilled water several times until it forms gel like substance (pH- neutral). After centrifugation the gel like substance is vacuum dried [35].

Photocatalytic test:-

Organic pollutant such as methylene blue were chosen for photocatalytically activities evaluate of the as synthesized GO powder and Graphite flake (Sigma Aldrich USA). A 400 W HgX lamp was used as the light source to provide the simulated solar light. The experiments performed at an ambient temperature. The photocatalysts (GO or Graphite flake) 0.05 g were added into 50 mL of organic pollutant 5 ppm solution, and suspension was magnetically stirred for 30 min in the dark to reach an adsorption-desorption equilibrium with the photocatalysts. At a every 30 min time intervals, a 3 mL solution collected and then analyzed on UV-Vis spectrophotometer during the photo degradation process and same experiment perform as blank (without GO or Graphite flake). The concentration of methylene blue were determined by monitoring the variations in the main absorption centered at 664nm.

Characterization:-

The crystalline structure of the Graphene Oxide (GO) was investigated by powder X-ray diffraction (XRD, PanAlytical, X-Pert pro, Netherland) with $\text{Cu K}\alpha$ ($\lambda=1.54218 \text{ \AA}$) radiation . The size and morphology of the product were obtained with a Scanning electron microscope (FESEM-CARL Zeiss Germany, Model Ultra 55 FESEM, Gemini column, 1nm Resolution, detector is INLENSE), Energy dispersive spectroscopy (Oxford company, model 20 nm X Ma) UV-Vis & UV-Vis diffuse reflectance spectra of the sample were obtained in the range 300 – 800 nm using a UV-vis spectrophotometer (UV2550, Shimadzu, Japan) barium sulphate (BaSO_4) was used as a reflectance standard.

Results and Discussion:-

Figure.1. shows the UV-Visible spectra of Graphene Oxide, the peak at 215nm is $\pi-\pi^*$ transition due to $\text{C}=\text{C}$ bonding is an aromatic ring, where as the broad shoulder peak at 291nm is $n-\pi^*$ transition due to $\text{C}-\text{O}$ bonding. The absorption over 291 nm is expected to be caused by the conjugated fused ring plane; this indicates a $\text{sp}^2-\pi$ conjugated network.

Fig.1:- UV-Visible spectra of Graphene Oxide

Fig 2:- Possible structure of Graphene Oxide

The XRD pattern obtained for as synthesized GO nanoparticles by Hummer's method is shown in Figure 3b. It shows the diffraction peak at $2\theta=10^\circ$, which is mainly due to the oxidation of graphite. The diffraction peak of pure graphite is found around 26° , corresponding to the highly organized layer structure with an interlayer distance of 0.34 nm along the (002) orientation is shown as inset in Figure 3a. The XRD pattern for synthesized GO by Modified Hummer's method is shown in Figure 3b. The disappearance of the peak at 26° and appearance of the peak at 10° , shows that the product is completely oxidized after the chemical oxidation and exfoliation, indicating an increase in d-spacing from 0.34 nm to 0.82 nm.

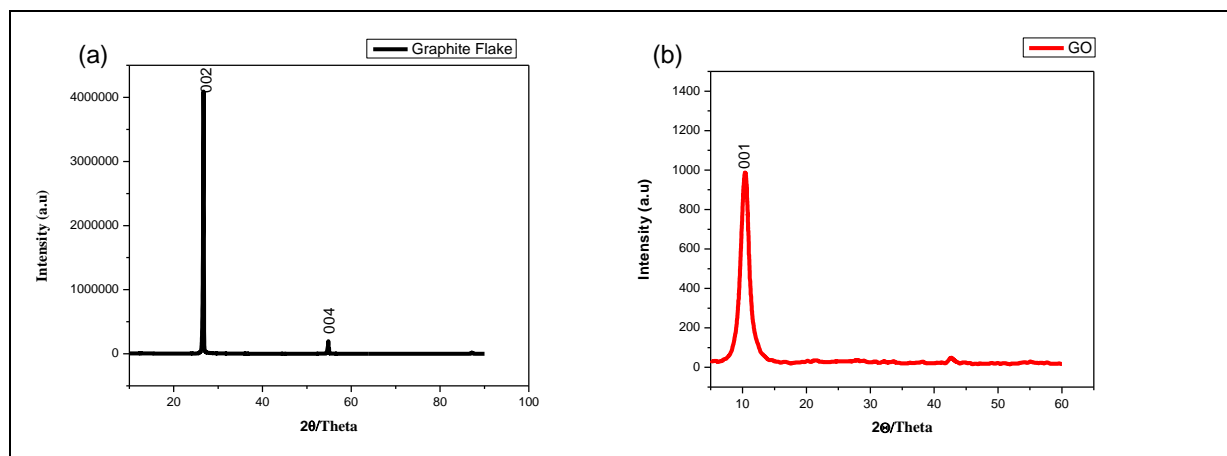

Fig.3:- XRD pattern of (a) Graphite flake, (b) Graphene Oxide.

Figure .4. Shows the FESEM images of Graphene Oxide. It shows single flakes of Graphene Oxide may be observed. Graphene Oxide flakes have relatively large surface and well defined and interlinked three-dimensional Graphene Oxide sheets, forming a porous network that resembles a loose sponge like structure with 49.38 nm range in size. Fig.5.shows the EDX spectra of Graphene Oxide, which revealed to purity of C,H,O elemental analysis and some impure of the elemental with Potassium (K) and Sulphur (S) also identified due to KMnO_4 and H_2SO_4 are precursor for the oxidation of GO..

Fig 4:- FESEM images of Graphene Oxide

Fig 5:- EDX spectra of Graphene Oxide.

Fig.6. shows Ultra Violet Diffuse-Reflectance Spectroscopy (UV-DRS) is an important method for charactering the electronic state, optical state and calculates the band gap of semiconductor materials. The DRS spectra of as synthesized of Graphene Oxide and the band gap calculated and the band gap is zero, due to its revealed Graphene Oxide as a non semiconductor, its like metal so Graphene Oxide as a semi metal.

Band gap energy (E_g) = $h*c/\lambda$ ----- (1)

Where E_g , h , c , λ are band gap energy, plank constant, speed of light, cut of wavelength respectively.

Fig 6:- UV-DRS spectrum of Graphene Oxide

Photocatalytic Effect:-

Generally photocatalytic degradation of dyes by a photocatalyst is critically depends on particle size, crystallinity, morphology, band gap energy, charge recombination and efficient charge separation. Graphene Oxide as a good efficiency for charge separation. Fig.7. shows the photocatalytic activity under visible light irradiation over degradation of Methylene blue were chosen as representative model pollutant. The establishment of adsorption – desorption equilibrium was obtained under continuous stirring 30 min before the degradation reaction was carried out, evaluated degradation under visible light irradiation measured to UV- Visible spectrometer to the cut off filter 664nm. Fig. 7a. shows 95.69 % degradation of MB with GO, Fig.7b shows 58.02 % degradation of MB with Graphite Flake and Fig.7c shows the 7.6 % degradation of MB in absence of catalyst within 120 min. Fig 7d shows a plot between time verses % of degradation of MB under GO, Graphite flake and in absence of catalyst. Among them GO responds more towards the degradation of MB under visible light irradiation and the GO curve indicate with increase the time degradation also increased, the increases of dye degradation below 30 minutes is rapidly after 30 minutes the degradation of dye is slow due to Graphene Oxide has large surface area so the degradation of starting 30 minutes is rapidly. So the effect of dye degradation not only depend on photo light (visible or ultra violet) also depend on surface area of catalyst.

$$\% \text{ of degradation} = (A_0 - A_t) / A_0 * 100 \text{ ----- (2)}$$

Where A_0 and A_t are respectively initial absorbance.

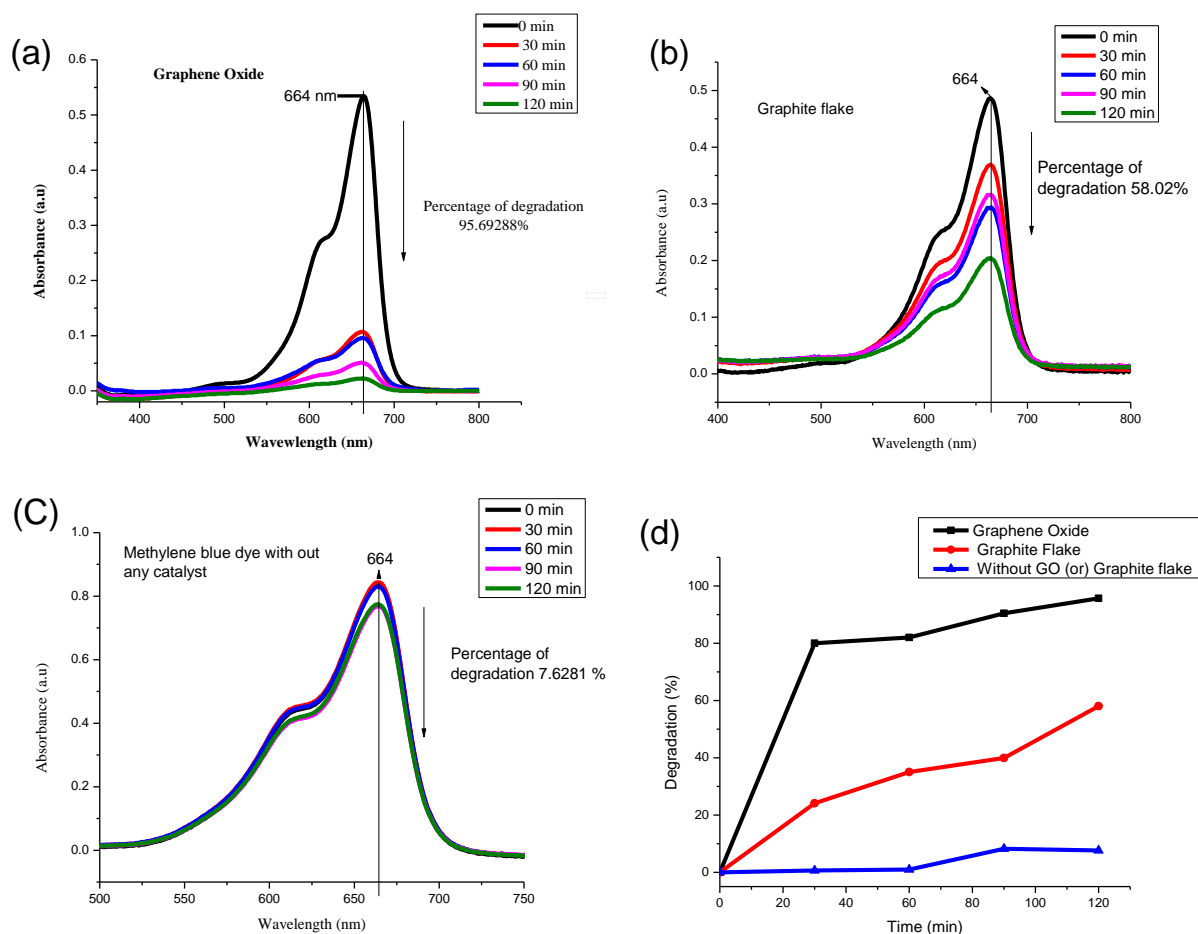

Fig.7:- Degradation of methylene blue dye under Visible light irradiation (a) MB dye with GO (b) MB dye with Graphite flake (c) MB dye without catalyst (d) Photocatalytic comparison between GO, Graphite flake and without catalyst under visible light irradiation as a function of time 't' verses % of degradation.

Conclusion:-

The synthesis of Graphene Oxide successfully synthesized by modified hummer's method. The synthesized of Graphene Oxide confirmed by XRD for the graphite flake disappearance of the peak at 26° and appearance of the peak at 10° , shows that the product is completely oxidized after the chemical oxidation to formation of Graphene Oxide and presence of C-O($n - \pi^*$ transition), C=C($\pi - \pi^*$ transition) bonds analysis by UV-Visible spectroscopy, FE-SEM image revealed sponge porous with large surface area and photocatalytic experiment gave good information for degradation of methylene blue dye with Graphene Oxide as a catalyst i.e. the effect of dye degradation not only depend on photo light (visible or ultra violet) also depend on surface area also due to this reason Graphene Oxide as only one best material for composite/hybridized to semiconductors and metals.

Abstract

Ground water contamination is generally irreversible i.e., once it is contaminated it is difficult to restore the original quality of water. The effect of municipal solid waste dump on ground water quality at Pipariya, Madhya Pradesh was investigated. Physicochemical quality parameters such as temperature, total dissolved solids, pH, electrical conductivity, alkalinity, total hardness, phosphate, chloride, residual chlorine, were analyzed in groundwater samples. Water samples were collected from many sample stations (hand pumps and bore-wells) from different locations near to a municipal solid waste dump site. The present study is an attempt to observe the existence of pollution in ground water quality and its ill effects on human beings who settled near the dump site at Pipariya Municipal Council (PMC). During the study it was found that total dissolved solids (TDS), electrical conductivity (EC), exceeded the World Health Organization (WHO) tolerance levels for drinking water.

Introduction:-

Ground water is the principal source of drinking water in both urban and rural areas. The importance of ground water for the existence of human society cannot be overemphasized¹⁻³. The quality of ground water depends on various chemical constituents and their concentration, which are mostly derived from the geological data of the particular region. Landfills used for *dumping* refuses and *municipal wastes*, contribute ground water pollution⁴⁻⁷. Water pollution refers to any type of aquatic contamination rendering the water body poisoned by toxic chemicals which affect living organisms. The contamination occurs through leakage, which is formed when rain water infiltrates the landfill and dissolves the solute fraction of the waste and the soluble product formed as a result of the chemical and biochemical processes occurring within the decaying wastes⁸⁻¹².

Pipariya is a Municipality city in district of Hoshangabad, Madhya Pradesh. Due to the uncontrolled and unscientific dumping of municipal solid wastes, all the water bodies near to the dumping sites at Pipariya gets polluted with toxic materials. The high rate of exploitation of ground water than its recharging, inappropriate dumping of solid and liquid wastes are the main causes of deterioration of ground water quality. Therefore the present study deals with assessment of ground water (drinking water) quality near municipal solid waste dumping sites in Pipariya.

Materials and Methods:-

Study area:-

The study area selected was the urban area of the city. The present solid waste disposal site of PMC is located at Sandia Road which the extreme north-east area of Pipariya. Municipal wastes dumped on this site are largely from domestic and commercial sources. No scientific method of waste disposal is adopted.

Sampling:-

Selection of the sampling sites was done on the basis of the overall objective of the present study. In all total five sampling sites were selected within 0.50 km radius of the landfill site from where the groundwater samples were taken to assess the status of ground water quality at Pipariya. Water samples were collected in clean 500 ml plastic bottles after the extraction of water either from a bore-well or a hand pump. All the collected samples were immediately transported to the laboratory, stored at 4°C and analyzed the same day.

Physicochemical Analysis:-

It is very essential and important to test the water before it is used for drinking, domestic, agricultural or industrial purpose. All the samples were analyzed for relevant physicochemical parameters according to internationally accepted procedures and standard methods¹³. The samples were analyzed for following physicochemical parameter, temperature, electrical conductivity, turbidity, pH total hardness, total dissolved solids, dissolved oxygen, total alkalinity, chloride, calcium, magnesium, iron, and sulphate (mg/l) etc. All The reagents used for the analysis were AR grade and double distilled water was used for preparation of solutions.

Results and Discussion:-

The results of the physicochemical analysis of the groundwater samples are presented in Table-1. Temperature of the Ground Water sample was recorded as to be normal as per the desirable range. Temperature of groundwater sample slightly varied ranged from 26.0 to 27.5

The pH of the groundwater samples is useful for the calculation of acidity and alkalinity, and important factor in maintaining the carbonate and bicarbonate system. The pH of the groundwater samples were from 7.79 to 7.93. The pH value of all the samples shows the water is neural in nature. The values of pH are within desirable limits (6.5-8.5).

Turbidity of groundwater samples obtained from 5.1 to 6.1NTU. EC is a measure of total salt content in water¹⁴. EC ranged between 885µs/cm to 910 µs/cm. TDS indicates the general nature of water quality or salinity¹⁵. During the study TDS is found between ranged 887 mg/l to 907 mg/l. The TDS concentration was found to be above the

permissible limit may be due to the leaching of various pollutants into the ground water which can decrease the potability and may cause gastro-intestinal irritation in human.

The total alkalinity was found to be in the range of 134 to 142 mg/l in ground water samples which are caused mainly due to OH^- , CO_3^{2-} , HCO_3^- ions¹⁶.

The total hardness of ground water samples were found in the range of 375 to 394 mg/l which is further compared with the standard value ranged 300 mg/l. Water hardness is usually due to the multivalent metal ions, which comes from minerals dissolved in the water. The hardness of water is not a pollution indicator parameter but it indicates water quality mainly in terms of calcium and magnesium. The desirable limit for hardness is 300 mg/l and the permissible limit in the absence of alternate source is 600 mg/l.

The value of chloride obtained 244 to 253 mg/l as presented in table which is further compared with the standard values 250 mg/l. Chloride is not harmful to human at low concentration but could alter the taste of water at concentration above 250 mg/l.

DO of ground water samples were found in the range of 2.4 to 3.0 mg/l. due to the capacity of water to hold oxygen¹⁷. The concentration of nitrate was found in water sample up to 4.1 mg/l. have also reported increase in nitrate concentration in ground water due to waste water dumped at the disposal site and likely indicate the impact of leachate.

The concentration of fluoride in the studied water samples ranged from 0.08 to 0.12 mg/l. The concentration of fluoride at low concentration in ground water has been considered beneficial but high concentration may causes dental fluorosis (tooth mottling) and more seriously skeletal fluorosis¹⁸.

Concentration of sulphate in water sample ranged from 99 mg/l to 129 mg/l. Sulphate is a non toxic anion but ailment like catharsis, dehydration and gastrointestinal irritation have been linked with it when concentration is high¹⁻²⁰.

Phosphate may occur in surface and ground water as a result of domestic sewage, detergents, and agricultural effluents. The phosphate content in the study area was found in all sites from 9.5 to 10.2 mg/l.

Calcium and Magnesium are measured by complexometric titration with standard solution of EDTA. The values of Calcium in water samples were found in the range of 146 to 153 mg/l. and Magnesium ranged from 143 to 151 mg/l.

Iron occurs in waters in varying degrees depending on the geology of the area. The iron content of water samples ranged between 0.12 and 0.2 mg/L.

Conclusion:-

The study assessed the evolution of water quality in ground water of Pipariya near MSW. On the basis of current investigation we can conclude that the ground water near the MSW dumping areas most of the under permissible limit of WHO but some of the achieving near permissible limit. A comparative study of ground water i.e. bore well and hand pump water carried out by taking certain important parameters like pH, TDS, TA, Nitrate, Cl^- , PO_4^{3-} , F^- etc. In this present investigation it was found that the maximum parameters were not at the level of pollution except few parameters like nitrate, TDS and TH in ground water.

Therefore, the best accepted option is to avoid the possibility of polluting the ground water resources and municipal solid wastes dump in controlled and scientific way at dumping sites.

Abstract

Anterior crown fractures are a common form of injury that mainly affects children and adolescents due to their position in the oral cavity especially in the maxillary arch. Reattachment of original tooth fragment to the fractured tooth forms a relatively quick, biologic and esthetic restoration. 32 years old male patient reported to the Department of conservative Dentistry & Endodontics with a crown fracture of maxillary left central incisor and mid root fracture of maxillary left lateral incisor one day after the trauma had occurred. This case report represent the maxillary left central incisor treated with reattachment of natural crown fragment using glass fiber post and dual core composite resin and in maxillary left lateral incisor treated with endodontic therapy.

Introduction:-

Dental fractures account for 26-76% of dental injuries in the permanent dentition. Coronal fractures of permanent incisors represent 18-22% of all trauma to dental hard tissues, 28-44% being simple (enamel and dentin) and 11-15% complex (enamel, dentin, and pulp). Traumatized anterior teeth require quick functional and esthetic repair. This is particularly true in case of young patients as it not only causes physiologic impairment, but also esthetic disfigurement leading to a psychological impact.¹

Primary goal of the treatment of traumatically injured teeth remains esthetic and functional rehabilitation. Several therapeutic procedures are available to restore fractured anterior teeth. Reattachment of the fractured fragment is an excellent biological approach for restoration, when the fragment is available.²

The concept of reattachment began in 1964 when Chosak and Eidelman used a cast post and conventional cement to reattach an anterior crown segment. Recent developments in restorative materials, placement techniques, and adhesive protocols allow reattachment using resin based composites.³ Tennery was the first to use acid etch technique for the reattachment of fractured tooth fragment.

With the recent improvements in resin based restorative materials, tooth colored fiber posts along with resin luting cement are of choice because of several advantages such as esthetics, bonding to tooth structure and low modulus of elasticity similar to that of dentin. In some cases where the fracture extends subgingivally, but is supra alveolar, a full-thickness envelope flap provides the required isolation and visibility.¹

This is a case of a permanent incisors with crown and middle root fracture treated using glass fiber post in left maxillary central incisor and Root canal treatment in maxillary left lateral incisor.

Case Report:-

A 32-year-old male patient reported to the Department of Conservative Dentistry and Endodontics with fractured maxillary anterior tooth. The tooth had fractured 1 day ago on account of a minor two wheeler accident. His medical history was noncontributory. Patient complained of severe pain and swelling with 21 & 22. On clinical and radiographic examination, it was diagnosed as a complicated crown fracture of the maxillary left central incisor and crown root fracture in maxillary left lateral incisor (Figure-1). The oblique fracture line was supragingival both labially and palatally with 21. The treatment plan decided for the patient was reattachment of the fragment with 21 and root canal treatment in reallion 22.

Figure 1:- Ellis class III fracture with 21 and middle root fracture with 22.

Patient was informed of long term prognosis of the teeth and the treatment was initiated. The teeth were anaesthetized using local infiltration technique (2% lidocaine with 1:100,000). Single visit root canal treatment of 21 and 22 was carried out (figure-2). The post space was prepared by using peeso reamers retaining 5 mm of apical gutta percha and No.2 prefabricated glass fiber post was selected. After checking the fit of the post, it was trimmed leaving about 2 mm of post beyond the tooth with 21. The pulpal aspect of the fractured fragment was prepared using a straight fissure bur (internal groove). The post and the fragment were adjusted until the fragment was approximated to its original position to obtain retention for the fragment. The post was luted using dual core resin luting cement (RelyX™ U200, 3M ESPE, Germany) with 21 [Figure-3].

Both the fragment and tooth were etched with 37% phosphoric acid etchant gel for 15 seconds. Then the bonding agent (3M ESPE, USA) was applied and light cured for 10 seconds. Flowable composite resin (Filtek Z 350XT flowable restorative, 3M ESPE, USA) was applied to both fragment and tooth surfaces. The fractured segment was then accurately attach on the tooth, paying special attention to the fit between the segments. When the original position had been reestablished, excess resin was removed and the bonded area was light cured for 40 seconds on each surface.

The occlusion was carefully checked and adjusted. The margins were properly finished with finishing burs and polished with polishing paste. Final radiograph was taken to confirm the proper alignment of the attached fragment. The patient was given oral hygiene instructions and was recalled for follow-up visits. The six month follow up (Figure-4) shows satisfactory result esthetically and functionally.

Figure 2:- Root canal treatment was carried out with 21 and 22.

Figure 3:- Reattachment with help of glass fiber post i.r.t.21 and MTA Fillapex i.r.t. 22.

Follow up after 6 months

Discussion:-

Traumatic dental injuries in the permanent dentition necessarily involve function, aesthetics and psychological aspects particularly in young patients. Factors determining the treatment plan and prognosis for coronal teeth fractures include the extent of fracture, endodontic involvement, periodontal status, maturity of root, biological width invasion, presence / absence of fractured tooth fragment and the fit of the fragment and remaining tooth, occlusion, esthetics and finances. Depending on these factors, various treatment options are composite restorations, orthodontic / surgical extrusion, crown lengthening followed by post and core supported restorations and reattachment of fractured fragment.^{2,4}

Conventional methods employed in the restoration of fractured teeth include partial and full coverage crowns, laminate veneers, and composite resins all of which are time consuming, high priced, and not conservative.⁴ It is beneficial to quickly restore the function and the aesthetics of a fractured tooth. The reattachment of a fractured crown fragment may be the most conservative and desirable treatment of choice for anterior teeth. The reattachment of the crown fragment to a fractured tooth is the best method to reinstate the natural shape, contour, surface texture, occlusal alignment and color of the fragment, which offers excellent esthetic and functional result.⁵

Post and core supported crowns are recommended in cases of major tooth loss where the fractured fragment is not available. With the fracture line extending below the alveolar crestal bone orthodontic extrusion or surgical extrusion is recommended before the restoration. But with the fracture lying above the alveolar bone crest reattachment of the fractured fragment is a more viable option. There is sufficient evidence to show that the reattachment of the fractured coronal fragments using modern adhesive systems results in predictably successful short- and medium-term outcomes.¹

However, this technique can be used only when the intact tooth fragment is available. As the fractured fragments were intact in the cases described above, use of natural tooth substance clearly eliminated problems of differential wear of restorative material unmatched shades and difficulty of contour and texture reproduction associated with other restorative techniques.⁷

The common complications in the post and core system are debonding and root fracture. These are more common with cast metal posts used earlier which can cause wedging forces coronally that may result in irreversible failure because of fracture of an already weakened root. The newer variety of nonmetallic posts is made of either ceramic or fiber reinforced materials like carbon, quartz or glass in an epoxy matrix. Fiber reinforced composite resin post offers many advantages for reattachment procedure such as conservation of tooth structure, bonding to the tooth structure, low modulus of elasticity equal to that of dentin, esthetics, simplicity of procedure requiring less chair time and cost-effectiveness.⁸

By using glass fiber post with composite core and with recent advances in adhesive techniques and materials one can create a Monoblock, a multi-layered structure with no inherent weak interlayer interfaces. Early retrospective studies indicate that the clinical performance of fiber post is promising and the failure rate recorded is 3.2% over a period of up to 4 years. Trope *et al.* in 1985 showed that Endodontically treated teeth can be reinforced with the use of resin composite restoration. The flowable composite reinforces the tooth, helps in achieving higher bond strengths and minimizes the inclusion of air voids.¹

Tooth fracture reattachment allows restoration of the tooth with minimal sacrifice of the remaining tooth structure. The use of natural tooth substance clearly eliminated problems of differential wear of restorative material, unmatched shades and difficulty of contour and texture reproduction associated with other restorative techniques.²

Conclusion:-

Reattachment technique is the most conservative and biological method of restoring a fractured anterior tooth. Reattaching a tooth fragment with newer adhesive materials may be used successfully to restore fractured teeth with adequate strength, but long term follow up is necessary in order to predict the durability of the tooth-adhesive-fragment complex. Patient cooperation and understanding of the limitations of the treatment is of utmost importance for good prognosis. The need of the day is to educate the population to preserve fractured segment and seek immediate dental treatment.

Abstract

Background: Rapid maxillary expansion usually associated with dental tipping of the anchor teeth, but the aims of the treatment are always to achieve minimal dental and maximum skeletal effects. The objective of the present study was to evaluate and compare the effect of memory palatal split screw (Memorax) to that of conventional Hyrax rapid palatal expanders on dento-alveolar structures, which were measured and recorded by Cone beam computed tomography (CBCT).

Materials and Methods: It was conducted over 14 subjects of adolescent patients with bilaterally constricted maxillary arch, with age ranged from 12ys to 15ys, with a mean of 13.6 ± 1.4 divided equally into two groups; the Memorax group and the Hyrax group. For all subjects, maxillofacial CBCTs were taken before expansion (T_1) and after 3 months at the time of removal of the expanders (T_2). 10 dental measurements were taken (5 linear and 5 angular). Data were explored for normality using Kolmogorov-Smirnov test of normality. Paired t test was used to compare mean values of before and after treatment. Independent (unpaired) test was used to compare between the two groups.

Results: There was no significant difference in the percent change after using both expanders, except in the inter-premolar apex width, where the percent change was significantly greater in the Memorax group ($p=0.0082$), and in the inter-premolar angle, where the percent change was significantly greater in the Hyrax group ($p=0.0096$).

Conclusion: In the premolar area, Memorax produced bodily movement expansion pattern, while Hyrax showed more tipping of the anchor teeth.

Introduction:-

Interest in rapid maxillary expansion (RME) has increased during the past four decades. In spite of the recommended use of the RME for different aims, its fundamental objective is to increase the transverse width of the upper dental arch at the apical base (Sarver and Johnston, 1989). Although the major treatment aim of RME could be observed in the transversal expansion of the skeletal facial structures, dento-alveolar changes may be considered as an additional contribution or side effect.

Usually, appliances with fixed jack screw are used for RME and they produce heavy forces which when applied to the maxillary anchor teeth and alveolar structures exceed the limits required for orthodontic movement (Isaacson and Ingram, 1964, and Zimring and Isaacson, 1965). Pressure caused by the applied forces compresses the periodontal ligament of the anchorage teeth and subsequently produces orthopedic movement by opening the mid-palatal suture (Haas A J, 1961) and orthodontic movement by tipping the upper posterior teeth and bending the alveolar bone (Da Silva Filho et al, 1991, Ciambotti et al, 2001, Oliveira et al, 2004, Kılıç et al, 2008, Braun et al, 2000, Asanza et al, 1997 and Garrett et al, 2008) with both slow maxillary expansion (Hicks, 1978) as well as RME. Hence, the aim of the RME treatment is to achieve minimal dental and maximum skeletal effects (Haas, 1961). Many different RME appliances have been developed for this purpose.

A study (Wichelhaus A, Geserick M and Ball J, 2004) described and evaluated a new maxillary memory palatal split screw (Memorax) that includes nickel–titanium open coil springs in the screw bed in order to lessen the massive expansion forces. The screw could be activated six times a day to produce a constant force level of 12-14 N (1224-1428 grams) providing effective and rapid expansion. According to the authors, this new screw could produce rapid, constant, and physiological expansion forces, thus making the expansion procedure more effective, more physiological, and well tolerated by patients. However, another study (Halicioğlu et al, 2010) showed that memory palatal split screw produced significant increase in the inter-premolar and intermolar distances and reduced the nasal airway resistance.

In other studies, the authors investigated effects of conventional Hyrax screw (Timms D J, 1981) and compared it with the memory screw on skeletal and dento-alveolar structures (Halicioğlu and Yavuz, 2011). They used plaster models and postero-anterior cephalograms at pretreatment (T_1), after expansion (T_2), and after retention (T_3). They found that the use of memory screw may be advantageous because it shortens the maxillary expansion period, provides additional expansion in the retention period, and generates light forces relative to the conventional Hyrax screw. Although studies about memory screw have increased, further investigations are still needed to compare the effects of RME caused by memory screw and Hyrax screw on the dento-facial structures. The aim of the present study is to investigate and compare the transversal dento-alveolar changes in subjects treated with a Memorax screw and conventional Hyrax screw using CBCT.

Methods:-

The material of this study consisted of CBCT radiographs of 14 patients, with bilateral maxillary cross-bite caused by basal apical narrowness, who were planned for RME at the Department of Orthodontics, Faculty of Dental Medicine for Girls, Al- Azhar University, Cairo, Egypt.

The research proposal was approved by the research ethics committee (REC), Faculty of Dental Medicine for Girls, Al- Azhar University, Cairo, Egypt. The detailed procedure was discussed with the patients and their guardians who signed an informed consent before the start of the clinical work.

The subjects were randomly divided into two equal groups: memory-screw group (Memorax group) treated using Memorax RME appliance (Product number: 167M1529—Memory expander type 'N'; Forestadent, Pforzheim, Germany). This group comprised 7 subjects (6 females and 1 male) with ages ranged from 13.6 ± 1.4 years, and Hyrax-screw group treated using Hyrax RME appliance (Product Type: 602-808-10 Hyrax® Medium, Dentaureum, Ispringen, Germany). This group also comprised 7 subjects (6 females and 1 male) with ages ranged from 13.5 ± 0.4 years. Maxillary first premolars and first molars were banded and four-armed expansion screws were soldered to the bands in both groups. In the conventional Hyrax-screw group, the patients were instructed to activate the screw two quarter-turns a day ($0.2 \times 2 = 0.4$ mm) one in the morning and one in the evening, while in the Memorax group, the patients were instructed to activate the screw six quarter-turns a day ($0.2 \times 6 = 1.2$ mm); two in the morning, two after lunch, and two in the evening. Both screws were activated until the occlusal aspect of the maxillary lingual cusp of the upper first molars contacted the occlusal aspect of the facial cusp of the mandibular first molars, thus producing the desiring expansion. The mean expansion period was 7 days in the memory-screw group and 22 days in the Hyrax-screw group with average total screw quart-turns in both group was 42 (8.4 mm) and 44 (8.8mm) respectively. Then, patients were left with the appliances as retainers for 3 months with the fixation of the screw of the hyrax group according to manufacturer instructions (Fig 1).

CBCT imaging: the RME achieved in this study was evaluated using Next Generation Scanora 3D CBCT scanner (Soredex, Tuusula, Finland). Images were taken prior to treatment (T_1), and 3 months after removing the appliance

(T2). The machine was set to the following protocol for all the scans of the study: 90kVp, 4mA, Voxel size 0.35mm, Scanning time was 45 seconds, with Field of view 13 x 13 cm.

After acquisition, data were exported and transferred in DICOM format to be secondarily re-evaluated for linear and angular measurement, where Invivo Dental software (version 5.3; Anatomage, San Jose, California, USA) was used for that purpose.

Invivo software was employed to superimpose preoperative and postoperative scans. The set of DICOM data of the preoperative scan was loaded into the software, and then the set of the postoperative scan of the same patient was loaded over it at the superimposition module. According to variation in positioning of both scans, a second adjustment was needed to ensure perfect superimposition, hence guaranteeing measuring linear and angular measurements at the exact level. Superimposition module was used to superimpose the postoperative scan over the preoperative one, where four landmarks, at different planes, were chosen at each scan, and then registration of these landmarks was automatically performed by the software. Superimposition sequence was repeated for each patient individually (**Fig 2**).

After completion of superimposition, the two scans (preoperative and postoperative) were regarded as a one unit and moved in the same manner. Orientation of the whole volume was made to ensure that the orthogonal reference lines (axial, coronal and sagittal) were following certain planes. Axial line was made parallel to maxillary plane (ANS-PNS) at sagittal view and parallel to the nasal floor at the coronal view respectively, and the sagittal line was parallel to the mid-sagittal plane at the coronal view (**Fig 3**). Ten dental measurements were recorded; five linear and five angular measurements (**Table 1**). For linear measurements, coronal view was utilized, where coronal reference line was moved to intersect at the palatal roots of the upper first molars at both sides. At the produced view, maxillary base width and inter-molar width (between apices of palatal roots and mesio-buccal cusp tips bilaterally) were measured at pre-operative scan then it was hidden then the same measurements were taken at the same view for the post-operative scan (**Fig 4**). At the same view, angulation of right and left first molars were measured in the same manner, and also the inter-molar angle as well. Molar angulation was measured by drawing the angle connecting the mesio-buccal cusp tip to the palatal root tip intersecting with the axial line which was made parallel to the nasal fossa for this measurement (**Fig 5**). Same measurements were repeated at the first premolars level after moving the coronal view to that level.

Figure 1:- Memorex rapid palatal expander during active expansion period.

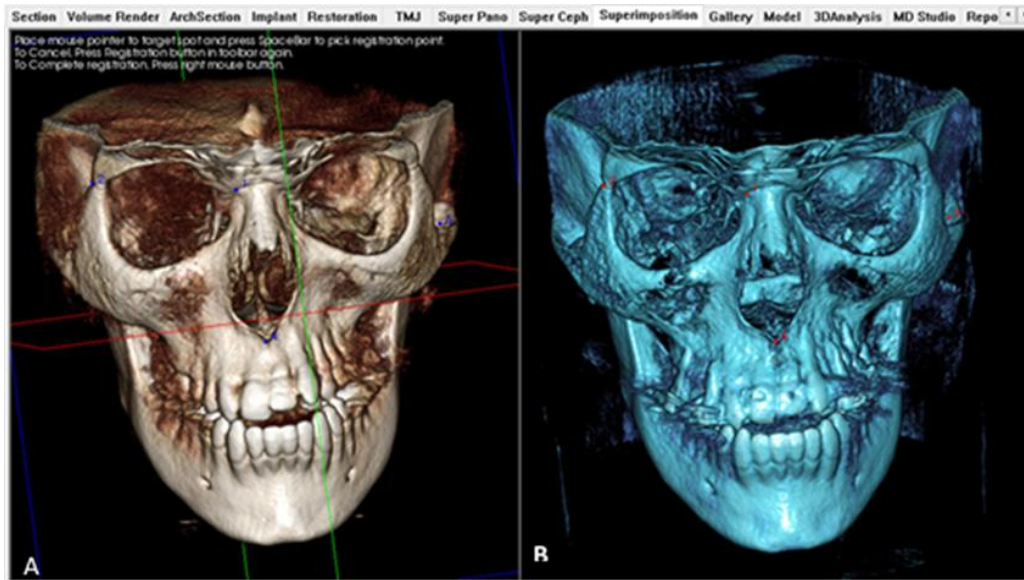

Figure 2: four landmarks, at different planes, numbered (1,2,3,4) were chosen at each scan (A: Blue colored numbers in the Preoperative scan), and then registration of these landmarks was automatically performed by the software (B: Red colored numbers in the postoperative scan).

Figure 3:- orthogonal reference lines. (A: coronal line, B: Axial line, and C: sagittal line)

Figure 4:- coronal reference line was moved to intersect at mesio-buccal cusp tips bilaterally to measure the inter-molar width in the pre- and post-operative scans.

Figure 5: Molar angulation measurements.

Results:-

Values of all parameters were presented as mean and standard deviation (SD) values. Data were explored for normality using Kolmogorov-Smirnov test of normality. The results of Kolmogorov-Smirnov test indicated that most of data were normally distributed (parametric data), so parametric tests were used for the comparisons. Paired t-test was used to compare mean values of before and after treatment. Independent (unpaired) t-test was used to compare between the two groups. The percentage change after treatment was calculated as follows:

(after-treatment value – before-treatment value) X100/ before-treatment value.

The significance level was set at $p \leq 0.05$. Statistical analysis was performed with SPSS for Windows v.16.0 (SPSS Inc., USA).

Both linear (mm) and angular (degree) values increased after treatment in the Memorex group. Paired t test revealed that the difference was statistically significant for all measurements, except for the right premolar angle degree, where the increase after treatment didn't reach the level of statistical significance ($p=0.0682$) (**Table 1**). Both linear and angular values increased after treatment in the Hyrax group. Paired t test revealed that the difference was statistically significant for all measurements (**Table 2**). Unpaired t-test revealed no significant difference in the mean pretreatment values of both groups. Moreover, there was no significant difference in the mean post-treatment values of both groups. Unpaired t-test revealed no significant difference in the percent change after using both expanders, except in the inter-premolar apex width, where the percent change was significantly greater in the

Memorax group ($p=0.0082$), and in the inter-premolar angle, where the percent change was significantly greater in the Hyrax group ($p=0.0096$) (Table 3).

Discussion:-

Generally, RME screw is turned twice a day during expansion. Isaacson and Ingram (1964) and Zimring and Isaacson (1965) suggested turning the screw twice until the suture opens in adolescent people and recommended that slower rates of expansion would allow for physiologic adjustment at the maxillary articulations and prevent residual force. In this study, the Hyrax screw was activated twice daily even after the suture has opened to stabilize the force applied to the appliance from the start till the end of expansion period. While in the Memorax group, screw was activated six times a day during RME. The difference between the screw activation protocols results from the different levels of forces produced by screws. Isaacson and Ingram (1964) measured the forces produced by conventional RME appliance and found that a quarter turns of the screw produced heavy and intermittent forces ranging from 1.5 to 4 kg, and may accumulate up to approximately 10 kg. However, Wichelhaus et al. (2004) evaluated that memory screw activated six times a day could generate a continuous force ranging from 1.225 to 1.425 kg. Additionally, Zimring and Isaacson (1965) hypothesized that if the expansion procedure was carried out at lower force level in a shorter treatment time, the total expansion might be physiologically stable. In the current study, adequate maxillary expansion was accomplished with the Memorax screw in 7 days with relatively lower forces than that produced by conventional expanders. However, the results of the present study shared to support the hypotheses of Zimring and Isaacson (1965) and Isaacson and Ingram (1964).

Both linear and angular values increased after treatment with both Memorax and Hyrax. Paired t-test revealed that the difference was statistically significant for all measurements, except for the right premolar angle degree in the Memorax group, where the increase after treatment did not reach the level of statistical significance. While there was no significant difference in the percent change after using both expanders, except in the inter-premolar apex width, where the percent change was significantly greater in the Memorax group ($p=0.0082$) which revealed a bodily movement pattern in the premolars area. In the Hyrax group, the percent change in the inter-premolar angle was significantly greater ($p=0.0096$) than the Memorax group which revealed a more tipping movement in the premolar area. These results could be regarded to the fact that the memory screw provided additional expansion in the retention period, which might have probably resulted from the activation of the nickel–titanium springs. In other words, in the retention period, nickel–titanium springs integrated in the screw might have not only resisted the residual forces that are considered to be the source of relapse, but according to Halıcıoğlu et al (2010), it also produce further expansion during the retention period. It was also observed that expansion with Hyrax led to a more tipping movement in the right rather than the left premolar, which may be attributed to the design of the Hyrax appliance used in the study. Braun et al (2000) demonstrated that the amount of dento-alveolar tipping depends on factors, such as the type of expansion appliance, age of the patient, resistance of the surrounding tissues, and schedule of screw activation. It has been observed that the rigidity of the expansion appliance is one of the factors responsible for decreasing the buccal tipping of the anchorage teeth (Timms, 1981). Although many different RME appliances have been developed to minimize the dento-alveolar inclination (Memikoglu and İşeri, 1999 and Başçiftçi and Karaman, 2002), occurrence of dento-alveolar tipping is unavoidable (Wertz, 1970 and Bishara and Staley, 1978). Asanza et al (1997) and Ciambotti et al (2001) found less molar tipping in patients treated with a Hyrax expander according to their studies. This difference may owe to the different measurement techniques employed for the determination of inclination. While Garrett et al (2008) showed that dento-alveolar inclination lacks significant correlations with the schedule of screw activation but correlate well with the amount of expansion. In the

present study, both the screws produced statistically significant dento-alveolar molar tipping after expansion. According to Hicks (1978) the anchorage teeth are expected to tip during expansion and remain upright at retention. In our study, this occurred in the Hyrax group showing significant increase in dento-alveolar tipping in the anchor premolars (inter premolar angle) ($P=0.0096$). This did not occur in the Memorax group, as an almost bodily movement of the anchorage teeth took place during the expansion period. This was due to the decreased alveolar bending occurred as a skeletal response to the rapid physiological distribution of the force applied by the appliance, which resulted from the nickel–titanium springs in the screw. This produced a significant increase in the inter-premolar apex width ($P=0.0082$). We believe that the continuous force exerted during retention, is the main reason behind preventing molar teeth to remain upright, producing non-significant dentoalveolar tipping in the anchored molars, which was decreased significantly in the premolar area. Hence, Memorax might increase the dento-alveolar tipping during the retention period especially in the molar area which might exceed the planned overexpansion if left more than 3 months. Halicioğlu K and Yavuz (2011) reported similar results when using Memorax for expansion, where the inter-premolar and molar width increased in the retention period. So they recommended before completing the active phase of RME, to take into account that some amount of increments will be observed in intermolar and interpremolar widths during the retention period. So according to previous findings which were emphasized during our study, The Memorax is not recommended to be left more than 3 months retention in the patient mouth.

Conclusions:-

Both appliances produced dento-alveolar tipping in the anchored teeth. But for the first premolars, Memorax produced a bodily movement expansion pattern with less dento-alveolar tipping. On the other hand, Hyrax showed a more tipping movement of the anchor premolars and molars.

Recommendations:-

- The Memorax is not recommended to be left more than 3 months as a retainer in the patient mouth as it increases the dento-alveolar tipping of the anchored teeth in the retention period.
- Further investigations are needed to analyze the forces and stresses produced by the Memorax in both active expansion and retention periods.

Abstract

The loss of plant genetic resources has necessitated the development of many *ex situ* conservation techniques. The application of plant tissue culture techniques in orchid conservation and propagation requires an efficient *in vitro* regeneration protocol. This study reports the development of such highly efficient protocols for the *in vitro* asymbiotic seed germination of *Spathoglottis plicata*. The seeds were successfully germinated asymbiotically on Gamborg B5 (1968). Various growth regulators such as 2,4-Dichlorophenoxyacetic acid (2,4-D), Indole acetic acid (IAA) Benzyladenine (BA) and Kinetin individually were used for callus induction and multiple shoot initiation from the protocorms. B5 medium supplemented with 2,4-D (9.03 μ M) was suitable for callus induction. Calli developed a route of production of protocorm-like bodies and eventually develop into plantlets on transfer to growth regulator free half strength basal medium. The well rooted plants were hardened successfully in the potting mixture containing coconut husk, sand, charcoal, and brick pieces in the ratio 1:1:1:1.

Introduction:-

Orchidaceae is a highly successful family, with representatives capable of occupying almost every ecological situation, apart from marine environments and habitats characterized by extreme cold throughout the year. Orchids exhibit an incredible range of diversity in size, shape and colour of their flowers and as a result, these plants have great ornamental value (Kasulo *et al.*, 2009). In India, orchids form 9% of the flora. It is estimated that about 1300 species belonging to 140 genera are present in the Himalayas with others scattered in Eastern and Western Ghats (Jain, 1980). Around 10% (3000) of the world's total orchid species are believed to be endangered in their native habitats. Orchids are subject to high levels of threat, through both natural and anthropogenic causes. The greatest threat to orchid diversity is habitat loss. Clearance of natural vegetation for ranching, monocrop agriculture, mining, logging, burning and urban development, has decimated many orchid species. Habitat destruction triggers the loss of pollinators, other plants and fungi on which the orchids mostly depend for their survival (Hagsater and Dumont, 1996).

Micropropagation has major advantages over conventional methods of plant propagation. It is an invaluable aid in the multiplication of elite clones of recalcitrant species, and is important in terms of multiplying plants throughout the year, with control over most facets of production. It is possible to generate pathogen free plants, even from explants of infected mother plants, plant materials such as male sterile, fertility maintainer and restorer lines can be cloned; and it enables the production of large number of plants in a short time from a selected number of genotypes,

where the traditional methods of multiplication are either not available or are ineffective in large scale multiplication systems (Debergh and Zimmerman, 1991).

The genus *Spathoglottis* is a member of the subfamily Epidendroideae. All members of this genus are terrestrial and most grow at low moderate altitudes, although a few taxa occur at high altitudes in grasslands and open forests in moist areas (Dressler, 1993; Beltrame, 2006). Whole plants as well as their different parts, viz., roots, rhizomes, pseudobulbs, stems and leaves are used as medicinal products. These are used for treatment of different diseases such as general debility, stomachache, bone fractures, colds, and wound healing, general weakness and to cure various other diseases (Subedi et al., 2013; Pant and Raskoti, 2013). *S. plicata* is a handsome terrestrial orchid species with nodes borne thickened bulb like stem (pseudobulb). The ground orchid *S. plicata* is one of the most commonly cultivated orchids in the Southeast Asia and could be found in gardens throughout the region. It is suitable as a potted orchid because it is very attractive, fast growing, easy to grow and with rapid fruit maturation. At maturity, plants flower almost throughout the year (Kheawwongjun and Thammasiri, 2008).

Materials and Methods:-

Explants source:-

Asymbiotic seed germination:-

The immature capsules of *S. plicata* (naturally pollinated) collected from Kakkavayal, Wayanad, Kerala were used for asymbiotic seed germination. The plant was authenticated and identified by Dr. K. Kishore Kumar, Head, Department of Botany, Farook College, Calicut, Kerala

Callus induction:-

40 days old protocorms (before the emergence of first leaves) of *S. plicata* were used as explants for callus.

Sterilization:-

The freshly collected capsules were surface sterilized in sodium hypochlorite solution (NaClO, 0.6 % w/v) for 2 minutes, rinsed thrice with sterile distilled water, dipped in 70 % (v/v) ethanol for 60 seconds and flamed. Seeds from the surface sterilized capsules were extracted by splitting the capsule longitudinally with a sharp sterilized surgical blade. The seeds were then spread as thin film in the test tube containing 10 ml of solid culture medium.

Culture media and initiation of culture:-

Five different basal media such as Murashige and Skoog (1962), Linsmaier and Skoog (1965), Gamborg B5 (1968), Schenk and Hildebrandt (1972) and Knudson C (1946) were tested to select a suitable medium for asymbiotic seed germination of *S. plicata*. Gamborg B5 with growth regulators such as 2,4-D (2.26, 4.52 and 9.03 μM), IAA (2.9, 5.7 and 11.4 μM) BA (2.22, 4.44 and 8.88 μM) and Kinetin (2.32, 4.64 and 9.29 μM) individually were used to assess the effect on callus induction.

All the media were supplemented with 3 % (w/v) sucrose and solidified with 0.8 % (w/v) agar (Hi media-India). The pH of the media was adjusted to 5.6–5.8 with 1 N NaOH or HCl. Around 10–15 ml of the medium was dispensed into 250 mm \times 150 mm culture tubes (Borosil). The mouth of the tubes was covered with aluminium foil and was autoclaved at 1.06 kg pressure for about 20 minutes at 121°C. The autoclaved medium in the culture tubes was cooled and allowed to solidify as slants. The inoculations were done after four days to ensure that the media were free from contamination. Five replicates were used for each treatment and maintained at $25 \pm 2^\circ\text{C}$ in culture room under a 12 hrs photoperiod of $50 \mu\text{mol m}^{-2} \text{s}^{-1}$ irradiance provided by white fluorescent tubes and with relative humidity of 70 %. All the experiments were repeated three times with 5 replicates per treatment.

Rooting:-

For root development, individual shoots were inoculated on half strength liquid basal medium supplemented with auxins such as IAA (2.9, 5.7, and 11.4 μM), IBA (2.46, 4.92, and 9.84 μM) and NAA (2.69, 5.38 and 10.76 μM) individually. The microshoots were supported on filter paper bridges (Whatman's No. 1).

Hardening of plantlets and transferring to community potting mix:-

About 2–4 cm long rooted plantlets (with 2–3 roots) were placed in perforated plastic cups containing charcoal pieces (\approx 2–4 cm), brick pieces (\approx 2–4 cm), coconut husks, and sand in the ratio of 1:1:1:1 and covered with holed transparent poly bag. The plantlets were maintained for 3–4 weeks in normal laboratory condition and irrigated at regular intervals. The potted plants were exposed to normal day light for about 1 hr in a day for the first week and

subsequently the exposure period was increased by 2 hrs and finally after 1 month the plantlets were placed in full day light condition.

Data Analysis:-

Asymbiotic seed germination:-

Bursting of the seed coat and emergence of the enlarged embryo i.e. the protocorm was considered as germination. The germination of seeds was recorded and percentage of seed germination was calculated. The seeds were scooped out and scrutinized randomly and observed under the microscope. The seeds were classified as germinated/non-germinated and the germination frequency was calculated by counting the total number of seeds germinated with that of total number of seeds observed.

$$\% \text{ of germination} = \frac{\text{Total number of seeds germinated}}{\text{Total number of seeds observed}} \times 100$$

Callus induction:-

The induction period, frequency of callus induction survival rate and conversion frequencies on various hormonal treatments were tabulated.

Results:-

Asymbiotic seed germination:-

The immature pods of *S. plicata* showed differential response (Table 1) when cultured on different basal media. Greening and swelling of seeds was found to be the first significant change after 8 weeks of culture.

Among the five different basal media used, B5 medium was found to be most effective in inducing a germination frequency of 95 % in *S. plicata* (Fig. 1) where as KC and MS induced 90 % and 25 % of seed germination.

Callus induction:-

80 days old protocorms were inoculated on the B5 basal medium supplemented with 2,4-D and IAA alone. Callus was initiated from the protocorms became visible within 30 days. Two morphologically distinct types of callus are observed. The first type was pale yellow in colour and compact in texture. The second type of callus was appeared slightly later and developed more rapidly than the first with translucent in colour and friable.

Callus induction was observed directly from seed derived protocorms of *S. plicata*. B5 medium supplemented with various concentrations of 2,4-D (2.26, 4.52 and 9.03 μM) were found to be efficient in inducing callus from protocorms of *S. plicata* (Table 2). 2,4-D (9.03 μM) supplemented B5 basal medium promoted 70 % callus induction within 45 days (Fig. 2 A&B). The well developed calli were transferred to hormone free basal medium for further differentiation. After 50 days with an intermediate subculture, the calli transformed into PLBs. These PLBs eventually develop into plantlets. The protocorm derived calli induced in the lower concentration of 2,4-D (2.26) shows 60 % frequency of plantlet conversion with the maximum of 4.6 ± 0.50 plantlets.

Rooting and Hardening:-

IAA significantly promoted rooting in *S. plicata* within 15 days. Number of days required for initiation was less, frequency of root induction was maximum, roots were longer and number of roots was more when compared to other hormonal treatments (Table 3; Fig 3 A&B). Higher root numbers were recorded in 5.7 μM of IAA (4.4 ± 0.92) with the maximum root length of 1.49 ± 0.34 . The well rooted shoots were washed thoroughly under sterile distilled water and transplanted into pots with a potting mixture of charcoal pieces, brick pieces and chopped mosses (at 1:1:1 ratio). The cultures were maintained for 3–4 weeks in normal laboratory condition before transferring to perforated plastic pots with potting mixture containing charcoal, brick pieces, coconut husks, and sand (at 1:1:1:1 ratio) for hardening (Fig 3 C,D&E).

Table 1:- Effect of various basal media on asymbiotic seed germination of *S. plicata*.

S.no	Basal Medium	No. of days taken for seed germination	Frequency of germination [%]
1	MS	30	25
2	LS	-	-
3	B5	30	95
4	SH	-	-
5	KC	30	90

MS - Murashige and Skoog (1962) medium, LS - Linsmaier and Skoog (1965), B5 - Gamborg B5 medium (1968), SH - Schenk and Hildebrandt medium (1972) and KC - Knudson C medium (1946).

Table 2: Effect of plant growth regulators on callus induction from 40 days old protocorms of *S. plicata*

Hormone (μM)		Number of days taken for callus induction ^a	Frequency of callus induction (%) ^a	Frequency of plantlet conversion (%) ^a	Average number of plantlets ($\pm\text{SE}$) ^{ab}
2,4-D	IAA				
2.26	-	30	64	60	4.6 \pm 0.50
4.52		30	44	45	3.4 \pm 0.38
9.03		30	70	30	3.6 \pm 0.38
	2.9	30	-	-	7.0 \pm 1.2

Many terrestrial and epiphytic orchids have been successfully propagated using *in vitro* asymbiotic seed germination techniques (Malmgren, 1992; Arditti and Ernst, 1990; Chou and Chang, 2004). Species specific media for germination of seeds have been reported in many orchids (Arditti and Ernst, 1984; Johnson *et al.*, 2007). This study reports the standardization of suitable seed germination medium for *S. plicata*. In the present study, B5 medium was found to be the best suitable medium for the germination of *S. plicata*. Similar results were observed with the early findings in *Calopogon tuberosus* (Kauth *et al.*, 2006) and *Habenaria macroceratitis* (Stewart and Kane, 2006). The nutrient requirement for orchid seed germination differs from species to species as well as there is no universal medium for all the orchid species (Stewart and Kane, 2006). The germinated seeds continued to develop into complete plants on the same respective seed germination medium (Fig. 1 C and 1 D).

Malmgren (1992) found that the asymbiotic seed germination of terrestrial orchids were higher on media containing amino acids because this form of nitrogen can more readily be assimilated by the germinating seeds than inorganic nitrogen due to its simplified form. However, glycine, an amino acid added to MS medium was reported to inhibit germination compared to ammonium nitrate (Spoerl and Curtis, 1948). Hence, in the present study, it is inferred that the low germination frequencies observed for *S. plicata* (25 %) on MS medium may be due to the inhibitory effects of glycine (2 mg/L) present in the medium. Effects of various amino acids on germination frequencies differ among orchid species (Kauth *et al.*, 2006). The nutritional requirement for seed germination and seedling development varies with genus, species and locality. A number of standard media such as KC, Vacin and Went, Raghavan and

Torrey, MS, Hyponix medium etc have been formulated for orchid culture. Several species of orchid show specific requirement.

Generally callus induction in orchids is rather difficult due to its slow growth and necrotic tendency (Naing *et al.*, 2011A). Recently, combinations of 2,4-D and TDZ have been reported for the callus induction of ornamental plants including some orchid genera, *Cypripedium formosanum* (Lee and Lee, 2003), *Vanda coerulea* (Lang and Hang, 2006). However, BA alone or in combination with 2,4-D totally inhibited callus induction in *Paphiopedilum* hybrid (Lin *et al.*, 2000). Similarly Ishii *et al.* (1998) mentioned that the combination of 2,4-D and BA could not effectively induce callus from leaf segment in *Phalaenopsis*. This shows that 2,4-D at certain concentration induced the callus formation in orchids. Similarly the ratios between concentrations of 2,4-D, BA and Kinetin were significantly associated with the percentage survival of protocorm and callus formation. Of the combinations tested, the lower concentration of 2,4-D (2.26 μ M) was found as optimal concentrations for the best callus induction in both the orchids. Finally it revealed that addition of exogenous hormones to the medium is quite important for callus induction.

In the present study higher concentration of 2,4-D (9.03 μ M) successfully induced callus from the protocorms within a short period of time. When PLB were transferred into different kinds of basal media, formation of shoots appeared on all media but conversion frequencies of PLBs to shoot and average number of shoots were ultimately low (Naing *et al.*, 2011B). In this study, transfer of callus obtained from lower concentration of 2,4-D (2.26) to hormone-free medium stimulated more PLB development and eventually allowed to produce plantlets.

Abstract

The goal of this article is to understand deeply what the most important elements of success of a business. To achieve this objective, the study extensively collected, identified and analyzed best management practices, decode them into qualified factors that contribute most to sustained business performance. The findings suggest that the talented team & innovation are the main concern in determining the success. Other remarkable findings include that culture & structure, Execution & Leadership were all interrelated to each other and essentially need to be satisfied for attaining success. The mechanism through which organizational culture impacts the design of structures and vice versa is explained at the conceptual level. This article provides formula which when executed correctly will lead to increase value for both customer & company as well as sustain in this dynamic world. A schema for understanding the different potential domains for innovation is also added

Introduction:-

For the initial 50 years of the twentieth century the path for profit optimization of firms was clear and unambiguous. In light of microeconomic hypothesis, this equation was to make an undifferentiated item at any rate conceivable unit cost and to offer it to the market at the most minimal price.^[1] Over the years number of substitutions for the microeconomic theory has showed up in business and scholarly writing. The Figure 1 represents the driving forces for success in 20th Century. An expanding number of firms found that the microeconomic theory no longer enhanced development and profitability. Subsequently, managers and academics began to search for alternative formulas for profit optimization.

Figure 1. Driving forces for success.^[1]

It is sensible that we have entered new age described by low development, quick change and complex. ^[2] Markets, products, and organizations have become global, diverse, knowledge intensive and multicultural. The view of the world and its systems as stable and predictable has been replaced with uncertainty, nonlinearity, and chaos.

Innovation – Need of the Hour:-

As per Forbes, the normal life expectancy of an effective Service and Product 500 Company was 67 years in the 1920's. Today it is 15 years. ^[3] More organizations need to innovate to enhance these declining numbers. We ought to be worried about many organizations that are presently effective don't have innovation instilled in the texture of their organizations. They are the ones that need to maintain a strategic distance from the FDH (fat, dumb, and happy) disorder, attempt new things and not rest on their laurels. They need to take risk to keep on achieving great success. They ought to realize that survival today requires more than treading water, and that a considerable lot of the organizations that were once extraordinary are currently gone or on out to a great extent since they quit innovating. Wherever advancements originate from, in any case they are done, and in whatever piece of the business they happen, organizations need to persistently innovate or risk dying. The problem with innovation improvement efforts is rooted in the lack of an innovation strategy. The remainder of this paper is devoted to presenting a formula for such strategic innovation

Evergreen Formula:-

Based on various literature studies, related analysis, personal observation and experience, a set of four dimensions appear to be dominant factor for business success. It is framed into equation as follows:

$$BS = e^L \times \int_s^c (wT + sI)$$

Where,

BS	= Business Success
wT	= Winning Team
ΔsI	= Triangle of strategic Innovation
Limits: C&S	= Culture & Structure (5F)
e ^L	= Execution & Leadership (3S)

In words the formula is stated as follows: “The degree of Business Success is equal to the integration of winning Team & strategic Innovation within the cultural & Structural boundaries, the whole executed under an effective leadership”. Let's take a look at each element briefly.

Winning Team (wT):-

Organizations realize that they should have the best talent keeping in mind the end goal to prevail in the hypercompetitive and progressively complex worldwide economy. The achievement of organization is directly proportional to the nature of the talent they can draw in and keep in their group for which talent and reward management plays import role.

A. Talent:-

Alongside the comprehension of the need to employ, create, and hold skilled individuals, organizations must oversee talent as a basic asset to accomplish the most ideal outcomes. The qualities of individuals who can possibly be the sort of "talent" are:

- Honesty/Integrity,
- Attitude of appreciation, energy and enthusiasm.
- Joy/Desire to be of service to others,
- At minimum a mid-level of competence combined with a high level of aptitude.

One should likewise realize that it's less expensive and more dependable to create stars than to get them. So first class training programs must be made to grow right skills and to hold top performers.

B. Reward:-

The best asset of an organization is people, on whom the greatest investment ought to be made. ^[4] Employee performance relies upon a substantial number of elements, for example, motivations, appraisals, work fulfillment, training and development, etc. Monetary incentive measures, for example, wages, and other benefits have traditionally been utilized to motivate employees to improve performance, particularly labors from production companies. ^[5] Incentives and related frameworks are fundamental to developing capacities and to translating them into better performance. However, studies have demonstrated that compensation does not help efficiency on the long run and cash does not enhance performance significantly (Whitley, 2002). ^[5] Moreover, concentrating just on this perspective may deteriorate workers' attitude, as they may seek after just monetary benefits. Luckily, there are other non-money related benefits that influence inspiration, for example, luxury gifts, travel, social acknowledgment and performance feedback.

Reward strategies are executed through measurements. But, if mere numbers alone considered as assessment for rewards, then it prompts to distorted systems. ^[6] Hence adequacy of these rewards systems additionally relies on upon various social, psychological and economic components. To actualize a genuine performance based reward system, organizations need to build up a proper reward strategy. There are many methodologies that can be utilized. It's vital to understand that there is no 'one-size-fits-all' way to deal with building up performance based reward culture. To be successful, one has to customize and tailor a system that's unique to their business needs and existing HR processes.

Strategic Innovation (ΔI):-

Innovation gets to be "strategic" when it is a deliberate, repeatable process that makes a noteworthy distinction in the value delivered to buyers, clients, partners and the company. A composite framework introduces the potential domains for successful innovation processes built within three boundaries or disciplines. Schema is given in figure:2

A. Boundaries:-

1. **Increasing value to Customers:** Strategy begins with the customer, not the company's assets. Choices must be taken whether to give superior price value (as lower costs) or superior non-price value (as superb usefulness, grand customer service, or an extraordinary customer relationship). Organization ought to include voice of clients in each progression of product development and catch their input throughout the customer journey. 85% of surveyed corporate leaders believe that strategies aiming at increasing value have more potential to lead to long-term success than strategies aiming at reducing prices ^[2]
2. **Increasing value to Company:** While watching out for operational efficiency, high performing companies ceaselessly search for better approaches to reinforce their top line. Innovative partnerships with academics, vendors, and organizations from different and/or comparable sectors are often considered to exploit the partners' offerings, processes, and resources, while profiting by internal strengths. Two-thirds of surveyed corporate leaders believe that strategies aiming at increasing revenue have more potential to lead to long-term success than strategies aiming at reducing costs. ^[2]
3. **Experimenting with new ideas:** It highly matters, what we change when the world around us changes. High-performing organizations understand the dynamics of today's economy. They urge employees to innovate and search for rapid ways to experiment with different ideas and models. Think big, begin little, learn and adjust quick, act smart. They also expect and accept failure.

Figure 2. Strategic Innovation Triangle.

B. Potential Domains:-

1. **Market Domain:** Marketing related growth strategies express at whom the business creates value for, running from existing to potential customers or customer segments, and where a business has or could have critical importance:
 - a. **Customers:** Customers are fundamental to any business model. Without them, no organization can survive. So-called customer strategies go for characterizing which segment of people or associations an organization ought to reach and serve, and which ones it ought not.
 - b. **Territories:** Similarly, strategies around sales territories give choices to organizations to create and enter particular markets, regardless of whether local or global.
2. **Value Addition:** Strategies that encompass an organization's value offer concentrate on an organization's customer confronting components, for example, how an organization creates recognizing elements and functionalities, how it upgrades the value of its offering through additional services, how it supports convincing cooperation with customers, and how it exhibit its offering and business on the market.
 - a. **Goods:** A product-based growth strategy comprises of creating an outstandingly grand product or structure of product: by creating unique elements and functionalities, or by being more straightforward or simpler to use than rival products. This permits an organization to win a considerable premium and gain a higher market share.
 - b. **Services:** A service-based growth strategy comprises of improving the value of the core product or structure of product through additional services, for example product guarantees, maintenance plans, or consumer support.
 - c. **Relationship:** Enhancing client experience is about creating and supporting convincing and meaningful interactions with client to engage them and create a sustainable emotional bond with them
 - d. **Brand:** Brand strategies comprise of improving the portrayal of an organization's identity, goods and services to the market, including its clients, prospects, vendors, rivals, and other key business associates.
3. **Operating Model:** An organization can also gain growth by concentrating on its business and operating models, including how it make profit, how it ties with business associates, and how it supports the business over the long run.
 - a. **Income:** Organization can grow by building up better approaches to generate revenue and increment edges.
 - b. **Partnerships:** Partnerships strategies give a path to an organization to bring superior value by benefiting from its own strengths while utilizing the abilities of others. It can occur at numerous levels of the value chain and with various business associations, extending from vendors and consumers to even rivals
 - c. **Operations:** Business can also develop by ensuring their process, procedures, methodologies and other operational activities completely support their value-creation desire.

According to corporate leaders, using a mix of many potential domains is expected to lead to higher performance levels and delivers more sustainable results than isolated improvements, and does so in ways competitors cannot

easily spot or copy.^[2] However, even when multiple domains are used, sustained success is possible only when all three boundaries are satisfied.

Culture & Structure (5F):-

The most imperative factor pulling in top talent is organization's culture. In some quarters of the business world, culture is still viewed as delicate—it's not considered as important as, say, operations.^[7] In accentuating issues and critical thinking, we fail to sustain trust, discovery, and creative ability. In making numbers, measurements, and material performance the methods and the objective, we disregarded our aggregate requirement for deep engagement, motivation, qualitative inquiry, pattern arrangement, narrative and meaning. We fragmented our values, our conduct, our families, our spirituality, our lives, and our work. We separated our bodies from our minds, our minds from our hearts, our hearts from our soul, and our souls from one another. We suffer now from the lack of individuals equipped to perform the new functions.^[8]

As indicated by a Bain survey of 365 organizations in Europe, Asia and North America, even those organizations that figure out how to cultivate high-performance cultures regularly discover them difficult to maintain. They additionally found that almost 70% of business pioneers concur: Culture gives the best source of competitive advantage. The progress of a sustainable culture that expects and boosts innovation at each level and capacity of the organization really undergirds every component of the innovation framework. The common elements of this winning culture are as follows.

- A. Fun:** making the way of culture where individuals enjoy the work they do and the people that they do it with. The most straightforward approach to check whether you've done this well, is just to walk around the place and check whether individuals are smiling. Smiling workers normally show people who are having a good time at work, making the most of their occupation, and having fun around with their associates. At the point when employees live it up will probably stay faithful to the organization.
- B. Family:** the way that employees characterize a "family like atmosphere" is that they realize that their superiors and companions truly care about them as an individual. This is the kind of culture where individuals demonstrate true concern and affection for each other, both as esteemed members from the team and as esteemed members from the community.
- C. Friends:** individuals who are exceptionally connected with and faithful to their organizations often consider much of their colleagues to be their close friends, some of the time even their best friends. This is not something one can command, it develops naturally from the initial two elements of fun and family.^[9]
- D. Freedom:** in organizations with a remarkable culture, individuals are given the training, resources, time and support to carry out their tasks amazingly well – and afterward they are given the freedom (empowerment) to go beyond and succeed all alone. Work satisfaction assumes a noteworthy part in stimulating new and beneficial ideas. Workers must be given the chance to do what they observe to satisfy in their roles to harness the creativity important to set up a innovative thought process. One of the quickest ways to kill the imagination and engagement of skilled worker is to attempt to micromanage their work which must be maintained a strategic distance from.
- E. Felicitate:** In an organization that has greatly engaged and satisfied employees, one of the fundamental things that inspires them is getting sincere, honest and genuine praise at least once every seven days.^[9] This compliment does not need to originate from the supervisor, it can be gotten from any of the colleagues, and the key is that it must be particular and honest to goodness. If people feel acknowledged for their work and are included in decision-making, their upgraded eagerness and inspiration will prompt to better efficiency and loyalty.

This kind of culture (5F) is what employees are looking for where they would give 110% of their discretionary effort. In order to embrace this new corporate philosophy, organization structures will also need to become more agile and flexible. If organizational culture and structure are not in accord, there will be serious tensions and problems which will affect the organization's functioning and its results. Organizational culture justifies the behavior and rules imposed on workers and administration by the organizational structure within the context of legitimate qualities and standards of behavior. On the other way, organizational structure standardizes the culture, i.e., mirrors its qualities, norms, and attitudes. However, the organizational structure can reinforce or even change the current organizational culture. Therefore, the relation of organizational culture and structure is dual as illustrated in figure 3.^[10]

Figure 3:- Mutual relations between organizational culture & structure.

Speed of decision has become increasingly important, with strategy development cycles becoming shorter and shorter. In light of a dynamic external environment, organizations must learn quickly and create a fast, flexible, flat structure that reduces bureaucracy and simplifies work. Departmental boundaries must be broken that avoid data sharing and collaboration. Nothing wrong with bureaucracy fundamentally. Processes and protocols are essential for any organization to function well. However, an excess of formality can hinder progress, diminish employee's excitement, and drain their energy. Additionally we need from our leaders Structural readiness. This denotes to the company structure's flexibility that backing innovation and to assign existing, qualified staff to high-priority operations – without question – one of the main obstructions to implementation.^[11]

Execution & Leadership (3S):-

Recommendations are meaningless unless you can act on them effectively. Creative minds are of no use, if you cannot instill a high level of disciplined execution where your great ideas are turned into massive action. It takes strong leadership at every level of an organization, determination and a willingness to make innovative culture a top priority. Leadership is a philosophy. It's an attitude. It's a state of mind. And it's available to each one of us. Successful leaders will perform following creative roles in the new leadership paradigm

- A. Spiritual Visionaries:** Spiritual visionaries are people who decipher the universe and individuals' roles in that—or if organization is taken, its part in business and society and its worker's roles in accomplishing its mission. An optimistic effective leader defines a very clear picture of the future—a vision for the team and blueprints for action to achieve those goals
- B. Social Artists:** Social artists are individuals who continually work on themselves to develop skills & wisdom to provide consultation, leadership, and guidance on changing paradigms. Social artists work in collaborative networks to create social innovation. They use powerful conversations to build trust, encourage forward thinking and create energy within the team. The behaviour displayed by the leader also influences the subordinate's mindset
- C. Scientific reflector:** leaders are proactive, seize opportunities before competitors do and tackle problems early. They work to change the organizational culture by implementing new ideas; eliminate waste, increase productivity. Delegate decision making wherever required.

Execution is a derivative of very clearly communicated expectations, visibility around key performance indicators, high levels of accountability and high levels of employee engagement. Investments in technologies and systems like ERP, CRM or SCM etc also influences success. The right tools clear the path for smoother execution and may improve the end product. But tools mean nothing without the right expertise and the right ingredients behind them. Software should support the process, but it can't stand alone.^[12] Disciplined attention & flawless operational execution is what really counts.

Limitations & Future Work Considerations:-

This fundamental research is mainly concerned with generalizations and with the formulation of a theory; can also be iterated as “Gathering knowledge for knowledge's sake”. While each factor of business has its own specific objectives, the formula as a whole has one overarching goal: Evergreen business success. It can be used as practical management tools which assures the firm's profitability & sustainability. It is primarily intended for strategy formulation or validation, redefining of existing strategies to make sure it's successful. The formula can be highly effective to entrepreneurs & decision makers – at all levels and in all functions of an organization – anyone who is struggling to make choice among multiple options. This vital decision is what turns the company from a nonprofit into a moneymaking endeavor in long run, whether across growing or declining market environment. Formula given will be relevant across industries like Automotive; Communications, Media; Chemicals; Building; Nutrition; HR Services; Hospitals; Retail, and Fabrics, but not limited to. Although this qualitative research addressed a major limitation of past studies, that being the lack of explicating the relationship/critical-link between all major variables,

it does not consider these factors in an empirical contextual, rather provided as a 'conceptual umbrella'. But this is an excellent base from which subsequent research will be undertaken on validation of these relationships in diverse environmental contexts. It would also summarize key trends, challenges/opportunities, and illustrates how this formula is applicable, through real-life examples in follow-up studies.

Conclusion:-

In the business world, the mandate for innovation is inescapable. If a company doesn't adapt to fit changing realities, it risks losing its position in the market. The formula provided is intended to tell managers which management practices they need to focus on and how they can improve it. The triangle of strategic innovation helps to grasp the full potential of future growth opportunities, and also corporate leaders will need to reinvent their business with above stated 5F & 3S techniques to achieve evergreen success.

Acknowledgment:-

I wish to express my sincere thanks to faculties of B-School, SRM University, Ramapuram for their kindest cooperation & Encouragement in accomplishing this task.

Key words:-

Fashion clothing involvement, consumer behavior, confidence, knowledge about purchasing and consumer's involvement.

Abstract

For many years, Fashion clothing has been an area of interest to many consumer researchers. This study examines the effect of age, gender, materialism and self-image product image congruency on consumer's involvement in fashion clothing. Today everyone has become materialist to get success. Thus people use fashion clothing as an important key to express their self to others and fit themselves in social environment. As fashion clothing has become the essential part of consumer's life. So, it is important to investigate consumer's involvement in fashion clothing to understand their behavior. The main purpose of this study is to measure the fashion clothing involvement of youth, adults, working people selected in Sargodha city. Fashion clothing is the center of this research. The sample size chosen for this study was 150. All samples were selected from Universities, Job Organization and Business establishment in Sargodha city. Factor analysis using principle components with varimax rotation was used. Also, the KMO and Bartlett's test was conducted in order to find or examine the interactions and relationships between variables.

Introduction:-

The term "Fashion" is accounted for through the attributes of change, ambivalence, novelty and added value when associated with an object (**Kawamura 2005, pp.4-5**). Clothing actually reflects the identity of wearer. **On Kivisit and Shaw (1987)** found that consumers select and buy products according to self-concept. Fashion involvement is used mainly to predict behavioral involvement and characteristic. Clothing sector firms are competing to increase their profit share in the market and among these firms; branded clothing has shifted the conventional clothing interest of people. Brand awareness have gained importance among consumers.

Mostly the choice of brands and products is based upon family acceptance. In Pakistan modernism and fashion clothing is a symbol of happiness and well-being. A large no. of Pakistan families adopt any fashion style but keeping their values and religious rules in their minds. Clothing may be seen as symbolizing status not only to the individual but also to the family and society.

Research reveals that the brands use to present a good image for customers. Brands are not that important for marketing but still they are viewed as improving the lifestyle of the consumers. The main benefit of brands is to give

Corresponding Author:- Iram Sana.

Address:- Department of Statistics-University of Sargodha.

status, value and quality to consumer. So that the consumer use more brands to enhance his personality. Similarly, we have chosen fashion clothing to examine the level of involvement of consumers with its purchase decision.

The need for the study is to check whether the purchase knowledge self-confidence fulfillment, social status, materialism, brands and fashion involvement and demographic characteristics of the youth, adults, job holders and business establishment consumers in Sargodha city can effect on their fashion involvement and also income.

Zaichkowsky (1986) defines involvement as “a person’s perceived relevance of the object based on inherent needs values and interest”. From this definition we can say that values play a key role in forming a consumer’s involvement to any product.

Review of Literature:-

The main purpose of this study was to examine the involvement of all the selected consumers in fashion clothing and whether the female consumer ranging age from 30 to 59 prefer fashion advertising models more closely to their age. The sample for this study was consisted of 182 females. A questionnaire designed to examine the response of consumers according to the given scales measuring participant’s belief about the model’s appearances and attractiveness. And how it effects on the purchasing that of clothes. Participants who perceived more similarity to the models were found to have more positive beliefs about the model’s appearance and attractiveness and the fashion ability of the model’s clothing. Hence the researcher finds in this study that the marketers should pay more attention to the advertisement of their clothes and should consider the age of the model used in their promotional materials.

(Kozar 2010):-

McFatter (2005) studied on fashion involvement to understand consumer behavior about purchasing and also to develop improved marketing strategies. The purpose of this study was to examine that the prediction of fashion involvement of female consumers can be determine by knowing the personality likes, media usage, price perception and selected demographic characteristics of the female consumers. Relationships to fashion involvement are discussed including the following variables: media usage, self-confidence, self-fulfillment, price perceptions and selected demographic characteristics. At the end of this study the researcher fond that the consumer’s media usage and price perceptions were significant of fashion involvement, while personality traits were not.

Browne and Kaldenberg (1997) presented a casual relation between materialism and involvement. In this context, it could be inferred that fashion clothing, as possession, may be seen for its role as a code. For instance, **Noesjirwan and Crawford (1982)** make this convergence saying that clothing is primarily a means of communicating, not personal identity, but social identity to others.

The study by **Grant and Stephen (2005)**, examine the impact of brands on the behaviors of younger teenage girls and their purchasing decision for fashion clothing. This group is highly Fashion-sensitive. The main purpose of study is to determine the role of branding and purchasing influences from the perspective of these young people in order to gain a richer and deeper understanding of their behavior. The findings revealed that the respondents were prepared to pay a premium for a branded product. This research also provided the basic difference of buying behavior of parents and children.

Kawabata and Rabolt (1999), compared the clothing purchase behavior of US and Japanese female university students. Evaluative criteria when buying clothing, an interest in clothing and fashion and source of fashion information were studied. Relationships between variables were investigated and the difference and similarity between the two countries were discussed. US students tended to give higher scores for fit quality, fashion and branded than Japanese students. We found the difference in the meaning of fashion between the two countries by cluster analysis. Japanese students were more interested in fashion when they spent more money on clothing. US students were more active in collecting information about fashion. In both countries, students who were selected for information tended to have more interest in fashion clothing.

Research Methodology:-

Statement of the Problem:-

To know the fashion clothing involvement among consumers in Sargodha city. To determine the fashion involvement of different genders (Students, Job holders, Businessman and housewives) from Sargodha. To identify the significant factors which are important to understand the involvement of customers in fashion clothing.

Objectives of study:-

The objectives of the present study are,

1. To identify the factors of fashion clothing involvement.
2. To identify the no. of people who prefer fashion clothing and also identify their demography.

Sampling Technique:-

The sample for determine the involvement of consumer in fashion clothing was collected with the help of given questionnaire from 150 consumers in Sargodha city. Samples were drawn from universities, job organizations and business establishments in Sargodha city.

Method of Data Collection:-

The primary data was collected by explaining the structured questionnaire to the respondent. Secondary data was collected by internet, news-paper, books and articles.

Analysis:-

Factor analysis and reliability tests:-

This study consists of five dimensions: confidence, quality interest, materialism, purchase knowledge, social consciousness in fashion involvement. To test and verify all these dimensions and reliability of these constructs including principal components factor analysis, items to total correlation analysis, and Cronbach's alpha analysis were conducted.

Questionnaire items with higher factor loadings were selected.

KMO and Bartlett's Test.

Kaiser-Meyer-Olkin Measure of Sampling			.650
Adequacy.			
Bartlett's Test of		Approx. Chi-Square	409.004
Sphericity		df	105
		Sig.	.000

The Bartlett test for Sphericity was significant at 105 degree of freedom ($\chi^2 = 409.004$, $p < 0.01$), which also showed the presence of significant correlations among variables. Another index of appropriateness of factor analysis is the Kaiser-Meyer-Olkin (KMO) measure of sample adequacy, which measures whether the distribution of values is adequate for conducting factor analysis. In this case, KMO was as high as 0.650.

This table gives the name of all the factors of fashion clothing involvement. This table also gives the values of loading for all variables and the last column shows the Cronbach's alpha values of each of the factors.

The values of Cronbach's alpha represent the reliability of the factors. If their values are more than 0.5, than the factors are assumed to be more reliable.

The major factors of fashion clothing involvement are

Social consciousness (Cronbach's alpha =0.68) Social consciousness is the most dominant factor. Fashion clothing is medium to fit into the social environment and central to consumer's identity as person. Consumer selects such type of clothes which are good to move in society and the other would like to carry that too. Furthermore, only those clothes will be acceptable for them which are accepted by their environment.

Purchase knowledge (Cronbach's $\alpha=0.333$) Purchase knowledge is the second dominant factor. This shows, consumers feel that they should have sufficient level of purchase knowledge about the product and new brands. For that, they think ads are very helpful to have purchase knowledge.

Confidence (Cronbach's $\alpha = 0.613$) Confidence is the third dominant factor. "Consuming the latest fashion clothes increases my self-confidence and more fashion clothing is important for their self-fulfillment. According to consumer, carrying new brands and trends gives them confidence to move in society

Materialism (Cronbach's $\alpha=0.453$) Materialism is the fourth dominant factor. Materialism indicates the purchasing as status, color or happiness. It shows that the consumer often used some brands or product to show off, therefore, the people that have Materialism values are more prone to be highly involved in fashion clothing.

Quality importance (Cronbach's $\alpha=0.450$) The fifth factor is called quality interest." People notice when you purchase the materials most expensive brand of product". Young consumers that are highly involved with fashion clothing, behavior reveals more interest in fashion clothing and also the product quality.

Finding:-

From the heading no.4, Analysis shows the analysis of demographic variable showed the homogeneity and heterogeneity between the consumers of different age group given in questionnaire. It shows that nothing is like in the choices of different generations in social consciousness, purchase knowledge, confidence, materialism and quality importance. The young generations carry new brands and expensive products to gain social approval.

In next table, KMO and Bartlett have showed the significant of correlation among variables and also showed that the values are adequate for conducting factor analysis. The Bartlett's Test of Sphericity was significant at 105 degree, of freedom (Chi-square= 409.09).

"Rotated component matrix" table gives the five factors which are highly involved in fashion clothing. All the factors contain different no. of variables.

Last table is "Naming of factors", in this table all the factors got names according to their properties. Social consciousness is the most dominant factor in this analysis which shows that the consumers adopt new fashion trend to survive in society. The respondent given in conducted in the questionnaire carry fashion and brands to make their personality in social environment. After social consciousness, purchase knowledge, confidence, materialism and quality importance are the factors which are highly involved in fashion clothing. In second column loadings are given against each variable. The Cronbach's α values represent the reliability of the factors. Since the Cronbach's α values for two factors are more than 0.5, so these factors are more reliable than others. Social consciousness is the most dominant factor than others factors.

Conclusion:-

After all the research work it can be concluded that this study can be used full for the consumers as well as the marketers who are trying to promote their product to the people because it gives them knowledge about the liking and thinking of consumers. This research based on consumer in Sargodha city. The researchers conclude that the selected demographic characteristic, the analysis showed that young people and females consumers involved more than the adults and men's. It could be credited to the fact that the most of the respondent were teen agers, young and females. Although the literature indicated that confidence might have some relationship to fashion involvement, they were significant in this study. The majority of the correspondences were female and student this could have contributed to confidence. By using this research, the marketer can gain benefit by developing pricing and could branding. Because this study have conclude that ads and branding effect on the involvement of consumers in fashion clothing. Retailers can also get benefit from the study by knowing what to consider when pricing products and promoting to consumers.

Abstract

The study attempts to discover out the determinant of customer satisfaction towards Sunday bazaar in 49 Tail, PAF Road. In this study 145 responses was surveyed by useful methods. For the literature review and expert opinion it has been found that customer satisfaction are based on products, price, services, atmosphere and personal interaction. Regression Analysis was used to identify the impact of factors on customer satisfaction. The research finding out that these factors were positively impacted on customer satisfaction towards studied Sunday bazaar.

Copy Right, IJAR, 2017., All rights reserved.

Introduction:-

In today highly competitive marketing environment the positioning decision of Sunday bazaar from store point getting goods from store point of view play important or in marketing management. Now a days shopping behavior of users has experienced a strange hanged and is putting many obstacles for market today. Sunday bazaar need to have not only the market designs to give them a better chance over the competitors but also need to develop these in a manner that uniqueness can be mainland international.

Traditionally price and differentiation of the products were consider as one of the most important factor to maintain the customers and satisfy them because Sunday bazaar owner provide their customers new varieties every Sunday. It is very important for the firms growing and development process to have customer satisfaction. Customer have become an important part of any firm especially those in the grocery retails sector and many researcher have force on the importance of the customer. Zairi (2000) cited in Singh (2006) said, "customers are the purpose of what we do and rather than depending on us, we very much depend on them. The customer is not source of a problem; we should not perhaps make that customer, should go away" because our future and our security will be put in jeopardy". That is the main reason why firms today are forcing on the customers satisfaction and loyalty.

According to Hnasemark & Albinsson (2004) cited in Singh (2006), "satisfaction is an overall attitude towards a product provider or an emotional reaction to the difference between what customers expect and what they actually receive regarding the fulfillment of a need".

We undertook survey of Sunday bazar in Sargodha and conclude that most of people shop here because it satisfied them. As the quality of product is better, not only better quality but also at reasonable price. It satisfied the customers as the get different varieties under same roof like. It saves there lot of time and also give the advantage of

Corresponding Author:- Iram Sana.

low price. Especially ladies prefer to shop here because they get advantage of getting different things like grocery, clothing, readymade food and many others.

These benefits are passed on to consumers in the form of savings. The number of the customers increase, it is more profitable for the owner of bazar as it achieves benefit of cost. As the buyers increase it also increases the quality of the different items. It promotes the international market. Progress of Sunday bazar is although slow but even then customers prefer to buy the goods of daily use because it provides advantage of low price and personalized service. That is the main reason why customers prefer to shop here.

Literature Review:-

Evans and Lindsay (1996) stated that companies with satisfied customers have a good opportunity to convert them into loyal customers who buy from these companies over an extended period of time. Today "in the highly competitive and dynamic business environment requires financial institutions to have satisfied customers and keep them in order to survive and compete with other players in the market successfully.

According to **Sivadas and Baker-Prewitt (2000)**, satisfaction also influences the likelihood to recommend a bank and redemption. It promotes loyalty to the extent that it is a prerequisite to maintain an attitude favorable report and recommend a bank takeover. Once customers recommend a financial institution, it promotes both redemption and loyalty to this financial institution. Thus, the key to generating loyalty is to get customers to recommend to other service provider. In addition, customers are likely to recommend a service provider when they are satisfied with the services and when they have a relatively favorable attitude to this service provider.

According to **Hansemark and Albinsson (2004)**, satisfaction is an overall attitude of clients to a service provider, or an emotional response to the difference between what customers expect and what they get, regarding the achievement of a need, purpose or desire.

Nguyen et. al, (2007). Studied on exploring the impact of hedonic shopping motivations and attributes on a supermarket loyalty shopper. In addition, the study focuses on loyalty attitudes. Loyalty behavior should be considered in future research. Found that as supermarkets attributes and hedonic shopping motivations had positive effects on shopper loyalty. And also found that the impact of hedonic motivations on shopper loyalty was different between younger and older, as well as low-income groups and higher customer. However, no difference was observed between male and female buyers.

Jayant Anand (2009). In this study evaluated the reason behind number of supermarkets in developing countries increasing and found that large and small retailers can survive profitably by separating their markets on the basis of income groups and their product grouping.

Skallerud and Gronhaug (2010) investigated the positioning strategies supermarket Chinese food and found some important factors related to the nature of the relationship between food supply and demand for food could be influenced by the positioning strategies of supermarkets.

According to **Mohsan et. al, (2011)** studied the best-performing financial institutions always seek the needs and requirements of their customers in order to survive and compete successfully in a dynamic business environment of today. That is why researchers' organization worldwide have consistently stressed the importance of customer satisfaction, loyalty and retention. The results of the study revealed that customer satisfaction is positively correlated with customer loyalty and negatively correlated with customer intentions to pass. Some recommendations for future research are also made.

Nguyễn Thị Thu Thương (2016). Studied on attempts to find out the determinants of customer satisfaction towards supermarkets in Thai Nguyen city. In this study 200 responses of the 4 selected supermarkets in Thai Nguyen city were surveyed by convenient method. The research findings showed that product, price, personal interaction, convenience, services and physical appearance were positively impacted on customer satisfaction towards studied supermarkets. Among them price had a strongest influence on customer satisfaction.

Research Methodology

The research process consist of five main steps. The first step consist of information to relate customer satisfaction with specific reference to Sunday bazaar. The second step focuses on questionnaire based on information. The third step consist of collecting data. The forth step contains data interpretation and analysis using appropriate statistical tools. The fifth step contains an outcome of the analysis.

Likert-type scale ranging from strongly agree (1) to strongly disagree (5) was related point to each of the identified selection attributes.

Exploratory factor analysis (EFA) offers an effective way of assessing construct measures. Accordingly, item-total correlations and Cronbach's alpha were first used to assess reliability, followed by principal components analysis along with varimax rotation to explore dimensionality for each scale. In this process, the items don't meet evaluating criteria are eliminated. Criteria of refinement of item included factor loading > 0.50 , item-total correlation > 0.3 , Cronbach alpha > 0.60 , % of variance $> 50\%$ (Hair et al., 1998). Using SPSS 21 software we were able to assess and refine measurement scale. Regression Analysis was chosen to identify the impact of the independent variables on dependent variable (Customer Satisfaction). Primary data was collected primarily through survey method using a structured questionnaire which was designed to capture the factors impacting customer satisfaction in Sunday bazar.

Sampling:-

Samples were selected by convenience method. The interviews were conducted in person at the Sunday bazar, household, offices, schools etc. Samples were selected as students, teachers, office staff, housewives etc. Based on the number of parameters to be estimated, the sample size targeted in this study was 145.

Hypothesis:-

In order to explore factors influenced significantly customer satisfaction and define the influenced level of these factors, sets of hypotheses were developed.

H1: There is a positive impact of product on customer satisfaction.

H2: There is a positive impact of price on customer satisfaction.

H3: There is a positive impact of personal interaction on customer satisfaction.

H4: There is a positive impact of convenience on customer satisfaction.

H5: There is a positive impact of services on customer satisfaction.

H6: There is a positive impact of physical appearance on customer satisfaction.

Analysis And Discussion Of Findings:-

Cronbach Alpha for Scale of Factors:-

Following the procedure and criteria described above, the Cronbach alpha results show that PR1 (Price of goods is appropriate to their quality) should be deleted due to items-total correlation of .365 under the cut-off value Cronbach alpha (0.4). The result Cronbach alpha is showed in the Table 1.

EFA for all Scale of Factor Together:-

The result of Bartlett's Test of Sphericity and KMO measure indicated that the degree of inter correlation among the items were suitable for EFA procedure ($KMO=0.678 > 0.5$, $Sig = .000$). After establishing the multidimensional scale and reliability of each scale, all 19 items were jointly subjected to a common factor analysis the result of this procedure shows that 6 factors consist 19 items together explained 64.667% of the total variance. In this testing, rotation method: Varimax with Principal Component Analysis was applied providing better reliability.

Table 1:- Cronbach Alpha Reliability Test Result.

Construct/items	Item	Description	Corrected item- Total correlation
Product-PROD (Alpha=.559)	PROD1	Products in Sunday bazaar is durable.	.558
	PROD2	I find product with high quality in the Sunday bazaar.	.490
	PROD3	Variety of product is good.	.651
	PROD4	The brands sold by the Sunday bazaar are good ones.	.634
Price-PR (Alpha=.299)	PR1	Price of goods is appropriate to their quality.	.365
	PR2	The Sunday bazaar provides special discount for potential byers on different occasions.	.448
	PR3	Prices in the Sunday bazaar are competitive.	.783
Personal interaction-PI (Alpha=.473)	PI1	The salesmen have enough knowledge to answer my question.	.761
	PI2	The salesmen assistance during purchase is good.	.720
	PI3	Billing is always correct.	.687
	PI4	Shopkeepers are friendly and polite.	.722
Convenience-CO (Alpha=.388)	CO1	Sunday bazaar location is convenient.	.737
	CO2	Sunday bazaar has good return policies.	.714
	CO3	Convenient and safe parking facility is available.	.658
Services-SER (Alpha=.655)	SER1	Security of Sunday bazaar is very good.	.688
	SER2	Delivery of goods is available.	.701
	SER3	Sunday bazaar's after sales services are good.	.629
Physical Appearance-PA (Alpha=.275)	PA1	Cleanliness of the Sunday bazaar is good.	.479
	PA2	A layout that allows me to easily find the products I need.	.431

Table 2:- Rotated Component Matrix^a

	Component

Rotation converged in 10 iteration

Testing Model and Hypotheses:-

Based on the revised model, the following function was established to present the relationship between independent variables and customer satisfaction (CS).

$$CS = b_0 + b_1*PROD + b_2*PR + b_3*PI + b_4*CO + b_5*SER$$

Regression Result:-

As shown in table 3 and 4 the result indicated that R square = .360, F value was 12.962, sig. = 0.000. These demonstrated that the liner multiple regressions between factors and customer satisfaction are appropriate with data and able to be used. The Sig. of factors was shown that four factors among five factors have statistical significant impact on customer satisfaction (table 5). VIF<2, it means that there is no multicollinearity in the research model.

They are product, personal interaction, service and physical appearance with standardized coefficient range from 0.227 to 0.236. Through the value of R square, the explanatory levels of the model is 36.0%. Its mean 36.0% can be explained by the four independent varieties.

Table 3:- Model Summary^b

Model	R	R square	Adjusted R square	Std. Error of Estimate	Change Statistics					Durbin-Watson
					R square Change	F Change	Df1	Df2	Sig. F Change	
1	.600 ^a	.360	.333	.372	.360	12.962	6	138	.000	1.468

a. Predictors: (constants),PHY,PRI,PROD,PER,SER,CON

b. Dependent variable: SAT

Table 4:- ANOVA^a

Model	Sum of Squares	df	Mean Square	F	Sig.
1 Regression	10.753	6	1.792	12.962	.000 ^b
Residual	19.081	138	.138		
Total	29.834	144			

a. Dependent variable: SAT

b. Predictors: (constants),PHY,PRI,PROD,PER,SER,CON

From the equations above it can be seen that one unit change in service increased by 0.236 times the level of customer satisfaction similarly one unit change in product increased by 0.227 times the level of personal loyalty.

Hypothesis 1:-

There is a positive impact of product on customer satisfaction.

The standardized regression coefficient of product on customer loyalty is 0.227 (sig. = 0.004 < 0.05). This means that product is directly proportional to on customer satisfaction with 95% level of confidence.

Therefore, the hypothesis 1 is supported.

Hypothesis 2:-

There is a positive impact of price on customer satisfaction.

The standardized regression coefficient of price on customer loyalty is 0.084 (sig. = 0.251 > 0.05). This means at the level of confidence of 95%, price do not contribute to explanation of level of customer satisfaction.

Therefore, the hypothesis 2 is rejected.

Hypothesis 3:-

There is a positive impact of personal interaction on customer satisfaction. The standardized regression coefficient of personal interaction on customer satisfaction is 0.126 (sig. = 0.089 < 0.05). This means that personal interaction is inversely proportional to customer loyalty with 95% level of confidence.

Therefore, the hypothesis 3 is rejected.

Hypothesis 4:-

There is a positive impact of convenience on customer satisfaction.

The standardized regression coefficient of convenience on customer loyalty is 0.088 (sig. = 0.290 > 0.05). This means that convenience is inversely proportional to customer satisfaction with 95% level of confidence.

Therefore, the hypothesis 4 is rejected.

Hypothesis 5:-

There is a positive impact of services on customer satisfaction.

The standardized regression coefficient of services on customer loyalty is 0.236 (sig. = 0.003 > 0.05). This means that services is directly proportional to customer satisfaction.

Therefore, the hypothesis 5 is supported.

Table 5:- Coefficients^a

Model	Unstandardized coefficients		Standardized coefficients	t.	Sig.	Collinearity Statistics	
	B	Std. coefficients	Beta			Tolerance	VIF
1 (Constant)	-.147	.182		-.805	.422		
PROD	.150	.050	.227	2.967	.004	.790	1.266
PRI	.058	.051	.084	1.154	.251	.865	1.156
PER	.081	.047	.126	1.714	.089	.857	1.166
CON	.048	.046	.088	1.061	.290	.675	1.482
SER	.108	.036	.236	2.991	.003	.742	1.348

a. Dependent variable: SAT

Conclusion:-

In Sargodha Sunday bazar is doing well and we think this types of bazars should be organized in different cities. We surveyed from different people around these areas and conclude that most of housewives, office holders and students overall they are very satisfied with the quality of product and price.

As the number of customer increase, they get more profit. The result, it is great advantage for the owners. They will provide new product and of better quality at reasonable price. This will promote international economy.

These types of bazar should be set in more cities so that every citizen can buy the different item of daily use. The manager should also focus on the negative impacts and try to improve them. Price has the highest impact on Sunday bazar, followed by product. an important conclusion from study, customers are satisfied with almost all factors.

The manager and retailers focus on the said attributes to propose appropriate promotion and positioning of Sunday bazar.

Arab Spring, Arab-Israeli Conflict,
Security, Political Upheaval.

Abstract

The Arab Spring as waves of protests brought down several dictator regimes that some of them were a pro-Israeli government. Israel, even if they wanted to, they could not stay away from Arab neighbors, especially with the continuation of the historical conflict with the Arab world, because of the Palestinian issue and the consequent tensions and animosities. Pledge Israel and its leaders are aware that what was happening in the Arab neighbors have impact in various fields and levels, which is a historical issue has been to prepare for it by setting up scientific institutions aim to monitor development in the Arab world, analyze and understand the meanings of these reflections on Israel and the Arab-Israeli conflict. The fear of Israel was real, when the people were attacking of Israel's embassy in Egypt, and the long peace treaty between Egypt and Israel has threatened. In opposite, signing an understanding deal between Fateh and Hamas, and re-opening of the Rafah crossing at the border between Egypt and the Gaza Strip that Israel has seen it as a threat to its national security. In addition, escalating Syrian civil war and growing terrorist groups in Syria has made the situation more complicated for Israel. The paper tries to evaluate the importance of the political uprising in the region on Israeli situation. Likewise, illustrate the impact of the Arab spring on the Arab-Israel conflict, and then how their relation has an impact on the security stability in the Middle East.

Introduction:-

Mass demonstration and popular revolts have been an outbreak with began in Tunisia at the end of 2010, and in other countries in the earlier 2011. Thus, a great wave of the uprising has started in the Islamic world generally and Arabic countries, particularly. This wave of protest has to lead into bring a political upheaval and eliminating some authoritarian Arab regimes which four presidents ultimately lost their power in the region. Additionally, such upheaval has opened a door to Islamist parties to come to power and have been a major player in those countries.

However, Arab spring marks the end of the stability of secular authoritarian regimes in the Arab world. Those countries that have experienced revolution, have stepped toward democratic and elective government, warm and active participation by the public in political activities, peaceful rivalry among political parties and prevent electoral fraud such as double voting and so on.

Corresponding Author:- Farhad Hassan Abdullah.

Address:- University Lecturer - The University of Sulaimani – Department: Politics and International Relations.

Furthermore, the elections in those countries have been proven that the Arab spring is also an Islamist spring, not only because of their results which they have gotten from the post-dictatorship election but also due to that role they have played in overthrowing secular dictatorship regimes. The initiated waves of change have affected every aspect of life in the region, including the Israel-Palestinian conflict; the primary reaction of Palestinians to the Arab spring was reconciliation between two major parties in Palestine both Hamas and Fatah.

The political changes in the Arab peninsula have definitely had a fundamental effect on Palestinian's and the Arab public way of thinking toward Israel. In the new Arabic world, public opinion is much more vital than the president or individual decision, and in the case of Arab-Israel conflict, it apparently seems public opinion will decide how the strife will be ended. And this is made a serious anxiety for Israel decision-makers about the future of their security and relations with the Arab world. Thereby, building security barriers on the borders by Israel with its neighbors such as Egypt and Jordan, enlarging the security budget and abstaining from any gesture toward Gaza Strip and West Bank have only been some of the steps taken by Israel in response to the Arab Spring as well.

This paper will discuss some questions such as, to what extent rising Islamic parties are creating an opportunity to minimized danger the conventional war between Arab-Israel? Or it might become escalating Arab-Israel conflict? Does Arab spring would inspire greater support for Palestinian conflict with Israel? I also discuss how the political upheaval in the Arab countries affects the Arab – Israeli conflict, and to what extend Israeli have concerned about the Arab spring? Here, there are some objectives, which are motivated to write this work, and those are clarifying what Arab spring is? How is it started? Similarly, an illustration of the impact of the Arab spring on the Arab-Israel conflict, and how their relation has an influence on the security stability in the Middle East will be discussed?

The Arab spring in the Middle East and North African countries has erupted in the result of existing of several internal factors, which became collapse some leadership who's had a strong relation with West and Israel, and they could keep the peace for a long time. Notwithstanding, shifting in some of those regimes have pushed the United States and Israel to rethink about their relations in such a way, which keep peace with Arab countries. In order to figure out the recent political upheaval in Arab peninsula and Arab-Israel conflict, we shall point out the background of this conflict and its roots, particularly the post-Cold war area.

Additionally, this work will be structured like this, first; point out the Arab spring as recent incidents and its factors. The next, impact of Arab spring on the current relations of Arab-Israel strife, through study Arab public version toward Israel and readiness of Israel to live peacefully with some new Arab regimes around its border. Subsequently, the discussion will be about implicating of Arab-Israel issues on the security conditions in the region.

Political Upheaval and Its Causes in the Arab Worlds:-

Up to late 2010, the Arab world boasted a long list of some leaders, such as Qaddafi, who took charge of Libya in 1969; Saleh became president of Yemen in 1978; Mubarak took power of Egypt in 1981; Ben Ali rose to Tunisia's presidency in 1987, and the Assad family has ruled Syria since 1970. (Gause III 2011) These leaders had controlled all aspects of life in their own countries and have banned all political activities rather torturing people under different reason in order to maintain on power. (Gause III 2011)

Arab spring, however, has become a turning point in the history of the Arab countries, which was a revolutionary wave of protests and wars occurring that began on 18 December 2010, and characterized by civil uprisings in most of those countries and transferred to civil war later in some of them. Therefore, whether we like it or not the Arab peoples' aspirations for dignity and voice are satisfied, and how smoothly transitions to democracy proceed, are not just great moral questions they will also determine the region's stability and its economic forecasts for decades to come. (Dadush and Dunne 2011)

Since Bouazizi set himself on fire in Tunisian in December 2010, the flames that ended his life have spread across the entire Middle East. The protests and upheavals originally stimulated by his action have developed a variety of terms such as Arab spring, awakening or uprising, and they have defeated, threatened, or at least alarmed almost every ruling regime in the region. (Brym, Godbout et al.) The terms used to describe this event clearly indicate a sharp break from the decades of political stagnation and oppression there. (Brym, Godbout et al.) Political upheavals have also received by the US and EU when they express their support to the revolution in Tunisia and Egypt, Obama and European leaders have backed the protestors to overthrow of authoritarian leaders in favor of transitions to

democracy (Dadush and Dunne 2011) The political upheaval in the region has not come from the vacuum but has derived from some reasons, for example, economic reason. The economic problem has played a key role in rising unrest situation such as the financial weakness, poverty, high level of joblessness, low wages and rising food costs; a great proportion of redundancy was mainly dominant among the rising numbers of young people in those countries have experienced Arab spring. (Goldstone 2011) Tunisia had very difficult economic and financial issues to deal with; GDP growth was at about 1.5% during the protest, and there was a blueprint for rising to nearer to 4% in 2012. (Taylor 2011) In addition, although neoliberal economic policies affected all states in the Arab world, Tunisia and Egypt hold a special place in the hearts of those advocating economic reform. Egypt was the site of the first test of neoliberalism in the region, and the president of the World Bank once hailed Tunisia as the "best student ... in the region" when it came to economic restructuring. Both states, application of neoliberal policies exacerbated the divide between rich and poor, creating tensions that played out during the uprising. (Gelvin, J. L. 2015) These hard conditions have affected the Arab-Israel conflict as Israeli president referred poverty and oppression in the region have motivated resentment against Israel, he said, it better our neighbors will have it; we shall have better neighbors.(Press 2011)

Demography factor; according to the United Nations development program in 2009, the region's population more than doubled between 1975 and 2005 to 314 million, and in 2010, over 50% of the population was under 25, with large numbers living in poverty. However, economic growth is not keeping pace with population growth and so does not provide sufficient jobs for those entering the labor market. Thus, regional youth unemployment stands at 23%, nearly double the world average of 13%. As an example, unofficial estimates say that young people make up 83% of Egypt's unemployed. (Spring 2012) Furthermore, since 1990, the population aged between 15 and 29 has increased by 50% in Tunisia and Libya, 65% in Egypt and 125% in Yemen, making a substantial lack of employment opportunities and leading to mass dissatisfaction and disappointment toward their own government. (Goldstone 2011)

Moreover, corruption is another reason; both Egypt and Tunisia were enabled through the exclusion of the majority of the population from the economy. Family members of the ruling elite boasted their wealth in the streets of Tunis and Cairo as standards of living for the majority of the population stagnated. (Dodge 2011) Thus, there was an enormous proportion of corruption and lack of transparency, for instance, in Egypt Mubarak's family seemingly built up a wealth of between \$40 to \$70 billion, and 39 officials and businessmen close to them are alleged to have made fortunes averaging more than \$1 billion each.(Goldstone 2011)

Moreover, Arab spring has not expanded to all Arab countries, actuality; just six out of twenty-two Arab League member states have experienced genuine upheaval in the region, which are Egypt, Tunisia, Libya, Bahrain, Yemen and Syria that have experienced various levels of serious unrest. (Say, East et al.) The political turmoil in some of those countries have has a direct impact on Israel, especially Egypt and Syria.

Israel Faces the New Reality:-

Israel's relationship with the Arab world has taken a variety of forms ranging from the stated position between the executive and the policies that are trying to take advantage of the changes on the ground in the region to serve their interests. Altogether, it is possible to point out that the Israeli position of the Arab spring movement between the three stages: the stage of shock, at which point stunned by the Arab spring, Israel and there was an Israeli fear of serious changes in Egypt specifically. And the phase out of the shock, a stage that followed the outbreak of the Syrian revolution, and specifically where Israel graduated from the shock and to re-examine its strategic location in the region began and trying to understand what is going on around them. And phase adjustment, the current phase, which is trying to Israel, which benefits as much as possible from the preoccupation with the Arab world, the Interior for privacy and faltering Arab spring in order to achieve political and strategic interests were useful in the long run with this transition passage in the Arab world, and these interests the issue of Syria's Weapons Mass Destruction, weakening Hamas and Hezbollah, situation of Sinai peninsula, Iran and a political settlement with the Palestinians. The following discussion will shed light on these issues.

The root of Arab-Israel conflict has returned to a time before waging World War one and weakness Osman Empire, since that time British has thought to establish Jewish state in the Arab peninsula, moreover, this process has started practically after 1918, and by 1929, enough population had gathered for that state. (Fraser 1995) Israeli state declared formally on 14 May 1948, and then the ending British mandate over era declared, conflict had started since that time, and the First Arab-Israeli War occurred in 1948. (Fraser 1995)

Successively, the second war happened when conflict increased as Egypt closed the Straits of Tiran for Israeli shipping, and then Syria, Jordan, and Iraq had based an enormous number of troops along the Israeli boundary. After diplomatic efforts to solve the crisis failed, Israel attacked in June 1967 and occupied the Gaza Strip; the Sinai Desert from Egypt, the Golan Heights from Syria and the West Bank and East Jerusalem from Jordan, afterward; in 1973, and another war was an outbreak. (Conflict 2008)

The conflict was on going during the cold war, and after a collapse communist bloc, Israel has persisted on hostility against Palestinian. Apparently, since Hamas took control of Gaza in 2007, Israel has tried to surround and damage the Islamist movements with a mix of diplomatic isolation, economic pressure, and occasional military strikes, to terrorize Hamas, specifically, Israel also retains the threat of a more massive military response, such as the 2008-2009 "Cast Lead" operation, which generated more than 1,000 Palestinian deaths. (Byman 2011) Now we are moving on current relation between both side and impact of Arab spring on this relationship.

The positions of Israel on the Arab revolutions have divided into two separate tracks. The first is led by Israeli President Shimon Peres, who adopted a stand in favor of democratic change and called on decision makers in his country to understand what happened and understand it and maybe the initiative to take advantage of the atmosphere of openness to wave again its vision based on the call for the Middle Eastern economic and political market share of its population, according to the claim Peres, democratic values and openness that as long as Israel has claimed that it owned, unlike the Arab world. The second track, however, has the position adopted by Israeli Prime Minister Benjamin Netanyahu's exciting suspicion of what is happening in the Arab world, considering what is going on around its country in preparation for the control of Islamist forces believed that the most important projects are to pounce on Israel and destroyed. He, therefore, called for caution and urged the world to be alert to the danger coming after the Arab spring.

Binyamin Netanyahu has launched a scathing attack on the uprisings in the Middle East and North Africa, said that Arab countries moved not forward, but backward ... the Arab spring was becoming an "Islamic, anti-western, anti-liberal, anti-Israeli, undemocratic wave". (Harriet Sherwood 2011) Israel's preliminary reaction to the beginning of the Arab spring could be, frankly, depicted as one of the fears bordering on high anxiety, and some say such a response was not completely groundless. When popular protests were widespread all over the region, and probably with their inspiration, gatherings were held in the West Bank and Gaza Strip for putting an end to the split between Fatah and Hamas, which Fatah has controlled the West Bank, and the government led by Hamas, which controls Gaza since 2005. (Heller 2012) The political uprising in the region, particularly in Egypt, encourages Palestinians to avoid their leaders with the intention of end up the Israeli occupation and unification of the two parts of the country. The success of the revolution in Tunisia and Egypt in 2010 and 2011 respectively, led to breakdown the barrier among the public across the region. Even, the people in the West Bank and Gaza Strip did not resistant from this wave of people power flowing through the region, and demonstrated on the streets in solidarity people in their neighbors' countries. In Palestinian Authority the government tried to conquer the demonstrations dreading the effects of people power for their own governments. The most emphasis had given to the settlement and reconciliation between Hamas and Fateh. The Collapse of Mubarak in Egypt and public pressure on the street pushed the both party to enter in a negotiation talk.

Protesters were called to regulate relations between both parties and "national reconciliation" which was presented both as a national goal and a means of helping the end of Israeli rule in the West Bank.(Heller 2012) Because, after won parliamentary election in January 2006 by Hamas, with a good record of non-corruption in comparison to Fatah, with 74 seats. However, Israeli refused to accept a Hamas dominated government, as a result, became a split between both parties. (Winstone 2006) Nevertheless, initiating of reconciliation has made a real fear for Israel in the case of controlling West Bank by Hamas. These changes were making Israeli been concern about the political upheaval and following the developments in the Arab countries, because what was happening in the region directly related to their national security. The following graph shows the reaction of Israeli toward political upheaval in the region.

Graph (1): Mixed Reaction among Israelis toward the Arab Spring.

Mixed Reaction Among Israelis

PEW RESEARCH CENTER Q91, Q92, & Q93.			

Source: Pew Research Center

As it can be noticed from the above graph, Israelis are evenly divided about the legacy of the popular uprisings: 43% think the political demonstrations will expand democracy in the region, while the same percentage disagrees. However, Israeli Arabs are much more optimistic, with fully 70% believing the protests will lead to more democracy. Just 39% of Israeli Jews share this view. This means that they have seen the Arab spring as a new dynamic that promote more instability and conflict between Arabs and Jew.

In addition, in regard, Israel's neighbors the civil war that has waged in Syria, and Assad's rule have shaken and lost control in the country. Later, the Supreme Military Council that replaced Mubarak's government has promised to defend its foothold in the Gaza Strip from Israeli attack.(Heller 2012) In these situations, Hamas agreed to sign a "reconciliation agreement" with Fatah, which drafted by Egypt in 2009 and deferred by the Hamas leadership under pressure from Syria and Iran.(Heller 2012) This is led to make the uncertain situation for Israel.

Furthermore, Israel is concerned about Hamas, because for Israel, reaching a deal with the Palestinians would mean making territorial concessions. Many here note that after Israel withdrew from Gaza in 2005, Hamas won Palestinian parliamentary elections in 2006, and then held control over Gaza in 2007. The Muslim Brotherhood also gained power in Egypt for the first time and experienced a very short rule in the country, observers also say, it may be a matter of time before Hamas takes over the West Bank, thus coming Islamists to power and possess an inclination to uphold Hamas has made Israel felt a hazard and expected an unstable security. (KERSHNER 2011)

Thus, the Arab spring played a role in the signing of the reconciliation pact, and the document asserted a willingness to hold elections for the presidency and Legislative Council. (Heller 2012) Therefore, the probability of exploding clashes between Palestinian and Israeli security forces as a result of outdoor condition still foreseeable. Hamas activists would try to place themselves at the forefront of the first fights since Arab spring. Furthermore, Hamas has repeatedly proven its capability to incentive a war against Israel, which would make Israel respond militarily action against the civilian. (Heller 2012)

New conflict via demonstration, if it started, will not be a direct product of the Arab spring, because Palestinian people would be conversant with the popular uprisings against Israel, but renewed conflict would erode the chance of the diplomatic process to settle the conflict, this development would be added to the other consequences of the turmoil in the region.(Heller 2012) Israel, for its part, will be cautious and worry of any new territorial deployment

in the West Bank because of fears about elevated security threats as a result of what they called radicalization among the Palestinians and throughout the region.(Heller 2012)

Rising Islamist parties in Arab countries is another concern point for Israel, which it believes, they would limit the inclination of resumption of negotiations for promoting peace and stability, accordingly, all of these would reduce the capacity and the desire, of international players, chiefly the US and EU to put forward a new initiative for reopening of dialogue. Thus, elevating mass protest among the Palestinians, may lead into an all-out strife against the hostility of Israel.(Heller 2012) Thus, Israel alarmed both Palestinian parties should take seriously the peril of the lack of diplomatic dialogue for managing conflict.

This shows the probability that Israel will take hostility action against Hamas and jihadist organizations in Gaza as occurred in November 2012, when Israel tanks shelling the area in response of Hamas operation, which generated four civilian casualties in Israel.(Ramadan 2012) In November, 14, 2012, the seven-day-long Gaza operation of Israel which called " Pillar of Defense" started; however, the changing balance in the region, the involvement of US administration and Islamic countries, including Egypt in the matter and the ability of Hamas to do damage in Tel Aviv due to its new missile's ability have all prevented a great catastrophe and the casualties in the recent Israeli military operation have remained relatively limited by 145 deaths from Palestinian compared to the level of destruction and number of casualties in the Operation Cast Lead in 2008.(BİLİCİ 2012)

This operation has some motivated, such as to influence US foreign policy after the re-election of Obama in 2012, an assessment of the Arab reaction after Arab spring and challenging Egyptian government, however, Egypt condemned the attack and withdrew its ambassador from Tel Aviv, and sent its foreign minister to Gaza.(Sayed 2012) Moreover, Israel considers the new political reality in Egypt as one of the most significant challenges facing Israel, due to the possibility of helping Hamas in Gaza. (Heller 2012) When the head of the Higher Military Council was vividly alarmed that "the threat against the Palestinian government has enraged Arab nations, which may augur disastrous results".(Levy 2012) Under Sisi authority also, regardless of its objective, any military operation in Gaza would inevitably prompt a harsh response in Egyptian public opinion and a demand to react against Israel. In anticipation of such a response, Israel will likely deny the relative freedom of action it enjoyed during Operation Cast Lead, instead, Israel will probably go to carry out a rapid campaign.(Heller 2012) Israel also put up security fences on the border with Egypt and Jordan, increasing the security budget and abstaining from any gesture toward the Palestinians have been only some of the steps taken.(Ravid 2011).

Furthermore, the Egypt-Israeli relationship could consider also in providing security of Sinai Peninsula and the Israeli-Egyptian border, recently despite an increased troop presence there; the Egyptian government apparently seems unable to control the area, and jihadist organizations are increasingly free to operate there.(Heller 2012) Islamist militants frequently attacking Egyptian military in North Sinai province and wounding more in an attack on a security checkpoint and military bases, and the Islamic State in Iraq and Syria (ISIS) group's Egyptian branch in the Sinai Peninsula claimed responsibility for the most incidents in the area. (Al Jazeera 2017). Apparently, this is a severe concern for the Israeli national security. The Islamic State-linked terrorist groups in the Peninsula have threatened Israel and Jews among its belligerent messages, as mentioned "Oh Jews, wait for us. The punishment [we have prepared for you] is severe and soon you will pay a high price." (JPOST 2016) Therefore, security officials in Israel have kept a close eye on their border with Egypt, concerned about possible attacks from Sinai Province. As the Israel Defence Forces (IDF) mentioned that "the enemy is Daesh ... we believe that these terror cells will try to hit our forces in order to prove themselves." (Derek Stoffel 2016)

The Islamic state from Sinai Province has launched several rocket attacks against Israeli territory in 2016. IDF declared that terrorist cell attacked an army patrol along the security fence that marks the Israeli-Egyptian border; the force was able to respond and to hit back at those who tried to infiltrate the border into Israel. (Derek Stoffel 2016)

Consequently, the situation along the Egyptian border, which includes the southern border with Gaza, is even more sensitive. Post-Mubarak period there were serious incidents along the Sinai border, leading to a crisis in relations. Gunmen regularly crossed the Sinai border into Israel and killed several Israelis. Israeli security forces then gave chase and killed some of the gunmen and also, Israel blamed Egypt for failing to control the Sinai. (Taylor 2011) Therefore, Israel believed that shifting of power in Egypt and instability in Jordan could have profound consequences for Israel, which depends on the peace accords, they were only two Arab countries, which regarded as

a cornerstone of Israeli security, And so, Israeli government claimed instability in Egypt requires Israel to prepare the response to a more extreme scenario in which the Egyptian army moves into Sinai in breach of the peace treaty. (Heller 2012)

Moreover, in Jordan, there is discontent on the Jordanian street, thus, Israel has worried about its border with Jordan, which thinks that it is largely unsecured. Therefore, Israel has trying to prepare for reaction; because it has already a peace agreement with Jordan so breaking that treaty will make Israel take aggressive action. (Heller 2012) Similarly, "The Daily Beast" America magazine reported that the US sources have confirmed the keenness of "Israel" for military intervention in Jordan, the event that a military attack by the fighters of ISIS. (Eli Lake 2014)

In addition, The Golan Heights security, it is vague where the unrest in Syria will end, but the current situation is likely to end at some point in political change. Assad also has supported Hamas and Hezbollah which they rejected peace or at least has not embraced negotiations and is a close friend of Iran.(Byman 2011) Still, Israel's artillery has fired back at Syria after gunfire hit an Israeli military vehicle in the Golan Heights. The incident comes amid high tensions in the region as Israel is waging an offensive against Gaza while civil war continues in Syria. Moreover, International community is really a concern about Syrian military use of chemical weapons against civilian and which they are waiting for final orders from Assad, as the US has officials reported. And Netanyahu says Israel, and the international community is watchfully observing developments in Syria regarding its stores of chemical weapons. (Benari 2012)

Furthermore, after rising the Islamic States in Iraq and Syria (ISIS) in Syria, the security threats of this terrorist group have increased to Israel. The Islamic States has released a video which threatens the Israeli occupation forces, and it appeared fighters, speaking in Hebrew, directed a message to "the Jews." The broadcast terrorist organization video under the name "break boundaries and slaughter the Jews" began to talk about the Jews and how they arrived in Palestine, and how they had occupied, and initiated some of the verses and the hadith related to the presence of Jews in the land of the Arabian Peninsula, as well as in the Levant.

Therefore, Arab uprising targeted Bin Ali in Tunisia and Mubarak in Egypt were the central pillars of a regime holding a critically important Arab state to a political course that completed Israel's vital security interests.(Heller 2012) Mubarak was scarcely the Zionist supporter, for instance; he did not allow anti-Israel and American movements and even propaganda in Egypt; Egyptian media were not only prohibited to critics Israel's hostility but also to speculate about the state of the President's health.(Heller 2012) Thus, from US standpoint, what Roosevelt said about Anastasio Somoza, could have said with equal validity about Mubarak: "He may be a son of a bitch, but he's our son of a bitch," because his significance service to Israel and American, his overthrow in the American circle necessarily augured badly for the US and Israel's interests.(Heller 2012) Mubarak has been a fixture of Israel's geostrategic landscape for three decades. Israel elected eight prime ministers, conducted several wars and engaged in peace talks with multiple partners, and Mubarak was always there. He personified regional stability.(Benn 2011)

Under Mubarak's rule, Egypt also kept the Rafah crossing point between Egypt and Gaza closed, helping Israel restrict the flow of goods and people into and out of Gaza.(Byman 2011) Therefore, his policy was based consistently on interpreting Egypt's national interest necessity for maintenance of the Israeli-Egyptian Peace Treaty, fight off Islamist movements, active suppression of what he called extremists, and close coordination with the U.S.(Heller 2012) However, Israel treaties with Egypt in 1979 and Jordan in 1994 remain unpopular among public, particularly during the Arab spring and in post-Mubarak era, while Israel was relied on the strength of Mubarak's regime and the Jordanian monarchy to keep them intact, but collapsing Mubarak increased the possibility of rising protest in Jordan led to Israeli disappointed. (Zacharia 2011) In consequence, Netanyahu expressed his anxious and asked the international community to oblige "any Egyptian government preserves the peace accord with Israel".(Zacharia 2011) Due to; a political leader of Egypt's Muslim Brotherhood had called on any government that replaces Mubarak's regime to withdraw from the 32-year-old peace treaty with Israel.(Lake 2011)

Nevertheless, Dan Gillerman, a former Israeli ambassador to the UN in respond to some threat by Muslim Brotherhood said, "if they do it, it will be a very unfortunate development for Egypt and Israel, both countries have enjoyed a peace for thirty years, undoubtedly not a very warm peace, but a cold peace is better than a hot war". (Lake 2011) Moreover, the revolution in Egypt and unrest elsewhere in the Arab world has shaken Arab leader loyalty for Israel, nevertheless, sympathy for Hamas in Egypt is getting high, and Hamas' resistance to Israel is also popular, already the new Egyptian government declared it will open Rafah and no longer collaborate with the

economic isolation of Gaza.(Byman 2011) Likewise, Cairo (Under Muslim Brotherhood Rules) had declared opening Rafah for putting an end to Palestinian suffering and breaking long term siege. Egyptian Foreign Minister has also added that "Egyptian national security and Palestinian security are one".(Levy 2012) Subsequently; the Muslim Brotherhood also called on the government to prevent the continuing supply of gas to Israel out of "solidarity with the Palestinian people besieged in the West Bank and Gaza".(Levy 2012)

Afterwards, the experienced of Arab spring by Libya, Yemen and Syria seemed uncomfortable for Israel because of weakening and overthrowing those regimes were hospitable to Israeli interests, thus, Israeli concerns were further intensified when it began to appear as though the forces most likely to benefit from and exploit the fall of established regimes were not the secular.(Heller 2012) Netanyahu also warned, "if extreme elements are allowed to exploit democratic processes to attain power and promote anti-democratic goals, as happened in Iran and Egypt under Morsi and elsewhere, the result will be harm to peace, and harm to democracy".(Zacharia 2011)

For that reason, the real fears among Israel's are that a new Arab government has might be dominated by Islamists, would it break the peace treaty between them and Israel? Would it seek to go to war again?(Miller 2011) In response, the spokesman for the Brotherhood asserted that they "would respect the peace treaty with Israel as long as Israel shows real progress on improving a lot of the Palestinians." (Lake 2011) However, the Israeli government regards its main approach to the Arab Spring is that Israel must prepare itself to deal with and respond whatever the upshots might be. Additionally, the US has illustrated its compulsion of the Israeli security and asked Israel to work for peace with new actors in the region, when US administration said, "as for Israel, our friendship is rooted deeply in a shared history and shared values; our commitment to Israel's security is unshakeable...It's important that we tell the truth: The status quo is unsustainable and Israel too must act boldly to advance a lasting peace."(President Barack Obama speech, Washington, D.C., May 19, 2011) Therefore, supporting Israel's security and pursuing Arab-Israeli peace by the US, require the US efforts to reshape the structure of the region in order to fulfill its own interests there.(Terrill 2011)

Also, the former US peace negotiator A. D. Miller contends "the irony is that the challenges a new Egypt would pose to America, and Israel would not come from the worst-case scenarios imagined by frantic policymakers and intelligence analysts an extremist Muslim takeover, an abrogation of peace treaties, the closing of the Suez Canal, nevertheless, from the very values of participatory government and free speech that free societies so cherish."(Byman 2011) Because, there's no doubt, a new Egyptian government and president, more responsive to public opinion, indeed, legitimized by the public in free elections, will be, by necessity or inclination, far more critical of Israeli actions and policies and far less likely to give Israel the benefit of any doubts.(Miller 2011) Moreover, Netanyahu has highlighted his fears in public, particularly the threat of Egypt turning into a new Iran. Nonetheless, yet a more optimistic analysis suggests that the Israeli government could be leverage the Egyptian crisis to seek new opportunities, a window to restart the peace process with the Palestinians and try to support the spread of democracy in the region.(Benn 2011) Seemingly, the current government would not want to withdraw from the peace treaty with Israel; nobody in Egypt wants war with Israel and there is every sign right now that the military will still play a strong role in the next. (Miller2011) In sum, the Arab Spring has not only shaken some dictator regimes in the region, but also threatened Israeli security. The consequences of the political uprising have made the situation much complicated, particularly after rising jihadist terrorists and hijacking the demands of people.

Conclusion:-

The Arab Spring has changed the structure of the regime and pushed Arab world toward semi - democracy, human dignity, transparency and so on. Several factors have played the role in such political and social upheaval such as economic, demography. Furthermore, political upheaval has brought Islamist to power (even for a short period), that creates concern for Israel and pushed Telavi to test the first operation on Gaza after Arab spring, which made a real concern for the regional and international security. The Arab Spring also has strengthened the conflict between Israel and some other Arab countries, when the peace treaty between those countries and Israel threatened. However, the question is remains is that whether future war between Arab and Israel will be limited between Israel and Palestinian or will engage other Arab countries and (jihadist groups like ISIS), specifically those countries that have experienced the Arab Spring?

Reconnaissance Drought Index (RDI);
 Drought; Iraq.

Abstract

The drought characteristics were analyzed in Iraq dependent on the observed climate data from ten meteorological stations during 1980-2011. Reconnaissance Drought Index (RDI) was used to studying and analyzing of droughts. The variable of interest in RDI is precipitation over potential evapotranspiration (ET_o), the ET_o is calculated using Penman-Monteith method. The results showed that the 2008 year was the worst dry year had passed in all parts of Iraq. It was observed that the maximum severity of drought (S_{max}) was identified during the periods (2007-2009) for the most stations. The Mild drought (Extremely drought) conditions are the highest (lowest) number of drought event than other conditions for all stations. Most of study region experienced the strongest drought events through the last period from 1999 to 2009 as compared with the previous period.

Introduction:-

In the last decades, drought has become a frequent phenomenon in many parts of the world, which in turn affects heavily on agriculture and water sources [1]. Analysis and monitoring of drought can be done with drought indices such as the Palmer Drought Severity Index (PDSI) widely used in the United States [2], the decile index operational in Australia [3], Z-Index used by the National Metrological Center of China [4], the Standardized Precipitation Index (SPI) [5], Reconnaissance Drought Index (RDI) [6], and the Standardized Precipitation Evapotranspiration Index (SPEI) [7]. The climate of Iraq classified as dry and semi-dry, so the impact of evapotranspiration on the drought considers a significant impact. Therefore, the Reconnaissance Drought Index (RDI) was used among these indices in this study, which is based on both precipitation and potential evapotranspiration.

Several studies on drought assessment have been carried out in different parts of the world can be summarized as follows: [8] attempted an assessment and monitoring of regional drought using two well-known indices, namely, SPI and RDI, during the period 1971-2008 in Cyprus. They found that both indices had been given a similar form in analyze drought conditions and monitor drought events. [9] used the SPI to evaluate the spatial and temporal characteristics of meteorological drought for the period 1980 to 2010 in Iraq. They showed that the worst dry year was observed at 2008. 30%, 36%, 22% and 12% of the area were classified under extreme, severe, moderate and near normal drought, respectively. [10] investigated the similarities or differences in SPI and RDI indices using data from a variety of climatic zones in Iran. Although their results showed that both indices had the same behavior, RDI index depends on ET was more sensitive to climatic variability than SPI index. The Iraq region is also prone to

drought. Nevertheless, the drought condition and its characteristics in Iraq has received limited attention. [11] calculated the SPI for 12-month using rainfall data records observed from 1941 to 2002 in the north of Iraq. He found that the percentage of wet (drought) conditions were up to 44 % (56%) of the study period. He declared that moderate wet and drought conditions were more common than others. [12] used the SPI method for 9, 12-month time scales. The results showed that the Northern of Iraq exposed to the severe drought for SPI 9- month during the study period as compared with other parts of the region. Whilst, the Baghdad, and Diwaniya regions experienced the highest degree of drought according to SPI 12-month.

The main aim of this paper is to analyze the drought characteristics using Reconnaissance Drought Index (RDI 9-month) for ten stations in Iraq. A MATLAB software codes were written by M-File Programming to calculate the potential evapotranspiration and drought characteristics.

Materials and Methods:-

Study area and Meteorological data:-

Iraq region is located in southwest Asia at the crossroads of the Middle East. It covers an area of 435,052 km², which lies between the latitudes of 29° 5' and 37° 22' north and the longitudes of 38° 45' and 48° 45' east. Historical records of monthly precipitation, temperature, humidity, wind speed, and sunshine data from 1980 to 2011 were obtained from the Iraqi Meteorological Organization and Seismology (IMOS) for ten stations. The location of the Meteorological stations are presented as shown in Fig.1.

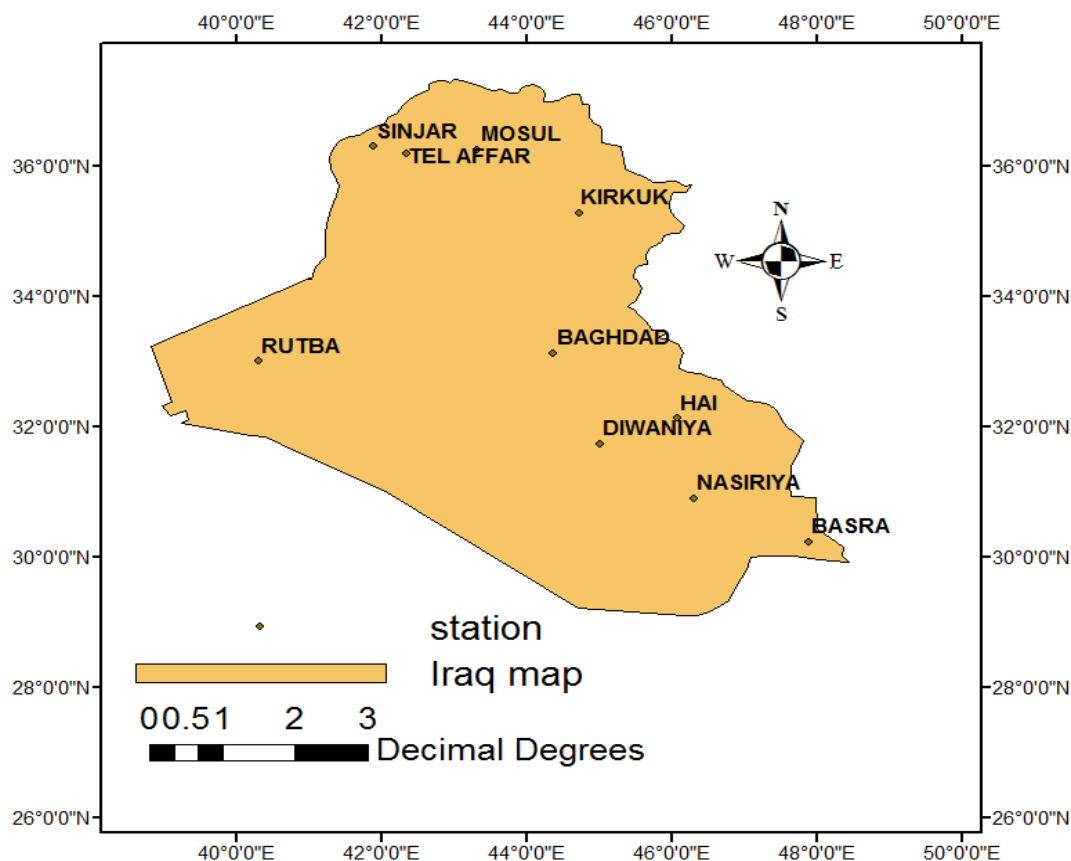

Fig.1:- locations of meteorological stations in Iraq

Methodology:-

Reconnaissance Drought Index (RDI):-

The Reconnaissance Drought Index is based on the ratios of precipitation over potential evapotranspiration values for different time scales [13]. The potential evapotranspiration is computed by the Penman- Monteith formula. Initially, α_k is presented as the coefficient of the i th year in an aggregated form using a monthly time step and can be calculated on a monthly, seasonal or annual basis as following.

$$\alpha_k^{(i)} = \frac{\sum_{j=1}^k P_{ij}}{\sum_{j=1}^k ET_{ij}}, \quad i = 1:N \quad \text{and} \quad j = 1:k \quad (1)$$

Where P_{ij} is precipitation, ET_{ij} is potential evapotranspiration in j^{th} month of i^{th} year.

The next step, the Normalized RDI (RDIn) is calculated, utilizing $\bar{\alpha}_0$ is the arithmetic mean of α_0 values calculated for the N years of data.

$$RDI_n^i = \frac{\alpha_0^i}{\bar{\alpha}_0} - 1 \quad (2)$$

After that, the Standardized RDI (RDIST) is calculated, using the following equation for each year.

$$RDI_{st}^i = \frac{y^i - \bar{y}}{\hat{\sigma}_y} \quad (3)$$

Where y_i is the $\ln(\alpha_0^{(i)})$, \bar{y} its arithmetic mean and $\hat{\sigma}_y$ is its standard deviation. In this study RDI is applied to represent RDIST. Drought category classification suggested for the RDI [13] as illustrated in Table-1.

Table 1:- Drought classification for RDI value and corresponding event probabilities.

RDI	Classification	Probability (%)
0 to -0.99	Mild drought (Mi.D)	34.1
-1 to -1.49	Moderately drought (Mo.D)	9.2
-1.5 to -1.99	Very drought (S.D)	4.4
-2<	Extremely drought (E.D)	2.3

Calculation of potential evapotranspiration:-

The Penman - Monteith formal is one of the most common used ones, defined as equation (4), recommended by the FAO in 1998 as reference ET, depended on observed meteorological data, such as the temperature, relative humidity, sunshine hours, and wind speed. Many studies found that the penman-monteith is more appropriate for arid and semi-arid regions [14];[15];[16]. In present study, total potential evapotranspiration (ET0) has been estimated for the study stations using Penman – Monteith equation [17] as follows

$$ET_0 = \frac{0.408\Delta(R_n - G) + \gamma \frac{900}{T + 273} U_2 (e_s - e_a)}{\Delta + \gamma(1 + 0.34U_2)} \quad (4)$$

Where ET0 is the potential evapotranspiration rate (mm d⁻¹), and the monthly value of ET0 will be used in this paper, G is the soil heat flux density (MJ m⁻² day⁻¹); T is the mean daily air temperature at 2 m height (°C); U_2 is the wind speed at 2 m height (m s⁻¹); e_d is the saturation vapor pressure (KPa); e_a is the actual vapor pressure (KPa); Δ is slope of vapor pressure curve (KPa 0C-1); γ is the psychrometric constant (KPa 0C-1); R_n is the net radiation at the crop surface (MJ m-2 day-1).

Results and Discussion:-

Drought characteristics for the RDI from 1980 to 2011 periods were presented in Table-1. It can observe from this table, the value of the maximum severity of drought (S_{max}) was identified during the periods (2007-2009) for the most stations. The highest value of S_{max} was found at Kirkuk station, and had the longest duration drought, began in Jan-2007 and ended in Oct-2009, lasted 34 months. The maximum value of the severity of peak drought (S_p) was observed in BAGHDAD station, occurred in Nov-1990 and relative frequency of drought during the whole periods is 43.4 %. While the relative frequency (RF) for all stations ranged between 39.6% - 52.1%.

As shown in Fig.2, the longer duration of drought for Mosul was observed between Sep-1998- Jul-2002 (47months), with the intensity of 1.3. The years in 1998, 1999, 2000, 2007, 2008, and 2009 were the worst drought years as compared with other years. Baghdad (Rutba) station exposed to worst dry through the years 1986, 1987, 1997, 1999, 2007, 2008, and 2009 (1983, 1984, 2001, 2004,2005,2006 and 2007), experienced the longer duration

of drought between Dec 1998- Jan2001 (Jan2004-Jun2005), with intensity 1(1.5). In Basra station, the longer duration of drought was determined between Jan2010- Dec2011. It exposed to worst dry years in 1994, 2003, 2008, 2010, and 2011.

Table 2:- Drought characteristics for the RDI 9-month time scale from 1980 to 2011 periods

Station	The severity of peak drought (Sp)	The relative frequencies (RF)%	The minimum severity of drought (Smin)	The maximum severity of drought (Smax)
MOSUL	-2.65 / (April 2008)	44.95	-0.01 / (May.1997)	-58.80 / (Sept. 1998 –July 2002)
SINJAR	-2.80 / (Nov. 2005)	45.21	-0.001 / (Aug. 1986)	-40.11 / (Nov. 2007 –Dec. 2009)
TEL AFFAR	-2.71 / (Oct. 2000)	39.63	-0.01 / (Apr. 1992)	-47.73 / (Sept.1998- April 2001)
KIRKUK	-3.09 / (Nov. 1999)	42.82	-0.02 / (Apr. 1992)	-52.55 / (Jan. 2007-Oct. 2009)
BAGHDAD	-3.81 / (Nov. 1999)	43.35	-0.16 / (Jan. 2003)	-35.80 / (Dec. 2007-Oct.2009)
RUTBA	-3.78 / (Sept. 2004)	44.15	-0.01 / (Sept. 1986)	-28.74 / (Jan. 2004-July 2005)
HAI	-3.63 / (Dec. 2003)	47.34	-0.001 / (Sept. 2010)	-45.31 (Jan. 2003-Dec.2004)
DIWANIYA	-3.01 / (Dec. 1998)	52.13	-0.001 (Oct. 2000)	-31.42 / (Jan. 2007-Nov.2009)
NASIRIYA	-3.07 / (Dec. 1990)	50.00	-0.06 / (Mar. 1991)	-29.04 / (Dec. 2007-Sept. 2010)
BASRA	-3.48 / (Dec. 1998)	42.55	-0.001 (Sept. 1995)	-31.86 (Jan.2008-Nov.2009)

Table-3 summarize the frequency of each wet / drought conditions for all stations. The results showed that the Mild wet / drought (Extremely wet /drought) conditions are the highest (lowest) number of wet / drought event than other conditions for all stations. In drought condition, the highest (lowest) number of drought events occurred in Diwaniya and Nasiriya (Basra, Kirkuk, and Baghdad) (the number of drought events between 188-196 (160-163) times). Sinjar (Tel Affar) recorded the highest numbers of moderately (severely) drought events, while the highest numbers of extremely drought events existed in the Mosul and Tel Affar.

Table-3 the numbers of wet / drought event results for the RDI 9-months.

Station	E.W	S.W	Mo.W	Mi.W	Mi.D	Mo.D	S.D	E.D
MOSUL	4	15	32	156	112	20	19	18
SINJAR	2	16	33	155	101	36	22	11
TEL AFFAR	7	6	28	186	85	16	29	19
KIRKUK	1	12	44	158	104	23	17	17
BAGHDAD	1	11	45	156	101	29	23	10
RUTBA	9	13	23	165	111	27	14	14
HAI	0	14	47	137	117	35	14	12
DIWANIYA	3	24	41	112	144	28	15	9
NASIRIYA	0	20	41	127	136	23	16	13
BASRA	5	14	31	166	102	26	16	16

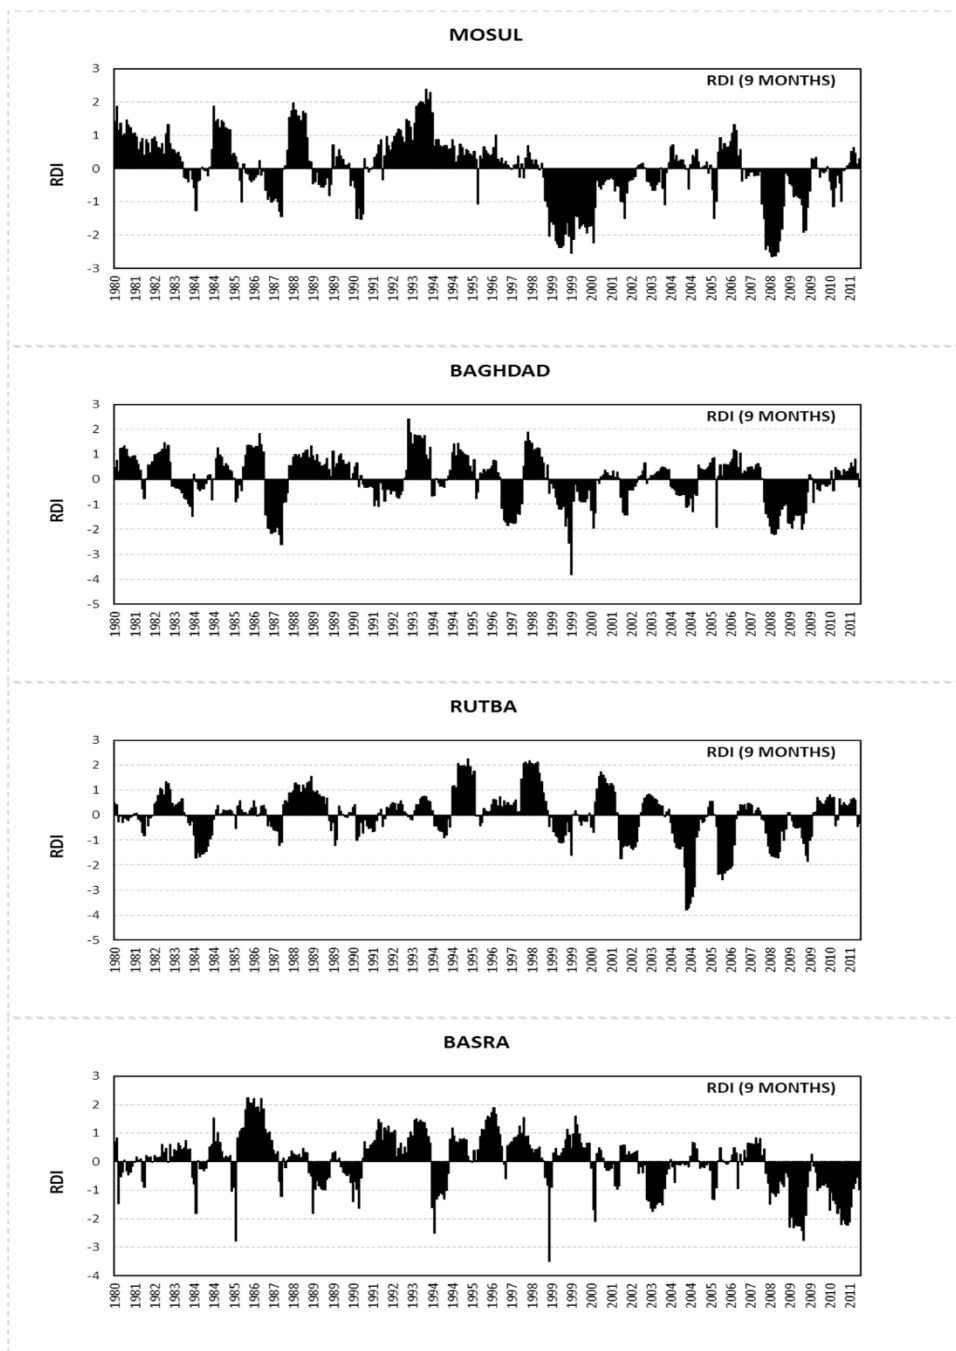

Fig 2:- The time series of RDI for some stations.

The duration of period (30) years was divided into three period each period represents by ten years. The percentage of drought events at three periods for all stations was calculated as shown in Fig.3. It was observed that the last period had the maximum percentage of drought events for all stations as compared with the previous periods except three stations. Indeed, the Kirkuk and Basra experienced the higher value of drought event at the first period, while the Nasirya station exposed to the stronger drought at second period.

Fig 3:- the percentage of drought events for all stations at three periods.

The RDI characteristics were used to generate drought maps for Iraq region using GIS software as shown in Fig.3. The spatial pattern of the average duration of drought (D_{avg}) shows an increasing trend from eastern part toward southwestern of the Iraq region, ranged from 2.62 to 10. The spatial distribution of the average severity of drought (S_{avg}) ranged from -2.12 to -7.87. The highest value of the average severity of drought (S_{avg}) dominated in the central Iraq decreases toward northeastern, and southwest of the study area. It can be seen from figure the Baghdad and Nasirya regions experienced the highest magnitude droughts and had the longer durations as compared with other regions.

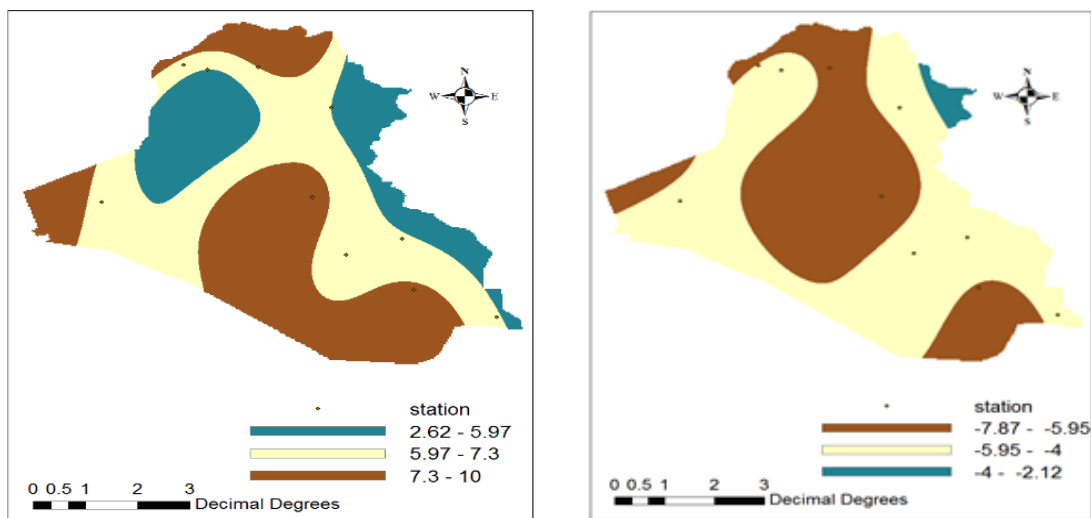

Fig 4:- The D_{avg} and S_{avg} drought using RDI.

Conclusion:-

The aim of this study is to analyze the drought characteristics in Iraq region. The Reconnaissance Drought Index (RDI) was used to analyze the drought based on the historical data for ten meteorological stations during the years from 1980 to 2011. The results showed that the 2008 year was the worst drought years had passed in all parts of Iraq, which was consistent with the finding of [9] and [12]. It was found that the frequency of each wet / drought conditions indicated that the Mild wet / drought (Extremely wet /drought) conditions are the highest (lowest) number of wet / drought event than other conditions for all stations. Also, most study regions were exposed to the highest drought events during the period from 1999 to 2009. As spatial pattern results, the Baghdad and Nasirya regions experienced the highest magnitude droughts and had the longer durations as compared with other regions through the study period.

 Hospital.

Abstract

Service quality dimension covering reliability, responsiveness, assurance, empathy, and tangible is the ultimate goal a public hospital should achieve as organization productivity through patients' satisfaction. This study investigated the influence of service quality on patients' satisfaction of Dr Syaiful Anwar Hospital in Malang, East Java, Indonesia. Assigning 50 patients hospitalized during the research, this study collected data using questionnaires, interview and document analysis and used SPSS 17.0 as a tool of analysis. Findings of t-test showed that variables of quality service gave positive effect on patients' satisfaction, each of which is: Assurance (46%), Reliability (34,3%), Tangible (42%), Responsiveness (67,1%), and Empathy (43,3%). Determinant test showed all variables affected 46.1% ($R^2 = .464$) on public satisfaction and responsiveness performed the most dominant effect on patients' satisfaction to 67.1% based on beta test.

Introduction:-

Satisfaction is feeling happy or disappointed someone has after comparing a perception or impression of the performance of a product and expectations. Satisfaction is a function of perception or impression of performance and expectations (Kotler, 2002). The quality of health care services to patients can not be separated from the employee's role as a provider of services to patients. Management commitment to quality of service is the first step process of providing excellent service to patients. Likewise, employees' commitment to the quality of service is standard, it is the continuous effort of the employee to provide service beyond the minimum standards set. Employee satisfaction to their job will be a positive influence on the quality of services received by users.

The fast development of human resource management that regarded nurses or clerks as a burden or cost, is currently changing the value to asset health. Therefore, almost all large and small health institutions will make every effort to develop human resources as much as possible through improving the quality and performance of the nurses to provide job satisfaction for employees. In conditions of fierce competition, each hospital attracts and retains patients, as well to apply right strategy to achieve patient's satisfaction. This means that no matter how small the patient's complaint, the hospital must respond positively, because the handling of complaints could provide an opportunity to turn disgruntled customer into a satisfied customer or even become immortal customer (Schnaars, 1991). According Artanti (2015), the impacts of dissatisfied customers vary: 90% of dissatisfied customers will not return to the hospital; a customer that is unsatisfied will tell at least to 9 other friends or relatives; a customer that is satisfied with the services will tell to others and direct them into customers; 13% of customers who were disappointed will tell to

more than 20 people; the cost to recruit new customers requires five times higher than if we maintain relationships with existing customers.

Dr. Saiful Anwar Public Hospital Malang is one of the spearheads of local government providing public health service. Management makes improvements for the sake of reform, particularly to improve service quality through evaluating the standard of service and formulation of policy services. By doing so, the hospital can make improvements on service quality and give satisfaction to public users, especially the patients.

To determine the patient's perception of service quality and satisfaction an empirical study is required. Evaluations carried out in general are not enough for management of the hospital, because the information can not be generated for all patients in the hospital. For the sake of the future strategic decisions, only research activities are appropriate to provide answers.

The main problem of the hospital as an institution of health services that challenges many competitors is whether its service has been devoted according to the expectations of patients or not? As local hospital, Dr. Saiful Anwar Hospital should always maintain confidence and satisfaction of patients as customers through improving quality of its services to increase patient satisfaction. Dr. Saiful Anwar Hospital needs to determine carefully the needs of patients as an effort to meet the desires and improve satisfaction services provided. Building relationships and conduct a study of patients are required to adjust services as expected. This is the concept of customer focus. The creation of quality of service will surely create user satisfaction with the service. The implication would be able to provide many benefits, including establishment of a harmonious relationship between providers of goods and services to customers, provide a good foundation for the creation of customer loyalty and make the patient as an agent of promotion.

The hospital has a system of health care standards set by the government, that is a standard service-oriented to customer satisfaction and a comprehensive standard for enterprise services. One effort of the hospital to win the competition is to improve the quality of products or its services. Therefore, hospitals are trying to win competition by improving the quality of products and services, so as to provide customer satisfaction.

In the future, a hospital should have a goal of achieving ISO certification. ISO provides advantages, such as: a better reputation, level of awareness of need to maintain quality, apparent procedures and responsibilities, better documented, eliminating unnecessary work, easier to track and audit, better service to customers, improved customer satisfaction and employee, performing continuous improvement, increasing profits, opportunities for expansion and change the bad image of society to government health services better. Accordingly, implementation of quality management system (ISO 9001:2000) makes service better, all activities are carried out procedurally, documented and regularly and an analysis of previous activities is possibly conducted.

The first step is to know what quality dimensions that influences patient satisfaction, especially patients in the hospital. According to Zeithaml, Berry and Parasuraman (2012) dimensions of quality include: reliability, responsiveness, assurance, empathy, and tangible (real) to qualify customers' satisfaction. Appropriate service policies of patient care should be examined through dimensions of quality services of hospital patients. The problem is whether there is an effect of the quality dimension variables. Thus, orientation of this study is to prove whether there is influence quality of service to client satisfaction based on the dimensions of reliability, responsiveness, assurance, empathy, and tangible at the hospital, to identify dimensions of service quality that gives the most influence on patient satisfaction.

Another problem is how much the influence of dimensions of service quality that consists of reliability, responsiveness, assurance, empathy and tangible to the satisfaction of patients. This study was done to contribute ideas to the management of health care providers to improve services to patients and to give consideration in decision making about the relationship improved service performance at the hospital. The so complex problems of life today that cause health problems makes health care is really critical.

Research Problems:-

The formulation of the problem of this research are:

- a. How are descriptions of quality activities of health service and patient satisfaction in the hospital of Dr Saiful Anwar Malang?

- b. How does dimension quality of health services that include reliability, responsiveness, assurance, empathy, tangible affect partially level of patient satisfaction in the hospital of Dr Saiful Anwar Malang?
- c. How does dimension quality of health services that include reliability, responsiveness, assurance, empathy, tangible affect simultaneously patient satisfaction in the hospital of Dr Saiful Anwar Malangd.
- d. What is dimension quality that affect the dominant influence on patient satisfaction of Dr Saiful Anwar Hospital in Malang?

Review of Literature:-

Quality:-

Quality is a zero defect, completeness and conformance to requirements. Quality is conformance to specifications, when viewed from perspective of manufacturer. Juran, (in Yamit, 2005:337) defines quality as a standard specifically where the ability (availability), performance, reliability, ease of maintenance (maintainability) and its characteristics can be measured. Davis, (in Yamit, 2005:8) makes the definition of quality broader in scope, as a dynamic condition related to products, services, people, processes, and environments that meet or exceed expectations. The approach used by Davis asserts that quality is not only emphasized on aspect of final result, i.e. products and services but also human quality, and quality of the environment. It is impossible to produce qualified products and services without qualified people and processes.

To provide product services is in contrast to produce manufactured products in some ways. Such differences have important implications in quality management. Zeithaml, Berry and Parasuraman, (in Yamit, 2005:10-12) has conducted various studies on types of services, and managed to identify five dimension characteristics used by customers in evaluating quality of service.

The fifth dimension of service quality characteristics are:

- a. Reliability, the ability to provide services quickly and satisfactorily and in accordance with what is already promised.
- b. Responsiveness (comprehension), desire of the staff to help customers and provide service with a full response.
- c. Assurance (collateral), the ability, courtesy and trustworthiness owned by the staff, free from danger, risk or hesitations.
- d. Empathy, ease in the relationship, good communication, and attention sincerely to customers' needs.
- e. Tangibles (direct evidence), physical facilities, equipment, employees, and means of communication.

Quality of services is strongly influenced by consumer expectations. Consumer expectations can vary from one consumer to another consumer even though the service provided is consistent. The quality may be seen as a disadvantage if consumers' expectations are too high, even good services have been served. According Wyckof in Lovelock (quoted from Purnama, 2006:19-20) notion of service quality is perfection level to meet wishes of consumers. Quality of service is a comparison between perceived service (perception) of consumers with quality of service the customers expect. If the perceived service quality is equal or exceeds from the quality of service being expected, the service is qualified and satisfactory. According to Grönroos (in Purnama, 2006:20) quality of service includes:

- a. Quality function, how service is implemented including dimension of contact with consumers, attitudes and behavior, internal relationships, appearance, ease of access, and service mindedness.
- b. Technical quality and output quality perceived by costumers, that is price, punctuality, speed of service, and aesthetic output.
- c. Company's reputation, reflected by the company's image and reputation in the eyes of consumers.

In sum, quality of service is level of service of excellence to meet the desires of consumers or customers by an organization. Quality of service is measured by five indicators of service: reliability, responsiveness, assurance, empathy, and tangibles.

Customer Satisfaction:-

To define actual patient satisfaction is not easy, because the patient has a wide range of characteristics: good knowledge, social strata, experience, income and expectations. For example, a patient coming just wants to try certain health services from a health center. Before transaction, this new patient must have had hopes that he would be better served, waiters are friendly, responsive, and he will be served with therapeutic treatment. If his expectations is consistent with what is experienced and perceived, it exceeds from his expectations and certainly he

will feel satisfied. Conversely, if he experienced and felt the service is beyond the expectations; for example, the service is unfriendly, unresponsive and ineffective treatment, it is ascertained the patient is not satisfied.

The example above shows patient satisfaction can be seen after the use of products and services. A patient satisfaction is an after-purchase evaluation or evaluation results after comparing what is felt to his expectations. Patient satisfaction is the result (outcome) perceived on the use of products health services, that is equal or exceeds from the expectations (in Zulian Yamit, 2005:78). Patient satisfaction has become a central concept in the management discourse (Tjiptono and Chandra, 2005:192). Public Health Service patients generally expects the health care services enjoyed with good service or satisfactory (Assauri, 2003). Patient satisfaction can shape perceptions and further enhance positioning sub-district health services in the public eye.

Patient satisfaction is the result of perceived control over the use of products and services, equal or exceed the desired expectations. Kotler (2003) suggests several methods to measure patient satisfaction, as follows:

- a. The complaint system. This system provides the opportunity for patients to give suggestions, complaints and other forms of dissatisfaction by providing a suggestion box. Any suggestions and complaints entry should be a concern of management, for suggestions and complaints are generally guided by experiences of patients to reflect their love to the an organization.
- b. Survey of patients. Survey of patients is a common method used in measuring patient satisfaction, for example, by postal mail, telephone or direct interviews.
- c. Panel patients. Management invites loyal patients and patients who have moved to other hospital. The faithful patients will provide information on the level of satisfaction they feel and the former patients will inform why they move to other hospital. If patients who are not faithful (customer loss rate) is increasing, this indicates a failure in satisfying the patient's management.

Parasuraman (1998) identifies five dimensions of service quality (Servqual) as follows: (1) Tangible, appearance of physical facilities, including equipment, personnel and means of communication. Tangible could include elements of physical, personnel equipment, and communications materials. The aim is to strengthen quality, comfort, and safety of services offered to consumers. (2) Reliability, company's ability to keep and fulfill the promises given to consumer confidence. According Yasid (1999:113) reliability is the ability of a reliable, accurate and consistent in providing appropriate services that consumers want. (3) Responsiveness, quick response in reading and serve the desires or needs of consumers. The response is the willingness to help customers and provide services immediately. Some organizations choose to focus on the response position. They give attention to the desire of consumers to show "willingness to help" and serve the desires as soon as possible. (4) Assurance, knowledge, reliability, courteous of employees, trustworthy and confident. These dimensions can be used for the positioning by a number of industry effectively, especially if the reliability and confidence of service providers is very important. (5) Empathy, giving genuine concern and a private individual given to consumers by trying to understand the desires of consumers. A company is expected to have knowledge and understanding of consumers, understanding the needs of consumer needs specifically.

Consumers' attitude is actions by individuals, group or organization pertaining to the decision making process to achieve and use goods or services that are affected by the environment including decision making process. One of the fundamental factors on the study of consumers' attitude is people often buy products not for what they do, but for what they mean. This way, consumers buy a product nit to achieve its functions, but for its certain purposes, e.g. image, pride, and personality. Smart marketers tend to create certain relation between offered product and consumers.

Mowday, et. al., (1979:230) and Roberts (2003:48) developed a model of service quality in the organization connecting factors that affect quality of service to organization. The model compares quality of service in organization with output or consequence of quality of service to the organization, including: personal characteristics (e.g. age and tenure), characteristics of role and work (e.g. identity and feedback), structural characteristics (e.g. formalization and decentralization) and work experience (including cohesiveness group) that will produce output and consequent quality of services organizations in the form of a will to survive in the organization, level of attendance, a feeling of belonging and being part of the organization and a willingness to try as much as possible for the organization.

Customer satisfaction is determined by the quality of customer services desired, so quality assurance is a top priority for every hospital, which is currently used as a measure of competitive advantage of the hospital. According to Oliver and Doner cited by Kotler et al. (2003) customer expectation is a trust before trying (pre-trial belief) about a product that is used as a standard to evaluate performance of a future product or experience. Based on the description above, the conceptual framework of this study as follows:

Figure 1:- Conceptual Framework of this Research

Method:-

This research employed quantitative design with explanatory non-experimental approach. The dependent variables included: reliability, responsiveness, assurance, empathy and tangible; and the independent variable was patient satisfaction. It described the influence of variables of service quality to client satisfaction through hypothesis testing without providing treatment. This study was conducted at Dr. Saiful Anwar Hospital in Malang, Indonesia from April to July 2016, which involved 50 patients as sample. Data were collected using questionnaires, observations and interviews, and were analyzed through descriptive and inferential statistics with SPSS version 17.

Results and Discussion:-

Regression Analysis:-

Test of multiple linear regression analysis is to examine and analyze the influence of Reliability, Responsiveness, Assurance, Empathy and Tangible to the satisfaction of the patients of Dr. Saiful Anwar Hospital in Malang. The magnitude of these effects can be seen from the recapitulation of regression testing in table 1.

Table 1:- Result of Regression Analysis

Model	Un-standardized Coefficients		Standardized Coefficients	T-value	T Table	Sig.
	B	Standard Error	Beta			
Constant	-21.198	2.080		-10.203	1.645	.000
X1	.343	.278	.305	2.551		.000
X2	.671	.412	.340	3.448		.016
X3	.266	.401	.257	2.463		.010
X4	.433	.315	.189	2.834		.022
X5	.420	.299	.277	2.321		.001
Multiple Correlation (R)				0.681		
Coef. Determinant (R ²)				0.464		
Ftest				16.287		
Ftable				2.400		
Probability				0.000		

Effect of Partial (t test):-

The ability of dimensions of service that affects patient satisfaction partially is explained by the regression equation. Based on data on Table 1, a regression equation was prepared as: $Y = -21.198 + 0.343 X_1 + 0.671 X_2 + 0.266 X_3 + 0.433 X_5 X_4 + 0.420 + 2.080$ and be explained as follows:

Effect of Reliability:-

Dimensions of reliability that had a positive impact on patient satisfaction at 0.343 meant if service quality dimension of reliability increased by 1 score it lead to increase patient satisfaction 34.3%. Evaluation of the effect of reliability through t-test showed t-value = 2.551 greater than t-table = 1.645 (df: 50, α : 5%) or $p < .05$, proving that reliability influenced significantly quality of patient care.

Figure 2:- Partial significance of *Reliability*

Effect of Responsiveness:-

Responsiveness dimension that had a positive impact on patient satisfaction = .671 meant if responsiveness increased 1 score it improved patient satisfaction 67.1%. Evaluation of significance through showed t-value = 3.448 bigger than t-table = 1.645 (df: 50, α : 5%) or ($p < .05$). Evidently, responsiveness affected significantly quality of patient care.

Figure 3:- Partial Significance of *Responsiveness*.

Effect of Assurance:-

Dimension of assurance that had a positive impact on patient satisfaction by 0.266 meant if assurance services increased 1 score it signified patient satisfaction 26.6%. Evaluation of significance through t-test showed t-value = 2.463, greater than t-table = 1.645 (df: 50, α : 5%) or $p < .05$. Evidently, assurance affected significantly quality of patient care.

Figure 4:- Partial Significance of *Assurance*

Effect of Empathy:-

Empathy dimension that contributed a positive impact on patient satisfaction at 0.433 meant if an empathy increased by 1 score, patient satisfaction increased 43.3%. Evaluation of significance through t-test showed t-value = 2,834, greater than t-table = 1645 (df: 50, α : 5%) or $p=0.002$. It is evident that empathy affected significantly quality of patient care.

Figure 5:- Partial Significance of *Empathy*

Effect of Tangible:-

Tangible dimension that gave a positive impact on patient satisfaction at 0.420 meant if the tangible increased 1 score, patient satisfaction lead by 42%. Evaluation of significance through t-test = 2,321 that was greater than t-table - 1,645 (df: 50, α : 5%) or $p=0.001$ evidently proved that tangible affected significantly quality of patient care.

Figure 6:- Partial Significance of *Tangible*.

Simultaneous Influence (Test F):-

Simultaneous effect of dimensions of Reliability (X1), Responsiveness (X2), Assurance (X3), Empathy (X4) and Tangible (X5) on patient satisfaction (Y) was described by F-test. Data on Table 1 showed t-value = 16 287 and F-table = 2.400. If it was equal or exceeds the F-table, it was significant. The figure showed that F-value was greater than F-table; showing the null hypothesis (H_0) was rejected and the alternative hypothesis (H_a) was accepted. That is, the variable of reliability, responsiveness, assurance, empathy and tangible jointly affected significantly patient satisfaction in Dr Saiful Anwar Hospital Malang ($p=0.000$).

Figure 7:- Determinant Coefficient Significance

Beta Test:-

Beta test was to examine independent variables that had the most dominant effect on dependent variable, the variable that had the highest regression coefficient. Result of analysis as seen in Table 1 was that among service dimension variables, i.e. Reliability (X1), Responsiveness (X2), Assurance (X3), Empathy (X4) and Tangible (X5) to client satisfaction (Y), Responsiveness (X2) gained the highest value of standardized beta coefficient = 3,448. Thus, responsiveness was a service variable that had the most dominant influence on patient satisfaction in Dr. Saiful Anwar Hospital in Malang.

Determinants (R^2) Test:-

Determinant test was used to determine the amount of free variable to variable terminated bound. Table 1 showed coefficient of determination (R^2) = .464. This meant all variables of quality service dimension covering reliability, responsiveness, assurance, empathy, tangible contributed patient satisfaction in Dr. Saiful Anwar Hospital Malang up to 46.40%. The remaining 53.60% was influenced by other variables not analyzed in this study.

Conclusion:-

1. Analysis of overall service gap dimension, the fit between services provided by Dr. Saiful Anwar Hospital in Malang with patient expectations shows there is a gap or level of satisfaction at (-10.54). This score was categorized as moderate; yet it fully meets expectations of patients, the services provided is quite good.
2. The variables of service quality dimensions (Reliability, Responsiveness, Assurance, Empathy, Tangible) jointly have positive effect and significant impact on patient satisfaction of Dr Saiful Anwar Hospital Malang. F-value (16.287) is greater than F-table (2.640)
3. The variables of service quality dimensions (Reliability, Responsiveness, Assurance, Empathy, Tangible) partially have positive influence and significant impact on patient satisfaction of Dr Saiful Anwar Hospital Malang. This is supported by the t-value of each variable is greater than t table (1.645). The t-values of each of these variables are: Assurance (2463), Reliability (2551), Tangible (2321), Responsiveness (3448), Empathy (2834). Furthermore, the value of R^2 = (0464) showed that 46.4% variable of customer satisfaction is contributed by the service quality that is Reliability, Responsiveness, Assurance, Empathy, and Tangible. Other remaining 53.6% is contributed by other variables that are not included in this research model
4. Results of Beta Test shows that responsiveness variable achieves regression coefficient = .671; that means responsiveness has a dominant influence on the patient satisfaction of Dr. Saiful Anwar Hospital Malang.

Abstract

Futures & options is one of the most important segments in derivatives market in India. Financial derivatives have emerged as one of the largest market of the world during the past two decades in terms of trading volume, number of index and stock options available for trading, participation of investors in derivatives market. It is also observed that investors are showing lot of interest in the derivatives market. However, investors have lost lot of money in the derivatives market due to lack of knowledge about the product and investment strategies etc. The risk involved in futures and options trading can be minimized / return on futures and options trading can be improvised through designing suitable investment strategies. So, investor need to develop risk management as well as risk analysis tool which is the key to limiting futures and options risk/maximizing profit. The derivatives contract is standardized contract. In India, the BSE Sensex and Nifty-50 are the popular indices on futures and options trading. The everyday price changes will occur on stock index futures and options. Some of the major factors such as weather, war, Debt, refugee displacement, land reclamation and micro & macro economic factors will affect the index prices. So, this study challenge to test the precariousness of stock index prices in Indian Derivatives market and also this study have to focus on software industry **Infosys & TCS** during the period of April to June 2016.

Introduction:-

The futures and options market have been the fastest growing segment of the securities industry. With this rapid growth has come to debate over the purpose served by futures and options in the capital markets. As we see it, the principal function of futures and options is to provide a significant expansion of the patterns of portfolio returns available to investors. Such expansions make investors better off and add to the liquidity and efficiency of the capital markets.

The emergence of the market for derivative products are forward, future and option are traded in the derivatives market. Comparing to stock market, derivatives markets are more risky because everything should be in a contract format. Derivatives are risk management instruments, which derive their value from an underlying asset. Banks,

Securities firms, companies and investors to hedge risks, to gain access to cheaper money and to make profit, use derivatives. Derivatives are likely to grow even at a faster rate in the years to come.

Price fluctuations make it hard for businesses to estimate their future production costs and revenues. Derivative securities provide them a valuable set of tools for managing this risk. This article describes the progress of Indian derivatives markets, the popular derivatives instruments, and the main users of derivatives in India.

Introduction to Derivatives Market in India:-

Derivative trading in India takes place either on a separate and independent Derivative Exchange or on a separate segment of an existing Stock Exchange. Derivative segment function as a Self-Regulatory Organisation (SRO) and SEBI acts as the oversight regulator. By their very nature, the financial markets are marked by a very high degree of volatility. Through the use of derivative products, it is possible to partially or fully transfer price risks by locking in asset prices. As instruments of risk management, these generally do not influence the fluctuations in the underlying asset prices. However, by locking in asset prices, derivative products minimize the impact of fluctuations in asset prices on the profitability and cash flow situation of risk-averse investors. In the last decade, many emerging and transition economies have started introducing derivative contracts.

National Stock Exchange of India Ltd:-

The National Stock Exchange of India Limited (NSE) commenced trading in derivatives with the launch of index futures on June 12, 2000. The futures contracts are based on the popular benchmark Nifty 50 Index. The Exchange introduced trading in Index Options (also based on Nifty 50) on June 4, 2001. NSE also became the first exchange to launch trading in options on individual securities from July 2, 2001. Futures on individual securities were introduced on November 9, 2001. Futures and Options on individual securities are available on 173 securities stipulated by SEBI. The Exchange has also introduced trading in Futures and Options contracts based on Nifty IT, Nifty Bank, and Nifty Midcap 50, Nifty Infrastructure, Nifty PSE indices. This section provides you with an insight into the derivatives segment of NSE. Real-time quotes and information regarding derivative products, trading systems & processes, clearing and settlement, risk management, statistics etc. are available here. Today NSE's share to the total equity market turnover in India averages around 72% whereas; in the futures and options market share is around 99%.

Basics of Equity Derivatives:-

According to the Securities Contract Regulation Act, (1956) the term Derivative is a contract or a product whose value is derived from value of some other asset known as underlying.

Equity derivative is a class of derivatives whose value is at least partly derived from one or more underlying equity securities. Options and futures are by far the most common equity derivatives. It provides you with an insight into the daily activities of the equity derivatives market segment on NSE. Two major products under Equity derivatives are Futures and Options, which are available on Indices and Stocks.

Derivatives Product:-

Index Futures: The contracts are traded on an Index futures or financial index. For each index there may be a different multiple for determining the price of the futures contract.

Index Option:- These options have the index as the underlying asset. In India, Index options are European option. For example options on Nifty, Sensex, etc.

Stock Futures:- Stock futures are agreements to buy or sell a specified stock, i.e., the equity share of a specified company, in the future at a specified price.

Stock option: These options have individual stocks as the underlying asset. For example, option on ONGC, NTPC etc.

Futures Contract:- A future contract is an agreement between two parties to buy or sell an asset at a certain time in the future at a certain price. Futures contracts are special types of forward contract in the sense that the former are standardized exchange-traded contracts.

Options Contract:-

An option represents the right to buy or sell a security or other asset during a given time for a specified price. Options are of two types:

Call option: It gives the buyer the right but not the obligation to buy a given quantity of the underlying asset.

Put option: It gives the buyer the right, but not the obligation to sell a given quantity of the underlying asset.

European option: The owner of such option can exercise his right only on the expiry date/day of the contract. In India, Index options are European.

Positions in derivatives market As a market participant, you will always deal with certain terms like long, short and open positions in the market. Let us understand the meanings of commonly used terms:

Long Position Outstanding/ unsettled buy position in a contract is called "Long Position".

Short Position Outstanding/ unsettled sell position in a contract is called "Short Position".

Open position Outstanding/ unsettled either long (buy) or short (sell) position in various derivative contracts is called "Open Position".

The Derivatives Market Participants:-

There are broadly three types of participants in the derivatives market - hedgers, traders (also called speculators) and arbitrageurs. An individual may play different roles in different market circumstances.

Hedgers They face risk associated with the prices of underlying assets and use derivatives to reduce their risk. They always wanted to reduce their investment risk.

Speculators They try to predict the future movements in prices of underlying assets and based on the view, take positions in derivative contracts. Derivatives are preferred over underlying asset for speculation purpose, as they offer leverage, are less expensive (cost of transaction is generally lower than that of the underlying) and are faster to execute in size (high volumes market). They are accepting their investment risk with view to more return.

Arbitrageurs Arbitrage is a deal that produces profit by exploiting a price difference in a product in two different markets. Arbitrage originates when a trader purchases an asset cheaply in one location and simultaneously arranges to sell it at a higher price in another location. Such opportunities are unlikely to persist for very long, since arbitrageurs would rush in to these transactions, thus closing the price gap at different locations. They don't want to take risk and always play with safe.

Review Of Literature:-

Phil Holmes (2006), Stock index future hedging: Hedge ratio estimation, duration effects, expiration effects and Hedge ratio stability this study focused the impact of hedge duration, and the time of expiration and hedge ratio stability over the study period and it helps to find with the help of some statistical tools like OLS, ECM, Risk & Return Analysis, Descriptive Statement and GARCH models.

Antonios Antoniou and Phil Holmes (2000), Futures trading, information and spot price volatility: evidence for the FTSE-100 stock index futures contract using GARCH This paper examines the impact of trading in the FTSE-100 Stock Index Futures on the volatility of the spot market. It ensures that the relationship between information and volatility of the spot and future with the use of GARCH analysis. The results suggested that futures' trading has a more volatile than spot market.

Stock returns volatility in the Tokyo stock exchange(2002), **Y.K. Tse** This paper examines the stock returns volatility in the Tokyo Stock Exchange. Structures of returns volatility are estimated and forecasted. The model of ARCH/GARCH and exponential weighted moving average (EWMA), this three tools used to measure the volatility of stock index future. The results show that the EWMA method gives the best forecasts. These findings have

implications in forecasting movements of market volatility, with applications to option pricing and control for variation margin risk in stock index futures.

Statement of the problem:-

The research in derivatives market awareness is comparatively less in India, when compared to other developed countries. The globalization of financial markets have been increasing the large number of traders over the decade by providing a wide variety of market and trading investment options. However, it makes the trading investment decisions process much more complex. The investors generally consider their investment needs, goals, objectives and constraints while making investment decisions. But it is not possible for them to make a successful investment decision at all times. Their attitude is influenced by a variety of factors such as speculative income, get rich quickly strategy, stories of successful traders, online trading, investor derivatives awareness programme, etc. A better understanding of equity derivatives options strategies, valuation processes and outcomes are important for financial planners because an understanding of how traders generally respond to market movements would help them in devising appropriate asset allocation strategies for clients.

Objectives of the Study:-

- The main objective of the study is to evaluate futures and options in equity derivatives of selected software companies of Infosys and TCS.
- To find out the risk and return relationship in future and option contract
- To have an in-depth awareness about future & option market in India.
- To assess risk management tools and its strategies.
- To analyze the precariousness of Future and Option market.

Scope for the Further Study:-

- The major scope of the study is to diminish the risk in derivatives and generate better returns in trading.
- A derivative contract is the off-balance sheet financing so no records maintain for the future reference.
- This study should spotlight on Future and option segment only so some changes happening in future.
- The different participants also obtain good returns in derivatives contract i.e. Hedger, speculator, Arbitrageur.

Limitations:-

- The study is based on secondary data and some inherent limitations of the secondary data would have exaggerated the study.
- This study should focus on stock future and options on particular companies only.
- The result of the investigation may change depending on the time period.
- This study we have to consider only the short term decision making.
- There is no stretchy trading in future contract because it is a standardized contract.

Methodology of the study:-

a.) Sample Selection, Sample size and Period of the study

- Underlying asset of Infosys and Tcs stock futures and options to be used for the study
- The availability of financial data required for calculating futures and options trading.
- Underlying assets must be in National stock exchange in the derivatives segment
- Selections of strike price have to be selected on contract's first day of options premium based on spot price.
- The study covers three contracts ranging from April 2016 to June 2016

Sources of Data:-

The study is exclusively based on secondary data. The base price of the contracts on subsequent trading days will be the daily close price of the futures and options contracts. The major sources of data collected from the www.nseindia.com.

Tools Used for Analysis:-

The statistical tools used to measure the futures and options price movements are; Risk (alpha & beta), Return and Descriptive Statement Analysis.

Jensen's Alpha is a risk-adjusted performance benchmark that tells you by how much the returns of an actively managed portfolio of market returns.

Originating in the late 1960s, Jensen's Alpha (often abbreviated to Alpha) was developed to evaluate the skill of active fund managers in stock picking.

- A positive Alpha means that a portfolio has beaten the market, while a negative value indicates underperformance
- A fund manager with a negative alpha and a beta greater than one has added risk to the portfolio but has poorer performance than the market

Careful stock picking and financial engineering means that investors can add alpha to a portfolio without adversely affecting beta.

Jensen Model ALPHA is defined by this equation

Expressed as a formula:

$$= R_f + \beta \times (R_m - R_f)$$

Where:

R_m = Return on Market

R_f = risk free rate of return.

β = Beta coefficient of portfolio

Beta describes the volatility of the portfolio with respect to that of the wider market, and is calculated with this equation

$$\beta = \text{Cov}_{xy} / \text{Var}_x$$

x = Market Returns

y = Portfolio Returns

The market return is usually described by the expected return of an index, like the Nifty 50 Index.

Returns:-

Long

$$R_t = (P_t - P_{t-1}) / P_{t-1} \times 100 \text{ or } (\text{Current Stock price} - \text{Previous day stock price}) / \text{Previous day stock price} \times 100$$

$$\text{Short} = (\text{Current Stock price} - \text{Next day stock price}) / \text{Next day stock price} \times 100$$

Where,

R_t = Return at the time

P_t = The Closing price of the day

P_{t-1} = The Closing price of the day $t-1$

Descriptive Statement Analysis of daily return, standard deviation, Skewness Kurtosis Jarque-Bera test were analysed.

Analysis and Interpretation:-**Return Analysis:-**

Return table for stock futures (Apr-Jun 2016)

Long	Month	Infosys Fut	TCS Fut	Short	Infosys Fut	TCS Fut
	April	10.00	16.00		-9.00	-16.00
	May	7.40	2.30		-6.00	-2.00
	June	-2.50	-2.40		3.20	2.70

Long & Short Stock Futures Return for Infosys and TCS (April to June)

The above table indicates comparing the long and short return percentage of two software industries stock future of Infosys and TCS. This analysis indicates that TCS has maximum return in the month of April 2016 (16%) and Infosys has maximum return in the month of April 2016 (10%). At the same time short return percentage almost negative for the selected period with little positive return for both Infosys and TCS.

Return table for stock options (Apr-Jun 2016).

Long					
Month		Infosys CE	TCS CE	Infosys PE	TCS PE
April		-3.36	-8.10	-18.45	-11.99
May		-9.59	-3.98	-33.30	-8.10
June		-15.19	-7.47	77.20	-7.70
Short					
Month		Infosys CE	TCS CE	Infosys PE	TCS PE
April		25.78	10.17	88.34	82.04
May		47.20	88.25	82.70	62.55
June		5.00	75.25	-59.20	11.17

Long Stock Options Return for Infosys and TCS (April to June)**Short Stock Options Return for Infosys and TCS (April to June)**

The stock option table indicates comparing the return percentage of Infosys and TCS, this opposite to futures return, long return percentage came with negative return at the same time short return stood with huge positive. This analysis indicates Infosys and Tcs showed maximum return in the month of April & May 2016 (88.34% & 88.25%) and only Infosys has down in the month of June put option. The above table indicates that short return has given more positive than long return because of mounting uncertainties for H1B Visa factor in software industries so inversely impacted.

Risk Analysis (Alpha & Beta):-

Alpha & Beta table for Infosys & TCS Futures (Apr – Jun 2016):

Long	Infosys -Tcs Fut	Infosys -Tcs CE	Infosys -Tcs PE
Beta	0.65	0.46	2.20
Jensen Expected Return (ALPHA)	1.24	0.88	4.16
Short	Infosys -Tcs Fut	Infosys -Tcs CE	Infosys -Tcs PE
Beta	0.65	0.65	2.20
Jensen Expected Return (ALPHA)	1.24	5.47	4.56

ALPHA for Infosys and TCS (April to June).**BETA for Infosys and TCS (April to June).**

The positive alpha means the stock has over priced and the negative alpha means the stock has underpriced. Here both stock Infosys & TCS has overpriced.

The beta of less than one means that the security prices will be less volatile than the market price. A beta of greater than 1 indicates that the security's price will be more volatile than the market. Here the beta of stock futures (.65) has less volatile than the market and the beta of stock option (2.20) has more volatile than the market.

Descriptive Statement:-**Long Stock futures and options for Infosys & TCS (Apr – Jun 2016)**

The above table presents the result of descriptive statistics of standard deviation, Skewness, Kurtosis and Jarque-Bera for Infosys and Tcs during the study period in the month of Apr – Jun 2016. It helps to summarize the overall performance of the business to understand the risk and reward of stock futures and options trading.

Summary of Findings and Suggestions of the Study.**Findings:-**

The following are the major findings of the Study.

- The study found that the highest return was gained from short positions in put options in the both the stocks.
- Indian derivatives markets were more unstable throughout the study period.
- From the above study illustrates the comparative return analysis of Infosys stock future and TCS stock future has maximum return in the month of April (10% & 16%)
- The comparative return analysis of Infosys & TCS stock option has highest return in the month of May & June 2016 (88.34% & 88.25%).
- The comparative risk analysis of Stock Future & option Infosys & TCS has utmost minimum risk in stock option 0.46 & less market volatility, the maximum risk in stock option is 2.20 & more market volatility is 2.20.
- The stock futures volatility is normal of 0.65. They are a lesser amount of volatile than market.
- Descriptive statement explains that are constructive in summarizing data.

Suggestion:-

The following are major suggestions of the study

- The investors are advised to create the short positions in the beginning of the monthly contract of the selected Futures and options.
- Trading positions should create beginning of the contract to capture the more premium with a view of the eroding in the end of the contract.
- Normally, derivatives have certain risk so the investors should not take immediate investment decision and instead they should wait and watch the market movement.
- This risk and return analysis helps the investors to take appropriate investment decision.
- The Descriptive statement helps the investors invest their securities in the foremost company.
- Updating of market information help the investors to get maximum return.
- The investors should aware about the stock market conditions (e.g. Macro and micro data's monetary policy, GDP, inflation, war, social and political issues, currency fluctuation, etc.)
- The study suggests that the Regulatory Authority (SEBI) must monitor the reliability or the truth of information released by Companies.
- The present study suggests that whenever the performances of sectors declines in response to crisis announcement, the share holders should obtain instant decision either to buy or sell the stocks.
- Investors should enter in to the market with right direction with view to gain potential return.

Conclusion:-

Investors need to see the overall on an average the value of beta and the value of expected returns. There are several different types of risks involved in financial derivatives transactions. Achieving the right balance between risk and return will ensure that traders achieve their financial goals with proper decisions. Risk in futures and options investment is about what might cause a loss of money on those investments. Deciding what risk is to take high or low as well as looking at chronological data are two examples of understanding risks and returns of future financial planning. The recent financial derivatives growth will definitely lead to boost the investors' self-belief in the Indian derivative market and carry an overall progress in all the segments of this market. Futures and Options traders need a very firm knowledge of the basics of Futures and options trading before even thinking of ways to make the money out of it. So, this article would give a broad outlook for the new investors to learn about the Futures and options trading in India.

Malocclusion, Awareness, questionnaire survey.

Abstract

Context: Malocclusion is not a disease in itself but a variation in the arrangement of teeth, morphology of jaws, face and cranium. Awareness is the state or ability to perceive, to feel or to be conscious. Awareness forms the basis for planning oral health which is an inseparable part of general health.

Aims & Objectives: - To assess the awareness of orthodontic problems & its treatment in Nagpur District.

Materials & Methods: A cross sectional, observational (non-experimental) descriptive questionnaire survey was conducted in urban population of Nagpur District. Two age groups were studied i.e. adolescence and adult. According to the prestructured questionnaire (15 objective questions) data was formulated for assessment of knowledge and awareness of orthodontic treatment.

Results: There were no statistically significant differences in general information and awareness about the proper age of orthodontic treatment.

Conclusion: Awareness of malocclusion and the need to make corrections has increasingly become prevalent among our population. As growing public interest in oral health increased, the demand for orthodontic treatment also became more noticeable in dental practices.

Introduction:-

Oral health can affect general health & well being of childhood through development. Malocclusion is not a disease in itself but a variation in the arrangement of teeth, morphology of jaws, face and cranium. Desire and need for orthodontic treatment is influenced by awareness, socioeconomic factors, and availability of the experts, ethnic trends and values. Awareness is the state or ability to perceive, to feel or to be conscious. Awareness forms the basis for planning oral health which is an inseparable part of general health. With the availability of meristic criteria and

evolutions of indices of malocclusion, information on malocclusion and treatment needs is now being made available from all around the world.

Aims & Objectives:-

There is a paucity of data about the awareness of orthodontic treatment among school children in the Indian context. Therefore the rationale for this study was to assess the awareness of children towards orthodontic problems & its treatment. In this context, the objective of the present epidemiological survey was to assess the awareness of orthodontic problems & its treatment in Nagpur District.

Materials & Methods:-

A cross sectional, observational (non- experimental) descriptive questionnaire survey was conducted in urban population of Nagpur District. The sample size of 2000 people represented the rural population of Nagpur District. The sample was constituted from patients reporting to college OPD, patients from satellite clinics and students from school and college. In this modern era, though general population is aware of a dentist yet many people are unaware of Orthodontics as a speciality dealing with misalignment of teeth. Even if people are aware of orthodontics they hesitate to seek the treatment because of high cost of treatment, long duration of treatment, esthetic concern about placement of orthodontic appliance, extraction of some teeth if necessary. This survey has been formulated to evaluate the concern of general population in seeking orthodontic treatment.

Two age groups were studied i.e. adolescence and adult. People in age group 13-19 years constituted adolescent group & and People in age group of 20-40 years constituted adult group. Children who obtained written informed consent from parents to participate in the study were included. Exclusion criteria used were- history of previous orthodontic treatment, rampant caries, multiple missing teeth, mutilated malocclusion and other craniofacial anomalies like cleft lip and palate, facial hemiatrophy, cleidocranial dysplasia etc. An oral health lecture was given to all the children in the school to create awareness about Dental health and Orthodontic treatment.

Statistical data was analysed and categorised according to age and gender. Responses of the people were recorded on a 3 point Likert scale from poor, fair and good. According to the prestructured questionnaire (15 objective questions) data was formulated for assessment of knowledge and awareness of orthodontic treatment.

Questions included were:-

- Q.1) Have you ever visited a dentist?
a) Yes b) No
- Q.2) Have you heard of an orthodontist?
a) Yes b) No
- Q.3) Are you aware that an Orthodontist can bring your teeth in proper position?
a) Yes b) No
- Q.4) Did you notice improper positioning of your teeth by yourself or was it told to you by society/others?
a) Yourself b) Society/others.
- Q.5) Have you ever noticed people with improperly positioned teeth?
a) Yes b) No
- Q.6) Do you think that teeth should be properly positioned for a better facial appearance?
a) Yes b) No
- Q.7) Do you know at what age orthodontic treatment should be started?
a) At school b) Junior college
- Q.8) Do you know the side effects of improperly positioned teeth?
a) Yes b) No
- Q.9) Do you know that taking proper orthodontic treatment at an early age would improve your facial appearance?
a) Yes b) No
- Q.10) Do you know the cost of orthodontic treatments?
a) Yes b) No
- Q.11) Do you know how much time, orthodontic treatment takes?
a) <1 year b) 2-3 year
- Q.12) Are you aware that few teeth may have to be removed for proper positioning of irregular teeth?
a) Yes b) No
- Q.13) Do you know different types of habits that can cause improper positioning of teeth?

- a) Yes b) No

Q.14) Do you know about orthodontic braces and its types?

- a) Metallic Braces , Ceramic Braces
b) Lingual Braces , invisalign braces

Q.15) Are you aware that the improperly positioned teeth can be corrected at the age of 35-40 yrs also?

- a) Yes b) No

Statistical analysis:-

Data was coded and entered into excel sheet. To maintain the data quality (validity) rechecking and cross checking was done during data entry phase. Later, data was transferred into SPSS windows version 16, where cleaning, coding, recording, crosschecking, processing and analysis of the data were done. Simple

Descriptive statistics was applied to describe the study variables. The t- test procedure was used to compare means for two groups.

Results:-

There were no statistically significant differences in general information and awareness about the proper age of orthodontic treatment. Gender & Age distribution of the sample participating in the study is represented in Tables 1 and 2.

According to their survey answers we found out that Majority of the sample included in this study had never visited a dentist before (Q1) neither the orthodontist (Q2) & his area of specialization (Q3). These people were told about their mal-alignment of teeth by other people of the society (Q4) & were not yet aware of the functioning of the orthodontist (Q6). These subjects were not aware of the side effects of improperly positioned teeth (Q8). They believed that this kind of treatment should be started at an early age (Q7) in order to improve their facial appearance (Q9), even though they were not aware about the cost of such treatment (Q10). They showed awareness that such treatment could take more than 2 years (Q11), but were not aware that few sound teeth had to be sacrificed for the same (Q12). The survey revealed that they had a knowledge about various habits causing malocclusion (Q13), metallic & teeth colored ceramic braces (Q14) but were not about adult orthodontic treatments (Q15). (Table 3-7)

Discussion:-

“Why people do not seek orthodontic treatment?” is the driving question among all staring orthodontist & a driving force for this study. The answer to this question would vary from, “Lack of Awareness, Metal display, Expensive treatment, Duration of treatment or Extraction of sound teeth”. The exact satisfactory response to this question was evaluated through this study.

Globally, there has been an increase in awareness of Orthodontics as a dental specialty in children as well as adults^[1-2]. The level of dental health knowledge, positive dental health attitude, and dental health behavior are interlinked and associated with the level of education and income as demonstrated by various studies^[3-8]. Attitudes and perceptions towards dental appearance differ among populations and among individuals^[9, 10].

Self-awareness is a dynamic process, not a static phenomenon^[11]. Although; imparting oral health education begins from the footstep of awareness, evaluation of its implementation is an important indicator of the success of the education imparted^[12]. Age-related changes in malocclusion concerns ideally should be studied longitudinally because with the progress in age, the awareness to nature & complexity of malocclusion increases.

In a similar study by Siddegowda¹³, High school children showed a higher level of awareness about orthodontic treatment when compared to middle school children. Urban children had shown more positive attitude like visiting a dentist in a study done by Singh *et al.* in 2012.^[14] Considering the influence of age on awareness of orthodontics, it was found that it increased significantly. Similar findings were seen in a study conducted by Friedman *et al.*, in 1976.^[14] The aim of orthodontic procedure is to improve dental occlusion, which results in better smile and good functioning in harmony with the face.^[13] Overall, it has been seen as an increase in awareness of orthodontic treatments as a dental specialty among children as well as adults.^[1]

Conclusion:-

Enhancing appearance and improving psychosocial status have been identified as important motivating factors behind the decision to initiate orthodontic treatment. This survey created awareness of orthodontic treatment among

various patients & children's. Awareness of malocclusion and the need to make corrections has increasingly become prevalent among our population. As growing public interest in oral health increased, the demand for orthodontic treatment also became more noticeable in dental practices.

Abstract

Dietary composition can influence the development of Nonalcoholic fatty liver disease (NAFLD). The amount and type of dietary fat may directly affect liver fat content, with high-fat diets being potentially harmful. A higher dietary fat intake is associated with liver inflammation and NAFLD. An Omega-3 fatty acid used in this study as a treatment to modulate these metabolic disturbances. This study was designed to elucidate the effect of Omega-3 fatty acid on high fat diet induced NAFLD in albino Wister rats. NAFLD induced by allowing rats to feed on the high fat diet for 20 weeks. Omega-3 fatty acid was used in doses of 0.8 mg/Kg body weight. Plasma glucose, triglycerides and non-esterified fatty acids (NEFA) were measured by enzymatic method. It can be concluded that administration of high fat diet caused NAFLD in rats via abnormal or extensive fat accumulation when energy intake exceed energy expenditure. Omega-3 fatty acid succeeded in ameliorating the deleterious effects of high fat diet induced NAFLD.

Copy Right, IJAR, 2017,. All rights reserved.

Introduction:-

Nonalcoholic fatty liver disease (NAFLD) is rapidly becoming a serious global health problem, as its prevalence has risen rapidly in concert with the prevalence of obesity and type 2 diabetes. Estimates of the prevalence of NAFLD range widely from 11 to 46 % . It can progress to advanced liver disease in approximately 15–20% of patients. Clinical characteristics associated with NAFLD include obesity, hyperlipidemia, diabetes mellitus, and hypertension, all of which have been associated with underlying insulin resistance. [1,2]

Aside from weight gain and obesity, dietary composition can influence the development of NAFLD. The amount and type of dietary fat may directly affect liver fat content, with high-fat diets being potentially harmful[3]. A higher dietary fat intake is associated with liver inflammation and NAFLD[4,5]

While no human studies have linked NAFLD and diets high in saturated fat, evidence from experimental animal studies demonstrates that high dietary saturated fatty acid consumption worsens insulin resistance, NAFLD, and cardiovascular disease in rodents[6].

Corresponding Author:- Ibrahim T. Ibrahim.

Address:- Department of Biochemistry, Faculty of Pharmacy, Beni-Suef University, Beni Suef, Egypt.

Omega-3 fatty acids have recently been proposed as a potential treatment for NAFLD. These fatty acids have proven benefit in lowering serum blood glucose, serum triglycerides nonesterified free fatty acids (NEFFA) and in the treatment of cardiovascular disease. Interest in their potential in the treatment of cancer, mood disorders and cognitive disorders has also emerged.[7]

n-3 polyunsaturated fatty acids (PUFAs), such as docosahexaenoic acid (DHA), have been found to decrease liver fat content in children with NAFLD and possess anti-inflammatory effects. Moreover, recent studies indicated the benefits of *n*-3 PUFAs in lipid metabolism modification, dyslipidemia improvement, and hepatic inflammation mitigation, which may contribute to the amelioration of NAFLD.[8,9]

The aim of this study is to investigate the biochemical effect of omega-3 fatty acid involved in treatment of NAFLD induced by high fat diet in rats.

Materials and Methods:-

Materials:-

Omega-3 fatty acid was purchased from Sedico Co. (Giza, Egypt). Glucose kits were purchased from Spinreact Co. (Santa Coloma, Spain), triglyceride kits obtained from Spinreact Co. (Santa Coloma, Spain).

Animals:-

The present study was carried out on Thirty male Wistar rats of 96 ± 10 gm as body weight range. They were obtained from animal house of research institute of ophthalmology (Giza, Egypt). They were housed in groups of five rats per cage under controlled environmental condition of air and temperature with a 12 h light- dark cycle. Animal were allowed the diet and water in a free manner. Body weight of rats was recorded every two weeks.

Diet:-

In this experiment there were the standard normal rat chow diet and the high fat diet for induction of obesity in rats. The standard normal chow diet (ATMID Company, Egypt) consists of soybean, Corn, soybean oil, calcium carbonate, dicalcium phosphate, sodium chloride, lecithin, methionine, and vitamin/mineral mixture.

The high fat diet consists of 25% fat "beef tallow" + 10% sucrose + 20% corn starch + 45% normal chow with 30% sucrose in drinking water according to [10] with modification.

Experimental design and animal grouping:-

The rats were divided randomly into three groups of ten rats each and treated as follows:

Group I:- (normal control): rats were fed on a normal chow diet for 20 weeks and administered water as a vehicle via oral gavage.

Group II:- (High fat diet group): rats were fed on the high fat diet for 20 weeks and administered water as a vehicle via oral gavage.

Group III:- (omega-3-fatty acid treated group): rats were fed on the high fat diet for 20 weeks and administered fish oil daily for the last two consecutive weeks via oral gavage in a dose accounting for (0.8 gm/ kg body weight) of Omega-3 fatty acid [11, 12]. The rats were weighed then sacrificed at the end of the experiment after about 18 hours fasting to minimize variation in lipid pattern during two successive days after blood samples have been collected from retro - orbital veins into tubes containing EDTA and centrifuged at 1500 RPM for 30 minutes. An aliquot of the separated plasma was used for immediate estimation of fasting blood glucose. Second aliquot was kept on -20°C for triglyceride and NEFA analysis. All animal procedures were performed upon approval from the Ethics Committee of Beni-Suef University and in accordance with the recommendations of the proper care and use of lab animals.

Biochemical Analysis:-

Fasting blood glucose was carried out by enzymatic method (Spinreact, Santa Coloma, Spain). The triglyceride level was determined according to the enzymatic method (Spinreact, Santa Coloma, Spain). And NEFA levels were determined according to the (Duncombe) method described by (Duncombe 1964 [13]).

Statistical Analysis:-

Data were presented as means \pm SEM values. The results were analyzed statistically by one-way analysis of variance (ANOVA) with subsequent multiple comparisons using Tukey multiple comparison Post-Hoc test. The p-values less than 0.05 were considered significant. Correlations between variables were assessed by Pearson's correlation test. All calculations were made using the computer program SPSS 16.0 (SPSS, Chicago, III, USA). The data were graphed using GraphPad Prism 6 (GraphPad Software, Inc., USA).

Results:-**Metabolic Markers:-****Fasting plasma glucose level:-**

The fasting plasma glucose level was significantly increased in high fat diet treated group when compared to that of the normal control group as shown in table (1). Treatment with omega-3 fatty acid significantly reduced fasting plasma glucose elevation as shown in table (1) and fig. (1).

Table 1:- fasting plasma glucose, triglyceride and non-esterified fatty acid levels in the rat of various studied groups.

	Normal control	High fat diet group	Omega-3 fatty acid treated group
Fasting plasma glucose level	93.01 \pm 3.89	135.26 \pm 2.54 [#]	102.69 \pm 4.12 [*]
Plasma triglyceride	84.01 \pm 15.80	145.26 \pm 18.78 [#]	85.55 \pm 7.12 [*]
Plasma NEFA	52.07 \pm 5.89	95.26 \pm 4.54 [#]	62.69 \pm 4.12 [*]
❖ Data are means \pm SEM. ❖ Data are expressed as mg/dl. ❖ #p < 0.05 compared with the normal control group. ❖ * p < 0.05 compared with the high fat fed group.			

Figure 1:- Changes in fasting plasma glucose level in different groups.

Plasma triglycerides level:-

The plasma triglycerides level was significantly increased in high fat diet treated group when compared to that of the normal control group as shown in table (1). Treatment with omega-3 fatty acid succeeded in significantly reducing plasma triglycerides level as shown in table (1) and fig. (2).

Plasma non- esterified fatty acid level:-

The plasma **non-esterified fatty acid** level was significantly increased in high fat diet treated group when compared to that of the normal control group as shown in table (1). Treatment with omega-3 fatty acid succeeded in significantly reducing plasma non- esterified fatty acid level as shown in table (1) and fig. (3).

Figure 3:- change in plasma non -esterified fatty acid in different groups.

Discussion:-

NAFLD can be considered the hepatic manifestation of the metabolic syndrome. Component of metabolic syndrome include insulin resistance, dyslipidemia, type 2 diabetes, hypertension and hypertriglyceridemia[13,14]. When the liver gets fatty because of NAFLD, the ability of insulin to inhibit hepatic glucose production is impaired. This hepatic insulin resistance leads to a slight increase in plasma glucose concentrations and stimulation of insulin secretion. The present study demonstrated that the level of fasting plasma glucose the high fat diet treated group was significantly increased compared to a normal control group. These data were in harmony with the previous study [15] which reported that a significance increase in fasting plasma glucose level with a defect in insulin signaling occurred in adipose tissue after HFD intake in rats compared with of control rats.

The present study found that treatment with omega-3 fatty acid, there was a significant decrease in the raised level of plasma glucose compared to HFD treated group. This in agreement with the previous studies [16,17], which reported that omega 3 fatty acid enhanced glucose uptake and improve insulin resistance in HFD-induced NAFLD in rats as omega -3 fatty acid may improve insulin signal transduction in adipocytes, affecting in turn, insulin-stimulated glucose transporter (GLUT4) in both skeletal muscle and adipose tissue accompanied with lower glycemia and insulinemia [18]. Moreover, omega-3 fatty acid could regulate both the activity and expression of the liver glucose-6-phosphatase, which could explain the protective effect with respect to the excessive hepatic glucose output induced by a high fat diet [19].

Hypertriglyceridemia and high levels of non-esterified fatty acids (NEFA) in the MetS promote abnormal accumulation of lipids within the liver, in a form of steatosis or non-alcoholic fatty liver disease (NAFLD)

(12). Thus, NAFLD affects up to 90% of obese people and nearly 70% of the overweight subjects, and it is thought to be the hepatic event in the MetS. In addition, NAFLD is commonly associated with MetS risk factors such as obesity, IR, hypertension and dyslipidemia [20]. Data presented in this study indicated that HFD intake resulted in a significant increase in the level of triglycerides and NEFA in rats compared to those of normal control. The observation of the current study was in accordance with those of the previous studies [21,22] which reported that there is an elevation of both triglycerides and NEFA in NAFLD in rats. The mechanisms governing the accumulation of TGs in hepatic cells include changes in hepatocellular metabolism, [23,24] propagating an imbalance between uptake and de novo fatty acid synthesis, VLDL formation and subsequent export, and oxidation capacity [25]. The present study also revealed that treatment with omega-3 fatty acid showed significant reduction in the level of triglycerides and NEFA in plasma compared to those of HFD treated group. This is in agreement with the previous [26,27] which supports the triglyceride-lowering properties of omega-3 fatty acid and decreased NEFA level in plasma. This could be explained by changes in transcription of several nuclear receptors are reported to mediate the TG-reducing effects of omega-3 fatty acid: sterol regulatory element binding proteins (SREBP), liver X receptor-alpha (LXR α), retinoid X receptor alpha (RXR α), farnesoid X receptor (FXR), and peroxisome proliferator-activated receptors (PPARs), and each play prominent roles in controlling lipid metabolism. Also the reduction of NEFA by omega-3 fatty acid due to suppressing in gene expression involved in new fatty acid synthesis and by inducing fatty acid oxidation in different tissues, such as, liver, skeletal muscle and white adipose tissue [28,29]

Abstract

Il n'est plus d'intérêt de rappeler l'importance du tourisme pour le développement socioéconomique des pays et des territoires. Le secteur devenant primordial dans les stratégies de développement de nombreux pays va attirer depuis près de trois décennies l'intérêt des chercheurs de tous les horizons qui vont chercher à le comprendre, l'analyser et identifier les facteurs clés de son développement. De même, le fort taux de croissance du secteur, sa forte résilience et résistance aux crises ainsi que les perspectives très encourageantes de son développement futur vont enflammer la course à la compétitivité des destinations touristiques, devenues les unités de base et centrales dans cette quête de compétitivité vont être au centre des politiques et des stratégies de développement touristiques, mais aussi, faire foisonner la recherche scientifique sur les conditions, les formes et les dimensions de cette compétitivité et sur les défis qu'elle impose et les formes, rôles et fonctions des structures de management de ces destinations pour y répondre efficacement et asseoir la compétitivité des destinations. Malgré, le caractère très récent de la recherche managériale sur ces différentes questions un nombre assez important de recherches ont été produites et un corpus théorique est entrain de se constituer et de s'établir.

Cet article, de nature exploratoire, se propose d'étudier, à l'aune de la littérature, le rôle et les fonctions des structures de gestion des destinations touristiques dans le cadre des nombreux défis imposés par la recherche de la compétitivité dans un marché touristique mondial évolutif, mutants et hautement concurrentiel. Plus particulièrement et à travers une synthèse de la littérature existante tant sur la compétitivité et ses implications pour les destinations touristique que sur les théories et modèles de management des destinations touristiques, nous cherchons à faire un état de la littérature sur ces questions et à relever le degré d'intégration des défis posés par la compétitivité dans les rôles et fonctions des structures de gestion des destinations touristiques.

Introduction:-

Depuis que le tourisme est reconnu comme secteur économique important, la question de la compétitivité des destinations touristiques est devenue à l'ordre du jour et intéresse aussi bien les gouvernements, les chercheurs que les organismes internationaux. En effet, le secteur touristique de part sa croissance continue et ses apports aux équilibres socioéconomiques de nombreux pays tant développés, émergents qu'en voie de développement est devenu un objet majeur au centre des politiques de développement prônées par les gouvernements et les organismes internationaux qu'un objet central dans les axes de recherche de plusieurs chercheurs à travers le monde. La nature mondialisée et hautement concurrentielle du marché touristique international fait que la réussite dépend largement de la position de ce secteur dans le marché international du tourisme (Gomezelj et Mihalic, 2008). De même, au centre du secteur, les destinations se pointent comme les unités centrales et importantes de l'analyse et de la mise en œuvre des politiques et stratégie touristiques. Et le succès d'une destination dans le tourisme international dépend en grande partie de sa compétitivité (Enright et Newton, 2004). Ainsi, La compétitivité des destinations devient un objet d'études central tant des chercheurs en tourisme que des organismes internationaux intéressés par le secteur qui s'intéressent tous à comprendre les dimensions et les enjeux de cette compétitivité et à étudier les aptitudes des entreprises, des territoires et des pays à soutenir la concurrence sur un marché mondial de plus en plus évolutif, saturé et intégré et à discuter plus particulièrement des fonctions et tâches fondamentales que doivent remplir les structures de management des destinations pour maintenir et améliorer leur compétitivité (Gomezelj et Mihalic, 2008).

Si la question des effets des structures organisationnelles pour la performance et le succès des organisations est un sujet largement discuté et débattu dans les sciences du management, la pertinence des structures organisationnelles pour la compétitivité des destinations touristiques est un sujet récent et qui depuis son initiation par Ritchie et Crouch en 1993 est devenu au centre de l'intérêt de la recherche scientifique sur le tourisme. Cette position centrale prise par cette thématique émane de la congruence de plus en plus constatée de la perception des destinations, par les chercheurs et les gouvernements, comme les unités compétitives du tourisme sur les quelles doivent ce centrer les questions de recherche et d'analyse et de mise en œuvre des actions de promotion et de développement visant l'amélioration de la compétitivité. Poser la question des effets des structures organisationnelles du management des destinations touristiques sur la compétitivité des destinations touristiques se heurte à plusieurs difficultés liées en premier lieu à la nature complexe et polysémique des concepts de compétitivité et de destination touristique et en second lieu à la problématique même de ces structures de gestion et de leurs fonctions.

Dans cet article de nature exploratoire nous chercherons à mettre en lumière, sur la base d'une étude documentaire relative aux différentes avancées théoriques sur la question, les fonctions, tâches et rôles que doivent assurer les structures de gestion des destinations pour faire face aux défis imposés par la compétitivité dans le secteur touristique. Cette quête nous mènera tout d'abord à s'interroger sur la question de la compétitivité des destinations touristiques et relever les principaux défis qu'elle impose aux organes de gestion des destinations touristique pour ensuite s'interroger sur ces différentes structures et leurs fonctions et enfin dégager les conclusions et les perspectives.

Sur les Destinations Touristiques et leur Compétitivite:-

Dans cette section nous tenterons de mettre en relief tous les aspects de la littérature relatifs aux concepts clés de notre recherche à savoir notre champ d'investigation – les destinations touristiques, le concept de compétitivité et celui de compétitivité des destinations touristique et les théories et modèles qui ont tenté de l'expliquer pour ensuite essayer identifier les principaux défis que cette compétitivité impose au management des destinations.

La destination touristique, un concept complexe et insuffisamment définie:-

Le succès du tourisme est étroitement associé au mot destination (Kadri et al., 2011). Toutefois ce concept de destination reste difficile à définir (Haywood, 1986). En effet, il existe une multitude de définition qui ont été données à la destination touristique. La littérature d'origine institutionnelle la définit généralement en référence à un espace géographique relativement cohérent, doté d'une certaine autonomie décisionnelle et présentant des caractéristiques attractives pour les visiteurs extérieurs auxquels des produits adaptés sont proposés (Commission européenne, 2000). L'Organisation Mondiale du Tourisme (OMT) la définit comme «tout territoire touristique accessible, incluant des infrastructures d'hébergement, de transport, ainsi que des activités, animations et services, constitue une destination. Cette destination, qui peut être définie par des limites physiques, thématiques ou administratives, adopte un ensemble d'images et de qualités distinctives qui lui donnent une identité.». Si l'on se réfère à présent à la *Resource-based view* (RBV), une destination peut être définie comme un ensemble de

ressources productives et humaines (Penrose, 1959) dont le stock disponible à un instant t résulte d'une économie d'accumulation des ressources (Cool, 2000) réalisée au fil des siècles par les générations successives (Dierickx et Cool, 1989). De même de nombreux chercheurs émanant de plusieurs disciplines ont tenté de cerner ce concept en lui apportant des définitions. Ainsi, GEE et al (1989) considèrent que les destinations touristiques représentent des domaines spécifiques que les voyageurs choisissent de visiter et où ils passent une période de temps significative. Mathieson et Wall's (1992) avancent qu'une destination touristique correspond à un endroit qui présente des caractéristiques qui sont connues par un nombre suffisant de visiteurs potentiels et qu'ils considèrent comme une identité qui attire les voyageurs quelques soient les attractions d'autres endroits. Pour Jenkins et Tosun (1996) les destinations touristiques sont des domaines ayant des caractéristiques naturelles ou créées par l'homme et qui attirent les visiteurs locaux et étrangers. De leur côté, Morant et al (1996) conçoivent la destination touristique comme une combinaison d'éléments interdépendants (ressources, infrastructure, transports, ...) qui produisent de la satisfaction des touristes. Kim (1998), lui, présente la destination touristique comme un produit exceptionnellement complexe de l'industrie du tourisme qui comprend, entre autres, le climat, l'infrastructure et de la superstructure (services et attributs naturels et culturels). D'autres auteurs adoptant des points de vue très étroits considèrent la destination comme une localité (Scaramuzzi, 1993), une station touristique, une zone touristique ou une région (Sancho, 1998).

De toutes ces définitions, il ressort qu'il ya un certain nombre de points communs partagés par les auteurs notamment la référence à l'aspect géographique (endroit, lieu, domaine, territoire, zone, région, localité), à l'aspect du fonctionnement en terme économique (marché, produits, services), l'aspect ressources et disponibilités (climat, infrastructures, ressources naturelles et culturelles,...) et à l'aspect psychologique (motivation du touriste et visiteurs).

Toutefois, malgré cette multitude de définition nous pouvons avancer que le concept de destination, au cœur de la compréhension du phénomène qu'est le tourisme (Botti et Séraphin, 2011), possède également un caractère complexe et souffre d'une insuffisance définitionnelle et de théorisation (Boualem et al, 2011) et ne fait pas l'objet d'un consensus commun, unanime et complet de tous les chercheurs. Il est ainsi, claire que le concept de destination pris dans sa totalité et sa complexité pose un problème de définition et d'approche. Une lecture de la littérature nous informe que le concept de destination est devenu en quelque sorte un mot-valise mythique (Hazebroucq, 2009 : 8) dont la signification est fortement corrélée à des considérations contextuelles (Kadri et al., 2011). Et cela est dû, selon les chercheurs, au fait de la domination scientifique de deux principales disciplines qui sont la géographie et le marketing qui ont été les premières à s'intéresser au concept de destination et qui l'on adapté à leur objet et imposer leur façon de l'aborder. La géographie, ayant été la première à s'accaparer le concept et l'étudier, a mis toujours en avant la dimension spatiale. Ainsi, les définitions telles que celles de l'Équipe MIT (2005, p. 11) et de Hayllar et al. (2008), montrent clairement le poids de la variable spatiale dans l'interprétation de ce concept (kadri et al, 2011). Pour l'Équipe MIT, «La destination est un lieu d'interactions territoriales qui relient ensemble les données socioculturelles, naturelles, patrimoniales et techniques» et pour Hayllar et al., « l'étude des territoires touristiques concerne d'abord l'étude des espaces.». Ainsi, nous pouvons relever que le concept de destination tel que abordé par cette discipline est resté, compte tenu de fait que les pratiques touristiques supposent mobilité et déplacement, attaché à une dimension spatiale malgré la nature de totalité et de complexité du phénomène touristique (Violier, 2009). Cet auteur, revient ensuite pour critiquer le réductionnisme de cette approche qu'il juge positiviste dans le sens où elle ne définit le lieu touristique que par la présence d'objet naturels ou culturels ; alors que pour lui, la présence d'objets ne suffit pas à assurer la présence des touristes. Selon cet auteur « la destination serait ce que les touristes perçoivent comme l'espace où ils mettront en œuvre des pratiques qui définissent alors le territoire touristique » (Violier, 2009). C'est dans le même sens que Caccomo (2006, p.136) avance que «c'est la fréquentation qui confère sa valeur à la destination» ou Ceriani et al. (2008) qui considèrent qu'un «lieu est touristique par les touristes qui le pratiquent et que, dialogiquement, il correspond plus ou moins au projet formé par les touristes». C'est une fois que la discipline du marketing va s'intéresser au concept de destination qu'un élargissement de sa conception va se constater. Sans occulter la dimension spatiale cette discipline va approcher la destination touristique comme un produit auquel peuvent s'appliquer les stratégies et les techniques de marketing applicables aux produits industriels. C'est déjà un géographe en la personne de Richard Butler qui a été le premier à présenter en 1980 un modèle, inspiré de la théorie du cycle de vie du produit, mettant en perspective la naissance et le déclin de la destination en fonction de l'évolution du nombre des visiteurs dans le temps. D'autres auteurs vont suivre cette nouvelle voie ouverte par Buttler et s'intéresser à la destination comme produit, notamment Tocquer et Zins (1999) qui définissent la destination touristique comme un type de produits et services touristiques issus de nombreux opérateurs privés et publics et Davidson et Maitland (2002) qui considèrent la destination comme un lieu de production de produits touristiques concentrant l'attention et les motivations des visiteurs. D'autres auteurs

comme Kye-Sung (1990), Etchner et Ritchie (1991), Stabler (1988), Telisman-Kosuta (1989) et Gallarza et al. (2002), quand à eux vont aborder la définition de la destination à partir de l'image que cette dernière renvoie à ses visiteurs. Dans cette perspective, la destination peut être un site, un village, une ville, une région, un pays ou une zone et la territorialité de la destination dépendra à la fois de l'effort de communication entrepris par cette dernière en sus des expériences vécues. De ce point de vue, le concept acquiert une dimension vitale dans la construction identitaire du territoire, dans la mesure où «la destination devient un lieu qui prend la dimension de destination», la marque de ce lieu (Gibson et Tiard, 1999, p. 79).

Comprendre le concept de destination touristique implique donc de faire la synthèse entre une approche géographique (la destination est avant tout un lieu qu'un ou plusieurs touristes ont décidé de visiter) et une approche marketing pour laquelle la destination est un territoire commercialisé. Dans cette perspective, la destination est appréhendée comme un territoire qui peut-être en lui-même un produit touristique, c'est-à-dire un ensemble de services supports (hôtellerie, restauration, transport...) qui gravitent autour d'éléments attractifs et qui, dans son ensemble, peut répondre aux besoins d'un segment de touristes (Botti et al., 2008).

Les travaux modernes issus des disciplines du management et de la gouvernance quant à eux ont élargi le champ de conceptualisation de la destination pour la rehausser au stade de système (Beritelli et al, 2007, Ruhanen et al, 2010, Laws et al. 2011, Zhang et Zhu, 2014). A ce titre Hazbroucq (2007) considère la destination comme «un « macroproduit » touristique qui repose sur un système complexe composé d'acteurs hétérogènes et disséminés sur le territoire» (Hazbroucq, 2007, p.121). Scott et al., (2008) avancent, de leur côté, qu'une destination peut être considérée comme «un groupe d'acteurs inter-reliés intégrés dans un réseau social. Ce groupe d'acteurs, malgré leur indépendance sont interdépendants dans leur recherche de la réponse aux besoins des touristes et visiteurs et participent tous à la fourniture de l'expérience clients. L'interaction de ces acteurs est complexe, dynamique et soumise à des chocs externes».

La compétitivité, un concept polysémique:-

Comme l'affirment Tixier et Mathe (1996), le souci de compétitivité occupe une position centrale parmi les éléments fondateurs des orientations politiques de l'entreprise. Pour cette raison, toute entreprise dont les activités veulent s'inscrire dans la durée doit intégrer cette notion dans son vécu quotidien. Le concept de compétitivité est un concept central dans la recherche économique et managériale. Issu en premier lieu du monde de l'entreprise où il s'appliquait à un processus industriel, à un produit ou à une firme et où il désignait la capacité de l'entreprise à réaliser des gains de parts de marché par rapport à ses concurrents ou à sa "capacité à réaliser des performances supérieures à la moyenne » (Marniesse et Filipiak, 2003) et comme « résultant de la capacité de l'entreprise à maintenir ses performances sur le long terme » (Muchielli, 2002). La compétitivité de l'entreprise est ainsi fonction de ses performances commerciales et se définit par rapport à sa position sur les marchés vis-à-vis de ses principaux concurrents. La notion de compétitivité fait allusion directe à celle de concurrence. Ainsi, être compétitif, c'est «être apte à affronter dans des conditions favorables la concurrence qui s'exerce dans un domaine de la vie économique et sociale».

Sur le plan des corpus théoriques managériaux ayant admis l'importance de la compétitivité, notre examen de la littérature nous montre que les principales approches se sont plus focalisées sur l'identification et l'analyse des sources et des facteurs de la compétitivité des entreprises. Ces corpus peuvent être distingués en deux principales approches : l'approche unidimensionnelle et l'approche pluridimensionnelle. La première approche est représentée par les travaux du célèbre bureau de consulting le Boston Consulting Group (B.C.G.) dont les adeptes voyaient en les *coûts* la principale source de compétitivité. En effet, pour le BCG, «dans un milieu concurrentiel, l'entreprise compétitive est celle qui a les coûts les plus bas, c'est à dire celle qui a su parvenir à l'utilisation la plus efficace des facteurs pour des coûts de facteurs équivalents et ce par le biais de l'expérience » (BCG, 1988). On peut déduire de cela que pour ce courant la compétitivité d'une entreprise se traduit exclusivement par la compétitivité de ses produits. Cette approche a été vivement critiquée par les chercheurs qui la considéraient d'une part réductrice pour avoir ramené la compétitivité à la seule dimension coût alors que d'autres dimensions telles que la qualité des produits, l'image du marque, les facilités de paiement sont à envisager dans une lutte concurrentielle et d'autre part sa non pertinence en matière d'analyse des coûts qu'elle aborde de manière séquentielle sans tenir compte des liaisons entre les activités et leur impacts sur ceux-ci. Ainsi, à la dimension coûts il est judicieux de tenir compte d'autres dimensions hors coût pour représenter la compétitivité. De l'autre côté, la lecture de la littérature concernant l'approche pluridimensionnelle nous renseigne que les tenants de cette approche ont développé plusieurs schémas d'analyse des sources, des facteurs et des déterminants de la compétitivité. En premier lieu, M. Porter

(M.E. PORTER 1985) dans son modèle de la chaîne de valeur a mis l'accent sur l'importance des liaisons entre les différentes activités comme sources de l'avantage concurrentiel de l'entreprise. De leur côté les adeptes de l'approche basée sur les ressources (RVC), (Wernerfelt, 1984 ; Rumelt, 1984 et Barney, 1986 et 1991), considèrent que l'avantage concurrentiel est à rechercher en interne. Ainsi, en concevant l'entreprise comme un portefeuille de ressources et non comme un portefeuille de Produits/Marché les tenants de l'approche ressources et compétences avancent que ce ne sont plus les besoins des clients qui déterminent la stratégie, mais se sont les ressources et les compétences que l'entreprise possède et l'acquisition de l'avantage compétitif provient de la combinaison des ressources au sein de l'entreprise et leur traduction en termes de stratégie à mettre en œuvre sur les marchés des biens. Cette approche considère que les entreprises sont capables d'accumuler des ressources et des compétences qui se transforment en avantage sur les concurrents si elles sont rares, créatrices de valeur, non substituables et difficiles à imiter (Barney, 1991; Dierickx et Cool, 1989). Ces ressources désignent généralement des actifs possédés de façon permanente ou contrôlés par l'entreprise en vue de concevoir et de mettre en œuvre sa stratégie. Barney (1991) les distingue en trois principales catégories: le capital physique, le capital organisationnel et le capital humain. Plus tard, trois autres catégories se sont venues s'ajouter en l'occurrence les ressources financières, les ressources technologiques (savoir-faire, brevets...) et les ressources réputationnelles (marques, notoriété...). Les compétences désignent de ce fait, la capacité organisationnelle de l'entreprise à pouvoir déployer ces ressources ou actifs sous forme de combinaisons efficaces et efficientes pour atteindre son objectif.

Certaines autres approches se sont attaquées à la question à travers un autre angle de vision notamment en mettant l'accent plus sur le processus causal de création de l'avantage compétitif plutôt que sur les ressources, les compétences ou les activités. A ce titre Lawrence et Lorsh (1986) estiment que la compétitivité d'une entreprise est principalement associée au degré de flexibilité de sa structure et sa capacité d'adaptation aux exigences de son environnement. Pour ces auteurs, rester compétitif exige une grande capacité d'adaptation aux changements de l'environnement qui se manifeste à travers d'une part l'adaptation de la structure organisationnelle, l'adaptation des compétences des dirigeants et l'insertion compétitive de l'entreprise dans son environnement. De leur côté, Hamel et Prahalad (1994), stipulent, contrairement aux avancées de porter qu'ils ont jugé trop défensives et à usage exclusif des entreprises dominantes et aux travaux de l'approche ressources qu'ils ont jugé trop centrés sur l'interne négligeant les mutations de l'environnement et des bases de la concurrence mais aussi de l'approche basée sur l'adaptation prônée par Lawrence et Lorch, que la compétitivité suppose une vision volontariste et offensive de la stratégie d'entreprise. Ce qu'ils qualifient d'*intention stratégique* (Hamel et Prahalad, 1994). En effet, selon ces auteurs, pour réussir et détenir un avantage compétitif, une entreprise ne doit pas s'adapter à son environnement mais le changer, le transformer à son profit. L'art du stratège est de modifier les règles du jeu concurrentiel et non de s'y conformer et le changement n'est plus une contrainte mais un objectif. Pour ces deux auteurs la stratégie ne se conçoit pas sans intentionnalité et l'entreprise doit avoir une ambition permanente de compétitivité partagée par tous ses membres, non directement reliée aux ressources actuelles détenues et permettant d'avoir un point de repère face à un environnement turbulent tout en créant une tension créatrice de valeur et de changement basée sur une vision claire des dirigeants permettant d'identifier les ressources et compétences manquantes afin d'atteindre le développement future souhaité.

Cette notion de compétitivité après avoir conquis le monde de l'entreprise va voir s'élargir son horizon dans les années 1980 pour s'appliquer à d'autres entités et dimensions, notamment le secteur, la branche, le territoire, la région et la nation. En effet, s'il est possible de s'interroger sur la compétitivité d'une entreprise, il est aussi possible de s'interroger sur celle d'une branche industrielle, d'un territoire ou encore de l'économie d'une nation, etc. Ainsi, de plus en plus va émerger une approche que l'on peut qualifier de macroéconomique de la compétitivité qui s'intéresse aux territoires et à la nation tout entière. Et de nombreuses définitions vont être données par les chercheurs à cette compétitivité. Ainsi, Debonneuil et Fontagne, 2003, p. 8) définissent la compétitivité d'une nation ou d'un territoire comme la « *Capacité à améliorer durablement le niveau de vie de ses habitants (...) et à leur procurer un haut niveau d'emploi et de cohésion sociale* ». Dans la même veine D'Andrea Tyson la conçoit comme l' « *Aptitude à produire des biens et des services qui satisfont au test de la concurrence sur les marchés internationaux et à augmenter de façon durable le niveau de vie de la population* ». De sa part l'OCDE présente la compétitivité comme « *la latitude dont dispose un pays évoluant dans des conditions de marché libre et équitable pour produire des biens et services qui satisfont aux normes internationales du marché tout en maintenant et en augmentant simultanément les revenus réels de ses habitants dans le long terme* ».

Cette transposition du terme «compétitivité» pour qualifier des entités géographiques a été très critiquée par plusieurs auteurs, en particulier par le prix Nobel Paul Krugman et M.E. Porter. Pour Krugman, «parler de la

compétitivité des pays n'aurait pas de sens » et « la plupart de ceux qui utilisent le terme de compétitivité ne s'y sont même pas arrêtés pour réfléchir à la chose » (Krugman, 2001, p. 20). De son côté, Porter estime que « chercher à expliquer la 'compétitivité' au niveau national est incorrecte. Ce qu'on doit comprendre, ce sont les déterminants de la productivité et le taux de croissance de la productivité. Pour trouver des solutions, on devrait focaliser, non pas sur l'ensemble de l'économie, mais plutôt sur des industries spécifiques ou encore des segments d'industrie" (Porter, 1990). Et il ajoute des années plus tard qu'« il n'y a même pas de définition admise du terme compétitivité appliquée à un pays. La notion de compétitivité est claire quand elle s'applique à une entreprise pas quand elle s'applique à un pays » (Porter, 1999, p.167). La majorité des auteurs ayant critiqué cette transition remettent en cause principalement l'incompatibilité des définitions de la compétitivité des territoires et des nations, elles mêmes porteuses de contradictions, avec les types de compétitivité de l'entreprise mais surtout les difficultés de l'utilisation d'outils conceptuelles identiques et les difficultés méthodologique d'établir des critères identiques pour mesure (Delaplace, 2011). Malgré tout cela, Aiginger, (2006) estime que même en présence de certaines controverses sur le concept, les travaux théoriques et les débats qui entourent la compétitivité des nations ont permis de faire émerger, une définition consensuelle

Somme toute, notre examen de la littérature traitant du concept de compétitivité nous révèle la nature polysémique, ambiguë, complexe et multidimensionnelle du concept et l'absence d'une définition unique et unanime du terme. Marniesse et Filipiak (2003) considèrent que « la compétitivité est une notion encore mal cernée ». Porter (1990) stipule que « son ambiguïté découle de l'existence d'une variété de définitions qui rend difficile une définition complète et indiscutable de la compétitivité ». Quand à Scott et Lodge (1985), ils expliquent cette complexité par la nature multidimensionnelle et relative du concept même de compétitivité. Par ailleurs, il ressort aussi que le concept est relatif et dynamique. Relatif du fait qu'il change avec le niveau de l'analyse menée (nation, secteur, entreprise), le bien analysé (bien homogène ou différencié), et enfin l'objectif de l'analyse et dynamique dans le sens où la compétitivité n'est pas un concept statique et est étroitement lié aux conditions économiques du pays ainsi que les conditions du marché international.

La compétitivité des destinations touristiques : entre recherche académique et modèles opérationnels:-

Malgré que le tourisme soit devenu un secteur économique très important dans la compétitivité des pays et des territoires, il est paradoxal de relever qu'il est resté un des parents pauvres de la recherche scientifique et un domaine d'étude récent. Certes, les difficultés à l'appréhender compte tenu de l'absence d'une définition unanime et universelle, les mythes et les préjugés qui lui sont associés et les difficultés de mesure de sa productivité ont fait que les économistes ont longtemps tardé à s'y intéresser et à lui accorder la place qu'il mérite comme secteur économique à part entière et comme sujet de recherche. C'est ainsi, que c'est à partir des années 1970 que les économistes et après eux les géographes ont commencé à l'étudier après que les services et plus particulièrement le tourisme sont devenus très importants dans les PIB des pays développés. Les sciences de gestion vont emprunter la voie à ces disciplines mais plus tardivement vers la fin des années 1980. Reconnu comme multiforme et multisectoriel est donc multi-produit et multi-métier (Botti et Peypoch), le tourisme nécessite pour sa compréhension et son développement de faire appel à plusieurs facettes du management (stratégie, politique, marketing, gestion des ressources humaines, gestion financière,...). Cet engouement vers le secteur va rapidement fait naître un foisonnement de travaux de recherche d'abord en Amérique du Nord (Bornhorts, Brent Richie, et Sheehan, 2010; Minguzzi, 2006) puis en Europe (Escadafal (1997), Dewailly (2006), Lozato Giotart et Balfet (2004) et Maunier (2007)). Rapidement l'intérêt pour la gestion et la compétitivité des destinations touristiques va passer au premier plan de l'intérêt des chercheurs après que celles-ci vont être reconnues d'une part, comme les unités de bases sur lesquelles repose la compétitivité du tourisme en général et des territoires en particuliers et d'autre part, de la prise de conscience que la concurrence internationale dans le secteur se fait de plus en plus entre destinations et non entre entreprises. En effet, Dwyer et al. (2000) nous enseignent qu'il est très utile pour l'industrie et le gouvernement de comprendre quels sont les points forts et les points faibles d'un pays par rapport à ses concurrents en matière de tourisme et de savoir comment et pourquoi la compétitivité d'une destination change. Teece et al. (2008), pour leur part, soulignent que la nature dynamique de la concurrence en matière de tourisme exige des destinations de combiner et gérer leurs ressources touristiques de manière à développer un avantage concurrentiel. Par conséquent, les destinations doivent faire face au défi de gérer et organiser leurs ressources rares de manière efficiente afin de fournir une expérience de vacances supérieure à d'autres expériences dans d'autres destinations (Cracolici et Nijkamp, 2008). Cet engouement pour la compétitivité des destinations touristiques va se traduire par de nombreuses recherches et travaux académiques mais aussi par le développement de modèles opérationnels sur la question.

La compétitivité des destinations touristique dans la recherche académique:-

Au niveau académique, notre examen de la littérature portant sur le sujet nous montre que de nombreux travaux de recherche ont porté sur la compétitivité touristique (Chon et al., 1991 ; Ritchie et Crouch, 1993 ; Hu et Ritchie, 1993; Gartner, 1993 ; De Keyser et Vanhove, 1994, Evans et Johnson, 1995 ; Dann, 1996 ; Pearce, 1997 ; Kozak et Rimmington, 1999 ; Crouch et Ritchie, 1999 ; Ritchie et Crouch 2000, Hassan, 2000 ; Mihalic, 2000 ; Thomas et Long, 2000 ; Gallarza et al., 2002 ; Dwyer et Kim, 2003; Kozak, 2002; Ritchie et Crouch 2003 ; Gonzalez et Falcon, 2003 ; Enright et Newton, 2004 ; Ruhanen, 2007 ; Cortes et al. 2007; Gomezel et Mihalic, 2008, Cracolici et Nijkamp, 2008.). Crouch l'une des références incontestée du domaine, a relevé dans sa revue de la littérature sur le sujet que l'analyse de la compétitivité des destinations touristiques ne peut se faire qu'en termes relatif et qu'elle peut viser l'étude d'un territoire particulier (par exemple Hong Kong pour Enright et Newton – 2004) ou l'analyse d'une des modalités de la compétitivité (la compétitivité prix pour Dwyer, Forsyth et Rao, 2002 ou le marketing de destination pour Buhalis, (2000) et Crouch, (2011).

Plusieurs constats peuvent être dégagés de cette littérature. Le premier est que ces travaux n'ont pas porté sur le développement d'un cadre théorique global définissant la compétitivité générale de la destination touristique mais ils se sont intéressés plus particulièrement à certaines destinations, à certaines formes de tourisme ou à certaines formes de tourisme dans certaines destinations. Le deuxième est la variation de l'échelle de destination retenue qui pouvait être des pays (ex : Omerzel Gomezel et Mihalic, 2008), des régions (ex : Cracolici et Nijkamp, 2008) ou des villes (ex : Clavers-Cortés et al., 2007). Le troisième est que certains travaux ont également eu des apports significatifs quant à l'opérationnalisation de la compétitivité touristique en proposant des méthodologies de mesure sophistiquées de cette compétitivité (ex : Enright et Newton, 2004). Le quatrième est que certains travaux de recherches ont porté sur des aspects particuliers de la compétitivité des destinations, y compris le positionnement des destinations (ex : Chacko 1998), les systèmes de gestion des destinations (ex: Baker, Hayzelden et Sussmann 1996), la commercialisation des destinations (ex : Buhalis 2000), la compétitivité des prix (ex :Dwyer, Forsyth et Rao 2000a, 2000b, 2000), la gestion de la qualité (ex : Go et Govers 2000), l'environnement (ex : Hassan 2000, Mihalic 2000), le tourisme de nature (ex :Huybers et Bennett 2003), la gestion stratégique (ex : Jamal et Getz 1996; Soteriou et Roberts 1998) et des voyages à forfait (ex :Taylor1995), l'image et l'attractivité des destinations au niveau touristique (ex : Dann, 1996 ; Chon et al., 1991 ; Hu et Ritchie, 1993 ; Gallarza et al., 2002 ; Gartner, 1993). Malgré ce foisonnement de travaux de recherche sur le concept de compétitivité des destinations touristiques peu d'auteurs ont tenté de lui donner une définition précise et les définitions qui existent ne montrent pas l'existence d'une définition standard, universelle et unanime. Ainsi, selon (Hassen, 2000), la compétitivité d'une destination touristique signifie «la capacité d'une destination à créer et intégrer des produits à valeur ajoutée en maintenant les ressources locales et préserver sa position sur le marché par rapport aux concurrents». Dans le même sens, Dwyer et al. (2011) retiennent que « la compétitivité d'une destination est liée à sa capacité à proposer des produits et services plus «performants » que ceux d'autres destinations pour satisfaire les besoins des visiteurs. ». De leur côté, Ritchie et Crouch (2000) la définissent comme «la capacité de la destination à créer de la valeur ajoutée et l'augmentation, par conséquent, du bien être national par la gestion des prestations et des processus en intégrant les relations entre eux dans un modèle économique et social». Adoptant une optique marketing D'Hauteserre (2000) parle de la capacité d'une destination de maintenir sa position sur le marché et de chercher l'amélioration au fil du temps afin de faire face à la concurrence. D'autres chercheurs comme Cracolici et Nijman (2008), Barney (1991); Grant, (2005) et Wernerfelt, 1984, sont allés s'attaquer à la question en se basant sur le mouvement des ressources et compétences pour expliquer et définir ce concept. Ces auteurs considèrent ainsi les destinations comme une combinaison de ressources physiques, naturelles, culturelles et humaines qui sont rares, inimitables et non-substituables et qui peuvent générer des compétences utiles pour créer et développer un avantage concurrentiel (Barney, 1991). Selon ces auteurs, la compétitivité d'une destination dépend de ses ressources tangibles et intangibles, de son management et de ses décisions.

De notre examen de la littérature académique, il paraît bien évident que la compétitivité des destinations touristique est un sujet qui a retenu fortement l'attention des chercheurs mais il apparaît également fort évident que les concepts de compétitivité en général et de compétitivité touristique en particulier, aisés à définir en apparence, posent d'importants problèmes de mesure (Cracolici et Nijkamp, 2008). Porter (1990) soulignait déjà l'ambiguïté du concept de compétitivité. Du fait de l'ambiguïté et du caractère multiforme de ce concept, les auteurs ont ainsi utilisé des méthodologies diverses pour mesurer la compétitivité touristique. Kim (1998) notait déjà que les chercheurs, pour caractériser l'attractivité d'une destination, ont utilisé une grande variété de critères, même si certains d'entre eux étaient communs à la plupart des travaux. Dwyer et al. (2011) notent pour leur part qu'un problème majeur, caractérisant toute tentative d'établir des indices de compétitivité, est lié à l'intégration de critères

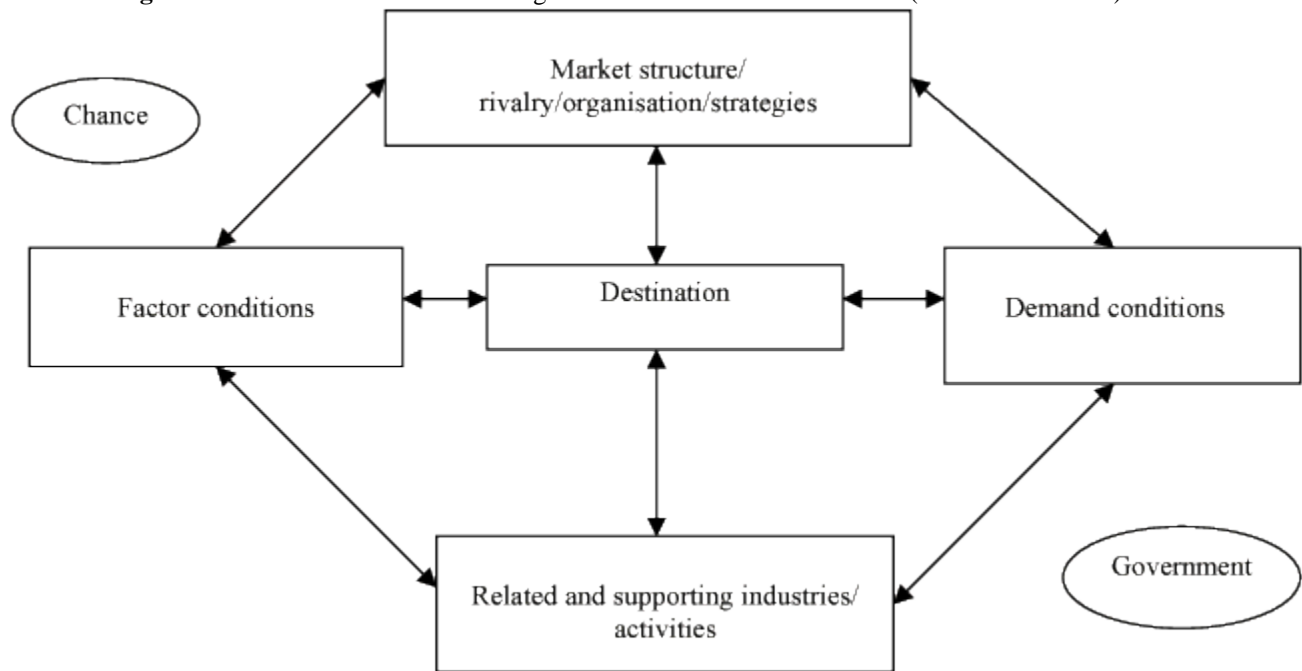

«objectifs» de compétitivité (ex: évolutions des parts de marché, nombre d'emplois issus du tourisme...) et «subjectifs (ex : richesse de la culture, qualité du service, beauté des paysages...). Il n'existe pas ainsi actuellement de méthode unanimement reconnue permettant d'intégrer simultanément ces deux types de critères (Dwyer et Kim, 2003).

Les modèles de compétitivités touristiques:-

En réalité il n'existe pas à proprement dit de modèles de compétitivités qui ont été élaborés spécifiquement aux destinations touristiques mais certains chercheurs qui ont été aussi reliés par certains organismes internationaux voulant modéliser la compétitivité des destinations touristique, sont allés, sur la base des théories économiques de l'avantage comparatif et des travaux de Porter (1990) sur les avantages compétitifs, proposés des modèles génériques visant à cerner l'ensemble des particularités et des dimensions de la compétitivité des destinations touristiques. Nous nous contenterons dans ce point de présenter l'application du modèle de Porter et de présenter l'un des modèles les plus connu, le plus influent et dominant dans la littérature à savoir celui développé par Crouch et Richie en 1999.

Le Diamant de M. Porter:-

Le modèle mis au point par M. Porter (1990) dans son ouvrage la compétitivité des nations est celui qui va être plus tard appliqué au secteur du tourisme (THR - Barcelone). Porter affirme que le succès d'une entreprise ne dépend pas uniquement de sa stratégie ni de son positionnement, mais également de son intégration au sein de son environnement. Sa thèse centrale repose sur l'idée que les régions, les destinations, les « clusters » connaissent un certain succès au niveau d'activités ou de secteurs partiels, car leur environnement local est le plus dynamique et le plus stimulant et encourage les entreprises à préserver leur avantage. Il s'agit de la thèse centrale. Dans destinations touristiques il existe des groupes de sociétés directement ou indirectement liés au tourisme et qui concentrés sur une zone géographique spécifique et fonctionnent comme des clusters. La nature cosmopolite du secteur touristique, nécessitant différentes entreprises de taille et d'activités différentes mais liées par le même marché, stimule ce processus de regroupement. Dans son modèle Porter explique que la l'avantage concurrentiel d'une nation ou d'un territoire repose sur quatre facteurs interdépendants qui, ensembles, forment un « **diamant** » selon le terme utilisé par Porter pour faire référence à ces points déterminants. Pour Smeral (1996) un point de départ pour le développement de stratégies pour l'amélioration de la position concurrentielle d'une destination touristique est à chercher dans le système dynamique constitué par les facteurs déterminant développé par Porter. Ainsi par référence au modèle de porter nous pouvons bâtir les fondements de la compétitivité de la destination. Appliqué aux destinations touristiques le modèle se présentera comme suit :

Fig. 1:- Points déterminants des avantages concurrentiels des destinations (Diamant de Porter).

Ces points déterminants sont:-

1. **Les conditions de facteurs.** Renvoient à la détention de dotations factorielles naturelles, culturelles ou artificielles (attractions naturelles, ressources culturelles et historiques, infrastructures d'hébergement, de transport NTI,..., ressources humaines, prix des facteurs, efficacité de la production,...) fortes et nécessaires à la concurrence dans le secteur du tourisme et sans les quels il ne peut y avoir d'activité touristique.
2. **Les conditions de la demande.** Élément majeur et déterminant important de l'avantage concurrentiel les conditions de la demande renvoient pour d'une destination à plusieurs éléments dont principalement, la taille du marché local, la structure et la diversité du marché, la position sur les marchés à croissance rapide, le renforcement de la culture touristique des consommateurs et des sociétés d'accueil (Cooper et al., 2001), la protection du touriste-consommateur,...
3. **Les secteurs d'activité associés et impliqués.** La position concurrentielle d'une destination dépend et peut être renforcée également par la diversité et la qualité des fournisseurs installés dans le territoire (transporteurs, services connexes de haute qualité (système financier, de télécommunication, de santé), industrie agroalimentaire, installations sportives, de loisirs et culturelles, etc.
4. **Structure du marché, rivalité, organisation et stratégie.** Ces conditions sont très importantes et renvoient à la manière dont la destination et ses éléments sont organisés et gérés notamment la disponibilité d'un plan stratégique soutenu par toutes les parties impliquées, à la fois des secteurs public et privé, d'une stratégie marketing et promotionnelle claire et efficace, une image de marque forte, des mécanismes de coordination efficaces, des organes de gestion bien structurés et gouvernés.

A ces quatre facteurs déterminants viennent s'ajouter deux autres facteurs non moins importants pour la compétitivité de la destination à savoir la chance et le gouvernement. Ces deux facteurs peuvent avoir une influence significative sur le degré de compétitivité de la destination et son succès notamment à travers d'une part les actions publiques qui peuvent être soit un facteur stimulant ou au contraire nuisant au développement du tourisme (ex : réglementation sur les hôtels, change, fiscalité, accueil et information des touristes, plan de circulation et d'aménagement, ...) et d'autre part, à travers la qualité de la gouvernance (implication ou non de toutes les parties prenantes).

A noter que le «diamant» se présente comme un système de renforcement mutuel dans le sens où il y a interdépendance entre les différents déterminants. Ainsi, par exemple, des conditions favorables de la demande n'engendreront un avantage concurrentiel que si l'état de la rivalité est suffisant pour que les entreprises (par ex., les hôtels) puissent leur répondre. De même, les avantages qui existent au niveau d'un point déterminant peuvent également créer ou améliorer les avantages d'un autre.

Le Modele De Crouch Et Ritchie:-

Le modèle considéré le plus influent en matière de compétitivité touristique au regard des chercheurs et praticiens reste celui développé par **Crouch** et **Ritchie** en 1999. Ces deux auteurs, en se basant eux aussi sur le modèle du diamant de Porter mais en soulignant les limites des travaux de recherche précédents et des modèles généraux qui ont été élaborés sur la compétitivité des destinations qui selon eux malgré qu'ils ait produits une liste assez exhaustive des déterminants de la compétitivité des destinations ces déterminants n'ont pas tous une importance ou une influence égale pour cerner toute les dimensions concurrentielles de la destination. Ces auteurs estiment que le niveau de recherche sur la question de la compétitivité des destinations est assez maintenant développée pour pouvoir passer du simple listage des attributs et déterminants de cette compétitivité pour se recentrer sur l'étude de l'importance relative de chaque attribut et déterminant. Pour eux, l'impact d'un attribut de compétitivité sur la performance relative d'une destination est fonction à la fois de l'importance de l'attribut ainsi que du degré de variation des destinations sur l'attribut et bien qu'un attribut puisse être considéré comme important, il ne sera pas un déterminant de la compétitivité s'il ya peu de différence entre les destinations sur cet attribut. Sur fond de ces limites ils vont développer un modèle conceptuel de la compétitivité des destinations touristiques qui repose sur quatre composants majeurs : « les ressources et attractions centrales », « les facteurs et ressources supports », « le management de la destination » et les « déterminants ». Les « ressources et attractions centrales » comprennent les éléments fondamentaux de l'attractivité d'une destination. Ce sont les raisons fondamentales qui expliquent pourquoi un visiteur choisit une destination plutôt qu'une autre. Les facteurs inclus dans cette composante sont la physiographie, la culture et l'histoire, les liens avec la destination, les activités, les événements et les infrastructures touristiques. La physiographie correspond au paysage et au climat, les liens avec la destination renvoient aux relations personnelles avec des résidents du pays émetteur et les infrastructures touristiques comprennent essentiellement le logement, les services de restauration, les moyens de transport et les attractions principales. L'image étant généralement considérée comme une composante importante de la compétitivité d'une destination, des attributs utilisés pour caractériser l'image comme par exemple le climat, les paysages ou l'hôtellerie, sont ainsi fréquemment utilisés pour mesurer la compétitivité touristique (Enright et Newton, 2004).

Les «facteurs et ressources supports» sont les facteurs susceptibles de soutenir le succès d'une destination au niveau touristique. Ils incluent notamment les infrastructures globales d'une destination, les établissements d'enseignement et les facteurs liés à l'accessibilité de la destination.

La troisième composante de la compétitivité touristique, à savoir le « management de la destination», se focalise sur les activités pouvant influencer les autres composantes, premièrement en améliorant l'attractivité des ressources et attractions centrales, deuxièmement en renforçant la qualité et l'efficacité des facteurs supports et enfin en adaptant les contraintes imposées par la quatrième composante à savoir les «déterminants».

Alors que les aspects de cette composante les plus étudiés sont le marketing de la destination, des auteurs estiment qu'un spectre plus large d'activités liées au management devrait être pris en compte comme l'organisation et la maintenance des ressources et attractions clefs, ainsi que les services liés à ces ressources et attractions.

La quatrième composante est les « déterminants ». Elle inclut les facteurs qui peuvent modifier, éventuellement d'une manière négative, l'influence des trois autres composantes.

Ces facteurs sont par exemple la localisation, la structure des coûts et la sécurité. Ces facteurs ne sont pas contrôlés par les acteurs du tourisme mais peuvent jouer un rôle crucial dans la compétitivité d'une destination (Enright et Newton, 2004). Crouch et Ritchie (1999) prennent en compte également dans leur modèle de la compétitivité touristique le micro et le macro environnement de la destination qu'ils estiment être inter-reliés et affectant simultanément "le cœur de la compétitivité" de la destination. Le microenvironnement renvoi aux aspects propres à la destination touristique et à ceux des acteurs principaux du tourisme dans la destination (T.O, Agences de voyages, les résidents, les touristes visiteurs, les employés des professions touristiques, les médias, les groupes de pression,...) pouvant faire l'objet de comparaison entre destinations concurrentes., les groupes d'action et de pression, les médias, les institutions financières et sociétés d'investissement, les administrations publiques, et l'environnement immédiat). Tandis que le macro-environnement concerne les éléments extérieurs à l'environnement immédiat de la destination mais pouvant exercer une certaine influence sur sa compétitivité. Il s'agit notamment, de l'attention portée par les autorités à l'environnement naturel et à sa protection, de la conjoncture économique internationale, des problèmes démographiques, de l'évolution technologique, etc.

En définitive, nous pouvons retenir que le modèle de Crouch et Ritchie donne une indication claire sur les différents éléments sur lesquels repose la concurrence entre destinations touristiques et enseigne que la compétitivité et la supériorité d'une destination sur le marché touristique dépend de sa capacité à gérer et organiser ses ressources de manière rationnelle et efficace.

Les Structures de Gestion des Destinations : Nature, Typologie et Fonctions:-

Parallèlement au développement des travaux sur la compétitivité des destinations touristiques, la question des structures organisationnelles et de leur pertinence pour la compétitivité des destinations a été au centre de la recherche sur le tourisme. Ritchie et Crouch ayant discuté cette question en 1993 (Ritchie et Crouch, 1993), puis l'ayant reprise dans leur modèle en 2003, (Crouch et Ritchie, 2003) considèrent qu'à part dans le cas spécifiques des *resorts*, aucun prestataire et acteur du territoire de la destination ne peut prétendre répondre à lui tout seul à la demande des touristes et prendre lui-même en main leur expérience globale. Selon eux, comme système d'offre la destination, même s'elle ne constitue pas une entité commerciale légale, elle est composée d'un ensemble d'entreprises, d'organisations et de groupes qui œuvrent ensemble de manière semi-organisée, en partie coopérative, mais qui sont finalement motivés en grande partie par leur propre intérêt et doit être exploitée comme une entreprise (Ritchie et Crouch, 2003, p : 96). Dans cette perspective, les deux auteurs ont mis en lumière l'impact du management de la destination et le rôle de la Destination Management Organization (DMO) dans la compétitivité des destinations (Botti et Peypoch, 2011).

Après avoir jeté les éclairages nécessaires sur la problématique de la compétitivité des destinations touristiques et les défis qu'elle impose au management de la destination, nous chercherons dans cette section, toujours sur la base d'une recherche documentaire, comment la littérature aborde les structures de management des destinations et d'identifier le degré de correspondance et de concordance de ces structures et plus particulièrement de leur rôles et fonctions par rapport aux défis de la compétitivité soulevés et des exigences d'un management efficace des destinations touristiques.

Panorama des structures du management des destinations touristiques:-

Notre propos ici n'est pas de traiter des structures de gestion dans le cadre institutionnel distinguant les organes intervenants dans la gestion du tourisme aux échelles nationales, régionales et locale mais il s'agit de présenter et de discuter des structures de gestion des destinations touristiques telles qu'elles ont été définies et présentées dans le point précédent. L'examen de la littérature sur les structures de management des destinations touristiques nous montre qu'il existe cinq types de structures allant des structures basées sur le marché aux structures de type hiérarchique. Ces différents types de structures et leurs caractéristiques sont présentés dans le tableau suivant :

Tableau n°1:- Les structures idéales des destinations touristiques.

		Structures marché	Structures en réseaux			Structures hiérarchiques
			Contrats implicites	Contrats explicites		
				Système décentralisé	Système centralisé (Entreprise Focale)	
Nombre d'acteurs		Élevé	Moyen	Moyen	Faible	
Taille des acteurs		PME	PME	PME et un grand groupe	Un grand groupe ou entreprise	
Coûts de transaction		Très élevés	Elevés	Moyens à faibles	Très faibles	
Objectifs des acteurs		Indépendant s	Interdépenda nts	Interdépenda nts	Dépendants	
Leadership de la destination		Aucun Leader dominant	Réseaux	Réseaux	Entreprises dominantes dans le réseau	
Marketing de la destination		Individual	RTO/ individuels	RTO fort / individuel	Entreprise dominante/ individuel	
Management de la destination		Absente	Collectivités locales	RTO/ gouverneme nt local	Entreprise dominante/ gouvernement local	
Coordination de la communication entre les parties prenantes		Absente	Limitée	Peu de coordination	Coordination entre les grands acteurs	
					Fortement intégrée/ stratégique	

Source : Réalisé sur la base des travaux de Powel (1990) et de Bieger (2006)

Comme mentionné ce tableau distingue cinq types de structures de gestion des destinations allant de la structure du type marché, caractérisée par la présence d'un grand nombre d'entreprises pour l'essentiel de petites taille offrant individuellement leur services aux touristes, poursuivant leur propres objectifs, menant leur propres actions marketing et commerciales et se livrant à une concurrence intense sans aucune coordination à l'autre extrême de type corporate modèle dominant en Amérique du Nord et caractérisé par l'existence d'une société ou groupe privé («business corporation» selon Flagestad, 2001) dominant qui, en agissant au nom de la collectivité, cherche à atteindre des objectifs d'efficience et de profit à travers la réduction des coûts de transaction en internalisant tous les services nécessaires aux touristes et opère par intégration ou par contractualisation avec les autres sociétés de services qui sont généralement de petites tailles. Ce groupe détient le pouvoir politique de prise de décision en matière de gestion, de développement et de commercialisation de la destination et tous les autres acteurs et parties prenantes de la destination, y compris la sphère publique, dépendent de ce groupe qui opère à leurs égard par un marketing et une communication stratégiques et hautement intégrés. Entre ces deux types de structures extrêmes, il existe tout un continuum de configurations possibles épousant des formes de réseaux plus ou moins formalisé du point de vue opérationnel et de coordination. Dans ces formes en réseau la forme des contrats implicites caractérise les destinations dirigées par un grand nombre d'acteurs sous la coordination d'un organisme touristique régional (OTR). Dans ce type de structure, l'absence d'une réelle coordination formelle fait que les coûts de transaction restent assez élevés et le comportement coopératif des acteurs est dicté plus par la nécessaire interdépendance de leurs activités et la peur de sanctions en cas de concurrence déloyale et non par l'engagement volontaire dans une stratégie de coopération (Williams, Harkins et Latane, 1981). Egalement dans ce type de destination c'est en général l'autorité publique locale qui assure la fonction du management alors que le marketing et la commercialisation sont assurés par les entreprises et le cas échéant par l'organisation touristique régionale. Dans d'autres destinations les relations entre les différents acteurs peuvent être formalisées par une contractualisation explicite. Cette contractualisation favorise la coopération et la coordination réduisant les risques et les coûts de transaction et rendant la gestion et la commercialisation de la destination plus efficace (Granovetter, 1973). Ce type de structure admet deux principales variantes. Soit un système de nature décentralisé dans le quel les entreprises, dont la grande majorité sont des PME, se constituent en réseau qui prend en charge la gestion et la promotion de la destination en s'aidant ou non par organisme touristique régional. Soit un système de nature centralisé avec la présence d'une entreprise dominante qui peut mobiliser assez de ressources et de pouvoir et qui joue le rôle de leadership et fixe les stratégies de développement et de promotion de la destination qui sont suivies par les autres acteurs. Dans ce type de structure étant donné que cet acteur stratégique ne peut à lui tout seul assurer tous les services et toute l'expérience aux touristes et visiteurs il reste dépendant en partie des autres prestataires avec lesquels il doit collaborer et coordonner les actions de communication et de marketing.

Fonctions principales de gestion des destinations:-

En retenant uniquement les travaux de recherche et les études qui ont porté sur le management des destinations, les principales fonctions de ce management répertoriées selon l'ordre de leur nombre et fréquence de citation par les différents auteurs sont reprises dans le tableau suivant.

Tableau n° 2:- Fonctions du management de la destination.

Fonctions	Auteurs
Marketing de la destination, branding et positionnement	Aberg (2014), Anderson (2000), Crouche et Richie (1999), Harril (2005), Jamieson (2006), Lasser et Beritelli (2013), Longjit et Pearce (2013), Morrisson (2013), Pearce et Schänzel (2013), Pearce (2014b), Pechlaner, herntrei et Kofink (2009) et OMT (2007)
Planification, suivi et évaluation des destinations	Aberg (2014), Anderson (2000), Crouche et Richie (1999), Dweyr et Kim (2003), Fuchs et Weiermair (2004), Jamieson (2006), Lasser et Beritelli (2013), Morrisson (2013), Pearce (2014b), Rygllová (2008) et OMT (2007).
Développement des produits/services	ARTN (n.d), Ivanis (2011), Jamieson (2006), Lasser et Beritelli (2013), Morrison (2013), Pearce (2014b), Pechlaner et al (2009), Risteski, Kocevski et Arnaudove (2012) et OMT (2007).
Recherche, gestion de l'information et renforcement des connaissances	Anderson (2000), ATRN (n.d.), Crouch et Richie (1999), Harrill (2005), Morrison (2013), Pavlovitch (2003), Pearce (2014b) et OMT (2007).
Gestion des ressources, gestion de l'environnement	Crouch et Richie (1999), Dwyer et Kim (2003), Fuchs et Weiermai (2004), Longjit et Pearce (2013), Pavlovitch (2003), Risteski et al. (2012) et Rygllová (2008).
Gestion des visiteurs, gestion de l'expérience des visiteurs, gestion des risques d'aventure, gestion de la sécurité	Anderson (2000), Crouch et Richie (1999), Longjit et Pearce (2013), Pavlovitch (2003), Pearce et Schänzel (2013) et Risteski et al. (2012)
Construction de relations	Crouch et Richie (1999), Dwyer et Kim (2003), Jamieson (2006), Morrison (2013) et OMT (2007).
Développement des ressources humaines, formation	Dwyer et Kim (2003), Longjit et Pearce (2013), Pearce (2014b) et OMT (2007).
Responsabilité organisationnelle, leadership et partenariat	Anderson (2000), Crouch et Richie (1999), , Jamieson (2006), Risteski et al. (2012)
Lobbying	Lasser et Beritelli (2013)
Coordination du service	Lasser et Beritelli (2013),
Fourniture et diffusion d'Informations	Pearce et Schänzel (2013)
Régulation et canalisation de la pression touristique	Laws (1995)
Gestion du cycle de vie	Sainaghi (2006)
Gestion de problèmes particuliers (par exemple, capacité de charge)	Sainaghi (2006)
Soutien aux entreprises	OMT (2007)

Source: Elaboré sur la base des travaux de Douglas G. Pearce (2015)

De la lecture de ce tableau nous pouvons relever en premier que le management des destinations touristiques, compte tenu de la complexité et de la multi-dimensionnalité de celle-ci exige un grand nombre de tâches et de fonctions portant sur plusieurs aspects. Ces fonctions, telles qu'elles ressortent de ces travaux et études, vont du marketing et de la commercialisation, à la planification de développement de la destination et de la formulation des stratégies, à la gestion des ressources et de l'environnement, au développement de l'offre et des produits et activités, la recherche et l'innovation, le suivi et l'évaluation et d'autres éléments spécifiques, la gestion de l'information et des connaissances, la gestion des touristes et visiteurs mais aussi à la gestion et de la collaboration et de la coordination entre les différents acteurs et les différentes parties prenantes agissant dans le territoire de la destination. Certaines autres dimensions aussi importantes dans la gestion des destinations ont été peu citées par les auteurs, tel est le cas du lobbying, l'information des touristes et visiteurs, la gestion du cycle de vie de la destination, la gestion de la capacité de charge, la régulation et la canalisation de la pression touristique et le soutien aux entreprises des différentes branches du secteur touristiques.

L'autre constat fondamental à relever de cette lecture de la littérature sur la question est que malgré l'existence d'un certain accord entre les chercheurs sur nombre de fonctions du management de la destination il reste qu'aucun de

ces travaux et de ces recherches n'a discuté ni la question de la pertinence, de la viabilité et de l'efficacité de telle ou telle de ces fonctions, ni celles qui sont effectivement réalisées dans les destinations.

Les fonctions de l'organisme de gestion de destination (OGD ou DMO):-

Plusieurs autres chercheurs se sont concentrés non pas uniquement sur les fonctions du management de la destination mais sont allés se poser des interrogations sur celles qui devraient être assurées par les organes ou structures de gestion de la destination, appelées généralement Organisme de Gestion des destinations (OGD) ou par son équivalent anglais *Destination Management Organisation* (DMO). Recherchant à identifier les rôles, formes et fonctions de ces structures, les auteurs se sont heurtés en premier lieu à la problématique de cette appellation de DMO. En effet, dans sa conception anglo-saxonne le 'M' dans le terme DMO renvoi au marketing plutôt qu'au management. Alors que dans son acception la plus courante, notamment celle de l'OMT, le terme DMO est désigné comme Organisme de Gestion des Destinations. D'autres auteurs sont même allés utiliser les deux acceptations pour parler d'organisme de gestion et de marketing des destinations. Il est à noter qu'au fond cette querelle entre auteurs ne porte pas sur le côté sémantique du terme mais plutôt sur l'intérêt de préciser exactement ce que reflète l'appellation en termes de fonctions et d'activités de base assurées par cette organisation dans le cadre d'une destination. Comme pour le cas des fonctions du management des destinations nous présenterons les fonctions de l'OGD de la destination en fonction de l'ordre et fréquence de citation par les différents auteurs. Les résultats de notre lecture de la littérature sur cette question sont repris dans le tableau suivant.

Tableau n° 3:- Les fonctions de l'OGD à l'aune de la littérature.

Fonctions	Auteurs
Marketing de la destination, Branding et positionnement	Baggio (2008), Bieger et al (2009), Bornhorst, Ritchie et Sheehan, Bramwell et Rawding (1994), Crouch et Richie (1999), Elbe et al (2009), Gretzel et al (2006), Heath et Wall (1999), Osmankovic et al (2010), Pechlaner et al. (2012), Presenza et al. (2005), Prideaux et Cooper (2002), ROS Développement et planification (2008), Sheehan, Richie et Hudon (2007) et Socher (2000))
Renforcement des relations / coordination / facilitation	Bornhorst et al. (2010), Crouch et Richie (1999), Elbe et al. (2009), Heath et Wall (1992), Presenza et al. (2005), Prideaux et Cooper (2002), Sheehan et al (2007) et OMT (2007)
Développement des produits/ développement des activités	Baggio (2008), Bieger et al. (2009), Bornhorst et al. (2010), Osmankovic et al (2010), Pechlaner et al. (2012), Socher (2000) et OMT (2007)
Planification, formulation de la stratégie, suivi et évaluation	Baggio (2008), Bornhorst et al. (2010) , Heath et Wall (1992), Pechlaner et al. (2012), Jenkins et al (2011) et OMT (2007).
Management des ressources, management de l'environnement	Bornhorst et al. (2010), Presenza et al. (2005) et ROS Développement et planification (2008)
Développement des ressources humaines, Formation	Presenza et al. (2005), ROS Développement et planification (2008) et OMT (2007).
Management de la destination	Bornhorst et al. (2010), Crouch et Richie (1999) et Gretzel et al (2006).
Assurance qualité	Osmankovic et al (2010) et ROS Développement et planification (2008).
Information et réservations	Bieger et al (2009), ROS Développement et planification (2008) et OMT (2007).
R&D, Système d'information, management et développement des connaissances	Osmankovic et al (2010) et Presenza et al. (2005)
Gestion des visiteurs, gestion de l'expérience clients	Bornhorst et al. (2010) et Presenza et al. (2005)
Fourniture de services, coordination	Bornhorst et al. (2010) et ROS Développement et planification (2008);
Soutien aux entreprises	Prideaux et Cooper (2002) et ROS Développement et planification (2008)
Prise de décisions ou exécution	Baggio (2008) et Bornhorst et al. (2010)

Management des crises	Presenza et al. (2005)
Aide à l'accès au financement	Presenza et al. (2005)
Améliorer le bien-être des résident	Bornhost et al. (2010)
Animation	ROS Développement et planification (2008)

Source: Elaboré sur la base des travaux de Douglas G. Pearce (2015)

Nous pouvons à la lumière de ce tableau constater que la fonction marketing de la destination se distingue comme le propre du travail et de la mission d'un OGD, suivie de l'établissement des relations et de la coordination entre acteurs et par la suite de l'activité développement des produits et de l'offre. Les autres tâches relatives à la planification, la stratégie de développement de la destination, la gestion des ressources, le soutien aux entreprises et l'aide à l'accès au financement,..., ne sont que peut traitées par les différents auteurs quand il s'agit du rôle et des fonctions de l'OGD. Cela nous amène à formuler la conclusion que, malgré qu'elle est citée par quelques auteurs, la fonction du management de la destination apparaît comme une fonction distincte ne relevant pas des attributions d'un OGD.

Un autre constat à relever de ces études est que, comme pour le cas du management des destinations, hormis quelques tentatives, les auteurs sont restés muets sur les fonctions effectives exécutées par les OGD et se sont plus intéressés à ce qu'ils devraient ou pourraient faire. Les quelques études empiriques menées en Amérique du Nord et en Europe (Presenza, Sheehan et Ritchie, 2005 ; Getz et al., 1998 et Gretzel et al., 2006, ROS Development and Planning, 2008) ont toutes montré que l'amalgame entre la fonction du marketing de la destination et l'intégration de la gestion de la destination par un OGD ont abouti à l'échec jusqu'au point où Pike et Page (2014, p. 205) sont allés affirmer que: «L'utilisation de l'organisation de gestion des destinations comme un descripteur générique est inutile dans l'ajout de clarté et de but à la discussion du rôle des OGD, car il confond le besoin perçu de gestion avec la fonction largement de commercialisation qu'ils entreprennent effectivement... un DMO est un organisme responsable de la commercialisation d'une destination touristique identifiable avec une frontière géographique explicite». Cette affirmation nous montre une fois encore que la fonction de gestion de la destination et à distinguer de celle du marketing de la destination et donc elle ne fait pas partie de la mission et des attributions de l'OGD. Cette conclusion contredit aussi la conception de l'OMT qui dans l'une de ses publications a défini l'OGD comme "une entité de premier plan qui coordonne la gestion de tous les éléments intégrant une destination (lieux d'intérêt, équipements, facilités d'accès, moyens de transport, hébergements, etc.) et des activités telles que le développement de produits, leur marketing et l'établissement de leurs prix. L'OGD fait le lien entre les diverses autorités, les parties prenantes et les groupes d'intérêt. Il facilite également les partenariats et les synergies dans le cadre d'une stratégie cohérente visant à améliorer le développement, la gestion et la promotion de la destination. Il existe de nombreux types d'OGD en fonction des besoins et des spécificités de chaque destination à l'échelon national, régional et/ou local." (OMT, 2007)

A ce stade est sur la base des conclusions de notre lecture de la littérature existante sur la question, il nous semble pertinent de se poser la question sur qui devrait assurer et exercer les fonctions de gestion de la destination ?

Certains éléments de réponse à cette interrogation sont à chercher dans les travaux et études d'un certains nombre d'autres chercheurs qui ont essayé d'étudier la question en interpellant le rôle joué par la sphère publique dans le développement et la gestion des destinations. En effet, ces auteurs mettant l'accent sur la prise de conscience, par les acteurs publics territoriaux, de l'importance du tourisme pour le développement et la promotion des territoires et régions et leur implication de différentes manières dans le secteur (Aménagement, réalisation d'infrastructures, élaboration de stratégies, gestion de biens collectifs, incitations et soutien aux investisseurs et aux entreprises,...) ont commencé à s'intéresser aux fondements, formes et modalités de cette implication et aux rôles et fonctions que devrait assurer cette sphère publique dans le management de la destination et le degré de leur efficacité. L'intérêt porté à cette nouvelle variable va élargir le champ des investigations sur la gestion des destinations touristiques du simple contexte sectoriel et professionnel vers un contexte plus large intégrant tous les acteurs et toutes les parties prenantes présents sur le territoire de la destination. Ainsi, une importante littérature va se développer sur les modalités juridiques de cette gestion (Dredge et al., 2011 et Jenkins et al., 2011), les fonctions à assurer par la sphère publique (Bramwell et Rawding, 1994), le partage des responsabilités (Longijt et Pearce, 2013) et la problématique de la coordination (Palmer, 1996) et de la gouvernance (Barrado Timón, 2004, Gerbaux et Marcelpoil, 2006 et Marsat et al., 2010), de la durabilité (Dredge et al. 2011). Toutefois, la littérature note que, mise à part l'étude de Marsat et al. (2010), qui ont pu développer une approche globale et multifonctionnelle de la gestion de la destination et ont examiné les liens entre les fonctions de la sphère publique locale et le management territorial, le produit de ce

courant de pensée est resté très diffus et cloisonné sur les fonctions spécifiques (marketing et commercialisation, aménagement, développement durable,...) et n'a pu se soulever au stade d'une véritable théorie de gestion des destinations.

Conclusions et implications theoriques:-

Notre revue de la littérature nous a montré que la question de la compétitivité des destinations touristiques est une question centrale dans les travaux de recherche en tourisme. Toutefois, les concepts de destination, de compétitivité que de compétitivité de destination, malgré la foisonnante littérature de recherche qui leur a été consacrée restent encore entachés d'un certain flou et ambiguïté. La compétitivité de la destination apparaît ainsi comme la finalité recherchée mais qui partage encore les chercheurs et les organismes intéressés par le tourisme sur les dispositifs et les stratégies à mettre en œuvre ainsi que les formes et les styles de gestion à adopter pour la booster. Une première réalité qui émerge clairement de cette littérature est que face aux défis imposés par la compétitivité le management de la destination touristique n'est pas une tâche aisée et nécessite une multitude de fonctions et fait intervenir un grand nombre d'acteurs. Vu comme système, la destination est composée d'un complexe d'acteurs indépendants mais en même temps interdépendants dans leurs activités et participant tous à la délivrance de l'expérience aux touristes et aux visiteurs et générant de la valeur pour le territoire et ses différentes parties prenantes. L'autre conclusion majeure qui se dégage de notre examen de la littérature est l'absence d'un modèle unique et unanime relatif aux fonctions à assurer et les structures qui devraient les assurer. En effet, nous avons ainsi pu relever que si les chercheurs identifient une palette très large de fonctions, tâches et activités que nécessite le management de la destination, ils ne reconnaissent qu'un nombre limité de ces fonctions, tâches et activités lorsqu'ils abordent les organismes de gestion des destinations ou la sphère publique. S'il est reconnu que les défis imposés par la compétitivité exigent pour une destination touristique la nécessité de coordonner et d'intégrer de multiples fonctions et d'acteurs aux intérêts fortement divergents, il est aussi de relever la grande variété des situations et des types de destinations touristiques et des contextes de leur émergence et développement et la nature et le nombre des acteurs impliqués dans leur gestion et promotion qui sont autant de contraintes pour les chercheurs les poussant à adopter des postures et des approches différentes ou de se concentrer sur certains aspects plutôt que d'autres.

La troisième conclusion importante à tirer de cette synthèse de la littérature et qui est directement liée à notre problématique principale de cette recherche est que les principaux défis imposés par la compétitivité même s'ils ne semblent pas être des préoccupations primordiales parmi les fonctions des structures de management des destinations touristiques comme c'est le cas par exemple des fonctions marketing, sont plus cités comme des fonctions de management de la destination et dans une moindre mesure parmi celles de l'OGD. Nous pensons que les considérations relatives à l'expérience client, à l'image de marque, au numérique, à la gestion des connaissances et au développement durable, malgré qu'elles soient au centre des préoccupations de nombreux chercheurs et qui les considèrent comme des déterminants de l'attractivité et de la compétitivité des destinations touristiques, elles sont encore insuffisamment modélisées pour le cas de ces dernières et qu'il s'agit de préoccupations incombant à toutes les parties prenantes de la destination prise comme système ou comme une entreprise virtuelle au sens de Botti (Botti, 2009).

En définitive, nous pensons que l'absence d'un corpus théorique complet et bien établi, aussi bien sur la gestion et la compétitivité des destinations touristiques que plus particulièrement sur les structures de gestion et leurs fonctions, traduit le caractère récent de l'intérêt pour ces domaines de la part de la science du management et dénote de leur caractère complexe et multidimensionnel toutefois, ils laissent aussi la porte grandement ouverte pour les chercheurs pour développer des recherches et études plus poussées sur les différentes dimensions du management stratégique et opérationnel des destinations touristiques.

Key words:-

Banana peels, protein deficiency,
Saccharomyces cerevisiae, single cell
 protein, fermentation.

Abstract

Protein deficiency is a state of malnutrition which results from eating a diet in which proteins are not enough or present in an inadequate amount. It is a major factor responsible for a variety of ailments including mental retardation, kwashiorkor and even death, with millions of affected people as it increases an individual's susceptibility to and severity of infections. The escalating prices of traditional protein sources have intensified this problem. The present study aims to produce low cost protein by using waste material like banana peels which can alleviate protein deficiency of masses while considerably reducing environmental pollution. Bioconversion of waste banana peels into valuable product like single cell protein (SCP) has the potential to solve the problem of protein deficiency worldwide. Here, banana peels were used as substrate; peels were treated with hydrochloric acid 10% (w/v), followed by inoculation with pure culture of the yeast i.e. *Saccharomyces cerevisiae* and left for eight days for fermentation. Temperature was maintained at 30° C for the growth of the yeast. Chemical analysis to quantify the protein content in the fermented media revealed an increase in the protein content as compared to the unfermented media. SCP is rich in certain essential amino acids which are limiting in most plant and animal sources. So, the protein thus produced is considered to be beneficial for the mankind for reducing illness and death. It is a method that can aid in reducing the burden of waste materials on the mother Earth.

Introduction:-

Protein is a nutrient needed for normal growth and maintenance of human body ^[1]. Proteins (made up of amino acids) are important dietary constituents because they are required for the structure, function, and regulation of the body's major tissues and organs. Protein deficiency in food may pose a problem because essential amino acids, which can't be synthesized by the body itself, are not replenished ^[2]. Single cell protein can be a potential alternate to solve the global protein deficiency problem ^[3]. SCP or microbial proteins are edible unicellular microorganisms, used especially as a substitute for protein-rich foods. It is rich in certain essential amino acids like lysine and methionine which are limited in conventional sources of protein like animal proteins ^[4]. India grows the second largest quantity of fruits and vegetables ^[5]. Each fruit generates about 40% of its total mass as waste that includes peels, pulp and seeds. Banana (*Musa sapientum*) is a popular fruit consumed worldwide. Once the peel is removed,

the fruit can be eaten raw or cooked and the peel is generally discarded. It is an abundant and low cost agricultural waste residue and is easily available in large quantities^[6]. Banana peel constitutes about 18-20% proportion of fruit which is wasted^[7]. These peels are sometimes used as feedstock for cattle, goats, pigs, poultry etc. as they are rich in carbohydrates, and various vitamins and mineral elements^[8]. Various microorganisms that are used for the production of SCP are bacteria (*Cellulomonas*, *Alcaligenes*, etc.), algae (*Spirulina*, *Chlorella*, etc.), molds (*Trichoderma*, *Fusarium*, *Rhizopus*, etc.) and yeast (*Candida*, *Saccharomyces*, etc.). Yeast is a suitable candidate for single cell protein production because of its superior nutritional quality and efficiency to use low cost raw materials^[9]. Moreover, yeast cells are easy to harvest because of their large size (than bacteria), high malic acid and lysine content and their ability to grow at acidic pH.

Thus, in the present study, submerged fermentation has been carried out to produce single cell protein of *Saccharomyces cerevisiae* by using banana peels as a source of energy to convert into a high quality of protein. The banana peels were treated with acid to obtain monosaccharide as *Saccharomyces cerevisiae* lack the enzymes that hydrolyze the polysaccharide into simpler glucose units. In this study, the effect of addition of dextrose as carbon source when added to banana peel extracts is compared with banana peel extract without dextrose supplementation.

Material and Methods:-

Requirements: Lyophilized culture, inoculating loop, incubator shaker, laminar air flow, Erlenmeyer flask (500ml), measuring cylinder, distilled water, autoclave, ethanol (70%), cotton, refrigerator, centrifuge, colorimeter, etc.

Culture revival of *Saccharomyces cerevisiae*:-

Medium components: Pure culture of yeast (*Saccharomyces cerevisiae*) used was MTCC170. It was revived on Yeast extract potato dextrose (Yeast Extract 3.0g; Peptone 10.0g; Dextrose 20.0g; Agar 15.0g; distilled water 1.0 L) at 30⁰ C for 48 hrs and was stored at 4⁰C^[10].

Procedure:-

- Pure culture was obtained in lyophilized form from MTCC (microbial type culture collection), IMTECH.
- Culture was revived in Yeast extract potato dextrose broth medium.
- Culture was spread on the Yeast extract potato dextrose agar (YEPDA) medium plates using spreader, under sterile conditions and incubated at 30⁰C for 24hrs. Optical density of the culture was checked in colorimeter at 680nm.
- Sub culturing was done to maintain culture for further use.

Collection of Banana peels:-

The banana peels were collected from the local market in Chandigarh, India and washed several times with sterile water.

Sample preparation and Pre-treatment:-

Medium components- Banana peels (60gm), hydrochloric acid 10%(w/v), Erlenmeyer flask (500ml), measuring cylinder, distilled water, water bath at 100⁰C, Whatman filter paper no. 1, autoclave, dextrose (4gm/100ml).

Procedure:-

- The Banana peels were degraded to convert cellulose content into more available sugars by chemical treatments with little modification to the procedure of Lenihan 2010^[11].
- 100 ml of 10% (w/v) Hydrochloric acid was added to 60gm of banana peels in conical flasks.
- The mixture was placed in water bath at 100⁰C for one hour.
- After being allowed to cool, Banana peel extract was filtered through Whatman filter paper no: 1. The filtrates (98ml) were used as substrates and dextrose was added (4gm/100ml) in one group i.e. banana peel dextrose (abbreviated as BPD) and one was used without dextrose supplementation i.e. Banana peel extract (abbreviated as BPE).
- The two media were autoclaved at 121⁰C for 15 min.

The sterile broths thus prepared were used as carbon and nitrogen sources for biomass production.

Fermentation and harvesting of single cell protein:-

- Submerged fermentation was carried out in different Erlenmeyer flasks containing 98ml of the media.
- Media were aseptically inoculated with 2ml of inoculum of *Saccharomyces cerevisiae* (2×10^7 cfu/ml).
- Static fermentation was carried out at 28°C in a laboratory incubator for 8 days.

Drying of the final sample after fermentation:-**Procedure:-**

- After 8 days of fermentation, media (BPE and BPD) were poured into different Eppendorf centrifuge tubes.
- The Eppendorf tubes containing media were centrifuged at 10,000rpm for 15min.
- Supernatant was removed and pellet along with Eppendorf tube was weighed (wet biomass).
- Chemical analysis of the wet pellet was done to find the protein content.
- Hot air oven was set at 60°C . The Eppendorf tubes containing pellet were kept in pre-heated oven (60°C) for 24hrs.
- After drying, the dry weight of the sample was weighed.

Results:-**Biomass content of *Saccharomyces cerevisiae*:-****Table 1:-** Final percentage increase in the Biomass content after fermentation of 8 days:

Growth media	Biomass content increase (%age)
Banana Peel Extract	72.4%
Banana Peel Ext+Dextrose	84.6%

In submerged process ^[12], the banana peel substrate used for fermentation contains the nutrients to support the growth of microorganisms. The results obtained in the study showed that there was difference in dried biomass and the protein content when comparing the BPE and BPD media after fermentation.

The results showed that there was an increase in the biomass content in the banana peel extract with and without dextrose supplementation after fermentation. The utilization of sugar from the extract corresponded to the biomass production. There was a constant increase in total biomass content in banana peel extract supplemented with dextrose and banana peels without dextrose supplementation, during fermentation. The biomass content of BPD was found to be more than BPE. Although, it was also observed that the difference between the percentage biomass content of the two media was not too big. This demonstrated that BPE and BPD both have the nutrients that could be needed by an SCP microorganism for its growth.

Protein estimation:-

Protein was estimated in the sample by the method of Lowry et al (1951).

Table 2:- Protein content in banana peel extract at concentration of 60% after fermentation.

Growth media	1 st day (mg/g)	8 th day (mg/g)
Banana Peel Extract	2.5	11.7
Banana Peel Extract + dextrose	3.1	12.9

Figure 1:- Concentration of protein in banana peel extracts after fermentation.

SCP from yeast provides superior and better nutritional value in diets than other sources. This may be due to its acceptability, palatability and digestibility compared to the other SCPs^[13]. Crude protein content of yeast cells is one of the major factors to study in different growth media.

During the 8 days of fermentation, the protein content has significantly increased in the media. When examined the two different media on first day of fermentation, a low content was found in both the media. However, the protein content in BPD (3.1mg/g) was little higher than that of BPE (2.5mg/g) on the first day of fermentation as shown in Figure-1. While on the final day of fermentation the resultant protein content of BPE (11.7mg/g) and BPD (12.9mg/g), when tested, uncovered that supplementation with dextrose resulted in the enrichment of protein content in BPD as compared to BPE. Nevertheless, the difference between the media was not very large. This showed that supplementation of dextrose supported the growth of *Saccharomyces cerevisiae* in the banana peel substrate and made source of carbon and energy readily available for the yeast during the fermentation process.

In the present study, the experimental results clearly showed that high residual sugar content in the banana peels could be a suitable substrate for multiplication of yeast in the form of single cell protein leading to considerable increase in protein content of the bio processed product^[10].

Discussion:-

The results obtained from this study revealed that fermentation can bring about desirable changes in the nutrient composition of banana peel extracts. Yeast showed potential to increase the protein content of the banana peel extracts. The peels fermented with *Saccharomyces cerevisiae* had an increase in the protein content to 12.9mg/g from 3.1mg/g (for BPD) and 11.9mg/g from 2.5mg/g (for BPE). This implied that yeast had significant ($P < 0.05$) effect on protein content. Both the media i.e. BPE and BPD had a considerable surge in the biomass and protein contents. Since the difference between biomass and protein contents of the two media was not colossal and both the media produced relatively good results, banana peel extract can be used for the SCP production, with or without dextrose supplementation. This observation, further confirmed that banana peels had enough nutrients for the growth of *Saccharomyces cerevisiae*.

Conclusion:-

The data obtained in this study indicated that banana peel provided necessary nutrients for the *Saccharomyces cerevisiae* to grow and synthesize proteins. In conclusion, a promising yield of SCP production by *Saccharomyces cerevisiae* was achievable by fermentation using banana fruit peels. The present findings suggested that banana peels can be used as a potential substrate for products with relatively high protein content as produced by submerged state bio processing of banana waste by *Saccharomyces cerevisiae* that successfully enriched its protein content by utilizing various ingredients available in banana peels and there is a scope of converting waste fruit peels to

proteinaceous feed and food. Thus, banana fruit peels should be exploited properly as a substrate for the production of cellular biomass of edible or food grade yeast instead of dumping them, so that they can be used as animal feed supplement and for human consumption with minimal expense of money.

Abstract:

In this paper, we study homogenous Finsler square metric $F = \frac{(\alpha+\beta)^2}{\alpha}$ of Douglas type, and we investigate the necessary and sufficient conditions for the homogenous Finsler square metric to be Douglas metric, then it has following properties:

- (1) it is a Berwald metric or Randers type, and
- (2) it is a Riemannian metric.

1. Introduction

A Finsler metric F on a manifold M is a homogeneous continuous function $F : TM \rightarrow [0; +\infty)$ where F is smooth on the slit tangent bundle TM_o satisfying nonnegativity ($F(y) > 0$ for any $y \neq 0$) and strong convexity (the fundamental tensor $g_{ij} := [\frac{1}{2}F^2]_{y^i y^j}$ is positive definite on TM_o). Here $(x^i; y^i)$ denote the natural system of coordinates of TM .¹

The notion of (α, β) -metric in Finsler spaces was introduced by M. Matsumoto [4] as a generalization of Randers metric $L = \alpha + \beta$, where α is a regular Riemannian metric $\alpha = a_{ij}(x)y^i y^j$, i.e., $\det(a^{ij}) \neq 0$ and β is a one-form $\beta = b_i(x)y^i$ and studied by many authors ([5], [6], [8], and [9]). A Finsler metric $L(\alpha, \beta)$ on a differentiable manifold M^n is called an (α, β) -metric, if L is a positively homogeneous function of degree one in α and β . There are several important (α, β) -metrics, namely Randers metric $L = \alpha + \beta$ Kropina metric $L = \frac{\alpha^2}{\beta}$, Matsumoto metric $L = \frac{\alpha^2}{(\alpha-\beta)}$, generalized Kropina metric $L = \frac{\alpha^{n+1}}{\alpha^n}$ and Z. Shen's square metric $L = \frac{(\alpha+\beta)^2}{\alpha}$.

In 1929, L. Berwald constructed the following famous Finsler metric[10]

$$F = \frac{(\sqrt{(1-|x|^2)}|y|^2 + \langle x, y \rangle^2 + \langle x, y \rangle)^2}{(1-|x|^2)^2 \sqrt{(1-|x|^2)}|y|^2 + \langle x, y \rangle^2}.$$

This metric, defined on the unit ball $B^n(1)$ with all the straight line segments as its geodesics, has constant flag curvature $K = 0$. In a modern point of view, Berwald's metric belongs to a special kind of Finsler metrics called Berwald type or square metrics given as the form

$$F = \frac{(\alpha + \beta)^2}{\alpha}, \quad (1.1)$$

where α is a Riemannian metric and β is a 1-form[1]. It is known that above equation is a regular Finsler metric if and only if the length of β with respect to α , denoted by b , satisfies $b < 1$.

(α, β) -metrics form an important class of Finsler metrics that can be expressed in the form

$$F = \alpha \phi\left(\frac{\beta}{\alpha}\right),$$

where $\alpha = \sqrt{a_{ij}(x)y^i y^j}$ is a Riemann metric and $\beta = b_i(x)y^i$ is a 1-form with $\|\beta\|_\alpha < b_0$ on a manifold. It is well known that $F = \alpha \phi(\frac{\beta}{\alpha})$, is a positive definite Finsler metric if and only if $\phi = \phi(s)$ is a positive C^∞ function on $(-b_0, b_0)$ satisfying the following condition[3]

$$\phi(s) - s\phi'(s) + (b^2 - s^2)\phi''(s) > 0, \quad |s| \leq b < b_0. \quad (1.2)$$

In 1927, J. Douglas introduced the Douglas curvature for Finsler metrics[11]. Douglas curvature is an important projectively invariant in Finsler geometry. It is also a non-Riemannian quantity, since all the Riemannian metrics have vanishing Douglas curvature inherently. Finsler metrics with vanishing Douglas curvature are called Douglas metrics. Roughly speaking, a Douglas metric is a Finsler metric which is locally projectively equivalent to a Riemannian metric[12].

Douglas metrics form a rich class of Finsler metrics including locally projectively at Finsler metrics and Berwald metrics, the later are those metrics whose Berwald curvature vanishes[7].

In this present article, we study homogenous Finsler square metric $F = \frac{(\alpha + \beta)^2}{\alpha}$ of Douglas type, and we investigate the necessary and sufficient conditions for the homogenous Finsler square metric to be Douglas metric, then it has following properties:

- (1) it is a Berwald metric or Randers type, and
- (2) it is a Riemannian metric.

2. Preliminaries

Definition 2.1. A locally projectively flat (α, β) -metric $F = \alpha \phi(\frac{\beta}{\alpha})$ is said to be trivial, if α is locally projectively flat and β is parallel with respect to α .

A result of Z. Shen and G. Civi Yildirim [8] says that a Berwald's metric $F = \frac{(\alpha + \beta)^2}{\alpha}$ is locally projectively flat if and only if the spray coefficients of α are given in an adapted coordinate system by

$$G_\alpha^i = \xi y^i - 2\tau \alpha^2 b^i, \quad (2.1)$$

for some 1-form $\xi = \xi_i(x)y^i$ and some scalar function $\tau = \tau(x)$, and at the same time the covariant derivative of β is given by

$$b_{i|j} = 2\tau\{(1 + 2b^2)a_{ij} - 3b_i b_j\}. \quad (2.2)$$

Later on, B. Li, Z. Shen and Y. Shen, found a sufficient and necessary condition for (α, β) -metrics to be locally projectively flat in dimension $n \geq 3$ [12]. It says that for a projectively flat (α, β) -metric $F = \alpha \phi(\frac{\beta}{\alpha})$ on an open subset $U \subseteq R^n$ with $n \geq 3$, if we add

Theorem 2.1. Let $s = \frac{\beta}{\alpha}$ and let $F = \alpha\phi(\frac{\beta}{\alpha})$ be an (α, β) -metric on an open subset $U \subseteq R^n (n \geq 3)$, where $\alpha = \sqrt{a_{ij}y^i y^j}$ and $\beta = b_i(x)y^i \neq 0$. Let $b := \|\beta\|_\alpha$. Suppose that the following conditions hold:

- F is not of Randers type, i.e., $F \neq \sqrt{c_1\alpha^2 + c_2\beta^2} + c_3\beta$ for any constants c_1, c_2 and c_3 ,
- β is not parallel with respect to α ,
- $db \equiv 0$ or $db \neq 0$ everywhere or b is constant on U .

Then F is a Douglas metric if and only if $\phi(s)$ satisfies the following ODE,

$$\{1 + (k_1 + k_3)s^2 + k_2s^4\}\phi''(s) = (k_1 + k_2s^2)\{\phi(s) - s\phi'(s)\}, \quad (2.3)$$

where k_1, k_2, k_3 are constants with $k_2 \neq k_1k_3$ and the covariant derivative $\nabla\beta = b_{i|j}y^i dx^j$ of β with respect to α satisfies equation (2.2).

We can see that the function $\phi(s) = (1 + s)^2$ satisfies equation (2.3) with $(k_1, k_2, k_3) = (2, 0, -3)$ or $(k_1, k_2, k_3) = (-3, 0, 2)$.

We used the following results which proved by G. Yang in [18].

Theorem 2.2. Let $F = \alpha\phi(s), s = \beta/\alpha$ be a regular (α, β) -metric on an open subset $U \subset R^2$, where $\phi(0) = 1$. Suppose that β is not parallel with respect to α and F is not of Randers type. Let F be a Douglas metric. Then one has one of the following two cases.

- $\phi(s)$ satisfies (2.3).
- F can be written as

$$F = \tilde{\alpha} \pm \frac{\tilde{\beta}^2}{\tilde{\alpha}}, \quad (\tilde{\alpha} := \sqrt{\alpha^2 - k\beta^2}, \quad \tilde{\beta} := c\beta), \quad (2.4)$$

where k, c are constants with $c \neq 0$

Corollary 2.1. Let $F = \alpha \pm \beta^2/\alpha$ be a two-dimensional (α, β) - metric. Then F is a Douglas metric if and only if β satisfies

$$r_{ij} = 2\tau\{(1 \pm b^2)a_{ij} \mp 3b_ib_j\} + \frac{3}{\pm 1 - b^2}(b_is_j + b_js_i), \quad (2.5)$$

where $\tau = \tau(x)$ is a scalar function. Note that

- $F = \alpha + \frac{\beta^2}{\alpha}$ is positive if and only if $b^2 < 1$,
- $F = \alpha - \frac{\beta^2}{\alpha}$ is positive if and only if $b^2 < \frac{1}{2}$.

Every Finsler metric F on a manifold M induced a spray $G = y^i \frac{\partial}{\partial x^i} - 2G^i \frac{\partial}{\partial y^i}$ which determines the geodesics. By definition, a Finsler metric F is a Berwald metric if the spray coefficients $G^i = G^i(x, y)$ are quadratic in $y \in T_x M$ at every point x , i.e., $G^i = \frac{1}{2}\Gamma_{jk}^i(x)y^j y^k$. Riemannian metrics are special Berwald metrics. In fact, Berwald metrics are almost Riemannian in the sense that every Berwald metric is affinely equivalent to a Riemannian metric, i.e., the geodesics of any Berwald metric are the geodesics of some Riemannian metric [2]. The Douglas metrics are more generalized ones than Berwald metrics. A Finsler metric is called a Douglas metric if the spray coefficients $G^i = G^i(x, y)$ are in the following form:

$$G^i = \frac{1}{2}\Gamma_{jk}^i(x)y^j y^k + P(x, y)y^i. \quad (2.6)$$

Douglas metrics form a rich class of Finsler metrics including locally projectively flat Finsler metrics. The study on Douglas metrics will enhance our understanding on the geometric meaning of non-Riemannian quantities.

Definition 2.2. Two (α, β) -metrics $F_1 = \alpha_1 \phi_1(\frac{\beta_1}{\alpha_1})$ and $4F_2 = \alpha_2 \phi_2(\frac{\beta_2}{\alpha_2})$ are said to be of same type if there is an element $\Pi \in G$ such that $\Pi(\phi_1) = \phi_2$. In this case, the functions $\phi_1(s)$ and $\phi_2(s)$ are said to be equivalent. G is called the representation group of (α, β) -metrics.

For example, all the functions equivalent to $(1 + s)$ will provide Randers type metrics. Conversely, if $F = \alpha \phi(\frac{\beta}{\alpha})$ is of Randers type, then $\phi(s)$ must be equivalent to $(1 + s)$. Actually, the functions for Randers type metrics, which are given by $\phi(s) = \sqrt{1 + us^2} + vs$, can be expressed as $\phi(s) = g_u \circ h_v(1 + s)$. Notice that all the functions are always asked to satisfy $\phi(0) = 1$. Suppose that a given locally projectively flat (α, β) -metric $F = \alpha \phi(\frac{\beta}{\alpha})$ is neither locally Minkowskian nor of Randers type, then $\phi(s)$ must be a solution of (2.3) according to Z. Shen's result. Due to the non-uniqueness, if we rewrite the metric as $F = \tilde{\alpha} \psi(\frac{\beta}{\tilde{\alpha}})$, then the new function $\psi(s)$, which is equivalent to $\phi(s)$, must be also a solution of (2.3) with some different parameters.

Theorem 2.3. A Finsler metric F on a manifold M ($\dim M \geq 3$) is locally projectively flat if and only if F is a Douglas metric with scalar flag curvature.

In [15] shows an (α, β) -metric $F = \alpha \phi(\frac{\beta}{\alpha})$ is a Berwald metric if and only if β is parallel with respect to α , i.e., $b_{i|j} = 0$, regardless of the choice of a particular ϕ , and [12] the authors obtained a characterization of (α, β) -metrics of Douglas type.

3. Homogeneous Finsler Square Metrics Of Douglas Type

Recall that the group $I(M; F)$ of isometries of a Finsler manifold $(M; F)$ is a Lie transformation group of M [14]. If $I(M; F)$ acts transitively on M , then $(M; F)$ is called homogeneous. Thus, the homogeneous Finsler manifold M can be written as the form $M = G/H$, where G is a Lie group acting isometrically and transitively on M , and H is the isotropy subgroup at a point in M . Moreover, if the Lie algebra of G , \mathfrak{g} , has a decomposition

$$\mathfrak{g} = \eta + m \quad (\text{direct sum of subspaces}),$$

where η is the Lie algebra of H and m is a subspace of \mathfrak{g} satisfying

$$\text{Ad}(h)(m) \subset m \quad \text{for all } h \in H.$$

Then the homogeneous Finsler manifold $(G/H; F)$ is called reductive. In this case, the tangent space $T_o(G/H)$, where $o = eH$ is the origin, can be canonically identified with m . Note that the isotropy subgroup $I_x(M, F)$ of $I(M; F)$ at a point $x \in M$ is compact [14], and M can be written as

$$M = I(M; F)/I_x(M, F).$$

Then $M = I(M; F)/I_x(M, F)$ is a reductive homogeneous manifold.

Let $(G/H; F)$ be a reductive homogeneous (α, β) -space of the form $F = \alpha \phi(s)$ where $s = \frac{\beta}{\alpha}$ with a Riemannian metric α and a 1-form β on G/H . In this section, we assume that α and β are both G -invariant. Consider the underlying homogeneous Riemannian manifold $(G/H; \alpha)$. Let $\langle \cdot, \cdot \rangle$ denote the corresponding inner product on m . According to [16], the form β corresponds to a vector u in the subspace

$$V = \{u \in m | \text{Ad}(h)u = u \quad \text{for all } h \in H\}.$$

We also assume that $\beta \neq 0$, or equivalently, $u \neq 0$.

We use the local coordinate system developed in [17], which is given as follow.

Let u_1, u_2, \dots, u_n be an orthonormal basis of m with respect to the inner product $\langle \cdot, \cdot \rangle$ and $u_n = \frac{u}{|u|}$. Then there exists a neighborhood U of $o = H$ in G/H such that the map

$$(\exp(x^1 u_1) \exp(x^2 u_2) \dots \exp(x^n u_n)) \longmapsto (x^1, x^2, \dots, x^n),$$

defines a local coordinate system on U .

Since α and β are both G -invariant, $b := \|\beta\|_\alpha = |u|$ is a constant. By [17], at the origin $o = H$, we have

$$\begin{aligned} a_{ij} &= \delta_{ij}, & b_i &= b\delta_{ni}, \\ b_{i|j} &= \frac{b}{2}(\langle [u_i, u_j], u_n \rangle - \langle [u_n, u_i], u_j \rangle - \langle [u_n, u_j], u_i \rangle), \\ s_{ij} &= \frac{b}{2}\langle [u_i, u_j], u_n \rangle, & r_{ij} &= -\frac{b}{2}(\langle [u_n, u_i], u_j \rangle + \langle [u_n, u_j], u_i \rangle). \end{aligned} \quad (3.1)$$

Note that $s_n = b^i s_{in} = b s_{nn} = 0$.

Theorem 3.4. *Let $F = \frac{(\alpha+\beta)^2}{\alpha}$ be a homogeneous Finsler square metric on G/H . Then F is a Douglas metric if and only if F is a Berwald metric or F is a Douglas metric of Randers type.*

Proof. Suppose that $F = \alpha\phi(\frac{\beta}{\alpha})$ is a homogeneous (α, β) -metric $F = \frac{(\alpha+\beta)^2}{\alpha}$ on G/H , where the Riemannian metric α and the 1-form β are both G -invariant. We only need to compute at the origin $o = H$. By (3.1), it is obvious that $b_{n|n} = 0$ at the origin. We now prove the theorem in the following two cases.

Case 1: $\dim(G/H) \geq 3$. Suppose that F is a Douglas metric, and F is neither a Berwald metric nor of Randers type. Since b is a constant, it follows from Theorem 2.3 and (2.2) that

$$b_{n|n} = 2\tau\{1 - b^2\} = 0. \quad (3.2)$$

Since α and β are both G -invariant, the scalar function $\tau = \tau(0)$ is a constant.

By the assumption that F is not a Berwald metric, it follows that $\tau \neq 0$. So we have

$$(1 - b^2) = 0. \quad (3.3)$$

By (2.3), we have

$$\phi''(s) = \{\phi(s) - s\phi'(s)\} \frac{k_1 + k_2 s^2}{1 + (k_1 + k_2 s^2)s^2 + k_3 s^2}. \quad (3.4)$$

Plugging (3.4) into (1.2), we get

$$\begin{aligned} \phi(s) - s\phi'(s) + (b^2 - s^2)\phi''(s) &= \{\phi(s) - s\phi'(s)\} \left\{ 1 + \frac{b^2 - s^2 + (k_1 + k_2 s^2)}{1 + (k_1 + k_3)s^2 + k_2 s^4} \right\} \\ &= \{\phi(s) - s\phi'(s)\} \left\{ 1 + \frac{1 + k_1 b^2 + (k_2 b^2 + k_3)s^2}{1 + (k_1 + k_3)s^2 + k_2 s^4} \right\}. \end{aligned} \quad (3.5)$$

By taking $b = s$ in (1.2) we can see that $\phi(s) - b\phi'(s) > 0$, is always positive as long as F is a Finsler metric. So the (1.2) implies the following

$$\frac{1 + k_1 b^2 + s^2(k_3 + k_2 b^2)}{1 + (k_1 + k_3)s^2 + k_2 s^4} > 0, \forall |s| \leq b < b_0. \quad (3.6)$$

Taking $s = 0$ we have $1 + k_1 b^2 > 0$ than $1 + k_1 s^2 \geq \min\{1, 1 + k_1 b^2\}$.

On other hand, we have $(k_1, k_2, k_3) = (2, 0, -3)$ and by taking $s = b$ in (2.3), then

$$\begin{aligned} \phi''(s) &= \{\phi(s) - s\phi'(s)\} \frac{2 + 0s^2}{1 + (2 + 0s^2)s^2 - 3s^2}, \\ &= \{\phi(s) - s\phi'(s)\} \frac{2}{1 - s^2}. \end{aligned} \quad (3.7)$$

And when $(k_1, k_2, k_3) = (-3, 0, 2)$ we have

$$\begin{aligned}\phi''(s) &= \{\phi(s) - s\phi'(s)\} \frac{-3 + 0s^2}{1 + (-3 + 0s^2)s^2 + s^2}, \\ &= \{\phi(s) - s\phi'(s)\} \frac{-3}{1 + s^2}.\end{aligned}\quad (3.8)$$

It is clear that the solution of (3.7) and (3.8) is given by

$$\phi(s) = \frac{c}{1 \mp s^2}, \quad (3.9)$$

for some constant c . This implies that is of Randers type, which is a contradiction. This completes our proof in this case.

Case 2: $\dim(G/H) = 2$. By Theorems 2.1 and 2.2, we only need to prove the theorem under the assumption that F is given by $F = \alpha \pm \frac{\beta^2}{\alpha}$, where the Riemannian metric α and the 1-form β are both G -invariant. We will also use the above local coordinate system and setting $n = 2$. Note that $b_2 = b$ and $s_2 = 0$. By Theorem 2.2,

- if $F = \alpha + \frac{\beta^2}{\alpha}$ is a Douglas metric, then at the origin $o = H$, we have

$$r_{22} = b_{22} = 2\tau(o)(1 - b^2).$$

Since $b^2 < 1$ when $F = \alpha + \frac{\beta^2}{\alpha}$ is positive definite, we conclude that $\tau(o) = 0$.

- If $F = \alpha - \frac{\beta^2}{\alpha}$ is a Douglas metric, then at the origin $o = H$, we have

$$r_{22} = b_{2|2} = 2\tau(o)(1 + b^2) = 0.$$

Thus we also have $\tau(o) = 0$. Since α and β are both G -invariant, the scalar function $\tau(x)$ is a constant. Therefore $\tau = \tau(o) = 0$, which implies that F is a Berwald metric.

This completes the proof of Theorem under the assumption that both α, β are G -invariant.

Let u be a vector corresponding to β in the subspace V given in the above. Then the condition for F to be a Berwald metric is equivalent to the following:

$$\langle [v, w]_m, u \rangle = 0 \quad \text{for all } v, w \in m, \quad (3.10)$$

$$\langle [u, v_1]_m, v_2 \rangle + \langle [u, v_2]_m, v_1 \rangle = 0 \quad \text{for all } v_1, v_2 \in m. \quad (3.11)$$

By Theorem 3.4 and a direct observation, we have

Theorem 3.5. Let $F = \frac{(\alpha + \beta)^2}{\alpha}$ be a homogeneous Finsler square metric on G/H , where the Riemannian metric α and the 1-form β are both G -invariant. Suppose the Lie algebra \mathfrak{g} of G is perfect, i.e., $\mathfrak{g} = [\mathfrak{g}, \mathfrak{g}]$, then F is a Douglas metric if and only if F is a Riemannian metric.

Proof. By Theorem 3.4, if $F = \alpha\phi(\frac{\beta}{\alpha})$ is a Douglas metric, then it is a Berwald metric or a Douglas metric of Randers type. Let $\mathfrak{g} = \eta + \mathfrak{m}$ denote a reductive decomposition of \mathfrak{g} . If F is a Douglas metric of Randers type, then F can be expressed in the form $F = \tilde{\alpha} + \tilde{\beta}$, where α and β are both G -invariant, and β is a closed 1-form. In this case, there exists a vector $u \in \mathfrak{m}$ satisfying (3.10), where the inner product $\langle \cdot, \cdot \rangle$ is corresponding to $\tilde{\alpha}$, and the vector u is corresponding to $\tilde{\alpha}$ with respect to the inner product. Now the condition that $\text{Ad}(h)(u) = u$ for all $h \in H$ is equivalent to

$$[v, u] = 0 \quad \text{for all } v \in \eta. \quad (3.12)$$

Since the inner product $\langle \cdot, \cdot \rangle$ is G -invariant, we have

$$\langle [v, w_1]_m, w_2 \rangle + \langle [v, w_2]_m, w_1 \rangle = 0 \quad \text{for all } v \in \eta, w_1, w_2 \in \mathfrak{m}. \quad (3.13)$$

Combining (3.12) and (3.13), we obtain

$$\langle [v, w]_m, u \rangle = 0 \quad \text{for all } v \in \eta, w \in \mathfrak{m}. \quad (3.14)$$

Now the assumption $g = [g, g]$ implies that there exists two vectors $w, v \in g$ such that $[w, v] = u$. Let $w = w_1 + w_2$ and $v = v_1 + v_2$, where $w_1, v_1 \in m$ and $w_2, v_2 \in \eta$. Then we have

$$[w, v] = [w_1, v_1] + [w_1, v_2] + [w_2, v_1] + [w_2, v_2]. \quad (3.15)$$

Therefore by (3.10) and (3.14), we have

$$\begin{aligned} \langle u, u \rangle &= \langle u, [w, v]_m \rangle \\ &= \langle u, [w_1, v_1]_m \rangle + \langle u, [w_1, v_2]_m \rangle + \langle u, [w_2, v_1]_m \rangle \\ &= 0. \end{aligned}$$

Thus $u = 0$, which implies that F is a Riemannian metric. If $F = \alpha\phi(\frac{\beta}{\alpha})$ is a Berwald metric with α and β both G -invariant, then there exists a vector $u \in m$ satisfying (3.10). Then a similar argument shows that F is also a Riemannian metric.

4. Conclusion

The important example of Finsler space are different type of (α, β) -metric are Randers metric, Kropina metric and other special (α, β) -metric. In [13] Ramesha M and S. K. Narasimhamurthy are devoted the necessary and sufficient conditions for a Finsler space with a special (α, β) -Metric $F = C_1\alpha + C_2\beta + \frac{\beta^2}{\alpha} : C_2 \neq 0$, to be a Douglas space and also to be Berwald space. H. Liu and S. Deng in [19] have shown the necessary and sufficient conditions for Randers homogeneous of Douglas type to be Berwald and Riemannian metric.

In this present article we consider homogenous Finsler square metric $F = \frac{(\alpha+\beta)^2}{\alpha}$ of Douglas type, and we investigate the necessary and sufficient conditions for the homogenous Finsler square metric to be Douglas metric, then it has following properties:

- (1) it is a Berwald metric or Randers type, and
- (2) it is a Riemannian metric.

Key words:-

Simvastatin, Osteoinductive, critical sized Bone defect.

Abstract

Objective: The aim of this study is to evaluate the effect of simvastatin as a sole osteoinductive material on bone formation by eliminating the role that may be attributed to the various bone grafts that have been used with simvastatin as drug carriers. **Material and methods:** The search terms (Simvastatin) AND (Bone Defect) were used to search the PUBMED electronic database. In addition to this online search, a hand search of the relevant major international journals was also performed. **Results:** The search results showed total of 46 articles, only 3 articles were found to fulfill the inclusion criteria. Two out of these 3 articles used the same simvastatin concentration (0.2ml simvastatin solution on either collagen or gelatin sponge) while in the third article, collagen graft of swine origin was used with two different simvastatin dose (2.2 mg and 0.5 mg). Simvastatin seems to have osteoinductive potentials when applied locally in bone defects when used in proper dose and with proper carrier. **Conclusion:** The safety and osteoinductive properties of simvastatin are directly affected by the used dose and carrier, thus further studies are needed in order to determine the ideal dose/carrier complex that maximize the osteoinductive capabilities and eliminate or minimize the associated inflammatory reaction.

Introduction:-

Although considered as the gold standard for bone regeneration, yet, autogenous bone is far away from being the (ideal) graft material because of its disadvantages such as donor site morbidity, limited availability [1,2] and unpredictable resorption.[3]

This has led to the use of other graft material such as allografts, xenografts and alloplastic materials in order to avoid these drawbacks especially in elective surgeries in which limiting patient discomfort should be considered as a main priority. [4] However, the use of these bone substitutes is also associated with some disadvantages such as the lack of osteoinduction, antigenicity & risk of disease transmission. [5, 6]

In the past years, researchers investigated the visibility of combining the osteoconductive properties of alloplasts with the osteoinductive properties of the recombinant bone morphogenic proteins (BMP). [7, 8] Which in spite of

showing promising results, yet it did not have its way to the common daily clinical practice due to the difficulties facing its application such as the high cost and the inability to deliver the accurate dose of BMP.[9,10]

These aforementioned drawbacks of the current reconstructive options led to the rise of a new concept **THE IN SITU TISSUE REGENERATION APPROACH** [11]"this is authors quoted text" which involves the use of an external stimuli that up-regulate the patient own cells. This can be achieved via the addition of certain pharmacological compounds to an osteoconductive bone substitute.[12]

The bone anabolic action of statins was first reported by Mundy et al in 1999 after he screened more than 30,000 pharmacological compounds. He found statins to be the only compounds that have the ability to up-regulate BMP-2 and stimulate osteoprogenitor cells proliferation .[13]In addition to their osteogenic properties , statins were found to have anti-inflammatory , anti-oxidant and angiogenic effects.[14,15]

However, on addressing the anti-inflammatory effect of simvastatin, it should be kept in mind that, simvastatin in high doses can actually induce inflammation around the site of local application, [16] that is to say, while a low dose can be inefficient in bone formation, high doses may stimulate an excessive inflammatory response [17] which is well recognized as a major contributing factor to delay healing in both animal and human models. [18, 19]

The effect of locally applied simvastatin on bone formation received the main attention of researchers in the last few years as it was used in combination with various carriers such as collagen sponge,[17,20] Alpha tricalcium phosphate (α -TCP),[12,21]Beta tricalcium phosphate(β -TCP),[21]hydroxyapatite (HA),[21] gelatin sponge[22]and bioglass.[23] The results of these studies showed that the local effect of Simvastatin on bone depends on 2 main factors which are the used carrier and the simvastatin dose.[11]

The aim of this study is to evaluate the effect of simvastatin as a sole osteoinductive material on bone formation by eliminating the role that may be attributed to the various bone grafts that have been used with simvastatin as drug carriers.

Materials and methods:-

Search strategy:-

The search terms (Simvastatin) AND (Bone Defect) were used to search the PUBMED electronic database. In addition to this online search, a hand search of the major international journals that covers the field of dental implants was performed to detect any overlooked articles (Clinical Implant Dentistry and Related Research, Clinical Oral Implants Research, Implant Dentistry, International Journal of Oral and Maxillofacial Surgery, Journal of Oral and Maxillofacial Surgery, Journal of oral implantology). Search was carried out on the 20th of November 2016

Inclusion criteria:-

1. Simvastatin applied in surgically created critical sized bone defects.
2. Simvastatin used as sole effective osteoinductive material.
3. Studies provide histomorphometric results.
4. In vivo studies only

Exclusion criteria:-

1. Studies in language other than English
2. Simvastatin applied in periodontal defects or on surface of intact bone.
3. Systemically administrated simvastatin.
4. Simvastatin used with specially designed carriers, bone substitutes or mixed with any other material than may induce new osteogenesis.
5. Presence of any systemic condition that may affect the osteogenesis process.

Study selection and data collection:-

The search results showed total of 46 articles which were subjected to a 3 staged filtering process in order to detect the articles that comply with the aforementioned inclusion criteria. In the first stage, 31 articles were excluded after screening their titles. In the second stage another 8 articles were excluded after screening their abstract. In the last stage the full text of the remaining 7 articles were screened which result in eliminating another 4 articles. In the end

of the filtering process, only 3 articles were found to fulfill the inclusion criteria {Table 1}. The screening process was accomplished by 2 reviewers. No additional articles were found through hand searching.

Results:-

The 3 selected papers were all animal studies which may reflect that simvastatin did not find its way to human application due to the diversity in the results which varies from success in some studies to failure in others.

Collagen sponges were used in 2 out of these 3 studies [17, 20] yet, they were of different origin and the simvastatin dose used in both studies was also different. In the third study gelatin sponge was used as a carrier for simvastatin. [22].

In the study performed by Wong et al in 2003, [20] the collagen graft used was of bovine origin. In this study 15 critical sized bone defects (10x5 mm) were created in the parietal bone of 9 New Zealand rabbits. The defects were divided into 3 equal groups, passive control group (received no graft), active control (grafted with 0.2 mg collagen graft) and experiential group (grafted with 0.2 mg collagen graft mixed with 0.2 ml simvastatin solution). All animals showed normal recovery without any complication. The histomorphometric results of the biopsies obtained after killing the animals in the 14th day showed that the amount of newly formed bone was 308 % more in the experiential group { mean $1.63 \text{ mm}^2 \pm 0.48 \text{ mm}^2$ } compared to the active group { $0.4 \text{ mm}^2 \pm 0.28 \text{ mm}^2$ }. The difference between the 2 groups was considered statistically significant.

The second study that used collagen sponge was performed by Calixto et al in 2011 [17] in which it was of swine origin due to the outbreak of bovine spongiform at this time. A bilateral critical sized bone defects were created in the parietal bones of 64 Wistar rats using a 5- mm diameter trephine. Animals were divided into 4 equal groups, Control group (received no treatment), carrier group (received 0.2 mg collagen sponge), Simvastatin -1 group (received collagen sponge mixed with 2.2 mg/50 μ l Simvastatin solution), Simvastatin-2 group (received collagen sponge mixed with 0.5mg/50 μ l Simvastatin solution).

During the recovery period, all animals of Simvastatin -1 group showed necrosis and crust formation which persisted until the 45th day after surgery. On the other hand, only 4 animals of the simvastatin -2 group showed such complication which lasts only for 30 days. The histomorphometric results of the biopsies obtained after killing the animals in the 60th day showed that the highest amount of newly formed bone was detected in the control group (mean $0.98 \text{ mm}^2 \pm 0.1 \text{ mm}^2$) followed by the simvastatin-1 group ($0.75 \text{ mm}^2 \pm 0.2 \text{ mm}^2$) while the least amount was in the simvastatin-2 group ($0.5 \text{ mm}^2 \pm 0.15 \text{ mm}^2$). The differences between these groups were considered statistically significant.

Unlike the previous studies, gelatin sponge was selected as a drug carrier by Özeç et al in 2007 [22] to perform his study in which he used a 3-mm round bur to create a 23 critically sized defects in the mandible of 23 Wistar rats. Animals were divided into 3 unequal groups, experimental group (include 9 animals that received 0.2mg gelatin sponge mixed with 0.2 ml simvastatin solution), active control group (include 8 animals that received gelatin sponge) and passive control group (include 6 animals that did not receive any graft).

All animals showed normal and complication free recovery. The histomorphometric results of the biopsies obtained after killing the animals in the 14th day showed that the amount of newly formed bone was 190 % more in the experiential group compared to the active group and 240 % more than the passive group { mean values were not available }. These results were both considered to be statistically significant.

Discussion:-

The direct effect of statins on bone was discovered for the first time by Mundy et al [13] in 1999. Their study, along with others, suggest that statins, administered either locally or systemically, act as potent stimulators of bone formation and regeneration [13,24,25] Simvastatin was found to up regulate BMP-2, [26] vascular endothelial growth factor (VEGF) gene expression and alkaline phosphatase expression in osteoblasts, [27] it was also found to inhibit osteoclastogenesis. [28]

On comparing the effect of locally applied versus systemically administered statin on stimulating bone healing, locally applied statin was found to be 50-80 times more potent than systemically administered statin. [29] The

minimal effect of systemically administered statin on bone is expected as statins are known for targeting liver to treat hyperlipidemia with only small amount that reach and accumulate in bone. [30]

The aim of this study was to highlight the anabolic potentials of Simvastatin on bone when used as a sole osteoinductive material; any study that used simvastatin with a carrier that may affect either osteogenesis or the rate of simvastatin release was excluded from this study.

As it was mentioned earlier, whether the locally applied statin will play a positive or negative effect on osteogenesis is mainly determined by the used carrier and the statin dose. The 3 papers selected in this research showed that 3 different carriers were used as well as 3 different doses of Simvastatin.

In two out of the three papers, the dose of simvastatin was the same (0.2 ml simvastatin solution); yet 2 different carriers were used. In the study conducted by Wong et al,[20] collagen graft of bovine origin was used while in the study conducted by Özeç et al,[22] gelatin sponge was used. The results of these two studies showed that collagen sponge may be preferred over gelatin sponge as a drug carrier for simvastatin. This was based on the fact that although in Wong's study the size of defect was larger than the size of defect in Özeç's study (10x15 mm vs. 3x3mm), yet when the experimental group in each study was compared to its relevant active control group, the amount of newly formed bone was higher in Wong's study than in Özeç's study (308 % vs. 190 %).

It is worth to be mentioned that in both studies, animals were killed at the 14th day after the surgical procedure which will eliminate the time factor in the process of bone formation. However, the limited number of the studies does not enable the author to reach a definite decision regarding the superiority of collagen sponge over gelatin sponge.

In the 3rd study conducted by Calixto et al, [17] two different doses of simvastatin were used (2.2 mg and 0.5 mg). The carrier used in this study was collagen sponge of swine origin. Unlike the previous studies, the passive control group showed the highest amount of bone formation when compared to the other 3 groups.

This was attributed to the higher inflammatory levels that were found in the carrier group compared to the control group. The inflammatory reaction was even higher in the simvastatin groups especially within the group that received higher simvastatin dose. The synergetic inflammatory reaction of both a high simvastatin dose and an antigenic carrier was found to have deleterious effect on bone formation.

Regarding the safety of using simvastatin, animals in studies conducted by Wong [20] and Özeç [22] showed normal and complication free recovery, whereas all animals in Calixto[17] study that received simvastatin showed necrosis and crust formation which was more evident in the animals that received 2.2mg simvastatin. In addition to this local complication 6 animals of the simvastatin groups died (4 animals from the 2.2mg group and 2 animals from the 0.5mg group). These results comply with the findings of Nyan [16] and Calixto[17] that statins may have a dual effect on osteogenesis based on the degree of inflammatory reaction which is affected by the used dose.

Conclusion:-

The safety and osteoinductive properties of simvastatin are directly affected by the used dose and carrier, thus further studies are needed in order to determine the ideal dose/carrier complex that maximize the osteoinductive capabilities and eliminate or minimize the associated inflammatory reaction.

Introduction:-

The quality of life of any person depends on many aspects. One's ability to see things clearly can determine success or failure at work or in school. Normal vision helps a person to lead an independent life, without having to rely on others to fulfill their basic needs.

It has been estimated that about 180 million people worldwide are visually disabled. 45 million of them are blind. Developing countries account for four out of five of the visually disabled. One of the major causes of correctable blindness is refractive error. It has been estimated that refractive errors are prevalent in about 2.3 billion people. Out of these, 1.8 billion people have access for examination of the eyes and proper treatment. The remaining 500 million people have uncorrected refractive errors resulting in impaired vision and blindness.

Refractive errors are the commonest cause of impaired vision and they form the second important cause of treatable blindness in the world next only to cataract.

Refractive error is an intrinsic optical defect where parallel light rays are not focussed on the retina, resulting in a blurred image. Refractive errors develop during childhood and adolescence. If they are not treated children may develop amblyopia or strabismus.

Refractive errors may not only be associated with genetic factors but also with various other risk factors like prolonged near activity like reading, playing video games and watching television or computer for longer duration which considerably reduces the outdoor play time of children. This study has been undertaken to study the prevalence of refractive errors in urban and rural school children in Madurai. It is expected that this study will also give an insight into the magnitude of this problem and create awareness among the common public.

Aim and objectives:-

- (i) To find the prevalence of refractive errors in school children aged 10-14 years.
- (ii) To compare the prevalence of refractive errors in urban school children with that in rural school children.

Materials and methods:-

A cross sectional school based study was designed with 600 students within the age group of 10-14 years. A total of four schools, two from an urban area and two from a rural area were selected randomly.

300 students were selected from the schools located in the urban area and another 300 students were selected from the schools located in the rural area.

The principals, teachers and the concerned students were briefed about the study. Prior informed consent for participation in the study was obtained from the parents of these children.

A standardized questionnaire prepared in their local language was used to collect data on their age, sex, parental history of wearing glasses and other environmental factors like watching television, playing video games, outdoor activities and reading books.

Visual acuity (VA) test was performed using Snellen's E chart. Students with visual acuity $<6/6$ in one or both the eyes were tested for the presence or absence of refractive error by pinhole test. Those showing improvement with pinhole (indicating refractive error) were then subjected to retinoscopy and subjective refraction.

Emmetropia was defined as a spherical equivalent between -0.50 DS and $+0.50$ DS. A spherical equivalent less than -0.50 DS was taken as myopia. Hypermetropia was defined as a spherical equivalent greater than $+0.50$ DS. Astigmatism was defined as a cylindrical error less than -0.50 diopter cylinder (DC) in any axis.

Those children with both spherical and cylindrical errors were documented as having the spherical equivalent of myopia or hypermetropia respectively. The children with only cylindrical errors were documented as having astigmatism. Refractive error was categorized into three groups as i) myopia ii) hypermetropia and iii) astigmatism.

The particulars of each student were filled on a structured questionnaire specially designed for this purpose.

The data collected was analyzed by Pearson's Chi Square test using SPSS (Statistical Package for Social Sciences).

Observation:-

Mean age of the 600 children examined was 12.05 years. Out of these children, 297 were boys and 303 were girls.

The results of the analysis are presented in the following table.

TABLE1:- Prevalence of refractive errors in school children.

	Number of children (600)	Percentage
Refractive errors	97	16.2
No refractive errors	503	83.8

The over-all prevalence of refractive errors in school children was found to be 16.2%.

TABLE 2:- Distribution of various types of refractive errors in school children.

Type of refractive error	Number of children	Percentage
Myopia	67	69.1%
Hypermetropia	10	10.3%
Astigmatism	20	20.6%

TABLE 3:- Prevalence of refractive errors in urban and rural school children.

	Refractive errors (97)	Percentage
Urban	62	64
Rural	35	36

p value = 0.015

Out of the 97 children with refractive errors, 62(64%) children were from urban schools and 35(36%) children belonged to rural schools. This difference in prevalence was statistically significant with a p value of 0.015.

TABLE: 4:- Distribution of various types of refractive errors in school children in urban and rural areas.

Type of error	Urban children (62)	Rural children (35)	p value
Myopia (67) (69.1%)	42 (67.7%)	25 (71.4%)	0.066
Hypermetropia (10) (10.3%)	6 (9.7%)	4 (11.4%)	0.758
Astigmatism (20) (20.6%)	14 (22.6%)	6 (17.2%)	0.125

From the above observations it was found that the percentage of myopes was higher in rural areas (71.4%) compared to urban areas (67.7%). Similarly, the percentage of hypermetropes was higher in rural areas (11.4%) compared to urban areas (9.7%). These differences were not significant.

In contrast, astigmatism was more prevalent in urban children (22.6%), compared to rural children (17.2%) though it was not significant was found to be the least common error.

Discussion:-

School children form a vulnerable group affected by visual impairment. **Murthy GVS, Gupta SK, et al.**, have reported in their study that 81.7% visual impairment in school age children had been due to refractive error.

Both the children and their parents fail to recognize the vague symptoms produced by the presence of refractive errors. This creates subsequent detrimental effects on the educational potential, learning ability and the mental health of children.

Once these children leave school, the chances of getting themselves screened for vision is reduced. If diagnosed, refractive error can be treated safely and effectively by simple methods. Hence this study was aimed at school children aged 10-14 years.

In this present study, 97 out of the 600 school children had refractive errors. Of these 97 children with refractive errors, 62 belonged to urban schools and 35 belonged to the rural schools. The increase in the prevalence of refractive errors in urban school children compared to rural school children is statistically significant.

This result is in accordance with the results obtained by **Saw SM et al., 2001**. This higher prevalence of refractive errors in the urban school children may be attributed to a change in life style and improved socioeconomic conditions with increased duration of near work, better education facilities, television and computer usage and reduction in outdoor activities compared to their rural counter parts.

Studies by **Afghani T et al., 2003**, have showed that increasing literacy standards was associated with an increase in prevalence of refractive errors.

Ayub A et al, 2007 found out in his study that there was an increase in prevalence of refractive errors in private sector schools, compared to government sector schools due to presence of the above said similar reasons.

Myopia was found to be the commonest refractive error in our study being **69.09 %** of the total. **Astigmatism** was the next common error forming **20.62%** of the total. **Hypermetropia** was the least common of all the errors contributing **10.31%** of the total.

This is in accordance with the previous studies conducted on this subject by **Hussain AB, Ahmed EK**. The prevalence of refractive errors in school age children was 25.32% in their study. They also reported myopia in 63.5%, hypermetropia in 11.2% and astigmatism in 20.4% children.

Study of **Junaid SM et al**, shows an overall refractive error of 10 % in school children. Hypermetropia was present in 58% while myopia was present in 36% children. Astigmatism was identified in 6% children. However their study reported a higher prevalence of hypermetropia than myopia which is contradictory to this present study. Another

study carried out by **Ayub A et al** demonstrated myopia in 43%, hypermetropia in 21.5% and astigmatism in 35.5% children.

Conclusion:-

This study has confirmed the finding of others that there is an increase in the prevalence of refractive errors in children of urban areas compared to those in rural areas. Myopia was found to be the commonest error being followed by astigmatism. Hypermetropia was found to be the least common error.

With the advent of modern gadgets and improvement in technology, children are being constantly exposed more and more to the ill effects of these inventions. With increasing importance being given to academic activities and a reduction in duration of outdoor activities, due precautions must be taken by parents to ensure adequate visual hygiene in children.

Awareness on refractive errors and the importance of wearing glasses in children with refractive errors must be imparted in schools.

During the last few years, steps have been taken by the government to screen children in schools for early identification of refractive errors and their effective management by provision of spectacles.

Adequate screening procedures in schools, maintenance of visual hygiene and providing corrective measures will definitely reduce the burden of this problem in our society.

Ecosystem, Edaphic, Fragmentation, *Myristica fatua* var. *magnifica*, *Myristica* swamps, Western Ghats.

Abstract

A vast area of Western Ghats, coming under different forest types, are degraded and are threatened with ecological deprivation and biodiversity loss. Deforestation for urbanization, fragmentation due to developmental activities, over exploitation to meet the increased demand are the main anthropogenic threats. The freshwater swamps of Western Ghats dominated by the Myristicaceae members too face this loss of character. These ecosystems have unique biodiversity, bio wealth ecological functioning and supporting edaphic factors. Historically the natural landscape of Kerala is well represented by freshwater swamps and marshy lands which create a positive water regime and provide protection for unique flora and fauna. The high population density and high demand on space and livelihood of the state lead to the depletion or alteration of this natural landscape. In advanced stages, this leads to the fragmentation and isolation of the unique ecosystem. These changes in the ecological and edaphological characteristics will deprive these unique flora and fauna of the marshy condition to which it is adapted. The existing fragments of the freshwater swamp create a series of remnant patches, relic vegetation, surrounded by a matrix of different vegetation and by altered land use. Since *Myristica* swamps have been edaphically created with free flowing water stream, fragmentation initially results in the modification of velocity of water flow and changes in the silting or free flow of running water. The present investigation discusses the current distribution of swamps and its conservation status, ecological function and vegetational succession, by highlighting the effects of fragmentation and isolation of vegetation.

1. Introduction:-

Myristica swamps are edaphic formations of fresh water evergreen forest type coming under type category 4C/FSI (Champion and Seth, 1968) represented by a unique phytogeographic condition with supporting characteristics like amphibian vegetation. The predominant arborescent members are from primitive families like Myristicaceae, Flacourtiaceae, Dipterocarpaceae, while the shrubby and herby flora is represented by members of advanced families like Araceae, Aricaceae, Zingiberaceae, Marantaceae, etc. The community status of Myristicaceae members

Corresponding Author:-M. Rajendraprasad.

Address:-Plant Systematics and Evolutionary Science Division, Jawaharlal Nehru Tropical Botanic Garden and Research Institute, Karimancode P.O., Palode, Thiruvananthapuram- 695 562, Kerala, India.

is structurally and functionally dominant over other members, hence, the name *Myristica* swamps. This water logged edaphic environment and associated vegetations are distributed in the valleys or foot hills of Western Ghats and subjected to seasonal flooding and silting. The evergreen members are amphibian in nature specially adapted for surviving in marshy water logged condition as well as in terrestrial condition. These swamps were reported from different states along the Western Ghats (Saldanha, 1984; Gadgil&Chandran, 1989; Chandran&Gadgil 1989; Chandran&Mest, 2001; Vasudeva et al., 2001) Karnataka, Goa (Santhakumaran et al., 1995, 1999) and Kerala (Krishnamoorthy, 1960; Pascal, 1984). The ever green vegetation of swamps includes many endemic tree species and are well documented (Bourdillion, 1908; Sasidharan&Sivarajan, 1996; Ramesh and Pascal, 1997; Chandran&Mesta, 2011). The swamps are also inhabited by some of the red listed plants included in red data book of Indian plant (Nayar&Sastry, 1987, 1990). Hence, the *Myristica* swamps, with pristine vegetation are virtually live museums of ancient life of great biological interest. During the historical events of development and urbanization, these forest lands have been exploited and obviously perished. Land use changes like conversion to paddy field or plantation of areca, coffee, rubber or submergence under irrigation projects or extermination due to fire, all have had adverse impacts on these swamps (Krishnamoorthy, 1960). The existing swamps are also heading towards extinction. An example of such anthropogenic activity is evident in the Sasthanada swamp, Sankili section, Kulathupuzha Forest Range, Trivandrum Forest Division having 12 patches, extending to an area of 0.223 sq km (22.29 Ha). The fragmentation involves dividing up of continuous ecosystem into smaller areas called patches, and each patch has a relatively homogenous floristic, ecologic, and edaphic conditions. When fragments are created, plant dynamics is modified owing to changes in the forest spatial organization, such as the size, shape, and type of isolation barrier of forest patches. The functional dynamism of patches are affected with edge effects, migration and establishment of new species, decrease in the recruitment rate of specific species and increased recruitment rate of flexible species and disturbances in faunal interactions and disproportionally favoured and hence dominating species like *Lagerstromaeaspeciosa* and while others like *Myristica fatua* var. *magnifica* are facing local extinction. This vegetational, structural and functional changes are generating changes in the availability of water, nutrients, light, wind and other basic environmental factors by creating different degrees of ecological succession in the same area viz. Core vegetation, the unchanged original vegetation; Edge vegetation, representing transformed one. In between the core and the edge there is transitional vegetation, which are in different stage of succession. In short, the fragmentation due to this change in land use causes, the vegetation which once was supported by wetland (core vegetation) changing to the terrestrial area vegetation (edge vegetation). Thus the isolation and fragmentation of *Myristica* swamps lead to the breakup of these natural ecosystems into smaller patches of vegetation posing threat to their conservation status. Changes in the physical edaphology and micro climate will alter the reproductive phenology of the members of the original vegetation, especially biota like *Myristica fatua* var. *magnifica*. It is also noticed that this unique ecosystems are also seen as Sacred Grove, the patches of vegetation protected in the religious ground to avoid the perceived wrath of its resident God. The community status of flagship species viz. *Myristica fatua* var. *magnifica* fluctuates in advance with vegetational succession indicating past massive fragmentation of swamp during the urbanization of the state and thus these habitats can be described as “swampy relics” especially due to fragmentation and isolation followed by the vegetational succession, ecological and edaphological changes. The present study puts emphasis on the trends of vegetational succession due to fragmentation and effect of invasion of other species in the swamp.

Methodology:-

2.1.Study area:-

Kerala, the most south-westerly state of India, is located between latitudes 8° 17' 30" N. and 12° 47' 40" N. and longitudes 74° 27' 47" E. and 77° 37' 12" E. The state is isolated from the Deccan Plateau by the Western-Ghats, one of the biodiversity hotspots of India. The *Myristica* swamp of Sasthanada region, Sankili section of Kulathupuzha Forest Range (8°45'82"N.and 77°10'55"E.) is situated at an elevation of 155 MSL. The vegetation of this *Myristica* swamps is in the three stages of succession such as core (Figure legend A), transition (Figure legend B) and edge zone (Figure legend C).

2.2. Vegetation sampling:-

A detailed exploration was made in entire study area. The vegetational type, floristic composition and anthropogenic pressure were identified. The whole area is divided into three regions the core, transition and edge area. The line transects were laid across all types. The phytosociological features and floristic status were assessed by laying quadrates of size 15 x 10 in random. All the members were identified and enumerated. Height and girth at breast height (GBH) of all trees and shrubs (≥ 10 cm GBH) were measured using clinometer and metallic measuring tape respectively. Vegetation with less than 10 cm GBH were counted and enumerated as seedlings or herb species. The identification of the species was done by referring authentic books. The following parameters were calculated using this vegetation data.

2.3. Phytosociological analysis:-

Relative frequency (rF), Relative density (rd), Relative dominance (rD) were calculated and summed up to get the Important Value Index (Barbour et al., 1947), the calculation is done by using the following formulae.

$$\text{Relative frequency (rF)} = \frac{\text{Frequency of } i^{\text{th}} \text{ species}}{\text{Total frequency of all the species}} \times 100$$

$$\text{Relative density (rd)} = \frac{\text{No. of individuals of } i^{\text{th}} \text{ species}}{\text{Total frequency of all the species}} \times 100$$

$$\text{Relative dominance (rD)} = \frac{\text{Sum of the basal area of the individual of the } i^{\text{th}} \text{ species}}{\text{Total basal area of all the individuals}} \times 100$$

$$\text{Basal area} = \frac{(\text{GBH})^2}{4\pi}$$

$$\text{Important Value Index (IVI)} = rF + rD + rd$$

2.4. Density:-

The density of trees were found out by using point centred quadrat method (Barbour et al., 1971) Random points were located, the area around each point was divided into four 90° quadrates and the nearest of each quadrat was marked. Average distance for all the trees were taken together and computed for density as per the formula given,

$$\text{Density (Trees/ hectare)} = \frac{10000}{2(\text{Average distance in meter})^2}$$

2.5. Whiteford index:-

It is the ratio of abundance and frequency. In general, an index value of 0.025 to 0.05 indicates that the species is random, while the value higher than 0.05 indicates increase in aggregation and value lower than 0.025 indicates a tendency towards regularity (Whiteford, 1948). It was calculated using the formula.

$$\text{Whiteford index} = \frac{\text{Abundance}}{\text{Frequency}}$$

$$\text{Frequency} = \frac{\text{Total no. of quadrates in which species occurred}}{\text{Total no. of quadrates studied}} \times$$

$$\text{Abundance} = \frac{\text{Total no. individuals of species}}{\text{Total no. of quadrates occurrence}}$$

2.6. Similarity index:-

The value of similarity index indicates the affinity between each community. It is derived by the formula of Sorenson (1948).

$$\text{Similarity index} = 2 \times \frac{\text{No. of common species}}{\text{Total no. species}}$$

2.7. Floristic diversity indices:-

The species diversity within a species, community or within a habitat is calculated to assess the biodiversity. The diversity comprises of two components via, species richness and evenness or equitability. A number of indices have been reported which measure both components of species diversity, i.e. Species richness and evenness into a single index. They are discussed below.

2.7.1. Simpson's index (D):-

The index measures the probability that two individuals selected at random from a sample will belong to the same species and range from 0-1 (Simpson, 1949).

$$D = 1 - \sum_{i=1}^S [ni/N]^2$$

ni = Number of individuals

N = total number of species

2.7.2. Shannon- Wiener Index (H'):-

This index of diversity is based on information theory. The information content is measure of the amount of uncertainty. The index is zero and maximum when all the species are represented by the same number of individuals. It generally falls between 1.5 to 3.5 and rarely exceeds 4.5 (Shannon- Wiener, 1963).

$$H' = - \sum_{i=1}^S \left[\left(\frac{n_i}{N} \right) \ln \left(\frac{n_i}{N} \right) \right]$$

n_i = Number of individuals

N = total number of species

2.7.3. Equitability (J):-

The natural distribution of individuals among the species is called species evenness or equitability (Gupta and Shukla, 1991; Pielou, 1975).

$$J = H'/H \text{ (max)}$$

$$H \text{ (max)} = \log_2 S$$

S = Number of species in a quadrat

2.7.4. Species richness:-

The index of species richness (R) was calculated using the formula given by Menhinick (1964).

$$R = S/\sqrt{N}$$

R = Richness index

S = total number of species in the community

N = total number of individuals summed over all species.

2.7.5. Variety ratio:-

It indicates the diversity of each species with reference to the total number of individuals in unit area. The high value indicates high diversity of species.

$$\text{Variety ratio} = \frac{\text{Total number of species (S)}}{\text{Total number of individuals (N)}}$$

2.8 Regenerative status:-

The natural germination percentage, seedling establishment and casualty rate were calculated by counting methods. Randomly selected 10x10 meter quadrates were placed, and number converted into percentage.

Results:-

The *Myristica* swamps are the freshwater evergreen vegetated ecosystems predominated by the members of arborescent family Myristicaceae. The *Myristica fatua* var. *magnifica*, *Gymnacrantheracananica* are the upper canopy dominant species, which constitute thick and continuous upper strata. These two species are structurally modified to survive in the swampy condition, especially with knee roots and silt roots (Plate 1.d & e). The Myristicaceae members like *Myristica malabarica*, *Knema attenuta* are commonly seen as dominant associate species; hence the name *Myristica Swamps* was derived. The non- Myristicaceae tree members like *Lophopetalum wightianum*, *Lagerstroemia speciosa*, *Hydnocarpus pentandra*, *Holigarna arnottiana*, *Syzygium travancoricum* etc. are also well distributed in this forest type and sometime fall in the dominant category. The second and third strata are also well represented with younger members of these species with discontinuous canopy. The migrant and flexible species like *Vateria indica* and *Hopea parviflora*, are also distributed with different magnifications, accordingly with successional status of the swamp. The ground vegetation is mostly represented with *Lagenandra ovata*, *Calamus rotang*, *Pinangadicksonii*, *Pandanuskaida*. The lianas and climbers are mostly represented by *Gnetumula*, *Entadarheedei*, *Jasminum cordifolium*, and *Piper spp.* The floristic composition of ground vegetation and occurrence of the liana members are also dependent on degree of succession. Analysing the degree of similarity and dissimilarity between the isolated fragments of the swampy vegetation is typified into three categories according to the different degree of vegetational succession, namely Core vegetation, dominated with the species like *Myristica fatua* var. *magnifica* and *Gymnacrantheracananica*, the transition vegetation has also the same dominant members with less degree of community status, while the edge vegetation is represented by dominant

species *Lagerstroemia speciosa* and, *Myristica fatua* var. *magnifica*. The recorded relative occurrence and community status of *Myristica fatua* in terms of IVI are 86.45 in core area, 49.81 in transition zone and 22.34 in edge area. This also indicates a gradual decrease in occurrence and dominance of the *Myristica fatua* var. *magnifica*. *Gymnacranthera canarica* shows the value of 52.58, 27.02, and 19.89 respectively. Other associate species show different degrees of community status with respects to IVI value. (Table 1). As we look into the similarity of these three zones closely using the similarity index, the vegetative structure clearly represents an inverse relation. The core and the edge show very less similarity (29.5%) compared to the core and transition zone (45.9%). whereas the transition zone shows more affinity towards edge vegetation (72%). This represents the invasion of other species from edge to the transition and this trend will later result in the extinction of the swamp and the replacement of the terrestrial forest vegetation.

Table 1:- The Community Status of Important Tree species of Myristica swamps in Three Succession Zone

Sl. No.	Binomial	Core Area	Transition Zone	Edge Area
1	<i>Aporosa lindleyana</i>		16.75	05.12
2	<i>Chilocarpus denudatus</i>	13.92	06.82	08.53
3	<i>Deris pinnatum</i>		04.47	03.95
4	<i>Gymnacranthera canarica</i>	52.56	19.89	49.37
5	<i>Holigarna arnottiana</i>	16.10	06.38	24.15

The floristic composition and diversity of Myristica swamps also vary with vegetational succession, due to the isolation and fragmentation. The floristic composition of swamp includes 82 species belonging to 72 genera of 44 families. The distribution pattern of swampy vegetation shows, 32% of species random in occurrence, 65% in aggregate distribution and the remaining 03% with regular distribution pattern. This indicates the conservation value of the system; hence any alteration in ecosystem will lead to the massive extinction of species (Fig.1).

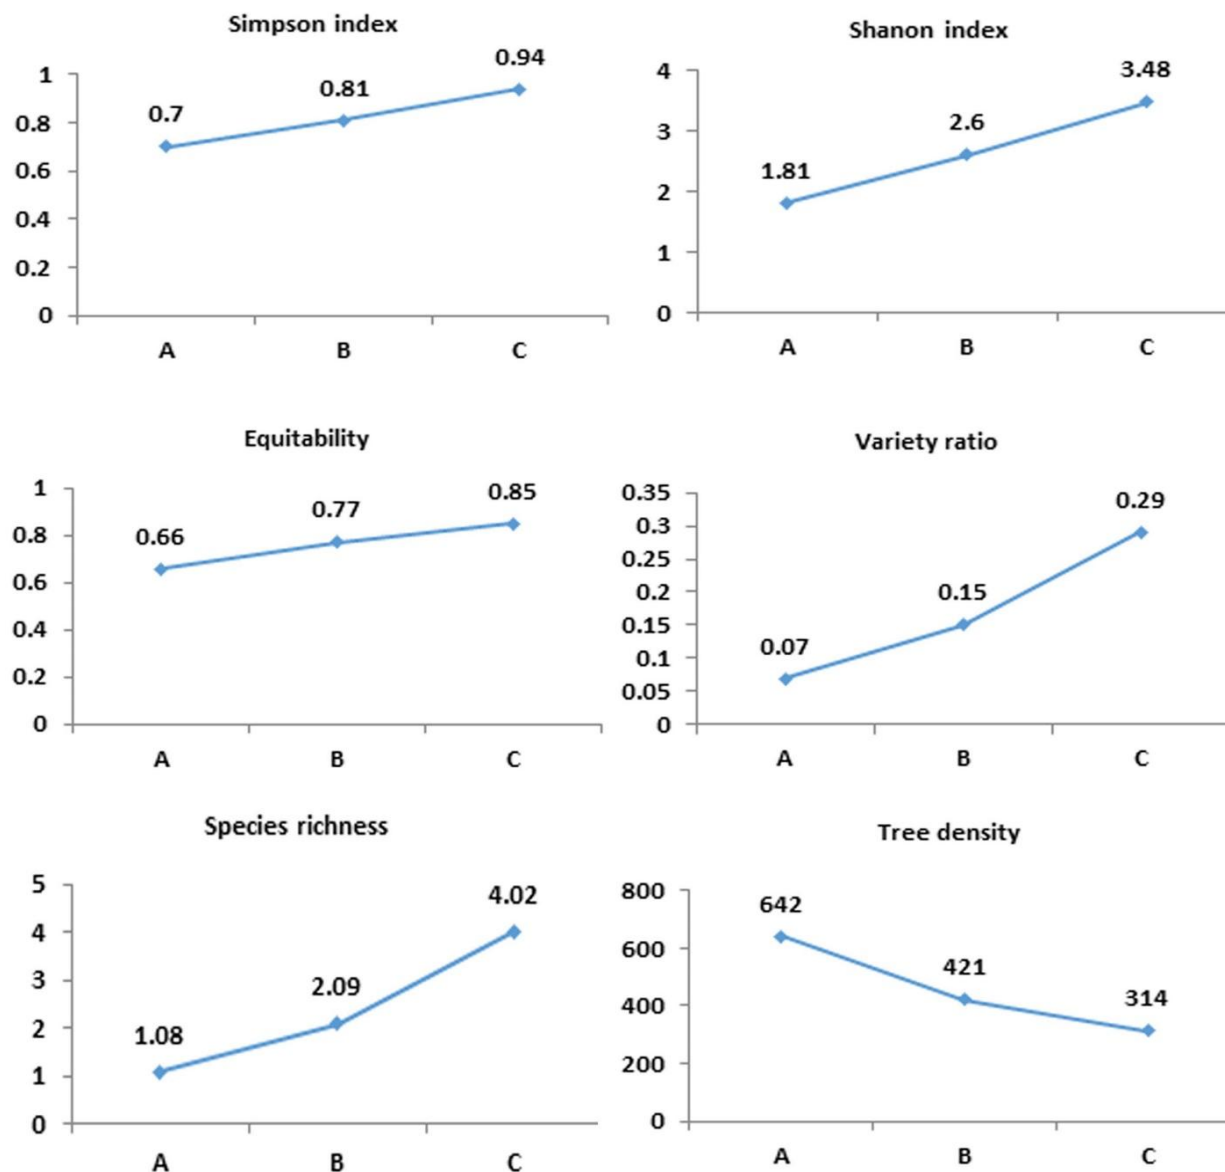

Fig.1: Vegetation Distribution pattern in Myristica Swamp

In the core area, the floristic diversity value, Simpson index is, 0.70, while in the transition zone, the value is, 0.81 and in the edge area the highest values which are about equal to that of the evergreen forests of Western Ghats i.e. 0.94 have been recorded. The same increasing trend has been recorded in the Shannon-Weinner index. The respective values are 1.81, 2.60, and 3.48. The Equitability value of core area is 0.66, transition zone value is 0.77

and edge area value is 0.85. The species richness also shows a decrease from 1.0 in the core area, 2.1 in the transition and 4.0 in the edge zone. The variety ratio also shows the standard of increasing the value by the advancement of ecological succession; the respective values are 0.07, 0.15 and 0.29. The density of tree species also shows changes with advancement of the ecosystem. In the core area of the swamp the tree density is 642 individuals per hectare, it decreases to 421 (68.5% of core area) in transition zone and further to 314 (48.9% of core area) in edge zone. The fragmentation and isolation of the specific ecological niche of the unique species of swamp ecosystems are declining or eroding gradually and lead to evolution and development of new vegetation and forest types (Fig.2).

Fig.2: Effect of fragmentation and isolation in florestic wealth and diversity of Myristica Swamps

The study about the reproductive capacity and aggressive capacity of *Myristica fatua* shows that the species has high degree of reproductive capacity with gregarious flowering and good fruit setting. The average seeding is 56 seeds in one sq. meter area and 92% of these seeds are viable. The primary dispersal rate is 58-66 %, mainly by *Ocercerosgriseus* (Hornbill), *Phaethontidaepsittaciformes* (Parrot) and *Ratafaindica* (Malabar Squirrel). The premature shedding due to the feeding of avian fauna like *Phaethontidaepsittaciformes* (Parrot), *Ocercerosgriseus* (Hornbill) and mammalian fauna like *Ratafaindica* (Malabar Squirrel), *Rhesus macaque* (common Monkey) were

also noticed. 48% of secondary dispersal was also noticed. The main dispersing agents are the common crustacean *Barytelphusa guerinii* (tropical freshwater Crabs) and *Rattus rattus* (Rat). The germination percentage in natural condition varies from 76.10 % to 23.37 % (core to edge) with an average value of 57.00 % (Fig.3). The subsequent growth and establishment of seedlings up to two years were analysed and the same trend was observed as for *Myristica fatua* and it also varies in accordance with different degree of succession and fluctuation. In the core area, the casualty rate is 91.70 %, in the transition zone, 92.90 % and 97.05 % in edge area. (Fig.4)

The *Myristica* swamps are the edaphic variant of tropical freshwater swamps and are evergreen in nature. These succumb to many threats due to the destructive and interactive face created by the natural and artificial factors. In turn it formulates various ecological and edaphological units. The population of unique species *Myristica fatua* var. *magnifica* in its different age class shows aggressive trends of declining population size through the advancement of transition of vegetation. In core area, the rate of population of *Myristica fatua* is 57%. While in transition vegetation the rate of population of *Myristica fatua* is 41%, in edge vegetation, surviving with other forest intruders, the *Myristica fatua* population is drastically declines to 18% of the total population. The analysis shows that invading of other evergreen species to the swampy area will cause the switch over of the swampy vegetation to evergreen vegetation (Fig. 5&6). The core area shows high degree of germination percentage and initial survival rate. The increased mortality rate indicates the specific ecological and edaphological requirements of the species for successful establishment. The fragmentation and isolation of this ecosystem has resulted in the decline in the number of individuals of structurally and functionally dominant specific species, *Myristica fatua* var. *magnifica* and hence it is considered as flagship species.

Discussion:-

Human alteration of the global environment has triggered six major extinction event in the history of the life and has caused wide spread changes in the abundance and distribution of the organisms (Han Olff and M.E Ritchie, 2002). Land use changes have the greatest impact on the biodiversity of the tropical forest area (Sala et al., 2000). Habitat fragmentation on a large scale occurs in the freshwater swamp ecosystem of the Western Ghats, which progressively gets subdivided into smaller and more isolated vegetation having interrupted matter and energy circulation. The changes in the ecological distribution has subsequently affected the floristic composition, vegetational structure and functional dynamism across other biotic and abiotic components stimulating a backdrop of natural patches created by changing landform and natural disturbance. This has led to different degrees of vegetational succession replacing the species that have survived in the swampy habitats. The fragmentation and isolation of ecosystem followed by the disruption and discontinuation of the flora and fauna will interrupt the functional dynamism of the ecosystem by checking energy and matter flow. These also result in the formation of different plant sub communities within the swamps itself. The different floristic elements occupy different space with different association having different boundaries, each with a varying degree of uniformity in structure and composition. By analysing the degree of similarity and dissimilarity between the floristic elements of fragments and isolated segments, a gradual gradation indicates the progressive trends of floristic fluctuation and succession. The vegetation is Phanero-thero type, dominated by trees and herbs, among which 80% of the arborescent species are paleoendemic and members of primitive families. Considering this primitive compositions, vegetation type, and antiquity, this swampy vegetation may be probably the remains of the most ancient forest of the Western Ghats. These unique and vital forest types are on the verge of extinction due to natural and manmade reasons. Nevertheless the fragmented freshwater swamps preserve remnants of vegetation thereby maintaining the conservation status of rare ecosystems to some extent.

The changing community structure of *Myristica* swamps are the primary driving force of vegetational changes, while direct effect of human activities like artificial constructions, habitat destruction, alternation of the land use pattern, exploitation for livelihood and introduction of alien species are secondary forces of change. Hobbs and Yates in 2003 and Laurence et al. in 2002 observed the same in other forest ecosystems. The fragmentation is also creating modified plant dynamism owing to the changes in the atypical organization in the size, shape and isolation of the forest patches. The edge effect and following invasion of other species have altered the internal microclimate and also the nutrient status of the soil system. These changes, the disproportionate establishment of plant species immediately affect the establishment of flagship species, *Myristica fatua* var. *magnifica*, the dominant species of the core area is being locally extinct in the edge area. Even in the transition zone, the number of the individual are not enough to specify the characteristic features of the swamp. The gradation of the floristic diversity indices and tree density indicates that this process is causing difference not only in the diversity but also in the bio wealth of core, transition and edge area. The change in the important value index indicates the changes in the community status of the common species of the swamp. The fragmentation of the swamp has a tendency to lose original species like *Myristica fatua* var. *magnifica*, *Gymnacranthera canarica*, and gain new species like *Lophopetalum wightianum*, *Vateria indica*, *Hopea parviflora*, the species that are capable of establishing fragmented swamp having new ecology and edaphology, initially by altering the water regime due to the acceleration in the silting and breakage of water flow. This alternate pattern of water flow leads to changes in normal drainage pattern and creates a modified substrate and ultimately leads to reduction of new environment for the plant colonization. The modified water regime results in the removal of specific underground swampy amphibian vegetation and can act as a focus for invasion of new species of terrestrial vegetation. The requisite micro niche of some vital faunal association also disturbed. The secondary seed dispersal of *Myristica fatua* var. *magnifica* were affected, hence successful establishment of the flagship species is affected in recruitment stage. The changes will also lead to changes in the humus deposition and decomposition rate. The flood washed off most of the debris and decrease saprophytic faunal diversity. This has altered the fauna abdication as well as the seed bed characterization resulting in mineral inequilibrium of soil system. The changes in the floristic composition and vegetational structure, upon the fragmentation of the *Myristica* swamp, and the production of remnant vegetation patches are likely to result in more flexible species getting established. Lovejoy et al., 1986 had reported that fragmentation in the tropical forest resulting in the rapid growth of vine and secondary vegetation in a 10-25.m, strip around the remnant edge. The freshwater swamps of Kerala once continuously distributed in low elevated lateritic hill rocks of the Western Ghats, were fragmented due to urbanization and other anthropogenic or natural reasons and are now distributed as relic vegetation, both in natural forest areas of southern Western Ghats and in the midst of the populated areas as sacred groves. The plant species *Myristica fatua* var. *magnifica* can only survive and tend to occur only in this specific ecosystem, hence they termed as 'flagship species'. In addition to this an interactive faunal association of *Barytelphusa gujerini* affects the secondary seed dispersal of *Myristica fatua* var. *magnifica*. The fragmentation in

swamp ecosystem is altered and a modified energy flow is created by generating a dispersal barrier for different life forms especially for flagship species or the keystone species.

Conclusion:-

Myristica Swamps are unique fresh water phyto-geographic ecosystems of Western Ghats, once distributed in low laying areas of Kerala State in a continuous manner. The floristic composition, ecology and edaphology are specific with high occurrence and distribution of Myristicaceae members, especially of flag ship species, *Myristica fatua* var. *magnifica*. The members are structurally modified due to inundated during greater part of the year. Presently, due to natural and manmade changes these are under threat and in path of extinction. The existing treasure home of biowealth, fresh water swamps, requires more attention to conserve, especially to check the local extinction of a few vital species and its associate. The typical swamps are characterised by low floristic diversity and high stem density. The vegetation is amphibian features, adapted to survive in marshy conditions. The germination and recruitment of new members of the important species are related to general ecology and physical edaphology including some faunal associations. These forest relics are facing various levels of disturbance, among which fragmentation is in prime position, which would be causative factor regarding the loss of swamp ecosystems. The fragmentation and isolation alter floristic structure, composition, micro climate, and water regime. These initial floristic, ecological and edaphological changes ends with formation of new ecosystem with common floristic composition, terrestrial ever green forest.

Anacyclus pyrethrum, Timahdite, polyphenolics content, Antioxidant activity.

Abstract

As part of valorisation of medicinal and aromatic plants from Timahdite, a region located in Moroccan Middle Atlas, we focused our study on an endemic species which belongs to Asteraceae family: *Anacyclus pyrethrum* L. This species, widely used by local people in traditional pharmacopeia, was chosen to conduct phytochemical studies and to assess the antioxidant activity of its roots, leaves and flowers extracts.

Thus, the plant was harvested in May 2014. The selected organs (roots, leaves and flowers) of *Anacyclus pyrethrum* were sorted, cleaned and dried separately. Then, they were reduced into powder and stored away from light in a cool and dry place until use. Each organ was subjected to a phytochemical screening in order to qualitatively highlight its secondary metabolites.

This qualitative analysis shows that roots are rich in alkaloids while the aerial parts (leaves and flowers) are rich in tannins and flavonoids. Extraction of total polyphenols was performed by maceration using methanol / water (70/30) as solvent. Yields were 2.30% for roots, 3.3% for leaves and 3.8% for flowers.

Then, fractionation of hydro-methanol crude extract was carried out using successively three organic solvents of increasing polarity: chloroform, ethyl acetate and butanol. Quantitative analysis of total polyphenols conducted with Folin-Ciocalteu reagent showed that hydro-methanol crude extracts are richer in phenolic compounds than other fractions.

Antioxidant activity of crude extracts determined through DPPH test was spectrophotometrically quantified and values of the half-maximal inhibitory concentrations (IC₅₀) were graphically determined. These values are 77.62 µg gallic acid equivalent (GAE) / ml for flowers, 94.18 µg / ml for leaves and 145.81 µg / ml for roots, while 46.79 µg / ml was found for ascorbic acid which was used as standard.

Finally, a correlation was observed between total polyphenols content and antioxidant capacity determined by DPPH method: Aerial parts

Introduction:-

These last decades have been marked by the widespread use of synthetic products in various industrial fields. Through years, this practice in the case of synthetic antioxidant molecules has often led to potential toxicological risks. Now, their use is reconsidered by international organizations and new plants are sought as a source of natural antioxidants [1,2]. Thanks to their properties, these natural antioxidants attract more interest in various fields. They are used to prevent and to treat cancer, inflammatory and cardiovascular diseases [3]. They are also used as additives in food, pharmaceutical and cosmetic products [1]. Thus, scientific research has been developed with the aim to extract, identify and quantify antioxidant compounds from natural sources such as medicinal plants and food products. In this quest for safe natural antioxidants, polyphenolics, which are widespread natural plant compounds, are of great interest because of their beneficial effects on health [4].

With the aim to find promising phenolic compounds, our research focuses on *Anacyclus pyrethrum* which is a Moroccan and Algerian endemic species belonging to *Asteraceae* family [5]. This perennial plant is widely prevalent in Moroccan Middle Atlas [6]. It is a 40 to 60 cm-height species which is characterized by long and thick roots. Its numerous simple or ramified stems lie on the ground and bear pinnate, alternate, finely cut, delicate and pubescent leaves. Its yellow-heart flowers are composed of white petals inside and purple petals outside. The species is well appreciated as a remedy against toothache [5], digestive disorders [8]. It also acts as a warming agent to enhance women fecundity and constitute a tonic agent for the nervous system [9]. *Anacyclus pyrethrum* is also used to treat cough, cold as well as heart, lung and digestive diseases [10]. For this medicinal value, this plant was selected for the present study. Moreover, review on this species showed that its chemistry remains insufficiently studied. According to our knowledge, no research work was conducted on the aerial parts of the plant. Thus, our work aims to contribute to a complete phytochemical study of *A. pyrethrum* and to contribute to the explanation of its various activities. We focused our interest on the wild species which particularly grows in Timahdite's forests, at altitudes ranging from 400 to 3100m. [11].

The aim of our work is to quantify *Anacyclus pyrethrum*'s phenolics in the extracts of three organs and to assess their antioxidant power by DPPH method.

Material and methods:-

plant material

Anacyclus pyrethrum was harvested in May 2014 at 1800m of altitude in Timahdite, a region located at 30km south from Azrou. Samples were harvested with their roots, stems, leaves and flowers in order to make their identification easier. This plant identification was conducted in the laboratory of Botany and Plant Ecology at the Scientific Institute of Rabat by Professor MOHAMED IBN TATOU. Samples of different organs (roots, flowers and leaves) were cleaned, shade dried at room temperature and then stored away from light until use.

phytochemical screening :-

Plants organs (roots, leaves and flowers) were powdered with an electric grinder. After this step, chemical composition of the drug was determined by a phytochemical study based on solubility tests, colour and precipitation reactions and also by observations under ultraviolet light.

The target phytochemical groups in these tests include: alkaloids, polyphenols (flavonoids, anthocyanins, tannins, ...), saponins, coumarins, sterols, terpenes, mucilage, carotenoids, reducing sugars (oses and holosides)

- Research on alkaloids was performed using Dragendorff and Mayer's reagents which are reagents for general characterization of alkaloids [12].
- Characterization of tannins was carried out with Iron chloride reagent. The differentiation between gallic and catechic tannins was shown thanks to Stiasny's reaction [13].
- Identification of flavonoids was performed by cyanidin test [14].
- Research of saponosides was quantitatively determined by calculating the foam index after shaking the aqueous extract [15].
- Anthraquinones were identified by Borntrager's test [16].

- Sterols and terpenes were highlighted by Liebermann-Burchard's test [17].
- Coumarins were demonstrated by UV fluorescence at 365 nm [13].
- Mucilages were indicated by the presence of a flocculent precipitate after adding ethyl ether in a test tube containing plant's decoction [18].

Phytochemical screening was carried out separately on plant's leaves, flowers and roots.

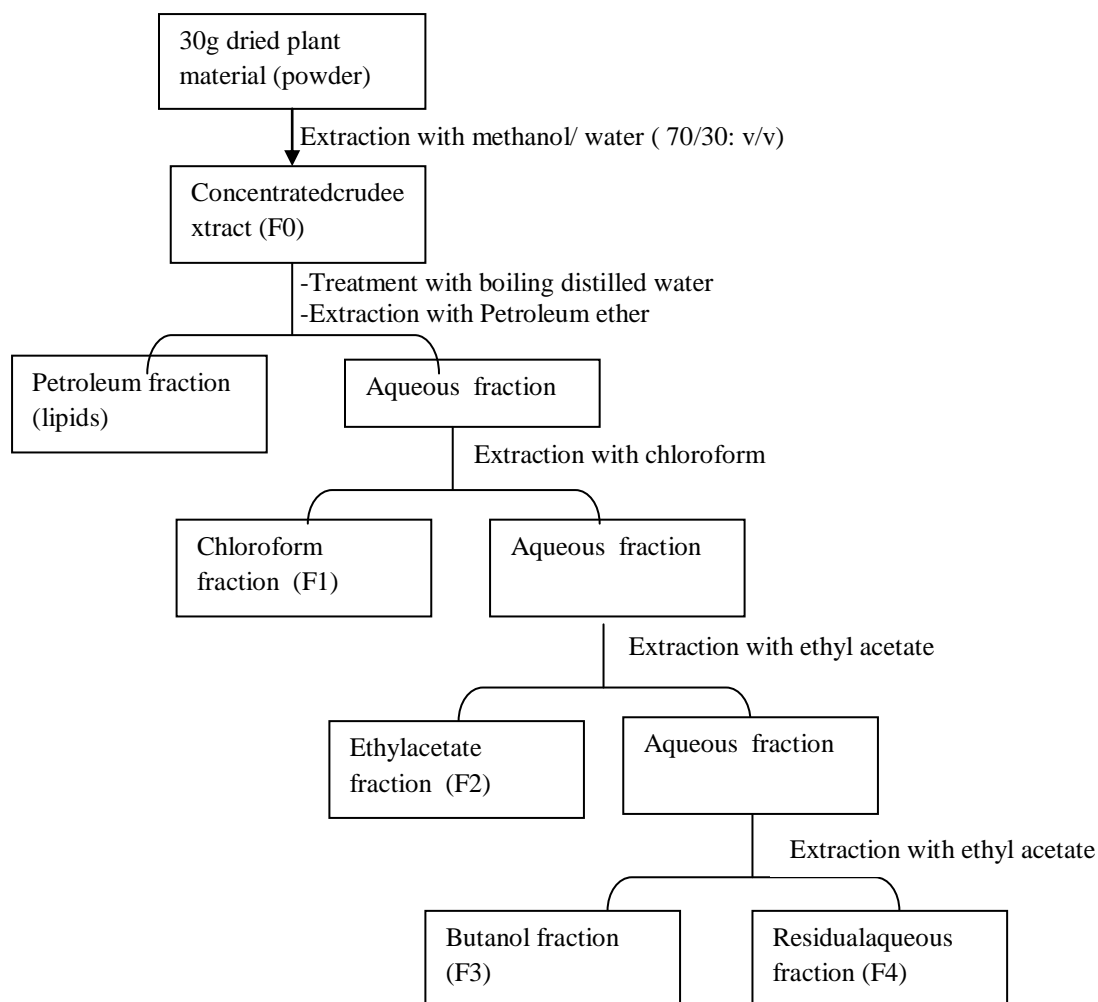

Preparation of extracts:-

Test samples composed of 30 g powder of root, leaves and flowers of *Anacyclus pyrethrum* was macerated in a hydro-alcoholic mixture (methanol / water 70/30: v / v) with magnetic stirring for 30 min. The mixture was then stored in the dark for 24 hours at room temperature. The obtained solution was filtered on filter paper and the filtrate was concentrated under vacuum at 50 ° C with a Büchi-type rotary evaporator [19]. The dry extract was then weighed, labelled and stored at 4 ° C until use.

Fractionation:-

Polyphenols extraction was performed according to Bruneton's method [15] with a slight modification. It is based on polyphenols' degree of solubility in organic solvents. Fractionation of crude hydro-methanol extracts was carried out by successive use of four organic solvents with different polarity: petroleum ether, chloroform, ethyl acetate and butanol.

In addition to the hydro-methanol crude extract (F0), four fractions were selected for further work: chloroform fraction (F1), ethyl acetate fraction (F2), butanol fraction (F3) and residual aqueous fraction (F4). The different extracts were kept cold away from light until use. Picture 1 summarises fractionation steps of the crude extracts.

Picture 1:- Fractionation steps of crude extracts.

Determination of Total Phenols Content :-

Total polyphenol content of *A. pyrethrum*'s crude extracts was determined by Folin-Ciocalteu's method [20]. In a 100 ml-volumetric flask, 40 ml of each extract were mixed with 1.5 ml of an aqueous solution of sodium bicarbonate (Na_2CO_3) at 10 % and 1.5 ml of Folin-Ciocalteu reagent (10fold diluted). Then the flask was supplemented with distilled water. The mixture was stirred and incubated in the dark at room temperature for 30 minutes. The reading step was performed against a blank using a spectrophotometer (UV mini-1240) at 765 nm. A standard curve with gallic acid as positive control was established in parallel under the same operating conditions. Results are expressed as milligrams of gallic acid equivalent per gram of extract (mg GAE / g).

Determination of flavonoids contents:-

Total flavonoids content of *A. pyrethrum*'s extracts was determined according to aluminumtrichloride method. The mixture was stirred and then incubated in the dark at room temperature for 30 minutes. A blank is prepared by replacing the extracts by methanol and the absorbance is read at 433 nm with a UV spectrophotometer. Results are expressed as mg of quercetin equivalent / gram of dry plant material. Quercetin calibration curve served as a standard.

Assessment of antioxidant activity :-**Dpph Test:-****Principle:-**

DPPH (2,2-diphenyl-1-picrylhydrazyl) is generally the most widely used substrate for rapid and direct assessment of antioxidant activity thanks to the stability of its free radical form and the simplicity of the analysis. This method is based on the measurement of antioxidants' ability to scavenge the DPPH radical [21]. Indeed, the latter is characterized by its ability to generate stable free radicals. This stability is due to the relocation of free electrons in the molecule, this relocation leads to a violet blue colour which is characteristic of the DPPH solution. Evaluation of antioxidant effectiveness is spectrophotometrically assessed at 515 nm through the decrease of the blue colour due to recombination of DPPH radicals [22]. In the presence of free radical scavengers, purple-coloured DPPH (2,2-diphenyl-1-picrylhydrazyl), is reduced into 2,2-diphenyl hydrazine -1- picryl which presents a yellow colour in the presence of free radical compounds [23].

Protocole:-

Ethanol solutions of ethyl acetate fraction were prepared. The following concentrations were obtained: 16; 32; 48; 64; 80; 96; 112; 128; 144; 160; 176 and 192 $\mu\text{g} / \text{ml}$. 200 μl of each ethanol solution were added to 1.8 ml of DPPH* solution which is also prepared in ethanol (0.024g / l). In parallel, a negative control was prepared by mixing 200 μl of ethanol with 1.8 ml of ethanol DPPH* solution. Absorbance was read against a blank at 515 nm after 30 min of incubation in the dark at room temperature. Ascorbic acid solution was used as a positive control. Absorbance was read in the same conditions for samples and controls. The test is repeated three times. Results are expressed as DPPH* reduction percentage. This percentage is calculated using the following formula:

$$\% P = [(A_{bl} - A_s) / A_{bl}] \times 100$$

P : DPPH* reduction percentage; A_{bl} : blank absorbance; A_s : sample absorbance

Results and discussion:-**phytochemical tests :-**

Results of phytochemical tests are gathered in table 1.

Table1:- Results of phytochemical screening of *Anacyclus pyrethrum*'s hydro-methanol extracts

Chemical class	Organs		
	Roots (R)	Leaves (LS)	Flowers (F)
Alkaloids	+++	+	+
Gallic tannins	+	+	+
Catechic tannins	+	++	+++
Flavonoids	-	++	+++
Anthocyanins	-	-	-
Leucoanthocyanins	+++	++	++
Saponosides	+	+	-
Free anthracenic compounds	-	-	-
Combined anthracenic compounds	+++	++	++

Coumarins	+	++	+
Carotenoids	-	-	-
Sterols and triterpenes	+	++	+
Reducing compound	+++	++	++
Oses et holosids	+++	++	++
Mucilages	+++	+	+
Narcotics	-	-	-

(+++): strong reaction; (++): moderate reaction; (+): weak reaction ;(-): no reaction

Results of phytochemical tests have shown that:

- Alkaloids are present in all three parts of the plant, but in small quantities in the aerial parts (leaves and flowers) compared to roots.
- Flavonoids are not detected in roots, but leaves contain mainly flavanols and flavanonols (red colour) while flowers essentially contain flavones (orange-pink colour).
- Tannins: Based on the colour obtained with FeCl₃ reagent, different parts of this species contain gallic tannin. Catechic tannins are less important in roots compared to leaves and flowers. Their presence is confirmed by Stiasny's reaction.
- Saponosides were detected and foams indices show that saponins content is low (1.1 cm) in leaves and roots. They are clearly absent in flowers.
- Sterols and terpenes are detected in a higher content in leaves compared to flowers and roots. A violet colour appears and then turns green.
- Coumarins presence is remarked thanks to fluorescent spots observed during qualitative analysis.
- Reducing compounds are present in large amount in the three parts of the plant.
- Finally, it should be noted that carotenoids, narcotics, free anthracenic compounds (anthraquinone) and anthocyanins are absent or rare in all studied parts of the plant.

The roots of *A. pyrethrum* mainly contain alkaloids and tannins. Similar results have been shown by Bellakhdar, 1996 [24], Hmamouchi, 1999,[25],Center for Mediterranean Cooperation, 2005[26], Selles et al., 2012[27], Limbachia&Jadhav, 2012 [28]). They also contain mucilage. The presence of mucilage in the roots of *A. pyrethrum* allowed us to note the viscous character of the extracts. During our phytochemical tests, we have demonstrated the presence of coumarins, sterols and triterpenes in the roots of *A. pyrethrum* but in small amount. These results are consistent with the previous works of Hamimed, 2009 [29]; Sellese et al., 2012[30]. The roots of *A. pyrethrum* also contain oses, holosides and reducing compounds. This was highlighted by (Selles C., 2012) [30]. Hence, the chemical composition of the roots of *A. pyrethrum* has proved to be interesting and rich in compounds known as bioactive molecules (Hamimed, 2009 [29]; Christian, 2013[31]). The overall results justify the various activities of this plant including the use of part of its chemical compounds as alternative to synthetic antioxidants.....

Extraction yields :-

Yields of crude hydro-methanol extracts from roots, leaves and flowers are respectively: 2.3%, 3.3% and 3.3% (Table 2).

For crude extracts fractionation, results show that butanol fraction has the highest yields (1.93%, 3.2% and 3.7%) followed by the aqueous fraction (1.33%; 2.9% and 3.2%) and then the ethyl acetate fraction (1.23%, 2.23% and 2.4%). On the other side, the lowest yield was obtained with the chloroform fraction: 0.76%, 1.8% and 2.1% respectively for roots, leaves and flowers (Table 2).

Table 2:- Yields of polyphenol extracts and fractions obtained from *Anacyclus pyrethrum* 'sorgans

Extracts and fractions from <i>A. pyrethrum</i> 'sorgans	Yields (%)		
	Roots (R)	leaves (LS)	Flowers (F)
Crude hydro-methanol extract	2.30%	3.3%	3.8%
Chloroform fraction	0.76%	1.8%	2.1%
Ethyl acetate fraction	1.23%	2.23%	2.4%
Butanol fraction	1.93%	3.2%	3.7%
Aqueous fraction	1.33%	2.9%	3.2%

total phénol content

UV / Visible spectrophotometry allowed to quantify polyphenols in all extracts and fractions. Results are shown in Table 3.

Table 3:- Polyphenol content of *A.pyrethrum*'s extracts and fractions expressed in milligrams equivalents gallic acid per gram of extract (mg GAE/g of extract)

Extracts	Polyphenol content in mg GA eq /g of extract		
	Flowers	Leaves	Roots
hydro-methanol extract (F ₀)	21.84 ± 2.41	14.23 ± 1.44	7.83 ± 1.18
Chloroform fraction (F ₁)	13.49 ± 1.51	5.67 ± 0.48	4.94 ± 0.21
ethylacetate fraction (F ₂)	14.20 ± 1.40	10.23 ± 1.34	5.94 ± 1.21
butanol fraction (F ₃)	19.84 ± 1.81	12.15 ± 1.18	6.15 ± 1.70
residual fraction (F ₄)	16.12 ± 0.09	11.85 ± 1.09	5.88 ± 0.63

For all parts of the studied plant, we noticed the variability of total phenols contents (Table 3). The highest content was found in flowers. It varies between 13.49mg and 21.84mg of gallic acid equivalent per gram of extract followed by the leaves with a content ranging between 5.67 mg and 14.23mg GA eq / g of extract. Polyphenol content of roots varies between 4.94 mg and 7.83mgGA eq / g of extract.

We also found that methanol crude extracts contain relatively high concentrations of polyphenols compared to other fractions. Phenol content of a plant depends on a number of factors such as climatic conditions, time of harvest, solvent of extraction, storage conditions [24].

flavonoids content:-

Flavonoid content in hydro-methanol extracts obtained from *A.pyrethrum*'s organs are recorded in picture 2.

Picture 2:- Flavonoid contents in flowers', leaves' and roots' extracts and fractions of *Anacyclus pyrethrum*

Concerning flavonoid, the highest content is recorded in flowers' hydro-methanol extract with a value equal to 3.4 mg of quercetin eq / g of dried plant material followed by the leaves' hydro-methanol extract with 2.93 mg of quercetin eq / g and finally roots' hydro-methanol extract with 0.96 mg of quercetin eq / g dried plant material.

We can deduce that the crude extracts from flowers and leaves of *A. pyrethrum* are the richest in flavonoids.

Antioxidant activity:-

Values obtained from DPPH test allowed to establish curves on picture 3.

Picture3:- DPPH d'inhibitionpourcentages according to extracts concentrations

Picture4:- Half maximal inhibitoryconcentration (IC₅₀) of hydro-methanol extracts towards DPPH

The results obtained show that hydro-methanol crude extracts of *A. pyrethrum*'s organs have very important antioxidativeactivities, with IC₅₀ 77.62µg / ml for flowers, 94.18µg / ml for leaves and 145.81µg / ml for the roots. These levels are lower than that of ascorbic acid (IC₅₀ 46.79µg / ml) used as a positive control (Picture 4).

On the other hand, we note that there is a correlation between the concentration of polyphenols and antioxidant activity, confirming that polyphenols are powerful antioxidants that inhibit the formation of free radicals and oppose oxidation of macromolecules.

The antioxidant activity depends not only of the concentration of polyphenols, but also on the structure and nature of antioxidants in the extract [13]. Generally, polyphenols with high number of hydroxyl groups show higher antioxidant activity [25].

Conclusion:-

The phytochemical study of three organs of *Anacyclus pyrethrum* shows that the leaves and flowers are rich in tannins and flavonoids, while the roots are richer in alkaloids than both of the other parts of the plant.

Concerning the phenolic composition of the extracts, flowers and leaves showed high total polyphenol content in comparison with the roots.

This in vitro study of the antioxidant activity performed with the method of scavenging DPPH free radical showed that methanol crude extracts have a high capacity to trap the DPPH radical with 50% inhibitory concentrations (IC₅₀) about 77.62 µg / ml for flowers, 94.18 µg / ml for leaves and 145.81 µg / ml for roots. These extracts may therefore be an alternative to some synthetic additives.

It is therefore important to characterise and identify the bioactive molecules in all fractions of the three organs of *A. pyrethrum* by HPLC analysis.

Abstract

Imaging is the most important and frequently used diagnostic tool in dentistry. Although the history and clinical examination are of prime importance when evaluating patients, the use and evolution of non-invasive technology from two-dimensional (2D) X-ray modalities to three-dimensional (3D) cone beam computed tomography (CBCT), for imaging is increasingly becoming popular. Interest in CBCT from all fields of dentistry is unprecedented because it has created a revolution in maxillofacial imaging, facilitating the transition of dental diagnosis from 2D to 3D images and expanding the role of imaging from diagnosis to image guidance of operative and surgical procedures by way of third-party applications software.

Introduction:-

Since introduction in the late 1990s, cone beam CT (CBCT) has become a common modality to image the facial skeleton. CBCT has been described as the 3D method of choice for maxillofacial imaging due to the lower cost of the equipment and test, the reduction in radiation level in comparison with multi-slice computed tomography, high resolution for bones and teeth, and the possibility of obtaining the whole set of traditional orthodontic images in only one exposure.¹

The American Association of Oral and Maxillofacial Radiology has stated that cross-sectional views are recommended for planning dental implants, and this in combination with the easy accessibility, easy handling, and low-radiation dose of CBCT imaging will lead to the widespread use of CBCT imaging in implantology.² Oral implants require localized area of oral and maxillofacial area for radiation exposure; so, CBCT is an ideal choice. CBCT scans help in the planning of oral implants; they enable measurement of the distance between the alveolar crest and mandibular canal to avoid impingement of inferior alveolar nerve, avoid perforation of the mandibular posterior lingual undercut, and assess the density and quality of bone, and help in planning of the oral implant in the maxilla with special attention to the nasopalatine canal and maxillary sinus.³ If CBCT was equal to a full-mouth series in efficacy, it could be argued that, depending on machine type, the radiation risk would be considerably less, as would the time and effort it takes to image the patient.

Background:-

The imaging of CBCT is achieved by operating a rotatory gantry to which an imaging x-ray tube and image receptor are fixed. A deviating pyramidal or cone-shaped source of ionizing radiation is focussed through the center of the

Address:- Resident associate , AHEAD academy, Rajinder Nagar, New delhi-110059.

area of interest onto an area image receptor on the opposing side. The x-ray tube and image receptor rotate around a rotation fulcrum fixed within the center of the region of interest. During the rotation, multiple (150 - 600) sequential planar projection images of the field of view (FOV) are obtained in a complete or partial arc. This technique varies from a traditional medical CT machine, which uses a fan-shaped x-ray beam in a helical progression to acquire individual image slices of the FOV and then stacks the slices to acquire a 3D image. Each slice requires a distinct scan and separate 2D reconstruction. Since CBCT exposure incorporates the entire FOV, only one rotational sequence of the gantry is necessary to acquire enough data for image reconstruction.⁴

The four components of CBCT image production are (1) acquisition configuration, (2) image detection, (3) image reconstruction, and (4) image display. The dimensions of the FOV or scan volume able to be covered depend primarily on the detector size and shape, the beam projection geometry and the ability to collimate the beam. During the scan, single exposures are made at certain degree intervals, providing individual 2D projection images. The resolution, and therefore detail, of CBCT imaging is determined by the individual volume elements or voxels produced from the volumetric data set. In CBCT imaging, voxel dimensions primarily depend on the pixel size on the area detector, unlike those in conventional CT, which depend on slice thickness.⁴

Benefits of cone-beam CT in dentistry:-

CBCT equipment occupies less room space compared to conventional CT machine. Structural relationships of hard and soft tissues can be observed directly. The ability to rotate images and to add or subtract structural components permits relationships to be studied. Contiguous structures can be separated and normal hidden surfaces examined in detail. Accurate linear and volumetric measurements can be made. It eliminates superimposition of images of structures outside the area of interest. CBCT imaging produces images with sub millimetre isotropic voxel resolution, which achieve accurate level of spatial resolution for maxillofacial imaging. Images of the patient can be acquired in sitting, standing or supine position. CBCT volumetric data is isotropic, which means all three dimensions of the image voxels are the same. This makes it possible to reorient the images to fit the patient's anatomic features and perform real-time measurements.^{5,6}

Applications of CBCT in dentistry:-

Implant Dentistry:-

Conventional panoramic radiography is unable to image adequate bony support preoperatively. Obviously, having this information preoperatively greatly reduces the likelihood of the need to change the treatment approach intraoperatively. The reported indications for CBCT use in implant dentistry vary from preoperative analysis regarding specific anatomic considerations, site development using grafts, and computer-assisted treatment planning to postoperative evaluation focusing on complications due to damage of neurovascular structures. It will be difficult to prove a clear and statistically significant benefit of cross-sectional imaging (with special emphasis on CBCT) over conventional two-dimensional imaging such as panoramic radiography with respect to damage of the IAN or other vital neurovascular structures in the arches resulting in dysesthesia or pain in comparative prospective studies due to the high number of cases needed for such an evaluation.⁷

Orthognathic Surgery:-

A 3-dimensional model can be reliably adopted for orthodontic and orthognathic analysis and surgical prediction, extensive research is needed to characterize the landmarks and relationships that this technology allows us to measure. As useful as cephalometric analysis can be, its imaging accuracy is inadequate in such deformities as hemifacial microsomia, severe facial asymmetries, and occlusal cant. Volumetric analysis promises to offer better prediction in terms of the morphology of the defect, as well as the volume of graft material necessary for repair. Questions abound regarding the stability of the arch after grafting, the quality of the bone graft over time, and the effect on overall facial growth; CBCT provides a means to investigate these issues in depth. Only difficulty is how best to apply and manipulate that data for more accurate surgery and treatment planning.⁸

In 2009, Swennen et al. recommended the following three-stage sequence for imaging when evaluating surgical treatment outcomes using CBCT: In Stage 1 (3–6 weeks post-operatively): imaging is used to verify the transfer of bony parts. This time frame circumvents post-operative soft tissue swelling which might interfere in occlusion and is prior to bony consolidation, thereby providing proper visualization of osteotomy lines. In Stage 2 (6 months to 1 year post-operatively): imaging at this stage evaluates the soft tissue response and should preferably occur after the removal of orthodontic brackets. In Stage 3 (2 years or more post-operatively): this imaging is used to evaluate long-term changes in surgical treatment.⁹

Orthodontics:-

Orthodontists can use CBCT images in orthodontic assessment and cephalometric analysis. Today, CBCT is already the tool of choice in the assessment of facial growth, age, airway function and disturbances in tooth eruption.^{10,11}

While 3D CBCT images are most often used to assess skeletal contributions to malocclusion, researchers are now investigating the use of these images to assess dental relationships in orthodontic patients.¹² CBCT likely will provide information that could result in one or more of the following outcomes: (1) enhanced diagnosis, such as precisely localizing impacted and supernumerary teeth; (2) quantifying the magnitude of a defect or deformity, such as in patients with craniofacial anomalies; (3) improving differential diagnosis of skeletal, dental or combined malocclusions, including identifying the jaw(s) contributing to malocclusion and determining whether the discrepancy is bilateral or unilateral, such as in orthognathic surgery, asymmetry, craniofacial anomaly and open bite cases; and (4) helping to identify possible causes of malocclusions, such as the contribution of TMJ abnormalities to an open bite or asymmetry.¹³

The decision regarding the use of CBCT depends on the severity of malocclusion. The more severe the malocclusion, the more probability of needing the examination and similarly the milder the malocclusion, the less likelihood of needing a CBCT scans. Malocclusion severity is understood as the presence of vertical and sagittal skeletal discrepancies, facial asymmetry, craniofacial malformation and tooth eruptive disorders. There is no rationale in indicating CBCT for patients with Class I malocclusion and anterior crowding.^{14,15}

Airway morphology and obstructive sleep apnoea:-

Cone beam computed tomography can better assess the cross-sectional dimensions of the airway space than conventional 2D radiography. The drawing of airway circumferences and calculation of cross-sectional areas by computer also greatly reduces operator-dependent bias.¹⁶ Aboudara et al found much larger interindividual variations of the volume and area of the upper airway in cephalograms than with CT.¹⁷

Caries diagnosis:-

CBCT imaging appears to be the best prospect for improving the detection and depth assessment of caries in approximal and occlusal lesions. Recent work with benchtop-based local or limited CBCT (LCT) systems has demonstrated the potential for caries detection and depth characterization by high-resolution systems. Further studies are needed to evaluate CBCT for the detection of occlusal or pit and fissure caries, a task for which 2D imaging has been weak.^{18,19}

Periodontal applications:-

Mol et al observed that the CBCT images provided more accurate information on periodontal bone levels in three dimensions than the images of photostimulated phosphor plates. In a similar study, it was found that CBCT was better in morphological description of periodontal bone defects, while the images obtained by charged coupled device sensor provided more bone details.²⁰ Noujeim et al concluded that CBCT technique has better diagnostic accuracy than periapical films in the detection of interradicular periodontal bone defects.²¹

CBCT measurements were found to be equivalent to direct measurements and dehiscences were diagnosed with higher accuracy than fenestrations. CBCT images were used for alveolar bone width measurements. Intra-surgical furcation involvement measurements were compared by using CBCT images and it was reported that CBCT images demonstrated a high accuracy in assessing the loss of periodontal tissue and classifying the degree of furcation involvement in maxillary molars.²²

Endodontic applications:-

CBCT for endodontic purposes appears to be the most promising use of CBCT, in many instances instead of 2D images. Endodontic applications include the diagnosis of periapical lesions due to pulpal inflammation, visualization of canals, elucidation of internal and external resorption, and detection of root fractures. CBCT was found to be useful in differentiating solid from fluid-filled lesions (periapical granulomas from cysts) using grayscale values in the lesions.²³

For most endodontic applications, limited FOV CBCT is preferred to medium or large FOV CBCT because there is less radiation dose to the patient, higher spatial resolution and shorter volumes to be interpreted. Limited FOV CBCT should be considered the imaging modality of choice for initial treatment of teeth with the potential for extra canals

and suspected complex morphology, such as mandibular anterior teeth, and maxillary and mandibular premolars and molars, and dental anomalies. If a preoperative CBCT has not been taken, limited FOV CBCT should be considered as the imaging modality of choice for intra-appointment identification and localization of calcified canals. Limited FOV CBCT should be considered the imaging modality of choice if clinical examination and 2-D intraoral radiography are inconclusive in the detection of vertical root fracture. Limited FOV CBCT should be the imaging modality of choice when evaluating the nonhealing of previous endodontic treatment to help determine the need for further treatment, such as nonsurgical, surgical or extraction and for nonsurgical retreatment to assess endodontic treatment complications, such as overextended root canal obturation material, separated endodontic instruments, and localization of perforations.²⁴

Temporomandibular joint diagnostics:-

CBCT in general has an acceptable accuracy for diagnosing osseous TMJ abnormalities with fairly high sensitivity, although small abnormalities might be missed. CBCT most accurately depicted erosive changes of the bone cortex of the mandibular condyle.²⁵ The high detectability of CBCT images on bone morphology of mandibular condyles was observed. CBCT has also been found useful as an image-guided technique for safe puncturing of the superior TMJ space. CBCT has been applied in the evaluation of bifid mandibular condyles, coronoid hyperplasia and articular eminence morphology and to assess condylar remodelling accompanying splint therapy.²⁶ CBCT was applied in a series of cases of osteochondroma of the mandibular condyle and the value of 3D reconstructions when viewing expansive lesions was emphasized. CBCT has also been applied to cases with facial asymmetry and condylar hyperplasia, synovial chondromatosis, fibrous ankylosis in rheumatoid arthritis, metastasis of a bronchial carcinoma and juvenile idiopathic arthritis.^{26, 27, 28}

Oral and Maxillofacial Pathology:-

CBCT is useful in evaluating the intricate anatomy of many unusual presentations, measuring their exact dimensions and their association with surrounding structures. CBCT scan is the imaging method of choice in pre and postoperative diagnosis assessment of inflammatory odontogenic cysts together with alloplastic graft materials repairment of the osseous defects and dental rehabilitation by metallic implants, due to high specific abilities in bone tissue 3D evaluation. Three-dimensional imaging of cysts and tumors of the maxillofacial region can give the surgeon the vital information necessary for planning surgery; with volumetric analysis, this can help anticipate the need for and volume of a potential graft for reconstruction.^{8,29} Various effects of cysts and tumours on the anatomic structures can be studied using CBCT.³⁰

Oral and maxillofacial surgery:-

CBCT is the technique of choice in mid-face fracture cases, orbital fracture assessment and management and for inter-operative visualisation of the facial bones after fracture. Since it is not a magnetic resonance technique, it is the best option for intra-operative navigation during procedures, including gun-shot wounds. CT is the modality of choice for the evaluation of complex facial fractures, especially those involving the frontal sinus, nasoethmoidal region, and the orbits. CBCT acquires all projection images in a single rotation, therefore scan time is reduced enormously (20 seconds or less), often performed with the patient in a seated position. Because the data are acquired volumetrically, voxel size is isotropic, equal in all 3 dimensions of the voxel, whereas conventional CT voxels are anisotropic, where the height of the voxel (Z-axis) is determined by slice pitch, a function of gantry motion.³¹

Prosthodontics:-

Other than implant planning, CBCT has its role in prosthodontics as planning craniofacial defect reconstruction. Three-dimensional augmented virtual models of the patient's face, bony structures, and dentition can be created out of CBCT DICOM data by software volume rendering for treatment planning. The process of initial assessment to a follow-up during a 4 years review would be precise with the use of a CBCT, thereby improving the prognosis of over dentures.³²

Forensic dentistry:-

CBCT technology offers 3D visualization and more complex and more accurate imaging compared to analog and digital radiographs. Increasing availability of this technology provides the forensic odontologist with an imaging modality capable of providing a 3D representation of the teeth and the jaws whose benefits may be extended in several ways to the science of forensic odontology. Rai et al investigated age estimation based on the pulp-to-tooth area ratio (PTR) of maxillary canines measured in three planes (axial, sagittal, and coronal) obtained from CBCT image data.³³

Limitations of CBCT:-

The spatial resolution and the contrast resolution of CBCT is lower than that of conventional film-based or digital intraoral radiography. Radiographic artifacts are another problem in CBCT imaging. The two types of artifact that can reduce the diagnostic yield of the images are distortion of metallic structures, called “cupping artifact” and the appearance of streaks and dark bands between two dense structures, so that these artifacts may reduce the diagnostic yield of images. The patient has to stay absolutely still as his/her movement can adversely affect the sharpness of the final image during the scan.³⁴

Effective dose of CBCT:-

Heterogeneity in measurement methods and scanning protocols between studies made comparisons of effective doses of different CBCT units and scanning protocols difficult. Few studies related doses to image quality. Reported effective dose varied across studies, ranging between 9.7 and 197.0 mSv for field of views (FOVs) with height #5 cm, between 3.9 and 674.0 mSv for FOVs of heights 5.1–10.0 cm and between 8.8 and 1073.0 mSv for FOVs .10 cm.³⁵

Conclusion:-

In summary, with the continued decreasing cost of CBCT technology, it is only a matter of time until CBCT finds its way into the average dental practice. It is clear that the utility of the CBCT cannot be disputed. CBCT is capable of providing accurate, submillimeter-resolution images in formats allowing 3D visualization of the complexity of the maxillofacial region.

Abstract

This study is purposing to studying the development of the growth rates in Libya's economy, as this study is purposing to know the real reasons of the decreasing or wiggling in the rate of the economic growth, beside to know the development that's happened in the main growth rates in the economic sector of Libya's economy and the change that happened to it during the period (1970-2015).

The economic growth is a process in which increased the real income an increase that cumulative and persistent during a period of time, where the investment according as most important factor in the investment process and the growth status materializewith a whole process of making capital, the process of expand the rate of the local production growth and that's by using the available local source, lie in taken two kind of decisions.

The first ones: Attaching in which sectors we should investing with.

The second ones: Blend of factors which must be using to product goods and services which rule the production technology, where the result pointed that the investment is the most important factor in the growth process and the status of growth materialize with the whole process of making capital, as the result showed that the Libya's economy had notice a rising with the growth rates in the product sectors during the study period.

It's arranged on it the speed of the living level improving, and that's considered a positive indicator which had service the path of the economic growth in Libya.

The Key Words: The Evolution of the Economy / The Rate of the Growth / The Libyan Economy.

Introduction:-

The economic and socially development is the most important purpose which all the countries are seeking to achieve it in our contemporary world, whether the development ones or the ones that walking in the growth way, as after the second world war had finished in the first of the forties of this century, the birth of about two-thirds of the world which are known now as the developing countries, where it's came into being, carrying with it a lot of economic, social, politic, cultural, and administrative problems, as a result to the tardiness that it had suffering of for a long centuries, and as a result of the hard life condition that arrange on other different factors like colonization with its two kind the old and modern, so the development had becomes presenting one of the main cases which occupies a

special place on the two levels, the global and the national, and one of these signs is, the large numbers of the researches, studies, and articles which spreading in several parts of the world, and that's in purpose of understand the problem of the development countries, and face it with an accurate scientific facing, where the development in our time depended on a set of components or elements, that must have provided to start with march of growth and progress in any community of human societies, and these components or elements, are an interlocking circles that completed each others, where the absence of one or some of it affecting in the growth process in these communities, where these components are usually presented of, the political system, economy system, a natural sources, investment, accumulation of capital, manufacturing, human sources, and the efficient flexible management of that able to make maximum benefit of these elements, as it showing during several experiment that passed it the underdevelopment countries, with preparation and implementation the economic and socially development plan, the economic and technical feasibility study of plans and programs development, are no longer in itself enough to rule on the possibility of implementation these plans, without taking in consideration another important factor which is the administrative feasibility study, which means the range of possibility or ability of administrative device that based on undertaken to such vital task before thinking of doing these plans, and that doesn't usually done unless provided an effective device for planning, take task of coordination and connection between planning and implementation process, and that's now are not available for most of the development countries, and that's consider to the absence of the active manager that able to find system of administrative planning of policies, programs and helpful sources to selecting the aims of the plan and how to apply it, where the economic and socially development planning with the absence of the active devices to collect the information, and a new system of information and active units to planning and budget, are forming a heavy burden to any country that seeks to achieve the development, as the plan that doesn't building on a specific information, will not achieve its goals, as the absence of the capable central and sub devices will make the plan is building on policies, objectives, and programs that so far from the necessary scientific studies to prepare the sound plan of development.

The final purpose of the development is to achieving the fit growth rate in each productivity and service sectors in balance way, and that's what wasn't achieved it in the past during the experiments and attempts which had done in this field, as a result of a combination of factors that contributed directly in the weakness of the economic basic in Libya, and occurrence to economic and social development were unbalanced, and a changing in administrative structure had a negatively affected in the administrative system efficiency, of these factors the unbalance change which had happened in the socially building of community, by the fast social change that's unplanned, as a result of administrative and developmental experience that relatively short, compared to other of the advanced industrial countries, and as a result of the flowing of cash capital after the showing of the oil in the middle of ninety, and what had come with it of the expenses in making a lot of main projects in the same time, the rarity of the work element especially the technical competencies, the economic, socially and cultural, incapacity on absorb the modern technology, the instability of economic policies and its stability in a particular style, the weakness of the level of the education and training, as well as the weakness of the system of material and moral incentives that motivation to work and good performance.

The Problem of the Study:-

Libya according as one of the development countries, which passing today on a transformative stage of the traditional possession to redevelop possession, beside of the transformative stage to the socialism and what came with it of the application and its obstacles problems, like the low or weakness with the rate of economic growth and achieving a low rates which lead the country to put many of plans and programs which purposing to increase the economic growth rate, and that's by:

- The controlling on inflation rates at low levels.
- Working on achieving a real positive interest prices.
- Limiting of the deterioration of the market prices in the local coin.
- Achieving a high economic growth rates.

Though Libya had passed through the development plans and programs in achieving a great deal of the economic stability, but achieving an economic growth rate was not in the required level, which means there is another factors stand in front of achieving an economic growth rate that desirable, where the reasons of that go back to three factors which are:

- The inactivity of the investment policies that been applied to achieving that much of the accumulation of capital which achieving the desirable economic growth rate.

- Disruption the relation between the available savings and required investment.
- The existence of two elements together.

From up the summary of the problem that the Libyan economic had suffering of presented to the stability of the real economic growth rates in the levels (acceptable) to insure of high growth rates during applying a comprehensive and sustainable development plan.

The limits and the scopes of the study:-

The study purposes to know the development that happened in the rates of the main growth in the production sectors of economy in Libya and what happened in it of changing during the period (1970-2015).

The Aim of the Study:-

The study aims to:

- Studying the growth rates in Libya's economy.
- Knowing the real reasons of the decreasing or the wiggle in the economic growth rates in Libya.
- Studying the requirements and the possible ways to decreasing a high growth rates in Libya's economy in the future.

The Methodology of the Study:-

The method that been used in the study on using analytical method with its two parts, descriptive and quantitativeto suit the nature of the study subject especially the specific indicators of growth rates during the study period.

The Important of the Study:-

The important of the study came from the few studies in the field of the economic growth rates, where the economic growth according as the most prominent targets of any economic program or economic plan, beside to what it presenting of facts and analytical observations that helping in study the privacy of the subject of the economic growth and its important in any analytical economic study.

1-The Accumulation of capital

The accumulation of capital had magnified during the net investment process (**Rostow, 1960**), which present the different between net country incomes (the social income minus the extinction) and between what it consumed of that income during a specific accounting period. The accumulation of capital has expanding the ability of the country of production goods.

The term of capital is broader than the term of traditional capital goods, in other words, it's the goods that doesn't giving a real time benefit but producing a goods that achieving these benefit, and if the capital had definition of the exists that creating an extra channel in the future to the income that measurable in the society, as many goods and services as has been customary a consumer goods that must classified specifically as a part of the accumulation of capital to country, as an example the expenses on education which is continually reinforcing the mind ability of individuals beside that it is giving a direct satisfaction , these expenses must partly account as investment expenses, and the same thing for some consumer goods like clothes, the consumer chive goods and similar, considered necessary to stimulate the agricultural product to increase the production and it's necessary to classify as an accumulation capital(**A.B. Therol, translated by Dr. Kasem Al-Dujaili 1998, P219**).

So that the only way to build the productivity energies of country and rising the average of individual income, is with distribution the productivity energies of goods and there is no need to material product of capital but to product a different kinds of capital like consumer goods (Catalyzed) and expansion the investment field in human capital and all of that are contributing in the production increase and rise the living levels. The development process is connected with manufacturing and the manufacturing connected with making capital, and a large number of the economist also seeing that the investment is the most important factor in the development process, the professor Arthur Lewis(**A. Louis, (Allen and Unwin 1955)**) had described the development process as a process that leading to transformation the economic from saving and investment 5% to saving and investment 12%. As the professor Johnson(**J.J. Johnson, 1969, P9**)had also seeing the formation of capital with its expansion conception that is a special character for development process. The state of the growth shapes in a comprehensive process of the capital formation, the mechanical, economical, and social stay, to sustain and increase the accumulation of capital to the per capita in its different shapes, conversely the state of the retardation connected with possess a relatively littleaccumulation of the different shapes to capital.

1.1. The Capital and the Technological Progress

The rate of growth of the required capital to absorption of new technology in countries which are characterized by delay in the technological level is being bigger than it is in the development countries. The countries that delay technology are limited with producing technology, and in the economics of the extra work and low factor to the capital\the work, as the deepening of capital which means giving each worker more capital to work with it may create a big difference in the production level, bigger than countries that have deepened capital continues for a long time.

The development in the product technical which is considered as the most clear explanation of the technological advances is the outcome of the group operations of researches and innovation, as it's an activity creating a new knowledge, but the development and evolution processes are processes that apply the new knowledge in production activities and all these processes are economical processes, as the relative importance of activities to the different factors which contribute in the progress process and the speeding of the progress itself had changing from country to country according to the development stage which is passing in it, beside that the number of the springs of technological advances are not recouping ones to the other [Dr- Qasim Al-Dujaili, 1998, P (226-227)].

1.1.1. Scarcity of Capital

Of the main properties which are characterized by the economics of development countries are the scarcity of capital which is the inability of capital, the bad using of it, and the inadequate what it consists to finance the necessary investments to promote with its economic potential and the implementation of its development plans, that's because of the capital is of the important direct growth factors, when this factor that synergizes with the human natural sources, so it will give a direct productivity.

The relative scarcity takes of capital different shapes in all sectors of the economic activity in such of countries, and the dominant phenomenon is the scarcity of the capital sources with its kinds like industrial buildings and the modern machinery and equipment with high production levels, and also the social capital like schools, hospitals, paved roads, Bridges, sewers, tunnels, railways, road transport and maritime and air, and the means of irrigation, sanitation and other (Mansoor. Dr-Ali Hafez, P32).

The scarcity of capital, is a phenomenon that has a strong relation of showing capital and demand of it and misguided of capital formation in economy, as the show of capital is weak and that's because the weakness of saving because of the decreasing of the real income level as a result of decreasing the production level which back to the decrease of capital, and the demand of capital as well is weak and that's incentive weakness on investment because of the weakness of the purchasing power as a result of the decreasing of the real income level which back to the decrease of the production level and that's because of the decrease of using capital in production.

And that's how the empty circles in the show and demand sides of capital in the economics of the development countries (Caftan. Dr-Mohammed Fazel Mohammed Aziz Caftan, 1978, P46) and it is possible to say that the scarcity of the capitals assets in most of the development countries are a reality that can't be denial and may cause in the continuing underdevelopment.

1.2. Resource Allocation and Economic Reconstruction

1.2.1. The Resource Allocation

Proceeding from the fact that the scarcity of resources in the development countries and its relation with needing the development process, the central issue in the development economics are resource allocation on the different needs which compete ones each other on these source, that's in most of the development countries there are two main limited on the growth of product process, and they are: the ability of the investment and the ability of import.

The most theories that resource allocation and most of the investment standards reflex this truth, so that, the start point that is known in the resource allocation process are how to maximize the rate of product growth by using what's available of the local resources, and how to minimize of this process needs of foreign currency.

Regardless of the decisions that are connected with the size of the required investment, it can be recognizing two kinds of specialized decisions of resource: [A. Luis, (Allen and Unwin 1955)]

- The first one is linked to which sectors that we should investing.
- The second one is combination of factors which must be using to production goods and services which control of production technology (Murad. Dr-Mohammed Helmi 1968, P 123).

In the same time which seems that these two decisions are separated ones on each other but in reality they are not as of the scientific side we find that the overlap between the product decisions and the technologic decisions are a thing that can avoid it.

As the deal of customize resources between the projects can't be separated from considerations of broader economic and policy subjects which is industry versus Agriculture, the balance growth versus unbalance growth, the outside trade strategy ...etc, and the effect of all these decisions will be through these next targets development strategy, as if the target is maximize the current level of well-being or maximize the growth and the output in some point of time in the future.

1.2.2. The Economic Rebuilding

The study of world experiments which engaged to its economic building for period of after war can take advantage of it with rebuilding our national economic in face of the different of condition, the stage natural, and the economic and socially development stage between Libya and those countries, but it faced a problems with one kind of natural and engaged to it almost with similar ways with different of the kind of methods that had take it to get this target.

With the different of the nature of the economic and socially systems of these countries and to rebuilding purposes, it requires concentration the economic resource, the ways of planning, and the central Administration in the hands of the state, as in British after war had establishment of the Ministry it mission to providing advice and recommendations to rebuilding and by that we seen that there is a necessary to make such a Ministry in Libya as to finish it mission after removing the reason of creating it(Naser. Salah, 1965, P161).

From other side the national economic rebuilding after war required providing large capitals, and the countries had different with providing these resources as the Soviet Union as an example had depending mainly basic on the self possibilities, while British beside to its self possibilities had depending on the outside helps, and as it comes to Libya, the provision of material resources is not a hard thing to do as Libya owns a huge reserves of oil, as the economic rebuilding required makes a critical reform for period of after war and required intensifying of capital element and increasing the production by inter improvement in the management and planning.

2- The Definition of Economic Growth

It's a process that increasing the real income an continues and cumulative increasing during a period of time extended to (quarter of century) where these increasing being bigger of the growth rate of peoples with providing a production and social services, Protect renewable resources from pollution, and preservation of non-renewable resources depletion(<http://ar.wikipedid.org>).

There is a different definitions of economic development, and of these commons definitions that the process including achieving a high growth rate of averagereal per capita income during a period that expanded from time (three decades) that is not accompanied by this deterioration in income distribution or an increasing in the poor level in society.

As it also known as the increasing of the number of goods and services which a specific economic producing it, and these goods had been production by using the mainly product elements which are earth, work, capital, and organization.

Since the industrial revolutionhas done then the spreads of it and what came of it of expansion changes in the industrial structure and achieving a big economic and social growth, then these economic and social progress is what called of the economic growth¹

So that the economic growth is means in general, the increasing the income for particular State had been majoring by using the ratio of the gross domestic product growth, and it's been comparing the ratio in particular year with the previous one.

¹ The English dictionary for example between the two words (Development, Growth) both are synonyms, one of them may be using in a place of other, as they're two carry the meaning of change which is connecting of improvement, so that the meaning of development and growth that's been mention in the research are the most popular meaning in the economic writes.

The increase in capital, the technologic progress, and improving the level of education, considered as the mainly reason of economic growth, as the past years had showing the idea of the sustainable development another factors like the main environmental factor of economic growth in realist by exclusion the rate of the expansion and not count it when the goods and services had been accounted.

2.1. The Theories of the Economic Growth

When we speaking on the economic growth. We must go back to some of the theories of economic growth and the opinions which the first economists had put it or came with it which the books of economic had included it, and brevity we mention of it:

- Adam Smith the first of traditional economist who contributed with explain the growth foundation in the free capital economics, and his theory had specialized with interaction trait in front of the steady progress where Adam Smith had built his thought on the principle of dividing work and connecting it degree with the size of market and how it expands, make the income a main condition of the economic growth and insuring of its important to collecting the capital to considered as a main element in the theories of economic growth.
- As Tomas Robert Malts said that the human well-been and his happiness are stopping on first of all the increasing of resource in ratio that equivalent to the increasing of people at less, and Malts had built his theory in peoples based on two principle:
 - The first ones: the food is necessary for human life and necessary to keep him alive.
 - The second ones: The instinct of controlling of each sex to the other, and Malts summarizes his theories to see the people increasing on a form ergonomically successive where the resources doesn't increasing unless on a form calculations successive.
- As the theory of Dived Ricardo was the more inclined to pessimism as he moved from the thought of increasing expensive which control on the thought of Adam Smith to the thought of decreasing expensive his situation in that is the same with the traditional economic which had following Adam Smith and founded the theory of the economic growth which characterized by pessimistic to the future, that the economic growth is achieving as a result of the people growth and what lead to it of increasing in the output nationalist.
- As Walt Whitman Rostow had focused in his study about the idea of stage as most notably as a standalone unit [Caftan, Mohammed Fazel Mohammed Aziz, 1984, P(175-212)], and it based on that the national economy walk on hard way cross stage after stage surpassing the difficulties and hardships until to the high degree of the economic growth to insure that the modern style of development, including five stages that should be done, started with the consumer society, to reach the starting stage which is the crucial stage.
- As Marx had building his analysis of economic growth in the light of capital on the theory of extra value as he start with divided the total national result in to three elements which are: the stable capital, the changing capital, and extra value which mean by it profit, rent and interest that the capitalist had it by unlawfully, and the Marxist interpretation of economic growth mainly on the physical interpretation of history and as it is the important factor and the final with make the history and it development is economic factor by its nature.

2.2. The Analyses of Growth and Income Distribution

There are many ways that consists of identical to expression about the growth in the income or the result of any country as an example [A.B troll \ translated by Dr-Qasim Al-Dujaili, P(123-124)].

The growth can be expression about the Calculated by dividing the investment coefficient to the gross (0\1) and the investment production is (1\ 5) which is:

$$\begin{array}{ccccccc}
 & \text{Increase in production} & & \text{investment} & & \text{increase in production} & \\
 \text{Growth} = & \frac{\quad}{\text{Gross}} & = & \frac{\quad}{\text{gross}} & * & \frac{\quad}{\text{investment}} & \\
 & \text{O } \Delta & 1 & \Delta \text{O} & & & \\
 \frac{\quad}{1} & * & \frac{\quad}{0} & = & \frac{\quad}{\quad} & = \text{growth} &
 \end{array}$$

And by definition that the slow growth either a decreasing of investment factor, or decreasing of production of capital, or both of them. And this equation is the mainly of the theory that said, the rate of the growth is faster in the development countries demanded a more resource for investment, but itself doesn't formed a development theory.

As an alternative we find that the output income can be expressed as a foregone conclusion of the total workstrength (L) divided on the output of unit work (L/O). and of that we can expressing about the output growth by its foregone of collection growth rate in unit work ($L/\Delta L$) and the growth rate in the output of unit work or what can expressing by productivity of work which is : $(L/O) \setminus [(L/O)] \Delta$

$$\text{Growth} = \frac{\frac{\Delta}{\text{Increase in production}}}{\frac{\Delta}{\text{Increase of workstrength}}} = \frac{\frac{\Delta}{\text{Increase in production}}}{\frac{\Delta}{\text{work strength}}} * \frac{\Delta}{\text{work output}}$$

And by this formula, the slow growth attributed by definition either to the slowly of growth rate, or delay of growth rate in work production, or both of them. And the expressing about growth on this way highlights on adoption the income growth of work unit (and the most important is growth of per capita income) on the growth of work production.

The main thought behind production function to measure the growth rate is provide a better understanding of growth resource and expressing by quantitative form about the size of the contribute which perform by all source when the growth rate had been calculated.

This way had been used in extensive form in the development countries and it had a lot of benefit, where some development countries has starting in our time to use this way as when some of these countries don't find it useful in extensive form because of the resource of growth in these countries had institutional in nature or not able to major.

2.3. The Mainly Indicators of Economic Growth in Libya

2.3.1. The Growth Indicator of the Period (1962-1969)

The traditional social and economic structure that mainstream in Libya's economy had changed radically change, where it enabled the successive cash flows as a result of oil exports to get rid of the deficit, where it directed attention to development that founded by oil income, and work on appear many economic development in start of it the rising of the growth rate, the increasing of the public spending, the level of the real income, improving the public level to the prices, increasing the imports, and creating a work opportunities.

As where the growth rates pointed on the available data but these period had seen a high growth rates which described by it's of higher growth rates in the world where the local output had achieved a yearly growth as much as (22.6%), and as a result of that the real average income to the individual had rising in realty of (16%) yearly, as the gross fixed investment had achieved a yearly growth rate as much as (15.6 %).

As on the economic sectors level, the data pointed that the oil sector had achieved a yearly growth as much as (46.7%) then the building and construction sector with average (19.9%), then the transportation sector with average (16.6%), then the services sector with average of (13.4%) finally the trade sector with average (12.7%).

The oil had achieved an increasing income for country what make it able to create an accumulation process in capital which consider as an important element of the economic development elements, where the available data in this regard pointing that since (1963) the oil revenues start to form an increasing rate of public revenues, where the rate of oil revenues had rising in the gross revenues from (26%) during the fiscal year (1962-1963) to (80%) in (1968-1969), in face of it the public spending with rate (1.7%) during the period (1955-1962) with rate (3.17%) during the period (1963-1968), where came of it most of these increasing about planning development program which targeted ensure rapid improvement in the standard of living and reducing migration from rural areas to cities and that's during increasing the important of the agricultural sector on the ground that the main supplier of foodstuffs and a source of income for too much community sons, beside to the increasing depended on the public sector with provide public services like education, health, transportation, and housing, where the State had depended a transformative economic and socially plan (plan 1963-1968) targeted through it provide development requirements, achieving the economic stability, and improve the living level for individuals, where it specialize for it huge amounts of money reached (450) million dinar a big part of it had specialized (43%) for spending on the

agriculture sector and service sector, while the rest has specialize (57%) for investment in the oil sector, where the percentage contribution of oil has rise in the economic active from (6.9%) in the year (1958) to (53.9%) in the year (1964) then to (62%) in the year (1968).

And the table number (1) the rate of real yearly growth of Libya economic during the period (1962-2009).

Table number (1), the rate of the real yearly growth of Libya economic during the period (1962-2009)

Item 1	1962-1969	1970-1982	1983-1990	1962-2009
Local production	22.6	13.2	2.5	11.8
Agriculture sector	4.1	4.6	11.8	6.7
Oil and Minerals	46.7	14.3	7.8	17.8
Manufacturing	8.4	18.6	7.0	13.0
Construction	19.9	15.3	1.8	12.0
transportation	16.6	18.1	0.4	13.1
Wholesale and retail trade	12.7	17.0	2.1	10.9
Services sector	13.4	14.0	2.7	11.1

The increasing of the contribution of non-oil sectors (Agriculture and Industry) in the gross domestic product, where it depended on the three development plans, the three-year plan (1973-1975), the five-year plan (1976-1980) and the second five-year plan (1981-1986) the development strategy that target achieving the most rate of total growth, with the different in the production activity, but it's with all these efforts, the contribution of sectors in the local product had stay very modest, which conform on continued the dominance of oil on the Libya's economic.

2.3.2. The Indicators of the economic growth for period (2010-2015)

During the past period Libya had notice a long war (Chad War – American Aggression) and live a tough economic siege, as its development journey had go back effected by the condition and economic policies which had approach far a way of the principle of developmental differentiation supporting to battleship efforts and the Sustainability of counter the siege which limit of the positive development effects which achieved during the period of seventies support of the negative of the next period as the result was staying the Libya's economic goes on in a vicious circle.

Where the gross domestic product with underway prices in the Libya's economic had achieving a growth rate as much as (16.9%) during the year (2010) and that as a result of the refresh of Libya's economic in the wake of the global economic crisis that affected on it perform during the year (2009) where the rise of the pace of growth of the world economy had contributed with the rising of oil prices in the national market and increasing the revenues and exports, and each of these factor had a positive effect on the value of the output and the rate of its growth, but in the year (2011) the Libya's economic had noticed a go back in its perform and that's as a result of the politic development events where the local output had recorded a negative rate of growth as much as (53.1%) comparison with the year (2010) but in the year of (2012) the record oil prices during the year of (2012) had supporting the economic growth in Libya, where Libya achieved the highest rate of growth at current market prices during the year (2012) it reached about (126.8%) and that's as a result of covering the economic from the consequences of political circumstances and the inside development which Libya had notice it during the year (2011), and in the year of (2013) we find the rate on the real gross domestic product in Libya had notice big swings in the last time affected by the number of the outside and inside factors and on its head the fiscal crisis and also the economic fallout that result of the politic transformative which Libya had notice it, the thing leads to shrink the output in Libya with average (22.5%), where the growth economic data had shows for the period (2010-2015) that the gross domestic product with the ongoing and study prices as in the table number (2)

Table number (2) the development of the gross domestic product:

the year	The domestic product with the ongoing prices	The growth rate
2010	73,965,000	16.5%
2011	34,699,000	-53.1%
2012	78,697,332	126.8%
2013	60,990,432	-22.5%
2014	28,543,523	-53.2%

From the table number (2) that the gross domestic product had start to decrease in the year of (2011) comparison with the year of (2010) and with decreasing rate as much as (53%) when in the year of (2012) we find that the gross domestic product had grown with rate (126.8%) and that's as a result of the rising in the oil prices.

As the contribution of economic sectors with generate the gross domestic product had affected with the political and economic events which Libya has pass through it after the year of (2010) where the rate of contribution of crude oil and mining sector had increasing from (6.9%) in (1958) to (53.9%) in (1964) then to (62%) in (1968) when the rate of contribution of other sectors had stay modest.

2.3.3. The Population Growth Rates

As to the size of the population and the rates of its growth, the growth population in Libya and with it absolute image had notice a quick, continuous and regular development.

Where the absolutely number of the population increases didn't affecting with the advance and retreat that the Libyan's economic had notice trough the time successive stages, and that's what assured it the result of the residential census that's had done in Libya from the first census until the last one, where the statistical data had point to the clearly increases of the residential census in Libya as it showing in the table number (3).

Table number (3) the numbers of the population in Libya during the period of 2000-2015

The year	Number of population (million population)
2000	5.640.000
2001	5.842.000
2002	6.021.000
2003	6.221.000
2004	6.420.000
2005	6.629.000
2006	6.843.000
2007	7.065.000
2008	7.294.000
2009	7.530.000
2010	7.774.000
2011	6.288.652
2012	6.283.403
2013	6.265.987

This population increase is a normal result and that's because of the rising in the rate of population growth which maintained a high pace (1.56%) during the seventies decade and a rate of (2.52%) during the eighties decade of the past century, but the pace of this rate had take to decreasing after the year of (2010) with rate (1.56%) during the period (1995-2006), as the data are also showing that yearly net growth rate of the Libyan population that been achieved in the period of (1973-1984) that amount to (4.21%) had decreasing to (2.80%) during the period of (1984-1995) then to (1.8%) during the period of (1995-2006) which insure that the gross of the population number had grown with a yearly rate as much as (2.94%) during the period of (1973-2006), as the available statistics point that the Libyan population that living in Libya are constitutes a rate (91%) of the gross population number according to the results of the population census in (1973) where this rate had decrease (89%) of the gross population number.

2.3.4. The Use Index

The available data pointed that the size of the power worker in Libya had reached 433500 thousand worker in the different economic activity, where the patriots number of them had reached 383500 thousand worker which is almost (88.5%) of the gross use index, when the power worker which are not patriots among 50000 worker which is almost (11.5%).

As on the sector level, the available data pointed to the decreasing the rate of the contribution of the agriculture sector to (22.659%) faced to the increasing of the rate of contribution of the manufacturing industry to (3.7%).

But the next period (1980-1990) had characterized by volatile remarkable on the partly level, where the total of use since the beginning of 1980 had reached 780223 thousand worker, (72.9%) of them are national employment as the

rest rate had formed (27.1%) of the foreignworker, as the available data pointed to the increase of the workers rate in the industry manufacturing sector to (4.6%) when the number of the worker in the agricultural sector had decreasing in to (15.5%), as this wiggle in the size of the power worker had continue during the period (1990-2007) where the gross use had reached 1780710 worker during the year (2007), where the national direct power had formed a rate of (90.6%), as the rest rate is (9.4%) of the foreign workers.

2.3.5. The indictors of the growth of the gross domestic product and Composition of fixed capital and Investment Spending

The Libyan oil exports had formed since (1961) an inflection point in the economic history of Libya, where it's foundation a new stage known of the capital surplus stage and quick growth, and with the start of (1962) a substantial changes had happened on the structure of the Libyan economic come with achieving a high rates of the growth and also in the rise of the part of the individual of the gross beside to create kind of the relatively sophisticated activities, and we can show these indictors according to these stages:

- **The first stage (1962-1969)**

This stage describing as one of the faster periods of the growth in the history of Libya, where substantial changes had happened on the structure of Libyan economic comes with achieving high rates of growth and also a rise of the per capita of the gross domestic product.

- **The second stage (1970-1981)**

This stage described as one of the important periods of the capital accumulation that output by the first oil price shock (1973-1974), where this period had noticed an economic vogue present of increasing the growth rates where the real gross domestic product had achieving a growth amount an average (13%) yearly, where this increase come with the rising in the average of the per capita of the gross domestic product and a decrease in the public level of the price, where the inflation rate had decreasing with rate (7.5%) in average, as this period had characterized rise of the work level therefore decrease with the unemployment, and the upward trendthat the Libyan economic that go through during this periodback to unit a combination of factors as one of the important is the rise of the oil prices in the national market, which arrange on it.

A fast growth in the income and spending, which led the State to take many procedures, where the state had put an economic and social growth plans for the years (1973-1975) and the first five-year plan for the years (1976-1980), Targeted by that the infrastructure, urbanism movement,and push forward the economy wheel to diversify its revenue sources.

- **The third stage (1982-1988) the stage of the recession**

This stage had notice a retread with spending the American dollar, and a strong decrease in the world oil prices, where the price of the one oil barrel in the year (1986) reach in to less than (10) dollar to the barrel, which led to decrease the oil income, the thing that made the State to intervention and working on set the public spending and austerity policies approach, and stop execution many of the economic projects which was listed in the second five-year plan (1981-1986).

The thing that arrange on it log the economic to the recession where the most prominent features presented with decrease the rate of the economic growth, and raise the rate of prices growth, where the inflation had reached almost (5%) in average.

These factors lead to discredit of the Libyan economic therefore to the local and outside fiscal unbalance, and the deepening of structural imbalances in different economic sectors, where the black market had shows and also the exchange market that parallel, as the deterioration of the balance of payments leaving behind inability amount to 1377.9 million dinar in the year (1981), and increase the inability of the public budget to the total output with the current market prices to (13.6%), the thing that arrange on it set many correction procedures which was decreasing the dinar value in face of other coins, limited the public spending, applying the cash policy, canceling some of policies that own to customs protection and replace it with the consumption tax.

- **The fourth stage (1989-2015) the stage of economic correction**

This stage had noticed enter Libya to the economic correction stage, which target the restructuring of Libyan economic, addressing the structural imbalances and direction it with what fits on the economic, policy, region, and national development, and working on push the pace of the activity economic with more depended on the self possibilities, where the methodological framework of the economic correction had focused on working with the demand management policies that purposing to suppression themagnificationpressure,laying an ingredients of a

well-established for stability and economic growth in the shadow of achieving a relative stability in the local level prices, as it had also focused on strengthen the supply side policy through making the structural correction, and that's by minimize the rule of the State in the economic activity, and also applying some fiscal repairs which purposing increase flexibility of the fiscal sector, as the program based on achieving its aims by making the State withcontinue with adopt the rationalization approach in the public spending, and the perfect uses of the public sources in a manner insure achieving a steadily growth.

TheLibyan economic had achieved an relative average growth rate during the period (1998-2005) in the real gross domestic product, where this growth back to rising of the local demand pace for consumption and investment caused by the improving the oil prices, where the available datapointed to, although the real gross domestic product had achieving a real growth its rate reached in the average about (3.5%), the inflation rate continue with rises, where it value reached this high (4.3%) when the outstanding balance of public local debt had decrease as a percent of the local result of (70.8%) in the year (1988) to (25.5%) in the year (2002), and with that improve the balance of payment had been put where it continue with a good achieving except the year (2001) which achieved an inability as much as 75.8 million dinar, where that's back to the surplus that came of the outstanding balance to the improving of the oil prices which its percent is almost (99%) of the gross exports, when with connected with the total inability of the public balance as a percent of the gross domestic product had decrease from (11.2%) yearly during the recession period in to (2.7%) yearly during this period.

As with what connecting with the analyses the reality of the public spending in the Libyan economic during the period (1990-2015), as the first half of the nineties century had noticed a marked fall back in the public spending and that's to direct the public policy to decrease the global economic recession effects in the national economic by rationalization the size of the public spending and working on rebalance between the revenues, expenses, and the payment balance, and that's aware to the decrease that happened in the oil revenues because of the oil prices, but in the second half of the nineties century had noticed an marked increase in the size of the public spending of improving which happened in the oil prices, and also to the last direction of the State to the increase of the public services size that introduction to citizens, where the increase had continue with this spending until the yearly composite growth rate had reached (16.2%) during the years (2007-2009) when it was (5.3%).

But the consumer spending, the rate of it input in the gross domestic product was high in the beginning of the nineties but it had decrease during the last years to reached to the less value in the year of (2008) with rate (26.92%), until the yearly composite growth rate had become (2.4%) and the cause of that back to the State direction to encourage the industrial sector and customizing the big part of the spending to invest seeking to achieving a requirements of the development project, where the Libyan economic had noticed a marked investment expansion, where the rate of the contribution of investment spending in the gross domestic product had increasing to reach to (73.08%), as the rate of the composite growth of this spending reach to (20.89%) for years (2003-2007) and during the years (2007-2009) reach to (19.6%) the thing that make sure the politic and economic direction of the State to rise the sectors contribution rate non-speed in the gross domestic product during increase the investment spending.

2.4. The Challenges and Future Economic Policies

2.4.1. The Challenges that Faced the Economic Growth

The economic growth in Libya had faced a set of economic and social challenges, as what pointing of the notes on the Libyan economic during the main indictors of the growth rates during the past period, that economic had facing these challenges:

- Rentier of Libyan economic, where the sector of crude oil extraction and exported it contribution with rate (34.3%) in generating the local product and with rate (95%) of the exports gross.
- The rule that limited to the privet sector in the development project in terms of the decreasing its rate contribution in the economic active, generating a work opportunities, covering the increase in the local demand, and financing investments.
- The high rates of the unemployment, where the high rates had continues for almost (12.2%).
- The tumble of the investment plans in the execution stage which is back to the weakness of the coordinate between the public fiscal policy of the state and the investment policy, the things that led to big growth of the government consumer spending with out to come with it a big improving in the government services.
- The weakness of the Libyans sharing in the projects that been listed in the social development program and depended on the foreign item.

- The weakness of the local market which not allowed to develop the production sectors, and excessive in expansion with the size of the public spending during the period of seventies and beginning of eighties.
- The decrease of the efficiency of the work item, where the data pointing to depended on execution most of the development plans on the foreign workers.
- The inactivity of the industrialization policies, which means the strategy of industrialization that direct to import substitution doesn't work with active the rule of this sector in the national economic.
- The limited of the rule of the fiscal and monetary policy to processing the problem that Libyan economic had exposed to it.

2.4.2. The Future Economic Policy of the Economic Growth

On the light of diagnosis the reality, the available humans and material potential, and defined the problem and challenging that facing the development in Libya, a plan had been put to economic correct of the Libyan economic, selected the necessary means and policies to achieving it in purpose of get an advance rates in the economic growth, and when we meditate with what come in the plan of vision and future economic policies on the economic in Libya and closing that with the economic reality in Libya and the variables that came on it and what had recorded and recording on that reality of opinion and notes, as a reflex of what came of visions and future economic policy, it may be an important and reality way to advancement with the economic rates growth in Libya on the total level on the national economic and on the sector level, and that's according to:-

- Required with the targets of the economic plan to connect to specific economic activity, for a specific period of time, measured accurate measure with the necessary of clarify the wording of aims to cross the possibilities of interpretation and different hermeneutics, and to make the aims a reality building on the light of balanced estimates to the future of the economic activity and derived from the history reliable information by using a appropriate ways for economic prediction, that's beside to the important to make the aims homogeneous, integrated, and consistent without interference[Bodka, Dr-Abd Al-Kader Mohammed, 1979, P (285-287)].
- The Libyan economic in his rentier current circumstances is the most need to an economic rule to the State that make the partnership easier and the merger with the private activity through a look that seen in the economic alliance between the State active and the works sector, a decisive shift to a perfect economic and social performance and with high harmony and compatibility of generating a well-established pattern of sustainable development.
- As the Libyan economic always need to follow a total policy including find a stable environment on the total economic level that make sure to stimulate the economic growth through control on the swell rates and the public spending that unjustified economic and socially.
- In the Activity funding: the important of activate the government outlay development (specialist) to take on it shoulder a missions to grant soft loans to the privet sector, and also restructuring support in the public arbitrage of the State and depended a Priorities doesn't missed the product activity on the privet sector, as it should be activate the laws, orders, prevalent instructions and what can be add to it of improvement that service the private investment climate in Libya.
- Minimize the spending in the operational paragraphs for saving money that direction to the investment beside employs the operation spending o support the investment spending.
- The balance in the distribution of investment in the base of the balance between the principles of social justice (as for services and the infrastructure) and on the base of the economic efficiency (as for production activity).
- The needs become so urgent to improving and increase the product level and developing the competition level in all the national economic sectors and raise the absorptive capacity of the investment and the ability to creative a new sources for wealth.
- And what the investment need in Libya in the future (Saleh. Dr-Muzher Mohammed Saleh, 2010): the development situation of Libya pointed on delve into the fragmented patterns of the investment doesn't strength the result of the growth unless it depending on a strong push of the development presented the minimum of the investment, its rate doesn't less than (15-20)% of the gross domestic product that necessary for make sure a self and sustained growth, and by that the availability of the minimum of the investment with it broad form consider as a necessary condition to achieve the self sustained growth that's limited with availability an external economic savings.
- Guarantee an important fiscal riser of the private investment activity that ensure the success of projects of the privet activity and it's initiative in two directions:

The first ones: Renew the areas and the existing industrial parks which owned it the private sector by saving technology, work ways, production, marketing that leave the past technological era, with making (5-7) new industrial parks in all country.

The second ones: presented by supply an important much of the social capital or the infrastructure that prepares to the industrial areas a research subject which it's exist considered as a necessary complement of self sustained growth supplements.

At the level of the agricultural activity, depended on strategy agricultural areas that ensure the grain security in Libya by suggestion make (7) agricultural areas by reality of (1) million acres for each area of the new intensive agricultural form take care of it the private activity by help from the State, beside of the expenses of the residential complexes idea on the same standers.

The open field in front of the foreign investment must be subject to the laws and the national legislation (Iraqi) of the organization, control, areas, limits and what ensure the right of each parts and achieving the hops benefit.

2.5. The Conclusions and Recommendations

Of all what came before about the economic growth and its main indicators in the Libyan economic for period (1970-2016) and discussed it, we can say that the economic growth is accounts today a increase interest of the concerned and specialists and with all government levels, private sector and public peoples which looking forward to the achievements of development that fit with the stage natural.

2.5.1. The Conclusions

*The investment is the most important factor in the development process, and the state of the growth shaping in the total process of formation the capital and establishes an economic and social mechanism to sustain and increase the accumulation of the capital.

In the country that characterize with late of the technological level, the rate of the demand capital growth to accommodate a new technology is being bigger of what it's in the development countries and of these main specialize which characterizing of it the economic development countries are the scarcity of capital, the miss used of it, and the inadequate of what it consists to finance the necessary investment to rise.

*The start point in the resource allocation process is how to maximize the rate of the growth of the output by using the local resources and how minimize the needs of this process of the foreign coins.

*The economic growth is means in general the increase of the income of a particular state, the increase in the goods and services which produce by particular economic and this increase in the capital, the technological advances and improving the education state are considering as the main reason of the economic growth.

*In Libya the period (1970-1980) had noticed a rise in the growth rates in the main product sectors and during the period (1986-2010) the development march had fall back and the positive development effects that been achieving in the seventies had limited because of the two war, the siege, the exceptional circumstances that Libya been through in the eighties and the period that follow it.

*The popular growth had kept its high pace (4.21%) during the seventies and eighties of the past century, but the pace of this rate had noticed a decrease after the year of (1990) in to (2.80%) affecting with the conditional that Libya go through it, and therefore the decrease of the values of the demographic indicators after the year (2003) but the rate of the popular growth in Libya had reached in rises to a rate of (3.26%) on the long average range during the period (2000-2010).

*The gross domestic product had increased with composite growth rate as much as (13.0%) of the underway prices for a period of time (1970-1980) but it decrease to (2.5%) of the underway prices for period of time (1980-1990) and (3.7%) of the fixed prices, and that's decrease back to filling the big part of the economic resources to the war effort and to the partly stopping of the oil exports during this period.

And the data of the economic growth of the period (2003-2007) had showed that the gross domestic product had achieved a yearly growth as much as (11.8%) of the underway prices and (6.8%) of the fixed prices which reflex the existence of a high inflationary pressures.

*During the period (1970-1979) the size of the making the fixed capital had increase with composite growth rate as much as (15.6%) of the underway prices but it's achieve a negative yearly growth rate as much as (7.55%) during the eighties as what came of the war from the devastation of the asset of the production capacities.

And during the period that came after (2003) as the making of the fixed capital had achieved a rate as much as (128%) of the underway prices and (97%) of the fixed prices thanks to the development in the government investment.

*During the year (2003) the proportion of government consumer spending to the local product (9.5%) while the investment spending doesn't reached except (8.8%) for the same year.

After (2005) and as a result of the relative improvement in the investment activity , the rate of the fixed capital to the gross domestic product had return to rise to reached (15.6%) in the year (2007) and that's considered as a positive indicator that servant the economic growth path in Libya.

*The main indicators of the Libyan economic growth rates during the period (1970-2010) pointed to that economic is facing a different challenges that the research pointed to it, and as the important ones of it:

- The rentierof the Libyan economic as the extraction and export of crude oil sector contributes with rate (95%) with generated the gross domestic product.
- The limited rule of the privet sector in the development process as the rate of it contributes of making the gross domestic product was (13.4%) during the eighties of the past century, rising toalmost reached the limit of (30%).
- The high rates of the unemployment had continued and it was almost (18.2%) as the last statistical survey of it in the year (2007) with clearly focuses of it among young people and women.
- The big growth in the government consumer spending which had formed a competition to the investment spending which leading in its part to decrease the rate of the public growth of economic.

2.5.2. TheRecommendations

The recommendations that we see are more important and provide opportunities to take by it to increase and stability the rates of the economic growth.

- 1- The rebuilding is require a concentration of the economic resources, planning ways and the central administration between the State which requiring provide a hung of capital.
- 2- Working on increase the rate of the contribution of the productive sectors (Agriculture, Industry and tourism) in the gross domestic product and the possibilities of material and human in Libya are available for that if it's been advantage and development well.
- 3- Activate the product investment of the natural and human resource during customize the necessary fiscal resources with what make the investment politic is support to the aim of achieving a comprehensive and sustainable development of the national economic.
- 4- Support the privet sector and build a partnership between it and the public sector and strengthen its role in all the economic and social activity.
- 5- Open the way (studying) in front of the direct and indirect foreign investment with continue in development the laws and legislation which organizing that.
- 6- The formation of the new investment consider as a very important factor with select the economic growth rate and increase the income with quick rates to cross the population growth rates for rising the living level of individual as the investment consider ad the first condition to achieving a quick rates of the economic growth.
- 7- Beside making an economic plans and apply it, it's necessary that:
 - Using the economic account in way that more comprehensive and profoundto reach the perfect use of resource.
 - Continuing applies the plan and considered that as not separated partof the planning process and that's according to mechanics and procedures that clear and accurate.
 - Select the future development of the Libyan economic for the ten years at less during preparing for the future predictive calculations.
- 8- And as we see it important and the necessary of had intention on it is go far or cross the phenomenon that the human only find himself in reach gain or take of gain in all ways that available in front of him, as that consider of the very dangerous things, especially in the way of the development process, as the development experiment in the development state hadshows that the development, building, and evolution are need the human that find himself in the form of the society and the country level during new add, special product work and as a part of

the development situation and that's what we need for to live up with economic growth rates in Libya and its prosperity.

Abstract

Moisture removal from air is a practice that is beneficial to many applications. One of the methods to separate water vapor from air is by using desiccants. Present work depicts water vapor sorption behavior of CaCl₂, Silica gel, Molecular sieve, Bentonite powder and Aluminum oxide desiccants. In comparison to open air conditions, superior water vapor sorption was exhibited by all the desiccants in closed glass casings containing water, due to availability of higher humidity. After 141 hours of absorption time, CaCl₂ absorbed 36.2% of its weight in open air conditions and 43.1% due to availability of higher humidity in closed glass casings having water. In comparatively lower humidity conditions prevailing in open air conditions, Molecular sieve exhibited superior adsorption capability than Silica gel while inside closed glass casings, Silica gel overpowered Molecular sieve during the later half of adsorption process. Regeneration experiments for desiccants showed that 100% regeneration of Silica gel and CaCl₂ could be obtained when heated to around 117.5°C and 134°C respectively for 5 hours. LiCl and Molecular sieve indicated 70.6% and 59.7% regeneration respectively when heated to 140°C.

Introduction:-

Separation of moisture from air is a practice that is being used in many applications for achieving the desirable benefits. Some of the applications where practice of moisture removal from air is followed are in chemical industry to remove water produced by chemical reactions, air dehumidification air-conditioning system for comfortable and healthy environment [1, 2], humidity control and air drying for industrial and agricultural sector like textile mills, post-harvest crop storage etc. [3], extracting water from air [4], control of humidity in food packaging [5], Moisture control in pharmaceutical [6] and electronics industry [7].

One of the methods to separate moisture from air is by using materials having affinity to attract water vapor and retain it in the form of water. Some of the commonly occurring materials that have the property to attract moisture from air are clay, sand, wood, sugar, caramel, honey, glycerol, table salts, polymers material such as cellulose, nylon etc. Commercially available materials having the property to attract water vapor from air are known as desiccants and the mechanism by which these materials attract and hold water vapor is adsorption or absorptions [8, 9]. Some of the desiccants are Calcium Chloride, Lithium Chloride, Lithium Bromide, Triethylene Glycol, Silica Gel, Aluminum silicates (Molecular sieve or Zeolites), Aluminum oxides, etc. These desiccants have been reported in many research works for sorption of water vapor molecules from air. As energy saving alternative Lithium chloride

Corresponding Author:- Daya Lama.

Address:- Defence Research Laboratory, Tezpur -784001, Sonitpur, Assam, India.

has been used for air dehumidification and desiccant regeneration [10]. Molecular sieve has been used for dehydration of natural gas [11] and for understanding moisture adsorbing behavior [12]. It is also reported that hygroscopic Lithium bromide can be used for providing an attractive alternative to conventional cooling systems [13]. Triethylene glycol desiccant was used in cooling system for dehumidification and regeneration [14]. Water vapor adsorption by Silica gel has been studied for desalination [15]. Use of Calcium chloride is reported for absorption of water vapor from air [16].

The objective of the present work is to study through experimental trials water vapor sorption behavior of different desiccants and identify their regeneration capability for reusable purpose.

Theoretical background:-

Desiccants attract moisture from air and thereby facilitate mass transport of water vapor molecule due to low vapor pressure created at the surface. Desiccants have low surface vapor pressure; this is due to the fact that it contains large surface area as a result of availability of pores. When these water molecules migrate at the surface due to low vapor pressure, adsorption occurs physically or chemically and in some cases by both the process. Desiccants like Silica gel, Molecular sieve, etc exhibit adsorption mechanism, whereby the water vapor molecules bind on a solid surface as a result of surface force attraction such as physical, electrostatic force or chemical adsorption. The molecular distances inside the pores of the adsorbent are much shorter than in the gaseous phase for similar pressure and temperature conditions and thus the adsorbate density in adsorbed phase becomes liquid-like due to van der Waals attractive forces. When pore size is very small, another phenomenon called as capillary condensation occurs. Capillary effect is mainly due to intermolecular van der Waals forces, surface tension effect and wetting behavior of water on desiccant surface. Due to capillary effect there is lowering of vapor pressure over the surface of desiccant and thereby facilitates condensation process.

In case of metal chloride desiccants like LiCl, CaCl₂ and LiBr water vapor is attracted to these desiccants via absorption process. Due to this absorption process there is lowering of vapor pressure over the surface of these desiccants. During absorption, water vapor molecules completely dissolve and dissociate the ions of these desiccants. The driving force for absorption in this case is the negative enthalpy of reaction of water with these desiccants; in other words it is thermodynamically favorable to absorb water molecule. There is also a physical interaction between electropositive metal ions and lone pair of oxygen in water through ion-dipole force.

Materials and Methods:-

For studying water vapor sorption behavior, self indicating irregular granular Silica Gel of 3-4 mesh size [Merck Specialities Pvt. Ltd., India], Aluminium Oxide of particle size 0.05 to 0.15 mm [Merck Specialities Pvt. Ltd., India], 8 x 12 mesh Molecular sieve 4A (Sodium Alumino Silicate) [HiMedia Laboratories Pvt. Ltd., India], Bentonite powder (Aluminium Silicate) of size lesser than 25µm [HiMedia Laboratories Pvt. Ltd., India] and Calcium Chloride (fused) 95% [Loba Chemie Pvt. Ltd., India] were considered. The desiccants chosen were all of general grade. The photograph of these desiccants is shown in figure 1.

Figure 1:- Photograph showing Calcium Chloride, Silica Gel, Molecular Sieve, Bentonite powder and Aluminium oxide desiccants.

Two batches of experiments were carried out, one in open air condition and another inside closed glass casings containing disc with water, for higher humidity condition. In one batch of experiment 10g each of the desiccant materials were kept in glass beakers for 141hrs in open air condition as shown in figure 2. The air temperature and humidity were recorded to vary between 20°C to 26°C and 52% to 71% respectively during the duration of experiment. In another batch, same quantity of desiccants were kept inside glass beakers and the beakers were placed inside closed glass casings having disc containing water as shown in figure 3. In this case due to water contained in the disc, humidity was observed to be 100%.

Mass gained by the desiccants materials due to sorption of water vapor from air, in both the batches of experiments, were recorded at various intervals of time during the experiment and mass of water molecules held by desiccants were found out. In both the batches of experiments percentage of water collected, relative to the mass of desiccants, from atmospheric air were obtained for all the desiccants and graph showing variation of percentage sorption with time were plotted.

Figure 2:- Experimental setup for water vapor sorption in open air condition by desiccants.

Figure 3:- Experimental setup for water vapor sorption in closed glass casings for higher humidity conditions.

For studying the regeneration temperatures LiCl, CaCl₂, Silica gel and Molecular sieve desiccants were taken into consideration. Four batches of 5g each of LiCl, CaCl₂, Silica gel and Molecular sieve were placed like before inside

a closed glass casings having disc containing water for 7 days and the relative humidity was observed to be 100% inside the glass casings. After 7 days of water vapor sorption by these desiccant materials, they were taken out from the glass casings and weighed in for quantifying the amount of water sorption. Immediately after sorption of water vapor, each batch of these desiccants was then heated for 5 hours in an oven at different temperatures. The temperatures chosen for heating the batches of desiccants were 110°C, 120°C, 130°C and 140°C. After heating in the oven, desiccants were weighed again to obtain the amount of water lost due to heat. Percentage of water removed due to heating effect from the desiccants was calculated as the ratio of mass of water removed during heating and mass of water vapor held during the sorption period of seven days. Since percentage regeneration of desiccants is considered as percentage of moisture removed from the desiccants, graph showing variation of percentage regeneration of desiccants with heating temperatures was plotted.

Results and Discussion:-

Sorption in open air conditions:-

Water vapor absorbed/adsorbed at different intervals of time by 10 grams of each desiccant material in open air condition is shown in table 1.

Table 1:- Mass of water vapor held by desiccants at different intervals time in open air condition.

Desiccants	Mass of water vapor absorbed/adsorbed					
	6 hrs	23 hrs	45 hrs	93 hrs	117 hrs	141 hrs
CaCl ₂	0.15	0.55	1.63	2.70	3.19	3.62
Silica Gel	0.13	0.44	1.09	1.56	1.74	1.90
Molecular sieve	0.17	0.64	1.80	2.07	2.09	2.09
Bentonite	0.05	0.16	0.29	0.30	0.32	0.33
Aluminium oxide	0.04	0.12	0.21	0.20	0.21	0.21

It is found that during the experiment intake of water vapor by Bentonite powders and Aluminium oxide was significantly less and this is due to the fact that surface area of these desiccants are much lesser than of other desiccants. In comparison to Bentonite and Aluminium oxide, Silica gel was found to be superior desiccant with higher moisture adsorption of 1.90 grams in 141 hrs. The reason behind this is due to the internal structure of Silica gel, consisting of network of interconnected microscopic pores formed by connections of the polysilica gel particles via oxygen[17]. This structure causes large surface area in the range of 500m²/g [18], producing a much reduced partial pressure of 0.13 Pa in an unsaturated state [19] and hence it has great affinity to adsorb water vapor. The adsorption process occurring in Silica gel is first by bonding of water molecule onto the hydroxyl groups of silica gel followed by further physical adsorption in additional layers by van der Waals forces, which are the decisive driving force for decreasing the vapor pressure [20]. At the end of experiment after 141 hrs of sorption process, CaCl₂ was found to absorb highest amount of moisture 3.62 grams, 1.9 times more than by Silica gel, followed by Molecular sieve with 1.90 grams. The reason behind CaCl₂ absorbing higher amount of moisture from air is due to thermodynamically favorable reaction of water molecule with CaCl₂, having enthalpy of formation for hexahydrate as -2218 kJ/mol. The bonding of water molecule with CaCl₂ is due to electrostatic interactions of Ca²⁺ ions with lone pair of oxygen. And once the absorption initiates, vapor pressure at the surface of the CaCl₂ lowers significantly facilitating higher absorption of water vapor.

Variation of percentage of water vapor intake with time by desiccants from air in open air condition at relative humidity between 52% and 71% is shown figure 4. After 141 hours CaCl₂ absorbs water vapor 36.2% of its weight, Molecular sieve and Silica gel adsorbs 20.9% and 19.0% of its weight. Whereas, Bentonite and Aluminum oxide

Figure 4:- Graph showing percentage sorption of water vapor by different desiccants in open air condition.

exhibits poor efficiency with water vapor adsorption of 3.3% and 2.1% respectively. It is observed that Molecular sieve in open air conditions that is in lower humidity, exhibited superior adsorption behavior than Silica gel with higher amount of water vapor adsorption at any stage during the experiment. Even when compared to other desiccants, Molecular sieve showed relatively better adsorption capability from initial to 60 minutes of adsorption time. The reason for molecular sieve showing superior behavior to other desiccants at lower humidity is due to the fact that molecular sieve has uniform network of pores with uniform pore size [21, 22].

Sorption in closed glass casings having higher humidity:-

In case of higher humidity conditions that is experiment conducted in closed glass casings, water vapor intake with respect to time by 10 grams each of desiccant materials is shown in table 2. In comparison to low humidity conditions in open air conditions, sorption of water vapor from air by all the desiccants were higher due to availability of higher humidity in closing glass casings having water disc. Like in open air condition here too CaCl₂ showed superior absorption capacity with 4.31 grams of water at 141 hrs. Further effect of higher humidity on adsorbing behavior of Molecular sieve and Silica gel was also observed whereby after 141 hrs of adsorption time, unlike in open air condition Silica gel with 2.72 grams of water exhibited superior capability than molecular sieve.

Table 2. Mass of water vapor absorbed/adsorbed by desiccants at different intervals time in closed glass casings with higher humidity.

Desiccants	Mass of water vapor absorbed/adsorbed					
	6 hrs	23 hrs	45 hrs	93 hrs	117 hrs	141 hrs
CaCl ₂	0.17	0.61	1.87	3.19	3.78	4.31
Silica Gel	0.15	0.52	1.39	2.14	2.45	2.72
Molecular sieve	0.17	0.66	1.92	2.16	2.18	2.19
Bentonite	0.09	0.29	0.67	0.92	1.11	1.09
Aluminium oxide	0.08	0.25	0.60	0.89	1.01	1.12

Variation of percentage intake of water vapor with time by desiccants in higher humidity conditions is shown in figure 5. It is observed that due to higher humidity percentage sorption of water by desiccants is improved with Calcium Chloride absorbing as high as 43.1% after 141 hrs.

Figure 5:- Graph showing percentage sorption of water vapor by desiccants in closed glass casings having higher humidity condition.

Also compared to other desiccants, relatively higher improvement in adsorption of water vapor was seen in case of Aluminium oxide, 11.2% and Bentonite powder, 10.9%; the margin of improvement in adsorption for Aluminium oxide and Bentonite was 9.1% and 7.6% respectively. As in lower humidity conditions, water vapor sorption rate was highest for Molecular sieve in initial part of adsorption process but in later half unlikely Calcium chloride showed exponential increase in moisture intake.

Regeneration of desiccants:-

Experimentation for studying regeneration temperature showed water sorption by 5 grams each of LiCl, CaCl₂, Molecular sieve and Silica Gel. Quantity of water vapor held by desiccants in seven days is shown in table 3 and water vapor removed later on after heating these desiccants at different temperature is shown in table 4.

Table 3:- Mass of water vapor held by desiccants in seven days.

Desiccants	Batch no.1 (g)	Batch no.2 (g)	Batch no. 3 (g)	Batch no. 4 (g)
LiCl	5.48	6.93	7.08	6.52
CaCl ₂	4.84	6.03	6.18	2.97
Molecular sieve	1.13	1.32	1.17	1.24
Silica Gel	2.02	2.05	2.14	2.24

Table 4:- Mass of water vapor removed from desiccants during heating in grams and percentage.

Desiccants	Batch no.1 110°C		Batch no.2 120°C		Batch no. 3 130°C		Batch no. 4 140°C	
	(g)	(%)	(g)	(%)	(g)	(%)	(g)	(%)
LiCl	1.85	33.8%	3.70	53.4%	4.37	61.7%	4.60	70.6%
CaCl ₂	2.78	57.4%	4.73	78.4%	5.19	84.0%	3.74	125.9%
Molecular sieve	0.45	39.9%	0.69	52.3%	0.64	54.7%	0.74	59.7%
Silica Gel	2.20	108.9%	2.34	114.1%	2.38	111.2%	3.29	146.8%

It is observed in case of LiCl and Molecular sieve, water vapor removal gradually increases with heating temperatures; water removal at 110°C is 33.8% for LiCl and 39.9% for Molecular sieve and whereas at higher temperature of 140°C mass of water vapor removed is increased to 70.6% and 59.7% respectively. Calcium chloride indicates 125.9% of water vapor removal at 140°C which suggest that heating temperature has exceeded the regeneration temperature and regeneration temperature is apparently 140°C. While in case of Silica gel 108.9%

water removal is observed even at 110°C, which indicates that the regeneration temperature of silica gel is below 110°C. Variation of percentage regeneration of desiccants with heating temperatures is shown in figure 5.

Figure 5:- Plot showing percentage regeneration of desiccants at different heating temperatures.

From the plot, it is observed that 100% regeneration of Silica gel and Calcium Chloride occurs when heated to around 117.5°C and 134°C respectively. These temperatures corresponding to 100% regeneration are regarded as the regeneration temperature of the Silica gel and CaCl₂ when heating duration is 5 hours. In case of LiCl and Molecular sieve, even at highest experimental heating temperature of 140°C it did not give away all the moisture and showed incomplete regeneration.

Conclusion:-

Moisture removal from air by desiccant route is a viable method. Compared to Aluminium oxide and Bentonite powders, CaCl₂, Molecular sieve and Silica gel are relatively more efficient for sorption of water vapor from air. Higher humidity condition generates higher sorption of water vapor from air by desiccants. Molecular sieve even at relatively lower humidity exhibits good adsorption capacity of water vapor molecules. The regeneration temperatures of Silica gel and CaCl₂ is in present experimental study is observed to be 117.5°C and 134.0°C respectively, whereas LiCl and Molecular sieve desiccant showed 70.6% and 59.7% regeneration respectively, when heated at 5 hours at 140°C.

Abstract

Background: Every year, more than 20 million people are injured and 1.17 million are killed due to road traffic accidents. According to the WHO, this is the second most important cause of death among 15 to 29 years old. The objective of this study was to determine the knowledge, attitudes and practices of healthcare profession students in Uttarakhand regarding road traffic safety regulations.

Materials and Methods: This descriptive cross sectional study was conducted among 150 students of Medical (100) and Nursing Science (50) at All India Institute of Medical Sciences, Rishikesh, Uttarakhand. Stratified random sampling technique was used and data was collected using a self-structured questionnaire.

Results: Data reveals that majority of them drive two wheelers (84%) and only 3.3% of them had learned driving training from driving school. Furthermore, only 38.7% own the driving license and 20% of them had history of Road Traffic accident. Moreover, even less than one fourth of the students (18.7%) had high level of knowledge about Road Traffic Safety and mean attitude score was 24.12 ± 3.5 (Mean%, 75.4%). Fortunately, 78.7% students use indicators while turning, 77.3% always blow horn before overtaking, 85.3% do not prefer driving after drinking alcohol, 66.7% always obey all traffic signals. However, 33% of them endanger their lives by not using helmets, (36%) not wears seatbelt while driving/seating in car (34%) and sometimes using mobile while driving (32.7%).

Conclusion: This study reveals that only 18.7% of students has high level of knowledge regarding road traffic safety regulation and majority (81.3%) of them had moderate to low level of knowledge. However, they had good mean score of attitude but still they endanger their lives, probably this has contributed in their inappropriate practices of road traffic safety. Therefore, they require sanitizations program to improve the knowledge, attitude and practice of road traffic safety regulations to reduce the chances of road traffic accidents.

Introduction:-

Every year the lives of almost 1.24 million people are cut short globally as a result of a road traffic accident. Around 20-50 million more people suffer from non fatal injuries. According to World Health Organization (WHO), road traffic accidents kill more people around the world than malaria, and are the leading cause of death for young people aged between 15-29 years old, especially in developing countries.ⁱ

The primary reason for the road accidents is increasing motorization, along with this contributing factors are over speed, poor following of traffic rules, driving while drinking, not wearing seat belts and helmets, using mobile phones while driving and poor road designs. In 2010, there were close to 5 lakh road accidents in India, resulting in more than 1.3 lakh deaths and inflicted injuries on 5.2 lakh persons. These translate into one road accident per minute and one road death every 4 minutes. Unfortunately, more than half the victims were in economically active age group. The loss of main bread winner can be catastrophic.ⁱⁱ **Error! Reference source not found.**

According to a report on accidental deaths in India 'Road Accidents' cases in the country have marginally increased by 0.7% during 2013 compared to 2012 while casualties in road accidents in the country decreased by 1.2% during 2013 as compared to 2012. It has also been observed that the rate of deaths per thousand vehicles has decreased marginally from 1.4 in 2009 to 0.9 in 2013, as the number of vehicles in the country has increased by 78.0% and the quantum of 'Road Accidents' has increased by 5.1% during the same period.ⁱⁱⁱ

In the state of Uttarakhand, 10.8 persons are killed per 10000 motor vehicles which is the very close to national average of 10.9 and during the year 2010, there were 773 fatal accidents causing 931 deaths and injured 1656 persons^{iv}. The state's capital Dehradun tops the list of persons injured in accidents followed by Haridwar, Udham Singh Nagar, Tehri and Chamoli. Hence we realized the need to assess the knowledge, attitude and practices of health sciences students regarding road traffic safety regulations in Uttarakhand.

Materials And Methods:-

A descriptive cross sectional study was conducted among the Medical and Nursing students of All India Institute of Medical Sciences, Rishikesh, Uttarakhand. A sample of 150 medical (100) and nursing (50) students was drawn using stratified random sampling technique. Data was collected through a self-structured questionnaire, which was distributed randomly among the students through Faculty In-charge of Medical and Nursing programs.

The questionnaire consisted of personal data and background information followed by a knowledge questions, attitude scale and expressed practice scale. The knowledge questionnaire consisted of 15 questions. Attitude scale consists of 8 statements, which were categorized as: strongly agree, agree, disagree and strongly disagree. The expressed practice scale consists of 12 statements categorized under always, sometimes and never practiced. The study was approved by Institutional Ethical Committee and confidentiality of information and anonymity of subjects was maintained. The data was collected after obtaining the verbal consent of the subjects. Data was analyzed using SPSS version 16 and data was presented using descriptive statistics.

Results:-

The data revealed that majority of the students (73.9%) were in the age group of 18-19 years and nearly equal number of them were males (52.7%) and females (47.3%). Furthermore, majority of them (75.3%) were either rural or suburban dwellers. Majority of them (61.3%) of them verbalized that their parents' monthly income is in between 10,001 – 50,000 per month (Table 1).

Table 1:-Socio-demographic characteristics of the students**N =150**

<i>Socio-demographic characteristics</i>	<i>f (%)</i>
<i>Age in years</i>	
17	07 (04.7)
18	51 (34.2)
19	58 (38.9)
20	23 (15.4)
≥21	10 (06.7)
<i>Gender</i>	
Male	79 (52.7)
Female	71 (47.3)
<i>Course of Study</i>	
Medical	100 (66.7)
Nursing	50 (33.3)
<i>Parent's monthly income in Rupees</i>	
Don't Know	14 (09.3)
≤ 10,000	16 (10.7)
10,001 – 50,000	92 (61.3)
≥ 50,000	28 (18.7)
<i>Place of residence</i>	
Urban	36 (24.0)
Rural	72 (48.0)
Semi-urban	41 (27.3)

Table 2 depicts that significantly good number of students (61.3%) did not owe a driving license, but still they drive two wheelers (84%) and four wheelers (16%). Moreover, only 3.3% of them learned driving from a formal driving school, rest of them (96.7%) learned it from family members/ friends. Furthermore, 20% of students verbalized the history of road traffic accident and in addition, 62% of them also mentioned the history of road traffic accident among their family members/ friends.

Table 2: Driving and Road Traffic Safety related information of students**N = 150**

<i>Variables</i>	<i>f (%)</i>
<i>Status of driving license ownership</i>	
Owes	58 (38.7)
Did not owe	92 (61.3)
<i>Type of vehicle drives</i>	
Two wheelers	126 (84.0)
Four wheeler	24 (16.0)
<i>Source of driving training</i>	
Family/ friends	145 (96.7)
Driving school	05 (03.3)
<i>H/o Road Traffic Accident (RTA)</i>	
Present	30 (20.0)
Absent	120 (80.0)
<i>H/o RTA among family/ friend</i>	
Present	93 (62.0)
Absent	57 (38.0)

Illustrated data in Table 3 shows that nearly one fourth of the students (23.3%) had low level, about half of them (58%) had moderate level and only few of them (18.7%) had high level of knowledge about Road Traffic Safety. The Mean attitude score of the students regarding the Road Traffic Safety was 24.12 ± 3.5 . The mean percentage of attitude score was 75.4% with range of 8-32.

Table 3:-Level of Knowledge and mean attitude towards Road Traffic Safety among students
N = 150

Knowledge& Attitude	Statistics
Level of Knowledge	
Low	35 (23.3)
Moderate	87 (58.0)
High	28 (18.7)
Attitude Score	
Mean±SD	24.12±3.5
Mean Percentage	75.4%
Range	8 – 32

*Attitude Score; Minimum= 8 & Max= 32; Figures given in parenthesis is percentage

It was found good number of students always practiced healthy road traffic safety regulation such as use indicators while taking turns (78.7%), blow horn before overtaking (77.3%), obey traffic signals, lights, signs (66.7%). However, many of them endanger their life by never practicing very crucial road traffic safety regulations such as never wearing helmet (36%), seat belts (34%), sticking to zebra crossing (24.7%) and following specified speed limits (10.7%).

Table 4:-Practices of Road Traffic Safety among students
N = 150

Road Traffic Safety Practices	Always f (%)	Sometimes f (%)	Never f (%)
Wear a seat belt when you are driving/ seating in a four wheeler?	54 (36.0)	45 (30.0)	51 (34.0)
Keep specified speed limit in mind while driving?	68 (43.0)	66 (44.0)	16 (10.7)
Use helmet when driving a two wheeler?	41 (27.0)	55 (36.7)	54 (36.0)
Obey all traffic signals, lights and signs?	100 (66.7)	38 (25.3)	12 (8.0)
Driving a vehicle when alcoholic?	---	22 (14.7)	128 (85.3)
Use mobile phone while driving a vehicle?	---	49 (32.7)	101 (67.3)
Stick to zebra crossing while crossing a road?	31 (20.7)	82 (54.7)	37 (24.7)
Use indicators while taking turns and look both sides before turning?	118 (78.7)	18 (12.0)	14 (9.3)
Use right side of road while driving?	---	44 (29.3)	106 (77.7)
Overtake from left side?	19 (12.7)	75 (50.0)	56 (37.3)
Blow horn before over take?	116 (77.3)	24 (16.0)	10 (06.7)

Discussion:-

Road traffic fatalities remain a major public health problem, with the highest fatality rates per 100000 population in low and middle income countries in Asia. These countries have higher road traffic fatality rates (21.5 and 19.5 per 100 000 population, respectively) than high-income countries (10.3 per 100 000). WHO predicts that road traffic injuries will rise to become the fifth leading cause of death by 2030.¹ Indian data shows that road traffic injuries account for 20-50% emergency admissions, 10-30% of hospital admissions, and 60-70% of people hospitalized with traumatic brain injuries.^v

We had nearly equal number of male and female participants. The majority (73.9%) were in the age group of 18-19 years, which is the most vulnerable group for road traffic accidents. Majority of our students were from middle class families, while few were having a monthly parental income <Rs 10000. This must be highlighted that persons from poor economic settings are disproportionately affected by road traffic injuries, even in high income countries. For instance a study in New South Wales, Australia^{vi}, found that children of relatively lower socioeconomic status were at highest risk of a road traffic injury. Another research from Bangalore^{vii} has found that mortality from road traffic injuries was 13.1 and 48.1 per 100000 in poorer socioeconomic groups of urban and rural populations respectively, compared to 7.8 & 26.1 among their more affluent urban and rural counterparts.

54.7% of students in study admitted about crossing the specified speed limits. Similar practices have been observed by another study from south India^{viii}, where 68% of students admitted about it. Many other Indian as well as

international studies have shown similar observations.^{ix,x,xi} An increase in average speed is directly related both to the likelihood of a crash occurring and to the severity of crash consequences^{xii,xiii}. A 5% increase in average speed leads to an approximately 10% increase in crashes that cause injuries, and a 20% increase in fatal crashes.^{xiv} Pedestrians have a 90% chance of surviving a car crash at 30 km/h or below, but less than a 50% chance of surviving impacts of 45 km/h or above^{14,xv}.

The risk of involvement in a crash increases significantly above a blood alcohol concentration (BAC) of 0.04 g/dl^{xvi,xvii}. Young or novice drivers are at a much increased risk of having a road traffic crash when under the influence of alcohol. Laws which establish lower BAC between zero and 0.02 g/dl for young/novice drivers can lead to reductions of between 4-24% in the crashes involving young people^{xviii}. 14.7% of our participants were indulging in drunken driving at times. Moreover, majority of our study participant were from age group between 18-19 years. This finding has been observed by others^{8,9}. A study from Haryana reported that 18% Road traffic accident victims gave history of having consumed alcohol within 6 hours before RTA^{xix}. However the percentage of accident victims under influence of alcohol was reportedly lower in older studies from India (4.6-8%)^{xx,xxi} showing that incidence of drunken driving is increasing in India.

Only 27% of students in our study always wore a helmet while driving. Wearing a motorcycle helmet correctly can reduce the risk of death by almost 40% and the risk of severe injury by over 70%^{xxii}. When motorcycle helmet laws are enforced effectively, helmet wearing rates can increase to over 90%^{xxiii,xxiv}.

66% of participants in our study use a seat belt (36 % always use it, another 30% consented that they use it off and on), while 34% told that they never use. A study from another medical college from India has shown 74% participants wearing the seat belts². Wearing a seat belt reduces the risk of a fatality among front seat passengers by 40-50%^{24,xxv,xxvi} and fatalities of rear seat occupants by 25-75%^{25,26,xxvii,xxviii}. Mandatory seat belt laws, their enforcement and appropriate public awareness campaigning have been shown to be very effective in increasing rate of wearing seat belts^{25,xxix,xxx}. 67% of study participants never use mobile phone while driving. Similar findings have been reported by Jogand S et al.^{xxxi}

A recent study on adolescent medical students from Maharashtra⁹ has found that knowledge about road traffic rules was good in 42.6%, average in 42.53%, and only 14% of students had poor knowledge. These findings are similar to our observations depicting that young student population is having an overall satisfactory knowledge but when it comes to actual use of this knowledge, many falter. In the above mentioned study, 80% donot use helmets, 68% donot have driving license and nearly two third do not always follow the traffic rules. Thus it is clear that though good attitude can play a major role in changing the behavior and practice of individuals, this is hardly enough. This must be accompanied by strict implementation of traffic laws. We also recommend that the knowledge about traffic rules may be included in basic school curriculum, so that children have an idea about road safety from a young age.

Conclusion:-

The present study assessed the knowledge, attitude and practice of health sciences students regarding road traffic safety regulations and found that students were having moderate level of knowledge. However, they had significant positive attitude towards obeying them. The human body is highly vulnerable to injury and that humans make mistakes. A safe road traffic system is therefore one that accommodates and compensates for human vulnerability. No country can afford to sit back and assume that its road safety work is complete and international community must continue to recognize road traffic injuries as an important health and development issue and intensify support for their prevention. Significant progress in national road safety requires close collaboration between relevant leaders and agencies. India being one the global leader in road traffic accidents has much work ahead. The knowledge of young individuals is moderately good but they still require frequent sensitization programs and implementation of traffic rules to develop practices which are actually safe on the road. Road safety measures through signboards, posters and mass media need to be strengthened to reduce the incidence of road traffic accidents. We also suggest addition of road safety knowledge as a part of curriculum of school children.
